Subject: Eric Schneiderman awarded the Earth Day New York/NRDC 2012 Public Official of the Year

Hey, Neal.

I am pleased to inform you that the Board of Directors of Earth Day New York has selected Eric as our 2012 Public Official of the Year in recognition of his stellar achievements both past and present on behalf of the environment. Past recipients have included Senators Chuck Schumer and Hillary Clinton, Mayor Michael Bloomberg, Speaker Christine Quinn and Congressman Jerry Nadler, to name a few.

The awards party is scheduled for Monday, April 16 about 7pm at Rouge Tomate in Manhattan. I wanted to see if it is possible for Eric to attend. If not, we can explore some other possibilities for him to receive it at one of our other public events.

I'll look forward to hearing back from you at your earliest convenience.

Best regards,

Pamela Lippe

President and Executive Director

# Leaking Profits

The U.S. Oil and Gas Industry Can Reduce Pollution, Conserve Resources, and Make Money by Preventing Methane Waste

March 2012

**Principal Author**

Susan Harvey, *Harvey Consulting, LLC*

**Contributing Authors**

Vignesh Gowrishankar, Ph.D., *Natural Resources Defense Council*

Thomas Singer, Ph.D., *Natural Resources Defense Council*

## **ACKNOWLEDGMENTS**

The authors would like to thank the William and Flora Hewlett Foundation for providing funding for this report. We would also like to thank the following individuals for their valuable contributions and peer review: Amy Mall, senior policy analyst, NRDC; George Peridas, scientist, NRDC Climate Center; Mark Fesmire, Alaska Region director, Bureau of Safety and Environmental Enforcement, U.S. Department of the Interior; Geir Vollsæter, director, Green World Advisors; and Erik Schlenker-Goodrich, director of the Southwest Office of Climate and Energy Program, Western Environmental Law Center.

This report relies heavily on the excellent work of the U.S. Environmental Protection Agency's Natural Gas STAR Program, and the innovative engineering excellence of many oil and gas companies that have developed, tested, and implemented new greenhouse gas emission control strategies. Harvey Consulting, LLC. (HCLLC) acknowledges the time, dedication, and commitment of the EPA staff to develop and maintain the Natural Gas STAR Program, and the corporations that have voluntarily committed to programs to reduce methane emissions.

### **About the Natural Resources Defense Council**

The Natural Resources Defense Council is a national nonprofit environmental organization with more than 1.3 million members and online activists. Since 1970, our lawyers, scientists, and other environmental specialists have worked to protect the world's natural resources, public health, and the environment. NRDC has offices in New York City, Washington, D.C., Los Angeles, San Francisco, Chicago, Montana, and Beijing.

### **About Harvey Consulting LLC**

Susan Harvey has 25 years of experience as a Petroleum and Environmental Engineer, working on oil and gas exploration and development projects. Ms. Harvey is the owner of Harvey Consulting, LLC, a consulting firm providing oil and gas, environmental, regulatory compliance advice and training to clients. Ms. Harvey held engineering and management positions at both Arco and BP. Ms. Harvey has planned, engineered, executed and managed both onshore and offshore exploration and production operations, and has been involved in the drilling, completion, stimulation, testing and oversight of hundreds of wells in her career. Ms. Harvey's experience also includes air and water pollution abatement design and execution, best management practices, environmental assessment of oil and gas project impacts, and oil spill prevention and response planning. Ms. Harvey taught air pollution control engineering courses at the University of Alaska in the Graduate Engineering Program.

# 1. EXECUTIVE SUMMARY

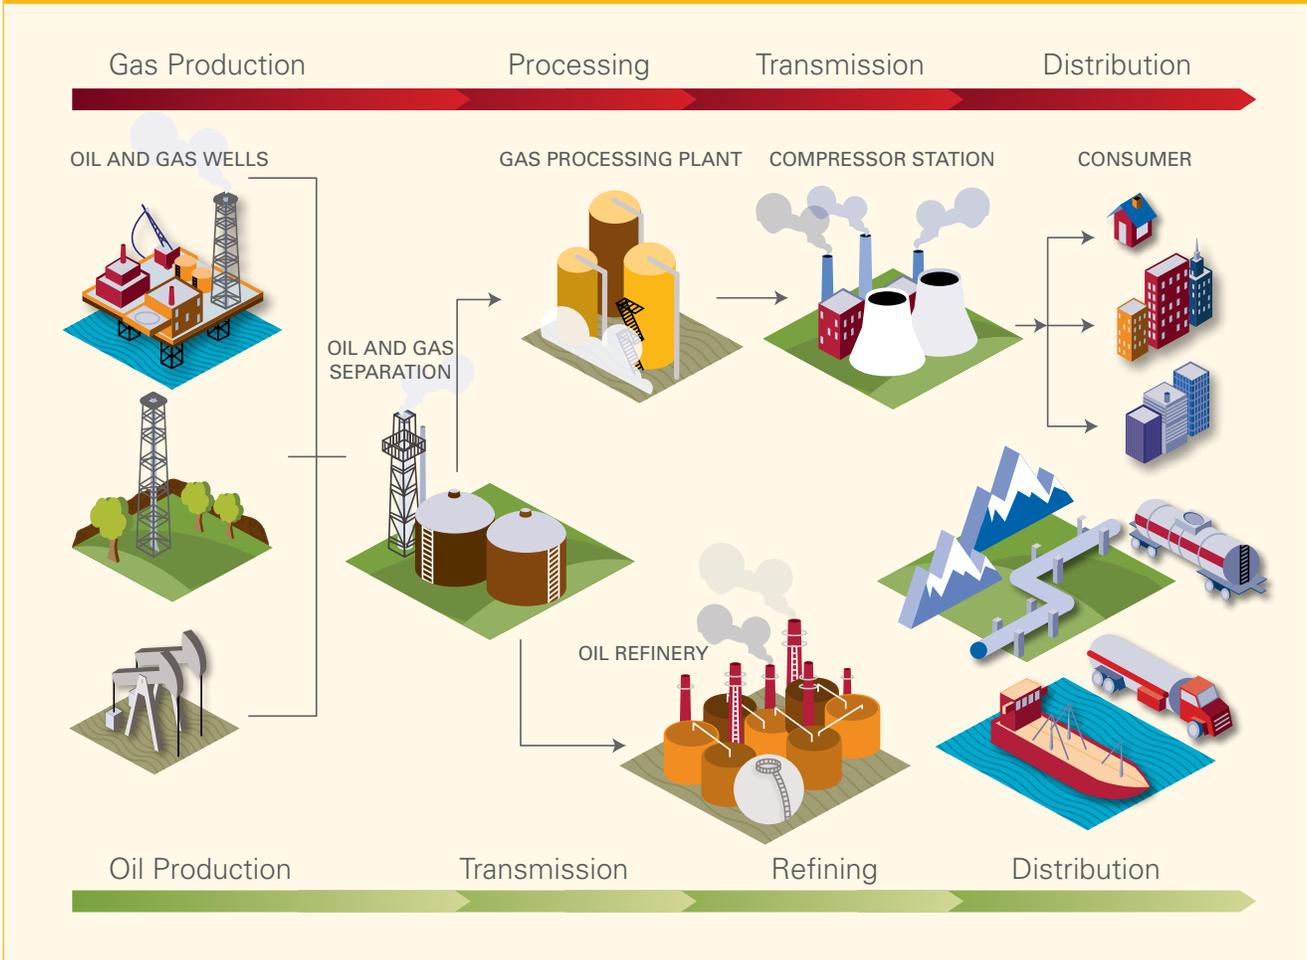

---

**M**ethane is valuable as a fuel, but it is also a greenhouse gas at least 25 times more potent than carbon dioxide over a 100 year period, with even greater relative impacts over shorter periods. Methane makes up as much as 90 percent of natural gas. Currently the United States loses at least 2 to 3 percent of its total natural gas production each year when gas is leaked or vented to the atmosphere. Natural gas is routinely allowed to escape into the atmosphere from oil and gas industry equipment and processes. This is a waste of a valuable fuel resource as well as a source of local pollution and climate change.

A focus on reducing methane waste can produce not only benefits for the climate but also substantial profits for oil and gas companies, and revenues for royalty owners including taxpayers, who own public lands. This report focuses on 10 profitable and widely applicable methane emission reduction opportunities in the United States oil and gas (O&G) industry. If these technologies are used throughout the industry, they have the potential to reduce U.S. methane emissions by more than 80 percent of current levels, based on the U.S. Environmental Protection Agency's (EPA) estimates, an amount greater than the annual greenhouse gas emissions from 50 coal fired power plants. This methane, if captured and sold, can bring in billions of dollars in revenues while benefiting the environment.

A combination of voluntary and mandatory programs implemented by the EPA and many states has already reduced the industry's U.S. methane emissions by more than 20 percent. Given industry practice to date, it appears that available control technologies, while profitable, do not provide sufficient incentive to drive further voluntary reductions. While voluntary programs have resulted in some progress, additional mandatory programs are needed to get closer to the more than 80 percent methane reduction level that this report demonstrates is within our reach.

**Figure 1: Oil and Gas Production, Processing, Transmission, Refining, and Distribution System Simplified Schematic**

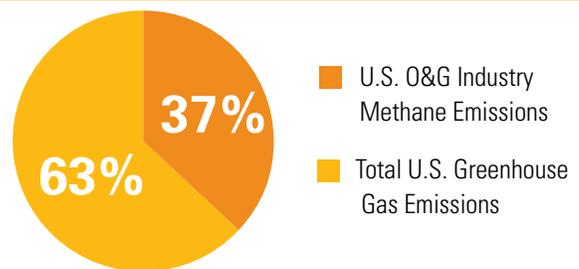

The U.S. O&G industry, which includes both liquid petroleum (crude oil, condensate, and natural gas liquids) and natural gas systems (Figure 1), produced 26,000 Bcf (billion cubic feet) of gas in 2009.<sup>1</sup> The industry lost an estimated 623 Bcf of methane to the atmosphere in 2009, a loss of 2.4 percent of the total U.S. gas produced. This amount of methane, 623 Bcf, is roughly 37 percent of total U.S. methane emissions (Figure 2).<sup>2</sup> Natural gas systems contribute most of the O&G industry’s methane emissions, 547 Bcf/year (88 percent of the total). Liquid petroleum systems, which currently result in methane emissions of about 76 Bcf/year (12 percent of the total), represent an additional emission source (Table 1).

The 10 technologies covered in this report are technically proven, commercially available, and profitable ways for operators to capture methane that would otherwise be leaked or vented to the atmosphere from oil and gas production, processing and transportation systems.<sup>3</sup> These 10 methane control solutions are only a starting point for the O&G industry. The EPA’s Natural Gas STAR Program, the O&G industry, and equipment vendors have identified nearly 100

methane control options that have merit.<sup>4</sup> We selected these 10 technologies because they have been proven by the EPA and industry to be both profitable and technically feasible, time and time again.

**Figure 2: Methane from the O&G Industry as a Percent of Total U.S. Methane Emissions**

Note: Methane made up 10.3 percent of U.S. greenhouse gas emissions in 2009.  
Source: U.S. EPA 2011 *Greenhouse Gas Inventory*

Together, these 10 technologies have the ability to capture more than 80 percent of the O&G sector's methane emissions:

1. **Green Completions** to capture oil and gas well emissions
2. **Plunger Lift Systems** or other well deliquification methods to mitigate gas well emissions
3. **Tri-Ethylene Glycol (TEG) Dehydrator Emission Controls** to capture emissions from dehydrators
4. **Desiccant Dehydrators** to capture emissions from dehydrators
5. **Dry Seal Systems** to reduce emissions from centrifugal compressor seals
6. **Improved Compressor Maintenance** to reduce emissions from reciprocating compressors
7. **Low-Bleed or No-Bleed Pneumatic Controllers** used to reduce emissions from control devices
8. **Pipeline Maintenance and Repair** to reduce emissions from pipelines
9. **Vapor Recovery Units** used to reduce emissions from storage tanks
10. **Leak Monitoring and Repair** to control fugitive emissions from valves, flanges, seals, connections and other equipment

Methane control technologies provide economic, health, safety, and environmental benefits for both operators and the public. These control technologies reduce not only greenhouse gas emissions, but also potentially explosive vapors, hazardous air pollutants, and volatile organic compounds (VOC), improving worker safety and limiting corporate liability. Using these technologies, captured methane can be turned into a supply of natural gas to meet ever-growing market demands, or used as a source of energy for operations. When development occurs on public lands, use of the technologies can result in royalty payments to the government from the sale of captured methane, as well as improved stewardship of our natural resources.<sup>5</sup>

In its 2011 *Greenhouse Gas Inventory*, the EPA estimated that the O&G industry reduced emissions by 168 Bcf in 2009. At a price of \$4 per thousand standard cubic foot (Mcf), the industry generated \$672 million in gross revenue by keeping this gas in the revenue stream. About a quarter (39 Bcf) of the emissions reductions came from Federal regulations such as NESHAPs (National Emission Standards for Hazardous Air Pollutants), and three quarters (129 Bcf) from voluntary emissions reductions under the EPA's Natural Gas STAR program.

The 10 technologies discussed in this report can capture more than 80 percent of the 623 Bcf wasted by the O&G industry. Selling this methane at the average 2011 price of \$4/Mcf would generate more than \$2 billion annually.

This is equivalent to reducing greenhouse gas emissions from more than:

- 40,000,000 passenger vehicles
- The electric use of 25,000,000 homes
- 50 coal fired power plants, or
- 500,000,000 barrels of oil<sup>6</sup>

Despite these environmental and financial benefits, in some instances there are technical, financial and institutional barriers that prevent O&G operators or companies from voluntarily investing in methane control. Nevertheless, most of the methane control technologies highlighted in this report can be achieved simply by modernizing outmoded business practices, commanding resource and budget allocations, and instilling a corporate commitment to methane emission reduction. If better operating conditions and profits are not enough incentive to implement these projects, policies that mandate emissions control will be necessary to achieve the full potential of these methane control technologies.

## EMISSION REDUCTION POTENTIAL OF 10 PROFITABLE TECHNOLOGIES

Each methane emission control technology evaluated in this report contributes to the goal of treating methane as a valued resource and keeping it out of the atmosphere. Just two methane control technologies, green completions and plunger lift systems, can potentially address nearly 40 percent of methane emissions (Figure 3). All 10 technologies discussed in this report together could address an estimated 88 percent of emissions from the O&G industry. This is equivalent to reducing gross emissions from 3 percent of production to about 0.4 percent of production.

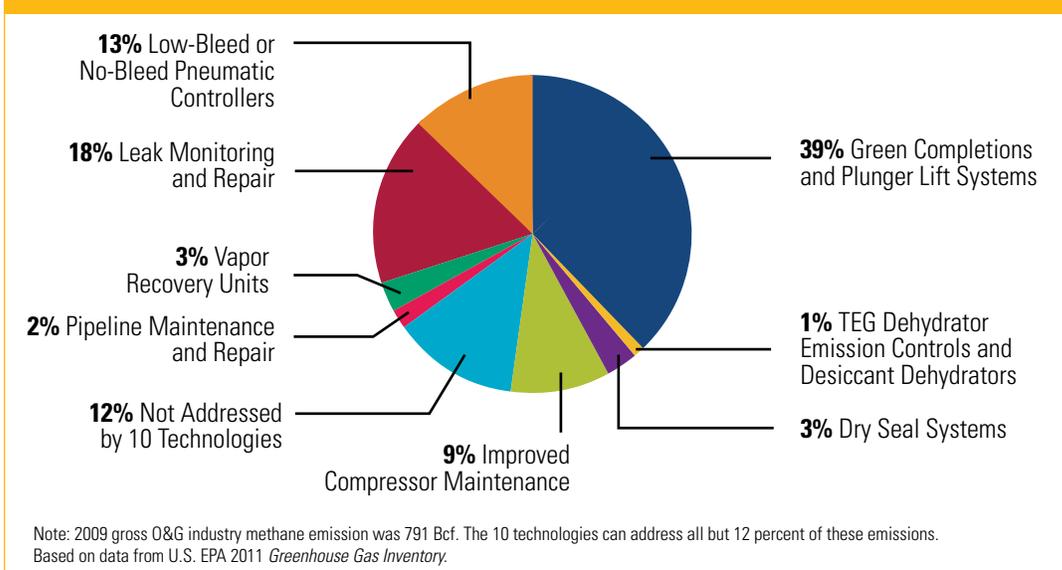

**Table 1: Methane Emissions (in Billion Cubic Feet)**

	Natural Gas System	Petroleum System	O&G Industry
Gross emissions	715	76	791
Emissions reductions*	168	-	168
Net emissions	547	76	623

\*From Natural Gas STAR program and federal regulations  
Source: U.S. EPA 2011 *Greenhouse Gas Inventory*

Only gross emissions estimates are available from the EPA in sufficient detail by source to use as a basis for analysis. The following emissions estimates, from the EPA's 2011 *Greenhouse Gas Inventory*, are based on gross emissions (corresponding to total gross emissions of 791 Bcf/year).<sup>7</sup>

- **Green completions**, also known as reduced emissions completions, are closed loop systems that capture liquids and gases coming out of the well during "completions" using temporary processing equipment brought to a well site, then routing fluids and gases to a tank for separation to enable sale of gas and condensate. Historically, the fluids and gases flowing back out of the well have been routed to an open air pit or perhaps a tank, allowing substantial amounts of methane to vent directly into the atmosphere. The EPA estimates that approximately 8,200 Mcf of natural gas is emitted per well completion, on average. Well completions, workovers and cleanups

**Figure 3: O&G Industry Methane Emission Reduction Potential by Technology**

emit approximately 305 Bcf gross of methane per year. Green completions may be used to control considerable emissions from well completions and workovers (68 Bcf). Green completions can also be used to control a portion of the 237 Bcf/year in emissions from cleanups of low pressure wells (also known as liquids unloading).

- **Plunger Lift Systems** are installed on gas wells that stop flowing when liquid (water and condensate) accumulates inside the wellbore. These systems lift accumulated liquids in the wellbore to the surface. Using this method, methane gas can be captured and sold rather than vented to atmosphere as waste. Approximately 4,500 to 18,000 Mcf/year of methane gas is emitted per well, mainly from normal cleanup operations. This contributes to the EPA's estimate of total gross emissions of 237 Bcf/year from liquids unloading.
- **TEG Dehydrator Emission Controls** or Desiccant Dehydrators can be used to reduce methane waste while removing moisture from natural gas from oil or gas wells. Methane is often vented during the process of dehydrating gas, but it can be captured using either emission control equipment placed on TEG dehydrators, or with desiccant dehydrators. Desiccant dehydrators dry gas by passing it through a bed of sacrificial hygroscopic salt (the desiccant); there are no pumps, contactors, regenerators, or reboilers. Only a small amount of methane is released intermittently when the unit is opened to replace the salt. Desiccant dehydrators are best suited for low gas flow rates and low gas temperatures. Alternatively, where glycol dehydrators are still required, there are emission control solutions that can capture methane gas for use as fuel. The EPA estimates that 20,000 Mcf/year of natural gas is emitted per well on average (including both old and new wells), and that smaller dehydrators still cumulatively emit approximately

8 Bcf of methane per year despite mandatory emission controls on most large dehydrator systems. A significant fraction of this 8 Bcf/year of gross emissions from this source can and should be captured.

- **Dry Seal Systems** can be used throughout the O&G industry to reduce emissions from centrifugal compressors that compress natural gas so that it can be efficiently moved through a pipeline. Methane can leak from the seals in centrifugal compressors and the rod packing mechanisms in reciprocating compressors. Installation of improved dry seals in centrifugal compressors, and **improved compressor maintenance** by replacing worn rod packing in reciprocating compressors, have the potential to significantly reduce the amount of methane emitted. The EPA estimates that leaking compressors emit about 102 Bcf/year (27 Bcf/year from centrifugal compressors and 75 Bcf/year from reciprocating compressors). A significant fraction of this can and should be captured.
- **Low-Bleed or No-Bleed Pneumatic Controllers** can be used throughout the O&G industry to reduce emissions while regulating pressure, gas flow, and liquid levels, and automatically operating valves. High-bleed pneumatic devices are designed to release methane gas to the atmosphere. Converting high-bleed gas devices to low-bleed devices, or moving away from gas-operated devices altogether in favor of instrument air, reduces methane emissions. The EPA estimates that 80 percent of all high-bleed pneumatic devices can be retrofitted, and that there is an opportunity to reduce a very large fraction of the 99 Bcf/year of gross methane emissions from pneumatic controllers.

- **Pipeline Maintenance and Repair** can result in methane venting to the atmosphere when an oil or gas pipeline is cut or when methane is vented to reduce potential fire or explosion risk while the pipe is under repair. Instead, to mitigate methane release, subject to a thorough safety evaluation, gas can either be re-routed and burned as fuel during the repair and maintenance, or work can be conducted on the pipeline while it is in operation. Methane gas venting can also be mitigated by using hot tap connections, de-pressuring the pipeline to a nearby low pressure fuel system, or using a pipeline pump-down technique to route gas to sales. The EPA estimates that pipeline maintenance and upset conditions requiring venting result in emission of 19 Bcf of methane per year, a sizeable fraction of which can and should be captured.
- **Tank Vapor Recovery Units (VRUs)** capture methane that otherwise would escape from crude oil and condensate tanks and be vented to the atmosphere through three different mechanisms: (1) flashing losses, (2) working losses, and (3) standing losses. To reduce these losses, a vapor recovery unit can be installed on the tank to capture methane gas for sale or for use as fuel. The EPA estimates these methane emissions amount to about 21 Bcf/year, a sizeable fraction of which can and should be captured. In addition to methane, tank vapor recovery units can also reduce emissions of hazardous air pollutants (HAPs), such as benzene, toluene, ethylbenzene, xylenes, and volatile organic compounds (VOCs).
- **Leak Monitoring and Repair** prevents leaks at oil or natural gas facilities that would otherwise result in fugitive methane emissions, which may occur due to normal wear and tear, improper or incomplete assembly of components, inadequate material specifications, manufacturing defects, damage during installation or use, corrosion, or fouling. As gas moves through equipment under high pressure, methane gas leaks can occur from numerous locations at oil and gas facilities: valves, drains, pumps, threaded and flanged connections, pressure relief devices, open-ended valves and lines, and sample points. Because methane is a colorless, odorless gas, methane leaks often go unnoticed. Leak monitoring programs, and prompt repair when leaks are detected, can be effective in controlling fugitive emissions. Control can be achieved through a two-part process: (1) a monitoring program to identify leaks, and (2) a repair program to fix the leaks. The EPA estimates that equipment leaks result in gross emissions of 143 Bcf of methane per year. A large part of this may be controlled by improved leak monitoring and repair programs.

## POLICY RECOMMENDATIONS

The EPA's *Greenhouse Gas Inventory* in recent years represents the agency's best current understanding of methane emissions from the O&G industry based on available data, recognizing that significant uncertainties exist. Changes to the inventory in recent years highlight challenges in understanding methane emissions from the O&G industry. NRDC calls upon the industry to provide improved data to aid the EPA in resolving uncertainties. NRDC strongly supports rigorous, mandatory reporting, especially from numerous small sources that in aggregate may result in significant emissions. Improved data can support more robust analyses of methane emissions, which will help with the development of appropriate emissions reduction solutions.

In its 2011 *Greenhouse Gas Inventory*, the EPA provides an excellent breakdown of emissions by both O&G sector (production, processing, transmission) and by source. It does not, however, provide enough detail of emissions reduction by leakage source. Emissions reduction is only identified at a broad sector level. NRDC recommends that the EPA provide a more detailed breakdown of emissions reduction by leakage source.

On broader policies to control methane emissions, NRDC supports the EPA's steps to improve the O&G industry proposed New Source Performance Standards (NSPS) to control VOCs, which will achieve significant methane reduction co-benefits.<sup>8</sup> For example, methane emitted during well completions and recompletions will be controlled to a much larger extent once the proposed VOC regulations are implemented. The EPA's proposed NSPS regulations are a good starting point.

However, NRDC recommends that the EPA's proposed NSPS regulations go much further.<sup>9</sup> First, the EPA should directly regulate methane. In addition, while the EPA has proposed federal performance standards for new and modified sources, the proposal does not cover the many existing sources of methane. The EPA should issue guidelines for existing sources, which states would then be required to adopt through their State Implementation Plans. The EPA's guidelines should cover all significant sources of emissions, and all segments of the natural gas supply chain, and require compliance with stronger standards and procedures.

While the Natural Gas STAR voluntary program has achieved some success in controlling methane emissions, mandatory control requirements such as under the NSPS and NESHAPs programs are necessary for greater industry-wide emissions reductions.

Federal land management agencies should also exercise their authority to control methane waste from oil and gas lease operations on federal lands.

Finally, state governments also can do more to require methane emission controls. Colorado, Montana, and Wyoming have rules covering existing methane emission sources including wells, pneumatic devices, and storage tanks. While these rules provide a good start, they and other states should develop even stronger regulations.

## 2. METHANE CONTROL: OPPORTUNITIES AND ISSUES

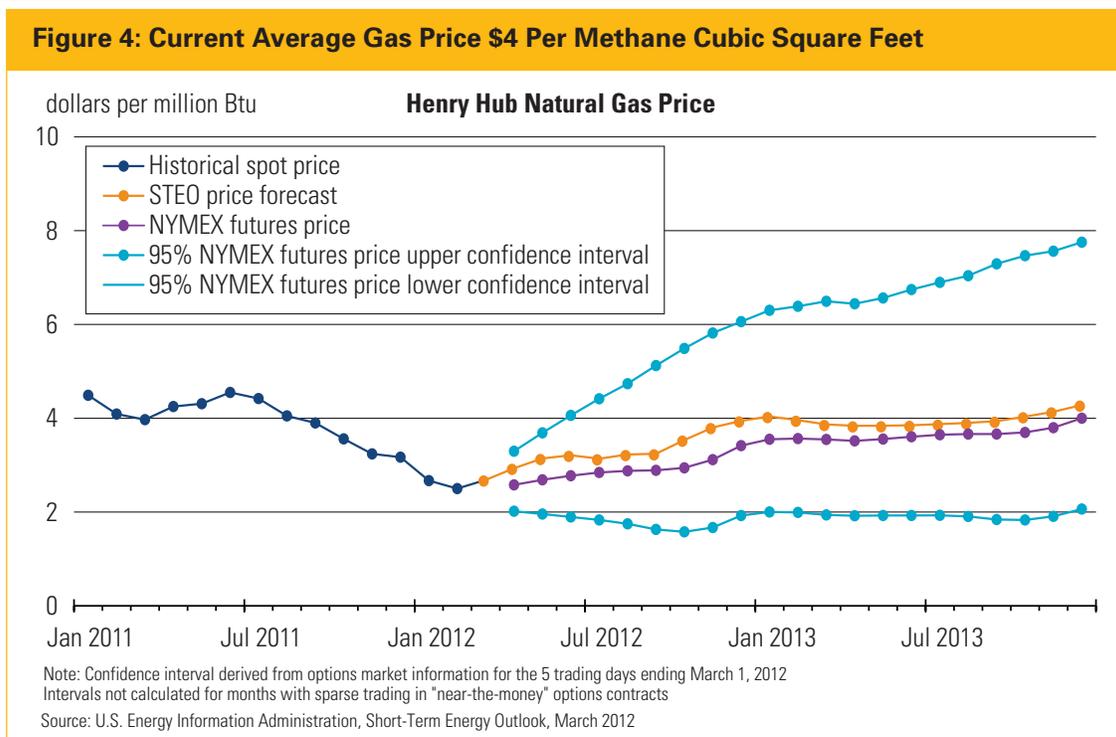

There is well established international scientific consensus, as demonstrated in the findings of the Intergovernmental Panel on Climate Change and the National Academy of Sciences, that greenhouse gas emissions are a significant cause of climate change. Methane gas is a well known and well-documented greenhouse gas, with a much greater global warming potential than carbon dioxide on a mass basis. Significant greenhouse gas emission controls, and methane emission control in particular, help to mitigate global warming.

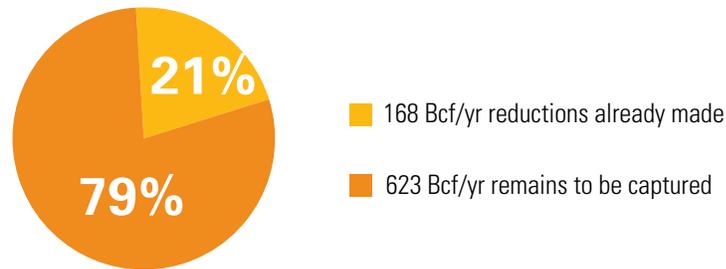

Methane is the primary component of natural gas, which typically contains 80 to 90 percent methane, ranging up to as high as 98 percent in some cases.<sup>10</sup> Every standard cubic foot (scf) of methane gas lost to the atmosphere is a standard cubic foot of methane not sold—a direct, real, and measurable loss of revenue. Methane control ensures that the gas produced at the well is kept in the revenue stream.<sup>11</sup>

Not only are methane capture projects in the O&G industry critical for addressing the climate crisis, but such projects also can be profitable, improve safety, maximize energy resources, reduce economic waste, protect human health, and reduce environmental impacts. Furthermore, upgrading production assets with modern and efficient equipment

has improved operational and economic performance, making assets more robust and less susceptible to upsets and downtime.

Using a gas price of \$4/Mcf, based on average 2011 prices, every Bcf of methane captured and sold, rather than vented into the atmosphere, can generate approximately \$4 million in gross revenue. The EPA used \$4/Mcf as a conservative estimate in its 2011 NSPS proposed rulemaking (Figure 4). Many of the control technologies pay out their investment and start generating profits after a short period of time for the O&G industry, as well as those, including the U.S. government, who receive royalties and taxes on gas sales.

**Figure 5: O&G Industry Methane Reduction and Remaining Opportunity**

Source: U.S. EPA 2011 *Greenhouse Gas Inventory*

## 2.1 INCENTIVES TO INVEST

In light of the fact that methane controls have been shown to be profitable, a commonly asked question is: “Why doesn’t the O&G industry voluntarily invest in methane emission control?”

In some limited cases, site-specific factors, such as flow rate, temperature, and low gas pressure, make methane emissions control technically infeasible or unprofitable. However, for most of the methane control technologies highlighted in this report, it is simply a matter of modernizing outmoded business practices, commanding resource and budget allocations, and instilling a corporate commitment to greenhouse gas emission reduction.

The American Petroleum Institute (API) explains that in order to maximize profit and provide shareholders with the highest possible return on investment, the O&G industry operates with a strict ranking of capital projects for maximum yield.<sup>12</sup> Thus, even though methane control can be profitable, other core business projects with an even higher rate of return often compete successfully for available corporate funding. Payout periods for methane control technologies discussed in this report range from immediate to three years, yet this may not be attractive enough to compare with oil and gas companies’ high expected rates of return. In other cases, factors such as reserves booking (accounting for oil and assets on the balance sheet), and short- and long-term acquisition and divestment strategies can outweigh even high return, low capital methane reduction projects.

Obstacles to implementing even profitable methane control technologies—whether site-specific, financial, or institutional arising from company culture—may seem hard to overcome. But there is an especially compelling case for fixing market failures where limiting greenhouse gas emissions and profits go hand in hand. This is why NRDC finds that where companies do not adopt these technologies voluntarily, regulations requiring mandatory reductions should be implemented. For companies that lack the technical expertise or staff resources in house, there are excellent private and federal resources for technical assistance on methane control.

## 2.2 METHANE EMISSION TRACKING

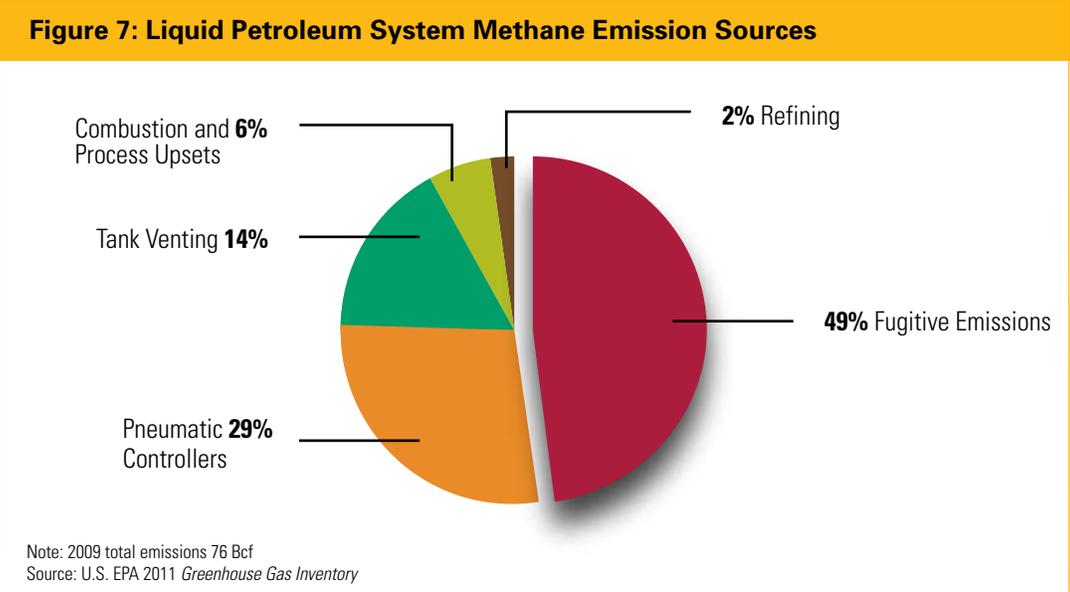

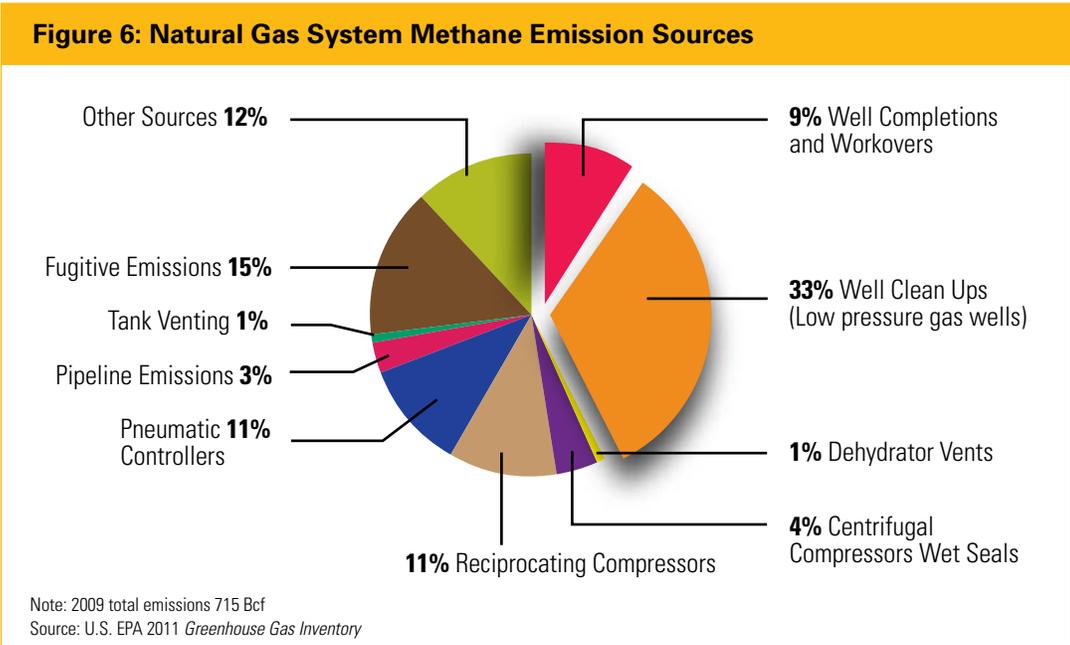

In its 2011 *Greenhouse Gas Inventory*, the EPA estimated that the O&G sector emitted 623 Bcf of methane, with natural gas systems accounting for 547 Bcf and liquid petroleum systems contributing 76 Bcf. The EPA also estimated that the industry captured 168 Bcf of gross methane emissions in 2009, exclusively from natural gas systems.<sup>13</sup> If no reductions were implemented, the gross leak rate would be an estimated 791 Bcf/year (623 Bcf/year net emissions plus 168 Bcf/year) as shown in Figure 5. The United States produces approximately 26,000 Bcf of natural gas per year. Thus, at the gross leak rate of 791 Bcf/year, the U.S. O&G industry is losing 3 percent of its total gas production to the atmosphere. At the EPA’s net leak rate of 623 Bcf/year, the industry is losing 2.4 percent of its total gas to the atmosphere.

As discussed in Section 2.3 below, the EPA numbers are quite uncertain. Other sources indicate that the amount of methane lost to the atmosphere each year in the United States could be substantially higher.<sup>14</sup>

According to the 2011 *Greenhouse Gas Inventory*, industry achieved the 168 Bcf in reductions through a combination of the EPA’s successful voluntary emission reduction program, Natural Gas STAR (77 percent), and federal emission regulations imposed on industry in the past decade to curb emissions (23 percent). The EPA did not identify any emission reductions achieved in the petroleum systems category. Most oil production operations also produce associated gas. Based on EPA estimates, there is a 76 Bcf methane reduction opportunity for the petroleum systems category.

The 2011 *Greenhouse Gas Inventory* tracks methane emissions by leakage source for natural gas systems (Figure 6) and liquid petroleum systems (Figure 7). In natural gas systems, methane emissions primarily come from wells, pneumatic controllers, compressors, and fugitive emissions. In liquid petroleum systems, methane emissions primarily come from equipment leaks, pneumatic controllers, and tank venting. Table 2 shows natural gas and liquid petroleum methane emissions in Bcf and identifies the applicable methane control technologies covered in this report.

A detailed breakdown of the methane emissions from both natural gas and liquid petroleum systems by source is shown in Appendix C.

**Table 2: Methane Emission Sources and Control Technologies**

2009 Natural Gas Systems		% of Total	Control Technologies
	Bcf	%	
Well Completions and Workovers	68	9%	No. 1 Green Completions
Well Clean Ups (Low pressure gas wells)	237	33%	No. 1 & 2 Green Completions & Plunger Lift Systems or Other Deliquification Methods
Dehydrator Vents	8	1%	No. 3 & 4 Dehydrator Controls
Centrifugal Compressors Wet Seals	27	4%	No. 5 Dry Seal Systems
Reciprocating Compressors	75	11%	No. 6 Improved Compressor Maintenance
Pneumatic Controllers	77	11%	No. 7 Low -Bleed or No-Bleed Controllers
Pipeline Emissions	19	3%	No. 8 Pipeline Maintenance and Repair
Tank Venting	10	1%	No. 9 Vapor Recovery Units
Fugitive Emissions	106	15%	No. 10 Leak Monitoring and Repair
Total of Emissions Controllable by the 10 Technologies	627	88%	
Other Sources	88	12%

## 2.3 UNCERTAINTY IN EMISSION ESTIMATES

The EPA has been tracking methane emissions since 1990. For more than 20 years, significant uncertainty has accompanied estimates of emissions from the O&G industry, with a general theme of underestimation. Some emissions have been underestimated by and for the O&G industry because sources have not been metered or tested to accurately determine the emission rate. Small emission sources that may result in cumulatively large emission totals have escaped emission monitoring or reporting, and not all emission sources are accounted for.

Evidence for underestimation due to uncertainty is found in the 2010 *Greenhouse Gas Inventory*, which states that “[n]atural gas well venting due to unconventional well completions and workovers, as well as conventional gas well blowdowns to unload liquids have already been identified as sources for which Natural Gas STAR reported reductions are significantly larger than the estimated inventory emissions.”<sup>15</sup>

Historically, the *Greenhouse Gas Inventory* was based on an emission factor of approximately 3,000 standard cubic feet (3 Mcf) per gas well drilled and completed.<sup>16</sup> Yet Natural Gas STAR program partner experience shows several cases where emission factors were thousands of times higher:

- BP employed green completions at 106 wells and reported 3,300 Mcf of gas recovered per well<sup>17</sup>
- Devon Barnett Shale employed green completions at 1,798 wells between 2005 and 2008 and reported 6,300 Mcf of gas recovery per well<sup>18</sup>
- Williams employed green completions at 1,064 wells in the Piceance Basin and reported 23,000 Mcf of gas recovered per well<sup>19</sup>

All of these examples show gas recovery estimates more than 1,000 times higher than the 3 Mcf of gas per well estimated in the 2008 *Greenhouse Gas Inventory*.<sup>20</sup> Clearly, errors in emission inventory estimations have occurred.

### *Well completion emission estimates were underestimated by a factor of 1,000*

The source of much of this uncertainty regarding well venting is the EPA’s historic reliance on a 1997 study jointly funded with the Gas Research Institute (GRI) to quantify methane emissions from United States natural gas operations.<sup>21</sup> The study concluded that methane emitted (leaked and vented) from natural gas facilities at an amount of 1.4 percent +/- 0.5 percent (approximately 1 to 2 percent) of gross natural gas production, and that additional emission controls could significantly reduce the amount of methane gas leaked and vented to atmosphere.

However, the study did not include important equipment leaks and venting that took place at the wellhead or at the well pad processing facilities in natural gas systems.

The largest change in methane emission estimates has been in accounting for wellhead and well pad processing facilities emissions that were substantially underestimated.

Since 1990, the EPA has more than doubled its methane emission estimate for natural gas systems from 220 Bcf to 464 Bcf. For many years the EPA quoted a 300 to 400 Bcf/year methane emission estimate for the entire O&G industry, yet now the EPA reports a 322 to 464 Bcf range for natural gas production alone (Figure 8). While some of the methane emission increase is attributed to growth in natural gas production, most of the increase represents continuous improvement in and revisions to the EPA’s emission estimates as it furthers its understanding of methane emissions sources from the O&G industry. For instance, in past years emissions arising from poor connections from the wellhead to processing equipment to transmission equipment were overlooked. Low emissions from the distribution stage as a result of low-leakage welded joints may have contributed to a misconception that equipment upstream of the distribution stage was also similarly leak-free.

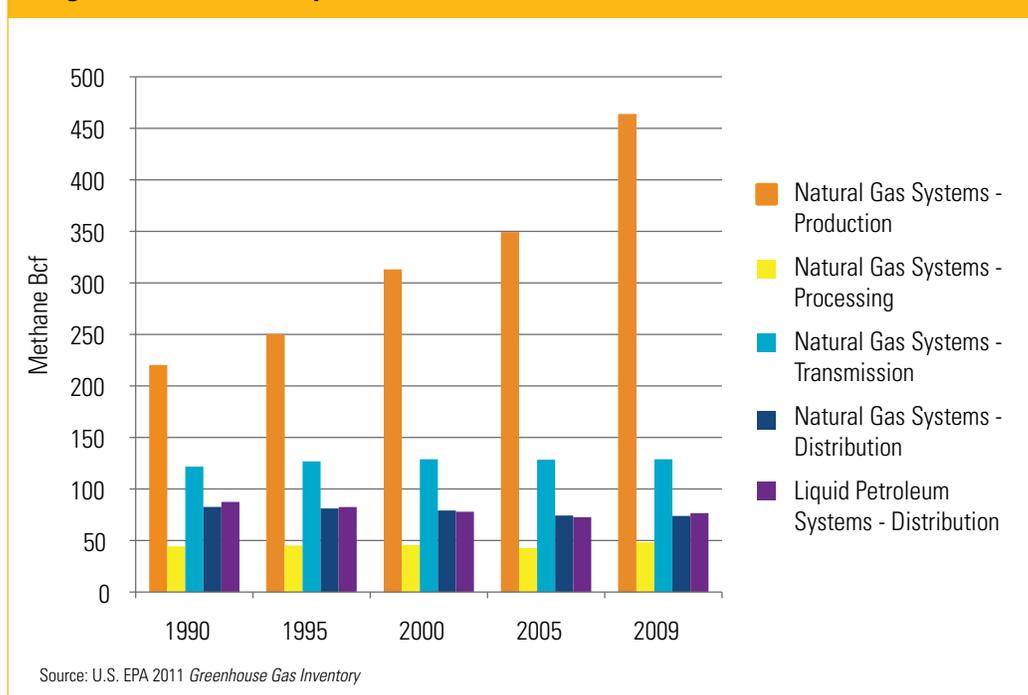

In 2010, the EPA undertook to develop a set of greenhouse gas reporting requirements for the O&G industry as part of a general charge from Congress to develop greenhouse gas reporting rules for all U.S. industries. The EPA assessed uncertainty in O&G emission estimates during this undertaking. The EPA explained the historic underestimation of natural gas systems, critiquing the “outdated and potentially understated” emissions estimates from the 1997 report.<sup>22</sup> The EPA cited several significant sources of underestimated emissions:

*The following emissions sources are believed to be significantly underestimated in the United States GHG Inventory: well venting for liquids unloading; gas well venting during well completions; gas well venting during well workovers; crude oil and condensate storage tanks; centrifugal compressor wet seal degassing venting; and flaring.*

In its 2011 *Greenhouse Gas Inventory*, the EPA raised its gross emissions estimate to 791 Bcf/year by adding the amount of gas that may be vented at the wellhead to the amount of gas that leaks from the processing equipment and pipeline infrastructure once the gas enters the system.

According to the EPA’s O&G Reporting Rule Technical Support Document, the emissions estimates for these sources “do not correctly reflect the operational practices of today.” In fact, the EPA believes that “emissions from some sources may be much higher than currently reported in the United States GHG Inventory.”<sup>23</sup>

The EPA revised emissions factors for four of these underestimated sources. Revised emissions estimates range from 11 times higher for well venting from liquids unloading, to 36 times higher for gas well venting from conventional well completions, to 3,540 and 8,800 times higher for gas well venting during well workovers and completions of unconventional wells, respectively.<sup>24</sup> Even with the EPA’s revisions to the O&G Reporting Rule, uncertainty continues to exist in the estimates of emissions from gas well completions and well workovers. As the EPA noted in the preamble to its proposed reporting rule:

**Figure 8: O&G Industry Methane Emissions 1990 to 2009**

*“[N]o body of data has been identified that can be summarized into generally applicable emissions factors to characterize emissions from these sources [(i.e., from well completion venting and well workover venting)] in each unique field. In fact, the emissions factor being used in the 2008 U.S. GHG Inventory is believed to significantly underestimate emissions based on industry experience as included in the EPA Natural Gas STAR Program publicly available information (<http://www.epa.gov/gasstar/>). In addition, the 2008 U.S. GHG Inventory emissions factor was developed prior to the boom in unconventional well drilling (1992) and in the absence of any field data and does not capture the diversity of well completion and workover operations or the variance in emissions that can be expected from different hydrocarbon reservoirs in the country.”<sup>25</sup>*

The EPA continues to report substantial uncertainty in its overall greenhouse gas emission estimates in its ongoing work on the *Greenhouse Gas Inventory*,<sup>26</sup> with uncertainty particularly evident for natural gas systems. In its 2011 *Greenhouse Gas Inventory*, the EPA used an average emission factor of 7,700 Mcf per well completion—much higher than its previous emissions factor of 3,000 Mcf per well completion—more than doubling the amount of emissions expected from the increasing number of unconventional well completions (e.g. horizontal and shale gas wells). Furthermore, the EPA did not include emissions from completions for tight gas wells in the 2011 *Greenhouse Gas Inventory*, which, as the EPA noted previously in its O&G Reporting Rule Technical Support Document, is a “significant underestimate” of total emissions.<sup>27</sup> The EPA also reported zero emissions from well completions in the Northeast

region, which is the location of extensive shale gas drilling and well completions in the Marcellus Shale.

Emissions estimates will likely continue to evolve and improve as the EPA obtains additional information from the O&G industry, including information submitted under its mandatory reporting rule. As with past inventories, it is expected that both emissions factors and activity factors will continue to be updated. If past trends hold, these factors are likely to be revised upward as a result of both better understanding of emissions associated with each process, and the aggressive pace of drilling and development across the country. However, emissions estimates for an individual source may also be revised downward as the EPA obtains better information about the type and amount of control technology in use.

Incidentally, the United States is not the only country that has struggled with estimating the O&G industry’s greenhouse gas emissions. Canada reports that its natural gas processing plants also discovered that methane emissions were roughly an order of magnitude higher than estimated.<sup>28</sup>

Despite all the uncertainty about the precise amount of methane emissions, we do know that there is a significant amount of methane that is leaking or being vented into the atmosphere that could be captured and sold or used as fuel.

## 2.4 VOLUNTARY CONTROL WITH EPA NATURAL GAS STAR

For a number of years, the EPA has coordinated the Natural Gas STAR Program, which describes itself as a “flexible, voluntary partnership that encourages oil and natural gas

companies—both domestically and abroad—to adopt cost-effective technologies and practices that improve operational efficiency and reduce emissions of methane, a potent greenhouse gas and an important transitional energy source.”<sup>29</sup>

To its credit, the EPA actively encourages O&G operators to invest in methane reduction technology through its Natural Gas STAR Program. Those members of the O&G industry that have recognized the adverse economic and environmental implications of methane emissions, and have voluntarily invested in greenhouse gas emission reduction technology at their facilities, also deserve credit.

While the Natural Gas STAR Program has been successful in identifying and documenting profitable methane emission reduction opportunities that aid in methane capture and in bringing captured methane into the revenue stream, to date the program remains voluntary and participation is limited.

Companies that participate in Natural Gas STAR sign a Memorandum of Understanding with the EPA, then evaluate and implement identified methane emission reduction opportunities. Companies can participate at any level they choose, from company-wide to site-specific to small pilot projects.<sup>30</sup> There is no mandatory requirement to identify or implement all methane reduction opportunities.

The extent to which enrolled companies participate is difficult to confirm. Natural Gas STAR publishes a list of participating companies, but all reports on the actual locations of emission control implementation, which methane control measures have been implemented by each company, and the emission reductions achieved, are confidential.

Despite these demonstrated solutions for capturing methane, many companies still have not participated in the Natural Gas STAR Program at all, and others have only implemented a few methane control measures.<sup>31</sup> Effective as the EPA's Natural Gas STAR efforts have been, vast quantities of methane continue to leak into the atmosphere. It is therefore clear that voluntary measures alone will not ensure that industry installs even profitable capture technologies.

## 2.5 PROPOSED EPA RULES NOT STRONG ENOUGH

On August 23<sup>rd</sup> 2011, the EPA published proposed regulations for a suite of technologies to reduce harmful air pollution from the oil and natural gas industry.<sup>32</sup> The rules are to be finalized by April 2012, after an opportunity for public comment.

The proposed EPA rules include NSPS for source categories as well as air toxics standards, or NESHAPs. In particular, the EPA is proposing stringent new NSPS for controls for VOCs from the oil and gas sector, which will also capture significant amounts of methane (referred to as “co-benefits” of the regulation).

The EPA estimates that the proposed NSPS for VOCs would reduce 540,000 tons of VOCs, an industry-wide reduction of 25 percent. The air toxics standards would reduce air toxics emissions by 30,000 tons, an overall reduction of nearly 30 percent.<sup>33</sup> The EPA estimates that the proposed standards would also reduce about 3.4 million tons per year of methane. This equates to roughly 160 Bcf/year. As an interim measure, the EPA quantified the global social benefits of these methane reductions in mitigating climate change at up to \$4.7 billion in 2015 co-benefits. For reasons set forth in NRDC's comments to the EPA on the proposed NSPS, we believe even this figure is a substantial underestimation.

Finally, the emissions baseline used in the EPA's proposed NSPS differs somewhat from the 791 Bcf/year gross emissions baseline in this report derived from the EPA's 2011 *Greenhouse Gas Inventory*. The differences reflect, among other things, the evolving nature of the emissions inventory. However, the differences do not meaningfully alter the analysis and recommendations made in this report.

The EPA's proposed standards do not control methane directly or cover existing sources, which account for the bulk of VOC and methane emissions. Further, the EPA omits other significant sources of VOCs and methane, in part due to exclusion of these sources altogether and in part because methane is not directly regulated. These omissions contrast with areas where the NSPS would in fact more effectively control emissions, such as from well completions and recompletions, and new sources of emission from pneumatic controllers, compressors, and equipment leaks.

This report does not provide a comprehensive assessment of the proposed NSPS, but the control technologies described here can serve as a guide to the EPA and the states in their control efforts.

Methane emissions reductions should be a high priority, as they provide economic, health, safety, and environmental benefits for both operators and the public. Existing market forces, government regulations, and voluntary programs are only leading to the capture of a small percentage of methane emissions at present. The EPA's proposed NSPS is a step in the right direction.

### 3. ANALYTIC APPROACH

While it would have been useful for the EPA to report the 168 Bcf emission reductions by leakage source, to clarify which sources and associated emissions reduction technologies are making progress in reducing emissions, that level of detail is not necessary to analyze the data and describe in layman's terms why methane control technologies are profitable and point out large potential methane control opportunities.

Since the EPA does not provide sufficient data in its inventory to break down the emission reductions by natural gas leakage source, the methane emission estimates used in this report correspond to EPA's emission estimate of 791 Bcf for natural gas and liquid petroleum systems.

This 791 Bcf estimate of gross emissions from both natural gas (715 Bcf) and petroleum (76 Bcf) systems has been reduced, the EPA reports, by 168 Bcf from Natural Gas STAR programs and regulations. All of these reductions have been achieved in natural gas systems. The total net emissions from both systems is therefore 623 Bcf (791 Bcf less 168 Bcf).

The total net emissions from natural gas systems is 547 Bcf (715 Bcf less 168 Bcf), and from petroleum systems it is 76 Bcf (Table 3). Additionally, it is important to note that the EPA's Natural Gas STAR Program emission reduction estimates are based on data voluntarily submitted by industry. These data represent a very rough estimate of the amount of methane control that may have been achieved to date, because they were not developed using common and rigorous metering, measurement, quality control, or audit procedures. Therefore, some caution should be exercised in assuming that this amount of emissions reduction has been fully achieved.

Table 3: Methane Emission Control Opportunity						
2009 Natural Gas Systems		Natural Gas STAR Reductions	EPA Regulation Reductions	Total Reductions	Estimated Remaining Target	
	Gg	Bcf	Bcf	Bcf	Bcf	Bcf
Production	8,931	464	104	38	142	322
Processing	931	48	4	1	5	43

### 3.1 PROFITABILITY

Profitable emission control opportunity, for purposes of this report, means an investment in methane emission control technology that results in more revenue generated or costs offset than the cost to install, operate, and maintain the emission control technology. To assist in identification of such opportunities, this analysis used the following criteria:

1. Control technology that either allows methane to be captured and placed into a natural gas pipeline for sale, or captured and used as fuel to offset operating cost
2. Technology that is commercially available, meaning that it has been developed, tested, and is available in the market for purchase and installation
3. Technology that has been used successfully in actual O&G operations
4. Emission control solutions that are well documented and reported by the O&G industry as profitable

The analysis recognizes that some emission reduction measures can be implemented quickly, while others may require more extensive planning, procurement, and execution timing.

Most of the emission control technologies described in this report have a very short payout period of a few months or years. The term “payout” means the period of time that it takes for the net cash flow to equal the investment expenditure, at which point the investment breaks even and starts to generate positive cash flow, as shown in Figure 9.<sup>34</sup> The revenue stream is calculated using constant dollars over the payout period.<sup>35</sup>

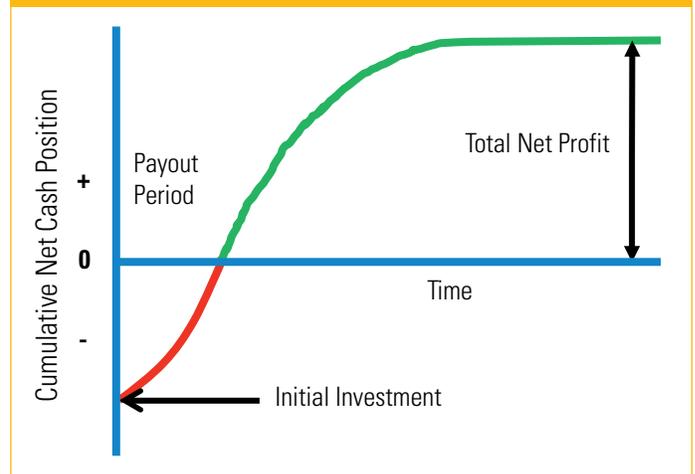

### 3.2 EXAMINATION OF METHANE CONTROL OPTIONS

Each of the 10 methane control options examined in this report is considered with a six-part analysis.

1. **Technology Description.** The technology description section identifies the equipment required and processes used in each control technology to capture methane emissions.
2. **Opportunity.** The opportunity section identifies the gross amount of methane emissions in the 2011 *Greenhouse Gas Inventory* that could be captured by each control technology for its associated leakage source.
 

The per-unit emission estimates provided in the opportunity section of the report are intended to provide an average emission control number, to use as a starting basis in a feasibility assessment. Individual consideration may be appropriate based on unique or exceptional circumstances at each site.
3. **EPA Proposed Regulations.** This section analyzes the proposed regulations from the EPA that are relevant to emissions from each source. It also discusses the emission reductions anticipated from the proposed EPA regulations, and concludes with a description of possible shortcomings of and improvements to the EPA proposal.

Figure 9: Payout Period Diagram

4. **Profit.** The profit section analyzes the costs of implementing each technology, along with any associated operational savings and revenues from methane sales. The revenues are calculated by multiplying the amount of methane controlled by a price of \$4/Mcf. The report does not attempt to quantify the additional financial benefits from offsetting fuel costs. Comparing the costs with the savings and additional revenues provides the profit. The average payout period is also calculated using these numbers. The cost data are intended to provide an average cost to use as a starting basis in a feasibility assessment. Again, individual consideration may be appropriate based on the particulars of a given application.

The proposed EPA regulations provide some estimates of the profitability of the various control technologies. However, in the supporting documentation for the proposed rulemaking, the EPA was not transparent enough about its methodology for cost-benefit estimates.<sup>36</sup> As a result, we were unable to independently verify sources and incorporate them into profitability estimates. Instead, we have relied on estimates from prior EPA and company reports. For the sake of completeness, in the appendix we provide tables of profitability estimates by control technology from this report, and compare them with the EPA estimates from the proposed rulemaking supporting documentation. In general, the EPA's proposed rulemaking estimates are somewhat more conservative than NRDC estimates. A more detailed analysis of NRDC's profitability comparisons can be found in the EPA's rulemaking docket.<sup>37</sup>

5. **Additional Benefits.** Beyond generating revenue, the additional benefits of methane capture for each technology are highlighted in this section.
6. **Limitations and Evaluation.** All emission control options have some technological (and, potentially, economic) limitations, and where those are known, they are summarized in this section for use as a starting

point in a feasibility assessment. In some cases, a certain emission control technology may not be suitable because it cannot handle a gas flow rate, temperature, or pressure. In other cases, the technology may not be appropriate for a retrofit, but would be a logical choice for designing and installing a new unit. This section includes flow charts to depict the basic decision steps of a feasibility analysis. The flow charts are intended to be simplistic outlines of the steps that might be taken to determine the feasibility of using a particular emission control method. This simplified approach is not intended to replace any company-specific evaluation processes, but rather to provide a basic outline of the evaluation steps in laymen's terms.

### 3.3. METHANE EMISSION REPORTING UNITS

While greenhouse gas emission estimates are often reported in terms of million metric tons of carbon dioxide equivalent (MMtCO<sub>2</sub>e), all methane emission and methane control estimates in this report are shown in terms of standard cubic feet, and most often reported in billions of standard cubic feet (Bcf). The report uses this emission reporting convention because gas is sold and used on a basis of standard cubic feet, and this unit can readily be converted to a profit estimate using a market price assumption of four dollars per thousand standard cubic feet (\$4/Mcf). This reporting convention prevents the reader from having to routinely convert from MMtCO<sub>2</sub>e to Bcf.

## 4. TEN PROFITABLE TECHNOLOGIES: AN ANALYSIS

The emission control potential, uses, benefits, and economics of each of the 10 methane control technologies are discussed in greater detail in this chapter. While many of the technologies are profitable on a very short time scale, many operators still have not installed them. In order to realize the methane control potential to limit greenhouse gas emissions, NRDC also proposes policy options to encourage the use of these technologies.

**Table 4: Methane Capture Technology Costs and Benefits**

Technology	Investment Cost	Methane Capture	Profit	Payout
<b>Green Completions</b>	\$8,700 to \$33,000 per well	7,000 to 23,000 Mcf/well	\$28,000 to \$90,000 per well	< 0.5 – 1 year
<b>Plunger Lift Systems</b>	\$2,600 to \$13,000 per well	600 to 18,250 Mcf/year	\$2,000 to \$103,000 per year	< 1 year
<b>TEG Dehydrator Emission Controls</b>	Up to \$13,000 for 4 controls	3,600 to 35,000 Mcf/year	\$14,000 to \$138,000 per year	< 0.5 years
<b>Desiccant Dehydrators</b>	\$16,000 per device	1,000 Mcf/year	\$6,000 per year	< 3 years
<b>Dry Seal Systems</b>	\$90,000 to \$324,000 per device	18,000 to 100,000 Mcf/year	\$280,000 to \$520,000 per year	0.5 – 1.5 years
<b>Improved Compressor Maintenance</b>	\$1,200 to \$1,600 per rod packing	850 Mcf/year per rod packing	\$3,500 per year	0.5 years
<b>Pneumatic Controllers Low-Bleed</b>	\$175 to \$350 per device	125 to 300 Mcf/year	\$500 to \$1,900 per year	< 0.5 – 1 year
<b>Pneumatic Controllers No-Bleed</b>	\$10,000 to \$60,000 per device	5,400 to 20,000 Mcf/year	\$14,000 to \$62,000 per year	< 2 years
<b>Pipeline Maintenance and Repair</b>	Varies widely	Varies widely but significant	Varies widely by significant	< 1 year
<b>Vapor Recovery Units</b>	\$36,000 to \$104,000 per device	5,000 to 91,000 Mcf/year	\$4,000 to \$348,000 per year	1 – 3 years
<b>Leak Monitoring and Repair</b>	\$26,000 to \$59,000 per facility	30,000 to 87,000 Mcf/year	\$117,000 to \$314,000 per facility per year	< 0.5 years

Note: Profit includes revenue from deployment of technology plus any O&M savings or costs, but excludes depreciation. Additional details provided in Appendix A.

### 4.1 GREEN COMPLETIONS

Methane gas is often released into the atmosphere when natural gas or oil wells are drilled, stimulated (e.g. hydraulically fractured), or repaired. Green completions can be used to capture methane gas and gas liquids (condensate).<sup>38</sup> Rather than being vented or flared into the atmosphere, methane captured in a green completion can be sold, used as fuel, or re-injected to improve well performance. Green completions also capture gas liquids that can be sold.

This technology is also called reduced emission completions, or REC, but throughout this report we use the term “green completions.”

When a well is drilled and completed, stimulated, or repaired, it is standard procedure to flow the well for a period of time to remove stimulation materials and other debris from the wellbore. This procedure is called “wellbore cleanup” and occurs before connecting the well to permanent processing equipment. Wellbore cleanup allows the operator to remove and dispose of unwanted material

without contaminating production facilities and pipelines. It also improves well recovery rates by reducing wellbore formation damage downhole. Historically, wells were “cleaned up” flowing liquid hydrocarbons to an open pit or tank, and by routing the associated methane gas to a gas vent or flare (Figure 10).

Venting gas near well operations creates potentially explosive vapor levels and can pose a human health hazard. Flaring resolves much of the explosive vapor problem by routing gas away from the well operations to a flare stack that burns the gas at a distance from the well and associated facilities, but flaring creates economic waste by combusting gas that could otherwise be collected and sold. Flaring also varies in efficiency, so not all pollutants may be combusted, and also generates air, light, and noise pollution.

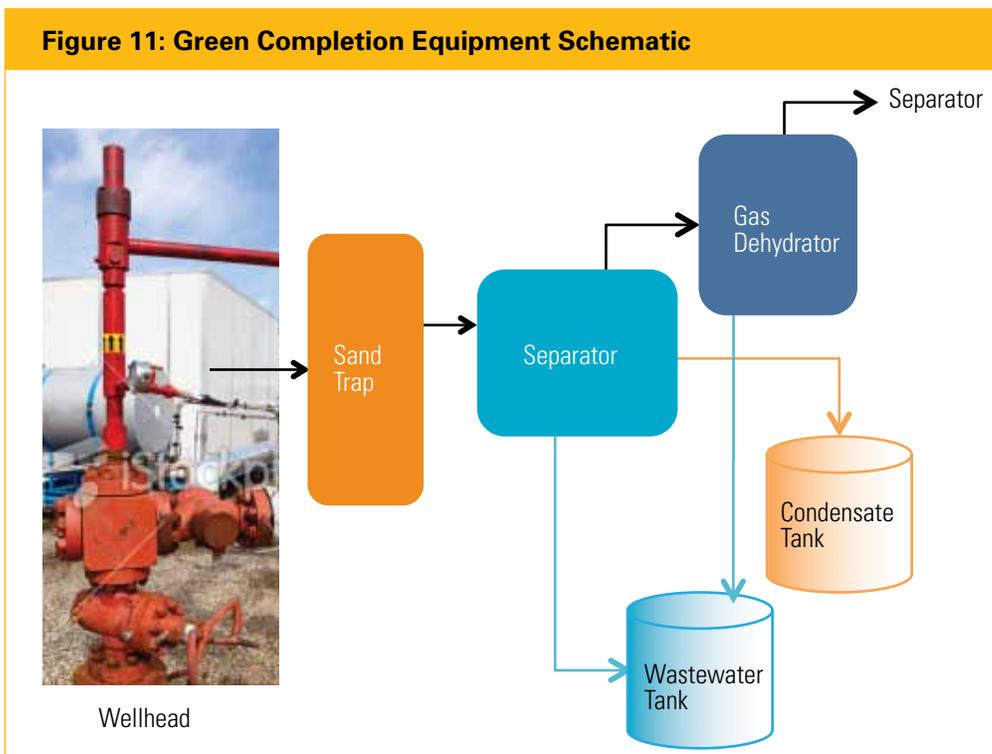

### 4.1.1 Technology Description

In a green completion, the operator brings temporary processing equipment to a well site during wellbore cleanup. Well cleanup fluids and gases are routed to the temporary processing equipment. Fluids, debris, and gas are separated, and gas and condensate are recovered for sale. The temporary processing equipment required for a green completion typically includes gas-liquid-sand separator traps, portable separators, portable gas dehydration units, additional tanks, and, sometimes, small compressors. A simplified schematic showing the equipment required for a green completion is shown in Figure 11.

Green completion processing equipment, which provides temporary gas processing capability, is typically mounted on a truck or trailer to move it from well to well (Figure 12).

© Robert Doman

**Figure 12: Green Completion Equipment**

Colorado Oil & Gas Conservation Commission, "Proposed Rules for Green Completions" presentation June 27, 2008

Portable green completion units are either owned by the operator or rented from a service provider. For new wells, equipment may need to be brought to the well site to provide temporary gas processing capability. However, at existing well sites, where wells have already been drilled but may need to be repaired or stimulated to improve hydrocarbon production rates, gas processing equipment may already be available onsite.

While the processing equipment is portable, some permanent facility infrastructure must be in place at the well site to make a green completion possible. Gas collected from a green completion can be used in several ways. It can be sold in a pipeline, used as fuel at the well site, or used as gas lift to enhance hydrocarbon production in low pressure wells. Each of these uses requires piping infrastructure to be in place at the well site to route the gas to the appropriate destination. Therefore, a green completion is typically not an option for exploration wells with no offset wells or pipeline infrastructure nearby.

**The EPA estimates that an average of 8,200 Mcf can be recovered per green completion**

Typically, gas produced from a well contains liquid ("wet gas") that exceeds the acceptable moisture content allowed in a gas sales pipeline. Depending on the gas composition, hydrocarbons may also condense from a gas to a liquid under certain temperature and pressure conditions. The pressure drop from the wellhead through the gas processing equipment can also yield gas-liquids (condensate) that can be captured and sold. Therefore, in most cases, before

gas from a green completion can be routed to a gas sales pipeline, it must be dehydrated to remove liquids to meet the gas pipeline specifications. Gas dehydration can be accomplished by bringing in a portable gas dehydration unit, or using a permanent gas dehydrator installed upstream of a gas pipeline. Condensate can either be collected in a temporary stock tank, or routed to a permanent stock tank if one is located on site.

#### 4.1.2 Opportunity

**Reduction Target: 68 Bcf/year and a portion of 237 Bcf/year**

The 2011 *Greenhouse Gas Inventory* estimates that well completions, workovers, and well cleanups emit approximately 305 Bcf of methane annually, 43 percent of total natural gas systems methane emissions.<sup>39</sup> Of this amount, well completions and workovers contributed about 68 Bcf/year, and well cleanups contributed about 237 Bcf/year, as shown in Table 2. Green completions may be used to control a significant fraction of emissions from well completions and workovers. Green completions can also be used to control a portion of the emissions from well cleanups, also known as liquids unloading.

There remains considerable uncertainty in wellhead emissions. In the decade prior to the 2011 *Greenhouse Gas Inventory*, the EPA revised its well emission estimates upward several times, and it reports continued uncertainty in the 2011 inventory estimates. It is likely that well methane emissions are still underestimated.

**Green completions alone could enable the United States to achieve more than 30 percent of its O&G industry methane reduction opportunity**

In 2005, the EPA estimated that an average of 7,000 Mcf of natural gas can be recovered during each green completion.<sup>40</sup> In 2011, the EPA increased its reduction estimate to 8,200 Mcf per green completion.<sup>41</sup> As part of its analyses relating to Subpart W of the Greenhouse Gas Reporting Rule, the EPA calculated the average emissions reduction to be 9,175 Mcf per green completion.<sup>42</sup> In a 2011 *Lessons Learned* report, the EPA estimated that an average of 10,800 Mcf could be saved per green completion.<sup>43</sup>

The EPA has found that green completions can be a major contributor to methane reductions on a national scale. In 2008, the EPA's Natural Gas STAR Program attributed 50 percent of the program's total reductions for the O&G production sector to green completions.<sup>44</sup> Considering the promising technical and economic feasibility of green completions, a very large fraction of the emissions from

well completions and workovers, and a portion of the emissions from well cleanups, could be captured using green completions.

The commercial viability of green completion equipment has been so well demonstrated that it is now required in several states:

- Colorado requires green completions on all oil and gas wells unless it is not technically and economically feasible.<sup>45</sup>
- Fort Worth, Texas requires green completions for all wells that have a sales line nearby, and for wells that are shut-in while gas is conserved, unless the operator can show that this requirement would endanger the safety of personnel or the public.<sup>46</sup>
- Montana requires VOC vapors (including methane) greater than 500 British Thermal Units (BTUs) per cubic foot from wellhead equipment with the potential to emit 15 tons per year or greater, to be routed to a control device (such as a flare), or to a pipeline for sale.<sup>47</sup>
- Wyoming has required green completions in the Jonah-Pinedale Anticline Development Area (JPAD) since 2007. More recently, Wyoming has expanded this requirement to all Concentrated Development Areas of oil and gas in the state.<sup>48</sup>

Such rules mandating green completions are an excellent method to help reduce emissions of greenhouse gases and toxic air pollutants, and exceptions written into these rules allowing operators not to use green completion technology should be very narrow, limited to only when it is proven to be unsafe or technically infeasible.

The API reports that there are only 300 green completion units in operation in the United States with the ability to complete 4,000 wells per year.<sup>49</sup> This corroborates the upper end of the EPA's estimate that the U.S. O&G industry has a capacity to implement approximately 3,000 to 4,000 green completions per year.<sup>50</sup>

While some operators report use of green completions at a portion of their operations in the United States, it is clear that opportunities abound for much wider deployment of green completions to reduce methane emissions. The API estimates that only 20 percent of U.S. gas well emissions are currently being captured by green completions and that an additional 16,000 wells per year could be processed if there were sufficient green completion equipment capacity.

### 4.1.3 Proposed EPA Regulations

The EPA is proposing to require green completions to control emissions from all production wells that undergo a hydraulic fracture treatment. The EPA proposes to exempt exploration wells and all other gas wells that are not hydraulically fractured.

Therefore, the EPA expects that more than 95 percent of emissions from well completions and workovers would be controlled using green completions. NRDC applauds the EPA's proposed regulations for targeting significant emissions

reductions during well completions and recompletions. Still, green completions should be required for all wells where technically feasible, including well cleanups and wells that are not hydraulically fractured. Such a requirement can be expected to lead to the rapid increase in availability of green completion equipment.

### 4.1.4 Profit

Green completions provide an immediate revenue stream by routing to a gas sales line gas (methane and condensates) which would otherwise be vented into the atmosphere or flared. Alternatively, captured gas can be used for fuel, offsetting operating costs or be re-injected to improve well performance. Industry has demonstrated that green completions are both an environmental best practice and profitable.

For each unconventional gas well green completion, there is an opportunity to generate about \$28,000 to \$90,000 in profit, based on capture rates of 7,000 to 23,000 Mcf per well, as shown in additional detail in Appendix A, Table A1. The EPA currently estimates the cost of implementing a green completion as high as \$33,000 (for rented equipment).<sup>51,52</sup> Based on these and other estimates, green completions using rented equipment will typically pay out immediately while those with purchased equipment will pay out within a year.<sup>53</sup> NRDC recognizes wells currently chosen for green completions are likely to be more productive and therefore profitable than average wells going forward.

Operators with a sufficient number of wells to amortize the cost of the equipment are finding it economically attractive to invest in their own green completion technology rather than to rent equipment. Most companies that have gone this route report a one- to- two year payout for investment in purchasing green completion equipment, and substantial profitability thereafter.<sup>54</sup>

Smaller operators can rent green completion equipment from a contractor. Renting equipment will result in a lower profit margin because there is usually a slightly higher operating cost attributed to equipment rental versus equipment ownership. Still, the payout for this investment would occur quickly if a contractor was hired and the operator paid only a per well green completion equipment rental charge. As long as the gas captured and sold exceeded the equipment rental charge, payout would be immediate.

In a 2009 study conducted for New York State, ICF Incorporated found that equipment payouts may be as short as three months. ICF also found that companies electing to conduct green completions in 2005 made more than \$65 million in profits.<sup>55</sup>

Examples listed below demonstrate how profitable green completions can be. The data is provided in the form reported by each company. However, these examples show that green completions are profitable, and generally pay out in less than two years:

- In 2004, Devon Energy reported an average incremental cost to perform a green completion of \$8,700 per well at its Texas Fort Worth Basin operations. Devon estimated that it made a profit of \$50,000 per well by selling the captured gas to market and achieved a total emission reduction of 6.16 Bcf at its operations in year 2005. 78 percent of the methane captured (4.8 Bcf) was attributed to green completion methods.<sup>56,57</sup>
- BP reported an initial investment cost of \$1.4 million to purchase a portable three-phase separator, sand trap, and tanks to conduct green completions. By 2005, BP completed 106 wells using this equipment and reported an average gas recovery of 0.35 Bcf per year, and condensate recovery of 6,700 barrels per year. The company's investment paid out in less than two years. Thereafter, the equipment brought in a profit of at least \$840,000 per year.<sup>58</sup> In 2007, BP reported that green completions had netted a profit of \$3.4 million on an investment of \$1.2 million, with a payout of 0.7 years, and a capture of 130 Mt of methane per well.<sup>59</sup>
- Williams reported \$159 million in revenue from green completions in its Colorado Piceance Basin Operations from 2002 to 2006, on an investment of \$17 million, for a net profit of \$142 million.<sup>60</sup> Williams' data was based on 1,177 wells and an average gas recovery of approximately 91 percent.
- EnCana Corporation, the largest natural gas producer in North America, which produces 1.5 percent of United States daily gas needs, reported that green completion methods were extremely profitable in the Jonah Field in Wyoming, yielding a net present value (NPV) of more than \$190 million.<sup>61</sup> EnCana's initial investment in the portable green completion equipment for the Jonah Field paid out in the first year.
- Anadarko reported an increased operating profit of \$10.3 million per year for the period 2006 to 2008 due to green completions on an average of 613 wells per year.<sup>62</sup>

#### 4.1.5 Additional Benefits

Green completions provide a number of additional benefits, aside from profitability and methane emission reductions. Green completions:

- Collect potentially explosive gas vapors, rather than venting them into the atmosphere (improves well site safety, reduces worker exposure to harmful vapors, and limits overall corporate liability)
- Reduce or eliminate the need for flaring
- Reduce emissions, noises, odors, and citizen complaints associated with venting or flaring

- Reduce VOCs and HAPs contained in natural gas along with methane. If flared and not captured, VOCs and HAPs generate nitrogen oxides (NO<sub>x</sub>) and particulate matter (PM), contributors to ground-level ozone and regional haze
- Improve well cleanup and enhance well productivity, as wells flow back to portable separation units for longer periods than would be allowed with direct venting into the atmosphere or flaring
- Reduce the need to drill new wells as more methane is kept in the system and brought to market

#### 4.1.6 Limitations and Evaluation

Green completions are most successful and profitable on higher pressure wells that have sufficient gas reservoir pressure to both flow into a pressurized gas sales pipeline and adequately clean up the wellbore.<sup>63</sup>

For lower pressure wells, artificial lift may be required, using portable compressors to withdraw gas from a pressurized sales gas line. The pressurized gas is then injected into the well to unload wellbore liquids and solids (artificial lift), and initiate flow. Compressors may also be needed to boost the lower pressure gas back into the sales line until normal reservoir flow and pressure is established.<sup>64</sup> Adding compression to the equipment package required for a green completion will increase cost.

Recognizing the existence of technical limits, Colorado sets boundaries on when green completions should be required:

*"Green completion practices are required on oil and gas wells where reservoir pressure, formation productivity, and wellbore conditions are likely to enable the well to be capable of naturally flowing hydrocarbon gas in flammable or greater concentrations at a stabilized rate in excess of five hundred (500) MCFD to the surface against an induced surface backpressure of five hundred (500) psig or sales line pressure, whichever is greater. Green completion practices are not required for exploratory wells, where the wells are not sufficiently proximate to sales lines, or where green completion practices are otherwise not technically and economically feasible.*

*An operator may request a variance from the Director if it believes that employing green completion practices is not feasible because of well or field conditions or that following them in a specific instance would endanger the safety of well site personnel or the public."<sup>65</sup>*

In the event that Colorado issues a variance from using green completion techniques due to technical or safety constraints, it still requires the use of Best Management Practices to minimize the amount of methane emitted:

*"In instances where green completion practices are not technically feasible or are not required, operators shall employ Best Management Practices to reduce emissions. Such BMPs may include measures or actions, considering safety, to minimize the time period during which gases are emitted directly to the atmosphere, or monitoring and recording the volume and time period of such emissions."*

Because pipelines are typically not installed at a natural gas production site until it is confirmed that an economical gas supply is found, gas from the first well is often flared or vented during drilling and completion activities. However, once a pipeline is installed, subsequent wells drilled on that same pad would be in a position to implement green completion techniques. Operators often point to the lack of pipeline infrastructure as a primary reason a green completion may not be possible, in particular at oil production facilities that do not have a nearby gas sales line. However, there are also alternatives to piping methane, such as using it on-site to generate power, re-injecting it to improve well performance, or providing it to local residents as an affordable power supply.

Figure 13 provides a simplified flowchart showing the basic steps for evaluating whether a green completion is technically feasible and profitable.

### 4.2 PLUNGER LIFT SYSTEMS

Older gas wells stop flowing when liquids (water and condensate) accumulate inside the wellbore. As liquid builds up in the wellbore it creates backpressure on the hydrocarbon formation, further reducing the gas flow rate.

Methane gas is emitted when companies open wells to vent gas to the atmosphere to unload wellbore liquids (water and condensate that accumulate in the bottom of the well) in order to resume gas flow. The industry typically refers to this process as “blowing down the well,” a “well blowdown,” or a “well deliquification.”

Eventually, even a well’s own gas pressure becomes insufficient to flow accumulated liquids to the surface and the well is either shut-in as uneconomic, or some form of artificial lift is installed to transport the liquids to the surface.

Plunger lift systems are one method of lifting accumulated liquids in the wellbore to the surface. In this method, methane gas can be captured and sold, rather than vented to atmosphere as waste.

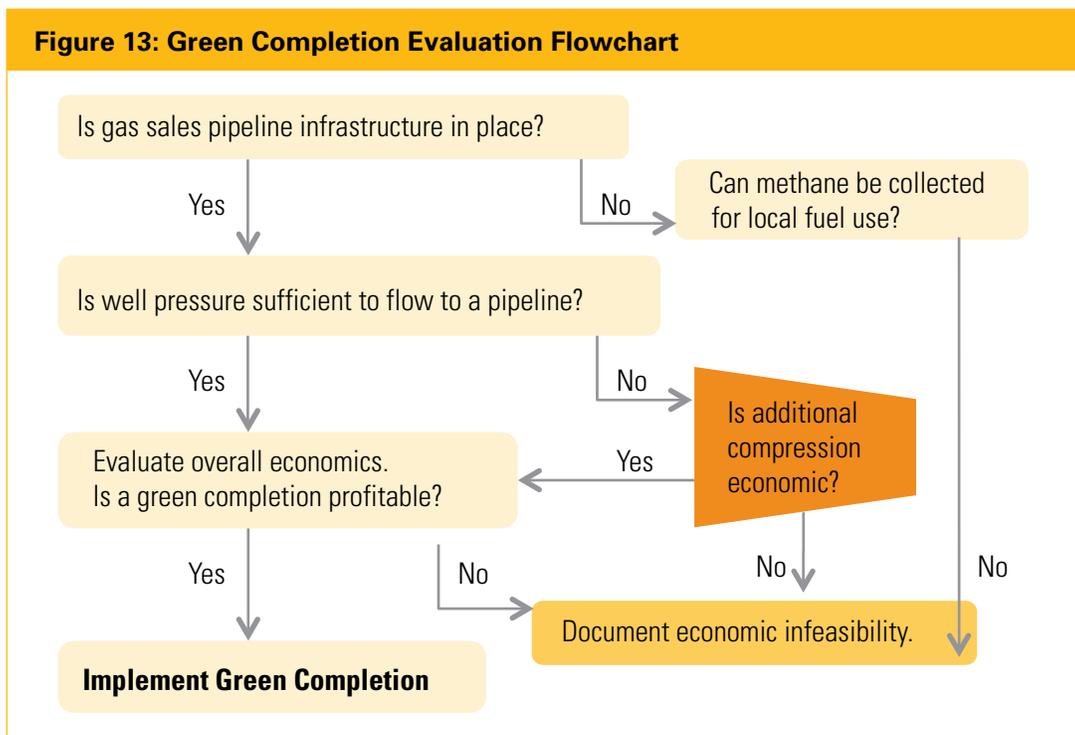

#### 4.2.1 Technology Description

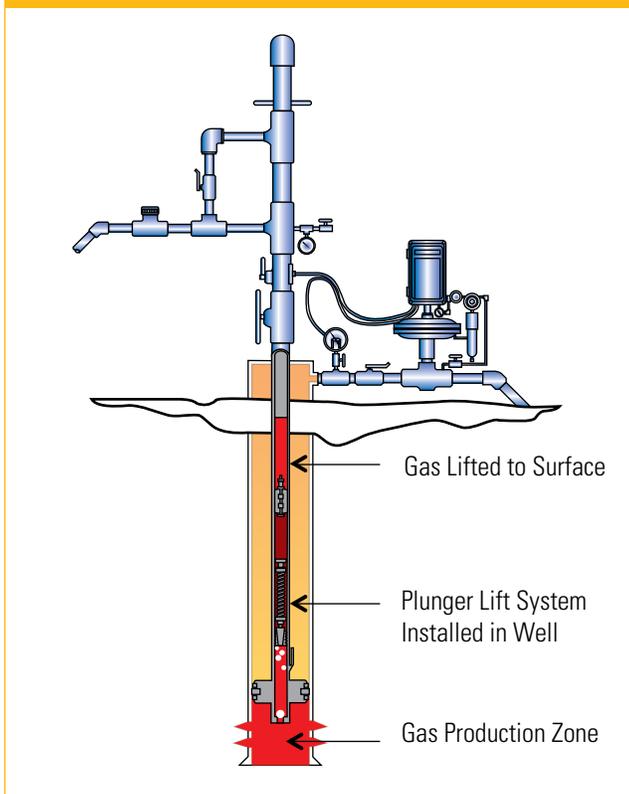

Installation of plunger lift systems provides an immediate revenue stream by routing methane gas to a gas sales line that would otherwise be vented. Industry has demonstrated that plunger lift systems are both an environmental best practice and profitable when addressing mature gas wells with back pressure from liquids.

Accumulation of liquid hydrocarbons and liquids in the well tubing of mature gas wells can halt or impede gas production. Historically, well operators would vent these mature gas wells to atmosphere to aid in expelling the liquids from the well tubing. Alternatively, plunger lift systems can be installed in a well to lift the liquids out of the well (Figure 14).

There are a number of deliquification methods that can be used on a mature gas well singly or in combination, such as sucker rod pumps, electric submersible pumps, progressing cavity pumps, compression, swabbing, gas lift, and smaller diameter tubing (velocity strings), but most of these methods require the addition of energy.<sup>66</sup> The plunger lift system is a low-cost system that uses the well’s own natural energy to complete the deliquification process. This technology is particularly useful at well sites that do not have power.

Plunger lift systems work by using the natural gas pressure that builds up in the casing tubing annulus to push a metal plunger up the well tubing, forcing a column of fluid to the surface. Gas and liquids are both collected. Liquids are separated from the gas, which is then routed to the pipeline for sale.

**Figure 14: Plunger Lift System Schematic**

Automated plunger lift systems have the added benefit of reducing the number of personnel that would be required to manually vent the well and extending the production life of the well.<sup>67</sup>

One vendor reports that plunger lift systems increase overall gas productivity and sales from each well by 10 to 20 percent.<sup>68</sup>

#### 4.2.2 Opportunity

##### **Reduction Target: 237 Bcf/year Less Green Completions Reduction**

Natural gas production is now predominantly occurring in unconventional formations: low permeability sands, shale, and coal bed methane reservoirs.<sup>69</sup> In its comments on the EPA's proposed NSPS regulations for plunger lift systems, the American Petroleum Institute said: "According to the Energy Information Administration...some 338,056 (73 percent) wells out of a total gas well inventory of 461,388 produce 90 Mcf of gas (15 BOE or less) or less per day...These low rate wells are either impaired by liquids accumulation or are using a deliquification method to produce."<sup>70</sup>

Maximizing production from each well drilled can minimize the need to drill new wells and therefore reduce overall environmental impacts from natural gas production. However, low gas rate wells eventually cease production due to liquid accumulation in the wellbore and are often shut-in,

unless a deliquification technique is employed on the well.

The EPA estimates that 4,700 to 18,250 Mcf/year of methane gas can be recovered per well with plunger lift systems.<sup>70,71</sup> In 2011, the EPA estimated that 237 Bcf of methane was emitted from well cleanups annually. A large fraction of these emissions could be controlled using plunger lift systems.

**Plunger lift systems are low cost and use a well's own natural energy**

#### 4.2.3 Proposed EPA Regulations

The EPA's proposed NSPS regulations would not require the use of plunger lift systems to address well cleanups. Even if plunger lifts are more widely used than previously assumed, we strongly recommend that the EPA revise its proposal to require plunger lift systems to ensure that such systems are in use at all feasible sites.

NRDC acknowledges that there are many options for well deliquification. In any case, there is a methane control target (237 Bcf) that should be addressed by plunger lifts or other well deliquification methods that capture methane with similar efficiency and effectiveness. NRDC recommends that, while operators should have flexibility in selecting among the options, the basis for selection should be minimizing methane emissions.

#### 4.2.4 Profit

Installing a plunger lift system in a gas well involves a small initial investment, estimated by the EPA to be between \$2,600 and \$10,400 per well.<sup>72</sup> Plunger lift system maintenance may cost about \$1,300 per year, but yields other operational savings such as avoided chemical treatment of about \$13,200 per year, resulting in a net savings.

Each plunger lift installed in an older gas well could result in 600 to 18,250 Mcf per year of recovered gas, valued at \$2,000 to \$103,000, when operations and maintenance savings are included. The value of methane gas recovered and sold rapidly covers that initial investment cost, as shown in greater detail in Appendix A, Table A2.

Most companies report a less than one-year payout and substantial profit thereafter, depending on the gas recovery rate. Future profits will be offset eventually by declines in gas recovery rates, and by minimal additional operating and maintenance costs, but since most plunger lift systems pay back in less than a year, plunger lift installations typically start profitable and remain profitable for many years after the initial investment.

The examples below, reported by industry, illustrate the profitability of plunger lift systems:

- Between 1995 and 1997, Mobil Oil installed plunger lifts in 19 wells at its Big Piney Field in Wyoming, reducing its emissions by 12,166 Mcf per year.<sup>73</sup>

- In 2000, BP installed plunger lift systems with automated controls on approximately 2,200 wells in the United States, and reported a 50 percent reduction in gas well blowdowns for liquid unloading by year 2004.<sup>74</sup> By 2006, BP reported the installation of “smarter” plunger lift automation systems, achieving a \$15.5 million per year profit on an average annual recovery of 1,424 Mcf of methane gas per well.<sup>75</sup>
- In 2000, Conoco reported that installation of plunger lift systems in its low-pressure gas wells in Lea County, New Mexico reduced operating costs by more than 70 percent.<sup>76</sup>
- In 2006, Amoco reported that it installed plunger lifts at a cost of \$13,000 per well at its Midland Texas field, resulting in electricity, well workover, and chemical treatment savings of \$24,000 per year per well. In addition there was a small increase in gas production, which added about an additional \$79,000 in profit to each well per year, for a total benefit of more than \$100,000 per well.<sup>77</sup>
- In 2007, Devon Energy reported a 1.2 Bcf reduction of vented methane gas in its operations due to installation of plunger lift systems.<sup>78</sup>
- In 2010, the New Mexico Oil and Gas Association submitted testimony to the New Mexico Environmental Improvement Board confirming that plunger lift systems have been technically viable and economically attractive in the San Juan Basin.<sup>79</sup>

#### 4.2.5 Additional Benefits

Automated plunger lift systems continuously optimize gas production. Regular fluid removal limits the periods of time that liquid loading “kills” the well and halts gas production.

The mechanical action of the plunger traveling up and down the tubing also prevents buildup of scale and paraffin

in the tubing. Preventing excess scale and paraffin buildup reduces the cost of the chemical or mechanical swabbing treatments required to remove this buildup, and, in more serious cases, the cost of well workovers. The EPA reports additional savings associated with plunger lift systems ranging from \$6,600 to \$14,500 per well for reduced chemical treatment and workover costs.<sup>80</sup>

Gas venting near well operations creates potentially explosive vapor levels that can pose a human health hazard. Collection of potentially explosive gas vapors, rather than venting the gas to atmosphere, improves well site safety, reduces worker exposure to harmful vapors, and limits overall corporate liability.

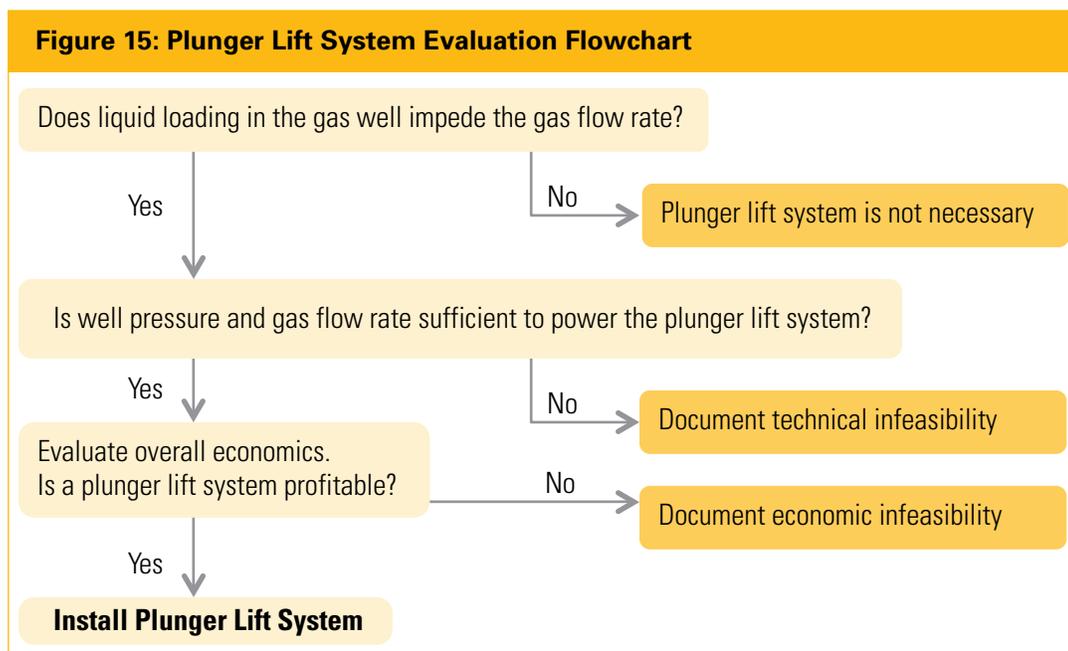

Additionally, gas capture and sale reduces emissions, noises, odors, and citizen complaints associated with venting.

Unprocessed natural gas contains VOCs and HAPs, along with methane. Therefore, capture of this gas also reduces VOCs and HAPs pollution.

#### 4.2.6 Limitations and Evaluation

Plunger lift systems are useful in gas wells that tend to fill with liquid, and have sufficient gas volume and pressure to power the plunger lift system. Such factors should be taken into account in determining applicability. In some cases, wells installed with plunger lifts may need to be vented for a short period of time to generate the differential pressure needed to resume well liquid removal. Even in this case, total methane emissions are substantially reduced. Also, a plunger cannot be run in a well bore with changing tube sizes, or wells with highly deviated directional or horizontal well bores.

Figure 15 provides a simplified evaluation flowchart showing the basic steps for evaluating whether a plunger lift system will be technically feasible and profitable.

### 4.3 TRI-ETHYLENE GLYCOL DEHYDRATOR EMISSION CONTROLS

Glycol dehydrators are used to remove moisture from natural gas to improve gas quality, minimize corrosion in the gas sales line, and mitigate gas hydrate formation. A number of different glycols can be used in dehydration systems (e.g. triethylene glycol (TEG), diethylene glycol (DEG), ethylene glycol (MEG), and tetraethylene glycol (TREG)). TEG is the most commonly used glycol in industry.<sup>81</sup> TEG dehydrators vent methane gas to the atmosphere, but in many cases methane gas can be captured instead.

#### 4.3.1 Technology Description

In some cases, if the design criteria can be met, a TEG dehydrator can be replaced with a desiccant dehydrator (see Section 4.4). However, desiccant dehydrators are limited to low gas flow rates—less than 5 MMcfd—and have temperature and pressure limitations. Therefore, for higher gas flow rates, the best solution is often to retrofit existing TEG dehydrators with emission controls.

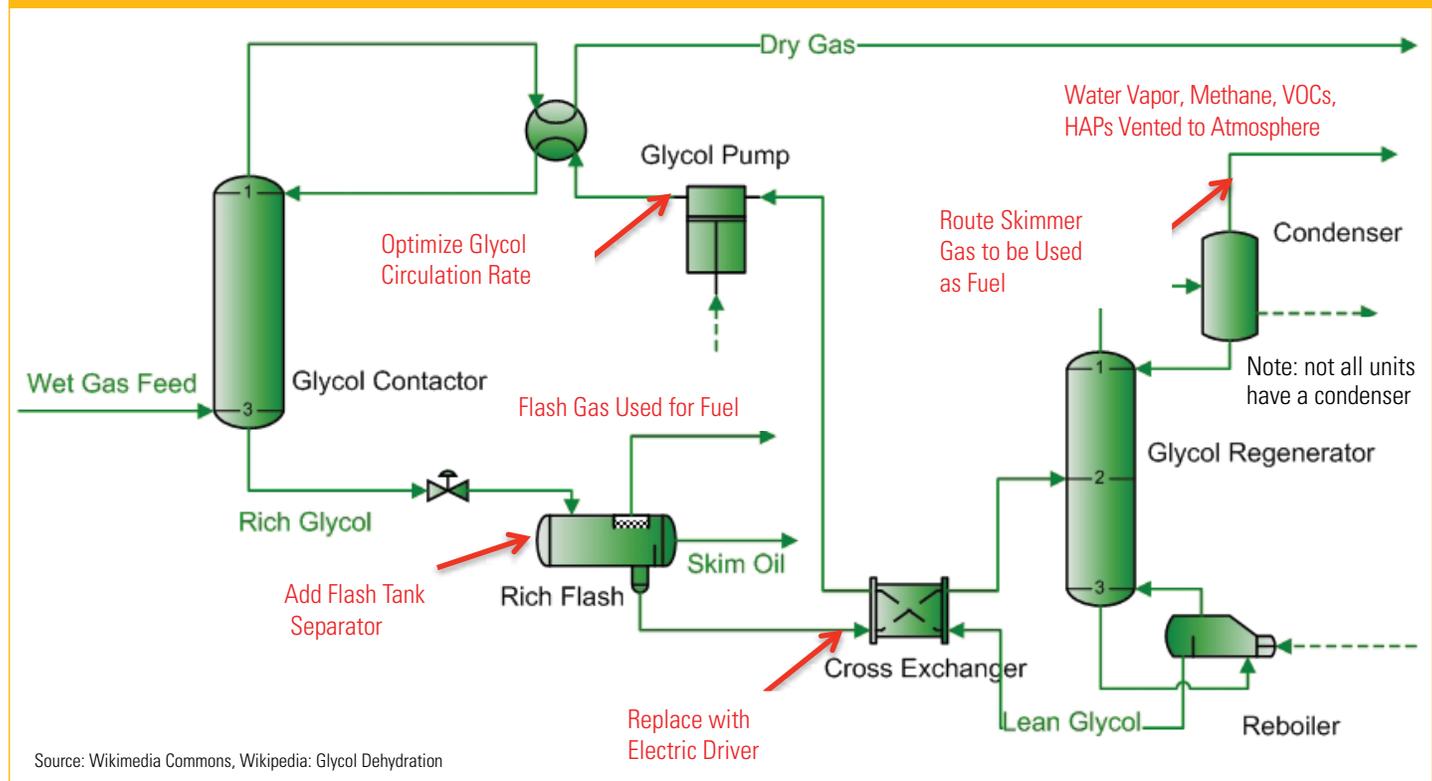

A typical glycol dehydration system includes a glycol contactor, a glycol exchange pump, a driver to run the pump, and a glycol regenerator and reboiler. In some cases, a condenser is also installed downstream of the glycol regenerator. Figure 16 provides a schematic for a typical glycol dehydration unit. As shown in the diagram, natural gas with moisture content exceeding pipeline specifications (“wet gas”) enters the glycol dehydration system and

moisture is removed to achieve pipeline specifications (“dry sales gas”).

A typical glycol dehydration system includes the following components:

- Glycol contactor:** Wet gas enters the glycol contactor. Glycol removes moisture from the gas by the process of physical absorption. Along with removing moisture, the glycol also absorbs methane, VOCs, and HAPs. Dry gas exits the glycol contactor absorption column and is either routed to a pipeline or a gas plant. The glycol contactor unit plays the primary role in dehydrating the gas to pipeline specifications, but the rest of the glycol dehydration system is required to convert the now moisture rich glycol back into a lean product that can be reused to dehydrate more incoming gas. Therefore, the next step in the process is to route the moisture rich glycol to regenerator and reboiler units to remove that moisture.
- Glycol regenerator & reboiler:** Glycol loaded with moisture, methane, VOCs, and HAPs (“rich glycol”) exits the bottom of the glycol contactor unit and is routed to the glycol regenerator and reboiler units to remove the absorbed components and return “lean” glycol back to the glycol contactor. If emission controls are not installed, methane, VOCs, HAPs, and water are boiled off and vented to atmosphere from the regenerator and reboiler units. One way to limit the amount of methane, VOCs, and HAPs emitted to the atmosphere from the regenerator and reboiler units is to install a flash tank separator.

Figure 16: Glycol Dehydration Unit Schematic

Source: Wikimedia Commons, Wikipedia: Glycol Dehydration

- **Flash tank separator:** Installation of a flash tank separator between the glycol contactor and the glycol regenerator/reboiler units creates a pressure drop in the system, allowing methane, and some VOCs and HAPs, to flash out of, or separate from, the glycol. The amount of pressure drop that can be created is a function of the fuel gas system pressure or compressor suction pressure because the methane gas flashed-off at the flash tank separator is then sent to be used as fuel in the TEG reboiler or compressor engine. Simply put, the pressure can only be dropped to a pressure that still exceeds the fuel gas pressure, allowing the collected methane gas to flow into the fuel system. Flash tank separators typically recover 90 percent of the methane and approximately 10 to 40 percent of the total VOCs that would otherwise be vented to atmosphere. Methane emissions can also be controlled by taking the simple step of adjusting the rate at which glycol circulates in the system.
- **Glycol recirculation pump:** Methane emissions are directly proportional to the glycol circulation rate. Circulating glycol at a rate that exceeds the operational need for removing water content from gas unnecessarily increases methane emissions. Glycol circulation rates are typically set at the maximum to account for peak throughput. Gas pressure and flow rate decline over time, requiring the glycol circulation rate to be adjusted to meet operational need. Optimizing the glycol circulation merely requires an engineering assessment and a field operating adjustment. If the glycol dehydration unit includes a condenser, methane emissions can be collected and used for fuel or destroyed rather than being vented to atmosphere.
- **Condensers:** Some glycol reboilers have still condensers to recover natural gas liquids and reduce VOCs and HAPs emissions. However, condensers do not capture methane (because it is a non-condensable gas); therefore, the addition of a condenser does not reduce methane emissions. In these cases, methane gas is typically vented to atmosphere. Alternatively, this methane gas (called “skimmer gas”) can be routed to the reboiler firebox or other low-pressure fuel gas systems.<sup>82</sup>
- **Electric pumps or energy-exchange pumps:** Historically, gas-assisted glycol pumps have been used. Where there is an electric supply, the gas-assisted glycol pumps can be replaced with an electric pump. Gas-assisted pumps are driven by expansion of the high-pressure gas entrained in the rich glycol that leaves the contactor, supplemented by the addition of untreated high-pressure wet (methane rich) natural gas. The high-pressure gas drives pneumatic pumps. Much like pneumatically operated valves, pneumatically operated pumps vent methane. Electric pumps would reduce emissions, since they do not vent methane.

Regarding electric pumps or energy-exchange pumps, the EPA reports:

*“The mechanical design of these pumps places wet, high-pressure TEG opposed to dry, low pressure TEG,*

*separated only by rubber seals. Worn seals result in contamination of the lean (dry) TEG making it less efficient in dehydrating the gas, requiring higher glycol circulation rates. Replacing gas-assisted pumps with electric pumps increases system efficiency and significantly reduces methane emissions.”<sup>83</sup>*

By comparison, electric pumps have lower emissions and no pathway for contamination of lean TEG by the rich TEG.

In summary, there are four straightforward solutions readily available to control methane emissions from TEG dehydrator units:

- Installing a flash tank separator
- Optimizing the glycol circulation rate
- Rerouting the skimmer gas
- Installing an electric pump to replace the natural gas driven energy exchange pump

### 4.3.2 Opportunity

#### Reduction Target 8 Bcf/year

The 2011 *Greenhouse Gas Inventory* estimates that gas dehydration systems emit approximately 8 Bcf of methane annually.<sup>84</sup>

In 2009, the EPA estimated that there were approximately 36,000 glycol dehydrators in operation in the U.S. natural gas sector.<sup>85</sup>

While a number of large glycol dehydrators are currently required by the EPA to install emission controls under the federal Maximum Achievable Control Technology standards (MACT standards at 40 CFR Part 63, Subpart HH), small glycol dehydrators are typically exempt from federal emission control requirements. Many small glycol dehydrator units do not have flash tank separators, condensers, electric pumps, or vapor recovery installed on the glycol regenerator.

*Many small glycol dehydrators operating in the United States are exempt from federal emission control*

**Table 5: Methane Capture Potential from TEG Dehydrator Controls**

Technology	Methane Capture Mcf/year
Flash Tank Separator	3,650
Optimize Glycol Circulation Rate	18,250
Reroute Skimmer Gas	7,665
Install Electric Pump	5,000
<b>Potential Methane Capture Range</b>	<b>3,650 to 34,565</b>

A significant fraction of this 8 Bcf/year of emissions from this source can and should be captured (Table 5).

**Installing Flash Tank Separator:** In 2005, the EPA estimated that the installation of a flash tank separator, on average, resulted in 10 Mcf/day (3,650 Mcf/year) of methane gas captured for use as fuel for each TEG dehydrator (typically a 90 percent reduction in methane emissions).

In 2009, the EPA reported that flash tank separators were only installed on 15 percent of the dehydration units processing less than 1 MMcfd, 40 percent of units processing 1 to 5 MMcfd, and between 65 and 70 percent of units processing more than 5 MMcfd.<sup>86</sup> Chevron reported it has installed flash tank separators, recovering 98 percent of the methane from the glycol and reducing methane emissions from 1,450 Mcf/year to 47 Mcf/year.<sup>87</sup>

**Optimizing Glycol Circulation Rate:** In 2005, the EPA estimated that optimizing the glycol circulation rate could result in a wide range of methane capture from 1 to 100 Mcf/day (18,250 Mcf/year using a median estimate of 50 Mcf/day).<sup>88</sup>

**Rerouting Glycol Skimmer Gas:** In 2005, the EPA estimated that rerouting glycol skimmer gas could result in an average methane capture of 21 Mcf/day (7,665 Mcf/year).<sup>89</sup>

**Installing Electric Pump:** In 2007, the EPA estimated that between 360 and 36,000 Mcf/year in methane emission reductions could be achieved by installing an electric pump to replace the natural gas-driven glycol energy exchange pump. The wide range in methane emission reductions is a function of the large variation in equipment sizes. In Table 5 we use the number 5,000 Mcf/year per electric pump.<sup>90</sup>

In 2007, the EPA determined that the total potential emission reductions at any given glycol dehydration unit is a function of how many of these emission control solutions

are installed, and estimated that the total reduction potential may range from 3,600 to 35,000 Mcf/year, or \$14,600 to \$138,000 of annual revenue. The 2011 *Greenhouse Gas Inventory* estimates the upper range of emissions at 38,000 Mcf/year.<sup>91</sup>

### 4.3.3 Proposed EPA Regulations

The EPA's proposed air toxics standards would cover new and existing small dehydrators located at major sources of HAPs.<sup>92</sup> The EPA classifies small dehydrators as units with an annual average gas flow rate less than 3 million Mcf/day at production sites, or 9.99 million Mcf/day at natural gas transmission and storage sites, or actual average benzene emissions less than 0.9 Mg/year.

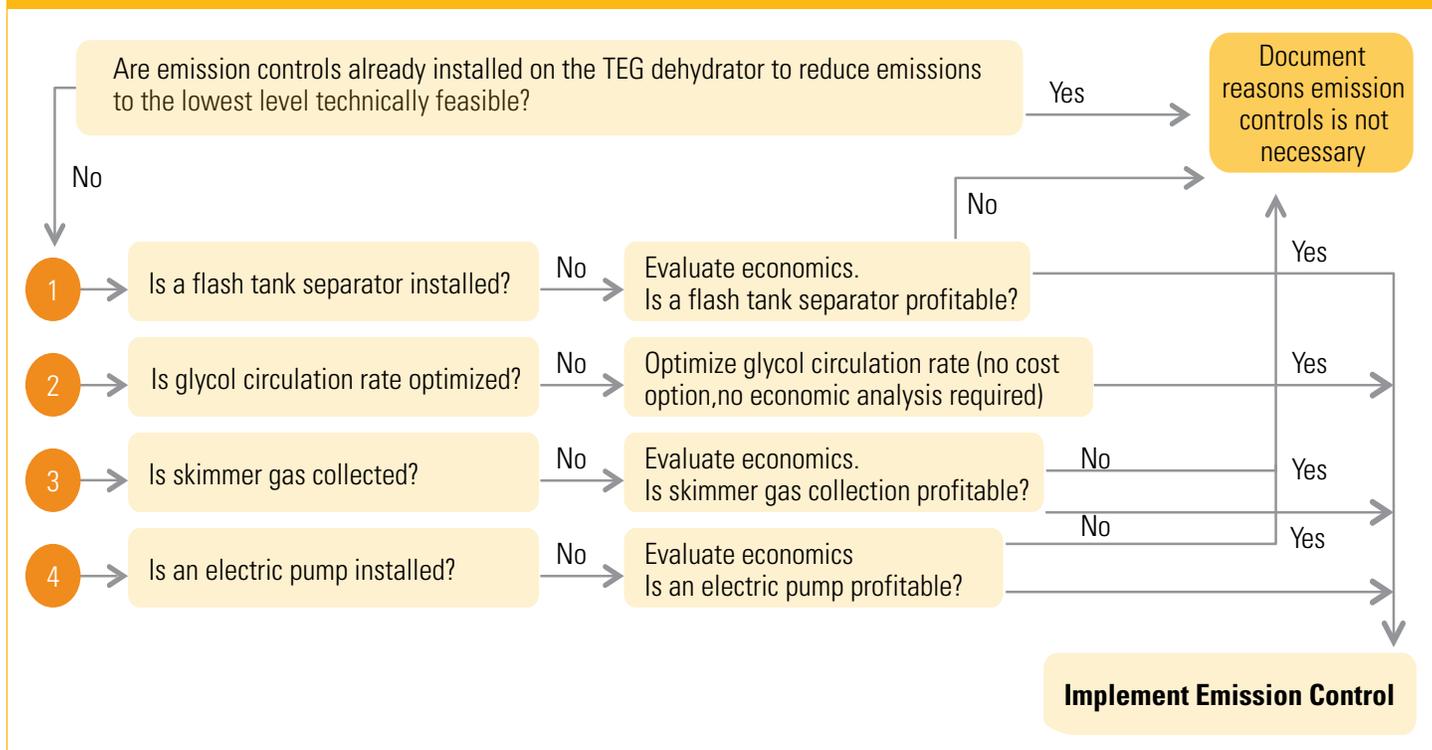

### 4.3.4 Profit

The EPA estimates that it costs on average:

- \$5,000 to install a flash tank separator
- Less than \$100 to adjust the glycol circulation rate
- \$1,000 per unit to reroute glycol skimmer gas, with \$100 per year of operating and maintenance costs<sup>93</sup>
- \$1,400 to \$13,000 to install an electric pump<sup>94</sup>

These technologies can be installed singly or in combination. Each unit, if equipped with the above technology, would capture approximately 3,600 to 35,000 Mcf per unit, per year. This translates to profits of between \$14,000 and \$138,000 per unit per year, as shown in greater detail in Appendix A Table A3. This technology has a payback period of less than a year, and can generate significant profits each year thereafter.

**Figure 17: TEG Dehydrator Emission Control Evaluation Flowchart**

### 4.3.5 Additional Benefits

One of the most important benefits of TEG dehydrator emission controls is the opportunity to reduce the amount of HAPs emitted to the atmosphere, especially benzene, a known human carcinogen. Along with methane gas, TEG dehydrators vent VOCs and HAPs to the atmosphere. In some cases, glycol dehydrators have still condensers and condensate separators to recover natural gas liquids and reduce VOCs and HAPs. But, if these units are not installed, VOC and HAP components (including benzene) are vented into the atmosphere.<sup>95</sup>

The installation of a flash tank separator reduces VOC and HAP emissions, improving air quality. The installation of a flash tank separator also improves the efficiency of downstream components (e.g. condensers) and reduces fuel costs by providing a fuel source to the TEG reboiler or compressor engine.<sup>96</sup>

### 4.3.6 Limitations and Evaluation

The option to reroute the skimmer gas can be employed only on dehydrators where a still condenser is installed. The following factors should be evaluated in assessing feasibility of installing an electric pump to replace the natural gas driven glycol energy exchange pump, as electricity may not be available at a remote well site: (1) the local electric grid's potential to make electric power available to a well site, (2) the potential to self-generate electricity on site using waste gas that might otherwise be vented or flared, or (3) availability of solar power.

Figure 17 provides a simplified evaluation flowchart showing the basic steps for evaluating whether TEG dehydrator emission controls are appropriate.

## 4.4 DESICCANT DEHYDRATORS

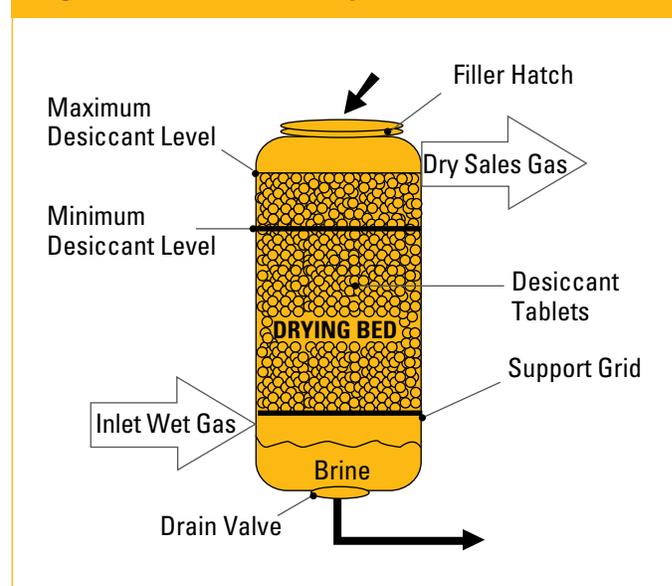

Desiccant dehydrators can be used as alternatives to glycol dehydrators to remove moisture from natural gas to improve gas quality, minimize corrosion in the gas sales line, and mitigate gas hydrate formation. Desiccant dehydrators do not emit significant quantities of methane gas into the atmosphere, and reduce emissions by up to 99 percent.

### 4.4.1 Technology Description

Desiccant dehydrators dry gas by passing the gas through a bed of sacrificial hygroscopic salt (the desiccant).<sup>97</sup> The salt type—typically calcium chloride ( $\text{CaCl}_2$ ) or lithium chloride ( $\text{LiCl}$ )—is selected based on gas temperature and pressure and to match the gas operating conditions, as shown in Figure 18. Unlike a traditional glycol dehydrator, there are no pumps, contactors, regenerators, or reboilers, and only a small amount of methane is released intermittently when the unit is opened to replace the salt.

The amount of moisture that can be removed from a gas

**Figure 18: Desiccant Dehydrator Schematic**

stream is a function of the gas pressure and temperature. At high gas temperatures, desiccant dehydrators can form gas hydrates, which can plug the unit. Therefore, desiccant dehydrators are best suited for 5 MMcfd gas flow rates or less, with a low wellhead gas temperature (less than 70 degrees Fahrenheit). Glycol dehydrators are needed for gas flow rates exceeding 5 MMcfd, for higher gas pressures, or when operation is required over a wide range of pressures.<sup>98</sup>

### 4.4.2 Opportunity

#### **Reduction Target: 8 Bcf/year**

The 2011 *Greenhouse Gas Inventory* estimates that gas dehydration systems emit approximately 8 Bcf of methane annually.<sup>99</sup>

Desiccant dehydrators can be used to replace an existing TEG dehydrator. When this occurs, there is an initial capital investment required. For example, a 1 MMcfd unit costs about \$12,500 to \$16,000, but the operating and maintenance costs for a desiccant dehydrator are lower than those for a TEG unit (cost savings of about \$1,800/year).<sup>100,101</sup> The EPA estimates that replacing a small TEG dehydrator with a desiccant dehydrator will capture about 1,000 Mcf/year of methane.<sup>102</sup> Larger units—up to 5 MMcfd—will cost incrementally more, but will have corresponding lower operating and maintenance costs and higher methane emission recovery.<sup>103</sup>

Of the 8 Bcf/year reduction target for dehydrators, most of the emissions are from small dehydrators that are exempt from MACT standards. Using desiccant dehydrators to replace aging glycol dehydrators, or as a lower emission alternative for new dehydration units, will reduce methane emissions from small dehydrators.

### 4.4.3 Proposed EPA Regulations

The EPA's proposed new air toxics standards include new and existing small dehydrators. Desiccant dehydrators are not specifically required.

While these proposed standards would cover both small and large glycol dehydrators, the EPA estimates that only 0.024 Bcf/year of methane would be captured (about 0.3 percent of the emissions from this source).

The EPA's proposed standards could be strengthened by requiring:

- Air toxics reductions of 98 percent (up from the proposed 95 percent)
- Better operational practices (e.g. optimized circulation rates)
- Portable desiccant dehydrators used during maintenance, and desiccant dehydrators for gas flow rates of 5 MMcfd or less.

### 4.4.4 Profit

If a desiccant dehydrator is technically feasible in a new installation, it will be more profitable than a TEG dehydrator. In addition to having lower capital and operating and maintenance costs than a TEG dehydrator, it has the added benefit of being able to collect methane for sale.

The EPA estimates that profit could amount to \$6,000 per year, including operations and maintenance savings. The initial investment of \$16,000 for replacing a glycol dehydrator with a desiccant dehydrator is paid out in less than three years, as shown in greater detail in Appendix A, Table A4.<sup>104</sup>

In 2007, BP reported that it eliminated 858 glycol dehydrators, replacing them with desiccant dehydrators, for a \$27 million profit and “immediate-payout.” This amounts to a profit of \$31,469 per unit total, or about \$31,000 per year averaged over a 10-year period.<sup>105</sup>

### 4.4.5 Additional Benefits

Unprocessed natural gas contains VOCs and HAPs, along with methane. Therefore, capture of this gas also reduces VOC and HAP pollution.

### 4.4.6 Limitations and Evaluation

Desiccant dehydrators produce a liquid brine waste that must be either routed to a produced water tank for reinjection or disposed of as waste. There are also pressure, temperature, and gas flow limitations.

Figure 19 provides a simplified evaluation flowchart showing the basic steps for evaluating whether a desiccant dehydrator would be an option.

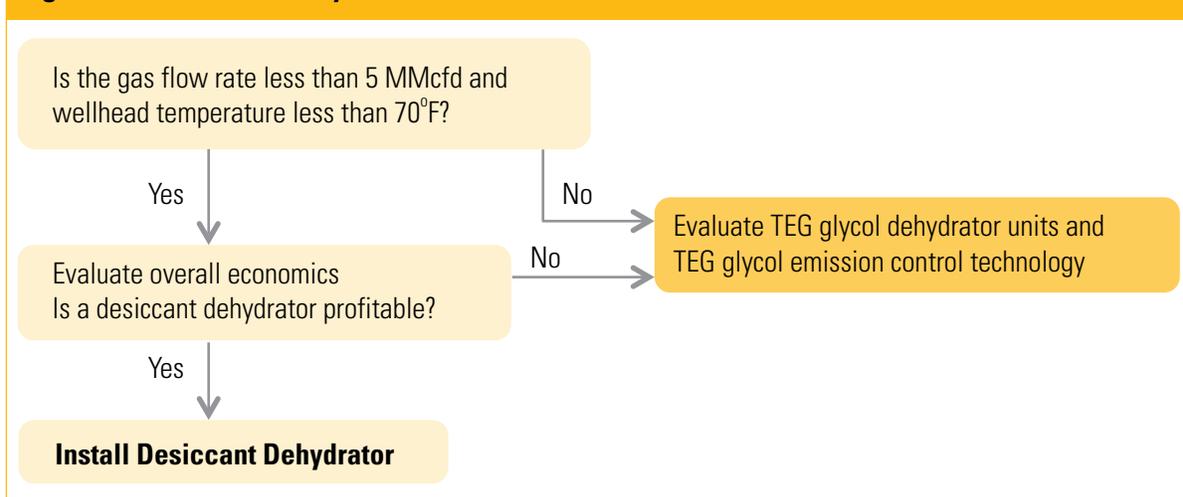

### 4.5 DRY SEAL SYSTEMS

Centrifugal compressors are used in the production and transportation of natural gas. Centrifugal compressors installed with wet seals have high-pressure seal oil that circulates between rings around the compressor shaft. This high-pressure oil is used as a barrier to prevent gas escape. The seal oil absorbs methane gas, however, and later the methane is vented to atmosphere, when the compressor seal oil gas is vented in a process called “seal oil degassing” (Figure 20).

Instead of using seal oil (wet seal), centrifugal compressors can use dry seals, in which high-pressure gas is used to seal the compressor. Changing out wet seals and installing dry seals reduces methane venting (Figure 21).

Wet seal technology is being phased out. In fact, more than 90 percent of new compressors are being sold with dry seal technology, due to the environmental and cost savings benefits it offers.

**Figure 19: Desiccant Dehydrator Evaluation Flowchart**

### 4.5.1 Technology Description

Dry seals prevent methane leaks by pumping gas between the seal rings, creating a high-pressure leak barrier when the compressor shaft is rotating (Figure 21). Typically, two dry seals are used in tandem to prevent gas leakage. When the compressor shaft is not rotating, the dry seal housing is pressed up tight against the rotating ring using a “dry seal spring,” thereby preventing gas leaks.<sup>106</sup>

### 4.5.2 Opportunity

#### Reduction Target: 27 Bcf/year

The 2011 *Greenhouse Gas Inventory* estimates that approximately 1,500 centrifugal compressors with wet seals were operating in the U.S. O&G industry, with rod packing systems emitting approximately 27 Bcf of methane annually, a significant fraction of which can and should be captured.<sup>107</sup>

The EPA estimates that 80 percent of natural gas compression station methane emissions are emitted from compressors.<sup>108</sup> If wet seals are used in compressors for other applications in gas production, those compressors can also emit large amounts of methane. According to the EPA, wet seal oil degassing may vent between 40 and 200 standard cubic feet per minute (scfm), compared to about 0.5 to 3 scfm with a dry seal.<sup>109</sup> Dry seal technology offers a technically and economically feasible alternative to reduce these methane emissions.

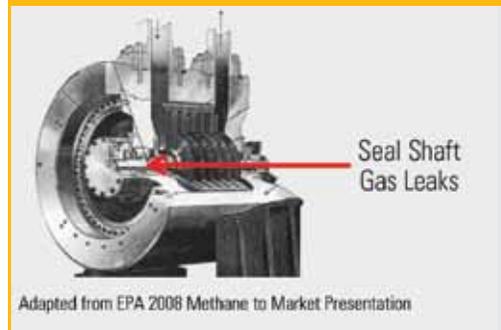

### 4.5.3 Proposed EPA Regulations

The EPA’s proposed NSPS regulations would require the use of dry seals for each new or modified centrifugal compressor located in the processing, transmission, and storage sectors. The standards would not apply to compressors at a well site or in the distribution sector.

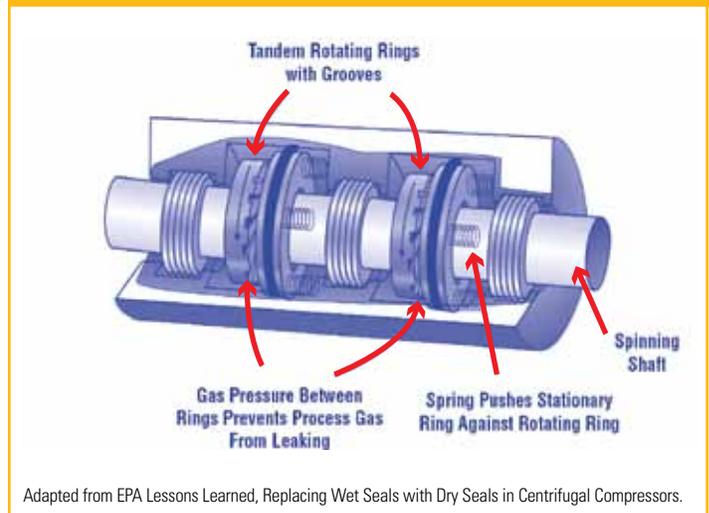

The EPA estimates that the proposed NSPS would reduce methane emissions from compressors with wet seals by about 0.25 Bcf/year, about 1 percent of the compressor methane emissions from this source. This low control percentage is primarily because the NSPS would only affect new or modified or replaced leakage sources, while the bulk of the emissions are from existing sources.

The proposed regulations could be further enhanced by requiring equipment and operational requirements for existing compressors. New compressors represent just 2 percent of all centrifugal compressors in the processing, transmission and storage sectors. Compressors are added or replaced in these sectors at an extremely low rate. Therefore, a standard applying only to such compressors would leave most of the emissions untouched.

**Figure 20: Centrifugal Compressor Leaks Schematic**

**Figure 21: Centrifugal Compressor Dry Seals**

### 4.5.4 Profit

The actual costs for a dry seal system will depend on compressor operating pressure, shaft size, rotation speed, and other site-specific factors. The EPA reports that a dry seal retrofit costs on average \$324,000, but results in an operations and maintenance cost savings of more than \$100,000 per year and can generate up to \$400,000 in additional annual revenue from captured methane, resulting in a payout of approximately one year.<sup>110,111</sup> One of the major factors in the profit equation is the lower O&M costs for dry seals—\$8,400 to \$14,000 per year—compared to wet seal costs of \$140,000 per year per compressor or more.

The EPA’s 2011 *Greenhouse Gas Inventory* and other sources estimate the leak rate to be approximately 18,000 to 100,000 Mcf per year. If captured and sold, this could annually yield up to \$400,000 in additional revenue, and up to \$120,000 in operations and maintenance savings. Additional details are provided in Appendix A, Table A5.

Using the EPA’s estimate that wet seal oil degassing may vent between 58 and 288 Mcf/day, compared to 0.7 to 4 Mcf/day with a dry seal, and using current gas prices, an

operator may save up to \$400,000 per year, per compressor.<sup>122</sup> However, the actual profits will vary based on site-specific circumstances.

In 2008, Petróleos Mexicanos (PEMEX) assessed the benefits of converting from wet seals to dry seals on centrifugal compressors at a compression station in southern Mexico.<sup>113</sup> PEMEX found a gas savings of 33.5 scfm per seal, and a gas savings of 35,000 Mcf/year (resulting in greenhouse gas emissions reduction of 7,310 metric tons of carbon dioxide equivalent per year), and a profit of \$126,690 annually.<sup>114</sup>

Targa Resources and the Gas Processors Association report that replacing a wet seal with a dry seal on a 6 inch shaft beam compressor that operates approximately 8,000 hours per year, leaking at 40 to 200 scfm, will pay out in four to 15 months, yielding more than \$1 million in net present value, assuming a 10 percent discount rate in a span of five years, and more than a 170 percent rate of return.<sup>115</sup>

#### 4.5.5 Additional Benefits

Upgrading compressor seals can reduce power requirements and downtime, improve compressor reliability, and lower operating costs by eliminating seal oil costs and associated maintenance.<sup>116</sup>

#### 4.5.6 Limitations and Evaluation

A compressor-specific, site-specific evaluation is necessary to determine if conversion to dry seals is technically feasible. A conversion to dry seals may not be possible on some

compressors because of compressor housing design or other operational or safety factors.

Figure 22 provides a simplified evaluation flowchart showing the basic steps for evaluating a dry compressor seal conversion.

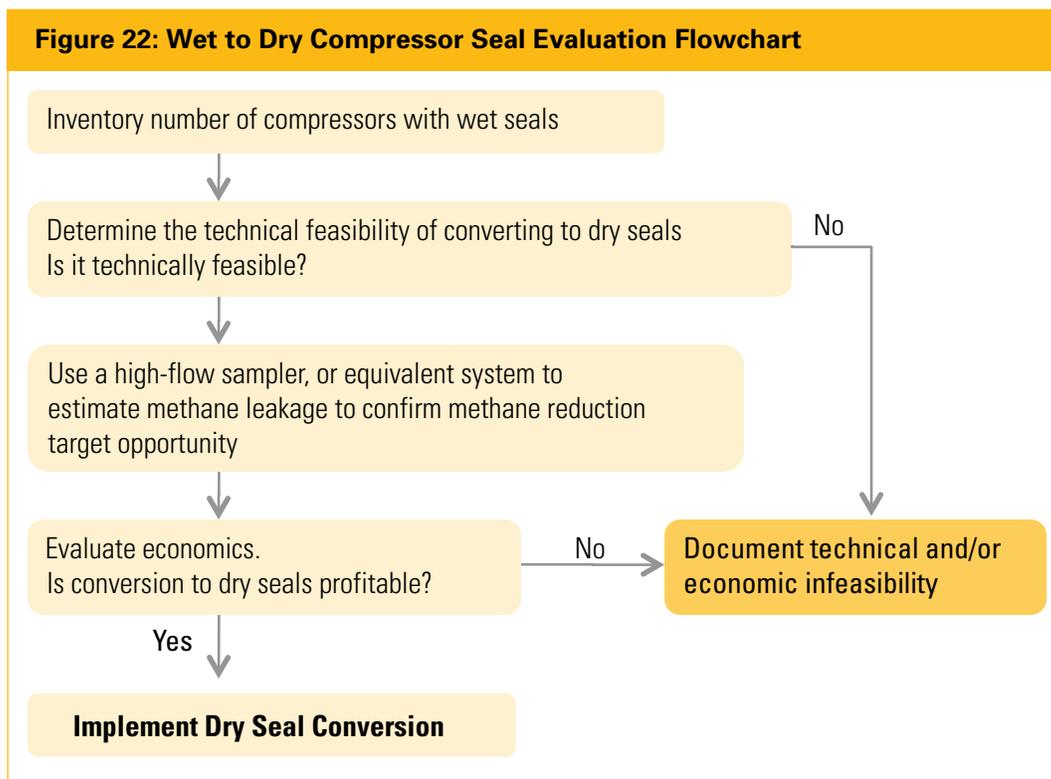

### 4.6 IMPROVED COMPRESSOR MAINTENANCE

Reciprocating compressors leak methane from a component called a rod packing case. A common practice is to route the rod packing emissions outside the compressor building and vent the methane emissions directly into the atmosphere. Methane emissions can be reduced by replacing worn out rod packing.

#### 4.6.1 Technology Description

Rod packing systems are used to maintain a seal around the piston rod, preventing gas compressed to a high pressure in the compressor cylinder from leaking, while still allowing the piston rod shaft to move freely. A series of flexible rings are fitted around the piston rod shaft, held in position by packing material and springs.

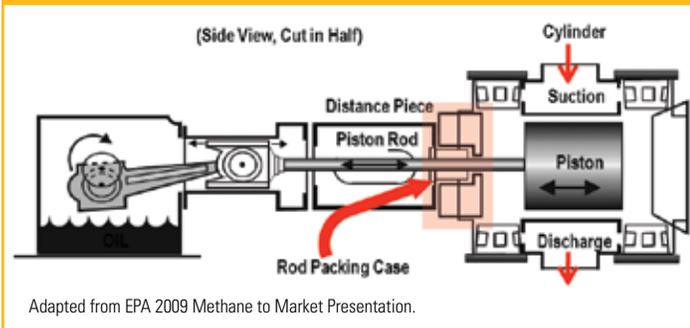

Methane leaks occur between the rings and piston rod shaft, around the outside of the rings, and between the packing (Figure 23). Packing leaks can occur for a number of reasons, such as a worn piston rod, an incorrect amount of lubrication, dirt or foreign matter in the packing, or packing material out of tolerance.<sup>117</sup> The amount of leakage will be a

function of the amount of misalignment between the piston rod, packing materials, and rings and packing case. Also, misalignment of the piston rod and any imperfections on the piston rod surface can cause leakage.<sup>118</sup>

Rod packing case leaks are also a function of the quality of initial installation, packing material selection, and the way in which the unit was operated during the initial, or break-in, operating period.

**Figure 23: Reciprocating Compressor Rod Packing Leaks Schematic**

#### 4.6.2 Opportunity

##### **Reduction Target: 75 Bcf/year**

In 2006, the EPA estimated that more than 51,000 reciprocating compressors were operating in the U.S. natural gas industry with, on average, four cylinders each, for a total of more than 200,000 piston rod packing systems in service.<sup>119</sup> The 2011 *Greenhouse Gas Inventory* estimates that these systems emit 75 Bcf of methane annually, a significant fraction of which can and should be captured.<sup>120</sup>

As with centrifugal compressors, an impediment to rod packing replacement is the equipment downtime required to make the replacement. However, routine repair and maintenance is a good business practice.

#### 4.6.3 Proposed EPA Regulations

The EPA's proposed NSPS regulations for reciprocating compressors require replacement of rod packing every 26,000 hours of operation (approximately every three years). These standards would only apply to reciprocating compressors at processing stations, gathering and boosting stations, transmission stations and underground storage facilities. The standards would not apply to compressors at a well site or beyond the city gate (distribution sector).

The EPA estimates that the proposed NSPS regulations would reduce emissions from reciprocating compressors by about 0.3 Bcf/year, less than 1 percent of the methane emissions from these sources. This is primarily because the NSPS would only apply to new or replaced reciprocating compressors starting from the time of installation, whereas

the bulk of the emissions come from existing compressors. It does not appear that the proposed standards would apply when an existing compressor is taken offline for maintenance.

The proposed regulations could be further strengthened by requiring equipment and operational requirements for existing compressors. New compressors represent just 3 percent of all reciprocating compressors in the processing, transmission and storage sectors. Compressors are added or replaced in these sectors at a low rate; therefore, a standard applying only to new compressors will leave most of the emissions untouched. The EPA should also require emission abatement at the wellhead (production sector). While replacement based on hours of operation is a good minimum threshold, the EPA should also consider requiring regular leak-rate tests and early replacement if leakage is deemed too high.

#### 4.6.4 Profit

Operators that carefully monitor and replace compressor rod packing systems on a routine basis can reduce methane emissions and reduce piston rod wear, both of which increase profit.<sup>121</sup>

The 2011 *Greenhouse Gas Inventory* uses a leak rate of 875 scf/hour (21,000 scf/day), equating to approximately \$100 of gas leaking from each compressor each day it is not repaired.

The EPA estimates that refurbishing the rings and packing material may cost between \$135 and \$2,500, depending on the size of the unit. Rod replacement can range from \$2,400 to \$13,500, depending on the number of rods replaced.<sup>122</sup>

The pace at which replacements are necessary is a function of the compressor type, use, maintenance and operating conditions, and is highly variable. In most cases, though, payout is achieved in less than a year. The EPA has estimated that on average, the annual investment expense of replacing one rod packing system is about \$600, with an initial investment of about \$1,600. The methane gas captured has a value of about \$3,500 per year, allowing payout to be achieved in less than half a year.<sup>123</sup> Another EPA reference reports a slightly lower initial cost for replacing rod packing of \$1,200, but with similar natural gas savings, to allow for payout in less than half a year.<sup>124</sup> Additional detail is shown in Appendix A, Table A6.

#### 4.6.5 Additional Benefits

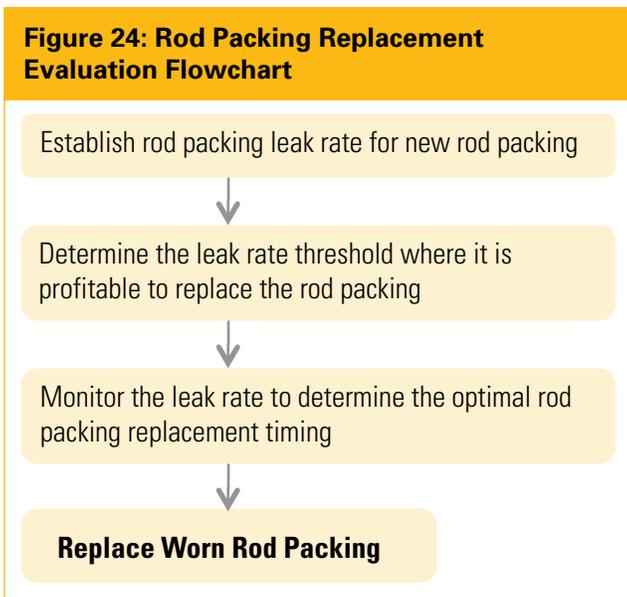

Collection of methane and other gas vapors at O&G operations creates a safer working environment by reducing potentially combustible vapors at the work site.

#### 4.6.6 Limitations and Evaluation

One major consideration in deciding whether to replace worn rod packing is the cost and feasibility of taking the compressor out of service to make the repair. Larger facilities with spare compressor capacity will not be as significantly

affected as smaller operations, where repairs may require a complete shutdown. Other variables affecting cost savings include the amount of wear already on the rings and rod shaft, fit and alignment of packing parts, and cylinder pressure.

Figure 24 provides a simplified evaluation flowchart showing the basic steps for evaluating rod packing replacement.

### 4.7 LOW-BLEED OR NO-BLEED PNEUMATIC CONTROLLERS

Pneumatic controllers are used to regulate pressure, gas flow, and liquid levels, and to automatically operate valves. They are used extensively in the O&G industry.

Pneumatic controllers are designed to release methane gas to the atmosphere as part of normal operations. Some pneumatic controllers bleed at a low rate (low-bleed) and others bleed at a high rate (high-bleed). A high-bleed

**Figure 25: Pneumatic Controller**

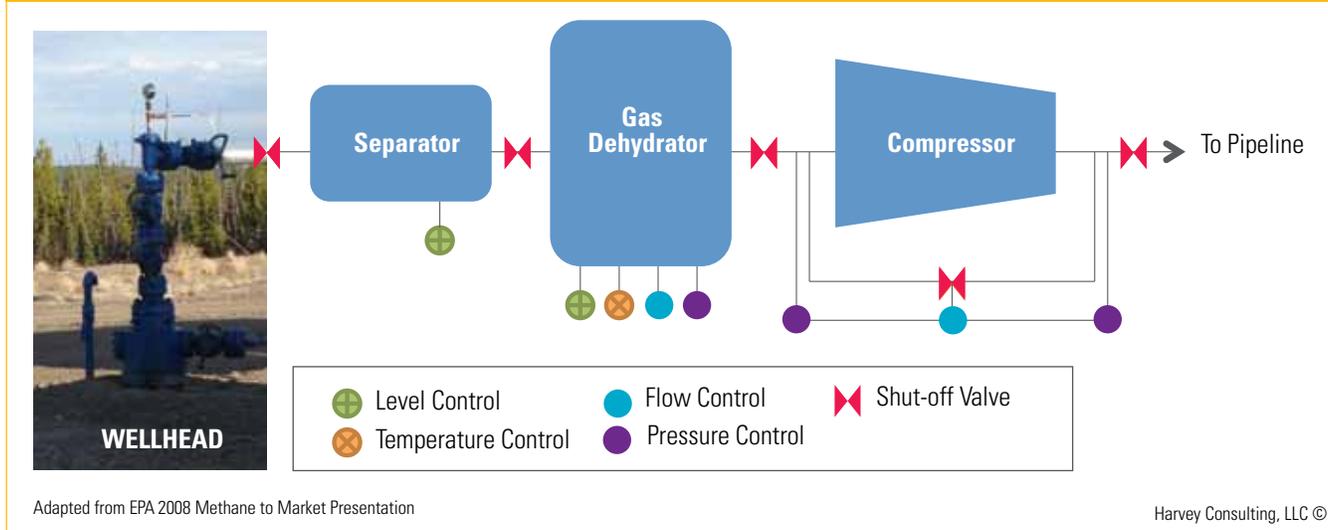

controller is defined by the EPA Natural Gas STAR Program as a device that releases 6 scf/hour or more. Converting high-bleed controllers to low-bleed controllers, or moving away from gas-operated controllers altogether in favor of instrument air controls, reduces methane emissions.

Colorado requires O&G operators to install low-bleed or no-bleed pneumatic controllers at all new facilities and whenever a device is repaired or replaced, if technically feasible.<sup>125</sup> Wyoming’s Oil and Gas Production Facility Guidance includes upgrading to low-bleed or no-bleed pneumatic controllers, or routing methane to a collection system during a repair or replacement.<sup>126</sup>

#### 4.7.1 Technology Description

Pneumatic controllers use clean, dry pressurized natural gas to provide a power supply to measure process conditions (e.g. liquid level, gas pressure, flow rate, temperature) and control

**Figure 26: Pneumatic Controller Locations in Natural Gas Production**

the conditions to a set point. Figure 25 shows a pneumatic controller. Figure 26 shows the locations in O&G operations where pneumatic controllers may be used.

There are three main pneumatic controller designs:

1. Intermittent bleed controllers that release gas only when the valve is stroked open or closed
2. Continuous bleed controllers that modulate flow, liquid levels, or pressures
3. Self-contained controllers that release gas back into piping and not to the atmosphere<sup>127</sup>

There are four main options for reducing methane emissions from pneumatic controllers:

1. Replacing high bleed pneumatic controllers with low- or no-bleed controllers
2. Retrofitting pneumatic controllers with bleed reduction kits
3. Converting natural gas pneumatics to instrument air
4. Performing routine maintenance to repair leaking gaskets, tube fittings, and seals

## 4.7.2 Opportunity

### **Reduction Target: 99 Bcf/year**

The 2011 *Greenhouse Gas Inventory* estimates that pneumatic controllers vented 99 Bcf of methane into the atmosphere.<sup>128</sup> Emissions are primarily generated from the production, processing, and transmission and storage sectors. The EPA also estimates that 84 percent of pneumatic controller emissions come from O&G production.<sup>129</sup> According to the American Petroleum Institute, there are approximately 1 million existing wells, and three controllers per well, indicating that there are a minimum of three million controllers in operation at well sites alone. The EPA reports that the typical high-bleed controller releases 140 Mcf/year of gas to the atmosphere.<sup>130</sup> Fortunately, nearly 80 percent of all high-bleed pneumatic controller can be replaced with low-bleed equipment or retrofitted to reduce methane emissions.<sup>131</sup>

Taking into account the EPA's assessment that 80 percent of high-bleed devices can be replaced or retrofitted, we consider that a very large fraction of the 99 Bcf/year emissions can be captured.

## 4.7.3 Proposed EPA Regulations

The EPA's proposed NSPS regulations require instrument air controllers that have zero methane emissions to be installed at processing plants. The EPA also proposes that low-bleed pneumatic controllers, with a limit of 6 scfh, be used in the production, transmission, and storage sectors. Requirements would apply to newly installed pneumatic controllers, including replacement of existing devices. The proposal

would exclude pneumatic controllers that are located in the distribution segment, as well as existing controllers.

The EPA estimates that the proposed NSPS regulations would reduce emissions from high-bleed pneumatic controllers by about 4.5 Bcf/year, or about 5 percent. The emission reduction is small because the proposed NSPS would only apply to pneumatic controllers at the time of installation, whereas the bulk of the emissions are from the existing fleet of controllers.

NRDC recommends that the EPA should require that existing sources be controlled to maximize methane emission reductions. The EPA should also consider regulating emission reductions from the distribution sector, and requiring no-bleed controllers at locations outside the processing sector where feasible.

## 4.7.4 Profit

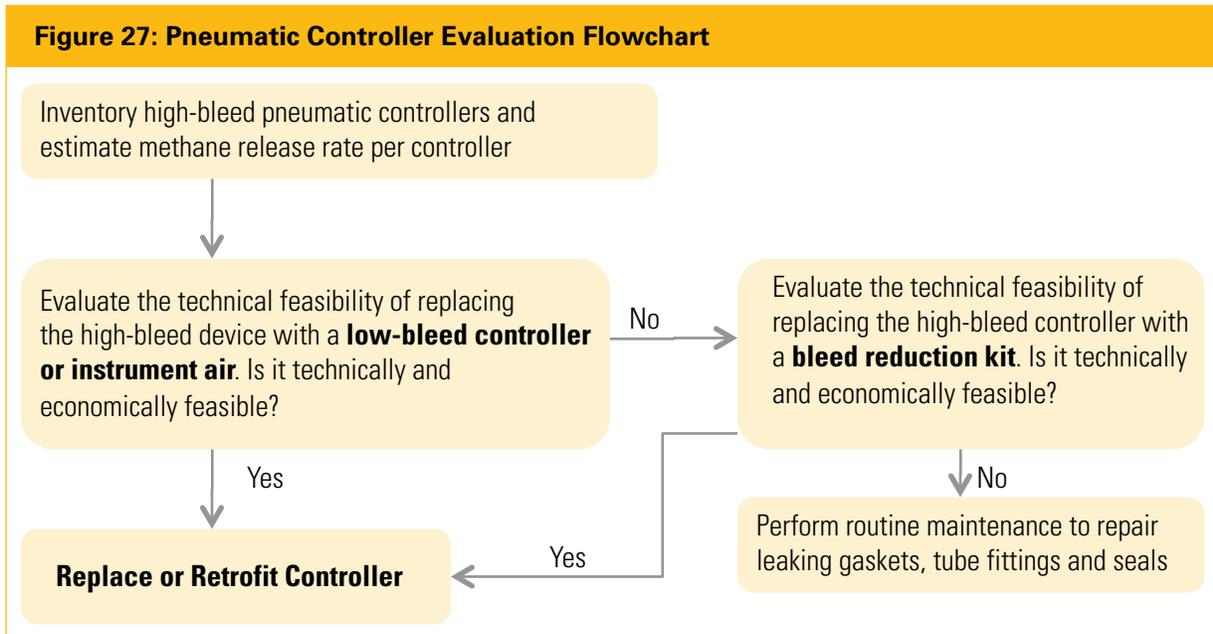

In 2005, the EPA reported that the incremental cost of replacing high-bleed controllers with low-bleed controllers was approximately \$350 per device, resulting in a \$1,100 annual operating and maintenance cost savings and a payback of less than one year for each device.<sup>132</sup> Natural gas savings of \$700 or more is also possible. The EPA estimates that retrofitting a pneumatic controller with a bleed reduction kit costs, on average, \$500, and pays out in nine months.<sup>133</sup> An EPA *Lessons Learned* report from 2006 also reports similar cost and natural gas savings, but with smaller operational and maintenance savings.<sup>134</sup>

While conversion from natural gas pneumatic controllers to instrument air is estimated to be more costly, at \$10,000 per conversion and \$7,500 in annual operating and maintenance costs, there are substantial annual natural gas savings of more than \$20,000 per year and payback in less than two years.<sup>135,136</sup> In 2006, the EPA estimated the cost/benefit of replacing large gas-operated controllers with instrument air controllers.<sup>137</sup> The EPA estimated the cost to be approximately \$60,000 per controller. The natural gas savings were commensurately larger at approximately \$80,000 per year, rendering the investment profitable with a payback period of just under one year. Additional detail is shown in Appendix A, Table A7 and A8.

BP reported that it replaced 11,500 high-bleed pneumatic controllers with low- or no-bleed controllers in six states, during the period of 1999 to 2002, capturing 3.4 Bcf/year.<sup>138</sup> The program yielded a net present value of \$65 million for a capital investment of \$4 million. BP also reported that it had installed 411 pneumatic pump pressure regulators, reducing gas use by 0.4 Bcf/year, at a cost of less than \$50,000, for a net present value of \$8.4 million.

QEP Resources Inc., Shell Upstream Americas, Ultra Petroleum, Devon Energy, EnCana, and other gas producers in Wyoming have replaced pneumatic controllers with new low-bleed controllers. Instead of gas venting the gas is routed to a pipeline for sale.<sup>139</sup>

**Figure 27: Pneumatic Controller Evaluation Flowchart**

#### 4.7.5 Additional Benefits

Upgrading pneumatic controllers to use instrument air increases operational efficiency, system-wide performance, and reliability. It also improves monitoring of gas flow, pressure, and liquid levels. Excess instrument air can be used for other equipment (e.g. pumps and compressor starters).

#### 4.7.6 Limitations and Evaluation

The EPA estimates that 80 percent of all high-bleed controllers can be retrofitted or replaced with low-bleed equipment, leaving 20 percent of the controller inventory not feasible for this technology.<sup>140</sup>

Figure 27 provides a simplified evaluation flowchart to show the basic steps for evaluating replacement of a high-bleed to a low or no-bleed pneumatic controller.

### 4.8 PIPELINE MAINTENANCE AND REPAIR

Methane is typically vented into the atmosphere when a gas pipeline is repaired or replaced, or must be cut to install a new connection point. Typically an operator will isolate the pipeline section to be worked on by shutting pipeline valves on either side of the repair, replacement, or connection point. The gas contained in the piping section is typically vented into the atmosphere to eliminate a potential fire or explosion risk while work is completed on the piping.

Subject to a thorough safety evaluation, alternatives exist to mitigate methane release. These alternatives involve either re-routing gas to be burned as fuel or allowing work to be conducted on the pipeline while it is in operation.

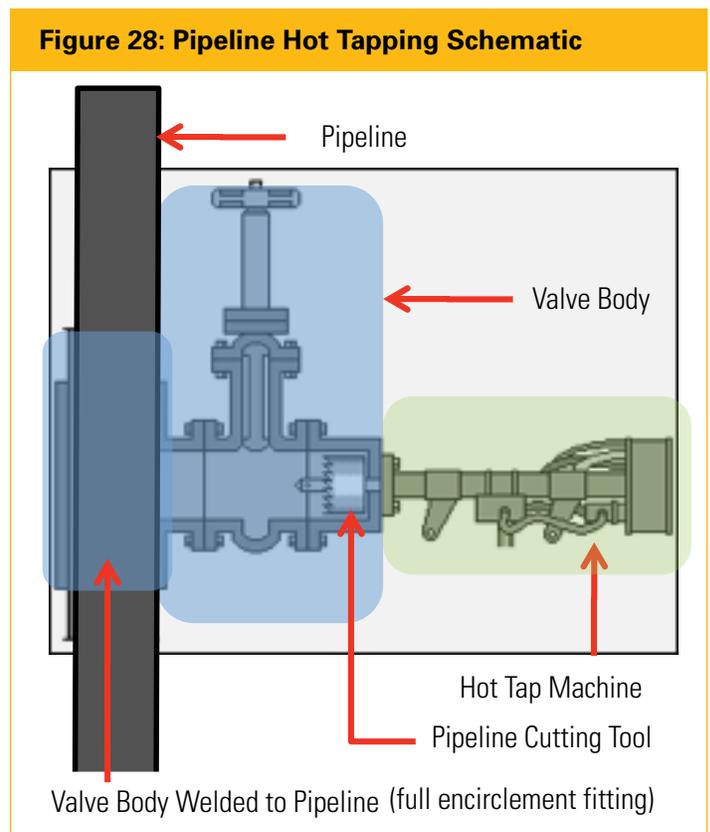

During pipeline repair, methane gas venting can be mitigated by:

- Using hot tap connections
- Re-injecting gas into a nearby low-pressure fuel system,
- Using a pipeline pump-down technique to route gas to sales

#### 4.8.1 Technology Description

**Hot Tap:** Hot tapping a pipeline allows an operator to make a connection to a pressurized piping system without causing any service interruption. Hot tapping is completed by first welding a branch fitting and permanent valve body onto the pipeline while the pipeline remains in service. Next, the hot tapping machine is installed on the valve body (Figure 28). The hot tap pipeline cutting tool is inserted through the valve body and used to cut into the pipeline while maintaining

**Figure 28: Pipeline Hot Tapping Schematic**

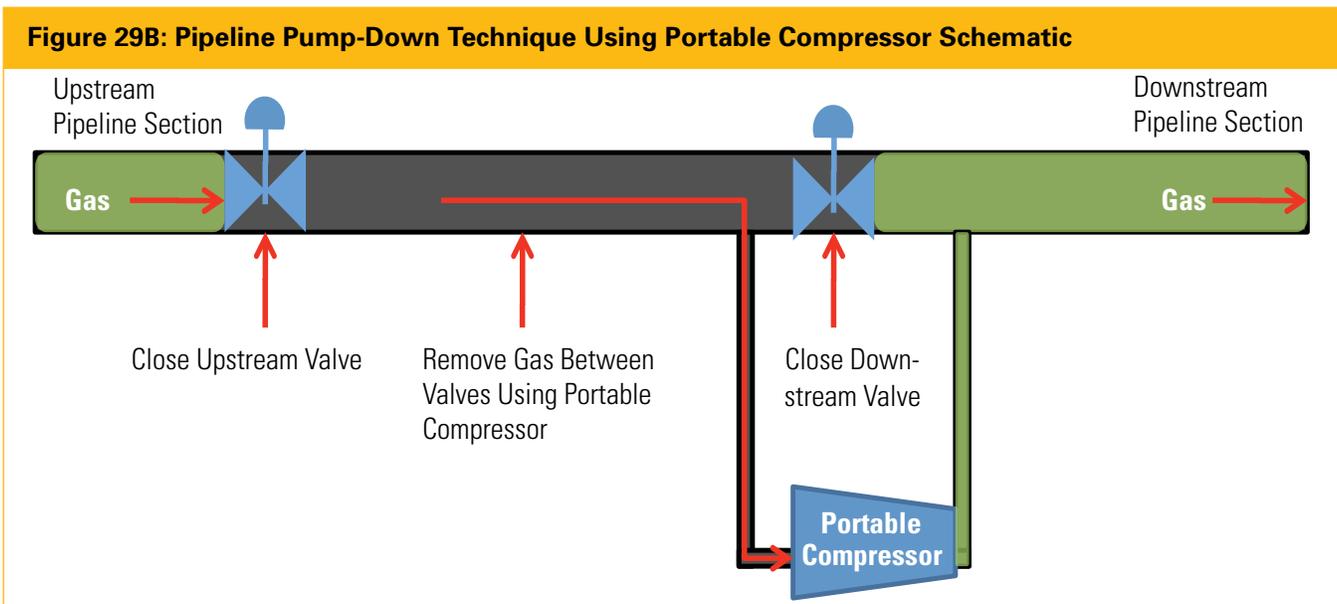

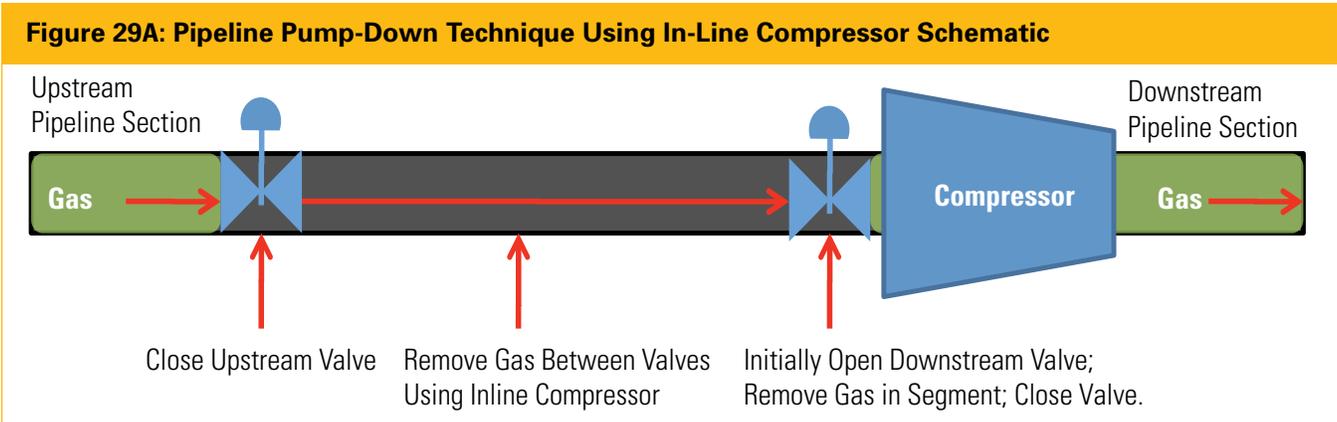

a complete seal between the valve body and the hot tap machine. This process does not allow any methane gas to escape. Once the pipeline wall is cut, the piece of pipe is removed along with the cutting tool by pulling both back through the valve body. The valve is closed and the hot tap machine is removed. Finally the branch line is connected and installed without releasing any methane into the environment.

Hot tapping is not a new technology; it has been in use for a number of years.<sup>141</sup> However, hot tapping techniques and equipment have improved in quality, availability, and safety. More technicians and engineers are trained on safe use and operation, and necessary equipment is now available in the sizes typically used.

**Re-injecting gas into a low pressure fuel system:** In some cases, complete gas evacuation is required to safely repair, replace, or conduct maintenance on a pipeline section. Rather than venting methane to the atmosphere, an operator can de-pressure the pipeline to a nearby low pressure fuel system. Some pipelines are initially designed and installed with a bypass connection from the high pressure pipeline to a lower pressure fuel gas system. If a permanent bypass connection does not exist, a temporary bypass connection can be installed.

**Pipeline pump-down technique:** Gas can be removed from the pipeline by using in-line compressors along, or in sequence with, portable compressors. As explained above, an operator often will isolate the pipeline section to be worked on by shutting in pipeline valves on either side of the repair, replacement, or connection point. The gas contained in the piping section is then vented into the atmosphere to eliminate a potential fire or explosion risk. Alternatively, in the pipeline pump-down technique, the operator only shuts in one valve (the upstream valve), which stops any new gas from entering the pipeline section to be worked on. Then gas is removed from the pipeline section by running an in-line compressor located downstream of the repair section. This technique will not completely remove all the gas in the pipeline section, but may reduce the gas pressure or concentration to a level that is safe for some repairs (Figure 29A).

Use of a portable compressor, alone or in addition to an existing in-line compressor, can remove up to 90 percent of the gas in the pipeline segment because portable compressors have a 5 to 1 compression ratio, compared to in-line compressors that are rated at 2 to 1.<sup>142</sup> To use a portable compressor, there must be a valve manifold at the downstream pipeline location to temporarily install the compressor during the repair work (Figure 29B).

## 4.8.2 Opportunity

### Reduction Target: 19 Bcf/year

The 2011 *Greenhouse Gas Inventory* estimates that routine maintenance and pipeline upsets resulted in 19 Bcf/year of methane vented into the atmosphere.<sup>143</sup>

For a pipeline ranging from 4 to 18 inches in diameter and operating between 100 and 1,000 psig, the EPA estimates that up to 2,000 Mcf of methane gas is vented when a pipeline is blown down to make a new connection, and 6,000 Mcf is vented when replacing pipe.<sup>144</sup> The amount of gas contained in the pipeline section will be a function of pipeline size, pipeline length between isolation valves, and gas pressure. Thus, gas venting rates and volumes will vary substantially.

## 4.8.3 Proposed EPA Regulations

The EPA's proposed NSPS and existing air toxics standards do not include pipeline maintenance and repair as a means to control methane. NRDC recommends that the EPA require methane control during maintenance and repair where safe and feasible.

## 4.8.4 Profit

Use of a hot tap tool prevents venting gas into the atmosphere, allowing that gas to reach market, and eliminates the cost of evaluating the pipeline to install the connection. Hot tap profitability will vary widely based on the pipeline size, flow rate and number of taps done in a period of time. However, in general the EPA reports that payback is short (less than one year) and the procedure is profitable.<sup>145</sup>

The EPA estimated that the capital cost of installing a

low pressure piping bypass to re-inject gas during a pipeline blowdown into a low-pressure fuel system is less than \$1,000.<sup>146</sup>

The pipeline pump-down technique is most profitable for higher pressure, higher volume pipelines with existing in-line compressors, or where valve manifolding exists to easily connect a portable compressor.

Overall, use of in-line compressors to remove gas from a pipeline during a pipeline pump-down technique is very profitable because there is no initial investment or rental costs, and payback is essentially immediate. If portable compressors are required, economics will vary and will require a site-specific evaluation. Still, this procedure is typically profitable, with a short payout.<sup>147</sup> Gas collected by the compressors can be routed to a gas sales line.

## 4.8.5 Additional Benefits

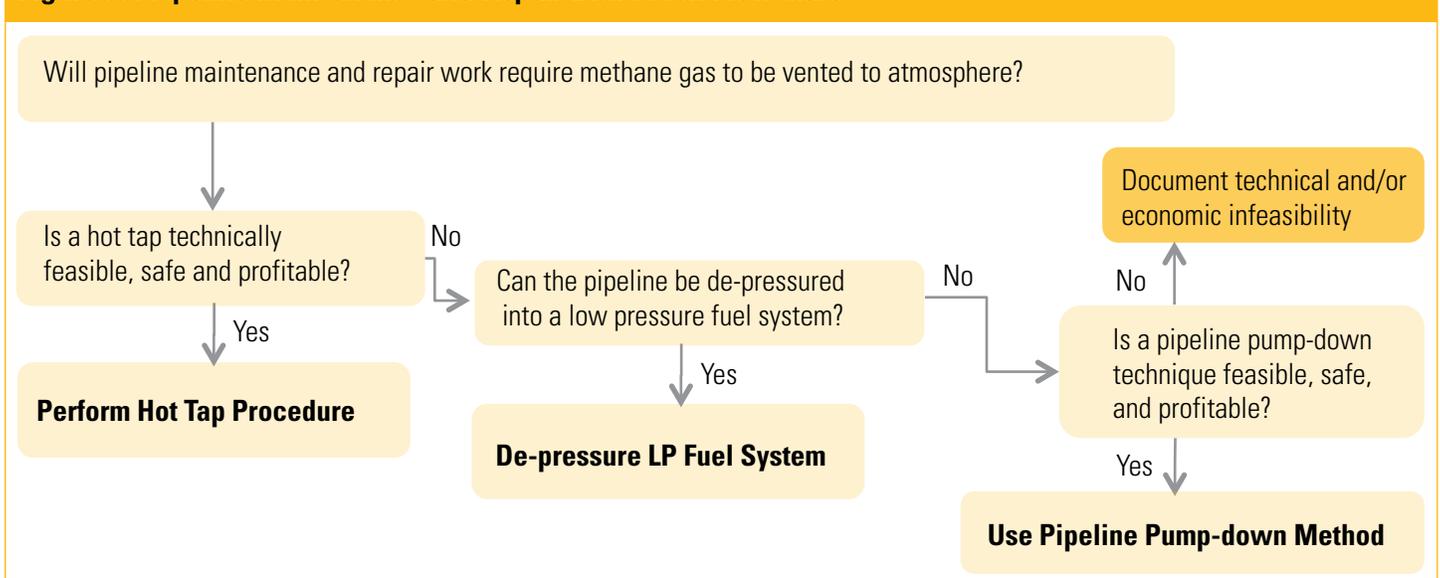

Continued operation of a pipeline during repair, maintenance, and installation of new connections eliminates disruption to gas service.

## 4.8.6 Limitations and Evaluation

The use of hot tap equipment and techniques requires a safety review and qualified personnel to safely operate the equipment, and there are some cases where use of hot tapping equipment is not safe or recommended. In these cases, advice can be sought from corporate health, safety, and environment experts to recommend alternate ways to avoid methane venting. Some repair, replacement, and pipeline connection plans require complete gas removal from the pipeline and a full purge to ensure the safety of personnel.

Figure 30 shows the basic steps for evaluating options to mitigate methane release from a pipeline during maintenance and repair work.

**Figure 30: Pipeline Maintenance and Repair Evaluation Flowchart**

## 4.9 VAPOR RECOVERY UNITS (VRUs)

Crude oil and condensate tanks that vent to atmosphere emit methane through three different mechanisms: flashing losses, working losses, and standing losses. To avoid methane emissions, a vapor recovery unit can be installed on the tank to capture methane gas for sale or to be used as fuel.

### 4.9.1 Technology Description

When liquid petroleum and natural gas are produced from a well, they are processed through a separator to partition oil, gas, and water. Oil, condensate, and gas are sold to market. Water is either re-injected or handled as waste.

Liquid petroleum is sometimes stored in tanks prior to delivery to a pipeline or other transportation method. Gas liquids (condensate), in some cases, are produced and collected in a tank. When oil leaves the last phase of separation, some amount of methane gas is still trapped in the oil; the amount of methane is dependent on the last-stage separator pressure.

Since the separator pressure is higher than the pressure in a crude oil or condensate tank, methane gas will escape from the crude oil or condensate during transfer into the tank. Liberation of natural gas is commonly referred to as “flashing” of natural gas from the oil. Flashed gas, typically, has a high BTU value and sales value.

Fewer flashing losses will be generated from an oil storage tank if a facility reduces the operating pressure of the low-pressure separator or heater equipment just upstream of the oil storage tank. In these cases, less gas will be routed to the tanks. These optimizations can be accomplished by adjusting operating pressures with minimal capital and operational costs.

Figure 31: Vapor Recovery Unit

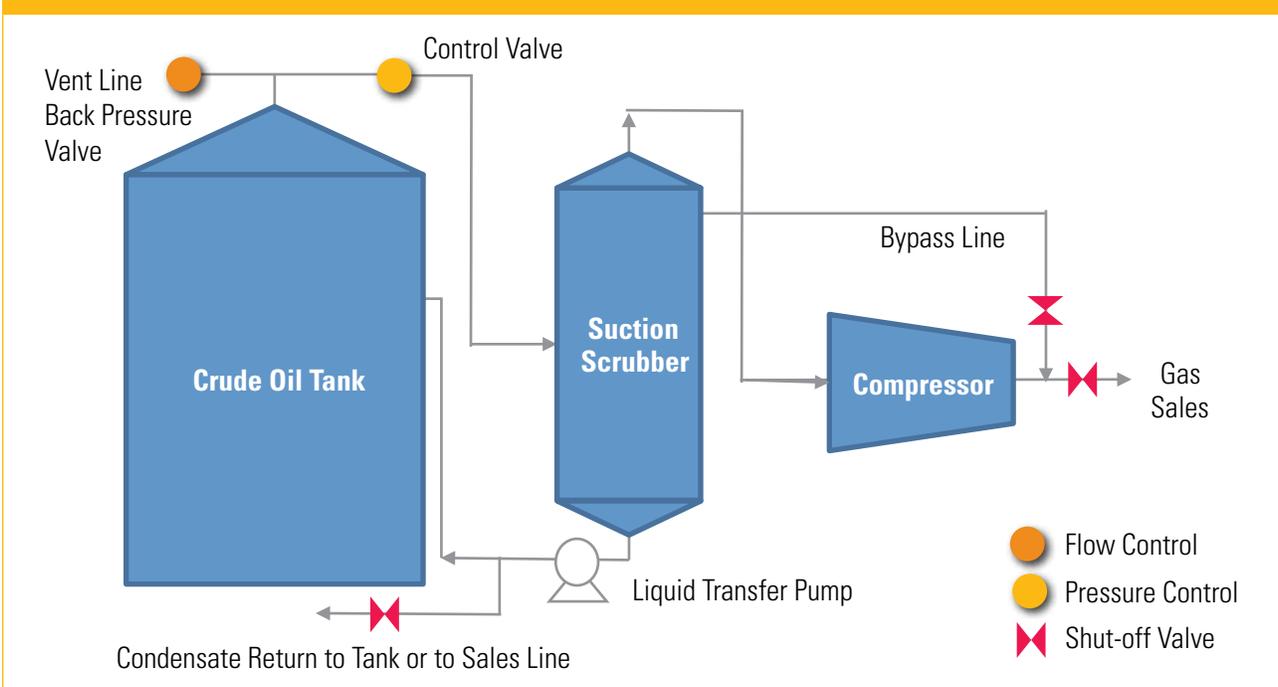

© Remediation Services International

Once crude oil and condensate are in the tank, they will continue to release methane gas when tank contents are agitated (working losses), which typically occurs during filling and removal of oil or condensate from the tank, and through standing losses during seasonal and daily temperature and pressure changes.

Vapor recovery units can typically capture up to 95 percent of the methane that would ordinarily be vented to atmosphere. Figure 31 shows vapor recovery equipment. Captured methane gas can be sold or used as fuel. Figure 32 is a schematic showing the typical equipment configuration needed for a vapor recovery system.

For sites where electric power is available, the EPA recommends conventional rotary or screw type compressor vapor recovery units. For sites without electric power, an

Figure 32: Vapor Recovery Unit Schematic

© M.A. Goodyear, A.L. Graham et al. Vapor Recovery of Natural Gas Using Non-mechanical Technology

ejector vapor recovery unit can be used if there is a high-pressure compressor with spare capacity.<sup>148</sup>

TotalFinaElf E&P USA, Inc. reports that it recovered \$334,000 in gas per year from its El Ebanito O&G facility tanks in Starr County, Texas using the Venturi Jet Ejector System (patented by COMM Engineering).<sup>149</sup> Patented by Hy-Bon Engineering, the Vapor Jet System is another option if there is produced water available at the site to operate the system. A small centrifugal pump forces water into a Venturi jet, creating a vacuum effect to move low-pressure gas to a gas sales line or fuel use intake point.

If gas is collected in the vapor recovery units, it must be at sufficient pressure to enter the intended gas pipeline or fuel system. If this is not the case, additional compression is required at an additional cost.

## 4.9.2 Opportunity

### Reduction Target: 21 Bcf/year

The 2011 *Greenhouse Gas Inventory* estimates that storage tanks vent approximately 21 Bcf/year of methane to the atmosphere.<sup>150</sup> Some crude oil tanks are required—by EPA and state regulation—to install vapor recovery units, however many smaller tanks do not have vapor recovery units installed.

## 4.9.3 Proposed EPA Regulations

The EPA's proposed NSPS for storage vessels would require at least 95 percent of VOC reductions for new and modified storage vessels.<sup>151</sup> These requirements would apply to vessels with a throughput equal to or greater than one barrel of

condensate per day or 20 barrels of crude oil per day, which are equivalent to VOC emissions of about 6 tons per year.<sup>151</sup> Controls would include either the installation of a VRU or the use of a combustion device. At the same time, the EPA is proposing revised air toxics standards for storage vessels. The standards would apply to new and modified sources as well as existing sources. The EPA is proposing a 95 percent HAP reduction requirement, which would also reduce VOC emissions at these sources by 95 percent. In order to avoid duplication in compliance requirements (monitoring, recordkeeping, and reporting), the EPA is proposing that sources which are subject to the NESHAPs requirements would not be subject to NSPS requirements.

The EPA estimates that the proposed NSPS and NESHAPs regulations would reduce methane emissions from storage tanks by about 0.52 Bcf/year, or just under 3 percent of the emissions from this source, because the proposed rules would not apply to most of the uncontrolled tanks currently in operation.

NRDC recommends that the EPA's proposed regulations be strengthened by reducing the threshold for emission control on smaller tanks (e.g., by aggregating small tanks into a battery of tanks and considering emissions of the entire battery). The EPA should also require emissions reductions from produced water tanks, and require 98 percent control efficiency for VRUs (up from 95 percent).

## 4.9.4 Profit

The amount of profit from vapor recovery units will vary widely, based on site-specific parameters. The EPA's Methane to Markets program found that tank vapor recovery projects can be profitable (Table 6). Depending on size of the systems,

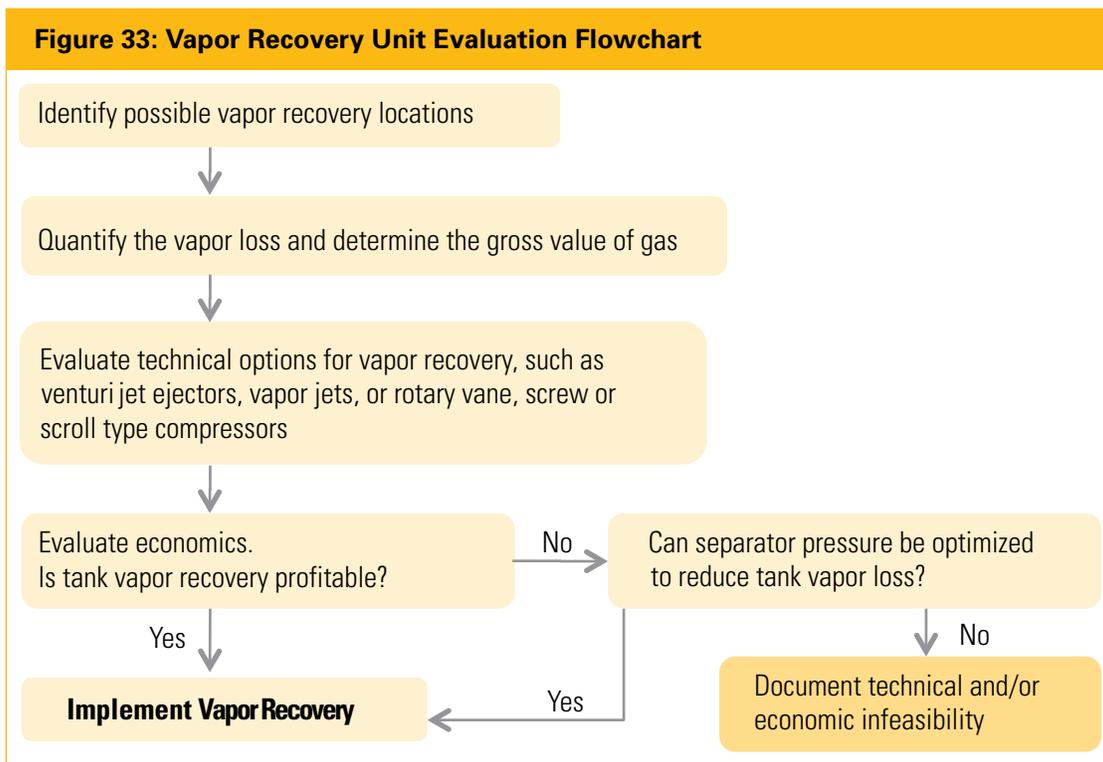

**Table 6: Crude Oil Tank Vapor Recovery Unit (VRU) Economics**

Financial Analysis for a Conventional VRU Project						
Peak Capacity (Mcf/day)	Installation & Capital* Costs	O&M Costs (year)	Value of Gas** (year)	Annual Savings	Simple Payback (months)	Internal Rate of Return %
25	\$35,738	\$7,367	\$18,262	\$10,895	39	28%
50	\$46,073	\$8,419	\$36,524	\$28,105	20	60%
100	\$55,524	\$10,103	\$73,048	\$62,945	11	113%
200	\$74,425	\$11,787	\$146,097	\$134,310	7	180%
300	\$103,959	\$16,839	\$365,242	\$348,403	4	335%

Adapted from: EPA Natural Gas STAR, Reducing Methane Emissions with Vapor Recovery on Storage Tanks, Lessons learned from the Natural Gas STAR Program, Newfield Exploration Company, Anadarko Petroleum Corporation, Utah Petroleum Association, Interstate O&G Compact Commission, Independent Petroleum Association of Mountain States, March 23, 2010.

\*Unit cost plus estimated installation of 75 percent of unit cost

\*\* \$4.00 per Mcf x 1/2 peak capacity x 365 (original price as per report was \$6.22)

capital and installation costs range from \$36,000 to \$104,000, methane capture at between 5,000 and 91,000 Mcf/year, and profits are between \$4,000 and \$348,000. Additional detail is provided in Appendix A, Table A9. Payback periods range from a few months to about three years, depending on flow rate and scale of the unit.<sup>152,153</sup>

Additional examples of tank vapor recovery profitability include:

- Anadarko reported netting \$7 million to \$8 million between 1993 and 1999 by installing more than 300 vapor recovery units.<sup>154</sup>
- ConocoPhillips installed vapor recovery on nine tank batteries at a total cost of \$712,500. The company's investment paid out within less than four months, earning \$189,000 per month thereafter.<sup>155</sup>
- Chevron installed eight vapor recovery units on crude oil stock tanks in 1996. This investment paid out in less than one year.<sup>156</sup>

If vapor recovery is not economic, an operator can consider minimizing the operating pressure of its low-pressure separators to reduce flashing losses, or the amount of methane vapors that are flashed off. For example, Devon Energy reported a savings of \$7,000 per year after optimizing operating pressures in its low-pressure separators, reducing the amount of methane vapors that are flashed off. The company reported that the "primary goal of the optimization

was to increase profits for the facility by putting more gas into the sales pipeline and to reduce emissions of methane with minimal costs to the facility."<sup>157</sup>

#### 4.9.5 Additional Benefits

Vapor recovery units are commonly required in ozone non-attainment areas as lowest achievable emission rate (LAER), or in attainment areas as best available control technology (BACT). Therefore, VRU use to control methane will also have ozone mitigation benefits. Control of tank vent gases can also reduce emissions of HAPs, such as benzene, toluene, ethylbenzene, and xylenes, VOCs, and hydrogen sulfide.

The collection of methane and other gas vapors creates a safer working environment by reducing potentially combustible vapors at the work site.

#### 4.9.6 Limitations and Evaluation

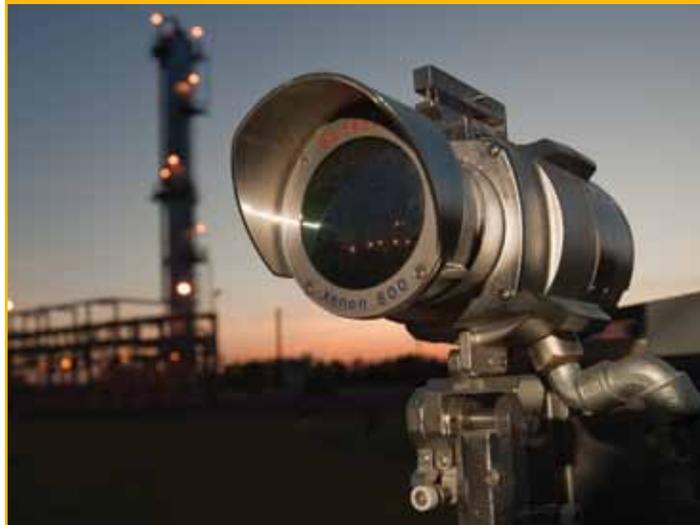

Care must be taken in VRU system design to avoid oxygen entrainment, because oxygen in the system can pose a corrosion and explosion hazard.<sup>158</sup>

VRUs are appropriate for locations that have access to a gas pipeline or an opportunity to use the recovered methane for fuel gas. If this infrastructure does not exist, the technical and economic feasibility may be limited.

Figure 33 illustrates the basic steps for evaluating tank vapor recovery options.

**Figure 34: Hand Held Infrared Camera**

**Figure 35: Remote Methane Leak Detector**

© Mine Safety Appliances Co.

#### 4.10 LEAK MONITORING AND REPAIR

Methane gas leaks can occur from numerous locations at oil and gas facilities—valves, drains, pumps, threaded and flanged connections, pressure relief devices, open-ended valves and lines, and sample points—as gas moves through equipment under pressure. These leaks are called fugitive emissions.

Fugitive emissions from equipment leaks are unintentional losses of methane gas that may occur due to normal wear and tear, improper or incomplete assembly of components, inadequate material specifications, manufacturing defects, damage during installation or use, corrosion, or fouling.<sup>159</sup>

Because methane is a colorless, odorless gas, leaks often go unnoticed. Historically, checks were typically performed on equipment components when they were first installed, using a soap bubble test or hand held sensor, to ensure the installation was leak tight. After installation, leaks were not typically monitored or repaired unless they became a significant safety hazard. For example, a significant gas leak would be repaired if area, building, or employee monitors set off alarms or if olfactory, audible, or visual indicators observed by facility employees identified the leak. Under these circumstances, the leaks had usually become an obvious safety concern. As a result, methane leaks at outdoor facilities and unmanned facilities often went undetected for long periods of time.

Today, an increasing number of operators are monitoring and repairing leaks at their facilities. Sometimes these programs are instituted voluntarily, other times they are required by the EPA, or state and local air quality control agencies. For instance, the EPA has leak detection and repair regulations for VOCs where facilities meeting certain specifications are required to survey for leaks and repair all detected leaks. A voluntary program, also undertaken by the EPA Natural Gas STAR program, is called Directed Inspection and Maintenance. In this program facilities identify leaks, and then prioritize and repair them based on cost-effectiveness.

**Figure 36: Leaking Valve as shown by Infrared Gas Detector**

© FLIR Systems, Inc.

##### 4.10.1 Technology Description

Fugitive emission control is a two-part process that includes both a monitoring program to identify leaks and a repair program to fix the leak. Monitoring program type and frequency is a function of the type of component, and how the component is put to use. In most cases, monitoring programs can be intermittently scheduled at a certain frequency (e.g. monthly or quarterly) to identify leaking equipment. However, permanent leak sensors may be required to detect chronic leakers.<sup>160</sup>

There are many different monitoring tools that can be used to identify leaks, including electronic gas detectors, acoustic leak detection systems, ultrasound detectors, flame ionization detectors, calibrated bagging, high volume sampler, end-of-pipe flow measurement, toxic vapor analyzers, and infrared optical gas detectors. A few of these methods are described in more detail to familiarize the reader with the availability of these tools and the ease of measurement capability. Once leaks are identified, the operator can evaluate what is causing the leak and develop a replacement or repair program to mitigate the problem. For example, a hand held infrared camera can be used as a

screening tool to detect emissions that are not visible to the naked eye. An infrared camera produces images of gas leaks in real-time. It is capable of identifying methane leaks, but cannot quantify the amount of the leak (Figure 34).

Remote methane leak detectors can detect methane leaks from as far away as 100 feet (Figure 35).

Infrared cameras produce photos that show methane gas leaks, like the leaking valve shown in Figure 36. Once a leak is identified, a more quantitative leak flow rate is needed, and other measurement devices such as high-flow samplers, vent-bag methods, and anemometers may be used.<sup>161</sup> High-flow samplers capture the entire leak, measuring the leak rate directly for leaks up to 10 cubic feet per minute, providing leak flow rate and concentration data.

In 2007, TransCanada reported significant reductions in fugitive emissions by implementing an effective leak monitoring and repair program that included measurement of fugitive emissions using high flow samplers to identify the largest and most effective repairs.<sup>162</sup>

Canadian experience with control of fugitive emissions at oil and gas facilities shows that:<sup>163</sup>

- Most methane leaks are from components in gas service
- Older facilities have the highest leak rates
- About 75 to 85 percent of leaks are economic to repair
- The top 10 leaks at a facility generally contribute more than 80 percent of the emissions

The EPA has found that components in sweet gas service tend to leak more often than those in sour gas service, and a high frequency of leaks occurs from components in vibration, cryogenic, or thermal cycling service.<sup>164</sup>

## 4.10.2 Opportunity

### **Reduction Target: 143 Bcf/year**

The 2011 *Greenhouse Gas Inventory* estimates that the O&G industry's fugitive emissions are 143 Bcf/year.<sup>165</sup> Elimination or reduction of gas leaks retains more gas in the piping system for sale.

Most large gas processing plants are already subject to the existing NSPS regulations (40 CFR Part 60, Subpart KKK) and required to implement an LDAR program. However, most of the 457,000 miles of production gathering pipelines, and 302,000 miles of transmission pipelines in the United States and 384,000 meters have not been required to implement LDAR programs.<sup>166</sup>

The 143 Bcf/year of fugitive emissions is largely uncontrolled today. Fugitive emissions management is an ongoing commitment, not a one-time initiative. The potential for fugitive equipment leaks will increase as facilities age. Successful fugitive emission control plans require trained personnel, emissions testing equipment, performance tracking systems, and corporate commitment.

## 4.10.3 Proposed EPA Regulations

The EPA's proposed NSPS regulations would lower leak detection thresholds at gas processing plants.<sup>167</sup> The EPA's proposed NSPS regulations would reduce methane emissions through leak detection and repair by about 0.1 Bcf/year, less than 0.1 percent of the methane emissions from equipment leaks.

Based on the EPA's reported leak monitoring and repair profitability, NRDC recommends that more LDAR programs can and should be required by the EPA. Facilities in all sectors, including the production, transmission and distribution sectors should undertake LDAR programs. Best management practices such as optimizing processes should be used in tandem with LDAR programs. Not all devices that detect VOCs can detect methane, so facilities should specifically employ equipment and processes that can detect methane, such as infrared laser detectors.

## 4.10.4 Profit

In 2009, the EPA examined the profitability of repairing equipment leaks at oil and gas facilities through a Directed Inspection & Maintenance program.<sup>168</sup>

EPA *Lessons Learned* documents for both gas processing plants and compressor stations show the average cost of repair was between \$26,000 and \$59,000 per year per facility.<sup>169,170</sup> Methane captured through these programs averaged 30,000 and 87,000 Mcf/year. For gas processing plants, leak screening and monitoring cost about \$32,000 annually per plant. At both gas processing plants and compressor stations, the investments are profitable generating as much as \$314,000 in profit per facility, with payback periods of just a few months. Additional detail is shown in Appendix A, Table A10.

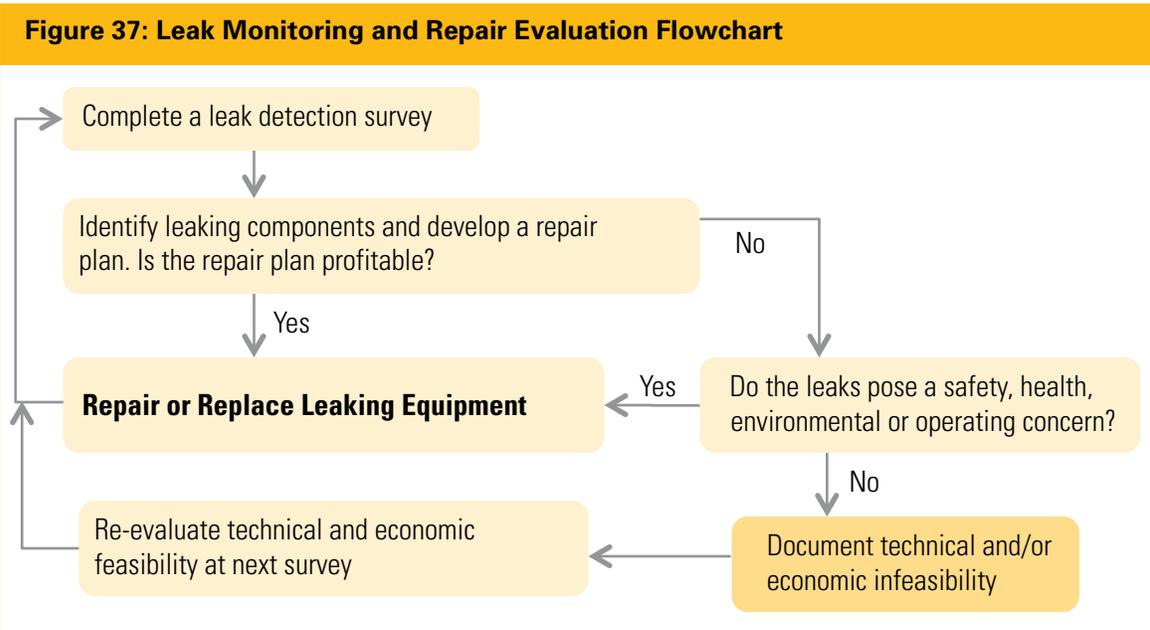

## 4.10.5 Additional Benefits

The EPA has found that fugitive emission control provides numerous benefits including: reduced maintenance costs and downtime, improved process efficiency, a safer work environment, a cleaner environment, and resource conservation.<sup>171</sup> Leaking gases may also include toxic air pollutants known to harm human health.

## 4.10.6 Limitations and Evaluation

There are no major limitations or barriers to implementation of a leak monitoring and repair program.

A simplified evaluation flowchart (Figure 37) is provided to show the basic steps for evaluating leak monitoring and repair.

## 5. CONCLUSION AND POLICY RECOMMENDATIONS

The technologies discussed in this report can be used to reduce significant amounts of methane emissions from the oil and gas production, processing, and transmission sector, while generating significant profits for the O&G Industry. NRDC recognizes that some companies have voluntarily implemented methane controls. Mandatory methane control regulations will be needed for companies that have not updated business-as-usual practices, embraced a culture of environmental responsibility, or chosen to voluntarily invest even in profitable methane control technologies. Through these steps methane can be kept out of the atmosphere and the health and safety of Americans can be improved.

NRDC supports establishing a fully effective system of safeguards to ensure that natural gas is produced, processed, stored, and distributed in a way that ensures protection of our water, air, land, climate, human health, and sensitive ecosystems (For more information on NRDC's position on natural gas and fracking, go to <http://www.nrdc.org/energy/gasdrilling/>). The use of natural gas in our homes, power plants, and industry also must be as efficient as possible. Americans do not have to trade clean water and clean air for increased natural gas supplies. The O&G industry can and should adopt the methane capture technologies discussed in this report, which are technically proven, commercially available, and profitable.

Given our country's growing reliance on natural gas and methane's strong link to global warming, methane emissions should be controlled to the maximum extent possible. It is fortunate that more than 80 percent of methane emissions can be captured with the technologies highlighted in this report and yield billions of dollars in revenues through sale of the captured methane. Under these circumstances, there is a compelling case for companies to be required to adopt the best methane capture practices as soon as possible, and for government at all levels to take a far more active role in addressing market failures and requiring producers to adopt best practices.

Taking these considerations into account, several policy options can reduce methane emissions across the natural gas industry nationwide. NRDC recommends adoption of the policies outlined below:

- The EPA's proposed NSPS and air toxics standards provide an important starting point for the reduction of air pollutants from O&G operations, with substantial methane co-benefits. Still, there are key ways in which

these regulations can be improved, with robust mandates needed, as voluntary programs have proven insufficient. Federal regulations to control methane emissions would need to be adopted by states through their State Implementation Plans. The EPA should:

- Regulate methane directly
- Expand its proposal to include emission reduction requirements for existing sources that are the main contributors to VOC and methane emissions from the oil and natural gas industry. States would then be required to adopt methane leakage control measures for existing sources through their State Implementation Plans
- Ensure coverage of all major methane emission sources for which controls are feasible, including coalbed methane wells and oil wells
- Strengthen standards where possible. For example, the EPA should raise standards for tank and dehydrator emissions reductions
- Strengthen required procedures where possible. For example, the EPA should complement its Leak Detection & Repair program by requiring that best management practices be implemented, including process optimization and conducting more frequent leak surveys
- The EPA should continue to improve its mandatory greenhouse gas emissions reporting program for the O&G industry so that methane emission sources can be better identified, and opportunities for reductions can be better targeted. Also, the EPA should provide a more detailed breakdown by source of methane emissions reductions achieved through the Natural Gas STAR program.

- The EPA's Natural Gas STAR program's voluntary framework has encouraged companies to reduce methane emissions and document their reduction activities. Through Natural Gas STAR, techniques to reduce methane emissions have been tried and tested by some companies. Still, many effective reduction technologies have not been widely adopted by industry. To achieve significant industry-wide reductions, the most successful practices documented by the Natural Gas STAR program need to become mandatory. through EPA's regulatory programs such as NSPS and NESHAPs. However, Natural Gas STAR should still play an important role in driving continued improvements that in turn can inform future revisions of EPA standards.
- Federal land management agencies, such as the Bureau of Land Management, should exercise their authority and responsibility to control methane waste from oil and gas lease operations on federal lands. Land management agencies should:
  - Modernize agency policies to prevent waste of methane resources through deployment of all technically and economically viable methane emission reduction technologies and practices, and to establish acceptable performance levels (i.e., levels of emissions beyond which production of mineral resources should be prohibited)
  - Evaluate methane emission risks and reduction opportunities as both a climate and waste problem
- through planning and environmental reviews before committing resources to development
- Not commit resources to development where methane emissions cannot technically or economically be abated within acceptable performance levels
- Where lands are committed to development, mandate specific methane reduction technologies and practices appropriate to the particular production field or geologic formation under consideration
- Shift the burden to oil and gas lessees and operators to demonstrate, before drilling permits are approved, that all reasonable and prudent methane emission prevention technologies and practices will be used, with land management agencies retaining full authority to mandate specific methane reduction technologies and practices or levels of performance
- States should require the use of methane control technologies. Several gas-producing states have already required methane pollution reduction measures to protect air quality and public health, mostly for large emission sources or in areas of concentrated development. These states, including Colorado, Wyoming, and Montana, provide a good start and model for action by other states and by federal agencies. Exceptions to these rules should be as narrow as possible.

## APPENDIX A

The tables in Appendix A provide a detailed economic summary of the 10 methane control technologies. A brief economic summary was also provided in Table 4. The economic analysis in this appendix is presented in a manner that facilitates a ready comparison among reports from various sources. Blank cells indicate insufficient data to compute values.

Where applicable, the economics of the technologies are also compared with the EPA's estimates from its proposed NSPS rulemaking. However, NRDC and other environmental organizations are concerned about potential deficiencies in the EPA's cost-benefit estimates of methane control technologies.<sup>172</sup> Therefore, NRDC has not utilized the EPA's NSPS estimates to inform the range of costs and benefits in this report, and instead has relied heavily on industry data and the EPA's Natural Gas STAR and Methane to Markets data.

Each line in the tables below represents a different data source or a different treatment within a source. Each line includes the source and year of the data (corresponding to the sources cited in the body of this report). The "Type" column describes any feature of the data, such as whether it was an upper bound or an average or based on a particular kind of technology. The next column specifies, if available, the number of devices (or wells or installations) from which an average was obtained. The remaining columns discuss the economics of the technologies.

The terms used in the tables are consistent with common industry and accounting practices:

- Total investment: Total costs of implementing a technology; typically up-front costs, excluding ongoing operating and maintenance expense.
- Annual investment expense: Effective investment cost spread out over the useful life of the investment. In a few tables, for simplicity this is just depreciation expense, using simple depreciation with no salvage value. In other tables where more information is available, this includes joint depreciation and interest expenses using a capital recovery factor.
- O&M expense: Operating and maintenance expense for technology deployment.
- Total annual expense: Annual investment expense plus O&M expenses.
- Revenue from NG: Revenue from the sale of natural gas, obtained by multiplying gas sales volume and price.
- Other revenue: Revenues other than from the sale of natural gas.
- O&M savings: Operating and maintenance savings from technology deployment.
- Total revenue plus savings: Sum of revenue and any O&M savings.
- Payout: Period (in years) in which initial investment is paid back (i.e., total investment divided by total revenues, plus O&M savings, less O&M costs per year).
- Operating profit excluding depreciation: Total revenues, plus O&M savings, less O&M costs, excluding depreciation; akin to EBITDA (earnings before interest, taxes, depreciation and amortization). This is sometimes referred to as "profit" in the text.
- Operating profit: Total revenues, plus O&M savings, less O&M costs, less depreciation (approximated to annual investment expense, as above); akin to EBIT (earnings before interest and taxes).

<sup>a</sup> For annual investment expense including joint depreciation and interest expenses, assumes similar lifetimes and discount rate as in the EPA's NSPS estimates.

<sup>b</sup> Illustrative high-end estimate of natural gas savings based on the range of savings from \$75,000 - \$400,000.

<sup>c</sup> Average maintenance and operational savings of \$120,000 based on the range of savings of \$100,000 - \$140,000.

<sup>d</sup> Average of 2 – 7 months.

<sup>e</sup> The EPA reports this to be 1-3% of the total pipeline cost. This is the incremental cost of a compressor with a dry seal instead of one with a wet seal (EPA NSPS TSD, page 6-19).

<sup>f</sup> The EPA assumes a 10-year lifetime and a 7% discount rate; here annual investment expense includes joint depreciation and interest expenses.

<sup>g</sup> EPA NSPS TSD, page 6-20, Table 6-8; based on individual compressor emissions reductions in tons per year.

**Table A6: Cost-effectiveness of replacing rod packing in reciprocating compressors**

<sup>a</sup> Cost of replacing rod packing for four cylinders (as per EPA TSD estimate of average number of reciprocating compressor cylinders in the production sector, Table 6-2), at \$1,620 per cylinder.  
<sup>b</sup> For annual investment expense including joint depreciation and interest expenses, assumes similar lifetimes and discount rate as in the EPA's NSPS estimate for reciprocating compressors in the production sector, i.e., same capital recovery factor (EPA NSPS TSD Table 6-7 and page 6-16).  
<sup>c</sup> Cost of replacing rod packing for four cylinders (as per EPA TSD estimate of average number of reciprocating compressor cylinders in the production sector, Table 6-2), at \$1,200 per cylinder.  
<sup>d</sup> Multiplying estimated emissions savings as reported by sources by four, to account for savings from four cylinders.  
<sup>e</sup> The EPA annual investment expense estimates include joint depreciation and interest expenses, but uses slightly different capital recovery factors for different kinds of devices (EPA NSPS TSD Table 6-7 and page 6-16).  
<sup>f</sup> EPA NSPS TSD, page 6-15, Table 6-6; based on individual compressor emissions reductions in tons per year.

**Table A7: Cost-effectiveness of replacing high-bleed pneumatic controllers with low-bleed pneumatic controllers**

Source	Year	Type	#	\$	\$ / yr	Mcf	\$ / Mcf	\$ / yr	O&M savings per year	Total revenue plus savings per year	Years	\$ / yr	Operating profit (ex depr) per year	\$ / yr	Operating profit per year

<sup>a</sup> Based on incremental cost of fitting low-bleed devices instead of high-bleed devices, for all lines.

<sup>b</sup> For annual investment expense including joint depreciation and interest expenses, assumes similar lifetimes and discount rate as in the EPA's NSPS estimates.

<sup>c</sup> Based on average natural gas savings of 0.3 Mcf/day (as reported in sources).

<sup>d</sup> Average of \$210 and \$340 per device.

<sup>e</sup> Average of 50 and 200 Mcf/year.

<sup>f</sup> Assumes half of replacement cost.

<sup>g</sup> 11,500 wells saved 3.4 Bcf/year.

<sup>h</sup> The EPA assumes a lifetime of 10 years and a discount rate of 7% (NSPS TSD page 5-16, 5-17); here annual investment expense includes joint depreciation and interest expenses.

<sup>i</sup> Using the average value of dollar savings (NSPS TSD page 5-16); calculated natural gas volume is consistent with TSD value quoted.

**Table A8: Cost-effectiveness of replacing high-bleed pneumatic controllers with instrument- air pneumatic controllers**

- 33 NRDC does not accept these EPA estimates, as discussed in our comments on the proposed NESHAPs: NRDC and other environmental organizations, Comments on New Source Performance Standards and National Emission Standards for Hazardous Air Pollutants Reviews, Proposed Rule, November 30, 2011, EPA Docket No. EPA-HQ-OAR-2010-0505, Document ID No. EPA-HQ-OAR-2010-0505-4457. Available at [www.regulations.gov](http://www.regulations.gov).
- 34 Campbell, J.M., Analysis and Management of Petroleum Investments: Risk, Taxes, and Time, John Campbell and Co., 1987.
- 35 The revenue stream is calculated using constant dollars over the payout period because the payout periods are short for the emission control alternatives examined in this report. Discount rates will vary widely for O&G Operators and will add unnecessary complexity to a simplified analysis that seeks to show revenue generated by selling methane will exceed the cost of methane controls. For the purposes of this report, profit computations do not include the opportunity cost of capital. While some companies may assert that they have more profitable places to spend their money than methane emission control, it is not possible for this report to evaluate the opportunity cost of capital because it will vary widely across oil and gas companies, depending on their portfolio of opportunities in the United States and abroad. The purpose of this report is to identify methane control opportunities that are commonly robust economic opportunities, and not to provide a company-specific economic analysis.

Available at [www.regulations.gov](http://www.regulations.gov).
- 38 Condensates are low density, high quality API gravity liquid hydrocarbons. The API gravity of condensate is typically 50 degrees to 120 degrees. Depending on the gas composition, hydrocarbons may condense from a gas to a liquid under certain temperature and pressure conditions. Dry gas is routed to the sales line, and liquid condensate is collected in tanks and sold.

Gas Bridged to 168 Coal Plant Cancellations Since 2005

Back in 2005, when America was bracing to import natural gas in large quantities, and natural gas prices were ever escalating, the power industry was rushing to build as many as 250 new coal plants. <http://www.sierraclub.org/environmentallaw/coal/plantlist.aspx>. Yet, the coal rush is now dead.

Just since 2005, an incredible 168 proposed, new coal plants have been cancelled. Unlike old coal plants that often have no modern pollution controls, the proposed 168 new power plants would have been built to meet all environmental requirements, but they were cancelled anyway. Why?

Power plant economics, not environmental regulation, was the decisive factor. Low, low natural gas prices produced by shale gas, steadily rising prices for coal over 10 years, and lower increases in electricity demand than had been forecast made each of the 168 power plants too expensive to build.

And how much carbon dioxide has been avoided by the cancellation of 168 proposed coal plants?

The Sierra Club calculates 610 million tons per year, making natural gas already a big bridge to a lower carbon economy. Moreover, the 610 million tons number does not appear to account for the retirement of 106 coal plants or for the reduction in operating time for many coal plants, as natural gas plants run more and coal plants less.

Two more proposed coal plants-- the 850 megawatt Ben Hill in Georgia and Big Cajun 1--were cancelled last week. The Big Cajun cancellation is particularly telling about how shale gas has changed the power world and avoided huge amounts of carbon pollution, as well as soot, mercury, and other pollutants.

Prior to the shale gas boom, new coal plants were even being suggested to replace expensive natural gas power plants, such as at Big Cajun 1, that made then and still makes electricity from combusting gas.

It sounds crazy, does it not? But in 2007, when natural gas prices were heading toward \$13 for a

thousand cubic feet by July 2008, Louisiana Generating actually proposed an economically sensible thing to do just 5 years ago: switching Big Cajun 1 from expensive gas to cheaper coal.

But here we are in April 2012 and 168 proposed coal plants, including Big Cajun 1, have been cancelled, and nobody is anymore suggesting to close gas plants and replace them with coal plants.

It is climate folly to not recognize these facts about the substantial carbon pollution already avoided just from coal plant cancellations by the natural gas bridge built by low gas prices from shale gas production.

---

Dear Counsel:

New York requests an 8-day extension, until August 10, 2012, of the deadline to file an amicus brief in American Public Gas Association v. United States Department of Energy, Case No. 11-1485, D.C. Cir. New York would be filing jointly with the Commonwealth of Massachusetts and the California Energy Commission, both of which have already requested an 8-day extension. Since no party to this proceeding has opposed those extension requests, we ask that consent be provided by the parties to our request as well.

Please do not hesitate to contact me at 518-473-5843, if you have any questions.

Thank you,

Subject: AGPA v. DOE: New York Request for Extension of Filing Deadline

Dear Counsel:

New York requests an 8-day extension, until August 10, 2012, of the deadline to file an amicus brief in American Public Gas Association v. United States Department of Energy, Case No. 11-1485, D.C. Cir. New York would be filing jointly with the Commonwealth of Massachusetts and the California Energy Commission, both of which have already requested an 8-day extension. Since no party to this proceeding has opposed those extension requests, we ask that consent be provided by the parties to our request as well.

Please do not hesitate to contact me at 518-473-5843, if you have any questions.

Thank you,

Morgan A. Costello

Subject: AGPA v. DOE: New York Request for Extension of Filing Deadline

Dear Counsel:

New York requests an 8-day extension, until August 10, 2012, of the deadline to file an amicus brief in American Public Gas Association v. United States Department of Energy, Case No. 11-1485, D.C. Cir. New York would be filing jointly with the Commonwealth of Massachusetts and the California Energy Commission, both of which have already requested an 8-day extension. Since no party to this proceeding has opposed those extension requests, we ask that consent be provided by the parties to our request as well.

Please do not hesitate to contact me at 518-473-5843, if you have any questions.

Thank you,

Morgan A. Costello

Subject: SEC Investor Prep Call: Wednesday, October 17 [1:00-2:00pmET]

Good Morning Morgan,

Thank you for getting back to me about your availability for an "Investor Prep Call" for the October 23rd meetings at the Securities and Exchange Commission (SEC). It appears that most participants are free to touch base on Wednesday, October 17th from 1:00-2:00pmET. Please hold this time on your calendars and use the call-in information below.

#### Call-In Information

Toll-Free Access: 877-326-0011

Meeting #: \*8457128\*

For those of you who have not booked your travel, all meetings with SEC Commissioners and Corp.

Finance staff are in the afternoon - with lunch and refreshments provided. I will circulate background materials and draft agendas prior to the call.

If you should have any questions or conflicts, please contact me via. email or phone (617) 247-0700 ex. 162.

Best Regards,

Siobhan

Cheers: Time for another EnviroSalon for former EPBers (including Lem who has returned to the EPB fold). What evenings are you available for the weeks of November 26th - 30th, December 3rd -7th, December 10th - 12th. Gordon has offered to host the EnviroSalon at his place which is 14 Douglass St. (between Court and Smith Streets), nearest to the F and G trains stop at Bergen Street, and a pleasant 12-15 minute stroll down Court Street from the Borough Hall/Court St. station 2, 3, 4, 5, and R trains. Let me know your availability at your earliest convenience.

Hope you're all well.

Bob

Wonderful idea! Dec 3-7 week is out for me as it is our board meeting that week. The week before is thus also suboptimal. The 10-12 period looks good.

Subject: SEC Investor Prep Call: Wednesday, October 17 [1:00-2:00pmET]

Good Morning Morgan,

Thank you for getting back to me about your availability for an "Investor Prep Call" for the October 23rd meetings at the Securities and Exchange Commission (SEC). It appears that most participants are free to touch base on Wednesday, October 17th from 1:00-2:00pmET. Please hold this time on your calendars and use the call-in information below.

#### Call-In Information

Toll-Free Access: 877-326-0011

Meeting #: \*8457128\*

For those of you who have not booked your travel, all meetings with SEC Commissioners and Corp.

Finance staff are in the afternoon - with lunch and refreshments provided. I will circulate background materials and draft agendas prior to the call.

If you should have any questions or conflicts, please contact me via. email or phone (617) 247-0700 ex. 162.

Best Regards,

Siobhan

Siobhan Collins

### 3. NEW YORK:

Fracking draft deadline could force Cuomo's hand this week

Colin Sullivan, E&E reporter

Published: Tuesday, February 12, 2013

NEW YORK -- Interests for and against hydraulic fracturing have all their attention trained on Albany, where a regulatory deadline of tomorrow may force Gov. Andrew Cuomo (D) to signal which way he's going to go on permitting the controversial drilling technique.

To drill or not to drill for natural gas through the process commonly known as high-volume, horizontal "fracking" is still the question facing the Democrat as his administration approaches a bureaucratic deadline that may force his hand on a review process that has lasted four years and counting.

Tomorrow, the Department of Environmental Conservation under Cuomo has to finish draft regulations if it is to pursue final regulations by the end of the month or restart the process. Many are expecting news anytime, though few were prepared to predict Cuomo's next move with certainty.

Tom Shepstone, of the pro-fracking Northeast Marcellus Initiative, said it could go either way, but he suspects the governor will support development. He cited the poor state of the economy in the upstate swath called the Southern Tier where drilling would take place, as well as the tone of the opposition, describing it as hindered by "hysterical ... attention-seeking celebrities and environmental special interests."

"The facts just aren't with them, and I don't think the governor will, in the end, sell out the Southern Tier for those kinds of arguments," he said.

Shepstone added: "The overall signs are that it's going to be approved. If I had to pick one sign that is most encouraging, it's that the people on the other side are acting depressed."

Thomas West, an attorney representing the industry side in state fracking cases, called the decision "one of the best-kept secrets in Albany." He said anyone's guess is as good as his.

"We will know when the Environmental Notice Bulletin is published on Wednesday," he said, adding that he has "no predictions on what will happen" and noting that the administration could still wiggle free, allow the draft regulations to lapse and start over.

"The DEC can issue the final [draft environmental impact statement] at any time and start issuing permits after it issues formal findings, which require a minimum of 10 days following the issuance of the final [draft] before the findings may be issued," he said.

Investigation adds new wrinkle

If Cuomo goes that direction and invokes another delay, he may leave himself open to charges of regulatory confusion and excess bureaucracy. Still, environmental groups all along have maintained that the process should return to square one, for an independent health review, and a few of the more aggressive organizations have added another wrinkle to the action by calling for an investigation of two top Cuomo administration aides.

The groups Public Citizen, Food and Water Watch, Frack Action, United for Action, Catskill Citizens for Safe Energy, and Capital District Against Fracking held a news conference yesterday to demand Albany County District Attorney David Soares investigate the aides.

The groups charged that Lawrence Schwartz, Cuomo's right-hand man, and Robert Hallman, deputy secretary for energy and the environment, have a conflict of interest in favor of industry. The gist of their case is that the DEC at the urging of the Cuomo aides worked closely with industry in a bid to ultimately end the state's moratorium against fracking (EnergyWire, Sept. 20, 2012).

Karen Moreau, executive director of the New York State Petroleum Council, sees the news conference as a sign of desperation.

"Their protests have gone from 'regulate fracking' to 'ban fracking,'" Moreau wrote in an email. "They are now calling for the Albany County District Attorney to investigate two of the governor's key advisers. This latest personal attack leads me to believe they are getting desperate."

Kate Sinding, an attorney at the Natural Resources Defense Council, wouldn't touch the question of desperation or the call for an investigation. She characterized her own view as "cautiously optimistic that the governor and DEC have heard the calls of New Yorkers not to finalize a fracking program while there are still so many outstanding questions about the health risks and while the health review remains shrouded in secrecy."

"We hope that this week will provide us with a restatement of the governor's long-standing commitment to conduct a fully deliberative and transparent process," she said.

Ready for the next round

Off the record, many sources were expressing confusion at what one called a "convoluted" process that could make for a surprise in either direction. Others said environmental groups have long since been cut out of the political process in Albany.

Katherine Nadeau, director of water and natural resources programs at Environmental Advocates of New York, said the governor and his agencies "have remained tight-lipped about how they want to proceed on fracking."

"What we know is that Gov. Cuomo will have a huge problem on his hands if he intends to permit fracking in New York," Nadeau said. "Any attempt to rush through the 204,000 comments recently submitted on draft regulations or to steamroll a public health impacts review will put the administration's credibility at risk, to say nothing of the risks to our New Yorkers, our air and our water if the governor moves before the science is in."

If the governor approves permits, Nadeau, Sinding and others have made no bones about threatening an all-out legal assault.

The office of the Albany County district attorney did not return a call seeking a comment on the investigation request.

#### HYDRAULIC FRACTURING:

Water-stressed areas home to nearly half of fracked wells -- investors' report

Debra Kahn, E&E reporter

Published: Thursday, May 2, 2013

SAN FRANCISCO -- Nearly half of "fracked" shale gas and oil wells in the United States are in areas where water is already in short supply, according to a group advocating for sustainable business practices.

In a report released today aimed at oil and gas investors, Ceres urges companies to disclose their strategies for obtaining water as they continue to access shale gas and oil through hydraulic fracturing, which uses millions of gallons of water per well.

Researchers from Ceres overlaid a map of the country's water-stressed areas with data from 25,450 wells compiled by industry website FracFocus.org. They found about 47 percent of the wells are in areas classified by the World Resources Institute as having "high" or "extremely high" water stress, meaning more than 80 percent of the annual available water is already being withdrawn by municipal, industrial and agricultural users.

In some states, the concentration of fracking activity in severely water-stressed areas is even higher, the report says. In Colorado, for example, 97 percent of wells are being developed under those conditions.

Overall, Ceres found that 65.8 billion gallons of water was used for fracking between January 2011 and September 2012 -- the equivalent of a year's water supply for 2.5 million Americans.

"Although water use for hydraulic fracturing is often less than 1 or 2 percent of a state's overall use, it can be much higher at the local level, increasing competition for scarce supplies," the report says, noting that fracking accounted for 29 percent of total water use in Johnson County, Texas, in 2011.

"Given projected sharp increases in production in the coming years and the intense nature of local water demands, competition and conflicts over water should be a growing concern for companies, policymakers and investors," it says.

Report co-author Monika Freyman, manager of Ceres' water program, said that companies should disclose to investors exactly how they obtain their water and how they plan to in the future, in order to avoid hurting local municipalities or farmers. "Companies can mitigate a lot of water-sourcing problems, but they have to be more proactive," she said. "Are they engaging with these communities, or are they just outbidding" them for water rights?

Another recent report on fracking and water use criticized FracFocus and its water data for being voluntary and industry-run. That study, by the Western Organization of Resource Councils, said the

amount of water being used was unclear and encouraged states to do their own research and analysis (EnergyWire, April 26).

Freyman conceded the database was imperfect. While yet another study estimated that oil and gas development in Texas used 26 billion gallons of water in 2011, the Ceres study found similar numbers over a longer period of time, supporting the idea that FracFocus underreports water use.

"However, the fact that it does indeed capture tens of thousands of data points on fracking activity across the U.S. is pretty compelling and certainly makes the data set worthy of analysis," she said.

An industry group dismissed the report, citing Ceres' vested interested in the stakeholders.

"Ceres, as a coalition of environmental groups, unions and 'sustainable' investors groups, has an obvious bias, as does their report," said Kathleen Sgamma, vice president of government and public affairs for the Denver-based Western Energy Alliance, which represents more than 400 oil and gas developers.

Further, the study should have compared oil and gas's water use to that of other energy sources, as well as other users of water, she said, citing a Colorado state government analysis that shows fracking uses 0.08 percent of the state's water.

"Compare that to 85.5 percent for agriculture and 7.4 percent for municipal and industrial uses," she said. "From that low water use, the oil and natural gas industry generates \$31 billion in economic impact to the state. That's a fantastic balance between wise resource use and economics."

The industry is also working on reducing its water use, she said.

Not sure if you saw this:

States want to meet with EPA on existing power plant rules -- Calif. air chief  
Debra Kahn and Jean Chemnick, E&E reporters  
Published: Wednesday, May 8, 2013

The chairwoman of the California Air Resources Board said yesterday that air agency employees from a group of like-minded states intend to meet this summer with U.S. EPA personnel to explore ways to craft and implement greenhouse gas rules for existing power plants.

"We have to wait until EPA has an administrator, and then try to formulate some common views about how this 111(d) process might work, but we're not there yet," said Mary Nichols, referring to the section of the Clean Air Act that provides for performance standards for existing sources.

Nichols' comments, in an interview with E&E Daily following a climate conference in San Francisco, come as EPA officials continue to hold that they have no plans to regulate greenhouse gases from today's power fleet. The agency committed to do so under a settlement with state and environmental litigants in late 2010, but officials have refused to discuss existing source standards ever since. EPA has proposed a rule for future power plants but has missed a deadline to finalize that rule.

In a written statement to Sen. David Vitter (R-La.) released this week, EPA administrator nominee Gina McCarthy modified the "no plans" line somewhat (E&ENews PM, May 6).

The current assistant administrator for air and radiation said EPA "is not currently developing any existing source [greenhouse gas] regulations."

"In the event that EPA does undertake action to address [greenhouse gas] emissions from existing power plants, the agency would ensure, as it always seeks to do, ample opportunity for States, the public and stakeholders to offer meaningful input on potential approaches," she added.

Despite EPA's statements, environmentalists say they are not overly worried that the agency might renege on its commitment to promulgate an existing power plant rule.

"I don't think at this point that that is our primary concern," said John Coequet of the Sierra Club in a recent interview. "Our primary concern is getting Gina confirmed and then working with EPA on the agenda once she is confirmed."

Reached late yesterday by email about Nichols' comments, Coequet noted that California has had its own concerns about how 111(d) might interact with its state climate change policies.

A California official said that a date for the talks hadn't been set yet but that they would probably take place in Washington, D.C., and include states that are members of the North America 2050 group, a coalition of 16 states and four Canadian provinces committed to low-carbon policies.

In addition to California, the meeting could include states that are members of the Northeast's Regional Greenhouse Gas Initiative and a handful of Western and Midwestern states that have supported similar policies.

The official said the goal of the meeting would be to demonstrate ways that states could comply with a federal rule for stationary sources.

"We've got a window in which to be constructive and show that EPA can put forth a proposal respecting states' existing policies, resources and politics," said the California Air Resources Board's assistant executive officer, Brian Turner.

Turner said the states might commission a report setting out ways that EPA could tailor its standards to allow for a range of policies to show compliance, from California's A.B. 32 to policies like Xcel Energy Inc.'s "integrated resource plan" in Colorado and Minnesota, which covers the utility's entire fleet rather than individual facilities. States with aggressive efficiency and renewables programs could also meet the standard, he said.

IG to assess EPA's efforts on methane from pipelines

Ellen M. Gilmer, E&E reporter

Published: Wednesday, June 5, 2013

Story Tools sponsored by America's Natural Gas Alliance

U.S. EPA's inspector general is launching a probe into whether the agency is doing enough to manage methane leaks from natural gas pipelines.

The IG's office will look at what steps EPA has taken to reduce the levels of methane emitted from gas pipelines that sprawl across the country. Over the next several months, the IG team will collect documents and data from the agency and interview EPA officials, along with researchers, industry representatives and environmental groups, said Assistant Inspector General Carolyn Copper.

Details for the evaluation, which was announced in the office's fiscal 2013 annual plan, were outlined in a memo this week to air chief Gina McCarthy and acting Assistant Administrator Lek Kadeli of the Office of Research and Development.

A spokesman for the IG's office said a timeline has not been set, and it will depend on the review's "scope and complexity." Asked what prompted the evaluation, he said only that it was "self-initiated" during the office's annual planning process.

The evaluation comes as climate hawks remain ever wary of the natural gas system's effect on global warming. Though natural gas burns cleaner than coal, its main component, methane, leaks from pipelines and other infrastructure to become a short-lived but powerful greenhouse gas.

Some estimates put methane leakage so high that it would cancel out the environmental benefits of natural gas use, but EPA's most recent rough estimate is a more manageable 1.54 percent. A recent study from the World Resources Institute suggests that leakage must be below 1 percent to improve on coal's climate impact (EnergyWire, April 5).

New York-based Environmental Defense Fund and the University of Texas, Austin, are working with several natural gas companies to take measurements and develop a better understanding of actual leakage rates.

EPA indirectly addressed methane leakage last year when it set new rules for emissions of volatile organic compounds, which are released alongside methane. But those requirements apply to the production phase of the natural gas life cycle. Pipeline venting, meanwhile, accounts for about 8 percent of the onshore oil and gas industry's methane emissions, EPA says.

The IG's office is planning a separate evaluation of the agency's efforts on controlling emissions from natural gas flaring from well sites and refineries.

Pipeline venting, meanwhile, accounts for about 8 percent of the onshore oil and gas industry's methane emissions, EPA says.

The IG's office is planning a separate evaluation of the agency's efforts on controlling emissions from natural gas flaring from well sites and refineries.

Yale EPC Project Proposal Template Fall 2013.pdf

---

Dear Robert:

I am writing to let you that the Yale Environmental Protection Clinic is soliciting project proposals for the Fall 2013 semester. Matt Eisenson (cc'd) and I are the teaching assistants for this clinic, and we are coordinating project submissions this semester.

If you or any of your colleagues at the NY Attorney General, Environmental Protection Bureau, is interested in submitting a project for students at Yale Law School or the Yale School of Forestry & Environmental Studies to work on, please see the memo I am attaching and pasting below from clinical teaching team: Allison Clements and Lisa Suatoni, of NRDC, and Josh Galperin, Associate Director of the Yale Center for Environmental Law and Policy. The memo provides information on the clinic, as well as instructions on submitting a project proposal.

To submit a proposal, please fill out the attached Project Proposal Template Form and email it to me (leslie.couvillion@yale.edu) and Matt (matthew.eisenson@yale.edu) by August 23rd, 2013. Essentially, we are seeking a 1-2 page write-up of the project with a proposed work plan and expected deliverables. If you're submitting multiple projects, you can put them together in one document. Please feel free to contact me with any questions about the clinic. I look forward to hearing from you!

Best,

Leslie Couvillion

#### MEMORANDUM

To: Potential Project Sponsors for the Yale Environmental Protection Clinic  
From: Allison Clements(NRDC Senior Attorney, Energy & Transportation Program), Lisa Suatoni (NRDC Senior Scientist, Oceans Program) and Joshua Galperin (Associate Director, Yale Center for Environmental Law and Policy)

Date: July 2013

Re: Project Proposals for the Yale Environmental Protection Clinic, Fall 2013 Semester

The Yale Environmental Protection Clinic is a collaboration between Yale Law School and the Yale School of Forestry & Environmental Studies. The clinic is taught by practitioners from the field in coordination with Yale faculty and staff. This year, Josh Galperin, the Associate Director of the Yale Center for Environmental Law and Policy will continue to co-teach the clinic alongside Allison Clements and Lisa Suatoni of the Natural Resource Defense Council. Allison and Lisa are taking the reins from NRDC colleague Kit Kennedy, who directed the clinic for the last few years. Leslie Couvillion and Matt Eisenson are joining the team this year as teaching assistants.

The Fall 2013 Semester for the Yale Environmental Protection Clinic begins in September and we are now soliciting project proposals. This memo provides a description of the clinic, as well as instructions on submitting proposals. We are also attaching a template form to use for project submissions. If you are interested in having the students work on a project please let us know as soon as possible! The due date for project proposals is Friday, August 23rd.

These proposals should be approximately 1-2 pages, and should include background information, a tentative work plan, and a description of the expected deliverables. Please use the template form that is attached. (We know it's the summer vacation season, so if you have a project idea but need a little more time to put it together, let us know, and we can work it out).

#### I. Background on the Environmental Protection Clinic

Clinic students come from Yale Law School and the Yale School of Forestry & Environmental Studies, with occasional students from other Yale graduate schools. We teach a weekly seminar on environmental advocacy and skills, and the Clinic's students also work in interdisciplinary teams on major environmental and clean energy projects for environmental groups, the private sector, or government agencies. Generally, 2-3 students will work on each project, each spending roughly 10-12 hours per week on the project over the semester (which is about 12 weeks). Clinic students can work on a wide array of projects, including but not limited to: researching and writing legal/policy/science reports on various topics; drafting appellate briefs or amicus briefs; developing policy recommendations and writing white papers; communications and outreach; or undertaking comparative international law projects and legislative drafting projects.

Recent projects have included:

- preparing a legal, technical and policy paper on fracking in China and how best to regulate it and participating in a workshop in Beijing to present the paper;
- drafting a white paper and providing recommendations to a state agency on how to move forward with regional renewable energy procurement;
- drafting several appellate briefs in environmental challenges under various statutes;
- assisting with the preparation a petition to a federal agency on state climate adaptation claims;
- preparing for and participating in the Conference of the Parties to the United Nations Framework Convention on Climate Change discussions in on behalf of a group representing the Pacific Island Nations;
- drafting a report for a Greek environmental organization with recommendations on EU and Greek provisions of law that might be used to require the raising of a recent shipwreck in the Aegean that is leaking oil and to pay for remediation of the damage caused by the wreck.
- drafting a petition to list the Arctic Ocean as a World Heritage Site
- researching and drafting public outreach material for a legislative campaign organized by a coalition of national environmental NGOs

– drafting a whitepaper on the science, economics, and legal issues surrounding a forthcoming administrative rulemaking.

Please note that all aspects of each project are kept entirely confidential both by the students and the teaching team unless the sponsoring organization wishes to make the fact of the project or the results of the project public.

## II. Requirements for Clinic Project Sponsors

Project sponsors are responsible for supervising and providing regular guidance and feedback to the clinic students working on their project. This usually entails the following steps. First, on Tuesday, September 17th from 12:00 – 2:00 pm ET, there will be an introductory call with each project team. These calls will be approximately 20 minutes and will include the sponsors (you), a member of teaching team, the students and teaching assistants Leslie Couvillion and Matt Eisenson. Please hold this time open on your calendar.

Second, project sponsors will typically have a brief call with the clinic student team every two weeks for the rest of the term. You may also want to organize an in-person meeting with your clinic students at the start of the term, if geography allows. The Clinic has a modest travel budget to assist with meetings.

Third, the project sponsors, teaching team, student team and teaching assistant will have another joint call mid-way through the term to check on the project's progress.

Finally, at the end of the term, the project sponsors, teaching team, student team and teaching assistant will have a final call to wrap up the project and review how the project went and its results. We also ask that you provide a 1-2 page memo to the students at the close of the term providing feedback to the students on their work and the project results.

The clinic has a small travel budget so that the students can travel to meet with you, do site visits or fieldwork, and attend outside meetings if needed to advance the project. Otherwise students will work remotely from New Haven.

## III. Follow-Up Projects

If a student team worked on a project for you last term we encourage you to propose a follow-up project. In some cases the same students may work on the next phase of the project, or it may be different students or a mix.

## IV. If Your Project Is Not Selected by a Clinic Team This Semester. . .

The clinic always has more proposed projects than we do student teams, so we cannot guarantee that your project will be selected. This is, unfortunately, a function of the small size of the clinic. If your project is not selected this term, we will try again next semester.

## V. For More Information

If you're interested, you can learn more about the Environmental Protection Clinic. Please contact any of us or visit the Clinic website at: <http://envirocenter.yale.edu/programs/environmental-protection-clinic>.

Please feel free to forward this memo to any other colleagues within or outside of your organization who may be interested in getting the Clinic's assistance on a project.

Best,

**Yale Environmental Protection Clinic Project Proposal Form  
for Fall Term 2013**

**Please fill out this form and return it to Leslie Couvillion ([leslie.couvillion@yale.edu](mailto:leslie.couvillion@yale.edu)) and Matt Eisenson ([matthew.eisenson@yale.edu](mailto:matthew.eisenson@yale.edu)) by Friday, August 23. Proposals are generally 1-2 pages in length.**

**Project Name:**

**Organization Name:**

**Supervisor Name(s) and Contact Information:**

[Provide the names, titles and contact info for the person who will supervise the project.]

**Brief Description of Organization:**

[This should be brief: no more than a paragraph. Also provide a link to your organization's website, if you have one.]

**Project Description:**

[Describe the specific tasks you seek the clinic's assistance with. Describe the end goals and objectives of the project, as well as why the project is important from an environmental/clean energy perspective and how it fits into your organizations' larger goals. This section should articulate the specific legal/policy/science questions that students will research. Please be as specific and concrete as possible.

Also describe any relevant background for the project, including its origins and/or the impetus for the project. Briefly describe any work already completed by the organization to advance the project.]

**Expected Work-Product and Deliverables:**

[Describe the type of work product (e.g., legal memo, legal brief, policy paper, database, etc.) that you expect students to produce. Please estimate the desired scope and length of the deliverables. The clinic's students work in teams, with 2-3 students working on each project 10-12hrs/week for the term (which is about 12 weeks), so the work product should be of a scope that can both absorb the energy and skills of a team of this size and can be feasibly completed in this amount of time.]

**Timetable and Deadlines:**

[If applicable, please propose a timetable for when any specific tasks should be completed. Make sure to include any known deadlines, as well as at least a tentative sense of when specific the

above-mentioned deliverables should be completed. This timeline may be tentative and provide a range of dates. Introductory projects calls will likely take place on Tuesday, September 17<sup>th</sup> at some point between 12:00 and 2:00 pm, so please hold that time and all final work-product will be completed by the end of December.]

**Useful Skills and Experience:**

[Describe any special skill sets or experience that you think would be an asset for the project team (e.g., expertise or prior experience in a particular area, fluency in another language, specialized IT skills etc.) Both Yale Law School students and Yale School of Forestry and Environmental Studies students enroll in the clinic, as well as occasional students from other Yale graduate schools, and students will thus come from a variety of backgrounds.]

**Skills/Experience Gained:**

[Describe what kinds of skills or experience students can expect to take away from the project. Please highlight why you feel this project is an interesting and valuable learning opportunity for students.]

Subject: Setting the Record Straight: EPA has Ample Authority to Protect Us from Carbon Pollution  
Date: Fri Sep 20 2013 11:13:41 EDT  
Attachments:

---

## Setting the Record Straight: EPA has Ample Authority to Protect Us from Carbon Pollution

Even though they account for 40 percent of U.S. emissions of harmful carbon pollution, fossil fuel-fired power plants are currently subject to no national limits on the amount of such pollution they emit. Drawing on the same Clean Air Act tools it has previously used to regulate other pollutants, the U.S. Environmental Protection Agency (EPA) is working to put in place common-sense standards for carbon pollution from new and existing power plants.

Recently, a group of state attorneys general issued a White Paper challenging EPA's authority to establish minimum emission performance standards for carbon pollution from existing power plants under Section 111(d) of the Clean Air Act, and to issue rigorous standards for new power plants that are based on advanced technologies such as carbon capture and storage. This attack on EPA's well-established authority to administer the Clean Air Act is legally unfounded and a misguided attempt to obstruct urgently-needed and long-delayed limits on carbon pollution from our nation's largest source, as examined here: <http://www.edf.org/blog/2013/09/20/setting-record-straight-epa-has-ample-authority-protect-us-carbon-pollution>

New paper outlines the legal foundations for strong Carbon Pollution Standards for power plants

By Megan Ceronsky | Bio | Published: October 4, 2013

On June 25th, at Georgetown University, President Barack Obama issued a stirring call to action on climate change, saying:

“As a president, as a father and as an American, I am here to say we need to act. I refuse to condemn your generation and future generations to a planet that’s beyond fixing.”

In that speech, President Obama announced his Climate Action Plan — a suite of actions that his Administration will take to curb dangerous emissions of heat-trapping pollutants.

In that Climate Action Plan, the President directed the Environmental Protection Agency (EPA) to develop Carbon Pollution Standards for new and existing power plants.

Power plants are the largest source of greenhouse gases in America, and there are currently no federal limits on the amount of climate-destabilizing pollutants that these plants can put into the air.

Unfortunately, but not surprisingly, the attacks on the Carbon Pollution Standards had begun months earlier.

Those attacks included the usual sensational, defeatist, and wholly-unsupported claims designed to delay, deny, and obstruct progress.

Quieter but no less sensational are the attacks launched by the lawyers of obstructionist fossil fuel interests. Hunton & Williams, on behalf of the opaque Utility Air Regulatory Group, is leading the pack.

The legal attacks on the standards for existing power plants effectively boil down to this:

1. EPA does not have the authority under the Clean Air Act to establish any actual limits on carbon pollution.

2. If EPA does have that authority, there are no demonstrated measures to reduce carbon pollution from power plants, so any required emission reductions must at most be "minimal."

We disagree.

In this white paper, we lay out the legal foundation for EPA's authority to work with the states to ensure implementation of strong and cost-effective Carbon Pollution Standards for existing power plants.

These standards can support our nation's transition to a cleaner, safer, smarter power infrastructure and deliver the reductions in carbon pollution we so urgently need.

In the President's words:

"Our progress here will be measured differently, in crises averted, in a planet preserved. But can we imagine a more worthy goal? For while we may not live to see the full realization of our ambition, we will have the satisfaction of knowing that the world we leave to our children will be better off for what we did."

America is united by these hopes and dreams for a better world. Thanks to the ingenuity of our engineers and inventors, and the skill of our workers, the solutions are at hand to build a cleaner power sector and to use energy more efficiently.

The Clean Air Act provides a framework under which EPA and the states can work together to deploy these solutions. We need only work together — in red states, blue states and purple states alike — to meet this challenge.

### *Environmental Defense Fund*

Environmental Defense Fund is a non-profit, non-partisan, non-governmental environmental organization that combines law, policy, science, and economics to find solutions to today's most pressing environmental problems.

## I. Introduction

The Intergovernmental Panel on Climate Change's recent report, "Climate Change 2013: The Physical Science Basis," includes several grim findings:

- Warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. The atmosphere and ocean have warmed, the amounts of snow and ice have diminished, sea level has risen, and the concentrations of greenhouse gases have increased.<sup>1</sup>
- It is *extremely likely* that human influence has been the dominant cause of the observed warming since the mid-20th century.<sup>2</sup>
- Continued emissions of greenhouse gases will cause further warming and changes in all components of the climate system. Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions.<sup>3</sup>

Climate impacts are already affecting American communities—and the impacts are projected to intensify. The U.S. Global Change Research Program has determined that if greenhouse gas emissions are not reduced it is likely that American communities will experience:

- increased severity of dangerous smog in cities;<sup>4</sup>
- intensified precipitation events, hurricanes, and storm surges;<sup>5</sup>
- reduced precipitation and runoff in the arid West;<sup>6</sup>
- reduced crop yields and livestock productivity;<sup>7</sup>
- increases in fires, insect pests, and the prevalence of diseases transmitted by food, water, and insects;<sup>8</sup> and
- increased risk of illness and death due to extreme heat.<sup>9</sup>

Extreme weather imposes a high cost on our communities, our livelihoods, and our lives. The National Climatic Data Center reports that the United States experienced twelve climate disasters each causing more than a billion dollars of damage in 2012, including a yearlong drought and widespread crop failure in 22 states, western wildfires that burned over 9.2 million acres, and

Hurricane Sandy, which devastated major population centers in the Northeast.<sup>10</sup> These are precisely the type of impacts projected to affect American communities with increasing frequency and severity as climate-destabilizing emissions continue to accumulate in the atmosphere.

Power plants are far and away the largest source of greenhouse gas emissions in the United States. In 2011, fossil fuel fired power plants emitted more than 2 billion metric tons of CO<sub>2</sub>e, equivalent to 41% of U.S. carbon pollution and nearly one-third of total U.S. greenhouse gas emissions.<sup>11</sup>

Section 111 of the Clean Air Act provides for the establishment of nationwide emission standards for major stationary sources of dangerous air pollution—including, since 1971, power plants. In response to the Supreme Court’s decision in *Massachusetts v. EPA*<sup>12</sup> that the Clean Air Act’s protections encompass greenhouse gas emissions and to EPA’s science-based determination that these climate-destabilizing emissions endanger public health and welfare,<sup>13</sup> EPA is now developing § 111 Carbon Pollution Standards for power plants.

EPA is developing separate carbon pollution-reduction frameworks for new and existing power plants under Clean Air Act § 111(b) and (d) respectively. Emission standards for existing pollution sources are developed and implemented through a dynamic federal-state collaboration, the legal underpinnings of which are described here. Through this collaboration, EPA and the states can put in place strong standards that will drive cost-effective reductions in carbon pollution and support our nation’s transition to a cleaner, safer, smarter power infrastructure.

## II. Background

Section 111(b) directs EPA to identify (“list”) categories of stationary sources that significantly contribute to dangerous air pollution, and to establish emission standards for air pollutants emitted by new sources in the listed categories.<sup>14</sup> Power plants were listed in 1971.<sup>15</sup> Section 111(d) directs the development of emission standards for pollutants emitted by existing sources

<sup>11</sup> EPA, Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2011, at ES-5, ES-7 (Apr. 2013), *available at* <http://www.epa.gov/climatechange/Downloads/ghgemissions/US-GHG-Inventory-2013-Main-Text.pdf>. Of the heat-trapping pollutants emitted by sources in the United States, carbon dioxide is by far the most prevalent. Transportation emissions are the only greenhouse gas emission source that approaches the scale of power plants.

<sup>12</sup> 549 U.S. 497 (2007).

<sup>13</sup> Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, 74 Fed. Reg. 66,496 (Dec. 15, 2009).

<sup>14</sup> 42 U.S.C. § 7411(b)(1).

<sup>15</sup> Air Pollution Prevention and Control: List of Categories of Stationary Sources, 36 Fed. Reg. 5931 (Mar. 31, 1971) (listing “Fossil fuel-fired steam generators of more than 250 million B.t.u. per hour heat input”).

in the listed categories. Emission standards are not established under § 111(d) if a source category's emissions of a specific pollutant are regulated under the provisions of the Clean Air Act addressing hazardous or criteria air pollutants.<sup>16</sup> Emission standards developed under § 111(d) must apply to "any existing source."<sup>17</sup>

The Clean Air Act provides that an emission standard (for new or existing sources) must reflect the emission reductions achievable through application of the "best system of emission reduction" that EPA finds has been adequately demonstrated, taking into account costs and any non-air quality health and environmental impacts and energy requirements.<sup>18</sup> For existing sources, once EPA guidance is issued identifying the best system of emission reduction and the emission reductions achievable under that system, the standards are implemented through state plans submitted to EPA for approval.<sup>19</sup> These plans must provide for the enforcement of the emission standards.<sup>20</sup>

### III. Understanding § 111(d)'s Dynamic Federal-State Collaboration

Section 111(d) provides for federal-state collaboration in securing emission reductions from existing sources, with state flexibility to identify the optimal systems of emission reduction for their state while achieving the necessary environmental performance. EPA's longstanding § 111(d) implementing regulations<sup>21</sup> provide for EPA to issue "emission guidelines" in which the

---

<sup>16</sup> 42 U.S.C. § 7411(d). Congress enacted § 111 in the 1970 Clean Air Amendments. Emissions of criteria pollutants from all sources are addressed through the detailed State Implementation Plan process set forth in § 110, *id.* § 7410, and hazardous air pollutants are the subject of a detailed framework of protections set out in § 112, *id.* § 7412. In its 1975 implementing regulations and for the subsequent 15 years EPA treated § 111(d) as a means of 'filling the gap,' and addressing pollutants that were not otherwise covered by § 110 or 112. *See* 40 Fed. Reg. 53,340, 53,340 (Nov. 17, 1975). In 1990, the House and Senate passed conflicting amendments to § 111(d), both of which were included in the Clean Air Act Amendments of 1990. In a 2005 rulemaking, after conducting a thorough analysis of the language and legislative history of the two versions, EPA described one way to reconcile them in a manner that comported with the overall thrust of the Clean Air Act Amendments of 1990. EPA concluded that it has authority under § 111(d) to regulate any air pollutant not listed under § 112(b) (i.e., any non-hazardous air pollutant), even if the source category to be regulated under § 111 is also being regulated under § 112. *See* 70 Fed. Reg. 15,994, 60,030-32 (Mar. 29, 2005). Thus, the only pollutants EPA may *not* regulate under § 111(d) are hazardous air pollutants emitted from a source category that is actually being regulated under § 112.

<sup>17</sup> 42 U.S.C. § 7411(d).

<sup>18</sup> *Id.* § 7411(a)(1).

<sup>19</sup> *Id.* § 7411(d)(1)(A).

<sup>20</sup> *Id.* § 7411(d)(1)(B).

<sup>21</sup> 40 C.F.R. pt. 60, subpt. B. EPA's regulations for the general implementation of § 111(d) have not been challenged since they were promulgated in 1975. *See* 40 Fed. Reg. 53,340 (Nov. 17, 1975); *see also* Clean Air Mercury Rule, 70 Fed. Reg. 28,606 (May 18, 2005), vacated on other grounds by *New Jersey v. EPA*, 517 F.3d 574 (D.C. Cir. 2008). Any challenge would now be time-barred. 42 U.S.C. §

Agency fulfills its § 111 duty to identify the “best system of emission reduction” for a specific pollutant and listed source category.<sup>22</sup> EPA then identifies the emission reductions achievable using that system. States are given the flexibility to deploy different systems of emission reduction than the “best” system identified by EPA, so long as they achieve equivalent or better emission reductions.<sup>23</sup> The achievement of equivalent emission reductions enables state plans to be deemed “satisfactory” in the statutorily required review.<sup>24</sup> The statute provides that when states do not submit a satisfactory plan, EPA must develop and implement emission standards for the sources in that state.<sup>25</sup>

**A. The statute gives EPA ample authority to oversee state compliance with § 111(d).**

Although some industry attorneys have posited that the states have the sole authority to determine the stringency of emission standards under § 111(d), this disregards the plain language of § 111. Section 111(a)(1) elucidates that it is EPA—not the states—that identifies the best system of emission reduction considering the statutory factors:

The term “standard of performance” means a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any nonair quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.<sup>26</sup>

That definition specifically refers to “the Administrator”<sup>27</sup> as the entity that “determines” what constitutes the best system of emission reduction based on the statutory factors such as optimal environmental performance (“best”) and cost. It is the Administrator who “tak[es] into account the cost of achieving such reduction and any nonair quality health and environmental impact and energy requirements.” Significantly, that definition is explicitly made applicable to the entirety of § 111.<sup>28</sup>

<sup>22</sup> 40 C.F.R. § 60.22(b)(5) (guidelines will “reflect[] the application of the best system of emission reduction (considering the cost of such reduction) that has been adequately demonstrated for designated facilities, and the time within which compliance with emission standards of equivalent stringency can be achieved”).

<sup>23</sup> *See* 40 C.F.R. § 60.24.

<sup>24</sup> *Id.*; 42 U.S.C. § 7411(a); *id.* § 7411(d)(2).

<sup>25</sup> *Id.* § 7411(d)(2).

<sup>26</sup> *Id.* § 7411(a)(1) (emphasis added).

<sup>27</sup> *Id.* § 7602(a) (defining “Administrator” to be “the Administrator of the Environmental Protection Agency”).

<sup>28</sup> *See id.* § 7411(a) (“For purposes of this section . . .”).

Under § 111(d)(1)(A), state plans must impose “standards of performance” on existing sources<sup>29</sup> according to the criteria provided in the “standard of performance” definition quoted above.<sup>30</sup> Section 111(d)(2) directs states to submit “satisfactory” plans, implementing such standards of performance, to EPA for review and approval.<sup>31</sup> EPA’s regulations and emission guidelines have long interpreted the Agency’s § 111(d) responsibility to determine whether state plans are “satisfactory” as governed by whether the plans implement emission standards that reflect the emission reductions achievable under the best system of emission reduction identified by the Administrator.<sup>32</sup>

EPA’s review of state plans is guided by the statutory parameters defining a “standard of performance”—do state plans establish emission standards that achieve emission reductions equivalent to or better than those achievable using the best system of emission reduction? This manifest interpretation of the statute flows inexorably from its plain language and structure, and EPA’s interpretation of its substantive role under § 111(d) carries the weight of nearly four decades of Agency statutory interpretation and practice under the 1975 § 111(d) implementing regulations.<sup>33</sup> It is implausible that Congress provided statutory criteria that state plans must meet and further provided for EPA review state plans, but did not intend for the statutory criteria to direct the review. Indeed, for EPA to approve state plans without regard to whether those plans satisfy the statutory criteria for standards of performance would be arbitrary.

Yet the language of § 111 requires substantive review of state plans by EPA even more directly. A “standard of performance” is defined as “a standard for emissions of air pollutants *which reflects the degree of emission limitation achievable through the application of the best system of emission reduction*” identified by the Administrator. An emission standard that fails on its face to secure the degree of emission reductions achievable under the best system of emission reduction is outside the statutory definition of standards of performance and does not meet the requirement that the “State establish[] standards of performance” for existing sources. State plans that fail to include a standard of performance cannot be approved as “satisfactory” by EPA under any reading of § 111.

---

<sup>29</sup> *Id.* § 7411(d)(1)(A).

<sup>30</sup> *Id.* § 7411(a) (all definitions, including “standard of performance,” apply “[f]or purposes of this section” (emphasis added)).

<sup>31</sup> *Id.* § 7411(d)(2) (discussing results if “the State fails to submit a *satisfactory* plan” (emphasis added)).

<sup>32</sup> *See* State Plans for the Control of Existing Facilities, 39 Fed. Reg. 36,102 (Oct. 7, 1974); *see also* State Plans for the Control of Certain Pollutants from Existing Facilities, 40 Fed. Reg. 53,340, 53,342-44 (Nov. 17, 1975) (rejecting commenters’ argument that EPA does not have authority to require states to establish emissions standards that are at least as stringent as EPA’s emission guidelines); *id.* at 53,346 (defining “emission guideline” as “a guideline . . . which reflects the degree of emission reduction achievable through the application of the best system of emission reduction which (taking into account the cost of such reduction) the Administrator has determined has been adequately demonstrated for designated facilities.”).

<sup>33</sup> *Id.* EPA has issued § 111(d) emission guidelines for a number of source categories. *See* 42 Fed. Reg. 12,022 (Mar. 1, 1977) (phosphate fertilizer plants); 42 Fed. Reg. 55,796 (Oct. 18, 1977) (sulfuric acid plants); 44 Fed. Reg. 29,828 (May 22, 1979) (kraft pulp mills); 45 Fed. Reg. 26,294 (Apr. 17, 1980) (primary aluminum plants); 61 Fed. Reg. 9,905 (Mar. 12, 1996) (municipal solid waste landfills).

In addition to being inconsistent with the language of § 111, exclusive state authority over the substance of existing source standards would be contrary to the purpose of the 1970 Clean Air Act—“to provide for a more effective program to improve the quality of the Nation’s air”<sup>34</sup>—because air quality could *worsen* if state plans were not subject to any enforceable substantive standards. Evidence of the central role for protective federal standard setting is found throughout the Clean Air Act, including in § 116, which prohibits the states from adopting or enforcing emission standards less stringent than those set by EPA.<sup>35</sup>

Preserving that basic role for EPA in protecting the nation’s air quality was a central theme of the regulations EPA adopted in 1975 to implement § 111(d). As EPA noted in the rulemaking:

[I]t would make no sense to interpret section 111(d) as requiring the Administrator to base approval or disapproval of State plans solely on procedural criteria. Under that interpretation, States could set extremely lenient standards—even standards permitting greatly increased emissions—so long as EPA’s procedural requirements were met. Given that the pollutants in question are (or may be) harmful to public health and welfare, and that section 111(d) is the only provision of the Act requiring their control, it is difficult to believe that Congress meant to leave such a gaping loophole in a statutory scheme otherwise designed to force meaningful action.<sup>36</sup>

In sum, both the language of § 111 and the overall purpose of the 1970 Clean Air Act amendments require a strong substantive role for EPA in ensuring that standards for existing sources meet the statutory requirements.

**B. EPA’s responsibility includes promulgation of binding emission guidelines for the states.**

Similarly, some stakeholders have questioned EPA’s authority to establish binding emission guidelines that identify the “best system of emission reduction” and the resulting emissions reductions that each state plan must achieve. That argument fails in light of the structure of § 111(d) and in light of congressional intent. It is also contrary to EPA’s reasonable interpretation of its statutory responsibility, laid out in the long-established regulations implementing § 111.

EPA’s interpretation of § 111(d) as authorizing it to adopt emission guidelines makes eminent sense in light of the statute’s overall structure. As EPA ultimately must approve state plans for existing sources under § 111(d), the states benefit from EPA giving them initial guidance on what the Agency will be expecting to see in their state plans. That guidance, in the form of emission guidelines, helps the states avoid wasting valuable time and resources as they develop their standards. The guidelines do so by providing states with the parameters a state plan must fit within in order to be found “satisfactory” by the Administrator.

---

<sup>34</sup> Clean Air Amendments of 1970, Pub. L. No. 91-604, 84 Stat. 1676, 1676 (1970).

<sup>35</sup> 42 U.S.C. § 7416.

<sup>36</sup> 40 Fed. Reg. at 53,343.

Moreover, while Congress did not detail the process by which EPA would evaluate and approve state plans, there is considerable evidence that Congress subsequently recognized and approved the guidelines process that EPA established in its 1975 regulations. In 1977, for example, when Congress modified the definition of “standard of performance,” the House committee explained that under § 111(d) “[t]he Administrator would establish *guidelines* as to what the best system for each . . . category of existing sources is.”<sup>37</sup> Then, in 1990, in § 129 of the Clean Air Act, Congress directed EPA to adopt standards for solid waste combustion that would mirror the § 111 process, expressly referring to the “*guidelines* (under section 7411(d) of this title . . .).”<sup>38</sup> Thus, Congress has both recognized and legislated in reliance upon EPA’s guidelines process under § 111(d).

Congress is not alone in affirming the place of emissions guidelines in the § 111(d) structure. The Supreme Court recently noted that states issue § 111(d) standards “in compliance with [EPA] guidelines and subject to federal oversight.”<sup>39</sup>

In the 1975 rulemaking to implement § 111(d), EPA received a number of comments questioning the Agency’s authority to set those substantive guidelines.<sup>40</sup> In response, EPA demonstrated its authority to do so with a detailed analysis of the language, purpose, and legislative history of § 111(d).<sup>41</sup> EPA’s authority to issue emission guidelines has long been settled.<sup>42</sup>

### **C. States can deploy locally designed solutions to meet EPA’s emission guidelines.**

Although EPA adopts emission guidelines identifying the best system of emission reduction, § 111(d) (and EPA’s implementing regulations) provide for state tailoring and flexibility in meeting those guidelines. The statute does not require states (or sources) to use the exact system of emission reduction identified by EPA. Instead, states simply must achieve the level of emission reductions that would be achieved under that best system, and can deploy the system or systems of emission reduction most appropriate for the emission sources in their state.<sup>43</sup>

With this state flexibility, § 111 is very similar to the process implemented under § 110, under which states put in place plans to achieve National Ambient Air Quality Standards for criteria pollutants. The safe level of ambient pollution is an expert, science-based determination made by EPA, but states have considerable discretion in determining how to reduce emissions to that level. EPA then reviews each state plan to ensure that “it meets all the applicable requirements”

---

<sup>37</sup> H.R. Rep. No. 95-294, at 195 (1977) (emphasis added).

<sup>38</sup> 42 U.S.C. § 7429(a)(1)(A) (emphasis added).

<sup>39</sup> *Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527, 2537-38 (2011).

<sup>40</sup> 40 Fed. Reg. at 53,342.

<sup>41</sup> *Id.* at 53,342-44.

<sup>42</sup> *See* 42 U.S.C. § 7607(b) (60-day review period for Clean Air Act rulemakings).

<sup>43</sup> *See id.* § 7411(a) (a “standard of performance” must “reflect[]” the emission reductions achievable through use of the best system, but need not actually use the best system).

of § 110.<sup>44</sup> This parallel structure for §§ 110 and 111—in which EPA uses its expertise to identify the emission reductions that must be achieved, states use their discretion to develop plans to achieve the emission reductions, and EPA reviews plans to ensure they are meeting the relevant statutory criteria—is reinforced by the statute explicitly, which provides that § 111(d) state plans be developed through “a procedure similar to that provided by” § 110.<sup>45</sup>

In sum, § 111(d) establishes a collaborative federal-state process for regulating existing sources in which EPA establishes quantitative emission guidelines and the states deploy locally tailored and potentially innovative solutions to achieve the required emission reductions.

#### **IV. A System of Emission Reduction That Achieves the Rigorous Cuts in Carbon Pollution Demanded by Science and Does so Cost-Effectively is Eminently Consistent with the § 111 Criteria and Is Plainly Authorized by § 111**

As EPA evaluates systems of emission reduction for existing power plants, it is instructive to look at what is taking place on the ground. Across the country, states and power companies are reducing emissions from fossil fuel fired power plants by making those plants more efficient, increasing the use of lower-carbon generation capacity and zero-emitting energy, and investing in demand-side energy efficiency. At their core, these approaches all have the same result—reducing emissions from existing high-emitting fossil fuel fired power plants and improving the emission performance of the power plant source category. The broad employment of this system across the country indicates that it is demonstrated in practice—and indeed, these approaches have been in use for decades.<sup>46</sup>

When seen through the lens of § 111, the system described above is fundamentally an emissions averaging system, achieving broadly based reductions from the power plant source category. Improving efficiency at plants, deploying zero-emitting energy on the grid, investing in demand-side energy efficiency to reduce demand, and shifting utilization towards lower-emitting generation all reduce emissions from fossil fuel fired units as a group. This system of emission reduction is conceptually more expansive than the typical pollution-control technology installed

---

<sup>44</sup> *Id.* § 7410(k)(3). Section 110 requires, *inter alia*, state plans to provide for “implementation, maintenance, and enforcement of” National Ambient Air Quality Standards, *id.* § 7410(a)(1), the use of emissions monitoring equipment as prescribed by EPA, *id.* § 7410(a)(2)(F), and any air quality modeling requirements prescribed by EPA, *id.* § 7410(a)(2)(K).

<sup>45</sup> *Id.* § 7411(d)(1).

<sup>46</sup> *See, e.g.*, World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: Michigan (Sept. 2013), *available at* <http://www.wri.org/publication/power-sector-opportunities-for-reducing-carbon-dioxide-emissions-michigan>; World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: North Carolina (Sept. 2013), *available at* <http://www.wri.org/publication/power-sector-opportunities-for-reducing-carbon-dioxide-emissions-north-carolina>; World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: Ohio (Aug. 2013), *available at* <http://www.wri.org/publication/power-sector-opportunities-for-reducing-carbon-dioxide-emissions-ohio>. *See generally* World Resources Institute, GHG Mitigation in the United States: An Overview of the Current Policy Landscape, at 10-12 (2012), *available at* <http://www.wri.org/publication/ghg-mitigation-us-policy-landscape>; Database of State Incentives for Renewables & Efficiency, <http://www.dsireusa.org/> (last visited Sept. 30, 2013).

at a plant but satisfies the statutory language and purpose of § 111(d) and is a reasonable interpretation of that provision. This system would employ emissions averaging across the regulated sources in order to recognize the pollution reductions achieved by changes in utilization at plants and among plants.

By incorporating an averaging framework, this system could create flexibility to identify the most cost effective emission reductions across the regulated sources. If sources are allowed to average emission reductions, the system will give sources flexibility to reduce emissions onsite or secure emission reductions from other sources that can achieve reductions beyond those necessary for their own compliance at lower cost. Each source would be required to comply with the emission standard established but could meet its compliance obligation by securing emission reductions at other units in the source category. By recognizing the emission reductions achieved by the deployment of low-carbon generation, shifts in utilization toward lower- or non-emitting generation, and improvements in demand-side energy efficiency, the system would create flexibility for states and regulated sources and enhance the cost-effectiveness and environmental co-benefits of the emission standards.

As discussed below, the language of § 111 is broad enough to encompass such an emission reduction system. Moreover, under § 111(d), where the goal is maximizing the reduction of carbon pollution from existing power plants considering cost and wider environmental and energy impacts, this emission reduction system facilitates optimization of the statutory factors.

**A. Section 111 gives EPA wide discretion to establish a system of emission reduction that achieves rigorous reductions in carbon pollution through locally tailored solutions.**

The language and structure of § 111 give EPA expansive authority to determine which system of emission reduction best serves the statutory goals. The marked breadth of the language indicates Congress' intention to provide EPA with ample flexibility in conceiving systems of emission reduction. Neither the term "best system of emission reduction" nor its components are given technical definitions in the Act. In common usage, a "system" is defined as "a complex unity formed of many often diverse parts subject to a common plan or serving a common purpose."<sup>47</sup> Clearly the ordinary meaning of the term "system" does not limit EPA to choosing end-of-pipe control technologies or other mechanical interventions at the plant. Rather, EPA may choose any "complex unity . . . serving a common purpose" that meets the other statutory requirements. A system of emission reduction that reflects the unified nature of the electric grid and achieves cost-effective emission reductions from the source category by treating all fossil fuel fired power plants as an interconnected group, averaging emissions across plants and recognizing changes in plant use that reduce emissions, fits securely within this framework.

The history of § 111 demonstrates that Congress deliberately rejected terms that were more restrictive than "best system of emission reduction," and that it was especially important to Congress for EPA to have flexibility in identifying solutions to reduce emissions from existing sources. The original 1970 language provided a unitary definition of "standard of performance"

---

<sup>47</sup> Webster's Third New International Dictionary 2322 (1967).

for both new and existing sources that is rather similar to the current definition: “a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction) the Administrator determines has been adequately demonstrated.”<sup>48</sup> Changes to the definition made in the 1977 Amendments to the Clean Air Act required § 111 standards for new sources to reflect “the best *technological* system of *continuous* emission reduction.”<sup>49</sup> In contrast, the § 111 standards for existing sources were to reflect the “best system of continuous emission reduction,”<sup>50</sup> which, as clarified by the Conference Report, need not be a technological system.<sup>51</sup> In 1990, Congress removed the requirements that standards for new sources be based on “technological” systems and that standards for both new and existing sources achieve “continuous” reductions, restoring use of broad “system” language for both new and existing source standards.<sup>52</sup> It is noteworthy that even during the period of time when Congress determined a more specific definition of “standard of performance” was advisable for new sources, it did not take this approach for existing sources. The current text of the Clean Air Act reflects both Congress’ more recent decision to allow EPA to select a non-technological system of emission reduction when promulgating standards for new sources under § 111 as well as Congress’ longstanding policy of allowing that approach for existing sources.

Courts have recognized that the identification of the best system of emission reduction is an expansive, flexible endeavor, in the service of securing the maximum emission reductions, finding that EPA may weigh “cost, energy, and environmental impacts in the broadest sense at the national and regional levels and over time as opposed to simply at the plant level in the immediate present.”<sup>53</sup> Further, courts have noted that EPA’s choice of the best system of emission reduction should encourage the development of systems that achieve greater emission reductions at lower costs and deliver energy and nonair health and environmental benefits.<sup>54</sup>

In short, § 111 gives EPA wide discretion to identify an emission reduction system that relies on solutions such as averaging to maximize environmental performance and enhance cost-effectiveness.

**B. The language of § 111 is sufficiently broad to authorize the selection of an averaging system as the best system of emission reduction.**

<sup>54</sup> *Id.* at 346-47.

Although the term “best system of emission reduction” is broad, it is not unbounded. Section 111 requires the “best” system to be the system adequately demonstrated to achieve the maximum emission reductions from the regulated sources, considering cost and impacts on non-air quality health or environmental impacts and energy requirements. The system must also provide the foundation for state standards of performance to apply a “standard for emissions” to “any existing source” in the listed category. EPA must seek out the system that best serves these clearly enunciated goals of § 111.

There are many available options for reducing carbon dioxide emissions from existing power plants through modifications or upgrades at these plants. In order to satisfy the statutory criteria described above, such an analysis of “onsite” measures would by necessity be expansive in scope—including not only significant improvements to the efficiency or “heat rate” of the plant, but also other emission reduction measures such as co-firing or re-powering with lower-carbon fuels;<sup>55</sup> utilizing renewable energy sources to provide supplemental steam heating;<sup>56</sup> using available waste heat to remove moisture from coal or switching to higher-rank coal;<sup>57</sup> and implementing combined heat and power (CHP) systems at plants near industrial facilities or district heating systems,<sup>58</sup> among other solutions. For example, engineering firms have estimated that with modest modifications, coal-fired power plants can derive as much as 50% of their heat input from natural gas.<sup>59</sup> Co-firing at this level could yield emission reductions of 20%, and could be combined with heat rate and other improvements to achieve even deeper reductions at a specific plant.

In some circumstances, however, averaging systems may distinctively further the statutory factors.<sup>60</sup> Flexible averaging programs implemented under the Clean Air Act and by states and

<sup>57</sup> See EPA, *Available and Emerging Technologies for Reducing Greenhouse Gas Emissions From Coal-Fired Electric Generating Units*, at 31-33 (Oct. 2010), available at <http://www.epa.gov/nsr/ghgdocs/electricgeneration.pdf> (describing a commercially-available on-site drying process that can reduce CO<sub>2</sub> emissions from a pulverized coal boiler by approximately 4%).

<sup>58</sup> See *id.* at 34-35.

<sup>59</sup> See Reinhart et al., *supra* note 55.

<sup>60</sup> EPA has allowed averaging or trading programs where they provide greater emissions reductions than source-specific technology standards. See, e.g., *Regional Haze Regulations*, 64 Fed. Reg. 35,714,

companies have demonstrated that they can significantly lower the cost of cutting pollution because they facilitate capture of the lowest-cost emission reduction opportunities.<sup>61</sup> In the context of the forthcoming Carbon Pollution Standards for existing power plants, a flexible averaging framework that rigorously quantifies the emission reductions achieved via increased utilization of lower and zero-emitting generation and investments in demand-side energy efficiency could achieve very substantial carbon pollution reductions cost-effectively while enabling proactive management of generation capacity and enhancement of grid reliability. Indeed, a flexible system would facilitate efficient compliance not only with the Carbon Pollution Standards but also with other applicable air quality and energy regulations, allowing states and companies to make sensible investments in multi-pollutant emission reductions and clean, safe, and reliable electricity infrastructure. Such a system would enable states to consider the “remaining useful life” of sources as the Clean Air Act provides<sup>62</sup> and optimize investments in existing and new generation to secure the necessary emission reductions. A flexible system that facilitates a variety of emission reduction pathways is also the system already being deployed by a number of states and companies, mobilizing innovative emission reduction measures and securing significant reductions in carbon pollution.<sup>63</sup>

---

35,739 (July 1, 1999) (allowing state plans “to adopt alternative measures in lieu of BART where such measures would achieve even greater reasonable progress toward the national visibility goal”).

<sup>61</sup> For example, a recent survey of economic research found that the Clean Air Act’s flexible Acid Rain Program has achieved “a range of 15-90 percent savings, compared to counterfactual policies that specified the means of regulation in various ways and for various portions of the program’s regulatory period.” Gabriel Chan, Robert Stavins, Robert Stowe & Richard Sweeney, *The SO<sub>2</sub> Allowance Trading System and the Clean Air Act Amendments of 1990: Reflections on Twenty Years of Policy Innovation*, at 5 (2012), available at [http://belfercenter.ksg.harvard.edu/files/so2-brief\\_digital4\\_final.pdf](http://belfercenter.ksg.harvard.edu/files/so2-brief_digital4_final.pdf).

<sup>62</sup> 42 U.S.C. § 7411(d)(1).

<sup>63</sup> Some have suggested that the general Clean Air Act definition of “standard of performance” in § 302(l) also applies in the context of § 111, and precludes an averaging approach because it requires “continuous emission reduction.” *Id.* § 7602(l). It is unlikely that the § 302(l) definition applies given that Congress provided a specific and different definition of the term “[f]or purposes of” § 111, 42 U.S.C. § 7411(a). See *Reynolds v. United States*, 132 S. Ct. 975, 981 (2012) (specific statutory language supersedes general language); *Fourco Glass Co. v. Transmirra Prods. Corp.*, 353 U.S. 222, 228 (1957) (same). However, even if § 302(l) were found to apply, an averaging approach qualifies as “a requirement of continuous emission reduction” per the § 302(l) definition because covered sources must collectively achieve the emission limitations, which apply continuously. Even in a flexible program each source meets its obligations continuously. Under an averaging framework each source must secure the emission reductions needed, onsite or from other plants, to continuously be in compliance with the standard.

It is also worth noting that the generally applicable definition of “emission standard” in § 302(k) likely does inform the otherwise undefined phrase “standard for emissions” within the definition of “standard of performance” in § 111(a)(1). See 42 U.S.C. § 7416 (referring to an “emission standard or limitation . . . under section 7411”). A § 302(k) “emission standard” or “emission limitation” is defined as “a requirement . . . which limits the quantity, rate, or concentration of emissions of air pollutants *on a continuous basis*.” *Id.* § 7602(k) (emphasis added). An averaging approach qualifies as an “emission standard” or “emission limitation,” because covered sources must meet a limitation that applies

EPA has long interpreted the statute to authorize the Agency to determine when an averaging framework is an appropriate emission reduction system for a § 111(d) standard. In one of its first § 111(d) rulemakings after the Clean Air Act Amendments of 1990, EPA's 1995 emission guidelines for existing municipal waste combustors allowed states to establish averaging and trading programs through which these sources could meet standards for nitrogen oxides (“NO<sub>x</sub>”) emissions.<sup>64</sup>

In addition, the Clean Air Act provides that the procedure for establishing standards of performance for existing sources under § 111(d) is to be “similar” to that of § 110,<sup>65</sup> and § 110 expressly provides that emission limitations and control measures can include “fees, marketable permits, and auctions of emissions rights.”<sup>66</sup> The direct link to § 110 thus further reinforces the appropriateness of such flexible approaches under § 111(d).

In the context of § 111 and greenhouse gas emissions, a flexible system that enables a wide variety of available solutions to achieve rigorous and cost-effective carbon pollution reductions manifestly fulfills the statutory criteria for the “best” system.

**C. Both EPA and the states can consider broad systems of emission reduction under § 111.**

Some stakeholders have proposed that there are systems of emission reduction that states may include in § 111(d) implementation plans that EPA may not consider in identifying the best system of emission reduction. This hypothesis assumes that when EPA identifies the best system of emission reduction under § 111(a)(1) it must ignore certain flexible, cost-effective means of securing emission reductions from fossil fuel power plants, while a state may rely on these very mechanisms in developing a “plan which . . . provides for the implementation and enforcement of such standards of performance” under § 111(d)(1). This contention is directly contrary to the process set forth in § 111, under which EPA must consider cost, impacts on energy, and other factors in identifying the best system of emission reduction; if there are systems of emission reduction that can better optimize pollution reductions considering cost, impacts on energy, etc., EPA must consider such systems in order to identify the best system.

Section 111 requires EPA to determine the best system of emission reduction for existing stationary sources. States then implement the system of emission reduction they deem most appropriate for their sources—which could be more expensive, more stringent, or have different

---

continuously. Indeed, Congress used the term “emission limitation” in 1990 to describe its Acid Rain Program. *See id.* §§ 7651b(a)(1), 7651c(a).

<sup>64</sup> 40 C.F.R § 60.33b(d)(2). This provision is still in effect. EPA also designed a trading program for mercury from power plants under § 111(d), 70 Fed. Reg. 28,606 (May 18, 2005), but the regulation of mercury under § 111(d) was found to violate the Act's requirement that hazardous air pollutants be regulated under § 112, *see New Jersey v. EPA*, 517 F.3d 574 (D.C. Cir. 2008), *cert. dismissed*, 555 U.S. 1162 (2009), *and cert. denied*, 555 U.S. 1169 (2009).

<sup>65</sup> 42 U.S.C. § 7411(d)(1).

<sup>66</sup> *Id.* § 7410(a)(2)(A).

energy requirements or non-air impacts on health or the environment—provided that the states’ plans secure the same or better emission reductions as the “best system of emission reduction” identified in EPA’s emission guidelines. States can also innovate under § 111, and implement cutting-edge systems of emission reduction of which EPA may not have been aware or which it may not have deemed “adequately demonstrated.” However, neither the language of § 111 nor EPA’s implementing guidelines distinguish between the systems of emission reduction that state plans can implement and the systems of emission reduction that EPA is to review in identifying the “best system of emission reduction.” The systems of emission reduction to be evaluated by EPA and the systems that can be implemented by the states share the same legal contours. As such, for EPA to ignore well-known and adequately demonstrated systems of emission reduction that achieve greater emission reductions and satisfy the other statutory criteria would be arbitrary. Indeed, if EPA were to adopt a narrow scope of inquiry, closing its eyes to what states are doing, and identify a “best system” that failed to achieve meaningful emission reductions—and then approve state plans implementing other systems capable of achieving greater emission reductions cost-effectively—the Agency would clearly violate its statutory responsibility to identify the best system of emission reduction.

## **V. Conclusion**

Across the country, states and power companies are reducing emissions from fossil fuel fired power plants by improving plant efficiency, by increasing the use of lower-carbon generation capacity and zero-emitting energy, and by investing in demand-side energy efficiency and demand management. The widespread and long-established use of this system and its success in achieving cost-effective carbon pollution reductions for diverse states and companies indicate that it satisfies the statutory criteria for the “best system of emission reduction.” This system allows states and companies to adjust to locally relevant factors and generation-fleet characteristics, deploying the emission reduction strategies most appropriate and effective. The language of § 111 is sufficiently broad to encompass a system-based approach to securing carbon pollution reductions from existing power plants. Indeed, the constraints provided by § 111—directing EPA to identify the system of emission reduction best able to secure rigorous carbon emission reductions considering cost and impacts on energy and other environmental considerations—strongly suggest that a system-based approach is optimal in satisfying the statutory requirements by securing the vital cuts in carbon pollution that science demands through locally-tailored and innovative solutions.

## QUESTIONS PRESENTED

The Clean Air Act's "good neighbor" provision, 42 U.S.C. § 7410(a)(2)(D)(i)(I), requires States to include in implementation plans "adequate provisions" that, "consistent with the provisions" of Title I of the Act, prohibit sources within their borders from emitting air pollutants in "amounts" that "contribute significantly" to other States' "nonattainment" of national ambient air quality standards (NAAQS). Invoking this provision, the Environmental Protection Agency (EPA) adopted the Transport Rule, requiring upwind-state emission reductions without regard to whether the required reductions went beyond those needed to eliminate a State's significant contribution and without regard to whether those reductions went beyond those needed for NAAQS attainment.

The questions presented are as follows:

1. Whether EPA's refusal to allow state implementation of the EPA-determined reduction requirements at the program's outset was unlawful.
2. Whether EPA lacks authority under the good neighbor provision to prohibit upwind-state emissions that reach a downwind State in amounts that EPA expressly found do not contribute significantly to nonattainment.
3. Whether EPA was required to assure that Transport Rule emission reductions do not exceed the amounts needed for NAAQS attainment.
4. Whether EPA was required to base good-neighbor emission reduction requirements on only the fraction of an upwind State's total emissions that reach a downwind State and contribute significantly to nonattainment in that State.
5. Whether the court of appeals had jurisdiction to consider *Chevron* step-one challenges to the rule.

(i)

## **PARTIES TO THE PROCEEDING**

A list of all parties to the proceeding is set forth at pages II-IV of the Brief for the Federal Petitioners.

### **RULE 29.6 STATEMENTS**

The **Utility Air Regulatory Group (UARG)** is a not-for-profit association of individual electric utilities and electric generating companies and national trade associations that participates on behalf of its members collectively in administrative proceedings under the Clean Air Act, and in litigation arising from those proceedings, that affect electric generators. UARG has no outstanding shares or debt securities in the hands of the public and has no parent company. No publicly held company has a 10 percent or greater ownership interest in UARG.

**Southern Company Services, Inc., Alabama Power Company, Georgia Power Company, Gulf Power Company, Mississippi Power Company, and Southern Power Company** are all wholly-owned subsidiaries of Southern Company, which is a publicly-held corporation. Other than Southern Company, no publicly-held company owns 10 percent or more of any of these respondents' stock. No publicly-held company holds 10 percent or more of Southern Company's stock. Southern Company stock is traded publicly on the New York Stock Exchange under the symbol "SO." Through its subsidiaries, Southern Company is a leading U.S. producer of electricity, generating and delivering electricity to over four million customers in the southeastern United States. Southern Company subsidiaries include four vertically integrated electric utilities—

Alabama Power Company, Georgia Power Company, Gulf Power Company, and Mississippi Power Company—as well as Southern Power Company, which owns generation assets and sells electricity at market-based rates in the wholesale market. These subsidiaries, each a respondent here, operate nearly 46,000 megawatts of coal, natural gas, oil, nuclear, and hydroelectric generating capacity. Southern Company Services, Inc. is the services company for Southern Company and its operating subsidiaries. Southern Company Services, Inc. provides, among other things, engineering and other technical support for the operating companies.

Pursuant to Rule 29.6 of the Supreme Court of the United States, counsel for the Environmental Committee of the Florida Electric Power Coordinating Group, Inc. certifies that the **Florida Electric Power Coordinating Group, Inc.** (FCG), is a non-profit, non-governmental corporate entity organized under the laws of Florida. The FCG does not have a parent corporation. No publicly held company owns 10 percent or more of the FCG's stock.

The **Midwest Ozone Group** is an unincorporated association of businesses and organizations formed to assist in the development of scientifically sound and effective air quality strategies. The Midwest Ozone Group has no outstanding shares or debt securities in the hands of the public and has no parent company. No publicly held company has a 10 percent or greater ownership interest in the Midwest Ozone Group.

Pursuant to Supreme Court Rule 29.6, counsel for the **National Mining Association** (NMA) certifies

that the NMA is an incorporated national trade association whose members include the producers of most of America's coal, metals, and industrial and agricultural minerals; manufacturers of mining and mineral processing machinery, equipment, and supplies; and engineering and consulting firms that serve the mining industry. NMA has no parent company, and NMA has not issued shares or debt securities to the public, although NMA's individual members have done so.

The **National Rural Electric Cooperative Association** (NRECA) is the national association of rural electric cooperatives. NRECA does not have a parent corporation, and no publicly held company owns 10 percent or more of its stock.

Pursuant to Supreme Court Rule 29.6, counsel for **Peabody Energy Corporation** certifies that it is a publicly-traded company on the New York Stock Exchange under the symbol "BTU." Peabody Energy Corporation does not have a parent company, and as of December 31, 2012 filings, no holding companies own 10 percent or more of Peabody Energy Corporation's outstanding shares.

## OPINIONS BELOW

The opinion of the court of appeals (Pet. App. 1a-116a) is reported at 696 F.3d 7 (D.C. Cir. 2012). The final rule of the Environmental Protection Agency (EPA or Agency) (Pet. App. 117a-1417a) is reported at 76 Fed. Reg. 48,208 (Aug. 8, 2011).

## JURISDICTION

The judgment of the court of appeals was entered on August 21, 2012. Petitions for rehearing were denied on January 24, 2013 (Pet. App. 1459a-1462a). The petitions for writs of certiorari were filed on March 29, 2013, and granted (and consolidated) on June 24, 2013. This Court's jurisdiction rests on 28 U.S.C. § 1254(1).

## STATUTORY PROVISIONS INVOLVED

Pertinent statutory provisions are set out in an appendix to the Brief for the Federal Petitioners.

## STATEMENT OF THE CASE

### I. Statutory and Regulatory Background

1. The Clean Air Act (CAA or Act) employs a “co-operative federalism” approach to the development and implementation of air quality standards. As described by the State and Local Government Respondents supporting affirmance of the court of appeals' decision, EPA defines air quality “ends,” and the States then choose the “means” to achieve those ends through state implementation plans (SIPs). Brief of Respondents State of Texas, *et al.* (hereinafter Brief of State and Local Government Respondents or State Br.), at 1-2; see 42 U.S.C. § 7410(a). In

this way, the CAA makes control of air pollution “the primary responsibility of States and local governments.” 42 U.S.C. § 7401(a)(3); see *id.* § 7407(a).

The CAA directs States to implement a series of programmatic requirements in their SIPs, which result in future emission reductions consistent with the terms of the specific CAA programs being implemented. See 42 U.S.C. § 7410(a)(2). Such programmatic requirements include, for example, “New Source Review” permitting programs, *id.* § 7410(a)(2)(C); visibility protection requirements, *id.* § 7410(a)(2)(J); and the “good-neighbor” program, which requires that SIPs “contain adequate provisions . . . prohibiting, consistent with the provisions of this subchapter [*i.e.*, Title I of the Act]” emissions of pollutants from sources within the State that will “contribute significantly to nonattainment” of national ambient air quality standards (NAAQS) in any other State. *Id.* § 7410(a)(2)(D).

This case involves the peculiar challenges posed by implementation of the good-neighbor program in the context of regional air pollution problems.

2. Before its amendment in 1990, the good neighbor provision focused on localized interstate impacts on nonattainment. That pre-1990 version targeted emissions from “any stationary source” in one State that “prevent[ed]” attainment of NAAQS in another State. *Air Pollution Control Dist. v. EPA*, 739 F.2d 1071, 1075-76 (6th Cir. 1984) (quoting pre-1990 version of good neighbor provision). The provision was structured to deal with NAAQS like the one for sulfur dioxide that involve elevated local pollution caused by emissions from a nearby source or a discrete group of nearby sources. See *id.* at 1075-77;

*Connecticut v. EPA*, 656 F.2d 902, 906 (2d Cir. 1981). The pre-1990 version was never used to address NAAQS like the ones for ozone or fine particulate matter (PM<sub>2.5</sub>). NAAQS for those pollutants address regional pollution formed through the transport and chemical transformation of so-called “precursor” pollutants that are emitted by numerous stationary and mobile sources over a large geographic area. See generally EPA, EPA-454/B-07-002, Guidance on the Use of Models and Other Analyses for Demonstrating Attainment of Air Quality Goals for Ozone, PM<sub>2.5</sub>, and Regional Haze at 4-5 (Apr. 2007), available at [www.epa.gov/scram001/guidance\\_sip.htm](http://www.epa.gov/scram001/guidance_sip.htm) (describing how ozone and PM<sub>2.5</sub> can result from precursor emissions far upwind).

In 1990, Congress amended the good neighbor provision to better address this type of regional pollution. See 63 Fed. Reg. 57,356, 57,367 (Oct. 27, 1998) (“Under the 1990 Amendments, Congress recognized the growing evidence that ozone and its precursors can be transported over long distances and that the control of transported ozone was a key to achieving attainment of the ozone standard across the nation.”). As amended in 1990, the provision covered all “emissions activity within the State,” not just “any stationary source” in the State. And the trigger for regulation was changed from emissions that “prevent attainment” to those that “contribute significantly to nonattainment.” The good neighbor provision now provides that SIPs must:

contain adequate provisions—

(i) prohibiting, consistent with the provisions of this subchapter [*i.e.*, Title I of the Act], any source or

other type of emissions activity within the State from emitting any air pollutant in amounts which will—

(I) contribute significantly to nonattainment in . . . any other State with respect to any such national primary or secondary ambient air quality standard . . . .

42 U.S.C. § 7410(a)(2)(D).

The text of the good neighbor provision establishes two criteria that define the scope of the contemplated “prohibit[ion]” on emissions that “contribute significantly to nonattainment.” First, only “significant[ ]” contributions to ambient air quality that is in “nonattainment” are properly subject to regulation by EPA. Accordingly, the provision cannot be invoked to prohibit emissions that contribute *insignificantly* to nonattainment or that contribute to air quality that is as good as, or better than, the NAAQS. Second, only that portion of the total emissions from an upwind State that both reaches a downwind State *and* contributes significantly to nonattainment in that State may be subject to the regulatory requirement. The good neighbor provision, in other words, targets only that portion of the upwind State’s emissions that contributes significantly to nonattainment areas in downwind States. It cannot be used to require regulation of emissions that are not transported outside the upwind State to such a downwind area.

The good neighbor provision is but one of the emission reduction measures Congress established to address nonattainment. In establishing this measure, Congress mandated that any prohibition on

emissions that contribute “significantly” must be “consistent with the provisions of [Title I of the CAA].” 42 U.S.C. § 7410(a)(2)(D)(i) (emphasis added). Thus, EPA’s “significant contribution” reduction requirements not only must observe the statutory limits discussed above but also must be “consistent with” separate but related CAA provisions.

Two elements are common to all of the statutory requirements in Subpart D of Title I of the CAA, 42 U.S.C. §§ 7501-7515, that relate to *intrastate* nonattainment SIPs. First, nonattainment emission reduction requirements must stop at the point of NAAQS attainment. Second, reduction requirements must be moderated where achieving attainment would be infeasible or otherwise entail excessive costs. See, e.g., 42 U.S.C. § 7502(c)(2) (“plan provisions shall require reasonable further progress” toward attainment); *id.* § 7501(1) (defining “reasonable further progress” as “such annual incremental reductions in emissions . . . as . . . may reasonably be required . . . for the purpose of ensuring attainment”); *id.* § 7502(c)(1) (“[s]uch plan provisions shall provide for the implementation of all reasonably available control measures,” including “reasonably available control technology”); 40 C.F.R. § 51.100(o) (defining “[r]easonably available control technology” as including consideration of control costs); 42 U.S.C. § 7511b(d) (providing that, in support of state plan development, EPA “shall provide guidance to the States to be used in evaluating the relative cost-effectiveness of various options for the control of emissions from existing stationary sources . . . which contribute to nonattainment”); *id.* § 7509(d) (“[c]onsequences for failure to attain” NAAQS in an area include imposition of “such additional measures

as [EPA] may reasonably prescribe, including all measures *that can be feasibly implemented in the area in light of technological achievability, costs, and any . . . health and environmental impacts*” (emphasis added)).<sup>1</sup>

To be “consistent with” these intrastate nonattainment provisions, EPA, in establishing good-neighbor emission reduction obligations, may use costs and feasibility to moderate the level of emission reductions that otherwise would be required where limiting contributions to nonattainment in a downwind State would otherwise be unreasonable. As the court below observed: “EPA may consider cost, but only to further lower an individual State’s [emission reduction] obligations” under the good neighbor provision. Pet. App. 27a (citing *Michigan v. EPA*, 213 F.3d 663, 675 (D.C. Cir. 2000) (per curiam); *North Carolina v. EPA*, 531 F.3d 896, 918 (D.C. Cir.) (per curiam), *modified on other grounds on reh’g*, 550 F.3d 1176 (D.C. Cir. 2008) (per curiam)).

---

<sup>1</sup> See also 42 U.S.C. § 7511(b)(2) (providing that, for ozone, the consequence of an area’s failure to attain generally is “re-classification” of the area so as to provide more time for attainment and to require application of additional, feasible controls); *id.* § 7513(e) (providing that, for particulate matter, attainment deadlines may be extended if attainment by the otherwise-applicable statutory date “would be impracticable” and the State demonstrates it has required the most stringent measures that “can feasibly be implemented in the [nonattainment] area” in question).

## **II. EPA's Approach to Defining Good-Neighbor Emission Reduction Obligations for Regional Pollution Problems**

### **A. EPA's Decision To Define States' Good-Neighbor Emission Reduction Obligations Through Separate and Distinct Comprehensive Regional Programs**

EPA first invoked the amended good neighbor provision to address a regional pollution problem in the late 1990s in the rulemaking that became known as the "NO<sub>x</sub> SIP Call."<sup>2</sup> See 63 Fed. Reg. 57,356 (Oct. 27, 1998). In that rulemaking, EPA addressed significant contributions to nonattainment of NAAQS for the pollutant ozone and, in this context, addressed what it means to "contribute significantly to nonattainment." See *id.* at 57,369.

For other CAA SIP programs, EPA has promulgated regulations that establish generally applicable requirements for identifying emissions that might need to be reduced and criteria for developing future emission limitations under those programs. EPA uses this "how-to manual" approach, for example, in addressing SIPs required by 42 U.S.C. § 7410(a)(2)(J) to implement the CAA visibility protection program, which calls for "reasonable progress" toward a national visibility goal, 42 U.S.C. § 7491(b)(2). EPA does not itself identify specific "reasonable progress" emission reductions for each State to implement through SIP revisions. Rather, EPA's regulations provide instructions for States to follow in developing their own "reasonable progress" emission reduction

---

<sup>2</sup> "NO<sub>x</sub>" means "nitrogen oxides."

requirements for their SIPs. See 40 C.F.R. § 51.308(d), (e).

Theoretically, EPA could have developed a similar approach with respect to the good neighbor provision. If EPA had done so, then immediately after EPA promulgated any new NAAQS, each State would have had a defined process to follow that would allow it to identify—and to develop control requirements that would satisfy—any good-neighbor emission reduction obligations it might have. But, instead of establishing a process that would allow each State to determine whether emission reductions are required—and, if they are, to determine the required amounts of those reductions—EPA opted for a federal rulemaking approach on a multi-state scale, under which EPA itself (1) identifies those States that have good-neighbor emission reduction obligations, (2) defines or quantifies those obligations for each chosen State, and then (3) gives each such State the opportunity to implement those obligations through SIP revisions. See 63 Fed. Reg. at 57,369, 57,376.

In its NO<sub>x</sub> SIP Call rulemaking, EPA selected this multi-state approach because NO<sub>x</sub> and other ozone precursors emitted over a wide geographic area can contribute to ozone concentrations in the ambient air hundreds of miles away, through a variety of chemical and atmospheric processes that transform those precursors into ground-level ozone. See *id.* at 57,359, 57,360. As EPA explained:

It is becoming increasingly apparent that some of the most highly polluted ozone nonattainment areas will not be able to demonstrate attainment simply

through the implementation of control measures within the nonattainment area. In some cases, significant ozone concentration and precursor emission reductions within the upwind air mass being transported into the nonattainment area also appear to be necessary.

62 Fed. Reg. 1420, 1422 (Jan. 10, 1997).

EPA recognized that its decision to define by regulation the good-neighbor emission reduction obligations of upwind States must be harmonized with the CAA's cooperative federalism structure. Under this structure, EPA could not simultaneously define the reduction obligation and dictate the measures that sources in each covered State must use to meet that obligation. See *Train v. Natural Res. Def. Council, Inc.*, 421 U.S. 60, 79 (1975) ("The Act gives the Agency no authority to question the wisdom of a State's choices of emission limitations if they are part of a plan which satisfies the standards of [42 U.S.C. § 7410(a)(2)], and the Agency may devise and promulgate a specific plan of its own only if a State fails to submit an implementation plan which satisfies those standards.") (citing 42 U.S.C. § 7410(c)). Rather, the States must be given an opportunity to implement their emission reduction obligations as newly defined by EPA. Accordingly, EPA used the CAA's SIP call provision—42 U.S.C. § 7410(k)(5)—and gave each State included within the program the opportunity and time to revise its SIP to implement its EPA-defined statewide good-neighbor emission reduction obligation. EPA's approach in this respect was consonant with the Act's core structure, under which EPA promulgates NAAQS or regulations governing programmatic emission reduction requirements, and

States determine the mix of controls to implement those EPA-defined control objectives. As EPA explained in promulgating the NO<sub>x</sub> SIP Call,

[o]nce EPA determines the overall level of reductions (by assigning the aggregate amounts of emissions that must be eliminated to meet the requirements of [42 U.S.C. § 7410(a)(2)(D)]), it falls to the State to determine the appropriate mix of controls . . . .

63 Fed. Reg. at 57,369.

This decision, whatever its merit, had consequences for the establishment of future good-neighbor emission reduction obligations to address regional pollution problems. In particular, EPA's decision meant that a State would not—indeed, could not—know whether it “significantly contributed” to downwind nonattainment, and, if so, what emission reductions the good neighbor provision demanded of it, until EPA had conducted and completed a comprehensive good-neighbor regional rulemaking.

As EPA explained,

the data and analytical tools available at the time the section [7410(a)(2)(D)] SIP is developed and submitted to EPA necessarily affect the content of the [SIP] submission [required after promulgation of a new NAAQS]. Where . . . the data and analytical tools to identify a significant contribution from upwind States to nonattainment areas in downwind States are available [*i.e.*, where EPA has adopted a final rule

identifying good-neighbor reductions for covered States], the State's SIP submission must address the existence of the contribution and the emission reductions necessary to eliminate the significant contribution.

70 Fed. Reg. 25,162, 25,263 (May 12, 2005). Because some States would be evaluated in EPA's regional rulemaking, however, EPA recognized that

*the section [7410(a)(2)(D)] SIP submission [for such a State] should indicate that the necessary information is not available at the time the submission is made . . . . EPA [will] . . . act at a later time after the initial section [7410(a)(2)(D)] submissions to issue a SIP call under section [7410(k)(5)] to States to revise their SIPs to provide for additional emission controls to satisfy the section [7410(a)(2)(D)] obligations if such action [is] warranted based upon subsequently-available data and analyses.*

*Id.* at 25,263-64 (emphasis added). In other words, if a State is not in a multi-state good-neighbor program, it has no obligation to submit a SIP requiring additional emission controls. If controls are found to be needed later, EPA will identify the State's emission reduction obligation at that time through a SIP call rulemaking.

## **B. The NO<sub>x</sub> SIP Call and CAIR**

The briefs of State and Local Government Respondents and of Industry and Labor Respondents

discuss EPA's first two regional good-neighbor programs—the NO<sub>x</sub> SIP Call, which addressed good-neighbor obligations under the 1997 “8-hour” ozone NAAQS and the 1979 “1-hour” ozone NAAQS, and the Clean Air Interstate Rule (CAIR), which addressed the 1997 NAAQS for 8-hour ozone and for annual PM<sub>2.5</sub>. This brief will not duplicate that discussion but emphasizes three important features of these programs that bear on the questions addressed here.

First, both of these programs used the same basic two-step framework for identifying and quantifying the good-neighbor emission reduction obligations for regionally widespread pollutants like ozone and PM<sub>2.5</sub>. That framework requires EPA: (1) to identify which States have emission reduction obligations and which do not; and (2) to define, in quantitative terms, that obligation for each covered State. See, *e.g.*, 63 Fed. Reg. at 57,365.

Second, as discussed in the Brief of State and Local Government Respondents, both the NO<sub>x</sub> SIP Call and CAIR respected the CAA's cooperative federalism structure by calling on States to submit SIPs to implement the emission reduction obligations identified in EPA's comprehensive rule. The NO<sub>x</sub> SIP Call gave States “real choice” as to how to implement the obligations defined by EPA. *Michigan*, 213 F.3d at 687-88. CAIR likewise gave the States “the flexibility to choose the measures to adopt to achieve the specified emissions reductions.” 70 Fed. Reg. at 25,167.

Finally, each of EPA's multi-state programs, including the Transport Rule, was unique. It was impossible for any State to know definitively whether it

would be included in these multi-state programs at all, let alone what its precise reduction obligations would be, until EPA took final rulemaking action resolving those issues. EPA relied exclusively on its own modeling to identify the States contributing to ozone and PM<sub>2.5</sub> nonattainment at levels exceeding the EPA-specified “insignificance” thresholds and to unravel the linkages between upwind and downwind States. Each of EPA’s good-neighbor rulemakings was infused with myriad technical assumptions and policy judgments that were subject to change between EPA’s proposal and its final promulgation of each program. As a result, predicting the outcome of these determinations in advance for each of these distinct good-neighbor programs would have been impossible—a “fool’s errand.” State Br. at 40.

### III. The Transport Rule

In August 2010, EPA proposed the Transport Rule as its response to the D.C. Circuit’s remand of CAIR in *North Carolina*. 75 Fed. Reg. 45,210 (Aug. 2, 2010). EPA promulgated the final Transport Rule a year later. 76 Fed. Reg. 48,208 (Aug. 8, 2011) (Pet. App. 117a-1417a).

In the Transport Rule, EPA created, “from the ground up,” *North Carolina*, 531 F.3d at 929, a new good-neighbor emission reduction program, covering different States, addressing an additional NAAQS, and imposing different emission reductions than did CAIR or the NO<sub>x</sub> SIP Call. In developing the Transport Rule, EPA applied its two-step framework to develop programs for the 1997 NAAQS for ozone and PM<sub>2.5</sub> addressed in CAIR as well as the newer, 2006 “24-hour” NAAQS for PM<sub>2.5</sub>.

At step one, EPA found that upwind-state emissions contributing less than one percent of the relevant NAAQS to any downwind area “do not significantly contribute to nonattainment or interfere with maintenance of the relevant NAAQS.” 76 Fed. Reg. at 48,236, 48,237 (Pet. App. 255a, 256a). EPA used this insignificance threshold to identify those States that were not subject to *any* good-neighbor emission reduction obligation for the ozone and PM<sub>2.5</sub> NAAQS. For those States contributing above the threshold, EPA in step two defined their emission reduction obligations using cost-effectiveness criteria that differed from those used in earlier programs. See 75 Fed. Reg. at 45,233 (contrasting Transport Rule cost analysis with that in the NO<sub>x</sub> SIP Call and CAIR).

The coverage of States in the proposed Transport Rule differed from that in CAIR, with some States added and others removed. *Id.* at 45,338 (explaining differences in coverage between CAIR and the proposed Transport Rule). The coverage also changed between the proposed and final rules for each of the NAAQS being addressed. Initially, a total of 31 States and the District of Columbia had emission reduction responsibilities. *Id.* at 45,212-13 (24 jurisdictions for annual PM<sub>2.5</sub> NAAQS; 25 for 24-hour PM<sub>2.5</sub> NAAQS; and 26 for ozone NAAQS). But the States covered by the program remained in flux until EPA promulgated the final Transport Rule. In the final rule, EPA imposed emission reduction obligations on Texas without prior notice, while EPA dropped other States from the program altogether. EPA included 27 States in the final rule. 76 Fed. Reg. at 48,210 (Pet. App. 130a-131a) (18 States for annual PM<sub>2.5</sub> NAAQS; 21 for 24-hour PM<sub>2.5</sub> NAAQS; and 20 for ozone NAAQS).

Two aspects of the final Transport Rule are important here. First, unlike its predecessors, the Transport Rule did not call on States to develop and submit SIPs establishing the means for accomplishing the EPA-defined ends. To the contrary, EPA immediately imposed federal implementation plans (FIPs) to implement those obligations. *Id.* at 48,208, 48,212, 48,219-20 (Pet. App. 117a, 139a-142a, 170a-176a).

Second, EPA declined to evaluate whether the emission reductions mandated by the final rule conformed to limits imposed by the text of the good neighbor provision—*i.e.*, whether the final rule’s requirements assured that emissions that either make no contribution or make only an “insignificant” contribution to nonattainment would be excluded from the rule’s coverage.

#### **IV. The Decision of the Court of Appeals**

When the D.C. Circuit was asked to review the Transport Rule, the court began, as every reviewing court must, by identifying the statutory limits imposed on agency authority. It then assessed EPA’s action in the context of those statutory limits.

As a result of this analysis, the court found that the Transport Rule violated the language of 42 U.S.C. § 7410(a)(2)(D)(i)(I) and the D.C. Circuit’s mandate in *North Carolina*. The rule crossed three clear statutory limitations on EPA’s authority by: (1) requiring reductions in emissions that contribute insignificantly to downwind nonattainment; (2) requiring greater emission reductions than needed to achieve attainment; and (3) requiring reductions in emissions from an upwind State that would never

reach the downwind nonattainment areas in question. Pet. App. 31a-40a. The court also found that EPA had no authority under 42 U.S.C. § 7410(c) to promulgate FIPs implementing this new and unique multi-state program without first having defined the end required of States (*i.e.*, state emission budgets) and then having given each State an opportunity to choose the means of achieving those ends through development and submittal of a SIP.

### SUMMARY OF ARGUMENT

The court of appeals correctly held that EPA acted beyond its statutory authority in promulgating the Transport Rule and that the rule was therefore unlawful. The court of appeals' decision should be affirmed.

I.A. The court of appeals had jurisdiction to address the FIP-before-SIP issue. Only the Transport Rule FIPs were before the court. No other EPA actions were affected by the court of appeals' vacatur of those FIPs. The Transport Rule FIPs and earlier SIP disapprovals (and findings of failure to submit) were separate and distinct EPA actions. As petitioners below were not collaterally attacking any earlier EPA actions, there was no jurisdictional impediment to the court's review of the merits of petitioners' FIP-before-SIP argument.

I.B. EPA chose to establish good-neighbor emission reduction requirements for ozone and PM<sub>2.5</sub> NAAQS through regional emission reduction programs. As a result, a State's good-neighbor ozone and PM<sub>2.5</sub> SIP obligations depended entirely on whether that State was included in the Transport Rule. Under any CAA program that must be imple-

mented in SIPs, States must be given the opportunity to exercise their statutory role at the implementation stage. The Transport Rule denied States that right.

The court of appeals correctly determined that the approach that EPA took in the Transport Rule was contrary to how the CAA's cooperative federalism structure works. EPA's argument here that States could have escaped EPA's imposition of a FIP by undertaking the regional analyses necessary to identify amounts of emissions that must be abated under the good neighbor provision conflicts with the system EPA chose to create to address regional interstate pollution. As EPA concluded in 1998, with respect to the ozone NAAQS, it was "EPA's responsibility" to determine the overall level of air pollutants that could be emitted in a given State without violating 42 U.S.C. § 7410(a)(2)(D)(i)(I). 63 Fed. Reg. at 57,369.

EPA reiterated this view of the good neighbor provision's applicability to regional pollution in defending the NO<sub>x</sub> SIP Call and in its CAIR rulemaking. The position EPA takes now in defense of the Transport Rule, however, flatly contradicts these long-standing pronouncements. And EPA's own actions in approving and disapproving good-neighbor SIPs establish that any SIP submittal by a potential Transport Rule State that was premised on the State's *not* contributing significantly to downwind nonattainment could not (and would not) have been approved until EPA concluded *in the final Transport Rule* that the State was outside the program.

II.A. The court of appeals correctly determined that the Transport Rule was statutorily flawed in

three distinct respects. The court's conclusion that the rule must be vacated as contrary to clear congressional intent should therefore be affirmed.

The first flaw is that the Transport Rule required upwind States to reduce amounts of pollutants that EPA itself had found to be "insignificant." Under 42 U.S.C. § 7410(a)(2)(D)(i)(I), the court of appeals held, EPA lacked statutory authority to compel such reductions. Once EPA found that amounts below one percent of the relevant NAAQS did not "contribute significantly" to nonattainment, EPA was precluded from requiring States to eliminate any portion of those "insignificant" contributions.

The second flaw is that the Transport Rule requires upwind-state reductions in emissions that never leave the State or contribute to downwind-state nonattainment. Because only part of the emissions originating in an upwind State will leave that State, and only a fraction of that part will "contribute significantly" to nonattainment in a downwind State, EPA exceeded its section 7410(a)(2)(D)(i)(I) authority.

The third flaw is that EPA failed in the Transport Rule to ensure that the collective obligations of the upwind States, when aggregated, did not produce unnecessary over-control (*i.e.*, more upwind-state emission controls than needed to achieve attainment of the NAAQS in downwind States). Under the plain terms of the good neighbor provision, the court held, EPA was required to account for such over-control. EPA does not here dispute the court of appeals' reading of the statute. The Agency can only suggest that the court's concern was theoretical in nature. But the record below contradicts EPA's attempts to dis-

miss the court's determination that the Transport Rule failed to respect this statutory limitation on EPA's authority.

II.B. The court of appeals had jurisdiction to consider the statutory objections to the lawfulness of the Transport Rule's "significant contribution" emission reduction requirements that were raised below. In addressing the statutory limits on EPA's "significant contribution" rulemaking authority, the court acted in accordance with its powers as a reviewing court.

The CAA imposes on a court reviewing EPA FIPs the obligation to "reverse any such action found to be . . . in excess of statutory jurisdiction, authority, or limitations." 42 U.S.C. § 7607(d)(9). That is what the court of appeals did: it determined that the Transport Rule failed as a matter of law. In so doing, the court acted in a manner consistent with the principles that underpin the administrative exhaustion doctrine and did not contravene the provisions of 42 U.S.C. § 7607(d)(7)(B). EPA argues here for a regime under which agencies would be discharged from obeying clear statutory commands, and reviewing courts would be precluded from exercising their constitutional and statutory responsibilities, whenever EPA claims that a statute's plain meaning is not spelled out with sufficient specificity in a rulemaking comment. That is not the law.

**ARGUMENT****I. The Court of Appeals' Invalidation of EPA's FIP-Before-SIP Approach Should Be Affirmed.****A. The Court of Appeals Had Jurisdiction To Address the FIP-Before-SIP Issue.**

The challenge below to EPA's FIP-before-SIP approach arose in briefing timely-filed petitions to review EPA's Transport Rule FIPs. Neither in those petitions nor in the briefs below did anyone argue that the earlier EPA actions disapproving SIPs and making findings of failure to submit SIPs should be set aside. Accordingly, the court below vacated only the Transport Rule FIPs; it rendered no judgment and made no disposition with respect to any other EPA action. As a result, petitioners below did not collaterally attack earlier EPA actions. For that reason, and the reasons presented in the Brief of State and Local Government Respondents, there was no jurisdictional impediment to the court of appeals' review of the merits of the FIP-before-SIP argument.

Petitioners also largely ignore timely petitions filed by Georgia, Kansas, and Ohio for judicial review of EPA's disapproval of their respective good-neighbor SIP submissions.<sup>3</sup> Proceedings on those pe-

---

<sup>3</sup> These EPA disapprovals are published at 76 Fed. Reg. 43,143 (July 20, 2011) (Kansas); 76 Fed. Reg. 43,159 (July 20, 2011) (Georgia); and 76 Fed. Reg. 43,175 (July 20, 2011) (Ohio). Petitions to review the disapproval of the Kansas and Georgia SIPs are pending in the D.C. Circuit. See *Westar Energy, Inc. v. EPA*, No. 11-1333 (D.C. Cir. filed Sept. 19, 2011); *Georgia v. EPA*, No. 11-1427 (D.C. Cir. filed Nov. 3, 2011). A petition to review the disapproval of the Ohio SIP is pending in the Sixth

titions for review have been stayed in the courts of appeals pending the outcome of this case.<sup>4</sup> But those SIP disapproval cases are independent of this Transport Rule FIP case. Consider what will happen to the SIP cases after the present case concludes.

Those pending SIP cases will be disposed of in one of two ways depending upon this Court's disposition of the present case. If the Court affirms the D.C. Circuit's decision and adopts its reasoning on the FIP-before-SIP issue, the issues in those SIP disapproval cases may be narrowed but not resolved. For example, EPA disapproved Kansas's SIP submission for two reasons: (1) it failed to anticipate the outcome of the Transport Rule; and (2) it was not supported by sufficient data. A Kansas challenge as to reason (1) would likely be rendered moot by a decision affirming the D.C. Circuit's reasoning, but a challenge as to reason (2) would not be moot. Kansas would need to prevail in its challenge on that latter basis to prevent EPA from including Kansas in a successor to the Transport Rule.

---

Circuit. See *Ohio v. EPA*, No. 11-3988 (6th Cir. filed Sept. 19, 2011).

<sup>4</sup> The Georgia and Kansas SIP disapproval cases were stayed at EPA's request. EPA, in a joint submission with the States, argued that the SIP disapproval cases should be stayed pending the outcome of the review of the Transport Rule because the decision in the Transport Rule case "could narrow or eliminate some issues that would otherwise be presented in [the SIP disapproval] litigation, or eliminate the need for litigating [the SIP disapproval] case[s] altogether." Joint Motion To Hold Case in Abeyance ¶ 6, *Georgia v. EPA*, No. 11-1427 (D.C. Cir. Jan. 17, 2012), Doc. No. 1353040; Joint Motion To Hold Case in Abeyance ¶ 6, *Westar Energy, Inc. v. EPA*, No. 11-1333 (D.C. Cir. Jan. 17, 2012), Doc. No. 1353039.

On the other hand, if this Court were to agree with EPA that the States' challenge was a collateral attack on these SIP disapprovals, and vacates that part of the decision below for lack of jurisdiction, then the issue would be back before the court of appeals almost immediately. The abeyance of the SIP disapproval cases would be lifted, and the D.C. Circuit would be asked to consider the questions that EPA says should have been considered on review of the SIP disapprovals and not in this case. If the D.C. Circuit were to adopt in those cases the same reasoning it applied in its merits decision on review here—as one must assume it would—and find the SIP disapprovals to be unlawful, then the Transport Rule FIPs for these States as they relate to the 2006 PM<sub>2.5</sub> NAAQS would lack a lawful predicate and therefore would be vacated. And, because the Transport Rule FIPs are not severable, all other Transport Rule FIPs would fall as well. See State Br. at 23.

**B. Approval of Good-Neighbor SIP Submissions Depended Entirely on Whether the State Was Included in the Transport Rule.**

There are good reasons why EPA opted to define “contribute significantly” with respect to ozone and PM<sub>2.5</sub> NAAQS through comprehensive rulemakings governing multiple States. Ozone and PM<sub>2.5</sub> are fairly described as regional pollution problems that demand regional solutions. But that approach is consistent with the CAA only if States are given an opportunity to perform their statutory role at the implementation stage. *Michigan*, 213 F.3d at 687.

EPA failed to give States that opportunity in the Transport Rule. State Br. at 12-13. EPA simultane-

ously (1) identified the States that had any good-neighbor emission reduction obligations; (2) defined what those obligations would be; and (3) imposed FIPs to implement those obligations. This, the court of appeals correctly held, is not how the CAA's cooperative federalism structure is designed to work.

EPA responds by suggesting that the States could have done their jobs without EPA's help. EPA Br. at 26 ("Nothing in the Act makes the timing of the State's submission contingent on prior action by the EPA to define what portion of its contribution to downwind nonattainment is 'significant.>"). If States simply had performed the technical analyses themselves, EPA argues, they could have identified emissions that must be abated under the good neighbor provision and thus would have escaped EPA's FIPs. *Id.* at 27.

This litigation position is fundamentally at odds with the system EPA created in 1998 and with repeated Agency pronouncements since then. From the outset, EPA rejected adoption of a regulatory system that would allow States to determine for themselves what their good-neighbor emission reduction obligations would be. Cf., *e.g.*, 40 C.F.R. § 51.308(d)(1) (regulations telling States how to derive the emission reductions necessary to make "reasonable progress" toward visibility objectives). Instead, EPA concluded in 1998 that, for NAAQS like the ozone NAAQS, "[d]etermining the overall level of air pollutants allowed to be emitted in a State [without violating section 7410(a)(2)(D)]" would be "EPA's responsibility." 63 Fed. Reg. at 57,369. "Once EPA determines the overall level of reductions (by assigning the aggregate amounts of emissions that must be eliminated to meet the requirements of section

[7410(a)(2)(D)],” *id.*, States would be responsible for choosing the mix of controls to abate those emissions.

Until it developed the Transport Rule, EPA readily acknowledged that its regional rulemaking approach was the administrative path EPA chose to create good-neighbor obligations that would trigger adoption of emission reduction SIPs. In the preamble to CAIR, for example, EPA explained that States outside the regional rulemaking were not required to adopt good-neighbor SIPs reducing their emissions. Instead, EPA explained, it can “issue a SIP call . . . to States to revise their SIPs to provide for additional emission controls to satisfy . . . [good-neighbor] obligations . . . based upon subsequently-available data and analyses.” 70 Fed. Reg. at 25,263-64. EPA’s argument here ignores this historical understanding and contradicts the arguments it advanced to defend its regional rulemaking approach when it was challenged in the court of appeals following promulgation of the NO<sub>x</sub> SIP Call. See *Michigan*, 213 F.3d at 685-88.

EPA’s argument here also is contradicted by its actions in approving and disapproving good-neighbor SIPs submitted in response to the 2006 PM<sub>2.5</sub> NAAQS. That record demonstrates that no State that EPA later included in the Transport Rule could have developed and submitted a SIP that EPA would have approved. The sole criterion that would allow EPA to approve a good-neighbor SIP submission under the 2006 PM<sub>2.5</sub> NAAQS was whether the State making the submission was excluded from the final Transport Rule’s coverage.

Compare the experience of Kansas, a State that EPA included in the final Transport Rule, and that of

Delaware, a State that EPA did not include in the final Transport Rule. Kansas and Delaware each submitted a SIP attempting to demonstrate through modeling data that the State did not contribute significantly to nonattainment or interfere with maintenance. EPA disapproved Kansas's submittal based on EPA's Transport Rule modeling supporting Kansas's inclusion in the Transport Rule. 76 Fed. Reg. at 43,145. EPA approved Delaware's submittal based on Transport Rule modeling that excluded Delaware from the program. 76 Fed. Reg. 53,638 (Aug. 29, 2011). In that approval, EPA made clear that it would have disapproved Delaware's SIP if EPA had made that State subject to the final Transport Rule. See *id.* at 53,638-39.

Because—and only because—Delaware was not included in the Transport Rule, EPA could approve the SIP, even though Delaware's technical demonstration was no more robust than the CAIR-based modeling provided by Kansas. *Id.* In short, whatever EPA may say now, the truth is that any submission by any potential Transport Rule State premised on the State not contributing significantly to downwind nonattainment could not have been approved before EPA promulgated the final Transport Rule with that State being excluded from coverage.

The Kansas and Delaware examples demonstrate that coverage of the good-neighbor regional program was dependent on promulgation of the Transport Rule in final form. As a result, specific emission reduction obligations for covered States did not, as a matter of law, come into existence until EPA's rule

was final.<sup>5</sup> No State may be required to submit a SIP now in order to satisfy requirements that are to be defined in the future. Cf. *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) (“[A] statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive rules unless that power is conveyed by Congress in express terms.”). And no State was required to guess the terms of the Transport Rule in preparing SIP submissions years before EPA promulgated that rule. As the State and Local Government Respondents argue, this is a classic case of “hide the ball.” State Br. at 20, 39. It is completely inconsistent with a system of cooperative federalism.

## **II. The Transport Rule Impermissibly Exceeds Statutory Boundaries.**

“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.” *Georgetown Univ. Hosp.*, 488 U.S. at 208. EPA “is a

---

<sup>5</sup> Similarly, the regulatory consequence of failing to submit a good-neighbor SIP following promulgation of the 2006 PM<sub>2.5</sub> NAAQS depended entirely on the outcome of EPA’s Transport Rule rulemaking. On June 9, 2010, EPA found that 29 States and territories had failed to submit good-neighbor SIPs for the 2006 PM<sub>2.5</sub> NAAQS. 75 Fed. Reg. 32,673 (June 9, 2010). Seventeen of those States and territories were not identified in the Transport Rule as “significantly contributing” to nonattainment of the 2006 PM<sub>2.5</sub> NAAQS in downwind States within the Transport Rule region. EPA has not imposed a FIP on any of these States. Indeed, EPA announced it had determined that, in light of its Transport Rule findings, one of those States—North Dakota—need not modify its SIP at all to address the good neighbor provision with respect to the 2006 PM<sub>2.5</sub> NAAQS. 78 Fed. Reg. 45,457 (July 29, 2013).

creature of statute, and has only those authorities conferred upon it by Congress; if there is no statute conferring authority, a federal agency has none.” *North Carolina*, 531 F.3d at 922 (internal quotation marks omitted).

When establishing States’ emission reduction obligations as part of a multi-state good-neighbor program, EPA must conform to the limits in 42 U.S.C. § 7410(a)(2)(D)(i)(I). The plain language of this provision precludes EPA from (1) prohibiting emissions that do not contribute significantly to nonattainment; (2) requiring emission reductions in amounts greater than necessary to achieve attainment; and (3) basing reduction requirements on emissions that never leave the upwind State and therefore can never reach the downwind-state nonattainment area. These statutory limits mean that a State can be required to prohibit no more than the amount of its total emissions that is transported to, and that contributes significantly to NAAQS nonattainment in, a downwind State. In promulgating the Transport Rule, EPA ignored these statutory boundaries.

#### **A. The Transport Rule Is Statutorily Flawed in Three Distinct Respects.**

The Transport Rule used a two-step approach in imposing good-neighbor ozone and PM<sub>2.5</sub> NAAQS emission reduction requirements. EPA first identified an air quality contribution threshold below which States could not be said to “contribute significantly” to nonattainment. 76 Fed. Reg. at 48,238-46 (Pet. App. 265a-309a). For each NAAQS, EPA made a finding in the rulemaking that a contribution of less than one percent of the NAAQS to any of the downwind nonattainment areas at issue “*do[es] not*

*significantly contribute* to nonattainment or interfere with maintenance of the relevant NAAQS.” *Id.* at 48,236, 48,237 (Pet. App. 255a, 256a) (emphasis added).

After identifying the States that would be included in the multi-state program, EPA quantified the amount of emissions that each State must abate. Because good-neighbor emission reduction requirements must be “consistent with the provisions” of Title I of the CAA, the cost of emission controls may properly moderate the reduction amount needed to achieve good-neighbor air quality goals. See *supra* at 5-6 & n.1 (identifying numerous provisions of Title I that require consideration of cost and feasibility in limiting CAA nonattainment-based emission reduction obligations). Rather than using cost as a brake on required reductions in emissions contributing to air quality concentrations that exceed one percent of the NAAQS, however, EPA used cost as a license to compel reductions in emissions that contribute insignificantly to nonattainment, as well as to mandate emission reductions exceeding the amount required to achieve NAAQS attainment.<sup>6</sup>

The court of appeals found that, in adopting this approach, EPA exceeded its authority in “at least

---

<sup>6</sup> The Brief of Industry and Labor Respondents (hereinafter Industry Br.) argues that EPA cannot consider costs in defining “significant contribution.” This Court need not resolve whether, and, if so, how, costs may be considered under the good neighbor provision in order to affirm the court of appeals’ vacatur of the Transport Rule. All respondents urging affirmance of the court of appeals’ decision agree that requiring reductions in emissions that contribute insignificantly to nonattainment cannot, as a matter of law, be justified on cost or any other grounds.

three independent but intertwined” ways. Pet. App. 31a. Each of the discrete flaws that the court of appeals identified in the Transport Rule compels the conclusion that the rule must be vacated as contrary to clear congressional intent.

*First*, the court of appeals found that, under 42 U.S.C. § 7410(a)(2)(D)(i)(I), EPA had “no statutory authority to compel States to reduce amounts of pollution that are ‘insignificant.’” *Id.* That is, the CAA “requires [an upwind] State to prohibit *at most* those ‘amounts’ which will ‘contribute significantly’—and no more.” *Id.* at 37a (emphasis added). Where “amounts below a numerical threshold do not contribute significantly to a downwind State’s nonattainment, EPA may not require an upwind State to do more.” *Id.*

The court of appeals properly found that EPA had exceeded its statutory authority. The good neighbor provision, the court noted, “is not a blank check for EPA to address interstate pollution on a regional basis without regard to an individual upwind State’s actual contribution to downwind air quality.” *Id.* at 23a. Once EPA promulgated a final rule finding that amounts below one percent of the relevant NAAQS “do not contribute significantly” to nonattainment, EPA could not require States to eliminate any emissions contributing below the one percent threshold.

The importance of administrative findings in determining the limits of an agency’s statutory authority is illustrated by *Food & Drug Administration v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120 (2000). In that case, the Court began its analysis with the observation that an agency “may not exercise its authority in a manner that is inconsistent

with the administrative structure that Congress enacted into law.” *Id.* at 125 (internal quotation marks and citation omitted). The Court then considered the findings that the Food and Drug Administration (FDA) made to justify the regulation, but not the prohibition, of tobacco products. *Id.* at 135. *Based on the agency findings*, the Court held that, if those products *were* within the regulatory ambit of the Food, Drug and Cosmetic Act (FDCA), the FDA would have to remove them “from the market entirely.” *Id.* at 143. Thus, given the FDA’s own findings, the only authority it could conceivably exercise under the FDCA would be authority to prohibit such products “entirely”—but, because Congress in subsequent legislation had rejected any such ban, “there [was] . . . no room for tobacco products within the FDCA’s regulatory scheme.” *Id.*

The Court’s reasoning in that case applies here. Once EPA made the regulatory finding that emissions contributing to concentrations below the one percent threshold “do not significantly contribute to nonattainment,” 76 Fed. Reg. at 48,236, 48,237 (Pet. App. 255a, 256a), the language of 42 U.S.C. § 7410(a)(2)(D)(i)(I) precluded EPA from regulating those emissions. Accordingly, any authority EPA has to require regulation of upwind States’ emissions is necessarily constrained by EPA’s own finding that amounts contributing below the one percent threshold do not significantly contribute. The Court’s admonition in *Brown & Williamson* applies here: “[W]e must take care not to extend the scope of the statute beyond the point where Congress indicated it would stop.” 529 U.S. at 161 (internal quotation marks and citation omitted).

EPA offers no effective rebuttal to the court of appeals' determination that, once EPA had made a finding marking "a floor below which 'amounts' of downwind pollution were not significant," the Agency "could not then ignore that mark and redefine each State's 'significant contribution' in such a way that an upwind State's required reductions could be *more* than its own significant contribution to a downwind State." Pet. App. 36a (emphasis in original). EPA suggests that "[t]he court of appeals' analysis is misguided" and that "[t]he court did not suggest that the EPA had set out to regulate emissions that will contribute *insignificantly* to downwind nonattainment, or even that the Transport Rule is likely to have that effect—only that the Rule does not eliminate that possibility." EPA Br. at 54 (emphasis in original). But regardless of whether EPA "set out to regulate" upwind emissions that do not contribute significantly to downwind nonattainment, under 42 U.S.C. § 7410(a)(2)(D)(i)(I) EPA is authorized only to require upwind-state prohibitions of emissions that create *significant* contributions.

*Second*, simple physics dictates—and EPA recognizes—that emissions originating in an upwind State, and the atmospheric products of those emissions, dissipate or deposit out of the atmosphere continually over time and distance. See, e.g., 76 Fed. Reg. at 48,316 (Pet. App. 621a-622a). In disregard of this principle, however, the Transport Rule failed to discount the portion of the emissions that never leaves the upwind State and reaches downwind-state nonattainment areas.

The court of appeals thus held that the Transport Rule ran "afoul of the [CAA's] proportionality requirement as described in . . . *North Carolina*." Pet.

App. 38a. “Under the statute,” the court explained, “each upwind State that contributes to a downwind nonattainment area is responsible for no more than its own ‘amounts which will . . . contribute significantly’ to the downwind State’s pollution problem.” *Id.* The Transport Rule, however, held each upwind State responsible for more than the emissions that traveled from the State to the downwind nonattainment areas at issue.

As the court of appeals observed, “the text of Section [7410(a)(2)(D)(i)(I)] tells us that the ‘amounts which will . . . contribute’ to a downwind State’s nonattainment are *at most* those amounts that *travel beyond an upwind State’s borders and end up in a downwind State’s nonattainment area.*” *Id.* at 23a (emphases added). Yet EPA acknowledged to the court of appeals that under the Agency’s construction of the good neighbor provision on which the Transport Rule rested, EPA “could require a State to reduce *more than the State’s total emissions that go out of State.*” *Id.* at 38a n.23 (emphasis in original); see also *id.* at 23a n.12. “[S]uch a claim of authority,” the court of appeals explained, “does not square with the statutory text—‘amounts’ of pollution obviously cannot ‘contribute’ to a downwind State’s pollution problem if they don’t even reach the downwind State.” *Id.* at 38a n.23.

Here, EPA neither repudiates this claim of sweeping authority nor identifies any statutory foundation for it. Instead, EPA blandly asserts that “no basis [exists] for the court of appeals’ concern that, under the EPA’s approach, an upwind State could be required to ‘reduce more than the State’s total emissions that go out of State.’” EPA Br. at 48 n.14. “The pollution that travels beyond an upwind State’s bor-

ders is not separate and distinct from the pollution with local impacts,” EPA says, and “[t]he only way to reduce 100% of a State’s contribution to a downwind area therefore would be to eliminate 100% of its emissions.” *Id.* at 48-49 n.14.

This is a non sequitur. While the “pollution” in a downwind State that is attributable to emissions from an upwind State is thoroughly mixed with the “pollution” created from emissions originating in the downwind State, it does not follow from this that an upwind State’s contribution is caused by all of the emissions originating in that upwind State. EPA’s atmospheric modeling determines the “contribution” in a downwind State that is attributable to the “emissions” from an upwind State, see 76 Fed. Reg. at 48,239 (Pet. App. 265a), and those upwind-state emissions reaching the downwind State are a fraction of the upwind State’s total emissions, see, *e.g.*, *id.* at 48,316 (Pet. App. 621a-622a) (reflecting the physical principle that pollutants deposit out of the atmosphere as emissions travel downwind).

*Third*, the court of appeals found that the Transport Rule was unlawful because EPA “failed to ensure that the collective obligations of the various upwind States, when aggregated, did not produce unnecessary over-control in the downwind States.” Pet. App. 39a. Because “EPA’s statutory authority . . . is limited to attaining the NAAQS in the downwind States[,] EPA [could] not require upwind States to do more than necessary for the downwind States to achieve the NAAQS.” *Id.* at 39a-40a. In the Transport Rule, however, “EPA did not try to take steps to avoid such over control.” *Id.* at 40a.

EPA does not dispute the court of appeals' reading of the statute. Rather, the Agency now suggests the court's "concern" was "theoretical and misplaced." EPA Br. at 50. As the Brief of Industry and Labor Respondents explains, EPA's after-the-fact explanations are unavailing; they are based on arguments that the Agency did not make below and that in any event the record contradicts. See Industry Br. at 18-20 (citing record evidence demonstrating over-control). As it is, the court of appeals recognized that, with "the end goal of the statute [being] attainment in the downwind State[,] EPA's authority to force reductions on upwind States ends at the point where the affected downwind State achieves attainment." Pet. App. 24a. Because, by its terms, the Transport Rule did not respect this statutory limitation on EPA's authority, the court properly found the rule to be unlawful.

**B. The Court of Appeals Had Jurisdiction To Consider Statutory Objections to the Lawfulness of EPA's "Significant Contribution" Emission Reduction Requirements.**

Petitioners argue that the court of appeals lacked jurisdiction under 42 U.S.C. § 7607(d)(7)(B) to declare EPA's Transport Rule emission reduction requirements contrary to the plain terms of the good neighbor provision because, they contend, rulemaking participants did not state with sufficient specificity what the statute means. EPA Br. at 33-42; Brief of American Lung Association, *et al.* (collectively, ALA), at 28-35. The respondents submitting this brief concur with the Brief of Industry and Labor Respondents that comments submitted in EPA's rulemaking by the Utility Air Regulatory Group (UARG),

Southern Company, and others raised statutory objections with sufficient specificity. See Industry Br. at 16, 47-48. The respondents submitting this brief further agree that the provisions of 42 U.S.C. § 7607(d)(7)(B) do not operate to limit the powers of a reviewing court.<sup>7</sup> See *id.* at 42-46. The respondents submitting this brief write separately to address the responsibility of the court of appeals under 42 U.S.C. § 7607(b) to determine whether the Transport Rule was consistent with clear statutory limits that Congress imposed on EPA and to explain further why 42 U.S.C. § 7607(d)(7)(B) cannot be construed to constrain the exercise of that jurisdiction.

Only by exercising its Article III power to interpret the law is a court able to review any agency decision. Because objections grounded in the Transport Rule's departure from the statute's terms were raised in the rulemaking, see Industry Br. at 16, 47-48; Comments of UARG at 64 (Oct. 1, 2010), EPA-HQ-OAR-2009-0491-2756, Deferred Joint Appendix, Vol. II at JA01060, *EME Homer City Generation, L.P. v. EPA*, No. 11-1302 (D.C. Cir. Mar. 14, 2012) (objecting to emission reduction requirements where EPA "fail[s] to adhere to the terms of the CAA"), the court below was obligated to decide whether the rule exceeded EPA's authority under the plain terms of the Act. To accept EPA's "waiver" arguments here

---

<sup>7</sup> The Brief of Industry and Labor Respondents explains that although EPA and ALA assert that the court of appeals exceeded its jurisdiction in reaching the merits of the petitioners' arguments below, neither EPA nor ALA makes any effort to show that 42 U.S.C. § 7607(d)(7)(B) in fact establishes a "jurisdictional" requirement. See Industry Br. at 43. That brief demonstrates that the administrative exhaustion requirement in 42 U.S.C. § 7607(d)(7)(B) is nonjurisdictional. *Id.* at 43-46.

would require the Court to construe 42 U.S.C. § 7607(d)(7)(B) as a congressional shield that protects plainly ultra vires Agency action from judicial review in order to give repose to rules that exceed textual statutory limitations. Enshrining Executive Branch conduct that violates explicit legislative direction is hardly Congress's normal priority.

The CAA establishes for a court reviewing EPA FIPs under 42 U.S.C. § 7607(b) the obligation to “reverse any such action found to be . . . in excess of statutory jurisdiction, authority, or limitations.” 42 U.S.C. § 7607(d)(9);<sup>8</sup> cf. 5 U.S.C. § 706(2)(C) (judicial review provision of the Administrative Procedure Act (APA)).<sup>9</sup> This is what the court of appeals did here. It determined, under *Chevron* step one,<sup>10</sup> that the Transport Rule failed as a matter of law in three independent respects.

In this regard, this Court's discussion of the fundamental purpose of the “administrative exhaustion” doctrine, and of the values that the doctrine is meant to promote, provides context for determining whether, as petitioners' arguments assume, 42 U.S.C. § 7607(d)(7)(B) contemplates that rulemaking participants can themselves “waive” statutory limits on EPA's powers. In *McCarthy v. Madigan*, 503 U.S.

---

<sup>8</sup> 42 U.S.C. § 7607(d)(1)(B) makes FIPs, including those promulgated by EPA in the Transport Rule, subject to the provisions of 42 U.S.C. § 7607(d).

<sup>9</sup> See *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 519 (D.C. Cir. 1983) (“The standard for substantive judicial review of EPA action under the Clean Air Act is taken directly from the APA.”).

<sup>10</sup> *Chevron, U.S.A., Inc. v. Natural Res. Def. Council, Inc.*, 467 U.S. 837, 842-43 (1984).

140, 145 (1992), the Court explained that “the exhaustion doctrine recognizes the notion, grounded in deference to Congress’ delegation of authority to coordinate branches of Government, that agencies, not the courts, ought to have primary responsibility for the programs that Congress has charged them to administer.” This principle requires application of the exhaustion doctrine “when the action under review involves exercise of *the agency’s discretionary power* or when the agency proceedings in question allow the agency to apply *its special expertise*.” *Id.* (citing *McKart v. United States*, 395 U.S. 185, 194 (1969) (emphases added)). Where, however, there is “*nothing to be gained* from permitting the compilation of a detailed factual record, or from [the application of] agency expertise,” *Bowen v. City of New York*, 476 U.S. 467, 485 (1986) (emphasis added), the rationale for requiring “exhaustion” before the agency disappears.

Consistent with the principles that underpin the exhaustion doctrine, the court of appeals properly addressed the statutory limits on EPA’s “significant contribution” rulemaking authority as an element of the court’s inherent powers as a reviewing court. Because, as the court of appeals found, the good neighbor provision is unambiguous regarding the three statutory limits on EPA’s authority, EPA had no “discretionary power” to exercise or “special expertise” to apply in determining whether to obey those limits. The issues here were pure questions of law not requiring application of EPA’s expertise. See *Marbury v. Madison*, 5 U.S. 137, 177 (1803) (interpreting the law is “the province and duty of the judicial department”).

Indeed, given these circumstances, had the court of appeals *declined* to reach issues related to the limits on EPA's statutory authority, the court would have abdicated its responsibility under 42 U.S.C. § 7607(d)(9)(C) to "reverse any [EPA] action found to be . . . in excess of statutory jurisdiction, authority, or limitations." This past Term, the Court had occasion to note that, "for agencies charged with administering congressional statutes[,] [b]oth their power to act and how they are to act [are] authoritatively prescribed by Congress." *City of Arlington v. FCC*, 133 S. Ct. 1863, 1869 (2013). Accordingly, when such agencies "act improperly, no less than when they act beyond their jurisdiction, what they do is ultra vires." *Id.*

The implications of petitioners' assertion that 42 U.S.C. § 7607(d)(7)(B) deprived the court of appeals of jurisdiction to consider whether EPA acted within the scope of its congressionally delegated authority are breathtaking. The asserted principle that EPA advances would discharge agencies from obeying clear statutory commands and would bar reviewing courts from exercising their constitutional and statutory responsibilities whenever agencies might claim that rulemaking comments failed to recite a statute's plain meaning.

At issue here was a straightforward question of statutory interpretation, involving a provision of the CAA that the court below found *not* to be ambiguous. Objections were raised during the rulemaking to the exercise of EPA's "significant contribution" emission reduction authority; EPA was not "subjected to verbal traps" or required "to wade through reams of documents searching for "implied" challenges." *Natural Res. Def. Council v. EPA*, 559 F.3d 561, 564

(D.C. Cir. 2009) (quoting *Mossville Env'tl. Action Now v. EPA*, 370 F.3d 1232, 1239 (D.C. Cir. 2004)).

To the contrary, as the majority below pointed out, “one of the central questions in the long history of EPA’s efforts to implement the good neighbor provision has been whether EPA has complied with the basic statutory limits on its authority.” Pet. App. 32a n.18. EPA thus, for example, “knew from the beginning [of the rulemaking here] that it was required to comply with *North Carolina*, including that part of the [court of appeals’] holding on which petitioners rel[ie]d” in challenging the Transport Rule. *Id.* Because the statutory provisions construed by the court below were *not* ambiguous, the *Chevron* framework removes all deference to the agency. As the court of appeals has stated, “at *Chevron* step one [the reviewing court] alone [is] tasked with determining Congress’s unambiguous intent,” and the court is therefore to “answer [the] inquir[y] without showing the agency any special deference.” *Vill. of Barrington v. Surface Transp. Bd.*, 636 F.3d 650, 660 (D.C. Cir. 2011).

EPA was obligated, in developing its Transport Rule emission reduction requirements, to assure that statutory limits imposed on the exercise of the Agency’s good-neighbor powers would not be crossed. Because EPA ignored those limits, the court of appeals’ obligation under 42 U.S.C. § 7607(d)(9)(C) was to vacate the Transport Rule.<sup>11</sup> Accepting petitioners’

---

<sup>11</sup> Other D.C. Circuit decisions recognize EPA’s independent obligation to justify “key assumptions as part of its affirmative ‘burden’” to promulgate valid rules, *Small Refiner*, 705 F.2d at 534-35, and recognize that “even the failure to object during the comment period is insufficient to bar [judicial] review” of those key assumptions. *S. Coast Air Quality Mgmt. Dist. v. EPA*, 472

view of the statute would enshrine outcomes that Congress explicitly precluded under statutory provisions that, on their face, give EPA notice of the limits on its authority. That is not the law.

### CONCLUSION

The judgment of the court of appeals should be affirmed.

Respectfully submitted,

NORMAN W. FICHTHORN

Here are the additions to the Climate Case Chart since Update #55.

## FEATURED DECISION

Coalition for Responsible Regulation v. EPA (U.S., cert. granted Oct. 15, 2013): added to the "Challenges to Federal Action" slide. On October 15, 2013, the U.S. Supreme Court granted certiorari with respect to six petitions seeking review of Coalition for Responsible Regulation v. Environmental Protection Agency, in which the D.C. Circuit upheld the authority of the United States Environmental Protection Agency (EPA) to regulate greenhouse gases under the Clean Air Act. The Supreme Court's grant of certiorari is limited to one question: "Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases." Certiorari was denied with respect to other

questions raised in petitions challenging the D.C. Circuit's decision, including issues relating to EPA's endangerment finding and tailpipe emissions standards.

## DECISIONS AND SETTLEMENTS

Washington Environmental Council v. Bellon (9th Cir. Oct. 17, 2013): added to the "Force Government to Act/Clean Air Act" slide. The Ninth Circuit dismissed on standing grounds a citizen suit brought by two environmental groups to compel the Washington Department of Ecology and two regional clean air agencies to regulate oil refineries under the Clean Air Act. The environmental groups alleged that the agencies' failure to define "reasonably available control technology" (RACT) greenhouse gas emissions limits violated Washington's State Implementation Plan. The district court for the Western District of Washington in 2011 ordered the agencies to complete the RACT process for refineries. On appeal, defendant-intervenor Western States Petroleum Association argued for the first time that plaintiffs lacked Article III standing, and in a decision issued on October 17, 2013, the Ninth Circuit agreed. The Ninth Circuit held that even assuming that plaintiffs established injury in fact resulting from climate changes, they had not provided evidence sufficient to establish the causality or redressability elements of standing at the summary judgment stage. The court assumed without deciding that "that man-made sources of [greenhouse gas] emissions are causally linked to global warming and detrimental climate change" but held that plaintiffs' "vague, conclusory statements" connecting the failure to set RACT standards to their injuries failed to satisfy their evidentiary burden. The Ninth Circuit further noted that establishing "a causal nexus" might be "a particularly challenging task" because "there is limited scientific capability in assessing, detecting, or measuring the relationship between a certain [greenhouse gas] emission source and localized climate impacts in a given region." The court rejected plaintiffs' argument that the causal link should be inferred because they were seeking to enforce a regulatory obligation; the court noted that plaintiffs could not benefit from the relaxed standing rule for sovereign states carved out by the Supreme Court in Massachusetts v. EPA. In concluding that plaintiffs had also failed to establishing the redressability element of standing, the Ninth Circuit pointed to the absence of evidence in the record that RACT standards would reduce the pollution causing plaintiffs' injuries.

Latinos Unidos de Napa v. City of Napa (Cal. Ct. App. Oct. 10, 2013): added to the "State NEPAs" slide. An affordable housing advocacy organization challenged the City of Napa's failure to prepare an environmental impact report (EIR) under the California Environmental Quality Act (CEQA) for revisions to housing elements of the City's general plan and related actions. The City determined that the actions would not result in any new significant environmental effects not identified and mitigated in the EIR for the 1998 general plan. The California Court of Appeal affirmed the trial court's denial of the challenge. Citing substantial evidence in the administrative record that the actions would not have any new significant impacts, the Court of Appeal rejected petitioner's contention that the City had failed to disclose the actions' impacts and cumulative impacts on greenhouse gas emissions.

Safari Club International v. Jewell (U.S. cert. denied Oct. 7, 2013): added to the "Endangered Species Act" slide. On October 7, 2013, the Supreme Court denied Safari Club International's petition for writ of certiorari in the case challenging the designation of polar bears as a threatened species under the Endangered Species Act.

Sierra Club v. Moser (Kan. Oct. 4, 2013): added to the "Challenges to Coal-Fired Power Plants" slide.

The Kansas Supreme Court granted in part the Sierra Club's petition for judicial review of the issuance of an air emissions source construction permit for an 895-megawatt coal-fired power plant in Holcomb, Kansas. The court remanded the proceeding on the ground that the Kansas Department of Health and Environment should have applied EPA regulations regarding one-hour emission limits for nitrogen dioxide and sulfur dioxide that became effective before the permit was issued.

Save the Plastic Bag Coalition v. County of Marin (Cal. review denied Oct. 2, 2013): added to the "State NEPAs" slide. On October 2, 2013, the California Supreme Court declined to review the California Court of Appeals decision upholding Marin County's ordinance banning plastic bags. Plaintiff had alleged that increased paper bag use might increase greenhouse gas emissions.

Shurtleff v. EPA (D.D.C. Sept. 30, 2013): added to the "Climate Protesters and Scientists" slide. The Attorney General of Utah commenced a lawsuit against EPA pursuant to the Freedom of Information Act (FOIA) seeking documents concerning the "endangerment" finding that provided a basis for regulating greenhouse gases under the Clean Air Act. In September 2012, a magistrate judge recommended that the motion be granted in part, holding that the agency adequately conducted a search of relevant documents concerning the FOIA request, but that certain documents withheld pursuant to the attorney-client privilege should be disclosed. In September 2013, the district court accepted in large part the recommendations of the magistrate judge but rejected the conclusion that EPA's search of relevant documents had been adequate for all portions of the FOIA request. The court found that EPA had not included some portions of the request in one of the three "phases" into which it had divided most of the request, and that for those undesignated portions it had not provided detail about the types of searches, search terms, methods or processes used. The court ordered EPA to perform new searches for responsive documents or to provide proof that its earlier search had met the adequacy standard. The court otherwise rejected plaintiff's arguments that any delay in response constituted a basis for denying EPA summary judgment and that EPA should have searched files of additional employees and offices where EPA explained its basis for limiting its search. The court also denied plaintiff's motion to supplement the record with correspondence between EPA and Congress regarding the EPA administrator's use of "alias email accounts," citing EPA's statement that the FOIA search had encompassed documents in both the administrator's official and internal e-mail accounts. The court also declined to order the disclosure of the internal e-mail address or the e-mail addresses of employees in the Executive Office of the President. The court accepted the recommendation that for 17 documents withheld under the claim of attorney-client privilege, EPA must either disclose such documents or submit supplemental materials explaining in sufficient detail why such documents are subject to the privilege. On the other hand, the court found that EPA had adequately supported the withholding of attorney comments and edits on EPA's response to comments under the work product doctrine where EPA had received "a flood of comments" attacking its proposed endangerment finding, indicating the likelihood of litigation. The court also agreed with the magistrate judge that EPA fulfilled its FOIA obligations by directing plaintiff to publicly available documents and was not required to identify specific responsive documents.

California Clean Energy Committee v. City of San Jose (Cal. Ct. App. Sept. 30, 2013): added to the "State NEPAs" slide. In an unpublished opinion, the California Court of Appeal reversed the decision of the trial court dismissing plaintiff's challenge to the City of San Jose's compliance with CEQA in conjunction with its approval of an update to the City's general plan entitled "Envision San Jose 2040 General Plan." The appellate court disagreed with the trial court's conclusion that plaintiff had failed to exhaust its administrative remedies, noting that plaintiff had submitted comments critical of the draft EIR (including comments critical of the draft EIR's analysis of greenhouse gas emissions). The appellate court held that because the City Council had improperly delegated the duty to certify the EIR as complete to the planning commission, no administrative appeal was available to plaintiff, and plaintiff's

comment letter on the draft EIR sufficed to exhaust its administrative remedies.

SSHI LLC dba DR Horton v. City of Olympia (Wash. Ct. App. Sept. 24, 2013): added to the “Stop Government Action/Other Statutes” slide. Developer DR Horton challenged the City of Olympia’s denial of its master plan application for an 80-acre “neighborhood village.” In its challenge under the Washington Land Use Petition Act, DR Horton claimed, among other things, that the City Council erred in denying the application for failure to satisfy public transit requirements. In an unpublished opinion, the Washington Court of Appeals affirmed the trial court’s orders dismissing the petition. With respect to the public transit requirements, the appellate court held that the Council had not erred in concluding that the proposed master plan failed to satisfy transit requirements. The court also concluded that the public transit requirement did not violate the developer’s substantive due process rights because it was grounded in the legitimate public purpose of reducing greenhouse gases.

#### NEW CASES, MOTIONS, AND NOTICES

Conservation Law Foundation, Inc. v. Dominion Energy Brayton Point, LLC (D. Mass., voluntary motion to dismiss filed Oct. 22, 2013): added to the “Challenges to Coal-Fired Power Plants” slide. Three environmental groups filed a voluntary motion to dismiss with prejudice their citizen suit against the owner and operator of the Brayton Point Station, a coal-, natural gas-, and oil-fired electricity generating station in Somerset, Massachusetts. The groups indicated that they had reached a settlement with the defendant. The terms of the settlement were not filed with the court, but news reports indicated that the owners had agreed to remediate emissions violations and report on their efforts, install soot monitoring equipment, and pay \$76,000 in civil penalties, \$65,000 of which would fund projects in Somerset. Earlier in October a new owner of the power plant announced its intent to close the plant as of June 2017.

American Petroleum Institute, Notice of Intent to File Citizen Suit (Oct. 17, 2013): added to the “Challenges to Federal Action” slide. On October 17, 2013, the American Petroleum Institute submitted a 60-day notice of intent to sue to EPA Administrator Gina McCarthy. The notice letter asserted EPA failures, and anticipated failures, to comply with statutory deadlines for setting biomass-based diesel and renewable fuel requirements for 2014. The notice letter cataloged EPA’s “habitual, historical delays” in promulgating the annual renewable fuel standards and asserted that “EPA’s continual tardiness has real, adverse effects on industry.”

Center for Biological Diversity v. EPA (W.D. Wash, filed Oct. 16, 2013): added to the “Stop Government Action/Other Statutes” slide. On October 16, 2013, the Center for Biological Diversity (CBD) commenced a lawsuit in the district court for the Western District of Washington challenging EPA’s approvals of Oregon’s and Washington’s lists of impaired waters. CBD alleged that the approvals were arbitrary and capricious and in violation of the Clean Water Act because of EPA’s longstanding acknowledgment that “as a result of absorbing large quantities of human-made carbon dioxide emissions, ocean chemistry is changing, and this is likely to negatively affect marine ecosystems and species including coral reefs, shellfish, and fisheries.” CBD further alleged that EPA had before it “substantial evidence” that oyster production problems in Oregon and Washington stemmed from acidification. CBD submitted a letter to EPA in July 2013 asking it to reconsider the approvals.

American Fuel & Petrochemical Manufacturers v. EPA, No. 13-1268 (D.C. Cir., filed Oct. 10, 2013); American Petroleum Institute v. EPA, No. 13-1267 (D.C. Cir., filed Oct. 8, 2013): added to the “Challenges to Federal Action” slide. The American Petroleum Institute and American Fuel & Petrochemical Manufacturers filed petitions in the D.C. Circuit for review of EPA’s final rule setting the 2013 renewable fuel standards. In the final rule, EPA concluded that available fuels would be available to meet the statutory volumes of 2.75 billion gallons for advanced biofuels and 16.55 billion gallons for total renewable fuels. EPA reduced the cellulosic biofuel volume for 2013 from the statutory volume of 1.0 billion gallons to 6 million gallons.

Rocky Mountain Farmers Union v. Corey (9th Cir., petitions for rehearing en banc (RMFU, AFPM) filed Oct. 2, 2013): added to the “Challenges to State Action” slide. On October 2, 2013, two separate petitions for rehearing en banc were filed in the case challenging California’s low carbon fuel standard (LCFS). The Rocky Mountain Farmers Union plaintiffs—representing farming and ethanol interests—filed one petition, in which they argued that the Ninth Circuit had contravened Supreme Court precedent by “invok[ing] the state’s purported nondiscriminatory purposes to avoid strict scrutiny of a facially discriminatory regulatory regime” and that the court “also failed to recognize that the LCFS by design impermissibly regulates conduct occurring in other states.” Similarly, the American Fuels & Petrochemical Manufacturers Association (AFPM) plaintiffs—representing petrochemical, energy, and trucking industry groups—argued in their petition that the Ninth Circuit had impermissibly abandoned the strict scrutiny framework for assessing “regulations that, on their face, impose discriminatory burdens on imported products based on ‘state boundaries’” and that the LCFS’s lifecycle analysis regulated “interstate and foreign commerce—the production and transportation of fuels—occurring wholly outside of California.” The AFPM plaintiffs also argued that the Ninth Circuit’s conclusion that the LCFS’s crude oil provisions did not violate the dormant Commerce Clause was in conflict with Supreme Court and other federal circuit court precedents. The AFPM plaintiffs contended that the crude oil provisions, which benefited a certain California crude oil while burdening imported and Alaskan crude oils, were not immune from challenge merely because they also burdened other California crude oils.

American Tradition Institute v. University of Arizona (Ariz. Super. Ct., filed Sept. 6, 2013): added to the “Climate Protestors and Scientists” slide. The American Tradition Institute, now known as the Energy and Environment Legal Institute, announced on September 10, 2013 that it had filed a lawsuit challenging the University of Arizona’s compliance with Arizona’s Public Records Act. The plaintiff contends that the University failed either to produce responsive records or to provide adequate detail about certain records it withheld regarding “the notorious global warming ‘Hockey Stick’, and the group that made it famous, the Intergovernmental Panel on Climate Change.”

Communities for a Better Environment v. EPA (D.C. Cir., filed Oct. 31, 2011; oral argument Sept. 26, 2013): added to the “Force Government to Act” slide. In October 2011, petitioners challenged EPA’s final rule entitled “Review of National Ambient Air Quality Standards for Carbon Monoxide.” Among other things, petitioners challenged EPA’s decision not to set a secondary standard for carbon monoxide (CO) based on its climate-related effects. EPA had concluded that there was “insufficient information at this time to support the consideration of a secondary standard based on CO effects on climate processes.” The oral argument on September 26, 2013 addressed the issue of EPA’s obligation under *Massachusetts v. EPA* to regulate pollutants that cause climate change.

Here are recent additions to the Non-U.S. Climate Litigation Chart.

*Nucifora v. Valuer-General* (Australia, Queensland Land Court [2013] QLC 19, 6 May 2013): Nucifora appealed a land valuation in an Australia state court asserting that the land was overvalued because it did not take into account permanent changes in weather patterns due to climate change. The judge dismissed the appeal, finding that Nucifora had failed show that the farm was permanently devalued as a result of climate change. In its reasoning, the court noted that "climate change is "still a subject of considerable public debate." --Added to "Climate Adaptation" slide.

*Industrie de bois de Vielsalm & Cie v. Region Wallone* (European Court of Justice [2013] C-195/12 Judgment of the General Court, Sept. 26, 2013): European Union adopted Directive 2004/8/EC to promote high-efficiency cogeneration and reduce greenhouse gas emissions. Under the Directive, Member States are to adopt certain support mechanisms to encourage cogeneration. In implementing the Directive, Walloon decided to exclude biomass from wood, because of the potentially negative environmental consequences. Industrie de bois de Vielsalm (IBV), which operates a cogeneration plant from sawmill waste, applied to the Walloon Government for green certificates under the support mechanism and was rejected. IBV challenged the refusal arguing that the exclusion of biomass from wood (1) was inconsistent with the Directive and (2) violated the EU Charter of Fundamental Rights. The Constitutional Court of Belgium referred these issues to the EU Court of Justice. The Court of Justice found Walloon's interpretation of biomass was permissible under the Directive given its purpose. Furthermore, the Court found that while Member States were subject to the equal treatment and non-discrimination clauses of EU's Charter of Fundamental Rights in implementing the cogeneration support mechanism, the Walloon Government did not defy those clauses when it excluded wood and wood waste from its biomass support scheme. --Added to "EU Emissions Trading Scheme" slide.

*Commission v. Latvia* (European Court of Justice [2013] C-267/11, Judgment of the General Court, 3 Oct. 2013): Latvia brought an action for annulment of the contested decision of its national allocation plan (NAP) for the 2008-2012 period arguing that the Commission's request for further information was not timely under Art 9.3 Directive 2003/87. The General Court annulled the contested decision, and the Commission appealed. The court upheld the annulment. --Added to "EU Emissions Trading Scheme" slide.

*West Coast Ent. Inc. v Buller Coal Ltd* (Supreme Court of New Zealand [2013] NZSC 87, 19 Sept. 2013): Buller Coal Ltd and Solid Energy Ltd both applied to West Coast Regional Council and the Buller District Council for resource consents under the Resource Management Act of 1991 to mine coal for export purposes. At issue was whether the High Court wrongly upheld a declaration that the end use of the coal was irrelevant to the resource consents required under the act. The Supreme Court dismissed the appeal, finding that the purpose of the 2004 Amendment Act precluded consent authorities from taking into account indirect discharges of greenhouse gases in considering applications for resource consents. --Added to "Extraction of Natural Resources" slide.

Sincerely,

Michael B. Gerrard

#### Tools & Materials

INCR Sustainable Stock Exchanges Webinar with Guest Speakers

Missed last week's Sustainable Stock Exchanges Working Group call? Listen to a presentation about the World Federation of Exchanges Annual Meeting in Mexico City and presentations from guest speakers Dough Morrow, VP of Research at Corporate Knights, Anthony Miller, from UNCTAD and Simon McMahon from Sustainalytics.

[Watch the webinar.](#)

#### Events

INCR Member Hill Day

Thursday, November 14  
All-Day Event

Join other INCR members and partners at US SIF for a joint Hill Day event. The morning meeting will provide expert briefings on the Carbon Pollution Standards for Power Plants, the Master Limited Partnerships Parity Act, and the proposed expansion of Real Estate Investment Trusts to renewable energy projects. Following this briefing members will meet with staff and key Members of Congress on

these policy and investment opportunity issues. For more information and to register, contact Brandon Smithwood, Manager on the Policy Program.

#### 21st Century Investor Webinar: Fiduciary Duty

Thursday, November 21  
12:00 - 1:00 pm ET

Join Ceres for the next 21st Century Investor Blueprint webinar to learn about the role of fiduciary duty in sustainable investing. Guest speakers include Keith Johnson from Reinhard Boerner Van Deuren, Catherine LaMarr, General Counsel at the Office of the Connecticut Treasurer, and Ian Lanoff at Groom Law Group. Register here.

#### INCR Integrated Reporting Working Group Call

Friday, November 22  
12:30 - 2:00 pm ET

Join INCR members and guest speakers for the Integrated Reporting Working Group call focused on harmonization with industry standards. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

#### INCR Highlights

##### Report Highlights Growing Taxpayer Burden from Climate Inaction

Inaction on Climate Change Report CoverOne year after Hurricane Sandy, new research highlights the rising taxpayer costs to federal programs that provide flood insurance, crop insurance, wildfire protection and disaster relief. The Ceres report, Inaction on Climate change: The Cost to Taxpayers, outlines escalating government losses from more pronounced extreme weather events, which are strongly influenced by climate change, and makes specific recommendations to combat them.

"Taxpayer costs from climate change are getting bigger and bigger. Last year's extreme weather events alone cost every American more than \$300 a piece, or \$100 billion altogether - most of it to pay for federal crop, flood, wildfire and disaster relief," said Ceres president Mindy Lubber. "Yet, our public disaster relief and recovery programs have been slow to recognize that worsening climate impacts will drive up future losses to unsustainable levels."

Recommendations from the report include: improving transparency and accounting of the costs of extreme weather events to disaster relief and recovery programs; boosting research to understand how climate change will impact these programs; requiring recipients of federal relief and recovery assistance to adopt more stringent building codes and prohibit development in vulnerable areas; find ways to increase the level of private insurance market participation to reduce pressure on government relief and recovery programs.

Investors including Miller Howard Investments, First Affirmative Financial Network, and Newground Social Investment Investors are engaging the insurance industry on climate change and sustainability issues through dialogues and shareholder engagements. The group is asking large players such as Chubb Corporation and Cincinnati Financial to issue a sustainability report "describing short and long term responses to ESG-related issues" and "the company's role in reducing systemic harm to the U.S. and global economy from climate change."

Download the report.

Explore how investors are engaging the insurance industry on climate and sustainability issues.

For more information about the report and how to engage the insurance industry through dialogues and shareholder resolutions, contact Nancy Israel, Senior Manager, Insurance Program.

#### Stakeholders Discuss the Benefits of Reducing Oil Consumption at Energy Policy Series

This week, Ceres Board member Carl Pope and Carol Lee Rawn, Director Of Ceres Transportation Program, spoke at the Harvard Kennedy School Energy Policy Seminar Series. Joined by Robbie Diamond, CEO of Securing America's Future, the group discussed the benefits of reducing oil consumption.

Carl Pope, former Executive Director for the Sierra Club, stressed that projections of transportation reliance on oil are a significant concern, primarily because of the potential climate impacts of oil consumption, describing this as the "largest climate threat, going forward." Pope argued that strong public policies, such as Low Carbon Fuel Standards, could result in both lower oil prices and reduced oil consumption, with "no sacrifice required." The key is to create protected markets that allow alternative fuels, such as natural gas, to gain a strong foothold in the market, enabling them to overcome infrastructure barriers.

Carol Lee Rawn gave an overview of specific public policies that help reduce carbon emissions from the transportation sector-including CAFE standards and clean fuels standards, which have been adopted in California and are under consideration in other states. Rawn presented the results of a recent ICF study commissioned by Ceres and other stakeholders, which demonstrated that the California Low Carbon Fuel Standards are feasible and driving investment in cleaner fuels and production techniques.

For more information about Low Carbon Fuel Standards and how to engage the transportation sector, contact Carol Lee Rawn, Director, Ceres' Transportation Program.

RE: *United States et al. v. American Electric Power Service Corp., et al.* (S.D. Ohio No. C2-99-1250/Environmental Mitigation Project Fund Request

Dear Ms. Henry:

We are submitting this request on behalf of New York State for environmental mitigation project funding pursuant to Paragraphs 127 and 128 of the Consent Decree in this case.

Specifically, the State would like to request a total of \$2,193,000 for two projects that build on the Buffalo Green and Healthy Homes Initiative ("BGHHI") created by our office in 2008 with funding from the Consent Decree. The BGHHI funds health, safety and energy efficiency improvements for low-income Buffalo homeowners. The environmental mitigation project funding is used to fund the energy efficiency improvement component of the Initiative.

The projects to be funded by the present request include \$193,600 to support outreach necessary to extend the BGHHI to Buffalo's resettled refugee communities; and 2) \$2,000,000 to support the replication of the BGHHI "model" in the New York cities of Rochester and Syracuse.

Thank you for your attention to this matter. Please contact me if you have any questions about the request.

Sincerely,

/s/ Michael J. Myers

Specifically, the State would like to request a total of \$2,193,000 for two projects that build on the Buffalo Green and Healthy Homes Initiative ("BGHHI") created by our office in 2008 with funding from the Consent Decree. The BGHHI funds health, safety and energy efficiency improvements for low-income Buffalo homeowners. The environmental mitigation project funding is used to fund the energy efficiency improvement component of the Initiative.

The projects to be funded by the present request include \$193,600 to support outreach necessary to extend the BGHHI to Buffalo's resettled refugee communities; and 2) \$2,000,000 to support the replication of the BGHHI "model" in the New York cities of Rochester and Syracuse.

Thank you for your attention to this matter. Please contact me if you have any questions about the request.

Sincerely,

/s/ Michael J. Myers

Janet, please see the attached request for additional mitigation funds under the consent decree. This reflects an additional request to the one made on Sept. 27, i.e., is not a cumulative one. Thanks and let me know if you have any questions.--Mike

**ORAL ARGUMENT NOT YET SCHEDULED**

**IN THE UNITED STATES COURT OF APPEALS  
FOR THE DISTRICT OF COLUMBIA CIRCUIT**

_____	)	
AMERICAN PETROLEUM	)	
INSTITUTE,	)	
	)	
<i>Petitioner,</i>	)	Case No. 13-1108
	)	
v.	)	
	)	
U.S. ENVIRONMENTAL	)	
PROTECTION AGENCY,	)	
	)	
<i>Respondent.</i>	)	
_____	)	

**UNOPPOSED MOTION OF RESPONDENT EPA TO CONTINUE  
STAY OF PROCEEDINGS TO ALLOW FURTHER  
ADMINISTRATIVE RECONSIDERATION**

Respondent United States Environmental Protection Agency (“EPA”) hereby moves, without opposition by any party, to continue the existing stay of proceedings in this case until February 24, 2014, and to require the parties to submit a further motion or motions to govern further proceedings on or before that date. In support of this motion, EPA states as follows:

1. This case originated from consolidated petitions for judicial review of EPA’s final rule under the Clean Air Act entitled “Oil and Natural Gas Sector: New Source Performance Standards and National Emission Standards for Hazardous Air Pollutants Reviews,” published at 77 Fed. Reg. 49,490 (Aug. 16,

2012) (“Final Rule”). Several petitioners also filed petitions for administrative reconsideration of the Final Rule. The Final Rule contains final actions on two different national standards promulgated by EPA: (1) new source performance standards (“NSPS”), promulgated under section 111 of the Clean Air Act, 42 U.S.C. § 7411, and (2) national emission standards for hazardous air pollutants (“NESHAP”), promulgated under section 112 of the Clean Air Act, 42 U.S.C. § 7412. Because EPA exercised its discretion to combine these actions in the same rulemaking, the actions were finalized together.

2. After the petitions for judicial review were filed and consolidated by the Court, EPA conferred with all of the Petitioners to discuss how to proceed in the case, including whether the NSPS- and NESHAP-related portions of the litigation should be severed and proceed on separate tracks. Following these discussions, and without opposition by any party, EPA filed a motion on January 16, 2013, requesting that the Court sever the litigation into NSPS- and NESHAP-related cases due to the differences between these two types of national standards, the potential for EPA to take action on the reconsideration petitions on a different schedule for each set of standards, and to serve the interest of efficiency by narrowing the parties and issues involved in each case in the event further litigation becomes necessary.

3. On April 3, 2013, the Court issued an order granting this motion. The NSPS-related portion of the litigation was assigned a new docket number, No. 13-1108. As EPA's motion had requested, the Court also ordered that motions to govern further proceedings in Case No. 13-1108 be filed on or before August 30, 2013, and that the case be held in abeyance until that date.

4. Both prior and subsequent to the Court's Order of April 3, 2013, EPA has taken further steps in response to the NSPS-related portions of the petitions for administrative reconsideration that are pending before the Agency. On April 12, 2013, EPA signed a notice of proposed rulemaking addressing certain NSPS issues on an expedited basis. See 78 Fed. Reg. 22,126 (Apr. 12, 2013) Following the conclusion of the public comment period for this proposed rule, EPA then signed on August 2, 2013 a rule taking final action on this proposal. This final rule has since been published in the Federal Register at 78 Fed. Reg. 58,416 (Sept. 23, 2013).

5. Following EPA's signature of the August 2 final rule, the Court granted EPA's unopposed motion for a thirty-day extension until September 30, 2013, of the deadline for filing motions to govern further proceedings. Clerk's Order dated Aug. 30, 2013. EPA requested this extension so that it would have additional time to confer with the Petitioners and provide them an update on the status of EPA's evaluation of other issues raised by the administrative reconsideration petitions.

6. On September 10, 2013, EPA informed Petitioners that it has identified several additional issues that warrant reconsideration and continues to evaluate the remaining issues in the administrative petitions for reconsideration. EPA further informed Petitioners that it presently anticipates the Agency will sign by December 17, 2013, a notice of proposed rulemaking addressing such additional NSPS issues, and that it presently anticipates the Agency will take final action on the proposal by November 25, 2014.

7. In light of the current reconsideration status and anticipated dates for further proposed and final action on reconsideration, EPA respectfully requests that the Court continue to hold this case in abeyance until February 24, 2014, and order the parties to file a motion or motions to govern further proceedings on or prior to that date. The parties will work in good faith to reach agreement on a motion to govern further proceedings, but reserve the right to file separate motions if an agreement cannot be reached.

8. All Petitioners have confirmed through counsel that they do not oppose this motion.

## CONCLUSION

For the foregoing reasons, EPA respectfully requests that the Court grant this unopposed motion and enter an order holding this case in abeyance until February 24, 2014, and requiring the parties file a motion or motions to govern further proceedings on or before that date.

Respectfully submitted,

ROBERT G. DREHER  
Acting Assistant Attorney General  
Environment & Natural Resources Division

When I set the call for Thurs., I had expected that the program would have a plan forward that we could discuss. The shutdown, however, has delayed everything. As you know, EPA had previously stated that the agency plans to sign the proposed Wood Heaters rule in December. EPA is still intending to sign a proposed rule promptly. At this point, however, EPA does not know if the delay from the shutdown, which has interfered with review of the proposal, will mean that signature will be delayed.

I will reschedule the call when the Agency has been able to confirm a planned date for signature.

In the meantime, we would like to get an extension in our duty to respond to the complaint so we can sort this out and then discuss a settlement. We believe that a 60 day extension in our answer date would provide sufficient time.

Thanks

Eileen T. McDonough

Dear Counsel:

Judge Sargus is scheduling a telephone conference call in the above-captioned case for Friday, November 15, 2013 at 4:00 p.m. Our Court Reporter has received a request for the transcript of a proceeding held on December 17, 2012 and the purpose of the call is whether or not the transcript should be released. The call-in information for the call is below.

The call in number is 888-684-8852 -- please call about 5 minutes prior to the scheduled time of call.

You will be asked for an access code, which is: 9586353#

Then you will be asked for a Conference Security Code, which is 1182

Debra Hepler  
Judicial Assistant to Judge Edmund A. Sargus, Jr.

#### Tools & Materials

Register for 21st Century Investor Webinar: Fiduciary Duty

Join Ceres for the 21st Century Investor Blueprint webinar on Thursday, November 21st from 12:00 - 1:00 pm ET on the role of fiduciary duty in sustainable investing. Guest speakers include Keith Johnson from Reinhard Boerner Van Deuren, Catherine LaMarr, General Counsel at the Office of the Connecticut Treasurer, and Ian Lanoff at Groom Law Group.

[Register here.](#)

#### Events

INCR Policy Working Group Call

Tuesday, November 19  
1:00 - 2:00 pm ET

Join INCR members and expert speakers for the monthly INCR Policy Working Group Call. Members and staff will debrief about this month's Hill Day event and follow-up with policymakers. To learn more and register, contact Brandon Smithwood, Senior Manager, Policy Program.

## 21st Century Investor Webinar: Fiduciary Duty

Thursday, November 21  
12:00 - 1:00 pm ET

Join Ceres for the next 21st Century Investor Blueprint webinar to learn about the role of fiduciary duty in sustainable investing. Guest speakers include Keith Johnson from Reinhard Boerner Van Deuren, Catherine LaMarr, General Counsel at the Office of the Connecticut Treasurer, and Ian Lanoff at Groom Law Group. Register here.

## INCR Integrated Reporting Working Group Call

Friday, November 22  
12:30 - 2:00 pm ET

Join INCR members and guest speakers for the Integrated Reporting Working Group call focused on harmonization with industry standards. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

## Sustainable Stock Exchanges Working Group Call

Monday, November 25  
12:00 - 1:00 pm ET

Join INCR members and Ceres staff for the monthly INCR SSE Working Group call where members will discuss recent global events and how to move forward with the INCR listing standards proposal. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

## RI Americas Conference 2013: Long-term, Sustainable, Fiduciary Investing

December 10th - 11th

Join Responsible Investor and Ceres' Chris Davis, Director of INCR at the fifth annual RI Americas conference in New York City. The event will provide an in-depth legal view on the changing face of fiduciary duties, investment returns and market sustainability. Register here.

## INCR Highlights

### Sustainable Stock Exchanges Work Highlighted on Global Stage This Month

WFE Annual Meeting From Mexico to Canada to Switzerland, stock exchanges' roles in promoting sustainability reporting were center stage this month at several global events. While the debate continues about which exchanges might embrace a listing standard on ESG reporting, recent reports highlight where markets have uptake of ESG reporting.

CK Capital released its second benchmarking report on stock exchanges' rankings of issuer ESG reporting (focused on seven commonly-reported Key Performance Indicators). That release was swiftly followed by a sustainability panel at the World Federation of Exchanges Annual Meeting and General Assembly in Mexico City, where exchanges and NGOs discussed leading disclosure initiatives. In these meetings, Ceres challenged the WFE to launch a Sustainability Working Group so that exchanges can discuss INCR's proposed listing standard and learn from peers on best practice and new ESG projects.

Last week in Geneva, investors, NGOs and UN representatives gathered for the 30th International Standards for Accounting and Reporting (ISAR) conference to discuss the release of a best practices

document for regulators and exchanges on sustainability. There, Ceres discussed the INCR Listing Standards proposal and encouraged UN agencies to help facilitate dialogue between investors and exchanges in order to bridge the gap between the ESG disclosures investors want and the willingness of exchanges to provide them across markets. That same day, EIRIS launched a report on exchanges' views on sustainability initiatives.

To participate in discussions of INCR's Listing Standards proposal, and next steps for stock exchange engagement, please join the INCR Sustainable Stock Exchanges Working Group meeting November 25th, from 12:00-1:00 pm Eastern.

Register here.

### INCR Members Meet on The Hill to Press Policymakers on Clean-Energy Solutions

Yesterday, INCR and US SIF held a joint "Hill Day" in Washington, DC. to outline key operative priorities and tactics on climate and clean energy. During the morning session, investors were briefed by a panel of policy experts, including the CEO of energy efficiency REIT Hannon Armstrong, First Wind's VP of Federal Affairs, The Center for Climate and Energy Solutions' VP for Strategic Outreach, and INCR member Ken Locklin of Impax Asset Management.

The panel provided a briefing on key policy priorities- including the Carbon Pollution Standard for Power Plants, the Production Tax Credit for Wind and Energy, and an expansion of Master Limited Partnerships and Real Estate Investment Trusts to include renewable energy. In the afternoon, investors met with staff for Democrats and Republicans on tax writing and energy committees. The investor interest in climate change and clean energy policy was welcomed by most of the offices visited, and several Senators and Representatives are eager to work with INCR members to advance solutions and legislation.

For more information about the Hill Day event and to join the next Policy Working Group call on November 19th at 1:00 pm ET, contact Brandon Smithwood, Senior Manager, Policy Program.

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since

2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since

2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since 2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

21st Century Investor Webinar: Fiduciary Duty

Thursday, November 21  
12:00 - 1:00 pm ET

Join us for a free webinar on Thursday, November 21st to learn about the role of fiduciary duty in sustainable investing. Guest speakers include Keith Johnson from Reinhart Boerner Van Deuren, Catherine LaMarr, General Counsel at the Office of the Connecticut Treasurer, and Ian Lanoff at Groom Law Group.

The fiduciary case for integrating material ESG factors into investment policies and practices must be understood by pension fund, foundation and endowment trustees if ESG risks and opportunities are to be incorporated into investment decisions to improve long-term investment outcomes for beneficiaries. In a fireside chat format, our panelists will answer questions about fiduciary duty in the context of material ESG risks that can impact investment return and the financial obligation fund sponsors have to their beneficiaries.

Register here.

For more information, contact Peter Ellsworth, Senior Manager, Investor Programs.

Events Calendar

\*Tuesday, November 19, 1:00 - 2:00 pm ET - INCR Policy Working Group Call - Join INCR members and expert speakers for the monthly INCR Policy Working Group Call. Members and staff will debrief about this month's Hill Day event and follow-up with policymakers. To learn more and register, contact Brandon Smithwood, Senior Manager, Policy Program.

\*Thursday, November 21, 12:00 - 1:00 pm ET - 21st Century Investor Blueprint Webinar - Join Ceres for the 21st Century Investor Blueprint webinar to learn about the role of fiduciary duty in sustainable investing. Guest speakers include Keith Johnson from Reinhard Boerner Van Deuren, Catherine LaMarr, General Counsel at the Office of the Connecticut Treasurer, and Ian Lanoff at Groom Law Group. Register here.

\*Monday, November 25, 12:00 - 1:00 pm ET - Sustainable Stock Exchanges Working Group Call - Join INCR members and Ceres staff for the monthly INCR SSE Working Group call where members will discuss recent global events and how to move forward with the INCR listing standards proposal. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

\*Monday, December 9, 12:30 - 2:00 pm ET - INCR Integrated Reporting Working Group Call - Join INCR members and guest speakers for the Integrated Reporting Working Group call focused on harmonization with industry standards. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

\*December 10th - 11th - RI Americas Conference 2013: Long-term, Sustainable, Fiduciary Investing - Join Responsible Investor and Ceres staff at the fifth annual RI Americas conference in New York City. The event will provide an in-depth legal view on the changing face of fiduciary duties, investment returns and market sustainability. Register here.

Ceres is an advocate for sustainability leadership that mobilizes a powerful network of investors, companies and public interest groups to build a sustainable global economy. Ceres is a non-profit organization. All gifts are tax deductible. Ceres has received high ratings from charity watchdog groups, a reflection of our effectiveness, integrity and impact.

DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT

Air Quality Control Commission

REGULATION NUMBER 7

CONTROL OF OZONE VIA OZONE PRECURSORS AND CONTROL OF HYDROCARBONS VIA OIL AND GAS EMISSIONS

(EMISSIONS OF VOLATILE ORGANIC COMPOUNDS AND NITROGEN OXIDES)

5 CCR 1001-9

II.B. Exemptions

Emissions of the organic compounds listed as having negligible photochemical reactivity in the common provisions definition of Negligibly Reactive Volatile Organic Compound are exempt from the provisions of this regulation.

(State Only) Notwithstanding the foregoing exemption, hydrocarbon emissions from oil and gas operations, including methane and ethane, are subject to this regulation as set forth in Sections XVII. and XVIII.

>>>>>>>>

**XVII. (State Only, except Section XVII.E.3.a. which was submitted as part of the Regional Haze SIP) Statewide Controls for Oil and Gas Operations and Natural Gas-Fired Reciprocating Internal Combustion Engines**

XVII.A. (State Only) Definitions

XVII.A.1 "Air Pollution Control Equipment," as used in this Section XVII, means a combustion device or vapor recovery unit. Air pollution control equipment also means alternative emissions control equipment and pollution prevention devices and processes intended to reduce uncontrolled actual emissions that comply with the requirements of Section XVII.B.2.e.

~~XVII.A.2. "Atmospheric", when used to modify the term "condensate storage tank", means a type of condensate storage tank that vents, or is designed to vent, to the atmosphere.~~

XVII.A.2. "Approved Instrument Based Monitoring Method" as used in this Section XVII. means an infra-red camera, Method 21, or other Division approved instrument based monitoring device or method. If an owner/operator elects to use a Division approved Continuous Emission Monitoring program, the Division may approve a streamlined inspection and reporting program for such operations. Any instrument based monitoring method approved by the Division under this definition must be at least as effective as Method 21 or an infra-red camera.

XVII.A.3. "Auto-Igniter" means a device which will automatically attempt to relight the pilot flame in the combustion chamber of a control device in order to combust volatile organic compound emissions.

- XVII.A.3. “Condensate Storage Tank” means any production tank or series of production tanks that are manifolded together that store condensate.
- XVII.A.4. “Component” means each pump seal, compressor seal, flange, pressure relief device, connector, open ended line, and valve that contains or contacts a process stream with hydrocarbons. Process streams consisting of glycol, amine, produced water, or methanol are not components for purposes of this Section XVII.
- XVII.A.5. “Connector” means flanged, screwed, or other jointed fittings used to connect two pipes or a pipe and a piece of process equipment or that close an opening in a pipe that could be connected to another pipe. Joined fittings welded completely around the circumference of the interface are not considered connectors.
- XVII.A.6. “Date of First Production” means the date reported to the COGCC as the “first date of production.”
- XVII.A.47. “Glycol Natural Gas Dehydrator” means any device in which a liquid glycol (including ethylene glycol, diethylene glycol, or triethylene glycol) absorbent directly contacts a natural gas stream and absorbs water.
- XVII.A.8. “Multi-Well Site” means a common well pad from which multiple wells may be drilled to various bottomhole locations.
- XVII.A.9. “Natural Gas Compressor Station” means a facility which contains one or more compressors designed to compress natural gas from well pressure to gathering system pressure and recompress natural gas prior to processing.
- XVII.A.10. “Normal Operation” means all periods of operation, excluding malfunction as defined in Section I.G of the Common Provisions regulation. For storage tanks at well production facilities, normal operation includes but is not limited to liquid dumps from the separator.
- XVII.A.11. “Stabilized” when used to refer to crude oil, condensate, intermediate hydrocarbon liquids, or produced water means that the vapor pressure of the liquid is sufficiently low to prevent the production of vapor phase upon transferring the liquid to an atmospheric pressure in a storage tank, and that any emissions that occur are limited to those commonly referred to within the industry as working, breathing, and standing losses.
- XVII.A.12. “Storage Tank” means any fixed roof storage vessel or series of storage vessels that are manifolded together via liquid line. Storage vessel is as defined in 40 CFR Part 60, Subpart OOOO. Storage tanks may be located at a well production facility or other location.
- XVII.A.13. “Unsafe to Monitor” means a component is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of such monitoring.
- XVII.A.14. “Visible Emissions” means observations of smoke for any period or periods of duration greater than or equal to one (1) minute in any fifteen (15) minute period during normal operation. Visible emissions do not include radiant energy or water vapor.
- XVII.A.15. “Well Production Facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells. This equipment includes, but is

not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline.

#### XVII.B. (State Only) General Provisions

XVII.B.1. General requirements for prevention of emissions and good air pollution control equipment, prevention of leakage, and flares and combustion devices practices for all oil and gas exploration and production operations, well production facilities, natural gas compressor stations, and natural gas processing plants.

XVII.B.1.a.~~XVII.B.1.b.~~ All intermediate hydrocarbon liquid condensate collection, storage, processing, and handling operations, regardless of size, shall be designed, operated, and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

XVII.B.1.b. At all times, including periods of start-up and shutdown, the facility and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions. Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the Division, which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

XVII.B.2. General requirements for air pollution control equipment, flares, and combustion devices used to comply with Section XVII.

XVII.B.2.a.~~XVII.B.1.a.~~ All air pollution control equipment shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file. In addition, all such air pollution control equipment shall be adequately designed and sized to achieve the control efficiency rates required by this Section XVII and to handle reasonably foreseeable fluctuations in emissions of volatile organic compounds and hydrocarbons during normal operations. Fluctuations in emissions that occur when the separator dumps into the tank are reasonably foreseeable.

XVII.B.2.b.~~XVII.B.1.c.~~ If a flare or other combustion device is used to control emissions of hydrocarbons~~volatile organic compounds to comply with Section XVII~~, it shall be enclosed, have no visible emissions during normal operations, and be designed so that an observer can, by means of visual observation from the outside of the enclosed flare or combustion device, or by other convenient means approved by the Division, determine whether it is operating properly.

XVII.B.2.c.~~XVII.B.1.d.~~ Any of the effective dates for installation of controls on condensate storage tanks, dehydrators, and/or internal combustion engines may be extended at the air pollution control-Division's discretion for good cause shown.

XVII.B.2.d. Auto-igniters

All combustion devices used to control emissions of hydrocarbons shall be equipped with and operate an auto-igniter as follows:

XVII.B.2.d.(i) All combustion devices installed on or after May 1, 2014, will be equipped with an operational auto-igniter upon installation of the combustion device.

XVII.B.2.d.(ii) All combustion devices installed before May 1, 2014, will be equipped with an operational auto-igniter by or before May 1, 2016, or after the next combustion device planned shutdown, whichever comes first.

XVII.B.2.e.XVII.B.2. Alternative emissions control equipment shall qualify as air pollution control equipment, and may be used in lieu of, or in combination with, combustion devices and vapor recovery units to achieve the emission reductions required by this Section XVII, if the Division approves the equipment, device or process. As part of the approval process the Division, at its discretion, may specify a different control efficiency than the control efficiencies required by this Section XVII.

XVII.B.3. Oil refineries are not subject to ~~this section of the rule~~Section XVII.

XVII.B.4. ~~Condensate tanks, Glycol natural gas~~ dehydrators and internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard ("NSPS") under 40 CFR Part 60 are not subject to this Section XVII.

XVII.C. (State Only) Emission reduction from ~~condensate~~ storage tanks at oil and gas exploration and production operations, well production facilities, natural gas compressor stations, ~~natural gas drip stations~~ and natural gas processing plants.

XVII.C.1. Control requirements for storage tanks

XVII.C.1.a. Beginning May 1, 2008, owners or operators of all ~~atmospheric condensate~~ storage tanks storing condensate with uncontrolled actual emissions of volatile organic compounds equal to or greater than twenty (20) tons per year based on a rolling twelve-month total ~~shall must~~ operate air pollution control equipment that has an average control efficiency of at least 95% for VOCs ~~on such tanks.~~

XVII.C.1.b. Owners or operators of all storage tanks with uncontrolled actual emissions of volatile organic compounds equal to or greater than six (6) tons per year based on a rolling twelve-month total must operate air pollution control equipment that achieves an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.C.1.b.(i) A storage tank constructed on or after May 1, 2014, must be in compliance by the date that the storage tank commences operation.

XVII.C.1.b.(ii) A storage tank constructed before May 1, 2014, must be in compliance by May 1, 2015.

XVII.C.1.b.(iii) A storage tank not otherwise subject to Sections XVII.C.1.b.(i) or XVII.C.1.b.(ii), above, that increases uncontrolled actual emissions to six tons VOC or more per year on a rolling twelve month basis after May 1,

2014, must be in compliance within sixty days of discovery of the emissions increase.

XVII.C.1.c. Control requirements within 90 days of the date of first production.

XVII.C.1.c.(i) Beginning May 1, 2014, owners or operators of storage tanks at well production facilities shall collect and control emissions by routing emissions to operating air pollution control equipment during the first 90 calendar days after the date of first production. The air pollution control equipment shall achieve an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons. Except that this requirement does not apply to storage tanks that are projected to have emissions less than 1.5 tons of VOC during the first 90 days after the date of first production.

XVII.C.1.c.(ii) The air pollution control equipment and any associated monitoring equipment required pursuant to Section XVII.C.1.c., above may be removed at any time after the first 90 calendar days as long as the source can demonstrate that uncontrolled actual emissions from the storage tank are below the threshold in Section XVII.C.1.b., above.

~~XVII.C.2. For condensate storage tanks with past, uncontrolled actual emissions of volatile organic compounds of less than 20 tons per year based on a rolling twelve-month total that may become subject to Section XVII.C.1. by virtue of the addition of a newly drilled well or the recompletion or stimulation of an existing well, owners or operators of such tanks shall have until 90 days after the date of 1<sup>st</sup> production of the newly drilled, recompleted or stimulated well to install and operate any required air pollution control equipment. If the owner or operator determines that emissions of volatile organic compounds will be below the 20-ton per year threshold, the owner or operator shall notify the Division of this determination in writing and include an explanation of the methodology used to make this determination.~~

XVII.C.2. Capture requirements for storage tanks that are fitted with air pollution control equipment as required by Sections XII.D. or XVII.C.1.

XVII.C.2.a. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall route all hydrocarbon emissions to air pollution control equipment, and shall operate without venting hydrocarbon emissions from the thief hatch (or other access point to the tank) or pressure relief device during normal operation unless venting is reasonably required for maintenance, gauging, or safety of personnel and equipment.

XVII.C.2.b. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall develop, certify, and implement a documented Storage Tank Emission Management System (STEM) plan to identify appropriate strategies to minimize emissions from venting at thief hatches (or other access points to a storage tank) and pressure relief devices during normal operation. As part of STEM, owners and operators shall evaluate and employ appropriate control technologies, monitoring practices, operational practices, and/or other strategies designed to meet the requirements set forth in Section XVII.C.2.a., above, and will update the STEM plan as necessary to achieve or maintain compliance. Owners and operators are not required to develop and implement STEM for storage tanks containing only stabilized liquids. The minimum elements of STEM are listed below.

XVII.C.2.b.(i) STEM must include a monitoring strategy that incorporates the minimum monitoring frequency set forth in Section XVII.F.5.e., procedures for evaluating ongoing storage tank emission capture performance, and, if applicable, the selected strategies.

XVII.C.2.b.(ii) STEM must include a certification by the owner or operator that the selected STEM strategy or strategies are designed to minimize emissions from storage tanks and associated equipment components at the facility or facilities, including thief hatches and pressure relief devices.

### XVII.C.3. Monitoring

~~:- The owner or operator of any condensate storage tank that is required to control volatile organic compound emissions pursuant to this Section XVII.C. shall visually inspect or monitor the Air Pollution Control Equipment to ensure that it is operating at least as often as condensate is loaded out from the tank, unless a more frequent inspection or monitoring schedule is followed. In addition, if a flare or other combustion device is used, the owner or operator shall visually inspect the device for visible emissions at least as often as condensate is loaded out from the tank. The monitoring strategy of each STEM plan must include monitoring in accordance with Approved Instrument Based Monitoring Methods, as specified in Section XVII.F.5.~~

XVII.C.3.a. In addition to any applicable Approved Instrument Based Monitoring Methods, audio, visual, olfactory ("AVO") inspection of the storage tank and any associated equipment (i.e. separator, air pollution control equipment, or other pressure reducing equipment), must be completed as often as liquids are loaded out from the storage tank. However, AVO inspection is required no more frequently than every seven (7) days or less frequently than every thirty (30) days. AVO monitoring is not required for components and tanks that are unsafe to monitor. AVO inspection must include, at a minimum:

XVII.C.3.a.(i) Visual inspection of any thief hatch, pressure relief valve, or other access point to ensure that they are closed and properly sealed;

XVII.C.3.a.(ii) Visual inspection or monitoring of the air pollution control equipment to ensure that it is operating, including that the pilot light is lit on combustion devices used as air pollution control equipment;

XVII.C.3.a.(iii) If a flare or other combustion device is used, visual inspection of the auto-igniter and valves for piping of gas to the pilot light, to ensure they are functioning properly;

XVII.C.3.a.(iv) Visual inspection of the air pollution control equipment to ensure that the valves for the piping from the storage tank to the air pollution control equipment are open; and

XVII.C.3.a.(v) If a flare or other combustion device is used, inspection of the device for the presence or absence of smoke. If smoke is observed, either the equipment will be immediately shut-in to investigate the potential cause for smoke and perform repairs, as necessary, or Method

22 shall be conducted to determine whether visible emissions are present for a period of at least one (1) minute in fifteen (15) minutes.

XVII.C.4. Recordkeeping

The owner or operator of each storage tank subject to XII.D. or XVII.C. must maintain records of STEM as applicable, including the plan, any updates, and the certification, to be made available to the Division upon request. In addition, for a period of two years, the owner or operator must maintain records of any required monitoring and make them available to the Division upon request, including:

- XVII.C.4.a. The AIRS ID for the storage tank.
- XVII.C.4.b. The date and duration of any period where the thief hatch, pressure relief device, or other access point are found to be venting hydrocarbon emissions.
- XVII.C.4.c. The date and duration of any period where the air pollution control equipment is not operating.
- XVII.C.4.d. Where a flare or other combustion device is being used, the date and result of any Method 22 test.
- XVII.C.4.e. The timing of and efforts made to eliminate venting, restore operation of air pollution control equipment, and mitigate visible emissions.

XVII.D. (State Only) Emission reductions from glycol natural gas dehydrators

XVII.D.1. Beginning May 1, 2008, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.2., shall reduce uncontrolled actual emissions of volatile organic compounds by at least 90 percent through the use of a condenser or air pollution control equipment.

XVII.D.2. The control requirement in Section XVII.D.1. shall apply where:

XVII.D.2.a. Actual uncontrolled emissions of volatile organic compounds from the glycol natural gas dehydrator are equal to or greater than two tons per year; and

XVII.D.2.b. The sum of actual uncontrolled emissions of volatile organic compounds from any single glycol natural gas dehydrator or grouping of glycol natural gas dehydrators at a stationary source is equal to or greater than 15 tons per year. To determine if a grouping of dehydrators meets or exceeds the 15 tons per year threshold, sum the total actual uncontrolled emissions of volatile organic compounds from all individual dehydrators at a stationary source, including those with emissions less than two tons per year.

XVII.D.3. Beginning May 1, 2015, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, and drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.4., shall reduce uncontrolled actual emissions of hydrocarbons by at least 95 percent on a rolling twelve-month basis through the use of a condenser or air pollution control equipment. If a

combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.D.4. The control requirement in Section XVII.D.3. shall apply where:

XVII.D.4.a. Actual uncontrolled emissions of volatile organic compounds from a single new glycol natural gas dehydrator are equal to or greater than two tons per year; or

XVII.D.4.b. Actual uncontrolled emissions of volatile organic compounds from a single existing glycol natural gas dehydrator are equal to or greater than six (6) tons per year, or two (2) tons per year if the glycol natural gas dehydrator is located within 1,320 feet of a building unit or designated outside activity area.

XVII.D.4.d. For purposes of Section XVII.D.4:

XVII.D.4.d.(i) Building Unit shall mean a residential building unit, and every five thousand (5,000) square feet of building floor area in commercial facilities or every fifteen thousand (15,000) square feet of building floor area in warehouses that are operating and normally occupied during working hours.

XVII.D.4.d.(ii) A designated outside activity area shall mean an outdoor venue or recreation area, such as a playground, permanent sports field, amphitheater, or other similar place of public assembly owned or operated by a local government, which the local government seeks to have established as a Designated Outside Activity Area; or an outdoor venue or recreation area where ingress to or egress from could be impeded in the even of an emergency condition at an oil and gas location less than three hundred and fifty (350) feet from the venue due to the configuration of the venue and the number of persons known or expected to simultaneously occupy the venue on a regular basis.

XVII.E. Control of emissions from new, modified, existing, and relocated natural gas fired reciprocating internal combustion engines.

XVII.E.1. (State Only) The requirements of this Section XVII.E. shall not apply to any engine having actual uncontrolled emissions below permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.2. (State Only) New, Modified and Relocated Natural Gas Fired Reciprocating Internal Combustion Engines

XVII.E.2.a. Except as provided in Section XVII.E.2.b. below, the owner or operator on any natural gas fired reciprocating internal combustion engine that is either constructed or relocated to the state of Colorado from another state, on or after the date listed in the table below shall operate and maintain each engine according to the manufacturer's written instructions or procedures to the extent practicable and consistent with technological limitations and good engineering and maintenance practices over the entire life of the engine so that it achieves the emission standards required in Section XVII.E.2.b. Table 1, below.

XVII.E.2.b. Actual emissions from natural gas fired reciprocating internal combustion engines shall not exceed the emission performance standards in Table 1, below as expressed in units of grams per horsepower-hour (G/hp-hr)

TABLE 1				
Maximum Engine Hp	Construction or Relocation Date	Emission Standards is G/hp-hr		
		NOx	CO	VOC
< 100 Hp	Any	NA	NA	NA
≥100 Hp and < 500 Hp	On or after January 1, 2008	2.0	4.0	1.0
	On or after January 1, 2011	1.0	2.0	0.7
≥500 Hp	On or after January 1, 2011	1.0	2.0	0.7
	On or after July 1, 2007	2.0	4.0	1.0
	On or after July 1, 2010	1.0	2.0	0.7
	On or after July 1, 2010	1.0	2.0	0.7

### XVII.E.3. Existing Natural Gas Fired Reciprocating Internal Combustion Engines

#### XVII.E.3.a. (Regional Haze SIP) Rich Burn Reciprocating Internal Combustion Engines

XVII.E.3.a.(i) Except as provided in Sections XVII.3.1.(i)(b) and (c) and XVII.E.3.a.(ii), all rich burn reciprocating internal combustion engines with a manufacturer's name plate design rate greater than 500 horsepower, constructed or modified before February 1, 2009 shall install and operate both a non-selective catalytic reduction system and an air fuel controller by July 1, 2010. A rich burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of less than 2% by volume.

XVII.E.3.a.(i)(a) All control equipment required by this Section XVII.E.3.a. shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file.

XVII.E.3.a.(i)(b) Internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard under 40 CFR Part 60 are not subject to this Section XVII.E.3.a.

XVII.E.3.a.(i)(c) The requirements of this Section XVII.E.3.a. shall not apply to any engine having actual uncontrolled emissions permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.3.a.(ii) Any rich burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of combined volatile organic compound and nitrogen oxides emission reductions (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.a. Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.E.3.b. (State Only) Lean Burn Reciprocating Internal Combustion Engines

XVII.E.3.b.(i) Except as provided in Section XVII.E.3.b.(ii), all lean burn reciprocating internal combustion engines with a manufacturer's nameplate design rate greater than 500 horsepower shall install and operate an oxidation catalyst by July 1, 2010. A lean burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of 2% by volume, or greater.

XVII.E.3.b.(ii) Any lean burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of volatile organic compound emission reduction (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.b.(i). Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.F. [\(State Only\) Leak detection and repair program for well production facilities, storage tanks, and compressor stations](#)

[XVII.F.1. Beginning January 1, 2015, owners and operators of well production facilities and compressor stations will identify and repair leaks from components at these facilities in accordance with the requirements of this Section XVII.F. The following shall apply in lieu of any directed inspection and maintenance program requirements established pursuant to Regulation Number 3, Part B, Section III.D.2.](#)

[XVII.F.2. Owners and operators of well production facilities or natural gas compressor stations that monitor components as part of this Section XVII.F. may opt to estimate emissions from components for the purpose of evaluating the applicability of component fugitive emissions to Regulation Number 3 by utilizing the emission factors defined as less than 10,000 ppmv of Table 2-8 of the 1995 EPA Protocol for Equipment Leak Emission Estimates \(Document EPA-453/R-95-017\).](#)

[XVII.F.3. Owners and operators of well production facilities or natural gas compressor stations shall utilize the Approved Instrument Based Monitoring Method and AVO program as outlined in Section XVII.F. AVO monitoring is not required of components and tanks that are unsafe to monitor or inaccessible to monitor, pursuant to XVII.F.5.g.](#)

XVII.F.4. Inspection schedules for natural gas compressor stations

Beginning January 1, 2015, owners and operators of natural gas compressor stations shall inspect components for leaks using an Approved Instrument Based Monitoring Method, in accordance with the following Table 2, except for components subject to XVII.F.5.g. For purposes of this Section XVII.F.4., fugitive emissions shall be calculated using the emission factors of Table 2-4 of the 1995 EPA Protocol for Equipment Leak Emission Estimates (Document EPA-453/R-95-017), or another Division approved method.

<b>TABLE 2</b>	
<u>Fugitive VOC Emissions (tpy)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 12</u>	<u>Annually</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly</u>
<u>&gt; 50</u>	<u>Monthly</u>

XVII.F.5. Requirements for well production facilities and/or storage tanks

XVII.F.5.a. Beginning August 1, 2014, all new well production facilities shall have a documented pressure test performed on all equipment and piping prior to start up. Documentation of this 90 day testing and monitoring shall be provided in the first annual report to the Division, as required by Section XVII.F.9.

XVII.F.5.b. Beginning January 1, 2015, within 90 days of startup of all new well production facilities and/or storage tanks, owners and/or operators shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method. Such action shall qualify as an inspection pursuant to the inspection frequency schedule in Table 3.

XVII.F.5.c. Consistent with the provisions of XVII.F.5.f., owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks using an Approved Instrument Based Monitoring Method, in accordance with the implementation schedule in XVII.F.5.e. Inspection frequency shall be determined according to Table 3.

XVII.F.5.d. Consistent with the provisions of XVII.F.5.f., owners and operators of new well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method beginning on January 1, 2015. Inspection frequency shall be determined according to Table 3.

XVII.F.5.e. The estimated uncontrolled actual emissions from storage tanks determine the frequency at which inspections must be performed. If no storage tanks are located at a well production facility or multi-well site, operators will rely on the potential to emit of VOC for all of the emissions sources, including emissions from components located at the facility. All components at a well production facility or storage tank must be inspected:

<b>TABLE 3</b>	
<u>Threshold (per XVII.F.5.e.) VOC Emissions (tpy, uncontrolled actual for sites with tanks or PTE for sites without tanks)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 6</u>	<u>One time using Approved Instrument Based Monitoring Method and thereafter using monthly AVO</u>
<u>&gt; 6 and &lt; 12</u>	<u>Annually with monthly AVO</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly with monthly AVO</u>
<u>&gt; 50</u>	<u>Monthly</u>
<u>Multi-well sites without storage tanks after April 15, 2014, that have a PTE &gt; 20 tpy VOC</u>	<u>Monthly</u>

XVII.F.5.f. Phase-in of Approved Instrument Based Monitoring Methods

Owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method, in accordance with the following schedule:

XVII.F.5.f.(i) Beginning January 1, 2015, facilities with uncontrolled actual VOC emissions greater than 50 tpy or multi-well sites.

XVII.F.5.f.(ii) Beginning July 1, 2015, facilities with uncontrolled actual VOC emissions greater than 20 tpy but less than or equal to 50 tpy.

XVII.F.5.f.(iii) Beginning January 1, 2016, facilities with uncontrolled actual VOC emissions greater than 6 tpy but less than or equal to 20 tpy.

XVII.F.5.f.(iv) By July 1, 2016, facilities with uncontrolled actual VOC emissions less than or equal to 6 tpy.

XVII.F.5.g. If a component is difficult, unsafe, or inaccessible to monitor, the owner or operator shall not be required to monitor the component until it becomes feasible to do so.

XVII.F.5.g.(i) Difficult to monitor components are those that cannot be monitored without elevating the monitoring personnel more than two meters above a supported surface or are unable to be reached via a wheeled scissor-lift or hydraulic type scaffold that allows access to components up to 7.6 meters (25 feet) above the ground.

XVII.F.5.g.(ii) Unsafe to monitor components are those that cannot be monitored without exposing monitoring personnel to an immediate danger as a consequence of completing the monitoring.

XVII.F.5.g.(iii) Inaccessible to monitor components are those that are buried, insulated in a manner that prevents access to the components by

a monitor probe, or obstructed by equipment or piping that prevents access to the components by a monitor probe.

XVII.F.6. Leak detection requiring repair

Leaks shall be identified utilizing the methods listed in this Section XVII.F.6.a. through XVII.F.6.d. Only leaks detected pursuant to this Section XVII.F.6. shall require repair under Section XVII.F.

XVII.F.6.a. For Method 21 monitoring at existing facilities, a leak is any concentration of hydrocarbon above 2,000 parts per million (ppm), except for existing well production facilities where leak is defined as any concentration of hydrocarbon above 500 ppm.

XVII.F.6.b. For Method 21 monitoring at facilities constructed after May 1, 2014, a leak is any concentration of hydrocarbon above 500 ppm.

XVII.F.6.c. For infra-red camera and AVO monitoring, a leak is any detectable emissions not associated with normal equipment operation, such as pneumatic device actuation and crank case ventilation.

XVII.F.6.d. For other Division approved monitoring devices or methods, leak identification requiring repair will be established as set forth in the Division's approval.

XVII.F.7. Repair and remonitoring

XVII.F.7.a. First attempt to repair a leak shall be made no later than five (5) working days after discovery, unless parts are unavailable, the equipment requires shutdown to complete repair, or other good cause exists. If parts are unavailable, they shall be ordered promptly and the repair shall be made within fifteen (15) working days of receipt of the parts. If shutdown is required, the leak shall be repaired during the next scheduled shutdown. If delay is attributable to other good cause, repairs shall be completed within fifteen (15) working days after the cause of delay ceases to exist.

XVII.F.7.b. Within fifteen (15) working days of completion of a repair, the leak shall be remonitored to verify the repair was effective.

XVII.F.7.c. Leaks discovered pursuant to the leak detection methods of Section XVII.F. shall not be subject to enforcement by the Division unless the owner or operator fails to perform the required repairs in accordance with Section XVII.F.7.

XVII.F.7.d. For leaks identified using an Approved Instrument Based Monitoring Method, owners and operators have the option of either repairing the leak in accordance with the repair schedule set forth in Section XVII.F.7. or conducting follow-up monitoring using Method 21 within five (5) working days of the leak detected. If the follow-up Method 21 monitoring shows that the leak concentration is less than or equal to 2,000 ppm hydrocarbon for existing facilities (other than existing well production facilities), or 500 ppm for new facilities or existing well production facilities, then the emission shall not be considered a leak for purposes of this Section.

XVII.F.8. Recordkeeping

The owner or operator of each facility subject to the inspection and maintenance requirements in this Section XVII.F. shall maintain the following for a period of two (2) years and make them available to the Division upon request.

XVII.F.8.a. Documentation of the pre-start-up pressure tests for new well production facilities;

XVII.F.8.b. The date and site information for each inspection;

XVII.F.8.c. A list of the leaking components and the monitoring method used to determine the presence of the leak;

XVII.F.8.d. The date of first attempt to repair the leak and, if necessary, any additional attempt to repair the leak;

XVII.F.8.e. The date the leak was repaired;

XVII.F.8.f. The delayed repair list including the basis for placing leaks on the list;

XVII.F.8.g. The date the leak was remonitored to verify the effectiveness of the repair, and the results of the remonitoring; and

XVII.F.8.h. A list of identification numbers for components that are designated as unsafe or inaccessible to monitor, as described in Section XVII.F.5.g., an explanation for each component stating why the component is so designated, and the plan for monitoring such component(s).

XVII.F.9. Reporting

The owner or operator of each facility subject to the inspection and maintenance requirements in Section XVII.F. shall submit a single annual report on or before April 30th of each year summarizing inspection and maintenance activities at all of their subject facilities during the previous calendar year. This report shall contain at a minimum the following information:

XVII.F.9.a. The number of facilities inspected;

XVII.F.9.b. The total number of inspections;

XVII.F.9.c. The total number of leaks identified, broken out by component type;

XVII.F.9.d. The total number of leaks repaired;

XVII.F.9.e. The number of leaks on the delayed repair list as of December 31st; and

XVII.F.9.f. Each report shall be accompanied by a self-certification form. The form shall contain a certification by a responsible official of the truth, accuracy, and completeness of such form, report, or certification stating that, based on information and belief formed after reasonable

inquiry, the statements and information in the document are true, accurate, and complete.

XVII.G. (State Only) Control of emissions from well production facilities.

XVII.G.1. Well Operation and Maintenance.

On or after August 1, 2014, during normal operation gas coming off of a separator produced from any newly constructed, hydraulically fractured, or recompleted oil or gas well must be either routed to a gas gathering line or controlled by air pollution control equipment that achieves an average hydrocarbon control efficiency of 95% from the date of first production. If a combustion device is used, it shall have a design destruction efficiency of at least 98% of hydrocarbons.

XVII.H. (State Only) Venting during downhole well maintenance and unloading events.

XVII.H.1. Well Maintenance.

Beginning May 1, 2014, hydrocarbon emissions from flowing wells must be captured or controlled during downhole well maintenance or servicing activities, unless venting is necessary for safety.

XVII.H.1.a. Operators shall use best management practices to minimize the need for well venting associated with downhole well maintenance and liquids unloading. During liquids unloading events, any means of creating differential pressure will first be used to attempt to unload the liquids from the well without venting. If these methods are not successful in unloading the liquids from the well, the well may be vented to the atmosphere to create the necessary differential pressure to bring the liquids to the surface.

XVII.H.1.b. Venting will be minimized to the extent possible, using best management practices during the well maintenance and liquids unloading events in XVII.H.1.a. The owner and/or operator shall be present on-site during any planned well maintenance and liquids unloading event in XVII.H.1.a. and shall ensure that any venting to the atmosphere is limited to the maximum extent practicable.

XVII.H.1.c. Records of the cause, date, time, and duration of venting events under this Section XVII.H. will be kept and made available to the Division upon request.

XVIII. (State Only) Natural Gas-Actuated Pneumatic Controllers Associated with Oil and Gas Operations ~~in the 8-Hour Ozone Control Area or Any Ozone Nonattainment or Attainment/Maintenance Area~~

XVIII.A. \_\_\_\_\_ Applicability

This section applies to pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations) ~~in the 8-Hour Ozone Control Area or any Ozone Nonattainment or Attainment/Maintenance Area.~~

XVIII.B. \_\_\_\_\_ Definitions

XVIII.B.1. "Affected Operations" shall mean pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations).

XVIII.B.2. "Enhanced Maintenance" is specific to high-bleed devices and shall include but is not limited to cleaning, tuning, and repairing leaking gaskets, tubing fittings, and seals; tuning to operate over a broader range of proportional band; and eliminating unnecessary valve positioners.

XVIII.B.3. "High-Bleed Pneumatic Controller" shall mean a pneumatic controller that is designed to have a constant bleed rate that emits in excess of 6 standard cubic feet per hour (scfh) of natural gas to the atmosphere.

XVIII.B.4. "Low-Bleed Pneumatic controller" shall mean a pneumatic controller that is designed to have a constant bleed rate that emits less than or equal to 6 scfh of natural gas to the atmosphere.

XVIII.B.5. "Natural Gas Processing Plant" shall mean any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both.

XVIII.B.6. ~~"No-bleed Pneumatic Controller" shall mean any pneumatic controller that is not using hydrocarbon gas as the valve's actuating gas.~~

XVIII.B.67. "Pneumatic Controller" shall mean an instrument that is actuated using natural gas pressure and used to control or monitor process parameters such as liquid level, gas level, pressure, valve position, liquid flow, gas flow, and temperature.

XVIII.C. \_\_\_\_\_ Emission Reduction Requirements

The owners and operators of affected operations shall reduce emissions of volatile organic compounds from pneumatic controllers associated with affected operations as follows:

XVIII.C.1. \_\_\_\_\_ In the 8-Hour Ozone Control Area:

[XVIII.C.1.a.](#) All pneumatic controllers placed in service on or after February 1, 2009, shall emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.2.1.b.](#) All high-bleed pneumatic controllers in service prior to February 1, 2009 shall be replaced or retrofit such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, by May 1, 2009, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.31.c.](#) All high-bleed pneumatic controllers that must remain in service -due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.

[XVIII.C.3-a.1.c.\(i\)](#) For high-bleed pneumatic controllers in service prior to February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and /or process purposes by March 1, 2009. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.3-b.1.c.\(ii\)](#) For high-bleed pneumatic controllers placed in service on or after February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to be installed due to safety and /or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.2.](#) [Statewide:](#)

[XVIII.C.2.a.](#) [All pneumatic controllers placed in service on or after May 1, 2014, shall:](#)

[XVIII.C.2.a.\(i\)](#) [Emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.; or](#)

[XVIII.C.2.a.\(ii\)](#) [Utilize no-bleed pneumatic controllers where on-site electrical grid power is being used and is technically and economically feasible.](#)

[XVIII.C.2.b.](#) [All high-bleed pneumatic controllers in service prior to May 1, 2014, shall be replaced or retrofitted by May 1, 2015, such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.](#)

[XVIII.C.2.c.](#) [All high-bleed pneumatic controllers that must remain in service due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.](#)

[XVIII.C.2.c.\(i\)](#) [For high-bleed pneumatic controllers in service prior to May 1, 2014, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and/or process purposes by March 1, 2015. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.](#)

[XVIII.C.2.c.\(ii\)](#) [For high-bleed pneumatic controllers placed in service on or after May 1, 2014, the owner/operator shall submit justification for high-bleed](#)

pneumatic controllers to be installed due to safety and/or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

#### XVIII.D. Monitoring

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

##### XVIII.D.1. In the 8-Hour Ozone Control Area:

XVIII.D.1.a. Effective May 1, 2009, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.1.b. Effective May 1, 2009, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

##### XVIII.D.2. Statewide:

XVIII.D.2.a. Effective May 1, 2015, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.b. Effective May 1, 2015, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

#### XVIII.E. Recordkeeping

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

XVIII.E.1. The owner or operator of affected operations shall maintain a log of the total number of high-bleed pneumatic controllers and their associated controller numbers per facility, the total number of high-bleed pneumatic controllers per company and the associated justification that the high-bleed pneumatic controllers must be used pursuant to SectionSections XVIII.C.31.c. and XVIII.C.2.c. The log shall be updated on a monthly basis.

XVIII.E.2. The owner or operator shall maintain a log of enhanced maintenance which shall include, at a minimum, inspection dates, the date of the maintenance activity, high-bleed pneumatic controller number, description of the maintenance performed, results and date of any corrective action taken, and the printed name and signature of the individual performing the maintenance. The log shall be updated on a monthly basis.

XVIII.E.3. Records of enhanced maintenance of pneumatic controllers shall be maintained for a minimum of three years and readily made available to the ~~division~~Division upon request.

Mike, Morgan,

I have attached Colorado's proposed oil and gas air quality revisions. Best wishes,

Peter

## Colorado Fracking Rules to Target Methane

Ninety percent of wells in Colorado are fracked.(Amy Harder)

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since 2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT

Air Quality Control Commission

REGULATION NUMBER 7

CONTROL OF OZONE VIA OZONE PRECURSORS AND CONTROL OF HYDROCARBONS VIA OIL AND GAS EMISSIONS

(EMISSIONS OF VOLATILE ORGANIC COMPOUNDS AND NITROGEN OXIDES)

5 CCR 1001-9

II.B. Exemptions

Emissions of the organic compounds listed as having negligible photochemical reactivity in the common provisions definition of Negligibly Reactive Volatile Organic Compound are exempt from the provisions of this regulation.

(State Only) Notwithstanding the foregoing exemption, hydrocarbon emissions from oil and gas operations, including methane and ethane, are subject to this regulation as set forth in Sections XVII. and XVIII.

>>>>>>>>

**XVII. (State Only, except Section XVII.E.3.a. which was submitted as part of the Regional Haze SIP) Statewide Controls for Oil and Gas Operations and Natural Gas-Fired Reciprocating Internal Combustion Engines**

XVII.A. (State Only) Definitions

XVII.A.1 "Air Pollution Control Equipment," as used in this Section XVII, means a combustion device or vapor recovery unit. Air pollution control equipment also means alternative emissions control equipment and pollution prevention devices and processes intended to reduce uncontrolled actual emissions that comply with the requirements of Section XVII.B.2.e.

~~XVII.A.2. "Atmospheric", when used to modify the term "condensate storage tank", means a type of condensate storage tank that vents, or is designed to vent, to the atmosphere.~~

XVII.A.2. "Approved Instrument Based Monitoring Method" as used in this Section XVII. means an infra-red camera, Method 21, or other Division approved instrument based monitoring device or method. If an owner/operator elects to use a Division approved Continuous Emission Monitoring program, the Division may approve a streamlined inspection and reporting program for such operations. Any instrument based monitoring method approved by the Division under this definition must be at least as effective as Method 21 or an infra-red camera.

XVII.A.3. "Auto-Igniter" means a device which will automatically attempt to relight the pilot flame in the combustion chamber of a control device in order to combust volatile organic compound emissions.

- XVII.A.3. “Condensate Storage Tank” means any production tank or series of production tanks that are manifolded together that store condensate.
- XVII.A.4. “Component” means each pump seal, compressor seal, flange, pressure relief device, connector, open ended line, and valve that contains or contacts a process stream with hydrocarbons. Process streams consisting of glycol, amine, produced water, or methanol are not components for purposes of this Section XVII.
- XVII.A.5. “Connector” means flanged, screwed, or other jointed fittings used to connect two pipes or a pipe and a piece of process equipment or that close an opening in a pipe that could be connected to another pipe. Joined fittings welded completely around the circumference of the interface are not considered connectors.
- XVII.A.6. “Date of First Production” means the date reported to the COGCC as the “first date of production.”
- XVII.A.47. “Glycol Natural Gas Dehydrator” means any device in which a liquid glycol (including ethylene glycol, diethylene glycol, or triethylene glycol) absorbent directly contacts a natural gas stream and absorbs water.
- XVII.A.8. “Multi-Well Site” means a common well pad from which multiple wells may be drilled to various bottomhole locations.
- XVII.A.9. “Natural Gas Compressor Station” means a facility which contains one or more compressors designed to compress natural gas from well pressure to gathering system pressure and recompress natural gas prior to processing.
- XVII.A.10. “Normal Operation” means all periods of operation, excluding malfunction as defined in Section I.G of the Common Provisions regulation. For storage tanks at well production facilities, normal operation includes but is not limited to liquid dumps from the separator.
- XVII.A.11. “Stabilized” when used to refer to crude oil, condensate, intermediate hydrocarbon liquids, or produced water means that the vapor pressure of the liquid is sufficiently low to prevent the production of vapor phase upon transferring the liquid to an atmospheric pressure in a storage tank, and that any emissions that occur are limited to those commonly referred to within the industry as working, breathing, and standing losses.
- XVII.A.12. “Storage Tank” means any fixed roof storage vessel or series of storage vessels that are manifolded together via liquid line. Storage vessel is as defined in 40 CFR Part 60, Subpart OOOO. Storage tanks may be located at a well production facility or other location.
- XVII.A.13. “Unsafe to Monitor” means a component is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of such monitoring.
- XVII.A.14. “Visible Emissions” means observations of smoke for any period or periods of duration greater than or equal to one (1) minute in any fifteen (15) minute period during normal operation. Visible emissions do not include radiant energy or water vapor.
- XVII.A.15. “Well Production Facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells. This equipment includes, but is

not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline.

#### XVII.B. (State Only) General Provisions

XVII.B.1. General requirements for prevention of emissions and good air pollution control equipment, prevention of leakage, and flares and combustion devices practices for all oil and gas exploration and production operations, well production facilities, natural gas compressor stations, and natural gas processing plants.

XVII.B.1.a.~~XVII.B.1.b.~~ All intermediate hydrocarbon liquid condensate collection, storage, processing, and handling operations, regardless of size, shall be designed, operated, and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

XVII.B.1.b. At all times, including periods of start-up and shutdown, the facility and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions. Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the Division, which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

XVII.B.2. General requirements for air pollution control equipment, flares, and combustion devices used to comply with Section XVII.

XVII.B.2.a.~~XVII.B.1.a.~~ All air pollution control equipment shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file. In addition, all such air pollution control equipment shall be adequately designed and sized to achieve the control efficiency rates required by this Section XVII and to handle reasonably foreseeable fluctuations in emissions of volatile organic compounds and hydrocarbons during normal operations. Fluctuations in emissions that occur when the separator dumps into the tank are reasonably foreseeable.

XVII.B.2.b.~~XVII.B.1.c.~~ If a flare or other combustion device is used to control emissions of hydrocarbons~~volatile organic compounds to comply with Section XVII~~, it shall be enclosed, have no visible emissions during normal operations, and be designed so that an observer can, by means of visual observation from the outside of the enclosed flare or combustion device, or by other convenient means approved by the Division, determine whether it is operating properly.

XVII.B.2.c.~~XVII.B.1.d.~~ Any of the effective dates for installation of controls on condensate storage tanks, dehydrators, and/or internal combustion engines may be extended at the air pollution control-Division's discretion for good cause shown.

XVII.B.2.d. Auto-igniters

All combustion devices used to control emissions of hydrocarbons shall be equipped with and operate an auto-igniter as follows:

XVII.B.2.d.(i) All combustion devices installed on or after May 1, 2014, will be equipped with an operational auto-igniter upon installation of the combustion device.

XVII.B.2.d.(ii) All combustion devices installed before May 1, 2014, will be equipped with an operational auto-igniter by or before May 1, 2016, or after the next combustion device planned shutdown, whichever comes first.

XVII.B.2.e.XVII.B.2. Alternative emissions control equipment shall qualify as air pollution control equipment, and may be used in lieu of, or in combination with, combustion devices and vapor recovery units to achieve the emission reductions required by this Section XVII, if the Division approves the equipment, device or process. As part of the approval process the Division, at its discretion, may specify a different control efficiency than the control efficiencies required by this Section XVII.

XVII.B.3. Oil refineries are not subject to ~~this section of the rule~~Section XVII.

XVII.B.4. ~~Condensate tanks, Glycol natural gas~~ dehydrators and internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard ("NSPS") under 40 CFR Part 60 are not subject to this Section XVII.

XVII.C. (State Only) Emission reduction from ~~condensate~~ storage tanks at oil and gas exploration and production operations, well production facilities, natural gas compressor stations, ~~natural gas drip stations~~ and natural gas processing plants.

XVII.C.1. Control requirements for storage tanks

XVII.C.1.a. Beginning May 1, 2008, owners or operators of all ~~atmospheric condensate~~ storage tanks storing condensate with uncontrolled actual emissions of volatile organic compounds equal to or greater than twenty (20) tons per year based on a rolling twelve-month total ~~shall must~~ operate air pollution control equipment that has an average control efficiency of at least 95% for VOCs ~~on such tanks.~~

XVII.C.1.b. Owners or operators of all storage tanks with uncontrolled actual emissions of volatile organic compounds equal to or greater than six (6) tons per year based on a rolling twelve-month total must operate air pollution control equipment that achieves an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.C.1.b.(i) A storage tank constructed on or after May 1, 2014, must be in compliance by the date that the storage tank commences operation.

XVII.C.1.b.(ii) A storage tank constructed before May 1, 2014, must be in compliance by May 1, 2015.

XVII.C.1.b.(iii) A storage tank not otherwise subject to Sections XVII.C.1.b.(i) or XVII.C.1.b.(ii), above, that increases uncontrolled actual emissions to six tons VOC or more per year on a rolling twelve month basis after May 1,

2014, must be in compliance within sixty days of discovery of the emissions increase.

XVII.C.1.c. Control requirements within 90 days of the date of first production.

XVII.C.1.c.(i) Beginning May 1, 2014, owners or operators of storage tanks at well production facilities shall collect and control emissions by routing emissions to operating air pollution control equipment during the first 90 calendar days after the date of first production. The air pollution control equipment shall achieve an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons. Except that this requirement does not apply to storage tanks that are projected to have emissions less than 1.5 tons of VOC during the first 90 days after the date of first production.

XVII.C.1.c.(ii) The air pollution control equipment and any associated monitoring equipment required pursuant to Section XVII.C.1.c., above may be removed at any time after the first 90 calendar days as long as the source can demonstrate that uncontrolled actual emissions from the storage tank are below the threshold in Section XVII.C.1.b., above.

~~XVII.C.2. For condensate storage tanks with past, uncontrolled actual emissions of volatile organic compounds of less than 20 tons per year based on a rolling twelve-month total that may become subject to Section XVII.C.1. by virtue of the addition of a newly drilled well or the recompletion or stimulation of an existing well, owners or operators of such tanks shall have until 90 days after the date of 1<sup>st</sup> production of the newly drilled, recompleted or stimulated well to install and operate any required air pollution control equipment. If the owner or operator determines that emissions of volatile organic compounds will be below the 20-ton per year threshold, the owner or operator shall notify the Division of this determination in writing and include an explanation of the methodology used to make this determination.~~

XVII.C.2. Capture requirements for storage tanks that are fitted with air pollution control equipment as required by Sections XII.D. or XVII.C.1.

XVII.C.2.a. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall route all hydrocarbon emissions to air pollution control equipment, and shall operate without venting hydrocarbon emissions from the thief hatch (or other access point to the tank) or pressure relief device during normal operation unless venting is reasonably required for maintenance, gauging, or safety of personnel and equipment.

XVII.C.2.b. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall develop, certify, and implement a documented Storage Tank Emission Management System (STEM) plan to identify appropriate strategies to minimize emissions from venting at thief hatches (or other access points to a storage tank) and pressure relief devices during normal operation. As part of STEM, owners and operators shall evaluate and employ appropriate control technologies, monitoring practices, operational practices, and/or other strategies designed to meet the requirements set forth in Section XVII.C.2.a., above, and will update the STEM plan as necessary to achieve or maintain compliance. Owners and operators are not required to develop and implement STEM for storage tanks containing only stabilized liquids. The minimum elements of STEM are listed below.

XVII.C.2.b.(i) STEM must include a monitoring strategy that incorporates the minimum monitoring frequency set forth in Section XVII.F.5.e., procedures for evaluating ongoing storage tank emission capture performance, and, if applicable, the selected strategies.

XVII.C.2.b.(ii) STEM must include a certification by the owner or operator that the selected STEM strategy or strategies are designed to minimize emissions from storage tanks and associated equipment components at the facility or facilities, including thief hatches and pressure relief devices.

### XVII.C.3. Monitoring

~~:- The owner or operator of any condensate storage tank that is required to control volatile organic compound emissions pursuant to this Section XVII.C. shall visually inspect or monitor the Air Pollution Control Equipment to ensure that it is operating at least as often as condensate is loaded out from the tank, unless a more frequent inspection or monitoring schedule is followed. In addition, if a flare or other combustion device is used, the owner or operator shall visually inspect the device for visible emissions at least as often as condensate is loaded out from the tank. The monitoring strategy of each STEM plan must include monitoring in accordance with Approved Instrument Based Monitoring Methods, as specified in Section XVII.F.5.~~

XVII.C.3.a. In addition to any applicable Approved Instrument Based Monitoring Methods, audio, visual, olfactory ("AVO") inspection of the storage tank and any associated equipment (i.e. separator, air pollution control equipment, or other pressure reducing equipment), must be completed as often as liquids are loaded out from the storage tank. However, AVO inspection is required no more frequently than every seven (7) days or less frequently than every thirty (30) days. AVO monitoring is not required for components and tanks that are unsafe to monitor. AVO inspection must include, at a minimum:

XVII.C.3.a.(i) Visual inspection of any thief hatch, pressure relief valve, or other access point to ensure that they are closed and properly sealed;

XVII.C.3.a.(ii) Visual inspection or monitoring of the air pollution control equipment to ensure that it is operating, including that the pilot light is lit on combustion devices used as air pollution control equipment;

XVII.C.3.a.(iii) If a flare or other combustion device is used, visual inspection of the auto-igniter and valves for piping of gas to the pilot light, to ensure they are functioning properly;

XVII.C.3.a.(iv) Visual inspection of the air pollution control equipment to ensure that the valves for the piping from the storage tank to the air pollution control equipment are open; and

XVII.C.3.a.(v) If a flare or other combustion device is used, inspection of the device for the presence or absence of smoke. If smoke is observed, either the equipment will be immediately shut-in to investigate the potential cause for smoke and perform repairs, as necessary, or Method

22 shall be conducted to determine whether visible emissions are present for a period of at least one (1) minute in fifteen (15) minutes.

XVII.C.4. Recordkeeping

The owner or operator of each storage tank subject to XII.D. or XVII.C. must maintain records of STEM as applicable, including the plan, any updates, and the certification, to be made available to the Division upon request. In addition, for a period of two years, the owner or operator must maintain records of any required monitoring and make them available to the Division upon request, including:

- XVII.C.4.a. The AIRS ID for the storage tank.
- XVII.C.4.b. The date and duration of any period where the thief hatch, pressure relief device, or other access point are found to be venting hydrocarbon emissions.
- XVII.C.4.c. The date and duration of any period where the air pollution control equipment is not operating.
- XVII.C.4.d. Where a flare or other combustion device is being used, the date and result of any Method 22 test.
- XVII.C.4.e. The timing of and efforts made to eliminate venting, restore operation of air pollution control equipment, and mitigate visible emissions.

XVII.D. (State Only) Emission reductions from glycol natural gas dehydrators

XVII.D.1. Beginning May 1, 2008, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.2., shall reduce uncontrolled actual emissions of volatile organic compounds by at least 90 percent through the use of a condenser or air pollution control equipment.

XVII.D.2. The control requirement in Section XVII.D.1. shall apply where:

XVII.D.2.a. Actual uncontrolled emissions of volatile organic compounds from the glycol natural gas dehydrator are equal to or greater than two tons per year; and

XVII.D.2.b. The sum of actual uncontrolled emissions of volatile organic compounds from any single glycol natural gas dehydrator or grouping of glycol natural gas dehydrators at a stationary source is equal to or greater than 15 tons per year. To determine if a grouping of dehydrators meets or exceeds the 15 tons per year threshold, sum the total actual uncontrolled emissions of volatile organic compounds from all individual dehydrators at a stationary source, including those with emissions less than two tons per year.

XVII.D.3. Beginning May 1, 2015, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, and drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.4., shall reduce uncontrolled actual emissions of hydrocarbons by at least 95 percent on a rolling twelve-month basis through the use of a condenser or air pollution control equipment. If a

combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.D.4. The control requirement in Section XVII.D.3. shall apply where:

XVII.D.4.a. Actual uncontrolled emissions of volatile organic compounds from a single new glycol natural gas dehydrator are equal to or greater than two tons per year; or

XVII.D.4.b. Actual uncontrolled emissions of volatile organic compounds from a single existing glycol natural gas dehydrator are equal to or greater than six (6) tons per year, or two (2) tons per year if the glycol natural gas dehydrator is located within 1,320 feet of a building unit or designated outside activity area.

XVII.D.4.d. For purposes of Section XVII.D.4:

XVII.D.4.d.(i) Building Unit shall mean a residential building unit, and every five thousand (5,000) square feet of building floor area in commercial facilities or every fifteen thousand (15,000) square feet of building floor area in warehouses that are operating and normally occupied during working hours.

XVII.D.4.d.(ii) A designated outside activity area shall mean an outdoor venue or recreation area, such as a playground, permanent sports field, amphitheater, or other similar place of public assembly owned or operated by a local government, which the local government seeks to have established as a Designated Outside Activity Area; or an outdoor venue or recreation area where ingress to or egress from could be impeded in the even of an emergency condition at an oil and gas location less than three hundred and fifty (350) feet from the venue due to the configuration of the venue and the number of persons known or expected to simultaneously occupy the venue on a regular basis.

XVII.E. Control of emissions from new, modified, existing, and relocated natural gas fired reciprocating internal combustion engines.

XVII.E.1. (State Only) The requirements of this Section XVII.E. shall not apply to any engine having actual uncontrolled emissions below permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.2. (State Only) New, Modified and Relocated Natural Gas Fired Reciprocating Internal Combustion Engines

XVII.E.2.a. Except as provided in Section XVII.E.2.b. below, the owner or operator on any natural gas fired reciprocating internal combustion engine that is either constructed or relocated to the state of Colorado from another state, on or after the date listed in the table below shall operate and maintain each engine according to the manufacturer's written instructions or procedures to the extent practicable and consistent with technological limitations and good engineering and maintenance practices over the entire life of the engine so that it achieves the emission standards required in Section XVII.E.2.b. Table 1, below.

XVII.E.2.b. Actual emissions from natural gas fired reciprocating internal combustion engines shall not exceed the emission performance standards in Table 1, below as expressed in units of grams per horsepower-hour (G/hp-hr)

TABLE 1				
Maximum Engine Hp	Construction or Relocation Date	Emission Standards is G/hp-hr		
		NOx	CO	VOC
< 100 Hp	Any	NA	NA	NA
≥100 Hp and < 500 Hp	On or after January 1, 2008	2.0	4.0	1.0
	On or after January 1, 2011	1.0	2.0	0.7
≥500 Hp	On or after January 1, 2011	1.0	2.0	0.7
	On or after July 1, 2007	2.0	4.0	1.0
	On or after July 1, 2010	1.0	2.0	0.7
	On or after July 1, 2010	1.0	2.0	0.7

### XVII.E.3. Existing Natural Gas Fired Reciprocating Internal Combustion Engines

#### XVII.E.3.a. (Regional Haze SIP) Rich Burn Reciprocating Internal Combustion Engines

XVII.E.3.a.(i) Except as provided in Sections XVII.3.1.(i)(b) and (c) and XVII.E.3.a.(ii), all rich burn reciprocating internal combustion engines with a manufacturer's name plate design rate greater than 500 horsepower, constructed or modified before February 1, 2009 shall install and operate both a non-selective catalytic reduction system and an air fuel controller by July 1, 2010. A rich burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of less than 2% by volume.

XVII.E.3.a.(i)(a) All control equipment required by this Section XVII.E.3.a. shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file.

XVII.E.3.a.(i)(b) Internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard under 40 CFR Part 60 are not subject to this Section XVII.E.3.a.

XVII.E.3.a.(i)(c) The requirements of this Section XVII.E.3.a. shall not apply to any engine having actual uncontrolled emissions permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.3.a.(ii) Any rich burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of combined volatile organic compound and nitrogen oxides emission reductions (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.a. Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.E.3.b. (State Only) Lean Burn Reciprocating Internal Combustion Engines

XVII.E.3.b.(i) Except as provided in Section XVII.E.3.b.(ii), all lean burn reciprocating internal combustion engines with a manufacturer's nameplate design rate greater than 500 horsepower shall install and operate an oxidation catalyst by July 1, 2010. A lean burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of 2% by volume, or greater.

XVII.E.3.b.(ii) Any lean burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of volatile organic compound emission reduction (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.b.(i). Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.F. [\(State Only\) Leak detection and repair program for well production facilities, storage tanks, and compressor stations](#)

[XVII.F.1. Beginning January 1, 2015, owners and operators of well production facilities and compressor stations will identify and repair leaks from components at these facilities in accordance with the requirements of this Section XVII.F. The following shall apply in lieu of any directed inspection and maintenance program requirements established pursuant to Regulation Number 3, Part B, Section III.D.2.](#)

[XVII.F.2. Owners and operators of well production facilities or natural gas compressor stations that monitor components as part of this Section XVII.F. may opt to estimate emissions from components for the purpose of evaluating the applicability of component fugitive emissions to Regulation Number 3 by utilizing the emission factors defined as less than 10,000 ppmv of Table 2-8 of the 1995 EPA Protocol for Equipment Leak Emission Estimates \(Document EPA-453/R-95-017\).](#)

[XVII.F.3. Owners and operators of well production facilities or natural gas compressor stations shall utilize the Approved Instrument Based Monitoring Method and AVO program as outlined in Section XVII.F. AVO monitoring is not required of components and tanks that are unsafe to monitor or inaccessible to monitor, pursuant to XVII.F.5.g.](#)

XVII.F.4. Inspection schedules for natural gas compressor stations

Beginning January 1, 2015, owners and operators of natural gas compressor stations shall inspect components for leaks using an Approved Instrument Based Monitoring Method, in accordance with the following Table 2, except for components subject to XVII.F.5.g. For purposes of this Section XVII.F.4., fugitive emissions shall be calculated using the emission factors of Table 2-4 of the 1995 EPA Protocol for Equipment Leak Emission Estimates (Document EPA-453/R-95-017), or another Division approved method.

<b>TABLE 2</b>	
<u>Fugitive VOC Emissions (tpy)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 12</u>	<u>Annually</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly</u>
<u>&gt; 50</u>	<u>Monthly</u>

XVII.F.5. Requirements for well production facilities and/or storage tanks

XVII.F.5.a. Beginning August 1, 2014, all new well production facilities shall have a documented pressure test performed on all equipment and piping prior to start up. Documentation of this 90 day testing and monitoring shall be provided in the first annual report to the Division, as required by Section XVII.F.9.

XVII.F.5.b. Beginning January 1, 2015, within 90 days of startup of all new well production facilities and/or storage tanks, owners and/or operators shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method. Such action shall qualify as an inspection pursuant to the inspection frequency schedule in Table 3.

XVII.F.5.c. Consistent with the provisions of XVII.F.5.f., owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks using an Approved Instrument Based Monitoring Method, in accordance with the implementation schedule in XVII.F.5.e. Inspection frequency shall be determined according to Table 3.

XVII.F.5.d. Consistent with the provisions of XVII.F.5.f., owners and operators of new well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method beginning on January 1, 2015. Inspection frequency shall be determined according to Table 3.

XVII.F.5.e. The estimated uncontrolled actual emissions from storage tanks determine the frequency at which inspections must be performed. If no storage tanks are located at a well production facility or multi-well site, operators will rely on the potential to emit of VOC for all of the emissions sources, including emissions from components located at the facility. All components at a well production facility or storage tank must be inspected:

<b>TABLE 3</b>	
<u>Threshold (per XVII.F.5.e.) VOC Emissions (tpy, uncontrolled actual for sites with tanks or PTE for sites without tanks)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 6</u>	<u>One time using Approved Instrument Based Monitoring Method and thereafter using monthly AVO</u>
<u>&gt; 6 and &lt; 12</u>	<u>Annually with monthly AVO</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly with monthly AVO</u>
<u>&gt; 50</u>	<u>Monthly</u>
<u>Multi-well sites without storage tanks after April 15, 2014, that have a PTE &gt; 20 tpy VOC</u>	<u>Monthly</u>

XVII.F.5.f. Phase-in of Approved Instrument Based Monitoring Methods

Owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method, in accordance with the following schedule:

XVII.F.5.f.(i) Beginning January 1, 2015, facilities with uncontrolled actual VOC emissions greater than 50 tpy or multi-well sites.

XVII.F.5.f.(ii) Beginning July 1, 2015, facilities with uncontrolled actual VOC emissions greater than 20 tpy but less than or equal to 50 tpy.

XVII.F.5.f.(iii) Beginning January 1, 2016, facilities with uncontrolled actual VOC emissions greater than 6 tpy but less than or equal to 20 tpy.

XVII.F.5.f.(iv) By July 1, 2016, facilities with uncontrolled actual VOC emissions less than or equal to 6 tpy.

XVII.F.5.g. If a component is difficult, unsafe, or inaccessible to monitor, the owner or operator shall not be required to monitor the component until it becomes feasible to do so.

XVII.F.5.g.(i) Difficult to monitor components are those that cannot be monitored without elevating the monitoring personnel more than two meters above a supported surface or are unable to be reached via a wheeled scissor-lift or hydraulic type scaffold that allows access to components up to 7.6 meters (25 feet) above the ground.

XVII.F.5.g.(ii) Unsafe to monitor components are those that cannot be monitored without exposing monitoring personnel to an immediate danger as a consequence of completing the monitoring.

XVII.F.5.g.(iii) Inaccessible to monitor components are those that are buried, insulated in a manner that prevents access to the components by

a monitor probe, or obstructed by equipment or piping that prevents access to the components by a monitor probe.

XVII.F.6. Leak detection requiring repair

Leaks shall be identified utilizing the methods listed in this Section XVII.F.6.a. through XVII.F.6.d. Only leaks detected pursuant to this Section XVII.F.6. shall require repair under Section XVII.F.

XVII.F.6.a. For Method 21 monitoring at existing facilities, a leak is any concentration of hydrocarbon above 2,000 parts per million (ppm), except for existing well production facilities where leak is defined as any concentration of hydrocarbon above 500 ppm.

XVII.F.6.b. For Method 21 monitoring at facilities constructed after May 1, 2014, a leak is any concentration of hydrocarbon above 500 ppm.

XVII.F.6.c. For infra-red camera and AVO monitoring, a leak is any detectable emissions not associated with normal equipment operation, such as pneumatic device actuation and crank case ventilation.

XVII.F.6.d. For other Division approved monitoring devices or methods, leak identification requiring repair will be established as set forth in the Division's approval.

XVII.F.7. Repair and remonitoring

XVII.F.7.a. First attempt to repair a leak shall be made no later than five (5) working days after discovery, unless parts are unavailable, the equipment requires shutdown to complete repair, or other good cause exists. If parts are unavailable, they shall be ordered promptly and the repair shall be made within fifteen (15) working days of receipt of the parts. If shutdown is required, the leak shall be repaired during the next scheduled shutdown. If delay is attributable to other good cause, repairs shall be completed within fifteen (15) working days after the cause of delay ceases to exist.

XVII.F.7.b. Within fifteen (15) working days of completion of a repair, the leak shall be remonitored to verify the repair was effective.

XVII.F.7.c. Leaks discovered pursuant to the leak detection methods of Section XVII.F. shall not be subject to enforcement by the Division unless the owner or operator fails to perform the required repairs in accordance with Section XVII.F.7.

XVII.F.7.d. For leaks identified using an Approved Instrument Based Monitoring Method, owners and operators have the option of either repairing the leak in accordance with the repair schedule set forth in Section XVII.F.7. or conducting follow-up monitoring using Method 21 within five (5) working days of the leak detected. If the follow-up Method 21 monitoring shows that the leak concentration is less than or equal to 2,000 ppm hydrocarbon for existing facilities (other than existing well production facilities), or 500 ppm for new facilities or existing well production facilities, then the emission shall not be considered a leak for purposes of this Section.

XVII.F.8. Recordkeeping

The owner or operator of each facility subject to the inspection and maintenance requirements in this Section XVII.F. shall maintain the following for a period of two (2) years and make them available to the Division upon request.

XVII.F.8.a. Documentation of the pre-start-up pressure tests for new well production facilities;

XVII.F.8.b. The date and site information for each inspection;

XVII.F.8.c. A list of the leaking components and the monitoring method used to determine the presence of the leak;

XVII.F.8.d. The date of first attempt to repair the leak and, if necessary, any additional attempt to repair the leak;

XVII.F.8.e. The date the leak was repaired;

XVII.F.8.f. The delayed repair list including the basis for placing leaks on the list;

XVII.F.8.g. The date the leak was remonitored to verify the effectiveness of the repair, and the results of the remonitoring; and

XVII.F.8.h. A list of identification numbers for components that are designated as unsafe or inaccessible to monitor, as described in Section XVII.F.5.g., an explanation for each component stating why the component is so designated, and the plan for monitoring such component(s).

XVII.F.9. Reporting

The owner or operator of each facility subject to the inspection and maintenance requirements in Section XVII.F. shall submit a single annual report on or before April 30th of each year summarizing inspection and maintenance activities at all of their subject facilities during the previous calendar year. This report shall contain at a minimum the following information:

XVII.F.9.a. The number of facilities inspected;

XVII.F.9.b. The total number of inspections;

XVII.F.9.c. The total number of leaks identified, broken out by component type;

XVII.F.9.d. The total number of leaks repaired;

XVII.F.9.e. The number of leaks on the delayed repair list as of December 31st; and

XVII.F.9.f. Each report shall be accompanied by a self-certification form. The form shall contain a certification by a responsible official of the truth, accuracy, and completeness of such form, report, or certification stating that, based on information and belief formed after reasonable

inquiry, the statements and information in the document are true, accurate, and complete.

XVII.G. (State Only) Control of emissions from well production facilities.

XVII.G.1. Well Operation and Maintenance.

On or after August 1, 2014, during normal operation gas coming off of a separator produced from any newly constructed, hydraulically fractured, or recompleted oil or gas well must be either routed to a gas gathering line or controlled by air pollution control equipment that achieves an average hydrocarbon control efficiency of 95% from the date of first production. If a combustion device is used, it shall have a design destruction efficiency of at least 98% of hydrocarbons.

XVII.H. (State Only) Venting during downhole well maintenance and unloading events.

XVII.H.1. Well Maintenance.

Beginning May 1, 2014, hydrocarbon emissions from flowing wells must be captured or controlled during downhole well maintenance or servicing activities, unless venting is necessary for safety.

XVII.H.1.a. Operators shall use best management practices to minimize the need for well venting associated with downhole well maintenance and liquids unloading. During liquids unloading events, any means of creating differential pressure will first be used to attempt to unload the liquids from the well without venting. If these methods are not successful in unloading the liquids from the well, the well may be vented to the atmosphere to create the necessary differential pressure to bring the liquids to the surface.

XVII.H.1.b. Venting will be minimized to the extent possible, using best management practices during the well maintenance and liquids unloading events in XVII.H.1.a. The owner and/or operator shall be present on-site during any planned well maintenance and liquids unloading event in XVII.H.1.a. and shall ensure that any venting to the atmosphere is limited to the maximum extent practicable.

XVII.H.1.c. Records of the cause, date, time, and duration of venting events under this Section XVII.H. will be kept and made available to the Division upon request.

XVIII. (State Only) Natural Gas-Actuated Pneumatic Controllers Associated with Oil and Gas Operations in the 8-Hour Ozone Control Area or Any Ozone Nonattainment or Attainment/Maintenance Area

XVIII.A. \_\_\_\_\_ Applicability

This section applies to pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations) in the 8-Hour Ozone Control Area or any Ozone Nonattainment or Attainment/Maintenance Area.

XVIII.B. \_\_\_\_\_ Definitions

XVIII.B.1. “Affected Operations” shall mean pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations).

XVIII.B.2. “Enhanced Maintenance” is specific to high-bleed devices and shall include but is not limited to cleaning, tuning, and repairing leaking gaskets, tubing fittings, and seals; tuning to operate over a broader range of proportional band; and eliminating unnecessary valve positioners.

XVIII.B.3. “High-Bleed Pneumatic Controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits in excess of 6 standard cubic feet per hour (scfh) of natural gas to the atmosphere.

XVIII.B.4. “Low-Bleed Pneumatic controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits less than or equal to 6 scfh of natural gas to the atmosphere.

XVIII.B.5. “Natural Gas Processing Plant” shall mean any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both.

XVIII.B.6. “No-bleed Pneumatic Controller” shall mean any pneumatic controller that is not using hydrocarbon gas as the valve’s actuating gas.

XVIII.B.67. “Pneumatic Controller” shall mean an instrument that is actuated using natural gas pressure and used to control or monitor process parameters such as liquid level, gas level, pressure, valve position, liquid flow, gas flow, and temperature.

XVIII.C. \_\_\_\_\_ Emission Reduction Requirements

The owners and operators of affected operations shall reduce emissions of volatile organic compounds from pneumatic controllers associated with affected operations as follows:

XVIII.C.1. \_\_\_\_\_ In the 8-Hour Ozone Control Area:

XVIII.C.1.a. All pneumatic controllers placed in service on or after February 1, 2009, shall emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.31.c.

XVIII.C.2.1.b. All high-bleed pneumatic controllers in service prior to February 1, 2009 shall be replaced or retrofit such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, by May 1, 2009, unless allowed pursuant to Section XVIII.C.31.c.

XVIII.C.31.c. All high-bleed pneumatic controllers that must remain in service -due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.

XVIII.C.3-a.1.c.(i) For high-bleed pneumatic controllers in service prior to February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and /or process purposes by March 1, 2009. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

XVIII.C.3-b.1.c.(ii) For high-bleed pneumatic controllers placed in service on or after February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to be installed due to safety and /or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

XVIII.C.2. Statewide:

XVIII.C.2.a. All pneumatic controllers placed in service on or after May 1, 2014, shall:

XVIII.C.2.a.(i) Emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.; or

XVIII.C.2.a.(ii) Utilize no-bleed pneumatic controllers where on-site electrical grid power is being used and is technically and economically feasible.

XVIII.C.2.b. All high-bleed pneumatic controllers in service prior to May 1, 2014, shall be replaced or retrofitted by May 1, 2015, such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.

XVIII.C.2.c. All high-bleed pneumatic controllers that must remain in service due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.

XVIII.C.2.c.(i) For high-bleed pneumatic controllers in service prior to May 1, 2014, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and/or process purposes by March 1, 2015. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

XVIII.C.2.c.(ii) For high-bleed pneumatic controllers placed in service on or after May 1, 2014, the owner/operator shall submit justification for high-bleed

pneumatic controllers to be installed due to safety and/or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

#### XVIII.D. Monitoring

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

##### XVIII.D.1. In the 8-Hour Ozone Control Area:

XVIII.D.1.a. Effective May 1, 2009, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.1.b. Effective May 1, 2009, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

##### XVIII.D.2. Statewide:

XVIII.D.2.a. Effective May 1, 2015, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.b. Effective May 1, 2015, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

#### XVIII.E. Recordkeeping

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

XVIII.E.1. The owner or operator of affected operations shall maintain a log of the total number of high-bleed pneumatic controllers and their associated controller numbers per facility, the total number of high-bleed pneumatic controllers per company and the associated justification that the high-bleed pneumatic controllers must be used pursuant to SectionSections XVIII.C.31.c. and XVIII.C.2.c. The log shall be updated on a monthly basis.

XVIII.E.2. The owner or operator shall maintain a log of enhanced maintenance which shall include, at a minimum, inspection dates, the date of the maintenance activity, high-bleed pneumatic controller number, description of the maintenance performed, results and date of any corrective action taken, and the printed name and signature of the individual performing the maintenance. The log shall be updated on a monthly basis.

XVIII.E.3. Records of enhanced maintenance of pneumatic controllers shall be maintained for a minimum of three years and readily made available to the ~~division~~Division upon request.

RIAmericas Event

Long-term, sustainable, fiduciary investing.

Dear Michael,

RI Americas 2013 takes place on December 10th and 11th at Bloomberg headquarters in New York City. This is Responsible Investor's fifth annual RI Americas conference and will gather institutional investors from the US, Canada and Latin America to discuss and debate the trends in long-term, sustainable, fiduciary investment.

More than 300 pension funds, asset managers, corporates, advisors and service providers attended the event in 2012.

RI Americas is free to attend for all INCR members.

Please use the code RICERES at the RI Americas website to register free of charge.

Topics to be explored at RI Americas 2013 include:

\*The latest research into long-horizon investing by Keith Ambachtsheer, the pre-eminent strategic advisor to pension funds around the world.

\*Asset owner speakers from NYCERS, New York State, CalSTRS, AP3 (Sweden), United Methodist Church and Universities Superannuation Scheme (UK)

\*In-depth legal view on the changing face of fiduciary duties, investment returns and market sustainability

\*Integration of strategic ESG research into equities, infrastructure, real assets and private equity.

\*Special RI Insight half-day on bonds at Bloomberg, the home of bond data.

\*Fixed income: long term risk and return issues in the world's biggest asset class.

We hope you will join us for RI Americas 2013.

Kind regards,

Siobhan Collins

#### In the News

##### New Research Shows 90 Companies Caused 2/3 of Man-Made Global Warming Emissions

A new publication in the Climatic Change journal found that a select group of investor-owned companies such as BP, Chevron and Exxon, and government owned firms produced the majority of historical greenhouse gas emissions. All but seven of the 90 were energy companies. John Ashton, former UK chief climate change negotiator stated, " by highlighting the way in which a relatively small number of large companies are at the heart of the current carbon-intensive growth model, this report highlights that fundamental challenge."

#### Investors Demand Oil, Coal and Power Companies Assess Climate Change Risks - Companies Respond

Coal Power Plant 2 There is a growing urgency to diversify our energy sources and leave much of the world's remaining fossil fuel reserves in the ground in order to avoid catastrophic climate change impacts. Oil, coal, and electric power companies must recognize that it is in their best interest to plan for a low-carbon future and that it's a smart business strategy.

Climate change isn't just fossil fuel companies' problem; it is everyone's problem. But the decision by fossil fuel companies to invest \$674 billion last year in developing new, potentially unusable reserves - a number that dwarfs the \$281 billion in total global investment in clean energy in 2012, poses significant business, investment and economic risks.

INCR members are among those recognizing the need to transition from fossil fuels to cleaner energy sources. Nearly 60% of the Global 100 companies have set goals for renewable energy sourcing and greenhouse gas reductions. Companies are embracing cleaner energy not only because it's cost-effective and sustainable, but also because they understand that fossil fuel energy is increasingly risky and prone to volatile price swings.

Last month INCR members, along with global pension funds and money managers, publicly recognized the connection between the value of their financial assets and the decisions being made by fossil fuel executives. As part of this effort, 70 global investors with collective assets totaling \$3 trillion made the first ever joint request to the world's 45 largest oil, coal and power companies - including Exxon, BP, BHP Billiton and Rio Tinto- to assess the financial risks that carbon reserves and climate change pose to your business plans.

"We would like to understand [the company's] reserve exposure to the risks associated with current and

probable future policies for reducing greenhouse gas emissions by 80% by 2050," the investors wrote in their letter to oil and gas companies. "We would also like to understand what options there are for [the company] to manage these risks..."

The energy companies that received the letters have generally acknowledged that the investors' requests have raised legitimate issues. Just last week, Shell's CEO told Bloomberg: "It would be stupid for the oil and gas industry to say that renewables will not play a major role in the energy system of the next few decades today's investment levels into wind and into solar have a very rapid growth. Renewables will be developed."

Read more about the Carbon Asset Risk initiative in an article from Ceres' Mindy Lubber and Mark Fulton published in The Guardian.

To sign onto the Carbon Asset Risk letters and join the initiative, contact Ryan Salmon, Senior Manager, Oil and Gas Program.

#### Increased Interest and Traction in Green Bond Market

Over the past few months there has been increased investment in, and availability of, green bonds. These projects generally finance low carbon, clean energy infrastructure and projects that mitigate physical risks from climate change and fund adaptation measures. The recent issues of climate and green bonds are expected to continue over the next 12 months and beyond.

Zurich Insurance, which recently allocated \$1 billion to green bonds, is hoping this will encourage market demand and interest. The company's CIO, Cecilia Reyes stated Zurich wanted "to improve liquidity in the \$11 billion green-bond market, stimulate interest from other investors and encourage new issuers." Leading fund manager and INCR member BlackRock will run the portfolio.

To build a credible, large-scale global green bonds market, issuers must comply with standards and criteria that ensure the environmental integrity of the bonds and the underlying projects.

Recent green bond sales include:

- \*Bank of America's 3 year, \$500 million green bond
- \*Swedish company Vasakronan's \$1.3 billion green bond
- \*Zurich Insurance's allocation of \$1 billion to green bond investing
- \*SolarCity and Credit Suisse's \$54.4 million climate bond
- \*Norway's Kommunalbanken's \$5 million green bond

For more information about green bonds and low-carbon investing, contact Chris Davis, Director, Investor Programs.

Webinar:  
INCR Integrated Reporting Working Group

December 9, 2013 12:30 - 2:00 pm ET

Speaker:

Ricky Cronin

Ricky Cronin  
Relationships Manager- North America,  
International Integrated Reporting Council  
Director- Accounting Advisory Services, KPMG

Integrated Reporting Framework Launches in December, Join Complimentary Webinar Discussion on Implementation and Next Steps

Please join us for an in-depth discussion of the International Integrated Reporting Council's (IIRC) new <IR> Framework, which is due to be released in early December 2013. Guest speaker Ricky Cronin, representing the IIRC, will walk investors through the new Framework, highlighting what is different from the consultation, and key issues that arose during the comment period. Members will have ample opportunity to ask the IIRC questions about the final Framework, including plans for its roll-out and use during 2014, how <IR> should be incorporated into existing company engagements, and what the responsibilities of investors are in using and promoting the Framework.

INCR's Integrated Reporting Working Group welcomes all INCR members to participate in this robust discussion of next steps and new reporting opportunities. Our guest speaker will also field questions on what investors should be looking for in an integrated report, what critiques investors currently have with the state of <IR> reporting, and he will discuss the Emerging Issues Database, which will feature examples of various <IR> practices and communications taking place in filings.

Register for the complimentary webinar discussion.

For more information on this event, please contact Tracey Rembert, Senior Manager of Investor Engagement and Coordinator of the Integrated Reporting Working Group, at 617-247-0700 x106.

1200 Pennsylvania Avenue NW  
Washington, DC 20460

**Attention: Docket ID No. EPA-HQ-OAR-2010-0929**

**Re: Comments on Proposed 2013 Revisions to Reporting and Recordkeeping Requirements, and Proposed Confidentiality Determinations under the Greenhouse Gas Reporting Program, 78 Fed. Reg. 55,994**

Dear Administrator McCarthy:

Environmental Defense Fund, Natural Resources Defense Council, Clean Air Task Force, Sierra Club, and Earthjustice respectfully submit these comments on behalf of their millions of supporters and members who have an interest in accurate greenhouse gas (“GHG”) emissions measurements across all sectors of the U.S. economy. We are writing to support EPA’s proposal to publicly disclose “inputs to equations” data elements reported by the petroleum and natural gas sector under Subpart W of EPA’s Mandatory Reporting Rule.<sup>1</sup> We also respectfully urge the agency to collect and report 2010–2013 data elements as expeditiously as possible and prior to reporting year 2014. Below, we offer several specific comments on EPA’s proposed rule.

**I. THE CLEAN AIR ACT REQUIRES EPA TO DISCLOSE SUBPART W INPUTS DATA**

Section 114(c) of the Clean Air Act provides that EPA must disclose “emission data,”<sup>2</sup> which agency regulations broadly define to include “[i]nformation necessary to determine the identity, amount, frequency, concentration, or other characteristics . . . of any emission which has been emitted,” or information necessary to determine the characteristics of any emissions which “under an applicable standard or limitation” a source may emit, or even “[a] general description of the location and/or nature of the source.”<sup>3</sup> Beyond certain very limited categories,<sup>4</sup> “emission data” is to be interpreted comprehensively, to fulfill the public purposes of the Act and regulations. Further, for information that is not “emission data” the Act requires:

---

<sup>1</sup> 78 Fed. Reg. 55,994 (Sept. 11, 2013).

<sup>2</sup> 42 U.S.C. § 1714(c).

<sup>3</sup> 40 C.F.R. § 2.301(a)(2)(i).

<sup>4</sup> The regulations provide that this definition may be read narrowly only for data pertaining to research and development processes. *Id.* § 2.301(a)(2)(ii).

[a]ny records, reports, or information obtained under subsection (a) of this section shall be available to the public, except that upon a showing satisfactory to the Administrator by any person that records, reports, or information, or particular part thereof, (other than emission data) to which the Administrator has access under this section if made public, would divulge methods or processes entitled to protection as trade secrets of such person, the Administrator shall consider such record, report, or information or particular portion thereof confidential.<sup>5</sup>

Subpart W inputs to emission equations data elements meet EPA's regulatory definition of emission data, and therefore must be disclosed. EPA and the public must rely upon these data to determine emissions because reporters using equations are, by definition, not directly measuring emissions. The *only* emission data available to EPA are the inputs and verification data. As EPA explained, "once a facility selects a calculation method [using emissions equations], then the equation becomes the only way for determining such emissions," and so "these inputs to the equation are information 'necessary to determine' the calculated emissions."<sup>6</sup> EPA has acknowledged that inputs to emissions equations are emission data, and therefore it must disclose them to the public.<sup>7</sup>

## II. SUBPART W INPUTS ARE PUBLICLY AVAILABLE AND MUST BE DISCLOSED

In addition to the fact that Subpart W inputs data are "emissions data" and must be disclosed, the Act separately requires disclosure of these data because they are publicly available and not commercially sensitive.<sup>8</sup> Indeed, industry comments on the proposed deferral indicated most data elements were publicly available because "[s]tate oil and gas commissions publish significant amounts of information on oil and gas production operations."<sup>9</sup> The exclusion of such inputs from reporting and public disclosure would unnecessarily deny the public access to vital emission data and could hinder efforts to refine other data collection programs such as the Annual Inventory of Greenhouse Gas Emissions and Sinks.

We support EPA's proposed determination in this rulemaking to disclose Subpart W inputs because the data are publicly available and not commercially sensitive. Using a careful four-step process, the agency concluded that the Subpart W "inputs to equations" data elements are not confidential. In the proposed rule, EPA concluded that "for all of the industry segments within Subpart W, either the data are reported at a level of geographical aggregation that protects individual well information, or the markets in which the affected firms operate are structured in ways that disclosure of 'inputs to equations' data elements would not be likely to cause

<sup>5</sup> 42 U.S.C. § 1714(c).

<sup>6</sup> 75 Fed. Reg. 39,094, 39,109 (July 7, 2010).

<sup>7</sup> *See, e.g., id.* at 39,108 *et seq.*

<sup>8</sup> *See* 42 U.S.C. § 7414; *see also* Env'tl. Def. Fund et al., Comments Regarding Proposed Deferral of Greenhouse Gas Reporting and Call for Information (Docket ID Nos. EPA-HQ-OAR-2010-0929 and EPA-HQ-2010-0964) (Mar. 7, 2011), *available at* [http://www.eenews.net/assets/2011/03/08/document\\_gw\\_01.pdf](http://www.eenews.net/assets/2011/03/08/document_gw_01.pdf). In our comments we included a report by Susan Harvey, an oil and gas expert, that contained dozens of examples where industry already publicly discloses information it had sought to protect as confidential business information. *Id.* at 24.

<sup>9</sup> Env'tl. Prot. Agency, Public Comments and Responses for: Mandatory Greenhouse Gas Reporting Rule: Deferral Notice 174 (Aug. 2011) (comments of Karin Ritter, American Petroleum Institute).

competitive harm.”<sup>10</sup> We agree that the rule as currently structured will not cause competitive harm, and this lack of competitive harm provides separate legal justification for disclosing the data.

### III. Subpart W Inputs Provide Important Additional Transparency

EPA has expressed the critical importance of creating a transparent, public database of GHG emission data. In the final reporting rule, for instance, EPA explained that:

using the rich data set provided by this rulemaking, EPA, States and the public will be able to track emission trends from industries and facilities within industries over time, particularly in response to policies and potential regulations. The data collected by this rule will also improve the U.S. government’s ability to formulate climate policies, and to assess which industries might be affected, and how these industries might be affected by potential policies. Finally, EPA’s experience with other reporting programs is that such programs raise awareness of emissions among reporters and other stakeholders, and thus contribute to efforts to identify and implement emission reduction opportunities. These data can also be coupled with efforts at the local, State and Federal levels to assist corporations and facilities in determining their GHG footprints and identifying opportunities to reduce emissions (e.g., through energy audits or other forms of assistance).<sup>11</sup>

Indeed, in its proposal to disclose GHG emission data, EPA again strongly stated that “[p]ublic release of the information collected under Part 98 that are emission data or non-[confidential business information] is important because it ensures transparency and promotes public confidence in the data.”<sup>12</sup> EPA went on to emphasize that such information was vital to “policy makers, the public, and industry” as they all work to understand and control emissions.<sup>13</sup> The agency in short has, in line with its statutory mandates, made a strong commitment to public disclosure and public participation in developing and sharing reporting rule data.

Moreover, EPA affirmed the importance of Subpart W data to deepening understanding of emissions in the oil and gas sector and achieving needed reductions:

The data submitted under [Subpart W] will provide important information on the location and magnitude of GHG emissions from petroleum and natural gas systems and will allow petroleum and natural gas facilities to track their own emissions, compare them to similar facilities and aid in identifying cost effective opportunities to reduce emissions in the future . . . . [Through collection of Subpart W data] EPA will be in a better position to characterize (1) the extent of methane emissions from these sources that will remain after imposition of

<sup>12</sup> 75 Fed. Reg. at 39,099.

<sup>13</sup> *Id.*

controls required by [the NSPS]; and (2) whether additional measures are available and appropriate for addressing such emissions.<sup>14</sup>

We disagree that EPA lacks the necessary information to set performance standards for methane. The agency has a mandatory legal duty to address these harmful emissions and robust Subpart W data only strengthens the imperative for addressing these harmful emissions.

Finally, reporting Subpart W data will help to address a recent report from EPA's Office of Inspector General, which recommended that EPA "develop and implement a comprehensive strategy for improving air emission data for the oil and gas production sector."<sup>15</sup> The report notes that EPA considers Subpart W as its main GHG emission data collection strategy from the oil and natural gas industries.

#### **IV. We Urge EPA to Disclose the Data Expeditiously**

Because EPA did not identify disclosure concerns for Subpart W "inputs to equations," the current deferral of reporting for such inputs will expire on March 2015. EPA proposes to collect and report this data as part of the annual report for reporting year 2014, which if EPA follows past practice would be released in October 2015. Given EPA's carefully-considered determination that Subpart W inputs are publicly available and not commercially sensitive, and that these inputs are already being collected by industry for eventual reporting, we respectfully urge EPA to begin collecting and reporting these data prior to reporting year 2014. We respectfully recommend that the agency set an interim deadline, such as August 2014, for the first reports of Subpart W inputs to be submitted. This would allow the data to be released to the public with the 2013 reporting year data in the fall of 2014, likely a full year before the current schedule in the proposed rule. Having this data quickly is imperative as policymakers and companies are evaluating mitigation opportunities.

In the proposed rule, EPA claims that the deferred reporting deadline will "ease the burden for facilities" by delaying the reporting deadline for Subpart W inputs to emission equations data.<sup>16</sup> However, facilities already possess the relevant data elements and are required to have organized the relevant data elements into a form that is suitable for expeditious inspection and review,<sup>17</sup> and promptly reporting them will promote transparency. EPA also states that "[t]his proposed approach would prevent facilities from being required to revise, re-certify, and re-submit annual reports from each previous reporting year."<sup>18</sup> To avoid this issue, EPA could instead request that the data be reported as a supplement to the annual report for reporting year 2013.

Congress mandated the establishment of the GHG reporting program to ensure the public benefits from greater transparency and accountability in the scope and dimensions of GHG

<sup>14</sup> 77 Fed. Reg. 49,490, 49,513–14 (Aug. 16, 2012).

<sup>15</sup> EPA Office of Inspector General, EPA NEEDS TO IMPROVE AIR EMISSIONS DATA FOR THE OIL AND NATURAL GAS PRODUCTION SECTOR—REPORT 13-P-0161 (Feb. 20, 2013); *available at* <http://www.epa.gov/oig/reports/2013/20130220-13-P-0161.pdf>.

<sup>17</sup> *See* 76 Fed. Reg. 53,057, 53,061 (Aug. 25, 2011) (citing 40 C.F.R. § 98.3(g)).

<sup>18</sup> *Id.*

emissions. State regulators, industry stakeholders, policymakers, and the public need the withheld data as soon as possible to deepen understanding of the emissions profile of the petroleum and natural gas sector and to assist in developing timely and effective technical and policy solutions. For instance, the inputs for which reporting is currently deferred include vital information on the number of emitting facilities and components deployed in the field. Without these inputs, it is difficult to assess whether differences in emissions reported by different facilities are attributable to inherent characteristics such as activity levels or component counts, or whether more site-specific factors are driving emissions. Release of Subpart W inputs will also help both EPA and the public verify the accuracy of emissions reports and build additional confidence in the reliability of the reporting system. Accurate and timely information on the sources of emissions from this sector will assist greatly in identifying and advocating for solutions—as Congress recognized when it directed EPA to develop the reporting system.

## V. CONCLUSION

Accurate reporting and verification of GHG emissions is vital. EPA has acknowledged the importance of public disclosure in “building public confidence in the quality of the data collected.”<sup>19</sup> Accordingly, we support EPA’s proposal to disclose Subpart W inputs to emission equations data, and we respectfully urge the agency to collect and report 2010–2013 data before reporting year 2014.

**Re: Incorporating the Latest Scientific Findings Concerning Methane's Climate Impacts into EPA Scientific Analyses and Policies**

Dear Administrator McCarthy and Acting Assistant Administrator McCabe:

Environmental Defense Fund ("EDF") respectfully urges EPA to incorporate the latest scientific findings concerning methane's climate impacts into its scientific analyses and policy decisions. In particular, we urge EPA to ensure these agency actions reflect updates to the global warming potential ("GWP") value of methane and other greenhouse gases in the recently-released Intergovernmental Panel on Climate Change Fifth Assessment Report. *See* CLIMATE CHANGE 2013: THE PHYSICAL SCIENCE BASIS, CONTRIBUTION OF WORKING GROUP I TO THE FIFTH ASSESSMENT REPORT OF THE INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE, *available at* [http://www.climatechange2013.org/images/uploads/WGIAR5\\_WGI12Doc2b\\_FinalDraft\\_All.pdf](http://www.climatechange2013.org/images/uploads/WGIAR5_WGI12Doc2b_FinalDraft_All.pdf).

The latest scientific consensus shows that methane is an even more potent climate forcer than previously understood. The Fifth Assessment Report concludes methane has a 20-year GWP of 84 and a 100-year GWP of 28 compared to previous scientific consensus that methane had a 20-year GWP of 72 and a 100-year GWP of 25. Moreover, when climate carbon-  
feedbacks are considered, the report concludes that methane has a 20-year GWP of 86 and a 100-year GWP of 34. In adjusting these GWP values, scientists concluded that failure to consider climate-carbon feedbacks meant that "GWPs presented in [the Fourth Assessment Report] may underestimate the relative impacts of non-CO2 gases." *Id.*

On June 25, the President called for our nation to work together in addressing harmful, climate-destabilizing pollution. Curbing methane emissions is an integral part of this overall Plan, which calls for an Interagency Methane Strategy that "will focus on assessing current

emissions data, addressing data gaps, identifying technologies and best practices for reducing emissions, and identifying existing authorities and incentive-based opportunities to reduce methane emissions.” EXECUTIVE OFFICE OF THE PRESIDENT, THE PRESIDENT’S CLIMATE ACTION PLAN 10 (2013).

In addition to this Interagency Strategy, EPA has a responsibility to undertake a number of scientific and policy actions for which accurate accounting of methane’s climate impacts will be crucial. These include EPA’s greenhouse gas reporting program, emission standards for the oil and natural gas sector, emissions standards for municipal solid waste landfills, and emissions standards from medium- and heavy-duty vehicles among others. To accurately account for methane’s climate impacts and to rigorously evaluate methane emissions reduction opportunities, we respectfully urge EPA to adopt the methane GWP values in the Fifth Assessment Report in these ongoing and upcoming actions.

Join Complimentary Webinar Discussion on Integrated Reporting Framework: Implementation and Next Steps

Monday, December 9  
12:30 - 2:00 pm ET

IRLogoPlease join INCR for an in-depth discussion of the International Integrated Reporting Council's (IIRC) new <IR> Framework, which is due to be released in early December 2013. Guest speaker Ricky Cronin, representing the IIRC, will walk investors through the new Framework, highlighting what is different from the consultation, and key issues that arose during the comment period. Members will have ample opportunity to ask the IIRC questions about the final Framework, including plans for its roll-out and use during 2014, how <IR> should be incorporated into existing company engagements, and what the responsibilities of investors are in using and promoting the Framework.

INCR's Integrated Reporting Working Group welcomes all INCR members to participate in this robust discussion of next steps and new reporting opportunities. Our guest speaker will also field questions on what investors should be looking for in an integrated report, what critiques investors currently have with the state of <IR> reporting, and he will discuss the Emerging Issues Database, which will feature examples of various <IR> practices and communications taking place in filings.

Register for the complimentary webinar discussion.

For more information on this event, please contact Tracey Rembert, Senior Manager of Investor Engagement and Coordinator of the Integrated Reporting Working Group.

Events Calendar

\*Tuesday, December 3, 1:00 - 2:00 pm ET - CDSB Webinar: Integrating Climate Change Information Into Mainstream Corporate Reports - This CDSB webinar will show how companies can place their climate change information into their annual financial reports using CDSB's Reporting Framework. You will hear perspectives from regulators, business, advisers, investors and non-financial reporting experts. Speakers include Lois Guthrie, Executive Director of CDSB and Jim Coburn of Ceres. Register here.

\*Wednesday, December 4, 2:00 - 3:00 pm ET - Shareholder Initiative on Climate and Sustainability (SICS) - The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change- related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge,

Senior Manager, Investor Programs.

\*Monday, December 9, 12:30 - 2:00 pm ET - INCR Integrated Reporting Working Group Call - Join INCR members and guest speakers for the Integrated Reporting Working Group call focused on harmonization with industry standards. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

\*December 10th - 11th - RI Americas Conference 2013: Long-term, Sustainable, Fiduciary Investing - Join Responsible Investor and Ceres staff at the fifth annual RI Americas conference in New York City. The event will provide an in-depth legal view on the changing face of fiduciary duties, investment returns and market sustainability. Register here.

\*Tuesday, December 17, 1:00 - 2:00 pm ET - INCR Policy Working Group Call - Join this month's INCR Policy working group call to hear from guest speakers, Ceres staff and investor peers. The discussion will focus on upcoming engagements, investor opportunities and new regulations. To register and learn more, contact Brandon Smithwood, Senior Manager, Policy Program.

Ceres is an advocate for sustainability leadership that mobilizes a powerful network of investors, companies and public interest groups to build a sustainable global economy. Ceres is a non-profit organization. All gifts are tax deductible. Ceres has received high ratings from charity watchdog groups, a reflection of our effectiveness, integrity and impact.

Ann --

Very sorry about this, but I now realize my flight east leaves at 2:50 PM Eastern tomorrow, so I probably will not be available for much more than a half hour. Especially given the difficulty of scheduling things this week, though, I think we should go ahead if 2 Eastern works for others, and even a short discussion could be useful. For a longer, more moot-like session, any time Friday afternoon from 1 PM Eastern would work best for me. I'm happy to schedule a discussion on Monday 12/9 too.

Thanks,  
-Sean

---

All—The Third Department affirmed Supreme Court's dismissal of the latest challenge to the RGGI program today. Morgan argued on behalf of the State in mid-October and did an excellent job. You may recall we won below on standing and laches grounds. The Appellate Division affirmed on different grounds: statute of limitations and mootness (see attached). Cheers!--Mike

All--Just wanted to pass along the good news that we received a favorable decision today granting our motion to dismiss the Thrun case. The judge found for us on standing and laches grounds. A copy of

the decision is attached. Thanks for your help in making the laches case, which the judge obviously found convincing. I expect the plaintiffs will appeal, so will keep you posted.--Mike

State of New York  
Supreme Court, Appellate Division  
Third Judicial Department

Decided and Entered: December 5, 2013

516556

LISA THRUN et al.,  
Appellants,  
v

MEMORANDUM AND ORDER

ANDREW M. CUOMO, as Governor  
of the State of New York,  
et al.,  
Respondents.

Calendar Date: October 17, 2013

Before: Peters, P.J., Rose, Lahtinen and Garry, JJ.

\_\_\_\_\_

Sam Kazman, Competitive Enterprise Institute, Washington, D.C. (Mark V. Smith of Smith Valliere, PLLC, New York City, of counsel), for appellants.

Eric T. Schneiderman, Attorney General, Albany (Morgan Costello of counsel), for respondents.

\_\_\_\_\_

Peters, P.J.

Appeal from an order of the Supreme Court (McNamara, J.), entered June 13, 2012 in Albany County, which granted defendants' motion to dismiss the complaint.

In 2005, the Governors of seven states, including then-Governor of New York George Pataki, signed a nonbinding memorandum of understanding (hereinafter MOU) in which they agreed to propose for legislative or regulatory approval within their respective states a carbon dioxide cap-and-trade program to target emissions from electricity generating power plants, known

as the Regional Greenhouse Gas Initiative (hereinafter RGGI).<sup>1</sup> In 2008, defendant Department of Environmental Conservation (hereinafter DEC) and defendant New York State Energy Research and Development Authority (hereinafter NYSERDA) adopted final regulations implementing New York's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). The DEC regulations require power plants generating 25 megawatts or more of electricity to obtain a permit from DEC which, in turn, obligates the regulated entities to purchase and hold sufficient carbon dioxide allowances to cover emissions for the past three-year control period (see 6 NYCRR 242-1.4 [a]; 242-1.5 [c] [6]; 242-3.1). The NYSERDA regulations authorize it to coordinate and implement the state's participation in the quarterly, multi-state auctions run by RGGI, Inc., a nonprofit corporation formed by the signatory states, through which the carbon dioxide allowances allocated for sale by DEC are sold to regulated entities (see 21 NYCRR 507.3; 507.6 [a], [b]). The auction proceeds are controlled by NYSERDA and used to "promote . . . programs for energy efficiency, renewable or non-carbon emitting technologies[] and innovative carbon emissions abatement technologies . . . and for reasonable administrative costs . . . associated with the [RGGI] [p]rogram" (21 NYCRR 507.4 [d]; see 21 NYCRR 507.3 [c]; 507.4 [a]-[d]).

In 2011, plaintiffs – three New York residents and electricity ratepayers – commenced this action seeking declaratory and injunctive relief against the enforcement of the RGGI program throughout the state. Plaintiffs alleged that the MOU was executed, and the regulations were promulgated, without legislative approval or statutory authorization and in violation of the NY Constitution and the separation of powers doctrine. Plaintiffs further asserted that the RGGI program imposes an unlawful tax upon ratepayers not authorized by the Legislature, and that the RGGI program, as implemented, is arbitrary and capricious. Lastly, plaintiffs claimed that the MOU constituted an interstate compact signed in violation of the US Constitution.

---

<sup>1</sup> Three additional states subsequently signed the MOU. In 2011, New Jersey, one of the original signatory states, withdrew its participation.

Defendants moved to dismiss the complaint on the grounds of standing, statute of limitations, mootness and/or laches. Supreme Court granted the motion and dismissed the complaint in its entirety, finding that plaintiffs lacked standing to challenge the RGGI regulations and that the doctrine of laches barred their claims. Plaintiffs now appeal and we affirm, albeit on different grounds.

We assume, without deciding, that plaintiffs have standing to bring this action (see Matter of Stray from the Heart, Inc. v Department of Health & Mental Hygiene of the City of N.Y., 20 NY3d 946, 948 [2012]; Matter of New York State Assn. of Criminal Defense Lawyers v Kaye, 96 NY2d 512, 516 [2001]; Matter of Hudson Prop. Owners' Coalition, Inc. v Slocum, 92 AD3d 1198, 1199 [2012]; see generally Matter of Hoston v New York State Dept. of Health, 203 AD2d 826, 827 [1994], lv denied 84 NY2d 803 [1994]). Nevertheless, the complaint must be dismissed in its entirety because certain claims are time-barred and the remaining claims have been rendered moot.

Although declaratory judgment actions are typically governed by a six-year statute of limitations (see CPLR 213 [1]), "a court must look to the underlying claim and the nature of the relief sought and determine whether such claim could have been properly made in another form" (Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d 1044, 1045 [2012]; see Gress v Brown, 20 NY3d 957, 959 [2012]; Solnick v Whalen, 49 NY2d 224, 231 [1980]; Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d 1088, 1088-1089 [2012]). "Where, as here, governmental activity is being challenged, the immediate inquiry is whether the challenge could have been advanced in a CPLR article 78 proceeding" (Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d at 1089 [internal quotation marks and citation omitted]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d 194, 201 [1994]). "While it is well established that a challenge to the validity of legislation may not be brought under [CPLR] article 78, this principle does not apply to the quasi-legislative acts and decisions of administrative agencies," which are subject to a four-month statute of limitations (Walton v New York State Dept. of Correctional Servs., 8 NY3d 186, 194 [2007];

see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d at 1045).

Here, plaintiffs' first three causes of action challenge the validity of the RGGI regulations promulgated by DEC and NYSERDA pursuant to the statutory authority granted to those respective administrative bodies pursuant to the Environmental Conservation Law and the Public Authorities Law. The enactment of such regulations was "quasi-legislative" and, as such, plaintiffs' challenges thereto were capable of being reviewed in the context of a CPLR article 78 proceeding (see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Town of Stony Point v State of N.Y. Dept. of Fin., Off. of Real Prop. Servs., 107 AD3d 1217, 1218 [2013]; Kent Acres Dev. Co., Ltd. v. City of New York, 41 AD3d 542, 549 [2007]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d 1100, 1101 [2006]; Matter of Purcell v Travis, 24 AD3d 824, 824 [2005], lv denied 7 NY3d 703 [2006]; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d 511, 511-512 [2003]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d 557, 560 [2000]). Although at times couched in terms of constitutional infirmity and illegality, the essence of plaintiffs' claims against DEC and NYSERDA is that the RGGI regulations are "arbitrary and capricious" and that the decision to promulgate such regulations was "affected by an error of law" (CPLR 7803 [3]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Marsh v New York State & Local Employees' Retirement Sys., 291 AD2d 713, 714 [2002]; Wechsler v State of New York, 284 AD2d 707, 709 [2001], lv denied 97 NY2d 607 [2001]; Matter of Aubin v State of New York, 282 AD2d 919, 921-922 [2001], lv denied 97 NY2d 606 [2001]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d at 560). Plaintiffs' challenges to the RGGI regulations are therefore subject to a four-month statute of limitations and, inasmuch as those regulations became effective more than 2½ years prior to the commencement of this action, their claims as against DEC and NYSERDA are time-barred (see CPLR 217 [1]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d at 1101; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d at 512).

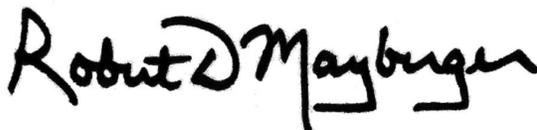

While plaintiffs' challenges to Governor Pataki's authority to enter into the MOU are not subject to the four-month statute of limitations (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d 801, 815 [2003], cert denied 540 US 1017 [2003]), such claims must be dismissed as moot. By signing the MOU, Pataki did not obligate New York to participate in the RGGI program, but merely agreed to propose a carbon dioxide emissions cap-and-trade program in New York. It is the regulations implementing RGGI in New York – not the MOU – that form the legal basis for the state's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). As the MOU did not actually effectuate the RGGI program or the state's participation in it, invalidating the MOU will not have the effect of repealing the regulations or otherwise affect their legality (cf. Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 812). A declaration as to the validity or invalidity of the MOU would, therefore, have no effect on the rights of the parties (see id.; see generally Matter of Hearst Corp. v Clyne, 50 NY2d 707, 713-714 [1980]). Furthermore, we are unpersuaded that the exception to the mootness doctrine is applicable under the circumstances presented here (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 811-812; Matter of Schulz v State of New York, 182 AD2d 3, 5 [1992], appeal dismissed 80 NY2d 924 [1992], lv denied 80 NY2d 761 [1992]; see generally Matter of Hearst Corp. v Clyne, 50 NY2d at 714-715).

In light of our holding, we need not address the parties' remaining contentions.

Rose, Lahtinen and Garry, JJ., concur.

ORDERED that the order is affirmed, without costs.

All--Just wanted to pass along the good news that we received a favorable decision today granting our motion to dismiss the Thrun case. The judge found for us on standing and laches grounds. A copy of the decision is attached. Thanks for your help in making the laches case, which the judge obviously found convincing. I expect the plaintiffs will appeal, so will keep you posted.--Mike

Sam Kazman, Competitive Enterprise Institute, Washington, D.C. (Mark V. Smith of Smith Valliere, PLLC, New York City, of counsel), for appellants.

Eric T. Schneiderman, Attorney General, Albany (Morgan Costello of counsel), for respondents.

---

Peters, P.J.

Appeal from an order of the Supreme Court (McNamara, J.), entered June 13, 2012 in Albany County, which granted defendants' motion to dismiss the complaint.

In 2005, the Governors of seven states, including then-Governor of New York George Pataki, signed a nonbinding memorandum of understanding (hereinafter MOU) in which they agreed to propose for legislative or regulatory approval within their respective states a carbon dioxide cap-and-trade program to target emissions from electricity generating power plants, known

as the Regional Greenhouse Gas Initiative (hereinafter RGGI).<sup>1</sup> In 2008, defendant Department of Environmental Conservation (hereinafter DEC) and defendant New York State Energy Research and Development Authority (hereinafter NYSERDA) adopted final regulations implementing New York's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). The DEC regulations require power plants generating 25 megawatts or more of electricity to obtain a permit from DEC which, in turn, obligates the regulated entities to purchase and hold sufficient carbon dioxide allowances to cover emissions for the past three-year control period (see 6 NYCRR 242-1.4 [a]; 242-1.5 [c] [6]; 242-3.1). The NYSERDA regulations authorize it to coordinate and implement the state's participation in the quarterly, multi-state auctions run by RGGI, Inc., a nonprofit corporation formed by the signatory states, through which the carbon dioxide allowances allocated for sale by DEC are sold to regulated entities (see 21 NYCRR 507.3; 507.6 [a], [b]). The auction proceeds are controlled by NYSERDA and used to "promote . . . programs for energy efficiency, renewable or non-carbon emitting technologies[] and innovative carbon emissions abatement technologies . . . and for reasonable administrative costs . . . associated with the [RGGI] [p]rogram" (21 NYCRR 507.4 [d]; see 21 NYCRR 507.3 [c]; 507.4 [a]-[d]).

In 2011, plaintiffs – three New York residents and electricity ratepayers – commenced this action seeking declaratory and injunctive relief against the enforcement of the RGGI program throughout the state. Plaintiffs alleged that the MOU was executed, and the regulations were promulgated, without legislative approval or statutory authorization and in violation of the NY Constitution and the separation of powers doctrine. Plaintiffs further asserted that the RGGI program imposes an unlawful tax upon ratepayers not authorized by the Legislature, and that the RGGI program, as implemented, is arbitrary and capricious. Lastly, plaintiffs claimed that the MOU constituted an interstate compact signed in violation of the US Constitution.

---

<sup>1</sup> Three additional states subsequently signed the MOU. In 2011, New Jersey, one of the original signatory states, withdrew its participation.

Defendants moved to dismiss the complaint on the grounds of standing, statute of limitations, mootness and/or laches. Supreme Court granted the motion and dismissed the complaint in its entirety, finding that plaintiffs lacked standing to challenge the RGGI regulations and that the doctrine of laches barred their claims. Plaintiffs now appeal and we affirm, albeit on different grounds.

We assume, without deciding, that plaintiffs have standing to bring this action (see Matter of Stray from the Heart, Inc. v Department of Health & Mental Hygiene of the City of N.Y., 20 NY3d 946, 948 [2012]; Matter of New York State Assn. of Criminal Defense Lawyers v Kaye, 96 NY2d 512, 516 [2001]; Matter of Hudson Prop. Owners' Coalition, Inc. v Slocum, 92 AD3d 1198, 1199 [2012]; see generally Matter of Hoston v New York State Dept. of Health, 203 AD2d 826, 827 [1994], lv denied 84 NY2d 803 [1994]). Nevertheless, the complaint must be dismissed in its entirety because certain claims are time-barred and the remaining claims have been rendered moot.

Although declaratory judgment actions are typically governed by a six-year statute of limitations (see CPLR 213 [1]), "a court must look to the underlying claim and the nature of the relief sought and determine whether such claim could have been properly made in another form" (Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d 1044, 1045 [2012]; see Gress v Brown, 20 NY3d 957, 959 [2012]; Solnick v Whalen, 49 NY2d 224, 231 [1980]; Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d 1088, 1088-1089 [2012]). "Where, as here, governmental activity is being challenged, the immediate inquiry is whether the challenge could have been advanced in a CPLR article 78 proceeding" (Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d at 1089 [internal quotation marks and citation omitted]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d 194, 201 [1994]). "While it is well established that a challenge to the validity of legislation may not be brought under [CPLR] article 78, this principle does not apply to the quasi-legislative acts and decisions of administrative agencies," which are subject to a four-month statute of limitations (Walton v New York State Dept. of Correctional Servs., 8 NY3d 186, 194 [2007];

see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d at 1045).

Here, plaintiffs' first three causes of action challenge the validity of the RGGI regulations promulgated by DEC and NYSERDA pursuant to the statutory authority granted to those respective administrative bodies pursuant to the Environmental Conservation Law and the Public Authorities Law. The enactment of such regulations was "quasi-legislative" and, as such, plaintiffs' challenges thereto were capable of being reviewed in the context of a CPLR article 78 proceeding (see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Town of Stony Point v State of N.Y. Dept. of Fin., Off. of Real Prop. Servs., 107 AD3d 1217, 1218 [2013]; Kent Acres Dev. Co., Ltd. v. City of New York, 41 AD3d 542, 549 [2007]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d 1100, 1101 [2006]; Matter of Purcell v Travis, 24 AD3d 824, 824 [2005], lv denied 7 NY3d 703 [2006]; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d 511, 511-512 [2003]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d 557, 560 [2000]). Although at times couched in terms of constitutional infirmity and illegality, the essence of plaintiffs' claims against DEC and NYSERDA is that the RGGI regulations are "arbitrary and capricious" and that the decision to promulgate such regulations was "affected by an error of law" (CPLR 7803 [3]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Marsh v New York State & Local Employees' Retirement Sys., 291 AD2d 713, 714 [2002]; Wechsler v State of New York, 284 AD2d 707, 709 [2001], lv denied 97 NY2d 607 [2001]; Matter of Aubin v State of New York, 282 AD2d 919, 921-922 [2001], lv denied 97 NY2d 606 [2001]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d at 560). Plaintiffs' challenges to the RGGI regulations are therefore subject to a four-month statute of limitations and, inasmuch as those regulations became effective more than 2½ years prior to the commencement of this action, their claims as against DEC and NYSERDA are time-barred (see CPLR 217 [1]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d at 1101; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d at 512).

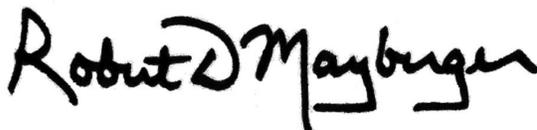

While plaintiffs' challenges to Governor Pataki's authority to enter into the MOU are not subject to the four-month statute of limitations (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d 801, 815 [2003], cert denied 540 US 1017 [2003]), such claims must be dismissed as moot. By signing the MOU, Pataki did not obligate New York to participate in the RGGI program, but merely agreed to propose a carbon dioxide emissions cap-and-trade program in New York. It is the regulations implementing RGGI in New York – not the MOU – that form the legal basis for the state's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). As the MOU did not actually effectuate the RGGI program or the state's participation in it, invalidating the MOU will not have the effect of repealing the regulations or otherwise affect their legality (cf. Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 812). A declaration as to the validity or invalidity of the MOU would, therefore, have no effect on the rights of the parties (see id.; see generally Matter of Hearst Corp. v Clyne, 50 NY2d 707, 713-714 [1980]). Furthermore, we are unpersuaded that the exception to the mootness doctrine is applicable under the circumstances presented here (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 811-812; Matter of Schulz v State of New York, 182 AD2d 3, 5 [1992], appeal dismissed 80 NY2d 924 [1992], lv denied 80 NY2d 761 [1992]; see generally Matter of Hearst Corp. v Clyne, 50 NY2d at 714-715).

In light of our holding, we need not address the parties' remaining contentions.

Rose, Lahtinen and Garry, JJ., concur.

ORDERED that the order is affirmed, without costs.

Eric T. Schneiderman, Attorney General, Albany (Morgan Costello of counsel), for respondents.

---

Peters, P.J.

Appeal from an order of the Supreme Court (McNamara, J.), entered June 13, 2012 in Albany County, which granted defendants' motion to dismiss the complaint.

In 2005, the Governors of seven states, including then-Governor of New York George Pataki, signed a nonbinding memorandum of understanding (hereinafter MOU) in which they agreed to propose for legislative or regulatory approval within their respective states a carbon dioxide cap-and-trade program to target emissions from electricity generating power plants, known

as the Regional Greenhouse Gas Initiative (hereinafter RGGI).<sup>1</sup> In 2008, defendant Department of Environmental Conservation (hereinafter DEC) and defendant New York State Energy Research and Development Authority (hereinafter NYSERDA) adopted final regulations implementing New York's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). The DEC regulations require power plants generating 25 megawatts or more of electricity to obtain a permit from DEC which, in turn, obligates the regulated entities to purchase and hold sufficient carbon dioxide allowances to cover emissions for the past three-year control period (see 6 NYCRR 242-1.4 [a]; 242-1.5 [c] [6]; 242-3.1). The NYSERDA regulations authorize it to coordinate and implement the state's participation in the quarterly, multi-state auctions run by RGGI, Inc., a nonprofit corporation formed by the signatory states, through which the carbon dioxide allowances allocated for sale by DEC are sold to regulated entities (see 21 NYCRR 507.3; 507.6 [a], [b]). The auction proceeds are controlled by NYSERDA and used to "promote . . . programs for energy efficiency, renewable or non-carbon emitting technologies[] and innovative carbon emissions abatement technologies . . . and for reasonable administrative costs . . . associated with the [RGGI] [p]rogram" (21 NYCRR 507.4 [d]; see 21 NYCRR 507.3 [c]; 507.4 [a]-[d]).

In 2011, plaintiffs – three New York residents and electricity ratepayers – commenced this action seeking declaratory and injunctive relief against the enforcement of the RGGI program throughout the state. Plaintiffs alleged that the MOU was executed, and the regulations were promulgated, without legislative approval or statutory authorization and in violation of the NY Constitution and the separation of powers doctrine. Plaintiffs further asserted that the RGGI program imposes an unlawful tax upon ratepayers not authorized by the Legislature, and that the RGGI program, as implemented, is arbitrary and capricious. Lastly, plaintiffs claimed that the MOU constituted an interstate compact signed in violation of the US Constitution.

---

<sup>1</sup> Three additional states subsequently signed the MOU. In 2011, New Jersey, one of the original signatory states, withdrew its participation.

Defendants moved to dismiss the complaint on the grounds of standing, statute of limitations, mootness and/or laches. Supreme Court granted the motion and dismissed the complaint in its entirety, finding that plaintiffs lacked standing to challenge the RGGI regulations and that the doctrine of laches barred their claims. Plaintiffs now appeal and we affirm, albeit on different grounds.

We assume, without deciding, that plaintiffs have standing to bring this action (see Matter of Stray from the Heart, Inc. v Department of Health & Mental Hygiene of the City of N.Y., 20 NY3d 946, 948 [2012]; Matter of New York State Assn. of Criminal Defense Lawyers v Kaye, 96 NY2d 512, 516 [2001]; Matter of Hudson Prop. Owners' Coalition, Inc. v Slocum, 92 AD3d 1198, 1199 [2012]; see generally Matter of Hoston v New York State Dept. of Health, 203 AD2d 826, 827 [1994], lv denied 84 NY2d 803 [1994]). Nevertheless, the complaint must be dismissed in its entirety because certain claims are time-barred and the remaining claims have been rendered moot.

Although declaratory judgment actions are typically governed by a six-year statute of limitations (see CPLR 213 [1]), "a court must look to the underlying claim and the nature of the relief sought and determine whether such claim could have been properly made in another form" (Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d 1044, 1045 [2012]; see Gress v Brown, 20 NY3d 957, 959 [2012]; Solnick v Whalen, 49 NY2d 224, 231 [1980]; Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d 1088, 1088-1089 [2012]). "Where, as here, governmental activity is being challenged, the immediate inquiry is whether the challenge could have been advanced in a CPLR article 78 proceeding" (Spinney at Pond View, LLC v Town Bd. of the Town of Schodack, 99 AD3d at 1089 [internal quotation marks and citation omitted]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d 194, 201 [1994]). "While it is well established that a challenge to the validity of legislation may not be brought under [CPLR] article 78, this principle does not apply to the quasi-legislative acts and decisions of administrative agencies," which are subject to a four-month statute of limitations (Walton v New York State Dept. of Correctional Servs., 8 NY3d 186, 194 [2007];

see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Capital Dist. Regional Off-Track Betting Corp. v New York State Racing & Wagering Bd., 97 AD3d at 1045).

Here, plaintiffs' first three causes of action challenge the validity of the RGGI regulations promulgated by DEC and NYSERDA pursuant to the statutory authority granted to those respective administrative bodies pursuant to the Environmental Conservation Law and the Public Authorities Law. The enactment of such regulations was "quasi-legislative" and, as such, plaintiffs' challenges thereto were capable of being reviewed in the context of a CPLR article 78 proceeding (see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Matter of Town of Stony Point v State of N.Y. Dept. of Fin., Off. of Real Prop. Servs., 107 AD3d 1217, 1218 [2013]; Kent Acres Dev. Co., Ltd. v. City of New York, 41 AD3d 542, 549 [2007]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d 1100, 1101 [2006]; Matter of Purcell v Travis, 24 AD3d 824, 824 [2005], lv denied 7 NY3d 703 [2006]; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d 511, 511-512 [2003]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d 557, 560 [2000]). Although at times couched in terms of constitutional infirmity and illegality, the essence of plaintiffs' claims against DEC and NYSERDA is that the RGGI regulations are "arbitrary and capricious" and that the decision to promulgate such regulations was "affected by an error of law" (CPLR 7803 [3]; see New York City Health & Hosps. Corp. v McBarnette, 84 NY2d at 205; Marsh v New York State & Local Employees' Retirement Sys., 291 AD2d 713, 714 [2002]; Wechsler v State of New York, 284 AD2d 707, 709 [2001], lv denied 97 NY2d 607 [2001]; Matter of Aubin v State of New York, 282 AD2d 919, 921-922 [2001], lv denied 97 NY2d 606 [2001]; Matter of Federation of Mental Health Ctrs. v DeBuono, 275 AD2d at 560). Plaintiffs' challenges to the RGGI regulations are therefore subject to a four-month statute of limitations and, inasmuch as those regulations became effective more than 2½ years prior to the commencement of this action, their claims as against DEC and NYSERDA are time-barred (see CPLR 217 [1]; Via Health Home Care, Inc. v New York State Dept. of Health, 33 AD3d at 1101; Matter of Peckham Materials Corp. v Westchester County, 303 AD2d at 512).

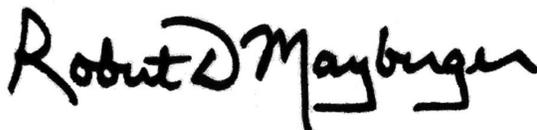

While plaintiffs' challenges to Governor Pataki's authority to enter into the MOU are not subject to the four-month statute of limitations (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d 801, 815 [2003], cert denied 540 US 1017 [2003]), such claims must be dismissed as moot. By signing the MOU, Pataki did not obligate New York to participate in the RGGI program, but merely agreed to propose a carbon dioxide emissions cap-and-trade program in New York. It is the regulations implementing RGGI in New York – not the MOU – that form the legal basis for the state's participation in the RGGI program (see generally 6 NYCRR part 242; 21 NYCRR part 507). As the MOU did not actually effectuate the RGGI program or the state's participation in it, invalidating the MOU will not have the effect of repealing the regulations or otherwise affect their legality (cf. Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 812). A declaration as to the validity or invalidity of the MOU would, therefore, have no effect on the rights of the parties (see id.; see generally Matter of Hearst Corp. v Clyne, 50 NY2d 707, 713-714 [1980]). Furthermore, we are unpersuaded that the exception to the mootness doctrine is applicable under the circumstances presented here (see Saratoga County Chamber of Commerce v Pataki, 100 NY2d at 811-812; Matter of Schulz v State of New York, 182 AD2d 3, 5 [1992], appeal dismissed 80 NY2d 924 [1992], lv denied 80 NY2d 761 [1992]; see generally Matter of Hearst Corp. v Clyne, 50 NY2d at 714-715).

In light of our holding, we need not address the parties' remaining contentions.

Rose, Lahtinen and Garry, JJ., concur.

INCR Members Outline Investment Case for Clean Energy

The Detroit Times published an op-ed by INCR member and Ceres Board member Bill Somplatsky-Jarman of the Presbyterian Church stressing the need to increase clean energy investments and work with utilities to diversify and improve their generation mix. "Decisions about building new fossil-fired plants don't just affect public health and our climate. They can hurt investors."

#### INCR Policy Working Group Call

Tuesday, December 17  
1:00 - 2:00 pm ET

Join this month's INCR Policy working group call to hear from guest speakers, Ceres staff and investor peers. The discussion will focus on upcoming engagements, investor opportunities and new regulations. To register and learn more, contact Brandon Smithwood, Senior Manager, Policy Program.

#### Investors Press Palm Oil Industry to Stop Fueling Deforestation and Driving Climate Change

PalmOilPlantations More than 40 institutional investors urged major players in the global palm oil industry to adopt policies that would ensure palm oil development does not contribute to deforestation, development on peatlands or human rights violations. The coalition of investors, including INCR members representing approximately \$270 billion in assets under management, sent letters to 40 major palm oil producers, financiers and buyers/users including Wilmar, Golden Agri Resources, Unilever, and HSBC urging them to support a new set of principles committing them to sustainable policies and practices.

The request comes just weeks after the palm oil industry faced renewed public scrutiny over continued illegal deforestation in national parks, and rampant human rights violations including child and forced labor.

"Fueling deforestation is bad business for any company seeking to position itself as a responsible, sophisticated global player," noted Lucia von Reusner, Shareholder Advocate for Green Century Capital Management, an INCR member who coordinated the letters.

Approximately 85% of palm oil is currently grown in Indonesia and Malaysia, and is a leading driver of deforestation and biodiversity loss in those nations. Due to high levels of largely driven palm oil deforestation and conversion of carbon-rich peatlands, Indonesia was ranked by the World Bank as the third largest greenhouse gas emitter globally. The palm oil industry is also listed as one of the most notorious for using child and forced labor, according to a recent U.S. Department of Labor report.

"The palm oil industry is at a crossroads," said Rob Berridge, Director of Shareholder Engagement at Ceres. "The investors we work with are asking the industry to eschew forced labor, habitat destruction and accelerating greenhouse gas emissions in favor of developing and operating palm plantations responsibly. The more damaging path is not sustainable and puts shareholder value at risk."

Companies that use or finance palm oil - such as Unilever, Kellogg, Dunkin Donuts, and HSBC - are facing high-profile consumer campaigns for incentivizing deforestation and habitat destruction of endangered species including orangutans. Many of these companies have subsequently faced questions from shareholders concerned about steps being taken to reduce the brand risks associated with purchasing unsustainable palm oil.

To learn more about the letters and company feedback, contact Leslie Samuelrich, President or Lucia von Reusner, Shareholder Advocate of Green Century Capital Management.

For more information and to engage companies on forestry and palm oil issues, contact Rob Berridge, Director, Shareholder Initiative on Climate and Sustainability.

## Webinar Explores How to Integrate Climate Change Information in Mainstream Corporate Reporting

This week, the Climate Disclosure Standards Board (CDSB) held a webinar, Integrating Climate Change Information into Mainstream Corporate Reports. Attendees learned about the advantages to companies-both internally and externally-from improving assessment and disclosure of climate change strategies, risks and opportunities.

Jim Coburn, Senior Manager of Ceres' Disclosure Program, discussed investor perspectives on material sustainability issues and investors' use of climate change related information. Ben Richards, from Radley Yeldar, addressed effective climate change storytelling, including best practice examples of U.S. and international reporting. Other panelists, including Lois Guthrie and Patrick Crawford of CDSB showcased how the CDSB reporting framework complements voluntary climate reporting and provides a systematic, clear framework for reporting in mainstream filings.

Amy Pawlicki of AICPA, provided an accounting perspective. She focused on current report preparation practices, evolving practices, and common preparation challenges, such as challenges in applying traditional report preparation practices to sustainability information. Ben Thompson of Autodesk provided a corporate perspective, discussing the integrated reporting trend, alignment of sustainability with the CFO's processes and language, and keeping a focus on material issues.

Download the slides and listen to the webinar.

### Ceres participates in NASDAQ OMX closing bell ceremony

Ceres joined the Sustainable Stock Exchanges (SSE) initiative November 27 at the NASDAQ stock exchange closing bell. The ceremony highlighted three recently-released reports by Sustainalytics, CK Capital and EIRIS.

NASDAQ OMX, after dialogue with INCR members, has been working with Ceres to encourage a global listing standard on sustainability disclosure. NASDAQ OMX also joined the SSE initiative as a Partner Exchange.

View the video and pictures of the event.

Join Complimentary Webinar Discussion on Integrated Reporting Framework: Implementation and Next Steps

TODAY Monday, December 9  
12:30 - 2:00 pm ET

IRLogoPlease join INCR for an in-depth discussion of the International Integrated Reporting Council's (IIRC) new <IR> Framework, which is due to be released in early December 2013. Guest speaker Ricky Cronin, representing the IIRC, will walk investors through the new Framework, highlighting what is different from the consultation, and key issues that arose during the comment period. Members will have ample opportunity to ask the IIRC questions about the final Framework, including plans for its roll-out and use during 2014, how <IR> should be incorporated into existing company engagements, and what the responsibilities of investors are in using and promoting the Framework.

INCR's Integrated Reporting Working Group welcomes all INCR members to participate in this robust discussion of next steps and new reporting opportunities. Our guest speaker will also field questions on what investors should be looking for in an integrated report, what critiques investors currently have with the state of <IR> reporting, and he will discuss the Emerging Issues Database, which will feature examples of various <IR> practices and communications taking place in filings.

Register for the complimentary webinar discussion.

For more information on this event, please contact Tracey Rembert, Senior Manager of Investor Engagement and Coordinator of the Integrated Reporting Working Group.

Attachments: 12-1269 ts Texas.pdf.pdf

To Clerk & Counsel:

This will operate as a statement of service for the Brief for the State Petitioners in Case No. 12-1269, Texas v. EPA.

On December 9, 2013, a PDF copy of that brief was e-mailed to the following counsel of record:

Peter D. Keisler

pkeisler@sidley.com

Counsel for Petitioners American Chemistry Council, et al.

Robert R. Gasaway

robert.gasaway@kirkland.com

Counsel for Petitioners Chamber of Commerce of the United States of America, et al.

Shannon Lee Goessling

shannon@southeasternlegal.org

Counsel for Petitioners Southeastern Legal Foundation, Inc., et al.

F. William Brownell

bbrownell@hunton.com

Counsel for Petitioner Utility Air Regulatory Group

John J. McMackin, Jr.

jjmcmackin@wms-jen.com

Counsel for Petitioners Energy-Intensive Manufacturers Working Group on Greenhouse Gas Regulation, et al.

Solicitor General Donald B. Verrilli, Jr.

SupremeCtBriefs@USDOJ.gov

Counsel for Respondent EPA

Solicitor General Barbara D. Underwood

barbara.underwood@ag.ny.gov

Counsel for Respondents New York et al.

Sean H. Donahue

sean@donahuegoldberg.com

Counsel for Respondents Environmental Organizations

Eric Groten

egroten@velaw.com

Counsel for Respondents Coalition for Responsible Regulation, Inc. et al.

Douglas A. Henderson

douglas.henderson@troutmansanders.com

Counsel for Respondent National Mining Association

As a courtesy, a PDF copy of the brief was e-mailed to the following counsel of record for amici curiae:

Christian J. Ward

cward@yettercoleman.com

Counsel for Scientists

Adam Jeffrey White

adam@boydengrayassociates.com

Counsel for Kansas, Montana, and West Virginia

A PDF copy of the brief was also e-mailed to the following:

LUTHER STRANGE, Attorney General of Alabama

PAMELA JO BONDI, Attorney General of Florida

SAMUEL S. OLENS, Attorney General of Georgia

GREGORY F. ZOELLER, Attorney General of Indiana

JAMES D. "BUDDY" CALDWELL, Attorney General of Louisiana

BILL SCHUETTE, Attorney General of Michigan

JON BRUNING, Attorney General of Nebraska

WAYNE STENEHJEM, Attorney General of North Dakota

E. SCOTT PRUITT, Attorney General of Oklahoma

ALAN WILSON, Attorney General of South Carolina

MARTY J. JACKLEY, Attorney General of South Dakota

HERMAN ROBINSON, Executive Counsel of the Louisiana  
Department of Environmental Quality

### **QUESTION PRESENTED**

Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.

(I)

## II

### **PARTIES TO THE PROCEEDING**

The Court has consolidated No. 12-1269 with Nos. 12-1146, 12-1248, 12-1254, 12-1268, and 12-1272. Petitioners in No. 12-1269, petitioners below, are the States of Texas, Alabama, Florida, Georgia, Indiana, Louisiana, Michigan, Nebraska, North Dakota, Oklahoma, South Carolina, and South Dakota, and the Louisiana Department of Environmental Quality.

Respondents in this Court, respondents below, are the U.S. Environmental Protection Agency and Lisa P. Jackson, Administrator, U.S. Environmental Protection Agency. Lisa P. Jackson ceased to hold the office of Administrator, U.S. Environmental Protection Agency, on February 15, 2013; that office is currently held by Gina McCarthy.

The following parties are considered respondents in No. 12-1269 under Supreme Court Rule 12.6, and are grouped according to their respective positions in the court below:

#### *Petitioners*

Alliance for Natural Climate Change Science and William Orr; Alpha Natural Resources, Inc.; American Chemistry Council; American Farm Bureau Federation; American Forest & Paper Association, Inc.; American Frozen Food Institute; American Fuel and Petrochemical Manufacturers; American Iron and Steel Institute; American Petroleum Institute; U.S. Representative Michele Bachmann; Haley Barbour, Governor of Mississippi; U.S. Representative Marsha Blackburn; U.S.

## III

Representative Kevin Brady; Brick Industry Association; U.S. Representative Paul Broun; U.S. Representative Dan Burton; Center for Biological Diversity; Chamber of Commerce of the United States of America; Clean Air Implementation Project; Coalition for Responsible Regulation, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Competitive Enterprise Institute; Corn Refiners Association; U.S. Representative Nathan Deal; Energy-Intensive Manufacturers' Working Group on Greenhouse Gas Regulation; Freedomworks; Georgia Agribusiness Council, Inc.; Georgia Coalition for Sound Environmental Policy, Inc.; Georgia Motor Trucking Association, Inc.; Gerdau Ameristeel Corporation; U.S. Representative Phil Gingrey; Glass Association of North America; Glass Packaging Institute; Great Northern Project Development, L.P.; Independent Petroleum Association of America; Indiana Cast Metals Association; Industrial Minerals Association-North America; J&M Tank Lines, Inc.; Kennesaw Transportation, Inc.; U.S. Representative Steve King; U.S. Representative Jack Kingston; Landmark Legal Foundation; Langboard, Inc.-MDF; Langboard, Inc.-OSB; Langdale Chevrolet-Pontiac, Inc.; Langdale Company; Langdale Farms, LLC; Langdale Ford Company; Langdale Forest Products Company; Langdale Fuel Company; Mark R. Levin; U.S. Representative John Linder; Massey Energy Company; Michigan Manufacturers Association; Mississippi Manufacturers Association; Missouri Joint Municipal Electric Utility Commission; National Association of Home Builders; National

IV

Association of Manufacturers; National Cattlemen's Beef Association; National Environmental Development Association's Clean Air Project; National Federation of Independent Businesses; National Mining Association; National Oilseed Processors Association; National Petrochemical & Refiners Association; North American Die Casting Association; Ohio Coal Association; Pacific Legal Foundation; Peabody Energy Company; Portland Cement Association; U.S. Representative Tom Price; U.S. Representative Dana Rohrabacher; Rosebud Mining Company; Science and Environmental Policy Project; U.S. Representative John Shadegg; U.S. Representative John Shimkus; South Carolina Public Service Authority; Southeast Trailer Mart Inc.; Southeastern Legal Foundation, Inc.; Specialty Steel Industry of North America; Tennessee Chamber of Commerce and Industry; Texas Agriculture Commission; Texas Attorney General Greg Abbott; Texas Commission on Environmental Quality; Texas Department of Agriculture; Texas General Land Office; Texas Governor Rick Perry; Texas Public Utilities Commission; Texas Public Utility Commission Chairman Barry Smitherman; Texas Railroad Commission; Utility Air Regulatory Group; Commonwealth of Virginia ex rel. Attorney General Kenneth T. Cuccinelli; West Virginia Manufacturers Association; Western States Petroleum Association; U.S. Representative Lynn Westmoreland; Wisconsin Manufacturers and Commerce;

V

*Respondent*

National Highway Traffic Safety Administration;

*Intervenors for Petitioners*

State of Alaska; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Arkansas State Chamber of Commerce; Associated Industries of Arkansas; Haley Barbour, Governor for the State of Mississippi; Chamber of Commerce of the United States of America; Colorado Association of Commerce & Industry; Corn Refiners Association; Glass Association of North America; Glass Packaging Institute; Idaho Association of Commerce and Industry; Independent Petroleum Association of America; Indiana Cast Metals Association; Kansas Chamber of Commerce and Industry; State of Kentucky; Langboard, Inc.-MDF; Langboard, Inc.-OSB; Langdale Chevrolet-Pontiac, Inc.; Langdale Farms, LLC; Langdale Ford Company; Langdale Fuel Company; Louisiana Oil and Gas Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Home Builders; National Association of Manufacturers; National Electrical Manufacturers Association; National Oilseed Processors Association; Nebraska Chamber of Commerce and Industry; North American Die Casting Association; Ohio Manufacturers Association; Pennsylvania Manufacturers Association; Portland Cement Association; Steel Manufacturers Association; Tennessee Chamber of Commerce and Industry;

VI

State of Utah; Virginia Manufacturers Association; West Virginia Manufacturers Association; Western States Petroleum Association; Wisconsin Manufacturers and Commerce;

*Intervenors for Respondents*

Alliance of Automobile Manufacturers; American Farm Bureau Federation; State of Arizona; Brick Industry Association; State of California; Center for Biological Diversity; State of Connecticut; Conservation Law Foundation; State of Delaware; Environmental Defense Fund; Georgia ForestWatch; Global Automakers; State of Illinois; Indiana Wildlife Federation; State of Iowa; State of Maine; State of Maryland; Commonwealth of Massachusetts; Michigan Environmental Council; State of Minnesota; National Environmental Development Association's Clean Air Project; National Mining Association; National Wildlife Federation; Natural Resources Council of Maine; Natural Resources Defense Council; State of New Hampshire; State of New Mexico; State of New York; City of New York; State of North Carolina; Ohio Environmental Council; State of Oregon; Peabody Energy Company; State of Rhode Island; Sierra Club; South Coast Air Quality Management District; Utility Air Regulatory Group; State of Vermont; State of Washington; Wetlands Watch; Wild Virginia.

TABLE OF CONTENTS

	Page
Opinions Below.....	1
Jurisdiction.....	1
Statutes and Regulations Involved .....	1
Statement .....	1
Summary of Argument.....	1
Argument.....	3
I. The Clean Air Act cannot be construed to authorize EPA to regulate greenhouse-gas emissions under the PSD and Title V programs.....	3
II. If this Court concludes that the Clean Air Act authorizes EPA to regulate stationary-source greenhouse-gas emissions, then EPA must enforce the statutory permitting thresholds and seek corrective legislation from Congress.....	8
A. EPA cannot subordinate the Clean Air Act’s unambiguous, rule-bound numerical thresholds to actual or imagined “congressional intent” .....	10
B. EPA cannot disregard the Clean Air Act’s unambiguous, agency-constraining numerical thresholds by invoking the “absurdity doctrine” .....	17

VIII

C. EPA’s permitting requirements for stationary sources that emit greenhouse gases violate the Constitution by seizing discretionary powers where no “intelligible principle” has been provided by statute..... 20

D. EPA’s Tailoring Rule arrogates powers that Congress reserved to itself in the Clean Air Act..... 22

III. *Massachusetts v. EPA* should be reconsidered or overruled if it compels EPA to regulate stationary-source greenhouse-gas emissions ..... 24

Conclusion ..... 30

## **BRIEF FOR THE STATE PETITIONERS**

### **OPINIONS BELOW**

The opinion of the D.C. Circuit (J.A. 191-267) is reported at 684 F.3d 102. The D.C. Circuit's orders denying panel rehearing and rehearing en banc (J.A. 139-90) are unreported.

### **JURISDICTION**

The D.C. Circuit entered judgment on June 26, 2012, and denied timely petitions for rehearing en banc on December 20, 2012. On March 8, 2013, the Chief Justice extended the time for filing a certiorari petition to and including April 19, 2013. The petition was filed on April 19, 2013 and granted on October 15, 2013. The jurisdiction of this Court rests on 28 U.S.C. § 1254(1).

### **STATUTES AND REGULATIONS INVOLVED**

Relevant provisions of the Clean Air Act, 42 U.S.C. §§ 7407 *et seq.*, are reproduced at Pet. App. 591a-619a. Relevant EPA rules are reproduced at J.A. 268-682, 1399-418.

### **STATEMENT**

State Petitioners incorporate by reference the statement provided by the American Chemistry Counsel in No. 12-1248.

### **SUMMARY OF ARGUMENT**

EPA is seeking to improve upon rather than implement the Clean Air Act. After declaring that it would begin regulating greenhouse-gas emissions

(1)

from stationary sources, EPA replaced unambiguous numerical permitting thresholds in the PSD and Title V programs with numbers and metrics of EPA's own creation, and then applied those agency-created criteria *solely* to greenhouse-gas emissions. EPA cannot use the "absurdity doctrine" as an excuse for departing from the Act's rigid, unambiguous permitting requirements, as the entire point of legislating by rule is to tolerate suboptimal policies in exchange for constraining an agency's discretion and forcing it to seek legislation (and therefore congressional input) before embarking on novel regulatory regimes.

EPA is correct to acknowledge the absurdity of applying the Act's 100/250 tons-per-year permitting requirements to CO<sub>2</sub> and other greenhouse gases, but the absurdity is caused entirely by EPA's questionable conclusion that greenhouse gases qualify as air pollutants subject to regulation under the PSD and Title V programs. An agency cannot construe *ambiguous* statutory language to *create* an absurdity, and then construe *unambiguous* statutory language to *avoid* that absurdity. The far-reaching and near-ridiculous regulatory burdens required by EPA's decision to regulate greenhouse-gas emissions under the PSD and Title V programs prove that the Act never delegated to EPA the authority to regulate greenhouse-gas emissions as "air pollutants" under those programs.

**ARGUMENT****I. THE CLEAN AIR ACT CANNOT BE CONSTRUED TO AUTHORIZE EPA TO REGULATE GREENHOUSE-GAS EMISSIONS UNDER THE PSD AND TITLE V PROGRAMS.**

The statutory permitting thresholds established in the PSD and Title V programs require facilities to obtain permits if they emit more than 100 tons per year (or in some cases, more than 250 tons per year) of “any air pollutant.” 42 U.S.C. §§ 7475(a), 7479(1), 7602(j), 7661(2), 7661a(a). These numerical thresholds are set far too low to accommodate rational regulation of greenhouse-gas emissions. As EPA has acknowledged, applying the 100/250 tons-per-year (tpy) thresholds to CO<sub>2</sub> and other greenhouse gases “would bring tens of thousands of small sources and modifications into the PSD program each year, and millions of small sources into the title V program.” 75 Fed. Reg. 31,514, 31,533 (June 3, 2010) (“Tailoring Rule”) (J.A. 355). This not only would expand the number of “major” sources subject to permitting requirements from 15,000 to more than 6,000,000, but it would also increase annual permitting costs from \$12,000,000 to \$1,500,000,000, and boost the number of man-hours required to administer these programs from 151,000 to 19,700,000. *See id.*, J.A. 381-88. Countless numbers of buildings, including churches and schools, would be subjected to EPA permitting requirements based on the CO<sub>2</sub> emissions from their water heaters.

The Clean Air Act cannot be interpreted to allow EPA to regulate greenhouse-gas emissions under either the PSD or Title V programs when the unambiguous statutory requirements would compel such preposterous consequences. The low, mass-based permitting thresholds established by the PSD and Title V provisions simply do not fit with a world in which EPA treats greenhouse-gas emissions as air pollutants for purposes of those programs. EPA must therefore obtain more specific authorization from Congress before asserting a prerogative to regulate greenhouse-gas emissions under either the PSD or Title V programs.

EPA cannot salvage its efforts to regulate greenhouse-gas emissions under these programs by pointing to ambiguities in the Act's definition of "air pollutant" or other provisions and insisting on *Chevron* deference. See, e.g., 75 Fed. Reg. 17,004, 17,007 (Apr. 2, 2010) ("Timing Rule") (J.A. 721-22) ("Because the term 'regulation' is susceptible to more than one meaning, there is ambiguity in the phrase 'each pollutant subject to regulation under the Act' that is used in both sections 165(a)(4) and 169(3) of the CAA."). In *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120 (2000), the Court refused to extend *Chevron* deference to FDA's decision to assert jurisdiction over tobacco products—even though those products fell squarely within the statutory definitions of "drugs" and "devices"—because the statutes governing FDA would have required the agency to ban cigarettes from interstate commerce.

Given that this outcome was incompatible with any semblance of rational regulation, the Court concluded that Congress could not have delegated to FDA the power to decide whether to regulate tobacco products. *Brown & Williamson* controls here and should lead the Court to disapprove EPA's attempt to regulate stationary-source greenhouse-gas emissions.

The facts of *Brown & Williamson* are remarkably similar to this case. The Food, Drug, and Cosmetic Act (FDCA) established FDA and authorized it to regulate drugs, among other items. The FDCA defined "drug" to include "articles (other than food) intended to affect the structure or any function of the body." 21 U.S.C. § 321(g)(1)(C). For many years, FDA declined to regulate tobacco products, even though the nicotine in those products is "intended to affect the structure or any function of the body." But in 1996 FDA changed tracks, declaring that nicotine qualified as a "drug" and asserting jurisdiction over tobacco products.

But once FDA asserted jurisdiction over tobacco products, the FDCA required the agency to remove all tobacco products from the market. The statute required preapproval of any new drug, with limited exceptions, and required FDA to disapprove any new drug not safe and effective for its intended purpose. *Id.* § 355(d)(1)-(2), (4)-(5). The statute also prohibited "[t]he introduction or delivery for introduction into interstate commerce of any food, drug, device, tobacco product, or cosmetic that is adulterated or misbranded," *id.* § 331(a), and defined

“misbranded” to include drugs or devices “dangerous to health when used in the dosage or manner, or with the frequency or duration prescribed, recommended, or suggested in the labeling thereof,” *id.* § 352(j).

FDA was understandably reluctant to take this drastic step. Following these unambiguous statutory requirements would have produced, in EPA parlance, an “absurd result,” a regulatory regime so heavy-handed as to fall outside the bounds of reasonable policymaking. So rather than enforcing a nationwide ban on tobacco products, FDA crafted an intermediate regulatory regime, one that merely restricted the marketing of tobacco products to children. *Brown & Williamson*, 529 U.S. at 127-29. Much like the Tailoring Rule that EPA promulgated to avoid the drastic consequences of its decision to regulate greenhouse gases, FDA’s tobacco-advertising rule similarly spurned an unambiguous statutory command in an effort to soften the impact of its decision to regulate tobacco as a drug.

The Court, however, vacated FDA’s rule in its entirety, refusing to allow the agency to chart its own regulatory course when an unambiguous statutory provision required the agency to ban all “dangerous” drugs or devices within its jurisdiction. And because the statute would produce this absurdity of banning all cigarettes from the market, the Court concluded that FDA could not assert jurisdiction over tobacco products in the first place—even though nicotine fell squarely within the FDCA’s definition of “drug.” The

Court explained: “[W]e are confident that Congress could not have intended to delegate a decision of such economic and political significance to an agency in so cryptic a fashion.” *Id.* at 160.

*Brown & Williamson* should lead the Court to similarly disapprove EPA’s attempts to regulate greenhouse-gas emissions under the PSD and Title V programs. EPA’s decision to regulate stationary-source greenhouse-gas emissions, like FDA’s attempt to assert jurisdiction over tobacco, would produce irrationally onerous regulatory burdens that can be avoided only by rewriting unambiguous statutory language. And EPA’s actions, like FDA’s failed tobacco effort, involve a novel assertion of agency power that does not fit with the regulatory regime envisioned by the decades-old governing statute. Finally, it is unlikely that Congress would have “intended to delegate” to EPA the power to regulate stationary-source greenhouse-gas emissions unilaterally, and render decisions of such “economic and political significance,” especially when the numerical thresholds in the PSD and Title V provisions would render such a project unworkable. *Id.* at 160. Just as the Court required FDA to obtain legislation from Congress extending its regulatory authority to tobacco, so too should it require EPA to seek legislation from Congress authorizing it to regulate greenhouse-gas emissions under the PSD and Title V programs.

The unambiguous (and low) mass-based numerical thresholds in sections 7479(1) and 7602(j)

foreclose any inference that the Act implicitly delegates to EPA the power to decide whether to treat greenhouse-gas emissions as air pollutants under the PSD and Title V programs. The inability to regulate these emissions rationally while simultaneously remaining faithful to the rigid, agency-constraining numerical thresholds in the Act demonstrates that greenhouse-gas regulation does not fit with the PSD and Title V provisions.

**II. IF THIS COURT CONCLUDES THAT THE CLEAN AIR ACT AUTHORIZES EPA TO REGULATE STATIONARY-SOURCE GREENHOUSE-GAS EMISSIONS, THEN EPA MUST ENFORCE THE STATUTORY PERMITTING THRESHOLDS AND SEEK CORRECTIVE LEGISLATION FROM CONGRESS.**

If the Court nevertheless concludes that the Act authorizes or requires EPA to regulate greenhouse-gas emissions from stationary sources, then it should vacate the Tailoring Rule and require EPA to enforce the statute's unambiguous permitting requirements. If EPA thinks the statutory permitting thresholds in the PSD and Title V programs are set too low to allow for rational regulation, then EPA must seek corrective legislation from Congress, rather than replace the statute's numerical, mass-based permitting thresholds with numbers and metrics of EPA's own choosing. Neither the unwillingness of Congress to enact this legislation, nor the unwillingness of the Executive Branch to spend its political capital to obtain this legislation, can justify

an agency's flagrant disregard of unambiguous statutory language.\*

EPA's Tailoring Rule is one of the most brazen power grabs ever attempted by an administrative agency. Rather than apply the unambiguous permitting requirements that the Act establishes for *all* air pollutants regulated under the PSD and Title V programs, EPA's Tailoring Rule invents its own permitting thresholds for CO<sub>2</sub> and other greenhouse-gas emissions, and sets them at approximately *750 to 1000 times* the threshold levels specified in the statute. J.A. 310-19. If that were not enough, EPA's Tailoring Rule also departs from the mass-based approach to significance levels established in the text of the Act, as it measures the threshold quantities of greenhouse-gas emissions according to their heat-trapping potential. J.A. 305-10, 340-49. This flouts the rule-based thresholds that the Act established to constrain EPA's discretion.

EPA concedes the incontestable, admitting that its Tailoring Rule "do[es] not accord with a literal reading of the statutory provisions for PSD applicability." J.A. 448. Yet EPA tries to defend its Tailoring Rule by noting that obeying the statutory language "would create undue costs for sources and

---

\* The court of appeals refused to address the legality of the Tailoring Rule by holding that the petitioners lacked standing to challenge it, but this conclusion is mistaken for the reasons explained in State Petitioners' certiorari petition. Pet. 22-28, *Texas v. EPA*, No. 12-1269 (U.S. Apr. 19, 2013).

impossible administrative burdens for permitting authorities,” J.A. 418, and attempts to create a legal veneer for its unilateral rewriting of the Act by invoking “congressional intent,” the “absurdity doctrine,” and *Chevron* deference. None of this can justify an agency’s decision to countermand unambiguous statutory language and expand its discretion by converting statutory rules into standards.

**A. EPA Cannot Subordinate The Clean Air Act’s Unambiguous, Rule-Bound Numerical Thresholds To Actual Or Imagined “Congressional Intent.”**

In defending its insouciance toward the enacted text of the Act, EPA makes an audacious claim: that “clear” congressional intent can trump unambiguous statutory language and liberate agencies to convert statutory rules into agency-empowering standards. EPA writes: “[I]f congressional intent for how the requirements apply to the question at hand is clear, the agency should implement the statutory requirements not in accordance with their literal meaning, but rather in a manner that most closely effectuates congressional intent.” J.A. 285.

That is nonsense. Even the clearest expressions of “congressional intent” cannot license an agency to convert the Act’s rule-bound numerical thresholds into standards that empower EPA administrators to weigh costs against benefits. This much is clear from *INS v. Chadha*, 462 U.S. 919 (1983). Once Congress confers discretionary powers on an agency

administrator, it cannot revoke that discretion by deploying a one- or two-house “legislative veto” over the agency’s decisions. *Id.* at 954-55. A two-house legislative veto is as clear a manifestation of “congressional intent” as one can imagine, yet even these “clear” congressional intentions cannot control an agency’s decisionmaking—unless they are codified in a statute that successfully runs the bicameralism-and-presentment process.

In like manner, once agency discretion is *restricted* by statute, it cannot be loosened by unenacted congressional wishes. Suppose that each house of Congress approved a nonbinding resolution urging EPA to ignore the Act’s statutory thresholds for all air pollutants and replace them with thresholds chosen by the EPA Administrator. One would think this should qualify as a “clear” manifestation of congressional intent—and it is far more clear than anything that EPA has offered in its Tailoring Rule. Yet no one would maintain that these unenacted aspirations could liberate EPA from an unambiguous statutory constraint. Surely less reliable indicators of congressional intent—such as opinion polls of current or former legislators, or facile and unsupported assertions of “congressional intent”—cannot be invoked to displace unambiguous, agency-controlling statutory language either.

EPA’s Tailoring Rule treats enacted statutory language not as law, but as mere evidence of what the law might be. The “real” law, according to EPA, is “congressional intent,” and statutory text serves as

little more than a guide to agencies as they attempt to discover or construct how “Congress” would want them to deal with problems. *See, e.g.*, J.A. 285 (“*To determine congressional intent*, the agency must first consider the words of the statutory requirements, and if their literal meaning answers the question at hand, then, *in most cases*, the agency must implement those requirements by their terms.”) (emphases added); J.A. 409 (“If the literal meaning of the statutory requirements is clear then, absent indications to the contrary, the agency must take it to indicate congressional intent and must implement it.”).

EPA’s efforts to equate the law with “congressional intent” rather than enacted text of federal statutes is irreconcilable with the jurisprudence of this Court. *See, e.g., Exxon Mobil Corp. v. Allapattah Servs., Inc.*, 545 U.S. 546, 567 (2005) (holding that arguments based on legislative “intent” have no relevance when interpreting unambiguous statutes); *Penn. Dep’t of Corrs. v. Yeskey*, 524 U.S. 206, 212 (1998) (assuming that “Congress did not ‘envisio[n] that the [statute] would be applied to state prisoners,” but holding that “in the context of an unambiguous statutory text that is irrelevant” (citation omitted)); *Lamie v. U.S. Trustee*, 540 U.S. 526, 542 (2004) (“If Congress enacted into law something different from what it intended, then it should amend the statute to conform it to its intent.”).

EPA's intentionalism is also irreconcilable with modern understandings of how the legislative process functions. First, this Court has recognized that legislation embodies compromises between competing interests, and that abstract speculations about congressional "intent" and "purpose" can unravel bargains memorialized in the enacted language. See *Ragsdale v. Wolverine World Wide, Inc.*, 535 U.S. 81, 93-94 (2002); *Barnhart v. Sigmon Coal Co.*, 534 U.S. 438, 461 (2002); *Bd. of Governors v. Dimension Fin. Corp.*, 474 U.S. 361, 374 (1986); *Mohasco Corp. v. Silver*, 447 U.S. 807, 818-19 (1980). The Act's provisions reflect compromises along many different dimensions. Most obviously, its provisions trade off the goals of providing clean air against the need to avoid excessive regulatory burdens. Congress "intended" to pursue each of these competing goals, yet *how much* an agency should pursue clean air and *how much* it should seek to avoid onerous regulation can be determined only by following the enacted statutory language. See *W. Va. Univ. Hosps., Inc. v. Casey*, 499 U.S. 83, 98 (1991) ("The best evidence of that purpose is the statutory text adopted by both Houses of Congress and submitted to the President.").

Second, the Act, like all statutes, must decide whether to pursue these goals by establishing statutory rules ("drive no faster than 55 miles per hour") or standards ("drive at a speed reasonable under the circumstances"). Legislating by rule has many virtues but also drawbacks. On the plus side,

statutory rules can promote predictability and planning, avoid arbitrary treatment of regulated entities, and reduce decision costs for those who implement the law. *See, e.g.,* Antonin Scalia, *The Rule of Law as a Law of Rules*, 56 U. CHI. L. REV. 1175 (1989). But statutory rules can be crude; they are sometimes insensitive to context, or over- or under-inclusive in relation to their underlying goals. Standards, by contrast, confer discretion on future decisionmakers to avoid suboptimal outcomes in particular cases, but this type of regime comes at the price of increased decision costs, the potential for arbitrary or unpredictable decisions, and (perhaps) increased error costs if future decisionmakers are untrustworthy. Rules and standards also allocate power between the legislature and the agencies and courts that implement the law. Standards delegate power to future decisionmakers such as agencies and courts, while statutory rules withhold discretion from these institutions and force them to seek legislative approval before deviating from the codified regime. *See, e.g.,* Louis Kaplow, *Rules Versus Standards: An Economic Analysis*, 42 DUKE L.J. 557, 559-60 (1992). How to calibrate these tradeoffs between rules and standards is an essential component of the legislative compromise necessary to produce statutes such as the Clean Air Act. But allowing agencies or courts to invoke abstract notions of “congressional intent” empowers those institutions to convert statutory rules into standards and withhold from Congress the prerogative of

legislating by rule. See *MCI Telecomms. Corp. v. AT&T Co.*, 512 U.S. 218, 231 n.4 (1994) (declaring that courts and agencies are “bound, not only by the ultimate purposes Congress has selected, but by the means it has deemed appropriate, and prescribed, for the pursuit of those purposes”).

Third, this Court has recognized that Congress, as a multi-member body, is incapable of having “intentions” or “purposes.” See *Barnhart*, 534 U.S. at 461; *Dimension Fin.*, 474 U.S. at 374; *Mohasco*, 447 U.S. at 818-19; see also *Church of the Lukumi Babalu Aye, Inc. v. City of Hialeah*, 508 U.S. 520, 558 (1993) (Scalia, J., concurring) (“[I]t is virtually impossible to determine the singular ‘motive’ of a collective legislative body . . . .”); KENNETH ARROW, *SOCIAL CHOICE AND INDIVIDUAL VALUES* (2d ed. 1963); Kenneth A. Shepsle, *Congress Is a “They,” Not An “It”: Legislative Intent as Oxymoron*, 12 INT’L REV. L. & ECON. 239 (1992); *United States v. Mitra*, 405 F.3d 492, 495 (7th Cir. 2005) (“Congress is a ‘they’ and not an ‘it’; a committee lacks a brain (or, rather, has so many brains with so many different objectives that it is almost facetious to impute a joint goal or purpose to the collectivity).”). Legislative outcomes can be manipulated by agenda control and logrolling, clouding any efforts to discover congressional “intentions” from the voting records of its members. See, e.g., Frank H. Easterbrook, *Statutes’ Domains*, 50 U. CHI. L. REV. 533, 548 (1983) (“[J]udicial predictions of how the legislature would have decided issues it did not in fact decide are bound to be little

more than wild guesses.”). Legislatures simply produce outcomes, which must be enforced by courts and agencies.

In all events, even if one accepts “congressional intent” as a coherent concept, EPA’s empirical claims regarding “congressional intent” are demonstrably false. There is no “clear” congressional intent from the legislators who enacted the Act or the 1977 amendments because the issues of global warming and greenhouse-gas emissions were not salient at the time of enactment. That means we not only do not know, but we cannot even reconstruct, how the Congresses of 1970 or 1977 would have wanted EPA to deal with this problem. As for the Congress that enacted the 1990 Clean Air Act Amendments, that Congress *rejected* several legislative proposals to regulate greenhouse-gas emissions, a fact that EPA conveniently ignores throughout its Timing and Tailoring Rules. *See, e.g.*, H.R. 5966, 101st Cong. (1990); S. 1224, 101st Cong. (1989). The statute’s rigidity demonstrates that the legislatures that enacted the Clean Air Act’s provisions expected EPA to come to Congress to seek statutory amendments and authorization to regulate newfound hazards such as global warming. And if the present-day Congress “intends” for EPA to disregard the numerical thresholds in the Act, as EPA suggests, then EPA should have no trouble securing corrective legislation from Congress.

**B. EPA Cannot Disregard The Clean Air Act's Unambiguous, Agency-Constraining Numerical Thresholds By Invoking The "Absurdity Doctrine."**

EPA's efforts to defend the Tailoring Rule by invoking the "absurdity doctrine" fail for several reasons.

First, agencies cannot rely on "absurd results" as an excuse to convert unambiguous statutory rules into standards. *Every* rule will produce suboptimal or even absurd results at the margins. Yet the entire point of legislating by rule is to tolerate these less-than-ideal outcomes in exchange for the benefits of cabining agency discretion, minimizing decision costs, and preserving the legislature's power vis-à-vis the agency. EPA's theory of "absurd results" would empower agencies to smuggle cost-benefit analysis into *any* statutory mandate, even when the statute expressly rejects this type of utilitarian calculus. *See* J.A. 356 ("For both programs, the addition of enormous numbers of additional sources would provide relatively little benefit compared to the costs to sources and the burdens to permitting authorities."). And it would disable Congress from using statutory rules as a means of forcing agencies to obtain congressional authorization and input before regulating novel and unforeseen environmental problems.

Second, EPA's Tailoring Rule wrongly conflates the canon of constitutional avoidance with a generalized prerogative of agencies to avoid "absurd

results” by converting statutory rules into standards. Many of the authorities that EPA cites involve cases in which the Court bent enacted statutory language to avoid an actual or potential *constitutional violation*. See J.A. 393-95 (citing *Nixon v. Mo. Mun. League*, 541 U.S. 125, 132-33 (2004); *Raygor v. Regents of Univ. of Minn.*, 534 U.S. 533, 542-45 (2002); *United States v. X-Citement Video, Inc.*, 513 U.S. 64, 69 (1994); *Green v. Bock Laundry Mach. Co.*, 490 U.S. 504 (1989); *Pub. Citizen v. DOJ*, 491 U.S. 440, 453-54 (1989)). Yet there is a great distance between the constitutional-avoidance canon and the absurdity doctrine applied by EPA. The avoidance doctrine is narrow; it applies only when the enacted statutory language would violate the Constitution or present a serious constitutional question. It is rooted in principles of constitutional supremacy and promotes judicial restraint by enabling courts to avoid unnecessary constitutional pronouncements. See *Nw. Austin Mun. Util. Dist. No. One v. Holder*, 129 S. Ct. 2504, 2513 (2009); *Lyng v. Nw. Indian Cemetery Protective Ass’n*, 485 U.S. 439, 445-46 (1988); see also *Ashwander v. TVA*, 297 U.S. 288, 345-46 (1936) (Brandeis, J., concurring). EPA’s notions of “absurdity” extend far beyond these situations, allowing agencies or courts to depart from unambiguous statutory language merely to avoid a suboptimal policy outcome, even when a straightforward textual interpretation would comply with all constitutional requirements. No matter how undesirable as a matter of policy, there is nothing

unconstitutional, or even constitutionally questionable, about imposing onerous regulatory burdens on buildings that emit greenhouse gases when the text of the Act establishes unambiguous numerical permitting thresholds.

Indeed, in this case the canon of constitutional avoidance *compels* EPA to adhere to the Act's specific numerical thresholds. As explained in Part II.C, EPA's decision to depart from these statutory rules empowers EPA to choose its own numerical thresholds without an "intelligible principle" provided by Congress. And even if one thinks that EPA's actions can be salvaged under the Constitution, it cannot be denied that EPA's unilateral revision of these numerical guidelines at least presents serious constitutional questions under the Court's nondelegation precedents. EPA's atextual interpretation aggravates rather than alleviates constitutional problems, by seizing discretionary powers without an "intelligible principle" provided by Congress. The Tailoring Rule's attempt to rely on the Court's constitutional-avoidance cases boomerangs.

Finally, even if one accepted the legitimacy of EPA's generalized "absurdity doctrine," it *still* would not justify EPA's unilateral departure from the Act's numerical thresholds. It would indeed be absurd to apply the Act's numerical thresholds to greenhouse-gas emissions, but it hardly follows that EPA may "cure" the absurdity by disregarding unambiguous statutory text. The proper means of avoiding this

absurdity is not by replacing the unambiguous numerical thresholds in the Act with arbitrary targets of EPA's own choosing, but by concluding that stationary-source greenhouse-gas emissions cannot qualify as "air pollutants" subject to regulation under the PSD and Title V programs. Nothing in the Act *compels* EPA to include greenhouse gases within the ambit of air pollutants regulated by the PSD and Title V programs; the relevant statutory provisions can be construed to exclude greenhouse-gas emissions from stationary sources, as the other petitioners explain in their briefs. When an agency can avoid an "absurd" result by adopting a plausible construction of statutory language, it cannot decline to follow that course and insist on curing the absurdity by disregarding *unambiguous* statutory language.

**C. EPA's Permitting Requirements For Stationary Sources That Emit Greenhouse Gases Violate The Constitution By Seizing Discretionary Powers Where No "Intelligible Principle" Has Been Provided By Statute.**

EPA's agency-created permitting requirements violate not only the Act, but also the Constitution. Agencies are allowed only to administer the laws; they may not exercise legislative powers that Article I vests exclusively in Congress. It is of course inevitable that agencies will exercise discretion when they implement federal statutes. Congress is not omniscient and cannot establish mechanical rules for every conceivable scenario that may arise. But the

Constitution requires federal statutes to authorize agency discretion *and* provide an “intelligible principle” to guide that discretion. *Whitman v. Am. Trucking Ass’ns*, 531 U.S. 457, 472 (2001); *J.W. Hampton, Jr. & Co. v. United States*, 276 U.S. 394, 409 (1928). Any agency that exercises discretionary powers absent an “intelligible principle” from Congress has crossed the line into constitutionally forbidden lawmaking.

EPA’s decision to replace the Act’s numerical thresholds with targets of its own creation is not and cannot be based on any intelligible principle provided by Congress. The Act envisions that EPA will either comply with the numerical thresholds or seek corrective legislation from Congress; as a result, it does not supply any intelligible principle for the improvisation project that EPA has undertaken in the Tailoring Rule. So even if EPA could conjure up a non-arbitrary justification for choosing 75,000 tpy CO<sub>2e</sub> and 100,000 tpy CO<sub>2e</sub> as the “new” threshold levels for greenhouse-gas emissions, it cannot link these decisions to any guideline provided in a federal statute, and it therefore cannot characterize its regulatory regime as anything but agency legislation.

EPA declares in its Tailoring Rule that future phase-ins will apply PSD and Title V “at threshold levels that are as close to the statutory levels as possible, and do so as quickly as possible, at least to a certain point.” J.A. 310. Putting aside whether this can qualify as “intelligible,” this reflects at most an effort *by EPA* to supply itself with a guiding

principle for the new threshold levels that it will choose. But *Whitman* squelches the notion that agency-supplied guidelines can satisfy the constitutional demand that *Congress* provide an intelligible principle to guide agency discretion. See 531 U.S. at 473. EPA's decision to establish new threshold levels for greenhouse-gas emissions is not governed by a congressionally supplied intelligible principle, and should be vacated as an unconstitutional exercise of legislative power.

**D. EPA's Tailoring Rule Arrogates Powers That Congress Reserved To Itself In The Clean Air Act.**

When Congress enacted and amended the Act, it chose to establish and retain specific numerical thresholds in the statute rather than instruct EPA to promulgate "reasonable" or "sensible" threshold levels for individual air pollutants. By doing this, Congress established that the threshold levels of pollutants would be governed by a rule rather than a standard. One reason legislatures establish rules is to reduce decision costs for those who implement the law, even though this may incur error costs by binding agency administrators to a crude statutory regime. But statutory rules serve another important function: They allocate power between the legislature and the agency that implements the legislative command.

When a federal statute delegates broad discretionary powers to an agency, it becomes more difficult for Congress to influence the agency's future

decisionmaking. Had the Act simply instructed EPA to “regulate air pollution in the public interest,” then EPA would have free rein to regulate greenhouse-gas emissions (or any future air pollution) without seeking permission or input from Congress. But by establishing rigid numerical thresholds in the text of the Act, Congress sought to hamstring EPA from *unilaterally* attacking some new and unforeseen problem of air pollution while relegating Congress to the sidelines. The decision to allocate power in this manner is an essential component of the bargaining that produced the Act and its amendments; for EPA to disregard this choice reflects nothing more than a raw power grab and a denigration of congressional prerogatives.

EPA apparently does not fancy the prospect of waiting for Congress to amend these numerical thresholds through legislation. Any efforts to obtain corrective legislation will require bargaining and concessions from both Congress and the Administration. EPA might not get everything that it wants, and the President will have to spend political capital that he might wish to preserve for other matters. How much easier to rewrite unilaterally the Act’s numerical thresholds and avoid the bother of negotiating with the people’s elected representatives. Yet the temptation to stray from the allocations of power memorialized in statutes is precisely why the Act provides for judicial review of agency action. If this Court decides that EPA has the statutory authority to regulate greenhouse-gas

emissions from stationary sources, it should disapprove the Tailoring Rule and force EPA to bargain with Congress over these matters.

**III. MASSACHUSETTS V. EPA SHOULD BE RECONSIDERED OR OVERRULED IF IT COMPELS EPA TO REGULATE STATIONARY-SOURCE GREENHOUSE-GAS EMISSIONS.**

Before 2007, EPA held that greenhouse gases did not qualify as “air pollutants” under the Act, which defines “air pollutant” as

any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air.

42 U.S.C. § 7602(g). EPA explained that it had traditionally construed the term “air pollution agent” as limited to pollutants “that occur primarily at ground level or near the surface of the earth . . . not higher in the atmosphere.” 68 Fed. Reg. 52,922, 52,926-27 (Sept. 8, 2003) (J.A. 1350); *see also id.* at J.A. 1350 (noting that greenhouse gases such as CO<sub>2</sub> are “fairly consistent in concentration throughout the world’s atmosphere up to approximately the lower stratosphere”). This view led EPA to refrain from regulating greenhouse-gas emissions under *any* of the Act’s provisions—not only the stationary-source regulations in the PSD and Title V programs, but also the motor-vehicle regulations in Title II.

*Massachusetts v. EPA*, 549 U.S. 497 (2007), held that EPA could no longer refuse to regulate *motor-vehicle* greenhouse-gas emissions simply by insisting that greenhouse gases fail to qualify as “air pollutants.” *Id.* at 528-32. This holding rested on two propositions. First, this Court observed that the four greenhouse gases emitted by motor vehicles— “[c]arbon dioxide, methane, nitrous oxide, and hydrofluorocarbons”—qualify as “physical [and] chemical . . . substances[s] which [are] emitted into . . . the ambient air” within the meaning of section 7602(g). *Id.* at 529. Second, this Court distinguished *Brown & Williamson* by noting that EPA regulation of motor-vehicle greenhouse-gas emissions “would lead to no . . . extreme measures.” *Id.* at 531. *Massachusetts* never considered whether EPA could or should regulate *stationary-source* greenhouse gases as air pollutants under the PSD and Title V programs, where the Act’s rigid permitting thresholds would produce burdens that exceed any semblance of rational regulation.

*Massachusetts*’s holding need not and should not be extended to stationary-source greenhouse-gas emissions. *Massachusetts*’s decision to regard motor-vehicle greenhouse-gas emissions as “air pollutants” under section 7602(g) rested in part on the absence of preposterous consequences. *Id.* Here, by contrast, EPA itself recognizes that including stationary-source greenhouse-gas emissions within the meaning of “air pollutant” will produce ridiculous outcomes, and for this reason the agency refuses to obey the

unambiguous permitting thresholds specified in the PSD and Title V provisions. *See* Part II, *supra*. And the *Massachusetts* Court never had the opportunity to consider the implications of defining the term “air pollutant” to include greenhouse-gas emissions from stationary sources, as not one of the twenty-nine briefs submitted by the parties and their amici informed the Court of the absurdities that would arise from extending the PSD and Title V permitting requirements to every building that emits more than 100 (or 250) tpy of CO<sub>2</sub>. *See United States v. L.A. Tucker Truck Lines, Inc.*, 344 U.S. 33, 38 (1952) (holding that when an issue “was not . . . raised in briefs or argument nor discussed in the opinion of the Court[,] . . . the case is not a binding precedent on this point”).

None of this would matter if the statutory definition of “air pollutant” were clear enough to *compel* EPA to regulate stationary-source greenhouse gases. But it isn’t; the phrase “air pollution agent” leaves wiggle room, *see Massachusetts*, 549 U.S. at 555-60 (Scalia, J., dissenting), and there is nothing paradoxical about interpreting section 7602(g)’s definition of “air pollutant” to include greenhouse-gas emissions from motor vehicles but not stationary sources, given the implausibility of regulating greenhouse-gas emissions in a manner consistent with PSD and Title V permitting regimes. The briefs submitted by the Industry Petitioners offer several ways for the Court to interpret the Act in a manner that excludes

greenhouse-gas emissions from the PSD and Title V programs, or that prevents greenhouse-gas emissions from triggering the permitting requirements of those programs.

EPA claims that it can interpret the Act to require the regulation of stationary-source greenhouse-gas emissions, and then avoid the absurd consequences of extending the PSD and Title V permitting requirements to greenhouse gases by replacing the unambiguous numerical thresholds specified in the Act with numbers and metrics of its own choosing. EPA's analysis is backward. Agencies can rewrite unambiguous statutory language in the name of avoiding "absurdity," if at all, only when no other permissible construction of the statute is available to avoid that absurdity. Indeed, EPA's analysis reflects a perverse brand of agency self-aggrandizement: The more mischief an agency causes by its interpretations of a statute, the more power it will have to rewrite the unambiguous provisions of a statute. To find *any* possible construction of the Act that avoids extending the PSD and Title V permitting regimes to greenhouse gases is to *require* a ruling that disapproves EPA's interpretation of the statute.

If this Court concludes that *Massachusetts* compels EPA to regulate greenhouse-gas emissions under the PSD and Title V programs, then the State Petitioners respectfully request that this Court reconsider *Massachusetts's* holding that CO<sub>2</sub> and other greenhouse gases unambiguously qualify as

“air pollutant[s]” within the meaning of the Act. Even EPA recognizes that the term “air pollutant” cannot possibly extend to “all airborne compounds of whatever stripe,” nor can it extend to all “physical [and] chemical . . . substance[s] which [are] emitted into . . . the ambient air.” *Massachusetts*, 549 U.S. at 529 (majority opinion) (internal quotation marks omitted). EPA insists that the term “air pollutant” extends only to “physical, chemical [or] biological” substances *subject to regulation under the Clean Air Act*—even though this limiting construction finds no support from *Massachusetts*, which equated the term “air pollutant” with “all airborne compounds of whatever stripe,” and further insisted that this construction of “air pollutant” was *compelled* and could not be narrowed by EPA. *See id.* at 529; *see also id.* at 558 n.2 (Scalia, J., dissenting).

The problems with *Massachusetts’s* interpretation of “air pollutant” are made painfully apparent by this case. With CO<sub>2</sub> as an “air pollutant,” every building that emits more than 100 or 250 tpy of CO<sub>2</sub> becomes subject to permitting requirements, a result that imposes extreme and unacceptable regulatory burdens on EPA and the more than 6,000,000 buildings that would suddenly become required to obtain permits. *See Part I, supra.* EPA deems these results so absurd that it refuses to apply the Act as written. *See J.A.* 280-88, 459-68. EPA also does not agree with *Massachusetts’s* all-encompassing definition of “air pollutant” because it refused to deem stationary-source greenhouse-gas emissions

“air pollutant[s]” under the statute until after it had promulgated its Endangerment Finding and the Tailpipe Rule. *See* J.A. 709.

Stare decisis is “not an inexorable command,” *see Payne v. Tennessee*, 501 U.S. 808, 827-28 (1991), and this Court has not hesitated to reconsider or overrule cases that have proven “unworkable” or “legitimately vulnerable to serious reconsideration,” *Vasquez v. Hillery*, 474 U.S. 254, 266 (1986). *Massachusetts’s* holding that CO<sub>2</sub> and other greenhouse gases “unambiguous[ly]” qualify as “air pollutant[s]” under the Act should be reconsidered in light of the preposterous results that are produced under the PSD and Title V programs.

\* \* \*

Fusing the law-making power with the law-execution power contradicts the Constitution’s most fundamental principles of limited government and separation of powers. *See, e.g., Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579, 633 (1952) (Douglas, J., concurring); THE FEDERALIST NO. 47 (Madison). Yet EPA believes it can disregard unambiguous, agency-constraining statutory rules and unilaterally establish a new regulatory regime to deal with novel environmental challenges. Few propositions could be more subversive of the rule of law, or the notion that agency power must be authorized rather than assumed. A ruling that approves this agency-created regulatory regime will allow EPA to become a law unto itself.

30

**CONCLUSION**

The judgment of the court of appeals should be reversed.

Respectfully submitted.

CERTIORARI GRANTED OCTOBER 15, 2013**

### QUESTION PRESENTED

After this Court decided *Massachusetts v. EPA*, 549 U.S. 497 (2007), the United States Environmental Protection Agency (EPA) determined that its promulgation of motor vehicle greenhouse gas (GHG) emission standards under Title II of the Clean Air Act (CAA), 42 U.S.C. § 7521(a)(1), compelled regulation of carbon dioxide and other GHGs under the CAA's Title I Prevention of Significant Deterioration (PSD) and Title V stationary-source permitting programs. EPA adopted the Timing Rule and the Tailoring Rule, which added GHGs to the pollutants covered by the PSD and Title V programs even though (i) including GHGs would vastly expand the PSD and Title V programs in a way that contradicts Congress's intent, and (ii) GHGs such as carbon dioxide do not deteriorate ambient air quality (*i.e.*, the outside air that people breathe). The court of appeals held that the CAA and *Massachusetts* compelled inclusion of GHGs in these programs and, based on that holding, dismissed on standing grounds all petitions to review EPA's GHG permitting rules. The question presented is:

Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.

**PARTIES TO THE PROCEEDING**

The following were parties to the proceedings in the U.S. Court of Appeals for the District of Columbia Circuit:

**Challenges to 75 Fed. Reg. 17,004 (Apr. 2, 2010)**  
**(the “Timing Rule”):**

1. The Utility Air Regulatory Group, petitioner on review, was a petitioner below.

2. The United States Environmental Protection Agency, respondent on review, was a respondent below.

3. Additional petitioners below, who are nominal respondents on review, were Coalition for Responsible Regulation, Inc.; Industrial Minerals Association – North America; National Cattlemen’s Beef Association; Great Northern Project Development, L.P.; Rosebud Mining Co.; Alpha Natural Resources, Inc.; Southeastern Legal Foundation, Inc.; The Langdale Company; Langdale Forest Products Company; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet-Pontiac, Inc.; Langdale Ford Company; Langboard, Inc. – MDF; Langboard, Inc. – OSB; Georgia Motor Trucking Association, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Kennesaw Transportation, Inc.; J&M Tank Lines, Inc.; Southeast Trailer Mart, Inc.; Georgia Agribusiness Council, Inc.; John Linder, U.S. Representative, Georgia 7<sup>th</sup> District; Dana Rohrabacher, U.S. Representative, California 46<sup>th</sup> District; John Shimkus, U.S. Representative, Illinois 19<sup>th</sup> District; Phil Gingrey, U.S. Representative, Georgia 11<sup>th</sup> District; Lynn Westmoreland, U.S. Representative, Georgia

iii

3<sup>rd</sup> District; Tom Price, U.S. Representative, Georgia 6<sup>th</sup> District; Paul Broun, U.S. Representative, Georgia 10<sup>th</sup> District; Steve King, U.S. Representative, Iowa 5<sup>th</sup> District; Nathan Deal, U.S. Representative, Georgia 9<sup>th</sup> District; Jack Kingston, U.S. Representative, Georgia 1<sup>st</sup> District; Michele Bachmann, U.S. Representative, Minnesota 6<sup>th</sup> District; Kevin Brady, U.S. Representative, Texas 8<sup>th</sup> District; John Shadegg, U.S. Representative, Arizona 3<sup>rd</sup> District; Marsha Blackburn, U.S. Representative, Tennessee 7<sup>th</sup> District; Dan Burton, U.S. Representative, Indiana 5<sup>th</sup> District; Clean Air Implementation Project; American Iron and Steel Institute; Gerdau Ameristeel US Inc.; Energy-Intensive Manufacturers' Working Group on Greenhouse Gas Regulation; Peabody Energy Company; American Farm Bureau Federation; National Mining Association; Chamber of Commerce of the United States of America; Missouri Joint Municipal Electric Utility Commission; National Environmental Development Association's Clean Air Project; Ohio Coal Association; National Association of Manufacturers; American Frozen Food Institute; American Petroleum Institute; Brick Industry Association; Corn Refiners Association; Glass Packaging Institute; Independent Petroleum Association of America; Indiana Cast Metals Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Home Builders; National Federation of Independent Business; National Oilseed Processors Association; National Petrochemical & Refiners Association; North American Die Casting Association; Specialty Steel Industry of North America; Tennessee Chamber of Commerce and Industry; Western States Petroleum

Association; West Virginia Manufacturers Association; Wisconsin Manufacturers and Commerce; State of Texas; State of Alabama; State of South Carolina; State of South Dakota; State of Nebraska; State of North Dakota; Commonwealth of Virginia; Rick Perry, Governor of Texas; Greg Abbott; Attorney General of Texas; Texas Commission on Environmental Quality; Texas Agriculture Commission; Texas Public Utilities Commission; Texas Railroad Commission; Texas General Land Office; Haley Barbour, Governor of the State of Mississippi; and Portland Cement Association.

4. Petitioner-intervenors below (with respect to certain petitions for review), who are nominal respondents on review, were American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Corn Refiners Association; Glass Association of North America; Independent Petroleum Association of America; Indiana Cast Metals Association; Louisiana Department of Environmental Quality; Michigan Manufacturers Association; National Association Manufacturers; National Association of Home Builders; National Oilseed Processors Association; Tennessee Chamber of Commerce and Industry; Western States Petroleum Association; West Virginia Manufacturers Association; and Wisconsin Manufacturers & Commerce.

5. Respondent-intervenors below (with respect to certain petitions for review), who are respondents (or, in some cases, nominal respondents) on review, were American Farm Bureau Federation; Brick Industry Association; Center for Biological Diversity; Commonwealth of Massachusetts; Conservation Law

v

Foundation; Environmental Defense Fund; Georgia ForestWatch; Indiana Wildlife Federation; Michigan Environmental Council; National Environmental Development Association's Clean Air Project; National Mining Association; Peabody Energy Company; Natural Resources Council of Maine; Natural Resources Defense Council; Ohio Environmental Council; Sierra Club; South Coast Air Quality Management District; State of California; State of Illinois; State of Iowa; State of Maine; State of Maryland; State of New Hampshire; State of New Mexico; State of New York; State of North Carolina; State of Oregon; State of Rhode Island; Utility Air Regulatory Group; Wild Virginia.

6. A respondent below, who is a nominal respondent on review, was Lisa Perez Jackson, Administrator, United States Environmental Protection Agency. Ms. Jackson ceased to hold the office of Administrator, United States Environmental Protection Agency, on February 15, 2013; that office is currently held by Gina McCarthy.

**Challenges to 75 Fed. Reg. 31,514 (June 3, 2010) (the "Tailoring Rule"):**

1. The Utility Air Regulatory Group, petitioner on review, was a petitioner below.

2. The United States Environmental Protection Agency, respondent on review, was a respondent below.

3. Additional petitioners below, who are nominal respondents on review, were Southeastern Legal Foundation, Inc.; John Linder, U.S. Representative, Georgia 7<sup>th</sup> District; Dana Rohrabacher, U.S. Repre-

representative, California 46<sup>th</sup> District; John Shimkus, U.S. Representative, Illinois 19<sup>th</sup> District; Phil Gingrey, U.S. Representative, Georgia 11<sup>th</sup> District; Lynn Westmoreland, U.S. Representative, Georgia 3<sup>rd</sup> District; Tom Price, U.S. Representative, Georgia 6<sup>th</sup> District; Paul Broun, U.S. Representative, Georgia 10<sup>th</sup> District; Steve King, U.S. Representative, Iowa 5<sup>th</sup> District; Jack Kingston, U.S. Representative, Georgia 1<sup>st</sup> District; Michele Bachmann, U.S. Representative, Minnesota 6<sup>th</sup> District; Kevin Brady, U.S. Representative, Texas 8<sup>th</sup> District; John Shadegg, U.S. Representative, Arizona 3<sup>rd</sup> District; Marsha Blackburn, U.S. Representative, Tennessee 7<sup>th</sup> District; Dan Burton, U.S. Representative, Indiana 5<sup>th</sup> District; The Langdale Company; Langdale Forest Products Company; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet-Pontiac, Inc.; Langdale Ford Company; Langboard, Inc. – MDF; Langboard, Inc. – OSB; Georgia Motor Trucking Association, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Kennesaw Transportation, Inc.; J&M Tank Lines, Inc.; Southeast Trailer Mart, Inc.; Georgia Agribusiness Council, Inc.; Coalition for Responsible Regulation, Inc.; Industrial Minerals Association – North America; National Cattlemen’s Beef Association; Great Northern Project Development, L.P.; Rosebud Mining Co.; Alpha Natural Resources, Inc.; The Ohio Coal Association; American Iron and Steel Institute; Gerdau Ameristeel US Inc.; Chamber of Commerce of the United States of America; Georgia Coalition for Sound Environmental Policy; National Mining Association; American Farm Bureau Federation; Peabody Energy Company; Energy-Intensive Manufacturers’ Working Group on Green-

house Gas Regulation; South Carolina Public Service Authority; Mark R. Levin; Landmark Legal Foundation; National Environmental Development Association's Clean Air Project; State of Alabama; State of North Dakota; State of South Dakota; Haley Barbour, Governor of Mississippi; State of South Carolina; State of Nebraska; Missouri Joint Municipal Electric Utility Commission; Clean Air Implementation Project; National Association of Manufacturers; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Brick Industry Association; Corn Refiners Association; Glass Association of North America; Glass Packaging Institute; Independent Petroleum Association of America; Indiana Cast Metals Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Oilseed Processors Association; Tennessee Chamber of Commerce and Industry; Western States Petroleum Association; West Virginia Manufacturers Association; Wisconsin Manufacturers & Commerce; National Association of Home Builders; National Federation of Independent Business; Portland Cement Association; Louisiana Department of Environmental Quality; Rick Perry, Governor of Texas; Greg Abbott; Attorney General of Texas; Texas Commission on Environmental Quality; Texas Department of Agriculture; Texas Public Utilities Commission; Texas Railroad Commission; Texas General Land Office; and State of Texas.

4. Petitioner-intervenors below (with respect to certain petitions for review), who are nominal respondents on review, were American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Corn Refiners As-

viii

sociation; Glass Association of North America; Independent Petroleum Association of America; Indiana Cast Metals Association; Michigan Manufacturers Association; National Association of Home Builders; National Association of Manufacturers; National Oilseed Processors Association; Tennessee Chamber of Commerce and Industry; Western States Petroleum Association; West Virginia Manufacturers Association; and Wisconsin Manufacturers & Commerce.

5. Respondent-intervenors below (with respect to certain petitions for review), who are respondents (or, in some cases, nominal respondents) on review, were American Farm Bureau Federation; Brick Industry Association; Center for Biological Diversity; Clean Air Implementation Project; Commonwealth of Massachusetts; Conservation Law Foundation; Environmental Defense Fund; Georgia ForestWatch; National Environmental Development Association's Clean Air Project; National Mining Association; Natural Resources Council of Maine, Inc.; Natural Resources Defense Council; Peabody Energy Company; Sierra Club; South Coast Air Quality Management District; State of California; State of Illinois; State of Iowa; State of Maine; State of Maryland; State of New Hampshire; State of New Mexico; State of New York; State of North Carolina; State of Oregon; State of Rhode Island; Utility Air Regulatory Group; and Wild Virginia.

6. A respondent below, who is a nominal respondent on review, was Lisa Perez Jackson, Administrator, United States Environmental Protection Agency. Ms. Jackson ceased to hold the office of Administrator, United States Environmental Protection

ix

Agency, on February 15, 2013; that office is currently held by Gina McCarthy.

## **CORPORATE DISCLOSURE STATEMENT**

The Utility Air Regulatory Group (UARG) is a not-for-profit association of individual electric utilities and electric generating companies and national trade associations that participates on behalf of its members collectively in administrative proceedings under the Clean Air Act, and in litigation arising from those proceedings, that affect electric generators. UARG has no outstanding shares or debt securities in the hands of the public and has no parent company. No publicly held company has a 10% or greater ownership interest in UARG.

## OPINIONS BELOW

The court of appeals' opinion is reported at 684 F.3d 102 and reproduced in the Joint Appendix (JA) at 191-267. Its orders denying panel and en banc rehearing are at JA 139-90. The Timing Rule is reproduced at JA 705-92, and the Tailoring Rule is at JA 268-682.

## JURISDICTION

The court of appeals entered judgment dismissing the Timing and Tailoring Rule cases on June 26, 2012. Pet. App. (No. 12-1146) 5a. Timely petitions for panel or en banc rehearing were denied on December 20, 2012. JA 141. This Court has jurisdiction under 28 U.S.C. § 1254(1).

## STATUTORY PROVISIONS INVOLVED

Relevant provisions of the Clean Air Act (CAA or Act), 42 U.S.C. §§ 7401 *et seq.*, are reproduced at Pet. App. (No. 12-1146) 664a-680a. Relevant regulations implementing the CAA are reproduced at Pet. App. (No. 12-1146) 681a-692a.

## STATEMENT OF THE CASE

This case concerns the decision of a panel of the lower court that, upon promulgation by the United States Environmental Protection Agency (EPA) of motor vehicle emission standards for greenhouse gases (GHGs) under Title II of the CAA, EPA was compelled by (1) this Court's decision in *Massachusetts v. EPA*, 549 U.S. 497 (2007), applying the CAA's general definition of "air pollutant" to Title II of the CAA, and (2) the use of the term "air pollutant" in the

CAA's Prevention of Significant (PSD) and Title V provisions, to regulate stationary sources' GHG emissions under the Title I and Title V permitting programs.<sup>1</sup> At issue is whether this determination by EPA that stationary source regulation is statutorily compelled is a permissible reading of the CAA.

Pollutants like sulfuric acid, benzene, sulfur dioxide, and nitrogen dioxide are regulated under the Act because they contribute to local or regional concentrations in the ambient air that pose risks to public health or welfare. By contrast, as EPA explained, GHG concentrations "tend to be relatively uniform around the world," JA 1091, causing climate change effects that cannot be related to specific sources' emissions. Although EPA identified health and welfare effects from global GHG concentrations, EPA also recognized that "[c]urrent and projected levels of ambient concentrations" of GHGs themselves are not responsible for direct adverse effects locally and regionally. *Id.* at 1145.

The "basket" of substances constituting GHGs is dominated by one – carbon dioxide.<sup>2</sup> Carbon dioxide is a colorless gas that, like nitrogen and oxygen, is a natural component of the outside air people breathe.

---

<sup>1</sup> Although this brief focuses on Title I PSD requirements, defining Title V "air pollutants" to include GHGs is also problematic; the arguments presented here regarding "major source" coverage generally also apply to Title V.

<sup>2</sup> EPA defines "GHGs" as consisting of six pollutants. Each is assigned a numerical value based on its "Global Warming Potential," measured relative to carbon dioxide, which is called "carbon dioxide equivalent." JA 290.

Ground-level ambient concentrations of carbon dioxide are uniform over large geographic areas and do not change measurably due to new carbon dioxide emissions from industrial and other sources. Exposure to carbon dioxide in ambient air is necessary to sustain life and is harmless to humans, animals, and property. See IPCC Special Report, Carbon Dioxide Capture and Storage, Annex 1, at 385 (2005), *available at* [http://www.ipcc.ch/pdf/special-reports/srccs/srccs\\_wholereport.pdf](http://www.ipcc.ch/pdf/special-reports/srccs/srccs_wholereport.pdf).

Congress limited coverage of the Title I PSD and Title V permit programs to “major” sources, which Congress defined in reference to annual emissions of “any air pollutant” – 100 tons per year (tpy) for Title V, 42 U.S.C. §§ 7602(j), 7661(2)(B), and 100 or 250 tpy for PSD depending upon the type of source, *id.* § 7479(1). If these tpy thresholds are applied to carbon dioxide emissions, the coverage of these programs will no longer be limited to “major” sources. Carbon dioxide emissions result from combustion and are emitted from stationary sources in amounts that are orders of magnitude greater than other CAA-regulated combustion byproducts. A source that, for example, emits 250 tpy of sulfur dioxide or particulate matter is, invariably, a large industrial facility. On the other hand, sources emitting 250 tpy of carbon dioxide include hospitals, schools, apartment buildings, shopping centers, and innumerable other small non-industrial sources. JA 283-84.

1. The modern CAA was enacted in 1970 and significantly amended in 1977 and 1990, as Congress turned its attention to new problems and devised different approaches to existing problems. The Act con-

tains six distinct titles (Subchapters I through VI of 42 U.S.C. Chapter 85); each establishes different programs to address different pollution problems in different geographic areas for different types of sources.

Title II addresses emission standards for mobile sources, including motor vehicles. Title I establishes a variety of programs governing stationary source emissions, including programs addressing national ambient air quality standards (NAAQS), control technology standards, air toxics regulation, and visibility protection. Congress revised Title I in 1977, adding, *inter alia*, a PSD preconstruction permit program for large industrial sources. In 1990, Congress added Title V to create an operating permit program for large stationary sources. Title III contains the CAA's "general provisions," including the Act's general definition of "air pollutant" addressed in *Massachusetts*. 42 U.S.C. § 7602(g).

2. The starting point for Title I stationary source regulation is the NAAQS program. *Id.* §§ 7408, 7409; *Union Elec. Co. v. EPA*, 427 U.S. 246, 249 (1976) (NAAQS program is the "heart" of the CAA). As specified by § 7409(b), EPA establishes NAAQS by defining maximum health- and welfare-protective concentrations of specific pollutants (so-called "criteria pollutants") in the "ambient air" – ground-level outdoor air to which people are exposed and which they breathe. *Train v. Natural Res. Def. Council*, 421 U.S. 60, 65 (1975) ("ambient air[]" ... is the statute's term for the outdoor air used by the general public"); 40 C.F.R. § 50.1(e) ("Ambient air means that portion of the atmosphere, external to buildings, to which the general public has access.").

After EPA promulgates a NAAQS, States have primary responsibility to ensure the ambient air within their borders attains and maintains the NAAQS. A State does this by adopting emission limitations and other measures in a state implementation plan (SIP) that it submits to EPA for review and approval. 42 U.S.C. §§ 7407, 7410. The CAA assigns responsibility for achieving NAAQS on a geographic basis. *Id.* § 7407(a). For each NAAQS, each state is divided into defined geographic areas that are designated, based on measured ambient air quality concentrations, as (1) “attainment” (meaning ambient air quality in the area is as good as or better than the NAAQS), (2) “nonattainment” (the area’s ambient air quality is worse than the NAAQS), or (3) “unclassifiable.” A geographic area may be in attainment with one NAAQS but nonattainment (or unclassifiable) for another.

3. The PSD program arose from litigation after EPA’s approval in 1972 of the first SIPs. In *Sierra Club v. Ruckelshaus*, 344 F. Supp. 253, 257 (D.D.C.), *aff’d per curiam*, 4 Env’t Rep. Cas. (BNA) 1815 (D.C. Cir. 1972), *aff’d per curiam by an equally divided Court sub nom. Fri v. Sierra Club*, 412 U.S. 541 (1973), the court ordered EPA to disapprove any SIP that allowed “attainment” ambient air quality in an area to “deteriorate” to the level of a NAAQS.

In 1974, EPA implemented that decision by promulgating the initial PSD rules. 39 Fed. Reg. 42,510, 42,514-17 (Dec. 5, 1974). Those rules sought to “prevent significant deterioration” of local ambient air quality in attainment areas by requiring permits before construction of named types of large industrial

sources (or modifications of such sources) could occur.<sup>3</sup> Deterioration of local air quality would be avoided by requiring that these large industrial facilities (i) not cause ambient air quality impacts above specified numerical “increments” for sulfur dioxide and particulate matter, and (ii) use “best available control technology” (BACT) for these pollutants.

4. In 1977, Congress enacted a PSD program based largely on EPA’s 1974 rules. See *Alaska Dep’t of Envtl. Conservation v. EPA*, 540 U.S. 461, 470-74 (2004). Like the 1974 rules, the statutory PSD program required preconstruction permits for construction or modification of major sources. The new statutory program covered only “major emitting facilit[ies].” 42 U.S.C. § 7479(1). For 28 listed categories of industrial facilities, sources were “major emitting facilit[ies]” if they “emit, or have the potential to emit, [100 tpy] or more of any air pollutant.” *Id.* Recognizing that other large industrial facilities, outside the 28 categories, could have emissions that deteriorate local ambient air quality, Congress provided such a facility would be a “major emitting facility” if it had “the potential to emit [250 tpy] or more of any air pollutant.” *Id.*

In 1978, EPA promulgated regulations to implement the statutory PSD program. JA 1496-536. Resolving challenges to those regulations, the D.C. Circuit in *Alabama Power Co. v. Costle*, 636 F.2d 323

---

<sup>3</sup> Eighteen specifically identified categories of large industrial sources were subject to review under EPA’s 1974 rules. 39 Fed. Reg. at 42,516.

(D.C. Cir. 1979), addressed Congress's intent for the PSD program.

Regarding "major emitting facility," the court explained the statutory definition was "not pollutant-specific, but rather identifies sources that emit more than a threshold quantity of *any* air pollutant." *Id.* at 352. The court observed that:

Once a source has been so identified, it may become subject to [the] substantial administrative burdens and stringent technological control requirements [imposed by § 7475 (discussed further below)] for each pollutant regulated under the Act, even though the air pollutant, emissions of which caused the source to be classified as a "major emitting facility," may not be a pollutant for which NAAQS have been promulgated or even one that is otherwise regulated under the Act. As [is] apparent from consideration of the ramifications of this definition, Congress's intention was to identify facilities which, due to their size, are financially able to bear the substantial regulatory costs imposed by the PSD provisions and which, as a group, are primarily responsible for emission of the deleterious pollutants that befoul our nation's air.

*Id.* at 352-53.

The "100 ton-per-annum threshold" applicable to the "28 categories of facilities" listed in § 7479(1), the court said, indicates "Congress was concerned with large industrial enterprises – major actual emitters

of air pollution” and intended to exclude from the statute’s major emitting facility definition “small industrial facilities within these categories [that] might actually and potentially emit less than the threshold amount.” *Id.* at 354. Emphasizing this point, the court said it had “no reason to believe that Congress intended [the term “major emitting facility”] to define such obviously minor sources” as “the heating plant operating in a large high school or in a small community college,” as “‘major’ for the purposes of the PSD provision.”<sup>4</sup> *Id.*

5. The PSD program’s exclusive focus on pollutants that can deteriorate ambient air quality in geographically-defined areas is evident in the 1977 statutory text. For example, Congress directed that “each applicable implementation plan shall contain emission limitations and such other measures *as may be necessary*, as determined under regulations promulgated under this part, to prevent *significant deterioration of air quality* in each [area] ... designated

---

<sup>4</sup> Although the text of § 7479(1) plainly defines “major emitting facility” in reference to a source that emits the applicable threshold amount of “any air pollutant,” EPA’s 1978 regulations defined the equivalent regulatory term “Major stationary source” to mean sources within the 28 statutorily-identified industrial categories that “emit, or have the potential to emit, 100 [tpy] or more of any air pollutant *regulated under the Clean Air Act.*” JA 1508 (emphasis added). EPA added the same limiting language to the 250-tpy threshold. Because no one objected to the limiting words “regulated under the Clean Air Act” added in EPA’s definition, the *Alabama Power* court had no occasion to consider whether this EPA addition conformed to congressional intent.

pursuant to section 7407 ... as attainment or unclassifiable.” 42 U.S.C. § 7471 (emphases added).

For “major emitting facilities” beginning construction after the 1977 CAA Amendments’ enactment, Congress established in § 7475 requirements for pre-construction permitting. To receive a permit, a proposed facility’s owner or operator must demonstrate

that emissions from construction or operation of such facility will not cause, or contribute to, air pollution in excess of any (A) maximum allowable increase or maximum allowable concentration for any pollutant *in any area* to which this part applies ..., (B) [NAAQS] *in any air quality control region*, or (C) any other applicable emission standard or standard of performance under [the Act].

*Id.* § 7475(a)(3) (emphases added).

To evaluate the significance of air quality deterioration, the owner or operator must “conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or [are] having, on *air quality in any area which may be affected* by emissions from such source.” *Id.* § 7475(a)(7) (emphasis added). Each proposed “major emitting facility” is subject to “an analysis ... of *the ambient air quality at the proposed site and in areas which may be affected* by emissions from such facility for *each pollutant subject to regulation under this [Act]* which will be emitted from such facility.” *Id.* § 7475(e)(1) (emphases added). This analysis must address

the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility at the site of the proposed major emitting facility and *in the area potentially affected* by the emissions from such facility for *each pollutant regulated under this [Act]* which will be emitted from, or which results from the construction or operation of, such facility, ... and such other factors as may be relevant in determining *the effect of emissions from a proposed facility on any air quality control region*.

*Id.* § 7475(e)(3)(B) (emphases added).

In parallel to the air quality monitoring and analysis of “each pollutant subject to regulation” that the facility would emit, *id.* § 7475(e)(1), a PSD permit must contain emission limitations based on BACT for each such pollutant, *id.* § 7475(a)(4). Although the CAA does not define “each pollutant subject to regulation,” *Alabama Power* rejected an argument, based on language in § 7476, that Congress intended that only sulfur dioxide and particulate matter be deemed “subject to regulation.” 636 F.2d at 405-06. The D.C. Circuit found that “[t]hrough Congress could have decided to delay the applicability of PSD for [other] pollutants until all studies and regulations required by [§ 7476] have been completed, Congress apparently chose not to do so....” *Id.* at 406. The court noted that “[w]hat legislative history there is on this point” indicated the BACT requirement “should be applicable to all pollutants emitted from any new major emitting facility so that the maximum degree of emission reduction would be achieved *in order to*

*minimize potential deterioration.”* *Id.* at 406-07 & n.81 (emphasis added) (quoting 123 Cong. Rec. S9162, S9170 (daily ed. June 8, 1977) (statement of Sen. Muskie)).

6. In 1999, several groups petitioned EPA to regulate motor vehicles’ GHG emissions under Title II of the Act, 42 U.S.C. § 7521(a)(1). See 66 Fed. Reg. 7486 (Jan. 23, 2001). EPA denied the petition on the ground that GHGs are not an “air pollutant” under the general definitional provision in Title III of the Act (42 U.S.C. § 7602(g)). JA 1332-378.

On review, this Court rejected EPA’s argument that the Act’s broad general definition of “air pollutant” excluded GHGs, stating that “[o]n its face, the [§ 7602(g)] definition embraces all airborne compounds of whatever stripe.” *Massachusetts*, 549 U.S. at 529. The Court concluded Title II embraced this capacious definition: “The broad language of [§ 7521(a)(1)] reflects an intentional effort to confer the flexibility necessary,” *id.* at 532, to authorize regulation of all vehicle emissions that “contribute to[] air pollution which may ... endanger public health or welfare,” 42 U.S.C. § 7521(a)(1), including vehicles’ GHG emissions if those emissions contribute to an “endangerment.”

7. After this Court decided *Massachusetts*, EPA determined that motor vehicles’ GHG emissions throughout the nation “cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare,” pursuant to § 7521(a)(1). JA 793, 821. EPA did not find, could not find, and was not called on to find that those emissions deteriorate ambient air quality; rather, it

found GHGs disperse throughout the global atmosphere and affect climate globally. *Id.* at 861-69. Following its Endangerment Finding, EPA promulgated the Motor Vehicle Rule, regulating vehicles' GHG emissions under § 7521(a). *Id.* at 683-704.

8. In 2009, EPA explained that “[c]urrently, EPA does not consider GHG emissions to be ‘regulated ... pollutants’ under the [Title I] PSD program.... EPA is in the process of reviewing its approach to PSD applicability...” 74 Fed. Reg. 55,292, 55,299 (Oct. 27, 2009) (proposed Tailoring Rule). Subsequently, EPA’s Timing Rule addressed when GHGs would become “subject to regulation” for PSD purposes, JA 771, and “conclude[d] only that ... GHGs would not be considered ‘subject to regulation’ ... earlier than January 2, 2011,” the Motor Vehicle Rule’s effective date, *id.* at 772.

In its companion Tailoring Rule, EPA determined that, under *Massachusetts’s* holding that GHGs are within § 7602(g)’s “air pollutant” definition, once the Motor Vehicle Rule took effect and resulted in GHGs becoming “subject to regulation” under Title II, regulation of *stationary* sources’ GHG emissions was compelled by operation of law under the Title I PSD and Title V programs. *Id.* at 283-84. According to EPA, “[o]ur legal basis for this rule is our interpretation of the PSD and title V applicability provisions,” *id.* at 280, *i.e.*, “that GHG sources would become subject to the PSD and title V permitting programs upon finalization” of the Motor Vehicle Rule, EPA, Prevention of Significant Deterioration and Title V GHG Tailoring Rule: EPA’s Response to Public Comments at 34 (May 2010), *available at* <http://>

[www.regulations.gov/#!searchResults;rpp=25;po=0;s=EPA-HQ-OAR-2009-0517-19181;fp=true;ns=true](http://www.regulations.gov/#!searchResults;rpp=25;po=0;s=EPA-HQ-OAR-2009-0517-19181;fp=true;ns=true) (Response to Comments).

At the same time, EPA acknowledged that treating GHGs covered by the PSD and Title V programs the same as previously regulated pollutants would expand those programs to myriad sources Congress *never* intended to regulate. See, *e.g.*, JA 355-56, 486-87; 74 Fed. Reg. at 55,304 (“Congress, focused as it was [in 1977] on sources of conventional pollutants and not global warming pollutants, expected that the 100/250 tpy applicability thresholds would limit PSD to larger sources.”). According to EPA, expanding the programs to cover smaller sources emitting GHGs over these thresholds would not be “consistent with other provisions of the PSD and title V requirements, and [would be] inconsistent with – and, indeed, undermine – congressional purposes for the PSD and title V provisions.” JA 418-19. EPA concluded that “applying PSD requirements literally to GHG sources ... would result in a program that would have been unrecognizable to the Congress that designed PSD.” *Id.* at 454-55; see also *id.* at 485 (same conclusion for Title V).

The Tailoring Rule was EPA’s response to what it viewed as a conflict between (i) the unambiguous 100- and 250-tpy applicability thresholds that Congress used to define “major emitting facility” and (ii) clear congressional intent *not* to apply PSD to tens of thousands, and Title V to millions, of small sources. EPA resolved this perceived conflict by amending 40 C.F.R. § 51.166 to limit PSD coverage by initially defining the GHGs regulated under PSD as those GHGs

emitted in amounts at or above 100,000 tpy of carbon dioxide equivalent for new construction (and at or above 75,000 tpy of carbon dioxide equivalent for modifications). *Id.* at 674. Similarly, GHGs regulated under Title V were defined as those emitted in amounts at or above 100,000 tpy of carbon dioxide equivalent.<sup>5</sup> *Id.* at 677-78. Because EPA construed the Act to require that GHGs be regulated the same as other § 7602(g) air pollutants, notwithstanding that such regulation would contradict Congress's intent in defining "major" sources under PSD and Title V, EPA decided it would, on a step-by-step basis, "consider in future rulemaking how closely to the statutory thresholds [it] will be able to implement the PSD and title V programs." *Id.* at 289.

9. In promulgating the Tailoring Rule, EPA rejected rulemaking comments arguing that (i) *Massachusetts* did not require EPA to interpret "air pollutant," as used in the Act's PSD provisions, to include GHGs where their inclusion would be inconsistent with Congress's understanding of "major emitting facility," and (ii) EPA was prohibited from undertaking, step-by-step, a program that contradicts this congressional intent. See Response to Comments at 34-43. A panel of the lower court agreed with EPA that inclusion of GHGs was dictated by "binding Supreme Court precedent." JA 145.

---

<sup>5</sup> The Tailoring Rule defines GHGs emitted below its 75,000-tpy and 100,000-tpy PSD thresholds and 100,000-tpy Title V threshold as not constituting air pollutants "subject to regulation" under the PSD and Title V programs, respectively. JA 673.

The D.C. Circuit denied petitions for rehearing en banc. Judges Brown and Kavanaugh dissented in separate opinions. Concurring in denial of rehearing, the panel judges reiterated their conclusion that, based on its reading of *Massachusetts*, “the panel’s interpretation of the statute is the only plausible one.” *Id.* at 144.

### SUMMARY OF ARGUMENT

This Court in *Massachusetts* held that the CAA’s general definition of “air pollutant” is sufficiently “sweeping” to encompass GHGs and that, under the language of § 7521(a) in Title II of the Act, EPA would have to prescribe standards for motor vehicles’ GHG emissions if it found those emissions “endanger public health or welfare.” *Massachusetts*, 549 U.S. at 528, 532-33. Nothing in *Massachusetts* supports the conclusion, however, that EPA’s Title II endangerment finding and Title II motor-vehicle regulation compelled regulation of stationary sources’ GHG emissions under very different Title I PSD and Title V programs.

Although GHGs fit within § 7602(g)’s general definition, they are not an air pollutant Congress intended to be regulated under PSD and Title V. In the PSD and Title V provisions, Congress defined “major emitting facility” so that only a certain type of source – large industrial facilities, relatively few in number – would be subject to those programs. The PSD definition covers stationary sources within 28 specific categories of industrial facilities that emit, or could emit, 100 tpy or more of “any air pollutant” and other stationary sources that emit 250 tpy or more of “any air pollutant.” The Title V definition covers station-

ary sources that emit 100 tpy or more of “any air pollutant.” Thousands of small, non-industrial sources, such as apartment buildings and schools, emit carbon dioxide in amounts well above 250 tpy, and millions of small sources emit carbon dioxide in amounts above the 100 tpy Title V threshold. To give effect to Congress’s intent, therefore, carbon dioxide and other GHGs cannot be pollutants regulated under PSD and Title V.

Further, whatever “endangerment” carbon dioxide may present due to effects of global climate change, carbon dioxide *does not deteriorate ambient air quality* – the quality of the air people breathe. The CAA’s PSD provisions address exclusively the review, analysis, monitoring, and control of “air pollutants” that deteriorate ambient air quality in specifically defined geographic areas. Carbon dioxide does not fit within those provisions.

### ARGUMENT

The CAA is an expansive statute that addresses different pollution problems using different regulatory responses. In a statute with distinct titles and numerous specialized programs, the general definition of “air pollutant” must be broad enough to reflect the entire range of substances that might be regulated under any of those diverse programs. Accordingly, the definition of “air pollutant” in § 7602(g) establishes, as *Massachusetts* holds, the outer bounds of what airborne substances are *potentially* eligible for regulation under any given CAA program.

Regarding regulation of motor vehicle emissions under Title II, the Act directs EPA to “prescribe ...

standards applicable to the emission of any air pollutant from ... new motor vehicles” where EPA determines those “air pollutant” emissions “cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” 42 U.S.C. § 7521(a) (emphasis added). Thus, any “air pollutant” the motor-vehicle emissions of which EPA concludes present an “endangerment” must be regulated under Title II standards for vehicles throughout the nation.

Regarding regulation of stationary source emissions under Title I, Congress provided different criteria for determining what pollutants to regulate under different programs. For example, “[f]or the purpose of establishing” NAAQS, EPA must develop “a list which includes each air pollutant ... [the] emissions of which ... cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare.” *Id.* § 7408(a)(1). But, unlike Title II endangerment findings, this Title I endangerment finding is not the end of the process of identifying pollutants that can be regulated. Rather, under the NAAQS provisions, EPA’s regulatory attention focuses on a specific type of endangerment: Only those listed pollutants that have “effects on public health or welfare ... *from the presence of such pollutant in the ambient air, in varying quantities,*” may become air quality “criteria” pollutants for which NAAQS are established. *Id.* § 7408(a)(2) (emphasis added). NAAQS, in turn, must be based on EPA-defined “air quality criteria.” *Id.* §§ 7408(a)(2), 7409(b).

For hazardous air pollutants, under § 7412, EPA must regulate “air pollutants” that Congress listed in

§ 7412(b)(1). EPA must “periodically review” this list and, “where appropriate,” revise it to add those air pollutants EPA determines “present, or may present, through inhalation or other routes of exposure, a threat of adverse human health effects ... or adverse environmental effects.” *Id.* § 7412(b)(2).

In Title I, Part C, *i.e.*, the Act’s PSD provisions, Congress directed that PSD requirements apply to “major emitting facilit[ies],” defined to include listed industrial facilities and “any other [stationary] source[s]” that emit above a specified numerical amount of “any air pollutant.” *Id.* § 7479(1). Such facilities’ emissions are to be regulated “as may be necessary ... to prevent significant deterioration of air quality” in geographically-defined air quality control regions. *Id.* § 7471. Part C is directed at protecting ambient air, the air people breathe, from the type of “deleterious pollutants that befoul our nation’s air.” *Alabama Power*, 636 F.2d at 353.

*Massachusetts* addressed whether § 7521(a)(1) “authorizes EPA to regulate [GHG] emissions from new motor vehicles in the event that it forms a ‘judgment’ that such emissions contribute to climate change” that “endanger[s] public health or welfare.” 549 U.S. at 528. No party in *Massachusetts* argued, or had reason to argue, that, if the “air pollutant” definition in § 7602(g) covered GHGs, those substances could not – in conformance with congressional intent – be considered air pollutants under § 7521(a)(1). Thus, after finding the § 7602(g) definition “embraces all airborne compounds of whatever stripe,” *id.* at 529, the Court had no reason to consider a less expansive interpretation in the Title II context, see,

*e.g., id.* at 531 (“EPA has not identified any congressional action that conflicts in any way with the regulation of greenhouse gases from new motor vehicles” or any “extreme” or “counterintuitive” results that would flow from such regulation).

The Court acknowledged that the “Congresses that drafted § [7521(a)(1) in Title II] might not have appreciated the possibility that burning fossil fuels could lead to global warming.” *Id.* at 532. But by authorizing regulation of vehicles’ air pollutant emissions that “endanger,” those Congresses “underst[oo]d that without regulatory flexibility, changing circumstances and scientific developments would soon render the [CAA] obsolete.” *Id.* “The broad language of § [7521(a)(1)],” the Court found, “reflects an intentional effort to confer the flexibility necessary to forestall such obsolescence.” *Id.*

Is the language of the CAA’s PSD and Title V provisions equally “broad,” “reflect[ing]” comparable congressional intent that GHGs be regulated under those programs? No. As explained below, it is clear on the face of the CAA that substances such as GHGs – while they may be air pollutants within the meaning of § 7602(g) – were never intended by Congress to be regulated as air pollutants under the PSD and Title V programs.

**I. GHGs Cannot Be a Pollutant Under the CAA’s PSD and Title V Programs Because Innumerable Small, Non-Industrial Sources Would Be “Major Emitting Facilities” Contrary to Congressional Intent.**

The “broad language” engaged in *Massachusetts* provides that EPA “shall ... prescribe” by regulation “standards applicable to the emission of any air pollutant from *any class or classes of new motor vehicles or new motor vehicle engines*, which ... cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” 42 U.S.C. § 7521(a)(1) (emphasis added). This language finds no corollary in the corresponding provisions of Title I and Title V that identify the emission sources that are subject to PSD and Title V requirements.

The Title II standards apply without qualification where the endangerment criterion is met for “any air pollutant” emitted from “any ... new motor vehicles.” In contrast, Congress provided that the Part C PSD requirements apply not to “any” stationary source but only to those that are “major emitting facilities” – a relatively small number of large industrial sources defined as facilities with actual or potential emissions of “any air pollutant” that equal or exceed 100 tpy (in specifically listed industrial categories) and 250 tpy (for sources in other, unlisted industrial categories).<sup>6</sup> *Id.* § 7479(1).

---

<sup>6</sup> Congress similarly limited Title V major sources to large industrial sources, 42 U.S.C. §§ 7602(j), 7661(2)(B), and the argu-  
(Continued . . .)

In using the term “major emitting facility,” Congress intended “to identify facilities which, due to their size, are financially able to bear the substantial regulatory costs imposed by the PSD provisions and which, as a group, are primarily responsible for emission[s]” that deteriorate ambient air. *Alabama Power*, 636 F.2d at 353. Only such large industrial facilities were to be subject to the Act’s PSD provisions. See JA 453 (“Congress ... designed the thresholds *deliberately* to limit the program’s scope.” (emphasis added)).

If the 250-tpy threshold for “any air pollutant” identified, in Congress’s contemplation, the “large industrial enterprises,” not otherwise listed, to which PSD is to apply, *Alabama Power*, 636 F.2d at 354, it necessarily follows that Congress *never* intended that GHGs be regulated under the PSD program. Myriad small sources, *not* “industrial” in nature, emit GHGs in amounts well above 250 tpy. Regulating GHGs as an “air pollutant” under Part C would drag such sources into the PSD program as “major emitting facilities,” contradicting Congress’s expectation and intent. *Id.* (Congress did not “intend[] to define such obviously minor sources [as a high school heating plant] as ‘major’ for the purposes of the PSD provision.”).

EPA understood this when it promulgated the Tailoring Rule. JA 453 (“Congress intended to limit the PSD program to large industrial sources because

---

ments presented in this section regarding PSD also apply to Title V. See *supra* note 1.

it was those sources that were the primary cause of the pollution problems in question and because those sources would have the resources to comply with the PSD requirements.”); *id.* at 454 (describing PSD provisions’ legislative history and noting “[t]he DC Circuit had occasion, in *Alabama Power*, to acknowledge this legislative history”).

As EPA observed, “Congress intended that PSD be limited to a *relatively small number of large industrial sources*[.]” and it was “not too much to say that applying PSD requirements literally to GHG sources ... would result in a program that *would have been unrecognizable to the Congress that designed PSD.*” *Id.* at 454-55 (emphases added); *id.* at 449 (“the great majority of these new sources [that would be regulated by applying PSD to GHGs] will be small commercial or residential sources,” a result “contrary to congressional intent for the PSD program”); *id.* at 485 (Title V).

Yet, in contravention of congressional intent, EPA promulgated a rule that does “apply[] PSD requirements literally to GHG sources,” *id.* at 454, with a twist – a rule that establishes a 100,000-tpy carbon dioxide equivalent “major source” threshold for GHGs as compared to the 100- and 250-tpy statutory thresholds. And, *curious and curiouser*, EPA “expect[s] to ... lower[] thresholds, as appropriate, in the future,” expanding GHG regulation “one-step-at-a-time,” *id.* at 555, 556-57, by bringing into the PSD program sources EPA concedes Congress never intended be regulated under that program.

EPA contended it was compelled to do this because *Massachusetts* held GHGs were an “air pollu-

tant” under § 7602(g) and because GHGs were “subject to regulation” under Title II as an “endangering” pollutant. The court below agreed. Given “both the statute’s plain language and ... *Massachusetts*,” the D.C. Circuit said, it had “little trouble concluding that the phrase ‘any air pollutant’ includes *all* regulated air pollutants, including [GHGs],” for purposes of PSD and Title V. *Id.* at 237. *Massachusetts*, which did not consider GHG regulation under PSD or Title V, does not support the D.C. Circuit’s conclusion that it had “little trouble” reaching.

In an expansive statute like the CAA, a general definition of a term such as “air pollutant” must be sufficiently capacious to reflect the entire range of substances that might be regulated under any one or more of several diverse programs established by the statute. Thus, § 7602(g) sets the outer bounds of the air pollutants that are potentially eligible for regulation under the various CAA programs; it does not define the precise meaning or delineate the exact scope of that term for each CAA individual program.

Throughout the CAA’s history, EPA has carefully limited Title I programs only to those substances within the § 7602(g) “air pollutant” definition that Congress intended be regulated under each individual program. For example, although § 7411 provides that new source performance standards (NSPS) apply whenever a source undertakes a “physical change ... which increases the amount of *any* air pollutant emitted,” 42 U.S.C. § 7411(a)(4) (emphasis added), EPA by regulation narrowed the universe of air pollutants that trigger NSPS to those “[air] pollutant[s] to which a standard applies” under 40 C.F.R. part 60.

40 C.F.R. § 60.14(a). And although § 7491 defines “major stationary source[s]” to which the CAA visibility protection program applies as sources “with the potential to emit 250 tons or more of *any* pollutant,” 42 U.S.C. § 7491(g)(7) (emphasis added), EPA by regulation limited the pollutants in this program to “visibility impair[ing]” pollutants, see, *e.g.*, 40 C.F.R. pt. 51, app. Y, § III.A.2. And in the rulemaking at issue here, although EPA read *Massachusetts* to compel PSD and Title V regulation of *all* GHGs, EPA limited regulation only to GHGs emitted at or above the 100,000- or 75,000-tpy carbon dioxide equivalent levels. JA 674, 677-78.

EPA’s historic approach of identifying which of the § 7602(g) air pollutants are subject to individual CAA programs not only makes sense, it comports with fundamental principles of statutory construction. “Of necessity, Congress selects different regulatory regimes to address different problems.” *Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527, 2538 (2011). The same term appearing in different statutory programs can (indeed, must) be given different regulatory meanings where congressional intent differs. See *Abbott Labs. v. Young*, 920 F.2d 984, 987 (D.C. Cir. 1990). “A given term in the same statute may take on distinct characters from association with distinct statutory objects calling for different implementation strategies.” *Envtl. Def. v. Duke Energy Corp.*, 549 U.S. 561, 574 (2007).

Here, it is evident in the statutory definition of “major emitting facility” that Congress did not intend that GHGs be an “air pollutant” under the PSD program. Accordingly, it is of no moment that GHGs are

regulated under the Title II motor vehicle program. That regulatory action, under that program, could not trigger PSD permitting requirements for tens of thousands (and Title V requirements for millions) of small, non-industrial stationary sources under programs that cover only a very limited number of large industrial facilities. EPA acted unlawfully in promulgating rules that are predicated on that misunderstanding of the Act.

**II. Congress Intended that Only “Air Pollutants” that Deteriorate Ambient Air Quality Be Regulated Under the PSD Program.**

The broad language of § 7521(a)(1) that the Court in *Massachusetts* read as “reflect[ing] an intentional effort” by Congress to bestow “flexibility” on EPA to regulate GHGs, 549 U.S. at 532, was language calling for standards that limit emissions that “endanger public health or welfare.” The Act’s PSD provisions, in contrast, contain no directive to, or authorization for, EPA to regulate emissions that “endanger public health or welfare.” Rather, the PSD provisions require EPA to adopt regulations to implement a program focused exclusively on “air pollutants” that deteriorate ambient air quality – *i.e.*, the air people breathe – in specific, geographic air quality control areas or “region[s].” 42 U.S.C. § 7471; see *id.* §§ 7407(a), (d), 7475, 7479(1).

As discussed above, the global effects of carbon dioxide are not effects caused by carbon dioxide deteriorating ambient air quality in the geographic areas PSD is directed at protecting. To the contrary, from the perspective of the quality of the ambient air, carbon dioxide is effectively indistinguishable from ni-

trogen and oxygen. See *supra* pp. 2-3. Regulation of carbon dioxide as an “air pollutant” under the PSD program, therefore, is contrary to congressional intent and thus unlawful. Cf. 73 Fed. Reg. 44,354, 44,408 (July 30, 2008) (“The global nature and effect of GHG emissions raise questions regarding the suitability of CAA provisions [like PSD] that are designed to protect local and regional air quality....”).

Under § 7471, “each applicable [SIP] shall contain emission limitations and such other measures as may be necessary ... to prevent significant deterioration of *air quality* in each” of the areas within a state designated pursuant to § 7407. 42 U.S.C. § 7471 (emphasis added). Further, § 7475(e) directs EPA to promulgate regulations governing an analysis, based on air quality monitoring information, of the impacts on “ambient air quality at the *proposed site* and in *areas which may be affected* by emissions from” a proposed new facility with respect to “*each pollutant subject to regulation* under [the Act] which will be emitted from such facility.” *Id.* § 7475(e)(1) (emphases added).

In § 7475(e), Congress expressly directs that the PSD preconstruction analysis be based on “continuous air quality monitoring” to ascertain expected effects, both at the proposed facility site and “in areas which may be affected by emissions ... [of] each pollutant subject to regulation under [the Act]” that the facility will emit. *Id.* § 7475(e)(1), (2). The “continuous ... monitoring” of ambient concentrations of carbon dioxide in the vicinity of a proposed source will reveal concentrations indistinguishable from ambient levels elsewhere, thus providing no meaningful information on ambient air quality that might be dete-

riorated by that source's emissions. Exclusion of carbon dioxide from the "pollutants" covered by the PSD program follows, therefore, from the very nature of the air quality analysis Congress required under that program for "pollutant[s] subject to regulation."

Any other conclusion would mean the statute demands an absurd result. If "each pollutant subject to regulation" includes GHGs, then the global nature of GHG emissions would require, under § 7475(e), a permit applicant to evaluate every area in the United States – Hawaii and Alaska included.<sup>7</sup> In other words, § 7475(e) would have to be construed to require each proposed major emitting facility first to collect meaningless "continuous [GHG] air quality monitoring data" for every designated area because every area "may be affected by emissions from such facility." *Id.* § 7475(e)(1), (2). Then, this meaningless data would go into the analysis required for each designated area in the nation. The results of this exercise would be wholly useless. As EPA has acknowledged, "because GHG emissions from single sources are small relative to aggregate emissions, and GHGs, once emitted from a given source, become well mixed in the global atmosphere," there are no "tools ... for evaluating or quantifying end-point impacts attributable to the emissions of GHGs from a single source."<sup>8</sup>

---

<sup>7</sup> The entire land mass of the United States has been divided into areas that have been designated under § 7407. 40 C.F.R. §§ 81.11-81.356.

<sup>8</sup> Letter from R.J. Meyers, EPA, to H.D. Hall, U.S. Fish and Wildlife Service, & J. Lecky, National Marine Fisheries Service, at 4 (Oct. 3, 2008), *available at* <http://www.regulations.gov/#!documentDetail;D=EPA-HQ-OAR-2009-0472-11543>.

Yet, the entire *point* of PSD preconstruction analysis is to “evaluat[e] ... end-point impacts attributable to the emissions ... from a single source.”

Furthermore, under § 7475(a)(4), a proposed “major emitting facility” must be “subject to [BACT] for each pollutant subject to regulation under [the CAA which is] emitted from, or which results from, such facility.” As with the § 7475(e) use of “each pollutant subject to regulation,” that term in § 7475(a)(4) must be read to refer *only* to those pollutants that deteriorate ambient air quality. See, *e.g.*, *Erlenbaugh v. United States*, 409 U.S. 239, 243 (1972) (“a legislative body generally uses a particular word with a consistent meaning in a given context”). Giving the same term in the same section of the statute a reading that would include only pollutants that deteriorate ambient air quality comports with congressional intent, as the *Alabama Power* court found. 636 F.2d at 406-07 n.81 (The BACT requirement in § 7475(a)(4) covers more than criteria pollutants “in order to minimize potential deterioration.”) (quoting legislative history).

In short, Congress made clear on the face of the PSD program’s provisions that that program is directed *not* to regulation of emissions of air pollutants that may endanger public health or welfare due to their uniform presence throughout the global atmosphere. Rather, that program is to provide for such regulation “as may be necessary ... to prevent significant deterioration” of the quality of the air that people breathe (*i.e.*, ambient air) in defined geographic areas affected by new emissions. 42 U.S.C. § 7471.

The court below, addressing none of this, instead relied heavily on the “Congressional declaration of purpose” for the PSD sections that “provides, in relevant part, that ‘[t]he purposes of this part are ... to protect public health and welfare from any actual or potential adverse effect which in the [EPA] Administrator’s judgment may reasonably be anticipated to occur from air pollution.’” JA 240 (ellipsis in original) (quoting 42 U.S.C. § 7470(1)). Because the CAA “provides that ‘[a]ll language referring to effects on welfare includes ... effects on ... weather ... and climate,’” it must follow, according to the court, that “one express purpose of the [PSD] program is to protect against the harms caused by greenhouse gases.” *Id.* (first ellipsis added) (quoting 42 U.S.C. § 7602(h)).

But this does not follow at all. Much as the Act provides an expansive general definition of “air pollutant” to embrace, but not to define the scope of, a range of programs, the Act defines “effects on welfare” broadly to be able to serve various programs within the Act addressing different kinds of pollution problems. That “effects on welfare” includes “weather” and “climate” effects does not mean *the PSD program* can be viewed as one that must address pollutants contributing to global “climate” impacts. As the PSD provisions show, welfare effects in the PSD program must be construed to refer to effects caused by air pollutants that deteriorate the quality of the air people breathe. Accordingly, the PSD programmatic provisions may, consistent with the PSD purposes section, address effects on “weather” and “climate” such as smog – a local or regional fog-like meteorolog-

ical condition produced through photochemical transformation of pollutants in the ambient air.<sup>9</sup> See Christa McAuliffe Planetarium, *The Straight Line on Bad Ozone*, at 1 (undated), *available at* [www.starhop.com/library/pdf/studyguide/high/Ozone-21.pdf](http://www.starhop.com/library/pdf/studyguide/high/Ozone-21.pdf). The PSD purposes section cannot be used to stretch those programmatic provisions to cover global climate effects when it is a program established to address local and regional pollution.<sup>10</sup>

\* \* \*

As discussed above, the statutory definition of “major emitting facility,” by its terms, identifies a source that emits above certain specified amounts of “any air pollutant.” The court below, after observing

---

<sup>9</sup> Only in the past two decades or so did references to “climate” and “weather” come to suggest anything more than regional meteorological conditions. Those terms were included in the definition of “effects on welfare” when the Act was amended in 1970 and first appeared in 1967 in a provision addressing sustained weather patterns in particular regions of the United States. Pub. L. No. 90-148, § 2, 81 Stat. 485, 490 (1967) (directing Secretary of Health, Education, and Welfare to “define,” for the Act’s purposes, “atmospheric areas of the Nation on the basis of those conditions, including ... climate, meteorology, and topography, which affect the interchange and diffusion of pollutants in the atmosphere”); Pub. L. No. 91-604, § 15(a)(1), 84 Stat. 1676, 1710 (1970).

<sup>10</sup> A reference to “climate,” like a reference to “endangerment,” does not resolve whether the reference is to local, regional, or global effects. For example, in § 7603 (“Emergency powers”), the term “endangerment” refers to acute, local threats, while in § 7521 (“Emission standards for new motor vehicles or new motor vehicle engines”), “endangerment” may cover everything from local to global effects.

that “the literal statutory definition” of “major emitting facility” “nowhere requires that ‘any air pollutant’ be a *regulated* pollutant,” opined that “‘any regulated air pollutant’ is the only logical reading of the statute.” JA 237. According to the court:

[I]f “any air pollutant” ... was read to encompass ... nonregulated air pollutants, sources could ... be subjected to PSD permitting requirements – if they emitted 100/250 tpy of a “physical, chemical, [or] biological” substance EPA had determined was harmless. It is absurd to think that Congress intended to subject stationary sources to the PSD permitting requirements due to emissions of substances that do not “*endanger public health or welfare.*”

*Id.* at 238 (quoting 42 U.S.C. § 7521(a)(1)) (emphasis added).

So much confusion encapsulated in so few words: This tortured statutory analysis reflects the critical flaw in the reasoning of the court below. Congress indeed did not intend that the stationary source thresholds be used to subject to PSD emissions determined to be “harmless.” It intended those thresholds to define a limited population of large industrial facilities. Congress also did not intend that pollutants regulated under the PSD program would include every “air pollutant” that “endanger[s] public health or welfare” but would not *deteriorate ambient air quality* – the sole focus and congressionally sanctioned purpose of regulation under Title I, Part C.

GHGs such as carbon dioxide are, as this Court concluded, air pollutants under § 7602(g)'s general definition. They may be "air pollutants" that EPA found to "endanger public health or welfare" under Title II. But they are not – and EPA does not dispute that they are not – "air pollutants" that deteriorate ambient air quality, and it is the "deterioration" of ambient air quality – not "endangerment" – that is the criterion for regulating a substance under PSD. Consequently, EPA's interpretation that, under the CAA's terms, regulation of motor vehicle GHG emissions under Title II compelled the application of Title I PSD permitting requirements to stationary sources' GHG emissions is an impermissible construction of the Act.

### CONCLUSION

The judgment should be reversed and the case remanded for the court of appeals to grant the Utility Air Regulatory Group's petitions for review and to set aside EPA's determination that GHG emissions are regulated under the PSD and Title V programs.

**QUESTION PRESENTED**

Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.

**RULE 24.1(b) STATEMENT**

Petitioners in Case No. 12-1272 are the Chamber of Commerce of the United States of America, State of Alaska, and American Farm Bureau Federation. The Chamber of Commerce of the United States of America was petitioner or petitioner-intervenor as to all of the challenged agency actions addressed by the consolidated judgment below. The State of Alaska and the American Farm Bureau Federation were petitioners and/or petitioner-intervenors in cases addressed by the consolidated judgment below.

This case has been consolidated with Case Nos. 12-1146, 12-1248, 12-1254, 12-1268, and 12-1269, which arise out of the same proceedings in the court of appeals. Petitioners in those cases are: Utility Air Regulatory Group (*No. 12-1146*); American Chemistry Council; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Iron and Steel Institute; American Petroleum Institute; Brick Industry Association; Clean Air Implementation Project; Corn Refiners Association; Glass Association of North America; Independent Petroleum Association of America; Indiana Cast Metals Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Home Builders; The National Association of Manufacturers; National Federation of Independent Business; National Oilseed Processors Association; North American Die Casting Association; Portland Cement Association; Specialty Steel Industry of North America; Tennessee Chamber of Commerce and Industry; Western States Petroleum Association; West Virginia Manufacturers Association; Wisconsin

iii

Manufacturers and Commerce (*No. 12-1248*); Energy-Intensive Manufacturers' Working Group on Greenhouse Gas Regulation and Glass Packaging Institute (*No. 12-1254*); Southeastern Legal Foundation, Inc.; U.S. Representative Michele Bachmann; U.S. Representative Joe Barton; U.S. Representative Marsha Blackburn; U.S. Representative Kevin Brady; U.S. Representative Paul Broun; U.S. Representative Phil Gingrey; U.S. Representative Steve King; U.S. Representative Jack Kingston; U.S. Representative Tom Price; U.S. Representative Dana Rohrabacher; U.S. Representative John Shimkus; U.S. Representative Lynn Westmoreland; The Langdale Company; Langdale Forest Products Company; Langdale Timber Company; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet, Inc.; Langdale Ford Company; Langboard, Inc. – MDF; Langboard, Inc. – OSB; Georgia Motor Trucking Association, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Kennesaw Transportation, Inc.; J&M Tank Lines, Inc.; Southeast Trailer Mart, Inc.; Georgia Agribusiness Council, Inc.; Competitive Enterprise Institute; FreedomWorks; and Science and Environmental Policy Project (*No. 12-1268*); and the States of Texas, Alabama, Florida, Georgia, Indiana, Louisiana, Michigan, Nebraska, North Dakota, Oklahoma, South Carolina, and South Dakota, and the Louisiana Department of Environmental Quality (*No. 12-1269*).

Respondents herein, who were also respondents in the cases below, are the Environmental Protection Agency and the Administrator of the Environmental Protection Agency. Lisa P. Jackson held the office of

Administrator until February 15, 2013. Gina McCarthy currently holds that office.

Other parties who were petitioners in the cases addressed by the consolidated judgment below are the following: Greg Abbott, Attorney General of Texas; Alpha Natural Resources, Inc.; Haley Barbour, Governor of the State of Mississippi; Coalition for Responsible Regulation, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Commonwealth of Virginia; Georgia Agribusiness Council, Inc.; Georgia Coalition for Sound Environmental Policy, Inc.; Georgia Motor Trucking Association, Inc.; Gerdau Ameristeel US Inc.; Great Northern Project Development, L.P.; Industrial Minerals Association—North America; J&M Tank Lines, Inc.; Kennesaw Transportation, Inc.; Landmark Legal Foundation; Mark R. Levin; Louisiana Department of Environmental Quality; Missouri Joint Municipal Electric Utility Commission; National Cattlemen's Beef Association; National Environmental Development Association's Clean Air Project; National Mining Association; Ohio Coal Association; Pacific Legal Foundation; Peabody Energy Company; Rick Perry, Governor of Texas; Rosebud Mining Co.; South Carolina Public Service Authority; Texas Agriculture Commission; Texas Commission on Environmental Quality; Texas General Land Office; Texas Public Utilities Commission; and Texas Railroad Commission.

Intervenors for petitioners in cases addressed by the consolidated judgment below—other than petitioners herein—include Alpha Natural Resources, Inc.; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Arkansas State Chamber of

v

Commerce; Associated Industries of Arkansas; Brick Industry Association; Coalition for Responsible Regulation, Inc.; Colorado Association of Commerce & Industry; Commonwealth of Kentucky; Corn Refiners Association; Glass Association of North America; Governor of Mississippi Haley Barbour; Great Northern Project Development, L.P.; Idaho Association of Commerce and Industry; Independent Petroleum Association of America; Indiana Cast Metals Association; Industrial Minerals Association North America; Kansas Chamber of Commerce and Industry; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet-Pontiac, Inc; Langdale Ford Company; Langboard, Inc.–MDF; Langboard, Inc.–OSB; Louisiana Department of Environmental Quality; Louisiana Oil and Gas Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Manufacturers; National Association of Home Builders; National Cattlemen’s Beef Association; National Electrical Manufacturers Association; National Environmental Development Association’s Clean Air Project; National Federation of Independent Business; National Mining Association; National Oilseed Processors Association; Nebraska Chamber of Commerce and Industry; North American Die Casting Association; Ohio Coal Association; Ohio Manufacturers Association; Peabody Energy Company; Pennsylvania Manufacturers Association; Portland Cement Association; Rosebud Mining Company; South Coast Air Quality Management District; Specialty Steel Industry of North America; Steel Manufacturers Association; Tennessee Chamber of Commerce and Industry; Utility Air Regulatory Group; Virginia Manufacturers Association; Western States

Petroleum Association; West Virginia Manufacturers Association; and Wisconsin Manufacturers & Commerce.

Intervenors for in cases addressed by the consolidated judgment below include Alliance of Automobile Manufacturers; Association of Global Automakers; Center for Biological Diversity; City of New York; Commonwealth of Massachusetts; Conservation Law Foundation; Environmental Defense Fund; Georgia ForestWatch; Global Automakers; Indiana Wildlife Federation; Michigan Environmental Council; Natural Resources Council of Maine; Natural Resources Defense Council; National Wildlife Federation; Ohio Environmental Council; Pennsylvania Department of Environmental Protection; Sierra Club; South Coast Air Quality Management District; State of California; State of Connecticut; State of Delaware; State of Illinois; State of Iowa; State of Maine; State of Maryland; State of Minnesota; State of New Hampshire; State of New Mexico; State of New York; State of North Carolina; State of Oregon; State of Rhode Island; State of Vermont; State of Washington; Wetlands Watch; and Wild Virginia.

## INTRODUCTION

This case is about the Environmental Protection Agency's determination to regulate greenhouse gas (GHG) emissions under the Clean Air Act (CAA) no matter how much the agency had to distort and even rewrite statutory provisions to do so. In fact, EPA conceded in the rulemaking and in this litigation that extending the CAA's Prevention of Significant Deterioration (PSD) program to cover GHGs produces "absurd" results that Congress never intended. Nonetheless, misreading *Massachusetts v. EPA*, 549 U.S. 497 (2007), EPA pressed ahead and promulgated what may be the costliest, most intrusive regulatory program the nation has yet seen. But *Massachusetts* did not address stationary sources in general or the PSD program in particular and hence could not have authorized the rules EPA promulgated below.

The PSD program requires permits to build new facilities or refurbish old ones. The text, structure, purposes, and history of the program show it was designed to apply to emissions of conventional pollutants like lead and carbon monoxide—pollutants that concentrate in local areas and affect health and welfare via direct exposures, such as through inhalation or ingestion. The statutory PSD apparatus simply does not work when applied to substances like GHGs that disperse globally and produce harms unrelated to pollutant exposures. Indeed, EPA's own statements, both in the rulemakings below and subsequent regulatory guidance, make clear that PSD controls can be applied to GHGs only by nullifying many of the program's key statutory elements.

Congress, for instance, set the PSD program's coverage provisions so that its cumbersome and

expensive permitting requirements would apply exclusively to large sources of conventional pollution, like steel mills and power plants. As applied to GHGs, however, the coverage provisions sweep in very small sources, like churches, bakeries, even large private homes. By EPA's admission, Congress never intended such a thing. Nonetheless, the agency plunged ahead and extended the program to encompass GHG emissions.

To justify this programmatic mismatch, EPA deployed the "absurd results" canon and claimed authority to rewrite the statute's numerical provisions defining which pollution sources are subject to PSD requirements. But that is not how the absurdity doctrine works. Once it recognized that the PSD program produced absurd results if extended to include GHGs, EPA should have drawn the obvious conclusion—GHGs are not the type of "pollutant" to which PSD applies. Because EPA overstepped the bounds of its authority, the Court should reverse the D.C. Circuit decision below.

### **OPINIONS AND ORDERS BELOW**

The opinion of the D.C. Circuit is reported at 684 F.3d 102 and reproduced in the Joint Appendix at 191-267. The order denying rehearing en banc is available at 2012 WL 6621785 and reproduced in the Joint Appendix at 139-190.

### **JURISDICTION**

The court of appeals rendered its decision on June 26, 2012, and denied petitions for rehearing on December 20, 2012. On October 15, 2013, the Court granted six petitions for writs of certiorari. This Court has jurisdiction under 28 U.S.C. § 1254(1).

## STATUTORY PROVISIONS

Relevant statutes are reproduced in the Statutory Addendum.

## STATEMENT OF THE CASE

In construing the Clean Air Act to justify these regulations, EPA reached an interpretive endpoint that, in its words, is “so contrary to what Congress had in mind—and that in fact so undermines what Congress attempted to accomplish” that the statute’s language should not be followed. Proposed Tailoring Rule, 74 Fed. Reg. 55,292, 55,310 (Oct. 27, 2009). EPA recognized that, under its interpretation, PSD permitting requirements designed for utility and heavy industrial sources would now apply to millions of smaller facilities, including multi-family dwellings and even some large private homes. See *id.* at 55,338.

When faced with the extreme measures and absurd results caused by its preferred policy, EPA rewrote the tons-per-year (tpy) emissions thresholds defining which sources are subject to PSD permitting. As Judges Kavanaugh and Brown observed in separate dissents from the denial of rehearing en banc, this “is not the proper way to interpret a statute.” JA174 (Kavanaugh, J., dissenting); see also JA156-57 (Brown, J., dissenting). “Instead of ‘reading new words into the statute’ to avoid absurd results ... the statute should be interpreted so that ‘no absurdity arises in the first place.’” JA174 (Kavanaugh, J., dissenting) (quoting *Kloeckner v. Solis*, 133 S. Ct. 596, 606-07 (2012)).

1. The Clean Air Act is organized into six titles, none of which expressly addresses controls on GHG emissions or prevention of global climate change:

“Air Pollution Prevention and Control” (Title I, 42 U.S.C. §§ 7401-7515); “Emission Standards for Moving Sources” (Title II, 42 U.S.C. §§ 7521-7590); “General Provisions” (Title III, 42 U.S.C. §§ 7601-7627); “Acid Deposition Control” (Title IV, 42 U.S.C. §§ 7651-7651o); “Permits” (Title V, 42 U.S.C. §§ 7661-7661f); and “Stratospheric Ozone Protection” (Title VI, 42 U.S.C. §§ 7671-7671q); see also 68 Fed. Reg. 52,922, 52,925-29 (Sept. 8, 2003) (JA1341-63) (EPA overview of legislative history as it relates to GHGs). Section 103(g) does mention the most prevalent GHG, carbon dioxide. 42 U.S.C. § 7403(g). Section 103(g) authorizes “nonregulatory strategies and technologies,” and it specifically forbids its use “to authorize the imposition on any person of air pollution control requirements.” *Id.* Neither GHGs in general nor carbon dioxide in particular are mentioned in the Act’s PSD provisions.

GHGs differ in kind from conventional pollutants. See 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,399-401 (JA1083-95). Their concentrations and effects are global in character, in contrast to conventional pollutants, which concentrate in particular areas or regions. See 74 Fed. Reg. at 66,517 (JA871-72); 73 Fed. Reg. at 44,399-401 (JA1083-95). Unlike conventional pollutants, GHGs do not affect health and welfare through direct exposures, such as through inhalation or ingestion. See 74 Fed. Reg. 18,886, 18,901 (Apr. 24, 2009) (Proposed Endangerment Rule) (“[A]mbient concentrations of carbon dioxide and the other greenhouse gases, whether at current levels or at projected ambient levels ... do not cause direct adverse health effects such as respiratory or toxic effects.”); EPA, *Technical Support Document for Final Endangerment Rule*, Regulatory Docket ID No. EPA-

HQ-OAR-2009-0171-11645, at 21 (Dec. 7, 2009) (available at [http://www.epa.gov/climatechange/Downloads/endangerment/Endangerment\\_TSD.pdf](http://www.epa.gov/climatechange/Downloads/endangerment/Endangerment_TSD.pdf)) (similar). And GHGs, particularly carbon dioxide, are emitted in much greater amounts than conventional pollutants, see 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,407, and from many more sources—including humans. See 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,376 (JA1041).

The issue of potentially regulating GHGs under the CAA initially arose under the Act's Title II, which focuses on emissions from mobile sources. See 68 Fed. Reg. at 52,922 (JA1332). This issue eventually reached the Court in *Massachusetts*, which held that GHGs are “air pollutants” for purposes of the Act-wide definition in Section 302(g), without addressing the Act's stationary-source provisions. In reaching this conclusion, *Massachusetts* distinguished *FDA v. Brown & Williamson Corp.*, 529 U.S. 120 (2000), reasoning that a ruling favoring the *Massachusetts* petitioners would not “lead to ... extreme measures.” 549 U.S. at 531.

In the proceedings on remand from *Massachusetts*, EPA regulated GHG emissions from new motor vehicles and went on to claim authority to regulate GHG emissions from stationary sources.

**2.** Two programs for regulating stationary-source GHG emissions are at issue in this case: Prevention of Significant Deterioration (PSD) of Title I, part C of the CAA (42 U.S.C. §§ 7470 et seq.), and the permitting provisions of Title V (42 U.S.C. §§ 7661 et seq.). Both programs impose permitting requirements on “major” emitting facilities—stationary sources with the potential to emit specific threshold amounts of “any air pollutant.”

The PSD program forbids the construction of “major emitting facilit[ies]” unless a permit is obtained from a state or federal permitting authority and a series of requirements are met. For purposes of the PSD program, “major emitting facility” means stationary sources that “emit, or have the potential to emit” either 100 tpy or 250 tpy of “any air pollutant.” 42 U.S.C. § 7479(1). Twenty-eight enumerated categories of industrial sources—for example, “iron and steel mill plants” and “primary lead smelters”—qualify as “major emitting facilities” if they have the potential to emit over 100 tpy of “any air pollutant.” *Id.* All other stationary sources qualify if they have potential to emit over 250 tpy of “any air pollutant.” *Id.*

Title V requires stationary sources to obtain state-issued operating permits to establish compliance with the PSD requirements, among others, if they have the potential to emit at least 100 tpy of “any air pollutant.” *Id.* § 7602(j).

3. The PSD program is closely related to maintenance of national ambient air quality standards (NAAQS). Under the NAAQS program, EPA designates certain pollutants as “criteria” pollutants and sets maximum allowable concentrations for regions throughout the nation. 42 U.S.C. §§ 7407, 7409. EPA thus far has designated only six substances as criteria pollutants—carbon monoxide, lead, nitrogen dioxide, ozone, particle pollution, and sulfur dioxide. All six harm human health and welfare through direct exposure by inhalation, ingestion, and the like; none is a greenhouse gas. See 40 C.F.R. pt. 50; 75 Fed. Reg. at 31,520 (JA298) (“There is no NAAQS for CO<sub>2</sub>.”); EPA, *National Ambient Air Quality Standards (NAAQS)*,

at <http://www.epa.gov/air/criteria.html> (Dec. 14, 2012); EPA, *What Are the Six Common Air Pollutants?*, at <http://www.epa.gov/air/urbanair/> (Apr. 20, 2012); see also EPA, *Health*, at <http://www.epa.gov/airquality/carbonmonoxide/health.html> (last visited Dec. 6, 2013) (describing exposure-related effects of carbon monoxide); EPA, *Health*, at <http://www.epa.gov/airquality/lead/health.html> (last visited Dec. 6, 2013) (same for lead). By contrast, carbon dioxide, the most ubiquitous greenhouse gas, see, e.g., 73 Fed. Reg. at 44,429, does not harm human health or welfare through direct exposure. See 74 Fed. Reg. at 18,901. People and animals exhale carbon dioxide when they breathe, and plants need carbon dioxide to live. See 73 Fed. Reg. at 44,376 (JA1047).

To ensure compliance with the NAAQS, EPA must determine whether a region is in “attainment” (the NAAQS is met), “nonattainment” (the NAAQS remains unmet), or “unclassifiable” (EPA cannot determine whether the NAAQS is met). 42 U.S.C. § 7407(d)(1)(A). The PSD program applies to areas that are in “attainment” or are “unclassifiable,” *id.* § 7471, and requires permits before major emitting facilities are built or modified in those regions, *id.* § 7475(a). To obtain a permit, a regulated facility must, among other things, install the “best available control technology [BACT] for each pollutant subject to regulation under [the CAA].” *Id.* § 7475(a)(4).

4. On remand from *Massachusetts*, EPA opened a single regulatory docket in July 2008, and issued an Advance Notice of Proposed Rulemaking (ANPR) to address GHG emissions from all sources, including both mobile and stationary sources. See 73 Fed. Reg. 44,354, 44,355 (July 30, 2008) (JA975, JA979-80).

The ANPR flagged the prospect that application of the PSD and Title V programs to carbon emissions would lead to “absurd” results. 73 Fed. Reg. at 44,503 (JA1272-73), 44,512 (JA1311-12).

In a preface to the ANPR, the EPA Administrator observed that it had “become clear” that EPA regulation of GHGs from motor vehicles under section 202(a)(1) could trigger “regulation of smaller stationary sources that also emit GHGs—such as apartment buildings, large homes, schools, and hospitals,” resulting in “an unprecedented expansion of EPA authority that would have a profound effect on virtually every sector of the economy and touch every household in the land.” 73 Fed. Reg. at 44,355 (JA979). The Administrator found that the CAA was “ill-suited for the task of regulating global greenhouse gases.” *Id.* (JA980).

Other federal agencies reinforced EPA’s concerns about absurd consequences. The Department of Energy expressed concern about “an enormously elaborate, complex, burdensome and expensive regulatory regime that would not be assured of significantly mitigating global atmospheric GHG concentrations and global climate change.” *Id.* at 44,365 (JA1004). The Department of Transportation was wary “that attempting to regulate [GHGs] under the [CAA] will harm the U.S. economy while failing to actually reduce global emissions.” *Id.* at 44,362 (JA988). And the Department of Commerce expressed concerns that GHG emission controls “would impose significant costs on U.S. workers, consumers, and producers and harm U.S. competitiveness without necessarily producing meaningful reductions in global GHG emissions.” *Id.* at 44,371 (JA1029).

Departing from the ANPR's single-docket approach, on April 17, 2009, EPA issued a standalone Proposed Endangerment Ruling as to six GHGs, 74 Fed. Reg. 18,886, including the four at issue in *Massachusetts* plus two others that are emitted only by stationary sources. This proposal was soon followed by a final rule, 74 Fed. Reg. 66,496 (Dec. 15, 2009) (JA793), that was followed in rapid succession by three more final rules, the so-called "Timing Rule" or "Triggering Rule," 75 Fed. Reg. 17,004 (Apr. 2, 2010) (JA705), the "Tailpipe Rule," 75 Fed. Reg. 25,324 (May 7, 2010) (JA683), and the "Tailoring Rule," 75 Fed. Reg. 31,514 (June 3, 2010) (JA268).

EPA determined in the Triggering Rule that once it had regulated GHG emissions from motor vehicles, it also had to regulate GHG emissions from stationary sources under the PSD program. EPA declared that "once EPA has determined to regulate a pollutant in some form under the Act and such regulation is operative on the regulated activity, the terms of the Act make clear that the PSD program is automatically applicable." 75 Fed. Reg. at 17,020 (April 2, 2010) (JA778). EPA did likewise for the Title V program. See *id.* at 17,023 (JA788). Further, EPA stated that "[u]nder the current interpretation of the PSD applicability provision, EPA's recent promulgation" of regulations governing GHG emissions from new motor vehicles "will trigger the applicability of PSD for GHG sources at the 100/250 tpy threshold levels as of January 2, 2011." 75 Fed. Reg. at 31,554 (JA449).

In applying the PSD coverage provisions to GHGs, EPA rejected the broadest meaning of "air pollutant" and restricted the term to encompass only "*regulated* air pollutants." Hence, according to EPA,

the PSD and Title V programs would be triggered for stationary sources as of the day that controls mandated by the Tailpipe Rule took effect. See 75 Fed. Reg. 17,004 (JA705). EPA rejected commenters' suggestions that it read "any air pollutant" restrictively to exclude GHGs and include only regulated conventional air pollutants. See *EPA's Response to Public Comments*, Regulatory Docket ID No. EPA-HQ-OAR-2009-0597-0128, at 147 (Mar. 29, 2010) ("Nine industry and commerce commenters ... suggest that EPA clarify in the PSD Interpretive Memo that the term 'Pollutants Subject to Regulation' exclude GHGs.").

5. In the "Tailoring Rule," EPA again acknowledged that applying the PSD and Title V programs to GHGs would produce effects so extreme as to be "absurd." 75 Fed. Reg. at 31,596 (JA631-32), 74 Fed. Reg. 55,292, 55,306-11 (Oct. 27, 2009). In EPA's words, "[a]pplying the PSD thresholds to sources of GHG emissions literally results in a PSD program that is so contrary to what Congress had in mind—and that in fact so undermines what Congress attempted to accomplish with the PSD requirements—that it should be avoided under the 'absurd results' doctrine." *Id.* at 55,310. In 2009, the PSD program applied to only 280 stationary sources, while Title V reached 14,700 sources—primarily large industrial facilities and power plants. 74 Fed. Reg. at 55,301, 55,302. But because GHGs, especially carbon dioxide, are emitted in far greater amounts, and from many more sources than all other "air pollutants" previously regulated, applying PSD to GHGs would mean that the program would apply to "41,000 new and modified facilities per year," *id.* at 55,301, while the Title V program would apply, for the first time, to "more than six million sources of GHGs," *id.* at

55,302. Not only would such regulation add untold billions in compliance costs and permitting expenses, EPA concluded it could produce permitting delays of up to ten years. See 75 Fed. Reg. at 31,563-64 (JA485-94).

Confronted with the conundrum of how to address absurd results flowing from its preferred policy, EPA rewrote the numerical coverage thresholds set by Congress instead of construing the statute to exclude GHGs from the PSD program. In particular, EPA temporarily exempted some but not all emitters of some but not all pollutants that the statutory text, as construed by the agency, would otherwise cover. See 75 Fed. Reg. at 31,514 (JA268). While Congress determined that the PSD and Title V programs would apply to facilities discharging more than 100/250 tpy, the agency mandated that, to fit the programs to GHGs, they would apply only to sources emitting GHGs in amounts more than 75,000 or 100,000 tpy—two EPA-created thresholds. *Id.*; see also *id.* at 31,516, 31,533 (JA281-82, JA355).

EPA asserted authority to ratchet down the agency-created thresholds over time on grounds it claimed were both “intertwined” with and “independent” of the absurdity doctrine. *Id.* at 31,514 (JA391). Specifically, EPA relied on an “administrative necessity” doctrine, which it contended allows an agency to decline to “follow the literal requirements” of a statute that “is impossible for the agency to administer.” *Id.* at 31,543-44 (JA401-02). And EPA relied on a newly invented doctrine that it contended confers expansive agency authority to “implement statutory mandates one step at a time.” *Id.* at 31,544 (JA403). In this fashion, EPA claimed discretion to regulate more parties by

further changing the coverage thresholds in future years.

6. More than seventy business groups, public policy groups, and States challenged EPA's rulemakings. In a *per curiam* opinion, a D.C. Circuit panel rejected these challenges and held that EPA's reasoning in support of the decision to "trigger" the PSD program had appropriately led the agency to deviate from "the literal statutory definition of air pollutant." JA237.

The panel denied rehearing, and the court denied rehearing en banc, with Judge Kavanaugh and Judge Brown dissenting separately. Both Judge Brown and Judge Kavanaugh viewed skeptically EPA's response to the acknowledged "absurd results" of its interpretation, deeming it a kind of "abuse" used "to preempt legislative prerogatives." JA158-59 (Brown, J., dissenting); see also JA189-90 (Kavanaugh, J., dissenting). Judge Kavanaugh noted that "an unusual twist" in this case is that "EPA openly acknowledged unreasonableness—indeed, the absurdity—caused by its interpretation of the statute." JA173. Yet, "EPA surprisingly did not choose the seemingly obvious option" of revisiting its construction of "any air pollutant" and adopting a narrower construction that would eliminate the absurdity. *Id.* In Judge Kavanaugh's view, EPA's absurdity-causing interpretation of "any air pollutant" is "the most critical point in this case," even though the panel failed to address it. JA187. According to Judge Kavanaugh, "EPA chose an admittedly absurd reading over a perfectly natural reading of the relevant statutory text. An agency cannot do that." JA187. Judge Brown separately emphasized that "[a]lthough the *Massachusetts* Court

distinguished *Brown & Williamson*, it did so only in the context of tailpipe emissions. Its reasoning did not extend to Title V and the PSD program.” JA163. “Congress simply did not intend for EPA to convert the ‘Clean Air Act’ to the ‘Warm Air Act’ writ large.” JA166.

7. Nine petitions for certiorari followed, six of which the Court granted.

### SUMMARY OF THE ARGUMENT

Through the so-called “Triggering Rule,” EPA expanded the PSD program’s ambit to encompass millions of new stationary sources, all the way down to neighborhood restaurants and even some homes. But by EPA’s own admission, the fit between the PSD program and GHG regulation is so poor as to produce absurd results, which EPA decided to address through statutory “tailoring.” Surely, the fact EPA needed to perform such a thing as statutory “tailoring” should have set off alarms that its interpretive enterprise had badly gone awry.

Regardless of how the Clean Air Act’s mobile-source provisions might work, the Act’s PSD provisions, properly construed, cannot and do not work if extended to encompass GHGs. Indeed, the only way to shoehorn GHGs into the PSD program is by nullifying many core statutory requirements. (See Section I, *infra*.) Moreover, even if EPA’s statute-nullifying PSD interpretation were the only one available (which it is not), proper application of the absurdity doctrine would still compel the conclusion that PSD regulation of GHGs falls beyond EPA’s statutory authority. (See Section II, *infra*.)

## ARGUMENT

EPA offered various justifications for rewriting the PSD program's emission thresholds while it dramatically expanded its regulatory authority. But the occasion for rewriting statutory provisions would never have arisen if the agency had properly construed the PSD provisions and properly applied the absurdity doctrine. Moreover, if the Court holds the PSD program cannot extend to GHGs, then by the same reasoning Title V cannot extend to GHGs. Because whether Title V properly applies to GHGs presents a parallel question to whether the PSD program applies, we do not address it separately.

Against this backdrop, we focus solely on the PSD program and absurdity doctrine. We focus in particular on the two dispositive questions—whether EPA properly concluded that the PSD statutory provisions extend to encompass GHGs and, if so, whether EPA properly responded to the admitted absurdity that arises from this extension. EPA erred on both questions.

### **I. EPA Erred By Rewriting or Ignoring the Plain Terms of the PSD Statutes in Order to Extend the Program to Encompass GHGs.**

In response to a petition asking EPA to regulate mobile-source emissions, the Court concluded in *Massachusetts* that GHGs are “air pollutants” for purposes of the Act-wide definition in Section 302(g). But *Massachusetts* neither addressed the Act's stationary-source provisions nor had occasion to consider EPA's ultimate determination on remand that applying the PSD program to GHGs produces absurd results. The posture and stated limits of *Massachusetts* are significant because, regardless of

how the CAA's mobile-source emissions programs might be framed, the PSD program for stationary sources, if applied to GHGs, produces the very type of "extreme measures" that *Massachusetts* disapproved. 549 U.S. at 531.

The fact that PSD regulation of GHGs requires that the statute's coverage thresholds be multiplied by orders of magnitude itself dooms EPA's rulemakings. But the incompatibilities between the statutory PSD provisions and EPA's implementing rulemakings and guidance documents extend well beyond unworkable coverage thresholds. If allowed to stand, EPA's "tailoring" of the Act will become an ongoing enterprise that requires and enables the agency to cut, reshape, and remold numerous parts of the statute.

1. The PSD program's stated purposes underscore that it is designed to address only pollutants that, unlike GHGs, produce exposure-related harms, concentrate locally, and are emitted in modest amounts from very large facilities that Congress determined are best able to reduce emissions in economically feasible ways.

***Prevention of Exposure-Related Harms.*** The first of the PSD program's stated purposes is to "protect public health and welfare" from adverse effects that "occur from air pollution or from *exposures* to pollutants in other media, which pollutants originate as emissions to the ambient air" notwithstanding attainment of NAAQs standards. 42 U.S.C. § 7470(1) (emphasis added). This reference to preventing "exposures to pollutants"—whether directly from air pollution or indirectly via "other media"—makes clear the program aims at curtailing

the types of exposure-related harms characteristic of conventional pollutants.

***Control of Localized Concentrations.***

Congress also declared that the program's purposes include preventing harmful interstate transport of pollutants that produces "deterioration of air quality for any other State," 42 U.S.C. § 7470(4), and assuring that any "decision to permit increased air pollution *in any area*" is made only upon "careful evaluation" and after opportunity for "informed public participation." *Id.* § 7470(5) (emphasis added). In other words, the program was established to control localized concentrations of harmful pollutants—concentrations that can sensibly be ascribed to a particular "state" or a particular "area."

***Economically Feasible Application.*** A third purpose is to "insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources." 42 U.S.C. § 7470(3). The PSD program's 100/250 tpy thresholds, see *id.* § 7479(1), implement this important purpose by imposing burdensome case-by-case PSD permitting requirements only on the "large" emissions sources that can most readily bear these costs. See, e.g., *Alabama Power Co. v. Costle*, 636 F.2d 323, 348 (D.C. Cir. 1979) (per curiam). Here, moreover, EPA admits that "the addition of enormous numbers of additional sources would provide relatively little benefit compared to the costs ...." 75 Fed. Reg. at 31,533 (JA356).

2. Unsurprisingly, the PSD program's declared purposes dovetail with and reinforce its operative provisions. As a result, EPA's extension of the program to encompass GHGs nullifies or renders unworkable core provisions of the program.

***Local Air Impact Analysis.*** Sections 165(a)(2) and (e)(1)'s public participation and local air quality assessment provisions cannot be squared with extending the program to GHGs. These Sections work in tandem to require a non-discretionary “public hearing” regarding “the ambient air quality *at the proposed site* and in *areas which may be affected* by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.” 42 U.S.C. § 7475(e)(1) (emphasis added). Likewise, Section 165(e)(3) requires that the Administrator “shall” analyze “the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility *at the site* of the proposed major emitting facility and *in the area potentially affected* by the emissions from such facility for each pollutant regulated under this Act.” *Id.* § 7475(e)(3) (emphasis added).

These features make sense when applied to conventional pollutants that give rise to localized, exposure-related harms due to impacts on “ambient air quality.” But they make no sense as applied to substances that do not degrade “ambient air quality” and whose concentrations and impacts can be meaningfully assessed only on a global scale. Indeed, EPA has effectively conceded as much, informing PSD permit applicants and authorities that they may ignore the statutory “ambient air” requirements because GHGs—being “well-mixed” in the atmosphere—do not give rise to localized impacts. See, e.g., *PSD and Title V Permitting Guidance for Greenhouse Gases* 48 (2011), available at [http://www.epa.gov/nsr/ghgdocs/ghgpermitting\\_guidance.pdf](http://www.epa.gov/nsr/ghgdocs/ghgpermitting_guidance.pdf) (“Considering the nature of GHG emissions and their global impacts, EPA does not believe it is practical or appropriate to expect permitting authorities to collect

monitoring data for purpose of assessing ambient air impacts of GHGs.”).

***Case-by-Case Economic Analysis.*** Building on its stated purposes, the PSD program mandates that “case-by-case ... economic” analyses be undertaken in issuing PSD permits for large facilities. 42 U.S.C. § 7479(3). Because the PSD program properly applies only to large sources that emit conventional pollutants, it makes sense to require expensive, case-by-case analyses to determine the best available control technology for each individual facility.

Case-by-case BACT assessments are impossible to faithfully adapt, however, in the GHG context, especially for carbon dioxide. If EPA’s interpretation of the program were correct, six million facilities, including 4.5 million residential facilities, would become subject to case-by-case PSD emission-control assessments. To address this unmanageable caseload and avoid imposing intolerable costs on small emitters, EPA has effectively eliminated case-by-case analysis, declaring that small GHG emitters shall eventually be governed by “presumptive” BACT standards and “general” permitting. See, e.g., 75 Fed. Reg. at 31,526 (JA325). But although Title V expressly provides for such general permitting, see 42 U.S.C. § 7661c(d), the PSD program does not.

***Case-by-Case Energy and Environmental Analysis.*** The PSD program also requires “case-by-case” analysis of both “energy ... impacts” and “environmental ... impacts.” 42 U.S.C. § 7479(3). A cardinal rule of interpretation requires that these distinct statutory terms must carry distinct meanings. See *Duncan v. Walker*, 533 U.S. 167, 174 (2001). In the context of PSD permitting for controls on conventional pollutants, this basic rule of

construction is readily followed. When permitting authorities confront proposed PSD controls in conventional-pollutant settings, they can and do make straightforward, independent, and sensible assessments of both energy and environmental impacts. In that context, a permitting authority need only consider the extra energy needed to prevent additional conventional pollution, for instance, by installing energy-consuming pollution-control equipment like the desulfurization units known as “scrubbers.” But when applied to the release of energy and carbon dioxide through burning fossil fuels, the required energy-impact and environmental-impact assessments become hopelessly muddled. The whole reason for emitting carbon dioxide, after all, is that fossil fuels *are* stores of energy and this energy can be released through combustion. As a result, what should be distinct inquiries into “energy” and “environmental” impacts collapse, in the context of fossil-fuel burning, into one and the same assessment: how should EPA regulate energy consumption itself?

***Coverage Thresholds.*** EPA recognized that conventional pollutants and GHGs critically differ in the scale on which they are emitted in an industrial economy. See, e.g., 75 Fed. Reg. at 31,535 (JA363) (“[I]t takes a relatively large source to generate emissions of conventional pollutants in the amounts of 100/250 tpy or more, but many sources combust fossil fuels for heat or electricity, and the combustion process for even small quantities of fossil fuel produces quantities of CO<sub>2</sub> that are far in excess of the sources’ quantities of conventional pollutants and that, for even small sources, equal or exceed the 100/250 tpy levels.”).

In other words, as applied to conventional pollutants, the PSD program's 100/250 tpy emission thresholds make sense and limit the program's burdens to large industrial sources. See *id.* But because GHGs, especially carbon dioxide, are emitted in much greater amounts than conventional pollutants, GHG emissions from a given facility will often exceed by orders of magnitude the facility's conventional-pollutant emissions. As a result, extending the PSD program to GHGs does violence to the Act's coverage thresholds, set with exposure-related harms caused by modestly sized conventional pollutant emissions in mind. The realization that the statutory thresholds fail in a GHG context to effectively winnow out small facilities prompted EPA's concession below that applying the statutory terms to GHGs would be "absurd."

These multiple contradictions, taken individually and even more when taken together, are fatal to EPA's reading of the Act. After all, a statutory "provision that may seem ambiguous in isolation is often clarified by the remainder of the statutory scheme," especially in cases where "only one of the permissible meanings produces a substantive effect compatible with the rest of the law." *United Sav. Ass'n of Tex. v. Timbers of Inwood Forest Assoc., Ltd.*, 484 U.S. 365, 371 (1988). Here, the substantive effects of extending the PSD program to GHGs are manifestly untenable. Any such extension means nullifying or rendering unworkable most central elements of the program.

3. EPA nonetheless determined that the statutory reference in the PSD program to "any air pollutant" would include GHGs, pointing to its

reading of *Massachusetts*. 75 Fed. Reg. at 31,561 (JA481).

But tellingly, EPA itself rejected the broadest possible reading of the *Massachusetts* holding; namely, a reading under which “air pollutant” must refer to “any airborne compound of whatever stripe” for all purposes under the Act. 549 U.S. at 529. In proceedings below, EPA read “any air pollutant” under both the PSD and Title V programs to mean, more restrictively, “any *regulated* air pollutant.” JA236. On review, the Court of Appeals endorsed this reasoning and upheld the agency. JA236-41. The Court rejected the alternative view that, for PSD purposes, the relevant pollutant universe should exclude GHGs and thus be confined to *regulated conventional* air pollutants. JA421-46.

In reaching these conclusions, both EPA and the D.C. Circuit recognized that words and phrases like “any air pollutant,” 42 U.S.C. § 7479(1), and “each pollutant,” *id.* § 7475(a)(4), can and should be read in context. See *Environmental Defense v. Duke Energy Corp.*, 549 U.S. 561, 574 (2007) (holding in a CAA case decided the same day as *Massachusetts* that “identical words used in different parts of the same act” need not always have the same meaning); *Train v. Colorado Public Interest Research Group, Inc.*, 426 U.S. 1, 23-24 (1976) (holding that the term “pollutant”—defined to include “radioactive materials”—was properly read in context to exclude three types of radioactive materials). In light of this recognition and the interpretive evidence canvassed above, EPA and the D.C. Circuit should have further recognized that the term “pollutant” must be read in a PSD context to stop short of encompassing GHGs.

4. Finally, EPA was simply not permitted under the Court's precedents to interpret its authority to regulate localized emissions of conventional pollutants as an implicit grant of authority to regulate the conceptually distinct problem of global climate change. See *Brown & Williamson*, 529 U.S. at 160 (striking down FDA regulation of cigarettes); see also *Gonzales v. Oregon*, 546 U.S. 243 (2006) (striking down DoJ regulation of physician-assisted suicide); *MCI Telecommunications Corp. v. AT&T Co.*, 512 U.S. 218 (1994) (striking down FCC deregulation of long-distance carriers). This is true “[r]egardless of how serious” the problem the agency “seeks to address” may be. *Ragsdale v. Wolverine World Wide, Inc.*, 535 U.S. 81, 91 (2002) (quotation marks and citations omitted); see also *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) (“axiomatic” that agencies lack power to promulgate regulations in absence of congressional authorization). And it is especially true here, in light of the “economic and political significance” of this expansive claim of new authority. *Brown & Williamson*, 529 U.S. at 160. Indeed, the implications of EPA’s claim of authority here are so great that, in the words of the Secretaries of Agriculture, Energy, Transportation, and Commerce, it would turn the agency into a “de facto zoning authority through control over thousands of what formerly were local or private decisions, impacting the construction of schools, hospitals, and commercial and residential development.” 73 Fed. Reg. at 44,360 (JA985).

If *Brown & Williamson*, *MCI*, and *Gonzales* were “extraordinary” cases requiring the relevant agencies to “hesitate” before finding an improbable “implicit delegation,” 529 U.S. at 143, 159, this case surely is

even more extraordinary and requires even more hesitation. In *Massachusetts*, the Court reasoned that construing “air pollutant” to include GHGs “would lead to no ... extreme measures” because there was “nothing counterintuitive to the notion that EPA can curtail” automotive GHG emissions. 549 U.S. at 531. Unlike in *Massachusetts*, where the mobile sources at issue already faced functionally equivalent Department of Transportation fuel economy regulations of their emissions, it is difficult to imagine administrative measures and real-world consequences more extreme than those presented by EPA’s triggering of PSD and Title V regulation of GHGs from all types of stationary sources.

In sum, EPA points to nothing in the text, structure, purposes, or history of the Clean Air Act, nor in any background principle of construction, remotely adequate to establish that Congress intended to grant it authority to regulate GHGs under the PSD program. Indeed, the *only* substantial evidence the agency can marshal is the Act’s use of the term “air pollutant,” but even EPA concedes this language cannot be taken in its broadest sense. As a matter of first principles, EPA’s willingness, perhaps eagerness, to construe statutory language in a manner that produces absurd results and expands its jurisdiction to where it becomes a “de facto zoning authority” cannot be squared with the Court’s precedents.

## **II. EPA Erred By Deploying the Absurdity Doctrine As a Roving License to Ignore Statutory Text.**

In choosing to trigger controls on emissions of GHGs under the PSD program, notwithstanding that the triggering produces absurd results, EPA

overlooked the elementary rule that, when confronted with potentially absurd statutory results, the first and best option is to read the relevant statute so that “no absurdity arises in the first place.” *Kloeckner v. Solis*, 133 S. Ct. 596, 607 (2012); see also *Nixon v. Missouri Mun. League, Inc.* 541 U.S. 125, 138 (2004) (avoiding interpretation “that leads to absurd or futile results”) (citation omitted); cf. John F. Manning, *The Absurdity Doctrine*, 116 Harv. L. Rev. 2387, 2392-93 (2003) (urging careful textual analysis to avoid recourse to the absurdity doctrine). EPA should have recognized, before embarking on statutory reconstruction, that it was bound to reject an admittedly absurd interpretation in favor of the more natural reading of the statute described above.

1. Rather than properly interpreting the CAA, EPA invoked a novel, agency-authority-maximizing version of the absurdity doctrine that finds no support in the Court’s cases. As explained below, even in rare cases where absurd results are unavoidable, courts and agencies do not attain *carte blanche* to rewrite a statute, much less a roving commission to continually modify it well into the future. A review of this Court’s decisions over two centuries recognizes just two principal ways to respond to unavoidably absurd applications of statutory language.

*First*, where a minor, self-evident adjustment to literal meaning suggests itself, the Court has applied that adjustment rather than the statute’s literal terms. See, e.g., *Green v. Bock Laundry Mach. Co.*, 490 U.S. 504 (1989). *Second*, in even rarer circumstances, the Court has declared a specific application of a statute, seemingly authorized by its plain terms, to be beyond its proper scope. See, e.g.,

*United States v. Kirby*, 74 U.S. (7 Wall.) 482 (1868). What the Court has never condoned is what EPA did here—using potentially absurd applications of statutory language as grounds for an “unhealthy process of amending the statute” by interpretation. *Public Citizen v. U.S. Dep’t of Justice*, 491 U.S. 440, 470 (1989) (Kennedy, J., concurring in the judgment). Such “loose invocation[s]” of the canon create intolerable risks that the relevant court or agency will exercise “its own ‘WILL instead of JUDGMENT,’ with the consequence of ‘substituting its own pleasure to that of the legislative body.’” *Id.* at 471 (quoting *The Federalist* No. 78, p. 469 (C. Rossiter ed. 1961)) (internal alterations omitted).

Having concluded that its preferred construction produces unavoidably absurd results, EPA was bound to inquire whether a minor, self-evident adjustment to statutory language was available for resolving the identified absurdity and, if not, to conclude simply that GHG regulation lay beyond the permissible scope of the PSD provisions.

2. Because the absurdity doctrine is an accepted interpretive canon, EPA properly concluded that it applies at *Chevron* step one. See 75 Fed. Reg. at 31,545 (JA408-09). At this first *Chevron* step, courts consider statutory meaning by applying “traditional tools of statutory construction,” without any deference to an implementing agency’s interpretation. *Chevron USA v. Nat. Res. Def. Council*, 467 U.S. 837, 843 n.9 (1984). These “traditional tools” include accepted construction canons, see, e.g., *Solid Waste Agency of N. Cook Cnty. v. U.S. Army Corps of Eng’rs*, 531 U.S. 159, 174 (2001), and these canons include the principle that statutes should be construed to avoid absurd

results—a practice deeply embedded in the Court’s jurisprudence and embraced for centuries by leading authorities. See *Kirby*, 74 U.S. (7 Wall.) at 487 (citing Baron Samuel von Pufendorf and Sir Edmund Plowden); see also, e.g., *United States v. Am. Trucking Ass’n*, 310 U.S. 534, 542 (1940); *Sorrells v. United States*, 287 U.S. 435, 450 (1932); *Lau Ow Bew v. United States*, 144 U.S. 47, 59 (1892); 1 Joseph Story, *Commentaries on the Constitution of the United States* § 403 (2d ed. 1858); 1 W. Blackstone, *Commentaries on the Laws of England* 60, 61 (1765).

After correctly concluding that its preferred construction produces absurd results and that the absurdity doctrine binds agencies at *Chevron* step one, EPA got practically everything else about the doctrine wrong. This case is singular in that it appears to be the first in the Court’s history where no party disputes that an agency’s interpretation of a statute it administers produces absurd results. This case, therefore, turns solely on whether EPA can deploy an admittedly absurd statutory result to rewrite statutory text and bolster its own regulatory authority—as opposed to the more modest step of embracing an interpretation that avoids absurd results from the outset by excluding GHGs from the PSD requirements.

3. EPA chose neither of the two distinct and discernible paths by which the Court’s precedents allow an unavoidable absurdity to be safely addressed.

The first of the two paths marked out by the Court’s cases follows in the wake of Blackstone’s classic admonition that “where words bear either none, or a very absurd signification, if literally understood, *we must a little deviate from the received*

*sense of them.*” Blackstone, *supra*, at 61 (emphasis added).

Blackstone’s classic formulation recognizes that minor “deviations” from legislative text—as opposed to wholesale rewriting at the discretion of a court or agency—can at times produce a more faithful application of the statute than “literal[]” application of the law. *Id.* But such “deviations” must indeed be “little.” Hence, this approach to addressing an absurdity has been essentially confined to making self-evident adjustments to a statute’s scope, making it slightly more or less inclusive, not unlike correcting a scrivener’s error. See, e.g., *Bock Laundry*, 490 U.S. at 529 (Scalia, J., concurring) (correcting text where nuance “could understandably have been omitted by inadvertence”). Limited in this fashion, courts can have confidence in their fidelity to congressional enactments. Accordingly, where self-evident deviations from literalism will prevent an absurdity, the Court has been willing to countenance such deviations.

The Court has followed this first path marked by Blackstone on numerous occasions, countenancing minor, self-evident, textual “deviations” to avoid absurdity without invading the legislative province or rewriting statutory terms from scratch. In *Bock Laundry*, for instance, the Court interpreted the word “defendant” in a federal rule of evidence to mean only criminal defendants, not civil defendants, for, as the Court explained, the language as written could not “mean what it sa[id].” 490 U.S. at 511. In *United States v. X-Citement Video, Inc.*, the Court rejected the “most natural grammatical reading” of a child-pornography statute and construed “the term ‘knowingly’” to “extend[] both to the sexually explicit

nature of the material and to the age of the performers” rather than merely to the transportation or shipment of a visual depiction in interstate or foreign commerce. 513 U.S. 64, 68-69, 78 (1994). In *Clinton v. City of New York*, the Court concluded that the category of “individuals” permitted to obtain expedited review of the constitutionality of the line-item veto statute should be interpreted to encompass not only natural persons but also corporate “persons” because it would be absurd to exclude corporate plaintiffs from the benefits of such review. 524 U.S. 417, 428-29 (1998). And in *Johnson v. South Pacific Co.*, the Court read “locomotives” to fall within a definition of rail “cars,” notwithstanding definitional language pointing in the other direction, in order to effectuate a railroad safety statute requiring that safer train couplings be used in interstate commerce. 196 U.S. 1, 14-15 (1904).

In each of these cases, the Court took care to respect statutory text by making what it thought were minor, natural adjustments to the scope of statutory language. “Any entity” meant any private entity. “Defendant” meant only criminal defendants. “Knowingly” applied to all elements of an offense. “Individual” was read to include all legal persons, including corporations. And rail “cars” was read to include all parts of a train, including locomotives. While some of these “deviations” prompted objections from dissenting justices, none were open-ended. All involved what appeared to be self-evident adjustments not unlike the correction of scrivener’s errors. Cf., e.g., *Bock Laundry*, 490 U.S. at 529 (Scalia, J., concurring).

The second path marked by the Court’s precedents, also drawn from Blackstone, applies in

situations where “there arise[s]” from a statute “any absurd consequences, manifestly contrary to common reason” (that cannot be addressed by deviating just a little from the unaltered text). Blackstone, *supra*, at 91. According to Blackstone, such statutes should be construed with regard to such consequences as “void.” *Id.*

Accordingly, where, as here, an absurdity cannot be avoided through a fairly evident and minor adjustment to statutory language, the particular application of the statute’s literal language must be deemed simply and altogether beyond the statute’s scope. *Kirby* presents the classic example. In that case, a county sheriff arrested a mail carrier for murder while the mail carrier was delivering the mail. A federal statute declared that if any person should knowingly and willfully obstruct or retard the passage of the mail, the person would be subject to penalty. 74 U.S. at 482. The question in *Kirby* was whether the sheriff could be punished for arresting an accused murderer, an obvious absurdity. Although recognizing that the act’s categorical language contained no exceptions for officers acting in their official duties, the Court declared the particular situation before it beyond the intended compass of the law. See *id* at 487.

Following *Kirby*, the Court has occasionally concluded that a literal application of statutory language would create absurd results, but found no evident deviation from the statute’s literal terms was available. In those rare cases, the Court has been satisfied to hold that the particular application at issue falls outside the statute’s scope. See, e.g., *Public Citizen*, 490 U.S. at 443 (Federal Advisory Committee Act does not apply to communications

with the American Bar Association regarding judicial nominations); *Sorrells*, 287 U.S. at 448-49 (criminal statute does not apply to case of entrapment); *Church of the Holy Trinity v. United States*, 143 U.S. 457, 465 (1892) (immigration statute does not apply to clergyman). In none of these cases did the Court strain to offer a definitive reinterpretation of the meaning of the relevant text. It instead concluded, more modestly, that the statute at issue ought not be interpreted to extend so far as to produce absurd results in the instance at hand.

4. EPA failed to appreciate any limitations on the options available for addressing statutory absurdities, and the court below did not even address the issue with regard to EPA's triggering of PSD and Title V. If either had done so—after identifying what concededly were extreme and absurd results and realizing no minor, self-evident “deviation” from statutory text would eliminate them—they would have simply concluded that Congress had not authorized the type of extreme measures needed to bring GHGs under the PSD program.

Remarkably, after realizing that its PSD “triggering” would create results “so contrary to what Congress had in mind” that they “should be avoided under the ‘absurd results’ doctrine,” 74 Fed. Reg. at 55,310, EPA did nothing to prevent the triggering. It opted instead to try to partially alleviate the ensuing absurd results by rewriting codified numerical thresholds, while nullifying other statutory requirements by fiat. In this fashion, EPA replaced the statute's numerical limits with limits of the agency's choosing. See 75 Fed. Reg. at 31,533 (JA355-56).

Significantly, however, there is nothing minor or self-evident about a decision to “unilaterally” increase the statute’s coverage thresholds for stationary-source emissions of some (but not all) pollutants from “250 tons to 100,000 tons—a 400-fold increase.” JA173 (Kavanaugh, J., dissenting). Far from it, selecting a numerical parameter to delineate the bounds of regulatory authority is a quintessentially legislative decision. See, e.g., *Hoctor v. U.S. Dep’t of Agric.*, 82 F.3d 165, 170 (7th Cir. 1996) (explaining an agency rule was legislative because “[t]here is no way to reason” to a particular number selected by the agency) (Posner, J.). This is especially true here, where EPA purports to retain still more discretion to further modify the agency-created numerical thresholds over time. Nothing in the statute’s text or structure even hints at the precise thresholds EPA selected as its initial, preferred PSD coverage levels, and in fact EPA proposed thresholds substantially different from the ones it eventually promulgated. See 74 Fed. Reg. at 55,292 (proposing 25,000 tpy threshold).

EPA’s statutory rewrite was thus by no means self-evident or akin to correcting a scrivener’s error. It was extreme by any measure and not at all authorized by *Massachusetts*, which expressly admonished EPA not to assume “a roving license to ignore the statutory text” and expressly required EPA to ground its “action or inaction in the statute.” 549 U.S. at 533, 535.

In sum, the whole justification for the absurdity doctrine is to better discover and better apply the true meaning of the law. But as invoked by EPA, the doctrine has been transformed from a way of ensuring fidelity to congressional enactments into a

springboard for an agency's never-ending and ultimately legislative rewriting of statutes. Once EPA saw that triggering PSD controls for GHGs produces absurd results, it ought to have recognized that, when facing such results, the best option is to read a statute so no absurdity arises in the first place, as we and other petitioners contend. But failing that, EPA ought to have appreciated at a bare minimum—under the Court's precedents and principles dating to Blackstone—that because no self-evident textual adjustments were available for eliminating the absurdity and still accommodating PSD regulation of GHGs, such regulation necessarily falls, quite simply, beyond the agency's authority.

**CONCLUSION**

The judgment of the court of appeals should be reversed.

Respectfully submitted,

**42 U.S.C. § 7403(g): Research, investigation,  
training, and other activities**

\* \* \*

**(g) Pollution prevention and emissions control**

In carrying out subsection (a) of this section, the Administrator shall conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention. Such strategies and technologies shall be developed with priority on those pollutants which pose a significant risk to human health and the environment, and with opportunities for participation by industry, public interest groups, scientists, and other interested persons in the development of such strategies and technologies. Such program shall include the following elements:

**(1)** Improvements in nonregulatory strategies and technologies for preventing or reducing multiple air pollutants, including sulfur oxides, nitrogen oxides, heavy metals, PM-10 (particulate matter), carbon monoxide, and carbon dioxide, from stationary sources, including fossil fuel power plants. Such strategies and technologies shall include improvements in the relative cost effectiveness and long-range implications of various air pollutant reduction and nonregulatory control strategies such as energy conservation, including end-use efficiency, and fuel-switching to cleaner fuels. Such strategies and technologies shall be considered for existing and new facilities.

2a

(2) Improvements in nonregulatory strategies and technologies for reducing air emissions from area sources.

(3) Improvements in nonregulatory strategies and technologies for preventing, detecting, and correcting accidental releases of hazardous air pollutants.

(4) Improvements in nonregulatory strategies and technologies that dispose of tires in ways that avoid adverse air quality impacts.

Nothing in this subsection shall be construed to authorize the imposition on any person of air pollution control requirements. The Administrator shall consult with other appropriate Federal agencies to ensure coordination and to avoid duplication of activities authorized under this subsection.

\* \* \*

3a

**42 U.S.C. § 7407: Air quality control regions**

**(a)** Responsibility of each State for air quality; submission of implementation plan

Each State shall have the primary responsibility for assuring air quality within the entire geographic area comprising such State by submitting an implementation plan for such State which will specify the manner in which national primary and secondary ambient air quality standards will be achieved and maintained within each air quality control region in such State.

**(b)** Designated regions

For purposes of developing and carrying out implementation plans under section 7410 of this title-

**(1)** an air quality control region designated under this section before December 31, 1970, or a region designated after such date under subsection (c) of this section, shall be an air quality control region; and

**(2)** the portion of such State which is not part of any such designated region shall be an air quality control region, but such portion may be subdivided by the State into two or more air quality control regions with the approval of the Administrator.

**(c)** Authority of Administrator to designate regions; notification of Governors of affected States

The Administrator shall, within 90 days after December 31, 1970, after consultation with

4a

appropriate State and local authorities, designate as an air quality control region any interstate area or major intrastate area which he deems necessary or appropriate for the attainment and maintenance of ambient air quality standards. The Administrator shall immediately notify the Governors of the affected States of any designation made under this subsection.

**(d) Designations**

**(1) Designations generally**

**(A) Submission by Governors of initial designations following promulgation of new or revised standards**

By such date as the Administrator may reasonably require, but not later than 1 year after promulgation of a new or revised national ambient air quality standard for any pollutant under section 7409 of this title, the Governor of each State shall (and at any other time the Governor of a State deems appropriate the Governor may) submit to the Administrator a list of all areas (or portions thereof) in the State, designating as—

**(i) nonattainment**, any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant,

**(ii) attainment**, any area (other than an area identified in clause (i)) that meets the national primary or secondary ambient air quality standard for the pollutant, or

5a

**(iii)** unclassifiable, any area that cannot be classified on the basis of available information as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

The Administrator may not require the Governor to submit the required list sooner than 120 days after promulgating a new or revised national ambient air quality standard.

**(B)** Promulgation by EPA of designations

**(i)** Upon promulgation or revision of a national ambient air quality standard, the Administrator shall promulgate the designations of all areas (or portions thereof) submitted under subparagraph (A) as expeditiously as practicable, but in no case later than 2 years from the date of promulgation of the new or revised national ambient air quality standard. Such period may be extended for up to one year in the event the Administrator has insufficient information to promulgate the designations.

**(ii)** In making the promulgations required under clause (i), the Administrator may make such modifications as the Administrator deems necessary to the designations of the areas (or portions thereof) submitted under subparagraph (A) (including to the boundaries of such areas or portions thereof). Whenever the Administrator intends to make a modification, the Administrator shall notify the State and provide such State with an opportunity to demonstrate

## 6a

why any proposed modification is inappropriate. The Administrator shall give such notification no later than 120 days before the date the Administrator promulgates the designation, including any modification thereto. If the Governor fails to submit the list in whole or in part, as required under subparagraph (A), the Administrator shall promulgate the designation that the Administrator deems appropriate for any area (or portion thereof) not designated by the State.

**(iii)** If the Governor of any State, on the Governor's own motion, under subparagraph (A), submits a list of areas (or portions thereof) in the State designated as nonattainment, attainment, or unclassifiable, the Administrator shall act on such designations in accordance with the procedures under paragraph (3) (relating to redesignation).

**(iv)** A designation for an area (or portion thereof) made pursuant to this subsection shall remain in effect until the area (or portion thereof) is redesignated pursuant to paragraph (3) or (4).

**(C)** Designations by operation of law

**(i)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(A), (B), or (C) of this subsection (as in effect immediately before November 15, 1990) is designated, by operation of law, as a nonattainment area for such pollutant within the meaning of subparagraph (A)(i).

7a

**(ii)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(E) (as in effect immediately before November 15, 1990) is designated by operation of law, as an attainment area for such pollutant within the meaning of subparagraph (A)(ii).

**(iii)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(D) (as in effect immediately before November 15, 1990) is designated, by operation of law, as an unclassifiable area for such pollutant within the meaning of subparagraph (A)(iii).

**(2)** Publication of designations and redesignations

**(A)** The Administrator shall publish a notice in the Federal Register promulgating any designation under paragraph (1) or (5), or announcing any designation under paragraph (4), or promulgating any redesignation under paragraph (3).

**(B)** Promulgation or announcement of a designation under paragraph (1), (4) or (5) shall not be subject to the provisions of sections 553 through 557 of Title 5 (relating to notice and comment), except nothing herein shall be construed as precluding such public notice and comment whenever possible.

**(3)** Redesignation

**(A)** Subject to the requirements of subparagraph (E), and on the basis of air quality data, planning

## 8a

and control considerations, or any other air quality-related considerations the Administrator deems appropriate, the Administrator may at any time notify the Governor of any State that available information indicates that the designation of any area or portion of an area within the State or interstate area should be revised. In issuing such notification, which shall be public, to the Governor, the Administrator shall provide such information as the Administrator may have available explaining the basis for the notice.

**(B)** No later than 120 days after receiving a notification under subparagraph (A), the Governor shall submit to the Administrator such redesignation, if any, of the appropriate area (or areas) or portion thereof within the State or interstate area, as the Governor considers appropriate.

**(C)** No later than 120 days after the date described in subparagraph (B) (or paragraph (1)(B)(iii)), the Administrator shall promulgate the redesignation, if any, of the area or portion thereof, submitted by the Governor in accordance with subparagraph (B), making such modifications as the Administrator may deem necessary, in the same manner and under the same procedure as is applicable under clause (ii) of paragraph (1)(B), except that the phrase “60 days” shall be substituted for the phrase “120 days” in that clause. If the Governor does not submit, in accordance with subparagraph (B), a redesignation for an area (or portion thereof) identified by the Administrator under

9a

subparagraph (A), the Administrator shall promulgate such redesignation, if any, that the Administrator deems appropriate.

**(D)** The Governor of any State may, on the Governor's own motion, submit to the Administrator a revised designation of any area or portion thereof within the State. Within 18 months of receipt of a complete State redesignation submittal, the Administrator shall approve or deny such redesignation. The submission of a redesignation by a Governor shall not affect the effectiveness or enforceability of the applicable implementation plan for the State.

**(E)** The Administrator may not promulgate a redesignation of a nonattainment area (or portion thereof) to attainment unless—

**(i)** the Administrator determines that the area has attained the national ambient air quality standard;

**(ii)** the Administrator has fully approved the applicable implementation plan for the area under section 7410(k) of this title;

**(iii)** the Administrator determines that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions;

**(iv)** the Administrator has fully approved a

10a

maintenance plan for the area as meeting the requirements of section 7505a of this title; and

**(v)** the State containing such area has met all requirements applicable to the area under section 7410 of this title and part D of this subchapter.

**(F)** The Administrator shall not promulgate any redesignation of any area (or portion thereof) from nonattainment to unclassifiable.

**(4)** Nonattainment designations for ozone, carbon monoxide and particulate matter (PM-10)

**(A)** Ozone and carbon monoxide

**(i)** Within 120 days after November 15, 1990, each Governor of each State shall submit to the Administrator a list that designates, affirms or reaffirms the designation of, or redesignates (as the case may be), all areas (or portions thereof) of the Governor's State as attainment, nonattainment, or unclassifiable with respect to the national ambient air quality standards for ozone and carbon monoxide.

**(ii)** No later than 120 days after the date the Governor is required to submit the list of areas (or portions thereof) required under clause (i) of this subparagraph, the Administrator shall promulgate such designations, making such modifications as the Administrator may deem necessary, in the same manner, and under the same procedure, as is applicable under clause (ii) of paragraph (1)(B), except that the phrase "60

## 11a

days” shall be substituted for the phrase “120 days” in that clause. If the Governor does not submit, in accordance with clause (i) of this subparagraph, a designation for an area (or portion thereof), the Administrator shall promulgate the designation that the Administrator deems appropriate.

**(iii)** No nonattainment area may be redesignated as an attainment area under this subparagraph.

**(iv)** Notwithstanding paragraph (1)(C)(ii) of this subsection, if an ozone or carbon monoxide nonattainment area located within a metropolitan statistical area or consolidated metropolitan statistical area (as established by the Bureau of the Census) is classified under part D of this subchapter as a Serious, Severe, or Extreme Area, the boundaries of such area are hereby revised (on the date 45 days after such classification) by operation of law to include the entire metropolitan statistical area or consolidated metropolitan statistical area, as the case may be, unless within such 45-day period the Governor (in consultation with State and local air pollution control agencies) notifies the Administrator that additional time is necessary to evaluate the application of clause (v). Whenever a Governor has submitted such a notice to the Administrator, such boundary revision shall occur on the later of the date 8 months after such classification or 14 months after November 15, 1990, unless the Governor makes the finding referred to in clause (v), and the Administrator concurs in such finding,

## 12a

within such period. Except as otherwise provided in this paragraph, a boundary revision under this clause or clause (v) shall apply for purposes of any State implementation plan revision required to be submitted after November 15, 1990.

(v) Whenever the Governor of a State has submitted a notice under clause (iv), the Governor, in consultation with State and local air pollution control agencies, shall undertake a study to evaluate whether the entire metropolitan statistical area or consolidated metropolitan statistical area should be included within the nonattainment area. Whenever a Governor finds and demonstrates to the satisfaction of the Administrator, and the Administrator concurs in such finding, that with respect to a portion of a metropolitan statistical area or consolidated metropolitan statistical area, sources in the portion do not contribute significantly to violation of the national ambient air quality standard, the Administrator shall approve the Governor's request to exclude such portion from the nonattainment area. In making such finding, the Governor and the Administrator shall consider factors such as population density, traffic congestion, commercial development, industrial development, meteorological conditions, and pollution transport.

**(B) PM-10 designations**

By operation of law, until redesignation by the Administrator pursuant to paragraph (3)—

13a

**(i)** each area identified in 52 Federal Register 29383 (Aug. 7, 1987) as a Group I area (except to the extent that such identification was modified by the Administrator before November 15, 1990) is designated nonattainment for PM-10;

**(ii)** any area containing a site for which air quality monitoring data show a violation of the national ambient air quality standard for PM-10 before January 1, 1989 (as determined under part 50, appendix K of title 40 of the Code of Federal Regulations) is hereby designated nonattainment for PM-10; and

**(iii)** each area not described in clause (i) or (ii) is hereby designated unclassifiable for PM-10.

Any designation for particulate matter (measured in terms of total suspended particulates) that the Administrator promulgated pursuant to this subsection (as in effect immediately before November 15, 1990) shall remain in effect for purposes of implementing the maximum allowable increases in concentrations of particulate matter (measured in terms of total suspended particulates) pursuant to section 7473(b) of this title, until the Administrator determines that such designation is no longer necessary for that purpose.

**(5)** Designations for lead

The Administrator may, in the Administrator's discretion at any time the Administrator deems

## 14a

appropriate, require a State to designate areas (or portions thereof) with respect to the national ambient air quality standard for lead in effect as of November 15, 1990, in accordance with the procedures under subparagraphs (A) and (B) of paragraph (1), except that in applying subparagraph (B)(i) of paragraph (1) the phrase “2 years from the date of promulgation of the new or revised national ambient air quality standard” shall be replaced by the phrase “1 year from the date the Administrator notifies the State of the requirement to designate areas with respect to the standard for lead”.

**(6) Designations****(A) Submission**

Notwithstanding any other provision of law, not later than February 15, 2004, the Governor of each State shall submit designations referred to in paragraph (1) for the July 1997 PM national ambient air quality standards for each area within the State, based on air quality monitoring data collected in accordance with any applicable Federal reference methods for the relevant areas.

**(B) Promulgation**

Notwithstanding any other provision of law, not later than December 31, 2004, the Administrator shall, consistent with paragraph (1), promulgate the designations referred to in subparagraph (A) for each area of each State for the July 1997 PM national ambient air quality standards.

15a

**(7) Implementation plan for regional haze**

**(A) In general**

Notwithstanding any other provision of law, not later than 3 years after the date on which the Administrator promulgates the designations referred to in paragraph (6)(B) for a State, the State shall submit, for the entire State, the State implementation plan revisions to meet the requirements promulgated by the Administrator under section 7492(e)(1) of this title (referred to in this paragraph as “regional haze requirements”).

**(B) No preclusion of other provisions**

Nothing in this paragraph precludes the implementation of the agreements and recommendations stemming from the Grand Canyon Visibility Transport Commission Report dated June 1996, including the submission of State implementation plan revisions by the States of Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon, Utah, or Wyoming by December 31, 2003, for implementation of regional haze requirements applicable to those States.

**(e) Redesignation of air quality control regions**

**(1)** Except as otherwise provided in paragraph (2), the Governor of each State is authorized, with the approval of the Administrator, to redesignate from time to time the air quality control regions within such State for purposes of efficient and effective air quality management. Upon such redesignation, the list under subsection (d) of this section shall be

16a

modified accordingly.

**(2)** In the case of an air quality control region in a State, or part of such region, which the Administrator finds may significantly affect air pollution concentrations in another State, the Governor of the State in which such region, or part of a region, is located may redesignate from time to time the boundaries of so much of such air quality control region as is located within such State only with the approval of the Administrator and with the consent of all Governors of all States which the Administrator determines may be significantly affected.

**(3)** No compliance date extension granted under section 7413(d)(5) of this title (relating to coal conversion) shall cease to be effective by reason of the regional limitation provided in section 7413(d)(5) of this title if the violation of such limitation is due solely to a redesignation of a region under this subsection.

17a

**42 U.S.C. § 7409. National primary and secondary ambient air quality standards**

**(a) Promulgation**

**(1) The Administrator—**

**(A)** within 30 days after December 31, 1970, shall publish proposed regulations prescribing a national primary ambient air quality standard and a national secondary ambient air quality standard for each air pollutant for which air quality criteria have been issued prior to such date; and

**(B)** after a reasonable time for interested persons to submit written comments thereon (but no later than 90 days after the initial publication of such proposed standards) shall by regulation promulgate such proposed national primary and secondary ambient air quality standards with such modifications as he deems appropriate.

**(2)** With respect to any air pollutant for which air quality criteria are issued after December 31, 1970, the Administrator shall publish, simultaneously with the issuance of such criteria and information, proposed national primary and secondary ambient air quality standards for any such pollutant. The procedure provided for in paragraph (1)(B) of this subsection shall apply to the promulgation of such standards.

**(b) Protection of public health and welfare**

18a

**(1)** National primary ambient air quality standards, prescribed under subsection (a) of this section shall be ambient air quality standards the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health. Such primary standards may be revised in the same manner as promulgated.

**(2)** Any national secondary ambient air quality standard prescribed under subsection (a) of this section shall specify a level of air quality the attainment and maintenance of which in the judgment of the Administrator, based on such criteria, is requisite to protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air. Such secondary standards may be revised in the same manner as promulgated.

**(c)** National primary ambient air quality standard for nitrogen dioxide

The Administrator shall, not later than one year after August 7, 1977, promulgate a national primary ambient air quality standard for NO<sub>2</sub> concentrations over a period of not more than 3 hours unless, based on the criteria issued under section 7408(c) of this title, he finds that there is no significant evidence that such a standard for such a period is requisite to protect public health.

**(d)** Review and revision of criteria and standards;  
independent scientific review committee;  
appointment; advisory functions

19a

**(1)** Not later than December 31, 1980, and at five-year intervals thereafter, the Administrator shall complete a thorough review of the criteria published under section 7408 of this title and the national ambient air quality standards promulgated under this section and shall make such revisions in such criteria and standards and promulgate such new standards as may be appropriate in accordance with section 7408 of this title and subsection (b) of this section. The Administrator may review and revise criteria or promulgate new standards earlier or more frequently than required under this paragraph.

**(2)**

**(A)** The Administrator shall appoint an independent scientific review committee composed of seven members including at least one member of the National Academy of Sciences, one physician, and one person representing State air pollution control agencies.

**(B)** Not later than January 1, 1980, and at five-year intervals thereafter, the committee referred to in subparagraph (A) shall complete a review of the criteria published under section 7408 of this title and the national primary and secondary ambient air quality standards promulgated under this section and shall recommend to the Administrator any new national ambient air quality standards and revisions of existing criteria and standards as may be appropriate under section 7408 of this title and subsection (b) of this section.

20a

(C) Such committee shall also (i) advise the Administrator of areas in which additional knowledge is required to appraise the adequacy and basis of existing, new, or revised national ambient air quality standards, (ii) describe the research efforts necessary to provide the required information, (iii) advise the Administrator on the relative contribution to air pollution concentrations of natural as well as anthropogenic activity, and (iv) advise the Administrator of any adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance of such national ambient air quality standards.

21a

**42 U.S.C. § 7470: Congressional declaration of purpose**

The purposes of this part are as follows:

- (1) to protect public health and welfare from any actual or potential adverse effect which in the Administrator's judgment may reasonably be anticipate to occur from air pollution or from exposures to pollutants in other media, which pollutants originate as emissions to the ambient air), notwithstanding attainment and maintenance of all national ambient air quality standards;
- (2) to preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value;
- (3) to insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources;
- (4) to assure that emissions from any source in any State will not interfere with any portion of the applicable implementation plan to prevent significant deterioration of air quality for any other State; and
- (5) to assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decisionmaking process.

22a

**42 U.S.C. § 7471. Plan requirements**

In accordance with the policy of section 7401(b)(1) of this title, each applicable implementation plan shall contain emission limitations and such other measures as may be necessary, as determined under regulations promulgated under this part, to prevent significant deterioration of air quality in each region (or portion thereof) designated pursuant to section 7407 of this title as attainment or unclassifiable.

23a

**42 U.S.C. § 7473: Increments and ceilings**

**(a)** Sulfur oxide and particulate matter; requirement that maximum allowable increases and maximum allowable concentrations not be exceeded

In the case of sulfur oxide and particulate matter, each applicable implementation plan shall contain measures assuring that maximum allowable increases over baseline concentrations of, and maximum allowable concentrations of, such pollutant shall not be exceeded. In the case of any maximum allowable increase (except an allowable increase specified under section 7475(d)(2)(C)(iv) of this title) for a pollutant based on concentrations permitted under national ambient air quality standards for any period other than an annual period, such regulations shall permit such maximum allowable increase to be exceeded during one such period per year.

**(b)** Maximum allowable increases in concentrations over baseline concentrations

**(1)** For any class I area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 24a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	5
Twenty-four-hour maximum	10
Sulfur dioxide:	
Annual arithmetic mean	2
Twenty-four-hour maximum	5
Three-hour maximum	25

**(2)** For any class II area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 25a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	19
Twenty-four-hour maximum	37
Sulfur dioxide:	
Annual arithmetic mean	20
Twenty-four-hour maximum	91
Three-hour maximum	512

**(3)** For any class III area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 26a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	37
Twenty-four-hour maximum	75
Sulfur dioxide:	
Annual arithmetic mean	40
Twenty-four-hour maximum	182
Three-hour maximum	700

(4) The maximum allowable concentration of any air pollutant in any area to which this part applies shall not exceed a concentration for such pollutant for each period of exposure equal to—

(A) the concentration permitted under the national secondary ambient air quality standard, or

(B) the concentration permitted under the national primary ambient air quality standard,

whichever concentration is lowest for such pollutant for such period of exposure.

27a

**(c)** Orders or rules for determining compliance with maximum allowable increases in ambient concentrations of air pollutants

**(1)** In the case of any State which has a plan approved by the Administrator for purposes of carrying out this part, the Governor of such State may, after notice and opportunity for public hearing, issue orders or promulgate rules providing that for purposes of determining compliance with the maximum allowable increases in ambient concentrations of an air pollutant, the following concentrations of such pollutant shall not be taken into account:

**(A)** concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from the use of petroleum products, or natural gas, or both, by reason of an order which is in effect under the provisions of sections 792(a) and (b) of Title 15 (or any subsequent legislation which supersedes such provisions) over the emissions from such sources before the effective date of such order.

**(B)** the concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from using natural gas by reason of a natural gas curtailment pursuant to a natural gas curtailment plan in effect pursuant to the Federal Power Act [16 U.S.C.A. § 791a et seq.] over the emissions from such sources before the effective date of such plan,

28a

(C) concentrations of particulate matter attributable to the increase in emissions from construction or other temporary emission-related activities, and

(D) the increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources which are included in the baseline concentration determined in accordance with section 7479(4) of this title.

(2) No action taken with respect to a source under paragraph (1)(A) or (1)(B) shall apply more than five years after the effective date of the order referred to in paragraph (1)(A) or the plan referred to in paragraph (1)(B), whichever is applicable. If both such order and plan are applicable, no such action shall apply more than five years after the later of such effective dates.

(3) No action under this subsection shall take effect unless the Governor submits the order or rule providing for such exclusion to the Administrator and the Administrator determines that such order or rule is in compliance with the provisions of this subsection.

29a

**42 U.S.C. § 7475. Preconstruction requirements**

**(a)** Major emitting facilities on which construction is commenced

No major emitting facility on which construction is commenced after August 7, 1977, may be constructed in any area to which this part applies unless--

**(1)** a permit has been issued for such proposed facility in accordance with this part setting forth emission limitations for such facility which conform to the requirements of this part;

**(2)** the proposed permit has been subject to a review in accordance with this section, the required analysis has been conducted in accordance with regulations promulgated by the Administrator, and a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of such source, alternatives thereto, control technology requirements, and other appropriate considerations;

**(3)** the owner or operator of such facility demonstrates, as required pursuant to section 7410(j) of this title, that emissions from construction or operation of such facility will not cause, or contribute to, air pollution in excess of any (A) maximum allowable increase or maximum allowable concentration for any pollutant in any area to which this part applies more than one time per year, (B) national ambient air quality standard in any air quality control region, or (C) any other

30a

applicable emission standard or standard of performance under this chapter;

(4) the proposed facility is subject to the best available control technology for each pollutant subject to regulation under this chapter emitted from, or which results from, such facility;

(5) the provisions of subsection (d) of this section with respect to protection of class I areas have been complied with for such facility;

(6) there has been an analysis of any air quality impacts projected for the area as a result of growth associated with such facility;

(7) the person who owns or operates, or proposes to own or operate, a major emitting facility for which a permit is required under this part agrees to conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or is having, on air quality in any area which may be affected by emissions from such source; and

(8) in the case of a source which proposes to construct in a class III area, emissions from which would cause or contribute to exceeding the maximum allowable increments applicable in a class II area and where no standard under section 7411 of this title has been promulgated subsequent to August 7, 1977, for such source category, the Administrator has approved the determination of best available technology as set forth in the permit.

(b) Exception

31a

The demonstration pertaining to maximum allowable increases required under subsection (a)(3) of this section shall not apply to maximum allowable increases for class II areas in the case of an expansion or modification of a major emitting facility which is in existence on August 7, 1977, whose allowable emissions of air pollutants, after compliance with subsection (a)(4) of this section, will be less than fifty tons per year and for which the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur oxides will not cause or contribute to ambient air quality levels in excess of the national secondary ambient air quality standard for either of such pollutants.

**(c)** Permit applications

Any completed permit application under section 7410 of this title for a major emitting facility in any area to which this part applies shall be granted or denied not later than one year after the date of filing of such completed application.

**(d)** Action taken on permit applications; notice; adverse impact on air quality related values; variance; emission limitations

**(1)** Each State shall transmit to the Administrator a copy of each permit application relating to a major emitting facility received by such State and provide notice to the Administrator of every action related to the consideration of such permit.

**(2)**

32a

**(A)** The Administrator shall provide notice of the permit application to the Federal Land Manager and the Federal official charged with direct responsibility for management of any lands within a class I area which may be affected by emissions from the proposed facility.

**(B)** The Federal Land Manager and the Federal official charged with direct responsibility for management of such lands shall have an affirmative responsibility to protect the air quality related values (including visibility) of any such lands within a class I area and to consider, in consultation with the Administrator, whether a proposed major emitting facility will have an adverse impact on such values.

**(C)**

**(i)** In any case where the Federal official charged with direct responsibility for management of any lands within a class I area or the Federal Land Manager of such lands, or the Administrator, or the Governor of an adjacent State containing such a class I area files a notice alleging that emissions from a proposed major emitting facility may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur dioxide will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area.

33a

**(ii)** In any case where the Federal Land Manager demonstrates to the satisfaction of the State that the emissions from such facility will have an adverse impact on the air quality-related values (including visibility) of such lands, notwithstanding the fact that the change in air quality resulting from emissions from such facility will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area, a permit shall not be issued.

**(iii)** In any case where the owner or operator of such facility demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such facility will have no adverse impact on the air quality-related values of such lands (including visibility), notwithstanding the fact that the change in air quality resulting from emissions from such facility will cause or contribute to concentrations which exceed the maximum allowable increases for class I areas, the State may issue a permit.

**(iv)** In the case of a permit issued pursuant to clause (iii), such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides and particulates from such facility will not cause or contribute to concentrations of such pollutant which exceed the following maximum allowable increases over the baseline concentration for such pollutants:

34a

**Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean . . . . .	19
Twenty-four-hour maximum . . . . .	37

Sulfur dioxide:

Annual arithmetic mean . . . . .	20
Twenty-four-hour maximum . . . . .	91
Three-hour maximum. . . . .	325

**(D)**

**(i)** In any case where the owner or operator of a proposed major emitting facility who has been denied a certification under subparagraph (C)(iii) demonstrates to the satisfaction of the Governor, after notice and public hearing, and the Governor finds, that the facility cannot be constructed by reason of any maximum allowable increase for sulfur dioxide for periods of twenty-four hours or less applicable to any class I area and, in the case of Federal mandatory class I areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If such variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph.

35a

**(ii)** In any case in which the Governor recommends a variance under this subparagraph in which the Federal Land Manager does not concur, the recommendations of the Governor and the Federal Land Manager shall be transmitted to the President. The President may approve the Governor's recommendation if he finds that such variance is in the national interest. No Presidential finding shall be reviewable in any court. The variance shall take effect if the President approves the Governor's recommendations. The President shall approve or disapprove such recommendation within ninety days after his receipt of the recommendations of the Governor and the Federal Land Manager.

**(iii)** In the case of a permit issued pursuant to this subparagraph, such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such facility will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period:

36a

**MAXIMUM ALLOWABLE INCREASE**

**[In micrograms per cubic meter]**

<b>Period of exposure</b>	Low terrain areas	High terrain areas
24-hr maximum . . . . .	36	62
3-hr maximum	130	221

(iv) For purposes of clause (iii), the term “high terrain area” means with respect to any facility, any area having an elevation of 900 feet or more above the base of the stack of such facility, and the term “low terrain area” means any area other than a high terrain area.

(e) Analysis; continuous air quality monitoring data; regulations; model adjustments

(1) The review provided for in subsection (a) of this section shall be preceded by an analysis in accordance with regulations of the Administrator, promulgated under this subsection, which may be conducted by the State (or any general purpose unit of local government) or by the major emitting facility applying for such permit, of the ambient air quality at the proposed site and in areas which may be affected by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.

(2) Effective one year after August 7, 1977, the analysis required by this subsection shall include continuous air quality monitoring data gathered for purposes of determining whether emissions from

## 37a

such facility will exceed the maximum allowable increases or the maximum allowable concentration permitted under this part. Such data shall be gathered over a period of one calendar year preceding the date of application for a permit under this part unless the State, in accordance with regulations promulgated by the Administrator, determines that a complete and adequate analysis for such purposes may be accomplished in a shorter period. The results of such analysis shall be available at the time of the public hearing on the application for such permit.

**(3)** The Administrator shall within six months after August 7, 1977, promulgate regulations respecting the analysis required under this subsection which regulations—

**(A)** shall not require the use of any automatic or uniform buffer zone or zones,

**(B)** shall require an analysis of the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility at the site of the proposed major emitting facility and in the area potentially affected by the emissions from such facility for each pollutant regulated under this chapter which will be emitted from, or which results from the construction or operation of, such facility, the size and nature of the proposed facility, the degree of continuous emission reduction which could be achieved by such facility, and such other factors as may be relevant in determining the effect of emissions from a proposed facility on any air quality control region,

38a

(C) shall require the results of such analysis shall be available at the time of the public hearing on the application for such permit, and

(D) shall specify with reasonable particularity each air quality model or models to be used under specified sets of conditions for purposes of this part.

Any model or models designated under such regulations may be adjusted upon a determination, after notice and opportunity for public hearing, by the Administrator that such adjustment is necessary to take into account unique terrain or meteorological characteristics of an area potentially affected by emissions from a source applying for a permit required under this part.

39a

**42 U.S.C. § 7477: Enforcement**

The Administrator shall, and a State may, take such measures, including issuance of an order, or seeking injunctive relief, as necessary to prevent the construction or modification of a major emitting facility which does not conform to the requirements of this part, or which is proposed to be constructed in any area designated pursuant to section 7407(d) of this title as attainment or unclassifiable and which is not subject to an implementation plan which meets the requirements of this part.

40a

**42 U.S.C. § 7479: Definitions**

For purposes of this part—

(1) The term “major emitting facility” means any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant from the following types of stationary sources: fossil-fuel fired steam electric plants of more than two hundred and fifty million British thermal units per hour heat input, coal cleaning plants (thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants, primary copper smelters, municipal incinerators capable of charging more than fifty tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production facilities, chemical process plants, fossil-fuel boilers of more than two hundred and fifty million British thermal units per hour heat input, petroleum storage and transfer facilities with a capacity exceeding three hundred thousand barrels, taconite ore processing facilities, glass fiber processing plants, charcoal production facilities. Such term also includes any other source with the potential to emit two hundred and fifty tons per year or more of any air pollutant. This term shall not include new or modified facilities which are nonprofit health or education institutions which have been exempted by the State.

41a

**(2)**

**(A)** The term “commenced” as applied to construction of a major emitting facility means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has (i) begun, or caused to begin, a continuous program of physical on-site construction of the facility or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed within a reasonable time.

**(B)** The term “necessary preconstruction approvals or permits” means those permits or approvals, required by the permitting authority as a precondition to undertaking any activity under clauses (i) or (ii) of subparagraph (A) of this paragraph.

**(C)** The term “construction” when used in connection with any source or facility, includes the modification (as defined in section 7411(a) of this title) of any source or facility.

**(3)** The term “best available control technology” means an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation under this chapter emitted from or which results from any major emitting facility, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic

## 42a

impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each such pollutant. In no event shall application of "best available control technology" result in emissions of any pollutants which will exceed the emissions allowed by any applicable standard established pursuant to section 7411 or 7412 of this title. Emissions from any source utilizing clean fuels, or any other means, to comply with this paragraph shall not be allowed to increase above levels that would have been required under this paragraph as it existed prior to November 15, 1990.

(4) The term "baseline concentration" means, with respect to a pollutant, the ambient concentration levels which exist at the time of the first application for a permit in an area subject to this part, based on air quality data available in the Environmental Protection Agency or a State air pollution control agency and on such monitoring data as the permit applicant is required to submit. Such ambient concentration levels shall take into account all projected emissions in, or which may affect, such area from any major emitting facility on which construction commenced prior to January 6, 1975, but which has not begun operation by the date of the baseline air quality concentration determination. Emissions of sulfur oxides and particulate matter from any major emitting facility on which construction commenced after January 6, 1975, shall not be included in the baseline and shall be counted against the maximum allowable increases in pollutant concentrations established under this part.

43a

**42 U.S.C. § 7491: Visibility protection for Federal Class I areas**

**(a)** Impairment of visibility; list of areas; study and report

**(1)** Congress hereby declares as a national goal the prevention of any future, and the remedying of any existing, impairment of visibility in mandatory class I Federal areas which impairment results from manmade air pollution.

**(2)** Not later than six months after August 7, 1977, the Secretary of the Interior in consultation with other Federal land managers shall review all mandatory class I Federal areas and identify those where visibility is an important value of the area. From time to time the Secretary of the Interior may revise such identifications. Not later than one year after August 7, 1977, the Administrator shall, after consultation with the Secretary of the Interior, promulgate a list of mandatory class I Federal areas in which he determines visibility is an important value.

**(3)** Not later than eighteen months after August 7, 1977, the Administrator shall complete a study and report to Congress on available methods for implementing the national goal set forth in paragraph (1). Such report shall include recommendations for—

**(A)** methods for identifying, characterizing, determining, quantifying, and measuring visibility impairment in Federal areas referred to in paragraph (1), and

44a

**(B)** modeling techniques (or other methods) for determining the extent to which manmade air pollution may reasonably be anticipated to cause or contribute to such impairment, and

**(C)** methods for preventing and remedying such manmade air pollution and resulting visibility impairment.

Such report shall also identify the classes or categories of sources and the types of air pollutants which, alone or in conjunction with other sources or pollutants, may reasonably be anticipated to cause or contribute significantly to impairment of visibility.

**(4)** Not later than twenty-four months after August 7, 1977, and after notice and public hearing, the Administrator shall promulgate regulations to assure **(A)** reasonable progress toward meeting the national goal specified in paragraph (1), and **(B)** compliance with the requirements of this section.

**(b) Regulations**

Regulations under subsection (a)(4) of this section shall—

**(1)** provide guidelines to the States, taking into account the recommendations under subsection (a)(3) of this section on appropriate techniques and methods for implementing this section (as provided in subparagraphs **(A)** through **(C)** of such subsection (a)(3) ), and

45a

**(2)** require each applicable implementation plan for a State in which any area listed by the Administrator under subsection (a)(2) of this section is located (or for a State the emissions from which may reasonably be anticipated to cause or contribute to any impairment of visibility in any such area) to contain such emission limits, schedules of compliance and other measures as may be necessary to make reasonable progress toward meeting the national goal specified in subsection (a) of this section, including—

**(A)** except as otherwise provided pursuant to subsection (c) of this section, a requirement that each major stationary source which is in existence on August 7, 1977, but which has not been in operation for more than fifteen years as of such date, and which, as determined by the State (or the Administrator in the case of a plan promulgated under section 7410(c) of this title) emits any air pollutant which may reasonably be anticipated to cause or contribute to any impairment of visibility in any such area, shall procure, install, and operate, as expeditiously as practicable (and maintain thereafter) the best available retrofit technology, as determined by the State (or the Administrator in the case of a plan promulgated under section 7410(c) of this title) for controlling emissions from such source for the purpose of eliminating or reducing any such impairment, and

**(B)** a long-term (ten to fifteen years) strategy for making reasonable progress toward meeting the national goal specified in subsection (a) of this section.

46a

In the case of a fossil-fuel fired generating powerplant having a total generating capacity in excess of 750 megawatts, the emission limitations required under this paragraph shall be determined pursuant to guidelines, promulgated by the Administrator under paragraph (1).

**(c) Exemptions**

**(1)** The Administrator may, by rule, after notice and opportunity for public hearing, exempt any major stationary source from the requirement of subsection (b)(2)(A) of this section, upon his determination that such source does not or will not, by itself or in combination with other sources, emit any air pollutant which may reasonably be anticipated to cause or contribute to a significant impairment of visibility in any mandatory class I Federal area.

**(2)** Paragraph (1) of this subsection shall not be applicable to any fossil-fuel fired powerplant with total design capacity of 750 megawatts or more, unless the owner or operator of any such plant demonstrates to the satisfaction of the Administrator that such powerplant is located at such distance from all areas listed by the Administrator under subsection (a)(2) of this section that such powerplant does not or will not, by itself or in combination with other sources, emit any air pollutant which may reasonably be anticipated to cause or contribute to significant impairment of visibility in any such area.

47a

**(3)** An exemption under this subsection shall be effective only upon concurrence by the appropriate Federal land manager or managers with the Administrator's determination under this subsection.

**(d)** Consultations with appropriate Federal land managers

Before holding the public hearing on the proposed revision of an applicable implementation plan to meet the requirements of this section, the State (or the Administrator, in the case of a plan promulgated under section 7410(c) of this title) shall consult in person with the appropriate Federal land manager or managers and shall include a summary of the conclusions and recommendations of the Federal land managers in the notice to the public.

**(e)** Buffer zones

In promulgating regulations under this section, the Administrator shall not require the use of any automatic or uniform buffer zone or zones.

**(f)** Nondiscretionary duty

For purposes of section 7604(a)(2) of this title, the meeting of the national goal specified in subsection (a)(1) of this section by any specific date or dates shall not be considered a "nondiscretionary duty" of the Administrator.

**(g)** Definitions

48a

For the purpose of this section—

(1) in determining reasonable progress there shall be taken into consideration the costs of compliance, the time necessary for compliance, and the energy and nonair quality environmental impacts of compliance, and the remaining useful life of any existing source subject to such requirements;

(2) in determining best available retrofit technology the State (or the Administrator in determining emission limitations which reflect such technology) shall take into consideration the costs of compliance, the energy and nonair quality environmental impacts of compliance, any existing pollution control technology in use at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology;

(3) the term “manmade air pollution” means air pollution which results directly or indirectly from human activities;

(4) the term “as expeditiously as practicable” means as expeditiously as practicable but in no event later than five years after the date of approval of a plan revision under this section (or the date of promulgation of such a plan revision in the case of action by the Administrator under section 7410(c) of this title for purposes of this section);

(5) the term “mandatory class I Federal areas” means Federal areas which may not be designated as other than class I under this part;

49a

(6) the terms “visibility impairment” and “impairment of visibility” shall include reduction in visual range and atmospheric discoloration; and

(7) the term “major stationary source” means the following types of stationary sources with the potential to emit 250 tons or more of any pollutant: fossil-fuel fired steam electric plants of more than 250 million British thermal units per hour heat input, coal cleaning plants (thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants, primary copper smelters, municipal incinerators capable of charging more than 250 tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production facilities, chemical process plants, fossil-fuel boilers of more than 250 million British thermal units per hour heat input, petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels, taconite ore processing facilities, glass fiber processing plants, charcoal production facilities.

50a

**42 U.S.C. § 7521: Emission standards for new motor vehicles or new motor vehicle engines**

**(a)** Authority of Administrator to prescribe by regulation

Except as otherwise provided in subsection (b) of this section—

**(1)** The Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare. Such standards shall be applicable to such vehicles and engines for their useful life (as determined under subsection (d) of this section, relating to useful life of vehicles for purposes of certification), whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution.

**(2)** Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.

**(3)**

**(A)** In general

51a

**(i)** Unless the standard is changed as provided in subparagraph (B), regulations under paragraph (1) of this subsection applicable to emissions of hydrocarbons, carbon monoxide, oxides of nitrogen, and particulate matter from classes or categories of heavy-duty vehicles or engines manufactured during or after model year 1983 shall contain standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.

**(ii)** In establishing classes or categories of vehicles or engines for purposes of regulations under this paragraph, the Administrator may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors.

**(B)** Revised standards for heavy duty trucks

**(i)** On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection revising any standard promulgated under, or before the

52a

date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph) and applicable to classes or categories of heavy-duty vehicles or engines.

**(ii)** Effective for the model year 1998 and thereafter, the regulations under paragraph (1) of this subsection applicable to emissions of oxides of nitrogen (NO<sub>x</sub>) from gasoline and diesel-fueled heavy duty trucks shall contain standards which provide that such emissions may not exceed 4.0 grams per brake horsepower hour (gbh).

**(C)** Lead time and stability

Any standard promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines shall apply for a period of no less than 3 model years beginning no earlier than the model year commencing 4 years after such revised standard is promulgated.

**(D)** Rebuilding practices

The Administrator shall study the practice of rebuilding heavy-duty engines and the impact rebuilding has on engine emissions. On the basis of that study and other information available to the Administrator, the Administrator may prescribe requirements to control rebuilding practices, including standards applicable to emissions from any rebuilt heavy-duty engines (whether or not the engine is past its statutory useful life), which in the Administrator's judgment

53a

cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare taking costs into account. Any regulation shall take effect after a period the Administrator finds necessary to permit the development and application of the requisite control measures, giving appropriate consideration to the cost of compliance within the period and energy and safety factors.

**(E) Motorcycles**

For purposes of this paragraph, motorcycles and motorcycle engines shall be treated in the same manner as heavy-duty vehicles and engines (except as otherwise permitted under section 7525(f)(1) of this title) unless the Administrator promulgates a rule reclassifying motorcycles as light-duty vehicles within the meaning of this section or unless the Administrator promulgates regulations under subsection (a) of this section applying standards applicable to the emission of air pollutants from motorcycles as a separate class or category. In any case in which such standards are promulgated for such emissions from motorcycles as a separate class or category, the Administrator, in promulgating such standards, shall consider the need to achieve equivalency of emission reductions between motorcycles and other motor vehicles to the maximum extent practicable.

**(4)**

**(A)** Effective with respect to vehicles and engines manufactured after model year 1978, no emission

54a

control device, system, or element of design shall be used in a new motor vehicle or new motor vehicle engine for purposes of complying with requirements prescribed under this subchapter if such device, system, or element of design will cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function.

**(B)** In determining whether an unreasonable risk exists under subparagraph (A), the Administrator shall consider, among other factors, (i) whether and to what extent the use of any device, system, or element of design causes, increases, reduces, or eliminates emissions of any unregulated pollutants; (ii) available methods for reducing or eliminating any risk to public health, welfare, or safety which may be associated with the use of such device, system, or element of design, and (iii) the availability of other devices, systems, or elements of design which may be used to conform to requirements prescribed under this subchapter without causing or contributing to such unreasonable risk. The Administrator shall include in the consideration required by this paragraph all relevant information developed pursuant to section 7548 of this title.

**(5)**

**(A)** If the Administrator promulgates final regulations which define the degree of control required and the test procedures by which compliance could be determined for gasoline vapor recovery of uncontrolled emissions from the fueling of motor vehicles, the Administrator shall,

## 55a

after consultation with the Secretary of Transportation with respect to motor vehicle safety, prescribe, by regulation, fill pipe standards for new motor vehicles in order to insure effective connection between such fill pipe and any vapor recovery system which the Administrator determines may be required to comply with such vapor recovery regulations. In promulgating such standards the Administrator shall take into consideration limits on fill pipe diameter, minimum design criteria for nozzle retainer lips, limits on the location of the unleaded fuel restrictors, a minimum access zone surrounding a fill pipe, a minimum pipe or nozzle insertion angle, and such other factors as he deems pertinent.

**(B)** Regulations prescribing standards under subparagraph (A) shall not become effective until the introduction of the model year for which it would be feasible to implement such standards, taking into consideration the restraints of an adequate leadtime for design and production.

**(C)** Nothing in subparagraph (A) shall (i) prevent the Administrator from specifying different nozzle and fill neck sizes for gasoline with additives and gasoline without additives or (ii) permit the Administrator to require a specific location, configuration, modeling, or styling of the motor vehicle body with respect to the fuel tank fill neck or fill nozzle clearance envelope.

**(D)** For the purpose of this paragraph, the term "fill pipe" shall include the fuel tank fill pipe, fill neck, fill inlet, and closure.

56a

**(6) Onboard vapor recovery**

Within 1 year after November 15, 1990, the Administrator shall, after consultation with the Secretary of Transportation regarding the safety of vehicle-based (“onboard”) systems for the control of vehicle refueling emissions, promulgate standards under this section requiring that new light-duty vehicles manufactured beginning in the fourth model year after the model year in which the standards are promulgated and thereafter shall be equipped with such systems. The standards required under this paragraph shall apply to a percentage of each manufacturer’s fleet of new light-duty vehicles beginning with the fourth model year after the model year in which the standards are promulgated. The percentage shall be as specified in the following table:

**IMPLEMENTATION SCHEDULE FOR ONBOARD VAPOR RECOVERY REQUIREMENTS**

<b>Model year commencing after standards promulgated</b>	<b>Percentage*</b>
Fourth.....	40
Fifth.....	80
After Fifth .....	100

\*Percentages in the table refer to a percentage of the manufacturer’s sales volume.

The standards shall require that such systems provide a minimum evaporative emission capture

## 57a

efficiency of 95 percent. The requirements of section 7511a(b)(3) of this title (relating to stage II gasoline vapor recovery) for areas classified under section 7511 of this title as moderate for ozone shall not apply after promulgation of such standards and the Administrator may, by rule, revise or waive the application of the requirements of such section 7511a(b)(3) of this title for areas classified under section 7511 of this title as Serious, Severe, or Extreme for ozone, as appropriate, after such time as the Administrator determines that onboard emissions control systems required under this paragraph are in widespread use throughout the motor vehicle fleet.

**(b)** Emissions of carbon monoxide, hydrocarbons, and oxides of nitrogen; annual report to Congress; waiver of emission standards; research objectives

**(1)**

**(A)** The regulations under subsection (a) of this section applicable to emissions of carbon monoxide and hydrocarbons from light-duty vehicles and engines manufactured during model years 1977 through 1979 shall contain standards which provide that such emissions from such vehicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide. The regulations under subsection (a) of this section applicable to emissions of carbon monoxide from light-duty vehicles and engines manufactured during the model year 1980 shall contain standards which provide that such emissions may not exceed 7.0 grams per vehicle mile. The regulations under subsection (a) of this section applicable to

## 58a

emissions of hydrocarbons from light-duty vehicles and engines manufactured during or after model year 1980 shall contain standards which require a reduction of at least 90 percent from emissions of such pollutant allowable under the standards under this section applicable to light-duty vehicles and engines manufactured in model year 1970. Unless waived as provided in paragraph (5), regulations under subsection (a) of this section applicable to emissions of carbon monoxide from light-duty vehicles and engines manufactured during or after the model year 1981 shall contain standards which require a reduction of at least 90 percent from emissions of such pollutant allowable under the standards under this section applicable to light-duty vehicles and engines manufactured in model year 1970.

**(B)** The regulations under subsection (a) of this section applicable to emissions of oxides of nitrogen from light-duty vehicles and engines manufactured during model years 1977 through 1980 shall contain standards which provide that such emissions from such vehicles and engines may not exceed 2.0 grams per vehicle mile. The regulations under subsection (a) of this section applicable to emissions of oxides of nitrogen from light-duty vehicles and engines manufactured during the model year 1981 and thereafter shall contain standards which provide that such emissions from such vehicles and engines may not exceed 1.0 gram per vehicle mile. The Administrator shall prescribe standards in lieu of those required by the preceding sentence, which provide that emissions of oxides of nitrogen may not exceed 2.0 grams per vehicle mile for any

59a

light-duty vehicle manufactured during model years 1981 and 1982 by any manufacturer whose production, by corporate identity, for calendar year 1976 was less than three hundred thousand light-duty motor vehicles worldwide if the Administrator determines that—

(i) the ability of such manufacturer to meet emission standards in the 1975 and subsequent model years was, and is, primarily dependent upon technology developed by other manufacturers and purchased from such manufacturers; and

(ii) such manufacturer lacks the financial resources and technological ability to develop such technology.

(C) The Administrator may promulgate regulations under subsection (a)(1) of this section revising any standard prescribed or previously revised under this subsection, as needed to protect public health or welfare, taking costs, energy, and safety into account. Any revised standard shall require a reduction of emissions from the standard that was previously applicable. Any such revision under this subchapter may provide for a phase-in of the standard. It is the intent of Congress that the numerical emission standards specified in subsections (a)(3)(B)(ii), (g), (h), and (i) of this section shall not be modified by the Administrator after November 15, 1990, for any model year before the model year 2004.

(2) Emission standards under paragraph (1), and measurement techniques on which such standards

60a

are based (if not promulgated prior to November 15, 1990), shall be promulgated by regulation within 180 days after November 15, 1990.

**(3)** For purposes of this part--

**(A)**

**(i)** The term “model year” with reference to any specific calendar year means the manufacturer’s annual production period (as determined by the Administrator) which includes January 1 of such calendar year. If the manufacturer has no annual production period, the term “model year” shall mean the calendar year.

**(ii)** For the purpose of assuring that vehicles and engines manufactured before the beginning of a model year were not manufactured for purposes of circumventing the effective date of a standard required to be prescribed by subsection (b) of this section, the Administrator may prescribe regulations defining “model year” otherwise than as provided in clause (i).

**(B)** Repealed. Pub.L. 101-549, Title II, § 230(1), Nov. 15, 1990, 104 Stat. 2529.

**(C)** The term “heavy duty vehicle” means a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways (not including any vehicle operated exclusively on a rail or rails) which has a gross vehicle weight (as determined under regulations promulgated by the Administrator) in excess of six thousand pounds. Such term includes any such vehicle which has

61a

special features enabling off-street or off-highway operation and use.

**(3)** Upon the petition of any manufacturer, the Administrator, after notice and opportunity for public hearing, may waive the standard required under subparagraph (B) of paragraph (1) to not exceed 1.5 grams of oxides of nitrogen per vehicle mile for any class or category of light-duty vehicles or engines manufactured by such manufacturer during any period of up to four model years beginning after the model year 1980 if the manufacturer demonstrates that such waiver is necessary to permit the use of an innovative power train technology, or innovative emission control device or system, in such class or category of vehicles or engines and that such technology or system was not utilized by more than 1 percent of the light-duty vehicles sold in the United States in the 1975 model year. Such waiver may be granted only if the Administrator determines—

**(A)** that such waiver would not endanger public health,

**(B)** that there is a substantial likelihood that the vehicles or engines will be able to comply with the applicable standard under this section at the expiration of the waiver, and

**(C)** that the technology or system has a potential for long-term air quality benefit and has the potential to meet or exceed the average fuel economy standard applicable under the Energy Policy and Conservation Act [42 U.S.C.A. § 6201 et seq.] upon the expiration of the waiver.

62a

No waiver under this subparagraph granted to any manufacturer shall apply to more than 5 percent of such manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater.

**(c)** Feasibility study and investigation by National Academy of Sciences; reports to Administrator and Congress; availability of information

**(1)** The Administrator shall undertake to enter into appropriate arrangements with the National Academy of Sciences to conduct a comprehensive study and investigation of the technological feasibility of meeting the emissions standards required to be prescribed by the Administrator by subsection (b) of this section.

**(2)** Of the funds authorized to be appropriated to the Administrator by this chapter, such amounts as are required shall be available to carry out the study and investigation authorized by paragraph (1) of this subsection.

**(3)** In entering into any arrangement with the National Academy of Sciences for conducting the study and investigation authorized by paragraph (1) of this subsection, the Administrator shall request the National Academy of Sciences to submit semiannual reports on the progress of its study and investigation to the Administrator and the Congress, beginning not later than July 1, 1971, and continuing until such study and investigation is completed.

**(4)** The Administrator shall furnish to such

## 63a

Academy at its request any information which the Academy deems necessary for the purpose of conducting the investigation and study authorized by paragraph (1) of this subsection. For the purpose of furnishing such information, the Administrator may use any authority he has under this chapter (A) to obtain information from any person, and (B) to require such person to conduct such tests, keep such records, and make such reports respecting research or other activities conducted by such person as may be reasonably necessary to carry out this subsection.

**(d) Useful life of vehicles**

The Administrator shall prescribe regulations under which the useful life of vehicles and engines shall be determined for purposes of subsection (a)(1) of this section and section 7541 of this title. Such regulations shall provide that except where a different useful life period is specified in this subchapter useful life shall—

**(1)** in the case of light duty vehicles and light duty vehicle engines and light-duty trucks up to 3,750 lbs. LVW and up to 6,000 lbs. GVWR, be a period of use of five years or fifty thousand miles (or the equivalent), whichever first occurs, except that in the case of any requirement of this section which first becomes applicable after November 15, 1990, where the useful life period is not otherwise specified for such vehicles and engines, the period shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs, with testing for purposes of in-use compliance under section 7541 of this title up to (but not beyond) 7 years or 75,000

64a

miles (or the equivalent), whichever first occurs;

**(2)** in the case of any other motor vehicle or motor vehicle engine (other than motorcycles or motorcycle engines), be a period of use set forth in paragraph (1) unless the Administrator determines that a period of use of greater duration or mileage is appropriate; and

**(3)** in the case of any motorcycle or motorcycle engine, be a period of use the Administrator shall determine.

**(e)** New power sources or propulsion systems

In the event of a new power source or propulsion system for new motor vehicles or new motor vehicle engines is submitted for certification pursuant to section 7525(a) of this title, the Administrator may postpone certification until he has prescribed standards for any air pollutants emitted by such vehicle or engine which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger the public health or welfare but for which standards have not been prescribed under subsection (a) of this section.

**(f)** High altitude regulations

**(1)** The high altitude regulation in effect with respect to model year 1977 motor vehicles shall not apply to the manufacture, distribution, or sale of 1978 and later model year motor vehicles. Any future regulation affecting the sale or distribution of motor vehicles or engines manufactured before the model year 1984 in high altitude areas of the

65a

country shall take effect no earlier than model year 1981.

**(2)** Any such future regulation applicable to high altitude vehicles or engines shall not require a percentage of reduction in the emissions of such vehicles which is greater than the required percentage of reduction in emissions from motor vehicles as set forth in subsection (b) of this section. This percentage reduction shall be determined by comparing any proposed high altitude emission standards to high altitude emissions from vehicles manufactured during model year 1970. In no event shall regulations applicable to high altitude vehicles manufactured before the model year 1984 establish a numerical standard which is more stringent than that applicable to vehicles certified under non-high altitude conditions.

**(3)** Section 7607(d) of this title shall apply to any high altitude regulation referred to in paragraph (2) and before promulgating any such regulation, the Administrator shall consider and make a finding with respect to—

**(A)** the economic impact upon consumers, individual high altitude dealers, and the automobile industry of any such regulation, including the economic impact which was experienced as a result of the regulation imposed during model year 1977 with respect to high altitude certification requirements;

**(B)** the present and future availability of emission control technology capable of meeting the applicable vehicle and engine emission

66a

requirements without reducing model availability;  
and

**(C)** the likelihood that the adoption of such a high altitude regulation will result in any significant improvement in air quality in any area to which it shall apply.

**(g)** Light-duty trucks up to 6,000 lbs. GVWR and light-duty vehicles; standards for model years after 1993

**(1)** NMHC, CO, and NO<sub>x</sub>

Effective with respect to the model year 1994 and thereafter, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), carbon monoxide (CO), and oxides of nitrogen (NO<sub>x</sub>) from light-duty trucks (LDTs) of up to 6,000 lbs. gross vehicle weight rating (GVWR) and light-duty vehicles (LDVs) shall contain standards which provide that emissions from a percentage of each manufacturer's sales volume of such vehicles and trucks shall comply with the levels specified in table G. The percentage shall be as specified in the implementation schedule below:

67a

**TABLE G—EMISSION STANDARDS FOR NMHC, CO,  
AND NO<sub>x</sub> FROM LIGHT-DUTY TRUCKS OF UP TO 6,000  
LBS. GVWR AND LIGHT-DUTY VEHICLES**

Vehicle type	Column A			Column B		
	(5 yrs/50,000 mi)			(10 yrs/100,000 mi)		
	NMHC	CO	NO <sub>x</sub>	NMHC	CO	NO <sub>x</sub>
LDTs (0-3,750 lbs. LVW) and light-duty vehicles.....	0.25	3.4	0.4*	0.31	4.2	0.6*
LDTs (3,751-5,750 lbs. LVW).....	0.32	4.4	0.7**	0.40	5.5	0.97

Standards are expressed in grams per mile (gpm).

For standards under column A, for purposes of certification under section 7525 of this title, the applicable useful life shall be 5 years or 50,000 miles (or the equivalent), whichever first occurs.

For standards under column B, for purposes of certification under section 7525 of this title, the applicable useful life shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs.

\* In the case of diesel-fueled LDTs (0-3,750 lvw) and light-duty vehicles, before the model year 2004, in lieu of the 0.4 and 0.6 standards for NO<sub>x</sub>, the applicable standards for NO<sub>x</sub> shall be 1.0 gpm for a useful life of 5 years or 50,000 miles (or the equivalent), whichever first occurs, and 1.25 gpm for a useful life of 10 years or 100,000 miles (or the equivalent), whichever first occurs.

\*\* This standard does not apply to diesel-fueled LDTs (3,751-5,750 lbs. LVW).

68a

**IMPLEMENTATION SCHEDULE FOR  
TABLE G STANDARDS**

<b>Model year</b>	<b>Percentage *</b>
1994 .....	40
1995 .....	80
after 1995.....	100

**(2) PM Standard**

Effective with respect to model year 1994 and thereafter in the case of light-duty vehicles, and effective with respect to the model year 1995 and thereafter in the case of light-duty trucks (LDTs) of up to 6,000 lbs. gross vehicle weight rating (GVWR), the regulations under subsection (a) of this section applicable to emissions of particulate matter (PM) from such vehicles and trucks shall contain standards which provide that such emissions from a percentage of each manufacturer's sales volume of such vehicles and trucks shall not exceed the levels specified in the table below. The percentage shall be as specified in the Implementation Schedule below.

**PM STANDARD FOR LDTS OF UP TO 6,000  
LBS. GVWR**

<b>Useful life period</b>	<b>Standard</b>
5/50,000 .....	0.80 gpm
10/100,000 .....	0.10 gpm

69a

The applicable useful life, for purposes of certification under section 7525 of this title and for purposes of in-use compliance under section 7541 of this title, shall be 5 years or 50,000 miles (or the equivalent), whichever first occurs, in the case of the 5/50,000 standard.

The applicable useful life, for purposes of certification under section 7525 of this title and for purposes of in-use compliance under section 7541 of this title, shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs in the case of the 10/100,000 standard.

**IMPLEMENTATION SCHEDULE FOR PM STANDARDS**

1995 .....	80%*	40%*
1996 .....	100%*	80%*
after 1996.....	100%*	100%*

---

**(h)** Light-duty trucks of more than 6,000 lbs. GVWR; standards for model years after 1995

Effective with respect to the model year 1996 and thereafter, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), carbon monoxide (CO), oxides

## 70a

of nitrogen (NO<sub>x</sub>), and particulate matter (PM) from light-duty trucks (LDTs) of more than 6,000 lbs. gross vehicle weight rating (GVWR) shall contain standards which provide that emissions from a specified percentage of each manufacturer's sales volume of such trucks shall comply with the levels specified in table H. The specified percentage shall be 50 percent in model year 1996 and 100 percent thereafter.

**TABLE H--EMISSION STANDARDS FOR NMHC AND CO FROM GASOLINE AND DIESEL FUELED LIGHT-DUTY TRUCKS OF MORE THAN 6,000 LBS. GVWR**

LDT Test weight	Column A			Column B			
	(5 yrs/50,000 mi)			(11 yrs/120,000 mi)			
	NMHC	CO	NO <sub>x</sub>	NMHC	CO	NO <sub>x</sub>	PM
3,751-5,750 lbs. TW	0.32	4.4	0.7*	0.46	6.4	0.98	0.10
Over 5,750 lbs. TW	0.39	5.0	1.1*	0.56	7.3	1.53	0.12

Standards are expressed in grams per mile (GPM).

For standards under column A, for purposes of certification under section 7525 of this title, the applicable useful life shall be 5 years or 50,000 miles (or the equivalent) whichever first occurs.

For standards under column B, for purposes of certification under section 7525 of this title, the applicable useful life shall be 11 years or 120,000 miles (or the equivalent), whichever first occurs.

\* Not applicable to diesel-fueled LDTs.

71a

**(i) Phase II study for certain light-duty vehicles and light-duty trucks**

**(1)** The Administrator, with the participation of the Office of Technology Assessment, shall study whether or not further reductions in emissions from light-duty vehicles and light-duty trucks should be required pursuant to this subchapter. The study shall consider whether to establish with respect to model years commencing after January 1, 2003, the standards and useful life period for gasoline and diesel-fueled light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less specified in the following table:

**TABLE 3--PENDING EMISSION STANDARDS FOR GASOLINE AND DIESEL FUELED LIGHT-DUTY VEHICLES AND LIGHT-DUTY TRUCKS 3,750 LBS. LVW OR LESS**

Pollutant	Emission level*
NMHC .....	0.125 GPM
NOx .....	0.2 GPM
CO .....	1.7 GPM

Such study shall also consider other standards and useful life periods which are more stringent or less stringent than those set forth in table 3 (but more stringent than those referred to in subsections (g) and (h) of this section).

72a

**(2)**

**(A)** As part of the study under paragraph (1), the Administrator shall examine the need for further reductions in emissions in order to attain or maintain the national ambient air quality standards, taking into consideration the waiver provisions of section 7543(b) of this title. As part of such study, the Administrator shall also examine—

**(i)** the availability of technology (including the costs thereof), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for meeting more stringent emission standards than those provided in subsections (g) and (h) of this section for model years commencing not earlier than after January 1, 2003, and not later than model year 2006, including the lead time and safety and energy impacts of meeting more stringent emission standards; and

**(ii)** the need for, and cost effectiveness of, obtaining further reductions in emissions from such light-duty vehicles and light-duty trucks, taking into consideration alternative means of attaining or maintaining the national primary ambient air quality standards pursuant to State implementation plans and other requirements of this chapter, including their feasibility and cost effectiveness.

**(B)** The Administrator shall submit a report to

73a

Congress no later than June 1, 1997, containing the results of the study under this subsection, including the results of the examination conducted under subparagraph (A). Before submittal of such report the Administrator shall provide a reasonable opportunity for public comment and shall include a summary of such comments in the report to Congress.

**(3)**

**(A)** Based on the study under paragraph (1) the Administrator shall determine, by rule, within 3 calendar years after the report is submitted to Congress, but not later than December 31, 1999, whether—

**(i)** there is a need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will be available, as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); and

**(iii)** obtaining further reductions in emissions from such vehicles will be needed and cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii).

74a

The rulemaking under this paragraph shall commence within 3 months after submission of the report to Congress under paragraph (2)(B).

**(B)** If the Administrator determines under subparagraph (A) that—

**(i)** there is no need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will not be available as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); or

**(iii)** obtaining further reductions in emissions from such vehicles will not be needed or cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii),

the Administrator shall not promulgate more stringent standards than those in effect pursuant to subsections (g) and (h) of this section. Nothing in this paragraph shall prohibit the Administrator from exercising the Administrator's authority under subsection (a) of this section to promulgate more stringent standards for light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less at any other time thereafter in accordance with subsection (a) of this

75a

section.

**(C)** If the Administrator determines under subparagraph (A) that—

**(i)** there is a need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will be available, as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); and

**(iii)** obtaining further reductions in emissions from such vehicles will be needed and cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii),

the Administrator shall either promulgate the standards (and useful life periods) set forth in Table 3 in paragraph (1) or promulgate alternative standards (and useful life periods) which are more stringent than those referred to in subsections (g) and (h) of this section. Any such standards (or useful life periods) promulgated by the Administrator shall take effect with respect to any such vehicles or engines no earlier than the model year 2003 but not later than model year 2006, as determined by the Administrator in the rule.

**(D)** Nothing in this paragraph shall be construed

## 76a

by the Administrator or by a court as a presumption that any standards (or useful life period) set forth in Table 3 shall be promulgated in the rulemaking required under this paragraph. The action required of the Administrator in accordance with this paragraph shall be treated as a nondiscretionary duty for purposes of section 7604(a)(2) of this title (relating to citizen suits).

**(E)** Unless the Administrator determines not to promulgate more stringent standards as provided in subparagraph (B) or to postpone the effective date of standards referred to in Table 3 in paragraph (1) or to establish alternative standards as provided in subparagraph (C), effective with respect to model years commencing after January 1, 2003, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), oxides of nitrogen (NO<sub>x</sub>), and carbon monoxide (CO) from motor vehicles and motor vehicle engines in the classes specified in Table 3 in paragraph (1) above shall contain standards which provide that emissions may not exceed the pending emission levels specified in Table 3 in paragraph (1).

**(j)** Cold CO standard

**(1)** Phase I

Not later than 12 months after November 15, 1990, the Administrator shall promulgate regulations under subsection (a) of this section applicable to emissions of carbon monoxide from 1994 and later model year light-duty vehicles and light-duty trucks

77a

when operated at 20 degrees Fahrenheit. The regulations shall contain standards which provide that emissions of carbon monoxide from a manufacturer's vehicles when operated at 20 degrees Fahrenheit may not exceed, in the case of light-duty vehicles, 10.0 grams per mile, and in the case of light-duty trucks, a level comparable in stringency to the standard applicable to light-duty vehicles. The standards shall take effect after model year 1993 according to a phase-in schedule which requires a percentage of each manufacturer's sales volume of light-duty vehicles and light-duty trucks to comply with applicable standards after model year 1993. The percentage shall be as specified in the following table:

**PHASE-IN SCHEDULE FOR COLD START STANDARDS**

<b>Model Year</b>	<b>Percentage</b>
1994 .....	40
1995 .....	80
1996 and after .....	100

**(2) Phase II**

**(A)** Not later than June 1, 1997, the Administrator shall complete a study assessing the need for further reductions in emissions of carbon monoxide and the maximum reductions in such emissions achievable from model year 2001 and later model year light-duty vehicles and light-duty trucks when operated at 20 degrees

78a

Fahrenheit.

**(B)**

**(i)** If as of June 1, 1997, 6 or more nonattainment areas have a carbon monoxide design value of 9.5 ppm or greater, the regulations under subsection (a)(1) of this section applicable to emissions of carbon monoxide from model year 2002 and later model year light-duty vehicles and light-duty trucks shall contain standards which provide that emissions of carbon monoxide from such vehicles and trucks when operated at 20 degrees Fahrenheit may not exceed 3.4 grams per mile (gpm) in the case of light-duty vehicles and 4.4 grams per mile (gpm) in the case of light-duty trucks up to 6,000 GVWR and a level comparable in stringency in the case of light-duty trucks 6,000 GVWR and above.

**(ii)** In determining for purposes of this subparagraph whether 6 or more nonattainment areas have a carbon monoxide design value of 9.5 ppm or greater, the Administrator shall exclude the areas of Steubenville, Ohio, and Oshkosh, Wisconsin.

**(3) Useful-life for phase I and phase II standards**

In the case of the standards referred to in paragraphs (1) and (2), for purposes of certification under section 7525 of this title and in-use compliance under section 7541 of this title, the applicable useful life period shall be 5 years or 50,000 miles, whichever first occurs, except that the

79a

Administrator may extend such useful life period (for purposes of section 7525 of this title, or section 7541 of this title, or both) if he determines that it is feasible for vehicles and engines subject to such standards to meet such standards for a longer useful life. If the Administrator extends such useful life period, the Administrator may make an appropriate adjustment of applicable standards for such extended useful life. No such extended useful life shall extend beyond the useful life period provided in regulations under subsection (d) of this section.

**(4) Heavy-duty vehicles and engines**

The Administrator may also promulgate regulations under subsection (a)(1) of this section applicable to emissions of carbon monoxide from heavy-duty vehicles and engines when operated at cold temperatures.

**(k) Control of evaporative emissions**

The Administrator shall promulgate (and from time to time revise) regulations applicable to evaporative emissions of hydrocarbons from all gasoline-fueled motor vehicles—

**(1)** during operation; and

**(2)** over 2 or more days of nonuse;

under ozone-prone summertime conditions (as determined by regulations of the Administrator). The regulations shall take effect as expeditiously as possible and shall require the greatest degree of

## 80a

emission reduction achievable by means reasonably expected to be available for production during any model year to which the regulations apply, giving appropriate consideration to fuel volatility, and to cost, energy, and safety factors associated with the application of the appropriate technology. The Administrator shall commence a rulemaking under this subsection within 12 months after November 15, 1990. If final regulations are not promulgated under this subsection within 18 months after November 15, 1990, the Administrator shall submit a statement to the Congress containing an explanation of the reasons for the delay and a date certain for promulgation of such final regulations in accordance with this chapter. Such date certain shall not be later than 15 months after the expiration of such 18 month deadline.

**(l) Mobile source-related air toxics****(1) Study**

Not later than 18 months after November 15, 1990, the Administrator shall complete a study of the need for, and feasibility of, controlling emissions of toxic air pollutants which are unregulated under this chapter and associated with motor vehicles and motor vehicle fuels, and the need for, and feasibility of, controlling such emissions and the means and measures for such controls. The study shall focus on those categories of emissions that pose the greatest risk to human health or about which significant uncertainties remain, including emissions of benzene, formaldehyde, and 1, 3 butadiene. The proposed report shall be available for public review and comment and shall include a summary of all comments.

## 81a

**(2) Standards**

Within 54 months after November 15, 1990, the Administrator shall, based on the study under paragraph (1), promulgate (and from time to time revise) regulations under subsection (a)(1) of this section or section 7545(c)(1) of this title containing reasonable requirements to control hazardous air pollutants from motor vehicles and motor vehicle fuels. The regulations shall contain standards for such fuels or vehicles, or both, which the Administrator determines reflect the greatest degree of emission reduction achievable through the application of technology which will be available, taking into consideration the standards established under subsection (a) of this section, the availability and costs of the technology, and noise, energy, and safety factors, and lead time. Such regulations shall not be inconsistent with standards under subsection (a) of this section. The regulations shall, at a minimum, apply to emissions of benzene and formaldehyde.

**(m) Emissions control diagnostics****(1) Regulations**

Within 18 months after November 15, 1990, the Administrator shall promulgate regulations under subsection (a) of this section requiring manufacturers to install on all new light duty vehicles and light duty trucks diagnostics systems capable of—

**(A)** accurately identifying for the vehicle's useful life as established under this section, emission-related systems deterioration or malfunction,

82a

including, at a minimum, the catalytic converter and oxygen sensor, which could cause or result in failure of the vehicles to comply with emission standards established under this section,

**(B)** alerting the vehicle's owner or operator to the likely need for emission-related components or systems maintenance or repair,

**(C)** storing and retrieving fault codes specified by the Administrator, and

**(D)** providing access to stored information in a manner specified by the Administrator.

The Administrator may, in the Administrator's discretion, promulgate regulations requiring manufacturers to install such onboard diagnostic systems on heavy-duty vehicles and engines.

**(2)** Effective date

The regulations required under paragraph (1) of this subsection shall take effect in model year 1994, except that the Administrator may waive the application of such regulations for model year 1994 or 1995 (or both) with respect to any class or category of motor vehicles if the Administrator determines that it would be infeasible to apply the regulations to that class or category in such model year or years, consistent with corresponding regulations or policies adopted by the California Air Resources Board for such systems.

**(3)** State inspection

The Administrator shall by regulation require States that have implementation plans containing

83a

motor vehicle inspection and maintenance programs to amend their plans within 2 years after promulgation of such regulations to provide for inspection of onboard diagnostics systems (as prescribed by regulations under paragraph (1) of this subsection) and for the maintenance or repair of malfunctions or system deterioration identified by or affecting such diagnostics systems. Such regulations shall not be inconsistent with the provisions for warranties promulgated under section 7541(a) and (b) of this title.

**(4) Specific requirements**

In promulgating regulations under this subsection, the Administrator shall require—

**(A)** that any connectors through which the emission control diagnostics system is accessed for inspection, diagnosis, service, or repair shall be standard and uniform on all motor vehicles and motor vehicle engines;

**(B)** that access to the emission control diagnostics system through such connectors shall be unrestricted and shall not require any access code or any device which is only available from a vehicle manufacturer; and

**(C)** that the output of the data from the emission control diagnostics system through such connectors shall be usable without the need for any unique decoding information or device.

**(5) Information availability**

The Administrator, by regulation, shall require (subject to the provisions of section 7542(c) of this

## 84a

title regarding the protection of methods or processes entitled to protection as trade secrets) manufacturers to provide promptly to any person engaged in the repairing or servicing of motor vehicles or motor vehicle engines, and the Administrator for use by any such persons, with any and all information needed to make use of the emission control diagnostics system prescribed under this subsection and such other information including instructions for making emission related diagnosis and repairs. No such information may be withheld under section 7542(c) of this title if that information is provided (directly or indirectly) by the manufacturer to franchised dealers or other persons engaged in the repair, diagnosing, or servicing of motor vehicles or motor vehicle engines. Such information shall also be available to the Administrator, subject to section 7542(c) of this title, in carrying out the Administrator's responsibilities under this section.

**(f) Model years after 1990**

For model years prior to model year 1994, the regulations under subsection (a) of this section applicable to buses other than those subject to standards under section 7554 of this title shall contain a standard which provides that emissions of particulate matter (PM) from such buses may not exceed the standards set forth in the following table:

85a

**PM STANDARD FOR BUSES**

.....

<b>Model year</b>	<b>Standard*</b>
1991 .....	0.25
1992 .....	0.25
1993 and thereafter .....	0.10

86a

**42 U.S.C. § 7602. Definitions**

When used in this chapter—

**(a)** The term “Administrator” means the Administrator of the Environmental Protection Agency.

**(b)** The term “air pollution control agency” means any of the following:

**(1)** A single State agency designated by the Governor of that State as the official State air pollution control agency for purposes of this chapter.

**(2)** An agency established by two or more States and having substantial powers or duties pertaining to the prevention and control of air pollution.

**(3)** A city, county, or other local government health authority, or, in the case of any city, county, or other local government in which there is an agency other than the health authority charged with responsibility for enforcing ordinances or laws relating to the prevention and control of air pollution, such other agency.

**(4)** An agency of two or more municipalities located in the same State or in different States and having substantial powers or duties pertaining to the prevention and control of air pollution.

**(5)** An agency of an Indian tribe.

87a

**(c)** The term “interstate air pollution control agency” means—

**(1)** an air pollution control agency established by two or more States, or

**(2)** an air pollution control agency of two or more municipalities located in different States.

**(d)** The term “State” means a State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands.

**(e)** The term “person” includes an individual, corporation, partnership, association, State, municipality, political subdivision of a State, and any agency, department, or instrumentality of the United States and any officer, agent, or employee thereof.

**(f)** The term “municipality” means a city, town, borough, county, parish, district, or other public body created by or pursuant to State law.

**(g)** The term “air pollutant” means any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air. Such term includes any precursors to the formation of any air pollutant, to the extent the Administrator has identified such precursor or precursors for the particular purpose for which the term “air pollutant” is used.

88a

**(h)** All language referring to effects on welfare includes, but is not limited to, effects on soils, water, crops, vegetation, manmade materials, animals, wildlife, weather, visibility, and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being, whether caused by transformation, conversion, or combination with other air pollutants.

**(i)** The term “Federal land manager” means, with respect to any lands in the United States, the Secretary of the department with authority over such lands.

**(j)** Except as otherwise expressly provided, the terms “major stationary source” and “major emitting facility” mean any stationary facility or source of air pollutants which directly emits, or has the potential to emit, one hundred tons per year or more of any air pollutant (including any major emitting facility or source of fugitive emissions of any such pollutant, as determined by rule by the Administrator).

**(k)** The terms “emission limitation” and “emission standard” mean a requirement established by the State or the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice or operational standard promulgated under this chapter..<sup>1</sup>

**(l)** The term “standard of performance” means a requirement of continuous emission reduction,

89a

including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction.

**(m)** The term “means of emission limitation” means a system of continuous emission reduction (including the use of specific technology or fuels with specified pollution characteristics).

**(n)** The term “primary standard attainment date” means the date specified in the applicable implementation plan for the attainment of a national primary ambient air quality standard for any air pollutant.

**(o)** The term “delayed compliance order” means an order issued by the State or by the Administrator to an existing stationary source, postponing the date required under an applicable implementation plan for compliance by such source with any requirement of such plan.

**(p)** The term “schedule and timetable of compliance” means a schedule of required measures including an enforceable sequence of actions or operations leading to compliance with an emission limitation, other limitation, prohibition, or standard.

**(q)** For purposes of this chapter, the term “applicable implementation plan” means the portion (or portions) of the implementation plan, or most recent revision thereof, which has been approved under section 7410 of this title, or promulgated under section 7410(c) of this title, or promulgated or approved pursuant to regulations promulgated under section 7601(d) of this

90a

title and which implements the relevant requirements of this chapter.

**(r) Indian tribe.** The term “Indian tribe” means any Indian tribe, band, nation, or other organized group or community, including any Alaska Native village, which is Federally recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians.

**(s) VOC.** The term “VOC” means volatile organic compound, as defined by the Administrator.

**(t) PM-10.** The term “PM-10” means particulate matter with an aerodynamic diameter less than or equal to a nominal ten micrometers, as measured by such method as the Administrator may determine.

**(u) NAAQS and CTG.** The term “NAAQS” means national ambient air quality standard. The term “CTG” means a Control Technique Guideline published by the Administrator under section 7408 of this title.

**(v) NO<sub>x</sub>.** The term “NO<sub>x</sub>” means oxides of nitrogen.

**(w) CO.** The term “CO” means carbon monoxide.

**(x) Small source.** The term “small source” means a source that emits less than 100 tons of regulated pollutants per year, or any class of persons that the Administrator determines, through regulation, generally lack technical ability or knowledge regarding control of air pollution.

91a

**(y) Federal implementation plan.** The term “Federal implementation plan” means a plan (or portion thereof) promulgated by the Administrator to fill all or a portion of a gap or otherwise correct all or a portion of an inadequacy in a State implementation plan, and which includes enforceable emission limitations or other control measures, means or techniques (including economic incentives, such as marketable permits or auctions of emissions allowances), and provides for attainment of the relevant national ambient air quality standard.

**(z) Stationary source.** The term “stationary source” means generally any source of an air pollutant except those emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in section 7550 of this title.

92a

**42 U.S.C. § 7661: Definitions**

As used in this subchapter—

**(1) Affected source**

The term “affected source” shall have the meaning given such term in subchapter IV-A of this chapter.

**(2) Major source**

The term “major source” means any stationary source (or any group of stationary sources located within a contiguous area and under common control) that is either of the following:

**(A)** A major source as defined in section 7412 of this title.

**(B)** A major stationary source as defined in section 7602 of this title or part D of subchapter I of this chapter.

**(3) Schedule of compliance**

The term “schedule of compliance” means a schedule of remedial measures, including an enforceable sequence of actions or operations, leading to compliance with an applicable implementation plan, emission standard, emission limitation, or emission prohibition.

**(4) Permitting authority**

The term “permitting authority” means the Administrator or the air pollution control agency

93a

authorized by the Administrator to carry out a permit program under this subchapter.

94a

**42 U.S.C. § 7661a. Permit programs****(a) Violations**

After the effective date of any permit program approved or promulgated under this subchapter, it shall be unlawful for any person to violate any requirement of a permit issued under this subchapter, or to operate an affected source (as provided in subchapter IV-A of this chapter), a major source, any other source (including an area source) subject to standards or regulations under section 7411 or 7412 of this title, any other source required to have a permit under parts C or D of subchapter I of this chapter, or any other stationary source in a category designated (in whole or in part) by regulations promulgated by the Administrator (after notice and public comment) which shall include a finding setting forth the basis for such designation, except in compliance with a permit issued by a permitting authority under this subchapter. (Nothing in this subsection shall be construed to alter the applicable requirements of this chapter that a permit be obtained before construction or modification.) The Administrator may, in the Administrator's discretion and consistent with the applicable provisions of this chapter, promulgate regulations to exempt one or more source categories (in whole or in part) from the requirements of this subsection if the Administrator finds that compliance with such requirements is impracticable, infeasible, or unnecessarily burdensome on such categories, except that the Administrator may not exempt any major source from such requirements.

**(b) Regulations**

95a

The Administrator shall promulgate within 12 months after November 15, 1990, regulations establishing the minimum elements of a permit program to be administered by any air pollution control agency. These elements shall include each of the following:

**(1)** Requirements for permit applications, including a standard application form and criteria for determining in a timely fashion the completeness of applications.

**(2)** Monitoring and reporting requirements.

**(3)**

**(A)** A requirement under State or local law or interstate compact that the owner or operator of all sources subject to the requirement to obtain a permit under this subchapter pay an annual fee, or the equivalent over some other period, sufficient to cover all reasonable (direct and indirect) costs required to develop and administer the permit program requirements of this subchapter, including section 7661f of this title, including the reasonable costs of—

**(i)** reviewing and acting upon any application for such a permit,

**(ii)** if the owner or operator receives a permit for such source, whether before or after November 15, 1990, implementing and enforcing the terms and conditions of any such permit (not including

96a

any court costs or other costs associated with any enforcement action),

**(iii)** emissions and ambient monitoring,

**(iv)** preparing generally applicable regulations, or guidance,

**(v)** modeling, analyses, and demonstrations, and

**(vi)** preparing inventories and tracking emissions.

**(B)** The total amount of fees collected by the permitting authority shall conform to the following requirements:

**(i)** The Administrator shall not approve a program as meeting the requirements of this paragraph unless the State demonstrates that, except as otherwise provided in subparagraphs (ii) through (v) of this subparagraph, the program will result in the collection, in the aggregate, from all sources subject to subparagraph (A), of an amount not less than \$25 per ton of each regulated pollutant, or such other amount as the Administrator may determine adequately reflects the reasonable costs of the permit program.

**(ii)** As used in this subparagraph, the term "regulated pollutant" shall mean (I) a volatile organic compound; (II) each pollutant regulated under section 7411 or 7412 of this title; and (III) each pollutant for which a national primary ambient air quality standard has been

97a

promulgated (except that carbon monoxide shall be excluded from this reference).

**(iii)** In determining the amount under clause (i), the permitting authority is not required to include any amount of regulated pollutant emitted by any source in excess of 4,000 tons per year of that regulated pollutant.

**(iv)** The requirements of clause (i) shall not apply if the permitting authority demonstrates that collecting an amount less than the amount specified under clause (i) will meet the requirements of subparagraph (A).

**(v)** The fee calculated under clause (i) shall be increased (consistent with the need to cover the reasonable costs authorized by subparagraph (A)) in each year beginning after 1990, by the percentage, if any, by which the Consumer Price Index for the most recent calendar year ending before the beginning of such year exceeds the Consumer Price Index for the calendar year 1989. For purposes of this clause—

**(I)** the Consumer Price Index for any calendar year is the average of the Consumer Price Index for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year, and

**(II)** the revision of the Consumer Price Index which is most consistent with the Consumer Price Index for calendar year 1989 shall be used.

98a

**(C)**

**(i)** If the Administrator determines, under subsection (d) of this section, that the fee provisions of the operating permit program do not meet the requirements of this paragraph, or if the Administrator makes a determination, under subsection (i) of this section, that the permitting authority is not adequately administering or enforcing an approved fee program, the Administrator may, in addition to taking any other action authorized under this subchapter, collect reasonable fees from the sources identified under subparagraph (A). Such fees shall be designed solely to cover the Administrator's costs of administering the provisions of the permit program promulgated by the Administrator.

**(ii)** Any source that fails to pay fees lawfully imposed by the Administrator under this subparagraph shall pay a penalty of 50 percent of the fee amount, plus interest on the fee amount computed in accordance with section 6621(a)(2) of Title 26 (relating to computation of interest on underpayment of Federal taxes).

**(iii)** Any fees, penalties, and interest collected under this subparagraph shall be deposited in a special fund in the United States Treasury for licensing and other services, which thereafter shall be available for appropriation, to remain available until expended, subject to appropriation, to carry out the Agency's activities for which the fees were collected. Any

99a

fee required to be collected by a State, local, or interstate agency under this subsection shall be utilized solely to cover all reasonable (direct and indirect) costs required to support the permit program as set forth in subparagraph (A).

**(4)** Requirements for adequate personnel and funding to administer the program.

**(5)** A requirement that the permitting authority have adequate authority to:

**(A)** issue permits and assure compliance by all sources required to have a permit under this subchapter with each applicable standard, regulation or requirement under this chapter;

**(B)** issue permits for a fixed term, not to exceed 5 years;

**(C)** assure that upon issuance or renewal permits incorporate emission limitations and other requirements in an applicable implementation plan;

**(D)** terminate, modify, or revoke and reissue permits for cause;

**(E)** enforce permits, permit fee requirements, and the requirement to obtain a permit, including authority to recover civil penalties in a maximum amount of not less than \$10,000 per day for each violation, and provide appropriate criminal penalties; and

100a

(F) assure that no permit will be issued if the Administrator objects to its issuance in a timely manner under this subchapter.

(6) Adequate, streamlined, and reasonable procedures for expeditiously determining when applications are complete, for processing such applications, for public notice, including offering an opportunity for public comment and a hearing, and for expeditious review of permit actions, including applications, renewals, or revisions, and including an opportunity for judicial review in State court of the final permit action by the applicant, any person who participated in the public comment process, and any other person who could obtain judicial review of that action under applicable law.

(7) To ensure against unreasonable delay by the permitting authority, adequate authority and procedures to provide that a failure of such permitting authority to act on a permit application or permit renewal application (in accordance with the time periods specified in section 7661b of this title or, as appropriate, subchapter IV-A of this chapter) shall be treated as a final permit action solely for purposes of obtaining judicial review in State court of an action brought by any person referred to in paragraph (6) to require that action be taken by the permitting authority on such application without additional delay.

(8) Authority, and reasonable procedures consistent with the need for expeditious action by the permitting authority on permit applications and related matters, to make available to the public any permit application, compliance plan, permit, and

101a

monitoring or compliance report under section 7661b(e) of this title, subject to the provisions of section 7414(c) of this title.

**(9)** A requirement that the permitting authority, in the case of permits with a term of 3 or more years for major sources, shall require revisions to the permit to incorporate applicable standards and regulations promulgated under this chapter after the issuance of such permit. Such revisions shall occur as expeditiously as practicable and consistent with the procedures established under paragraph (6) but not later than 18 months after the promulgation of such standards and regulations. No such revision shall be required if the effective date of the standards or regulations is a date after the expiration of the permit term. Such permit revision shall be treated as a permit renewal if it complies with the requirements of this subchapter regarding renewals.

**(10)** Provisions to allow changes within a permitted facility (or one operating pursuant to section 7661b(d) of this title) without requiring a permit revision, if the changes are not modifications under any provision of subchapter I of this chapter and the changes do not exceed the emissions allowable under the permit (whether expressed therein as a rate of emissions or in terms of total emissions: *Provided*, That the facility provides the Administrator and the permitting authority with written notification in advance of the proposed changes which shall be a minimum of 7 days, unless the permitting authority provides in its regulations a different timeframe for emergencies.

102a

**(c)** Single permit

A single permit may be issued for a facility with multiple sources.

**(d)** Submission and approval

**(1)** Not later than 3 years after November 15, 1990, the Governor of each State shall develop and submit to the Administrator a permit program under State or local law or under an interstate compact meeting the requirements of this subchapter. In addition, the Governor shall submit a legal opinion from the attorney general (or the attorney for those State air pollution control agencies that have independent legal counsel), or from the chief legal officer of an interstate agency, that the laws of the State, locality, or the interstate compact provide adequate authority to carry out the program. Not later than 1 year after receiving a program, and after notice and opportunity for public comment, the Administrator shall approve or disapprove such program, in whole or in part. The Administrator may approve a program to the extent that the program meets the requirements of this chapter, including the regulations issued under subsection (b) of this section. If the program is disapproved, in whole or in part, the Administrator shall notify the Governor of any revisions or modifications necessary to obtain approval. The Governor shall revise and resubmit the program for review under this section within 180 days after receiving notification.

**(2)**

103a

**(A)** If the Governor does not submit a program as required under paragraph (1) or if the Administrator disapproves a program submitted by the Governor under paragraph (1), in whole or in part, the Administrator may, prior to the expiration of the 18-month period referred to in subparagraph (B), in the Administrator's discretion, apply any of the sanctions specified in section 7509(b) of this title.

**(B)** If the Governor does not submit a program as required under paragraph (1), or if the Administrator disapproves any such program submitted by the Governor under paragraph (1), in whole or in part, 18 months after the date required for such submittal or the date of such disapproval, as the case may be, the Administrator shall apply sanctions under section 7509(b) of this title in the same manner and subject to the same deadlines and other conditions as are applicable in the case of a determination, disapproval, or finding under section 7509(a) of this title.

**(C)** The sanctions under section 7509(b)(2) of this title shall not apply pursuant to this paragraph in any area unless the failure to submit or the disapproval referred to in subparagraph (A) or (B) relates to an air pollutant for which such area has been designated a nonattainment area (as defined in part D of subchapter I of this chapter).

**(3)** If a program meeting the requirements of this subchapter has not been approved in whole for any State, the Administrator shall, 2 years after the date required for submission of such a program

104a

under paragraph (1), promulgate, administer, and enforce a program under this subchapter for that State.

**(e) Suspension**

The Administrator shall suspend the issuance of permits promptly upon publication of notice of approval of a permit program under this section, but may, in such notice, retain jurisdiction over permits that have been federally issued, but for which the administrative or judicial review process is not complete. The Administrator shall continue to administer and enforce federally issued permits under this subchapter until they are replaced by a permit issued by a permitting program. Nothing in this subsection should be construed to limit the Administrator's ability to enforce permits issued by a State.

**(f) Prohibition**

No partial permit program shall be approved unless, at a minimum, it applies, and ensures compliance with, this subchapter and each of the following:

- (1)** All requirements established under subchapter IV-A of this chapter applicable to “affected sources”.
- (2)** All requirements established under section 7412 of this title applicable to “major sources”, “area sources,” and “new sources”.
- (3)** All requirements of subchapter I of this chapter (other than section 7412 of this title) applicable to

105a

sources required to have a permit under this subchapter.

Approval of a partial program shall not relieve the State of its obligation to submit a complete program, nor from the application of any sanctions under this chapter for failure to submit an approvable permit program.

**(g)** Interim approval

If a program (including a partial permit program) submitted under this subchapter substantially meets the requirements of this subchapter, but is not fully approvable, the Administrator may by rule grant the program interim approval. In the notice of final rulemaking, the Administrator shall specify the changes that must be made before the program can receive full approval. An interim approval under this subsection shall expire on a date set by the Administrator not later than 2 years after such approval, and may not be renewed. For the period of any such interim approval, the provisions of subsection (d)(2) of this section, and the obligation of the Administrator to promulgate a program under this subchapter for the State pursuant to subsection (d)(3) of this section, shall be suspended. Such provisions and such obligation of the Administrator shall apply after the expiration of such interim approval.

**(h)** Effective date

The effective date of a permit program, or partial or interim program, approved under this subchapter, shall be the effective date of approval by the

106a

Administrator. The effective date of a permit program, or partial permit program, promulgated by the Administrator shall be the date of promulgation.

**(i) Administration and enforcement**

**(1)** Whenever the Administrator makes a determination that a permitting authority is not adequately administering and enforcing a program, or portion thereof, in accordance with the requirements of this subchapter, the Administrator shall provide notice to the State and may, prior to the expiration of the 18-month period referred to in paragraph (2), in the Administrator's discretion, apply any of the sanctions specified in section 7509(b) of this title.

**(2)** Whenever the Administrator makes a determination that a permitting authority is not adequately administering and enforcing a program, or portion thereof, in accordance with the requirements of this subchapter, 18 months after the date of the notice under paragraph (1), the Administrator shall apply the sanctions under section 7509(b) of this title in the same manner and subject to the same deadlines and other conditions as are applicable in the case of a determination, disapproval, or finding under section 7509(a) of this title.

**(3)** The sanctions under section 7509(b)(2) of this title shall not apply pursuant to this subsection in any area unless the failure to adequately enforce and administer the program relates to an air pollutant for which such area has been designated a nonattainment area.

107a

(4) Whenever the Administrator has made a finding under paragraph (1) with respect to any State, unless the State has corrected such deficiency within 18 months after the date of such finding, the Administrator shall, 2 years after the date of such finding, promulgate, administer, and enforce a program under this subchapter for that State. Nothing in this paragraph shall be construed to affect the validity of a program which has been approved under this subchapter or the authority of any permitting authority acting under such program until such time as such program is promulgated by the Administrator under this paragraph.

108a

**42 U.S.C. § 7661b. Permit applications**

**(a) Applicable date**

Any source specified in section 7661a(a) of this title shall become subject to a permit program, and required to have a permit, on the later of the following dates--

- (1) the effective date of a permit program or partial or interim permit program applicable to the source; or
- (2) the date such source becomes subject to section 7661a(a) of this title.

**(b) Compliance plan**

- (1) The regulations required by section 7661a(b) of this title shall include a requirement that the applicant submit with the permit application a compliance plan describing how the source will comply with all applicable requirements under this chapter. The compliance plan shall include a schedule of compliance, and a schedule under which the permittee will submit progress reports to the permitting authority no less frequently than every 6 months.
- (2) The regulations shall further require the permittee to periodically (but no less frequently than annually) certify that the facility is in compliance with any applicable requirements of the permit, and to promptly report any deviations from permit requirements to the permitting authority.

## 109a

**(c) Deadline**

Any person required to have a permit shall, not later than 12 months after the date on which the source becomes subject to a permit program approved or promulgated under this subchapter, or such earlier date as the permitting authority may establish, submit to the permitting authority a compliance plan and an application for a permit signed by a responsible official, who shall certify the accuracy of the information submitted. The permitting authority shall approve or disapprove a completed application (consistent with the procedures established under this subchapter for consideration of such applications), and shall issue or deny the permit, within 18 months after the date of receipt thereof, except that the permitting authority shall establish a phased schedule for acting on permit applications submitted within the first full year after the effective date of a permit program (or a partial or interim program). Any such schedule shall assure that at least one-third of such permits will be acted on by such authority annually over a period of not to exceed 3 years after such effective date. Such authority shall establish reasonable procedures to prioritize such approval or disapproval actions in the case of applications for construction or modification under the applicable requirements of this chapter.

**(d) Timely and complete applications**

Except for sources required to have a permit before construction or modification under the applicable requirements of this chapter, if an applicant has submitted a timely and complete application for a permit required by this subchapter (including

110a

renewals), but final action has not been taken on such application, the source's failure to have a permit shall not be a violation of this chapter, unless the delay in final action was due to the failure of the applicant timely to submit information required or requested to process the application. No source required to have a permit under this subchapter shall be in violation of section 7661a(a) of this title before the date on which the source is required to submit an application under subsection (c) of this section.

**(e) Copies; availability**

A copy of each permit application, compliance plan (including the schedule of compliance), emissions or compliance monitoring report, certification, and each permit issued under this subchapter, shall be available to the public. If an applicant or permittee is required to submit information entitled to protection from disclosure under section 7414(c) of this title, the applicant or permittee may submit such information separately. The requirements of section 7414(c) of this title shall apply to such information. The contents of a permit shall not be entitled to protection under section 7414(c) of this title.

111a

**42 U.S.C. § 7661c. Permit requirements and conditions**

**(a) Conditions**

Each permit issued under this subchapter shall include enforceable emission limitations and standards, a schedule of compliance, a requirement that the permittee submit to the permitting authority, no less often than every 6 months, the results of any required monitoring, and such other conditions as are necessary to assure compliance with applicable requirements of this chapter, including the requirements of the applicable implementation plan.

**(b) Monitoring and analysis**

The Administrator may by rule prescribe procedures and methods for determining compliance and for monitoring and analysis of pollutants regulated under this chapter, but continuous emissions monitoring need not be required if alternative methods are available that provide sufficiently reliable and timely information for determining compliance. Nothing in this subsection shall be construed to affect any continuous emissions monitoring requirement of subchapter IV-A of this chapter, or where required elsewhere in this chapter.

**(c) Inspection, entry, monitoring, certification, and reporting**

Each permit issued under this subchapter shall set forth inspection, entry, monitoring, compliance certification, and reporting requirements to assure compliance with the permit terms and conditions.

112a

Such monitoring and reporting requirements shall conform to any applicable regulation under subsection (b) of this section. Any report required to be submitted by a permit issued to a corporation under this subchapter shall be signed by a responsible corporate official, who shall certify its accuracy.

**(d) General permits**

The permitting authority may, after notice and opportunity for public hearing, issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to permits under this subchapter. No source covered by a general permit shall thereby be relieved from the obligation to file an application under section 7661b of this title.

**(e) Temporary sources**

The permitting authority may issue a single permit authorizing emissions from similar operations at multiple temporary locations. No such permit shall be issued unless it includes conditions that will assure compliance with all the requirements of this chapter at all authorized locations, including, but not limited to, ambient standards and compliance with any applicable increment or visibility requirements under part C of subchapter I of this chapter. Any such permit shall in addition require the owner or operator to notify the permitting authority in advance of each change in location. The permitting authority may require a separate permit fee for operations at each location.

113a

**(f) Permit shield**

Compliance with a permit issued in accordance with this subchapter shall be deemed compliance with section 7661a of this title. Except as otherwise provided by the Administrator by rule, the permit may also provide that compliance with the permit shall be deemed compliance with other applicable provisions of this chapter that relate to the permittee if—

- (1)** the permit includes the applicable requirements of such provisions, or
- (2)** the permitting authority in acting on the permit application makes a determination relating to the permittee that such other provisions (which shall be referred to in such determination) are not applicable and the permit includes the determination or a concise summary thereof.

Nothing in the preceding sentence shall alter or affect the provisions of section 7603 of this title, including the authority of the Administrator under that section.

**QUESTION PRESENTED**

Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.

**RULE 24.1(b) STATEMENT**

Petitioners in Case No. 12-1272 are the Chamber of Commerce of the United States of America, State of Alaska, and American Farm Bureau Federation. The Chamber of Commerce of the United States of America was petitioner or petitioner-intervenor as to all of the challenged agency actions addressed by the consolidated judgment below. The State of Alaska and the American Farm Bureau Federation were petitioners and/or petitioner-intervenors in cases addressed by the consolidated judgment below.

This case has been consolidated with Case Nos. 12-1146, 12-1248, 12-1254, 12-1268, and 12-1269, which arise out of the same proceedings in the court of appeals. Petitioners in those cases are: Utility Air Regulatory Group (*No. 12-1146*); American Chemistry Council; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Iron and Steel Institute; American Petroleum Institute; Brick Industry Association; Clean Air Implementation Project; Corn Refiners Association; Glass Association of North America; Independent Petroleum Association of America; Indiana Cast Metals Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Home Builders; The National Association of Manufacturers; National Federation of Independent Business; National Oilseed Processors Association; North American Die Casting Association; Portland Cement Association; Specialty Steel Industry of North America; Tennessee Chamber of Commerce and Industry; Western States Petroleum Association; West Virginia Manufacturers Association; Wisconsin

## iii

Manufacturers and Commerce (*No. 12-1248*); Energy-Intensive Manufacturers' Working Group on Greenhouse Gas Regulation and Glass Packaging Institute (*No. 12-1254*); Southeastern Legal Foundation, Inc.; U.S. Representative Michele Bachmann; U.S. Representative Joe Barton; U.S. Representative Marsha Blackburn; U.S. Representative Kevin Brady; U.S. Representative Paul Broun; U.S. Representative Phil Gingrey; U.S. Representative Steve King; U.S. Representative Jack Kingston; U.S. Representative Tom Price; U.S. Representative Dana Rohrabacher; U.S. Representative John Shimkus; U.S. Representative Lynn Westmoreland; The Langdale Company; Langdale Forest Products Company; Langdale Timber Company; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet, Inc.; Langdale Ford Company; Langboard, Inc. – MDF; Langboard, Inc. – OSB; Georgia Motor Trucking Association, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Kennesaw Transportation, Inc.; J&M Tank Lines, Inc.; Southeast Trailer Mart, Inc.; Georgia Agribusiness Council, Inc.; Competitive Enterprise Institute; FreedomWorks; and Science and Environmental Policy Project (*No. 12-1268*); and the States of Texas, Alabama, Florida, Georgia, Indiana, Louisiana, Michigan, Nebraska, North Dakota, Oklahoma, South Carolina, and South Dakota, and the Louisiana Department of Environmental Quality (*No. 12-1269*).

Respondents herein, who were also respondents in the cases below, are the Environmental Protection Agency and the Administrator of the Environmental Protection Agency. Lisa P. Jackson held the office of

iv

Administrator until February 15, 2013. Gina McCarthy currently holds that office.

Other parties who were petitioners in the cases addressed by the consolidated judgment below are the following: Greg Abbott, Attorney General of Texas; Alpha Natural Resources, Inc.; Haley Barbour, Governor of the State of Mississippi; Coalition for Responsible Regulation, Inc.; Collins Industries, Inc.; Collins Trucking Company, Inc.; Commonwealth of Virginia; Georgia Agribusiness Council, Inc.; Georgia Coalition for Sound Environmental Policy, Inc.; Georgia Motor Trucking Association, Inc.; Gerdau Ameristeel US Inc.; Great Northern Project Development, L.P.; Industrial Minerals Association—North America; J&M Tank Lines, Inc.; Kennesaw Transportation, Inc.; Landmark Legal Foundation; Mark R. Levin; Louisiana Department of Environmental Quality; Missouri Joint Municipal Electric Utility Commission; National Cattlemen's Beef Association; National Environmental Development Association's Clean Air Project; National Mining Association; Ohio Coal Association; Pacific Legal Foundation; Peabody Energy Company; Rick Perry, Governor of Texas; Rosebud Mining Co.; South Carolina Public Service Authority; Texas Agriculture Commission; Texas Commission on Environmental Quality; Texas General Land Office; Texas Public Utilities Commission; and Texas Railroad Commission.

Intervenors for petitioners in cases addressed by the consolidated judgment below—other than petitioners herein—include Alpha Natural Resources, Inc.; American Frozen Food Institute; American Fuel & Petrochemical Manufacturers; American Petroleum Institute; Arkansas State Chamber of

v

Commerce; Associated Industries of Arkansas; Brick Industry Association; Coalition for Responsible Regulation, Inc.; Colorado Association of Commerce & Industry; Commonwealth of Kentucky; Corn Refiners Association; Glass Association of North America; Governor of Mississippi Haley Barbour; Great Northern Project Development, L.P.; Idaho Association of Commerce and Industry; Independent Petroleum Association of America; Indiana Cast Metals Association; Industrial Minerals Association North America; Kansas Chamber of Commerce and Industry; Langdale Farms, LLC; Langdale Fuel Company; Langdale Chevrolet-Pontiac, Inc; Langdale Ford Company; Langboard, Inc.–MDF; Langboard, Inc.–OSB; Louisiana Department of Environmental Quality; Louisiana Oil and Gas Association; Michigan Manufacturers Association; Mississippi Manufacturers Association; National Association of Manufacturers; National Association of Home Builders; National Cattlemen’s Beef Association; National Electrical Manufacturers Association; National Environmental Development Association’s Clean Air Project; National Federation of Independent Business; National Mining Association; National Oilseed Processors Association; Nebraska Chamber of Commerce and Industry; North American Die Casting Association; Ohio Coal Association; Ohio Manufacturers Association; Peabody Energy Company; Pennsylvania Manufacturers Association; Portland Cement Association; Rosebud Mining Company; South Coast Air Quality Management District; Specialty Steel Industry of North America; Steel Manufacturers Association; Tennessee Chamber of Commerce and Industry; Utility Air Regulatory Group; Virginia Manufacturers Association; Western States

Petroleum Association; West Virginia Manufacturers Association; and Wisconsin Manufacturers & Commerce.

Intervenors for in cases addressed by the consolidated judgment below include Alliance of Automobile Manufacturers; Association of Global Automakers; Center for Biological Diversity; City of New York; Commonwealth of Massachusetts; Conservation Law Foundation; Environmental Defense Fund; Georgia ForestWatch; Global Automakers; Indiana Wildlife Federation; Michigan Environmental Council; Natural Resources Council of Maine; Natural Resources Defense Council; National Wildlife Federation; Ohio Environmental Council; Pennsylvania Department of Environmental Protection; Sierra Club; South Coast Air Quality Management District; State of California; State of Connecticut; State of Delaware; State of Illinois; State of Iowa; State of Maine; State of Maryland; State of Minnesota; State of New Hampshire; State of New Mexico; State of New York; State of North Carolina; State of Oregon; State of Rhode Island; State of Vermont; State of Washington; Wetlands Watch; and Wild Virginia.

## INTRODUCTION

This case is about the Environmental Protection Agency's determination to regulate greenhouse gas (GHG) emissions under the Clean Air Act (CAA) no matter how much the agency had to distort and even rewrite statutory provisions to do so. In fact, EPA conceded in the rulemaking and in this litigation that extending the CAA's Prevention of Significant Deterioration (PSD) program to cover GHGs produces "absurd" results that Congress never intended. Nonetheless, misreading *Massachusetts v. EPA*, 549 U.S. 497 (2007), EPA pressed ahead and promulgated what may be the costliest, most intrusive regulatory program the nation has yet seen. But *Massachusetts* did not address stationary sources in general or the PSD program in particular and hence could not have authorized the rules EPA promulgated below.

The PSD program requires permits to build new facilities or refurbish old ones. The text, structure, purposes, and history of the program show it was designed to apply to emissions of conventional pollutants like lead and carbon monoxide—pollutants that concentrate in local areas and affect health and welfare via direct exposures, such as through inhalation or ingestion. The statutory PSD apparatus simply does not work when applied to substances like GHGs that disperse globally and produce harms unrelated to pollutant exposures. Indeed, EPA's own statements, both in the rulemakings below and subsequent regulatory guidance, make clear that PSD controls can be applied to GHGs only by nullifying many of the program's key statutory elements.

Congress, for instance, set the PSD program's coverage provisions so that its cumbersome and

expensive permitting requirements would apply exclusively to large sources of conventional pollution, like steel mills and power plants. As applied to GHGs, however, the coverage provisions sweep in very small sources, like churches, bakeries, even large private homes. By EPA's admission, Congress never intended such a thing. Nonetheless, the agency plunged ahead and extended the program to encompass GHG emissions.

To justify this programmatic mismatch, EPA deployed the "absurd results" canon and claimed authority to rewrite the statute's numerical provisions defining which pollution sources are subject to PSD requirements. But that is not how the absurdity doctrine works. Once it recognized that the PSD program produced absurd results if extended to include GHGs, EPA should have drawn the obvious conclusion—GHGs are not the type of "pollutant" to which PSD applies. Because EPA overstepped the bounds of its authority, the Court should reverse the D.C. Circuit decision below.

### **OPINIONS AND ORDERS BELOW**

The opinion of the D.C. Circuit is reported at 684 F.3d 102 and reproduced in the Joint Appendix at 191-267. The order denying rehearing en banc is available at 2012 WL 6621785 and reproduced in the Joint Appendix at 139-190.

### **JURISDICTION**

The court of appeals rendered its decision on June 26, 2012, and denied petitions for rehearing on December 20, 2012. On October 15, 2013, the Court granted six petitions for writs of certiorari. This Court has jurisdiction under 28 U.S.C. § 1254(1).

## STATUTORY PROVISIONS

Relevant statutes are reproduced in the Statutory Addendum.

## STATEMENT OF THE CASE

In construing the Clean Air Act to justify these regulations, EPA reached an interpretive endpoint that, in its words, is “so contrary to what Congress had in mind—and that in fact so undermines what Congress attempted to accomplish” that the statute’s language should not be followed. Proposed Tailoring Rule, 74 Fed. Reg. 55,292, 55,310 (Oct. 27, 2009). EPA recognized that, under its interpretation, PSD permitting requirements designed for utility and heavy industrial sources would now apply to millions of smaller facilities, including multi-family dwellings and even some large private homes. See *id.* at 55,338.

When faced with the extreme measures and absurd results caused by its preferred policy, EPA rewrote the tons-per-year (tpy) emissions thresholds defining which sources are subject to PSD permitting. As Judges Kavanaugh and Brown observed in separate dissents from the denial of rehearing en banc, this “is not the proper way to interpret a statute.” JA174 (Kavanaugh, J., dissenting); see also JA156-57 (Brown, J., dissenting). “Instead of ‘reading new words into the statute’ to avoid absurd results ... the statute should be interpreted so that ‘no absurdity arises in the first place.’” JA174 (Kavanaugh, J., dissenting) (quoting *Kloeckner v. Solis*, 133 S. Ct. 596, 606-07 (2012)).

1. The Clean Air Act is organized into six titles, none of which expressly addresses controls on GHG emissions or prevention of global climate change:

“Air Pollution Prevention and Control” (Title I, 42 U.S.C. §§ 7401-7515); “Emission Standards for Moving Sources” (Title II, 42 U.S.C. §§ 7521-7590); “General Provisions” (Title III, 42 U.S.C. §§ 7601-7627); “Acid Deposition Control” (Title IV, 42 U.S.C. §§ 7651-7651o); “Permits” (Title V, 42 U.S.C. §§ 7661-7661f); and “Stratospheric Ozone Protection” (Title VI, 42 U.S.C. §§ 7671-7671q); see also 68 Fed. Reg. 52,922, 52,925-29 (Sept. 8, 2003) (JA1341-63) (EPA overview of legislative history as it relates to GHGs). Section 103(g) does mention the most prevalent GHG, carbon dioxide. 42 U.S.C. § 7403(g). Section 103(g) authorizes “nonregulatory strategies and technologies,” and it specifically forbids its use “to authorize the imposition on any person of air pollution control requirements.” *Id.* Neither GHGs in general nor carbon dioxide in particular are mentioned in the Act’s PSD provisions.

GHGs differ in kind from conventional pollutants. See 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,399-401 (JA1083-95). Their concentrations and effects are global in character, in contrast to conventional pollutants, which concentrate in particular areas or regions. See 74 Fed. Reg. at 66,517 (JA871-72); 73 Fed. Reg. at 44,399-401 (JA1083-95). Unlike conventional pollutants, GHGs do not affect health and welfare through direct exposures, such as through inhalation or ingestion. See 74 Fed. Reg. 18,886, 18,901 (Apr. 24, 2009) (Proposed Endangerment Rule) (“[A]mbient concentrations of carbon dioxide and the other greenhouse gases, whether at current levels or at projected ambient levels ... do not cause direct adverse health effects such as respiratory or toxic effects.”); EPA, *Technical Support Document for Final Endangerment Rule*, Regulatory Docket ID No. EPA-

HQ-OAR-2009-0171-11645, at 21 (Dec. 7, 2009) (available at [http://www.epa.gov/climatechange/Downloads/endangerment/Endangerment\\_TSD.pdf](http://www.epa.gov/climatechange/Downloads/endangerment/Endangerment_TSD.pdf)) (similar). And GHGs, particularly carbon dioxide, are emitted in much greater amounts than conventional pollutants, see 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,407, and from many more sources—including humans. See 75 Fed. Reg. at 31,535 (JA363); 73 Fed. Reg. at 44,376 (JA1041).

The issue of potentially regulating GHGs under the CAA initially arose under the Act's Title II, which focuses on emissions from mobile sources. See 68 Fed. Reg. at 52,922 (JA1332). This issue eventually reached the Court in *Massachusetts*, which held that GHGs are “air pollutants” for purposes of the Act-wide definition in Section 302(g), without addressing the Act's stationary-source provisions. In reaching this conclusion, *Massachusetts* distinguished *FDA v. Brown & Williamson Corp.*, 529 U.S. 120 (2000), reasoning that a ruling favoring the *Massachusetts* petitioners would not “lead to ... extreme measures.” 549 U.S. at 531.

In the proceedings on remand from *Massachusetts*, EPA regulated GHG emissions from new motor vehicles and went on to claim authority to regulate GHG emissions from stationary sources.

**2.** Two programs for regulating stationary-source GHG emissions are at issue in this case: Prevention of Significant Deterioration (PSD) of Title I, part C of the CAA (42 U.S.C. §§ 7470 et seq.), and the permitting provisions of Title V (42 U.S.C. §§ 7661 et seq.). Both programs impose permitting requirements on “major” emitting facilities—stationary sources with the potential to emit specific threshold amounts of “any air pollutant.”

The PSD program forbids the construction of “major emitting facilit[ies]” unless a permit is obtained from a state or federal permitting authority and a series of requirements are met. For purposes of the PSD program, “major emitting facility” means stationary sources that “emit, or have the potential to emit” either 100 tpy or 250 tpy of “any air pollutant.” 42 U.S.C. § 7479(1). Twenty-eight enumerated categories of industrial sources—for example, “iron and steel mill plants” and “primary lead smelters”—qualify as “major emitting facilities” if they have the potential to emit over 100 tpy of “any air pollutant.” *Id.* All other stationary sources qualify if they have potential to emit over 250 tpy of “any air pollutant.” *Id.*

Title V requires stationary sources to obtain state-issued operating permits to establish compliance with the PSD requirements, among others, if they have the potential to emit at least 100 tpy of “any air pollutant.” *Id.* § 7602(j).

3. The PSD program is closely related to maintenance of national ambient air quality standards (NAAQS). Under the NAAQS program, EPA designates certain pollutants as “criteria” pollutants and sets maximum allowable concentrations for regions throughout the nation. 42 U.S.C. §§ 7407, 7409. EPA thus far has designated only six substances as criteria pollutants—carbon monoxide, lead, nitrogen dioxide, ozone, particle pollution, and sulfur dioxide. All six harm human health and welfare through direct exposure by inhalation, ingestion, and the like; none is a greenhouse gas. See 40 C.F.R. pt. 50; 75 Fed. Reg. at 31,520 (JA298) (“There is no NAAQS for CO<sub>2</sub>.”); EPA, *National Ambient Air Quality Standards (NAAQS)*,

at <http://www.epa.gov/air/criteria.html> (Dec. 14, 2012); EPA, *What Are the Six Common Air Pollutants?*, at <http://www.epa.gov/air/urbanair/> (Apr. 20, 2012); see also EPA, *Health*, at <http://www.epa.gov/airquality/carbonmonoxide/health.html> (last visited Dec. 6, 2013) (describing exposure-related effects of carbon monoxide); EPA, *Health*, at <http://www.epa.gov/airquality/lead/health.html> (last visited Dec. 6, 2013) (same for lead). By contrast, carbon dioxide, the most ubiquitous greenhouse gas, see, e.g., 73 Fed. Reg. at 44,429, does not harm human health or welfare through direct exposure. See 74 Fed. Reg. at 18,901. People and animals exhale carbon dioxide when they breathe, and plants need carbon dioxide to live. See 73 Fed. Reg. at 44,376 (JA1047).

To ensure compliance with the NAAQS, EPA must determine whether a region is in “attainment” (the NAAQS is met), “nonattainment” (the NAAQS remains unmet), or “unclassifiable” (EPA cannot determine whether the NAAQS is met). 42 U.S.C. § 7407(d)(1)(A). The PSD program applies to areas that are in “attainment” or are “unclassifiable,” *id.* § 7471, and requires permits before major emitting facilities are built or modified in those regions, *id.* § 7475(a). To obtain a permit, a regulated facility must, among other things, install the “best available control technology [BACT] for each pollutant subject to regulation under [the CAA].” *Id.* § 7475(a)(4).

4. On remand from *Massachusetts*, EPA opened a single regulatory docket in July 2008, and issued an Advance Notice of Proposed Rulemaking (ANPR) to address GHG emissions from all sources, including both mobile and stationary sources. See 73 Fed. Reg. 44,354, 44,355 (July 30, 2008) (JA975, JA979-80).

The ANPR flagged the prospect that application of the PSD and Title V programs to carbon emissions would lead to “absurd” results. 73 Fed. Reg. at 44,503 (JA1272-73), 44,512 (JA1311-12).

In a preface to the ANPR, the EPA Administrator observed that it had “become clear” that EPA regulation of GHGs from motor vehicles under section 202(a)(1) could trigger “regulation of smaller stationary sources that also emit GHGs—such as apartment buildings, large homes, schools, and hospitals,” resulting in “an unprecedented expansion of EPA authority that would have a profound effect on virtually every sector of the economy and touch every household in the land.” 73 Fed. Reg. at 44,355 (JA979). The Administrator found that the CAA was “ill-suited for the task of regulating global greenhouse gases.” *Id.* (JA980).

Other federal agencies reinforced EPA’s concerns about absurd consequences. The Department of Energy expressed concern about “an enormously elaborate, complex, burdensome and expensive regulatory regime that would not be assured of significantly mitigating global atmospheric GHG concentrations and global climate change.” *Id.* at 44,365 (JA1004). The Department of Transportation was wary “that attempting to regulate [GHGs] under the [CAA] will harm the U.S. economy while failing to actually reduce global emissions.” *Id.* at 44,362 (JA988). And the Department of Commerce expressed concerns that GHG emission controls “would impose significant costs on U.S. workers, consumers, and producers and harm U.S. competitiveness without necessarily producing meaningful reductions in global GHG emissions.” *Id.* at 44,371 (JA1029).

Departing from the ANPR's single-docket approach, on April 17, 2009, EPA issued a standalone Proposed Endangerment Ruling as to six GHGs, 74 Fed. Reg. 18,886, including the four at issue in *Massachusetts* plus two others that are emitted only by stationary sources. This proposal was soon followed by a final rule, 74 Fed. Reg. 66,496 (Dec. 15, 2009) (JA793), that was followed in rapid succession by three more final rules, the so-called "Timing Rule" or "Triggering Rule," 75 Fed. Reg. 17,004 (Apr. 2, 2010) (JA705), the "Tailpipe Rule," 75 Fed. Reg. 25,324 (May 7, 2010) (JA683), and the "Tailoring Rule," 75 Fed. Reg. 31,514 (June 3, 2010) (JA268).

EPA determined in the Triggering Rule that once it had regulated GHG emissions from motor vehicles, it also had to regulate GHG emissions from stationary sources under the PSD program. EPA declared that "once EPA has determined to regulate a pollutant in some form under the Act and such regulation is operative on the regulated activity, the terms of the Act make clear that the PSD program is automatically applicable." 75 Fed. Reg. at 17,020 (April 2, 2010) (JA778). EPA did likewise for the Title V program. See *id.* at 17,023 (JA788). Further, EPA stated that "[u]nder the current interpretation of the PSD applicability provision, EPA's recent promulgation" of regulations governing GHG emissions from new motor vehicles "will trigger the applicability of PSD for GHG sources at the 100/250 tpy threshold levels as of January 2, 2011." 75 Fed. Reg. at 31,554 (JA449).

In applying the PSD coverage provisions to GHGs, EPA rejected the broadest meaning of "air pollutant" and restricted the term to encompass only "*regulated* air pollutants." Hence, according to EPA,

the PSD and Title V programs would be triggered for stationary sources as of the day that controls mandated by the Tailpipe Rule took effect. See 75 Fed. Reg. 17,004 (JA705). EPA rejected commenters' suggestions that it read "any air pollutant" restrictively to exclude GHGs and include only regulated conventional air pollutants. See *EPA's Response to Public Comments*, Regulatory Docket ID No. EPA-HQ-OAR-2009-0597-0128, at 147 (Mar. 29, 2010) ("Nine industry and commerce commenters ... suggest that EPA clarify in the PSD Interpretive Memo that the term 'Pollutants Subject to Regulation' exclude GHGs.").

5. In the "Tailoring Rule," EPA again acknowledged that applying the PSD and Title V programs to GHGs would produce effects so extreme as to be "absurd." 75 Fed. Reg. at 31,596 (JA631-32), 74 Fed. Reg. 55,292, 55,306-11 (Oct. 27, 2009). In EPA's words, "[a]pplying the PSD thresholds to sources of GHG emissions literally results in a PSD program that is so contrary to what Congress had in mind—and that in fact so undermines what Congress attempted to accomplish with the PSD requirements—that it should be avoided under the 'absurd results' doctrine." *Id.* at 55,310. In 2009, the PSD program applied to only 280 stationary sources, while Title V reached 14,700 sources—primarily large industrial facilities and power plants. 74 Fed. Reg. at 55,301, 55,302. But because GHGs, especially carbon dioxide, are emitted in far greater amounts, and from many more sources than all other "air pollutants" previously regulated, applying PSD to GHGs would mean that the program would apply to "41,000 new and modified facilities per year," *id.* at 55,301, while the Title V program would apply, for the first time, to "more than six million sources of GHGs," *id.* at

55,302. Not only would such regulation add untold billions in compliance costs and permitting expenses, EPA concluded it could produce permitting delays of up to ten years. See 75 Fed. Reg. at 31,563-64 (JA485-94).

Confronted with the conundrum of how to address absurd results flowing from its preferred policy, EPA rewrote the numerical coverage thresholds set by Congress instead of construing the statute to exclude GHGs from the PSD program. In particular, EPA temporarily exempted some but not all emitters of some but not all pollutants that the statutory text, as construed by the agency, would otherwise cover. See 75 Fed. Reg. at 31,514 (JA268). While Congress determined that the PSD and Title V programs would apply to facilities discharging more than 100/250 tpy, the agency mandated that, to fit the programs to GHGs, they would apply only to sources emitting GHGs in amounts more than 75,000 or 100,000 tpy—two EPA-created thresholds. *Id.*; see also *id.* at 31,516, 31,533 (JA281-82, JA355).

EPA asserted authority to ratchet down the agency-created thresholds over time on grounds it claimed were both “intertwined” with and “independent” of the absurdity doctrine. *Id.* at 31,514 (JA391). Specifically, EPA relied on an “administrative necessity” doctrine, which it contended allows an agency to decline to “follow the literal requirements” of a statute that “is impossible for the agency to administer.” *Id.* at 31,543-44 (JA401-02). And EPA relied on a newly invented doctrine that it contended confers expansive agency authority to “implement statutory mandates one step at a time.” *Id.* at 31,544 (JA403). In this fashion, EPA claimed discretion to regulate more parties by

further changing the coverage thresholds in future years.

6. More than seventy business groups, public policy groups, and States challenged EPA's rulemakings. In a *per curiam* opinion, a D.C. Circuit panel rejected these challenges and held that EPA's reasoning in support of the decision to "trigger" the PSD program had appropriately led the agency to deviate from "the literal statutory definition of air pollutant." JA237.

The panel denied rehearing, and the court denied rehearing en banc, with Judge Kavanaugh and Judge Brown dissenting separately. Both Judge Brown and Judge Kavanaugh viewed skeptically EPA's response to the acknowledged "absurd results" of its interpretation, deeming it a kind of "abuse" used "to preempt legislative prerogatives." JA158-59 (Brown, J., dissenting); see also JA189-90 (Kavanaugh, J., dissenting). Judge Kavanaugh noted that "an unusual twist" in this case is that "EPA openly acknowledged unreasonableness—indeed, the absurdity—caused by its interpretation of the statute." JA173. Yet, "EPA surprisingly did not choose the seemingly obvious option" of revisiting its construction of "any air pollutant" and adopting a narrower construction that would eliminate the absurdity. *Id.* In Judge Kavanaugh's view, EPA's absurdity-causing interpretation of "any air pollutant" is "the most critical point in this case," even though the panel failed to address it. JA187. According to Judge Kavanaugh, "EPA chose an admittedly absurd reading over a perfectly natural reading of the relevant statutory text. An agency cannot do that." JA187. Judge Brown separately emphasized that "[a]lthough the *Massachusetts* Court

distinguished *Brown & Williamson*, it did so only in the context of tailpipe emissions. Its reasoning did not extend to Title V and the PSD program.” JA163. “Congress simply did not intend for EPA to convert the ‘Clean Air Act’ to the ‘Warm Air Act’ writ large.” JA166.

7. Nine petitions for certiorari followed, six of which the Court granted.

### SUMMARY OF THE ARGUMENT

Through the so-called “Triggering Rule,” EPA expanded the PSD program’s ambit to encompass millions of new stationary sources, all the way down to neighborhood restaurants and even some homes. But by EPA’s own admission, the fit between the PSD program and GHG regulation is so poor as to produce absurd results, which EPA decided to address through statutory “tailoring.” Surely, the fact EPA needed to perform such a thing as statutory “tailoring” should have set off alarms that its interpretive enterprise had badly gone awry.

Regardless of how the Clean Air Act’s mobile-source provisions might work, the Act’s PSD provisions, properly construed, cannot and do not work if extended to encompass GHGs. Indeed, the only way to shoehorn GHGs into the PSD program is by nullifying many core statutory requirements. (See Section I, *infra*.) Moreover, even if EPA’s statute-nullifying PSD interpretation were the only one available (which it is not), proper application of the absurdity doctrine would still compel the conclusion that PSD regulation of GHGs falls beyond EPA’s statutory authority. (See Section II, *infra*.)

## ARGUMENT

EPA offered various justifications for rewriting the PSD program's emission thresholds while it dramatically expanded its regulatory authority. But the occasion for rewriting statutory provisions would never have arisen if the agency had properly construed the PSD provisions and properly applied the absurdity doctrine. Moreover, if the Court holds the PSD program cannot extend to GHGs, then by the same reasoning Title V cannot extend to GHGs. Because whether Title V properly applies to GHGs presents a parallel question to whether the PSD program applies, we do not address it separately.

Against this backdrop, we focus solely on the PSD program and absurdity doctrine. We focus in particular on the two dispositive questions—whether EPA properly concluded that the PSD statutory provisions extend to encompass GHGs and, if so, whether EPA properly responded to the admitted absurdity that arises from this extension. EPA erred on both questions.

### **I. EPA Erred By Rewriting or Ignoring the Plain Terms of the PSD Statutes in Order to Extend the Program to Encompass GHGs.**

In response to a petition asking EPA to regulate mobile-source emissions, the Court concluded in *Massachusetts* that GHGs are “air pollutants” for purposes of the Act-wide definition in Section 302(g). But *Massachusetts* neither addressed the Act's stationary-source provisions nor had occasion to consider EPA's ultimate determination on remand that applying the PSD program to GHGs produces absurd results. The posture and stated limits of *Massachusetts* are significant because, regardless of

how the CAA's mobile-source emissions programs might be framed, the PSD program for stationary sources, if applied to GHGs, produces the very type of "extreme measures" that *Massachusetts* disapproved. 549 U.S. at 531.

The fact that PSD regulation of GHGs requires that the statute's coverage thresholds be multiplied by orders of magnitude itself dooms EPA's rulemakings. But the incompatibilities between the statutory PSD provisions and EPA's implementing rulemakings and guidance documents extend well beyond unworkable coverage thresholds. If allowed to stand, EPA's "tailoring" of the Act will become an ongoing enterprise that requires and enables the agency to cut, reshape, and remold numerous parts of the statute.

1. The PSD program's stated purposes underscore that it is designed to address only pollutants that, unlike GHGs, produce exposure-related harms, concentrate locally, and are emitted in modest amounts from very large facilities that Congress determined are best able to reduce emissions in economically feasible ways.

***Prevention of Exposure-Related Harms.*** The first of the PSD program's stated purposes is to "protect public health and welfare" from adverse effects that "occur from air pollution or from *exposures* to pollutants in other media, which pollutants originate as emissions to the ambient air" notwithstanding attainment of NAAQs standards. 42 U.S.C. § 7470(1) (emphasis added). This reference to preventing "exposures to pollutants"—whether directly from air pollution or indirectly via "other media"—makes clear the program aims at curtailing

the types of exposure-related harms characteristic of conventional pollutants.

***Control of Localized Concentrations.***

Congress also declared that the program's purposes include preventing harmful interstate transport of pollutants that produces "deterioration of air quality for any other State," 42 U.S.C. § 7470(4), and assuring that any "decision to permit increased air pollution *in any area*" is made only upon "careful evaluation" and after opportunity for "informed public participation." *Id.* § 7470(5) (emphasis added). In other words, the program was established to control localized concentrations of harmful pollutants—concentrations that can sensibly be ascribed to a particular "state" or a particular "area."

***Economically Feasible Application.*** A third purpose is to "insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources." 42 U.S.C. § 7470(3). The PSD program's 100/250 tpy thresholds, see *id.* § 7479(1), implement this important purpose by imposing burdensome case-by-case PSD permitting requirements only on the "large" emissions sources that can most readily bear these costs. See, e.g., *Alabama Power Co. v. Costle*, 636 F.2d 323, 348 (D.C. Cir. 1979) (per curiam). Here, moreover, EPA admits that "the addition of enormous numbers of additional sources would provide relatively little benefit compared to the costs ...." 75 Fed. Reg. at 31,533 (JA356).

2. Unsurprisingly, the PSD program's declared purposes dovetail with and reinforce its operative provisions. As a result, EPA's extension of the program to encompass GHGs nullifies or renders unworkable core provisions of the program.

***Local Air Impact Analysis.*** Sections 165(a)(2) and (e)(1)'s public participation and local air quality assessment provisions cannot be squared with extending the program to GHGs. These Sections work in tandem to require a non-discretionary “public hearing” regarding “the ambient air quality *at the proposed site* and in *areas which may be affected* by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.” 42 U.S.C. § 7475(e)(1) (emphasis added). Likewise, Section 165(e)(3) requires that the Administrator “shall” analyze “the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility *at the site* of the proposed major emitting facility and *in the area potentially affected* by the emissions from such facility for each pollutant regulated under this Act.” *Id.* § 7475(e)(3) (emphasis added).

These features make sense when applied to conventional pollutants that give rise to localized, exposure-related harms due to impacts on “ambient air quality.” But they make no sense as applied to substances that do not degrade “ambient air quality” and whose concentrations and impacts can be meaningfully assessed only on a global scale. Indeed, EPA has effectively conceded as much, informing PSD permit applicants and authorities that they may ignore the statutory “ambient air” requirements because GHGs—being “well-mixed” in the atmosphere—do not give rise to localized impacts. See, e.g., *PSD and Title V Permitting Guidance for Greenhouse Gases* 48 (2011), available at [http://www.epa.gov/nsr/ghgdocs/ghgpermitting\\_guidance.pdf](http://www.epa.gov/nsr/ghgdocs/ghgpermitting_guidance.pdf) (“Considering the nature of GHG emissions and their global impacts, EPA does not believe it is practical or appropriate to expect permitting authorities to collect

monitoring data for purpose of assessing ambient air impacts of GHGs.”).

***Case-by-Case Economic Analysis.*** Building on its stated purposes, the PSD program mandates that “case-by-case ... economic” analyses be undertaken in issuing PSD permits for large facilities. 42 U.S.C. § 7479(3). Because the PSD program properly applies only to large sources that emit conventional pollutants, it makes sense to require expensive, case-by-case analyses to determine the best available control technology for each individual facility.

Case-by-case BACT assessments are impossible to faithfully adapt, however, in the GHG context, especially for carbon dioxide. If EPA’s interpretation of the program were correct, six million facilities, including 4.5 million residential facilities, would become subject to case-by-case PSD emission-control assessments. To address this unmanageable caseload and avoid imposing intolerable costs on small emitters, EPA has effectively eliminated case-by-case analysis, declaring that small GHG emitters shall eventually be governed by “presumptive” BACT standards and “general” permitting. See, e.g., 75 Fed. Reg. at 31,526 (JA325). But although Title V expressly provides for such general permitting, see 42 U.S.C. § 7661c(d), the PSD program does not.

***Case-by-Case Energy and Environmental Analysis.*** The PSD program also requires “case-by-case” analysis of both “energy ... impacts” and “environmental ... impacts.” 42 U.S.C. § 7479(3). A cardinal rule of interpretation requires that these distinct statutory terms must carry distinct meanings. See *Duncan v. Walker*, 533 U.S. 167, 174 (2001). In the context of PSD permitting for controls on conventional pollutants, this basic rule of

construction is readily followed. When permitting authorities confront proposed PSD controls in conventional-pollutant settings, they can and do make straightforward, independent, and sensible assessments of both energy and environmental impacts. In that context, a permitting authority need only consider the extra energy needed to prevent additional conventional pollution, for instance, by installing energy-consuming pollution-control equipment like the desulfurization units known as “scrubbers.” But when applied to the release of energy and carbon dioxide through burning fossil fuels, the required energy-impact and environmental-impact assessments become hopelessly muddled. The whole reason for emitting carbon dioxide, after all, is that fossil fuels *are* stores of energy and this energy can be released through combustion. As a result, what should be distinct inquiries into “energy” and “environmental” impacts collapse, in the context of fossil-fuel burning, into one and the same assessment: how should EPA regulate energy consumption itself?

***Coverage Thresholds.*** EPA recognized that conventional pollutants and GHGs critically differ in the scale on which they are emitted in an industrial economy. See, e.g., 75 Fed. Reg. at 31,535 (JA363) (“[I]t takes a relatively large source to generate emissions of conventional pollutants in the amounts of 100/250 tpy or more, but many sources combust fossil fuels for heat or electricity, and the combustion process for even small quantities of fossil fuel produces quantities of CO<sub>2</sub> that are far in excess of the sources’ quantities of conventional pollutants and that, for even small sources, equal or exceed the 100/250 tpy levels.”).

In other words, as applied to conventional pollutants, the PSD program's 100/250 tpy emission thresholds make sense and limit the program's burdens to large industrial sources. See *id.* But because GHGs, especially carbon dioxide, are emitted in much greater amounts than conventional pollutants, GHG emissions from a given facility will often exceed by orders of magnitude the facility's conventional-pollutant emissions. As a result, extending the PSD program to GHGs does violence to the Act's coverage thresholds, set with exposure-related harms caused by modestly sized conventional pollutant emissions in mind. The realization that the statutory thresholds fail in a GHG context to effectively winnow out small facilities prompted EPA's concession below that applying the statutory terms to GHGs would be "absurd."

These multiple contradictions, taken individually and even more when taken together, are fatal to EPA's reading of the Act. After all, a statutory "provision that may seem ambiguous in isolation is often clarified by the remainder of the statutory scheme," especially in cases where "only one of the permissible meanings produces a substantive effect compatible with the rest of the law." *United Sav. Ass'n of Tex. v. Timbers of Inwood Forest Assoc., Ltd.*, 484 U.S. 365, 371 (1988). Here, the substantive effects of extending the PSD program to GHGs are manifestly untenable. Any such extension means nullifying or rendering unworkable most central elements of the program.

3. EPA nonetheless determined that the statutory reference in the PSD program to "any air pollutant" would include GHGs, pointing to its

reading of *Massachusetts*. 75 Fed. Reg. at 31,561 (JA481).

But tellingly, EPA itself rejected the broadest possible reading of the *Massachusetts* holding; namely, a reading under which “air pollutant” must refer to “any airborne compound of whatever stripe” for all purposes under the Act. 549 U.S. at 529. In proceedings below, EPA read “any air pollutant” under both the PSD and Title V programs to mean, more restrictively, “any *regulated* air pollutant.” JA236. On review, the Court of Appeals endorsed this reasoning and upheld the agency. JA236-41. The Court rejected the alternative view that, for PSD purposes, the relevant pollutant universe should exclude GHGs and thus be confined to *regulated conventional* air pollutants. JA421-46.

In reaching these conclusions, both EPA and the D.C. Circuit recognized that words and phrases like “any air pollutant,” 42 U.S.C. § 7479(1), and “each pollutant,” *id.* § 7475(a)(4), can and should be read in context. See *Environmental Defense v. Duke Energy Corp.*, 549 U.S. 561, 574 (2007) (holding in a CAA case decided the same day as *Massachusetts* that “identical words used in different parts of the same act” need not always have the same meaning); *Train v. Colorado Public Interest Research Group, Inc.*, 426 U.S. 1, 23-24 (1976) (holding that the term “pollutant”—defined to include “radioactive materials”—was properly read in context to exclude three types of radioactive materials). In light of this recognition and the interpretive evidence canvassed above, EPA and the D.C. Circuit should have further recognized that the term “pollutant” must be read in a PSD context to stop short of encompassing GHGs.

4. Finally, EPA was simply not permitted under the Court's precedents to interpret its authority to regulate localized emissions of conventional pollutants as an implicit grant of authority to regulate the conceptually distinct problem of global climate change. See *Brown & Williamson*, 529 U.S. at 160 (striking down FDA regulation of cigarettes); see also *Gonzales v. Oregon*, 546 U.S. 243 (2006) (striking down DoJ regulation of physician-assisted suicide); *MCI Telecommunications Corp. v. AT&T Co.*, 512 U.S. 218 (1994) (striking down FCC deregulation of long-distance carriers). This is true "[r]egardless of how serious" the problem the agency "seeks to address" may be. *Ragsdale v. Wolverine World Wide, Inc.*, 535 U.S. 81, 91 (2002) (quotation marks and citations omitted); see also *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) ("axiomatic" that agencies lack power to promulgate regulations in absence of congressional authorization). And it is especially true here, in light of the "economic and political significance" of this expansive claim of new authority. *Brown & Williamson*, 529 U.S. at 160. Indeed, the implications of EPA's claim of authority here are so great that, in the words of the Secretaries of Agriculture, Energy, Transportation, and Commerce, it would turn the agency into a "de facto zoning authority through control over thousands of what formerly were local or private decisions, impacting the construction of schools, hospitals, and commercial and residential development." 73 Fed. Reg. at 44,360 (JA985).

If *Brown & Williamson*, *MCI*, and *Gonzales* were "extraordinary" cases requiring the relevant agencies to "hesitate" before finding an improbable "implicit delegation," 529 U.S. at 143, 159, this case surely is

even more extraordinary and requires even more hesitation. In *Massachusetts*, the Court reasoned that construing “air pollutant” to include GHGs “would lead to no ... extreme measures” because there was “nothing counterintuitive to the notion that EPA can curtail” automotive GHG emissions. 549 U.S. at 531. Unlike in *Massachusetts*, where the mobile sources at issue already faced functionally equivalent Department of Transportation fuel economy regulations of their emissions, it is difficult to imagine administrative measures and real-world consequences more extreme than those presented by EPA’s triggering of PSD and Title V regulation of GHGs from all types of stationary sources.

In sum, EPA points to nothing in the text, structure, purposes, or history of the Clean Air Act, nor in any background principle of construction, remotely adequate to establish that Congress intended to grant it authority to regulate GHGs under the PSD program. Indeed, the *only* substantial evidence the agency can marshal is the Act’s use of the term “air pollutant,” but even EPA concedes this language cannot be taken in its broadest sense. As a matter of first principles, EPA’s willingness, perhaps eagerness, to construe statutory language in a manner that produces absurd results and expands its jurisdiction to where it becomes a “de facto zoning authority” cannot be squared with the Court’s precedents.

## **II. EPA Erred By Deploying the Absurdity Doctrine As a Roving License to Ignore Statutory Text.**

In choosing to trigger controls on emissions of GHGs under the PSD program, notwithstanding that the triggering produces absurd results, EPA

overlooked the elementary rule that, when confronted with potentially absurd statutory results, the first and best option is to read the relevant statute so that “no absurdity arises in the first place.” *Kloeckner v. Solis*, 133 S. Ct. 596, 607 (2012); see also *Nixon v. Missouri Mun. League, Inc.* 541 U.S. 125, 138 (2004) (avoiding interpretation “that leads to absurd or futile results”) (citation omitted); cf. John F. Manning, *The Absurdity Doctrine*, 116 Harv. L. Rev. 2387, 2392-93 (2003) (urging careful textual analysis to avoid recourse to the absurdity doctrine). EPA should have recognized, before embarking on statutory reconstruction, that it was bound to reject an admittedly absurd interpretation in favor of the more natural reading of the statute described above.

1. Rather than properly interpreting the CAA, EPA invoked a novel, agency-authority-maximizing version of the absurdity doctrine that finds no support in the Court’s cases. As explained below, even in rare cases where absurd results are unavoidable, courts and agencies do not attain *carte blanche* to rewrite a statute, much less a roving commission to continually modify it well into the future. A review of this Court’s decisions over two centuries recognizes just two principal ways to respond to unavoidably absurd applications of statutory language.

*First*, where a minor, self-evident adjustment to literal meaning suggests itself, the Court has applied that adjustment rather than the statute’s literal terms. See, e.g., *Green v. Bock Laundry Mach. Co.*, 490 U.S. 504 (1989). *Second*, in even rarer circumstances, the Court has declared a specific application of a statute, seemingly authorized by its plain terms, to be beyond its proper scope. See, e.g.,

*United States v. Kirby*, 74 U.S. (7 Wall.) 482 (1868). What the Court has never condoned is what EPA did here—using potentially absurd applications of statutory language as grounds for an “unhealthy process of amending the statute” by interpretation. *Public Citizen v. U.S. Dep’t of Justice*, 491 U.S. 440, 470 (1989) (Kennedy, J., concurring in the judgment). Such “loose invocation[s]” of the canon create intolerable risks that the relevant court or agency will exercise “its own ‘WILL instead of JUDGMENT,’ with the consequence of ‘substituting its own pleasure to that of the legislative body.’” *Id.* at 471 (quoting *The Federalist* No. 78, p. 469 (C. Rossiter ed. 1961)) (internal alterations omitted).

Having concluded that its preferred construction produces unavoidably absurd results, EPA was bound to inquire whether a minor, self-evident adjustment to statutory language was available for resolving the identified absurdity and, if not, to conclude simply that GHG regulation lay beyond the permissible scope of the PSD provisions.

2. Because the absurdity doctrine is an accepted interpretive canon, EPA properly concluded that it applies at *Chevron* step one. See 75 Fed. Reg. at 31,545 (JA408-09). At this first *Chevron* step, courts consider statutory meaning by applying “traditional tools of statutory construction,” without any deference to an implementing agency’s interpretation. *Chevron USA v. Nat. Res. Def. Council*, 467 U.S. 837, 843 n.9 (1984). These “traditional tools” include accepted construction canons, see, e.g., *Solid Waste Agency of N. Cook Cnty. v. U.S. Army Corps of Eng’rs*, 531 U.S. 159, 174 (2001), and these canons include the principle that statutes should be construed to avoid absurd

results—a practice deeply embedded in the Court’s jurisprudence and embraced for centuries by leading authorities. See *Kirby*, 74 U.S. (7 Wall.) at 487 (citing Baron Samuel von Pufendorf and Sir Edmund Plowden); see also, e.g., *United States v. Am. Trucking Ass’n*, 310 U.S. 534, 542 (1940); *Sorrells v. United States*, 287 U.S. 435, 450 (1932); *Lau Ow Bew v. United States*, 144 U.S. 47, 59 (1892); 1 Joseph Story, *Commentaries on the Constitution of the United States* § 403 (2d ed. 1858); 1 W. Blackstone, *Commentaries on the Laws of England* 60, 61 (1765).

After correctly concluding that its preferred construction produces absurd results and that the absurdity doctrine binds agencies at *Chevron* step one, EPA got practically everything else about the doctrine wrong. This case is singular in that it appears to be the first in the Court’s history where no party disputes that an agency’s interpretation of a statute it administers produces absurd results. This case, therefore, turns solely on whether EPA can deploy an admittedly absurd statutory result to rewrite statutory text and bolster its own regulatory authority—as opposed to the more modest step of embracing an interpretation that avoids absurd results from the outset by excluding GHGs from the PSD requirements.

3. EPA chose neither of the two distinct and discernible paths by which the Court’s precedents allow an unavoidable absurdity to be safely addressed.

The first of the two paths marked out by the Court’s cases follows in the wake of Blackstone’s classic admonition that “where words bear either none, or a very absurd signification, if literally understood, *we must a little deviate from the received*

*sense of them.*” Blackstone, *supra*, at 61 (emphasis added).

Blackstone’s classic formulation recognizes that minor “deviations” from legislative text—as opposed to wholesale rewriting at the discretion of a court or agency—can at times produce a more faithful application of the statute than “literal[]” application of the law. *Id.* But such “deviations” must indeed be “little.” Hence, this approach to addressing an absurdity has been essentially confined to making self-evident adjustments to a statute’s scope, making it slightly more or less inclusive, not unlike correcting a scrivener’s error. See, e.g., *Bock Laundry*, 490 U.S. at 529 (Scalia, J., concurring) (correcting text where nuance “could understandably have been omitted by inadvertence”). Limited in this fashion, courts can have confidence in their fidelity to congressional enactments. Accordingly, where self-evident deviations from literalism will prevent an absurdity, the Court has been willing to countenance such deviations.

The Court has followed this first path marked by Blackstone on numerous occasions, countenancing minor, self-evident, textual “deviations” to avoid absurdity without invading the legislative province or rewriting statutory terms from scratch. In *Bock Laundry*, for instance, the Court interpreted the word “defendant” in a federal rule of evidence to mean only criminal defendants, not civil defendants, for, as the Court explained, the language as written could not “mean what it sa[id].” 490 U.S. at 511. In *United States v. X-Citement Video, Inc.*, the Court rejected the “most natural grammatical reading” of a child-pornography statute and construed “the term ‘knowingly’” to “extend[] both to the sexually explicit

nature of the material and to the age of the performers” rather than merely to the transportation or shipment of a visual depiction in interstate or foreign commerce. 513 U.S. 64, 68-69, 78 (1994). In *Clinton v. City of New York*, the Court concluded that the category of “individuals” permitted to obtain expedited review of the constitutionality of the line-item veto statute should be interpreted to encompass not only natural persons but also corporate “persons” because it would be absurd to exclude corporate plaintiffs from the benefits of such review. 524 U.S. 417, 428-29 (1998). And in *Johnson v. South Pacific Co.*, the Court read “locomotives” to fall within a definition of rail “cars,” notwithstanding definitional language pointing in the other direction, in order to effectuate a railroad safety statute requiring that safer train couplings be used in interstate commerce. 196 U.S. 1, 14-15 (1904).

In each of these cases, the Court took care to respect statutory text by making what it thought were minor, natural adjustments to the scope of statutory language. “Any entity” meant any private entity. “Defendant” meant only criminal defendants. “Knowingly” applied to all elements of an offense. “Individual” was read to include all legal persons, including corporations. And rail “cars” was read to include all parts of a train, including locomotives. While some of these “deviations” prompted objections from dissenting justices, none were open-ended. All involved what appeared to be self-evident adjustments not unlike the correction of scrivener’s errors. Cf., e.g., *Bock Laundry*, 490 U.S. at 529 (Scalia, J., concurring).

The second path marked by the Court’s precedents, also drawn from Blackstone, applies in

situations where “there arise[s]” from a statute “any absurd consequences, manifestly contrary to common reason” (that cannot be addressed by deviating just a little from the unaltered text). Blackstone, *supra*, at 91. According to Blackstone, such statutes should be construed with regard to such consequences as “void.” *Id.*

Accordingly, where, as here, an absurdity cannot be avoided through a fairly evident and minor adjustment to statutory language, the particular application of the statute’s literal language must be deemed simply and altogether beyond the statute’s scope. *Kirby* presents the classic example. In that case, a county sheriff arrested a mail carrier for murder while the mail carrier was delivering the mail. A federal statute declared that if any person should knowingly and willfully obstruct or retard the passage of the mail, the person would be subject to penalty. 74 U.S. at 482. The question in *Kirby* was whether the sheriff could be punished for arresting an accused murderer, an obvious absurdity. Although recognizing that the act’s categorical language contained no exceptions for officers acting in their official duties, the Court declared the particular situation before it beyond the intended compass of the law. See *id* at 487.

Following *Kirby*, the Court has occasionally concluded that a literal application of statutory language would create absurd results, but found no evident deviation from the statute’s literal terms was available. In those rare cases, the Court has been satisfied to hold that the particular application at issue falls outside the statute’s scope. See, e.g., *Public Citizen*, 490 U.S. at 443 (Federal Advisory Committee Act does not apply to communications

with the American Bar Association regarding judicial nominations); *Sorrells*, 287 U.S. at 448-49 (criminal statute does not apply to case of entrapment); *Church of the Holy Trinity v. United States*, 143 U.S. 457, 465 (1892) (immigration statute does not apply to clergyman). In none of these cases did the Court strain to offer a definitive reinterpretation of the meaning of the relevant text. It instead concluded, more modestly, that the statute at issue ought not be interpreted to extend so far as to produce absurd results in the instance at hand.

4. EPA failed to appreciate any limitations on the options available for addressing statutory absurdities, and the court below did not even address the issue with regard to EPA's triggering of PSD and Title V. If either had done so—after identifying what concededly were extreme and absurd results and realizing no minor, self-evident “deviation” from statutory text would eliminate them—they would have simply concluded that Congress had not authorized the type of extreme measures needed to bring GHGs under the PSD program.

Remarkably, after realizing that its PSD “triggering” would create results “so contrary to what Congress had in mind” that they “should be avoided under the ‘absurd results’ doctrine,” 74 Fed. Reg. at 55,310, EPA did nothing to prevent the triggering. It opted instead to try to partially alleviate the ensuing absurd results by rewriting codified numerical thresholds, while nullifying other statutory requirements by fiat. In this fashion, EPA replaced the statute's numerical limits with limits of the agency's choosing. See 75 Fed. Reg. at 31,533 (JA355-56).

Significantly, however, there is nothing minor or self-evident about a decision to “unilaterally” increase the statute’s coverage thresholds for stationary-source emissions of some (but not all) pollutants from “250 tons to 100,000 tons—a 400-fold increase.” JA173 (Kavanaugh, J., dissenting). Far from it, selecting a numerical parameter to delineate the bounds of regulatory authority is a quintessentially legislative decision. See, e.g., *Hoctor v. U.S. Dep’t of Agric.*, 82 F.3d 165, 170 (7th Cir. 1996) (explaining an agency rule was legislative because “[t]here is no way to reason” to a particular number selected by the agency) (Posner, J.). This is especially true here, where EPA purports to retain still more discretion to further modify the agency-created numerical thresholds over time. Nothing in the statute’s text or structure even hints at the precise thresholds EPA selected as its initial, preferred PSD coverage levels, and in fact EPA proposed thresholds substantially different from the ones it eventually promulgated. See 74 Fed. Reg. at 55,292 (proposing 25,000 tpy threshold).

EPA’s statutory rewrite was thus by no means self-evident or akin to correcting a scrivener’s error. It was extreme by any measure and not at all authorized by *Massachusetts*, which expressly admonished EPA not to assume “a roving license to ignore the statutory text” and expressly required EPA to ground its “action or inaction in the statute.” 549 U.S. at 533, 535.

In sum, the whole justification for the absurdity doctrine is to better discover and better apply the true meaning of the law. But as invoked by EPA, the doctrine has been transformed from a way of ensuring fidelity to congressional enactments into a

springboard for an agency's never-ending and ultimately legislative rewriting of statutes. Once EPA saw that triggering PSD controls for GHGs produces absurd results, it ought to have recognized that, when facing such results, the best option is to read a statute so no absurdity arises in the first place, as we and other petitioners contend. But failing that, EPA ought to have appreciated at a bare minimum—under the Court's precedents and principles dating to Blackstone—that because no self-evident textual adjustments were available for eliminating the absurdity and still accommodating PSD regulation of GHGs, such regulation necessarily falls, quite simply, beyond the agency's authority.

**CONCLUSION**

The judgment of the court of appeals should be reversed.

Respectfully submitted,

**42 U.S.C. § 7403(g): Research, investigation,  
training, and other activities**

\* \* \*

**(g) Pollution prevention and emissions control**

In carrying out subsection (a) of this section, the Administrator shall conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention. Such strategies and technologies shall be developed with priority on those pollutants which pose a significant risk to human health and the environment, and with opportunities for participation by industry, public interest groups, scientists, and other interested persons in the development of such strategies and technologies. Such program shall include the following elements:

**(1)** Improvements in nonregulatory strategies and technologies for preventing or reducing multiple air pollutants, including sulfur oxides, nitrogen oxides, heavy metals, PM-10 (particulate matter), carbon monoxide, and carbon dioxide, from stationary sources, including fossil fuel power plants. Such strategies and technologies shall include improvements in the relative cost effectiveness and long-range implications of various air pollutant reduction and nonregulatory control strategies such as energy conservation, including end-use efficiency, and fuel-switching to cleaner fuels. Such strategies and technologies shall be considered for existing and new facilities.

2a

(2) Improvements in nonregulatory strategies and technologies for reducing air emissions from area sources.

(3) Improvements in nonregulatory strategies and technologies for preventing, detecting, and correcting accidental releases of hazardous air pollutants.

(4) Improvements in nonregulatory strategies and technologies that dispose of tires in ways that avoid adverse air quality impacts.

Nothing in this subsection shall be construed to authorize the imposition on any person of air pollution control requirements. The Administrator shall consult with other appropriate Federal agencies to ensure coordination and to avoid duplication of activities authorized under this subsection.

\* \* \*

3a

**42 U.S.C. § 7407: Air quality control regions**

**(a)** Responsibility of each State for air quality; submission of implementation plan

Each State shall have the primary responsibility for assuring air quality within the entire geographic area comprising such State by submitting an implementation plan for such State which will specify the manner in which national primary and secondary ambient air quality standards will be achieved and maintained within each air quality control region in such State.

**(b)** Designated regions

For purposes of developing and carrying out implementation plans under section 7410 of this title-

**(1)** an air quality control region designated under this section before December 31, 1970, or a region designated after such date under subsection (c) of this section, shall be an air quality control region; and

**(2)** the portion of such State which is not part of any such designated region shall be an air quality control region, but such portion may be subdivided by the State into two or more air quality control regions with the approval of the Administrator.

**(c)** Authority of Administrator to designate regions; notification of Governors of affected States

The Administrator shall, within 90 days after December 31, 1970, after consultation with

4a

appropriate State and local authorities, designate as an air quality control region any interstate area or major intrastate area which he deems necessary or appropriate for the attainment and maintenance of ambient air quality standards. The Administrator shall immediately notify the Governors of the affected States of any designation made under this subsection.

**(d) Designations**

**(1) Designations generally**

**(A) Submission by Governors of initial designations following promulgation of new or revised standards**

By such date as the Administrator may reasonably require, but not later than 1 year after promulgation of a new or revised national ambient air quality standard for any pollutant under section 7409 of this title, the Governor of each State shall (and at any other time the Governor of a State deems appropriate the Governor may) submit to the Administrator a list of all areas (or portions thereof) in the State, designating as—

**(i) nonattainment**, any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant,

**(ii) attainment**, any area (other than an area identified in clause (i)) that meets the national primary or secondary ambient air quality standard for the pollutant, or

5a

**(iii)** unclassifiable, any area that cannot be classified on the basis of available information as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

The Administrator may not require the Governor to submit the required list sooner than 120 days after promulgating a new or revised national ambient air quality standard.

**(B)** Promulgation by EPA of designations

**(i)** Upon promulgation or revision of a national ambient air quality standard, the Administrator shall promulgate the designations of all areas (or portions thereof) submitted under subparagraph (A) as expeditiously as practicable, but in no case later than 2 years from the date of promulgation of the new or revised national ambient air quality standard. Such period may be extended for up to one year in the event the Administrator has insufficient information to promulgate the designations.

**(ii)** In making the promulgations required under clause (i), the Administrator may make such modifications as the Administrator deems necessary to the designations of the areas (or portions thereof) submitted under subparagraph (A) (including to the boundaries of such areas or portions thereof). Whenever the Administrator intends to make a modification, the Administrator shall notify the State and provide such State with an opportunity to demonstrate

## 6a

why any proposed modification is inappropriate. The Administrator shall give such notification no later than 120 days before the date the Administrator promulgates the designation, including any modification thereto. If the Governor fails to submit the list in whole or in part, as required under subparagraph (A), the Administrator shall promulgate the designation that the Administrator deems appropriate for any area (or portion thereof) not designated by the State.

**(iii)** If the Governor of any State, on the Governor's own motion, under subparagraph (A), submits a list of areas (or portions thereof) in the State designated as nonattainment, attainment, or unclassifiable, the Administrator shall act on such designations in accordance with the procedures under paragraph (3) (relating to redesignation).

**(iv)** A designation for an area (or portion thereof) made pursuant to this subsection shall remain in effect until the area (or portion thereof) is redesignated pursuant to paragraph (3) or (4).

**(C)** Designations by operation of law

**(i)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(A), (B), or (C) of this subsection (as in effect immediately before November 15, 1990) is designated, by operation of law, as a nonattainment area for such pollutant within the meaning of subparagraph (A)(i).

7a

**(ii)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(E) (as in effect immediately before November 15, 1990) is designated by operation of law, as an attainment area for such pollutant within the meaning of subparagraph (A)(ii).

**(iii)** Any area designated with respect to any air pollutant under the provisions of paragraph (1)(D) (as in effect immediately before November 15, 1990) is designated, by operation of law, as an unclassifiable area for such pollutant within the meaning of subparagraph (A)(iii).

**(2)** Publication of designations and redesignations

**(A)** The Administrator shall publish a notice in the Federal Register promulgating any designation under paragraph (1) or (5), or announcing any designation under paragraph (4), or promulgating any redesignation under paragraph (3).

**(B)** Promulgation or announcement of a designation under paragraph (1), (4) or (5) shall not be subject to the provisions of sections 553 through 557 of Title 5 (relating to notice and comment), except nothing herein shall be construed as precluding such public notice and comment whenever possible.

**(3)** Redesignation

**(A)** Subject to the requirements of subparagraph (E), and on the basis of air quality data, planning

## 8a

and control considerations, or any other air quality-related considerations the Administrator deems appropriate, the Administrator may at any time notify the Governor of any State that available information indicates that the designation of any area or portion of an area within the State or interstate area should be revised. In issuing such notification, which shall be public, to the Governor, the Administrator shall provide such information as the Administrator may have available explaining the basis for the notice.

**(B)** No later than 120 days after receiving a notification under subparagraph (A), the Governor shall submit to the Administrator such redesignation, if any, of the appropriate area (or areas) or portion thereof within the State or interstate area, as the Governor considers appropriate.

**(C)** No later than 120 days after the date described in subparagraph (B) (or paragraph (1)(B)(iii)), the Administrator shall promulgate the redesignation, if any, of the area or portion thereof, submitted by the Governor in accordance with subparagraph (B), making such modifications as the Administrator may deem necessary, in the same manner and under the same procedure as is applicable under clause (ii) of paragraph (1)(B), except that the phrase "60 days" shall be substituted for the phrase "120 days" in that clause. If the Governor does not submit, in accordance with subparagraph (B), a redesignation for an area (or portion thereof) identified by the Administrator under

9a

subparagraph (A), the Administrator shall promulgate such redesignation, if any, that the Administrator deems appropriate.

**(D)** The Governor of any State may, on the Governor's own motion, submit to the Administrator a revised designation of any area or portion thereof within the State. Within 18 months of receipt of a complete State redesignation submittal, the Administrator shall approve or deny such redesignation. The submission of a redesignation by a Governor shall not affect the effectiveness or enforceability of the applicable implementation plan for the State.

**(E)** The Administrator may not promulgate a redesignation of a nonattainment area (or portion thereof) to attainment unless—

**(i)** the Administrator determines that the area has attained the national ambient air quality standard;

**(ii)** the Administrator has fully approved the applicable implementation plan for the area under section 7410(k) of this title;

**(iii)** the Administrator determines that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions;

**(iv)** the Administrator has fully approved a

10a

maintenance plan for the area as meeting the requirements of section 7505a of this title; and

**(v)** the State containing such area has met all requirements applicable to the area under section 7410 of this title and part D of this subchapter.

**(F)** The Administrator shall not promulgate any redesignation of any area (or portion thereof) from nonattainment to unclassifiable.

**(4)** Nonattainment designations for ozone, carbon monoxide and particulate matter (PM-10)

**(A)** Ozone and carbon monoxide

**(i)** Within 120 days after November 15, 1990, each Governor of each State shall submit to the Administrator a list that designates, affirms or reaffirms the designation of, or redesignates (as the case may be), all areas (or portions thereof) of the Governor's State as attainment, nonattainment, or unclassifiable with respect to the national ambient air quality standards for ozone and carbon monoxide.

**(ii)** No later than 120 days after the date the Governor is required to submit the list of areas (or portions thereof) required under clause (i) of this subparagraph, the Administrator shall promulgate such designations, making such modifications as the Administrator may deem necessary, in the same manner, and under the same procedure, as is applicable under clause (ii) of paragraph (1)(B), except that the phrase "60

## 11a

days” shall be substituted for the phrase “120 days” in that clause. If the Governor does not submit, in accordance with clause (i) of this subparagraph, a designation for an area (or portion thereof), the Administrator shall promulgate the designation that the Administrator deems appropriate.

**(iii)** No nonattainment area may be redesignated as an attainment area under this subparagraph.

**(iv)** Notwithstanding paragraph (1)(C)(ii) of this subsection, if an ozone or carbon monoxide nonattainment area located within a metropolitan statistical area or consolidated metropolitan statistical area (as established by the Bureau of the Census) is classified under part D of this subchapter as a Serious, Severe, or Extreme Area, the boundaries of such area are hereby revised (on the date 45 days after such classification) by operation of law to include the entire metropolitan statistical area or consolidated metropolitan statistical area, as the case may be, unless within such 45-day period the Governor (in consultation with State and local air pollution control agencies) notifies the Administrator that additional time is necessary to evaluate the application of clause (v). Whenever a Governor has submitted such a notice to the Administrator, such boundary revision shall occur on the later of the date 8 months after such classification or 14 months after November 15, 1990, unless the Governor makes the finding referred to in clause (v), and the Administrator concurs in such finding,

## 12a

within such period. Except as otherwise provided in this paragraph, a boundary revision under this clause or clause (v) shall apply for purposes of any State implementation plan revision required to be submitted after November 15, 1990.

(v) Whenever the Governor of a State has submitted a notice under clause (iv), the Governor, in consultation with State and local air pollution control agencies, shall undertake a study to evaluate whether the entire metropolitan statistical area or consolidated metropolitan statistical area should be included within the nonattainment area. Whenever a Governor finds and demonstrates to the satisfaction of the Administrator, and the Administrator concurs in such finding, that with respect to a portion of a metropolitan statistical area or consolidated metropolitan statistical area, sources in the portion do not contribute significantly to violation of the national ambient air quality standard, the Administrator shall approve the Governor's request to exclude such portion from the nonattainment area. In making such finding, the Governor and the Administrator shall consider factors such as population density, traffic congestion, commercial development, industrial development, meteorological conditions, and pollution transport.

**(B) PM-10 designations**

By operation of law, until redesignation by the Administrator pursuant to paragraph (3)—

13a

**(i)** each area identified in 52 Federal Register 29383 (Aug. 7, 1987) as a Group I area (except to the extent that such identification was modified by the Administrator before November 15, 1990) is designated nonattainment for PM-10;

**(ii)** any area containing a site for which air quality monitoring data show a violation of the national ambient air quality standard for PM-10 before January 1, 1989 (as determined under part 50, appendix K of title 40 of the Code of Federal Regulations) is hereby designated nonattainment for PM-10; and

**(iii)** each area not described in clause (i) or (ii) is hereby designated unclassifiable for PM-10.

Any designation for particulate matter (measured in terms of total suspended particulates) that the Administrator promulgated pursuant to this subsection (as in effect immediately before November 15, 1990) shall remain in effect for purposes of implementing the maximum allowable increases in concentrations of particulate matter (measured in terms of total suspended particulates) pursuant to section 7473(b) of this title, until the Administrator determines that such designation is no longer necessary for that purpose.

**(5)** Designations for lead

The Administrator may, in the Administrator's discretion at any time the Administrator deems

## 14a

appropriate, require a State to designate areas (or portions thereof) with respect to the national ambient air quality standard for lead in effect as of November 15, 1990, in accordance with the procedures under subparagraphs (A) and (B) of paragraph (1), except that in applying subparagraph (B)(i) of paragraph (1) the phrase “2 years from the date of promulgation of the new or revised national ambient air quality standard” shall be replaced by the phrase “1 year from the date the Administrator notifies the State of the requirement to designate areas with respect to the standard for lead”.

**(6) Designations****(A) Submission**

Notwithstanding any other provision of law, not later than February 15, 2004, the Governor of each State shall submit designations referred to in paragraph (1) for the July 1997 PM national ambient air quality standards for each area within the State, based on air quality monitoring data collected in accordance with any applicable Federal reference methods for the relevant areas.

**(B) Promulgation**

Notwithstanding any other provision of law, not later than December 31, 2004, the Administrator shall, consistent with paragraph (1), promulgate the designations referred to in subparagraph (A) for each area of each State for the July 1997 PM national ambient air quality standards.

15a

**(7) Implementation plan for regional haze**

**(A) In general**

Notwithstanding any other provision of law, not later than 3 years after the date on which the Administrator promulgates the designations referred to in paragraph (6)(B) for a State, the State shall submit, for the entire State, the State implementation plan revisions to meet the requirements promulgated by the Administrator under section 7492(e)(1) of this title (referred to in this paragraph as “regional haze requirements”).

**(B) No preclusion of other provisions**

Nothing in this paragraph precludes the implementation of the agreements and recommendations stemming from the Grand Canyon Visibility Transport Commission Report dated June 1996, including the submission of State implementation plan revisions by the States of Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon, Utah, or Wyoming by December 31, 2003, for implementation of regional haze requirements applicable to those States.

**(e) Redesignation of air quality control regions**

**(1)** Except as otherwise provided in paragraph (2), the Governor of each State is authorized, with the approval of the Administrator, to redesignate from time to time the air quality control regions within such State for purposes of efficient and effective air quality management. Upon such redesignation, the list under subsection (d) of this section shall be

16a

modified accordingly.

**(2)** In the case of an air quality control region in a State, or part of such region, which the Administrator finds may significantly affect air pollution concentrations in another State, the Governor of the State in which such region, or part of a region, is located may redesignate from time to time the boundaries of so much of such air quality control region as is located within such State only with the approval of the Administrator and with the consent of all Governors of all States which the Administrator determines may be significantly affected.

**(3)** No compliance date extension granted under section 7413(d)(5) of this title (relating to coal conversion) shall cease to be effective by reason of the regional limitation provided in section 7413(d)(5) of this title if the violation of such limitation is due solely to a redesignation of a region under this subsection.

17a

**42 U.S.C. § 7409. National primary and secondary ambient air quality standards**

**(a) Promulgation**

**(1) The Administrator—**

**(A)** within 30 days after December 31, 1970, shall publish proposed regulations prescribing a national primary ambient air quality standard and a national secondary ambient air quality standard for each air pollutant for which air quality criteria have been issued prior to such date; and

**(B)** after a reasonable time for interested persons to submit written comments thereon (but no later than 90 days after the initial publication of such proposed standards) shall by regulation promulgate such proposed national primary and secondary ambient air quality standards with such modifications as he deems appropriate.

**(2)** With respect to any air pollutant for which air quality criteria are issued after December 31, 1970, the Administrator shall publish, simultaneously with the issuance of such criteria and information, proposed national primary and secondary ambient air quality standards for any such pollutant. The procedure provided for in paragraph (1)(B) of this subsection shall apply to the promulgation of such standards.

**(b) Protection of public health and welfare**

18a

**(1)** National primary ambient air quality standards, prescribed under subsection (a) of this section shall be ambient air quality standards the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health. Such primary standards may be revised in the same manner as promulgated.

**(2)** Any national secondary ambient air quality standard prescribed under subsection (a) of this section shall specify a level of air quality the attainment and maintenance of which in the judgment of the Administrator, based on such criteria, is requisite to protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air. Such secondary standards may be revised in the same manner as promulgated.

**(c)** National primary ambient air quality standard for nitrogen dioxide

The Administrator shall, not later than one year after August 7, 1977, promulgate a national primary ambient air quality standard for NO<sub>2</sub> concentrations over a period of not more than 3 hours unless, based on the criteria issued under section 7408(c) of this title, he finds that there is no significant evidence that such a standard for such a period is requisite to protect public health.

**(d)** Review and revision of criteria and standards;  
independent scientific review committee;  
appointment; advisory functions

19a

**(1)** Not later than December 31, 1980, and at five-year intervals thereafter, the Administrator shall complete a thorough review of the criteria published under section 7408 of this title and the national ambient air quality standards promulgated under this section and shall make such revisions in such criteria and standards and promulgate such new standards as may be appropriate in accordance with section 7408 of this title and subsection (b) of this section. The Administrator may review and revise criteria or promulgate new standards earlier or more frequently than required under this paragraph.

**(2)**

**(A)** The Administrator shall appoint an independent scientific review committee composed of seven members including at least one member of the National Academy of Sciences, one physician, and one person representing State air pollution control agencies.

**(B)** Not later than January 1, 1980, and at five-year intervals thereafter, the committee referred to in subparagraph (A) shall complete a review of the criteria published under section 7408 of this title and the national primary and secondary ambient air quality standards promulgated under this section and shall recommend to the Administrator any new national ambient air quality standards and revisions of existing criteria and standards as may be appropriate under section 7408 of this title and subsection (b) of this section.

20a

(C) Such committee shall also (i) advise the Administrator of areas in which additional knowledge is required to appraise the adequacy and basis of existing, new, or revised national ambient air quality standards, (ii) describe the research efforts necessary to provide the required information, (iii) advise the Administrator on the relative contribution to air pollution concentrations of natural as well as anthropogenic activity, and (iv) advise the Administrator of any adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance of such national ambient air quality standards.

21a

**42 U.S.C. § 7470: Congressional declaration of purpose**

The purposes of this part are as follows:

- (1) to protect public health and welfare from any actual or potential adverse effect which in the Administrator's judgment may reasonably be anticipate to occur from air pollution or from exposures to pollutants in other media, which pollutants originate as emissions to the ambient air), notwithstanding attainment and maintenance of all national ambient air quality standards;
- (2) to preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value;
- (3) to insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources;
- (4) to assure that emissions from any source in any State will not interfere with any portion of the applicable implementation plan to prevent significant deterioration of air quality for any other State; and
- (5) to assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decisionmaking process.

22a

**42 U.S.C. § 7471. Plan requirements**

In accordance with the policy of section 7401(b)(1) of this title, each applicable implementation plan shall contain emission limitations and such other measures as may be necessary, as determined under regulations promulgated under this part, to prevent significant deterioration of air quality in each region (or portion thereof) designated pursuant to section 7407 of this title as attainment or unclassifiable.

23a

**42 U.S.C. § 7473: Increments and ceilings**

**(a)** Sulfur oxide and particulate matter; requirement that maximum allowable increases and maximum allowable concentrations not be exceeded

In the case of sulfur oxide and particulate matter, each applicable implementation plan shall contain measures assuring that maximum allowable increases over baseline concentrations of, and maximum allowable concentrations of, such pollutant shall not be exceeded. In the case of any maximum allowable increase (except an allowable increase specified under section 7475(d)(2)(C)(iv) of this title) for a pollutant based on concentrations permitted under national ambient air quality standards for any period other than an annual period, such regulations shall permit such maximum allowable increase to be exceeded during one such period per year.

**(b)** Maximum allowable increases in concentrations over baseline concentrations

**(1)** For any class I area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 24a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	5
Twenty-four-hour maximum	10
Sulfur dioxide:	
Annual arithmetic mean	2
Twenty-four-hour maximum	5
Three-hour maximum	25

**(2)** For any class II area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 25a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	19
Twenty-four-hour maximum	37
Sulfur dioxide:	
Annual arithmetic mean	20
Twenty-four-hour maximum	91
Three-hour maximum	512

**(3)** For any class III area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

## 26a

Pollutant	Maximum allowable increase (in micrograms per cubic meter)
Particulate matter:	
Annual geometric mean	37
Twenty-four-hour maximum	75
Sulfur dioxide:	
Annual arithmetic mean	40
Twenty-four-hour maximum	182
Three-hour maximum	700

(4) The maximum allowable concentration of any air pollutant in any area to which this part applies shall not exceed a concentration for such pollutant for each period of exposure equal to—

(A) the concentration permitted under the national secondary ambient air quality standard, or

(B) the concentration permitted under the national primary ambient air quality standard,

whichever concentration is lowest for such pollutant for such period of exposure.

27a

**(c)** Orders or rules for determining compliance with maximum allowable increases in ambient concentrations of air pollutants

**(1)** In the case of any State which has a plan approved by the Administrator for purposes of carrying out this part, the Governor of such State may, after notice and opportunity for public hearing, issue orders or promulgate rules providing that for purposes of determining compliance with the maximum allowable increases in ambient concentrations of an air pollutant, the following concentrations of such pollutant shall not be taken into account:

**(A)** concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from the use of petroleum products, or natural gas, or both, by reason of an order which is in effect under the provisions of sections 792(a) and (b) of Title 15 (or any subsequent legislation which supersedes such provisions) over the emissions from such sources before the effective date of such order.

**(B)** the concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from using natural gas by reason of a natural gas curtailment pursuant to a natural gas curtailment plan in effect pursuant to the Federal Power Act [16 U.S.C.A. § 791a et seq.] over the emissions from such sources before the effective date of such plan,

28a

(C) concentrations of particulate matter attributable to the increase in emissions from construction or other temporary emission-related activities, and

(D) the increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources which are included in the baseline concentration determined in accordance with section 7479(4) of this title.

(2) No action taken with respect to a source under paragraph (1)(A) or (1)(B) shall apply more than five years after the effective date of the order referred to in paragraph (1)(A) or the plan referred to in paragraph (1)(B), whichever is applicable. If both such order and plan are applicable, no such action shall apply more than five years after the later of such effective dates.

(3) No action under this subsection shall take effect unless the Governor submits the order or rule providing for such exclusion to the Administrator and the Administrator determines that such order or rule is in compliance with the provisions of this subsection.

29a

**42 U.S.C. § 7475. Preconstruction requirements**

**(a)** Major emitting facilities on which construction is commenced

No major emitting facility on which construction is commenced after August 7, 1977, may be constructed in any area to which this part applies unless--

**(1)** a permit has been issued for such proposed facility in accordance with this part setting forth emission limitations for such facility which conform to the requirements of this part;

**(2)** the proposed permit has been subject to a review in accordance with this section, the required analysis has been conducted in accordance with regulations promulgated by the Administrator, and a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of such source, alternatives thereto, control technology requirements, and other appropriate considerations;

**(3)** the owner or operator of such facility demonstrates, as required pursuant to section 7410(j) of this title, that emissions from construction or operation of such facility will not cause, or contribute to, air pollution in excess of any (A) maximum allowable increase or maximum allowable concentration for any pollutant in any area to which this part applies more than one time per year, (B) national ambient air quality standard in any air quality control region, or (C) any other

30a

applicable emission standard or standard of performance under this chapter;

(4) the proposed facility is subject to the best available control technology for each pollutant subject to regulation under this chapter emitted from, or which results from, such facility;

(5) the provisions of subsection (d) of this section with respect to protection of class I areas have been complied with for such facility;

(6) there has been an analysis of any air quality impacts projected for the area as a result of growth associated with such facility;

(7) the person who owns or operates, or proposes to own or operate, a major emitting facility for which a permit is required under this part agrees to conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or is having, on air quality in any area which may be affected by emissions from such source; and

(8) in the case of a source which proposes to construct in a class III area, emissions from which would cause or contribute to exceeding the maximum allowable increments applicable in a class II area and where no standard under section 7411 of this title has been promulgated subsequent to August 7, 1977, for such source category, the Administrator has approved the determination of best available technology as set forth in the permit.

(b) Exception

31a

The demonstration pertaining to maximum allowable increases required under subsection (a)(3) of this section shall not apply to maximum allowable increases for class II areas in the case of an expansion or modification of a major emitting facility which is in existence on August 7, 1977, whose allowable emissions of air pollutants, after compliance with subsection (a)(4) of this section, will be less than fifty tons per year and for which the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur oxides will not cause or contribute to ambient air quality levels in excess of the national secondary ambient air quality standard for either of such pollutants.

**(c)** Permit applications

Any completed permit application under section 7410 of this title for a major emitting facility in any area to which this part applies shall be granted or denied not later than one year after the date of filing of such completed application.

**(d)** Action taken on permit applications; notice; adverse impact on air quality related values; variance; emission limitations

**(1)** Each State shall transmit to the Administrator a copy of each permit application relating to a major emitting facility received by such State and provide notice to the Administrator of every action related to the consideration of such permit.

**(2)**

32a

**(A)** The Administrator shall provide notice of the permit application to the Federal Land Manager and the Federal official charged with direct responsibility for management of any lands within a class I area which may be affected by emissions from the proposed facility.

**(B)** The Federal Land Manager and the Federal official charged with direct responsibility for management of such lands shall have an affirmative responsibility to protect the air quality related values (including visibility) of any such lands within a class I area and to consider, in consultation with the Administrator, whether a proposed major emitting facility will have an adverse impact on such values.

**(C)**

**(i)** In any case where the Federal official charged with direct responsibility for management of any lands within a class I area or the Federal Land Manager of such lands, or the Administrator, or the Governor of an adjacent State containing such a class I area files a notice alleging that emissions from a proposed major emitting facility may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur dioxide will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area.

33a

**(ii)** In any case where the Federal Land Manager demonstrates to the satisfaction of the State that the emissions from such facility will have an adverse impact on the air quality-related values (including visibility) of such lands, notwithstanding the fact that the change in air quality resulting from emissions from such facility will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area, a permit shall not be issued.

**(iii)** In any case where the owner or operator of such facility demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such facility will have no adverse impact on the air quality-related values of such lands (including visibility), notwithstanding the fact that the change in air quality resulting from emissions from such facility will cause or contribute to concentrations which exceed the maximum allowable increases for class I areas, the State may issue a permit.

**(iv)** In the case of a permit issued pursuant to clause (iii), such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides and particulates from such facility will not cause or contribute to concentrations of such pollutant which exceed the following maximum allowable increases over the baseline concentration for such pollutants:

34a

**Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean . . . . .	19
Twenty-four-hour maximum . . . . .	37

Sulfur dioxide:

Annual arithmetic mean . . . . .	20
Twenty-four-hour maximum . . . . .	91
Three-hour maximum. . . . .	325

**(D)**

**(i)** In any case where the owner or operator of a proposed major emitting facility who has been denied a certification under subparagraph (C)(iii) demonstrates to the satisfaction of the Governor, after notice and public hearing, and the Governor finds, that the facility cannot be constructed by reason of any maximum allowable increase for sulfur dioxide for periods of twenty-four hours or less applicable to any class I area and, in the case of Federal mandatory class I areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If such variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph.

35a

**(ii)** In any case in which the Governor recommends a variance under this subparagraph in which the Federal Land Manager does not concur, the recommendations of the Governor and the Federal Land Manager shall be transmitted to the President. The President may approve the Governor's recommendation if he finds that such variance is in the national interest. No Presidential finding shall be reviewable in any court. The variance shall take effect if the President approves the Governor's recommendations. The President shall approve or disapprove such recommendation within ninety days after his receipt of the recommendations of the Governor and the Federal Land Manager.

**(iii)** In the case of a permit issued pursuant to this subparagraph, such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such facility will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period:

36a

**MAXIMUM ALLOWABLE INCREASE**

**[In micrograms per cubic meter]**

<b>Period of exposure</b>	Low terrain areas	High terrain areas
24-hr maximum . . . . .	36	62
3-hr maximum	130	221

(iv) For purposes of clause (iii), the term “high terrain area” means with respect to any facility, any area having an elevation of 900 feet or more above the base of the stack of such facility, and the term “low terrain area” means any area other than a high terrain area.

(e) Analysis; continuous air quality monitoring data; regulations; model adjustments

(1) The review provided for in subsection (a) of this section shall be preceded by an analysis in accordance with regulations of the Administrator, promulgated under this subsection, which may be conducted by the State (or any general purpose unit of local government) or by the major emitting facility applying for such permit, of the ambient air quality at the proposed site and in areas which may be affected by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.

(2) Effective one year after August 7, 1977, the analysis required by this subsection shall include continuous air quality monitoring data gathered for purposes of determining whether emissions from

## 37a

such facility will exceed the maximum allowable increases or the maximum allowable concentration permitted under this part. Such data shall be gathered over a period of one calendar year preceding the date of application for a permit under this part unless the State, in accordance with regulations promulgated by the Administrator, determines that a complete and adequate analysis for such purposes may be accomplished in a shorter period. The results of such analysis shall be available at the time of the public hearing on the application for such permit.

**(3)** The Administrator shall within six months after August 7, 1977, promulgate regulations respecting the analysis required under this subsection which regulations—

**(A)** shall not require the use of any automatic or uniform buffer zone or zones,

**(B)** shall require an analysis of the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility at the site of the proposed major emitting facility and in the area potentially affected by the emissions from such facility for each pollutant regulated under this chapter which will be emitted from, or which results from the construction or operation of, such facility, the size and nature of the proposed facility, the degree of continuous emission reduction which could be achieved by such facility, and such other factors as may be relevant in determining the effect of emissions from a proposed facility on any air quality control region,

38a

(C) shall require the results of such analysis shall be available at the time of the public hearing on the application for such permit, and

(D) shall specify with reasonable particularity each air quality model or models to be used under specified sets of conditions for purposes of this part.

Any model or models designated under such regulations may be adjusted upon a determination, after notice and opportunity for public hearing, by the Administrator that such adjustment is necessary to take into account unique terrain or meteorological characteristics of an area potentially affected by emissions from a source applying for a permit required under this part.

39a

**42 U.S.C. § 7477: Enforcement**

The Administrator shall, and a State may, take such measures, including issuance of an order, or seeking injunctive relief, as necessary to prevent the construction or modification of a major emitting facility which does not conform to the requirements of this part, or which is proposed to be constructed in any area designated pursuant to section 7407(d) of this title as attainment or unclassifiable and which is not subject to an implementation plan which meets the requirements of this part.

40a

**42 U.S.C. § 7479: Definitions**

For purposes of this part—

(1) The term “major emitting facility” means any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant from the following types of stationary sources: fossil-fuel fired steam electric plants of more than two hundred and fifty million British thermal units per hour heat input, coal cleaning plants (thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants, primary copper smelters, municipal incinerators capable of charging more than fifty tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production facilities, chemical process plants, fossil-fuel boilers of more than two hundred and fifty million British thermal units per hour heat input, petroleum storage and transfer facilities with a capacity exceeding three hundred thousand barrels, taconite ore processing facilities, glass fiber processing plants, charcoal production facilities. Such term also includes any other source with the potential to emit two hundred and fifty tons per year or more of any air pollutant. This term shall not include new or modified facilities which are nonprofit health or education institutions which have been exempted by the State.

41a

**(2)**

**(A)** The term “commenced” as applied to construction of a major emitting facility means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has (i) begun, or caused to begin, a continuous program of physical on-site construction of the facility or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed within a reasonable time.

**(B)** The term “necessary preconstruction approvals or permits” means those permits or approvals, required by the permitting authority as a precondition to undertaking any activity under clauses (i) or (ii) of subparagraph (A) of this paragraph.

**(C)** The term “construction” when used in connection with any source or facility, includes the modification (as defined in section 7411(a) of this title) of any source or facility.

**(3)** The term “best available control technology” means an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation under this chapter emitted from or which results from any major emitting facility, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic

## 42a

impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each such pollutant. In no event shall application of "best available control technology" result in emissions of any pollutants which will exceed the emissions allowed by any applicable standard established pursuant to section 7411 or 7412 of this title. Emissions from any source utilizing clean fuels, or any other means, to comply with this paragraph shall not be allowed to increase above levels that would have been required under this paragraph as it existed prior to November 15, 1990.

(4) The term "baseline concentration" means, with respect to a pollutant, the ambient concentration levels which exist at the time of the first application for a permit in an area subject to this part, based on air quality data available in the Environmental Protection Agency or a State air pollution control agency and on such monitoring data as the permit applicant is required to submit. Such ambient concentration levels shall take into account all projected emissions in, or which may affect, such area from any major emitting facility on which construction commenced prior to January 6, 1975, but which has not begun operation by the date of the baseline air quality concentration determination. Emissions of sulfur oxides and particulate matter from any major emitting facility on which construction commenced after January 6, 1975, shall not be included in the baseline and shall be counted against the maximum allowable increases in pollutant concentrations established under this part.

43a

**42 U.S.C. § 7491: Visibility protection for Federal Class I areas**

**(a)** Impairment of visibility; list of areas; study and report

**(1)** Congress hereby declares as a national goal the prevention of any future, and the remedying of any existing, impairment of visibility in mandatory class I Federal areas which impairment results from manmade air pollution.

**(2)** Not later than six months after August 7, 1977, the Secretary of the Interior in consultation with other Federal land managers shall review all mandatory class I Federal areas and identify those where visibility is an important value of the area. From time to time the Secretary of the Interior may revise such identifications. Not later than one year after August 7, 1977, the Administrator shall, after consultation with the Secretary of the Interior, promulgate a list of mandatory class I Federal areas in which he determines visibility is an important value.

**(3)** Not later than eighteen months after August 7, 1977, the Administrator shall complete a study and report to Congress on available methods for implementing the national goal set forth in paragraph (1). Such report shall include recommendations for—

**(A)** methods for identifying, characterizing, determining, quantifying, and measuring visibility impairment in Federal areas referred to in paragraph (1), and

44a

**(B)** modeling techniques (or other methods) for determining the extent to which manmade air pollution may reasonably be anticipated to cause or contribute to such impairment, and

**(C)** methods for preventing and remedying such manmade air pollution and resulting visibility impairment.

Such report shall also identify the classes or categories of sources and the types of air pollutants which, alone or in conjunction with other sources or pollutants, may reasonably be anticipated to cause or contribute significantly to impairment of visibility.

**(4)** Not later than twenty-four months after August 7, 1977, and after notice and public hearing, the Administrator shall promulgate regulations to assure **(A)** reasonable progress toward meeting the national goal specified in paragraph (1), and **(B)** compliance with the requirements of this section.

**(b) Regulations**

Regulations under subsection (a)(4) of this section shall—

**(1)** provide guidelines to the States, taking into account the recommendations under subsection (a)(3) of this section on appropriate techniques and methods for implementing this section (as provided in subparagraphs **(A)** through **(C)** of such subsection (a)(3) ), and

45a

**(2)** require each applicable implementation plan for a State in which any area listed by the Administrator under subsection (a)(2) of this section is located (or for a State the emissions from which may reasonably be anticipated to cause or contribute to any impairment of visibility in any such area) to contain such emission limits, schedules of compliance and other measures as may be necessary to make reasonable progress toward meeting the national goal specified in subsection (a) of this section, including—

**(A)** except as otherwise provided pursuant to subsection (c) of this section, a requirement that each major stationary source which is in existence on August 7, 1977, but which has not been in operation for more than fifteen years as of such date, and which, as determined by the State (or the Administrator in the case of a plan promulgated under section 7410(c) of this title) emits any air pollutant which may reasonably be anticipated to cause or contribute to any impairment of visibility in any such area, shall procure, install, and operate, as expeditiously as practicable (and maintain thereafter) the best available retrofit technology, as determined by the State (or the Administrator in the case of a plan promulgated under section 7410(c) of this title) for controlling emissions from such source for the purpose of eliminating or reducing any such impairment, and

**(B)** a long-term (ten to fifteen years) strategy for making reasonable progress toward meeting the national goal specified in subsection (a) of this section.

46a

In the case of a fossil-fuel fired generating powerplant having a total generating capacity in excess of 750 megawatts, the emission limitations required under this paragraph shall be determined pursuant to guidelines, promulgated by the Administrator under paragraph (1).

**(c) Exemptions**

**(1)** The Administrator may, by rule, after notice and opportunity for public hearing, exempt any major stationary source from the requirement of subsection (b)(2)(A) of this section, upon his determination that such source does not or will not, by itself or in combination with other sources, emit any air pollutant which may reasonably be anticipated to cause or contribute to a significant impairment of visibility in any mandatory class I Federal area.

**(2)** Paragraph (1) of this subsection shall not be applicable to any fossil-fuel fired powerplant with total design capacity of 750 megawatts or more, unless the owner or operator of any such plant demonstrates to the satisfaction of the Administrator that such powerplant is located at such distance from all areas listed by the Administrator under subsection (a)(2) of this section that such powerplant does not or will not, by itself or in combination with other sources, emit any air pollutant which may reasonably be anticipated to cause or contribute to significant impairment of visibility in any such area.

47a

**(3)** An exemption under this subsection shall be effective only upon concurrence by the appropriate Federal land manager or managers with the Administrator's determination under this subsection.

**(d)** Consultations with appropriate Federal land managers

Before holding the public hearing on the proposed revision of an applicable implementation plan to meet the requirements of this section, the State (or the Administrator, in the case of a plan promulgated under section 7410(c) of this title) shall consult in person with the appropriate Federal land manager or managers and shall include a summary of the conclusions and recommendations of the Federal land managers in the notice to the public.

**(e)** Buffer zones

In promulgating regulations under this section, the Administrator shall not require the use of any automatic or uniform buffer zone or zones.

**(f)** Nondiscretionary duty

For purposes of section 7604(a)(2) of this title, the meeting of the national goal specified in subsection (a)(1) of this section by any specific date or dates shall not be considered a "nondiscretionary duty" of the Administrator.

**(g)** Definitions

48a

For the purpose of this section—

(1) in determining reasonable progress there shall be taken into consideration the costs of compliance, the time necessary for compliance, and the energy and nonair quality environmental impacts of compliance, and the remaining useful life of any existing source subject to such requirements;

(2) in determining best available retrofit technology the State (or the Administrator in determining emission limitations which reflect such technology) shall take into consideration the costs of compliance, the energy and nonair quality environmental impacts of compliance, any existing pollution control technology in use at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology;

(3) the term “manmade air pollution” means air pollution which results directly or indirectly from human activities;

(4) the term “as expeditiously as practicable” means as expeditiously as practicable but in no event later than five years after the date of approval of a plan revision under this section (or the date of promulgation of such a plan revision in the case of action by the Administrator under section 7410(c) of this title for purposes of this section);

(5) the term “mandatory class I Federal areas” means Federal areas which may not be designated as other than class I under this part;

49a

(6) the terms “visibility impairment” and “impairment of visibility” shall include reduction in visual range and atmospheric discoloration; and

(7) the term “major stationary source” means the following types of stationary sources with the potential to emit 250 tons or more of any pollutant: fossil-fuel fired steam electric plants of more than 250 million British thermal units per hour heat input, coal cleaning plants (thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants, primary copper smelters, municipal incinerators capable of charging more than 250 tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production facilities, chemical process plants, fossil-fuel boilers of more than 250 million British thermal units per hour heat input, petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels, taconite ore processing facilities, glass fiber processing plants, charcoal production facilities.

50a

**42 U.S.C. § 7521: Emission standards for new motor vehicles or new motor vehicle engines**

**(a)** Authority of Administrator to prescribe by regulation

Except as otherwise provided in subsection (b) of this section—

**(1)** The Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare. Such standards shall be applicable to such vehicles and engines for their useful life (as determined under subsection (d) of this section, relating to useful life of vehicles for purposes of certification), whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution.

**(2)** Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.

**(3)**

**(A)** In general

51a

**(i)** Unless the standard is changed as provided in subparagraph (B), regulations under paragraph (1) of this subsection applicable to emissions of hydrocarbons, carbon monoxide, oxides of nitrogen, and particulate matter from classes or categories of heavy-duty vehicles or engines manufactured during or after model year 1983 shall contain standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.

**(ii)** In establishing classes or categories of vehicles or engines for purposes of regulations under this paragraph, the Administrator may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors.

**(B)** Revised standards for heavy duty trucks

**(i)** On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection revising any standard promulgated under, or before the

52a

date of, the enactment of the Clean Air Act Amendments of 1990 (or previously revised under this subparagraph) and applicable to classes or categories of heavy-duty vehicles or engines.

**(ii)** Effective for the model year 1998 and thereafter, the regulations under paragraph (1) of this subsection applicable to emissions of oxides of nitrogen (NO<sub>x</sub>) from gasoline and diesel-fueled heavy duty trucks shall contain standards which provide that such emissions may not exceed 4.0 grams per brake horsepower hour (gbh).

**(C)** Lead time and stability

Any standard promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines shall apply for a period of no less than 3 model years beginning no earlier than the model year commencing 4 years after such revised standard is promulgated.

**(D)** Rebuilding practices

The Administrator shall study the practice of rebuilding heavy-duty engines and the impact rebuilding has on engine emissions. On the basis of that study and other information available to the Administrator, the Administrator may prescribe requirements to control rebuilding practices, including standards applicable to emissions from any rebuilt heavy-duty engines (whether or not the engine is past its statutory useful life), which in the Administrator's judgment

53a

cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare taking costs into account. Any regulation shall take effect after a period the Administrator finds necessary to permit the development and application of the requisite control measures, giving appropriate consideration to the cost of compliance within the period and energy and safety factors.

**(E) Motorcycles**

For purposes of this paragraph, motorcycles and motorcycle engines shall be treated in the same manner as heavy-duty vehicles and engines (except as otherwise permitted under section 7525(f)(1) of this title) unless the Administrator promulgates a rule reclassifying motorcycles as light-duty vehicles within the meaning of this section or unless the Administrator promulgates regulations under subsection (a) of this section applying standards applicable to the emission of air pollutants from motorcycles as a separate class or category. In any case in which such standards are promulgated for such emissions from motorcycles as a separate class or category, the Administrator, in promulgating such standards, shall consider the need to achieve equivalency of emission reductions between motorcycles and other motor vehicles to the maximum extent practicable.

**(4)**

**(A)** Effective with respect to vehicles and engines manufactured after model year 1978, no emission

## 54a

control device, system, or element of design shall be used in a new motor vehicle or new motor vehicle engine for purposes of complying with requirements prescribed under this subchapter if such device, system, or element of design will cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function.

**(B)** In determining whether an unreasonable risk exists under subparagraph (A), the Administrator shall consider, among other factors, (i) whether and to what extent the use of any device, system, or element of design causes, increases, reduces, or eliminates emissions of any unregulated pollutants; (ii) available methods for reducing or eliminating any risk to public health, welfare, or safety which may be associated with the use of such device, system, or element of design, and (iii) the availability of other devices, systems, or elements of design which may be used to conform to requirements prescribed under this subchapter without causing or contributing to such unreasonable risk. The Administrator shall include in the consideration required by this paragraph all relevant information developed pursuant to section 7548 of this title.

**(5)**

**(A)** If the Administrator promulgates final regulations which define the degree of control required and the test procedures by which compliance could be determined for gasoline vapor recovery of uncontrolled emissions from the fueling of motor vehicles, the Administrator shall,

## 55a

after consultation with the Secretary of Transportation with respect to motor vehicle safety, prescribe, by regulation, fill pipe standards for new motor vehicles in order to insure effective connection between such fill pipe and any vapor recovery system which the Administrator determines may be required to comply with such vapor recovery regulations. In promulgating such standards the Administrator shall take into consideration limits on fill pipe diameter, minimum design criteria for nozzle retainer lips, limits on the location of the unleaded fuel restrictors, a minimum access zone surrounding a fill pipe, a minimum pipe or nozzle insertion angle, and such other factors as he deems pertinent.

**(B)** Regulations prescribing standards under subparagraph (A) shall not become effective until the introduction of the model year for which it would be feasible to implement such standards, taking into consideration the restraints of an adequate leadtime for design and production.

**(C)** Nothing in subparagraph (A) shall (i) prevent the Administrator from specifying different nozzle and fill neck sizes for gasoline with additives and gasoline without additives or (ii) permit the Administrator to require a specific location, configuration, modeling, or styling of the motor vehicle body with respect to the fuel tank fill neck or fill nozzle clearance envelope.

**(D)** For the purpose of this paragraph, the term "fill pipe" shall include the fuel tank fill pipe, fill neck, fill inlet, and closure.

56a

**(6) Onboard vapor recovery**

Within 1 year after November 15, 1990, the Administrator shall, after consultation with the Secretary of Transportation regarding the safety of vehicle-based (“onboard”) systems for the control of vehicle refueling emissions, promulgate standards under this section requiring that new light-duty vehicles manufactured beginning in the fourth model year after the model year in which the standards are promulgated and thereafter shall be equipped with such systems. The standards required under this paragraph shall apply to a percentage of each manufacturer’s fleet of new light-duty vehicles beginning with the fourth model year after the model year in which the standards are promulgated. The percentage shall be as specified in the following table:

**IMPLEMENTATION SCHEDULE FOR ONBOARD VAPOR RECOVERY REQUIREMENTS**

---

<b>Model year commencing after standards promulgated</b>	<b>Percentage*</b>
Fourth.....	40
Fifth.....	80
After Fifth.....	100

\*Percentages in the table refer to a percentage of the manufacturer’s sales volume.

The standards shall require that such systems provide a minimum evaporative emission capture

## 57a

efficiency of 95 percent. The requirements of section 7511a(b)(3) of this title (relating to stage II gasoline vapor recovery) for areas classified under section 7511 of this title as moderate for ozone shall not apply after promulgation of such standards and the Administrator may, by rule, revise or waive the application of the requirements of such section 7511a(b)(3) of this title for areas classified under section 7511 of this title as Serious, Severe, or Extreme for ozone, as appropriate, after such time as the Administrator determines that onboard emissions control systems required under this paragraph are in widespread use throughout the motor vehicle fleet.

**(b)** Emissions of carbon monoxide, hydrocarbons, and oxides of nitrogen; annual report to Congress; waiver of emission standards; research objectives

**(1)**

**(A)** The regulations under subsection (a) of this section applicable to emissions of carbon monoxide and hydrocarbons from light-duty vehicles and engines manufactured during model years 1977 through 1979 shall contain standards which provide that such emissions from such vehicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide. The regulations under subsection (a) of this section applicable to emissions of carbon monoxide from light-duty vehicles and engines manufactured during the model year 1980 shall contain standards which provide that such emissions may not exceed 7.0 grams per vehicle mile. The regulations under subsection (a) of this section applicable to

## 58a

emissions of hydrocarbons from light-duty vehicles and engines manufactured during or after model year 1980 shall contain standards which require a reduction of at least 90 percent from emissions of such pollutant allowable under the standards under this section applicable to light-duty vehicles and engines manufactured in model year 1970. Unless waived as provided in paragraph (5), regulations under subsection (a) of this section applicable to emissions of carbon monoxide from light-duty vehicles and engines manufactured during or after the model year 1981 shall contain standards which require a reduction of at least 90 percent from emissions of such pollutant allowable under the standards under this section applicable to light-duty vehicles and engines manufactured in model year 1970.

**(B)** The regulations under subsection (a) of this section applicable to emissions of oxides of nitrogen from light-duty vehicles and engines manufactured during model years 1977 through 1980 shall contain standards which provide that such emissions from such vehicles and engines may not exceed 2.0 grams per vehicle mile. The regulations under subsection (a) of this section applicable to emissions of oxides of nitrogen from light-duty vehicles and engines manufactured during the model year 1981 and thereafter shall contain standards which provide that such emissions from such vehicles and engines may not exceed 1.0 gram per vehicle mile. The Administrator shall prescribe standards in lieu of those required by the preceding sentence, which provide that emissions of oxides of nitrogen may not exceed 2.0 grams per vehicle mile for any

59a

light-duty vehicle manufactured during model years 1981 and 1982 by any manufacturer whose production, by corporate identity, for calendar year 1976 was less than three hundred thousand light-duty motor vehicles worldwide if the Administrator determines that—

(i) the ability of such manufacturer to meet emission standards in the 1975 and subsequent model years was, and is, primarily dependent upon technology developed by other manufacturers and purchased from such manufacturers; and

(ii) such manufacturer lacks the financial resources and technological ability to develop such technology.

(C) The Administrator may promulgate regulations under subsection (a)(1) of this section revising any standard prescribed or previously revised under this subsection, as needed to protect public health or welfare, taking costs, energy, and safety into account. Any revised standard shall require a reduction of emissions from the standard that was previously applicable. Any such revision under this subchapter may provide for a phase-in of the standard. It is the intent of Congress that the numerical emission standards specified in subsections (a)(3)(B)(ii), (g), (h), and (i) of this section shall not be modified by the Administrator after November 15, 1990, for any model year before the model year 2004.

(2) Emission standards under paragraph (1), and measurement techniques on which such standards

60a

are based (if not promulgated prior to November 15, 1990), shall be promulgated by regulation within 180 days after November 15, 1990.

**(3)** For purposes of this part--

**(A)**

**(i)** The term “model year” with reference to any specific calendar year means the manufacturer’s annual production period (as determined by the Administrator) which includes January 1 of such calendar year. If the manufacturer has no annual production period, the term “model year” shall mean the calendar year.

**(ii)** For the purpose of assuring that vehicles and engines manufactured before the beginning of a model year were not manufactured for purposes of circumventing the effective date of a standard required to be prescribed by subsection (b) of this section, the Administrator may prescribe regulations defining “model year” otherwise than as provided in clause (i).

**(B)** Repealed. Pub.L. 101-549, Title II, § 230(1), Nov. 15, 1990, 104 Stat. 2529.

**(C)** The term “heavy duty vehicle” means a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways (not including any vehicle operated exclusively on a rail or rails) which has a gross vehicle weight (as determined under regulations promulgated by the Administrator) in excess of six thousand pounds. Such term includes any such vehicle which has

61a

special features enabling off-street or off-highway operation and use.

**(3)** Upon the petition of any manufacturer, the Administrator, after notice and opportunity for public hearing, may waive the standard required under subparagraph (B) of paragraph (1) to not exceed 1.5 grams of oxides of nitrogen per vehicle mile for any class or category of light-duty vehicles or engines manufactured by such manufacturer during any period of up to four model years beginning after the model year 1980 if the manufacturer demonstrates that such waiver is necessary to permit the use of an innovative power train technology, or innovative emission control device or system, in such class or category of vehicles or engines and that such technology or system was not utilized by more than 1 percent of the light-duty vehicles sold in the United States in the 1975 model year. Such waiver may be granted only if the Administrator determines—

**(A)** that such waiver would not endanger public health,

**(B)** that there is a substantial likelihood that the vehicles or engines will be able to comply with the applicable standard under this section at the expiration of the waiver, and

**(C)** that the technology or system has a potential for long-term air quality benefit and has the potential to meet or exceed the average fuel economy standard applicable under the Energy Policy and Conservation Act [42 U.S.C.A. § 6201 et seq.] upon the expiration of the waiver.

62a

No waiver under this subparagraph granted to any manufacturer shall apply to more than 5 percent of such manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater.

**(c)** Feasibility study and investigation by National Academy of Sciences; reports to Administrator and Congress; availability of information

**(1)** The Administrator shall undertake to enter into appropriate arrangements with the National Academy of Sciences to conduct a comprehensive study and investigation of the technological feasibility of meeting the emissions standards required to be prescribed by the Administrator by subsection (b) of this section.

**(2)** Of the funds authorized to be appropriated to the Administrator by this chapter, such amounts as are required shall be available to carry out the study and investigation authorized by paragraph (1) of this subsection.

**(3)** In entering into any arrangement with the National Academy of Sciences for conducting the study and investigation authorized by paragraph (1) of this subsection, the Administrator shall request the National Academy of Sciences to submit semiannual reports on the progress of its study and investigation to the Administrator and the Congress, beginning not later than July 1, 1971, and continuing until such study and investigation is completed.

**(4)** The Administrator shall furnish to such

## 63a

Academy at its request any information which the Academy deems necessary for the purpose of conducting the investigation and study authorized by paragraph (1) of this subsection. For the purpose of furnishing such information, the Administrator may use any authority he has under this chapter (A) to obtain information from any person, and (B) to require such person to conduct such tests, keep such records, and make such reports respecting research or other activities conducted by such person as may be reasonably necessary to carry out this subsection.

**(d) Useful life of vehicles**

The Administrator shall prescribe regulations under which the useful life of vehicles and engines shall be determined for purposes of subsection (a)(1) of this section and section 7541 of this title. Such regulations shall provide that except where a different useful life period is specified in this subchapter useful life shall—

**(1)** in the case of light duty vehicles and light duty vehicle engines and light-duty trucks up to 3,750 lbs. LVW and up to 6,000 lbs. GVWR, be a period of use of five years or fifty thousand miles (or the equivalent), whichever first occurs, except that in the case of any requirement of this section which first becomes applicable after November 15, 1990, where the useful life period is not otherwise specified for such vehicles and engines, the period shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs, with testing for purposes of in-use compliance under section 7541 of this title up to (but not beyond) 7 years or 75,000

64a

miles (or the equivalent), whichever first occurs;

**(2)** in the case of any other motor vehicle or motor vehicle engine (other than motorcycles or motorcycle engines), be a period of use set forth in paragraph (1) unless the Administrator determines that a period of use of greater duration or mileage is appropriate; and

**(3)** in the case of any motorcycle or motorcycle engine, be a period of use the Administrator shall determine.

**(e)** New power sources or propulsion systems

In the event of a new power source or propulsion system for new motor vehicles or new motor vehicle engines is submitted for certification pursuant to section 7525(a) of this title, the Administrator may postpone certification until he has prescribed standards for any air pollutants emitted by such vehicle or engine which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger the public health or welfare but for which standards have not been prescribed under subsection (a) of this section.

**(f)** High altitude regulations

**(1)** The high altitude regulation in effect with respect to model year 1977 motor vehicles shall not apply to the manufacture, distribution, or sale of 1978 and later model year motor vehicles. Any future regulation affecting the sale or distribution of motor vehicles or engines manufactured before the model year 1984 in high altitude areas of the

65a

country shall take effect no earlier than model year 1981.

**(2)** Any such future regulation applicable to high altitude vehicles or engines shall not require a percentage of reduction in the emissions of such vehicles which is greater than the required percentage of reduction in emissions from motor vehicles as set forth in subsection (b) of this section. This percentage reduction shall be determined by comparing any proposed high altitude emission standards to high altitude emissions from vehicles manufactured during model year 1970. In no event shall regulations applicable to high altitude vehicles manufactured before the model year 1984 establish a numerical standard which is more stringent than that applicable to vehicles certified under non-high altitude conditions.

**(3)** Section 7607(d) of this title shall apply to any high altitude regulation referred to in paragraph (2) and before promulgating any such regulation, the Administrator shall consider and make a finding with respect to—

**(A)** the economic impact upon consumers, individual high altitude dealers, and the automobile industry of any such regulation, including the economic impact which was experienced as a result of the regulation imposed during model year 1977 with respect to high altitude certification requirements;

**(B)** the present and future availability of emission control technology capable of meeting the applicable vehicle and engine emission

66a

requirements without reducing model availability;  
and

**(C)** the likelihood that the adoption of such a high altitude regulation will result in any significant improvement in air quality in any area to which it shall apply.

**(g)** Light-duty trucks up to 6,000 lbs. GVWR and light-duty vehicles; standards for model years after 1993

**(1)** NMHC, CO, and NO<sub>x</sub>

Effective with respect to the model year 1994 and thereafter, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), carbon monoxide (CO), and oxides of nitrogen (NO<sub>x</sub>) from light-duty trucks (LDTs) of up to 6,000 lbs. gross vehicle weight rating (GVWR) and light-duty vehicles (LDVs) shall contain standards which provide that emissions from a percentage of each manufacturer's sales volume of such vehicles and trucks shall comply with the levels specified in table G. The percentage shall be as specified in the implementation schedule below:

67a

**TABLE G—EMISSION STANDARDS FOR NMHC, CO,  
AND NO<sub>x</sub> FROM LIGHT-DUTY TRUCKS OF UP TO 6,000  
LBS. GVWR AND LIGHT-DUTY VEHICLES**

Vehicle type	Column A			Column B		
	(5 yrs/50,000 mi)			(10 yrs/100,000 mi)		
	NMHC	CO	NO <sub>x</sub>	NMHC	CO	NO <sub>x</sub>
LDTs (0-3,750 lbs. LVW) and light-duty vehicles.....	0.25	3.4	0.4*	0.31	4.2	0.6*
LDTs (3,751-5,750 lbs. LVW).....	0.32	4.4	0.7**	0.40	5.5	0.97

Standards are expressed in grams per mile (gpm).

For standards under column A, for purposes of certification under section 7525 of this title, the applicable useful life shall be 5 years or 50,000 miles (or the equivalent), whichever first occurs.

For standards under column B, for purposes of certification under section 7525 of this title, the applicable useful life shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs.

\* In the case of diesel-fueled LDTs (0-3,750 lvw) and light-duty vehicles, before the model year 2004, in lieu of the 0.4 and 0.6 standards for NO<sub>x</sub>, the applicable standards for NO<sub>x</sub> shall be 1.0 gpm for a useful life of 5 years or 50,000 miles (or the equivalent), whichever first occurs, and 1.25 gpm for a useful life of 10 years or 100,000 miles (or the equivalent), whichever first occurs.

\*\* This standard does not apply to diesel-fueled LDTs (3,751-5,750 lbs. LVW).

68a

**IMPLEMENTATION SCHEDULE FOR  
TABLE G STANDARDS**

<b>Model year</b>	<b>Percentage *</b>
1994 .....	40
1995 .....	80
after 1995.....	100

**(2) PM Standard**

Effective with respect to model year 1994 and thereafter in the case of light-duty vehicles, and effective with respect to the model year 1995 and thereafter in the case of light-duty trucks (LDTs) of up to 6,000 lbs. gross vehicle weight rating (GVWR), the regulations under subsection (a) of this section applicable to emissions of particulate matter (PM) from such vehicles and trucks shall contain standards which provide that such emissions from a percentage of each manufacturer's sales volume of such vehicles and trucks shall not exceed the levels specified in the table below. The percentage shall be as specified in the Implementation Schedule below.

**PM STANDARD FOR LDTS OF UP TO 6,000  
LBS. GVWR**

<b>Useful life period</b>	<b>Standard</b>
5/50,000 .....	0.80 gpm
10/100,000 .....	0.10 gpm

69a

The applicable useful life, for purposes of certification under section 7525 of this title and for purposes of in-use compliance under section 7541 of this title, shall be 5 years or 50,000 miles (or the equivalent), whichever first occurs, in the case of the 5/50,000 standard.

The applicable useful life, for purposes of certification under section 7525 of this title and for purposes of in-use compliance under section 7541 of this title, shall be 10 years or 100,000 miles (or the equivalent), whichever first occurs in the case of the 10/100,000 standard.

**IMPLEMENTATION SCHEDULE FOR PM STANDARDS**

.....

<b>Model year</b>	<b>Light-duty vehicles</b>	<b>LDTs</b>
1994 .....	40%*	.....
1995 .....	80%*	40%*
1996 .....	100%*	80%*
after 1996.....	100%*	100%*

**(h)** Light-duty trucks of more than 6,000 lbs. GVWR; standards for model years after 1995

Effective with respect to the model year 1996 and thereafter, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), carbon monoxide (CO), oxides

## 70a

of nitrogen (NO<sub>x</sub>), and particulate matter (PM) from light-duty trucks (LDTs) of more than 6,000 lbs. gross vehicle weight rating (GVWR) shall contain standards which provide that emissions from a specified percentage of each manufacturer's sales volume of such trucks shall comply with the levels specified in table H. The specified percentage shall be 50 percent in model year 1996 and 100 percent thereafter.

**TABLE H--EMISSION STANDARDS FOR NMHC AND CO FROM GASOLINE AND DIESEL FUELED LIGHT-DUTY TRUCKS OF MORE THAN 6,000 LBS. GVWR**

LDT Test weight	Column A			Column B			
	(5 yrs/50,000 mi)			(11 yrs/120,000 mi)			
	NMHC	CO	NO <sub>x</sub>	NMHC	CO	NO <sub>x</sub>	PM
3,751-5,750 lbs. TW	0.32	4.4	0.7*	0.46	6.4	0.98	0.10
Over 5,750 lbs. TW	0.39	5.0	1.1*	0.56	7.3	1.53	0.12

Standards are expressed in grams per mile (GPM).

For standards under column A, for purposes of certification under section 7525 of this title, the applicable useful life shall be 5 years or 50,000 miles (or the equivalent) whichever first occurs.

For standards under column B, for purposes of certification under section 7525 of this title, the applicable useful life shall be 11 years or 120,000 miles (or the equivalent), whichever first occurs.

\* Not applicable to diesel-fueled LDTs.

71a

**(i) Phase II study for certain light-duty vehicles and light-duty trucks**

**(1)** The Administrator, with the participation of the Office of Technology Assessment, shall study whether or not further reductions in emissions from light-duty vehicles and light-duty trucks should be required pursuant to this subchapter. The study shall consider whether to establish with respect to model years commencing after January 1, 2003, the standards and useful life period for gasoline and diesel-fueled light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less specified in the following table:

**TABLE 3--PENDING EMISSION STANDARDS FOR GASOLINE AND DIESEL FUELED LIGHT-DUTY VEHICLES AND LIGHT-DUTY TRUCKS 3,750 LBS. LVW OR LESS**

Pollutant	Emission level*
NMHC .....	0.125 GPM
NOx .....	0.2 GPM
CO .....	1.7 GPM

Such study shall also consider other standards and useful life periods which are more stringent or less stringent than those set forth in table 3 (but more stringent than those referred to in subsections (g) and (h) of this section).

72a

**(2)**

**(A)** As part of the study under paragraph (1), the Administrator shall examine the need for further reductions in emissions in order to attain or maintain the national ambient air quality standards, taking into consideration the waiver provisions of section 7543(b) of this title. As part of such study, the Administrator shall also examine—

**(i)** the availability of technology (including the costs thereof), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for meeting more stringent emission standards than those provided in subsections (g) and (h) of this section for model years commencing not earlier than after January 1, 2003, and not later than model year 2006, including the lead time and safety and energy impacts of meeting more stringent emission standards; and

**(ii)** the need for, and cost effectiveness of, obtaining further reductions in emissions from such light-duty vehicles and light-duty trucks, taking into consideration alternative means of attaining or maintaining the national primary ambient air quality standards pursuant to State implementation plans and other requirements of this chapter, including their feasibility and cost effectiveness.

**(B)** The Administrator shall submit a report to

73a

Congress no later than June 1, 1997, containing the results of the study under this subsection, including the results of the examination conducted under subparagraph (A). Before submittal of such report the Administrator shall provide a reasonable opportunity for public comment and shall include a summary of such comments in the report to Congress.

**(3)**

**(A)** Based on the study under paragraph (1) the Administrator shall determine, by rule, within 3 calendar years after the report is submitted to Congress, but not later than December 31, 1999, whether—

**(i)** there is a need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will be available, as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); and

**(iii)** obtaining further reductions in emissions from such vehicles will be needed and cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii).

74a

The rulemaking under this paragraph shall commence within 3 months after submission of the report to Congress under paragraph (2)(B).

**(B)** If the Administrator determines under subparagraph (A) that—

**(i)** there is no need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will not be available as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); or

**(iii)** obtaining further reductions in emissions from such vehicles will not be needed or cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii),

the Administrator shall not promulgate more stringent standards than those in effect pursuant to subsections (g) and (h) of this section. Nothing in this paragraph shall prohibit the Administrator from exercising the Administrator's authority under subsection (a) of this section to promulgate more stringent standards for light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less at any other time thereafter in accordance with subsection (a) of this

75a

section.

**(C)** If the Administrator determines under subparagraph (A) that—

**(i)** there is a need for further reductions in emissions as provided in paragraph (2)(A);

**(ii)** the technology for meeting more stringent emission standards will be available, as provided in paragraph (2)(A)(i), in the case of light-duty vehicles and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 lbs. or less, for model years commencing not earlier than January 1, 2003, and not later than model year 2006, considering the factors listed in paragraph (2)(A)(i); and

**(iii)** obtaining further reductions in emissions from such vehicles will be needed and cost effective, taking into consideration alternatives as provided in paragraph (2)(A)(ii),

the Administrator shall either promulgate the standards (and useful life periods) set forth in Table 3 in paragraph (1) or promulgate alternative standards (and useful life periods) which are more stringent than those referred to in subsections (g) and (h) of this section. Any such standards (or useful life periods) promulgated by the Administrator shall take effect with respect to any such vehicles or engines no earlier than the model year 2003 but not later than model year 2006, as determined by the Administrator in the rule.

**(D)** Nothing in this paragraph shall be construed

## 76a

by the Administrator or by a court as a presumption that any standards (or useful life period) set forth in Table 3 shall be promulgated in the rulemaking required under this paragraph. The action required of the Administrator in accordance with this paragraph shall be treated as a nondiscretionary duty for purposes of section 7604(a)(2) of this title (relating to citizen suits).

**(E)** Unless the Administrator determines not to promulgate more stringent standards as provided in subparagraph (B) or to postpone the effective date of standards referred to in Table 3 in paragraph (1) or to establish alternative standards as provided in subparagraph (C), effective with respect to model years commencing after January 1, 2003, the regulations under subsection (a) of this section applicable to emissions of nonmethane hydrocarbons (NMHC), oxides of nitrogen (NO<sub>x</sub>), and carbon monoxide (CO) from motor vehicles and motor vehicle engines in the classes specified in Table 3 in paragraph (1) above shall contain standards which provide that emissions may not exceed the pending emission levels specified in Table 3 in paragraph (1).

**(j)** Cold CO standard

**(1)** Phase I

Not later than 12 months after November 15, 1990, the Administrator shall promulgate regulations under subsection (a) of this section applicable to emissions of carbon monoxide from 1994 and later model year light-duty vehicles and light-duty trucks

77a

when operated at 20 degrees Fahrenheit. The regulations shall contain standards which provide that emissions of carbon monoxide from a manufacturer's vehicles when operated at 20 degrees Fahrenheit may not exceed, in the case of light-duty vehicles, 10.0 grams per mile, and in the case of light-duty trucks, a level comparable in stringency to the standard applicable to light-duty vehicles. The standards shall take effect after model year 1993 according to a phase-in schedule which requires a percentage of each manufacturer's sales volume of light-duty vehicles and light-duty trucks to comply with applicable standards after model year 1993. The percentage shall be as specified in the following table:

**PHASE-IN SCHEDULE FOR COLD START STANDARDS**

Model Year	Percentage
1994 .....	40
1995 .....	80
1996 and after .....	100

**(2) Phase II**

**(A)** Not later than June 1, 1997, the Administrator shall complete a study assessing the need for further reductions in emissions of carbon monoxide and the maximum reductions in such emissions achievable from model year 2001 and later model year light-duty vehicles and light-duty trucks when operated at 20 degrees

78a

Fahrenheit.

**(B)**

**(i)** If as of June 1, 1997, 6 or more nonattainment areas have a carbon monoxide design value of 9.5 ppm or greater, the regulations under subsection (a)(1) of this section applicable to emissions of carbon monoxide from model year 2002 and later model year light-duty vehicles and light-duty trucks shall contain standards which provide that emissions of carbon monoxide from such vehicles and trucks when operated at 20 degrees Fahrenheit may not exceed 3.4 grams per mile (gpm) in the case of light-duty vehicles and 4.4 grams per mile (gpm) in the case of light-duty trucks up to 6,000 GVWR and a level comparable in stringency in the case of light-duty trucks 6,000 GVWR and above.

**(ii)** In determining for purposes of this subparagraph whether 6 or more nonattainment areas have a carbon monoxide design value of 9.5 ppm or greater, the Administrator shall exclude the areas of Steubenville, Ohio, and Oshkosh, Wisconsin.

**(3) Useful-life for phase I and phase II standards**

In the case of the standards referred to in paragraphs (1) and (2), for purposes of certification under section 7525 of this title and in-use compliance under section 7541 of this title, the applicable useful life period shall be 5 years or 50,000 miles, whichever first occurs, except that the

79a

Administrator may extend such useful life period (for purposes of section 7525 of this title, or section 7541 of this title, or both) if he determines that it is feasible for vehicles and engines subject to such standards to meet such standards for a longer useful life. If the Administrator extends such useful life period, the Administrator may make an appropriate adjustment of applicable standards for such extended useful life. No such extended useful life shall extend beyond the useful life period provided in regulations under subsection (d) of this section.

**(4) Heavy-duty vehicles and engines**

The Administrator may also promulgate regulations under subsection (a)(1) of this section applicable to emissions of carbon monoxide from heavy-duty vehicles and engines when operated at cold temperatures.

**(k) Control of evaporative emissions**

The Administrator shall promulgate (and from time to time revise) regulations applicable to evaporative emissions of hydrocarbons from all gasoline-fueled motor vehicles—

**(1)** during operation; and

**(2)** over 2 or more days of nonuse;

under ozone-prone summertime conditions (as determined by regulations of the Administrator). The regulations shall take effect as expeditiously as possible and shall require the greatest degree of

## 80a

emission reduction achievable by means reasonably expected to be available for production during any model year to which the regulations apply, giving appropriate consideration to fuel volatility, and to cost, energy, and safety factors associated with the application of the appropriate technology. The Administrator shall commence a rulemaking under this subsection within 12 months after November 15, 1990. If final regulations are not promulgated under this subsection within 18 months after November 15, 1990, the Administrator shall submit a statement to the Congress containing an explanation of the reasons for the delay and a date certain for promulgation of such final regulations in accordance with this chapter. Such date certain shall not be later than 15 months after the expiration of such 18 month deadline.

**(l) Mobile source-related air toxics****(1) Study**

Not later than 18 months after November 15, 1990, the Administrator shall complete a study of the need for, and feasibility of, controlling emissions of toxic air pollutants which are unregulated under this chapter and associated with motor vehicles and motor vehicle fuels, and the need for, and feasibility of, controlling such emissions and the means and measures for such controls. The study shall focus on those categories of emissions that pose the greatest risk to human health or about which significant uncertainties remain, including emissions of benzene, formaldehyde, and 1, 3 butadiene. The proposed report shall be available for public review and comment and shall include a summary of all comments.

## 81a

**(2) Standards**

Within 54 months after November 15, 1990, the Administrator shall, based on the study under paragraph (1), promulgate (and from time to time revise) regulations under subsection (a)(1) of this section or section 7545(c)(1) of this title containing reasonable requirements to control hazardous air pollutants from motor vehicles and motor vehicle fuels. The regulations shall contain standards for such fuels or vehicles, or both, which the Administrator determines reflect the greatest degree of emission reduction achievable through the application of technology which will be available, taking into consideration the standards established under subsection (a) of this section, the availability and costs of the technology, and noise, energy, and safety factors, and lead time. Such regulations shall not be inconsistent with standards under subsection (a) of this section. The regulations shall, at a minimum, apply to emissions of benzene and formaldehyde.

**(m) Emissions control diagnostics****(1) Regulations**

Within 18 months after November 15, 1990, the Administrator shall promulgate regulations under subsection (a) of this section requiring manufacturers to install on all new light duty vehicles and light duty trucks diagnostics systems capable of—

**(A)** accurately identifying for the vehicle's useful life as established under this section, emission-related systems deterioration or malfunction,

82a

including, at a minimum, the catalytic converter and oxygen sensor, which could cause or result in failure of the vehicles to comply with emission standards established under this section,

**(B)** alerting the vehicle's owner or operator to the likely need for emission-related components or systems maintenance or repair,

**(C)** storing and retrieving fault codes specified by the Administrator, and

**(D)** providing access to stored information in a manner specified by the Administrator.

The Administrator may, in the Administrator's discretion, promulgate regulations requiring manufacturers to install such onboard diagnostic systems on heavy-duty vehicles and engines.

**(2)** Effective date

The regulations required under paragraph (1) of this subsection shall take effect in model year 1994, except that the Administrator may waive the application of such regulations for model year 1994 or 1995 (or both) with respect to any class or category of motor vehicles if the Administrator determines that it would be infeasible to apply the regulations to that class or category in such model year or years, consistent with corresponding regulations or policies adopted by the California Air Resources Board for such systems.

**(3)** State inspection

The Administrator shall by regulation require States that have implementation plans containing

83a

motor vehicle inspection and maintenance programs to amend their plans within 2 years after promulgation of such regulations to provide for inspection of onboard diagnostics systems (as prescribed by regulations under paragraph (1) of this subsection) and for the maintenance or repair of malfunctions or system deterioration identified by or affecting such diagnostics systems. Such regulations shall not be inconsistent with the provisions for warranties promulgated under section 7541(a) and (b) of this title.

**(4) Specific requirements**

In promulgating regulations under this subsection, the Administrator shall require—

**(A)** that any connectors through which the emission control diagnostics system is accessed for inspection, diagnosis, service, or repair shall be standard and uniform on all motor vehicles and motor vehicle engines;

**(B)** that access to the emission control diagnostics system through such connectors shall be unrestricted and shall not require any access code or any device which is only available from a vehicle manufacturer; and

**(C)** that the output of the data from the emission control diagnostics system through such connectors shall be usable without the need for any unique decoding information or device.

**(5) Information availability**

The Administrator, by regulation, shall require (subject to the provisions of section 7542(c) of this

## 84a

title regarding the protection of methods or processes entitled to protection as trade secrets) manufacturers to provide promptly to any person engaged in the repairing or servicing of motor vehicles or motor vehicle engines, and the Administrator for use by any such persons, with any and all information needed to make use of the emission control diagnostics system prescribed under this subsection and such other information including instructions for making emission related diagnosis and repairs. No such information may be withheld under section 7542(c) of this title if that information is provided (directly or indirectly) by the manufacturer to franchised dealers or other persons engaged in the repair, diagnosing, or servicing of motor vehicles or motor vehicle engines. Such information shall also be available to the Administrator, subject to section 7542(c) of this title, in carrying out the Administrator's responsibilities under this section.

**(f) Model years after 1990**

For model years prior to model year 1994, the regulations under subsection (a) of this section applicable to buses other than those subject to standards under section 7554 of this title shall contain a standard which provides that emissions of particulate matter (PM) from such buses may not exceed the standards set forth in the following table:

85a

**PM STANDARD FOR BUSES**

.....

<b>Model year</b>	<b>Standard*</b>
1991 .....	0.25
1992 .....	0.25
1993 and thereafter .....	0.10

86a

**42 U.S.C. § 7602. Definitions**

When used in this chapter—

**(a)** The term “Administrator” means the Administrator of the Environmental Protection Agency.

**(b)** The term “air pollution control agency” means any of the following:

**(1)** A single State agency designated by the Governor of that State as the official State air pollution control agency for purposes of this chapter.

**(2)** An agency established by two or more States and having substantial powers or duties pertaining to the prevention and control of air pollution.

**(3)** A city, county, or other local government health authority, or, in the case of any city, county, or other local government in which there is an agency other than the health authority charged with responsibility for enforcing ordinances or laws relating to the prevention and control of air pollution, such other agency.

**(4)** An agency of two or more municipalities located in the same State or in different States and having substantial powers or duties pertaining to the prevention and control of air pollution.

**(5)** An agency of an Indian tribe.

87a

**(c)** The term “interstate air pollution control agency” means—

**(1)** an air pollution control agency established by two or more States, or

**(2)** an air pollution control agency of two or more municipalities located in different States.

**(d)** The term “State” means a State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands.

**(e)** The term “person” includes an individual, corporation, partnership, association, State, municipality, political subdivision of a State, and any agency, department, or instrumentality of the United States and any officer, agent, or employee thereof.

**(f)** The term “municipality” means a city, town, borough, county, parish, district, or other public body created by or pursuant to State law.

**(g)** The term “air pollutant” means any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air. Such term includes any precursors to the formation of any air pollutant, to the extent the Administrator has identified such precursor or precursors for the particular purpose for which the term “air pollutant” is used.

88a

**(h)** All language referring to effects on welfare includes, but is not limited to, effects on soils, water, crops, vegetation, manmade materials, animals, wildlife, weather, visibility, and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being, whether caused by transformation, conversion, or combination with other air pollutants.

**(i)** The term “Federal land manager” means, with respect to any lands in the United States, the Secretary of the department with authority over such lands.

**(j)** Except as otherwise expressly provided, the terms “major stationary source” and “major emitting facility” mean any stationary facility or source of air pollutants which directly emits, or has the potential to emit, one hundred tons per year or more of any air pollutant (including any major emitting facility or source of fugitive emissions of any such pollutant, as determined by rule by the Administrator).

**(k)** The terms “emission limitation” and “emission standard” mean a requirement established by the State or the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice or operational standard promulgated under this chapter..<sup>1</sup>

**(l)** The term “standard of performance” means a requirement of continuous emission reduction,

89a

including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction.

**(m)** The term “means of emission limitation” means a system of continuous emission reduction (including the use of specific technology or fuels with specified pollution characteristics).

**(n)** The term “primary standard attainment date” means the date specified in the applicable implementation plan for the attainment of a national primary ambient air quality standard for any air pollutant.

**(o)** The term “delayed compliance order” means an order issued by the State or by the Administrator to an existing stationary source, postponing the date required under an applicable implementation plan for compliance by such source with any requirement of such plan.

**(p)** The term “schedule and timetable of compliance” means a schedule of required measures including an enforceable sequence of actions or operations leading to compliance with an emission limitation, other limitation, prohibition, or standard.

**(q)** For purposes of this chapter, the term “applicable implementation plan” means the portion (or portions) of the implementation plan, or most recent revision thereof, which has been approved under section 7410 of this title, or promulgated under section 7410(c) of this title, or promulgated or approved pursuant to regulations promulgated under section 7601(d) of this

90a

title and which implements the relevant requirements of this chapter.

**(r) Indian tribe.** The term “Indian tribe” means any Indian tribe, band, nation, or other organized group or community, including any Alaska Native village, which is Federally recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians.

**(s) VOC.** The term “VOC” means volatile organic compound, as defined by the Administrator.

**(t) PM-10.** The term “PM-10” means particulate matter with an aerodynamic diameter less than or equal to a nominal ten micrometers, as measured by such method as the Administrator may determine.

**(u) NAAQS and CTG.** The term “NAAQS” means national ambient air quality standard. The term “CTG” means a Control Technique Guideline published by the Administrator under section 7408 of this title.

**(v) NO<sub>x</sub>.** The term “NO<sub>x</sub>” means oxides of nitrogen.

**(w) CO.** The term “CO” means carbon monoxide.

**(x) Small source.** The term “small source” means a source that emits less than 100 tons of regulated pollutants per year, or any class of persons that the Administrator determines, through regulation, generally lack technical ability or knowledge regarding control of air pollution.

91a

**(y) Federal implementation plan.** The term “Federal implementation plan” means a plan (or portion thereof) promulgated by the Administrator to fill all or a portion of a gap or otherwise correct all or a portion of an inadequacy in a State implementation plan, and which includes enforceable emission limitations or other control measures, means or techniques (including economic incentives, such as marketable permits or auctions of emissions allowances), and provides for attainment of the relevant national ambient air quality standard.

**(z) Stationary source.** The term “stationary source” means generally any source of an air pollutant except those emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in section 7550 of this title.

92a

**42 U.S.C. § 7661: Definitions**

As used in this subchapter—

**(1) Affected source**

The term “affected source” shall have the meaning given such term in subchapter IV-A of this chapter.

**(2) Major source**

The term “major source” means any stationary source (or any group of stationary sources located within a contiguous area and under common control) that is either of the following:

**(A)** A major source as defined in section 7412 of this title.

**(B)** A major stationary source as defined in section 7602 of this title or part D of subchapter I of this chapter.

**(3) Schedule of compliance**

The term “schedule of compliance” means a schedule of remedial measures, including an enforceable sequence of actions or operations, leading to compliance with an applicable implementation plan, emission standard, emission limitation, or emission prohibition.

**(4) Permitting authority**

The term “permitting authority” means the Administrator or the air pollution control agency

93a

authorized by the Administrator to carry out a permit program under this subchapter.

94a

**42 U.S.C. § 7661a. Permit programs****(a) Violations**

After the effective date of any permit program approved or promulgated under this subchapter, it shall be unlawful for any person to violate any requirement of a permit issued under this subchapter, or to operate an affected source (as provided in subchapter IV-A of this chapter), a major source, any other source (including an area source) subject to standards or regulations under section 7411 or 7412 of this title, any other source required to have a permit under parts C or D of subchapter I of this chapter, or any other stationary source in a category designated (in whole or in part) by regulations promulgated by the Administrator (after notice and public comment) which shall include a finding setting forth the basis for such designation, except in compliance with a permit issued by a permitting authority under this subchapter. (Nothing in this subsection shall be construed to alter the applicable requirements of this chapter that a permit be obtained before construction or modification.) The Administrator may, in the Administrator's discretion and consistent with the applicable provisions of this chapter, promulgate regulations to exempt one or more source categories (in whole or in part) from the requirements of this subsection if the Administrator finds that compliance with such requirements is impracticable, infeasible, or unnecessarily burdensome on such categories, except that the Administrator may not exempt any major source from such requirements.

**(b) Regulations**

95a

The Administrator shall promulgate within 12 months after November 15, 1990, regulations establishing the minimum elements of a permit program to be administered by any air pollution control agency. These elements shall include each of the following:

**(1)** Requirements for permit applications, including a standard application form and criteria for determining in a timely fashion the completeness of applications.

**(2)** Monitoring and reporting requirements.

**(3)**

**(A)** A requirement under State or local law or interstate compact that the owner or operator of all sources subject to the requirement to obtain a permit under this subchapter pay an annual fee, or the equivalent over some other period, sufficient to cover all reasonable (direct and indirect) costs required to develop and administer the permit program requirements of this subchapter, including section 7661f of this title, including the reasonable costs of—

**(i)** reviewing and acting upon any application for such a permit,

**(ii)** if the owner or operator receives a permit for such source, whether before or after November 15, 1990, implementing and enforcing the terms and conditions of any such permit (not including

96a

any court costs or other costs associated with any enforcement action),

**(iii)** emissions and ambient monitoring,

**(iv)** preparing generally applicable regulations, or guidance,

**(v)** modeling, analyses, and demonstrations, and

**(vi)** preparing inventories and tracking emissions.

**(B)** The total amount of fees collected by the permitting authority shall conform to the following requirements:

**(i)** The Administrator shall not approve a program as meeting the requirements of this paragraph unless the State demonstrates that, except as otherwise provided in subparagraphs (ii) through (v) of this subparagraph, the program will result in the collection, in the aggregate, from all sources subject to subparagraph (A), of an amount not less than \$25 per ton of each regulated pollutant, or such other amount as the Administrator may determine adequately reflects the reasonable costs of the permit program.

**(ii)** As used in this subparagraph, the term "regulated pollutant" shall mean (I) a volatile organic compound; (II) each pollutant regulated under section 7411 or 7412 of this title; and (III) each pollutant for which a national primary ambient air quality standard has been

97a

promulgated (except that carbon monoxide shall be excluded from this reference).

**(iii)** In determining the amount under clause (i), the permitting authority is not required to include any amount of regulated pollutant emitted by any source in excess of 4,000 tons per year of that regulated pollutant.

**(iv)** The requirements of clause (i) shall not apply if the permitting authority demonstrates that collecting an amount less than the amount specified under clause (i) will meet the requirements of subparagraph (A).

**(v)** The fee calculated under clause (i) shall be increased (consistent with the need to cover the reasonable costs authorized by subparagraph (A)) in each year beginning after 1990, by the percentage, if any, by which the Consumer Price Index for the most recent calendar year ending before the beginning of such year exceeds the Consumer Price Index for the calendar year 1989. For purposes of this clause—

**(I)** the Consumer Price Index for any calendar year is the average of the Consumer Price Index for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year, and

**(II)** the revision of the Consumer Price Index which is most consistent with the Consumer Price Index for calendar year 1989 shall be used.

98a

**(C)**

**(i)** If the Administrator determines, under subsection (d) of this section, that the fee provisions of the operating permit program do not meet the requirements of this paragraph, or if the Administrator makes a determination, under subsection (i) of this section, that the permitting authority is not adequately administering or enforcing an approved fee program, the Administrator may, in addition to taking any other action authorized under this subchapter, collect reasonable fees from the sources identified under subparagraph (A). Such fees shall be designed solely to cover the Administrator's costs of administering the provisions of the permit program promulgated by the Administrator.

**(ii)** Any source that fails to pay fees lawfully imposed by the Administrator under this subparagraph shall pay a penalty of 50 percent of the fee amount, plus interest on the fee amount computed in accordance with section 6621(a)(2) of Title 26 (relating to computation of interest on underpayment of Federal taxes).

**(iii)** Any fees, penalties, and interest collected under this subparagraph shall be deposited in a special fund in the United States Treasury for licensing and other services, which thereafter shall be available for appropriation, to remain available until expended, subject to appropriation, to carry out the Agency's activities for which the fees were collected. Any

99a

fee required to be collected by a State, local, or interstate agency under this subsection shall be utilized solely to cover all reasonable (direct and indirect) costs required to support the permit program as set forth in subparagraph (A).

**(4)** Requirements for adequate personnel and funding to administer the program.

**(5)** A requirement that the permitting authority have adequate authority to:

**(A)** issue permits and assure compliance by all sources required to have a permit under this subchapter with each applicable standard, regulation or requirement under this chapter;

**(B)** issue permits for a fixed term, not to exceed 5 years;

**(C)** assure that upon issuance or renewal permits incorporate emission limitations and other requirements in an applicable implementation plan;

**(D)** terminate, modify, or revoke and reissue permits for cause;

**(E)** enforce permits, permit fee requirements, and the requirement to obtain a permit, including authority to recover civil penalties in a maximum amount of not less than \$10,000 per day for each violation, and provide appropriate criminal penalties; and

100a

(F) assure that no permit will be issued if the Administrator objects to its issuance in a timely manner under this subchapter.

(6) Adequate, streamlined, and reasonable procedures for expeditiously determining when applications are complete, for processing such applications, for public notice, including offering an opportunity for public comment and a hearing, and for expeditious review of permit actions, including applications, renewals, or revisions, and including an opportunity for judicial review in State court of the final permit action by the applicant, any person who participated in the public comment process, and any other person who could obtain judicial review of that action under applicable law.

(7) To ensure against unreasonable delay by the permitting authority, adequate authority and procedures to provide that a failure of such permitting authority to act on a permit application or permit renewal application (in accordance with the time periods specified in section 7661b of this title or, as appropriate, subchapter IV-A of this chapter) shall be treated as a final permit action solely for purposes of obtaining judicial review in State court of an action brought by any person referred to in paragraph (6) to require that action be taken by the permitting authority on such application without additional delay.

(8) Authority, and reasonable procedures consistent with the need for expeditious action by the permitting authority on permit applications and related matters, to make available to the public any permit application, compliance plan, permit, and

101a

monitoring or compliance report under section 7661b(e) of this title, subject to the provisions of section 7414(c) of this title.

**(9)** A requirement that the permitting authority, in the case of permits with a term of 3 or more years for major sources, shall require revisions to the permit to incorporate applicable standards and regulations promulgated under this chapter after the issuance of such permit. Such revisions shall occur as expeditiously as practicable and consistent with the procedures established under paragraph (6) but not later than 18 months after the promulgation of such standards and regulations. No such revision shall be required if the effective date of the standards or regulations is a date after the expiration of the permit term. Such permit revision shall be treated as a permit renewal if it complies with the requirements of this subchapter regarding renewals.

**(10)** Provisions to allow changes within a permitted facility (or one operating pursuant to section 7661b(d) of this title) without requiring a permit revision, if the changes are not modifications under any provision of subchapter I of this chapter and the changes do not exceed the emissions allowable under the permit (whether expressed therein as a rate of emissions or in terms of total emissions: *Provided*, That the facility provides the Administrator and the permitting authority with written notification in advance of the proposed changes which shall be a minimum of 7 days, unless the permitting authority provides in its regulations a different timeframe for emergencies.

102a

**(c) Single permit**

A single permit may be issued for a facility with multiple sources.

**(d) Submission and approval**

**(1)** Not later than 3 years after November 15, 1990, the Governor of each State shall develop and submit to the Administrator a permit program under State or local law or under an interstate compact meeting the requirements of this subchapter. In addition, the Governor shall submit a legal opinion from the attorney general (or the attorney for those State air pollution control agencies that have independent legal counsel), or from the chief legal officer of an interstate agency, that the laws of the State, locality, or the interstate compact provide adequate authority to carry out the program. Not later than 1 year after receiving a program, and after notice and opportunity for public comment, the Administrator shall approve or disapprove such program, in whole or in part. The Administrator may approve a program to the extent that the program meets the requirements of this chapter, including the regulations issued under subsection (b) of this section. If the program is disapproved, in whole or in part, the Administrator shall notify the Governor of any revisions or modifications necessary to obtain approval. The Governor shall revise and resubmit the program for review under this section within 180 days after receiving notification.

**(2)**

103a

**(A)** If the Governor does not submit a program as required under paragraph (1) or if the Administrator disapproves a program submitted by the Governor under paragraph (1), in whole or in part, the Administrator may, prior to the expiration of the 18-month period referred to in subparagraph (B), in the Administrator's discretion, apply any of the sanctions specified in section 7509(b) of this title.

**(B)** If the Governor does not submit a program as required under paragraph (1), or if the Administrator disapproves any such program submitted by the Governor under paragraph (1), in whole or in part, 18 months after the date required for such submittal or the date of such disapproval, as the case may be, the Administrator shall apply sanctions under section 7509(b) of this title in the same manner and subject to the same deadlines and other conditions as are applicable in the case of a determination, disapproval, or finding under section 7509(a) of this title.

**(C)** The sanctions under section 7509(b)(2) of this title shall not apply pursuant to this paragraph in any area unless the failure to submit or the disapproval referred to in subparagraph (A) or (B) relates to an air pollutant for which such area has been designated a nonattainment area (as defined in part D of subchapter I of this chapter).

**(3)** If a program meeting the requirements of this subchapter has not been approved in whole for any State, the Administrator shall, 2 years after the date required for submission of such a program

104a

under paragraph (1), promulgate, administer, and enforce a program under this subchapter for that State.

**(e) Suspension**

The Administrator shall suspend the issuance of permits promptly upon publication of notice of approval of a permit program under this section, but may, in such notice, retain jurisdiction over permits that have been federally issued, but for which the administrative or judicial review process is not complete. The Administrator shall continue to administer and enforce federally issued permits under this subchapter until they are replaced by a permit issued by a permitting program. Nothing in this subsection should be construed to limit the Administrator's ability to enforce permits issued by a State.

**(f) Prohibition**

No partial permit program shall be approved unless, at a minimum, it applies, and ensures compliance with, this subchapter and each of the following:

- (1)** All requirements established under subchapter IV-A of this chapter applicable to “affected sources”.
- (2)** All requirements established under section 7412 of this title applicable to “major sources”, “area sources,” and “new sources”.
- (3)** All requirements of subchapter I of this chapter (other than section 7412 of this title) applicable to

105a

sources required to have a permit under this subchapter.

Approval of a partial program shall not relieve the State of its obligation to submit a complete program, nor from the application of any sanctions under this chapter for failure to submit an approvable permit program.

**(g)** Interim approval

If a program (including a partial permit program) submitted under this subchapter substantially meets the requirements of this subchapter, but is not fully approvable, the Administrator may by rule grant the program interim approval. In the notice of final rulemaking, the Administrator shall specify the changes that must be made before the program can receive full approval. An interim approval under this subsection shall expire on a date set by the Administrator not later than 2 years after such approval, and may not be renewed. For the period of any such interim approval, the provisions of subsection (d)(2) of this section, and the obligation of the Administrator to promulgate a program under this subchapter for the State pursuant to subsection (d)(3) of this section, shall be suspended. Such provisions and such obligation of the Administrator shall apply after the expiration of such interim approval.

**(h)** Effective date

The effective date of a permit program, or partial or interim program, approved under this subchapter, shall be the effective date of approval by the

106a

Administrator. The effective date of a permit program, or partial permit program, promulgated by the Administrator shall be the date of promulgation.

**(i) Administration and enforcement**

**(1)** Whenever the Administrator makes a determination that a permitting authority is not adequately administering and enforcing a program, or portion thereof, in accordance with the requirements of this subchapter, the Administrator shall provide notice to the State and may, prior to the expiration of the 18-month period referred to in paragraph (2), in the Administrator's discretion, apply any of the sanctions specified in section 7509(b) of this title.

**(2)** Whenever the Administrator makes a determination that a permitting authority is not adequately administering and enforcing a program, or portion thereof, in accordance with the requirements of this subchapter, 18 months after the date of the notice under paragraph (1), the Administrator shall apply the sanctions under section 7509(b) of this title in the same manner and subject to the same deadlines and other conditions as are applicable in the case of a determination, disapproval, or finding under section 7509(a) of this title.

**(3)** The sanctions under section 7509(b)(2) of this title shall not apply pursuant to this subsection in any area unless the failure to adequately enforce and administer the program relates to an air pollutant for which such area has been designated a nonattainment area.

107a

(4) Whenever the Administrator has made a finding under paragraph (1) with respect to any State, unless the State has corrected such deficiency within 18 months after the date of such finding, the Administrator shall, 2 years after the date of such finding, promulgate, administer, and enforce a program under this subchapter for that State. Nothing in this paragraph shall be construed to affect the validity of a program which has been approved under this subchapter or the authority of any permitting authority acting under such program until such time as such program is promulgated by the Administrator under this paragraph.

108a

**42 U.S.C. § 7661b. Permit applications**

**(a) Applicable date**

Any source specified in section 7661a(a) of this title shall become subject to a permit program, and required to have a permit, on the later of the following dates--

- (1) the effective date of a permit program or partial or interim permit program applicable to the source; or
- (2) the date such source becomes subject to section 7661a(a) of this title.

**(b) Compliance plan**

- (1) The regulations required by section 7661a(b) of this title shall include a requirement that the applicant submit with the permit application a compliance plan describing how the source will comply with all applicable requirements under this chapter. The compliance plan shall include a schedule of compliance, and a schedule under which the permittee will submit progress reports to the permitting authority no less frequently than every 6 months.
- (2) The regulations shall further require the permittee to periodically (but no less frequently than annually) certify that the facility is in compliance with any applicable requirements of the permit, and to promptly report any deviations from permit requirements to the permitting authority.

## 109a

**(c) Deadline**

Any person required to have a permit shall, not later than 12 months after the date on which the source becomes subject to a permit program approved or promulgated under this subchapter, or such earlier date as the permitting authority may establish, submit to the permitting authority a compliance plan and an application for a permit signed by a responsible official, who shall certify the accuracy of the information submitted. The permitting authority shall approve or disapprove a completed application (consistent with the procedures established under this subchapter for consideration of such applications), and shall issue or deny the permit, within 18 months after the date of receipt thereof, except that the permitting authority shall establish a phased schedule for acting on permit applications submitted within the first full year after the effective date of a permit program (or a partial or interim program). Any such schedule shall assure that at least one-third of such permits will be acted on by such authority annually over a period of not to exceed 3 years after such effective date. Such authority shall establish reasonable procedures to prioritize such approval or disapproval actions in the case of applications for construction or modification under the applicable requirements of this chapter.

**(d) Timely and complete applications**

Except for sources required to have a permit before construction or modification under the applicable requirements of this chapter, if an applicant has submitted a timely and complete application for a permit required by this subchapter (including

## 110a

renewals), but final action has not been taken on such application, the source's failure to have a permit shall not be a violation of this chapter, unless the delay in final action was due to the failure of the applicant timely to submit information required or requested to process the application. No source required to have a permit under this subchapter shall be in violation of section 7661a(a) of this title before the date on which the source is required to submit an application under subsection (c) of this section.

**(e) Copies; availability**

A copy of each permit application, compliance plan (including the schedule of compliance), emissions or compliance monitoring report, certification, and each permit issued under this subchapter, shall be available to the public. If an applicant or permittee is required to submit information entitled to protection from disclosure under section 7414(c) of this title, the applicant or permittee may submit such information separately. The requirements of section 7414(c) of this title shall apply to such information. The contents of a permit shall not be entitled to protection under section 7414(c) of this title.

111a

**42 U.S.C. § 7661c. Permit requirements and conditions**

**(a) Conditions**

Each permit issued under this subchapter shall include enforceable emission limitations and standards, a schedule of compliance, a requirement that the permittee submit to the permitting authority, no less often than every 6 months, the results of any required monitoring, and such other conditions as are necessary to assure compliance with applicable requirements of this chapter, including the requirements of the applicable implementation plan.

**(b) Monitoring and analysis**

The Administrator may by rule prescribe procedures and methods for determining compliance and for monitoring and analysis of pollutants regulated under this chapter, but continuous emissions monitoring need not be required if alternative methods are available that provide sufficiently reliable and timely information for determining compliance. Nothing in this subsection shall be construed to affect any continuous emissions monitoring requirement of subchapter IV-A of this chapter, or where required elsewhere in this chapter.

**(c) Inspection, entry, monitoring, certification, and reporting**

Each permit issued under this subchapter shall set forth inspection, entry, monitoring, compliance certification, and reporting requirements to assure compliance with the permit terms and conditions.

112a

Such monitoring and reporting requirements shall conform to any applicable regulation under subsection (b) of this section. Any report required to be submitted by a permit issued to a corporation under this subchapter shall be signed by a responsible corporate official, who shall certify its accuracy.

**(d) General permits**

The permitting authority may, after notice and opportunity for public hearing, issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to permits under this subchapter. No source covered by a general permit shall thereby be relieved from the obligation to file an application under section 7661b of this title.

**(e) Temporary sources**

The permitting authority may issue a single permit authorizing emissions from similar operations at multiple temporary locations. No such permit shall be issued unless it includes conditions that will assure compliance with all the requirements of this chapter at all authorized locations, including, but not limited to, ambient standards and compliance with any applicable increment or visibility requirements under part C of subchapter I of this chapter. Any such permit shall in addition require the owner or operator to notify the permitting authority in advance of each change in location. The permitting authority may require a separate permit fee for operations at each location.

113a

**(f)** Permit shield

Compliance with a permit issued in accordance with this subchapter shall be deemed compliance with section 7661a of this title. Except as otherwise provided by the Administrator by rule, the permit may also provide that compliance with the permit shall be deemed compliance with other applicable provisions of this chapter that relate to the permittee if—

- (1)** the permit includes the applicable requirements of such provisions, or
- (2)** the permitting authority in acting on the permit application makes a determination relating to the permittee that such other provisions (which shall be referred to in such determination) are not applicable and the permit includes the determination or a concise summary thereof.

Nothing in the preceding sentence shall alter or affect the provisions of section 7603 of this title, including the authority of the Administrator under that section.

Date: Tue Dec 10 2013 10:54:34 EST

Attachments: 12-1254 ts Energy-Intensive Manuf .pdf  
CWEmbed1.xml

Counsel,

Attached is a copy of the brief of the Energy-Intensive Manufacturers, et al. The Chamber's list is broader than the one I used for courtesy copies, so I wanted to make sure everyone got one.

COCKLE LEGAL BRIEFS (800) 225-6964  
WWW.COCKLELEGALBRIEFS.COM

**QUESTION PRESENTED**

Whether EPA permissibly determined that its regulation of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.

## **PARTIES TO THE PROCEEDINGS**

The following were parties to the proceedings in the U.S. Court of Appeals for the District of Columbia Circuit:

### **Challenges to 75 Fed. Reg. 17,004 (Apr. 2, 2010)** **(the “Timing Rule”):**

1. The Utility Air Regulatory Group, petitioner on review, was a petitioner below.

2. The United States Environmental Protection Agency, respondent on review, was a respondent below.

3. ## **OPINIONS BELOW AND JURISDICTION**

Pursuant to the Court's briefing order, we adopt these portions of the briefs of other petitioners.

---

## **CONSTITUTIONAL AND STATUTORY PROVISIONS INVOLVED**

Relevant provisions of Article I of the Constitution of the United States are set out at Pet. App. 2. Relevant provisions of the Clean Air Act, 42 U.S.C. §§ 7401 *et seq.* are reproduced at Pet. App. 162-190.

---

## **STATEMENT OF THE CASE**

Pursuant to the Court's briefing order, we adopt the Statements of the other petitioners, and add the following points concerning the PSD program:

1. Pre-GHG History.

Over the contentious course of its pre-greenhouse-gas (GHG) history, the Prevention of Significant Deterioration (PSD) program was focused primarily on the relatively straightforward matter of "bolt on" control devices such as catalytic converters and particle precipitators.<sup>1</sup> Nevertheless, it has been

---

<sup>1</sup> The nature of the program is well reflected in the administrative litigation involving it. A compilation of Environmental

(Continued on following page)

among the Clean Air Act's most criticized and controversial programs, primarily because of the complexity involved in the determination of "best available control technology" (BACT), which it requires. Thus, in proposing its Tailoring Rule, EPA described the PSD program – because of the complexity of the BACT determination – as a "complicated, resource-intensive, time consuming and sometimes contentious process." 74 Fed. Reg. at 55,321-22. In its Advance Notice of Proposed Rulemaking on Regulating Greenhouse Gases Under the Clean Air Act (ANPR), EPA reviewed a long list of the program's controversial aspects, including:

Because of the case-by-case nature . . . the complexity . . . and the time needed to complete the PSD permitting process, it can take . . . more than a year to receive a permit. . . . There have been significant and broad-based concerns . . . over the years due to the program's complexity and the costs, uncertainty, and construction delays. . . .

73 Fed. Reg. at 44,500-01.

## 2. As Applied to GHGs.

A remarkably detailed picture of the PSD program as applied to GHGs is already available, from three sources. First, the Agency's discussion in the Tailoring Rule of the reach and burdensomeness of

---

Review Board cases is available at [http://yosemite.epa.gov/oa/EAB\\_Web\\_Docket.nsf/PSD+Permit+Appeals?OpenView](http://yosemite.epa.gov/oa/EAB_Web_Docket.nsf/PSD+Permit+Appeals?OpenView).

the program when applied to GHGs, which EPA, in turn, used to justify the temporary exemption of minor emitters from it; second, the extensive and detailed general “PSD and Title V Permitting Guidance for Greenhouse Gases”<sup>2</sup> (hereinafter “*Guidance*”); and, third, some initial EPA sector-specific additional permitting guides. Below is a brief summary of two important aspects revealed in those documents.

a. Local Orientation of the Statute To Be Ignored.

The statute imposes as part of its permitting regime – using “shall” language – requirements explicitly made applicable to “each pollutant subject to regulation under the Act” to monitor and assess the air quality surrounding the facility to be permitted, as well as to assess local environmental impacts, as to vegetation, soil or visibility. 42 U.S.C §§ 7475(a)(6), 7475(a)(7), 7475(e)(1), 7475(e)(3)(B). The monitoring, analysis and data required are preconditions to issuing a permit and are to be available for the required local hearing. 42 U.S.C. §§ 7475(a), 7475(a)(1), 7475(a)(2), 7475(e)(1), 7475(e)(3)(C); *Guidance*, 20, 38, 44, 45.

Because these locale-centric factors do not fit the nature of GHGs and the harm associated with them,

---

<sup>2</sup> PSD and Title V Permitting Guidance for Greenhouse Gases, Pub. No. EPA-457/B-11/001 (March 2011), <http://www.epa.gov/nsr/ghgdocs/ghgpermittingguidance.pdf>.

the Agency, in an aside in the Tailoring Rule, 75 Fed. Reg. at 31,520 (June 3, 2010) (J.A. 300-01), elaborated in the *Guidance* (47-48; *see also* 39, 41-42), declared that these requirements may be ignored by permitting officials and applicants. Further, the Agency declared, a “proxy” for these considerations will be “to focus on reducing GHG emissions to the maximum extent.” *Guidance*, 48.

b. Aspects of Production Regulated.

The statute requires BACT, which is defined to include not just “control technology” in the everyday sense but also production technology, as well as operational and “process” options. In the statute’s words, it includes “production processes and available methods, systems, and techniques.” 42 U.S.C. § 7479(3).

Because of the correlation of carbon emissions with energy consumption, PSD carbon regulation, explicitly, is mostly a scheme to regulate energy consumption. As the *Guidance* puts it, “The application of methods, systems, or techniques to increase energy efficiency is a key GHG-reducing opportunity that falls under the category of ‘lower-polluting processes/practices.’” *Guidance*, 29; *see also* 21-22, 28-32, 40-46. For example, all of the BACT options in the Agency’s 39-page document on reducing GHG emissions in steel-industry production are about *energy efficiency*. *See generally*, Available and Emerging Technologies for Reducing Greenhouse Gas Emissions from the Iron and Steel Industry (Sept. 2012).

As that document also notes, “Because energy is a major part of a manufacturer’s cost of production, many companies typically have strong internal programs that perform the same functions. . . .” *Id.*, 5.

The broader Guidance calls for ranking each *option* for each *aspect* of production that could affect the emission of carbon dioxide or consumption of energy, from best to worst. The end sought is “control options that result in energy efficiency measures to achieve the lowest possible emission level.” *Guidance*, 37; *see also* 21-22, 28-32, 40-46. The Agency specifies that selection should “default to the highest level of control for which the applicant could not adequately justify its elimination based on energy, environmental and economic impacts.” *Id.*, 45.

At one extreme, the microscopic, the Agency confirms that control options could reach the selection of light bulbs in a factory cafeteria, yet it assures that is unlikely “since the burden of this level of review would likely outweigh any gain in emissions reductions achieved.” *Guidance*, 31. However, regulation of “induced draft fans and electric water pumps,” for example, is likely to be worth the effort. *Id.*

At the other extreme, with respect to the most fundamental matters, EPA states that permitting authorities can demand changes that would “fundamentally redefine the source,” as otherwise defined by the facility owner’s “goal, objectives, purpose or basic design of the facility.” *Guidance*, 26. However, the Agency cautions, this should be ordered only after a “hard look.” *Id.*

One example of regulation between these extremes of light-bulb selection and facility-redefinition involves the commercially and industrially ubiquitous “natural gas boiler.” Regulation of a boiler could include specification of a “combination of oxygen trim control, an economizer and condensate recovery for the boiler, along with high transfer efficiency design for the heat exchanger,” a “preventative maintenance program” for the controller, and “a requirement for periodic maintenance and calibration of the natural gas meter and the steam flow analyzer.” *Guidance*, F1-3.

### **SUMMARY OF ARGUMENT**

There are differences between, on the one hand, the conventional pollutants and conventional pollution Congress had in mind as it wrote the provisions of the PSD and title V programs, and, on the other, carbon dioxide and global warming. These differences cause the nature, function, effect or import of each of the key statutory provisions that make up these programs to change dramatically when they are applied to GHGs. As a result, at least ten of these provisions – nine for the PSD program and one for title V – are damaged in various ways by their extension to GHGs. The various types of damage include: (i) nullification, as reflected in the obscured but critical Agency admission that all concerned may ignore statutorily-commanded provisions essential to the integrity of PSD regulation; (ii) self-contradiction,

exemplified by the fact that a provision meant to assure that minor emitters were excluded from the program instead becomes a provision that requires their regulation; *(iii)* absurdities, admitted and unadmitted, that result; and *(iv)* elephantine expansion, beyond Congressional intent and beyond all reason.

With respect to the last, inflation of the effect of textual provisions to unintended and unreasonable dimensions, the best example is PSD's signature BACT requirement. BACT is defined by the statute to include not just "control technology" as commonly understood, but to include "production processes and available methods, systems and techniques." 42 U.S.C. § 7479(3). Applied to the conventional pollutants for which PSD was intended, this resulted in a program that was essentially about "add on" controls such as catalytic converters or particle collectors, with only occasional forays into operations. Applied to carbon dioxide, it covers – as the Agency has explained in great detail – every aspect of a facility's operation and design that affects either its emission of carbon dioxide or its consumption of energy, because the latter is the primary determinant of the former. This is – as EPA has explained – everything conceivable, from light bulbs in the factory cafeteria to changes that, in the Agency's term, "fundamentally redefine the facility."

With respect to "absurdity," the Agency correctly acknowledged that its reading would lead to regulation of millions of previously and intentionally excluded

minor emitters of all sizes. EPA employed the absurdity, administrative necessity and one-step-at-a-time doctrines to *facilitate* the eventual achievement of permanent contravention of the statute's meaning and intent, by promising to regulate, eventually, as many as possible of the minor emitters Congress told it to exclude.

The Agency explicitly equated the “absurdity” involved with the “administrative necessity” it could not yet meet: it did not have enough permitting capacity to regulate all of the small facilities and minor emitters swept into the program by the inclusion of CO<sub>2</sub>. In keeping with this, EPA promises to find (statute-contravening) ways to “streamline” permitting, through such things as “general permits” and “presumptive BACT.” Its goal – and commitment – is to regulate as many as possible of the minor emitters, as rapidly as possible. This is the same reasoning that would attempt to solve the problem of an over-broadly interpreted criminal statute by streamlining indictment and eliminating trial for the newly targeted would-be criminals, because of the “absurdity” of not enough enforcement personnel and courtrooms.

The Agency trumpets its commitment to eventual full compliance with the literal terms of the Act as it reads it. This is as damaging a mistaken commitment as ever made by an administrative agency. Compliance with the literal GHG-*transformed* meaning, import or effect of CAA provisions is a commitment to Congressional-intent-defying, statute-destroying,

elephantine regulation, created without constitutional processes.

The underlying errors of interpretive approach that produced this commitment and any number of other errors of interpretive outcome in this matter, are truly fundamental, and both the Agency and lower court make them. Their approach had two primary characteristics: undue reliance on “plain” and “isolated” language. The Agency and court stopped at “plain language,” or as the Agency often put it, “literal” meaning. Hence, their approach was unable to see the damage to the text’s import and intended effects caused by the GHG application. This can only be seen by an interpretive process that includes “substantive effects” or “textual consequences.”

Similarly, the approach of the Agency and court fell victim to the limitations of “isolated language,” in two respects. First, abandoning the process that it had begun in an ANPR, the Agency made no effort to see the statute as an integrated whole. It thereby abandoned any effort to consider alternative ways of regulating stationary sources under the statute that might better serve what the Agency itself has correctly identified as the statute’s “dual” purposes – controlling pollution and “promoting” economic growth. 75 Fed. Reg. at 31,555 (J.A. 452). Second, it ignored the “whole statute” in another sense by ignoring all of the relevant substantive statutory components of the PSD program and their transformation, contradiction,

and nullification that result when they are applied to GHGs.

The misuse of plain meaning and the associated error of ignoring relevant statutory context and its effects in the new GHG context produced an indefensible claim by the Agency and lower court that there existed a *Chevron*-one command of Congress that tied the Agency's hands. The law made the Agency do it.

*Chevron* step one, in its original and full formulation, applies where Congress has "directly addressed the precise question at issue" and answered it "unambiguously." *Chevron, U.S.A., Inc. v. N.R.D.C.*, 467 U.S. 837, 842-43 (1984). PSD carbon regulation – and its "triggering" – were not within Congress' wildest imagination as it created the program, just as they would not be within the contemplation of any rational policymaker as a means to regulate carbon and combat climate change.

In fact, Congress was speaking with *Chevron* clarity – about conventional pollutants, not carbon dioxide and global warming and their marriage with the PSD program. And, any "ambiguity" that exists in this case is, precisely, the radical change in meaning, import or effect of otherwise clear terms when they are applied to GHGs, to the point of their self-contradiction.

Rather than being a *Chevron*-one command, PSD and title V GHG regulation fails at step one of *Chevron* because it clearly contravenes the statute – as apparent under the proper interpretive approach.

Moreover, it represents a clearly impermissible construction of the statute under *Chevron* step two for exactly the same reasons. And, because it is impermissible, it is also beyond the Agency's authority under the separation-of-powers-bounded conception of agency authority last stated by this Court in *City of Arlington, Texas v. F.C.C.*, 133 S.Ct. 1863, 1870 (2013). Similarly, for the same reason, it violates the judicial review provisions incorporated into the Act itself, which, in addition to the familiar "contrary to law" standard for reversing agency actions, contains the less often quoted but even more basic standard "in excess of statutory jurisdiction, authority or limitations, or short of statutory right." 42 U.S.C. §§ 7607(b)(9)(B), 7607(b)(9)(C).

A fundamentally erroneous approach to statutory construction for cases involving application of the CAA to GHGs has created – without ownership of the decision in any branch – a prescriptive and particularistic scheme of comprehensive regulation of industrial operations that has the potential for almost unlimited harm.

It is, however, just the beginning. This is but the first of a likely endless parade of cases that turn the CAA on its head, and claims the Act's plain language requires it.

The second has arrived. It is *Center for Biological Diversity v. E.P.A.*, No. 11-1101, slip. op. (D.C. Cir. July 12, 2013). There the court on various grounds sided with environmental-group petitioners who

argued that exempting from the PSD program – as EPA wished to do – so-called “biogenic” carbon dioxide, the kind that comes from decaying plant material, “violates the Clean Air Act’s plain language” and that therefore “the agency has no *authority* to exempt any sources of carbon dioxide.” *Id.*, 12. (emphasis added).

Against this, the Agency had argued that it had authority to defer regulation while it studied the matter “because these sources have unique characteristics that were ‘unquestionably unforeseen when Congress enacted [the] PSD program.’” *Id.* As a concurrence stated, however, given the D.C. Circuit precedent – that is, the case presently before this Court – “There is zero basis in the text . . . to distinguish biogenic carbon dioxide. . . .” (Kavanaugh, J., concurring, at 1).

As our argument demonstrates, EPA does not have the authority to regulate GHGs under the PSD program, because of the damage to the statute’s terms it causes. Under the precedent represented by the case under review, however, and the mistaken approach to interpretation it represents, parties are successfully arguing, by contrast, that the Agency does not have authority *not* to regulate, even, a distinctively different form of GHGs, or, even, as the Agency thought wise, take time to study the question in a way that took into account factual differences of potentially enormous policy significance.

For the present – broader – case, the factual differences between GHGs and conventional pollutants are the reasons that no reasonable person or political entity would choose or has chosen a prescriptive, particularistic, public-hearing-requiring means of regulating carbon – and energy. They are also the reasons that the meaning, import or effect of all of the important PSD and title V statutory components has been destructively transformed.

---

◆

## ARGUMENT

### **I. Whether Any Particular CAA Provision or Program Can Encompass GHGs Requires an Interpretive Approach that Considers the Effects of Applying the Relevant Provisions to GHGs.**

The Agency and lower court relied on plain and isolated language, making it impossible for them to see the effect that the GHG application had on the relevant statutory provisions.<sup>3</sup> Before proceeding in Section II to the particular statute-defying effects of applying the PSD statutory provisions to GHGs, we briefly outline the relationship of *Massachusetts v. E.P.A.*, 549 U.S. 497 (2007), to the change in meaning

---

<sup>3</sup> The approach of the lower court, featuring “plain” language, lack of “ambiguity,” “clear” congressional intent, *Chevron* step one, and “judicial inquiry is complete,” is illustrated at: Pet. 18-19, and J.A. 144, 145, 236, 242.

or import of CAA terms in this and similar cases and the approach to interpretation it makes necessary, using three propositions.

1. The change in meaning or import of the Act's terms can only be seen by examination of what the Court has called "substantive effects," rather than relying on plain and isolated language alone. As the Court has explained,

Statutory construction is a holistic endeavor. A provision that may seem ambiguous in isolation is often clarified by the remainder of the statutory scheme . . . because only one of the permissible meanings produces a substantive effect compatible with the rest of the law.

*United Sav. Ass'n of Tex. v. Timbers of Indwood Forest Assoc., Ltd.*, 484 U.S. 365, 371 (1988). This element of the requisite interpretive process could also be called attending to "textual consequences."<sup>4</sup>

---

<sup>4</sup> See, ANTONIN SCALIA & BRYAN GARNER, *READING LAW: THE INTERPRETATION OF LEGAL TEXTS*, at 352 (Thompson/West 2012). ["Some outcome-pertinent consequences – what might be called textual consequences – are relevant to a sound textual decision – specifically those that: . . . cause a private instrument or governmental prescription to be ineffective . . . invalid . . . contain a provision that contradicts another provision . . . (or) produce an absurd result . . . "]; cf., STEVEN BREYER, *ACTIVE LIBERTY: INTERPRETING OUR DEMOCRATIC CONSTITUTION* 120 (Vintage 2006) ["(T)o emphasize consequences is to emphasize consequences related to the particular textual provision at issue."].

2. Even if *Massachusetts*' holding was that the statute's general definition of "air pollutant" was such that it *must* include greenhouse gases, as opposed to that it is broad enough *to* include greenhouse gases, that would not necessarily control its meaning in any given "statutory context." This is the holding of *Brown & Williamson*, which was addressing, *inter alia*, a definition of "drug" in the Food, Drug & Cosmetic Act that did in fact, as all agreed, necessarily include nicotine. Yet there the Court warned:

In determining whether Congress has specifically addressed the question at issue, a reviewing court should not confine itself to examining a particular statutory provision in isolation. The meaning – or ambiguity – of certain words or phrases may only become evident when placed in context. *See Brown v. Gardner*, 513 U.S. 115, 118 (1994) ("Ambiguity is a creature not of definitional possibilities but of statutory context.").

*Food & Drug Admin. v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120, 132-33 (2000) (other internal citations omitted).

Similarly, that is the import of *United States v. Palmer*, 16 U.S. 610, 631 (1818), wherein Chief Justice Marshall said of the meaning of "any person or persons" in a piracy statute under consideration:

The words of the section are in terms of unlimited extent. The words "any person or persons" are broad enough to comprehend every human being. But general words must

not only be limited to cases within jurisdiction of the state, but also those objects to which the legislature intended to apply them.

3. Moreover, in any event, the definition of “air pollutant” in the CAA cannot be said necessarily to include GHGs. The limited statement that definition can support is that it is unambiguously broad enough to include GHGs, such that one cannot say as a matter of definition alone that it cannot. A careful reading of *Massachusetts* indicates that was all the Court was saying, in keeping with terms of the definition.

That definition is essentially circular, turning on a tautological use of the adjective “polluting” in the term “polluting agent.” 42 U.S.C. § 7602(g). It would be possible to misread the Court’s opinion, as the lower court seems to, to say that because the definition contains an unexceptional elaboration that the “polluting agent” can be in any form of matter, from molecule to compound or radiation, that, therefore, any molecule, compound or electromagnetic wave is an “air pollutant” so long as it meets the definition’s other (also very broadly defined) requirement that it is “emitted” into the air. This, however, would include light, data transmission, baseballs and animal waste – solid, liquid or gaseous. Most of the definition’s restrictiveness – and the key to its meaning – are in the open-ended and flexible “polluting.”

Underlying the mistaken reading, of course, is a logical fallacy. It would be no more valid than this claim: “Because ‘American hero’ is defined as ‘any agent of a heroic action, including a person of any gender, nationality or country of birth,’ we are all American heroes thereby.”

## **II. The Most Important PSD and Title V Statutory Provisions Are Contravened in Various Ways by Their Application to GHGs.**

We note at the outset two preliminary points about the meaning, effect or import of key PSD and title V provisions as affected by their application to GHGs.

First, all of the PSD provisions at issue are directly tied to one of the *four* usages in the PSD part of the Act of the term “any air pollutant subject to regulation under the Act” (or variants of it), or to the fifth instance in which the phrase “regulated under the Act” has been added, by the Agency’s “longstanding” interpretation, to the statute’s broader term “any air pollutant.”

With respect to that phrase in particular, a kind of “cross reference” (of which the Act is laden), our argument is that the principles of holism, which include the statute’s purposes and all of its relevant provisions, and the importance of statutory context and “substantive effects,” apply just as they do to any other statutory term, whatever its function. Since

this phrase is what the Agency refers to as the “automatic trigger” of PSD (and title V) regulation, the key point is that whether Congress would have intended that an “automatic trigger” apply to a new or transformed context depends on what is triggered thereby and the effect on relevant text.

This is in the same way that triggering of a pound of gunpowder is one thing, of plastic explosives quite another. In formal terms, the trigger is in the nature of an if/then statement: if  $x$ , then  $y$ . Such statements are not necessarily valid for all meanings of  $x$ .

Second, all of the substantive effects that contravene the provisions in various ways result from three categories of differences between GHGs and conventional pollutants.

1. Carbon dioxide’s relative ubiquity and abundance in human productive activity as compared to that of conventional pollutants. Much of industrial activity involves using heat, derived from combustion, which by definition releases carbon dioxide, to cause chemical reactions involving carbonate materials that separately release carbon dioxide, to produce things using energy-consuming machinery.<sup>5</sup>

---

<sup>5</sup> *See, generally*, Comments of Energy-Intensive Manufacturers Working Group on Greenhouse Gas Regulation, at 11, also 19-22, 27-29, 30-36, 40-41; EPA-HQ-OAR-2009-0517 (also: 2009-0472 and 2009-0597) (Dec. 26, 2009).

2. GHGs are “well mixed” in the atmosphere and their harm is caused by long-term build-up in upper atmospheric levels. 68 Fed. Reg. at 52,926-27 (Sep. 8, 2003). These differences render it impossible to use ambient levels of GHGs or assessment of local impacts to gauge regulation of GHGs, in practice and in theory.

3. Energy is a “first party” cost. As a consequence, unlike with respect to the emission of conventional pollutants, energy efficiency, which is what the PSD GHG scheme regulates, is incentivized by market forces, especially for energy-intensive industries.<sup>6</sup> Moreover, for related reasons, PSD GHG regulation amounts to the second-guessing of an almost unlimited number of production-management trade-offs involving such things as reliability, speed, familiarity, convenience, maintenance and product quality and differentiation.<sup>7</sup> This difference also explains why, when an inter-agency task force, which included EPA, last examined the matter, America’s energy-intensive industries were on course to meet the President’s goals for carbon emissions – without regulation.<sup>8</sup>

---

<sup>6</sup> See, Steel Industry Guidance Document, *ante*, p.4, at 45.

<sup>7</sup> See, Comments, *supra* note 5.

<sup>8</sup> See, The Effects of H.R. 2454 on International Competitiveness and Emission Leakage in Energy-Intensive and Trade-Exposed Industries (Dec. 2, 2009) (available at <http://www.epa.gov/climatechange/economics/economicanalyses.html#interagency>) (“Overall . . . the total energy-related CO<sub>2</sub> emissions of the six sectors . . . would decline nearly 20 percent from 1996 to 2020 under business-as-usual circumstances.” *Id.*, 19).

There are at least nine instances in which applying the PSD provisions to GHGs contravenes those provisions in various ways, and a tenth related to title V. We briefly outline them below, including references to places where the Agency for various reasons – including declaring some provisions void – has itself elaborated them.

1 & 2. The statutory scheme features provisions, as part of the PSD permitting process, requiring monitoring and analysis of the ambient air quality around the facility to be regulated and, similarly, analysis of local impacts as to “climate, meteorology, terrain, soils, vegetation and visibility.” 42 U.S.C §§ 7475(a)(6), 7475(a)(7), 7475(e)(1), 7475(e)(3)(B). These requirements are expressed in “shall” terms by the statute, and pertain to “each pollutant subject to regulation under the Act.” The required actions and information are preconditions for issuing a permit. 42 U.S.C. §§ 7475(a), 7475(a)(1), 7475(a)(2), 7475(e)(1). And, the information is to be available for the required local hearing. 42 U.S.C. §§ 7475(a)(2), 7475(e)(3)(C); *Guidance*, 44. The information is an essential part of a reasonable case-by-case permitting decision, as required by the Act, and is an essential part of the showing an applicant must make, and the burden it must carry, to obtain its permit. *Guidance*, 20, 38, 44, 45. Yet, because these requirements make no sense for GHGs, EPA declared in an aside in the Tailoring Rule that permitting officials and applicants may ignore them. 75 Fed. Reg. at 31,520 (J.A.

300-01). It elaborates on the point at length in the Guidance. *Guidance*, 47-48, *see also* 39, 41-42. In other words, these statutory provisions, as EPA effectively concedes, are contradicted, rendered ineffective or nullified, or, alternatively, rendered absurd, by the GHG application.

3 & 4. By limiting the program to objectively defined “major emitters,” Congress blocked EPA from regulating minor emitters – because they could not afford it *and* because they were a minor part of the problem of local conventional pollution. *See, Alabama Power v. Costle*, 636 F.2d 323, 353-54 (D.C. Cir. 1979); *see also*, 75 Fed. Reg. at 31,550, 31,558-59 (J.A. 430, 467-68). For instance, the Senate version of the legislation gave an exemplary list of the kinds of minor emitters to be excluded even if they somehow had the potential to emit more than the legislation’s general threshold of 100 tpy of “any air pollutant”: “houses, dairies, farms, highways, hospitals, schools, grocery stores and other such sources.” *See*, 75 Fed. Reg. at 31,550 (J.A. 429) and the legislative history cited there. In the statute as enacted, Congress chose to assure their (and similar minor facilities’) exclusion by raising the regulatory threshold as to them to 250 tpy of “any air pollutant” – creating an extra margin to assure that these facilities would never be subjected to PSD permitting. 42 U.S.C. § 7479(1); *see also*, 75 Fed. Reg. at 31,550 (J.A. 430). Hence, in selecting both the 100- and 250-tpy definitions of “major” facilities, Congress was taking advantage of a common quality of all conventional pollutants: the fact that they are emitted in small, even if harmful, amounts.

It did so to remove EPA discretion to determine how major was major, but to accomplish that in a way that did not try to name all of the kinds of excluded facilities. However, as EPA explains, it is the marked difference of CO<sub>2</sub> in the relevant dimension – its relative ubiquity and abundance in human productive activity – that causes the statutory terms to take on an import that is opposite that of the enacted provision and the Congressional intent that accompanied it. 75 Fed. Reg. at 31,535 (J.A. 363). The Agency, nonetheless, promises to regulate as many of these minor emitters as possible, as soon as possible, through streamlining of the permitting process. *See*, 75 Fed. Reg. at 31,523, 31,548, 31,566, 31,573, 31,577 (J.A. 310, 421-22, 502-03, 529, 549).<sup>9</sup> The comparable dynamic respecting the title-V 100-tpy threshold makes the fourth statutory contravention. 42 U.S.C. § 7602(j); 75 Fed. Reg. at 31,583 (J.A. 485-502, 574). Lastly, the Court needs to be aware of this additional point: To accomplish conveniently these statutory contraventions without the need for states to change their parallel statutes, the Agency has adopted a radically new GHG-specific regulation interpreting the words “subject to regulation,” under which GHGs are both subject to regulation and not, depending not on their chemical identity but the quantity and location of their emission. *See*,

---

<sup>9</sup> The government correctly insists that the Agency “did not disavow the goal of ultimately applying those thresholds according to their literal terms.” Br. for Fed. Resps. in Opp. 41.

75 Fed. Reg. 31,607 (J.A. 680-81); *see also* 75 Fed. Reg. 31,525 (J.A. 320-23).

5. BACT – Production Processes, Methods, Systems, Techniques, etc. The sweeping definition of BACT includes “production processes and available methods, systems, and techniques. . . .” 42 U.S.C. § 7479(3). Again, the effect of this provision when it is applied to GHGs transforms the program from one of limited intrusion to a comprehensive scheme of regulation of industrial operations.

6. BACT – Energy. The definition of BACT incorporates the following qualification: “which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such facility. . . .” 42 U.S.C. § 7479(3). The statute contemplated “energy” as one of the potential costs of regulating conventional pollutants – as is almost always the case because devices such as catalytic converters and particle precipitators consume energy, and low-contaminant fuels likewise are often less energy-efficient. *See, e.g., Guidance*, 39, 41. Applied to carbon dioxide, the role of energy is turned on its head. PSD regulation becomes mostly a scheme for the *mandating of energy efficiency* in all its manifestations. It converts a limitation on regulation – *i.e.*, the weighing of increases in energy consumption required to control conventional pollutants – into an object of regulation, a regulated *first-party* cost, one that opens the factory door or the farm gate to unlimited regulator access.

7 & 8. BACT – Case-by-Case Requirement and Local Hearing Requirement. In the language quoted above, the BACT definition incorporates the statute’s requirement of case-by-case analysis, hearing, and decision. A companion of the BACT-definition case-by-case requirement is the PSD public hearing requirement, found in 42 U.S.C. § 7475(a)(2), requiring as a pre-condition of a permit that “a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of such source, alternatives thereto, control technology requirements, and other appropriate considerations.” *See also*, 42 U.S.C. § 7475(e)(3)(C). Commenting on changes to the program worked by the 1977 amendments, in *Alabama Power v. Costle*, 636 F.2d 323, 350 (D.C. Cir. 1979), the court emphasized these changes: “case-by-case determination of BACT rather than automatic application of NSPS . . . provisions requiring public hearing in all cases instead of mere opportunity for written comment.” Both of these provisions are rendered ineffective or nullified both by the elimination of local-impacts information and analysis and the proposed streamlining of the permitting process through “general permits” and “presumptive BACT.”

9. BACT – Local Impacts. As indicated above, the BACT definition incorporates the phrase “on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, [the permitting authority] determines is achievable for such facility.” 42 U.S.C. § 7479(3). Hence, this

aspect of *the definition of BACT* also incorporates consideration of the local information to be adduced under the requirements of §§ 7475(a)(6) and 7475(e) discussed above, the same requirements and associated information that the Agency has declared applicants and permitting authorities are free to ignore.

10. BACT – “Economic Effects and Other Costs.” The damage to the BACT definitional factors is nowhere greater than with respect to the “economic impacts and other costs.” 42 U.S.C. § 7479(3). Given the pervasiveness of the effects of PSD carbon regulation on production, and the nearly impossible-to-measure impact it could have on production efficiency, reliability, quality, familiarity of personnel with existing practices, maintenance, and such, factoring in costs to permit applicants would be so complex and uncertain as to be nearly impossible.

In response, EPA adopts the following extraordinarily liberating – and statute-defying – conception of such “costs” for purposes of PSD carbon regulation: “The emphasis should be on the cost of control relative to the amount of pollutant removed, rather than the economic parameters that provide an indication of the general affordability of the control alternative relative to the source.” *Guidance*, 38.

The “economic parameters that provide an indication of the general affordability of the control alternative to the source,” of course, concern things like “production costs,” “capital costs,” “materials costs,” “costs of maintenance and repair,” “cost of goods sold,” “profit margins,” and “return on investment” – the “parameters” that make private economic

activity possible. Concern with cost to a regulated entity in this everyday sense has been turned into the very different concept of the relative efficiency of one pollution/energy-control strategy to another. The irony is that the very structure of PSD regulation – prescriptive and particularistic – makes true efficiency even in that sense unachievable.

### **III. Extension of the PSD Program to GHGs, as the Agency and Lower Court Conceive It, Contradicts Important Doctrines in Administrative Law, Defeating Their Purposes.**

In addition to the absurd consequences doctrine discussed above, two others have been subjected to rationale-defying contravention.

#### **A. The *Chevron* Doctrine Is Misused, Causing the Mis-Assignment of Accountability for the Policy Decisions Implicit in PSD GHG Regulation and Defeating Rational Policymaking.**

Of the many reasons for the *Chevron* typology, the most basic is to assign policymaking responsibility and accompanying accountability to the two policy-making branches, as opposed to courts. *See, Chevron*, 467 U.S. at 864-65 [“Such policy arguments are more properly addressed to legislators or administrators, not to judges. . . . (A)n agency to which Congress has delegated policymaking responsibilities may, within limits of the delegation, properly rely on the incumbent administration’s views of wise policy to inform its judgments.”].

Here, by virtue of the false *Chevron*-one claim, EPA and the lower court assign responsibility for PSD and title V carbon regulation – “directly” and “precisely” – to Congress, even though it is a way of regulating *carbon dioxide* Congress did not contemplate and that would be unthinkable to it. By the same token, political responsibility is evaded by the Executive,<sup>10</sup> which claims its hands are tied by Congress.

Moreover, *rational* policymaking, not just accountable policymaking, is utterly defeated. It is replaced by the irrational premise that a means of regulation appropriate for conventional pollutants is necessarily appropriate – or tolerable – for GHGs.

Additionally, this Court has explained *Chevron* as a stable “background” rule against which Congress can legislate. Congress knows that if it leaves ambiguous gaps in statutes it will be for agencies to fill them, and, if it wishes to avoid that, it must write unambiguously. *See generally, City of Arlington, Texas v. F.C.C.*, 133 S.Ct. 1863, 1868 (2013).

*Chevron* is usually thought to refer to a statutory gap, which, indeed, is how *Chevron* explained itself. *See, Chevron*, 467 U.S. 837 at 843-44 (“If congress has explicitly left a gap. . .”). This case is not about

---

<sup>10</sup> Indeed, PSD carbon regulation seems directly contrary to Administration policy. *See*, Barack Obama, President, U.S.A., 2013 State of the Union Address (Feb. 12, 2013) (calling for “market-based” carbon regulation).

gap-filling. It is a case of stretching the coverage of a statute beyond that for which it was designed, and each statutory contravention represents a snapping of a thread of the statutory fabric stitched by Congress.

There is no colorable *Chevron*-one command to regulate GHGs under the PSD program. The *Chevron* command was to regulate *conventional* pollutants under the program if they are regulated elsewhere in the Act. Congress supported this command with substantive PSD provisions that make sense for conventional pollutants, but not for GHGs. Congress cannot be said to have commanded an application that contravenes the provisions that it wrote.

A *Chevron*-one command with respect to GHGs exists in this case – the *Chevron*-one command *not* to regulate GHGs under the PSD and title V programs. Under an approach to interpretation that includes substantive effect, this is clear. Moreover, for the same reasons – the ten contraventions of the text – PSD and title V GHG regulation would represent an impermissible construction of the Act under *Chevron* step two.

### **B. The Implied Delegation Doctrine Is Misused.**

As the above indicates, any implicit delegation to regulate GHGs under the CAA found in its flexible and capacious definition of “air pollutant” cannot apply to PSD and title V regulation. To so apply it would be to create an irrational “term” for such delegation, under which Congress would be said to

require: apply the Act's PSD provisions, written for the conventional-pollutant context, to GHGs without considering whether the application changes their effect in ways that contravene the provisions, whether it makes sense, or whether there are better ways under the Act to attempt to achieve the statute's purposes. Because this also involves the constitutionally significant destruction of any intelligible principle for a delegation of authority to regulate GHGs, we discuss it further in that context, below.

#### **IV. PSD Application to GHGs Fails Because It Causes Absurdity and Raises Grave Constitutional Issues.**

Other petitioners have explicated well the principle that any permissible alternative interpretation, in particular the interpretation that PSD and title V do not apply to GHGs, should prevail over one that causes absurdity. To this we add the constitutional doubt avoidance canon: "When the validity of an act of Congress is drawn into question, and even if a serious doubt of constitutionality is raised, it is a cardinal principle that this Court will first ascertain whether a construction of the statute is fairly possible by which the question can be avoided." *Crowell v. Bensen*, 285 U.S. 22, 62 (1932).

In the normal case, these two avoidance canons, seeking to avoid unnecessary constitutional doubt and absurd outcomes, could be said to seek to protect Congress from itself – to protect its presumed intent

from its imperfect execution. In the present case, the canons apply in a different way and with added force – they protect, in addition, Congress’ Article I prerogatives, and its ability to fulfill the obligations that accompany them, to exercise reasoned judgment about the necessary and proper means of exercising its powers. Because the canons would protect against absurdity and unconstitutionality caused not by any action of Congress or its drafting, but from actions of other branches that cause untoward results in a statute that otherwise does not contain them, the canons serve the separation of powers, as well as sound interpretation.

#### **A. It Causes Absurdity.**

PSD GHG regulation is thoroughly absurd, root and branch. For instance, it constitutes this three-headed absurd-policy creature: *(i)* an energy-efficiency-driven BACT definition so intrusive it can impose almost unlimited costs on trade-exposed, energy-intensive industries, costs as extensive as could be imposed on any regulated utility; *(ii)* a regulatory “cost” mechanism so transformed it is no longer concerned with costs to the facility owner in a business-survival-relevant sense; yet, *(iii)* no mechanism of a rate-regulation type to assure that the demi-utility can earn an asset-replacement-level return, or any return. And, in response to pleas from the energy-intensive industries that this could create quintessential CAA-policy absurdity, severe economic harm to the country coupled with worsening of global

GHG emissions, the Agency responded it may someday look into that matter under its “absurd consequences” powers: Regulate first; find out if it is absurd later. 75 Fed. Reg. at 31,589-90 (J.A. 602-04); Comments of EIM Group, *ante*, p.18 n.5.

### **B. It Raises Grave Constitutional Issues.**

The core Article I issues in this case can be summarized using two concepts that have been well explored by this Court – proper “means” of regulation and a proper “delegation” of legislative powers.

While Congress’ power under the Commerce Clause to regulate GHGs is not challenged in this case, there are pressing questions of the proper *means* of regulation and the delegation of the determination of the proper means. The text and form of PSD regulation, applied to carbon dioxide, produce the most extensive and intrusive exercise of the Commerce Power in our history. In order to regulate one thing – the level of GHG emissions – the PSD program claims the power to prescribe virtually everything, even to the point of “fundamentally redefining the facility” regulated.

Because pollution, and *a fortiori* carbon dioxide emissions and energy consumption, are not themselves “interstate commerce,” Congress’ power to regulate them comes from the Necessary and Proper Clause. In *McCulloch v. Maryland*, 4 Wheat. 316, 421 (1819), the Court, in an opinion by Chief Justice Marshall, established the test for determining whether

an act of Congress has selected a means permissible under that clause to regulate a concededly proper end:

Let the end be legitimate, let it be within the scope of the constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consistent with the letter and spirit of the constitution, are constitutional.

As Justice Scalia wrote in his concurrence in *Gonzales v. Raich*, 485 U.S. 1, 39 (2005), the requirements that the means selected be “appropriate,” “plainly adapted” to the end sought, “not prohibited,” and “consistent with the letter and spirit of the constitution,” are “not mere hortatory.” The Court enforces them by striking down legislation.

If Congress had enacted PSD/title V carbon regulation, that would have presented a substantial issue as to whether the means chosen met the *McCullough v. Maryland* requirements. Because Congress did not choose these means, additional substantial constitutional questions are raised, because Congress was denied the opportunity *to make the judgments* involved in determining whether the means were proper.

The opportunity to make these judgments is a necessary concomitant of the vesting of both the Commerce and Necessary and Proper powers in Congress by Article I. The most important cases of this Court establishing the broad limits of the Commerce

Power turn on deference to *Congress*' exercise of judgment in the exercise of its powers. *See, e.g., United States v. Carolene Products Co.*, 304 U.S. 144 (1938); and *United States v. Darby*, 312 U.S. 100, 121 (1941).

The fundamental Article I concerns involved in this can also be seen by considering this Court's explication of proper terms of delegation of legislative powers. In fact, carefully expressed, as this Court has made clear, the legislative power vested in Congress by Article I *cannot* be delegated. *Touby v. United States*, 500 U.S. 160, 165 (1991) ["From the (language of this section of the Constitution) the Court has derived the non-delegation doctrine: that Congress may not constitutionally delegate its legislative power to another branch of Government."].

Accordingly, to retain the legislative power but leave some important decision-making to others, Congress must lay down in the delegating legislation "intelligible principles" to govern its exercise. "When Congress confers decision-making authority upon agencies *Congress* must 'lay down by legislative act an intelligible principle to which the person or body authorized to [act] is directed to conform.'" *Whitman v. American Trucking Associations, Inc.*, 531 U.S. 457, 472 (2001) (quoting *J.W. Hampton, Jr., Co. v. United States*, 276 U.S. 394, 409 (1928)).

If decision-making authority pursuant to an Article I power cannot be delegated without an intelligible principle to govern it, it follows that it cannot

be delegated *implicitly* without an intelligible principle to govern it. Indeed, such a scenario would seem to present even greater separation of powers problems, since potentially it would involve other branches in the expropriation of unguided legislative powers – not just their delegation by Congress.

The PSD program is an elaborate and detailed *express* delegation to EPA to regulate conventional pollutants. At a general level, the most fundamental principles upon which that delegation is based involve careful study of, and the making of distinctions appropriate to, the different conventional pollutants to be covered by PSD. In addition to this and other general principles, there are *specific terms, provisions, rules and standards* to govern the delegation. All of this is rendered incoherent, even self-contradictory, by the application to GHGs.

The most aggressive exercise of the Commerce Power in our history, PSD/title V carbon regulation, does not in any real sense represent an “act” of Congress, nor does it represent, therefore, an opportunity afforded Congress to guide and restrict its exercise. In *Whitman’s* phrase, while the PSD-enacting Congress enacted principles and terms to which the Agency’s actions must “conform” as part of the express PSD delegation, these are “deformed” by a misperceived implied delegation (or, here, misperceived command) to regulate GHGs.

**CONCLUSION**

The judgment of the court of appeals should be reversed.

Respectfully submitted,

RONALD TENPAS

## **RULE 29.6 DISCLOSURE STATEMENT**

Petitioner Southeastern Legal Foundation, Inc. (SLF) is a non-profit Georgia corporation and constitutional public interest law firm and policy center that advocates limited government, individual economic freedom, and the free enterprise system in the courts of law and public opinion. SLF has no parent companies. No publicly held corporation has ten percent or greater ownership interest in SLF.

Petitioner the Langdale Company is a Georgia corporation and is the parent company for a diverse group of businesses, some of which were described in Petitioners' Petition. The Langdale Company has no parent companies. No publicly held corporation has ten percent or greater ownership in the Langdale Company.

Petitioner Langdale Forest Products Company is a Georgia corporation and is a leading producer of lumber, utility poles, marine piling, and fence posts. Langdale Forest Products Company is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langdale Forest Products Company.

Petitioner Langdale Farms, LLC is a Georgia Corporation in the business of producing soybeans, peanuts, cotton, pecans, tomatoes, hay, cattle, and fish. Langdale Farms, LLC is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langdale Farms, LLC.

**RULE 29.6 DISCLOSURE STATEMENT**

– Continued

Petitioner Langdale Fuel Company is a Georgia corporation in the business of providing fuel and lubricants for the Langdale Company's needs. Langdale Fuel Company is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langdale Fuel Company.

Petitioner Langdale Chevrolet-Pontiac, Inc. is a Georgia corporation in the business of selling and servicing automobiles. Langdale Chevrolet-Pontiac, Inc. is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langdale Chevrolet-Pontiac, Inc.

Petitioner Langdale Ford Company, Inc. is a Georgia corporation in the business of selling and servicing automobiles and trucks, including for commercial fleets. Langdale Ford Company is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langdale Ford Company.

Petitioner Langboard, Inc. – OSB is a Georgia corporation in the business of producing oriented strand board, which is used as flooring, roofing, and siding in the home construction industry. Langboard, Inc. – OSB is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has

**RULE 29.6 DISCLOSURE STATEMENT**

ten percent or greater ownership in Langboard, Inc. – OSB.

Petitioner Langboard, Inc. – MDF is a Georgia corporation in the business of producing medium density fiberboard, which is used, among other things, in the construction of molding, flooring, and furniture. Langboard, Inc. – MDF is a wholly owned subsidiary of the Langdale Company. No publicly held corporation has ten percent or greater ownership in Langboard, Inc. – MDF.

Petitioner Georgia Motor Trucking Association, Inc. is a Georgia corporation and trade association for the trucking industry in Georgia. The mission of the Georgia Motor Trucking Association is to promote: reasonable laws; evenhanded, common-sense administration; equitable and competitive fees and taxes; a market, political and social environment favorable to the trucking industry; and good citizenship among the people and companies of Georgia's trucking industry. It represents more than 400 for-hire carriers, 400 private carriers, and 300 associate members. Georgia Motor Trucking Association, Inc. has no parent corporation. No publicly held corporation has ten percent or greater ownership interest in the Georgia Motor Trucking Association.

Petitioner Collins Industries, Inc. is a Georgia corporation in the business of transporting building

**RULE 29.6 DISCLOSURE STATEMENT**

products. Collins Industries, Inc. has no parent corporation. No publicly held corporation has ten percent or greater ownership interest in Collins Industries.

Petitioner Collins Trucking Company, Inc. is a Georgia corporation in the business of transporting pine and hardwood logs in Georgia. Collins Trucking Company, Inc. is a subsidiary of Collins Industries, Inc. No publicly held corporation has ten percent or greater ownership interest in Collins Trucking Company, Inc.

Petitioner Kennesaw Transportation, Inc. is a Georgia corporation in the business of truckload long-haul transportation of goods across the United States. Kennesaw Transportation, Inc. has no parent company. No publicly held corporation has a ten percent or greater ownership interest in Kennesaw Transportation, Inc.

Petitioner J&M Tank Lines, Inc. is a Georgia corporation in the business of transporting industrial-grade products, such as lime, calcium carbonate, cement, and sand; food-grade products, such as flour; and agricultural-grade products, such as salt. J&M Tank Lines, Inc. operates a fleet of tractors and tanks and has terminals located in Georgia, Alabama, and Texas. J&M Tank Lines, Inc. has no parent company.

**RULE 29.6 DISCLOSURE STATEMENT**

No publicly held corporation has a ten percent or greater ownership in J&M Tank Lines, Inc.

Petitioner Southeast Trailer Mart, Inc. is a Georgia corporation in the business of selling and servicing semi-trailers. Southeast Trailer Mart, Inc. has no parent company. No publicly held company has a ten percent or greater ownership in Southeast Trailer Mart, Inc.

Petitioner Georgia Agribusiness Council, Inc. is a Georgia corporation whose mission is to advance the business of agriculture and promote environmental stewardship in Georgia. The Georgia Agribusiness Council, Inc. has no parent company. No publicly held company has a ten percent or greater ownership in Georgia Agribusiness Council, Inc.

Petitioner Competitive Enterprise Institute is a non-profit 501(c)(3) corporation organized under the laws of the District of Columbia for the purpose of defending free enterprise, limited government, and the rule of law. Competitive Enterprise Institute has no parent companies. No publicly held corporation has a ten percent or greater ownership interest in Competitive Enterprise Institute.

Petitioner FreedomWorks is a non-profit 501(c)(4) corporation organized under the laws of the District of Columbia for the purpose of promoting individual liberty, consumer choice and competition, and has

## PRELIMINARY STATEMENT

This case involves perhaps the most audacious seizure of pure legislative power over domestic economic matters attempted by the Executive Branch since *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579 (1952). EPA's assumption of authority to "tailor" stationary source permitting to target a select universe of greenhouse gas (GHG) emitters on a scale and schedule of the Agency's own choosing directly contravenes the carefully chosen numerical permitting thresholds mandated by Congress in the Clean Air Act. This action is an unabashed assault on the foundational structure of the Constitution, and this Court should confront EPA's executive overreach and firmly invalidate it.

Answering the question before the Court in this case calls for more than routine judicial review of an administrative action. In a moment of unusual candor, EPA acknowledged that regulating GHG emissions under the Act's "Prevention of Significant Deterioration" (PSD) and Title V provisions would inevitably lead to "absurd results" involving "undue costs for sources and impossible administrative burdens for permitting authorities." *See* Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule, 75 Fed. Reg. 31514 (June 3, 2010) [hereinafter Tailoring Rule], Joint Appendix [hereinafter JA] 418-19. Further, these extreme results could never have been contemplated by Congress and would actually "undermine" the "congressional purposes" behind the PSD program and Title V of the Clean Air Act. *Id.* In

light of those acknowledged consequences, the proper template for analyzing and resolving the question of statutory interpretation presented here is supplied by this Court's decision in *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120 (2000).

In *Brown & Williamson*, this Court held that Congress had not authorized FDA to regulate tobacco products under the Food, Drug, and Cosmetic Act (FDCA), given the extreme consequences that would follow and the history of congressional actions addressing tobacco issues. The *Brown & Williamson* framework should lead the Court to similarly conclude here that Congress foreclosed PSD and Title V regulation of GHG emissions. EPA's GHG regulatory program is foreclosed by (1) the text and structure of the Clean Air Act read as a whole, (2) the legislative history of the Act, and (3) the "absurd results" and administrative impossibility that EPA itself conceded would necessarily follow if the PSD and Title V mandatory permitting thresholds were applied to GHG emissions.

### **OPINIONS AND ORDERS BELOW**

The opinion of the Court of Appeals is reported at 684 F.3d 102 and is reproduced at JA 191-267. The unpublished order denying rehearing en banc is reproduced at JA 139-90.

## **JURISDICTION**

The Court of Appeals issued its opinion on June 26, 2012, and denied petitions for rehearing en banc by order dated December 20, 2012. Nine groups of petitioners filed timely petitions for writs of certiorari with this Court, and on October 15, 2013, this Court granted six of the petitions. This Court has jurisdiction under 28 U.S.C. § 1254(1).

## **CONSTITUTIONAL AND STATUTORY PROVISIONS**

Article I of the Constitution of the United States provides: “All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.” U.S. Const. art. I, § 1.

Article II of the Constitution provides: The President “shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient,” and “shall take Care that the Laws be faithfully executed.” U.S. Const. art. II, § 3, cl. 1 & cl. 4.

Relevant provisions of the Clean Air Act, 42 U.S.C. § 7471-7476, 7479, 7602(j) are reproduced at 1-30 of the appendix to this brief. Relevant rulemakings

of the U.S. Environmental Agency are reproduced at JA 268-1331.

### STATEMENT OF THE CASE

Petitioners Southeastern Legal Foundation, Inc., *et al.*, hereby incorporate by reference, as if set forth in this brief, the Statement of the Case contained in the Opening Brief of Petitioners Chamber of Commerce of the United States of America, State of Alaska, and American Farm Bureau Federation (Chamber Brief) and the Statutory and Regulatory Background contained in the Brief of the Utility Air Regulatory Group (UARG Brief).

---

◆

### SUMMARY OF THE ARGUMENT

Congress has not authorized EPA to regulate GHG emissions under PSD and Title V. This Court's decision in *Brown & Williamson* is on all fours with the present case and provides the controlling framework for that conclusion. The text and structure of the Clean Air Act, read as a whole, plainly foreclose EPA's conclusion that PSD and Title V permitting requirements are triggered by the Agency's separate decision to regulate GHG emissions from new motor vehicles. EPA's recognition that applying the Act's PSD and Title V provisions to GHGs would produce "absurd results" and "impossible administrative burdens" that could never have been contemplated or

intended by Congress resoundingly confirms that EPA has no such authority. As in *Brown & Williamson*, there is a rich legislative backdrop of failed climate change legislation that further supports this reading of the statute.

EPA's contrary interpretation of the statute, which depended upon an assertion of unbounded administrative discretion, must be rejected as beyond the limits of proper executive authority under the Constitution. EPA misapplied the "absurd results" and "administrative necessity" canons of construction in an agenda-driven effort to aggrandize its own discretionary policy-making power at the expense of Congress. In doing so, it effected an intolerable invasion of Congress's domain that threatens to obliterate the line dividing executive from legislative power. This breakdown in the constitutional separation of powers must be avoided where, as here, there are other reasonable readings of the statute that preserve and respect the Constitution's great bulwarks.

---

◆

### ARGUMENT

There are two core rulings at issue in the orders under review. First, EPA ruled that the Clean Air Act compels PSD and Title V regulation of GHG emissions as an unavoidable result of the Agency's decision to regulate GHG emissions from new motor vehicles. *See* Reconsideration of Interpretation of

Regulations that Determine Pollutants Covered by Clean Air Act Permitting Programs, 75 Fed. Reg. 17004 (Apr. 2, 2010) [hereinafter Triggering Rule], JA 705-92. Second, though it conceded that applying the Act's mandatory numerical permitting thresholds to GHGs would produce absurd and impossible consequences never intended by Congress, EPA chose to relieve those consequences by rewriting those thresholds and constructing a regulatory framework far different from that carefully specified in the Act. In the process, EPA created a new permitting regime that would be rolled out on a scale and schedule more politically palatable and more administratively convenient. Tailoring Rule, JA 268-682.

The first ruling is based on a misconstruction of the Clean Air Act. A proper reading of the Act as a whole confirms that the statute forecloses GHG regulation under PSD and Title V. The second ruling plainly invades the legislative domain reserved exclusively to Congress under our constitutional structure. For the sake of preserving that founding structure, this Court should decisively reject EPA's effort to assume for itself unbounded law-making discretion.

**I. The text, structure, and background of the Clean Air Act make it plain that Congress has not authorized EPA to regulate GHG emissions under PSD and Title V.**

In *Brown & Williamson*, this Court addressed another federal agency's response to a pressing national issue – the public health problems attendant to tobacco use. Frustrated by Congress's refusal to enact legislation comprehensively addressing the issue, FDA took the dramatic step of attempting to regulate the promotion, labeling, and sale of tobacco products under the FDCA, by interpreting the term “drug” under the Act to include nicotine and the term “drug delivery device” to encompass cigarettes and smokeless tobacco. *See Brown & Williamson*, 529 U.S. at 127-29. The Court's approach to FDA's assertion of regulatory authority over tobacco products has direct relevance in the present case and should control the outcome here.<sup>1</sup>

---

<sup>1</sup> The grounds stated in *Massachusetts v. EPA*, 549 U.S. 497 (2007), for not applying *Brown & Williamson* to foreclose EPA from regulating GHG emissions in new motor vehicles do not hold in the present case. In *Massachusetts*, the Court observed that there had been no showing that the regulation of GHG in new motor vehicles would produce “extreme measures” and counter-intuitive results or that such regulation would be incompatible with the expressed purposes of Congress. *See* 549 U.S. at 530-31. Here, by contrast, EPA acknowledges that extending the PSD and Title V permitting requirements as written to GHG emissions would generate “absurd results” that would “vitiate much of the purpose” of the permitting thresholds and “would directly

(Continued on following page)

**A. *Brown & Williamson* is the correct framework for reviewing EPA's action.**

In striking down FDA's action under step one of *Chevron U.S.A., Inc. v. NRDC, Inc.*, 467 U.S. 837 (1984), the Court in *Brown & Williamson* did not probe for subtle ambiguities in the statutory terms. Rather, the Court looked to the overall structure of the statutory regime for drug regulation and read it against the background of other congressional enactments addressing tobacco products. See *Brown & Williamson*, 529 U.S. at 132-33, 142-43. First, the Court noted that “[t]hese findings [that tobacco products are harmful] logically imply that, if tobacco products were ‘devices’ under the FDCA, the FDA would be required to remove them from the market.” *Id.* at 135. The Court continued, “Congress, however, has foreclosed the removal of tobacco products from the market.” *Id.* at 137. As a result, “[a] ban on tobacco products by the FDA would therefore plainly contradict congressional policy.” *Id.* at 139. Precisely the same analysis applies here. Part C of the Act logically implies that if GHGs are “air pollutants” for purposes of PSD, EPA would be required to regulate numerous small sources. Congress, however, intended to foreclose the regulation of numerous small sources by the way the PSD provisions were drafted. In both cases, therefore, for both FDA and EPA, the agency reading of the statute requires it to do something that Congress has precluded.

---

contravene Congress's intention” to limit such permitting to the largest industrial sources. Tailoring Rule, JA 457.

“In addition,” the Court observed, “we must be guided to a degree by common sense as to the manner in which Congress is likely to delegate a policy decision of such economic and political magnitude to an administrative agency.” *Id.* at 133 (citing *MCI Telecomms. Corp. v. AT&T Co.*, 512 U.S. 218, 231 (1994)). In the case of tobacco regulation, the Court concluded, “we are confident that Congress could not have intended to delegate a decision of such economic and political significance to an agency in so cryptic a fashion.” *Id.* at 160; *see also MCI*, 512 U.S. at 231 (“It is highly unlikely that Congress would leave the determination of whether an industry will be entirely, or even substantially, rate-regulated to agency discretion – and even more unlikely that it would achieve that through such a subtle device as permission to ‘modify’ rate-filing requirements.”).

**B. The *Brown & Williamson* analysis shows that Congress foreclosed regulation of GHG emissions under PSD and Title V.**

EPA’s present action is, if anything, even more extraordinary and implausible than FDA’s effort to regulate tobacco products, and the *Brown & Williamson* analysis leads to a very similar conclusion here.

***The text and structure of the Act.*** For the reasons argued in greater detail in Argument Point I of the Chamber Brief and in the UARG Brief, the PSD and Title V provisions of the Clean Air Act, read as a whole, make it plain that Congress intended

such stationary source permitting to be triggered only for a small number of large sources and only by the emission of certain types of air pollutants, namely those that have adverse effects in the region where they are emitted.

In contrast, as EPA itself has found, the asserted dangers of GHG emissions are the opposite of local: They occur only through the mixing of gases in the upper atmosphere and the global diffusion of those gases to produce worldwide climate effects, such that a molecule of carbon dioxide released in one location will produce precisely the same potential climate effect as a molecule of carbon dioxide released on the other side of the world. *See* Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, 74 Fed. Reg. 66496 (Dec. 15, 2009) [hereinafter Endangerment Finding], JA 793-974, 858 (“Greenhouse gases, once emitted, become well mixed in the atmosphere, meaning U.S. emissions can affect not only the U.S. population and environment, but other regions of the world as well. Likewise, emissions in other countries can affect the United States.”); *id.* at 894 (“[T]he air over the United States will by definition affect climate change only in circumstances where the air around the world is also doing so. The impacts of the air over the United States cannot be assessed separately from the impacts from the global pool, as they occur together and work together to affect the climate.”). The direct exposure to carbon dioxide in the ambient air poses no human health risks, and GHGs

have no measurable or differentiated local effect on air quality. *See* Regulating Greenhouse Gas Emissions Under the Clean Air Act, 73 Fed. Reg. 44354 (July 30, 2008), JA 975-1331, 1135.

Just as this Court concluded that tobacco products “simply do not fit” within the statutory regime enacted by Congress, *Brown & Williamson*, 529 U.S. at 143, so too is it plain that GHG emissions do not fit within the Clean Air Act’s regime for local PSD and Title V permitting. Indeed, even apart from the mandatory numerical thresholds for PSD and Title V regulation contained in 42 U.S.C. §§ 7479(1) and 7602(j), discussed below, there are numerous other provisions of the Act that are incompatible with EPA’s interpretation. As more fully set forth in the Chamber and UARG Briefs, the PSD and Title V provisions of the Clean Air Act form a complex, integrated, coherent whole. EPA’s regulatory scheme dismantles this entire structure. For example:

- (1) Section 161, 43 U.S.C. § 7471, requires implementation plans for areas designated as attainment or nonclassifiable relative to National Ambient Air Quality Standards (NAAQS). This requirement cannot work for GHGs because they are globally well-mixed and have no regional variation in concentration, and because there is no NAAQS standard by which an area can be classified;

- (2) Section 162, 42 U.S.C. § 7472, provides for initial classifications of air quality areas. This provision is meaningless for GHGs because they are globally well-mixed and have no effect on local air quality;
- (3) Section 163, 42 U.S.C. § 7473, limits the “maximum allowable increases” in the concentration of pollutants in attainment areas. This limitation cannot work for GHGs because they are globally well-mixed and there are no NAAQS against which an increase can be compared;
- (4) Section 164, 42 U.S.C. § 7474, establishes procedures for reclassification of local air quality areas. This provision is meaningless for GHGs because they are globally well-mixed and have no effect on local air quality;
- (5) Section 165, 42 U.S.C. § 7475, requires pre-construction permits, which are keyed to maximum allowable increments relative to NAAQS in local air quality areas. As a condition of permitting, this Section requires local air quality impact monitoring and analysis. These requirements make no sense for GHGs because they are globally well-mixed, have no effect on local air quality, and there are no NAAQS for such gases. For these reasons, EPA has dispensed with the statutory air quality impact analysis and monitoring requirements. *See* PSD and

Title V Permitting Guidance for Greenhouse Gases,<sup>2</sup> p. 48 (“Considering the nature of greenhouse gas emissions and their global impacts, EPA does not believe it is practical or appropriate to expect permitting authorities to collect monitoring data for purpose of assessing ambient air impacts of greenhouse gases.”);

- (6) Section 166, 42 U.S.C. § 7476, establishes procedures for promulgating regulations for pollutants with newly established NAAQS. Since EPA’s new GHG program does not and cannot set a NAAQS for GHGs, the program necessarily ignores and bypasses these procedures; and
- (7) EPA’s interpretation is inconsistent with the Federal-State partnership construct found throughout the Act.

As with tobacco regulation under the FDCA, GHG regulation under PSD and Title V simply does not fit, and the program EPA has enacted bears essentially no resemblance to the structure carefully crafted by Congress. EPA claims this statutory debris field is compelled by a triumphalist definition for the phrase “any air pollutant” to which all contrary provisions of the Act are subordinate. But no statute can be properly read to compel its own repudiation.

***Absurd consequences.*** Any conceivable doubt that might exist about the impermissibility of EPA's interpretation, and the consequent encroachment into Congress's legislative domain, is erased completely by the "absurd results" and "impossible administrative burdens" that EPA acknowledged would occur from the application of the Clean Air Act's mandatory numerical permitting thresholds to GHGs. Tailoring Rule, JA 418-19, 454-55 (applying the numerical thresholds "would result in a program that would have been unrecognizable to the Congress that designed PSD" and "contrary to Congress's careful efforts to confine PSD to large industrial sources" because it would expand the program "from the current 280 sources per year to almost 82,000 sources, virtually all of which would be smaller than the sources currently in the PSD program and most of which would be small commercial and residential sources" that "would each incur, on average, almost \$60,000 in PSD permitting expenses").

Once the Agency recognized that interpreting the statute to require PSD and Title V permitting for GHGs would necessarily produce extreme and absurd consequences under the mandatory terms of the Act, that realization should have been the end of the enterprise. To avoid encroaching on legislative prerogatives, "interpretations of a statute which would produce absurd results are to be avoided if alternative interpretations consistent with the legislative purpose are available." *Griffin v. Oceanic Contractors, Inc.*, 458 U.S. 564, 575 (1982). As shown in the briefs

of petitioners, the alternative interpretation of the Act that limits stationary source permitting to certain pollutants not including GHGs is fully consistent with the plain language of the statute and the purposes of the permitting regime.

**Legislative background.** The conclusion that Congress has not authorized EPA to require PSD and Title V permitting for GHGs under the Clean Air Act is further confirmed by the relevant legislative background. *See Brown & Williamson*, 529 U.S. at 144 (canvassing legislative proposals in which Congress had addressed tobacco-related legislation on the understanding that FDA “lacked authority under the FDCA to regulate tobacco,” including bills rejected by Congress “that would have granted the FDA such jurisdiction”).

EPA acknowledged that Congress chose the 100- and 250-tons-per-year mandatory numerical PSD and Title V permitting thresholds so they would apply only to a few of the largest industrial sources that could bear the costs. *See Tailoring Rule*, JA 430-31. Because GHGs are typically emitted in volumes far greater than these statutory thresholds by small businesses – and even by many residential buildings and other non-commercial facilities like churches and schools – the application of PSD and Title V permitting requirements to GHGs cannot possibly be consistent with congressional intent. *Id.*

Congress has considered a huge volume of bills for regulating or reducing GHG emissions since

enactment of the PSD program in the 1977 Amendments to the Clean Air Act and since the addition of the Title V permitting provisions in the Clean Air Act Amendments of 1990. *See, e.g.*, Center for Climate and Energy Solutions, *Climate Debate in Congress*, available at <http://www.c2es.org/federal/congress> (overview of all legislative proposals related to climate change from the 106th Congress to the present) (last visited Dec. 6, 2013); *see* JA 152 (Brown, J., dissenting from denial of rehearing *en banc*), citing Abigail R. Moncrieff, Reincarnating the “Major Questions” Exception to Chevron Deference as a Doctrine of Non-interference (or Why Massachusetts v. EPA Got It Wrong), 60 Admin. L. Rev. 593, 636-37 (2008) (finding more than 400 bills from 101st to 110th Congress); Marlo Lewis, EPA Permitting of Greenhouse Gases: What Does Legislative History Reveal about Congressional Intent?, available at <http://www.globalwarming.org/2013/12/03/epa-permitting-of-greenhouse-gases-what-does-legislative-history-reveal-about-congressional-intent/#more-18134> (finding 692 bills from 101st through 111th Congresses) (last visited Dec. 6, 2013).

These proposals have involved a wide variety of approaches to reducing GHG emissions from stationary sources, including emission caps through permits, industry-wide emission caps, so-called “cap and trade” programs, and tax and other incentives for achieving reductions. *See, e.g.*, Climate Stewardship and Innovation Act of 2007, S. 280, 110th Cong. (2007) and Climate Stewardship Act of 2007, H.R.

620, 110th Cong. (2007) (bill to establish market-driven system of tradable GHG allowances to be administered by EPA; passed by House but died in Senate); Greenhouse Gas Registry Act, H.R. 232, 111th Cong. (2009) (bill to authorize EPA to create federal GHG registry; failed in House); Clean Energy Jobs and American Power Act, S. 1733, 111th Cong. (2009) and American Clean Energy and Security Act of 2009, H.R. 2454, 111th Cong. (2009) (bill to create "Pollution Reduction and Investment" program to be administered by EPA to establish economy-wide, market-based program for reducing GHG emissions; passed House but not Senate). But none of these subsequent legislative proposals indicates that Congress ever intended to extend the PSD and Title V programs beyond their limited scope.

In addition, nearly all of these bills would have involved a significant role for EPA in administering programs for reducing GHG emissions from stationary sources. Congress's repeated consideration of such legislative proposals, as it continues to grapple with the immense and divisive economic and policy implications of GHG regulation, only reinforces the plain meaning of the statute. These proposals obviously assume that EPA currently lacks the broad authority it now claims to restrict GHG emissions through PSD and Title V permits.

***In sum.*** Just as with FDA's effort to regulate tobacco products, EPA's interpretation of the Clean Air Act that PSD and Title V stationary source permitting for GHG emissions are automatically triggered by mobile source regulation is foreclosed by the

text, structure, and legislative background of the Act. EPA has created a permitting regime for GHGs that bears no resemblance to the limited PSD and Title V programs established by Congress. This new regime cannot plausibly be squared with the statutory scheme Congress intended the Agency to administer.

## **II. EPA's action depended on a gross misuse of canons of statutory interpretation.**

In contravention of the plain meaning of the statute and Congress's manifest intent not to authorize PSD and Title V regulation for GHG emissions under the Clean Air Act, EPA nevertheless devised a new program to do exactly that. EPA did so through the gross misapplication of two doctrines of statutory interpretation – the doctrine of “absurd results” and the doctrine of “administrative necessity.” As will be discussed in Section III, below, this action by EPA raises an intolerable separation of powers issue.

### **A. The “absurd results” doctrine does not authorize an administrative override of congressional intent.**

Resort to the “absurd results” doctrine has been approved by this Court only in the most limited circumstances. The Court has sanctioned its use to give a narrowing or specialized construction to a statutory term where applying the literal meaning or most natural reading of the term would produce an absurdly broad reach for the statutory regime or an

absurd application of a statutory requirement that could not have been intended by Congress. *See, e.g., Nixon v. Mo. Mun. League*, 541 U.S. 125, 132-33 (2004) (“any entity” construed to mean only private entity); *Green v. Bock Laundry Mach. Co.*, 490 U.S. 504 (1989) (“defendant” construed to mean only criminal defendant); *Train v. Colo. Pub. Interest Res. Group*, 426 U.S. 1, 23-24 (1976) (“pollutants,” defined in the Federal Water Pollution Control Act to include any “radioactive materials,” construed not to include three specific types of radioactive materials); *United States v. Am. Trucking Ass’ns*, 310 U.S. 534, 538-42 (1940) (“employees” construed to be limited to employees whose activities affect safety); *Holy Trinity Church v. United States*, 143 U.S. 457, 516-17 (1892) (“any alien” construed not to apply to foreign pastor).

Because of the dangers inherent in a license to stray from the natural meaning of statutory language, any invocation of the doctrine must remain true to congressional intent. *See Horn v. Comm’r of Internal Rev.*, 968 F.2d 1229, 1239 (D.C. Cir. 1992) (“The [absurd results] canon is sensible, so far as it goes, but it can only be used to further Congress’ intent, not to circumvent it. . . . A canon of interpretation cannot nullify part of a statute.”); *see also Pub. Citizen v. U.S. Dep’t of Justice*, 491 U.S. 440, 470 (1989) (Kennedy, J., concurring in judgment) (“When used in a proper manner, this narrow exception to our normal rule of statutory construction does not intrude upon the lawmaking powers of Congress, but rather demonstrates a respect for the coequal Legislative

Branch, which we assume would not act in an absurd way.”); *United States v. Brown*, 333 U.S. 18, 27 (1948) (absurd results doctrine is only justified where necessary to avoid “blind nullification of the congressional intent” behind a statute); *Holy Trinity Church*, 143 U.S. at 459 (approving invocation of the absurd results doctrine to exclude a subject from the literal scope of a statute’s reach where it would be “unreasonable to believe that the legislator intended to include the particular act”).

As is apparent, the “absurd results” doctrine is used only where Congress inadvertently used a term and the absurdity of a literal application requires a non-literal reading to avoid an unreasonable outcome. Here, by contrast, EPA has relied on “absurd results” as justification for *ignoring* Congress’s carefully crafted, deliberate, express intent that the precisely specified numerical permitting thresholds, and only those thresholds, would define the scope of the PSD and Title V programs. Properly understood and applied, this doctrine could readily support a narrowed construction of “any air pollutant” for purposes of PSD permitting to include only pollutants having a localized effect on ambient air quality, even if the term may be given a broader meaning in the mobile source provisions of the statute. Such a narrowed construction for stationary source purposes is necessary to avoid the absurd application of the statute that EPA itself recognized would be contrary to anything Congress ever contemplated. *See Griffin*, 458 U.S. at 575. But to invoke “absurd results,” as

EPA did, to alter radically the statute's strict numerical stationary source permitting requirements – by changing 250 tons-per-year to 100,000 tons-per-year and 100 tons-per-year to 75,000 tons-per-year – is an obvious misuse of the doctrine.

**B. EPA cannot rely on the concept of “administrative necessity” to establish a new regulatory program that Congress has not authorized.**

EPA also misused the “administrative necessity” doctrine as authority for rewriting the statute's permitting thresholds so as to enable an extension of the PSD and Title V programs to GHGs. EPA rationalized this maneuver on the ground that complying with the literal terms of the Act was impossible. Of course: It was only EPA's own deviation from the clear limits that Congress placed on the scope of these programs that rendered compliance impossible.

In approving the doctrine of administrative necessity, the D.C. Circuit has circumscribed its use to three types of regulatory accommodations: adopting limited categorical exemptions where the statute permits flexibility; crafting case-by-case determinations within the discretion of the agency; and postponing statutory deadlines to avoid administrative hardship or harsh or unintended consequences. *See Ala. Power Co. v. Costle*, 636 F.2d 323, 357-60 (D.C. Cir. 1980); *see also Sierra Club v. EPA*, 719 F.2d 436, 463 (D.C. Cir. 1983); *Env'tl. Def. Fund, Inc. v. EPA*,

636 F.2d 1267 (D.C. Cir. 1980). Here, EPA ventured well beyond any such measured precedents to fashion its own novel standard that would sanction use of “administrative necessity” whenever the Agency can (1) demonstrate the unavailability of alternatives, (2) quantify the impossible administrative burdens, and (3) achieve a favored result by claiming to deviate from the plain text of the statute as little as possible. *See* Tailoring Rule, JA 401-02. Quite apart from EPA’s own culpability in creating the asserted “administrative necessity,” EPA did not even hew to its own newly minted three-factor test in that there were readily available alternatives and it radically deviated from the plain text of the statute. EPA effectively converted this carefully circumscribed doctrine into an unconstrained tool of “administrative convenience.”

Indeed, the authority claimed by EPA is so unconstrained that it imperils more than just one provision of the statutory scheme of PSD and Title V regulation. As shown above at pp. 11-13, EPA’s reasoning eventually compels it to repudiate a panoply of other requirements of the PSD provisions that are made ridiculous or superfluous if applied to GHGs. The ensuing legal chaos shows why the use of “administrative necessity” to abrogate congressional intent should never be permitted.

### **III. EPA's actions create a grave threat to the constitutional separation of executive and legislative powers.**

By its misconstruction and abuse of these interpretive doctrines, EPA arrogated to itself a degree of unadulterated legislative power that, if accepted, would represent a far-reaching incursion of the Executive Branch into the constitutionally assigned province of Congress. See JA 170-90, JA 175 (Kavanaugh, J., dissenting from denial of rehearing *en banc*) (“Allowing agencies to exercise [this] kind of statutory re-writing authority could significantly enhance the Executive Branch’s power at the expense of Congress’s and thereby alter the relative balance of powers in the administrative process.”).

Actions, such as EPA’s, by which one Branch of our Government would presume to expropriate or invade the constitutionally assigned functions of another Branch present one of the greatest threats to liberty. “In a government, where the liberties of the people are to be preserved . . . , the executive, legislative and judicial, should ever be separate and distinct, and consist of parts, mutually forming a check upon each other.” Charles Pinckney, Observations on the Plan of Government Submitted to the Federal Convention of May 28, 1787, *reprinted in* 3 M. Farand, Records of the Federal Convention of 1787, p. 108 (rev. ed. 1966); see The Federalist Nos. 47-51 (James Madison) (explaining and defending the Constitution’s structural design of separated powers); see also *Clinton v. City of New York*, 524 U.S. 417, 447

(1998) (striking down the line-item veto as unconstitutional because it “gives the President the unilateral power to change the text of duly enacted statutes”); *see also id.* at 450 (Kennedy, J., concurring) (“Liberty is always at stake when one or more of the branches seek to transgress the separation of powers.”).

**A. Separation of powers is essential to the constitutional design.**

In addressing EPA’s action, it is appropriate to recall this Court’s clarion repudiation of executive overreach in the *Youngstown* case. There, Members of the Court warned that the “accretion of dangerous power” is spawned by “unchecked disregard of the restrictions that fence in even the most disinterested assertion of authority.” *Youngstown*, 343 U.S. at 594 (Frankfurter, J., concurring). In voting to strike down the President’s Executive Order directing the Secretary of Commerce to take possession of major steel mills to head off the grave consequences of a labor shutdown of the mills during time of war, Justice Douglas returned to first principles: “In the framework of our Constitution, the president’s power to see that the laws are faithfully executed refutes the idea that he is to be a lawmaker.” *Id.* at 587 (Douglas, J., concurring). The purpose of the separation of powers is “not to avoid friction, but, by means of the inevitable friction incident to the distribution of the governmental powers among three departments, to save the people from autocracy.” *Id.* at 629; *see id.* at 638

(Jackson, J., concurring) (“Presidential claim to a power at once so conclusive and preclusive must be scrutinized with caution, for what is at stake is the equilibrium established by our constitution.”).

The EPA Administrator and the President of the United States apparently believe that GHGs contribute to global climate change and that global climate change poses a serious long-term risk to the Earth that demands a national policy response. They may also be frustrated by Congress’s failure to enact a legislative program to respond to their concerns. But while the failure to enact a regulatory response may create challenges in some ways, “a judiciary that licensed extra-constitutional government with each issue of comparable gravity would, in the long run, be far worse.” *Free Enter. Fund v. Pub. Co. Accounting Oversight Bd.*, 130 S. Ct. 3138, 3157 (2010) (internal quotation marks, alterations, and citations omitted). “Legislative action may indeed often be cumbersome, time-consuming, and apparently inefficient,” *Youngstown*, 343 U.S. at 629 (Douglas, J.), but the Framers of the Constitution “designed it that way,” and “[t]he time and difficulty of enacting new legislation has never justified an agency’s contravention of statutory limits.” JA 189 (Kavanaugh, J., dissenting). See *Clinton*, 524 U.S. at 449 (Kennedy, J., concurring) (“The Constitution’s structure requires a stability which transcends the convenience of the moment.”).

If existing statutory authority is insufficient to meet a national challenge, the President has the duty and power under the Recommendations Clause

to “recommend” for Congress’s “Consideration such Measures as he shall judge necessary and expedient.” U.S. Const. art. II, § 3, cl. 1. The President is expected to advocate forcefully until Congress grants the necessary regulatory authority, but in the meantime, he is obligated to ensure that the laws Congress actually has enacted are “faithfully executed.” *Id.* art. II, § 3, cl. 4.

**B. The Act can and must be interpreted to avoid EPA’s separation of powers violation.**

Ultimately, the Court in this case need not pronounce a definitive judgment on the constitutional violation effected by EPA’s interpretive strategem. The separation of powers Kraken that would be unleashed if EPA’s action were upheld is sufficient to trigger a superior principle: constitutional avoidance. EPA’s misuse of the “absurd results” and “administrative necessity” doctrines to invade the legislative domain is put to the sword by this greater canon of construction. *See Edward J. DeBartolo Corp. v. Fla. Gulf Coast Bldg. & Constr. Trades Council*, 485 U.S. 568, 575 (1988) (recognizing that the avoidance of serious constitutional issues wherever possible is a “cardinal principle” of statutory interpretation that “has for so long been applied by [this Court] that it is beyond debate”). To preserve the Constitution free from unnecessary judicial involvement, the avoidance canon demands that a statute be interpreted to avoid giving rise to any serious constitutional issue unless

the saving construction is unreasonable and plainly contrary to Congress's intent. "[E]very reasonable construction must be resorted to, in order to save a statute from unconstitutionality." *Id.* "If an otherwise acceptable construction of a statute would raise serious constitutional problems, and where an alternative interpretation of the statute is 'fairly possible,' the Court is obligated to construe the statute to avoid such problems." *INS v. St. Cyr*, 533 U.S. 289, 300 (2001).

This Court applied the avoidance canon in *Solid Waste Agency of No. Cook County v. Army Corps of Eng'rs*, 531 U.S. 159 (2001), to reject the Army Corps of Engineers' interpretation of "navigable waters" under the Clean Water Act to extend federal authority to reach isolated patches of wholly intrastate wetlands. *See id.* at 172-73. Similarly, this Court has held that where an interpretation of a statute would result in a "sweeping delegation of legislative power" to an agency, "[a] construction of the statute that avoids this kind of open-ended grant should certainly be favored." *Indus. Union Dep't, AFL-CIO v. API*, 448 U.S. 607, 646 (1980). These cases call for a similar affirmation of constitutional boundaries: EPA's interpretation of the Clean Air Act to trigger stationary source permitting for GHGs under the PSD and Title V programs exceeded the Agency's authority in a manner that threatens an undue aggrandizement of executive power at the expense of the Legislative Branch.

As shown in Point I above, and as argued in greater detail in the briefs of other petitioners, the alternative readings of the Act that would deny EPA authority to trigger PSD and Title V permitting for stationary source emissions of GHGs avoid this unconstitutional power grab. Those alternative interpretations fully align with the statute's text and structure and honor and preserve the intent of Congress. Under the rule of constitutional avoidance, EPA's faulty interpretation, which satisfies none of these requirements, must be rejected.

**CONCLUSION**

For the reasons set forth above, and those discussed in the briefs of other petitioners, the judgment of the Court of Appeals should be reversed.

App. 1

42 U.S.C. § 7471

§ 7471. Plan requirements

In accordance with the policy of section 7401(b)(1) of this title, each applicable implementation plan shall contain emission limitations and such other measures as may be necessary, as determined under regulations promulgated under this part, to prevent significant deterioration of air quality in each region (or portion thereof) designated pursuant to section 7407 of this title as attainment or unclassifiable.

---

App. 2

42 U.S.C. § 7472

§ 7472. Initial classifications

(a) Areas designated as class I

Upon the enactment of this part, all –

- (1) international parks,
- (2) national wilderness areas which exceed 5,000 acres in size,
- (3) national memorial parks which exceed 5,000 acres in size, and
- (4) national parks which exceed six thousand acres in size,

and which are in existence on August 7, 1977, shall be class I areas and may not be redesignated. All areas which were redesignated as class I under regulations promulgated before August 7, 1977, shall be class I areas which may be redesignated as provided in this part. The extent of the areas designated as Class I under this section shall conform to any changes in the boundaries of such areas which have occurred subsequent to August 7, 1977, or which may occur subsequent to November 15, 1990.

(b) Areas designated as class II

All areas in such State designated pursuant to section 7407(d) of this title as attainment or unclassifiable which are not established as class I under subsection (a) of this section shall be class II areas unless redesignated under section 7474 of this title.

---

App. 3

42 U.S.C. § 7473

§ 7473. Increments and ceilings

(a) Sulfur oxide and particulate matter; requirement that maximum allowable increases and maximum allowable concentrations not be exceeded

In the case of sulfur oxide and particulate matter, each applicable implementation plan shall contain measures assuring that maximum allowable increases over baseline concentrations of, and maximum allowable concentrations of, such pollutant shall not be exceeded. In the case of any maximum allowable increase (except an allowable increase specified under section 7475(d)(2)(C)(iv) of this title) for a pollutant based on concentrations permitted under national ambient air quality standards for any period other than an annual period, such regulations shall permit such maximum allowable increase to be exceeded during one such period per year.

(b) Maximum allowable increases in concentrations over baseline concentrations

(1) For any class I area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

App. 4

**Pollutant                    Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean .....	5
Twenty-four-hour maximum .....	10

Sulfur dioxide:

Annual arithmetic mean .....	2
Twenty-four-hour maximum .....	5
Three-hour maximum .....	25

(2) For any class II area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of such pollutants shall not exceed the following amounts:

**Pollutant                    Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean .....	19
Twenty-four-hour maximum .....	37

Sulfur dioxide:

Annual arithmetic mean .....	20
Twenty-four-hour maximum .....	91
Three-hour maximum .....	512

(3) For any class III area, the maximum allowable increase in concentrations of sulfur dioxide and particulate matter over the baseline concentration of

App. 5

such pollutants shall not exceed the following amounts:

**Pollutant                      Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean .....37

Twenty-four-hour maximum .....75

Sulfur dioxide:

Annual arithmetic mean .....40

Twenty-four-hour maximum .....182

Three-hour maximum .....700

(4) The maximum allowable concentration of any air pollutant in any area to which this part applies shall not exceed a concentration for such pollutant for each period of exposure equal to –

(A) the concentration permitted under the national secondary ambient air quality standard, or

(B) the concentration permitted under the national primary ambient air quality standard,

whichever concentration is lowest for such pollutant for such period of exposure.

(c) Orders or rules for determining compliance with maximum allowable increases in ambient concentrations of air pollutants

(1) In the case of any State which has a plan approved by the Administrator for purposes of carrying

## App. 6

out this part, the Governor of such State may, after notice and opportunity for public hearing, issue orders or promulgate rules providing that for purposes of determining compliance with the maximum allowable increases in ambient concentrations of an air pollutant, the following concentrations of such pollutant shall not be taken into account:

**(A)** concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from the use of petroleum products, or natural gas, or both, by reason of an order which is in effect under the provisions of sections 792(a) and (b) of Title 15 (or any subsequent legislation which supersedes such provisions) over the emissions from such sources before the effective date of such order.

**(B)** the concentrations of such pollutant attributable to the increase in emissions from stationary sources which have converted from using natural gas by reason of a natural gas curtailment pursuant to a natural gas curtailment plan in effect pursuant to the Federal Power Act [16 U.S.C. § 791a et seq.] over the emissions from such sources before the effective date of such plan,

**(C)** concentrations of particulate matter attributable to the increase in emissions from construction or other temporary emission-related activities, and

**(D)** the increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources

App. 7

which are included in the baseline concentration determined in accordance with section 7479(4) of this title.

**(2)** No action taken with respect to a source under paragraph (1)(A) or (1)(B) shall apply more than five years after the effective date of the order referred to in paragraph (1)(A) or the plan referred to in paragraph (1)(B), whichever is applicable. If both such order and plan are applicable, no such action shall apply more than five years after the later of such effective dates.

**(3)** No action under this subsection shall take effect unless the Governor submits the order or rule providing for such exclusion to the Administrator and the Administrator determines that such order or rule is in compliance with the provisions of this subsection.

---

App. 8

42 U.S.C. § 7474

§ 7474. Area redesignation

(a) Authority of States to redesignate areas

Except as otherwise provided under subsection (c) of this section, a State may redesignate such areas as it deems appropriate as class I areas. The following areas may be redesignated only as class I or II:

- (1) an area which exceeds ten thousand acres in size and is a national monument, a national primitive area, a national preserve, a national recreation area, a national wild and scenic river, a national wildlife refuge, a national lakeshore or seashore, and
- (2) a national park or national wilderness area established after August 7, 1977, which exceeds ten thousand acres in size.

The extent of the areas referred to in paragraph (1) and (2) shall conform to any changes in the boundaries of such areas which have occurred subsequent to August 7, 1977, or which may occur subsequent to November 15, 1990. Any area (other than an area referred to in paragraph (1) or (2) or an area established as class I under the first sentence of section 7472(a) of this title) may be redesignated by the State as class III if –

- (A) such redesignation has been specifically approved by the Governor of the State, after consultation with the appropriate Committees of the legislature if it is in session or with the leadership of the legislature if it is not in session

App. 9

(unless State law provides that such redesignation must be specifically approved by State legislation) and if general purpose units of local government representing a majority of the residents of the area so redesignated enact legislation (including for such units of local government resolutions where appropriate) concurring in the State's redesignation;

**(B)** such redesignation will not cause, or contribute to, concentrations of any air pollutant which exceed any maximum allowable increase or maximum allowable concentration permitted under the classification of any other area; and

**(C)** such redesignation otherwise meets the requirements of this part.

Subparagraph (A) of this paragraph shall not apply to area redesignations by Indian tribes.

(b) Notice and hearing; notice to Federal land manager; written comments and recommendations; regulations; disapproval of redesignation

**(1)(A)** Prior to redesignation of any area under this part, notice shall be afforded and public hearings shall be conducted in areas proposed to be redesignated and in areas which may be affected by the proposed redesignation. Prior to any such public hearing a satisfactory description and analysis of the health, environmental, economic, social, and energy effects of the proposed redesignation shall be prepared and made available for public inspection and prior to any such redesignation, the description and

## App. 10

analysis of such effects shall be reviewed and examined by the redesignating authorities.

**(B)** Prior to the issuance of notice under subparagraph (A) respecting the redesignation of any area under this subsection, if such area includes any Federal lands, the State shall provide written notice to the appropriate Federal land manager and afford adequate opportunity (but not in excess of 60 days) to confer with the State respecting the intended notice of redesignation and to submit written comments and recommendations with respect to such intended notice of redesignation. In redesignating any area under this section with respect to which any Federal land manager has submitted written comments and recommendations, the State shall publish a list of any inconsistency between such redesignation and such recommendations and an explanation of such inconsistency (together with the reasons for making such redesignation against the recommendation of the Federal land manager).

**(C)** The Administrator shall promulgate regulations not later than six months after August 7, 1977, to assure, insofar as practicable, that prior to any public hearing on redesignation of any area, there shall be available for public inspection any specific plans for any new or modified major emitting facility which may be permitted to be constructed and operated only if the area in question is designated or redesignated as class III.

App. 11

(2) The Administrator may disapprove the redesignation of any area only if he finds, after notice and opportunity for public hearing, that such redesignation does not meet the procedural requirements of this section or is inconsistent with the requirements of section 7472(a) of this title or of subsection (a) of this section. If any such disapproval occurs, the classification of the area shall be that which was in effect prior to the redesignation which was disapproved.

(c) Indian reservations

Lands within the exterior boundaries of reservations of federally recognized Indian tribes may be redesignated only by the appropriate Indian governing body. Such Indian governing body shall be subject in all respect to the provisions of subsection (e) of this section.

(d) Review of national monuments, primitive areas, and national preserves

The Federal Land Manager shall review all national monuments, primitive areas, and national preserves, and shall recommend any appropriate areas for redesignation as class I where air quality related values are important attributes of the area. The Federal Land Manager shall report such recommendations, within<sup>2</sup> supporting analysis, to the Congress and the affected States within one year after August 7, 1977. The Federal Land Manager shall consult with the appropriate States before making such recommendations.

## App. 12

## (e) Resolution of disputes between State and Indian tribes

If any State affected by the redesignation of an area by an Indian tribe or any Indian tribe affected by the redesignation of an area by a State disagrees with such redesignation of any area, or if a permit is proposed to be issued for any new major emitting facility proposed for construction in any State which the Governor of an affected State or governing body of an affected Indian tribe determines will cause or contribute to a cumulative change in air quality in excess of that allowed in this part within the affected State or tribal reservation, the Governor or Indian ruling body may request the Administrator to enter into negotiations with the parties involved to resolve such dispute. If requested by any State or Indian tribe involved, the Administrator shall make a recommendation to resolve the dispute and protect the air quality related values of the lands involved. If the parties involved do not reach agreement, the Administrator shall resolve the dispute and his determination, or the results of agreements reached through other means, shall become part of the applicable plan and shall be enforceable as part of such plan. In resolving such disputes relating to area redesignation, the Administrator shall consider the extent to which the lands involved are of sufficient size to allow effective air quality management or have air quality related values of such an area.

---

App. 13

42 U.S.C. § 7475

§ 7475. Preconstruction requirements

(a) Major emitting facilities on which construction is commenced

No major emitting facility on which construction is commenced after August 7, 1977, may be constructed in any area to which this part applies unless –

(1) a permit has been issued for such proposed facility in accordance with this part setting forth emission limitations for such facility which conform to the requirements of this part;

(2) the proposed permit has been subject to a review in accordance with this section, the required analysis has been conducted in accordance with regulations promulgated by the Administrator, and a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of such source, alternatives thereto, control technology requirements, and other appropriate considerations;

(3) the owner or operator of such facility demonstrates, as required pursuant to section 7410(j) of this title, that emissions from construction or operation of such facility will not cause, or contribute to, air pollution in excess of any (A) maximum allowable increase or maximum allowable concentration for any pollutant in any area to which this part applies more than one time per year, (B) national ambient air quality standard in

App. 14

any air quality control region, or (C) any other applicable emission standard or standard of performance under this chapter;

(4) the proposed facility is subject to the best available control technology for each pollutant subject to regulation under this chapter emitted from, or which results from, such facility;

(5) the provisions of subsection (d) of this section with respect to protection of class I areas have been complied with for such facility;

(6) there has been an analysis of any air quality impacts projected for the area as a result of growth associated with such facility;

(7) the person who owns or operates, or proposes to own or operate, a major emitting facility for which a permit is required under this part agrees to conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or is having, on air quality in any area which may be affected by emissions from such source; and

(8) in the case of a source which proposes to construct in a class III area, emissions from which would cause or contribute to exceeding the maximum allowable increments applicable in a class II area and where no standard under section 7411 of this title has been promulgated subsequent to August 7, 1977, for such source category, the Administrator has approved the determination of best available technology as set forth in the permit.

App. 15

(b) Exception

The demonstration pertaining to maximum allowable increases required under subsection (a)(3) of this section shall not apply to maximum allowable increases for class II areas in the case of an expansion or modification of a major emitting facility which is in existence on August 7, 1977, whose allowable emissions of air pollutants, after compliance with subsection (a)(4) of this section, will be less than fifty tons per year and for which the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur oxides will not cause or contribute to ambient air quality levels in excess of the national secondary ambient air quality standard for either of such pollutants.

(c) Permit applications

Any completed permit application under section 7410 of this title for a major emitting facility in any area to which this part applies shall be granted or denied not later than one year after the date of filing of such completed application.

(d) Action taken on permit applications; notice; adverse impact on air quality related values; variance; emission limitations

(1) Each State shall transmit to the Administrator a copy of each permit application relating to a major emitting facility received by such State and provide notice to the Administrator of every action related to the consideration of such permit.

App. 16

**(2)(A)** The Administrator shall provide notice of the permit application to the Federal Land Manager and the Federal official charged with direct responsibility for management of any lands within a class I area which may be affected by emissions from the proposed facility.

**(B)** The Federal Land Manager and the Federal official charged with direct responsibility for management of such lands shall have an affirmative responsibility to protect the air quality related values (including visibility) of any such lands within a class I area and to consider, in consultation with the Administrator, whether a proposed major emitting facility will have an adverse impact on such values.

**(C)(i)** In any case where the Federal official charged with direct responsibility for management of any lands within a class I area or the Federal Land Manager of such lands, or the Administrator, or the Governor of an adjacent State containing such a class I area files a notice alleging that emissions from a proposed major emitting facility may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur dioxide will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area.

**(ii)** In any case where the Federal Land Manager demonstrates to the satisfaction of the State that the

## App. 17

emissions from such facility will have an adverse impact on the air quality-related values (including visibility) of such lands, notwithstanding the fact that the change in air quality resulting from emissions from such facility will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area, a permit shall not be issued.

**(iii)** In any case where the owner or operator of such facility demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such facility will have no adverse impact on the air quality-related values of such lands (including visibility), notwithstanding the fact that the change in air quality resulting from emissions from such facility will cause or contribute to concentrations which exceed the maximum allowable increases for class I areas, the State may issue a permit.

**(iv)** In the case of a permit issued pursuant to clause (iii), such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides and particulates from such facility will not cause or contribute to concentrations of such pollutant which exceed the following maximum allowable increases over the baseline concentration for such pollutants:

App. 18

**Maximum allowable increase  
(in micrograms per cubic meter)**

Particulate matter:

Annual geometric mean .....19

Twenty-four-hour maximum .....37

Sulfur dioxide:

Annual arithmetic mean .....20

Twenty-four-hour maximum .....91

Three-hour maximum .....325

**(D)(i)** In any case where the owner or operator of a proposed major emitting facility who has been denied a certification under subparagraph (C)(iii) demonstrates to the satisfaction of the Governor, after notice and public hearing, and the Governor finds, that the facility cannot be constructed by reason of any maximum allowable increase for sulfur dioxide for periods of twenty-four hours or less applicable to any class I area and, in the case of Federal mandatory class I areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If such variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph.

## App. 19

(ii) In any case in which the Governor recommends a variance under this subparagraph in which the Federal Land Manager does not concur, the recommendations of the Governor and the Federal Land Manager shall be transmitted to the President. The President may approve the Governor's recommendation if he finds that such variance is in the national interest. No Presidential finding shall be reviewable in any court. The variance shall take effect if the President approves the Governor's recommendations. The President shall approve or disapprove such recommendation within ninety days after his receipt of the recommendations of the Governor and the Federal Land Manager.

(iii) In the case of a permit issued pursuant to this subparagraph, such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such facility will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period:

## App. 20

**MAXIMUM ALLOWABLE INCREASE****[In micrograms per cubic meter]**

<b>Period of exposure</b>	<b>Low terrain areas</b>	<b>High terrain areas</b>
24-hr maximum .....	36	62
3-hr maximum .....	130	221

(iv) For purposes of clause (iii), the term “high terrain area” means with respect to any facility, any area having an elevation of 900 feet or more above the base of the stack of such facility, and the term “low terrain area” means any area other than a high terrain area.

(e) Analysis; continuous air quality monitoring data; regulations; model adjustments

(1) The review provided for in subsection (a) of this section shall be preceded by an analysis in accordance with regulations of the Administrator, promulgated under this subsection, which may be conducted by the State (or any general purpose unit of local government) or by the major emitting facility applying for such permit, of the ambient air quality at the proposed site and in areas which may be affected by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.

(2) Effective one year after August 7, 1977, the analysis required by this subsection shall include continuous air quality monitoring data gathered for

## App. 21

purposes of determining whether emissions from such facility will exceed the maximum allowable increases or the maximum allowable concentration permitted under this part. Such data shall be gathered over a period of one calendar year preceding the date of application for a permit under this part unless the State, in accordance with regulations promulgated by the Administrator, determines that a complete and adequate analysis for such purposes may be accomplished in a shorter period. The results of such analysis shall be available at the time of the public hearing on the application for such permit.

**(3)** The Administrator shall within six months after August 7, 1977, promulgate regulations respecting the analysis required under this subsection which regulations –

**(A)** shall not require the use of any automatic or uniform buffer zone or zones,

**(B)** shall require an analysis of the ambient air quality, climate and meteorology, terrain, soils and vegetation, and visibility at the site of the proposed major emitting facility and in the area potentially affected by the emissions from such facility for each pollutant regulated under this chapter which will be emitted from, or which results from the construction or operation of, such facility, the size and nature of the proposed facility, the degree of continuous emission reduction which could be achieved by such facility, and such other factors as may be relevant in determining the effect of emissions from a proposed facility on any air quality control region,

App. 22

(C) shall require the results of such analysis shall be available at the time of the public hearing on the application for such permit, and

(D) shall specify with reasonable particularity each air quality model or models to be used under specified sets of conditions for purposes of this part.

Any model or models designated under such regulations may be adjusted upon a determination, after notice and opportunity for public hearing, by the Administrator that such adjustment is necessary to take into account unique terrain or meteorological characteristics of an area potentially affected by emissions from a source applying for a permit required under this part.

---

App. 23

42 U.S.C. § 7476

§ 7476. Other pollutants

(a) Hydrocarbons, carbon monoxide, photochemical oxidants, and nitrogen oxides

In the case of the pollutants hydrocarbons, carbon monoxide, photochemical oxidants, and nitrogen oxides, the Administrator shall conduct a study and not later than two years after August 7, 1977, promulgate regulations to prevent the significant deterioration of air quality which would result from the emissions of such pollutants. In the case of pollutants for which national ambient air quality standards are promulgated after August 7, 1977, he shall promulgate such regulations not more than 2 years after the date of promulgation of such standards.

(b) Effective date of regulations

Regulations referred to in subsection (a) of this section shall become effective one year after the date of promulgation. Within 21 months after such date of promulgation such plan revision shall be submitted to the Administrator who shall approve or disapprove the plan within 25 months after such date or promulgation in the same manner as required under section 7410 of this title.

(c) Contents of regulations

Such regulations shall provide specific numerical measures against which permit applications may be evaluated, a framework for stimulating improved

App. 24

control technology, protection of air quality values, and fulfill the goals and purposes set forth in section 7401 and section 7470 of this title.

(d) Specific measures to fulfill goals and purposes

The regulations of the Administrator under subsection (a) of this section shall provide specific measures at least as effective as the increments established in section 7473 of this title to fulfill such goals and purposes, and may contain air quality increments, emission density requirements, or other measures.

(e) Area classification plan not required

With respect to any air pollutant for which a national ambient air quality standard is established other than sulfur oxides or particulate matter, an area classification plan shall not be required under this section if the implementation plan adopted by the State and submitted for the Administrator's approval or promulgated by the Administrator under section 7410(c) of this title contains other provisions which when considered as a whole, the Administrator finds will carry out the purposes in section 7470 of this title at least as effectively as an area classification plan for such pollutant. Such other provisions referred to in the preceding sentence need not require the establishment of maximum allowable increases with respect to such pollutant for any area to which this section applies.

App. 25

(f) PM-10 increments

The Administrator is authorized to substitute, for the maximum allowable increases in particulate matter specified in section 7473(b) of this title and section 7475(d)(2)(C)(iv) of this title, maximum allowable increases in particulate matter with an aerodynamic diameter smaller than or equal to 10 micrometers. Such substituted maximum allowable increases shall be of equal stringency in effect as those specified in the provisions for which they are substituted. Until the Administrator promulgates regulations under the authority of this subsection, the current maximum allowable increases in concentrations of particulate matter shall remain in effect.

---

App. 26

42 U.S.C. § 7479

§ 7479. Definitions

For purposes of this part –

(1) The term “major emitting facility” means any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant from the following types of stationary sources: fossil-fuel fired steam electric plants of more than two hundred and fifty million British thermal units per hour heat input, coal cleaning plants (thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants, primary copper smelters, municipal incinerators capable of charging more than fifty tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production facilities, chemical process plants, fossil-fuel boilers of more than two hundred and fifty million British thermal units per hour heat input, petroleum storage and transfer facilities with a capacity exceeding three hundred thousand barrels, taconite ore processing facilities, glass fiber processing plants, charcoal production facilities. Such term also includes any other source with the potential to emit two hundred and fifty tons per year or more of any air pollutant. This term shall not include

## App. 27

new or modified facilities which are nonprofit health or education institutions which have been exempted by the State.

**(2)(A)** The term “commenced” as applied to construction of a major emitting facility means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has (i) begun, or caused to begin, a continuous program of physical on-site construction of the facility or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed within a reasonable time.

**(B)** The term “necessary preconstruction approvals or permits” means those permits or approvals, required by the permitting authority as a precondition to undertaking any activity under clauses (i) or (ii) of subparagraph (A) of this paragraph.

**(C)** The term “construction” when used in connection with any source or facility, includes the modification (as defined in section 7411(a) of this title) of any source or facility.

**(3)** The term “best available control technology” means an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation under this chapter emitted from or which results from any major emitting facility, which the permitting authority, on a case-by-case

## App. 28

basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each such pollutant. In no event shall application of "best available control technology" result in emissions of any pollutants which will exceed the emissions allowed by any applicable standard established pursuant to section 7411 or 7412 of this title. Emissions from any source utilizing clean fuels, or any other means, to comply with this paragraph shall not be allowed to increase above levels that would have been required under this paragraph as it existed prior to November 15, 1990.

(4) The term "baseline concentration" means, with respect to a pollutant, the ambient concentration levels which exist at the time of the first application for a permit in an area subject to this part, based on air quality data available in the Environmental Protection Agency or a State air pollution control agency and on such monitoring data as the permit applicant is required to submit. Such ambient concentration levels shall take into account all projected emissions in, or which may affect, such area from any major emitting facility on which construction commenced prior to January 6, 1975, but which has not begun operation by the date of the baseline air quality concentration determination. Emissions of sulfur oxides and particulate matter from any major emitting facility on which construction

App. 29

commenced after January 6, 1975, shall not be included in the baseline and shall be counted against the maximum allowable increases in pollutant concentrations established under this part.

---

App. 30

42 U.S.C. § 7602. Definitions

§ 7602. Definitions

(j) Except as otherwise expressly provided, the terms “major stationary source” and “major emitting facility” mean any stationary facility or source of air pollutants which directly emits, or has the potential to emit, one hundred tons per year or more of any air pollutant (including any major emitting facility or source of fugitive emissions of any such pollutant, as determined by rule by the Administrator).

INCR Members Receive Strong Scores on New AODP Climate Index

The Asset Owners Disclosure Project's second Global Climate Investment Index, rates how the world's biggest institutional investors are managing growing financial risks to their investments posed by climate change. INCR members including CalPERS, CalSTRS, the New York State Comptroller's Office and the AFL-CIO all received high ratings, with CalPERS being ranked among the world's top 5 pension funds on climate disclosure and related investment practices.

INCR Policy Working Group Call

Tuesday, December 17  
1:00 - 2:00 pm ET

Join this month's INCR Policy working group call to hear from guest speakers, Ceres staff and investor peers. The discussion will focus on upcoming engagements, investor opportunities and new regulations. To register and learn more, contact Brandon Smithwood, Senior Manager, Policy Program.

INCR Sustainable Stock Exchanges Working Group Call

Thursday, December 19

12:00 - 1:00 pm ET

INCR Sustainable Stock Exchanges Working Group Call - The SSE Working Group will review major plans for 2014, including the public launch of the INCR Listing Standards Proposal, creation of the SSE Progress database, planning for a global IOSCO sign-on letter, updates on shareholder resolutions filed with exchanges, and potential partnerships for communications to investors. Register here. For more information, contact Tracey Rembert , Senior Manager, Investor Programs.

The INCR Bulletin will be taking a break for the holidays. We'll be back January 6, 2014. We hope you all have a happy holiday season!  
Integrated Reporting Framework Launched

IRLogoThe International Integrated Reporting Council (IIRC) has generated substantial financial press with the launch of the much-awaited <IR> Framework . The Framework is the Integrated Reporting guidance document for investors, companies, and others, and follows a three-month consultation period that began in April 2013. It is also the culmination of several reports put out by the IIRC seeking investor and corporate views on the concepts and principles of integrated reporting.

INCR's Integrated Reporting Working Group hosted a webinar discussion on the new Framework on its launch day, December 9th-the first post-launch event to discuss the new <IR> guidance. Guest speaker Ricky Cronin, who serves as North American Relationship Manager for the IIRC and previously at KPMG, walked investors through the final framework, highlighting the following topics:

- \*Key differences between the consultation document and the final framework
- \*Areas where companies and investors raised concerns during the consultation
- \*The journey in getting to the framework, and who was involved in reviewing comments
- \*The Emerging <IR> Database
- \*Technical and legal issues that arose during the consultation and final drafting
- \*Controversies over using the term "materiality" in the Framework
- \*The road ahead in 2014 and rollout plan

Listen to the IR Working Group webinar.

View the presentation slides.

Read or download the <IR> Framework.

For information on INCR's quarterly Integrated Reporting Working Group, contact Tracey Rembert, Senior Manager of Investor Engagement or call 617-247-0700 x106.

#### INCR Members Push State RPS Programs and Renewable Energy Policy

Driven in part by the American Legislative Exchange Council, a number of states are considering legislation to repeal or weaken state renewable energy standards. These standards are critical policies that drive renewable energy deployment and scale clean energy for broad capital market investment. These State RPS Programs and standards generate 1/3 of the demand for new renewable energy in the United States and, as the Ceres report Power Forward indicates, they facilitate corporate adoption of renewable energy. To date, all of the efforts to roll back these standards have failed, in part due to effective investor advocacy on the value of RPS'.

INCR members have been critical in pushing forward key climate and renewable energy policies. Read about member engagements and op-eds related to Ohio's renewable energy and efficiency legislation below:

- \*Wind Makes a Powerful Investment, by Jeff Perkins of Friends Fiduciary
- \*Stu Dalheim of Calvert Investments made the business case for Ohio renewable energy policies at the

Ohio Statehouse

\*Campbell's Soup came out in opposition to the bill following engagement by Tim Smith and Aaron Ziulkowski of Walden Asset Management

INCR members interested in learning more about renewable energy legislation and to join the INCR Policy Working Group call next Tuesday December 17th from 1-2:00 pm ET, contact Brandon Smithwood, Senior Manager, Policy Program.

Ceres is an advocate for sustainability leadership that mobilizes a powerful network of investors, companies and public interest groups to build a sustainable global economy. **TABLE OF CONTENTS**

TABLE OF AUTHORITIES..... ii

INTERESTS OF *AMICI CURIAE*.....1

BACKGROUND .....6

ARGUMENT

EPA REPEATEDLY IGNORED A PERMISSIBLE INTERPRETATION OF THE CLEAN AIR ACT AND INSTEAD RELIED ON TOOLS OF LAST RESORT TO IMPROPERLY REWRITE CLEAR STATUTORY TEXT .....13

A. The Agency Cannot Use Tools of Last Resort in the Face of Permissible Interpretations of the Clean Air Act .....16

B. A Pollutant-Specific Interpretation of the Triggering Provision of the PSD Program is a Permissible Interpretation of the Clean Air Act that Avoids the Absurd Results Claimed by EPA.....19

C. The Agency’s Decision to Rewrite Perfectly Clear Statutory Provisions Constitutes an Impermissible Consolidation of Legislative and Executive Functions, Warranting Instead Application of the Canon of Constitutional Avoidance .....24

CONCLUSION .....27

ADDENDUM A – Table: Effects of the Interpretation of the Permitting Trigger on Annual PSD Permitting.....28

### INTERESTS OF *AMICI CURIAE*

The *amici curiae* are three trade associations that represent a variety of petroleum, manufacturing, and business interests throughout the State of Texas. The Texas Oil & Gas Association (TXOGA) is the oldest and largest petroleum trade association in the State of Texas; it represents approximately 5,000 members who, collectively, account for more than 90 percent of all crude oil and natural gas produced in Texas, operate nearly all of the State's refining capacity, and are responsible for the vast majority of the State's pipelines. The Texas Association of Business is a trade association with an over 85-year history of representing Texas businesses large and small. And the Texas Association of Manufacturers is a trade association representing over 450 large and small manufacturing companies located throughout the State of Texas. The *amici* have a substantial interest in the question presented herein, which relates to the proper regulation of Greenhouse Gas (GHG) emissions by stationary sources under the Clean Air Act.<sup>1</sup>

There are actually two issues fairly encompassed within the question on which this Court granted *certiorari*.<sup>2</sup> The first issue, addressed by a number of

---

<sup>1</sup> Counsel for all parties have consented to the filing of this brief, and those consents are on file with the Clerk of the Court. No counsel for a party in this case authored this brief in whole or in part. No person or entity—other than *amici*, their members, or their counsel—made a monetary contribution specifically for the preparation or submission of this brief.

<sup>2</sup> The Court granted *certiorari* to resolve the following question: “Whether EPA permissibly determined that its regulation

the Petitioners, including the Utility Air Regulatory Group (No. 12-1146), relates to whether GHG emissions qualify as “air pollutants” under Title I of the Clean Air Act, such that they may be regulated under Title I’s permitting programs. The second issue, address by Petitioners American Chemistry Council, *et al.* (No. 12-1248), concerns whether, if GHG emissions do qualify as “air pollutants” under Title I, GHG emissions from a stationary source trigger those permitting requirements.

*Amici* submit this brief in support of the Petitioners; they do so focusing exclusively on the second issue—specifically, whether GHG emissions from a stationary source trigger permitting requirements under Title I’s Prevention of Significant Deterioration (PSD) Program.<sup>3</sup>

The Environmental Protection Agency sought to resolve the issue of PSD applicability through a series of rulemakings that culminated in the so-called

---

of greenhouse gas emissions from new motor vehicles triggered permitting requirements under the Clean Air Act for stationary sources that emit greenhouse gases.”

<sup>3</sup> The Clean Air Act imposes separate permitting obligations on certain stationary sources under Title V of the Act. *See* 42 U.S.C. §§ 7661–7661c. That said, Title V “does not impose substantive new requirements.” 40 C.F.R. § 70.1(b). Rather, it mandates that a source certify compliance with other requirements under the Act, including the PSD Program. *See, e.g.*, 42 U.S.C. § 7661a(a). Although this brief does not specifically address Title V, the scope of eligibility for permitting under the PSD Program would affect a stationary source’s derivative obligations under Title V.

Tailoring Rule. But there was nothing routine about this administrative action. Through the Tailoring Rule, EPA invoked *tools of last resort* to rewrite perfectly clear portions of the Clean Air Act—*i.e.*, explicit numerical permitting thresholds of 100 and 250 tons per year. In this circumstance, the Agency cannot claim that it is owed deference; it instead bears the burden of demonstrating that there were *no other permissible interpretations* available to it before rewriting the Act. In other words, if there is at least one other permissible interpretation that would avoid the absurdities claimed by EPA, the Agency was *compelled to adopt such an interpretation* rather than rewrite the Act. EPA cannot meet this burden.

As *amici* explain more fully below, EPA was presented with numerous opportunities to adopt a permissible interpretation of the Clean Air Act—one that would have avoided the absurd results identified by the Agency, but without rewriting perfectly clear provisions of the Act. This alternative interpretation turns on the *pollutant-specific nature* of the PSD Program—a program that was designed to ensure that *specific areas* of the country would remain in attainment with national ambient air quality standards (NAAQS) for *specific, criteria pollutants*—currently, ozone, sulfur dioxide, particulate matter, nitrogen oxides, carbon monoxide, and lead, *but not GHGs*. See 40 C.F.R. §§ 50.1–50.12. Under a pollutant-specific interpretation of the PSD Program, a stationary source is required to get a PSD permit if it is in a *location* attaining a NAAQS for a criteria pollutant, and it will emit threshold quantities (100/250 tons per year) of *that criteria pollutant*.

Consistent with congressional intent, under this interpretation, EPA would continue to issue several hundred PSD permits each year. *See* Addendum A, *infra*, at 28. And under this interpretation, a stationary source that satisfies the pollutant-specific triggering requirement would have to install “best available control technology [(BACT)] for each pollutant subject to regulation under” the Act, 42 U.S.C. § 7475(a)(4). Thus, although a pollutant-specific approach would limit the number of stationary sources that are covered by the PSD Program, as intended by Congress, a source that is covered by the PSD Program might still have to install BACT for GHG emissions.

Rather than give meaning to the targeted nature of the PSD Program, EPA chose in 1980 to adopt an interpretation that would require a stationary source to apply for a PSD permit any time it emitted threshold quantities of *any* air pollutant subject to regulation anywhere under the Act, as long as the source is located in an area attaining a NAAQS for *any* pollutant, even if that source does not emit that criteria pollutant at all. For many years the absurdity inherent in EPA’s approach lay dormant, but when the Agency first applied it to GHG emissions, the fallacy of this approach became patently obvious. Whereas Congress only intended for the Agency to issue *several hundred* PSD permits each year, the Agency’s interpretation would mean that *tens of thousands* of sources of GHG emissions would have to apply for a permit every year, including small and nonindustrial sources like schools, hospitals, and apartment buildings.

The revelation of such an absurdity should have caused EPA to reevaluate its underlying interpretation of the PSD Program, but instead, it used the occasion to “tailor” perfectly clear provisions of the Clean Air Act. The upshot of EPA’s approach is that it gets to select for itself which sources of GHG emissions are required to apply for permits under the Act, in direct contravention of the numerical thresholds mandated by Congress. And EPA has assumed for itself the authority to modify this approach, going forward, in its *unbounded discretion*.

EPA’s choices can be analogized to the questions that face a traveler during a long journey. Many years ago, EPA set about to traverse the interpretative path that is the Clean Air Act. In 1980, it came to a fork in the road. From where it stood, there appeared to be two equally viable options. And as with any binary choice, the Agency was forced to select between those two options and move forward. Unfortunately, after nearly 30 years down its chosen path, EPA came to learn that it had reached an interpretative dead end; the path that it selected placed it at the precipice of absurdity. And yet, rather than return to the fork and then head down the path that would have avoided this absurdity, the Agency did the one thing it could not do; it rewrote the Clean Air Act to avoid an absurdity that was a product of its own making.

Such a misappropriation of legislative authority is unprecedented. The supporting judgment of the court of appeals should be reversed.

## BACKGROUND

1. Title I of the Clean Air Act regulates emissions of air pollutants from certain stationary sources. *See* 42 U.S.C. §§ 7401–7515.

Among the programs established under Title I, Part A establishes national ambient air quality standards (NAAQS) for criteria pollutants—pollutants whose presence in the ambient air pose particular risks for public health and welfare. *See id.* § 7408(a). There are currently a very limited number of criteria pollutants: ozone, sulfur dioxide, particulate matter, nitrogen oxides, carbon monoxide, and lead. *See* 40 C.F.R. §§ 50.1–50.12. Under Section 109 of the Act, EPA must promulgate a NAAQS that sets safe levels for each criteria pollutant. *See* 42 U.S.C. § 7409. And under Section 107, EPA must designate areas of the country as either in attainment or in nonattainment with each NAAQS. *See id.* § 7407(d).

Importantly, area designations are NAAQS-specific and, therefore, “pollutant-specific” as well. *E.g., Alabama Power Co. v. Costle*, 636 F.2d 323, 350 (D.C. Cir. 1980); *see also* 42 U.S.C. § 7407(d). Thus, a single geographic area may be in attainment with one NAAQS while in nonattainment with another.

One of the goals of Title I was to help ensure that each area of the country is in attainment with each NAAQS. Among its means of achieving that goal, Congress established two complementary permitting programs: one for areas in nonattainment, and a second for areas in attainment with each NAAQS. Both permitting programs are run principally by the

States through implementation programs. *See* 42 U.S.C. § 7410(a)(2)(C).

For areas in nonattainment, Congress established the Nonattainment New Source Review (NNSR) Program in Part D of Title I of the Act. To help these areas achieve attainment, Congress required certain stationary sources in those areas to obtain NNSR permits that impose the “lowest achievable emissions rate” to control emissions of the criteria pollutant whose NAAQS the area is not attaining. *See id.* §§ 7501(3), 7502.

The other permitting program, the PSD Program of Part C of Title I, was enacted to ensure that areas in attainment would remain so. *See Alabama Power*, 636 F.2d at 349; *see also* 42 U.S.C. § 7470; S. REP. NO. 95-127, at 29 (1977) (stating that the PSD Program was designed to “protect national ambient air quality standards”). The first substantive provision of the PSD Program, Section 161 of the Act, links the program to attainment areas. It requires State or federal implementation plans to “contain emission limitations and such other measures as may be necessary . . . to prevent significant deterioration of air quality in each region (or portion thereof) designated . . . as attainment” pursuant to Section 107. 42 U.S.C. § 7471.

The principal means by which the PSD Program helps to achieve continued attainment with each NAAQS is a preconstruction permitting regime. Section 165 of the Act requires a permit before construction begins on any “major emitting facility . . . in any area to which this part applies.” *Id.* § 7475(a).

Securing and satisfying a PSD permit are demanding obligations. To get one, a facility must demonstrate, among other things, that its emissions will not cause air quality to exceed any NAAQS—which is to say, a facility must demonstrate that its emissions will not cause an attainment area to become a nonattainment area for any criteria pollutant. *See id.* § 7475(a)(3). In addition, after a PSD permit is issued, a facility must install “best available control technology for each pollutant subject to regulation under” the Act, which may include both criteria and non-criteria pollutants. *Id.* § 7475(a)(4); *see also id.* § 7479(3) (defining “best available control technology”).

All parties agree that Congress only intended for the PSD Program to apply to “facilities which, due to their size, are financially able to bear the substantial regulatory costs imposed by the PSD provisions and which, as a group, are primarily responsible for” air pollution. *Alabama Power*, 636 F.2d at 353. In addition, Congress recognized that “[t]he numbers of sources that meet these criteria . . . are reasonably in line with EPA’s administrative capability.” *Id.* at 354.

Thus, given the burdens of applying for, then implementing, PSD permits, the threshold question is which sources need them. A “major emitting facility” potentially subject to PSD permitting is defined as one with “major” emissions—more than 100 or 250 tons per year—of “any air pollutant.” 42 U.S.C. § 7479(1). But not all major emitting facilities need PSD permits. Under the PSD Program’s triggering provision, Section 165(a), only those “in any area to

which this part applies” need obtain one. *Id.* § 7475(a).

2. At issue here are two potential interpretations of the PSD Program’s triggering provision.

In interpreting the PSD Program’s statutory trigger, EPA has long placed controlling weight on the phrase “major emitting facility.” Ignoring the pollutant-specific nature of the PSD Program, along with the statutory phrase “in any area to which this part applies,” EPA has insisted that any stationary source that exceeds the 100- or 250-tons-per-year thresholds for *any* air pollutant subject to regulation *anywhere* under the Act must obtain a PSD permit. *E.g.*, EPA, *Requirements for Preparation, Adoption, and Submittal of Implementation Plans; Approval and Promulgation of Implementation Plans; Final Rule*, 45 Fed. Reg. 52,676, 52,711 (Aug. 7, 1980).

But there is another way to read the PSD Program’s statutory trigger. Under this alternative interpretation, a major emitting facility is required to obtain a PSD permit only if it is *located* in an area attaining the NAAQS for a criteria pollutant, and it will emit threshold quantities of *that criteria pollutant*. Simply put, the PSD Program can (and should) be read to impose a pollutant-specific, situs requirement.

EPA’s interpretative choice—a pollutant-indifferent approach—posed no problem for many years. That is, even under EPA’s approach, the Agency only issued several hundred PSD permits each year. EPA, *Prevention of Significant Deterioration*

*tion and Title V Greenhouse Gas Tailoring Rule; Final Rule*, 75 Fed. Reg. 31,514, 31,537 (June 3, 2010).

But this all changed when EPA promulgated the so-called Tailpipe Rule, which regulated GHG emissions under Title II of the Act in response to this Court's decision in *Massachusetts v. EPA*, 549 U.S. 497 (2007). See EPA, *Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule*, 75 Fed. Reg. 25,324 (May 7, 2010). Because GHG emissions were now a regulated pollutant somewhere under the Act, EPA claimed that it was required to issue permits to stationary sources that exceeded the 100- or 250-tons-per-year thresholds established in the definition of a "major emitting facility" located within the PSD Program. See Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,516. By so doing, EPA estimated that it would now field *more than 82,000* PSD permit applications each year, covering many sources that, heretofore, had never been subject to regulation under the Act. *Id.* at 31,538. Moreover, EPA acknowledged that the review of this crushing number of applications would exceed its administrative capability and could lead to delays in issuing permits of "a decade or longer." *Id.* at 31,557.

EPA freely admitted that such an explosion of PSD permits would be "inconsistent with Congress's expressed intent," but it claimed that such an outcome was compelled by a "literal application" of the Clean Air Act. EPA, *Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule; Proposed Rules*, 74 Fed. Reg. 55,292, 55,304 (Oct. 27, 2009). Indeed, EPA claimed that it was precluded

from reconsidering its underlying interpretation of the PSD Program's triggering provision. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,517 (claiming that, "under *Chevron* Step 1," the Agency could not reconsider the scope of the PSD permitting program).

To remedy the absurdity imbued in its interpretation, EPA promulgated a rulemaking, the so-called Tailoring Rule, which invoked administrative tools of last resort—the "absurd results," "administrative necessity," and "one-step-at-a-time" doctrines—to rewrite and delay the application of the PSD Program's otherwise clear 100- and 250-tons-per-year thresholds. *Id.* at 31,516. EPA proposed to reduce the number of PSD permits that the Tailpipe Rule would require by "tailoring" the emissions thresholds for stationary sources of GHG emissions, raising them far, far above the statutory thresholds set out in the definition of a "major emitting facility." *See id.* at 31,560.

Commenters in this and related rulemakings, including Petitioners American Chemistry Council, *et al.* (No. 12-1248), proposed that EPA adopt the narrower, pollutant-specific interpretation of the PSD permitting trigger, which would avoid the absurdities upon which EPA relied to justify changing the statutory thresholds.<sup>4</sup> Indeed, because GHG emissions are not criteria pollutants, no area of the country is designated as in attainment with such a NAAQS. Thus, under this narrower interpretation, no newly constructed source with major emissions of only GHGs would have to obtain a PSD permit, and no existing major source undertaking a modification

---

<sup>4</sup> *See infra* note 6 (citing comments to related rulemakings).

would have to get a PSD permit solely because of its increased GHG emissions.

But EPA rejected these proposals, reaffirmed its interpretation of the PSD permitting trigger, and settled on 100,000 tons per year as the new, GHG-specific threshold. *Id.* at 31,560–62. Even under these super-elevated thresholds, EPA still expects the new number of annual PSD permit applications to surpass the old. *See id.* at 31,536–41; *see also* Addendum A, *infra*, at 28.

The Tailoring Rule was implemented in two phases—with more promised. During the first phase, which lasted until June 30, 2011, no construction of a major source required a PSD permit solely because of GHG emissions. *See id.* at 31,516. That said, during this phase, the PSD Program still regulated GHG emissions insofar as sources that were required to get a PSD permit were required to adopt BACT for GHG emissions. During the second phase of the Tailoring Rule, which took effect on July 1, 2011, the new GHG-specific thresholds kicked in. EPA has stated that it will propose additional phases for the Tailoring Rule in order to expand PSD permitting to “smaller sources.” *Id.* at 31,566. All the same, the Agency stated that, in addressing “permitting requirements for smaller sources,” it will “tak[e] into account . . . problems concerning costs to sources and burdens to permitting authorities.” *Id.* Thus, it is possible that in applying this cost-benefit approach, EPA may never get around to fully implementing its interpretation of the PSD Program to sources of GHG emissions that would otherwise satisfy the 100- and 250-tons-per-year thresholds.

**ARGUMENT****EPA REPEATEDLY IGNORED A PERMISSIBLE INTERPRETATION OF THE CLEAN AIR ACT AND INSTEAD RELIED ON TOOLS OF LAST RESORT TO IMPROPERLY REWRITE CLEAR STATUTORY TEXT.**

EPA squandered numerous opportunities to adopt a permissible interpretation of the Clean Air Act—one that would have avoided the absurd results that EPA claimed as a justification for rewriting perfectly clear provisions of the Act. Back in 2009, the pollutant-specific approach was raised and discussed by stakeholders at the very first meeting of the Climate Change Work Group of the EPA Clean Air Act Advisory Committee (CAAAC).<sup>5</sup> The pollutant-specific approach was discussed further with the Agency and the Work Group, formally presented in a *White Paper*, and raised in a series of public comments to the Agency, including in comments to the rulemaking at issue here.<sup>6</sup>

---

<sup>5</sup> See Permits, New Source Review and Toxics Subcomm. of CAAAC, *Interim Phase I Report of the Climate Change Work Group* 3–4 (Feb. 3, 2010) (available at [http://www.epa.gov/oar/caaac/climate/2010\\_02\\_InterimPhaseIReport.pdf](http://www.epa.gov/oar/caaac/climate/2010_02_InterimPhaseIReport.pdf)).

<sup>6</sup> See Charles H. Knauss, *White Paper for EPA Climate Change Workgroup: Scope of the PSD Problem to Be Addressed: Why There Is No Automatic PSD Trigger or “NAPT” Simply Because GHGs Become Regulated Under the Clean Air Act* (Jan. 8, 2010, rev. Feb. 8, 2010), reprinted in Joint App’x at 1495–1502, *Am. Chem. Council v. EPA*, No. 10-1167 (D.C. Cir. filed July 29, 2010) (Nat’l Ass’n of Mfrs., et al., *Petition to Reconsider, Rescind, and/or Revise EPA’s Prevention of Significant Deterioration Regulation* (July 6, 2010) (available at

Instead, EPA rejected the ideas of its own advisory committee and chose to invoke the “absurd results,” “administrative necessity,” and “one-step-at-a-time” doctrines to rewrite and delay the application of the PSD Program’s otherwise clear 100- and 250-tons-per-year thresholds. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,516. And yet, the Agency was too quick to invoke these administrative tools.

The doctrines on which EPA relies are truly tools of last resort. As this Court recently reaffirmed in a related context, instead of “reading new words into [a] statute” to avoid absurd results, the statute should be interpreted so that “no absurdity arises in the first place.” *Kloeckner v. Solis*, 133 S. Ct. 596, 606–07 (2012). Here, as in *Kloeckner*, it is EPA’s

Mfrs., *Comments on EPA’s Proposed Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule*, EPA-HQ-OAR-2009-0517-5083 (Dec. 28, 2009) (same); Air Permitting Forum, *Comments on the Proposed Rulemaking to Establish Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards (Motor Vehicle Rule)*, EPA-HQ-OAR-2009-0472-7253 (Nov. 27, 2009) (same); Air Permitting Forum, *Comments on the Proposed Prevention of Significant Deterioration (PSD): Reconsideration of Interpretation of Regulations That Determine Pollutants Covered by the Federal PSD Permit Program (PSD Interpretive Memorandum) (Proposed Reconsideration)*, EPA-HQ-OAR-2009-0597-0085 (Dec. 7, 2009) (same).

“own misreading that creates the need to ‘fix’” the PSD Program. *Id.* at 607.

A pollutant-specific interpretation of the PSD Program’s triggering provision avoids the absurdities claimed by EPA. As explained in detail below, under this alternative interpretation, EPA will continue to field only several hundred PSD permit applications each year. *See* Addendum A, *infra*, at 28.

In rejecting this approach, EPA adopted a heightened showing of congressional intent nowhere supported by *Chevron, U.S.A., Inc. v. NRDC*, 467 U.S. 837 (1984), or its progeny. According to EPA, a “literal reading” of the Act supported its pollutant-indifferent approach, and because it could find no “explicit statements in the legislative history that Congress intended to limit PSD applicability to sources of NAAQS pollutants,” the Agency was *precluded* from adopting the pollutant-specific approach. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,562. But this standard turns *Chevron* on its head. It allowed EPA to reject a *permissible* interpretation of the statute, and substitute for it an interpretation that required the Agency to rewrite perfectly clear statutory provisions, all because the Agency could not say for sure that the pollutant-specific approach was compelled. As this Court explained in a different context, “That the only cure [proposed by the Government] is worse than the disease suggests the Government is simply wrong.” *Moncrieffe v. Holder*, 133 S. Ct. 1678, 1692 (2013); *see also Chevron*, 467 U.S. at 843 (holding that, where a statute is ambiguous, an agency does not have license to rewrite the statute any way it might deem fit; it must adopt an

interpretation “based on a permissible construction of the statute”).

The end result of EPA’s approach is that it gets to select for itself which sources of GHG emissions are required to apply for permits under the Act. But the Clean Air Act does not grant EPA the authority to determine for itself which sources warrant regulation under the PSD Program; it includes very specific emissions thresholds that the Agency is powerless to rewrite.

**A. The Agency Cannot Use Tools of Last Resort in the Face of Permissible Interpretations of the Clean Air Act.**

EPA seemed to acknowledge the difficulties it would face in invoking administrative tools of last resort, but it never truly grappled with them. *See* Final Tailoring Rule, *supra*, at 75 Fed. Reg. at 31,542. For instance, while acknowledging that this Court has “held that the literal meaning of a statutory provision is not conclusive ‘in the rare cases [in which] the literal application of a statute will produce a result demonstrably at odds with the intentions of the drafters,’” *id.* (quoting *United States v. Ron Pair Enters.*, 489 U.S. 235, 242 (1989)), EPA went on to note that the doctrine is not really “rare” because it has been discussed in “legions of court decisions,” *id.* (quoting *In re Nofziger*, 925 F.2d 428, 434 (D.C. Cir. 1991)).

Yet, the true import of the “absurd results,” “administrative necessity,” and “one-step-at-a-time” doctrines is not the frequency with which these doctrines have been discussed by the courts; it is that

they are exceedingly difficult to invoke. In *Logan v. United States*, for example, this Court explained that statutory terms “may be interpreted against their literal meaning where the words ‘*could not conceivably have been intended to apply*’ to the case at hand.” 552 U.S. 23, 36 (2007) (emphasis added). EPA has all but admitted that it cannot satisfy that standard here.

Even if EPA’s pollutant-indifferent interpretation could be said to be supported by a “literal reading” of the Act, Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,562, the same can be said about a pollutant-specific approach. But, unlike EPA’s approach, the pollutant-specific approach does not produce absurd results. The Agency was required to consider the absurdity of its approach at *Chevron*’s first step. *See Chevron*, 467 U.S. at 843 n.9 (noting that an agency must “employ[] traditional tools of statutory construction,” which includes the absurdity canon, at *Chevron*’s first step). Instead, EPA ruled out a *permissible* interpretation of the PSD Program’s triggering provision—an interpretation that would not have worked an absurd result—*not* because it was contrary to congressional intent, but rather, because EPA could find no “explicit statements in the legislative history that” such an interpretation was *mandated* by Congress. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,562. That was error. *See Chevron*, 467 U.S. at 843 (holding that, even if a statute can be read to support more than one permissible interpretation, the agency must select a *reasonable* interpretation of the statute); *see also Alabama Power*, 636 F.2d at 359 (explaining that, under the related doctrine of administrative necessity, an agency may be

relieved of the obligation “to do an impossibility,” but the agency bears the “heavy burden” of demonstrating the existence of such an impossibility); *accord Sierra Club v. EPA*, 719 F.2d 436, 463 (D.C. Cir. 1983).<sup>7</sup>

The invocation of cases like *Holy Trinity Church v. United States*, 143 U.S. 457 (1892), should carry a stigma. See Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,542 & n.25. Before an agency may rewrite perfectly clear provisions in a statute, it should be required to demonstrate that *no other permissible alternative construction* was available to the agency that would have avoided the claimed absurdity. See *Kloeckner*, 133 S. Ct. at 606–07; see also *Griffin v. Oceanic Contractors, Inc.*, 458 U.S. 564, 575 (1982) (emphasizing that “interpretations of a statute which would produce absurd results are to be avoided if al-

---

<sup>7</sup> The EPA’s approach also fails the administrative “one-step-at-a-time” doctrine developed by the D.C. Circuit. Under that doctrine, an agency may achieve a statutory mandate in a “piecemeal fashion,” but it must work towards the goal of full compliance with that congressional mandate. *E.g.*, *Ctr. for Biological Diversity v. EPA*, 722 F.3d 401, 409–10 (D.C. Cir. 2013); see also *Grand Canyon Air Tour Coal. v. FAA*, 154 F.3d 455, 477 (D.C. Cir. 1998) (explaining that “it would be arbitrary and capricious for an agency simply to thumb its nose at Congress and say—without any explanation—that it simply does not intend to achieve a congressional goal on any timetable at all”). EPA has not met that burden here. By its own admission, the Agency has stated that, under its interpretation of the PSD Program’s triggering provision, it is not sure that it will ever achieve full compliance with the statutory thresholds. See Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,566 (stating that, in addressing “permitting requirements for smaller sources,” the Agency will “tak[e] into account . . . problems concerning costs to sources and burdens to permitting authorities”).

ternative interpretations consistent with the legislative purpose are available”). As demonstrated in the section that follows, EPA cannot make that showing here.

**B. A Pollutant-Specific Interpretation of the Triggering Provision of the PSD Program is a Permissible Interpretation of the Clean Air Act that Avoids the Absurd Results Claimed by EPA.**

EPA had before it a completely permissible interpretation of the PSD Program’s triggering provision that would have avoided the absurd results claimed by the Agency—a pollutant-specific approach. This approach not only maintains fidelity with the text and structure of the Act, but it also would continue to achieve Congress’s overarching goal in enacting the PSD Program—to help ensure continued attainment of NAAQS for criteria pollutants.

Under Section 165 of the Act, not all newly constructed or modified “major emitting facilit[ies]” are required to get a PSD permit; rather, a PSD permit is only required of a “major emitting facility . . . in any area to which this part applies.” 42 U.S.C. § 7475(a). A “major emitting facility” is one with major emissions—100 or 250 tons per year—of “any pollutant.” *Id.* § 7479(1). “[T]his part [Part C] applies” to an area only with respect to specific criteria pollutants for which the area is in attainment with a governing NAAQS, *see id.* § 7471. And a criteria pollutant includes ozone, sulfur dioxide, particulate matter, nitrogen oxides, carbon monoxide, and lead, *but not GHG emissions*, 40 C.F.R. §§ 50.1–50.12. Ignoring the import of these phrases in tandem, EPA has

placed exclusive emphasis on the definition of “major emitting facility,” construing the permitting obligations of the PSD Program to apply to any facility emitting major amounts of “*any* air pollutant subject to regulation” *anywhere* under the Act. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,562 (emphasis added). But there is another way to read these phrases in tandem: A stationary source is required to get a PSD permit if it is in a *location* attaining a NAAQS for a criteria pollutant, and it will emit threshold quantities (100/250 tons per year) of *that criteria pollutant*.

A pollutant-specific approach is fully consistent with the text of the PSD Program. Besides Section 165(a), Congress used the phrase “in any area to which this part applies” only three other times throughout the Clean Air Act, all in PSD Provisions: Section 163(b)(4), Section 165(a)(3)(A), and Section 165(c). *See* 42 U.S.C. §§ 7473(b)(4), 7475(a)(3)(A), 7475(c). Congress’s use of this phrase in Section 163(b)(4) is particularly instructive. There, Congress provided that “[t]he maximum allowable concentration of *any air pollutant in any area to which this part applies* shall not exceed a concentration for such pollutant for each period of exposure equal to” the lowest of the concentrations permitted under the “primary” or “secondary” NAAQS for that pollutant. *Id.* § 7473(b)(4) (emphasis added). In this context, “in any area to which this part applies” plainly modifies “any air pollutant,” and limits the meaning of that latter phrase to criteria pollutants. *Id.* In contrast, if the phrase “in any area to which this part applies” was pollutant indifferent, as EPA claims, then Section 163(b)(4) would apply to *non-criteria*

pollutants. Yet, EPA cannot set a “maximum allowable concentration” for such pollutants, because non-criteria pollutants have no primary or secondary NAAQS. Thus, the phrase “any area to which this part applies” should be read to impose a pollutant-specific approach throughout the PSD Program, including in that program’s triggering provision, Section 165(a). *See id.* § 7475(a).

A pollutant-specific approach also comports with the overall structure of Title I. Beyond the pollutant-specific nature of the NAAQS Program generally, the PSD Program was specifically designed to complement the NNSR Program. That latter program was intended to “ensur[e] attainment of the applicable national ambient air quality standard” for an area that is “designated ‘nonattainment’ with respect to [criteria] pollutant[s]” designated under Section 107. 42 U.S.C. § 7501(1), (2). It would make little sense if, in enacting these complementary programs, Congress provided that the trigger for the NNSR Program is pollutant-specific, but the trigger for the PSD Program is pollutant-indifferent.

And a pollutant-specific approach is fully consistent with the overarching purpose of the PSD Program as well. Congress designed the PSD Program to implement what its unabbreviated name provides—to “*prevent significant deterioration* of air quality in each region . . . designated pursuant to [Section 107] as attainment,” 42 U.S.C. § 7471 (emphasis added)—and to complement and reinforce the pollutant-specific NAAQS Program, *see* S. REP. NO. 95-127, at 29 (1977) (stating that the PSD Program was designed to “protect national ambient air quality

standards”). Indeed, one of the basic requirements for obtaining a PSD permit is for a qualifying facility to demonstrate that it will not cause an attainment area to become a nonattainment area for any NAAQS. *See* 42 U.S.C. § 7475(a)(3).

Critically, the pollutant-specific approach avoids the immediate absurdities claimed by EPA. Under such an approach, “not a single additional PSD permit would be required.” Charles H. Knauss & Shannon S. Broome, *EPA’s Missed Opportunity to Ground Its GHG Tailoring Rule in the Statute: What the Situs Argument Would Mean for the Future of the PSD Program*, 42 ENVTL. L. REP. 10,424, 10,430 (May 2012) (available at <http://elr.info/sites/default/files/docs/42.ELR.10424.pdf>). As the table reprinted in an addendum to this brief depicts, unlike EPA’s interpretation of the PSD Program’s triggering provision, which would require EPA to issue an estimated 82,173 permits each year, a pollutant-specific approach would maintain the status quo at 688 permits annually. *See* Addendum A, *infra*, at 28.

Moreover, because a stationary source that satisfies the pollutant-specific requirements discussed above would still have to install “best available control technology for each pollutant subject to regulation under” the Act, 42 U.S.C. § 7475(a)(4), a covered facility may have to install BACT for GHG emissions even under a pollutant-specific approach. Thus, a pollutant-specific approach would sensibly limit the number of stationary sources that are covered by the PSD Program—without doing violence to the program as a whole.

EPA did not refute any of these observations. Instead, beyond claiming that it was required to find that a pollutant-specific approach was *compelled* by the “legislative history” of the Clean Air Act Amendments of 1977, *see* Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,562, EPA argued that, because Section 165(a)(4) requires a PSD permit holder to adopt BACT for “each pollutant subject to regulation” under the Act, Congress intended for the PSD *triggering provision* to be pollutant indifferent as well, *id.* at 31,561. But EPA puts the cart before the horse. There is no logical reason why the PSD Program’s permitting trigger must be coextensive with the substantive requirements of that program. Indeed, Congress adopted just such a non-coextensive approach under Section 112 of the Act. There, Congress determined that only “major sources”—those that may emit at least 10 tons per year of a hazardous air pollutant—would be subject to stringent “maximum achievable control technology” (MACT) standards, but once a source so qualifies, it is subject to MACT for all hazardous air pollutants, including pollutants for which it is not capable of emitting above the 10-ton threshold. *See* 42 U.S.C. § 7412.

In addition, EPA’s approach renders superfluous Congress’s inclusion of the phrase “in any area to which this part applies.” Even before EPA adopted its overly-broad definition of the PSD Program’s triggering provision, *every area of the country had been—and continues to be—in attainment with at least one NAAQS*. *See, e.g.*, Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,561. If EPA’s broad interpretation of the trigger is the only permissible one, then Congress could have simply omitted the phrase “in any area to

which this part applies.” EPA’s chosen path therefore violates the canon that superfluity—*i.e.*, “an interpretation of a congressional enactment which renders superfluous another portion of that same law”—should be avoided. *E.g.*, *Mackey v. Lanier Collection Agency & Serv., Inc.*, 486 U.S. 825, 837 (1988).

Regardless of whether a pollutant-specific approach is compelled by the text, structure, and purpose of Title I of the Clean Air Act, it is plainly a permissible approach. As a result, EPA was not free to reject it over an approach that required the Agency to rewrite other provisions of the Act.

**C. The Agency’s Decision to Rewrite Perfectly Clear Statutory Provisions Constitutes an Impermissible Consolidation of Legislative and Executive Functions, Warranting Instead Application of the Canon of Constitutional Avoidance.**

An absurdity of the magnitude claimed by EPA—the expansion of PSD permitting from 688 to an estimated 82,173 sources annually—should have caused the Agency to reevaluate its underlying interpretation of the PSD Program. Indeed, the Agency itself recognized that the results of its interpretation were “so contrary to what Congress had in mind—and [would] in fact so undermine[] what Congress attempted to accomplish with the PSD requirements”—that they were appropriately characterized as “absurd.” Proposed Tailoring Rule, *supra*, 74 Fed. Reg. at 55,310.

And yet, faced with an absurdity of its own making, the Agency instead arrogated for itself the au-

thority to rewrite perfectly clear statutory text. It increased by over 400-fold the 100- and 250-tons-per-year thresholds, settling upon 75,000 and 100,000 tons per year. Final Tailoring Rule, *supra*, 75 Fed. Reg. at 31,516. And the Agency stated that, in addressing future “permitting requirements for smaller sources,” it would “tak[e] into account . . . problems concerning costs to sources and burdens to permitting authorities.” *Id.* at 31,566. Thus, the Agency claimed virtually unfettered discretion to make and implement legislative judgments about which sources should be subject to permitting for GHG emissions. Such a course is both unprecedented and unconstitutional.

To the Framers of our Constitution, separating the powers of government was a means to prevent a potentially deleterious end—the “accumulation of all powers, legislative, executive, and judicial, in the same hands.” FEDERALIST NO. 47, at 244 (G. Willis ed. 1982) (J. Madison). According to Thomas Jefferson: “The concentrati[on of these powers] in the same hands[] is precisely the definition of despotic government.” FEDERALIST NO. 48, at 252 (J. Madison quoting T. Jefferson). And James Madison—associating any such accumulation with “tyranny”—rejected any notion that our Constitution is “chargeable with the accumulation of power or with a mixture of powers having a dangerous tendency to such an accumulation.” FEDERALIST NO. 47, at 244.

These statements might appear hyperbolic to the modern American, but the Framers undoubtedly imbued our Constitution with structural safeguards that have continued vitality to this day. For in-

stance, this Court struck down the line-item veto as unconstitutional precisely because it gave to “the President the unilateral power to change the text of duly enacted statutes.” *Clinton v. City of New York*, 524 U.S. 417, 447 (1998). A similar outcome is warranted here.

The traditional canon of constitutional avoidance should have compelled EPA to adopt a narrower interpretation of the PSD Program’s triggering provision. Under this canon, “[i]f an otherwise acceptable construction of a statute would raise serious constitutional problems” (as does an agency’s decision to unilaterally rewrite clear statutory text), “and where an alternative interpretation of the statute is ‘fairly possible,’” the statute should be construed “to avoid such problems.” *INS v. St. Cyr*, 533 U.S. 289, 299–300 (2001). Here, EPA was faced with *more than* a “fairly possible” alternative interpretation, but instead elected to cling to an interpretation that not only produced absurd results, but also served as a justification for the Agency to rewrite the Clean Air Act and assume for itself the authority to decide which stationary sources are subject to permitting for GHG emissions.

Because EPA failed to apply the canon of constitutional avoidance, this “Court is obligated to” do so. *Id.* That canon places yet another thumb on the scale against the interpretation adopted by EPA.

\* \* \*

As Judge Kavanaugh remarked in his dissent from the denial of rehearing *en banc* in these cases: “When an agency is faced with two initially plausible

readings of a statutory term, but it turns out that one reading would cause absurd results, I am aware of no precedent that suggests the agency can still choose the absurd reading and then start rewriting other perfectly clear portions of the statute to try to make it all work out.” J.A. 174. Settled principles of administrative and constitutional law counsel against providing EPA with such a precedent here.

### CONCLUSION

The judgment of the court of appeals should be reversed.

Respectfully submitted.

A.G. SCHNEIDERMAN & COALITION STATES: CLEAN AIR ACT MANDATES FEDERAL ACTION TO CUT CLIMATE-CHANGE POLLUTION FROM POWER PLANTS

Existing Fossil-Fuel Power Plants Are The Single Largest Source Of Climate-Change Pollution; Opponents Of Action Grasping At Legal Straws To Forestall Common-Sense Pollution Controls

Schneiderman: EPA Needs To Take Prompt Action Required By Law To Limit Pollution From Power Plants And Must Afford States Flexibility In Implementation

NEW YORK - In comments submitted today to the federal Environmental Protection Agency, Attorney General Eric T. Schneiderman and a coalition of attorneys general from 11 other states and the District of Columbia argue that, in order to substantially reduce dangerous climate-change pollution from existing fossil-fuel power plants, the agency must both set strong emission limits and give states flexibility on how they choose to meet those limits.

The comments lay out the legal requirements for the EPA to take action against climate-change pollution under the federal Clean Air Act. They are a rebuttal to claims by those who oppose cutting

climate-change pollution from existing power plants, and who wrongly argue that the Clean Air Act bars the EPA from moving forward with planned regulations.

“Climate change represents the greatest environmental threat of our time, posing the risk of catastrophic harm to the health and safety of all New Yorkers and to our economy,” Attorney General Schneiderman said. “Despite the real and present danger of unabated climate-change pollution, opponents continue to grasp at legal straws to forestall common-sense controls on its single largest source -- existing fossil-fuel power plants. As our coalition makes plain, opponents of EPA action are wrong on the law. The Clean Air Act is clear in requiring that EPA set strong limits on climate-change pollution emissions from existing power plants and in giving states the flexibility they need to best meet them.”

In 2007, the U.S. Supreme Court ruled in *Massachusetts v. EPA* that greenhouse gases that contribute to climate change are covered by the Act's definition of air pollutants. The court further ruled that EPA must determine whether these gases cause or contribute to air pollution that may endanger public health or welfare. Subsequently, EPA determined that greenhouse gases endanger the health and welfare of Americans. In October of this year, the Supreme Court refused to reconsider a lower court decision that affirmed this “endangerment” determination.

The coalition's comments detail EPA's legal obligation under the Act to regulate climate-change pollution from power plants, thereby directly countering the erroneous legal arguments of opponents of EPA action -- particularly those who claim that EPA lacks the authority to set substantive limits on existing power plant emissions of climate-change pollution.

The Act mandates that the agency regulate emission sources that cause or significantly contribute to air pollution that endangers public health or welfare. As fossil-fuel power plants are the single largest source of climate-change pollution in the United State -- emitting roughly 40 percent of the nation's total emissions -- EPA is obligated to regulate the climate-change pollution emissions of these plants.

Accordingly, in September 2013, EPA proposed limits on climate-change pollution from new power plants. Under the Act, because EPA is regulating these emissions -- and because the pollutants that contribute to climate change are not being regulated as “criteria” or “hazardous” air pollutants under other sections of the Act -- the agency is obligated to prescribe regulations limiting emissions from existing power plants as well.

Through this regulatory framework, EPA establishes emission guidelines based on the best system for reducing climate-change pollution from existing power plants, while giving states flexibility to determine how best to achieve these or greater reductions. The coalition's comments stress the importance of EPA maintaining this flexibility. Many states have already responded to the threat of climate change by moving forward independently to implement programs to reduce climate-change pollution from their electricity sectors. New York and other states have used a variety of approaches to achieve important reductions, including market-based cap-and-trade systems, such as the "Regional Greenhouse Gas Initiative" in which New York participates, planned retirements of coal-fired power plants, renewable portfolio standards, demand management and energy-efficiency programs.

It is critically important for EPA to use its expertise to set strong and achievable emission targets. There is compelling scientific evidence that significant reductions in climate-change pollution must occur to prevent increases in the frequency, magnitude and scale of adverse health, safety and economic impacts. These impacts include:

- \*More heat-related deaths and illnesses;
- \*Extreme weather, including storms, floods, and droughts;
- \*Higher smog levels, increasing the rate of asthma, pneumonia, and bronchitis;
- \*Coastal land loss due to inundation, erosion, submergence and habitat loss from rising sea levels;
- \*Threats to ecosystems, including the Adirondacks in New York;
- \*Disappearance of plant and animal species and a rise in insect-borne illnesses, destructive fungi and

pests;

\*Threats to our food production, agriculture and forest productivity; and

\*Threats to our energy, transportation and water resource infrastructure.

Joining Attorney General Schneiderman today in submitting the comments to EPA are the Attorneys General of California, Connecticut, Delaware, Maine, Maryland, Massachusetts, Oregon, Rhode Island, Vermont, Washington and the District of the Columbia.

This matter is being handled by Assistant Attorneys General Jung W. Kim, Morgan A. Costello and Michael J. Myers, and Chief Scientist Alan Belenz of the Attorney General's Environmental Protection Bureau, under the supervision of Bureau Chief Lemuel M. Srolovic, Executive Deputy Attorney General for Social Justice Alvin Bragg and First Deputy for Affirmative Litigation Janet Sabel.

A copy of today's letter can be read here.

**COMMENTS OF THE ATTORNEYS GENERAL OF NEW YORK,  
CALIFORNIA, MASSACHUSETTS, CONNECTICUT, DELAWARE, MAINE,  
MARYLAND, NEW MEXICO, OREGON, RHODE ISLAND, VERMONT,  
WASHINGTON, AND THE DISTRICT OF COLUMBIA ON THE DESIGN OF  
A PROGRAM TO REDUCE CARBON POLLUTION FROM  
EXISTING POWER PLANTS**

**Executive Summary**

The Environmental Protection Agency is soliciting input from stakeholders in developing a proposed rule under section 111(d) of the Clean Air Act (Act) to address greenhouse gas emissions from existing power plants: the largest source of greenhouse gas emissions in the nation. The Act requires EPA to ensure that States achieve emission reductions from existing power plants necessary to protect human health and welfare from the harms of carbon pollution. As part of its outreach effort in advance of proposing a rule in June 2014, EPA has requested the view of States on several aspects of regulation under section 111(d), including determining the best system of emission reduction and designing criteria by which to evaluate the adequacy of state programs.

The Attorneys General of New York, California, Massachusetts, Connecticut, Delaware, Maine, Maryland, New Mexico, Oregon, Rhode Island, Vermont, Washington, and the District of Columbia submit these comments in response to that request and on related issues concerning EPA's vital obligation to limit greenhouse gas emissions from existing power plants. Although each of the undersigned States has already taken significant steps to reduce greenhouse gas pollution emitted by the power sector, substantial work remains.

Section I of these comments provides background on the importance of EPA's rulemaking to address carbon pollution from existing power plants. First, we discuss the serious and well-recognized harms caused by carbon pollution and associated with climate change. Against this backdrop, we summarize how EPA finally reached the point of regulating greenhouse gas emissions from power plants. We then explain the various programs that, in the absence of EPA action until now, States have implemented to reduce greenhouse gas emissions from the power industry cost-effectively. These approaches include renewable portfolio standards, market-based cap-and-trade systems, planned retirements of coal-fired power plants, demand management and energy efficiency programs.

Section II discusses EPA's legal authority to regulate greenhouse gas emissions from existing power plants under section 111(d), including the text and legislative history supporting such regulation. Because EPA is regulating greenhouse gas emissions from new power plants under section 111(b) and greenhouse gases are not regulated as criteria pollutants or as hazardous air pollutants, EPA must regulate those emissions from existing power plants under

section 111(d). The obligation to act is further supported by EPA's longstanding interpretation of the scope of its authority to regulate under section 111(d), which was not altered by Congress's amendment of the statute in 1990.

Section III concerns the substantive aspects of regulation under section 111(d), including its cooperative federalism framework and EPA's role within this structure. Although some State Attorneys General have sought to relegate EPA to a perfunctory procedural role, EPA's role is far more central. EPA is first tasked with issuing emission guidelines that include minimum substantive emission limitations. In doing so, the Act authorizes EPA to determine the degree of emission limitation achievable when the best *system* of emission reduction, as determined by EPA to have been adequately demonstrated, is applied. To make this determination, EPA must consider a range of systems, including source-based and system-based<sup>1</sup> approaches of emission reduction. Then, EPA prescribes how to measure the achievable emission limitation, for example, with a pounds per megawatt hour emission rate, or a tons per year mass emission limit. Many existing programs that States have employed to begin the urgent task of reducing greenhouse gas emissions from the power sector should inform EPA's determination of the reductions achievable.

Finally, in Section IV, we look at the States' critical responsibilities under section 111(d). EPA sets the required degree of emission reduction, but each State must actually determine how to regulate its existing sources through its own state plan. Because section 111(d) puts the States in the driver's seat to implement and enforce the required emission reductions, EPA must give the States options to demonstrate compliance with its emission guidelines and tell the States how to show that their plans are equivalent to such guidelines. Such alternative mechanisms may include trading and other existing state programs, use of multi-year compliance periods, regional cooperation, and phased reductions if, among other things, the proposed standards are enforceable and the reductions are measurable and timely achieved. In short, the statute gives EPA and the States sufficient flexibility to achieve meaningful reductions of greenhouse gas emissions quickly and in a cost-effective way.

---

<sup>1</sup> In its request for input in advance of EPA's proposed section 111(d) rule, EPA referred to two options for addressing carbon pollution from existing power plants, a "source-based approach" and a "system-based approach." CONSIDERATIONS IN THE DESIGN OF A PROGRAM TO REDUCE CARBON POLLUTION FROM EXISTING POWER PLANTS (Sept. 23, 2013), *available at* <http://www2.epa.gov/sites/production/files/2013-09/documents/20130923statequestions.pdf>. EPA explained that "[a] system-based approach evaluates a broader portfolio of measures including those that could be taken beyond the affected sources but still reduce emissions at the source." *Id.* at 1-2. These comments accordingly use the terms "system-based approach" or a "system-wide approach" to mean industry-wide or power sector-wide systems of emission reduction.

## I. The Urgency of Aggressively Addressing the Largest Sources of Carbon Pollution

In *Massachusetts v. EPA*, 549 U.S. 497, 521 (2007), the Supreme Court noted that “[t]he harms associated with climate change are serious and well recognized.” As the recent draft U.S. Climate Action Report prepared by the Department of State succinctly states: “The scientific consensus . . . is that anthropogenic emissions of greenhouse gases are causing changes in the climate that include rising average national and global temperatures, warming oceans, rising average sea levels, more extreme heat waves and storms, extinctions of species, and loss of biodiversity.” Climate Action Report 2014, U.S. Biennial Report – Highlights at 2.<sup>2</sup> The release of atmospheric carbon dioxide from human activities is also the primary cause of ocean acidification, which causes changes to ecosystems and marine biodiversity, potentially impacting food security and the economy.<sup>3</sup> A recent report confirmed that “[t]he ocean continues to acidify at an unprecedented rate in Earth’s history,” with a projected increase of 170 percent in ocean acidity by 2100 compared with preindustrial levels if carbon dioxide emissions are not reduced.<sup>4</sup> Significant reductions in greenhouse gas emissions must occur to prevent increases in the frequency, magnitude and scale of the adverse impacts of climate change pollution, which include:

- more heat-related deaths and illnesses;
- higher smog levels, increasing the rate of asthma, pneumonia and bronchitis;
- extreme weather, including storms, floods and droughts;
- loss of water supplies due to increased salinity and saltwater intrusion;
- coastal land loss due to inundation, erosion, submergence and habitat loss from a rising sea level;
- increased risk of wildfire;
- loss of snowpack in California’s Sierra Nevada and the Cascade mountains in Oregon and Washington;
- ocean acidification;
- threats to ecosystems from the Adirondacks in New York to the Sierra Nevada in California;
- disappearance of plant and animal species and a rise of insect-borne illnesses, destructive fungi and pests;
- displacement of cold water fish species such as native brook trout in New York;

---

<sup>2</sup> Available at <http://www.state.gov/e/oes/climate/ccreport2014/index.htm>.

<sup>3</sup> Ocean Acidification Summary for Policymakers, Third Symposium on the Ocean in a High-CO2 World, available at <http://www.igbp.net/publications/summariesforpolicymakers/summariesforpolicymakers/oceanacidificationsummaryforpolicymakers2013.5.30566fc6142425d6c9111f4.html>.

<sup>4</sup> *Id.*

- warmer stream temperatures and reduced stream flow, threatening Chinook salmon, coho salmon and steelhead trout species in California, Oregon and Washington;
- reduced hydroelectric production from snowmelt-driven shifts in stream flow;
- threats to our food production, agriculture and forest productivity;
- threats to our energy, transportation and water resource infrastructure; and
- increased environmental pressures on certain communities in low-lying areas, particularly in Alaskan indigenous communities.

The Supreme Court's decision not to disturb a federal court of appeals' ruling upholding EPA's determination that greenhouse gas emissions endanger public health and welfare ends the legal debate on climate science, *Coalition for Responsible Regulation v. EPA*, 684 F.3d 102 (D.C. Cir. 2012), *cert. denied*, 82 U.S.L.W. 3214 (U.S. Oct. 15, 2013) (No. 12-1272), switching the focus squarely to what the federal government and the States can do to address these emissions.

#### **A. The history of federal regulation of power plant greenhouse gas emissions**

In 2006, after EPA revised its new source performance standards (NSPS) for power plants and failed to include standards for greenhouse gas emissions, the States of New York, Connecticut, California, Delaware, Maine, New Mexico, Oregon, Rhode Island, Vermont, Washington, the Commonwealth of Massachusetts, the District of Columbia and the City of New York filed a petition seeking judicial review of that failure. *New York v. EPA* (D.C. Cir. No. 06-1322). The matter was ultimately remanded to the agency after the Supreme Court's decision in *Massachusetts v. EPA*, and in 2010, the parties entered into a settlement agreement setting a schedule for EPA to propose and promulgate NSPS for greenhouse gas emissions from new and existing power plants.

Although EPA failed to meet that rulemaking schedule, on June 25, 2013, President Obama issued a memorandum to the Administrator of the EPA, in which he directed the Administrator to fulfill her statutory duty under sections 111(b) and 111(d) of the Act "to issue standards, regulations, or guidelines, as appropriate, that address carbon pollution from modified, reconstructed, and existing power plants and build on State efforts to move toward a cleaner power sector." The President established new dates for the Administrator to issue a new proposal for NSPS for greenhouse gas emissions, for the Administrator to propose and finalize emission guidelines for existing power plants, and for the States to submit their implementation plans pursuant to those guidelines.

**“The unique characteristics of carbon pollution and the interconnected nature of the electric power sector call for a broad and flexible approach to designing the program for existing power plants.”**

EPA Overview Presentation of Clean Air Act Section 111 (minute 27:49), *available at* <http://www2.epa.gov/carbon-pollution-standards/what-epa-doing#overview>.

EPA proposed NSPS for greenhouse gas emissions from new power plants on September 20, 2013.<sup>5</sup> As discussed below, the proposal triggered EPA’s obligation to proceed with rulemaking under section 111(d), which governs regulation of air pollutants for existing sources that if new, would be subject to the NSPS. EPA’s authority to act under section 111 is supported by the Supreme Court’s decision in *American Electric Power v. Connecticut*, 131 S. Ct. 2527, 2537 (2011) (*AEP*), where the Court specifically pointed to section 111 in finding that the Act “speaks directly” to carbon dioxide emissions from power plants and that therefore, the Act “and the EPA actions it authorizes” displace any federal common law right of action to abate carbon dioxide emissions from fossil fuel-fired power plants.<sup>6</sup>

## **B. State efforts to curb power plant greenhouse gas emissions**

Rather than simply wait for federal action, many States moved forward independently to implement programs to reduce greenhouse gas emissions from fossil fuel-fired power plants. Twenty States and the District of Columbia have set greenhouse gas emissions targets, reduced levels of emissions that each State has committed to achieve by a specified time.<sup>7</sup> States have employed different strategies to curb emissions, some of which are highlighted below.

### **Renewable portfolio standards**

Most States now have renewable portfolio standards that require electricity providers to obtain a given amount of their electricity from sources such as wind or solar energy. These standards create demand for new renewable power generation, which can displace generation from existing fossil fuel-fired sources.

<sup>5</sup> EPA had previously proposed an NSPS for greenhouse gas emissions from new power plants on April 13, 2012. 77 Fed. Reg. 22,392 (April 13, 2012). After receiving and reviewing more than a million public comments on the proposal, EPA decided to issue a new proposal. See <http://www2.epa.gov/sites/production/files/2013-09/documents/20130920proposal.pdf>.

<sup>6</sup> Because *AEP* concerned existing power plants, not new ones, the Court’s reference to EPA’s authority under the NSPS provisions of the Act to abate carbon dioxide emissions from fossil fuel-fired power plants must be to regulation under section 111(d).

<sup>7</sup> See <http://www.c2es.org/us-states-regions/policy-maps/emissions-targets>.

Under these programs, state renewable energy targets range from 1.5 percent (Iowa) to 40 percent (Hawaii), with compliance due over a range of time periods. Emission reductions attributable to these standards depend on the level and design of the standards and other state-specific factors, like the carbon intensity of existing sources and changes in demand. New York's effort to meet its renewable target of 30 percent by 2015 has already eliminated millions of tons of carbon dioxide, in addition to other pollutants. The World Resources Institute has projected that even States with relatively modest standards of between 8 and 12.5 percent can achieve reductions in emissions from existing power plants.<sup>8</sup>

### Market-based systems

A number of Northeastern and mid-Atlantic States have joined together to reduce greenhouse gas emissions from existing power plants in their States through a regional cap-and-trade system known as the Regional Greenhouse Gas Initiative (RGGI).<sup>9</sup> Pursuant to each RGGI State's own regulations, regulated power plants must acquire, either at auction or on a secondary market, one emission allowance for each ton of carbon dioxide emitted. RGGI has succeeded in reducing carbon dioxide emissions from the power sector by more than 40 percent below 2005 levels, with further reductions projected. At the same time, these States have used the proceeds from allowance auctions to fund investments in energy efficiency, further reducing demand and generating large net economic benefits (hence the coining of the term a "cap-and-invest" program). For example, a recent analysis of RGGI's costs and benefits in the participating States found that the program produces a net benefit of \$1.6 billion in the region (net present value), based on the first three-year compliance period.<sup>10</sup>

---

<sup>8</sup> See Michael Obeiter et al., World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: Ohio 2 (2013), *available at* [http://www.wri.org/sites/default/files/power\\_sector\\_opportunities\\_for\\_reducing\\_carbon\\_dioxide\\_emissions\\_ohio\\_summary.pdf](http://www.wri.org/sites/default/files/power_sector_opportunities_for_reducing_carbon_dioxide_emissions_ohio_summary.pdf); Michael Obeiter et al., World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: North Carolina 2 (2013), *available at* [http://www.wri.org/sites/default/files/power\\_sector\\_opportunities\\_for\\_reducing\\_carbon\\_dioxide\\_emissions\\_north\\_carolina\\_summary.pdf](http://www.wri.org/sites/default/files/power_sector_opportunities_for_reducing_carbon_dioxide_emissions_north_carolina_summary.pdf); Michael Obeiter et al., World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: Michigan 2 (2013), *available at* [http://www.wri.org/sites/default/files/power\\_sector\\_opportunities\\_for\\_reducing\\_carbon\\_dioxide\\_emissions\\_michigan\\_summary.pdf](http://www.wri.org/sites/default/files/power_sector_opportunities_for_reducing_carbon_dioxide_emissions_michigan_summary.pdf); Michael Obeiter et al., World Resources Institute, Power Sector Opportunities for Reducing Carbon Dioxide Emissions: Pennsylvania 2 (2013), *available at* [http://www.wri.org/sites/default/files/power\\_sector\\_opportunities\\_for\\_reducing\\_carbon\\_dioxide\\_emissions\\_pennsylvania\\_summary.pdf](http://www.wri.org/sites/default/files/power_sector_opportunities_for_reducing_carbon_dioxide_emissions_pennsylvania_summary.pdf).

<sup>9</sup> The States that currently participate in RGGI are Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont.

<sup>10</sup> See Analysis Group, The Economic Impacts of the Regional Greenhouse Gas Initiative on Ten Northeast and Mid-Atlantic States (2011), *available at* [http://www.analysisgroup.com/uploadedFiles/Publishing/Articles/Economic\\_Impact\\_RGGI\\_Report.pdf](http://www.analysisgroup.com/uploadedFiles/Publishing/Articles/Economic_Impact_RGGI_Report.pdf).

California's economy-wide cap-and-trade program likewise requires power plants to obtain allowances or credits sufficient to match their emissions. The program is a key element of the State's efforts to reduce emissions to 1990 levels by 2020, as required by the California Global Warming Solutions Act. *See* CAL. HEALTH & SAFETY CODE §§ 38550, 38562(a). California projects the combination of cap and trade, a renewable portfolio standard, energy efficiency standards for consumer and industrial products, and other programs will reduce power sector emissions by at least 25 percent from 2005 levels by 2025. The state board has set a declining cap on emissions at a level deemed necessary to achieve the statute's emissions reductions goals, and thus can use the cap as a backstop in the event other programs in California's portfolio fall short of achieving their projected reductions.

### **Demand management**

States have achieved significant cost-effective emission reductions and saved ratepayers money through efforts to reduce demand for electricity generation. More than half of the States require utilities to adopt Energy Efficiency Resource Standards, reducing demand by a specified amount each year.<sup>11</sup>

### **Retirement planning and plant refurbishment**

Some States have enacted laws to encourage the retirement of old, inefficient power plants. Colorado's Clean Air Clean Jobs Act, HB-1365, required utilities to develop plans to reduce carbon dioxide and other emissions from their coal-fired power plants. The law encouraged utilities drafting those plans to consider retiring those plants and investing in energy efficiency programs, and allowed utilities to recover the costs of such changes. The State's largest utility, Xcel Energy, developed a plan to replace coal-fired power plants with natural gas-fired plants. Xcel projects its plan will reduce its carbon dioxide emission by 28 percent by 2020 and its emissions of other pollutants like sulfur and nitrogen oxides and mercury by more than 80 percent each. A similar law in Minnesota led Xcel to replace two existing coal-fired power plants and refurbish another, leading to a 21 percent reduction in greenhouse gas emissions.

### **Energy efficiency programs**

Other state efforts include energy efficiency standards for consumer products and commercial and industrial equipment, residential and commercial building codes, and incentives for consumers to adopt more efficient technologies, and

---

<sup>11</sup> *See* American Council for an Energy-Efficient Economy, *The 2013 State Energy Efficiency Scorecard 19-20* (2013), available at <http://aceee.org/research-report/e13k>.

investment in energy efficiency projects. Massachusetts' energy efficiency programs have been so successful that the Independent System Operator New England (ISO-NE), New England's regional transmission organization which operates the bulk electric power generation and transmission system for New England and administers wholesale electricity markets, has begun to take the programs into account for purposes of its long term load forecasting. For the period 2016 through 2022, ISO-NE is projecting that, with state energy efficiency investments fully included, load growth will remain flat at about 132,000 GWh.<sup>12</sup> Such flat load growth means that customers reduce energy costs by 1) avoiding the cost of energy that would have been used absent energy efficiency; 2) reducing overall energy prices since lower demand results in lower prices for everyone; and 3) avoiding generation, transmission, and distribution infrastructure costs system-wide. By contrast, without including state energy efficiency programs in the projection, load growth is forecasted to increase from 144,000 to 152,000 GWh during that same period.<sup>13</sup> These data show that consumers can dramatically reduce the demand curve if state programs offer the right incentives.

The Massachusetts energy efficiency programs reduced retail sales of electricity in the Commonwealth by 2 percent in 2012; that number is expected to reach 2.5 percent in 2015, resulting in a cumulative annual carbon dioxide emission reduction of three million metric tons in 2015 from electric energy efficiency programs implemented from 2005 through 2015.<sup>14</sup> Because energy efficiency is less expensive than fossil fuel-fired power, the flattening of demand attributable to the Massachusetts efficiency programs represents both substantial savings to consumers and highly cost-effective reductions in carbon dioxide emissions.

Oregon's public purpose charge – 3 percent of the total revenues collected by the state's utilities – provides roughly \$60 million per year to support energy efficiency, renewable energy, and low-income programs in Oregon. This funding supports the Energy Trust of Oregon's electric programs, including a goal of saving over 2,000 GWh of electricity between 2010 and 2014, equivalent to 1 percent of electricity sales in 2013 and 2014.

California has likewise focused on energy efficiency as a means to protect its consumers and reduce air pollution. For decades, California has enforced an expanding network of efficiency standards which help minimize the energy needed

<sup>13</sup> *Id.*

<sup>14</sup> Massachusetts Department of Environmental Protection (November 21, 2013).

to power appliances and buildings.<sup>15</sup> Energy savings are projected at nearly 70,000 GWh in 2013 alone.<sup>16</sup> The California Energy Commission estimates that these efficiency standards have generated \$74 billion in savings for California consumers over the last several decades.<sup>17</sup> Energy efficiency is the first resource California looks to as it considers its energy needs, and is the first resource considered in procurement proceedings under California's loading order.<sup>18</sup> Because California has decoupled utility profits from energy sales, its investor-owned utilities have strong incentives to pursue these savings.<sup>19</sup> Academic analysts have concluded that hundreds of thousands of jobs can be created by California's expanding energy efficiency programs.<sup>20</sup>

States' innovative programs provide valuable data and experience for EPA to consider and upon which it should draw in determining the best system of emission reduction from existing power plants.

## II. EPA's Legal Authority to Regulate Greenhouse Gas Emissions from Existing Power Plants

EPA historically has interpreted section 111(d) to mandate regulation of existing sources' emissions of pollutants that are not regulated as criteria pollutants (under sections 108 and 110, 42 U.S.C. §§ 7408, 7410) or as hazardous air pollutants (under section 112, *id.* § 7412) once EPA regulates emissions of those pollutants from new sources under section 111(b). This construction is consistent with the idea that section 111(d) provides a "backstop" to regulation of pollutants under the national ambient air quality standards (NAAQS) or hazardous air pollutant programs. Thus, here power plants emitting greenhouse gases are subject to mandatory regulation under section 111(d) because greenhouse gases are not regulated as criteria pollutants or as hazardous air pollutants and because EPA has

<sup>19</sup> See American Council for an Energy-Efficient Economy, *State Energy Efficiency Database: California* (2013), available at <http://aceee.org/sector/state-policy/california>.

<sup>20</sup> David Roland-Holst, *Energy Efficiency, Innovation, and Job Creation in California* 35 (2008), available at [http://are.berkeley.edu/~dwrh/CERES\\_Web/Docs/UCB%20Energy%20Innovation%20and%20Job%20Creation%2010-20-08.pdf](http://are.berkeley.edu/~dwrh/CERES_Web/Docs/UCB%20Energy%20Innovation%20and%20Job%20Creation%2010-20-08.pdf).

moved forward with regulating greenhouse gas emissions from power plants under section 111(b).

Two recent commentators have sought to use a legislative oddity – the enactment in 1990 of two differently worded amendments to section 111(d) – to argue that EPA is powerless to regulate greenhouse gas emissions from existing power plants.<sup>21</sup> As explained below, however, Congress’s enactment of these two amendments did not change the backstop nature of EPA’s authority to regulate under section 111(d). Instead, Congress revised section 111(d) to correct a cross-reference to section 112 as a result of substantive changes to section 112, not to effectuate sweeping change in the coverage of pollutants regulated under section 111(d).

**A. The language, structure and history of section 111(d) show that greenhouse gas emissions from existing power plants are subject to regulation under this section.**

Under the familiar two-pronged test of *Chevron, U.S.A., Inc. v. NRDC*, courts and agencies “must give effect to the unambiguously expressed intent of Congress.” 467 U.S. 837, 842 (1984) (*Chevron*). If the statute is silent or ambiguous with respect to the specific issue, the question for the court is whether the agency’s answer is based on a permissible construction of the statute. *Id.* at 842.

At step one of *Chevron*, “traditional tools of statutory construction,” including legislative history and statutory text and structure, are employed to discern legislative intent. *Id.* at 843 n.9. *See, e.g., Zuni Public School Dist. No. 89 v. Dep’t of Educ.*, 550 U.S. 81, 89-100 (2007) (considering legislative history and purpose of statute first at step one, then again at step two). The text and structure of section 111(d) and the circumstances surrounding the amendment of section 111(d) make clear that power plant greenhouse gas emissions are subject to section 111(d) regulation.

Before its amendment in 1990, section 111(d) authorized regulation of “any air pollutant which is not included on a list published under section 7408(a) or 7412(b)(1)(A) of this title.” *See* 42 U.S.C. § 7411(d) (West 1977). At that time, section 112(b)(1)(A) required EPA to list hazardous air pollutants meriting regulation under section 112. *See id.* § 7412(b)(1)(A). Congress amended the Act extensively in 1990 after its approach to regulating hazardous air pollutants “proved to be disappointing” due to EPA’s delay in listing those pollutants under

<sup>21</sup> William J. Haun, *The Clean Air Act as an Obstacle to the Environmental Protection Agency’s Anticipated Attempt to Regulate Greenhouse Gas Emissions from Existing Power Plants*, THE FEDERALIST SOCIETY (March 2013); Brian H. Potts, *The President’s Climate Plan for Power Plants Won’t Significantly Lower Emissions*, 31 YALE J. REG. ONLINE 1, 9 (Aug. 22, 2013).

section 112.<sup>22</sup> The 1990 amendments overhauled section 112 to identify 188 specific hazardous air pollutants and to regulate their emissions. 42 U.S.C. § 7412 (2012). To conform the language of section 111(d) to the changes made to section 112, Congress also revised section 111(d).

However, in an unusual turn of events, different language in the House and Senate bills amending section 111(d) was enacted into law without being reconciled in conference. In such circumstances, the Statutes at Large, rather than the U.S. Code, are controlling.<sup>23</sup> The Statutes at Large contain both the House and Senate amendments to section 111(d). The Senate amendment, set forth at Pub. L. No. 101-549, § 302(a), 104 Stat. 2399, 2574 (1990), simply substituted the reference to the amended section of the Act<sup>24</sup> and provides:

Section 111(d)(1) of the Clean Air Act is amended by striking ‘112(b)(1)(A)’ and inserting in lieu thereof ‘112(b).’

The House amendment, set forth at Pub. L. No. 101-549, § 108(g), 104 Stat. 2399, 2467 (1990), took a different approach and replaced the simple reference with an explanation:

Section 111(d)(1)(A)(i) of the Clean Air Act [42 U.S.C. 7411(d)(1)(A)(i)] is amended by striking ‘or 112(b)(1)(A)’ and inserting ‘or emitted from a source category which is regulated under section 112.’

Both amendments appear in the House Conference Report, which was enacted by both the House and the Senate, H.R. Conf. Rep. 101-952, at 50, 123 (1990), and the bill signed by President Bush contained both amendments surrounded by brackets with a footnote describing the amendments as “duplicative.” According to the codifier, the provisions did nothing more than merely “in different language, change the reference to section 112.” The Clean Air Act, as Amended, *reprinted in* 1 ENVIRONMENT AND NATURAL RES. POLICY DIV., LIBRARY OF CONGRESS, A LEGISLATIVE HISTORY OF THE CLEAN AIR ACT AMENDMENTS OF 1990, at 46 (1998).

---

<sup>22</sup> See *Sierra Club v. EPA*, 353 F.3d 976, 979-80 (D.C. Cir. 2004) (describing history of hazardous air pollutant provisions between 1970 and 1990).

<sup>23</sup> 1 U.S.C. § 112 (2012). See *United States Nat’l Bank of Oregon v. Indep. Ins. Agents of Am.*, 508 U.S. 439, 448 (1993) (“Though the appearance of a provision in the current edition of the United States Code is ‘prima facie’ evidence that the provision has the force of law, 1 U.S.C. § 204(a), it is the Statutes at Large that provides the ‘legal evidence of laws,’ [1 U.S.C.] § 112, and despite its omission from the Code [a provision] remains on the books if the Statutes at Large so dictates”).

<sup>24</sup> See 42 U.S.C.A. § 7411(d) (West 1977).

**The bill signed by President George H.W. Bush contained both amendments surrounded by brackets with a footnote stating: “The amendments . . . appear to be duplicative; both, in different language, change the reference to section 112.”**

The Clean Air Act, as Amended, *reprinted in* 1 ENVIRONMENT AND NATURAL RES. POLICY DIV., LIBRARY OF CONGRESS, A LEGISLATIVE HISTORY OF THE CLEAN AIR ACT AMENDMENTS OF 1990, at 46 (1998).

Consistent with congressional intent and the codifier’s understanding, the revisions to section 111(d) must be read, as a *Chevron* step one matter, as differently worded provisions that simply conformed the reference in section 111(d) to preclude the simultaneous regulation of air pollutants under sections 111(d) and 112. Indeed, the House and Senate amendments are found under the headings “Miscellaneous Provisions” and “Conforming Amendments,” respectively. Pub. L. No. 101-549, §§ 108, 302(a), 104 Stat. 2399, 2467, 2574 (1990).

Despite the statutory language and structure and the legislative history, two recent commentators have argued that the House amendment precludes EPA regulation of greenhouse gas emissions from power plants under section 111(d), because greenhouse gas emissions would fall under the category of *any* pollutant that happens to be emitted from a source category that is being regulated under section 112. Nothing in the legislative history or structure of section

111(d) suggests that Congress intended the amendment to effect a sweeping, substantive change in the scope of regulation under section 111(d).

First, “[s]uch a reading would be inconsistent with the general thrust of the 1990 amendments, which, on balance, reflects Congress’ desire to require EPA to regulate more substances, not eliminate EPA’s ability to regulate large categories of pollutants like non-[hazardous air pollutants].” 70 Fed. Reg. 15,994, 16,032 (March 29, 2005). And where the 1990 amendments provided regulatory relief for specific categories of sources, they did so explicitly, *see, e.g.*, 42 U.S.C. §§ 7412(e)(1), 7412(n)(1), and after much discussion.<sup>25</sup> As the Supreme Court said in another Clean Air Act case, Congress “does not, one might say, hide elephants in mouseholes.” *Whitman v. Am. Trucking Ass’ns.*, 531 U.S. 457, 468 (2001).

<sup>25</sup> *See, e.g.*, S. Rep. No. 101-228, at 147 (1989), *reprinted in* 5 ENVIRONMENT AND NATURAL RES. POLICY DIV., LIBRARY OF CONGRESS, A LEGISLATIVE HISTORY OF THE CLEAN AIR ACT AMENDMENTS OF 1990, at 8514-15 (1998) (describing section 112(e) exceptions to general rules for scheduling standard-setting for sources under section 112(d)); Senate Debate on S. 1630 (April 3, 1990), *reprinted in* 4 ENVIRONMENT AND NATURAL RES. POLICY DIV., LIBRARY OF CONGRESS, A LEGISLATIVE HISTORY OF THE CLEAN AIR ACT AMENDMENTS OF 1990, at 7139-40 (1998) (discussing Senate Amendment adding section 112(n) requirement of study of mercury emissions from power plants prior to setting standards under section 112).

Second, as the former head of EPA’s enforcement office recently wrote, such an interpretation would make section 111(d) a “dead letter” because it is “difficult—perhaps impossible—to think of an air pollutant that is (a) emitted by stationary sources within the ambit of section 111 but (b) not also emitted by some sources (stationary or otherwise) that *also* emit[] hazardous air pollutants.” Adam Kushner and Judith Coleman, “*Lessons from Mercury: Ensuring Legal Certainty for New GHG Performance Standards from Existing Fossil Fuel Plants*,” EE News 6 (Oct. 24, 2013) (emphasis original).<sup>26</sup> This huge gap in regulation would render section 111(d) ineffective in fulfilling its structural and historical role as a backstop provision and “impute to Congress a purpose to paralyze with one hand what it sought to promote with the other.” *Clark v. Uebersee Finanz-Korporation, A.G.*, 332 U.S. 480, 488-89 (1947). A “cardinal principal of statutory construction” requires courts to reject interpretations like this that would render statutory provisions superfluous. *New York v. EPA*, 443 F.3d 880, 887 (D.C. Cir. 2006) (quoting *TRW, Inc. v. Andrews*, 534 U.S. 19, 31 (2001)).

The Federalist Society’s interpretation “would make section 111(d) a ‘dead letter’ because it is “difficult—perhaps impossible—to think of an air pollutant that is (a) emitted by stationary sources within the ambit of section 111 but (b) not also emitted by some sources (stationary or otherwise) that also emits hazardous air pollutants.”

Adam Kushner and Judith Coleman, “Lessons from Mercury: Ensuring Legal Certainty for New GHG Performance Standards from Existing Fossil Fuel Plants,” (Oct. 24, 2013) at 6.

**B. EPA has reasonably interpreted section 111(d) to resolve any ambiguity.**

At a minimum, EPA’s interpretation that gives effect to both the Senate and House amendments by limiting (not eliminating) its section 111(d) authority when it is regulating a source category under section 112 should be upheld because it is a permissible construction of the statute. *Chevron*, 467 U.S. at 843; *City of Arlington v. FCC*, 133 S. Ct. 1863 (2013) (reiterating that *Chevron* framework applies when agency interprets jurisdictional provision of statute it administers). Under EPA’s

<sup>26</sup> Available at [http://www.eenews.net/assets/2013/10/24/document\\_gw\\_01.pdf](http://www.eenews.net/assets/2013/10/24/document_gw_01.pdf). Indeed, the commentators do not admit this potential breadth insofar as they suggest that the House Amendment precludes regulation of air pollutants emitted by a source category only where the source category to be regulated under section 111(d) is also regulated under section 112. Moreover, the fortuity that pollutant X shares a source with other more stringently regulated pollutants logically should have no bearing on the stringency, or existence of, regulation of pollutant X. See *Desert Citizens Against Pollution v. EPA*, 699 F.3d 524, 527-28 (D.C. Cir. 2012) (rejecting argument that certain consequences flowed simply because sources listed under one section for their emissions of seven particular hazardous air pollutants also emitted other pollutants).

interpretation, if EPA is regulating source category X under section 112, section 111(d) could not be used to regulate any hazardous air pollutant emissions from that particular source category. 70 Fed. Reg. at 16,031; *see also* 73 Fed. Reg. 44,354, 44,417-18, 44,487, 44,493 (July 30, 2008); 69 Fed. Reg. 4,652, 4,685 (Jan. 30, 2004).

In *Citizens to Save Spencer County v. EPA*, 600 F.2d 844, 872 (D.C. Cir. 1979), the court upheld EPA's approach of seeking to reconcile seemingly inconsistent amendments by giving some effect to both, explaining that:

[where Congress] drew upon two bills originating in different Houses and containing provisions that, when combined, were inconsistent in respects never reconciled in conference . . . it was the greater wisdom for the agency to devise a middle course between inconsistent statutes so as to give maximum possible effect to both.

Similarly here, EPA's interpretation gives effect to each amendment, maintaining the focus of the previous version of the Act on specific pollutants, as preserved by the Senate amendment, and incorporating the House amendment's reference to specific sources to ensure that section 112 regulated source categories will not be subject to duplicative regulation of hazardous air pollutants under both section 112 and section 111(d). As a *Chevron* step two matter, EPA's interpretation giving effect to both amendments is a reasonable one. *Chevron*, 467 U.S. at 843; *Smiley v. Citibank, N.A.*, 517 U.S. 735, 744-745 (1996).<sup>27</sup>

Thus, because greenhouse gases are not regulated as hazardous air pollutants or criteria pollutants, and because EPA has moved forward with regulation of power plant greenhouse gas emissions under section 111(b), power plant greenhouse gas emissions must be regulated under section 111(d).

### III. The Cooperative Federalism Framework of Section 111(d)

Section 111(d) establishes a framework that gives EPA and the States distinct but complementary roles to regulate air pollutants from existing sources that, if new, would be subject to NSPS. Section 111(d) requires EPA to prescribe regulations that establish a section 110-like procedure under which each State shall submit to EPA a plan establishing, implementing and enforcing standards of performance for such sources. "Standard of performance" is defined as a standard for emissions of air pollutants that reflects the degree of emission limitation

---

<sup>27</sup> *See also Am. Water Works Ass'n v. EPA*, 40 F.3d 1266, 1271 (D.C. Cir. 1994) (quoting *Chem. Mfrs. Ass'n v. NRDC*, 470 U.S. 116, 126 (1985); *Desert Citizens Against Pollution*, 699 F.3d at 527-28 (agreeing with EPA's interpretation that section 112(c)(6)'s cross-reference to sections 112(d)(2) and (d)(4) only meant that seven pollutants specified in section 112(c)(6) were subject to standards required in latter sections, not that all hazardous air pollutants emitted by sources that also emitted seven pollutants were subject to these standards).

achievable through the application of the best system of emission reduction that, considering the cost of achieving the reduction and any nonair quality health and environmental impact and energy requirements, EPA determines has been adequately demonstrated. 42 U.S.C. § 7411(a)(1).

As discussed below, the definition of “standard of performance” calls for EPA to determine the adequately demonstrated best system of emission reduction and the corresponding achievable degree of emission limitation.<sup>28</sup> Once EPA sets the floor in its emission guidelines, each State must submit a plan establishing standards of performance for existing sources and implementing and enforcing such standards. 42 U.S.C. § 7411(d)(1).

Thus, like the section 110 state implementation plan (SIP) framework and procedure, section 111(d) directs EPA to work hand-in-hand with the States to ensure that each State – through its plan – achieves the reductions that EPA has determined are achievable through the application of the best system of emission reduction that has been adequately demonstrated. This cooperative federalism allows EPA to establish the minimum reductions required, while giving the States flexibility to determine how to achieve those reductions (or more).

**A. Section 111(d) requires EPA to establish emission guidelines, including substantive limitations, for existing sources.**

Under section 111(d), EPA issues emission guidelines and, “in compliance with those guidelines and subject to federal oversight, the States then issue performance standards for stationary sources within their jurisdiction.” *AEP*, 131 S. Ct. at 2537 (citing 42 U.S.C. § 7411(d)). The statutory framework thus requires EPA to “establish guidelines as to what the best system for each such category of existing sources is” and the States to apply those guidelines. H.R. Rep. No. 95-294, at 195, *as reprinted in* 1977 U.S.C.C.A.N. 1077, 1274.

To fulfill its statutory responsibilities, EPA must establish substantive emission limitations for existing sources. Pursuant to section 111(a), EPA must determine the emission reduction achievable through application of the best system of emission reduction it determines is adequately demonstrated, considering costs and other factors. 42 U.S.C. § 7411(a). Based on this determination, EPA uses its expertise to establish standards for new and modified sources under section 111(b) and emission guidelines for the States to follow under section 111(d). For EPA to evaluate the adequacy of state plans under section 111(d)(2), as the statute requires it to do, EPA must first establish a benchmark. That way it can, if necessary, step

---

<sup>28</sup> “Emission limitation” is defined in section 302 to mean requirements which limit the quantity, rate or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice or operational standard promulgated under this chapter. 42 U.S.C. § 7602.

in where a State either submits an unsatisfactory plan or fails to enforce provisions of an approved plan. 42 U.S.C. § 7411(d)(2).

Another group of State Attorneys General has pointed to the language in section 111(d) that requires EPA to establish a procedure similar to that under section 110 for submission of state plans as limiting the agency's role to a perfunctory one.<sup>29</sup> EPA correctly dismissed that interpretation at the beginning of the section 111(d) program. That interpretation cannot be squared with the statute's directive that EPA evaluate the content of state plans under section 111(d) and "prescribe a plan for a State in cases where the State fails to submit a satisfactory plan." 42 U.S.C. § 7411(d)(2). And if the States alone could determine the standards to be applied, it would not have been necessary for Congress to expressly require EPA to allow the States to consider the "remaining useful life of a source" when applying those standards. Indeed, the very language upon which these commentators rely, requiring EPA to establish a "procedure similar to that provided by section 7410," does not support their interpretation because EPA uses its scientific expertise to establish substantive standards under section 110 (national ambient air quality standards), which the States then develop plans to

implement. Thus, section 111(d) plainly requires EPA to establish minimum emission limitations to guide the States in devising their plans and to provide an objective measure against which EPA may judge the equivalency of the performance standard(s) included in each state plan.

EPA's regulations call for guideline documents to include:

- a description of adequately demonstrated systems of emission reduction,
- the degree of emission reduction achievable with each system,
- the costs and environmental effects of each system,
- an emission guideline reflecting the application of the best system of emission reduction adequately demonstrated for existing sources, and
- the time within which compliance with equivalent emission standards can be achieved.

40 C.F.R. § 60.22(b).

EPA's longstanding interpretation of its authority further affirms that it is, at a minimum, *allowed* to establish substantive guidelines. *See Chevron*, 467 U.S. at 842 (agency's interpretation will be upheld if based on permissible statutory construction). In its rulemaking proposal to establish general procedures under section 111(d), EPA explained that it would publish guideline documents setting minimum emission limitations that reflect the best available demonstrated systems of emission control. 39 Fed. Reg. 36,102 (Oct. 7, 1974).

EPA reiterated in the preamble to its final rule that the agency has the statutory

<sup>29</sup> *Perspective of 18 States on Greenhouse Gas Emission Performance Standards for Existing Sources under § 111(d) of the Clean Air Act*, submitted to EPA under cover letter dated September 11, 2013 by the State of Nebraska Office of the Attorney General ("*Nebraska*").

authority to set minimum emission guidelines for state emission standards included in state plans. 40 Fed. Reg. 53,340, 53,342 (Nov. 17, 1975). Responding to industry comments questioning EPA's authority to prescribe more than procedural requirements for state plan adoption and submittal, EPA correctly reasoned that its interpretation was necessary to implement section 111(d) effectively. If EPA had no authority to set minimum substantive guidelines, the States would be able to set "extremely lenient standards" for air pollutants subject to regulation only under Section 111(d) – which would leave "a gaping loophole in a statutory scheme otherwise designed to force meaningful action." *Id.* at 53,343.

Thus, if the Administrator determines that a designated pollutant may cause or contribute to endangerment of public health or welfare, emission standards shall be no less stringent than EPA's emission guidelines.<sup>30</sup> 40 CFR § 60.24(a)(d). EPA has followed this approach in each of the emission guidelines it has promulgated pursuant to section 111(d), repeatedly establishing minimum emission limitations in its final emission guidelines for each State to include in its respective plan.<sup>31</sup> A contrary interpretation would undermine the intent of section 111(d) to provide a backstop for emissions of harmful unregulated air pollutants from existing sources and also effectively would nullify section 111(d)'s provisions concerning EPA's role in determining the best system of emission reduction and in approving state plans.<sup>32</sup>

---

<sup>30</sup> EPA's guidelines to the States are not enforceable against a source, but may be used to judge the adequacy of state plans. 40 Fed. Reg. at 53,343.

<sup>31</sup> *See, e.g.*, 40 C.F.R. § 60.31d (establishing emission guideline for sulfuric acid production units at 0.25 grams sulfuric acid mist per kilogram of sulfuric acid produced); 40 C.F.R. § 60.33b (establishing emission guidelines for pollutants emitted by municipal waste combustors); 40 C.F.R. § 60.33e (establishing specified emission limits for pollutants emitted by hospital, medical, infectious waste incinerators); 40 C.F.R. § 1515 (establishing specified emission limits for pollutants emitted by small municipal waste combustion units); 40 C.F.R. § 60.2515 (establishing specified emission limits for pollutants emitted by commercial and industrial solid waste incineration units); 40 C.F.R. § 60.2983 (establishing specified emission limits for pollutants emitted by other solid waste incineration units); 40 C.F.R. § 60.5015 (establishing specified emission limits for pollutants emitted by sewage sludge incineration units).

<sup>32</sup> *Cf. Big Rivers Elec. Corp. v. EPA*, 523 F.2d 16, 22 (6th Cir. 1975) (EPA acted within its authority in rejecting alternate control strategies in lieu of emission limitations that Kentucky sought to include in its state implementation plan and explaining that under section 110's "dual scheme, the freedom of the States to choose the manner of achieving this goal [of reducing air pollution] was made subject to the absolute requirement that every state plan include emission limitations as an ingredient").

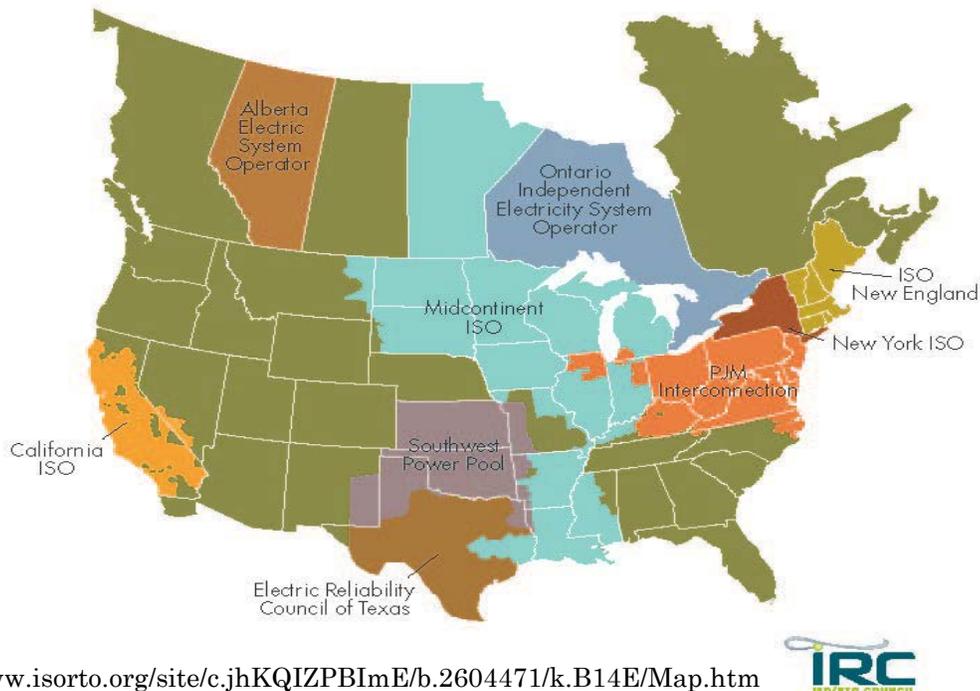

**B. EPA must evaluate the full range of available systems in determining the achievable emission reductions from existing power plants.**

EPA must require emission reductions at a level that is achievable when applying the best system of emission reduction that EPA determines is adequately demonstrated, considering the cost of achieving the reduction and any nonair quality health and environmental impact and energy requirements. 42 U.S.C. § 7411(a); *AEP*, 121 S. Ct. at 2549. Because section 111(d) applies only to existing sources, Congress recognized from the outset a need for flexibility in determining appropriate control measures. See “Clean Air Act Amendments of 1977,” *Committee on Interstate and Foreign Commerce*, H.R. Rep. No. 95–294 at 195, reprinted in 4 “A Legislative History of the Clean Air Act Amendments of 1977,” *Congressional Research Service*, 2662. Therefore, to achieve the greatest level of reductions from existing power plants cost effectively, EPA must evaluate diverse types of systems when considering the best demonstrated system of emission reduction, in keeping with the highly interconnected nature of the existing sources at issue here.

**1. EPA must consider system-based approaches as well as source-based approaches to determine the best system of emission reduction adequately demonstrated and the corresponding emission limitation.**

EPA must consider existing systems of emissions reductions in determining the “best system of emission reduction” for greenhouse gases emitted by power plants. Because the statute does not separately define “system,” the assumption is that “the ordinary meaning of that language accurately expresses the legislative purpose.” *Engine Mfrs. Ass’n v. S. Coast Air Quality Mgmt. Dist.*, 541 U.S. 246, 252–53 (2004) (quotations and citations omitted). At the time that Congress created the NSPS program in 1970, system was defined as “a complex unity formed of many often diverse parts subject to a common plan or serving a common purpose.” Webster’s Third New International Dictionary of the English Language Unabridged 2322 (1968). This broad definition includes not just source-specific systems or approaches to reducing emissions, but also system-wide approaches that have been adequately demonstrated. Source-specific changes that reduce carbon emissions include plant efficiency improvements, heat rate improvements, switching to or co-firing with lower carbon fuels, combined heat and power programs, and carbon capture and sequestration. System-wide approaches would include those programs that shift generation from less efficient to more efficient plants and to renewable energy and programs that reduce the need for generation and could drive or otherwise implicate the source-specific approaches noted above. Such systems would include emissions from all power plants or from multiple power plants within a regional, state or regulatory system to which each power plant must adhere.

Because existing power plants are components of a complex and interconnected electricity grid, or network, EPA must consider system-wide programs that reduce carbon emissions from this sector. Approaches for reducing emissions from existing power plants will be most effective if they reflect the fact that power plants operate not in isolation, but as parts of large, dynamic grid-connected systems.

<http://www.isorto.org/site/c.jhKQIZPBIImE/b.2604471/k.B14E/Map.htm>

For example, ISO-NE, New England's regional transmission organization, includes 300 generating plants and 8,000 miles of transmission lines. ISO-NE serves 6.5 million households and businesses, and its 400 market participants complete wholesale electricity transactions valued annually at ten billion dollars.<sup>33</sup> The interconnected nature of the electricity system is taken into account for purposes of system management; for example, decisions concerning plant retirements and dispatch are made on the basis of system-wide considerations. *See, e.g.,* ISO-NE Non-Price Retirement Determination Letters and Resource Responses.<sup>34</sup>

EPA has previously recognized the interconnected relationship between regional multi-state power pool dispatch decisions and resulting emissions impacts in the participating States. In EPA's SIP call for nitrogen oxides (NO<sub>x</sub> SIP call), EPA approved a redistribution of the NO<sub>x</sub> SIP call budgets for Connecticut, Massachusetts and Rhode Island based on a Memorandum of Understanding

<sup>33</sup> See ISO-NE history, available at [http://www.iso-ne.com/aboutiso/co\\_profile/history/index.html](http://www.iso-ne.com/aboutiso/co_profile/history/index.html).

<sup>34</sup> Available at [http://www.iso-ne.com/genrtion\\_resrcs/reports/non\\_prc\\_retremnt\\_ltrrs/2011/salem\\_retirement\\_election.pdf](http://www.iso-ne.com/genrtion_resrcs/reports/non_prc_retremnt_ltrrs/2011/salem_retirement_election.pdf).

(MOU) entered into by the three States and EPA. 64 Fed. Reg. 49,987, 49,989 (Sept. 15, 1999). EPA noted that the States belonged to the same power pool and that, because “dispatch is determined on the power pool level rather than the State level, dispatch itself may result in redistribution of generation and resulting emissions among the States in the power pool.” *Id.* Therefore, EPA concluded “a redistribution, based on the MOU, of budgets within that power pool is appropriate if the same overall budget results.” *Id.*

“[S]tandards adopted for existing sources under section 111(d) of the Act are to be based on available means of emission control (not necessarily technological).” H.R. Rep. No. 95-294, at 11, *as reprinted in* 1977 U.S.C.C.A.N. 1077, 1088. Thus, in analyzing the best system to reduce greenhouse gas emissions from power plants that is adequately demonstrated, EPA must consider electric power system-based approaches and existing state and regional programs, including those described above, that have successfully reduced carbon dioxide emissions from the power sector as a whole. *See Essex Chem. Corp. v. Ruckelshaus*, 486 F.2d 427, 433-34 (D.C. Cir. 1973) (explaining that “[it] is the system which must be adequately demonstrated and the standard which must be achievable”). Such reductions, which have resulted in part from system-based approaches that provide incentives for sources to increase efficiency and find reductions elsewhere in the power sector, must be considered by EPA in determining the best system of emission reduction. In addition to recognizing the true nature of electricity generation and supply, such an approach offers the greatest potential for achieving significant greenhouse gas reductions from existing power plants.

**2. EPA may determine that the emission limitation is best measured by mass and best achieved in phases.**

EPA’s emission guideline must reflect the application of the best system of emission reduction as determined by EPA. *See* 40 C.F.R. § 60.22(b). In establishing the emission guideline, EPA may determine that the best metric is a mass-based limit and that existing power plants may achieve increasingly stringent limitations in phases.

Although EPA has typically defined an emission limitation by an emission rate, for example, pounds per megawatt hour (lbs/MWh), EPA is not constrained to do so. The Act defines “emission limitation” as a limit on “the quantity, rate or concentration of emissions of air pollutants on a continuous basis.” 42 U.S.C. § 7602(k). Thus, EPA may find that the best metric for the achievable emission limitation is a mass-based limit or cap on the quantity of emissions, for example, tons/year, as long as the source is continuously subject to the emission limitation or standard. *See* 42 U.S.C. § 7602(k) (defining “emission limitation”). In *Sierra Club v. EPA*, 551 F.3d 1019, 1027 (D.C. Cir. 2008), the court rejected EPA’s attempt to exempt major sources from normal emission standards under section 112 during startups, shutdowns and malfunctions and explained that “[w]hen *sections 112 and*

302(k) are read together, . . . Congress has required that there must be continuous *section 112-compliant* standards.” Thus, when sections 111(d) and 302(k) are read together, the source must be continuously subject to section 111(d)-compliant standards.<sup>35</sup>

To ensure that sources are subject to continuous emission limitations, section 111(d) standards, whether in emission rate or mass-based form, must be reliable and enforceable. *See Kennecott Copper Corp. v. Train*, 526 F.2d 1149, 1155 (9th Cir. 1975) (finding that intermittent control systems are not reliable or enforceable and therefore violate statute’s requirement that NAAQS be met by continuous emission limitations to maximum extent possible). Thus, although EPA may broadly define a “system” for purposes of determining what level of emission reductions are achievable, state plans must ensure that emission limits can be enforced against covered facilities, as is done through the RGGI program for example.

EPA also may determine that the best demonstrated system of emission reduction can achieve specified limitations in phases. For example, certain renewable energy programs may require investment and time to realize lower emissions, or certain retirement planning and clean energy incentives may mean that greater emission reductions will be achieved later in time. In such circumstances, a phased approach may best reflect the achievable emission limitations. *See* 42 U.S.C. § 7411(d)(1). EPA has discretion under section 111(d) to so determine and to allow States to give affected sources more time to meet more stringent reduction requirements, based on when the reductions may be achieved, provided that the critical goal of achieving significant emission reductions from this industry sector expeditiously is maintained. *Id.*; *see* 70 Fed. Reg. at 28,620.

#### IV. Evaluating Equivalency of State Programs Under Section 111(d)

Once EPA sets the floor in its emission guidelines, each State must submit a plan establishing standards of performance for existing sources and implementing and enforcing such standards. 42 U.S.C. § 7411(d)(1). As under section 110, it is up to the States to make the choices.<sup>36</sup> So long as the States demonstrate that the steps and strategies proposed in their plans meet EPA’s guidelines, the States

---

<sup>35</sup> In this way, the definition of “standard of performance” in section 302, which means “a requirement of continuous emission reduction,” is also satisfied. 42 U.S.C. § 7602(l).

<sup>36</sup> In the section 110 context, which provides insight because of section 111(d)’s reference thereto, courts have rejected attempts by EPA to dictate to the States the choices they employ in their SIPs. *See Train v. NRDC*, 421 U.S. 60, 79 (1975) (explaining that although EPA is “plainly charged” with setting NAAQS, EPA has “no authority to question the wisdom of a State’s choices of emission limitations if they are part of a plan which satisfies the standards of § 110(a)(2)”; *Union Electric Co. v. EPA*, 427 U.S. 246, 268-69 (1976) (rejecting claims of technological or economic infeasibility as basis for EPA to deny SIP, because “Congress plainly left with the States . . . the power to determine which sources would be burdened by regulation and to what extent” and that Congress considered risks associated with technology forcing and “decided that the dangers posed by uncontrolled air pollution made them worth taking”).

retain the authority to determine *how* to achieve the overall emission limitations. *See, e.g., Virginia v. EPA*, 108 F.3d 1397, 1410 (D.C. Cir. 1997) (finding that EPA has no authority under section 110, as amended in 1990, to force a State to adopt particular control measures). At the same time, EPA must ensure that state plans achieve real, quantifiable and enforceable reductions.

Because the States must demonstrate that their plans comport with EPA's guidelines, EPA should provide sufficient guidance regarding the minimum requirements and how the States can show that their strategies will achieve the necessary reductions. Equivalency determinations should be guided by the general principles discussed above: that Congress gave EPA the authority to require the States to achieve specified reductions, that Congress gave the States the authority to set performance standards for existing sources, and that Congress recognized the need for flexibility, including the appropriateness of considering remaining useful life and other factors for particular sources.

**A. The States must be given flexibility in their plans provided that their proposed programs are enforceable.**

Given the daunting challenge of addressing climate change, EPA should fully embrace the flexibility built into the statutory design by accepting a variety of state programs under section 111(d) so long as those programs achieve the emission limitation EPA sets and are enforceable.<sup>37</sup> As discussed above, many States have already implemented a variety of programs that have achieved significant reductions of carbon dioxide emissions from the power sector. These programs include 1) both interstate and intrastate market-based programs that cap carbon dioxide emissions at reduced levels, 2) retirement and refurbishment planning as well as renewable portfolio standards that encourage a shift away from more carbon-intensive electricity production, and 3) demand side management and energy efficiency programs that reduce the amount of electricity needed and thereby cause a decrease in carbon dioxide pollution. Because these types of programs have succeeded in reducing carbon pollution from the power sector, the States should be permitted to rely on these programs in their plans, subject to EPA review, to demonstrate equivalency consistent with section 111(d)'s requirements.

---

<sup>37</sup> The National Association of Regulatory Utility Commissioners (NARUC), whose members' fundamental role is to assure that utilities provide reliable electricity at a fair cost, recently recognized the need to address greenhouse gas emissions with flexibility and from a regional perspective, resolving that, among other things, "the guidelines should provide sufficiently flexible compliance pathways or mechanisms that recognize State and regional variations to achieve the most cost-effective emissions reductions in each State;..." *Resolution on Increased Flexibility with Regard to the EPA's Regulation of Greenhouse Gas Emissions from Existing Power Plants*, available at <http://www.naruc.org/Resolutions/Resolution%20on%20Increased%20Flexibility%20with%20Regard%20to%20the%20EPAs%20Regulation%20of%20Greenhouse%20Gas%20Emissions%20from%20Existing%20Power%20Plants.pdf>.

Similarly, if EPA elects to issue a rate-based emission guideline, EPA should provide guidance to the States, for the purpose of demonstrating equivalency of state programs. For example, if EPA issues a pounds-per-megawatt hour carbon dioxide limit on power plant emissions, it should provide guidance on how to translate that rate-based emission guideline into a mass-based standard, for example, tons of carbon dioxide emitted annually from power plants, individually and/or combined in a state or regional system (see below).

EPA should also provide adequate guidelines on appropriate implementation and enforcement mechanisms, such as monitoring and reporting requirements. These guidelines are necessary to ensure that each State meets its obligations and that no “double counting” occurs. One option EPA could consider that would allow for flexibility yet ensure enforceability would be to allow the States to utilize a multi-year compliance period. Under this approach, each source is required to demonstrate full compliance on a multi-year, instead of an annual, basis.

**B. States should be allowed to use trading programs to meet their section 111(d) obligations.**

Cap-and-trade programs are well-suited to address greenhouse gas emissions from existing power plants in light of the ability of such programs to ensure source compliance with emission limitations and the difference in “hot spot” effects caused by greenhouse gas emissions and criteria pollutants. If a cap-and-trade program sets the cap appropriately below current emissions and mandates that all emissions from sources in the category are covered by sufficient allowances, such a program should qualify as a system that requires continuous emission reduction. *See* 42 U.S.C. §§ 7411(a); 7602(l).<sup>38</sup> As discussed below and in the next section, EPA should therefore allow the States to use intrastate and interstate cap-and-trade programs in meeting their section 111(d) obligations.

EPA has previously allowed the States to implement trading programs to satisfy their section 111(d) obligations. For example, in its municipal waste combustor rule, EPA allowed the States to establish a program to enable municipal waste combustor plants to engage in trading of nitrogen oxides emission credits, so long as EPA approved the trading program before implementation. 60 Fed. Reg. 65,387, 65,402 (Dec. 19, 1995); 40 CFR § 60.33b.

---

<sup>38</sup> EPA may consider scenarios in which emissions reductions attributable to renewables generation and increased end use energy efficiency would be credited on the basis of carbon dioxide emissions avoided, and such credits used by covered facilities to achieve compliance with the emission guidelines. *See, e.g.*, Natural Resources Defense Council, Closing the Power Plant Carbon Pollution Loophole: Smart Ways the Clean Air Act Can Clean Up America’s Biggest Climate Polluters (March 2013). In considering these scenarios, EPA should evaluate and articulate any methodology to be used to determine credit eligibility sufficient to satisfy section 111(d)’s existing source emission limitation requirement.

Similarly, in the Clean Air Mercury Rule (CAMR), EPA authorized the States to participate in a cap-and-trade program to meet their section 111(d) obligations. 70 Fed. Reg. at 28,616-17. Although that rule was vacated by the D.C. Circuit on other grounds,<sup>39</sup> there are several aspects of that rulemaking that could inform EPA's thinking here, especially given that greenhouse gas emissions do not pose the type of "hot spot" concerns as pollutants such as mercury.

First, in determining that a cap-and-trade program could be considered the best system of emission reduction, EPA concluded that it was the best system "in the relevant timeframe." 70 Fed. Reg. at 28,617. That is instructive here where in light of the potential options for existing power plants, supply side energy efficiency, fuel switching, and co-firing with cleaner fuels, shifting dispatch to lower emitting facilities, and demand side energy efficiency are some of the emission reduction strategies available "in the relevant timeframe."

Second, EPA allowed each State to choose whether to fulfill its section 111(d) obligations by participating in a cap-and-trade program or selecting some other means to stay within its statewide emissions budget. A similar approach could work here for greenhouse gas emissions. Third, EPA required new units to be subject to the cap-and-trade program and to hold sufficient allowances to cover their emissions. *See* 70 Fed. Reg. at 28,632. EPA let each State choose an allocation method and choose whether to set aside allowances to account for new units. *See id.* at 28,632; 69 Fed. Reg. at 12,406-409. Similarly, the States should have the option of including all power plants, including those that may come on-line after a state plan is approved, within a trading plan for greenhouse gas emissions. A state plan could specify its allocation method and specify how new units will be accommodated.

A source category cap-and-trade program, whether standing alone or as an element of a larger state cap-and-trade program, will drive reductions both at and outside the source category because cap-and-trade is designed to provide an economic incentive for sources to increase efficiency and deploy other means of reducing emissions and for end users to innovate, as well. All reductions attributable to such a market-based approach should be considered for purposes of EPA's best system of emissions reduction determination. Nevertheless, while cap-and-trade drives reductions outside the source, it is not necessary to quantify and account for those reductions for compliance purposes. For all the reasons discussed

---

<sup>39</sup> The D.C. Circuit vacated the section 112 delisting rule that EPA relied upon to promulgate CAMR under section 111(d). *New Jersey v. EPA*, 517 F.3d 574 (D.C. Cir. 2008). References to the CAMR in this paper do not reflect any support or endorsement of EPA's attempt through CAMR to regulate hazardous air pollutants under section 111 rather than section 112. As discussed above, a cap-and-trade program involving greenhouse gas emissions does not raise the type of local air pollution concerns that were present with respect to CAMR.

above, EPA should allow the States to use a cap-and-trade system under section 111(d).

**C. The States should be allowed to work together to meet their obligations.**

The States should be allowed to cooperate with each other to achieve the overall reductions and to demonstrate regional compliance, consistent with the Act's general encouragement of cooperative activities by the States and local government for the prevention and control of air pollution. 42 U.S.C. § 7402. Moreover, as a matter of state sovereignty, the States should be given the choice of working in coordination with their sister States to meet their section 111(d) obligations, so long as each individual state plan is enforceable against covered facilities and ensures against both States claiming "credit" for the same emission reductions.

Regional efforts can reduce emissions at least as effectively as individual state efforts, and more cost-efficiently. Regional efforts may be especially appropriate because, as discussed above, existing power plants are components of a complex and interconnected electricity grid, or network, that supplies the nation's energy. Allowing regional cooperation among States that share an electricity grid would also decrease the likelihood of emissions leakage by maintaining an even playing field among those sources within the same regional transmission organization.

EPA in the section 110 context has already recognized that redistribution of NO<sub>x</sub> emissions among three States within a power pool is appropriate if the overall budget remains the same. 64 Fed. Reg. at 49,989.<sup>40</sup> The same rationale applies here to allow the States to cooperate together to achieve overall regional reductions under section 111(d), provided that those reductions are enforceable.

**D. EPA should evaluate allowing the States to implement their state plan reduction requirements in phases.**

EPA should evaluate allowing the States to implement their state plan reduction requirements in phases and require sources to meet specified emission reductions by certain target dates, according to when the reductions are achievable. A phased approach would allow the States to account for planned retirements, or the remaining useful life of sources, and call for more modest reductions sooner and greater reductions later when an old, less efficient source will be replaced, or at least have its electricity production replaced, by a cleaner more efficient source or demand reduction measures. *See* 42 U.S.C. § 7411(d)(1); H.R. Rep. No. 95-294, at 195, *as reprinted in* 1977 U.S.C.C.A.N. 1077, 1274 (explaining that EPA's "guidelines must take into account the remaining useful life of existing sources").

---

<sup>40</sup> *See* discussion *infra* pp. 19-20.

However, any phasing must be scrutinized to account for the critical need to reduce greenhouse gas emissions from power plants as expeditiously as possible.

**V. Conclusion**

Section 111(d) gives EPA and the States the necessary authority to make meaningful reductions of harmful greenhouse gas emissions from existing power plants. Existing state programs adequately demonstrate that significant emission reductions from the power sector are achievable. EPA accordingly should apply the best system of emission reduction as reflected by these state programs and require the States to achieve the corresponding emission limitation as expeditiously as possible. By working together, as mandated by section 111(d), EPA and the States can reduce carbon pollution as necessary to protect human health and welfare.

Respectfully submitted,

### INTEREST OF *AMICI CURIAE*<sup>1</sup>

The disposition of this case requires a careful analysis of this Court's decision in *Massachusetts v. EPA*, 549 U.S. 497 (2007). Everyone, including the parties and the court below, recognizes the momentous economic consequences at stake, as well as the difficult statutory and separation-of-powers questions that have arisen over EPA's interpretation of *Massachusetts*. The policy questions stir passionate interest on all sides. At its heart, however, *Massachusetts* was not a "global warming case"; it was an administrative law case. The disposition of this case may depend in no small part on what *Massachusetts* did and did not say on questions of administrative law.

*Amici* law professors (listed in Appendix A) have taught and written extensively on administrative law as well as constitutional and environmental law. The Judicial Education Project is a non-profit educational organization in Washington, D.C., dedicated to defending the Constitution as envisioned by its Framers—a federal government of enumerated,

---

<sup>1</sup> The parties have consented to the filing of this brief in letters on file in the Clerk's office. Pursuant to S. Ct. R. 37.6, *amici* state that no counsel for any party authored this brief in whole or in part, and no person or entity, other than *amici*, their members, or their counsel, made a monetary contribution intended to fund the preparation or submission of this brief. *Amici* law professors received no compensation for offering the views reflected herein. Counsel of record represented certain petitioners in the proceedings below, but is solely representing *amici* before this Court.

limited powers. Through this brief, they seek to inform the Court of the exceptionally important administrative law questions at issue in this extraordinary case.

*Amici* file this brief in support of petitioners the Chamber of Commerce, the State of Alaska, and the American Farm Bureau Federation (Case No. 12-1272). In *amici*'s judgment, those petitioners provide the most comprehensive discussion of the key issues in this case: the proper reading of *Massachusetts*; the correct interpretation of the Clean Air Act; and EPA's deployment of an "absurdity doctrine" that would permit agencies to rewrite congressional statutes and thus violate foundational separation-of-powers principles.

## INTRODUCTION AND SUMMARY OF ARGUMENT

This case is the Court's third encounter with global warming and government policies on greenhouse gases. In its previous rulings, the Court held that EPA has authority to regulate greenhouse gas emissions under the Clean Air Act's "capacious" Act-wide definition of "air pollutant," *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007), and that the agency "must ground its reasons for action or inaction in the statute," *id.* at 535. The Court also held that the congressional grant of authority displaces any claim arising under the federal common law of (interstate) nuisance, regardless of whether EPA actually exercises that authority. *American Elec. Power v. Connecticut*, 131 S. Ct. 2527, 2538–39 (2011).

This third encounter with global warming regulation is of a very different kind. It is the Court's first review of EPA's actual exercise of authority to issue binding greenhouse gas regulations, as distinct from the potential existence and displacement effect of that authority *vel non*. That exercise, all parties agree, is of breathtaking proportion, potentially covering millions of heretofore unregulated stationary emission sources with a highly prescriptive, detailed regime of permitting and compliance obligations. JA259–60. All parties also agree that the administration of that regime—the Prevention of Significant Deterioration ("PSD"), 42 U.S.C. §§ 7501 *et seq.*, and Title V, 42 U.S.C. §§ 7661 *et seq.*, programs of the Clean Air Act—would, with respect to greenhouse gases, entail "absurd" consequences that Congress cannot conceivably have

intended. *See* 73 Fed. Reg. 44,354, 44,503 (July 30, 2008) (JA1271–73), *id.* at 44,512 (JA1309–10); 75 Fed. Reg. 31,514, 31,597 (June 3, 2010) (JA632–34); *see also* 74 Fed. Reg. 55,292, 55,306–11 (Oct. 27, 2009). For precisely that reason, EPA claims unprecedented authority to re-write, unilaterally, the numerical permitting thresholds contained in those programs, and to revise the rewritten thresholds whenever it chooses. *See* JA268.

The decisions of EPA and the court below rest on an aggressive interpretation of this Court’s decision in *Massachusetts*. *See, e.g.*, JA973, JA236–37 (the Act’s “plain[] language” is “buttressed” by *Massachusetts*’ interpretation of section 302(g), 42 U.S.C. § 7602(g)); *cf.* JA180 (Kavanaugh, J., dissenting from denial of rehearing en banc) (the panel’s “conclusion [that ‘air pollutant’ must include greenhouse gases for PSD purposes] appears to have been heavily if not dispositively influenced by *Massachusetts v. EPA*.”). Upon casual reading, that understanding may appear to find support in *Massachusetts*’ *dicta*, stripped from the context in which they appear and without accounting for the case’s unusual posture. But it is important to determine with greater care what exactly this Court has and has not held with respect to EPA’s authority and obligations to regulate greenhouse gases. That examination counsels a far more nuanced analysis than the broad-brush reading adopted by EPA and by the court below. Most critically with respect to the question presented here, and contrary to EPA’s contention, *Massachusetts* did *not* hold that greenhouse gases must be “air pollutants” *for all purposes* of the Clean Air Act. This brief addresses

three sets of concerns arising over EPA's misinterpretation.

*First, Massachusetts* should be understood in the context of the posture in which the case arrived at the Court—EPA's denial of a rulemaking petition under section 202(a), 42 U.S.C. § 7521(a), governing emissions from new motor vehicles. While the Court's opinion contains broad (and occasionally ambiguous) pronouncements, its explicit holdings, as well as the relief granted, addressed the questions arising from the specific, discrete agency action under review. The Court's *dicta* provide no warrant for the agency's unprecedented assertion of regulatory authority in this case. (See Section I, below.)

*Second*, EPA's overreading of *Massachusetts* upends familiar *Chevron* canons. See *Chevron USA Inc. v. Natural Res. Defense Council, Inc.*, 467 U.S. 837, 842–43 (1984). On its migration from an “endangerment finding” to the comprehensive regulation of stationary sources, EPA employs the *Chevron* “step one” inquiry not as a comprehensive interpretive endeavor but as a simplistic “magic word” canon: so far as greenhouse gases are concerned, “air pollutant” must have the same meaning throughout the entire Clean Air Act. Confronted with the absurd consequences of that approach, EPA then claims authority to re-write unambiguous, numerical emission thresholds that govern the coverage of stationary sources under the PSD and Title V programs. In this deployment, *Chevron* canons produce the separation-of-powers

problems that those canons, properly applied, serve to contain. (See Section II, below.)

*Third*, in an administrative law context, the overreading of this Court's decisions poses special and particularly acute dangers. Separation-of-powers problems are never far afield, and agencies have powerful incentives to seize on judicial pronouncements as a warrant to expand their authority. This case poses those problems in spades. (See Section III, below.)

## ARGUMENT

### **I. This Court's Decisions Do Not Command EPA's Position Or The Ruling Below.**

EPA and the court below overread *Massachusetts* in three key respects. *First*, *Massachusetts* did not directly impose any affirmative regulatory obligations on EPA. In fact, the Court specifically disavowed any such holding. *Second*, *Massachusetts* did not hold that the generic Act-wide definition of "air pollutant" requires that the term have the identical meaning for all purposes and programs throughout the statute. The contrary interpretation puts *Massachusetts* on a collision course with *Environmental Defense v. Duke Energy Corp.*, 549 U.S. 561 (2007). In that case, the Court held that EPA had discretion to interpret the term "modification" of a stationary emission source differently for different parts of the Act—despite an explicit statutory cross-reference that, on its face, appeared to mandate an identical construction. *Id.* at 576; see *id.* at 574 ("A given term in the same statute may take on distinct characters from

association with distinct statutory objects calling for different implementation strategies.”). *Third*, *Massachusetts* did *not* eliminate EPA’s discretion with respect to regulating greenhouse gases; rather, it exhorted EPA “to exercise discretion within defined statutory limits.” 549 U.S. at 533.

**A. *Massachusetts* Imposed No Direct Regulatory Obligations On EPA.**

In EPA’s rendition, *Massachusetts* assumes the air of a *mandamus* ruling or, perhaps more modestly, a case compelling agency action unlawfully withheld. 5 U.S.C. § 706(1); *see, e.g.*, JA295, 1072–73; JA195 (*Massachusetts* “held that EPA had a ‘statutory obligation’ to regulate harmful greenhouse gases”). In truth, *Massachusetts* presented no such scenario and imposed no such obligation.

There was nothing to compel or mandate in *Massachusetts*—other than agency compliance with the correct legal standard—because EPA *had* taken a final action: it had denied a petition for rulemaking under section 202(a)(1). The review of that final action was an “arbitrary and capricious” case. *Massachusetts*, 549 U.S. at 505; *cf. American Elec.*, 131 S. Ct. at 2533 (summarizing *Massachusetts*’ holding). This Court deemed the agency’s action reviewable under the deferential standard applicable to denials of petitions for rulemaking (as distinct from full notice-and-comment rules). *Massachusetts*, 549 U.S. at 527 (citing *American Horse Protection Ass’n, Inc. v. Lyng*, 812 F.2d 1, 3–4 (D.C. Cir. 1987)).

From beginning to end, from the questions presented to the relief granted, *Massachusetts*

addresses the agency's reasons for its final action and the statutory provisions bearing on the adequacy of those reasons. The Court's opinion begins with a precise statement of petitioners' "two questions concerning the meaning of 202(a)(1)" of the Clean Air Act:

whether EPA has the statutory authority to regulate greenhouse gas emissions from new motor vehicles; and if so, whether its stated reasons for refusing to do so are consistent with the statute.

*Massachusetts*, 549 U.S. at 505. The Court's opinion answers the first question in the affirmative and the second in the negative. Admittedly, neither part of the opinion is free from ambiguity. The difficulties arise from the peculiar posture of the case.

As to petitioners' first question, the Court rejected the categorical position, then advanced by EPA, that greenhouse gases cannot be "air pollutants" for purposes of the Clean Air Act—not ever, not for any regulatory program. *Massachusetts*, 549 U.S. at 513 (stating the agency's position). While proffered in response to a rulemaking petition under a specific section (§ 202(a)(1)) of the Act, EPA's position could not and did not rest on an interpretation of *that* section. Instead, the agency maintained that greenhouse gases did not fall under the Act-wide definition of "air pollutant" in section 302(g). Repeatedly emphasizing the "broad," "sweeping," and "capacious" language of that provision, *Massachusetts* held that EPA's position was foreclosed: Section 302(g) "unambiguous[ly]"

includes greenhouse gases. *Massachusetts*, 549 U.S. at 529.

So far as *amici* are aware, no petitioner contests that holding. The far more difficult question is whether including greenhouse gases within section 302(g)'s "capacious" definition compels the same conclusion with respect to all of the Clean Air Act's other provisions. A few sentences in the Court's opinion, ripped out of context, may seem to suggest an affirmative answer. *E.g.*, *Massachusetts*, 549 U.S. at 532 ("Because greenhouse gases fit well within the Clean Air Act's capacious definition of 'air pollutant,' we hold that EPA has statutory authority to regulate the emission of such gases from new motor vehicles."). But the Court's contemporaneous decision in *Duke Energy Corp.* held that "a given term in the same statute may take on distinct characters from association with distinct statutory objects calling for different implementation strategies." 549 U.S. at 574. A more careful reading of *Massachusetts* dispels the notion that the term "any air pollutant" must have the same meaning for all statutory purposes.

Petitioners' second question concerned the agency's claimed discretion to decline to exercise regulatory authority. The Court held that the agency had "offered no reasoned explanation," only "a laundry list of [policy] reasons not to regulate." *Massachusetts*, 549 U.S. at 533–34. And it held that "EPA must ground its reasons for action or inaction in the statute." *Id.* at 535. Legal scholars and lower courts have struggled to discern the Court's precise holding on this point. The discretion-limiting

language may refer to the agency’s determination of whether an air pollutant meets section 202(a)(1)’s “endangerment” standard or (also) to the agency’s decision about whether to make that judgment in the first instance. *See, e.g.,* Jody Freeman & Adrian Vermeule, *Massachusetts v. EPA: From Politics to Expertise*, 2007 Sup. Ct. Rev. 51, 78–80, 83–87 (2007) (discussing the ambiguity in detail). In *amici*’s estimation, *Massachusetts* is best read for the more limited proposition that “*once EPA has responded to a petition for rulemaking, its reasons for action must conform to the authorizing statute.*” *Massachusetts*, 549 U.S. at 533 (emphasis added).<sup>2</sup> Both EPA and the D.C. Circuit have adopted that reading. JA194–95; JA1072–73; *but see Natural Res. Defense Council v. FDA*, 872 F. Supp. 2d 318, 333–34 (S.D.N.Y. 2012). Either way, *Massachusetts* channels *but does not erase* EPA’s discretion to take *or decline* to take action on an endangerment finding under section 202, let alone other regulatory programs.

The Court’s opinion in *Massachusetts* powerfully supports a circumspect interpretation. It ends, in its last sentences, with a concise statement of the relief granted, tailored to the questions presented:

We need not and do not reach the question whether on remand EPA must make an

---

<sup>2</sup> On a more aggressive interpretation, *Massachusetts* might be read as holding that EPA *must* make an “endangerment finding” whenever it receives a petition to that effect. *Cf. Massachusetts*, 549 U.S. at 549 (Scalia, J. dissenting). For reasons stated in the text, *Massachusetts* ought not be read in such a novel construction.

endangerment finding, or whether policy concerns can inform EPA's actions in the event that it makes such a finding. We hold only that EPA must ground its reason for action or inaction in the statute.

*Massachusetts*, 549 U.S. at 534–35 (citation omitted); see also S. Ct. R. 14.1(a).

Put politely, it is a stretch to convert this summary of the Court's holding—which disclaims any judicially imposed agency obligation to make an endangerment finding, let alone to regulate—into an affirmative “statutory obligation’ to regulate.” JA195.<sup>3</sup> Even if *Massachusetts* made it likely that some federal regulation of greenhouse gas emissions would follow, the Court's holding imposed no legal obligation even with respect to the mobile source program at issue in the case, not to mention the Clean Air Act at large.

---

<sup>3</sup> The “statutory obligation” quoted by the court below appears in the following sentence: “Nor can EPA avoid its statutory obligation by noting the uncertainty surrounding various features of climate change and concluding that it would therefore be better not to regulate at this time.” *Massachusetts*, 549 U.S. at 534 (citing 68 Fed. Reg. at 52,930–31). The sentence summarizes the agency's position at the time. It cannot plausibly be read as an affirmative judicial command to regulate; rather, it simply says that scientific uncertainty is not a sufficient reason for inaction. In the two-page section containing the quoted language, *Massachusetts* repeatedly declined to decide whether EPA must act even by making an endangerment finding under section 202(a), let alone regulate. *Id.* at 533; *id.* at 534 (“We need not and do not reach the question whether on remand EPA must make an endangerment finding . . .”).

And yet: overreading *Massachusetts*, EPA has constructed, and the court below has upheld, the propositions that (1) an air pollutant that “fit[s] well” under a “capacious,” statute-wide definition *must* be an “air pollutant” for all purposes of that Act; and (2) a ruling that limits an agency’s discretionary authority to reasons grounded “in the statute” eliminates agency discretion altogether. JA201–05, 221–22, 236–38. Both propositions suffer from a common fallacy, that of the excluded “third” or “middle.” Both reach far beyond the limited holdings of *Massachusetts*. Both run up hard against bedrock tenets of administrative law. Both should be rejected.

**B. *Massachusetts* Did Not Hold That Greenhouse Gases Are “Air Pollutants” For All Purposes Of The Act.**

EPA’s “Triggering Rule,” which is also referred to as its “Timing Rule,” 75 Fed. Reg. 17,004 (Apr. 2, 2010) (JA705), is a critical step in a sequence of rulemaking proceedings orchestrated by EPA in the wake of *Massachusetts*. EPA made an “Endangerment Finding” under section 202(a), which in turn prompted the imposition of greenhouse gas emission standards for new motor vehicles. *See* 74 Fed. Reg. 66,496 (Dec. 15, 2009) (JA793); 75 Fed. Reg. 25,324 (May 7, 2010) (JA683). EPA then issued its Triggering Rule, prompting the imposition of greenhouse gas emission standards for stationary sources under the Clean Air Act’s PSD and Title V programs—which, if administered in accordance with the Act’s unambiguous terms, would extend the expensive, cumbersome PSD permitting

requirements to even very small sources and render both programs unworkable by overwhelming the capacity of state and federal permitting authorities. EPA failed to properly consider that statutory absurdity in its Triggering Rule. JA705. Instead, it issued a “Tailoring Rule,” effectively rewriting the statutory emission standards. See 75 Fed. Reg. 31,514 (June 3, 2010) (JA268). EPA’s central defense of this remarkable assertion of authority, and the holding of the decision below, is that *Massachusetts* compelled the result.

EPA determined that the statutory “permit triggers” of sections 165(a) and 169(1), 42 U.S.C. §§ 7475(a), 7479(1), *required* the imposition of PSD requirements for “major” greenhouse gas emission sources. Section 169(1), the agency noted, governs sources that (potentially) emit in excess of specified amounts of “any air pollutant.” Thus, in the agency’s view, once it classified greenhouse gases as regulated pollutants under section 202(a), the statute’s plain language compelled the regulation of those pollutants under the PSD program. JA333–36. The court below did not deem that determination merely “permissible”; it held that the agency *had no other choice*. JA236 (“[W]e agree with EPA that its longstanding interpretation of the PSD permitting trigger is statutorily compelled.”). In support of that conclusion, the court cited the Act’s “plain language” and this Court’s ruling in *Massachusetts*. *Id.*

Strikingly, however, the court below in fact disavowed the proposition that the statute’s “plain language” means, literally, *any* air pollutant. The phrase, the court explained (agreeing with EPA’s

position) must in this context mean any *regulated* air pollutant: any other interpretation would be “absurd.” JA237–38. Similarly, EPA has in several other instances adopted a narrowing definition, where adherence to an “any means any” position would render statutory provisions and programs senseless. *See, e.g.*, 40 C.F.R. pt. 51, App. Y, sec. II.A. (in the context of the Act’s visibility program, 91 Stat. 685, “any pollutant” means “any visibility-impairing pollutant”).<sup>4</sup>

Under this interpretation, “any air pollutant” thus means each and every pollutant in any statutory context—except when it doesn’t. And both the ironclad rule (“any means each and every”) and the exception (“any pollutant” means “any regulated pollutant”) are supposedly commanded by the statute. Manifestly, a “plain language” analysis cannot yield such a result. JA175–79 (Kavanaugh, J., dissenting from denial of rehearing en banc). *Massachusetts*—and the perceived gloss it put on the statute—is the *only* basis for EPA’s and the lower court’s “must regulate” interpretation of the permit triggers. Yet the agency’s interpretation of *Massachusetts* merits no *Chevron* deference, *see*

---

<sup>4</sup> The court below provided an extended statutory interpretation purporting to explain why “any pollutant” in that context must be understood in a narrower sense. JA238–41. Regardless of what one makes of the discussion, it confirms that statutory interpretation requires close attention to the context, not a mechanical importation of terms from one portion of a statute into another. *Duke Energy*, 549 U.S. at 574–76.

*Negusie v. Holder*, 555 U.S. 511 (2009) and, in any event, the agency misreads *Massachusetts*.

Upon casual reading, *Massachusetts* may seem to permit or perhaps even encourage EPA's expansive reading. See, e.g., *Massachusetts*, 549 U.S. at 528 (emphasizing the "sweeping definition of 'air pollutants'" in section 302(g)); *id.* at 529 ("On its face, the definition [of air pollutants in section 302(g)] embraces all airborne compounds of whatever stripe, and underscores that intent through the repeated use of the word 'any.'"); *id.* at 532 (greenhouse gases "fit well within" the definition); *id.* at 531 ("[T]here is nothing counterintuitive to the notion that EPA can curtail the emission of substances that are putting the global climate out of kilter."); *id.* at 529 ("The statute is unambiguous."). The lower court laid great stress on these pronouncements and, in particular, *Massachusetts's* suggestion that the statute is unambiguous. JA237 ("Crucially for purposes of the issue before us [the interpretation of the section 165(a) and section 169(1) permit triggers], the Court concluded that 'the statute is unambiguous.'" (quoting *Massachusetts*, 549 U.S. at 529)). Respectfully, that inference is unwarranted.

Each and every one of the just-quoted, broad and inclusive formulations appears in the Court's analysis of the meaning of *section 302(g)*. The Court's references to "the statute" must be understood in that context, lest they become meaningless: it is difficult to imagine an entire statute that is unambiguous *per se*, across the board, and in every respect. The precise question before the Court was whether EPA was right in insisting "that

carbon dioxide is not an ‘air pollutant’ within the meaning of [section 302(g)],” and the Court’s answer was that “[t]he statutory text forecloses EPA’s reading.” *Massachusetts*, 549 U.S. at 528. The statutory text is section 302(g), as distinct from section 202(a) or, for that matter, the PSD permitting triggers. Whether a particular statutory phrase like “any air pollutant” is unambiguous in any given regulatory context or necessarily imported into that context is a separate question; it remains a matter of statutory interpretation.

Unlike EPA’s and the lower court’s attempt to read *Massachusetts* as a mandate for a-contextual literalism, the reading just described renders *Massachusetts* consistent with the Court’s holding and opinion in *Duke Energy*—decided the same day, under the same statute. The Court held in that case that EPA had discretion to interpret the term “modification” of a stationary emission source differently for different parts of the Act—despite an explicit statutory cross-reference (added by a standalone technical amendment) that, on its face, appeared to mandate an identical construction. *Duke Energy*, 549 U.S. at 576. Even in that context, the Court held that “[a] given term in the same statute may take on distinct characters from association with distinct statutory objects calling for different implementation strategies.” *Id.* at 574; *see also id.* at 575-76 (“There is, then, no ‘effectively irrebuttable’ presumption that the same defined term in different provisions of the same statute must ‘be interpreted identically.’ Context counts.” (citation omitted)). If an explicit cross-reference from one program to another cannot strictly command an identical

interpretation, a statute-wide definition of “air pollutant” cannot do so either—least of all when an agency’s insistence to the contrary produces a statutory “absurdity” and a corresponding claim of authority to rewrite the statute.

To put the point directly: while *Massachusetts* unequivocally rejected EPA’s categorical contention that greenhouse gases *could not* be “air pollutants” for any purposes of the Act, *Massachusetts*, 549 U.S. at 528, the Court did not thereby embrace EPA’s current, equally categorical position that greenhouse gases *must* be air pollutants for all purposes and programs of the Clean Air Act without regard to the statutory or real-world consequences of such an interpretation. To spell out the omitted “third” in EPA’s analysis: It is entirely possible and plausible that an air pollutant that is *included* by the capacious definition of section 302(g) is an air pollutant for some *but not all* purposes of the Act. Section 302(g) unambiguously embraces greenhouse gases within the Act-wide pollutant definition. EPA’s statutory authority, much less its statutory obligation, to regulated greenhouse gases under any particular Clean Air Act program is a very different question—which the Court left explicitly undecided even with respect to section 202(a), let alone other programs. *Id.* at 535. The Court’s decision in *American Electric Power* likewise assumed EPA’s potential *authority* to regulate greenhouse gas emissions from fossil-fuel fired power plants (rather than motor vehicles) but explicitly contemplated the possibility that EPA might lawfully “decline to regulate carbon-dioxide emissions altogether at the

conclusion of its [pending] rulemaking.” 131 S. Ct. at 2538–39.

To be sure, *Massachusetts* rejected the notion that EPA has “authority to narrow that definition [of section 302(g)] whenever expedient by asserting that a particular substance is not an [air pollution] ‘agent.’” 549 U.S. at 529 n.26. And while a “whenever expedient” prohibition is not much of a restraint on an agency’s discretion, the Court rejected several of EPA’s proffered reasons for declining jurisdiction over greenhouse gases. Crucially, however, that discussion focuses not on regulation under the Clean Air Act at large but on regulation *under section 202(a)*. Nothing in *Massachusetts* suggests that EPA would be foreclosed from ever applying a narrowing construction when necessary to harmonize the Clean Air Act’s provisions and avoid results that Congress could not have intended.

Significantly, the Court rejected EPA’s reliance on *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120 (2000), on two grounds. *First*, the Court concluded that unlike an FDA ban on tobacco products, “EPA jurisdiction would lead to no such extreme measures.” *Massachusetts*, 549 U.S. at 531. That determination is readily explained by the posture of the case. The *Massachusetts* petitioners solemnly averred that they were seeking no relief beyond a reconsideration of the rulemaking petition. *See* Br. for Petitioner at 3, *Massachusetts*, 549 U.S. 497, 2006 WL 2563378. The Court awarded only that limited relief, *Massachusetts*, 549 U.S. at 534–35, and it carefully noted EPA’s discretion to delay action and to consider compliance costs *under section*

202(a)(2). *Id.* at 531. *Second*, the Court observed that, in contrast to congressional actions suggesting that FDA lacked authority to regulate tobacco, “EPA has not identified any congressional action that conflicts in any way with the regulation of greenhouse gases *from new motor vehicles.*” *Id.* (emphasis added). Moreover, the Court rejected EPA’s contention that EPA regulation of greenhouse gases might conflict with the authority of the Department of Transportation to set mileage standards, a consideration that is obviously irrelevant outside the context of regulating mobile sources. *Id.* at 531–32. The discussion strongly suggests that the unambiguous, statute-wide definition of “air pollutant” does not compel EPA to regulate merely because the same term appears in another operative provision.

As a technical matter of administrative law, it is arguable that *Massachusetts* leaves the question of whether greenhouse gases must be regulated as air pollutants open even with respect to new motor vehicle emissions under section 202(a). What is not arguable is that *Massachusetts* emphasized that neither “extreme measures” and “counterintuitive” results nor statutory conflicts would ensue from regulating “greenhouse gases from new motor vehicles.” *Id.* at 531. In sharp contrast, everyone agrees that applying the numerical emission thresholds in the PSD and Title V programs to stationary source greenhouse gas emissions *would* entail “extreme measures” and directly conflict with Congress’s intent.

The numerical statutory thresholds are not only completely unambiguous; they also reflect a deliberate and careful legislative compromise. See *Alabama Power Co. v. Costle*, 636 F.2d 323, 350, 353–54 (D.C. Cir. 1979) (per curiam). Congress carefully structured the PSD and Title V programs to “minimize disruption,” *id.* at 350, and carefully selected the numerical thresholds to “identify facilities which, due to their size, are financially able to bear the substantial regulatory costs imposed by the PSD provisions and which, as a group, are primarily responsible for emission of the deleterious pollutants that befoul our nation’s air.” *Id.* EPA does not dispute that the statutory thresholds, as applied to greenhouse gases, would entail precisely the disruption that Congress sought to avoid. The agency’s response—an exemption for smaller emitters in the form of a statutory rewrite, subject to future upward revision, see JA268—conflicts not only with the plain language of the statute but also with the legislature’s unmistakable intent. Congress designed the statutory thresholds as a safe harbor for smaller emitters, not an EPA-administered holding pen.

The short of it is that *Massachusetts* does not impose a generalized “statutory obligation” to regulate” greenhouse gases, least of all by means of an administrative rewrite of the statutory language. And because the confessedly “extreme measures” and the “absurdity” that attend the regulation of stationary sources were neither presented nor considered in *Massachusetts*, it is pure speculation

what the Court *might* have said about those matters.<sup>5</sup> In this very different case and context, reliance on *Massachusetts* beyond its specific holding is misplaced. See *Cohens v. Virginia*, 19 U.S. (6 Wheat.) 264, 399 (1821) (“general expressions, in every opinion, are to be taken in connection with the case in which those expressions are used,” and “[i]f they go beyond the case, they may be respected, but ought not to control the judgment in a subsequent suit when the very point is presented for decision”).

**C. *Massachusetts* Directed EPA To Exercise Discretion In Accordance With The Statute.**

The same misreading of *Massachusetts* characterizes the agency’s and the lower court’s discussion of whether EPA must act in the first instance. It is uncontested that EPA’s interpretation of *Massachusetts* would produce “absurd” consequences: EPA not only admitted but affirmatively relied on that absurdity in defense of its Tailoring Rule. JA286. And yet on EPA’s account and that of the court below, agency discretion to take that statutory absurdity into account disappears at

---

<sup>5</sup> Responding to Judge Brown’s dissent from the denial of rehearing *en banc*, the panel disputes this characterization, observing that a respondent’s brief adverted to the potential consequences for stationary source regulation. JA142–43. Respectfully, that is exceedingly thin gruel. Not one word in *Massachusetts* discusses the question. Whether individual justices considered the consequences *in foro interno* is haruspicy, not legal argument. Cf. *City of Arlington v. FCC*, 133 S. Ct. 1863, 1871 (2013).

each critical juncture. Just as EPA supposedly lacked discretion to give a narrowing construction to the statutory term “air pollutant,” so too it supposedly was barred from considering statutory absurdity in conducting its endangerment finding and in deciding whether to make such a finding.

The court below described the absurdity as a scarecrow of petitioners’ imagination. *See, e.g.*, JA205 (“However absurd Petitioners consider [EPA’s re-write of the PSD emission thresholds] . . . it is still irrelevant to the endangerment inquiry.”); *cf.* JA144 (ascribing “what he considers absurd results” to “Judge Kavanaugh”). The court ignored that EPA itself admitted that its decision to trigger regulation under the PSD and Title V programs produced absurd results. JA286. Instead, the court again rested on what it viewed as *Massachusetts*’ interpretation of the statute. Thus, an endangerment finding requires “scientific judgment,” “not policy discussions.” JA202 (citing *Massachusetts*, 549 U.S. at 534); JA204 (“The statute speaks in terms of endangerment, not in terms of policy . . .”). In the court’s opinion, petitioners’ arguments concerning the statutory absurdity that would result from an “any means any” interpretation of the permit triggers were merely additions to the “laundry list” of policy reasons already rejected in *Massachusetts*. JA204.

To be sure, *Massachusetts* did limit EPA’s discretion in responding to a rulemaking petition and rejected the agency’s “laundry list of reasons not to regulate.” 549 U.S. at 533. And it is fair to say that this Court’s discussion is in some tension with the

pronouncement earlier in the opinion that agency denials of rulemaking petitions are subject to a deferential standard of review: the Court's dismissal and rejection of the agency's prudential reasons to defer regulation has a "hard look"-ish flavor. *See id.* at 532–34; *cf.* Freeman & Vermeule, 2007 Sup. Ct. Rev. at 97–98. Even so, *Massachusetts* did not erase EPA's discretion. Rather, it exhorted the agency "to exercise discretion within defined statutory limits." *Massachusetts*, 549 U.S. at 533.

Again, the lower court's interpretation commits the fallacy of the excluded "third." A consideration of statutory absurdity is not a "scientific" inquiry or judgment. But it is not a mere "policy discussion" either; it is a matter of statutory interpretation. Even the hardest of looks cannot be viewed as a command to drive an agency into statutory absurdity, and nothing in *Massachusetts* dictates that result. In fact, EPA's failure to consider absurdity at each stage of the rulemaking process is an abuse of the discretion *Massachusetts* affirmatively preserved and commanded. 549 U.S. at 533; *id.* at 535 ("EPA must ground its reasons for action or inaction in the statute.").

## **II. Under *Chevron*, Statutes Should Be Interpreted To Avoid Separation-Of-Powers Problems.**

In an administrative law context, the reasons for strict adherence to Supreme Court holdings and conventional canons of law—rather than the tenor or atmospherics of the Court's decisions—are particularly compelling. Separation-of-powers concerns are never far afield. False steps may put

post-*Chevron* administrative law and the separation-of-powers doctrine in conflict, and both at risk. The panel's curt response to Judge Kavanaugh's and Judge Brown's dissents from the denial of rehearing *en banc* suggests the gravity of the problem.

The dissenting judges stressed the profound implications of allowing EPA to seize authority to revise statutory thresholds and decide when to regulate greenhouse gas emissions from stationary sources. Surely, both urged, a decision of that import must be decided by Congress, not judges; and *Massachusetts* should not be read to hold otherwise. JA168 (Brown, J., dissenting) ("the matter properly belongs before Congress, not courts or agencies"); JA188 (Kavanaugh, J., dissenting) ("the bedrock underpinnings of our system of separation of powers are at stake"). The panel agreed that the "underlying policy questions and the outcome of this case are undoubtedly matters of exceptional importance." JA145. And it agreed that "the question here is: Who Decides?" *Id.* (quoting JA187 (Kavanaugh, J., dissenting)).

But the panel failed to afford those questions the careful consideration they deserve. Instead, according to the panel, "Congress spoke clearly, EPA fulfilled its statutory responsibilities, and the panel, playing its limited role, gave effect to the statute's plain meaning." *Id.* Cite to *Chevron, id.*, and to all a good night. With respect, that reply falls far short of engaging with the dissenters' arguments and the real stakes in this case. And it is not consistent with *Chevron*.

**A. *Chevron* Is A Doctrine Of Statutory Interpretation, Not Of “Magic Words.”**

Time and again, EPA and the court below rely on *Massachusetts*' averment that “[t]he statute”—*i.e.* the definition of “air pollutant” in section 302(g)—is “unambiguous.” *E.g.*, JA194, 237, 240, 241, 959, 973, 1163 n.230.
