“Unambiguous” is shorthand for the question whether Congress “has directly spoken to the precise question at issue.” *Chevron*, 467 U.S. at 842–43. Still, “unambiguous” in this sense is, well, ambiguous. *See, e.g.*, Gary Lawson, *Federal Administrative Law* 608–10, 640 (6th ed. 2013). It may mean “obvious and indisputable,” as when a statute says that it applies to anyone who emits in excess of, say, 250 tons per year of some pollutant. Or, “unambiguous” may mean a high degree of confidence: it’s the meaning of the legal term that we (judges) can be sure of, once we have applied and exhausted traditional tools of statutory construction. *See, e.g., United States v. Home Concrete & Supply, LLC*, 132 S. Ct. 1836, 1843–44 (2012); *see also Dole v. United Steelworkers*, 494 U.S. 26, 35–40 (1990) (applying traditional tools of statutory construction and examining the statute as a whole to avoid a “counterintuitive” statutory interpretation).

EPA is of three minds on the subject. It maintains that it may re-write a numerical statutory standard—an *obviously, indisputably* “unambiguous” term—in its own discretion, based on interpretive canons. JA285–88. On the other hand, the agency insists that it cannot and must not do any interpretive work on the term “air pollutant” in the

statutory permit triggers—supposedly because the statutory language is “plain” and *Massachusetts* says so. On the third hand, the agency says that the very same term, in the very same provisions, may and must be read in a narrowed sense (“any *regulated* pollutant”).

The agency cannot have it all three ways. The better understanding of *Massachusetts* is that section 302(g) unambiguously includes greenhouse gases. What the term means in any given regulatory context remains a matter of statutory construction in accordance with conventional canons. Among those canons are the propositions that agencies must construe their organic statutes so as to avoid resort to extravagant canons, *Duke Energy*, 549 U.S. at 576; that their duty extends to interpreting the statute as a whole, *Pilot Life Ins. Co. v. Dedeaux*, 481 U.S. 41, 51 (1987); and that an interpretation of an individual clause that produces absurdity in another part of the statute is not a permissible interpretation, *Kloeckner v. Solis*, 133 S. Ct. 596, 606–07 (2012). In neglecting to apply any of these canons, EPA failed to ground its reasons for action in the statute.

#### **B. EPA’s Position Up-Ends *Chevron*’s Rationale.**

*Chevron* is rooted in concerns about delegation. Cass R. Sunstein, *Nondelegation Canons*, 67 U. Chi. L. Rev. 315, 329 (2000); John F. Manning, *The Non-Delegation Doctrine as a Canon of Avoidance*, 2000 Sup. Ct. Rev. 223 (2000). *Massachusetts*, fairly read, is entirely consistent with that orientation. EPA may not categorically and arbitrarily decline to exercise jurisdiction conveyed by a carefully worded,

“capacious” statutory term, or turn a blind eye to statutory provisions that deliberately signal “breadth” and a congressional intent to permit agency adjustments to new evidence and circumstances. *Massachusetts*, 549 U.S. at 532. But the actual exercise of that broad authority remains subject to ordinary demands of statutory interpretation.

In the interpretation of EPA and the court below, *Massachusetts* upended this constitutionally grounded regime. Once it is determined that a broad term (“air pollutant”) *authorizes* the agency to regulate greenhouse gases, the agency *must* do so—even when the regulatory enterprise is confessedly absurd and in conflict with Congress’s plain intent. On the basis of that reading, the agency has taken a plain-vanilla *Chevron* ruling to produce, rather than avoid, a separation-of-powers problem.

The problem, moreover, is not a mirage or 2L AdLaw puzzle; it is real. For example, EPA has claimed authority to exempt biogenic sources of greenhouse gases from regulation, on the theory that, while such emissions are unambiguously subject to regulation, actual regulation would be “absurd” and excessively burdensome for the agency. *Center for Biological Diversity v. EPA*, 722 F.3d 401 (D.C. Cir. 2013) (rejecting EPA’s position). And there is method to this madness: while EPA’s Tailoring Rule, for now, exempts smallish greenhouse gas emitters from regulation on the grounds of “absurdity” and “administrative necessity,” the agency explicitly reserves authority to regulate those sources at some future point, in some way, in conformity with the

statute or maybe not: absurdity, “one step at a time.” JA403. In feigned obeisance to what it claims to be the unambiguous commands of the Clean Air Act and *Massachusetts*, the agency is simply “making it up as it goes along. That is not how the administrative process is supposed to work.” *Center for Biological Diversity*, 722 F.3d at 415 (Kavanaugh, J., concurring).

*Massachusetts* provides no warrant for any of this. The decision did not settle the vexing, perplexing question of fitting an unanticipated “air pollutant” (greenhouse gases) into a statute built for different purposes. Rather, it commanded EPA to be serious—to “ground its reasons for action *or inaction* in the statute.” *Massachusetts*, 549 U.S. at 535 (emphasis added). Precisely when and where the regulatory grant is broad (and where the structure of the statute does not easily accommodate, in all contexts, an unanticipated problem), an agency must take special care to conform its programs to the operative terms of the statute, to respect its unmistakable commands, and to make sense of the statute as a whole. *Kloeckner*, 133 S. Ct. at 596; *Duke Energy*, 549 U.S. at 576; *Pilot Life Ins. Co.*, 481 U.S. at 51.

### **III. No Agency Has Authority To Rewrite Unambiguous Statutory Requirements.**

This case presents a recurrent problem—that of a Supreme Court of unquestioned authority but limited capacity to “say what the law is,” *Marbury v. Madison*, 5 U.S. (1 Cranch) 137, 177 (1803), and to make its rulings “stick” throughout a vast judicial system in competition with institutions that may

have very different ideas and incentives. Constitutional commands, professional norms, and Supreme Court decisions ameliorate the difficulty to some extent. Lower courts and administrative agencies are supposed to discern, fairly construe, and then follow this Court's *holdings*—as opposed to *dicta*, atmospherics, or the perceived trajectory of the Court's jurisprudence. See, e.g., *Kokkonen v. Guardian of Life Ins. Co.*, 511 U.S. 375, 379 (1994); *Rodriguez de Quijas v. Shearson/Am. Express, Inc.*, 490 U.S. 477, 484 (1989). Invariably, however, agencies and lower courts will look for “signals” beyond the Court's strict holdings. In light of the sheer mass of government business and lower court decisions on one hand and the Court's limited capacity to exercise review in all but a handful of administrative law cases on the other, it is entirely predictable that agencies and lower courts will look for such signals—and that this Court should economize on its monitoring function by sending them. *Massachusetts* has been widely understood in that light. Freeman & Vermeule, 2007 Sup. Ct. Rev. at 51–52.

Alas, the enterprise carries a grave risk that the signals may be misunderstood. In the administrative context, that risk often becomes a separation-of-powers risk. It is particularly severe in politically charged cases where the Court's decisions are of an action- or agency-forcing nature, as opposed to a decision that limits agencies or lower courts. In the vernacular, a “cut it out” command can be disobeyed only at some peril of discovery. In contrast, a “get going” command is not readily distinguishable from a “the sky is the limit” signal of encouragement. It can

be invoked as authority from here to eternity, barring only congressional intervention or a further Supreme Court ruling, to the effect of “that is not what we meant.”

This Court is hardly unfamiliar with “go ahead” rulings that, under the force of bureaucratic empire-building, mushroomed into regulatory regimes far beyond the Court’s intent or imagination. Most instructive perhaps in the present (environmental) context is the Court’s decision in *United States v. Riverview Bayside Homes*, 474 U.S. 121 (1985). In that case, the Court upheld a regulation by the U.S. Army Corps of Engineers that, in a departure from the agency’s earlier position, interpreted the statutory term “waters of the United States,” contained in the Clean Water Act, to cover not only navigable waters but also certain wetlands connected to those waters. Predictably, government agencies (the Corps as well as EPA) relied on the decision to further expand their jurisdiction over wetlands that, though unconnected to waters of the United States, were said to have a migratory bird “nexus.” The Court resolutely rejected that step. *Solid Waste Agency of N. Cook County v. U.S. Army Corps of Eng’rs* (“SWANCC”), 531 U.S. 159, 171 (2001) (“We thus decline respondents’ invitation to take what they see as the next ineluctable step after *Riverside Bayview Homes*.”). Even after that decision, lower courts continued to uphold the Corps’ sweeping assertions of jurisdiction over ephemeral channels and drains. Five years later, the Court again rejected the government’s essentially boundless view of its jurisdiction. *Rapanos v. United States*, 547 U.S. 715 (2006); *id.* at 779 (Kennedy, J., concurring in

judgment); *cf. id.* at 758 (Roberts, C.J., concurring) (“Rather than refining its view of its authority in light of our decision in *SWANCC*, and providing guidance meriting deference under our generous standards, the Corps chose to adhere to its essentially boundless view of the scope of its power.”); *see also Sackett v. EPA*, 132 S. Ct. 1367, 1375 (2012) (Alito, J., concurring) (“Unsurprisingly, the EPA and the Army Corps of Engineers interpreted the phrase as an essentially limitless grant of authority. We rejected that boundless view.” (citing *Rapanos* and *SWANCC*)).

The precise legal questions in this case differ from those at issue in *SWANCC* and *Rapanos*. Still, the parallels are instructive. Here as there, the starting point is a generous judicial interpretation of a statute-wide term defining the scope of the agency’s jurisdiction. Here as there, the agency has seized on the Court’s initial holding and perceived signal as an “essentially limitless grant of authority.” Here as there, the agency has refused to give reasonable meaning to its organic statute and instead claimed authority to decide in its own discretion whom and what it will regulate, in what way. Here as there, an administrative agency has been and will be careful not to push its authority to the point of triggering congressional intervention.

Here, however, unlike there, the agency has mobilized this Court’s ruling not simply to expand its authority but to re-write the statute; and the stakes are infinitely higher. This Court’s administrative law cases—from *Chevron* to *Mead* to *City of Arlington*, and every decision in between—are

grounded in the premise that any exercise of agency authority is to be constrained by and assessed in light of “the statute’s text, its context, the structure of the statutory scheme, and canons of textual construction.” *City of Arlington v. FCC*, 133 S. Ct. 1863, 1876 (2013) (Breyer, J., concurring). As this Court has explained, these principles of administrative law establish “a stable background rule against which Congress can legislate.” *Id.* at 1868 (majority opinion). “Congress knows to speak in plain terms when it wishes to circumscribe, and in capacious terms when it wishes to enlarge, agency discretion.” *Id.*

The entire edifice collapses if, as EPA maintains, administrative agencies have free rein to unilaterally rewrite unambiguous statutory text whenever their preferred policies require an interpretation that results in absurd consequences. *See, e.g., Public Citizen v. U.S. Dep’t of Justice*, 491 U.S. 440, 470 (1989) (Kennedy, J., concurring in judgment (construing statutes to avoid absurd results “demonstrates a respect for the coequal Legislative Branch, which we assume would not act in an absurd way”). When an agency interprets a statute at war with the statutory text in a fashion that leads to absurd results and nullifies central statutory provisions, the only permissible answer is that the agency’s interpretation must be wrong and that some other interpretation is required. *Cf. National Ass’n of Home Builders v. Defenders of Wildlife*, 551 U.S. 644, 666 (2007) (accepting interpretation that harmonizes statutory provisions but “does not override express statutory mandates”).

The Court should firmly reject EPA's extraordinary attempt to dismantle basic safeguards of administrative law and claim authority to rewrite statutory text. Instead, the Court should clarify that EPA must heed *Massachusetts'* holding and comply with settled principles of administrative law.

**CONCLUSION**

The judgment of the court of appeals should be reversed.

Respectfully submitted,

ASHLEY C. PARRISH

**APPENDIX**

### **List of *Amici* Law Professors**

(affiliations appear for  
identification purposes only)

**Jonathan H. Adler** is the Johan Verheij Memorial Professor of Law and Director of the Center for Business Law and Regulation at the Case Western Reserve University School of Law in Cleveland, Ohio where he teaches and writes about administrative, constitutional, and environmental law.

**Richard A. Epstein** is the Laurence A. Tisch Professor of Law, New York University Law School, the James Parker Hall Distinguished Service Professor Emeritus of Law and Senior Lecturer University of Chicago, and the Peter and Kirsten Bedford Senior Fellow at the Hoover Institution. He researches and writes in a broad range of subjects, and has taught administrative, constitutional, and environmental law.

**James Huffman** is Dean Emeritus at the Lewis & Clark Law School, where he teaches courses in constitutional law, environmental law, and jurisprudence. He is a member of the Hoover Institution Property Rights, Freedom and Prosperity Task Force.

**Andrew P. Morris** is the D. Paul Jones, Jr. & Charlene Angelich Jones Chairholder of Law at the University of Alabama School of Law in Tuscaloosa, Alabama, where he teaches and writes about regulatory issues involving environmental and energy law, among other subjects. He is affiliated

with the Property & Environment Research Center, the Regulatory Studies Center at George Washington University, the Institute for Energy Research, and the Mercatus Center at George Mason University.

**Jeremy A. Rabkin** is a professor of law at George Mason University Law School and previously a Professor of Government at Cornell University. He teaches constitutional, administrative, and international law and has written widely on these subjects.

### INTEREST OF *AMICI CURIAE*<sup>1</sup>

*Amici* professors of economics Thomas C. Schelling, Vernon L. Smith, and Robert W. Hahn all have significant experience analyzing the costs, benefits and effects of regulation, including environmental regulation.

Thomas C. Schelling is a Distinguished University Professor Emeritus at the University of Maryland. Among the vast body of scholarly literature Professor Schelling has produced over more than sixty years, he has written extensively on environmental and energy regulation, including the regulation of greenhouse gas emissions. He was awarded the Nobel Prize in Economics in 2005.

Vernon L. Smith is the George L. Argyros Endowed Chair in Finance and Economics, Chapman University. His research over more than fifty years includes work on environmental economics and regulation. Among other highly regarded texts, he is the author of *Rationality in Economics: Constructivist and Ecological Forms*. He was awarded the Nobel Prize in Economics in 2002.

---

<sup>1</sup> All parties have consented to the filing of this brief. No counsel for any party authored this brief in whole or in part, and no person or entity, other than Consumers' Research Inc., has made a monetary contribution intended to support the preparation or submission of this brief. *Amici* professors received no compensation for offering the views expressed in this brief. Consumers' Research Inc. expresses no opinion on the views reflected herein.

Robert W. Hahn is Director of Economics and Professor, Smith School of Enterprise and the Environment, University of Oxford. Professor Hahn's publications on regulation include *The Impact of Economics on Environmental Policy* and *Government Analysis of the Benefits and Costs of Regulation*.

The *amici* economics professors gratefully acknowledge a monetary contribution from Consumers' Research that enabled the preparation and printing of this brief. The views expressed in the brief are solely those of the *amici* economics professors. Those views should not be attributed to Consumers' Research, or to any institution with which the *amici* economics professors are now, or have in the past been, affiliated.

*Amici* are convinced that the regulatory regime at issue, of which the challenged rule is an intrinsic part, is likely to produce unnecessary, and potentially substantial, costs on the public. Accordingly, we write in support of the Petitioners and respectfully suggest, to the extent settled economic analysis has a role to play in adjudicating the legality of the challenged rule, that the analysis counsels against the implementation of the regulatory regime proposed by EPA.

To be sure, as economists, *amici* lack the expertise to assess the legal issues in the case. We do understand that the Environmental Protection Agency ("EPA") contends that the Clean Air Act and this Court's decision in *Massachusetts v. EPA*, 549 U.S. 497 (2007), *compelled* the programs at issue. If that is correct, proper resort may be to the Legislature, not to this Court. If, however, the

regulations are not so compelled (as Petitioners contend), and if a proper disposition permits or requires a more comprehensive accounting and precise consideration of the costs and/or benefits of the rules at issue, we believe there is a wide gulf between the proposed regulations and available, more sensible approaches to the issue the agency would like to address.

### SUMMARY OF ARGUMENT

Economists who study the costs and benefits of environmental regulation typically begin by assessing whether the regulatory subject is best addressed by one of two potential modes (setting aside cases in which no regulation is necessary or appropriate): (i) “command-and-control” regulation, with governing rules set forth by a central authority; and (ii) “incentive-based” regulation, which is less prescriptive regarding the approaches firms and individuals may use to meet a given social objective. Over time, the majority of economists who analyze these questions have concluded that the second mode, based on incentives, best serves the interests of regulator and regulated alike, by enhancing the likelihood that regulatory goals will be achieved at the lowest cost to society.<sup>2</sup>

---

<sup>2</sup> This brief takes as an *assumption* that policymakers have elected to regulate greenhouse gases, and analyzes, based on that assumption, whether the mode of regulation chosen by EPA is superior versus an incentive-based system. We do not suggest that any one mode of regulation is superior to another in all cases.

To address the issue of GHGs, however, EPA has selected the former mode, that of command-and-control. If implemented, this regulatory choice will impose substantial, yet avoidable, costs on society, while reducing the potential that the problem identified will be resolved.

Specifically, in the wake of this Court's decision in *Massachusetts v. EPA*, 549 U.S. 497 (2007), EPA first found—pursuant to Section 202(a)(1) of the Clean Air Act, 42 U.S.C. § 7521(a)(1)—that CO<sub>2</sub> and other GHGs may “cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” See *Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act*, 74 Fed. Reg. 66,496 (Dec. 15, 2009). EPA then proposed and subsequently finalized a series of substantive regulations, among them: a “Tailpipe Rule,” which imposes stringent emissions standards for new motor vehicles; a “Triggering Rule,” which stated that the Tailpipe Rule's regulation of motor vehicle emissions triggered stationary source regulations under the Act's PSD and Title V provisions; and a “Tailoring Rule,” which will govern the application of the Clean Air Act's PSD and Title V stationary source permitting programs to GHG emitters and emissions. See *Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule*, 75 Fed. Reg. 25,324 (May 7, 2010) (Tailpipe Rule); *EPA, Reconsideration of Interpretation of Regulations That Determine Pollutants Covered by Clean Air Act Permitting Programs; Final Rule*, 75 Fed. Reg. 17,004 (Apr. 2, 2010) (Triggering Rule); *Prevention of Significant*

*Deterioration and Title V Greenhouse Gas Tailoring Rule*, 75 Fed. Reg. 31,514 (June 3, 2010) (Tailoring Rule).

We understand that the Court has agreed to review the legality of the “Triggering Rule” only. That said, we discuss below the subject rules collectively, to provide the Court with a broader understanding of the potential economic impact of the regulatory regime of which the Triggering Rule is a key part, and because we understand that the Tailoring Rule may have no practicality if the Triggering Rule is struck.

Taken together, then, the contemplated regime is a classic example of command-and-control regulation; it imposes performance standards on automobile manufacturers. The Triggering and Tailoring Rules will impose technology standards (*i.e.*, installation of the “best available control technology,” or BACT), on stationary sources of GHG emissions. *See* 42 U.S.C. § 7479(1).

These types of command-and-control mechanisms were standard features of early environmental and health and safety statutes (like the Clean Air Act, enacted in 1970 and amended in relevant part here in 1977). Since the 1970’s, however, economists and policy analysts, following a long period of “blackboard” analysis and careful empirical studies, found that command-and-control regulation often yields disappointing results that are unduly costly. Indeed, in a notoriously contentious profession, that finding has held up strikingly well. Economists now overwhelmingly agree that well-designed incentive-based systems, either in the form of taxes or

transferable property rights (e.g., “cap and trade” or carbon taxes) tend to produce better outcomes at far lower cost. See, e.g., Arthur C. Pigou, *Economics of Welfare* (1920), and J.H. Dales, *Pollution, Property, and Prices* (1968). Some of the reasons are briefly summarized below.

To be sure, this consensus position does not cover every environmental problem. For example, incentive-based regulatory systems may be ineffective in dealing with highly concentrated, *localized* pollution or other unwanted externalities; in such “hot spots,” only a direct control (perhaps up to an outright ban) may be appropriate. But the limited exceptions to the general proposition that incentive-based regulation dominates command-and-control regulation in environmental matters do not apply here.

Indeed, if *any* problem is well-suited to using market-based environmental approaches, it is the control of CO<sub>2</sub> for addressing climate change. That is because, as EPA acknowledges, GHGs are “sufficiently long-lived in the atmosphere” that “they become ‘well-mixed,’” and “essentially uniform.” See U.S. Env'tl. Prot. Agency, EPA-HQ-OAR-2009-0171, Response to Public Comments No. 10: Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act (2009). Put another way, emissions *anywhere* affect GHG concentrations *everywhere*. Because the harms they cause are unrelated to local conditions, each ton of emissions has approximately the same impact regardless of the location of its source. Under the

circumstances, a market-based approach to emissions control is preferred.

A leading textbook, originally written for law students by then-Professor Breyer, concisely summarizes some of the major reasons:

All serious proposals for a regulatory regime to reduce [GHG] emissions ... would rely on either a carbon tax or a cap and trade regime ... [T]he benefits of economic incentives are especially salient here: The costs of reduction vary enormously, and therefore the savings to be had from getting reductions from those able to do so least expensively are likewise enormous ... At the same time, perhaps the most significant problem with economic incentives—the danger of “hot spots”—does not arise because GHGs are “perfectly mixed” pollutants; where they are emitted simply [does] not matter.

Stephen G. Breyer et al., *Administrative Law and Regulatory Policy* 293 (7th ed. 2011).<sup>3</sup>

---

<sup>3</sup> Observation of the mismatch between climate change problems and command-and-control measures is not limited to economists and policy experts. To our knowledge, no legislature in the world has seriously contemplated a large command-and-control system for regulating GHGs. In fact, then-EPA Administrator Lisa Jackson stated in 2010 that “the *best* way to address” GHG emissions “is through a gradual move to a *market-based program* like cap and trade.” *The President’s Proposed EPA Budget For FY 2010 Before The S. Comm. On Env’t & Public Works*, 111th Cong. (2009) (statement of Lisa Jackson, Administrator, Environmental Protection Agency)(emphasis added).

Notwithstanding this modern, and largely settled, understanding regarding the economics of GHG regulation, we understand that absent reversal of the decisions below, the regulatory process will proceed and generate a complex, highly prescriptive command-and-control regime. This brief highlights why the mismatch between the problem identified and solution proposed is likely to impose significant, yet avoidable costs on the public without attendant benefits.

### **ARGUMENT**

In Part I below, we describe the command-and-control nature of the regulatory program, of which the Triggering Rule is a part, and the special problems they may give rise to with respect to controlling emissions of GHGs. In Part II, we explain why GHG problems are better addressed using incentive-based regulation. We conclude by respectfully suggesting that the Court, if it agrees that economic analysis is germane to determining the legality of the challenged measures, consider that there are more effective, lower costs regulatory options available to EPA than the regime chosen.

#### **I. The Contemplated Regime For The Regulation Of Stationary GHG Emissions Is Economically Inefficient.**

The Tailpipe, Triggering, and Tailoring Rules constitute command-and-control regulation of a sweeping nature. Economic theory suggests that the measures are likely to impose outsized costs on society.

**A. EPA Has Imposed A Command-and-Control Approach For Regulating Greenhouse Gases.**

We understand that EPA has not yet implemented its regulatory program, and aspects of each regulation remain in development. Nonetheless, we are able to offer certain observations based on prior analysis, and what is known about the program presently. Scholars have studied extensively the existing PSD program, and other programs using command-and-control approaches to environmental regulation. Insights gleaned from this work cast light on what a GHG regulatory program might look like.

EPA has also offered guidance on how the proposed regime is intended to operate. *See* PSD and Title V Permitting Guidance for Greenhouse Gases, EPA-457/B-11/001, (March 2011) (“Permitting Guidance”), <http://www.epa.gov/nsr/ghgdocs/ghgpermittingguidance.pdf>. At its core, the Regime’s stationary source aspects would impose “best available control technology” (BACT) standards by means of the statutory permitting process. We understand that, in the ordinary case, once a major source has become subject to PSD, the source must apply BACT, demonstrate compliance with air quality related values and PSD increments, address impacts on special Class I areas (for example, national parks), and assess impacts on soils, vegetation, and visibility. *Id.* at 6. Nonetheless, we understand that EPA expects to eliminate the impact on soils, vegetation, and visibility as well as on special Class I areas for GHG emissions because with current technology, these measurements for GHGs

are not feasible. *Id.* at 48. Hence, emission levels with BACT will be the EPA's primary assessment tool for GHGs.

Furthermore, we understand EPA plans to use the same BACT determination method for GHGs as for other pollutants. Under that plan, the permitting authority determines the emissions limitation based on the maximum degree of emissions reduction possible when BACT is employed at that source. This includes a five-step process for determining the BACT for a given source: (i) the identification of all control technologies; (ii) the elimination of technically infeasible options; (iii) the ranking of remaining technologies in descending order of effectiveness; (iv) the evaluation of the most effective controls; and (v) the selection of the BACT.<sup>4</sup>

The process described above constitutes classic command-and-control regulation. The regulator leaves the regulated entity with relatively little scope for how to comply with a regulation.

### **B. The Contemplated Regime Is Unprecedented, Sweeping, And Costly.**

An economic assessment of the impact of the GHG rules must take account of the rules' *scope*. EPA's permitting guidance document explains that the intended approach will impact how energy consumption is regulated, manufacturing processes

---

<sup>4</sup> Under step four, the permit applicant must demonstrate that technical considerations, or energy, environmental, or economic impacts make a technology not achievable. Absent such a showing, the most effective alternative would be selected.

are regulated, and permits are evaluated and awarded. As this guidance makes clear, the command-and-control approach is far-reaching.

Indeed, the new regulations appear to sweep new categories of equipment, facilities, manufacturing methods, and emission types into the regulatory mix. In each case, expansion of the regulatory regime imposes significant costs that should be considered.

In particular, we understand that under current EPA rules, permitting authorities may consider source-wide energy efficiency strategies throughout an entire production process or multiple processes. *See* Permitting Guidance, at 23. As contemplated by the GHG rules, BACT will apply to more pieces of equipment than with traditional emissions.

We also understand that the new regime will allow EPA to regulate energy consumption in a large number of facilities, and that many aspects of a facility's manufacturing methods are subject to change. The expansion, therefore, of the PSD program for GHG emissions will increase the costs for permitting authorities in determining the proper level of emissions and application of BACT. Permitting itself is made more costly through new substantive and procedural requirements.

Moreover, for GHGs, permitting authorities will assess how reducing GHG emissions at the facility will affect the demand for energy from the electrical grid and offsite emissions as well. *See* Permitting Guidance, at 24. In fact, EPA intends to rely increasingly on energy efficiency determinations in regulating GHG emissions. *Id.* at 29. This constitutes a significant change from the existing regime for

conventional pollutants, for which EPA has interpreted the BACT requirements as *not* applying to *secondary* emissions that occur as a result of the construction or operation of the source but come from offsite locations. *Id.* at 24.

The combination of source-wide regulation, energy efficiency determinations, and the consideration of offsite emissions significantly increases the scope of EPA regulation beyond the parameters within which the PSD program was designed. The impact of the new regime will grow accordingly.

## **II. Incentive-Based Regulation Is A Superior Method For Regulating Greenhouse Gases.**

Command-and-control regulation may be sensible in some settings—for example, in dealing with acute local pollution problems. Concerns of this sort may help to explain the command-and-control mechanisms of the original Clean Air Act, which addressed local, rather than transboundary (let alone global) pollution problems. *See* Thomas Merrill, “Golden Rules for Transboundary Air Pollution,” 46 *Duke L. J.* 931 (1997).

For GHG regulation, however, such reservations have no place. In that context, the economist’s critique of command-and-control regulation applies with full, unqualified force.

### **A. Incentive-Based Approaches Are Often Preferable To Command-And-Control Approaches For General Air Pollution Problems.**

The pathologies of command-and-control regulation and especially of technology standards are

described in many economic textbooks, with only minor variations. Five shortcomings receive consistent mention.<sup>5</sup>

*First*, uniform BACT requirements ignore variations among regulated entities in their costs of reducing pollution. This wastes “many billions of dollars annually” compared with incentive-based approaches for environmental protection. Ackerman, 13 Colum. J. Env'tl. L. at 173.<sup>6</sup>

*Second*, BACT requirements impose higher regulatory burdens on new products and processes, discourage new investment, and penalize growth. Higher environmental standards are imposed on new products and processes, in part, because there is “no risk of shutdown.” *Id.* New investment is discouraged because of uncertainty associated with the “length of regulatory proceedings to win approval.” *Id.* Economic growth is reduced because disproportionate burdens are imposed on “more productive and profitable industries.” *Id.* at 174.

*Third*, BACT requirements “do not provide strong incentives for the development of new,

---

<sup>5</sup> Our exposition here follows Bruce A. Ackerman & Richard B. Stewart, “Reforming Environmental Law: The Democratic Case for Economic Incentives,” 13 Colum. J. Env'tl. L. 171 (1988). In addition to its concise exposition, the article was written principally about air pollution controls, but before global warming became a prominent concern—dispelling any notion that that such concern drives its analysis.

<sup>6</sup> Ackerman and Stewart use the term “BAT,” but we understand that BAT and BACT may be used interchangeably.

environmentally superior strategies and may actually discourage their development.” *Id.* These innovations are essential for long-run economic growth. As we note below, such innovation is particularly important for addressing the challenge of reducing GHG emissions.

*Fourth*, BACT regulations require “centralized, uniform determination of complex scientific, engineering and economic issues involving the feasibility of controls on hundreds of thousands of pollution sources.” *Id.* The information burdens on administrators are substantial. Furthermore, the high costs of control make it more attractive for industry to litigate and attempt to delay regulation.

*Fifth*, a BACT “strategy is inconsistent with intelligent priority setting.” *Id.* Agencies have limited resources. Given the “very large administrative and compliance costs” *Id.* at 175, associated with BACT, “agencies will seek to limit the number of substances on the agenda for regulatory action.” *Id.*

### **B. The Unique Characteristics Of GHGs Exacerbate The Problems Of Command-and-Control Regulation.**

We argued in the preceding section that, for at least five reasons, incentive-based regulation was preferred to command-and-control regulation for a large array of air pollution problems. In this section we explain that incentive-based regulation is especially attractive in the case of limiting GHG emissions, for at least four reasons.

*First*, in the case of GHGs, it is likely that a (substantially) larger number of sources will need to

be controlled. Accordingly, there will be an increase in administrative costs of writing and implementing BACT regulations that could be avoided with incentive-based regulation.

*Second*, as the number of sources to be regulated grows larger, the variation in the costs of control (versus most conventional pollution problems) broadens. This suggests that the cost savings in moving from a command-and-control regulation could be substantial, and greater than for many conventional air pollution problems. These savings are likely to be especially large when regulators (as is the case for BACT standards for stationary sources of GHGs), are not designing regulations to get the most bang for the buck, but instead are instructed to regulate “to the hilt.” Ackerman, 13 Colum. J. Envtl. L. at 174.

*Third*, the inherent *uncertainty* in both costs and benefits associated with GHG reductions favors incentive-based regulation over command-and-control. Uncertainty—as to costs *and* benefits—increases the difficulty for regulators seeking to judge whether a policy gives rise to net benefits to society. At a minimum, the use of a well-designed market-based approach reduces the likelihood that a particular targeted emissions reduction in GHGs will fail a benefit-cost test. This flows from the fact that while any *benefits* from such a targeted emission reduction would be the same under both an incentive-based approach and the command-and-control approach, *costs* are likely to be far lower under the incentive-based approach.

*Finally*, the nature of climate change as a *political* (and not simply environmental, or economic) issue suggests that substantial reductions in control costs over time will be required to make GHG reductions politically acceptable. Such cost innovations are much more likely to occur with a well-designed market-based approach than with the BACT approach, in light of the profit incentives inherent to well-designed market-based measures. *See Ackerman*, 13 Colum. J. Envtl. L. at 181.

**C. The Incremental Approach Adopted By EPA Is Likely To Be Problematic.**

There is nothing wrong *in principle* with piecemeal regulation. A well-designed incentive-based system may well have that feature, as when a carbon tax is phased in to avoid shocks to the economy, and to examine and learn from the effects over time. For any such incremental approach, however, the first step must be a *reasonable* step. We are concerned that the approach taken by EPA may be unreasonable.

For example, EPA's "tailored" PSD program, triggered by the challenged rule, envisions the imposition of technology controls for a new set of pollutants in a wide range of industries and, eventually, for facilities that have never been subject to Clean Air Act permitting requirements. The program, therefore, acts more like a "sledgehammer" than a "scalpel," and in doing so may be counter-productive. Ideally, one would want emission reductions to be achieved (first) by industries and firms that can do so at the least cost. The point of a broad-based incentive-based system is to force the

trade-offs and to incentivize lowest-cost reductions across firms and industries. The program contemplated does not appear to allow for this process. Moreover, the PSD program is not meant to address the key issue of keeping economic costs as low as possible, which should be central to an overarching policy for limiting GHG emissions.

## CONCLUSION

The overarching regulatory regime, of which the challenged rule is a core part, however well-meaning, is unsound economically when compared with measures that would be designed to maximize social welfare. While the issue of global warming may be the subject of controversy, economic analysis attendant to the regulation of GHGs is not. Accordingly, we respectfully suggest, to the extent settled economic analysis has a role to play in adjudicating the legality of the challenged rule, that the analysis counsels against the implementation of the regulatory regime proposed by EPA.

Respectfully submitted,

A.G. SCHNEIDERMAN & COALITION STATES: CLEAN AIR ACT MANDATES FEDERAL ACTION TO CUT CLIMATE-CHANGE POLLUTION FROM POWER PLANTS

## Existing Fossil-Fuel Power Plants Are The Single Largest Source Of Climate-Change Pollution; Opponents Of Action Grasping At Legal Straws To Forestall Common-Sense Pollution Controls

Schneiderman: EPA Needs To Take Prompt Action Required By Law To Limit Pollution From Power Plants And Must Afford States Flexibility In Implementation

NEW YORK - In comments submitted today to the federal Environmental Protection Agency, Attorney General Eric T. Schneiderman and a coalition of attorneys general from 11 other states and the District of Columbia argue that, in order to substantially reduce dangerous climate-change pollution from existing fossil-fuel power plants, the agency must both set strong emission limits and give states flexibility on how they choose to meet those limits.

The comments lay out the legal requirements for the EPA to take action against climate-change pollution under the federal Clean Air Act. They are a rebuttal to claims by those who oppose cutting climate-change pollution from existing power plants, and who wrongly argue that the Clean Air Act bars the EPA from moving forward with planned regulations.

“Climate change represents the greatest environmental threat of our time, posing the risk of catastrophic harm to the health and safety of all New Yorkers and to our economy,” Attorney General Schneiderman said. “Despite the real and present danger of unabated climate-change pollution, opponents continue to grasp at legal straws to forestall common-sense controls on its single largest source -- existing fossil-fuel power plants. As our coalition makes plain, opponents of EPA action are wrong on the law. The Clean Air Act is clear in requiring that EPA set strong limits on climate-change pollution emissions from existing power plants and in giving states the flexibility they need to best meet them.”

In 2007, the U.S. Supreme Court ruled in *Massachusetts v. EPA* that greenhouse gases that contribute to climate change are covered by the Act's definition of air pollutants. The court further ruled that EPA must determine whether these gases cause or contribute to air pollution that may endanger public health or welfare. Subsequently, EPA determined that greenhouse gases endanger the health and welfare of Americans. In October of this year, the Supreme Court refused to reconsider a lower court decision that affirmed this “endangerment” determination.

The coalition's comments detail EPA's legal obligation under the Act to regulate climate-change pollution from power plants, thereby directly countering the erroneous legal arguments of opponents of EPA action -- particularly those who claim that EPA lacks the authority to set substantive limits on existing power plant emissions of climate-change pollution.

The Act mandates that the agency regulate emission sources that cause or significantly contribute to air pollution that endangers public health or welfare. As fossil-fuel power plants are the single largest source of climate-change pollution in the United State -- emitting roughly 40 percent of the nation's total emissions -- EPA is obligated to regulate the climate-change pollution emissions of these plants.

Accordingly, in September 2013, EPA proposed limits on climate-change pollution from new power plants. Under the Act, because EPA is regulating these emissions -- and because the pollutants that contribute to climate change are not being regulated as “criteria” or “hazardous” air pollutants under other sections of the Act -- the agency is obligated to prescribe regulations limiting emissions from existing power plants as well.

Through this regulatory framework, EPA establishes emission guidelines based on the best system for reducing climate-change pollution from existing power plants, while giving states flexibility to determine how best to achieve these or greater reductions. The coalition's comments stress the importance of EPA maintaining this flexibility. Many states have already responded to the threat of climate change by moving forward independently to implement programs to reduce climate-change pollution from their electricity sectors. New York and other states have used a variety of approaches to achieve important reductions, including market-based cap-and-trade systems, such as the “Regional Greenhouse Gas

Initiative" in which New York participates, planned retirements of coal-fired power plants, renewable portfolio standards, demand management and energy-efficiency programs.

It is critically important for EPA to use its expertise to set strong and achievable emission targets. There is compelling scientific evidence that significant reductions in climate-change pollution must occur to prevent increases in the frequency, magnitude and scale of adverse health, safety and economic impacts. These impacts include:

- \*More heat-related deaths and illnesses;
- \*Extreme weather, including storms, floods, and droughts;
- \*Higher smog levels, increasing the rate of asthma, pneumonia, and bronchitis;
- \*Coastal land loss due to inundation, erosion, submergence and habitat loss from rising sea levels;
- \*Threats to ecosystems, including the Adirondacks in New York;
- \*Disappearance of plant and animal species and a rise in insect-borne illnesses, destructive fungi and pests;
- \*Threats to our food production, agriculture and forest productivity; and
- \*Threats to our energy, transportation and water resource infrastructure.

Joining Attorney General Schneiderman today in submitting the comments to EPA are the Attorneys General of California, Connecticut, Delaware, Maine, Maryland, Massachusetts, Oregon, Rhode Island, Vermont, Washington and the District of the Columbia.

This matter is being handled by Assistant Attorneys General Jung W. Kim, Morgan A. Costello and Michael J. Myers, and Chief Scientist Alan Belensz of the Attorney General's Environmental Protection Bureau, under the supervision of Bureau Chief Lemuel M. Srolovic, Executive Deputy Attorney General for Social Justice Alvin Bragg and First Deputy for Affirmative Litigation Janet Sabel.

A copy of today's letter can be read here.

## INTEREST OF AMICI CURIAE<sup>1</sup>

*Amici* States of Kansas, Kentucky, Montana, Ohio, West Virginia, and Wyoming have direct and substantial interests in this case. The decision below, affirming the Environmental Protection Agency's (EPA) new pre-construction permitting regime for greenhouse gas (GHG) emissions, will impose immense administrative costs upon the States that carry out the program. According to EPA's own estimates, if greenhouse gas emissions trigger pre-construction permitting requirements for industry under the Clean Air Act's plain terms and volumetric thresholds, then States would be forced to review *millions* of permit applications, costing the States *billions* of dollars. J.A. 550-51. Furthermore, EPA's regulatory regime will impose immense costs on the States' economies, as explained in this brief.

---

<sup>1</sup> The parties have consented to the filing of this brief, and their letters of consent have been filed with the Clerk. No party's counsel authored this brief in whole or in part, and no person or entity other than *amici* or their counsel made a monetary contribution intended to fund to its preparation or submission.

## INTRODUCTION AND SUMMARY OF ARGUMENT

“Congress could hardly preemptively prohibit every discharge of carbon dioxide unless covered by a permit.” *Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527, 2538 (2011). That was the Court’s common-sense explanation of the absurdity of regulating greenhouse gas emissions, in small increments, through *ex ante* permit requirements. “Of necessity,” the unanimous Court observed, “Congress selects different regulatory regimes to address problems.” *Id.* And it did not select a permit-based regime to micromanage small emissions of greenhouse gases.

Yet that is precisely how EPA now interprets Title I of the Clean Air Act. According to EPA, Congress unambiguously intended “air pollutant” to include greenhouse gas emissions, for purposes of the Prevention of Significant Deterioration (PSD) and Title V permitting programs. Therefore, EPA reasons, Congress required States to impose *ex ante* permit requirements for greenhouse gas emissions of as little as 100 or 250 tons per year. EPA concludes that only EPA can save the States and the public from the burdens that Congress has imposed upon them. EPA further declares that it must accomplish this by unilaterally replacing Congress’s statutory volumetric thresholds with more lenient standards devised by the agency itself, to be tightened or loosened at any future time in EPA’s sole discretion.

As the State and Industry Petitioners explain, EPA’s interpretation is unfaithful to the Act’s text, purpose, structure, and history. The *amici* States respectfully submit this brief to offer further

perspective on the ramifications of EPA's statutory interpretation at the heart of this case; to explain how EPA's misuse of the "absurd results" doctrine highlights the fundamental error of EPA's underlying statutory interpretation; and to restore the PSD and Title V programs to what Congress itself saw to be their "basic purpose": protecting air quality from local pollutants. J.A. 427.

The Clean Air Act recognizes that "air pollution control at its source is the primary responsibility of States and local governments," not the Federal government. 42 U.S.C. § 7401(a)(3). And in carrying out that responsibility, the States know firsthand the impacts of EPA's vast expansion of the Act's pre-construction permit programs, the PSD and Title V programs. As explained below, those impacts include not just the program's economic costs within the States, but also the immense burdens that EPA's PSD and Title V programs will impose on the State agencies tasked with administering them. These impacts on the States threaten the Act's very nature as a "cooperative federalism" program.

These burdens, and the other "absurd results" invoked by EPA in its attempt to justify the "Tailoring Rule," are all problems of EPA's own making. They would not have occurred if EPA had not insisted upon construing the Act in a manner unsupported by the Act's text, purpose, structure, and history. And they reflect EPA's attempt to aggrandize its own power and discretion, at the expense of the States.

## ARGUMENT

### I. “Any Air Pollutant,” As That Term Is Used In The Clean Air Act’s Pre-Construction Permitting Framework, Does Not Include Greenhouse Gas Emissions

The Clean Air Act imposes a pre-construction permitting requirement for power plants and other stationary sources, a requirement that is triggered by the emission of “any air pollutant” above statutorily defined threshold amounts by a “major emitting facility.” 42 U.S.C. §§ 7479(1), 7475(a). As EPA itself notes, this program, known as Prevention of Significant Deterioration (PSD), was originally intended to protect local air quality: “the basic purpose of the PSD program . . . is to safeguard maintenance of the NAAQS”—that is, the National Ambient Air Quality Standards. J.A. 427 (citing S. Rep. No. 95-127, at 27 (1977), *reprinted in 3 A Legislative History of the Clean Air Act Amendments of 1977*, at 1371, 1401 (1979) (hereinafter “*Legislative History*”)).

But, according to EPA, in this statutory context the term “any air pollutant” unambiguously includes greenhouse gas emissions, now that such emissions are “regulated” for purposes of the Act’s automobile emissions program in a separate title of the Act. EPA rejects the notion that the Act’s stationary source program covers only emissions that actually deteriorate local air quality. See, e.g., J.A. 478 n.44.

As the D.C. Circuit recognized, EPA’s interpretation of the statute does not actually reflect the statute’s “literal statutory definition.” J.A. 237. Specifically, EPA construes the statutory term, “any

air pollutant,” to refer only to any “regulated” air pollutant, even though the statute “nowhere requires that ‘any air pollutant’ be a *regulated* pollutant.” *Id.* Nevertheless, even after departing from the statute’s literal text, both EPA and the court below conclude that the Clean Air Act commands this and only this interpretation. *Id.* at 235-41. Their analysis misapplies *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007), obstructs Congress’s clear intent, and undermines the law’s long-understood meaning.

**A. *Massachusetts v. EPA* Does Not Dictate EPA’s Favored Interpretation**

In affirming EPA’s interpretation of “any air pollutant,” 42 U.S.C. § 7479(1), the D.C. Circuit largely ascribed its conclusion to this Court’s decision in *Massachusetts v. EPA*: “we are faced with a statutory term—‘air pollutant’—that the Supreme Court has determined unambiguously includes greenhouse gases.” J.A. 237 (citing *Massachusetts*, 549 U.S. at 529, and 42 U.S.C. § 7602(g)).

But *Massachusetts v. EPA* did not interpret the term “any air pollutant” in the context of the Clean Air Act’s PSD and Title V framework for stationary sources (*i.e.*, 42 U.S.C. § 7479(1)). Rather, the Court in that case interpreted “air pollutant” strictly in the separate context of the Act’s Title II framework for motor vehicle regulations. *Massachusetts*, 549 U.S. at 506, 532.

The distinction between Titles I and II is not pedantic; rather, the differences between them are crucial to the task of interpreting each of the Titles, even when both employ the term “air pollutant.” Sometimes “the same phrase used in different parts

of the same statute means different things.” *Barber v. Thomas*, 130 S. Ct. 2499, 2506 (2010); cf. *Nat’l Ass’n of Mfrs. v. NLRB*, 717 F.3d 947, 954 n.7 (D.C. Cir. 2013) (noting that “[e]ven within the Federal Register Act, the term ‘promulgated’ seems to have different meanings in different contexts”).

And, in fact, this Court already has recognized that the Clean Air Act is precisely such a law, in a case decided on the same day as *Massachusetts v. EPA*. In *Environmental Defense v. Duke Energy Corp.*, the Court held that a single word in the statute could mean two different things: “modification” has one meaning for purposes of the Act’s PSD program, and another meaning for the Act’s “new source performance standards” program. 549 U.S. 561, 573-76 (2007). The Court recognized that “most words have different shades of meaning and consequently may be variously construed, not only when they occur in different statutes, but when used more than once in the same statute or even in the same section.” *Id.* at 574 (brackets omitted).

This is true “even when the terms share a common statutory definition, if it is general enough.” *Id.* (In *Environmental Defense*, for example, the statute provided only one definition of “modification.” *Id.* at 576.) The “natural presumption that identical words used in different parts of the same act are intended to have the same meaning” is “not rigid”; it “readily yields whenever there is such variation in the connection in which the words are used as reasonably to warrant the conclusion that they were employed in different parts of the act with different intent.” *Id.* at 574. A “given term in the same statute may take on distinct characters from association

with *distinct statutory objects* calling for *different implementation strategies.*” *Id.* (emphasis added).

Those are precisely the considerations that belie EPA’s and the lower court’s conclusions that *Massachusetts v. EPA*’s interpretation of “air pollutant” for mobile sources unambiguously commands an identical interpretation for stationary sources. The two programs regulate “distinct statutory objects,” each “calling for different implementation strategies.” *Id.*

Furthermore, such practical considerations were central to the Court’s task of interpreting “air pollutant” for the motor vehicle program in *Massachusetts v. EPA*. There, the Court concluded that to include greenhouse gas emissions as “air pollutants” for motor vehicle regulations would not lead to “extreme” consequences. 549 U.S. at 531. The Court’s certainty reflected the successful petitioners’ assurances that the Court’s decision regarding the Act’s application to motor vehicles would have *no* bearing on the separate question of whether EPA could also regulate stationary sources:

The federal program for controlling air pollution from motor vehicles was first created in 1965, five years before the 1970 Act created the NAAQS program.[<sup>2</sup>] *The programs were not merged, and they retain significant independent status and effects.* Organizationally, mobile sources are regulated under Title II of the Act,

---

<sup>2</sup> And twelve years before the 1977 Act created the statutory PSD framework.

which is separate from Title I . . . Furthermore, *the two programs cover different pollutants.*”

Brief for Petitioners at 28, *Massachusetts v. EPA*, 549 U.S. 497 (2007) (No. 05-1120) (emphasis added).<sup>3</sup>

In short, the Court in *Massachusetts v. EPA* tested its statutory interpretation against what it saw to be the practical consequences of that interpretation, in the narrow context of motor vehicle regulations under Title II of the Act. In that case, as in *Environmental Defense v. Duke Energy*, “[c]ontext counts.” 549 U.S. at 576.

Context counts here, too. As EPA administers the Clean Air Act’s PSD and Title V framework, it should interpret the Act in light of the consequences of its interpretation, not in spite of them.

**B. EPA’s Interpretation Of The PSD And Title V Frameworks Is Incompatible With Congress’s Express Intent And Evident Understanding Of The Law**

EPA’s attempt to stretch Title I’s PSD and Title V frameworks to include greenhouse gas emissions contradicts more than just the assurances of *Massachusetts v. EPA*’s pro-regulation petitioners. It also contradicts the expectations of the Congress that enacted the PSD program in the first place. If

---

<sup>3</sup> The petitioners in that case went so far as to assert that critics’ concerns that Title II mobile-source regulation might trigger Title I stationary-source regulation were merely an attempt to “change the subject,” a “classic debater’s trick.” *Id.*

legislative history is relevant to the task of interpreting statutes in Step One of *Chevron's* two-step process,<sup>4</sup> then this factor is fatal to EPA's statutory interpretation in this case.

EPA did not demonstrate that its interpretation of the statute "give[s] effect to the unambiguously expressed intent of Congress." *Chevron U.S.A. v. Natural Res. Def. Council*, 467 U.S. 837, 843 (1984). The legislative record of Congress's 1977 enactment of the PSD program lacks any evidence of congressional intent to cover greenhouses gas emissions, or any evidence that Congress understood the Act to accomplish this result.<sup>5</sup>

Instead, the legislative history is replete with statements of Congress's understanding and intention that the PSD program would apply only to a small set of large industrial facilities and local NAAQS pollutants. The PSD program's *ex ante*

---

<sup>4</sup> In *Chevron* Step One's evaluation of whether the statute's commands are unambiguous, the Court applies "the traditional tools of statutory construction." *Chevron, U.S.A. v. Natural Res. Def. Council*, 467 U.S. 837, 843 n.9 (1984). Some courts have included among those tools not just "text, structure, [and] purpose," but also "legislative history." See, e.g., *Pharm. Research & Mfrs. of Am. v. Thompson*, 251 F.3d 219, 224 (D.C. Cir. 2001) (relying on legislative history that "makes quite clear" what "Congress's purpose" was).

<sup>5</sup> And as the State Petitioners explain, Congress repeatedly rejected efforts to expressly place greenhouse gas emissions within EPA's PSD jurisdiction, in the years after the 1977 Act. See Texas Br. 16.

permit requirement might be feasible “for very large sources, such as new electrical generating plants or new steel mills,” the Senate Report explains, but it would “prove costly and potentially unreasonable if imposed on construction of storage facilities for” smaller sources that “have the potential to emit 100 tons of pollution annually.” S. Rep. No. 95-127, at 96 (1977), *reprinted in 3 Legislative History* at 1470.

Congress intended and understood the PSD framework’s 100 or 250 tons per year thresholds to exempt all but the largest emitters; the Act’s regulatory reach would not extend to smaller sources, such as “dairies, farms, highways, hospitals, schools, grocery stores, and other such sources.” Senate Debate on S. 252, June 8, 1977, *in 3 Legislative History* 705, 725. But, as the State Petitioners note, those are the types of small companies and organizations that would be subject to statutory PSD and Title V permitting requirements if greenhouse gases are deemed “air pollutants” for Title I of the Act. See Texas Br. at 3.

To deem greenhouse gas emissions to be “air pollutants” triggering PSD permitting requirements is wholly incompatible with these statements of congressional intent. For that reason, even EPA admits that its inclusion of greenhouse gas emissions “result[s] in a program that would have been unrecognizable to the Congress that designed PSD” and “intended that PSD be limited to a relatively small number of large industrial sources.” J.A. 454-55. EPA’s interpretation, by contrast, results in PSD and Title V programs that would govern virtually all industrial sources, because “virtually all sources emit

at least 100 [tons per year of carbon dioxide] annually.” *Id.* at 456 n.39.

When EPA’s interpretation collides with Congress’s intent, the solution cannot be to allow EPA to unilaterally “tailor” the Clean Air Act’s volumetric thresholds by degrees of magnitude, and subsequently to expand them in the agency’s sole discretion. Rather, the proper solution is to enforce the Act as written, reasonably interpreting the term “any air pollutant” in a way that respects the Act’s unambiguous volumetric thresholds and the congressional intent they embody.

This solution, unlike EPA’s, would “follow the cardinal rule that a statute is to be read as a whole.” *King v. St. Vincent’s Hosp.*, 502 U.S. 215, 221 (1991). It would honor “one of the most the basic interpretive canons,” that a “statute should be construed so that effect is given to *all* its provisions, so that no part will be inoperative or superfluous, void or insignificant.” *Corley v. United States*, 556 U.S. 303, 314-15 (2009) (quoting *Hibbs v. Winn*, 542 U.S. 88, 101 (2004)). And in honoring not just the absurd results doctrine but also these other canons of construction, it would avoid treating the absurd results doctrine as “conclusive,” to the detriment of other equally important canons of construction. *Chickasaw Nation v. United States*, 534 U.S. 84, 94 (2001); *see also id.* at 95 (“Specific canons ‘are often countered . . . by some maxim pointing in a different direction.’”) (quoting *Circuit City Stores v. Adams*, 532 U.S. 105, 115 (2001)).

Again, “Congress selects different regulatory regimes to address different problems.” *Am. Elec. Power Co.*, 131 S. Ct. at 2538. In this case, Congress

did not select the PSD regulatory regime to address greenhouse gas emissions.<sup>6</sup>

## **II. EPA's Preconstruction Permit Program Will Impose Immense Costs Upon The States And The Public**

As the primary administrators of EPA's PSD and Title V permit programs, the States know firsthand the immense costs that would be imposed if "air pollutant" were to include greenhouse gases for purposes of those programs. Indeed, the States bear much of those costs directly.

If greenhouse gas emissions are covered by the PSD and Title V programs, then the Clean Air Act's 100 and 250 tons per year thresholds "would bring tens of thousands of small sources and modifications into the PSD program each year, and millions of small sources into the title V program." J.A. 355. In

---

<sup>6</sup> The unanimous Court's analysis in *American Electric Power Co. v. Connecticut* is relevant for another reason. After noting the implausibility of attempting to regulate greenhouse gas emissions through an *ex ante* permit regime, the Court focused on EPA's other regulatory priority, the pending "New Source Performance Standards" rulemaking pursuant to 42 U.S.C. § 7411. See 131 S. Ct. at 2538-39. That focus was instructive, because the Court declined to mention at all EPA's pending PSD and Title V permit rulemaking, which had been the predominant focus of the Government's brief in that case. See Brief for Tenn. Valley Auth. at 47-50 (PSD), 50-51 (NSPS), *Am. Elec. Power Co. v. Connecticut*, 131 S. Ct. 2527 (2011) (No. 10-174).

the absence of “streamlined permit procedures,” the result would be “administrative strains” leading “to multi-year backlogs in the issuance of PSD and title V permits, which would undermine the purposes of those programs.” *Id.* at 356. Worse still, “the addition of enormous numbers of additional sources would provide *relatively little benefit* compared to the costs to sources and the burdens to permitting authorities.” *Id.* (emphasis added).

EPA’s own estimates of the new costs and administrative burdens are shocking:

On the PSD side, annual permit applications would increase by over 300-fold, from 280 to almost 82,000; costs to the permitting authorities would increase more than 100-fold, from \$12 million to \$1.5 *billion*; and the permitting authorities would need to hire, train, and manage 9,772 FTEs [*i.e.*, full-time equivalent workers]. For title V, total permit applications would increase by over 400-fold, from 14,700 to 6.1 million; costs to the permitting authorities would increase from \$62 million to \$21 *billion*; and the permitting authorities would need to hire, train, and manage 229,118 FTEs.

J.A. 550-51 (emphasis added). In short, EPA’s interpretation of the PSD and Title V statutes would have Congress commanding States to accomplish “an impossible administrative task.” *Id.*

The States already are beginning to bear burdens of reviewing greenhouse gas emissions in administering the Clean Air Act for stationary sources. In *amicus* West Virginia, for example, the

inclusion of greenhouse gas emissions as “Best Available Control Technology,” for PSD and Title V permits triggered by non-greenhouse-gas pollutants, already has increased the State’s administrative burden by approximately five to ten percent, according to the State’s internal estimates. If EPA’s interpretation of the PSD and Title V frameworks withstands judicial review and carbon dioxide itself triggers PSD and Title V permitting requirements, then West Virginia will also incur the much more substantial costs of reviewing additional permit applications triggered by greenhouse gas emissions.

Those costs will increase over time, especially as EPA revises its tailoring rule downward in years to come, toward the statutory 100 or 250 tons per year thresholds—a trajectory that EPA purports to commit to its own exclusive discretion. See, *e.g.*, J.A. 288 (“we cannot say at this point how close to the statutory thresholds we will eventually reach . . . we do not find it necessary to answer these questions in this rule, and instead we expect to resolve them through future rulemaking”).

Of course, regulators are not the only ones who bear the cost of regulation. People and businesses will bear the greatest burdens of this new regulatory program. According to EPA, if greenhouse gas emissions are “pollutants” for PSD purposes, then the annual number of PSD permit applications would increase from 280 to 82,000 sources per year, and “commercial and residential sources—the great majority of which are small businesses—would each incur, on average, almost \$60,000 in PSD permitting expenses.” J.A. 455. “This result,” EPA adds, “would be contrary to Congress’s careful efforts to confine

PSD to large industrial sources that could afford these costs.” *Id.*

Moreover, EPA’s interpretation would place 6.1 *million* sources above the 100 tons per year threshold for purposes of the Title V permit program. J.A. 485. At a per-application cost of \$23,175 (for commercial or residential sources) or \$46,350 (for industrial sources), EPA’s interpretation would cost “a staggering \$49 billion per year over a 3 year period”—much of these costs incurred for “relatively little benefit.” *Id.* at 487.

The imposition of PSD’s and Title V’s *ex ante* permitting requirements could also deter or greatly delay the development of new facilities. The permitting process can take up to nearly two years, not counting judicial review of a permit decision. See J.A. 303 (Title V permits). EPA recognizes that under a GHG permitting regime, “the number of PSD permits will be about twice what we estimated at proposal, and the average processing time for both PSD and title V permits will be two or three times greater than what we estimated at proposal.” J.A. 385-86. Those delays would be further exacerbated by the time it would take State and local permitting authorities to hire and train an immense new workforce: “it would take the permitting authorities 2 years, on average, to hire the staff necessary to handle a ten-fold increase in PSD permits and a 40-fold increase in title V permits, and that 90 percent of their staff would need additional training in all aspects of permitting for GHG sources.” *Id.* at 386. All told, the opportunity costs of permit delays caused by such a vast new regulatory program may be incalculable, but they are certainly enormous.

EPA has not attempted to calculate the total costs that would be imposed by its broad interpretation of “air pollutant” for PSD and Title V purposes. But its analysis suggests that if greenhouse gases are deemed “air pollutants” under these statutes, then the costs of such a program would be astonishing. EPA estimates that just the first two and a half years of applying the PSD and Title V programs to facilities exceeding the statute’s 100/250 tons per year emissions thresholds would cost over \$193 *billion*. J.A. 647.

Yet EPA candidly admits that if greenhouse gas emissions are “air pollutants” within the meaning of the PSD and Title V statutes and if Congress’s volumetric thresholds were enforced, then “the addition of [these] enormous numbers of additional sources would provide *relatively little benefit* compared to the costs to sources and the burdens to permitting authorities.” J.A. 356 (emphasis added).

Ultimately, the administrative burdens and economic costs may threaten the sustainability of the Clean Air Act’s “cooperative federalism” character. Congress created the Act’s PSD and Title V programs to be “an experiment in cooperative federalism.” *Michigan v. EPA*, 268 F.3d 1075, 1083 (D.C. Cir. 2001); see also *Luminant Generation Co. v. EPA*, 675 F.3d 917, 921 (5th Cir. 2012) (same). But by expanding the PSD and Title V programs to cover greenhouse gas emissions, and thus forcing States to bear millions or billions of dollars in new administrative burdens, EPA risks transforming these programs from “cooperative federalism” to national micromanagement.

Just weeks after promulgating the Timing and Tailoring Rules, EPA published a proposed “SIP Call,” indicating that thirteen EPA-approved State implementation plans (SIPs) were inadequate to implement EPA’s new greenhouse gas requirements. 75 Fed. Reg. 53892 (Sept. 2, 2010). That list included several of the Petitioner and *Amici* States in this case. *Id.* at 53899. EPA finalized that rule just months later, demanding that the States update their SIPs to cover greenhouse gas emissions. 75 Fed. Reg. 77698 (Dec. 13, 2010). When Texas failed to revise its SIP to EPA’s satisfaction, EPA replaced Texas’s SIP with a Federal Implementation Plan (FIP). 76 Fed. Reg. 25178 (May 3, 2011).

Of course, EPA’s power to impose a FIP and displace a State’s program, in a particular case, does not by itself signal the end of cooperative federalism; after all, the Clean Air Act does provide for FIPs. But as a practical matter, the magnitude of the burden that the States face under EPA’s re-interpretation of the PSD and Title V programs, among others, places the Act’s cooperative federalism “experiment” under unprecedented strain. Cf. Patrick Morrissey, Attorney General of West Virginia, *et al.*, *Last Call For Cooperative Federalism? Why EPA Must Withdraw SIP Call Proposal On Startup, Shutdown, and Maintenance*, Washington Legal Foundation Legal Backgrounder (Sept. 13, 2013). Many States, including Petitioners and *Amici* States, have apprised EPA that the “recent increase in the level of federal regulatory activity under the Clean Air Act has generated a corresponding increase in concerns among the States regarding the preservation of their role in environmental protection.” Jon Bruning, Attorney General of Nebraska, *et al.*, *Perspective of*

*18 States on Greenhouse Gas Emission Performance Standards for Existing Sources under § 111(d) of the Clean Air Act 1-2* (Sept. 11, 2013).

The Act requires none of these problems. When EPA's interpretation of "any air pollutant" would require States to carry out "an impossible administrative task," J.A. 551, EPA should consider seriously the possibility that its interpretation of the statute is fundamentally wrong.<sup>7</sup>

---

<sup>7</sup> Such caution is particularly warranted when the agency is establishing a regulatory model that may be difficult or impossible to later replace with market-based reforms. EPA noted in its 2008 advance notice of proposed rulemaking that market mechanisms, "when well-suited to the environmental problem, offer important advantages over non-market-oriented approaches." 73 Fed. Reg. 44354, 44409 (July 30, 2008). But the institution of non-market regulatory regimes can entrench interests that become very difficult to overcome. See, e.g., Todd J. Zywicki, *Environmental Externalities and Political Externalities: The Political Economy of Environmental Regulation and Reform*, 73 Tul. L. Rev. 845, 915 (1999) ("Deregulation . . . may come about only if the distributive consequences to entrenched interest groups and politicians is large enough to offset the rents they are sacrificing."); Nathaniel O. Keohane *et al.*, *The Choice of Regulatory Instruments in Environmental Policy*, 22 Harv. Envtl. L. Rev. 313, 365 (1998) ("aggregate demand for a market-based instrument is likely to be greatest (and the opportunity costs of legislator support is likely to be least) when the environmental problem has not previously been regulated").

### **III. The “Absurd Results” Doctrine Does Not Allow EPA To Save Itself From Absurdities Of Its Own Making, Nor Does It Free EPA To Alleviate The “Absurdity” By Any Means That It Chooses**

In re-interpreting the PSD and Title V statutes to include greenhouse gas emissions as “air pollutants,” EPA recognized that its interpretation was incompatible with the statutory 100/250 tons per year thresholds triggering the statutes’ permitting requirements. J.A. 447-502. But EPA’s nominal effort to cabin and correct this absurdity, through the Tailoring Rule, fails to consider that these were absurd results of EPA’s making, not Congress’s. Cf. J.A. 454-55 (“It is not too much to say that applying PSD requirements literally to GHG sources at the present time . . . would result in a program that would have been unrecognizable to the Congress that designed PSD”).

As explained below, an agency cannot invoke the “absurd results” doctrine to remedy absurdities of the agency’s own making, any more than the patricidal defendant can invoke the court’s mercy as an orphan. And in the rare cases where the doctrine’s application actually is warranted, it requires a court to select the alternative statutory construction that does the *least* violence to Congress’s enacted text. EPA’s failure to heed both of these doctrinal limitations illustrates the fundamental constitutional problems inherent in allowing agencies a free hand to re-write statutes to solve problems that the agency itself created.

**A. The “Absurd Results” Doctrine Does Not Apply When The “Absurdity” Results From The Agency’s Untenable Interpretation Of The Statute**

The “absurd results” doctrine is a narrow exception to the normal rules of statutory construction. Courts and agencies must “begin with the understanding that Congress says in a statute what it means and means in a statute what it says there[.]” *Hartford Underwriters Ins. Co. v. Union Planters Bank, N.A.*, 530 U.S. 1, 6 (2000) (quotation marks omitted). Thus, “when the statute’s language is plain, the sole function of the courts—at least where the disposition required by the text is not absurd—is to enforce it according to its terms.” *Id.* (quotation marks omitted).

The absurd results exception that the Court noted parenthetically is limited strictly. The Constitution commits the legislative power to Congress, not to agencies or courts. Thus, resort to the absurd results doctrine to “override the literal terms of a statute” is appropriate “only under rare and exceptional circumstances.” *Crooks v. Harrelson*, 282 U.S. 55, 60 (1930); see also *Barnhart v. Sigmon Coal Co., Inc.*, 534 U.S. 438, 441 (2002) (“the Court rarely invokes such a test to override unambiguous legislation”). In those rare cases where Congress’s intentions are embodied in generally stated laws that, if applied literally, would direct results plainly at odds with Congress’s intent and understanding of the law, it falls to the courts to employ a limiting construction to avoid such results.

But in doing so, the courts must take care not to put the cart before the horse. The absurd results

doctrine applies only when the absurdity in question is the product of a statute's *unambiguous* direction. When an interpretation of ambiguous text produces absurd results, those results should signal that the statute's "proper scope" has been misconstrued to begin with. *Pub. Citizen v. U.S. Dep't of Justice*, 491 U.S. 440, 454 (1989).<sup>8</sup>

In this case, EPA's interpretation of the statute produces results so absurd that they would be "unrecognizable to the Congress that designed" the statute. J.A. 454-55. But EPA fails to take the next obvious step of asking whether these results cast doubt upon its interpretation of "air pollutant" for purposes of PSD and Title V. The fact that Congress could not possibly have intended the specific 100/250 tons per year threshold to apply to greenhouse gases proves that the agency misinterpreted the Act's general "any air pollutant" phrase, not that Congress

---

<sup>8</sup> See also *Chem. Mfrs. Ass'n v. Natural Res. Def. Council*, 470 U.S. 116, 125-26 (1985) (because the "broadest sense" of a statutory phrase leads to a nonsensical result, that statutory phrase "has no plain meaning" for purposes of *Chevron's* Step One); *Chapman v. United States*, 500 U.S. 453, 476 (1991) (Stevens, J., dissenting) ("There is nothing in our jurisprudence that compels us to interpret an ambiguous statute to reach such an absurd result."); *Nixon v. Mo. Mun. League*, 541 U.S. 125, 144 (2004) (Stevens, J., dissenting) ("Before nullifying Congress' evident purpose in an effort to avoid hypothetical absurd results, I would first decide whether the statute can reasonably be read so as to avoid such absurdities, without casting aside congressional intent.").

intended EPA to have broader discretion to address the matter in spite of the statutes.

EPA should have relinquished its preferred interpretation and accepted an interpretation that makes sense of the *whole* statutory scheme. Here, as elsewhere, “EPA may not construe the statute in a way that completely nullifies textually applicable provisions meant to limit its discretion.” *Whitman v. Am. Trucking Ass’ns*, 531 U.S. 457, 485 (2001). If EPA had interpreted “any air pollutant” in the PSD context as covering only regulated pollutants that deteriorate local air quality—which EPA itself recognizes was “the basic purpose” of the PSD and Title V statutes (J.A. 427)—then the results would not have been absurd.

**B. The Absurd Results Doctrine Requires A Court To Select The Limiting Construction That Does The Least Violence To The Statute**

Proceeding from the mistaken premise that the term “air pollutant,” in the PSD and Title V context, necessarily includes greenhouse gas emissions, the agency attempts to redress the absurd consequences of its interpretation by effectively amending Congress’s statute. And the court of appeals, proceeding from the mistaken premise that *Massachusetts v. EPA* controlled the interpretation of “air pollutant” in this context, agreed. In a profound understatement, the court acknowledged the strain that EPA’s interpretation of “air pollutant” puts on the cohesiveness of the PSD and Title V programs as a whole: “That EPA adjusted the statutory thresholds to accommodate regulation of

greenhouse gases emitted by stationary sources may indicate that the [Clean Air Act] is a regulatory scheme less-than-perfectly tailored to dealing with greenhouse gases.” J.A. 205.

Even if the court and EPA were correct that Congress’s choice of terms, rather than EPA’s interpretation of those terms, is what gave rise to the absurd results, the appropriate remedy would be to adopt the narrowing construction that “does *least* violence to the text.” *Green v. Bock Laundry Mach. Co.*, 490 U.S. 504, 529 (1989) (Scalia, J., concurring in the judgment).<sup>9</sup> This ensures the doctrine’s core purpose of preserving legislative intent in the face of a result Congress could not possibly have intended. See *Pub. Citizen*, 491 U.S. at 471 (Kennedy, J., concurring); see also *Mova Pharm. Corp. v. Shalala*, 140 F.3d 1060, 1068 (D.C. Cir. 1998) (“When the agency concludes that a literal reading of a statute would thwart the purposes of Congress, it may deviate no further from the statute than is needed to protect congressional intent.”).

In this case, if EPA had been correct that the absurd results were of Congress’s making rather

---

<sup>9</sup> See also *id.* at 533 (Blackmun, J., dissenting) (urging an interpretation that does least violence to the Congress’s intent); *Mova Pharm. Corp. v. Shalala*, 140 F.3d 1060, 1068 (D.C. Cir. 1998) (invalidating a rule that avoided absurd results but was “gravely inconsistent with the text and structure of the statute,” rejecting the agency’s “adventurous transplant operation in response to blemishes in the statute that could have been alleviated with more modest corrective surgery”).

than EPA's, then the best option would have been the simplest one: not to negate plainly stated numerical thresholds, but rather to adjust the construction of "any air pollutant" to cover only "pollutants" that actually deteriorate local air quality—which, EPA itself notes, was "the basic purpose" of Congress in enacting the statute. J.A. 427. Such construction "adds a qualification that the [phrase] does not contain but . . . does not give the [phrase] a meaning . . . it simply will not bear." *Bock Laundry*, 490 U.S. at 529 (Scalia, J., concurring in the judgment). As the lower court acknowledged, "nothing in the [Clean Air Act] requires regulation of a substance simply because it qualifies as an 'air pollutant' under this broad definition." J.A. 238. Moreover, the term "air pollutant" is, "in some contexts, capable of narrower interpretations." *Id.* at 251. Extending the narrower interpretation to the very same term in § 7479(1) requires the least statutory revision and is the most consistent Congress's decision to legislate one set of thresholds for all "air pollutants." It would avoid all of the unintended consequences that flow from EPA's interpretation of the Act.

But instead of choosing the narrowest alternative construction of "any air pollutant," EPA insisted on the *broadest* possible construction of that term, despite the cascade of absurdities that result and the more drastic regulatory fixes necessary to remedy them. To shoehorn its interpretation of "any air pollutant" into this context, EPA substituted its own greenhouse-gas-specific emissions limit for

Congress's clear thresholds, completely negating the thresholds that Congress had carefully devised.<sup>10</sup>

Moreover, in insisting upon its interpretation of the Act's more general term ("air pollutant") and adjusting the Act's specific numerical thresholds, EPA ignored this Court's caution that the absurd results doctrine allows only for slight adjustment to a statute's "[g]eneral terms," *United States v. Kirby*, 74 U.S. 482, 486 (1868), not wholesale revisions of its *specific* terms. This limitation, too, is intended to preserve the supremacy of congressional intent, by limiting the potential for courts and agencies to encroach on legislative intent. See *Holy Trinity Church v. United States*, 143 U.S. 457, 459 (1892).<sup>11</sup>

---

<sup>10</sup> See also D. Wiley Barker, *The Absurd Results Doctrine, Chevron, and Climate Change*, 26 *BYU J. Pub. L.* 73, 97 (2012) (concluding that EPA's approach in this case "does the most violence to the statutory language by changing the clear numbers of the statute"); Katherine Kirklin O'Brien, *Beyond Absurdity: Climate Regulation and the Case for Restricting the Absurd Results Doctrine*, 86 *Wash. L. Rev.* 635, 653 (2011) ("EPA's Tailoring Rule may represent the broadest interpretation of the absurd results doctrine to date, as it revises unambiguous, numerical statutory standards").

<sup>11</sup> As the Court explained in *Holy Trinity Church*:

This is not the substitution of the will of the judge for that of the legislator; for frequently words of general meaning are used in a statute, words broad enough to include an act in question, and yet a consideration of the whole legislation, or of the circumstances surrounding its enactment, or of the absurd results which follow from giving such broad meaning to the

In this case, by contrast, EPA has substituted its own will for that of Congress in the most egregious way—by construing a general statutory term so as to force an alteration of Congress’s specific numerical standard—an alteration that “satisf[ies] the policy preferences of the [agency],” but that presumes to decide unilaterally “battles that should be fought among the political branches and the industry.” *Barnhart*, 534 U.S. at 462 (2002).

EPA cannot say that all of this was done in the interests of preserving Congress’s literal words, “any air pollutant.” For even after rewriting the emissions threshold, EPA’s position still relies upon construing “any air pollutant” to mean any “*regulated* pollutant,” in order to avoid bringing facilities within the purview of PSD based solely on their emissions of harmless chemicals. J.A. 237-38.<sup>12</sup>

In sum, EPA surveyed the plausible alternative constructions of the statute, and chose the one that does the most violence to the Act—and that maximizes EPA’s own power and discretion at the

---

words, makes it unreasonable to believe that the legislator intended to include the particular act.

*Holy Trinity Church*, 143 U.S. at 459.

<sup>12</sup> That construction of “air pollutant” also results in the Act requiring the “useless” exercise of collecting “continuous [GHG] air quality monitoring data” for every designated area, even though GHGs dissipate into the global atmosphere and do not measurably alter ambient air quality. See Brief of Util. Air Regulatory Group at 27.

expense of the States. If the Act itself gives rise to absurd results, all of those unintended consequences can and must be avoided by a limiting construction of “any air pollutant” to refer only to pollutants that actually deteriorate local air quality.

\* \* \*

This case demonstrates the risk inherent in expanding the absurd results doctrine to allow agencies to revise congressional statutes as EPA did here. An agency motivated to regulate in a manner inconsistent with the express intent of Congress has a clear incentive to identify “plain meanings” and “absurd results” in the legislative text where the text may in fact be ambiguous and the alleged absurdities illusory. As Publius noted, executive departments exercise not “merely judgment,” but “force,” *The Federalist* No. 78 (Alexander Hamilton). For that very reason, courts must take care to “keep agencies tethered to Congress and to our representative system of government.” David S. Tatel, *The Administrative Process and the Rule of Environmental Law*, 34 *Harv. Envtl. L. Rev.* 1, 7 (2010). EPA has “programs it is eager to execute. But those programs will be legitimate—and will be sustained in court—only if their implementation conforms to the rule of law.” *Id.* at 8.

When EPA nullifies Congress’s plainly stated volumetric thresholds and replaces them with new thresholds of the agency’s own making, EPA becomes the author of the laws it administers. This “violat[e]s a fundamental principle of separation of powers—that the power to write a law and the power to interpret it cannot rest in the same hands.” *Decker v. Nw. Envtl. Def. Ctr.*, 133 S. Ct. 1326, 1341 (2013)

(Scalia, J. concurring in part and dissenting in part)  
(citing Montesquieu, *Spirit of the Laws* bk. XI, ch. 6,  
pp. 151–152 (O. Piest ed., T. Nugent transl. 1949)).

### CONCLUSION

The judgment of the court of appeals should be reversed.

Respectfully submitted.

**RULE 26.1 DISCLOSURE STATEMENT OF THE  
AMERICAN PETROLEUM INSTITUTE**

Pursuant to Rule 26.1 of the Federal Rules of Appellate Procedure and Circuit Rule 26.1, Petitioner American Petroleum Institute (“API”) files the following statement:

API is a nationwide, non-profit trade association representing over 500 member companies, headquartered in the District of Columbia. API’s member companies engage in all segments of the oil and gas industry, including science and research, exploration and production of oil and natural gas, transportation, refining of crude oil, and marketing of oil and gas products. API has no parent companies, and no publicly held company has a 10 percent or greater ownership interest in API.

No. 13-1292

**RULE 26.1 STATEMENT**

Pursuant to Federal Rule of Appellate Procedure 26.1 and D.C. Circuit Rule 26.1, Petitioner Texas Oil and Gas Association (TXOGA) makes the following Disclosure:

TXOGA, a “trade association” within the meaning of Circuit Rule 26.1, is the largest and oldest petroleum organization in Texas, representing more than 5,000 members. The membership of TXOGA produces in excess of 90 percent of Texas’ crude oil and natural gas, operates nearly 100 percent of the state’s refining capacity, and is responsible for the vast majority of the state’s pipelines. TXOGA member companies produce approximately a quarter of the nation’s oil, a third of its natural gas and account for one-fourth of the U.S. refining capacity and,

therefore, own and operate facilities that are affected by the rule at issue in this case. TXOGA has not issued shares or debt securities to the public, has no parent company, and no publicly-held company has a 10 percent or greater ownership interest in TXOGA.

**RULE 26.1 DISCLOSURE STATEMENT  
OF THE INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA,  
INDEPENDENT OIL AND GAS ASSOCIATION OF WEST VIRGINIA,  
INC., KENTUCKY OIL & GAS ASSOCIATION, INC., PENNSYLVANIA  
INDEPENDENT OIL & GAS ASSOCIATION, OHIO OIL AND GAS  
ASSOCIATION, ILLINOIS OIL AND GAS ASSOCIATION, INDIANA OIL  
AND GAS ASSOCIATION AND VIRGINIA OIL & GAS ASSOCIATION**

Pursuant to Fed. R. App. P. 26.1 and D.C. Circuit Rule 26.1, Petitioners the Independent Petroleum Association of America, Independent Oil and Gas Association of West Virginia, Inc., Kentucky Oil & Gas Association, Inc.,

Pennsylvania Independent Oil & Gas Association, Ohio Oil and Gas Association, Illinois Oil and Gas Association, Indiana Oil and Gas Association, and Virginia Oil & Gas Association (collectively, the "Independent Producers") file the following statement:

The Independent Petroleum Association of America ("IPAA") is an incorporated trade association that represents thousands of independent oil and natural gas producers and service companies across the United States that are active in the exploration and production segment of the industry, which often involves the hydraulic fracturing of wells. IPAA serves as an informed voice for the exploration and production segment of the industry, and advocates its members' views before the United States Congress, the Administration and federal agencies. IPAA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

The Independent Oil and Gas Association of West Virginia, Inc. ("IOGA-WV") is a statewide nonprofit trade association that represents companies engaged in the extraction and production of natural gas and oil in West Virginia and the companies that support these extraction and production activities. IOGA-WV was formed to promote and protect a strong, competitive and capable independent natural gas and oil producing industry in West Virginia, as well as the natural

environment of our state. IOGA-WV has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

The Kentucky Oil & Gas Association, Inc. ("KOGA") was formed in 1931 to represent the interests of Kentucky's crude oil and natural gas industry, and more particularly, the independent crude oil and natural gas operators as well as the businesses that support the industry. KOGA is comprised of 220 companies which consist of over 600 member representatives that are directly related to the crude oil and natural gas industry in Kentucky. KOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

The Pennsylvania Independent Oil & Gas Association ("PIOGA") is a non-profit corporation that was initially formed in 1978 to represent the interests of smaller independent producers of Pennsylvania natural gas from conventional limestone and sandstone formations. Through the years PIOGA's membership has grown to nearly 1,000 members: oil and natural gas producers, drilling contractors, service companies, engineering companies, manufacturers, marketers, Pennsylvania Public Utility Commission-licensed Natural Gas Suppliers ("NGSs"), professional firms and consultants, and royalty owners. PIOGA promotes the interests of its members in environmentally responsible oil and natural gas operations in both conventional geologic formations and unconventional shale formations, and the development of competitive markets and additional uses for

Pennsylvania-produced natural gas. PIOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

The Ohio Oil & Gas Association ("OOGA") is a trade association with over 3,150 members involved in all aspects of the exploration, production and development of crude oil and natural gas resources within the State of Ohio. OOGA represents the people and companies directly responsible for the production of crude oil, natural gas, and associated products in Ohio. OOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

Indiana Oil and Gas Association, Inc. ("INOGA") has a rich history of involvement in the exploration and development of hydrocarbons in the State of Indiana. INOGA was formed in 1942 and historically has been an all-volunteer organization principally made up of representatives of oil and gas exploration and development companies (operators), however, it has enjoyed support and membership from pipeline, refinery, land acquisition, service, supply, legal, engineering and geologic companies or individuals. INOGA has been an active representative for the upstream oil and gas industry in Indiana and provides a common forum for this group. INOGA represents its membership on issues of state, federal and local regulation/legislation that has, does and will affect the business of this industry. INOGA is a 501(c)(6) trade association incorporated as

Non-Profit Domestic Corporation under the statutes of Indiana. INOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

The Illinois Oil & Gas Association ("IOGA") was organized in 1944 to provide an agency through which oil and gas producers, land owners, royalty owners, and others who may be directly or indirectly affected by or interested in oil and gas development and production in Illinois, may protect, preserve and advance their common interests. IOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

Formed in 1977 the Virginia Oil & Gas Association ("VOGA") is a non-profit trade association representing the interests of companies, partnerships, individuals or other entities having an interest in the oil and gas industry who are primarily engaged in the exploration, production, development, transportation and distribution of natural gas and oil in Virginia. VOGA has no parent corporation and there is no publicly held corporation that owns 10% or more of its stock.

**RULE 26.1 DISCLOSURE STATEMENT OF PETITIONERS  
GAS PROCESSORS ASSOCIATION**

Pursuant to Rule 26.1 of the Federal Rules of Appellate Procedure and Rule 26.1 of the Local Rules of this Court, Petitioners Gas Processors Association hereby provides the following information:

The Gas Processors Association (GPA) is a non-profit trade organization made up of approximately 130 corporate members, all of whom are engaged in the processing of natural gas into merchantable pipeline gas, or in the manufacture, transportation, or further processing of liquid products from natural gas. Our members also produce, gather, transmit, and market natural gas and natural gas liquids. GPA has no parent company, and no publicly held company has a 10 percent or greater ownership interest in GPA.

[EPA-HQ-OAR-2010-0505, FRL-9844-4]

RIN 2060-AR75

**Oil and Natural Gas Sector:  
Reconsideration of Certain Provisions  
of New Source Performance Standards****AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Final Amendments.

**SUMMARY:** This action finalizes the amendments to new source performance standards for the oil and natural gas sector. The Administrator received petitions for reconsideration of certain aspects of the August 12, 2012, final standards. These amendments are a result of reconsideration of certain issues raised by petitioners related to implementation of storage vessel provisions. The final amendments provide clarity of notification and compliance dates, ensure control of all storage vessel affected facilities and update key definitions. This action also corrects technical errors that were inadvertently included in the final standards.

**DATES:** This final rule is effective on September 23, 2013.

**ADDRESSES:** The EPA has established a docket for this action under Docket ID No. EPA-HQ-OAR-2010-0505. All documents in the docket are listed on the <http://www.regulations.gov> Web site. Although listed in the index, some information is not publicly available, e.g., confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through <http://www.regulations.gov> or in hard copy at the EPA's Docket Center, Public Reading Room, EPA West Building, Room Number 3334, 1301 Constitution Avenue NW., Washington, DC 20004. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the Air Docket is (202) 566-1742.

**FOR FURTHER INFORMATION CONTACT:** Mr. Bruce Moore, Sector Policies and Programs Division (E143-05), Office of Air Quality Planning and Standards,

Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number: (919) 541-5460; facsimile number: (919) 685-3200; email address: [moore.bruce@epa.gov](mailto:moore.bruce@epa.gov).

**SUPPLEMENTARY INFORMATION:**  
*Organization of This Document.* The information presented in this preamble is organized as follows:

- I. Preamble Acronyms and Abbreviations
- II. General Information

**II. General Information****A. Executive Summary****1. Purpose of This Regulatory Action**

The purpose of this action is to finalize amendments to the 40 CFR part 60, subpart OOOO, Standards of Performance for Crude Oil and Natural Gas Production, Transmission and

Distribution final rule promulgated under section 111(b) of the Clean Air Act (CAA), which was published on August 16, 2012 [77 FR 49490]. The amendments being finalized were proposed on April 12, 2012 [78 FR 22126]. Specifically, this final rule action amends aspects of the 2012 new source performance standards (2012 NSPS) to address select issues raised by different stakeholders through several administrative petitions for reconsideration of the 2012 NSPS. The select issues being reconsidered and addressed by this action are related primarily to implementation of the storage vessel provisions.

## 2. Summary of Major Amendments to the NSPS

This rule finalizes a number of aspects of the proposal but, after consideration of public comments received, it also makes certain changes, as described in this section.

### a. Initial Notification and Compliance Dates

For Group 1 storage vessels (*i.e.*, those the construction, reconstruction or modification of which began after August 23, 2011, and on or before April 12, 2013),<sup>1</sup> the final amendments require that owners/operators estimate emissions from the storage vessels to determine affected facility no later than October 15, 2013, and a notification be submitted with the facilities' annual report due by January 15, 2014, to inform regulatory agencies of the existence and location of the Group 1 storage vessel affected facilities. The final amendments retain the requirement that all Group 1 storage vessel affected facilities comply with the emission standards but, in a change from proposal, extend the compliance deadline to April 15, 2015. Since all Group 1 affected facilities are required to meet the emission standards, the final amendments do not require Group 1 storage vessel affected facilities to track emission increase events, as we had proposed.

For Group 2 storage vessel affected facilities (*i.e.*, those the construction, reconstruction or modification of which began after April 12, 2013), the final amendments extend the compliance date to April 15, 2014 (or 60 days after startup, whichever is later), for implementing the emission standards, as proposed.

In response to comments regarding the confusion about when the affected

facility status for Group 1 storage vessels should be determined, we have also made clarifying changes to § 60.5365(e) in the final amendments that clearly specify October 15, 2013, as the deadline for calculating potential volatile organic compound (VOC) emissions from Group 1 storage vessels for determining the affected facility status.

### b. Group 1 and Group 2 Storage Vessel Emission Standards Applicability

We have amended § 60.5395 to more clearly specify that the requirements of the NSPS apply to Group 1 and Group 2 storage vessel affected facilities (*i.e.*, those with potential to emit (PTE) 6 or more tpy of VOC, as determined by the methods and dates specified in this final rule). We amended this language in response to several comments expressing confusion about whether the requirements applied to all Group 1 storage vessels or just those with VOC emissions of 6 tpy or greater (*i.e.*, affected facilities).

### c. Group 1 Storage Vessel Affected Facility Emission Standards and Compliance Dates

A key feature of this action is that the final amendments require control of all storage vessel affected facilities constructed since the August 23, 2011, proposal date of the 2012 NSPS. This decision, as summarized in this section and discussed fully in sections IV.A and V.C of this preamble, was based on new information we received that indicates that the projected control device supply appears to be greater than we originally estimated.

In the preamble to the proposed amendments, based on the information then available to the EPA, we developed an estimate of the supply of the type of combustors likely to be used by owners and operators to comply with the control requirements and concluded that control supply would not catch up with its demand under this rule until 2016. To avoid delaying control until such time, we proposed that Group 1 affected facilities notify the EPA of their presence and location by October 15, 2013, but need not comply with the 95 percent reduction requirement unless they experience an emission increase event. However, new information we received since proposal indicates that the combustor suppliers have the manufacturing capacity to meet the demand posed both by this regulation and a variety of state and local regulations that require the installation of control devices. Therefore, in the final amendments, we are not changing the requirement of the 2012 NSPS that

Group 1 storage vessel affected facilities comply with the emission standard requirements. However, we have extended the current compliance deadline. For the reasons discussed in detail in section IV.A, these final amendments require that Group 2 affected facilities comply with the emission standards by April 15, 2014, as we proposed, and that Group 1 affected facilities comply by April 15, 2015.

### d. Alternative 4-tpy Uncontrolled Actual VOC Emission Rate

To help alleviate the control supply shortage believed to exist at the time, we had proposed that affected facilities meet the 95% reduction requirement or an uncontrolled actual VOC emission rate of less than 4 tpy, which would allow control devices to be removed from storage vessel affected sources below that emission rate and relocated to those that have just come on line and have PTE of 6 tpy VOC or more. As mentioned above, new information we received since proposal indicate that the combustor suppliers have the manufacturing capacity to meet the demand posed by this regulation, which in turn would suggest that a supply buffer may no longer be necessary. However, for the reasons provided in section V.C of this preamble, we are finalizing the amendment to the storage vessel emission standards as proposed due to questionable cost effectiveness, the secondary environmental impact and the energy impacts from the continued operation of the combustion control device at an inlet stream concentration of less than about 4 tpy. We were aware but had not highlighted these concerns in the proposed amendment because the perceived supply problem alone necessitated proposing the amendment. The resolution of the supply issue, however, shifts our focus back to these concerns. As explained in more detail in section V.C of this preamble, in light of the questionable cost effectiveness of additional control, the secondary environmental impact and the energy impacts we conclude that the best system of emissions reduction (BSER) for reducing VOC emissions from storage vessel affected facilities is not represented by continued control when their sustained uncontrolled emission rates fall below 4 tpy. We are therefore finalizing the amendment as proposed. Under the final amendments, an owner or operator may comply with the uncontrolled actual VOC emission rate instead of the 95 percent control requirement where it can be demonstrated that, based on records of monthly determinations of actual

<sup>1</sup> The 2012 NSPS proposal was published on August 23, 2011, and the proposed rule for this action was published on April 12, 2013.

emission rate for the 12 consecutive months immediately preceding the demonstration, that the storage vessel affected facility uncontrolled actual VOC emissions for each month during that 12-month period have been below 4 tpy. The final amendments require that the owner or operator re-evaluate the uncontrolled actual VOC emissions on a monthly basis. If the results of the monthly determination show that the uncontrolled actual VOC emission rate is 4 tpy or more, the owner or operator would have 30 days to meet the 95 percent control requirement. We discuss this further in section V.C of this preamble.

**e. Definition of Storage Vessel Affected Facility**

We have finalized the proposed amendments to the definition of "storage vessel affected facility" in the final rule (see § 60.5365(e)) to (1) include the 6 tpy VOC emission threshold and to clarify that a source can take into account any legally and practically enforceable emission limit under federal, state, local or tribal authority when determining the VOC emission rate for purposes of this threshold; (2) clarify that a storage vessel affected facility whose VOC PTE decreases to less than 6 tpy would

remain an affected facility; and (3) to clarify that PTE does not include any vapor recovered and routed to a process.

**f. Streamlined Compliance Monitoring Provisions**

We received several comments regarding the streamlined compliance monitoring provisions; our review of the comments did not result in significant changes since proposal. These compliance monitoring provisions include inspections of covers, closed-vent systems and control devices, performed at least monthly. We believe that these measures are sufficient to ensure that storage vessel affected facilities that have installed controls meet the 95 percent VOC reduction standard. Although the more stringent compliance monitoring provisions in the 2012 NSPS may provide better assurance of compliance, there are significant issues regarding their implementation, which have been raised in several administrative reconsideration petitions. We continue to evaluate the reconsideration issues related to compliance monitoring and intend to complete our reconsideration by the end of 2014.

**3. Cost and Benefits**

Owners and operators of storage vessel affected facilities are expected to

install and operate the same or similar air pollution control technologies under these final amendments as would have been necessary to meet the previously finalized standards for the oil and natural gas sector under the 2012 NSPS. We project that these amendments will not result in a significant change in costs and or benefits compared to the 2012 NSPS. The final amendments continue to require that all storage vessel affected facilities comply with the emission standards. Although the final amendments may not achieve the same level of emission reductions as the 2012 NSPS, it was necessary to revise the standards due to the limitations of the 2012 rule. The revisions provided in the final amendments were needed for the reasons explained in this preamble, and we believe the rule provides significant benefits. We anticipate that, if there are any changes in costs for these units, such changes would likely be small relative to both the overall costs of the individual projects and the overall costs and benefits of the final rule.

*B. Does this reconsideration notice apply to me?*

Categories and entities potentially affected by today's notice include:

TABLE 1—INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS ACTION

Category	NAICS code <sup>1</sup>	Examples of regulated entities
Industry .....	211111 211112 221210 486110 486210	Crude Petroleum and Natural Gas Extraction. Natural Gas Liquid Extraction. Natural Gas Distribution. Pipeline Distribution of Crude Oil. Pipeline Transportation of Natural Gas.
Federal government .....	.....	Not affected.
State/local/tribal government .....	.....	Not affected.

<sup>1</sup> North American Industry Classification System.

This table is not intended to be exhaustive, but rather is meant to provide a guide for readers regarding entities likely to be affected by this action. If you have any questions regarding the applicability of this action to a particular entity, consult either the air permitting authority for the entity or your EPA regional representative as listed in 40 CFR 60.4 or 40 CFR 63.13 (General Provisions).

**C. How do I obtain a copy of this document and other related information?**

In addition to being available in the docket, electronic copies of these proposed rules will be available on the Worldwide Web through the Technology Transfer Network (TTN).

Following signature, a copy of each proposed rule will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: <http://www.epa.gov/ttn/oarpg/>. The TTN provides information and technology exchange in various areas of air pollution control.

**D. Judicial Review**

Under section 307(b)(1) of the CAA, judicial review of this final rule is available only by filing a petition for review in the U.S. Court of Appeals for the District of Columbia Circuit by November 22, 2013. Under section 307(d)(7)(B) of the CAA, only an objection to this final rule that was raised with reasonable specificity

during the period for public comment can be raised during judicial review. Moreover, under section 307(b)(2) of the CAA, the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce these requirements. Section 307(d)(7)(B) of the CAA further provides that "[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review." This section also provides a mechanism for us to convene a proceeding for reconsideration, "[i]f the person raising an objection can demonstrate to the EPA that it was

impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule." Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, Ariel Rios Building, 1200 Pennsylvania Ave. NW., Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW., Washington, DC 20460.

### III. Summary of Final Amendments

The final amendments include revisions to certain reconsidered aspects of the existing 2012 NSPS which primarily affect the implementation of the regulation of VOC emissions from storage vessels. A summary of the final amendments resulting from our reconsideration are provided in the following paragraphs.

#### A. Initial Notification and Compliance Dates

For Group 1 storage vessel affected facilities, we have amended the 2012 NSPS to require that a notification be submitted with the initial annual report, to inform regulatory agencies of the existence and location of the vessels. In addition, we have amended the 2012 NSPS to require that all Group 1 storage vessel affected facilities comply with the emission standards no later than April 15, 2015, and that all Group 2 storage vessel affected facilities comply no later than April 15, 2014, (or 60 days after startup, whichever is later).

The final amendments also make clarifying changes to § 60.5395 that clearly specify October 15, 2013, as the deadline for calculating potential VOC emissions from Group 1 storage vessels to determine affected facility status.

#### B. Group 1 and Group 2 Storage Vessel Emission Standards Applicability

We have amended § 60.5395 to clearly state that the emission standards apply to Group 1 and Group 2 storage vessel affected facilities (as opposed to all storage vessels).

#### C. Group 1 Storage Vessel Affected Facility Control Requirements

The final amendments retain the requirement in the 2012 NSPS that all

storage vessel affected facilities meet the emission standards. However, the final amendments require that owners and operators of Group 1 storage vessel affected facilities comply with the emission standards by April 15, 2015, and that Group 2 storage vessel affected facilities comply by April 15, 2014.

#### D. Alternative 4-tpy Uncontrolled Actual VOC Emission Rate

We have amended the storage vessel standards to include a sustained uncontrolled actual VOC emission rate of less than 4 tpy. Specifically, an owner or operator may comply with the uncontrolled actual VOC emission rate instead of the 95 percent control requirement where it can be demonstrated that, based on records of monthly emission estimates for the 12 months immediately preceding the demonstration, that the storage vessel affected facility uncontrolled actual VOC emissions estimated each of those months were below 4 tpy. The owner or operator would be required to re-evaluate the uncontrolled actual VOC emissions on a monthly basis. If the results of the monthly determination show that the uncontrolled actual VOC emission rate is 4 tpy or more, the owner or operator would have 30 days to meet the 95 percent control requirement, unless the increase was associated with the fracturing or refracturing of a well feeding the storage vessel affected facility. In that case, 95 percent control would be required as soon as liquids are routed from the fractured or refractured well to the storage vessel. We discuss this further in section V.C of this preamble.

#### E. Definition of Storage Vessel

The final amendments revise the definition of "storage vessel" to clarify that it refers only to vessels containing crude oil, condensate, intermediate hydrocarbon liquids or produced water.

#### F. Definition of Storage Vessel Affected Facility

The final amendments revise the definition of "storage vessel affected facility" (see § 60.5365(e)) to (1) include the 6 tpy VOC emission limit and to clarify that a source can take into account any legally and practically enforceable emission limit under federal, state, local or tribal authority when determining the VOC emission rate for purposes of this threshold; (2) clarify that a storage vessel affected facility whose VOC PTE decreases to less than 6 tpy would remain an affected facility; (3) clarify that "other mechanisms" (or non-federally enforceable mechanisms) must be

legally and practically enforceable under federal, state, local or tribal authority; and (4) clarify that vapor from a storage vessel that is recovered and routed to a process is not to be counted in the PTE for purposes of determining affected facility status.

We also added language at § 60.5395(f) to address storage vessel affected facilities that are removed from service. Owners and operators are required to include a notification in their next annual report that the storage vessel has been taken out of service. If a storage vessel's return to service is associated with fracturing or refracturing of a well feeding the storage vessel, the storage vessel is subject to control requirements immediately upon returning to service. If, however, the storage vessel's return to service is not associated with well fracturing or refracturing, the PTE of the storage vessel must be determined within 30 days. If the PTE is 4 tpy or greater, then the storage vessel affected facility must comply with control requirements within 60 days of returning to service.

#### G. Streamlined Compliance Monitoring Provisions

For storage vessels that install controls to meet the 95 percent VOC reduction standard, we have amended the 2012 NSPS to adopt the streamlined compliance monitoring provisions as proposed without significant changes. These compliance monitoring provisions include inspections performed at least monthly of covers, closed-vent systems and control devices. As mentioned above, we continue to evaluate the reconsideration issues raised concerning the compliance monitoring provisions in the 2012 NSPS and intend to complete our reconsideration by the end of 2014.

#### H. Combustion Control Device Manufacturer Test Protocol

We have finalized amendments to the enclosed combustor manufacturer test protocol in the NSPS to align it with a similar protocol in the Oil and Natural Gas National Emission Standards for Hazardous Air Pollutants (NESHAP) (40 CFR 63, subpart HH).

#### I. Annual Report and Compliance Certification

We finalized amendments to allow 90 days after the end of the compliance period for submittal of the annual report and compliance certification.

### IV. Summary of Significant Changes Since Proposal

Section III summarized the amendments to the 2012 NSPS that the

58420 Federal Register / Vol. 78, No. 184 / Monday, September 23, 2013 / Rules and Regulations

EPA is finalizing in this rule. This section will discuss the key changes the EPA has made since the April 12, 2013, proposal. These changes are the result of the EPA's consideration of the many substantive and thoughtful comments submitted on the proposal and other information received since proposal. We believe that the changes we have made sufficiently address concerns expressed by commenters and improve the clarity of the rule while improving or preserving public health and environmental protection required under the CAA.

#### *A. Group 1 Storage Vessel Affected Facility Control Requirements and Applicability*

We received comments requesting clarification regarding Group 1 storage vessel affected facility control requirement applicability. We also received comments on our estimate of the supply of combustors used to comply with the control requirements and our use of this estimate to determine the requirements for Group 1 storage vessel affected facilities.

To the extent that there was confusion regarding the applicability of Group 1 storage vessel affected facility control requirements, we agree that there is a need for more clarity in the final amendments. To accomplish this, we have included amendments to § 60.5395(b) that make it clear that these requirements apply only to Group 1 storage vessel affected facilities (emphasis added) (*i.e.*, those that have the PTE of 6 tpy VOC or more, as determined by the dates specified in the rule, as amended), not all Group 1 storage vessels. Refer to section V.A of this preamble for further discussion of comments and responses pertaining to these changes.

In the proposed amendments, based on the information then available to the EPA, we concluded that control supply would not catch up with its demand under this rule until 2016. To avoid delaying control until such time, we proposed that Group 1 affected facilities notify the EPA of their presence and location by October 15, 2013, but need not comply with the 95 percent reduction requirement unless they experience an emission increase event. Information we received since proposal indicate that the combustor suppliers have the manufacturing capacity to meet the demand posed both by this regulation and a variety of state and local regulations that require the installation of control devices even when accounting for the need to cover Group 1 well in advance of the projected 2016 date. Therefore, in the

final amendments we did not finalize the proposed requirement for Group 1 storage vessel affected facilities to be controlled only if there is an emission increase event. However, as explained in more detail below, we have concerns regarding the projections of potential combustor supply; the pace at which the combustor manufacturing industry can ramp up production and provide the necessary supply in the short-term; and the availability of trained personnel to install these devices on all affected facilities that will have already come on line by the current compliance date of October 15, 2013, as well as the additional approximately 1,100 new affected facilities per month that may need control. Consideration of these factors leads us to conclude that an adjustment to the compliance schedule is warranted.

First, we note that there is a great variability in the projections of potential combustor supply, with one supplier's projection greatly exceeding the other suppliers' projections. Our revised conclusion regarding supply of control devices is largely based on this one supplier's manufacturing capacity, which, if changed, could potentially affect sources' ability to acquire and install control by the current compliance deadline (*i.e.*, October 15, 2013 or 60 days after startup, whichever is later). In light of the above, additional time is needed beyond October 15, 2013, for compliance with the 95 percent reduction requirement. Secondly, we share the concern raised by several commenters that, due to the large number of storage vessel affected facilities, some may not be able to secure the necessary trained personnel to install control devices by the current compliance deadline, especially in the near term. Under the 2012 NSPS, installation of controls would be required by the current compliance date of October 15, 2013, for over 20,000 affected facilities that we estimate will have already come on line since the August 23, 2011, proposal date of the 2012 NSPS, as well as the additional approximately 1,100 new affected facilities per month that will need to install control 60 days after start-up. Lastly, while the overall supply of combustors appears to be adequate, we have concerns about how quickly the combustor manufacturing industry can ramp up production and provide the necessary supply in the short-term. We are doubtful that, even at full current capacity, there would be sufficient control devices to meet the October 15, 2013, compliance date. For the reasons stated above, we decided to take a

phase-in compliance approach that requires the newer affected facilities (which would have higher emissions) to comply first. Accordingly, the final amendments require that Group 2 affected facilities comply with the emission standards by April 15, 2014, as we proposed, and that Group 1 affected facilities comply by April 15, 2015.

Refer to section V.C of this preamble for further discussion regarding these changes.

In addition, we had proposed a list of examples of "events" that would trigger control requirements for Group 1 storage vessel affected facilities. As noted, all Group 1 storage vessel affected facilities must meet the control requirements by April 15, 2015. Therefore, we no longer need to look to events that may be presumed to increase emissions to determine which Group 1 storage vessel affected facilities are subject to control requirements. All proposed provisions related to tracking events have been removed from the final amendments, thereby simplifying the rule and avoiding additional burden and potential confusion.

Refer to section V.A of this preamble for further discussion regarding these changes.

#### *B. Applicability Dates and Compliance Dates*

As discussed in section IV.A of this preamble, the EPA previously concluded that there will be an insufficient supply of combustion control devices for all storage vessel affected facilities until 2016, based on information available at proposal. To avoid postponing control for all storage vessels affected facilities until 2016, we proposed alternative measures for Group 1 and Group 2 storage vessel affected facilities. For Group 1 storage vessel affected facilities, we proposed to require initial notification by October 15, 2013, to inform regulatory agencies of the existence and location of these storage vessels. We also proposed that Group 1 storage vessel affected facilities that undergo an event after April 12, 2013, that could reasonably be expected to lead to an increase in VOC PTE would be subject to control requirements. For Group 2 storage vessel affected facilities, we proposed April 15, 2014, as the compliance date for implementing control requirements.

In response to comments concerning Group 1 storage vessel control requirement applicability and compliance being tied to the "events" listed in § 60.5395(b)(2) and unclear notification and compliance dates for both Group 1 and Group 2 storage vessels, we have made changes to the

final amendments. For Group 1 storage vessels, we are requiring that the owner or operator determine whether the storage vessel is an affected facility no later than October 15, 2013. In the proposed amendments, owners or operators of Group 1 storage vessel affected facilities had to submit an initial notification of these storage vessels by October 15, 2013, as well as an initial annual report by January 15, 2014. In the final amendments, the initial notification may be combined with the initial annual report to reduce the burden of submitting two notifications within a 90-day period. As discussed previously in section IV.A of this preamble, the final amendments retain the requirement in the 2012 NSPS that all Group 1 storage vessel affected facilities comply with emission standards, and specify that compliance must be achieved by April 15, 2015. Therefore, we have removed all provisions related to tracking emission increase events from the final amendments.

For Group 2 storage vessel affected facilities, we are finalizing April 15, 2014, (or 60 days after startup, whichever is later) as the compliance date for implementing control requirements.

Refer to section V.A of this preamble for further discussion of comments and responses regarding these provisions.

#### C. Definition of Storage Vessel Affected Facility

We proposed to amend the definition of "storage vessel affected facility" to specify that the storage vessel must have a VOC PTE equal to or greater than 6 tpy to be an affected facility and to clarify that the owner or operator can take into account any legally and practically enforceable emission limit in an operating permit, or by another mechanism under state, local or tribal authority, when determining the VOC PTE. The proposed amendment also clarified that a storage vessel affected facility whose potential VOC emissions decrease to less than the threshold of 6 tpy would remain an affected facility. We proposed this amendment to clarify that a storage vessel complying with the proposed uncontrolled actual VOC emission rate would remain an affected facility.

We received comments opposing the revisions to the definition of "storage vessel affected facility" to the extent that it may allow storage vessel operators to account for non-federally enforceable emission limitations that may change in the future and are not enforceable by the EPA in the determination of VOC PTE. Upon

evaluation, we believe that the commenters' concern arises from language we used in the proposed amendments to § 60.5365(e) to define the storage vessel affected facility which could have been confusing due to the phrase "other mechanisms." Therefore, the final amendments clarify that "other mechanisms" must be legally and practically enforceable under federal, state, local or tribal authority.

We received public comments that requested that the 6 tpy threshold for storage vessel affected facilities be determined after application of a vapor recovery unit (VRU) (i.e., taking the VRU vapor recovery into account in the emissions determination) for Group 1 and Group 2 storage vessels.

In September 2012, in response to issues brought to the EPA's attention after the publication of the 2012 NSPS, we clarified that we do not consider VRUs that route recovered gas and vapor back to the process to be control devices, which is consistent with their treatment under 40 CFR part 63, subpart HH.<sup>2</sup>

As long as certain operating requirements are met, we believe it is appropriate to take into account reductions in VOC emissions that result from the recovery of vapor and routing of it to a VRU when determining the VOC PTE from a storage vessel for purposes of determining affected facility status. Routing of vapor through a VRU to a process reduces VOC emissions without secondary environmental impacts (e.g., NO<sub>x</sub> emissions) and is responsible conservation of our energy resources. However, it does not totally eliminate VOC emissions, since the VRU cannot operate 100 percent of the time due to maintenance and repair down time. Our September 28, 2012, letter clarified that the cover and closed vent requirements must be met when VRU is used to meet the 95 percent reduction emission standards. That said, we previously determined that routing of vapor through a cover and properly operated closed-vent system would recover all vapor routed to the system as long as the VRU is operating (i.e., 95 percent of the vapor being routed to a line when operating for 95 percent of the time). In light of the above, as long as the VRU is operated consistent with those requirements, we believe that it is appropriate to exclude 95 percent of the vapor that would otherwise be emitted if not recovered when determining PTE for purposes of determining affected facility status. As a result of this

<sup>2</sup> Letter from Peter Tsirigotis to Matthew Todd, American Petroleum Institute, September 28, 2012, Docket Item No. EPA-HQ-OAR-2010-0505-4595.

comment, and based on our prior clarification of this issue, the final amendments to § 60.5365(e) include a provision that "any vapor from the storage vessel that is recovered and routed to a process through a VRU designed and operated as specified in this section is not required to be included in the determination of VOC potential to emit for purposes of determining affected facility status." Further, we have added language to § 60.5365(e) that provides for this adjustment of PTE as long as (1) the storage vessel is operated in compliance with cover requirements in § 60.5411(b) and the closed-vent system requirements in § 60.5411(c), which has a requirement that the CVS (including the VRU) is operational at least 95 percent of the time, and that the operator maintain records demonstrating compliance with these requirements.

We were concerned that, should a VRU be removed or operated inconsistent with the conditions that were the basis for the PTE reduction following the PTE determination for assessing whether the storage vessel is an affected facility, emissions could increase without the storage vessel being subject to control. To address that possibility, we have added language to § 60.5365(e) such that, in the event of removal of apparatus that recovers and routes vapor to a process or operation that is inconsistent with the conditions for qualifying for the PTE reduction, the owner or operator would be required to determine PTE from the storage vessel within 30 days of such removal or operation. If the PTE is determined to be 6 tpy VOC or more, then the storage vessel would be an affected facility and subject to the control requirements in § 60.5395. We believe this approach will help avoid circumvention of the NSPS.

We received comment that storage vessel affected facilities that are removed from service should cease to be considered affected facilities. Although, for the reasons presented in section V.C of this preamble, we disagree with the commenter and have added language at § 60.5395(f) to address storage vessel affected facilities that are removed from service. Owners and operators are required to include a notification in their next annual report following removal from service that the storage vessel has been taken out of service. If a storage vessel's return to service is associated with the fracturing or refracturing of a well feeding the storage vessel, the storage vessel is subject to control requirements immediately upon returning to service. If, however, the storage vessel's return to service is not

associated with well fracturing or refracturing, the PTE of the storage vessel must be determined within 30 days. If the PTE is 4 tpy or greater, then the storage vessel affected facility must comply with control requirements within 60 days of returning to service.

#### V. Summary of Significant Comments and Responses

This section summarizes the significant comments on our proposed amendments and our response thereto.

##### A. Major Comments Concerning Applicability Dates and Compliance Dates

1. When do Group 1 storage vessels have to determine emissions?

###### a. Applicability Determination

*Comment:* One commenter requested that the final rule specify the date upon which the determination of the potential VOC emission rate should occur for the purpose of determining whether the storage vessel is an affected facility. According to the commenter, since the EPA has stipulated controls to not be cost effective for storage vessels emitting less than 6 tpy of VOC, and emission rates for storage vessels in the oil production segment tend to decrease as production declines, the commenter believes the determination should be made near to the date upon which controls would be required in order to minimize the potential to install controls on storage vessels for which production decline has rendered controls no longer cost effective. The commenter stated that the proposed revisions would require a determination by October 15, 2013, of whether individual Group 1 storage vessels are affected facilities, and thus October 15, 2013, would be an appropriate date upon which determination of the potential VOC emission rate should be based. According to the commenter, this would remain consistent with the requirement for determining the potential VOC emission rate for Group 2 storage vessels by April 15, 2014 or 30 days after startup, whichever comes later.

The commenter appears to suggest that, like Group 2, Group 1 storage vessel affected facilities located in the natural gas processing and natural gas transmission and storage segments should also be required to determine potential VOC emissions as the trigger for installing control instead of tracking events but to do so by April 15, 2015 (instead of April 15, 2014, proposed for Group 2). According to the commenter, control of the relatively low number of Group 1 storage vessel affected facilities

in these segments could likely be accommodated by this date.

Another commenter pointed out that the proposed reconsideration rule does not establish the date for a Group 1 storage vessel to determine its potential emissions. The commenter also recommended that notifications are only required for tanks that exceed the 6 tpy threshold on October 15, 2013. Although the publication date of the proposed reconsideration rule was April 12, 2013, the commenter contends that the EPA is not required to, nor should it, establish the emissions determination date for the source category of Group 1 storage vessels on that date. First, given the rapidly declining emissions at storage vessels following initial fracturing, the commenter believes that the expected emissions reduction to be gained from Group 1 storage vessels is likely to be limited. The commenter also states that the proposal date of April 12, 2013, has passed and operators may not be able to accurately back-calculate emissions from that date. Moreover, the commenter contends that emissions from many of these storage vessels will be below the 6 tpy affected source threshold as of October 2013. Given EPA's proposed approach, where storage vessel affected facilities whose emissions drop below 6 tpy remain subject to the standard, the commenter believes that many Group 1 storage vessels will be unnecessarily captured in the source category and required to indefinitely track "events" and perhaps install control devices even if their emissions never again exceed 6 tpy.

*Response:* The final amendments to § 60.5365(e) specify that Group 1 storage vessel affected facilities must determine potential VOC emissions by October 15, 2013, for purposes of determining whether it is an affected facility. For the reasons provided in the Response to Public Comments on the Proposed Amendments document available in the docket, the final amended § 60.5365(e) requires that Group 1 affected facilities submit a notification with the first annual report by January 15, 2014, to inform regulatory agencies of their existence and locations. Determining potential emissions and affected source status early on is not only necessary for Group 1 affected facilities to comply with the notification requirement by January 15, 2014,<sup>3</sup> it will also provide Group 1 affected facilities advance notice and time to secure the necessary

<sup>3</sup> We had proposed to require such notification by October 15, 2013, but, in response to comment, we have extended this deadline slightly to January 15, 2014, to allow Group 1 affected facilities to submit the notification with their annual report instead of separately.

control devices and schedule the installation personnel to perform the installation by April 15, 2015. We reject suggestions by some commenters that emission determination be conducted closer to the deadline for installing control because such delay would frustrate the reason for extending the compliance date for Group 1 affected facilities in the final amendments (i.e., to provide advance notice and time to secure the necessary control devices and schedule the installation personnel to perform installation). Further, the commenters apparently assumed, though incorrectly, that the EPA has concluded that control is not cost effective when VOC emissions are below 6 tpy. No such determination has been made by the EPA or demonstrated by commenters. On the contrary, as discussed in section V.C of this preamble, we have determined that continuing control at uncontrolled emission rates of 4 tpy or above is cost-effective. For the reasons stated above, the final amendments specify October 15, 2013, as the deadline for determining the VOC PTE for Group 1 storage vessels. If the VOC PTE of the Group 1 storage vessel is 6 tpy or greater on October 15, 2013 (or an earlier date if the owner or operator chooses to make the determination prior to October 15, 2013), then the storage vessel is a Group 1 storage vessel affected facility and is subject to the NSPS, which for Group 1 includes the notification requirement by January 15, 2014 (i.e., the date by which the first annual report is due), and the control requirement by April 15, 2015. We are not finalizing the proposed requirement that Group 1 storage vessels track events that may increase the VOC PTE of the storage vessel (refer to section V.A of this preamble) and install control should there be such event; this proposed Group 1 storage vessel requirement is no longer necessary since the final amendments retain the control requirement for all Group 1 storage vessel affected facilities.

One of the commenters expressed concern that Group 1 storage vessels will have to indefinitely track events for these storage vessels and install controls even if VOC emissions do not exceed 6 tpy. The final amendments do not include requirements for owners and operators to track events for Group 1 storage vessels, so this comment is now moot.

The EPA does not believe it is necessary to defer the date at which Group 1 storage vessels located in the natural gas processing and natural gas transmission and storage segments are required to determine emissions. The commenter was suggesting an

alternative to tracking events for storage vessels in these segments, and the final amendments do not include the proposed event tracking provisions.

#### b. Determination After an Event

*Comment:* One commenter sought clarification that the requirement to re-estimate emissions when there is an event that could reasonably be expected to increase emissions does not apply to non-affected facilities. Two commenters requested that the EPA specify whether the VOC emissions increase for Group 1 storage vessels are to be based on potential or actual emissions. Another commenter suggested that the EPA clarify that the baseline emissions used to determine whether a Group 1 storage vessel experiences an emission increase is the level of emissions immediately prior to the event.

*Response:* In the final amendments, we have removed the requirement to track events for Group 1 storage vessels (refer to section IV.A of this preamble). Therefore, these concerns are now moot.

#### 2. Which Group 1 storage vessels are subject to the initial notification requirements and when are the notifications due?

*Comment:* One commenter states that the definitions for "Group 1 storage vessel" and "storage vessel" in § 60.5430 do not contain the 6 tpy threshold required for a "storage vessel affected facility" under § 60.5365(e). The commenter believes that the EPA's intent is to only be notified by October 15, 2013, of Group 1 storage vessels that exceed 6 tpy and for operators to monitor these vessels for a subsequent "event" because any storage vessel under 6 tpy is not an affected facility and therefore should not be subject to requirements under the rule. The commenter further states that in § 60.5395, the heading which premises paragraph (b)(1) states, "You must comply with the standards in this section for each storage vessel affected facility." The commenter asserts that, based on the definition of Group 1 storage vessel and the order of requirements in the above provisions, this requirement could be misinterpreted to mean that all storage vessels between those specified Group 1 dates must be reported, regardless of their PTE.

Another commenter agreed, stating that none of the storage vessel definitions contains the 6 tpy threshold that is included in the § 60.5365(e) definition of "storage vessel affected facility." The commenter added that, as proposed, § 60.5395(b) seems to include requirements for "Group 1 storage

vessel affected facilities" but the notification and event requirements in proposed § 60.5395(b)(1) and (2) apply to "Group 1 storage vessels" rather than "Group 1 storage vessel affected facilities." The commenter believes that these requirements may be misinterpreted to apply to all storage vessels containing an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, regardless of whether their potential emissions meet the 6 tpy threshold.

*Response:* As proposed, § 60.5395(a)(1) states that owners or operators of Group 1 storage vessel affected facilities must comply with paragraph § 60.5395(b). The commenters are correct in their interpretation that the § 60.5395(b) requirements apply only to Group 1 storage vessel affected facilities (i.e., those Group 1 storage vessels with potential VOC emissions of 6 tpy or more), not all Group 1 storage vessels. For clarity, we have moved the affected facility determination requirements from § 60.5395 to § 60.5365(e) and have only requirements that apply to affected facilities now in § 60.5395. The final amendments to § 60.5365(e) clarify our intent.

We also proposed in § 60.5395(b) that owners or operators submit the initial notification of Group 1 storage vessel affected facilities by October 15, 2013. As discussed in section V.A of this preamble, the final amendments require that owners or operators determine the VOC PTE of Group 1 storage vessels by October 15, 2013, and submit the initial notification for Group 1 storage vessel affected facilities, which may be included in the first annual report, by January 15, 2014. The provisions in the final amendments to allow the initial notification of Group 1 storage vessel affected facilities to be submitted with the initial annual report are discussed further in the Response to Public Comments on the Proposed Amendments, available in the docket.

#### 3. Group 1 Storage Vessels That Become Affected Facilities on or After April 12, 2013

*Comment:* One commenter requested that Group 1 storage vessels that experience a triggering event should follow the same schedule for Group 2 storage vessel affected facilities to install controls (by April 15, 2014, or 60 days after startup, whichever is later), except that there could be a hard deadline for Group 1 storage vessel affected facilities along a natural gas pipeline. The commenter pointed to the preamble of the proposed amendments (FR 78 22131) that indicates the EPA's intent was for Group 1 storage vessel

affected facilities, after a triggering event, to become subject to the same control requirements as those in Group 2, and that these controls would be required no later than 60 days after the event, or April 15, 2014, whichever is later. According to the commenter, this intent was overlooked in the proposed rule amendments.

Two commenters added that the final rule should specify a compliance period for Group 1 storage vessels that originally had potential VOC emissions less than 6 tpy and subsequently experience an event that causes the potential VOC emission rate to meet or exceed 6 tpy. In such cases, the commenters requested that the storage vessel should be required to achieve compliance within 60 days after the event.

Another commenter contended that almost all events that would increase emissions at Group 1 storage vessels are planned or are of a foreseeable nature. The commenter believes that it is feasible for storage vessel operators to install and operate controls simultaneously with the occurrence of such planned events. The commenter added that because emissions from storage vessels are likely to be highest immediately after the events listed in 60.5395(b)(2), it is also essential for protection of public health that controls be implemented as soon as possible.

*Response:* As explained in section IV.A of this preamble, the emission standards remain applicable to all Group 1 affected facilities, as in the 2012 NSPS. Accordingly, we are not finalizing the proposed requirement to track emission increase events and meet the control requirement as a result of such events for Group 1 storage vessels affected facilities. Thus, comments/issues relative to compliance schedule for Group 1 storage vessel affected facilities that experience an event are now moot.

#### B. Major Comments Concerning the Storage Vessel Affected Facility Definition

*Comment:* In the reconsideration proposal, the EPA proposed to include a VOC emissions threshold of 6 tpy to determine, in part, which storage vessels are affected facilities. Additionally, the proposal allowed operators to take into account requirements under a legally and practically enforceable limit in an operating permit or by other mechanism. One commenter opposed this proposal to the extent that it allows storage vessel operators to account for non-federally enforceable emission limitations. According to the

commenter, the inclusion of non-federally enforceable limitations leads to oversight concerns, and some storage vessels would avoid the NSPS under the proposed threshold.

Additionally, the commenter maintains that the CAA does not allow "synthetic minor" programs to determine applicability of its NSPS regulations. The commenter states that the term "potential to emit" is not found in section 111 of the CAA but is a concept from CAA programs governing expressly defined major sources. As a result, the commenter states that the CAA does not specify that a minor source program run by the states or other entities should be a means to avoid NSPS regulations. According to the commenter, allowing non-federally enforceable standards to exempt sources from NSPS is problematic because states vary widely in the letter, implementation, and enforcement of their synthetic minor programs.

*Response:* In the preamble to the proposed amendments we stated that our intent was that "a source can take into account any legal and practically enforceable emissions limit under federal, state, local or tribal authority when determining the VOC emission rate for purposes of [the 6 tpy] threshold" (78 FR 22132). The language we used in the proposed amendments to § 60.5365(e) to define the storage vessel affected facility allows the owner or operator to "tak[e] into account requirements under a legally and practically enforceable limit in an operating permit or by other mechanism." We agree with the commenter in so much as the term "other mechanism" may be construed to include non-federally enforceable mechanisms that may have questionable, if any, enforceability provisions. Therefore, the final amendments removed the term "other mechanisms" and revised the provision to allow the owner or operator to "tak[e] into account requirements under a legally and practically enforceable limit in an operating permit or requirement under a Federal, state, local or tribal authority." We believe that the amendment clarifies only legally and practically enforceable limits can be considered when a source determines its PTE. The EPA's ability to require Federal enforceability rather than just legal and practical enforceability has been an issue since the DC Circuit decision in *National Mining Assn. v. EPA*, 59 F.3d 1351 (D.C. Cir. 1995). As we have yet to address this remand/vacatur, the agency does not feel at this time that it can dictate Federal enforceability in this context.

Concerning the comments on our use of PTE as an applicability threshold, that was based on our BSER determination made in the 2012 NSPS taking into account the control's cost effectiveness. Section 111(a)(1) of the CAA specifically identifies cost of achieving reduction as a factor to consider in setting NSPS standards. Nothing in section 111 of the CAA prohibits the EPA from using PTE to reflect our cost consideration in establishing applicability thresholds under section 111. Petitioner failed to explain how the fact that PTE is often used in connection with determining major source status in other provisions of the CAA bars its use for determining applicability status under section 111.

### C. Major Comments Concerning Storage Vessel Control Requirements

#### 1. CAA Section 111 Requirements

*Comments:* According to one commenter, section 111 of the CAA is fundamentally a technology-forcing provision that can and should be used to spur aggressive deployment of emission control technologies. The commenter contends that standards are to be set stringently, in order to force the development of new technology. If the EPA must phase in controls, and can otherwise justify such an approach under section 111, the commenter believes the EPA must do so in as limited a way possible, ensuring it does not disrupt incentives which would otherwise expand pollution control development.

The commenter added that the courts have clarified that EPA's selection of BSER is only limited by cost when industry demonstrates an "inability to adjust itself in a healthy economic fashion to the end sought by the Act as represented by the standards prescribed." Further, the commenter states that creating deferrals meant to track control equipment supply is not technology-forcing, but market-following. According to the commenter, this ignores the role of standard-setting in incentivizing higher production of control equipment. If EPA cites availability of control devices in deferring or reducing the stringency of an NSPS, the commenter contends that the EPA must offer a strong demonstration that supply constraints render the standard unachievable or prohibitively expensive for the industry as a whole.

*Response:* As explained in section IV.A of this preamble, the EPA proposed to phase in the control requirement for storage vessel affected facilities based on its belief at the time that there would

not be enough control devices to meet the demand of all storage vessel affected facilities by the October 15, 2013, compliance date in the 2012 NSPS or any time in the near future. Although new information received since our proposal indicates that control supply may not be an issue, the EPA is phasing in the storage vessel control requirement in the final amendments for the reasons provided in section IV.A. The phase-in approach has never been based on cost, as the commenter suggests; rather, as indicated in section IV.A of this preamble and in the preamble to the April 12, 2013, reconsideration proposal, the phase-in approach is intended to avoid setting a control requirement that cannot be met due to limitations associated with installing control devices. We do not believe that a standard that ignores such limitations accurately represents the BSER for these affected facilities.

#### 2. Group 1 Requirements

##### a. No Control of Group 1 Storage Vessels

*Comment:* According to one commenter the proposal to exempt Group 1 storage vessels that do not experience increases in emissions rests on questionable projections of estimated current and future supply of control devices, number of storage vessels and decline of oil and natural gas well production. The commenter contends that the EPA cited only unidentified oil and gas industry sources for the asserted level of control device production and provided no justification for forecasted rate of production increase or the production rate plateau of 1,400 units per month. The commenter believes that it is as or more likely that industry would continue to expand control device production in response to the proposed standards, but the proposed delays would slow control manufacture by removing demand. According to the commenter, the EPA could remove its artificial ceiling for control manufacture and accelerate the compliance deadline for Group 2 storage vessels and require most or all Group 1 storage vessels to control emissions by mid-2015. The commenter contended that the EPA must disclose the information underlying these forecasts to allow the public to evaluate their reasonableness and offer comments.

The commenter added that the assumption of one storage vessel per well overestimates the number of new storage vessels and is unjustified. The commenter provided examples of increased use of multi-well pads.

According to the commenter, the EPA uses the fact that oil and gas wells

decline in production over time as justification for exempting Group 1 storage vessels from control requirements. The commenter states that the EPA's forecast of control equipment availability implies no reduction in the number of storage vessels requiring control. This is contrary to the justification given for exempting Group 1 storage vessels from control requirements. According to estimates of a decline in production, the commenter believes that some Group 1 storage vessels could remain a significant source of emissions.

The commenter also contended that the EPA's projections indicate that the supply of existing control devices will be adequate to meet the combined demands of Group 1 and 2 storage vessels by 2016. It is not clear to the commenter what portion of the estimated 20,000 Group 1 storage vessels would ultimately be subject to control, so it is unclear whether subpart OOOO would ever apply to those Group 1 storage vessels with high emissions. Even assuming that emissions from these Group 1 storage vessels generally continue to decline over their remaining lives, the commenter believes that allowing this group of storage vessels to be uncontrolled would result in a large amount of excess emissions relative to the current rule. Conservative estimates by the commenter indicate that the proposal to leave Group 1 storage vessels unregulated would allow over 3 million tpy VOC and 700,000 tpy of methane to be emitted. Taking into account the production decline, the commenter contends that an analysis of the Bakken shale formation indicates that in 2015 storage vessels could still be emitting about 30 percent of their initial emissions. For the reasons given above, the commenter believes that the Group 1 storage vessel exemption is arbitrary and falls short of section 111 mandates that standards of performance reflect BSEER.

The commenter further contended that if EPA's analysis indicates a sufficient supply of control devices will be available in the future, then Group 1 storage vessels should be controlled within a reasonable time. The commenter states that a compliance deadline in mid 2015 would provide adequate time for all storage vessels currently subject to the proposed rule to come into compliance. To support this view, the commenter reasons that, if some fraction of the Group 1 storage vessels will no longer have emissions exceeding 6 tpy, the demand for control devices is likely to be lower than the EPA's projections, given the opportunities to manifold closely-

spaced storage vessels, the increased practice of multi-well pads which would share storage vessels, and the EPA's statement in the preamble to the proposed rule that control device manufacturers are likely to be flexible in their ability to meet equipment demand increases in the future.

Another commenter agrees that an alternate compliance schedule is necessary to accommodate the increased demand for control devices but recommended that Group 1 storage vessels that continue to have emissions greater than 6 tpy as of the Group 2 compliance date be required to comply with the control requirements of the rule.

Several commenters express concern that the increased demand for control devices will lead to delays in getting the devices installed and that additional time to comply with the proposed standards is required. One commenter states that the companies that supply the services to comply with the proposed amendments will have their time monopolized by the large oil and gas companies, leading to a shortage of these services for small oil and gas companies. Another commenter similarly expresses concern that small independent producers will experience a shortage of service personnel because the smaller producers have less leverage and buying power than large producers.

*Response:* In the preamble to the proposed amendments, we discussed our rationale for requiring controls only on those Group 1 storage vessel affected facilities that have an event that would likely lead to an increase in the potential to emit VOC (78 FR 22130). Our decision to require controls only on Group 1 storage vessels that experience such an event was based, in large part, on our understanding at that time and the information then available of the supply of combustors that likely would be used to comply with the control requirements. As we understood the combustor manufacturing industry at the time of proposal, the total capacity to produce combustors was approximately 300 units per month, which was based on information from six combustor manufacturers, and that the industry had the capability of increasing that capacity by about 100 units per month.

In response to comments questioning our combustor supply analysis, we reassessed the production capacity of the combustor manufacturing industry. We were able to confirm the data for some of the six manufacturers for which we had data at proposal, which leads us to believe the data as a whole for these manufacturers are reasonable (*i.e.*,

current capacity on average of about 600 units per year for each company). In addition, we were able to identify five additional combustor manufacturers. Of these five, three provided production capacity estimates that were in line with the data we originally had for the six companies, one provided production estimates that were significantly higher than any of the other companies, and one did not provide any data. We averaged the production capacity of the nine similar companies to complete the missing data from the one facility that did not provide data. We then summed the capacity of these 11 companies to determine total current manufacturing capacity of combustors, which was approximately 2,300 units per month.

We also estimated future capacity of the combustor manufacturers based on information provided by the manufacturers for anticipated future increases in production capacity. Based on this information, we estimated future capacity to be as high as approximately 3,000 units per month by April 15, 2015.

The new information described above (for further details, see the memorandum entitled *Combustor Supply and Demand Analysis*, available in the docket) seems to indicate that the combustor suppliers have the manufacturing capacity to meet the demand posed by all (*i.e.*, both Group 1 and Group 2) storage vessel affected facilities required to comply with emission standards in the 2012 NSPS. Therefore, in the final amendments, we continue to require that Group 1 storage vessel affected facilities comply with the emission standard requirements. However, we have extended the current compliance deadline for the reasons stated below.

While the overall projected supply of combustors appears to be adequate, we do not have information as to whether the combustor manufacturers are producing at the projected capacity and, if not, how quickly they can ramp up production to provide the necessary supply for the 2012 NSPS. More importantly, we note that there is a great variability in the projections of combustor supply, where one supplier's projection greatly exceeds the other suppliers' projections and accounts for a significant portion of the supply. To gauge the sensitivity of this one company on the combustor supply, we revisited our supply analysis assuming this company could manufacture combustors only at the highest manufacturing rate reported by any of the other combustor manufacturers. We found that under this scenario the supply of combustors never satisfies the

demand. Thus, this one manufacturer is critical in meeting the overall demand imposed by the 2012 NSPS.

Because this company plays such an important role in meeting the combustor supply, any factor that may delay or slow their production may significantly affect the ability of Group 1 and Group 2 storage vessel affected facilities to achieve compliance by the current compliance deadline in the 2012 NSPS (*i.e.*, October 15, 2013, or 60 days after startup, whichever is later). In light of the above, we believe it is prudent to allow more time for compliance to lift the pressure on the demand of control devices, especially in the short term. Under the 2012 NSPS, compliance is required by October 15, 2013, for an estimated over 20,000 storage vessel affected facilities that will have come on line since the August 23, 2011, (the proposal date of the 2012 NSPS), and an additional 1,100 new affected facilities per month will need to install control 60 days after start-up. Extending the current compliance deadline would allow the market to more easily absorb any events that may cause combustor manufacturing to fall short of the projected production capacity.

In addition to the supply issues described above, commenters raise the concern about not being able to secure the necessary trained personnel to install control devices by the current compliance deadline. In light of the large number of storage vessel affected facilities (estimated over 20,000 by October 15, 2013, with an additional 1,000 per month after that), and given the wide geographic distribution of oil and gas wells across the United States, we believe that the commenters raise a legitimate concern. In particular, we are concerned about how a potential shortage of trained personnel may impact small businesses. The comments we received indicate that larger owners and operators may be able to garner the majority of the available installation personnel due to their greater resources and influence. This may result in a situation where small owners and operators may be placed in a disadvantage to their larger competitors in obtaining installation personnel. If such a situation should occur, the smaller owners and operators may be forced to shut down wells or delay drilling new wells until installation personnel are made available.

In light of the issues described above that may hinder storage vessel affected facilities' ability to comply by the current October 15, 2013, deadline, we do not believe it is reasonable to retain that compliance date. Instead, in the final amendments, we take a phase-in

compliance approach that first addresses newer affected facilities (which would have higher emissions) while assuring that all affected facilities have time to acquire and schedule installation of control. The final amendments establish Group 1 and Group 2 affected facilities, as proposed, where Group 1 are those affected facilities that came on line on or before April 12, 2013, and Group 2 are those that come on line after that date. The final amendments require that Group 2 comply by April 15, 2014 (or 60 days after start-up, whichever is later), a 6-month extension from the current October 15, 2013, deadline for these newer affected facilities. The final amendments require that Group 1 comply by April 15, 2015. Were we to require that both groups comply by April 15, 2014, an estimated 30,000 affected facilities would be competing to acquire and install control by that date; as a result, the 6 month extension would do little to ease the demand for control or skilled personnel to install control should either become an issue in the near future. Also, requiring Group 1 to comply by April 15, 2014 would likely affect Group 2's ability to comply, thus undermining our goal to address the newer storage affected facilities sooner. Lastly, considering the large number of Group 1 affected facilities (which we estimate to be around 19,400), we believe that requiring all Group 1 affected facilities to comply by April 15, 2015 is reasonable. In light of the issues discussed above, we do not expect that these affected facilities would wait until near that deadline and risk noncompliance; rather, we believe that the deadline provides Group 1 advance notice and allows them time to plan for acquiring and scheduling installation of control device by that date. Therefore, in the final amendments, we have specified that all Group 1 storage vessel affected facilities must comply by April 15, 2015, and that Group 2 storage vessel affected facilities must comply by April 15, 2014, or 60 days after startup, whichever is later.

#### b. Clarification of "Events" That May Increase Emissions

*Comment:* Several commenters request that the EPA more clearly define the types of events that would trigger emission increases for Group 1 storage vessels. Seven commenters request that the EPA limit the examples to a finite list of events to remove ambiguity. One commenter states that the "events" that trigger control requirements for Group 1 tanks should be more specific for storage vessels at well sites. According to the commenter, only the events

described in § 60.5395(b)(2)(i) through (iii) of the proposed amendments should be considered triggering events for storage vessels that store reservoir fluids (*i.e.*, at well sites, tank batteries, centralized production facilities).

One commenter requested that the EPA delete the list of examples of events that would increase emissions from the rule language and provide that control requirements are triggered by a change that, in the owner's/operator's judgment, is one that could reasonably be expected to increase VOC emissions.

One commenter suggests that the EPA should clarify the illustrative list of emission-increasing events to include well maintenance activities, such as liquids unloading, various well workover procedures, and any other well maintenance activities which increase production.

*Response:* As discussed in section IV.A of this preamble, the final amendments do not change the requirement in the 2012 NSPS that all storage vessel affected facilities, including those we define as Group 1 affected facilities, to meet the emission standards, although the amendments extend the time for compliance. Since all Group 1 storage vessel affected facilities remain subject to control requirements, there is no need to track events in order to determine which Group 1 storage vessel affected facilities are subject to control requirements, we are not finalizing the proposed provisions related to events in the final amendments.

c. At what emission rate are Group 1 storage vessels that experience an event required to install controls?

*Comment:* Three commenters request that the EPA clarify that Group 1 storage vessels that experience an event that results in an increase in emissions would not be required to install controls if the VOC emissions are below the 6-tpy emission threshold. Two commenters recommend that the 6 tpy threshold be included either in the definition of "Group 1 storage vessels" in § 60.5430 or be explicitly listed as a condition in the requirement under § 60.5395(b)(1).

One commenter states that if emissions from a Group 1 storage vessel affected facility decrease below 6 tpy due to production decline, and it was determined even after a potentially triggering event that emissions had not returned to a level above 6 tpy, the storage vessel should not become subject to Group 2 controls. This view is generally supported by two additional commenters. The commenter refers to § 60.5410(i) which specifies that the

requirement for installing Group 2-level controls is further limited to Group 1 storage vessel affected facilities for which the potential VOC emission rate is 6 tpy or greater after the triggering event. According to the commenter, this 6 tpy threshold is reasonable and appropriate because the EPA concluded in the initial rulemaking that Group 2 controls would not be cost effective for storage vessels emitting less than 6 tpy of VOC.

The commenter adds that based on statements in the preamble (78 FR 22132) and regulatory language in § 60.5410(i), this 6 tpy threshold should be repeated in § 60.5395.

*Response:* As discussed in the previous comment response, the final amendments do not require that Group 1 storage vessels track events. Therefore, these comments are now moot.

### 3. Alternative 4-tpy Uncontrolled Actual VOC Emission Rate

*Comment:* One commenter states that the proposed 4 tpy emission rate, below which controls would not be required, is not BSER and would allow large and unjustifiable emissions increases. According to the commenter, the 95 percent control limit ensures that actual emissions do not exceed 0.2 tpy. Under the proposal, a storage vessel could emit up to 4 tpy indefinitely which is nearly a 3.8 tpy increase above the emissions that would be allowed under the proposed NSPS.

According to the commenter, once control devices are removed, it is more likely that unplanned events will cause significant emissions spikes, further increasing air pollution. For example, if an operator diverts a sudden surge of VOC-containing liquids to a storage vessel for which the operator has removed controls under the proposed mass-based limit, there will be no way to control the resulting emissions spike. The commenter contends that the result is that transient but significant emissions events may become more common at storage vessels using the proposed mass-based limits.

The commenter adds that even if it is assumed that the proposed emission rate would apply for a single year of a given group of storage vessels' lives, the proposal would allow tens of thousands of tons of pollution in that year. If storage vessels operate longer, or decline more slowly after passing the 4 tpy threshold, the amount of additional air emissions will be even higher.

The commenter could find no authority in the CAA for abandoning BSER controls after they have been installed. Having already determined that 95 percent control is BSER, the

commenter states that the EPA provided no justification of the basic premise or the level of the proposed emission rate. The emission rate has not been demonstrated to alleviate any control device shortage, and control devices that would become available due to the emission rate are unlikely to be available for more than a decade after the proposal is finalized.

The commenter contends that the EPA has not shown that the proposed 4 tpy limit corresponds to BSER. To make such a demonstration, the commenter believes, it would be necessary for the EPA to show that control technology has not been demonstrated below the 4 tpy emission rate, meaning that such sources can properly escape control, or that controls are not cost-effective for the industry as a whole below such an emission rate. According to the commenter, controls clearly are available for storage vessels with emissions of 4 tpy and below, so there is no justification for the 4 tpy emission rate on control technology availability grounds. Additionally, the commenter contends that significant VOC emissions can be captured below the proposed threshold. With respect to cost, the commenter believes recent information indicates the annualized cost of storage vessel combustors has declined substantially since subpart OOOO was finalized, significantly enhancing the cost effectiveness of controlling VOC emissions from storage vessels with a PTE of 4 tpy or less. The commenter provides information from a Colorado Department of Public Health and Environment (DPHE) pending rulemaking showing that the annualized combustor costs are around \$15,900/yr, as compared to the previous value of \$19,600/yr, resulting in a cost effectiveness of \$4200/ton at 4 tpy.

Further, the commenter believes that the EPA's control costs overestimate actual costs because the EPA does not take into account savings that would be experienced when controls are shared among storage vessels. As a result, controls are more affordable at lower uncontrolled emissions thresholds. According to the commenter, if the EPA sets a very low emission threshold at which removal and reuse is permissible, more vessels would have to buy new control devices, raising control costs again. Thus, the commenter believes that the EPA's analysis does not compare this variation, or considered the appropriate way to design such a system in light of the variation.

According to the commenter, the EPA states in the proposal that control device manufacture will lag the growing population of storage vessels for a few

years and used this rationale to separately waive controls for Group 1 storage vessels and assure adequate supply of control devices for Group 2 storage vessels. The commenter contends that the EPA further states that allowing affected storage vessels to remove controls under the proposed emission rate would help alleviate the control device shortage. According to the commenter, the EPA's justification that imposing the emission rate is due to uncertainty in their control technology projections and that an additional exemption would "help build a buffer" against this uncertainty is not a cognizable justification for a section 111 standard under the CAA. Further, the commenter does not believe that the EPA has demonstrated either the necessity or appropriateness of the proposed emission rate.

The commenter states that the EPA's concerns about "buffering" technology supply could only justify this departure from the existing standard if the proposed emission rate was also demonstrated to be BSER. According to the commenter, the EPA determined that requiring storage vessels with uncontrolled emissions greater than 6 tpy to achieve 95 percent control of those emissions reflects BSER and is cost effective. The commenter states that if these controls were maintained on a storage vessel as its emissions declined over time, total uncontrolled emissions would continue to fall. But under the proposed emission rate, the commenter contends that emissions could instead jump sharply after the threshold has been crossed. The commenter believes that this reversal in the emissions trend does not reflect BSER because it does not reflect the best demonstrated system of emissions control. According to the commenter, it is instead what happens when BSER controls are removed.

The commenter adds that for the EPA's "buffer" rationale to hold up, operators must be able to cost-effectively and regularly remove used control devices, store them as needed, and transfer them to new storage vessels at a rate which will meaningfully address the control device shortage which the EPA projects. The commenter asserts that the EPA provided no evidence showing operators would be able to do this, or would choose to do so. According to the commenter, storage vessels installed now would in all likelihood not take advantage of the proposal until the 15th year of operation (based on decline curve data provided by the commenter showing that it would take up to 15 years for well production to decline to a level to produce uncontrolled storage vessel emissions of

4 tpy). As a result, the commenter believes that the proposed emission rate would not generate any control devices for transfer for more than a decade, which is long after the EPA estimates adequate control devices will be available. Thus, according to the commenter's analysis, even if control devices could be transferred, such transfers will not buffer a short-term shortage. That shortage, if it exists, will long have passed. Instead, the commenter believes that the proposed emission rate would simply increase air pollution.

The commenter further states that even if the EPA were to actually require operators to build the buffer it desires, the EPA offers no evidence that such a buffer is required indefinitely. Elsewhere in the proposal, the commenter contends, the EPA expresses its view that control device manufacturers will respond to the standards by manufacturing enough control devices to meet the demand imposed by the standards, perhaps after an initial delay. The commenter points out that past experience shows that control devices become available if they are required, and this technology-forcing function is central to how section 111 is intended to work. By instead allowing operators to avoid purchasing new controls, and to remove them from other sources and reuse them, the commenter contends that the EPA permanently limits the market for new control technology, while also allowing excess emissions. The result will be fewer controls in the long-term, and more pollution.

The commenter believes that the Wyoming guidance the EPA mentions in the proposal does not comply with section 111 standards, and contends that the EPA does not offer evidence that it has avoided excess pollution.

Another commenter believes the EPA's choice of an uncontrolled emission rate of 4 tpy as the emission rate is arbitrary and unsupported. The commenter states that the EPA provided no engineering basis, credible health benefit estimate, or other justification for why the 4 tpy emission rate is appropriate.

The commenter also states that the EPA did not provide any justification or analysis demonstrating whether control at 4 tpy is cost effective. The commenter states a cost effectiveness analysis was performed for the 6 tpy applicability threshold, but no such information is provided for the proposed 4 tpy emission rate. The commenter opined that this approach will create situations of great inequity where neighboring facilities may have identical PTE VOC

emissions from a single storage vessel or battery, but very different regulatory burdens. The commenter provides an example where a site with emissions of 5.95 tpy is not subject to any of the notification, reporting, or control requirements of this NSPS. However, a neighboring site with initial production emissions of 6.1 tpy must notify, control, monitor, record, and report to comply with the NSPS. The commenter provides that, as natural production declines occur, after a year of uncontrolled emissions of 3.95 tpy (below the 4 tpy threshold) the additional controls may be removed, but the burden of reporting and recordkeeping continues indefinitely for this site.

The commenter also states that this approach may also drive companies to design their sites in a way that results in increased emissions overall, defeating the goal of the rule itself. For example, according to the commenter, to avoid applicability of the rule as a whole, new sites will likely be designed with more tanks such that no single tank will exceed the 6 tpy applicability threshold but emissions from the larger number of small tanks may have higher overall emissions. The commenter believes that this in turn may exacerbate the shortage of storage tanks that already exists and may further delay production due to the lack of tank availability. Further, the commenter states that the proposed emission rate may lead to hastily constructed tanks that may not be as soundly designed and constructed creating potential concerns for public health and safety as well as air quality.

The commenter contends that the EPA focused on the concept of any planned event that has the potential to increase emissions to or above 4 tpy. However, according to the commenter, this does not account for any potential short-term activities that may trigger reinstallation of controls such as degassing, refilling, inspection or maintenance when emissions in the long-term would otherwise remain below the 4 tpy level. The commenter states that this may result in the delay of appropriate maintenance or other actions that would otherwise be conducted. Building on the example of neighboring sites described above, the commenter states that, if the second site wanted to confirm tank integrity by inspection and cleaning, one-time emissions may raise the annual uncontrolled PTE to over 4 tpy, thus triggering not only reinstallation of controls but all associated monitoring, recordkeeping and reporting requirements.

Several commenters believe that a more appropriate approach would be to allow the removal of controls if a storage vessel has had uncontrolled actual emissions that remain below 6 tpy VOCs for 6 months. The commenters also believe that this initial determination is sufficient and that no further monitoring should be required unless otherwise required under § 60.5395(b)(2). According to the commenters, wells experiencing natural production decline are unlikely to ever experience an increase in emissions, but instead will continue to experience an emissions decrease. The commenters state that this continuing natural decline also supports the contention that 6 months is a sufficient timeframe to monitor emissions before removing controls.

One commenter adds that the proposed approach would require owners/operators to make a one-time commitment of what a tank will contain to the extent that potential emissions will ever exceed 6 tpy. The commenter believes that this inappropriately extends the "once in, always in" policy beyond its previous applications. While it appears that EPA would allow vessels to come in and out of regulation based on whether they contain crude oil, condensate, intermediate hydrocarbon liquids, or produced water at a given time, the commenter contended that the proposal would create a one-time determination of potential emissions that forever captures a tank, regardless of whether it continues to hold the materials that would bring it within regulation. In proposing low emitting storage vessels remain subject to the rule indefinitely, the commenter believes that the EPA is imposing unnecessary and burdensome control, recordkeeping, and reporting requirements on many storage vessels. Should EPA retain this "once in, always in" requirement, the commenter recommends that it should affirm that storage vessels no longer holding VOC-containing liquids or that are taken out of service are no longer an affected source.

Concerning re-installation of controls, several commenters state that the threshold should be 6 tpy instead of 4 tpy based on the EPA's cost effectiveness determination.

*Response:* To help alleviate the control supply shortage believed to exist at the time, we had proposed to amend the storage vessel emission standards to require compliance with either the 95 percent reduction requirement or an uncontrolled actual VOC emission rate of less than 4 tpy, which would allow control devices to be removed from storage vessel affected facilities below

that emission rate and relocated to those that have just come on line and have the VOC PTE of 6 tpy or more. As previously mentioned, new information we received since proposal indicates that the combustor suppliers have the manufacturing capacity to meet the demand posed by this NSPS, which in turn suggests that a supply buffer may no longer be necessary. However, for the reasons stated below, we have amended the storage vessel emission standards as proposed due to the cost effectiveness of continuing control and the increasing environmental disbenefits and energy impacts from the continued operation of the combustion control device at an inlet stream VOC concentration of less than 4 tpy.

As shown in the memo entitled *Cost and Secondary Environmental Impacts Associated with Controlling Storage Vessels under the Oil and Natural Gas Sector New Source Performance Standards*, available in the docket, our analysis indicates that the cost of controls for each storage vessel affected facility at a VOC emission rate of 4 tpy is approximately \$5,100 per ton. This cost increases to approximately \$6,900 per ton at an emission rate of 3 tpy, and to approximately \$10,000 per ton at 2 tpy. For comparison, we note that, in a previous NSPS rulemaking [72 FR 64864 (November 16, 2007)], we had concluded that a VOC control option was not cost effective at a cost of \$5,700/ton, which calls into question the cost effectiveness of continuing control of storage vessel affected facilities at an emission rate below 4 tpy.

One commenter recommends that, if we retain the uncontrolled VOC emission rate, it should be set no higher than 0.3 tpy (representing the emission rate of a 6 tpy VOC emission stream controlled at 95 percent) rather than 4 tpy. We emphasize that the 4 tpy uncontrolled VOC emission rate is not based on equivalency to the 95 percent reduction, nor do we think such conversion to an emission limit is appropriate considering it would result in a range of emission limits depending on the baseline uncontrolled emissions. The 0.3 tpy suggested by the commenter only represents the limit for sources with PTE of 6 tpy while those with higher PTE would have higher limits that equate to 95 percent reduction. Further, at the commenter's suggested emission rate of 0.3 tpy, the cost would be approximately \$70,000 per ton of emission reduction, which we do not consider to be cost effective.

One commenter questioned the basis of our control cost estimates and pointed to a recent update by Colorado

DPHE, an earlier version of which we used as the basis for our cost estimate, which indicated a lower cost of control. We point out that the lower cost in the revised Colorado analysis is primarily due to a lower cost (by approximately half) of the fuel for the pilot flame. Our assumption is that gas prices will remain relatively stable over time and question whether this lower fuel cost is applicable to all areas of the U.S. outside Colorado and whether such costs will be maintained in the long term. We also point out that the Colorado analysis did not include costs for a surveillance system or data management system, which were included in our analysis. Finally, the Colorado analysis showed an increase in capital cost of about \$2,000 over the capital costs in our analysis. For these reasons, we believe our costs, if anything, may underestimate costs rather than overestimate as the commenter claims. We made no changes to our cost analysis based on this comment.

Another commenter suggested that our cost estimate overestimates costs because we did not take into account savings that would result when control devices are shared by storage vessels. The comment is incorrect. In our analysis, we assumed that there would be one control device used per well site. We also acknowledged that there are likely multiple storage vessels per well site, all of which would be routed to a single control device.

In addition to cost effectiveness, we evaluated the secondary impact from continuing control below 4 tpy. As shown in the memo entitled *Cost and Secondary Environmental Impacts Associated with Controlling Storage Vessels under the Oil and Natural Gas Sector New Source Performance Standards*, available in the docket, on a nationwide basis, the combustion of the pilot flame fuel and the combustion of the VOC vapor in the storage vessel vent stream will result in increases in NO<sub>x</sub>, CO, CO<sub>2</sub>, and methane emissions, most notably CO<sub>2</sub> emissions. We estimate that the operation of each combustion control device on a VOC storage vessel vent stream flow rate of 3 tpy will result in the following secondary emissions: 54 tpy of carbon dioxide (CO<sub>2</sub>), 0.14 tpy of carbon monoxide (CO) and 0.028 tpy of nitrogen oxides (NO<sub>x</sub>).

We also evaluated the energy impacts associated with continuing control below 4 tpy. The discussion here for secondary energy and environmental impacts is on the basis of one combustion control device. As of the date of publication of this preamble, we estimate that there are approximately

20,000 storage vessel affected facilities that require combustion control devices and that the number is projected to increase by about 11,000 per year. We also estimate that on average, from 2014 through 2020, approximately 8,000 storage vessel affected facilities per year will experience VOC emissions decline to below 4 tpy. Our information indicates that the fuel usage (primarily methane) for the pilot flame on a single combustion control device may be approximately 12 tpy (based on a fuel flow rate of 70 scf/hr for the pilot flame, or about 613 Mcf per year). Thus, at a storage vessel VOC emission rate of 4 tpy, a combustion device would have to combust an amount of fuel gas about 3 times the mass of the VOC vapor from the tank being controlled simply to keep the pilot flame operating. This ratio increases even further for VOC emission rates less than 4 tpy. Considering the nationwide energy impact of continuing to operate the pilot flame of an extremely large number of combustion control devices for VOC flow rates far lower than the pilot flame fuel flow rates, we question whether this is a responsible use of our energy resources.

In light of the cost-effectiveness, the secondary environmental impacts and the energy impacts, we have concluded that the BSER for reducing VOC emissions from storage vessel affected facilities is not represented by continued control when their sustained uncontrolled emission rates fall below 4 tpy. For the reason stated above, we have amended the storage vessel emission standards to require that, at all times, affected facilities comply with either the 95 percent reduction requirement or an uncontrolled actual VOC emission rate of less than 4, as proposed. Under the final amendments, an owner or operator may comply with the uncontrolled VOC emission rate instead of the 95 percent control requirement where it can be demonstrated that, based on records of monthly determinations of VOC emissions for the 12 consecutive months immediately preceding the demonstration, that the storage vessel affected facility uncontrolled actual VOC emissions each month during that 12-month period are below 4 tpy. The final amendments require that the owner or operator re-evaluate the uncontrolled VOC emissions on a monthly basis. For the same reasons discussed below in this section in our response to comments concerning storage vessels that are taken out of service, the 4 tpy alternative emission standards in the final amendments at § 60.5395(d)(2) require control to be

applied in either of two cases. First, if a well feeding a storage vessel affected facility undergoes fracturing or refracturing, the owner or operator must comply with the 95 percent reduction requirements in § 60.5395(d)(1) as soon as liquids from the well following fracturing or refracturing are routed to the storage vessel affected facility, regardless of the last monthly emissions determination. On the other hand, if a monthly emissions determination required in § 60.5395(d)(2) indicates that VOC emissions from a storage vessel affected facility have increased to 4 tpy or greater, and the increase is not associated with fracturing or refracturing of a well feeding the storage vessel, then the owner or operator must apply 95 percent control according to § 60.5395(d)(1) within 30 days of the monthly calculation.

One commenter stated that the 4 tpy uncontrolled VOC emission rate does not represent BSER. As previously explained, due to the cost effectiveness, the secondary environmental impact and energy impact, the 4 tpy emission rate likely represents a point below which continued control ceases to be the BSER for reducing VOC emissions from storage vessel affected facilities.

One commenter asserted that some maintenance events at neighboring sites may cause short-term spikes in VOC emissions of 4 tpy or more, thereby triggering control for at least another 12 months. As discussed above, the final amendments provide for two alternative emission standards, either of which must be met at all times. However, the 2012 NSPS contains affirmative defense provisions that may be considered in cases where malfunctions occur causing emissions to exceed the standard. Planned activities are expected to be conducted in compliance with the emission standards.

We also made changes to the final amendments to clarify our intent that the uncontrolled VOC emission rate is available for all storage vessel affected facilities. In the proposed amendments, § 60.5395(d)(2) conditionally allowed the owner or operator to meet an uncontrolled actual VOC emission rate so long as the monthly actual uncontrolled emission rate remained below 4 tpy. However, in the proposed amendments we included the following qualifier in § 60.5395(d)(2): "provided that you have been using a control device and have demonstrated that the VOC emissions have been below 4 tpy without considering control for at least the 12 consecutive months immediately preceding the demonstration."

We now believe that this qualifier places undue restriction on the use of

the emission rate. Under the qualifier, Group 1 affected facilities that had uncontrolled emission below 4 tpy by the amended compliance date would not be able to avail itself of this option. We see no reason for such limitation and have therefore removed the qualifier language in the final amendments.

Concerning a commenter's assertion that one storage vessel with PTE of just over 6 tpy would be subject to control, recordkeeping and reporting requirements but that a storage vessel with PTE of just under 6 tpy would not be subject to any requirements, we respond that applicability thresholds exist for many rules and that subpart OOOO is not unique in that regard. With regard to the assertion that owners and operators may try to circumvent the NSPS by installing multiple small throughput storage vessels to keep individual tank emissions below the 6 tpy threshold, this comment pertains to the 2012 NSPS and not the proposed reconsideration, since changes to that threshold were not proposed. In response to the commenter's concern about transient emissions above 4 tpy that are caused by operator actions, storage vessels that increase emissions to at least the 4 tpy actual VOC emissions limit are subject to the control requirements. Owners and operators must ensure that they are aware of emissions increases that may occur after an activity and take appropriate action to control those emissions as required by the NSPS. With regard to uncontrolled VOC emissions of 6 tpy for 6 consecutive months being a more appropriate uncontrolled actual VOC emission limit, we have explained in section IV.B our rationale for the 4 tpy emission limit. In addition, we have never determined that control below 6 tpy is not cost-effective; to the contrary, we have determined that control at 4 tpy and above is cost-effective. Furthermore, we are concerned that setting the emission limit to allow removal of control if uncontrolled emissions are below 6 tpy for 6 consecutive months does not provide for reasonable certainty that emissions would not be controlled to the maximum extent possible that is still cost-effective and that does not create undue secondary impacts. Moreover, a full 12 months of sustained monthly uncontrolled actual emissions estimates below the 4 tpy limit will reasonably ensure that emissions fluctuations will not cause excursions above the limit, requiring controls to be reapplied. In the context of once in always in, the EPA has not extended this policy by providing that

storage vessel affected facilities that subsequently reduce PTE to below 6 tpy remain affected facilities. The EPA historically has never let facilities in and out of affected facility status and is consistent in subpart OOOO. Having storage vessels remain affected facilities when emissions decline allows regulatory agencies to track emissions of these storage vessels and to monitor compliance if they increase. Further, operators are not restricted as to what they store in a tank; if the contents are crude oil, condensate, hydrocarbon intermediates or produced water, and the storage vessel has PTE of at least 6 tpy, it is a storage vessel affected facility and subject to subpart OOOO. In addition, in response to a comment that a tank is forever an affected facility regardless of its future contents, we disagree. If a tank ceases to be used for a purpose other than to hold an accumulation of any of the materials listed above, then it ceases to fit the definition of storage vessel under subpart OOOO and is therefore no longer an affected facility subject to the standards.

One commenter requests that we clarify that a storage vessel affected facility that is taken out of service ceases to be an affected facility under the NSPS. On the contrary, the storage vessel remains to be an affected facility, although we realize that there may be undue burden associated with control and monitoring, recordkeeping and reporting requirements for storage vessels that are not in service. However, if a storage vessel affected facility that is out of service is returned to service, an emissions determination is necessary to see whether it can continue compliance with the 4 tpy uncontrolled emission rate or it must now install control to meet the 95 percent reduction requirement. In the 2012 NSPS, we concluded that we need to provide sufficient time for determining emissions and, if necessary, installing control. See 77 FR 49490, at 49526 (August 16, 2012). Accordingly, the 2012 NSPS provide 30 days for determining emissions and an additional 30 days to make control operational. We believe that a similar time frame is needed for a dormant storage vessel returned to service to demonstrate continued compliance with the 4 tpy uncontrolled emission rate or to install control to meet the 95 percent reduction requirement. After all, these storage vessels may very well have very low emissions upon startup and should not be forced to install control immediately without an opportunity to demonstrate that they can continue

compliance with the 4 tpy uncontrolled emission rate. However, we are concerned that a dormant storage vessel that is returned to service associated with the fracturing or refracturing of a well feeding it is likely to release substantial amounts of vapor if not controlled right away due to the initially high liquid flow and flash emissions from freshly fractured or refractured wells. We also believe that potential emissions associated with fracturing and refracturing of a well are unlikely to meet the 4 tpy uncontrolled emission rate. We are therefore not providing the time period described above for storage vessels returned to service associated with fracturing or refracturing of a well. In light of these considerations, we have added language at § 60.5395(f) of the final amendments to address storage vessel affected facilities that are removed from service. After taking a storage vessel affected facility out of service, owners or operators are required provide notification in their next annual report that the storage vessel has been taken out of service. If a storage vessel's return to service is associated with fracturing or refracturing of a well feeding the storage vessel, the storage vessel must comply with control requirements in § 60.5395(d) immediately upon returning to service. If, however, the storage vessel's return to service is not associated with well fracturing or refracturing, the PTE of the storage vessel must be determined within 30 days. If the PTE is 4 tpy or greater, then the storage vessel affected facility must comply with control requirements in § 60.5395(d) within 60 days of being returned to service.

#### *D. Major Comments Concerning Ongoing Compliance Requirements*

##### 1. Burden of Monitoring and Testing Requirements

*Comment:* One commenter states that the monitoring and testing requirements for storage vessels in the 2012 NSPS are overly complex and stringent given the large number of units affected and the remoteness of some wells sites. The commenter supports the EPA's intent to reduce the monitoring and testing burden on affected sources by means of the streamlined monitoring provisions in the proposed amendments. However, the commenter contends that many of these "streamlined" provisions remain overly burdensome due to the large number of affected vessels and the remoteness of the well sites at which they are installed. In particular, the commenter believes that § 60.5416 should only require an annual auditory,

visual and olfactory (AVO) inspection of the vessel and control device, and that Method 22 observation should be required only if smoke is observed by the operator.

Another commenter states that, as proposed, the monthly inspections and obligations for prompt repairs can be accomplished with existing personnel and not add significantly to the cost of compliance while ensuring that the required emissions controls are operating properly.

*Response:* In this action, the EPA is finalizing the streamlined compliance monitoring requirements, as proposed, with minor clarifying changes. As we stated in the preamble to the proposed amendments (78 FR 22134), we will continue to fully evaluate the compliance demonstration and monitoring issues. We intend to complete our reconsideration of these requirements, along with other issues for which we intend to grant reconsideration, by the end of 2014.

In response to the comment stating that the streamlined monitoring provisions are still too burdensome, the EPA has re-evaluated the Method 22 requirements in the proposed reconsideration rule and continues to believe that an observation time of fifteen minutes with a one minute smoke allowance for all combustion controls is appropriate. For manufacturer-tested enclosed combustors, the required frequency of the Method 22 test is quarterly. For all other combustion controls, the required frequency of the Method 22 test is monthly. A "smoke/no smoke" determination is essentially what Method 22 requires. Method 22 simply requires the observer to note how long emissions were seen over a period of time (15 minutes for monthly testing, 1 hour for quarterly testing). If smoke is seen for more than a specified amount of time, it is a violation. We have information indicating that personnel are on-site at each well at least monthly. Since the Method 22 observation does not require highly trained personnel to conduct the test, we believe the personnel already on-site are capable of performing the test. Thus, we do not agree with the commenter that the monitoring provisions in the reconsideration proposal would result in undue burden, or that they are inappropriate considering the remoteness of the well sites. We have therefore finalized those provisions.

##### 2. Streamlined Compliance Monitoring

*Comment:* Several commenters commented on the proposed streamlined compliance monitoring

requirements for closed vent systems and control devices installed to reduce VOC emissions from storage vessels. Four commenters request that the EPA make the streamlined compliance monitoring requirements permanent. One of these commenters states that monitoring requirements imposed by the 2012 NSPS would be particularly onerous for small, independent operators that cannot afford the number of employees-hours required to travel to distant well sites with such high frequency. According to the commenters, their suggested changes to the proposed amendments would meet the goal of proper monitoring of emissions without requiring such a large amount of human and capital resources. Two commenters oppose the streamlined monitoring requirements and request that the EPA reinstate the more rigorous requirements in the 2012 NSPS. One commenter states that portions of the streamlined monitoring requirements are unnecessary and burdensome.

Another commenter expresses concern that the proposed amendments replace instrument-based monitoring of control devices and closed vent systems (CVS) with less reliable methods. Effective monitoring of the integrity and performance of emission control devices is vital to ensuring compliance with emissions limitations under section 111, according to the commenter, and is evident in the radically revised number of storage vessels with emissions exceeding 6 tpy.

The commenter pointed out that the current subpart OOOO requirements for continuous parametric monitoring system (CPMS) and Method 22 testing, as well as Method 21 monitoring, build on other long-standing EPA regulations, including storage vessel standards under subpart HH and the NSPS for volatile organic liquid storage vessels, subpart Kb. The commenter added that they are also consistent with the proposed Uniform Standards for CVS and storage vessels. According to the commenter, the EPA went in the wrong direction by proposing to eliminate the CPMS requirements, shorten the Method 22 visible emissions testing, and allow operators to inspect CVS using OVA inspections.

The commenter states that previous agency studies indicate that instrument-based monitoring is cost-effective and more sensitive than sensory inspections, suggesting that if anything subpart OOOO should extend such monitoring to all roof fittings that could emit VOC. The commenter contends that the EPA provided no information in the proposed reconsideration that questions

the findings of the Uniform Standards on relative effectiveness or cost of instrument monitoring of storage vessel components. The commenter also points to the Fort Berthold Indian Reservation Federal Implementation Plan (FBIR FIP) where the EPA required continuous parametric monitoring of enclosed combustors, utility flares, and other control devices. Also in the FBIR FIP according to the commenter, the EPA rejected reducing the Method 22 observation period to 1 hour to mitigate burdensome compliance costs as an option that was not suitable. The commenter does not believe the EPA provided specific information to warrant a different approach.

The commenter adds that the EPA did not demonstrate that the proposed changes are necessary to mitigate cost and burdens raised by industry. The commenter states that the EPA cited general personnel and infrastructure concerns in the preamble but did not provide an analysis of the anticipated costs of implementing monitoring. In proposing to determine that the current monitoring requirements were infeasible, the commenter contends that the EPA did not indicate whether it took into account the reduced monitoring costs associated with the Group 1 exemption for storage vessels that do not undergo an emissions-increasing event and the deferral of the Group 2 storage vessel compliance date.

Further, the commenter states that there is no indication as to whether Method 21 inspections, CPMS and full Method 22 testing would be infeasible at storage vessels at or near manned facilities. As a result, the commenter contends that the EPA's streamlined monitoring requirements appear to be overly broad as well as inadequately supported.

Another commenter adds that periodic monitoring of closed-vent systems and control devices is a very important part of controlling the air quality in the nation. The commenter asserts that most well sites are located far away from cities and sometimes it can be bothersome to drive back and forth in order to accomplish testing and monitoring processes. The commenter believes that the best way to encourage operators to use the appropriate models is by not letting them install equipment without proper documentation, and to fine them, or even stop onsite operations in case they do not obey the requirement.

*Response:* In today's action, the EPA is finalizing the streamlined compliance monitoring requirements, as proposed, with minor clarifying changes. In finalizing these provisions, the EPA has

made no determination on the cost or feasibility of the compliance monitoring provisions in the 2012 NSPS, as some commenters appear to suggest. We also agree with the commenters about those provisions' reliability and effectiveness. However, as we explained in the preamble to the proposed amendments (78 FR 22134), significant issues regarding their implementation have been raised in the administrative petitions for reconsideration of the 2012 NSPS, which we are continuing to evaluate. We intend to complete our reconsideration of these requirements, along with any other issues for which we intend to grant reconsideration, by the end of 2014. We do not believe it is appropriate to impose these monitoring requirements on affected facilities while we are still evaluating their implementation issues. However, to avoid delaying compliance, we have proposed and are finalizing in today's action a set of streamlined compliance monitoring requirements. We believe that they are adequate to assure compliance. Several commenters urge us to retain the monitoring provisions in the 2012 NSPS for the reasons summarized above, but none of them claim that the streamlined provisions laid out in the proposal are inadequate to assure compliance. In light of the above, we are finalizing the streamlined compliance monitoring requirements, as proposed, with minor clarifying changes.

#### *E. Major Comments Concerning Design Requirements*

*Comment:* Three commenters support the inclusion of design parameters in the final amendments. One commenter states that design parameters are important to reduce the possibility for an unintended loophole in the rule language which might result in potentially significant emissions. The commenter adds that their agency has observed the highest emission rates corresponding to flash VOC emissions while liquids are being added to an existing storage vessel and believes that this is common at well sites, where the natural formation results in high pressure liquids which are then routed through the separator to a storage vessel that is at or around atmospheric pressure. The commenter contends that if a closed cover is not maintained during such liquids addition, a large percentage of the annual emissions could vent out of a pressure relief valve or thief hatch, rather than being routed to a control device.

Another commenter supported this view and states that the final amendments must ensure that vapor

collection systems and control devices will reduce 95 percent of VOCs during all phases of operation, including when air pressure significantly increases during loading. The commenter contends that where systems are currently in place to control condensate tank emissions at natural gas exploration and production sites, they are sometimes inadequate for controlling the high-pressure vapor produced when the tanks receive a slug of condensate. The commenter points out that the EPA has noted in this rulemaking that the feasibility of meeting the storage-vessel standards with a vapor recovery unit may be affected by "fluctuations in vapor loading caused by surges in throughput and flash emissions from the storage vessel." The commenter provides several possible approaches to assure equipment is properly designed to meet the storage vessel standards.

One of the commenters adds that the inclusion of design requirements would provide enforceable provisions that would assist permitting agencies in regulating sources.

Eight commenters generally opposed the inclusion of design requirements in the final amendments. One commenter states that the EPA has already established BSER for affected storage vessels as the reduction of VOC emissions by 95 percent or greater and established work practice standards for the closed vent system to any control device or vapor recovery system. According to the commenter, these work practice standards address potential equipment design and maintenance issues that could affect the proper collection of and destruction or recovery of VOC emissions from storage vessels. The commenter asserts that a storage vessel, closed vent system, and control device that are not properly designed would not be able to meet the work practice standards and minimum control device destruction efficiency already required in the proposed rule; therefore, any process design standards would only be duplicative requirements and result in more burden to industry and state agencies responsible for compliance.

The commenter maintains that the EPA should not attempt to expand any NSPS regulations by specifically regulating the process or mechanical design of storage vessels or the closed vent system to control devices or vapor recovery systems. The commenter further states that owners and operators are responsible for designing process equipment based on individual site process conditions and safety considerations. According to the

commenter, it would be a massive undertaking for the EPA to attempt to write regulations regarding the specific "proper" design of storage vessels and closed vent systems. The commenter expresses doubt that the EPA could provide enough flexibility in process and mechanical design of equipment regulations to cover all the unique process conditions at individual facilities.

One commenter adds that over-prescriptive regulations on storage vessel design could stifle technological innovation, including new tank designs that emit less than current storage vessels. Additionally, according to the commenter, storage vessels are specifically designed in accordance with federal safety standards and these specifications should not be potentially compromised under any circumstances. Further, the commenter states that it is in the best economic interest of all operators to procure properly designed equipment and operate storage vessels efficiently. Lastly, the commenter states that, under the CAA, operators already have a general duty requirement to "maintain and operate any affected facility including air pollution control equipment in a manner consistent with good air pollution control practices for minimizing emissions."

One commenter does not believe that the EPA has the authority under NSPS to require a particular technology or design as a performance standard. The commenter contends that the EPA should not mandate a particular technology, but rather allow companies to choose the technology to best meet the emission standard.

One state agency commenter believes that specifying design requirements in regulations will stifle innovation and create a plateau for new products. The commenter believes that such restrictions will not allow for economic or technological creation of new methods or equipment. The commenter further states that, as the industry grows and changes, so too should the facilities and equipment associated with it, but prescriptive design requirements would not allow this to happen. Also, according to the commenter, due to high variability of materials and situations in the field it seems illogical and inappropriate to deem only certain designs of facilities and equipment acceptable or not. The commenter contends that design requirements specified by rule could cause certain facilities or regions to be unable to implement engineering solutions necessary to account for site- or region-specific conditions.

*Response:* The EPA appreciates the information provided by these commenters in response to the EPA's solicitation of comment on whether the NSPS should include design requirements for storage vessels, closed vent system and control devices. In the preamble to the proposed rule, we had solicited comment on whether the EPA should require that storage vessel installations and associated controls be sized and designed properly for specific applications to minimize excess emissions due to improperly sized and designed storage vessels or control systems. We did not solicit comment on whether the EPA should require specific technology or design parameters. Accordingly, because the reconsideration proposal did not include any specific design requirements for storage vessels and associated closed vent systems and control device, no such requirement is included in the final amendments.

#### *F. Major Comments Concerning Impacts*

*Comment:* One commenter contends that the EPA failed to assess the air quality impacts of its proposed amendments and the EPA must provide further analysis of air quality impacts to support that the proposed revised standards is BSER. According to the commenter's analysis, Group 1 storage vessels that do not experience an event that would increase emissions would result in an increase from the final NSPS in VOC emissions of over 3 million tpy and methane emissions of over 700,000 tpy. In addition, the commenter states that the six-month delay of the compliance date for Group 2 storage vessels results in an increase of 450,000 tpy of VOC emissions and 100,000 tpy of methane emissions. The commenter added that the removal of a control device from sources whose uncontrolled emissions drop below 4 tpy would result in an emission increase of 3.8 tpy VOC per vessel. Assuming that the 11,600 new vessels the EPA projects would qualify for the uncontrolled actual VOC emission rate, emissions would increase by 23,000 tpy VOC and 5,000 tpy methane. The commenter also contends that the removal of the control device would result in sources left uncontrolled during any unplanned events that would generate significant emissions. Additionally, the commenter states that using their decline curve analysis, new sources would not qualify for uncontrolled actual VOC emission rate for at least 14 years, and the increase in pollution is not justified by the EPA's control device availability concerns.

*Response:* As we discussed in section IV.A of this preamble, we are not finalizing our proposal to subject only those Group 1 storage vessels that experience an event to the emission standards. Thus, all Group 1 storage vessel affected facilities will be subject to the emission standards, as required under the 2012 NSPS. We believe this addresses the commenters' concerns about any increase in emissions based on our proposal to require Group 1 to control only if there is a subsequent emission increase event. The commenter is also concerned with emission increase from delayed compliance. However, we believe that the extended deadlines in the final amendments are justified for the reasons stated in section IV.A, and we are phasing the compliance deadlines to address facilities with projected higher emissions more quickly.

We have also provided further analysis of air quality impacts, as the commenter suggests, as well as the cost effectiveness and energy impact associated with the proposed uncontrolled emission rate of less than 4 tpy. As discussed in more detail in section V.C of this preamble, 4 tpy likely represents a point below which control ceases to be the BSER for reducing VOC emissions from storage vessel affected facilities due to the cost effectiveness, the secondary environmental impact and energy impact.

#### **VI. Technical Corrections and Clarifications**

The EPA is finalizing corrections to recordkeeping and reporting requirements for all affected facilities. In addition, the final amendments include corrections that are editorial in nature, such as typographical and grammatical errors, as well as incorrect cross-references.

#### **VII. Impacts of These Final Amendments**

Our analysis shows that owners and operators of storage vessel affected facilities would choose to install and operate the same or similar air pollution control technologies under the proposed standards as would have been necessary to meet the previously finalized standards. We project that this rule will result in no significant change in costs, emission reductions, or benefits. Even if there were changes in costs for these units, such changes would likely be small relative to both the overall costs of the individual projects and the overall costs and benefits of the final rule. Since we believe that owners and operators would put on the same

controls for this revised final rule that they would have for the original final rule, there should not be any incremental costs related to this proposed revision.

*A. What are the air impacts?*

We believe that owners and operators of storage vessel affected facilities will install the same or similar control technologies to comply with the revised standards finalized in this action as they would have installed to comply with the previously finalized standards. Accordingly, we believe that this final rule will not result in significant changes in emissions of any of the regulated pollutants.

*B. What are the energy impacts?*

This final rule is not anticipated to have an effect on the supply, distribution, or use of energy. As previously stated, we believe that owners and operators of storage vessel affected facilities would install the same or similar control technologies as they would have installed to comply with the previously finalized standards.

*C. What are the compliance costs?*

We believe there will be no significant change in compliance costs as a result of this final rule because owners and operators of storage vessel affected facilities would install the same or similar control technologies as they would have installed to comply with the previously finalized standards. However, we note that there likely will be reductions of costs imposed on owners and operators associated with the streamlined compliance monitoring procedures provided in the final amendments.

*D. What are the economic and employment impacts?*

Because we expect that owners and operators of storage vessel affected facilities would install the same or similar control technologies to meet the standards finalized in this action as they would have chosen to comply with the previously finalized standards, we do not anticipate that this final rule will result in significant changes in emissions, energy impacts, costs, benefits, or economic impacts. Likewise, we believe this rule will not have any impacts on the price of electricity, employment or labor markets, or the U.S. economy.

*E. What are the benefits of the proposed standards?*

As previously stated, the EPA anticipates the oil and natural gas sector will not incur significant compliance

costs or savings as a result of this rule and we do not anticipate any significant emission changes resulting from this rule. Therefore, there are no direct monetized benefits or disbenefits associated with this rule.

**VIII. Statutory and Executive Order Reviews**

*A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review*

This action is not a "significant regulatory action" under the terms of Executive Order 12866 (58 FR 51735, October 4, 1993) and is therefore not subject to review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011).

An RIA was prepared for the April 2012 NSPS and can be found at: [http://www.epa.gov/ttn/ecas/regdata/RIAs/oil\\_natural\\_gas\\_final\\_neshap\\_nsps\\_ria.pdf](http://www.epa.gov/ttn/ecas/regdata/RIAs/oil_natural_gas_final_neshap_nsps_ria.pdf). This final rule will not result in a significant change in costs, emission reductions, or benefits in 2015 (the year of full implementation of the 2012 NSPS being amended with this action).

*B. Paperwork Reduction Act*

This action does not impose any new information collection burden. This action does not change the information collection requirements previously finalized under the 2012 NSPS and, as a result, does not impose any additional burden on industry. However, OMB has previously approved the information collection requirements contained in the existing regulations (see 77 FR 49490) under the provisions of the *Paperwork Reduction Act*, 44 U.S.C. 3501 *et seq.* and has assigned OMB control number 2060-0673). The OMB control numbers for the EPA's regulations are listed in 40 CFR part 9 and 48 CFR chapter 15.

*C. Regulatory Flexibility Act*

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of this rule on small entities, a small entity is defined as: (1) A small business in the oil or natural gas industry whose parent company has no more than 500

employees (or revenues of less than \$7 million for firms that transport natural gas via pipeline); (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of today's final rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. The EPA has determined that none of the small entities will experience a significant impact because these final amendments will not impose additional compliance costs on owners or operators of affected facilities.

*D. Unfunded Mandates Reform Act*

This action contains no federal mandates under the provisions of Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), 2 U.S.C. 1531-1538 for State, local, or tribal governments or the private sector. This action imposes no enforceable duty on any state, local or tribal governments or the private sector. Therefore, this action is not subject to the requirements of sections 202 or 205 of the UMRA.

This action is also not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. This action contains no requirements that apply to small governments nor does it impose obligations upon them.

*E. Executive Order 13132: Federalism*

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. This final rule is a reconsideration of an existing rule and imposes no new impacts or costs. Thus, Executive Order 13132 does not apply to this action.

In the spirit of Executive Order 13132, and consistent with the EPA policy to promote communications between the EPA and state and local governments, the EPA specifically solicited comment on the proposed action from state and local officials.

**F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments**

This action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). It will not have substantial direct effect on tribal governments, on the relationship between the federal government and tribal governments or on the distribution of power and responsibilities between the federal government and tribal governments, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

In the spirit of Executive Order 13175, and consistent with the EPA policy to promote communications between the EPA and tribal governments, the EPA specifically solicited comment on the proposed action from tribal officials. The EPA notes that significant oil and natural gas development is occurring on some tribal lands and has been mindful of this in consideration of these final amendments.

**G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks**

This action is not subject to EO 13045 (62 FR 19885, April 23, 1997) because it is not economically significant as defined in EO 12866, and because the agency does not believe the environmental health risks or safety risks addressed by this action present a disproportionate risk to children. This final rule will not result in a significant change in emission reductions and benefits in 2015, the year of full implementation of the 2012 NSPS being amended with this action. Therefore, health and risk assessments were not conducted.

The public was invited to submit comments or identify peer-reviewed studies and data that assess effects of early life exposure to HAP from oil and natural gas sector activities.

**H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use**

This action is not subject to Executive Order 13211 (66 FR 28355 (May 22, 2001)), because it is not a significant regulatory action under Executive Order 12866.

**I. National Technology Transfer and Advancement Act**

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 ("NTTAA"), Public Law 104-113, 12(d) (15 U.S.C. 272 note) directs the EPA to use voluntary

consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. The NTTAA directs the EPA to provide Congress, through OMB, explanations when the agency decides not to use available and applicable voluntary consensus standards.

This final rule does not involve technical standards. Therefore, the EPA is not considering the use of any voluntary consensus standards.

**J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations**

Executive Order (EO) 12898 (59 FR 7629 (Feb. 16, 1994)) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

The EPA has determined that this final rule will not have disproportionately high and adverse human health or environmental effects on minority, low-income, or indigenous populations because it does not affect the level of human health or environmental protection for all affected populations. This final rule is a reconsideration of an existing rule and imposes no new impacts or costs. Therefore, this final rule would not have any disproportionately high and adverse human health or environmental effects on any population, including any minority, low income or indigenous populations.

**K. Congressional Review Act**

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of Congress and to the Comptroller General of the United States. The EPA will submit a report containing this rule and other required information to the U.S.

Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the Federal Register. A major rule cannot take effect until 60 days after it is published in the Federal Register. This action is not a "major rule" as defined by 5 U.S.C. 804(2). This rule will be effective September 23, 2013.

**List of Subjects in 40 CFR Part 60**

Administrative practice and procedure, Air pollution control, Intergovernmental relations, Reporting and recordkeeping.

Dated: August 2, 2013.

Gina McCarthy,  
Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

**PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES**

■ 1. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

**Subpart OOOO—[Amended]**

■ 2. Section 60.5365 is amended by revising paragraphs (e) and (h)(4) to read as follows:

**§ 60.5365 Am I subject to this subpart?**

\* \* \* \* \*

(e) Each storage vessel affected facility, which is a single storage vessel located in the oil and natural gas production segment, natural gas processing segment or natural gas transmission and storage segment, and has the potential for VOC emissions equal to or greater than 6 tpy as determined according to this section by October 15, 2013 for Group 1 storage vessels and by April 15, 2014, or 30 days after startup (whichever is later) for Group 2 storage vessels. A storage vessel affected facility that subsequently has its potential for VOC emissions decrease to less than 6 tpy shall remain an affected facility under this subpart. The potential for VOC emissions must be calculated using a generally accepted model or calculation methodology, based on the maximum average daily throughput determined for a 30-day period of production prior to the applicable emission determination deadline specified in this section. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement

established under a Federal, State, local or tribal authority. Any vapor from the storage vessel that is recovered and routed to a process through a VRU designed and operated as specified in this section is not required to be included in the determination of VOC potential to emit for purposes of determining affected facility status, provided you comply with the requirements in paragraphs (e)(1) through (4) of this section.

(1) You meet the cover requirements specified in § 60.5411(b).

(2) You meet the closed vent system requirements specified in § 60.5411(c).

(3) You maintain records that document compliance with paragraphs (e)(1) and (2) of this section.

(4) In the event of removal of apparatus that recovers and routes vapor to a process, or operation that is inconsistent with the conditions specified in paragraphs (e)(1) and (2) of this section, you must determine the storage vessel's potential for VOC emissions according to this section within 30 days of such removal or operation.

\* \* \* \* \*

(h) \* \* \*

(4) A gas well facility initially constructed after August 23, 2011, is considered an affected facility regardless of this provision.

■ 3. Section 60.5380 is amended by revising paragraphs (a)(2), (b), and (c) to read as follows:

**§ 60.5380 What standards apply to centrifugal compressor affected facilities?**

\* \* \* \* \*

(a) \* \* \*

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of § 60.5411(b), that is connected through a closed vent system that meets the requirements of § 60.5411(a) and routed to a control device that meets the conditions specified in § 60.5412(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(b) You must demonstrate initial compliance with the standards that apply to centrifugal compressor affected facilities as required by § 60.5410(b).

(c) You must demonstrate continuous compliance with the standards that apply to centrifugal compressor affected facilities as required by § 60.5415(b).

\* \* \* \* \*

■ 4. Section 60.5390 is amended by:

- a. Revising the introductory text;
- b. Revising paragraph (a); and

■ c. Revising paragraph (c).

The revisions read as follows:

**§ 60.5390 What standards apply to pneumatic controller affected facilities?**

For each pneumatic controller affected facility you must comply with the VOC standards, based on natural gas as a surrogate for VOC, in either paragraph (b)(1) or (c)(1) of this section, as applicable. Pneumatic controllers meeting the conditions in paragraph (a) of this section are exempt from this requirement.

(a) The requirements of paragraph (b)(1) or (c)(1) of this section are not required if you determine that the use of a pneumatic controller affected facility with a bleed rate greater than the applicable standard is required based on functional needs, including but not limited to response time, safety and positive actuation. However, you must tag such pneumatic controller with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that pneumatic controller, as required in § 60.5420(c)(4)(ii).

\* \* \* \* \*

(c)(1) Each pneumatic controller affected facility constructed, modified or reconstructed on or after October 15, 2013, at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline must have a bleed rate less than or equal to 6 standard cubic feet per hour.

(2) Each pneumatic controller affected facility at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline must be tagged with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that controller as required in § 60.5420(c)(4)(iii).

\* \* \* \* \*

■ 5. Section 60.5395 is revised to read as follows:

**§ 60.5395 What standards apply to storage vessel affected facilities?**

Except as provided in paragraph (h) of this section, you must comply with the standards in this section for each storage vessel affected facility.

(a)(1) If you are the owner or operator of a Group 1 storage vessel affected facility, you must comply with paragraph (b) of this section.

(2) If you are the owner or operator of a Group 2 storage vessel affected facility, you must comply with paragraph (c) of this section.

(b) *Requirements for Group 1 storage vessel affected facilities.* If you are the owner or operator of a Group 1 storage vessel affected facility, you must comply with paragraphs (b)(1) and (2) of this section.

(1) You must submit a notification identifying each Group 1 storage vessel affected facility, including its location, with your initial annual report as specified in § 60.5420(b)(6)(iv).

(2) You must comply with paragraphs (d) through (g) of this section.

(c) *Requirements for Group 2 storage vessel affected facilities.* If you are the owner or operator of a Group 2 storage vessel affected facility, you must comply with paragraphs (d) through (g) of this section.

(d) You must comply with the control requirements of paragraph (d)(1) of this section unless you meet the conditions specified in paragraph (d)(2) of this section.

(1) Reduce VOC emissions by 95.0 percent according to the schedule specified in (d)(1)(i) and (ii) of this section.

(i) For each Group 2 storage vessel affected facility, you must achieve the required emissions reductions by April 15, 2014, or within 60 days after startup, whichever is later.

(ii) For each Group 1 storage vessel affected facility, you must achieve the required emissions reductions by April 15, 2015.

(2) Maintain the uncontrolled actual VOC emissions from the storage vessel affected facility at less than 4 tpy without considering control. Prior to using the uncontrolled actual VOC emission rate for compliance purposes, you must demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy as determined monthly for 12 consecutive months. After such demonstration, you must determine the uncontrolled actual VOC emission rate each month. The uncontrolled actual VOC emissions must be calculated using a generally accepted model or calculation methodology. Monthly calculations must be based on the average throughput for the month. Monthly calculations must be separated by at least 14 days. You must comply with paragraph (d)(1) of this section if your storage vessel affected facility meets the conditions specified in paragraphs (d)(2)(i) or (ii) of this section.

(i) If a well feeding the storage vessel affected facility undergoes fracturing or refracturing, you must comply with paragraph (d)(1) of this section as soon as liquids from the well following fracturing or refracturing are routed to the storage vessel affected facility.

(ii) If the monthly emissions determination required in this section indicates that VOC emissions from your storage vessel affected facility increase to 4 tpy or greater and the increase is not associated with fracturing or refracturing of a well feeding the storage vessel affected facility, you must comply with paragraph (d)(1) of this section within 30 days of the monthly calculation.

(e) *Control requirements.* (1) Except as required in paragraph (e)(2) of this section, if you use a control device to reduce emissions from your storage vessel affected facility, you must equip the storage vessel with a cover that meets the requirements of § 60.5411(b) and is connected through a closed vent system that meets the requirements of § 60.5411(c), and you must route emissions to a control device that meets the conditions specified in § 60.5412(c) and (d). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(2) If you use a floating roof to reduce emissions, you must meet the requirements of § 60.112b(a)(1) or (2) and the relevant monitoring, inspection, recordkeeping, and reporting requirements in 40 CFR part 60, subpart Kb.

(f) *Requirements for storage vessel affected facilities that are removed from service.* If you are the owner or operator of a storage vessel affected facility that is removed from service, you must comply with paragraphs (f)(1) and (2) of this section.

(1) You must submit a notification in your next annual report, identifying all storage vessel affected facilities removed from service during the reporting period.

(2) If the storage vessel affected facility identified in paragraph (f)(1) of this section is returned to service, you must comply with paragraphs (f)(2)(i) through (iii) of this section.

(i) If returning your storage vessel affected facility to service is associated with fracturing or refracturing of a well feeding the storage vessel affected facility, you must comply with paragraph (d) of this section immediately upon returning the storage vessel to service.

(ii) If returning your storage vessel affected facility to service is not associated with a well that was fractured or refractured, you must comply with paragraphs (f)(2)(ii)(A) and (B) of this section.

(A) You must determine emissions as specified in § 60.5365(e) within 30 days of returning your storage vessel affected facility to service.

(B) If the uncontrolled VOC emissions without considering control from your storage vessel affected facility are 4 tpy or greater, you must comply with paragraph (d) of this section within 60 days of returning to service.

(iii) You must submit a notification in your next annual report identifying each storage vessel affected facility that has been returned to service.

(g) *Compliance, notification, recordkeeping, and reporting.* You must comply with paragraphs (g)(1) through (3) of this section.

(1) You must demonstrate initial compliance with standards as required by § 60.5410(h) and (i).

(2) You must demonstrate continuous compliance with standards as required by § 60.5415(e)(3).

(3) You must perform the required notification, recordkeeping and reporting as required by § 60.5420.

(h) *Exemptions.* This subpart does not apply to storage vessels subject to and controlled in accordance with the requirements for storage vessels in 40 CFR part 60, subpart Kb, 40 CFR part 63, subparts G, CC, HH, or WW.

■ 6. Section 60.5410 is amended by:

■ a. Revising the introductory text;

■ b. Revising paragraphs (a)(3) and (4);

■ c. Revising paragraphs (b)(2) through (5);

■ d. Revising paragraphs (b)(7) and (8);

■ e. Removing and reserving paragraph (c)(2);

■ f. Revising paragraphs (d)

introductory text, (d)(1), (d)(2), and (d)(4);

■ g. Removing and reserving paragraph (e); and

■ h. Adding paragraphs (h) and (i).

The revisions and additions read as follows:

■ The revisions and additions read as follows:

(3) You must maintain a log of records as specified in § 60.5420(c)(1)(i) through (iv) for each well completion operation conducted during the initial compliance period.

(4) For each gas well affected facility subject to both § 60.5375(a)(1) and (3), as an alternative to retaining the records specified in § 60.5420(c)(1)(i) through (iv), you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the well site imbedded within or stored with the digital file showing the equipment for storing or re-injecting recovered liquid, equipment for routing recovered gas to the gas flow line and the completion combustion device (if applicable) connected to and operating at each gas well completion operation that occurred during the initial compliance period. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the equipment connected and operating at each well completion operation with a photograph of a separately operating GIS device within the same digital picture, provided the latitude and longitude output of the GIS unit can be clearly read in the digital photograph.

(b) \* \* \*

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of § 60.5411(b) that is connected through a closed vent system that meets the requirements of § 60.5411(a) and is routed to a control device that meets the conditions specified in § 60.5412(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(3) You must conduct an initial performance test as required in § 60.5413 within 180 days after initial startup or by October 15, 2012, whichever is later, and you must comply with the continuous compliance requirements in § 60.5415(b)(1) through (3).

(4) You must conduct the initial inspections required in § 60.5416(a) and (b).

(5) You must install and operate the continuous parameter monitoring systems in accordance with § 60.5417(a) through (g), as applicable.

\* \* \* \* \*

(7) You must submit the initial annual report for your centrifugal compressor affected facility as required in § 60.5420(b)(3) for each centrifugal compressor affected facility.

(8) You must maintain the records as specified in § 60.5420(c)(2).

(c) \* \* \*

(2) [Reserved]

(d) To achieve initial compliance with emission standards for your pneumatic controller affected facility you must comply with the requirements specified in paragraphs (d)(1) through (6) of this section, as applicable.

(1) You must demonstrate initial compliance by maintaining records as specified in § 60.5420(c)(4)(ii) of your determination that the use of a pneumatic controller affected facility with a bleed rate greater than 6 standard cubic feet of gas per hour is required as specified in § 60.5390(a).

(2) You own or operate a pneumatic controller affected facility located at a natural gas processing plant and your pneumatic controller is driven by a gas other than natural gas and therefore emits zero natural gas.

(4) You must tag each new pneumatic controller affected facility according to the requirements of § 60.5390(b)(2) or (c)(2).

(e) [Reserved]

(h) For each storage vessel affected facility, you must comply with paragraphs (h)(1) through (5) of this section. For a Group 1 storage vessel affected facility, you must demonstrate initial compliance by April 15, 2015, except as otherwise provided in paragraph (i) of this section. For a Group 2 storage vessel affected facility, you must demonstrate initial compliance by April 15, 2014, or within 60 days after startup, whichever is later.

(1) You must determine the potential VOC emission rate as specified in § 60.5365(e).

(2) You must reduce VOC emissions in accordance with § 60.5395(d).

(3) If you use a control device to reduce emissions, or if you route emissions to a process, you must demonstrate initial compliance by meeting the requirements in § 60.5395(e).

(4) You must submit the information required for your storage vessel affected facility as specified in § 60.5420(b).

(5) You must maintain the records required for your storage vessel affected facility, as specified in § 60.5420(c)(5) through (8) and § 60.5420(c)(12) and (13) for each storage vessel affected facility.

(i) For each Group 1 storage vessel affected facility, you must submit the notification specified in § 60.5395(b)(2)

with the initial annual report specified in § 60.5420(b)(6).

■ 7. Section 60.5411 is amended by:

- a. Revising the section heading;
- b. Revising paragraphs (a) introductory text, (a)(1), and (a)(3)(i)(A);
- c. Revising the heading of paragraph (b), and paragraphs (b)(1) and (b)(2)(iv);
- d. Adding paragraph (b)(3); and
- e. Adding paragraph (c).

The revisions and additions read as follows:

**§ 60.5411 What additional requirements must I meet to determine initial compliance for my covers and closed vent systems routing materials from storage vessels and centrifugal compressor wet seal degassing systems?**

\* \* \* \* \*

(a) Closed vent system requirements for centrifugal compressor wet seal degassing systems. (1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the wet seal fluid degassing system to a control device or to a process that meets the requirements specified in § 60.5412(a) through (c).

\* \* \* \* \*

(3) \* \* \*

(i) \* \* \*

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings as specified in § 60.5416(a)(4) and sounds an alarm when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere.

\* \* \* \* \*

(b) Cover requirements for storage vessels and centrifugal compressor wet seal degassing systems. (1) The cover and all openings on the cover (e.g., access hatches, sampling ports, pressure relief valves and gauge wells) shall form a continuous impermeable barrier over the entire surface area of the liquid in the storage vessel or wet seal fluid degassing system.

(2) \* \* \*

(iv) To vent liquids, gases, or fumes from the unit through a closed-vent system designed and operated in accordance with the requirements of paragraph (a) or (c) of this section to a control device or to a process.

(3) Each storage vessel thief hatch shall be weighted and properly seated. You must select gasket material for the hatch based on composition of the fluid in the storage vessel and weather conditions.

(c) Closed vent system requirements for storage vessel affected facilities

using a control device or routing emissions to a process. (1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the storage vessel to a control device that meets the requirements specified in § 60.5412(c) and (d), or to a process.

(2) You must design and operate a closed vent system with no detectable emissions, as determined using olfactory, visual and auditory inspections. Each closed vent system that routes emissions to a process must be operational 95 percent of the year or greater.

(3) You must meet the requirements specified in paragraphs (c)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process.

(i) Except as provided in paragraph (c)(3)(ii) of this section, you must comply with either paragraph (c)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that sounds an alarm, or, initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere.

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (c)(3)(i) of this section.

■ 8. Section 60.5412 is amended by:

- a. Revising paragraphs (a) introductory text, (a)(1) introductory text, and (a)(2);
- b. Revising paragraph (b);
- c. Revising paragraphs (c) introductory text and (c)(1); and
- d. Adding paragraph (d).

The revisions and addition read as follows:

**§ 60.5412 What additional requirements must I meet for determining initial compliance with control devices used to comply with the emission standards for my storage vessel or centrifugal compressor affected facility?**

\* \* \* \* \*

(a) Each control device used to meet the emission reduction standard in § 60.5380(a)(1) for your centrifugal compressor affected facility must be installed according to paragraphs (a)(1) through (3) of this section. As an alternative, you may install a control device model tested under § 60.5413(d), which meets the criteria in § 60.5413(d)(11) and § 60.5413(e).

(1) Each combustion device (e.g., thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (a)(1)(i) through (iv) of this section.

\* \* \* \* \*

(2) Each vapor recovery device (e.g., carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of § 60.5413. As an alternative to the performance testing requirements, you may demonstrate initial compliance by conducting a design analysis for vapor recovery devices according to the requirements of § 60.5413(c).

\* \* \* \* \*

(b) You must operate each control device installed on your centrifugal compressor affected facility in accordance with the requirements specified in paragraphs (b)(1) and (2) of this section.

(1) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the wet seal fluid degassing system affected facility, as required under § 60.5380(a), through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

(2) For each control device monitored in accordance with the requirements of § 60.5417(a) through (g), you must demonstrate compliance according to the requirements of § 60.5415(b)(2), as applicable.

(c) For each carbon adsorption system used as a control device to meet the requirements of paragraph (a)(2) or (d)(2) of this section, you must manage the carbon in accordance with the requirements specified in paragraphs (c)(1) or (2) of this section.

(1) Following the initial startup of the control device, you must replace all carbon in the control device with fresh carbon on a regular, predetermined time

interval that is no longer than the carbon service life established according to § 60.5413(c)(2) or (3) or according to the design required in paragraph (d)(2) of this section, for the carbon adsorption system. You must maintain records identifying the schedule for replacement and records of each carbon replacement as required in § 60.5420(c)(10) and (12).

\* \* \* \* \*

(d) Each control device used to meet the emission reduction standard in § 60.5395(d) for your storage vessel affected facility must be installed according to paragraphs (d)(1) through (3) of this section, as applicable. As an alternative, you may install a control device model tested under § 60.5413(d), which meets the criteria in § 60.5413(d)(11) and § 60.5413(e).

(1) Each enclosed combustion device (e.g., thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed to reduce the mass content of VOC emissions by 95.0 percent or greater. You must follow the requirements in paragraphs (d)(1)(i) through (iii) of this section.

(i) Ensure that each enclosed combustion device is maintained in a leak free condition.

(ii) Install and operate a continuous burning pilot flame.

(iii) Operate the enclosed combustion device with no visible emissions, except for periods not to exceed a total of one minute during any 15 minute period. A visible emissions test using section 11 of EPA Method 22, 40 CFR part 60, appendix A, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes. Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practices as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection. Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A, visual observation as described in this paragraph.

(2) Each vapor recovery device (e.g., carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater. A carbon replacement schedule must be included

in the design of the carbon adsorption system.

(3) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the storage vessel affected facility through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

■ 9. Section 60.5413 is amended by:

- a. Revising the introductory text;
- b. Revising paragraph (a)(7);
- c. Revising paragraph (d); and
- d. Adding paragraph (e).

The revisions and addition read as follows:

**§ 60.5413 What are the performance testing procedures for control devices used to demonstrate compliance at my storage vessel or centrifugal compressor affected facility?**

This section applies to the performance testing of control devices used to demonstrate compliance with the emissions standards for your centrifugal compressor affected facility. You must demonstrate that a control device achieves the performance requirements of § 60.5412(a) using the performance test methods and procedures specified in this section. For condensers, you may use a design analysis as specified in paragraph (c) of this section in lieu of complying with paragraph (b) of this section. In addition, this section contains the requirements for enclosed combustion device performance tests conducted by the manufacturer applicable to both storage vessel and centrifugal compressor affected facilities.

(a) \* \* \*

(7) A control device whose model can be demonstrated to meet the performance requirements of § 60.5412(a) through a performance test conducted by the manufacturer, as specified in paragraph (d) of this section.

\* \* \* \* \*

(d) *Performance testing for combustion control devices—manufacturers' performance test.* (1) This paragraph applies to the performance testing of a combustion control device conducted by the device manufacturer. The manufacturer must demonstrate that a specific model of control device achieves the performance requirements in paragraph (d)(11) of this section by conducting a performance test as specified in paragraphs (d)(2) through (10) of this section. You must submit a test report for each combustion control device in accordance with the

requirements in paragraph (d)(12) of this section.

(2) Performance testing must consist of three one-hour (or longer) test runs for each of the four firing rate settings specified in paragraphs (d)(2)(i) through (iv) of this section, making a total of 12 test runs per test. Propene (propylene) gas must be used for the testing fuel. All fuel analyses must be performed by an independent third-party laboratory (not affiliated with the control device manufacturer or fuel supplier).

(i) 90–100 percent of maximum design rate (fixed rate).

(ii) 70–100–70 percent (ramp up, ramp down). Begin the test at 70 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 100 percent of the maximum design rate. Hold at 100 percent for 5 minutes. In the 10–15 minute time range, incrementally ramp back down to 70 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iii) 30–70–30 percent (ramp up, ramp down). Begin the test at 30 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 70 percent of the maximum design rate. Hold at 70 percent for 5 minutes. In the 10–15 minute time range, incrementally ramp back down to 30 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iv) 0–30–0 percent (ramp up, ramp down). Begin the test at the minimum firing rate. During the first 5 minutes, incrementally ramp the firing rate to 30 percent of the maximum design rate. Hold at 30 percent for 5 minutes. In the 10–15 minute time range, incrementally ramp back down to the minimum firing rate. Repeat three more times for a total of 60 minutes of sampling.

(3) All models employing multiple enclosures must be tested simultaneously and with all burners operational. Results must be reported for each enclosure individually and for the average of the emissions from all interconnected combustion enclosures/chambers. Control device operating data must be collected continuously throughout the performance test using an electronic Data Acquisition System. A graphic presentation or strip chart of the control device operating data and emissions test data must be included in the test report in accordance with paragraph (d)(12) of this section. Inlet fuel meter data may be manually recorded provided that all inlet fuel data readings are included in the final report.

(4) Inlet testing must be conducted as specified in paragraphs (d)(4)(i) through (ii) of this section.

(i) The inlet gas flow metering system must be located in accordance with Method 2A, 40 CFR part 60, appendix A–1, (or other approved procedure) to measure inlet gas flow rate at the control device inlet location. You must position the fitting for filling fuel sample containers a minimum of eight pipe diameters upstream of any inlet gas flow monitoring meter.

(ii) Inlet flow rate must be determined using Method 2A, 40 CFR part 60, appendix A–1. Record the start and stop reading for each 60-minute THC test. Record the gas pressure and temperature at 5-minute intervals throughout each 60-minute test.

(5) Inlet gas sampling must be conducted as specified in paragraphs (d)(5)(i) through (ii) of this section.

(i) At the inlet gas sampling location, securely connect a Silonite-coated stainless steel evacuated canister fitted with a flow controller sufficient to fill the canister over a 3-hour period. Filling must be conducted as specified in paragraphs (d)(5)(i)(A) through (C) of this section.

(A) Open the canister sampling valve at the beginning of each test run, and close the canister at the end of each test run.

(B) Fill one canister across the three test runs such that one composite fuel sample exists for each test condition.

(C) Label the canisters individually and record sample information on a chain of custody form.

(ii) Analyze each inlet gas sample using the methods in paragraphs (d)(5)(ii)(A) through (C) of this section. You must include the results in the test report required by paragraph (d)(12) of this section.

(A) Hydrocarbon compounds containing between one and five atoms of carbon plus benzene using ASTM D1945–03.

(B) Hydrogen (H<sub>2</sub>), carbon monoxide (CO), carbon dioxide (CO<sub>2</sub>), nitrogen (N<sub>2</sub>), oxygen (O<sub>2</sub>) using ASTM D1945–03.

(C) Higher heating value using ASTM D3588–98 or ASTM D4891–89.

(6) Outlet testing must be conducted in accordance with the criteria in paragraphs (d)(6)(i) through (v) of this section.

(i) Sample and flow rate must be measured in accordance with paragraphs (d)(6)(i)(A) through (B) of this section.

(A) The outlet sampling location must be a minimum of four equivalent stack diameters downstream from the highest peak flame or any other flow

disturbance, and a minimum of one equivalent stack diameter upstream of the exit or any other flow disturbance. A minimum of two sample ports must be used.

(B) Flow rate must be measured using Method 1, 40 CFR part 60, appendix A–1 for determining flow measurement traverse point location, and Method 2, 40 CFR part 60, appendix A–1 for measuring duct velocity. If low flow conditions are encountered (*i.e.*, velocity pressure differentials less than 0.05 inches of water) during the performance test, a more sensitive manometer must be used to obtain an accurate flow profile.

(ii) Molecular weight and excess air must be determined as specified in paragraph (d)(7) of this section.

(iii) Carbon monoxide must be determined as specified in paragraph (d)(8) of this section.

(iv) THC must be determined as specified in paragraph (d)(9) of this section.

(v) Visible emissions must be determined as specified in paragraph (d)(10) of this section.

(7) Molecular weight and excess air determination must be performed as specified in paragraphs (d)(7)(i) through (iii) of this section.

(i) An integrated bag sample must be collected during the Method 4, 40 CFR part 60, appendix A–3, moisture test following the procedure specified in (d)(7)(i)(A) through (B) of this section. Analyze the bag sample using a gas chromatograph-thermal conductivity detector (GC–TCD) analysis meeting the criteria in paragraphs (d)(7)(i)(C) through (D) of this section.

(A) Collect the integrated sample throughout the entire test, and collect representative volumes from each traverse location.

(B) Purge the sampling line with stack gas before opening the valve and beginning to fill the bag. Clearly label each bag and record sample information on a chain of custody form.

(C) The bag contents must be vigorously mixed prior to the gas chromatograph analysis.

(D) The GC–TCD calibration procedure in Method 3C, 40 CFR part 60, appendix A, must be modified by using EPA Alt–045 as follows: For the initial calibration, triplicate injections of any single concentration must agree within 5 percent of their mean to be valid. The calibration response factor for a single concentration re-check must be within 10 percent of the original calibration response factor for that concentration. If this criterion is not met, repeat the initial calibration using at least three concentration levels.

(ii) Calculate and report the molecular weight of oxygen, carbon dioxide, methane, and nitrogen in the integrated bag sample and include in the test report specified in paragraph (d)(12) of this section. Moisture must be determined using Method 4, 40 CFR part 60, appendix A-3. Traverse both ports with the Method 4, 40 CFR part 60, appendix A-3, sampling train during each test run. Ambient air must not be introduced into the Method 3C, 40 CFR part 60, appendix A-2, integrated bag sample during the port change.

(iii) Excess air must be determined using resultant data from the EPA Method 3C tests and EPA Method 3B, 40 CFR part 60, appendix A, equation 3B-1.

(8) Carbon monoxide must be determined using Method 10, 40 CFR part 60, appendix A. Run the test simultaneously with Method 25A, 40 CFR part 60, appendix A-7 using the same sampling points. An instrument range of 0-10 parts per million by volume-dry (ppmvd) is recommended.

(9) Total hydrocarbon determination must be performed as specified by in paragraphs (d)(9)(i) through (vii) of this section.

(i) Conduct THC sampling using Method 25A, 40 CFR part 60, appendix A-7, except that the option for locating the probe in the center 10 percent of the stack is not allowed. The THC probe must be traversed to 16.7 percent, 50 percent, and 83.3 percent of the stack diameter during each test run.

(ii) A valid test must consist of three Method 25A, 40 CFR part 60, appendix A-7, tests, each no less than 60 minutes in duration.

(iii) A 0-10 parts per million by volume-wet (ppmvw) (as propane) measurement range is preferred; as an alternative a 0-30 ppmvw (as carbon) measurement range may be used.

(iv) Calibration gases must be propane in air and be certified through EPA Protocol 1—"EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards," September 1997, as amended August 25, 1999, EPA-600/R-97/121 (or more recent if updated since 1999).

(v) THC measurements must be reported in terms of ppmvw as propane.

(vi) THC results must be corrected to 3 percent CO<sub>2</sub>, as measured by Method 3C, 40 CFR part 60, appendix A-2. You must use the following equation for this diluent concentration correction:

$$C_{\text{corr}} = C_{\text{meas}} \left( \frac{3}{\text{CO}_{2\text{meas}}} \right)$$

Where:

$C_{\text{meas}}$  = The measured concentration of the pollutant.

$\text{CO}_{2\text{meas}}$  = The measured concentration of the CO<sub>2</sub> diluent.

3 = The corrected reference concentration of CO<sub>2</sub> diluent.

$C_{\text{corr}}$  = The corrected concentration of the pollutant.

(vii) Subtraction of methane or ethane from the THC data is not allowed in determining results.

(10) Visible emissions must be determined using Method 22, 40 CFR part 60, appendix A. The test must be performed continuously during each test run. A digital color photograph of the exhaust point, taken from the position of the observer and annotated with date and time, must be taken once per test run and the 12 photos included in the test report specified in paragraph (d)(12) of this section.

(11) *Performance test criteria.* (i) The control device model tested must meet the criteria in paragraphs (d)(11)(i)(A) through (D) of this section. These criteria must be reported in the test report required by paragraph (d)(12) of this section.

(A) Method 22, 40 CFR part 60, appendix A, results under paragraph (d)(10) of this section with no indication of visible emissions.

(B) Average Method 25A, 40 CFR part 60, appendix A, results under paragraph (d)(9) of this section equal to or less than 10.0 ppmvw THC as propane corrected to 3.0 percent CO<sub>2</sub>.

(C) Average CO emissions determined under paragraph (d)(8) of this section equal to or less than 10 parts ppmvd, corrected to 3.0 percent CO<sub>2</sub>.

(D) Excess combustion air determined under paragraph (d)(7) of this section equal to or greater than 150 percent.

(ii) The manufacturer must determine a maximum inlet gas flow rate which must not be exceeded for each control device model to achieve the criteria in paragraph (d)(11)(iii) of this section. The maximum inlet gas flow rate must be included in the test report required by paragraph (d)(12) of this section.

(iii) A control device meeting the criteria in paragraph (d)(11)(i)(A) through (D) of this section must demonstrate a destruction efficiency of 95 percent for VOC regulated under this subpart.

(12) The owner or operator of a combustion control device model tested under this paragraph must submit the information listed in paragraphs (d)(12)(i) through (vi) in the test report required by this section in accordance with § 60.5420(b)(8).

(i) A full schematic of the control device and dimensions of the device components.

(ii) The maximum net heating value of the device.

(iii) The test fuel gas flow range (in both mass and volume). Include the maximum allowable inlet gas flow rate.

(iv) The air/stream injection/assist ranges, if used.

(v) The test conditions listed in paragraphs (d)(12)(v)(A) through (O) of this section, as applicable for the tested model.

(A) Fuel gas delivery pressure and temperature.

(B) Fuel gas moisture range.

(C) Purge gas usage range.

(D) Condensate (liquid fuel) separation range.

(E) Combustion zone temperature range. This is required for all devices that measure this parameter.

(F) Excess combustion air range.

(G) Flame arrestor(s).

(H) Burner manifold.

(I) Pilot flame indicator.

(J) Pilot flame design fuel and calculated or measured fuel usage.

(K) Tip velocity range.

(L) Momentum flux ratio.

(M) Exit temperature range.

(N) Exit flow rate.

(O) Wind velocity and direction.

(vi) The test report must include all calibration quality assurance/quality control data, calibration gas values, gas cylinder certification, strip charts, or other graphic presentations of the data annotated with test times and calibration values.

(e) *Continuous compliance for combustion control devices tested by the manufacturer in accordance with paragraph (d) of this section.* This paragraph applies to the demonstration of compliance for a combustion control device tested under the provisions in paragraph (d) of this section. Owners or operators must demonstrate that a control device achieves the performance requirements in (d)(11) of this section by installing a device tested under paragraph (d) of this section and complying with the criteria specified in paragraphs (e)(1) through (6) of this section.

(1) The inlet gas flow rate must be equal to or less than the maximum specified by the manufacturer.

(2) A pilot flame must be present at all times of operation.

(3) Devices must be operated with no visible emissions, except for periods not to exceed a total of 2 minutes during any hour. A visible emissions test using Method 22, 40 CFR part 60, appendix A, must be performed each calendar quarter. The observation period must be 1 hour and must be conducted according to EPA Method 22, 40 CFR part 60, appendix A.

(4) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(5) Following return to operation from maintenance or repair activity, each device must pass an EPA Method 22, 40 CFR part 60, appendix A, visual observation as described in paragraph (e)(3) of this section.

(6) If the owner or operator operates a combustion control device model tested under this section, an electronic copy of the performance test results required by this section shall be submitted via email to *Oil and Gas\_PT@EPA.GOV* unless the test results for that model of combustion control device are posted at the following Web site: *epa.gov/airquality/oilandgas/*.

- 10. Section 60.5415 is amended by:
- a. Revising paragraphs (b) introductory text and (b)(2);
- b. Revising paragraph (e) introductory text;
- c. Removing and reserving paragraphs (e)(1) and (2);
- d. Adding paragraph (e)(3); and
- e. Revising paragraph (h)(1) introductory text.

The revisions and addition read as follows:

**§ 60.5415 How do I demonstrate continuous compliance with the standards for my gas well affected facility, my centrifugal compressor affected facility, my stationary reciprocating compressor affected facility, my pneumatic controller affected facility, my storage vessel affected facility, and my affected facilities at onshore natural gas processing plants?**

\* \* \* \* \*

(b) For each centrifugal compressor affected facility, you must demonstrate continuous compliance according to paragraphs (b)(1) through (3) of this section.

\* \* \* \* \*

(2) For each control device used to reduce emissions, you must demonstrate continuous compliance with the performance requirements of § 60.5412(a) using the procedures specified in paragraphs (b)(2)(i) through (vii) of this section. If you use a condenser as the control device to achieve the requirements specified in § 60.5412(a)(2), you must demonstrate compliance according to paragraph (b)(2)(viii) of this section. You may switch between compliance with

paragraphs (b)(2)(i) through (vii) of this section and compliance with paragraph (b)(2)(viii) of this section only after at least 1 year of operation in compliance with the selected approach. You must provide notification of such a change in the compliance method in the next annual report, as required in § 60.5420(b), following the change.

(i) You must operate below (or above) the site specific maximum (or minimum) parameter value established according to the requirements of § 60.5417(f)(1).

(ii) You must calculate the daily average of the applicable monitored parameter in accordance with § 60.5417(e) except that the inlet gas flow rate to the control device must not be averaged.

(iii) Compliance with the operating parameter limit is achieved when the daily average of the monitoring parameter value calculated under paragraph (b)(2)(ii) of this section is either equal to or greater than the minimum monitoring value or equal to or less than the maximum monitoring value established under paragraph (b)(2)(i) of this section. When performance testing of a combustion control device is conducted by the device manufacturer as specified in § 60.5413(d), compliance with the operating parameter limit is achieved when the criteria in § 60.5413(e) are met.

(iv) You must operate the continuous monitoring system required in § 60.5417 at all times the affected source is operating, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments). A monitoring system malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring system failures that are caused in part by poor maintenance or careless operation are not malfunctions. You are required to complete monitoring system repairs in response to monitoring system malfunctions and to return the monitoring system to operation as expeditiously as practicable.

(v) You may not use data recorded during monitoring system malfunctions, repairs associated with monitoring system malfunctions, or required monitoring system quality assurance or control activities in calculations used to report emissions or operating levels. You must use all the data collected

during all other required data collection periods to assess the operation of the control device and associated control system.

(vi) Failure to collect required data is a deviation of the monitoring requirements, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required quality monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments).

(vii) If you use a combustion control device to meet the requirements of § 60.5412(a) and you demonstrate compliance using the test procedures specified in § 60.5413(b), you must comply with paragraphs (b)(2)(vii)(A) through (D) of this section.

(A) A pilot flame must be present at all times of operation.

(B) Devices must be operated with no visible emissions, except for periods not to exceed a total of 2 minutes during any hour. A visible emissions test using section 11. of Method 22, 40 CFR part 60, appendix A, must be performed each calendar quarter. The observation period must be 1 hour and must be conducted according to section 11. of EPA Method 22, 40 CFR part 60, appendix A.

(C) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(D) Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A, visual observation as described in paragraph (b)(2)(vii)(B) of this section.

(viii) If you use a condenser as the control device to achieve the percent reduction performance requirements specified in § 60.5412(a)(2), you must demonstrate compliance using the procedures in paragraphs (b)(2)(viii)(A) through (E) of this section.

(A) You must establish a site-specific condenser performance curve according to § 60.5417(f)(2).

(B) You must calculate the daily average condenser outlet temperature in accordance with § 60.5417(e).

(C) You must determine the condenser efficiency for the current operating day using the daily average condenser outlet temperature calculated under paragraph (b)(2)(viii)(B) of this

section and the condenser performance curve established under paragraph (b)(2)(viii)(A) of this section.

(D) Except as provided in paragraphs (b)(2)(viii)(D)(1) and (2) of this section, at the end of each operating day, you must calculate the 365-day rolling average TOC emission reduction, as appropriate, from the condenser efficiencies as determined in paragraph (b)(2)(viii)(C) of this section.

(1) After the compliance dates specified in § 60.5370, if you have less than 120 days of data for determining average TOC emission reduction, you must calculate the average TOC emission reduction for the first 120 days of operation after the compliance dates. You have demonstrated compliance with the overall 95.0 percent reduction requirement if the 120-day average TOC emission reduction is equal to or greater than 95.0 percent.

(2) After 120 days and no more than 364 days of operation after the compliance date specified in § 60.5370, you must calculate the average TOC emission reduction as the TOC emission reduction averaged over the number of days between the current day and the applicable compliance date. You have demonstrated compliance with the overall 95.0 percent reduction requirement, if the average TOC emission reduction is equal to or greater than 95.0 percent.

(E) If you have data for 365 days or more of operation, you have demonstrated compliance with the TOC emission reduction if the rolling 365-day average TOC emission reduction calculated in paragraph (b)(2)(viii)(D) of this section is equal to or greater than 95.0 percent.

\* \* \* \* \*

(e) You must demonstrate continuous compliance according to paragraph (e)(3) of this section for each storage vessel affected facility, for which you are using a control device or routing emissions to a process to meet the requirement of § 60.5395(d)(1).

(1) [Reserved]

(2) [Reserved]

(3) For each storage vessel affected facility, you must comply with paragraphs (e)(3)(i) and (ii) of this section.

(i) You must reduce VOC emissions as specified in § 60.5395(d).

(ii) For each control device installed to meet the requirements of § 60.5395(d), you must demonstrate continuous compliance with the performance requirements of § 60.5412(d) for each storage vessel affected facility using the procedure specified in paragraph (e)(3)(ii)(A) and

either (e)(3)(ii)(B) or (e)(3)(ii)(C) of this section.

(A) You must comply with § 60.5416(c) for each cover and closed vent system.

(B) You must comply with § 60.5417(h) for each control device.

(C) Each closed vent system that routes emissions to a process must be operated as specified in § 60.5411(c)(2).

\* \* \* \* \*

(h) \* \* \*

(1) To establish the affirmative defense in any action to enforce such a standard, you must timely meet the reporting requirements in § 60.5415(h)(2), and must prove by a preponderance of evidence that:

\* \* \* \* \*

■ 11. Section 60.5416 is amended by:

- a. Revising the introductory text;
- b. Revising paragraphs (a) introductory text, (a)(1)(ii), (a)(2)(iii), and (a)(3)(ii);
- c. Revising paragraphs (b) introductory text, (b)(9) introductory text, and (b)(11); and
- d. Adding paragraph (c).

The revisions and addition read as follows:

**§ 60.5416 What are the initial and continuous cover and closed vent system inspection and monitoring requirements for my storage vessel and centrifugal compressor affected facility?**

For each closed vent system or cover at your storage vessel or centrifugal compressor affected facility, you must comply with the applicable requirements of paragraphs (a) through (c) of this section.

(a) *Inspections for closed vent systems and covers installed on each centrifugal compressor affected facility.* Except as provided in paragraphs (b)(11) and (12) of this section, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (a)(1) and (2) of this section, inspect each cover according to the procedures and schedule specified in paragraph (a)(3) of this section, and inspect each bypass device according to the procedures of paragraph (a)(4) of this section.

(1) \* \* \*

(ii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must monitor a component or connection using the test methods and procedures in paragraph (b) of this section to demonstrate that it operates with no detectable emissions following any time the component is

repaired or replaced or the connection is unsealed. You must maintain records of the inspection results as specified in § 60.5420(c)(6).

(2) \* \* \*

(iii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must maintain records of the inspection results as specified in § 60.5420(c)(6).

(3) \* \* \*

(ii) You must initially conduct the inspections specified in paragraph (a)(3)(i) of this section following the installation of the cover. Thereafter, you must perform the inspection at least once every calendar year, except as provided in paragraphs (b)(11) and (12) of this section. You must maintain records of the inspection results as specified in § 60.5420(c)(7).

\* \* \* \* \*

(b) *No detectable emissions test methods and procedures.* If you are required to conduct an inspection of a closed vent system or cover at your centrifugal compressor affected facility as specified in paragraphs (a)(1), (2), or (3) of this section, you must meet the requirements of paragraphs (b)(1) through (13) of this section.

\* \* \* \* \*

(9) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (b)(9)(i) and (ii) of this section, except as provided in paragraph (b)(10) of this section.

\* \* \* \* \*

(11) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (b)(11)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (a)(1) through (3) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (a)(1), (2), or (3) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

\* \* \* \* \*

(c) *Cover and closed vent system inspections for storage vessel affected facilities.* If you install a control device

or route emissions to a process, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (c)(1) of this section, inspect each cover according to the procedures and schedule specified in paragraph (c)(2) of this section, and inspect each bypass device according to the procedures of paragraph (c)(3) of this section. You must also comply with the requirements of (c)(4) through (7) of this section.

(1) For each closed vent system, you must conduct an inspection at least once every calendar month as specified in paragraphs (c)(1)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in § 60.5420(c)(6).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(2) For each cover, you must conduct inspections at least once every calendar month as specified in paragraphs (c)(2)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in § 60.5420(c)(7).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (e.g., fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(3) For each bypass device, except as provided for in § 60.5411(c)(3)(ii), you must meet the requirements of paragraphs (c)(3)(i) or (ii) of this section.

(i) Set the flow indicator to sound an alarm at the inlet to the bypass device when the stream is being diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is sounded according to § 60.5420(c)(8).

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections and records of each time the key is checked out, if applicable, according to § 60.5420(c)(8).

(4) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (c)(4)(i) through (iii) of this section, except as provided in paragraph (c)(5) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 30 calendar days after the leak is detected.

(iii) Grease or another applicable substance must be applied to deteriorating or cracked gaskets to improve the seal while awaiting repair.

(5) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(6) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (c)(6)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (c)(1) or (2) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(7) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (c)(7)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection

requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

- 12. Section 60.5417 is amended by:
- a. Revising paragraph (a);
- b. Revising paragraph (b) introductory text;
- c. Revising paragraph (c) introductory text;
- d. Revising paragraphs (d)(1)(viii)(A) and (B);
- e. Revising paragraph (d)(2);
- f. Revising paragraph (f)(1)(iii);
- g. Revising paragraph (g)(6)(ii); and
- h. Adding paragraph (h).

The revisions and addition read as follows:

**§ 60.5417 What are the continuous control device monitoring requirements for my storage vessel or centrifugal compressor affected facility?**

\* \* \* \* \*

(a) For each control device used to comply with the emission reduction standard for centrifugal compressor affected facilities in § 60.5380, you must install and operate a continuous parameter monitoring system for each control device as specified in paragraphs (c) through (g) of this section, except as provided for in paragraph (b) of this section. If you install and operate a flare in accordance with § 60.5412(a)(3), you are exempt from the requirements of paragraphs (e) and (f) of this section.

(b) You are exempt from the monitoring requirements specified in paragraphs (c) through (g) of this section for the control devices listed in paragraphs (b)(1) and (2) of this section.

\* \* \* \* \*

(c) If you are required to install a continuous parameter monitoring system, you must meet the specifications and requirements in paragraphs (c)(1) through (4) of this section.

\* \* \* \* \*

- (d) \* \* \*
- (1) \* \* \*
- (viii) \* \* \*

(A) The continuous monitoring system must measure gas flow rate at the inlet to the control device. The monitoring instrument must have an accuracy of ±2 percent or better. The flow rate at the inlet to the combustion device must not exceed the maximum or minimum flow rate determined by the manufacturer.

(B) A monitoring device that continuously indicates the presence of

the pilot flame while emissions are routed to the control device.

(2) An organic monitoring device equipped with a continuous recorder that measures the concentration level of organic compounds in the exhaust vent stream from the control device. The monitor must meet the requirements of Performance Specification 8 or 9 of 40 CFR part 60, appendix B. You must install, calibrate, and maintain the monitor according to the manufacturer's specifications.

\* \* \* \* \*

(f) \* \* \*  
(1) \* \* \*

(iii) If you operate a control device where the performance test requirement was met under § 60.5413(d) to demonstrate that the control device achieves the applicable performance requirements specified in § 60.5412(a), then your control device inlet gas flow rate must not exceed the maximum or minimum inlet gas flow rate determined by the manufacturer.

\* \* \* \* \*

(g) \* \* \*  
(6) \* \* \*

(ii) Failure of the quarterly visible emissions test conducted under § 60.5413(e)(3) occurs.

(h) For each control device used to comply with the emission reduction standard in § 60.5395(d)(1) for your storage vessel affected facility, you must demonstrate continuous compliance according to paragraphs (h)(1) through (h)(3) of this section. You are exempt from the requirements of this paragraph if you install a control device model tested in accordance with § 60.5413(d)(2) through (10), which meets the criteria in § 60.5413(d)(11), the reporting requirement in § 60.5413(d)(12), and meet the continuous compliance requirement in § 60.5413(e).

(1) For each combustion device you must conduct inspections at least once every calendar month according to paragraphs (h)(1)(i) through (iv) of this section. Monthly inspections must be separated by at least 14 calendar days.

(i) Conduct visual inspections to confirm that the pilot is lit when vapors are being routed to the combustion device and that the continuous burning pilot flame is operating properly.

(ii) Conduct inspections to monitor for visible emissions from the combustion device using section 11 of EPA Method 22, 40 CFR part 60, appendix A. The observation period shall be 15 minutes. Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15 minute period.

(iii) Conduct olfactory, visual and auditory inspections of all equipment associated with the combustion device to ensure system integrity.

(iv) For any absence of pilot flame, or other indication of smoking or improper equipment operation (e.g., visual, audible, or olfactory), you must ensure the equipment is returned to proper operation as soon as practicable after the event occurs. At a minimum, you must perform the procedures specified in paragraphs (h)(1)(iv)(A) and (B) of this section.

(A) You must check the air vent for obstruction. If an obstruction is observed, you must clear the obstruction as soon as practicable.

(B) You must check for liquid reaching the combustor.

(2) For each vapor recovery device, you must conduct inspections at least once every calendar month to ensure physical integrity of the control device according to the manufacturer's instructions. Monthly inspections must be separated by at least 14 calendar days.

(3) Each control device must be operated following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions. Records of the manufacturer's written operating instructions, procedures, and maintenance schedule must be available for inspection as specified in § 60.5420(c)(13).

■ 13. Section 60.5420 is amended by:

- a. Revising paragraph (a) introductory text;
- b. Revising paragraph (a)(1);
- c. Revising paragraph (b) introductory text;
- d. Revising paragraph (b)(3)(iii);
- e. Revising paragraph (b)(4)(i);
- f. Revising paragraph (b)(5) introductory text;
- g. Revising paragraph (b)(5)(i);
- h. Revising paragraph (b)(6) introductory text;
- i. Revising paragraphs (b)(6)(i) and (ii);
- j. Adding paragraphs (b)(6)(iv) through (vii);
- k. Revising paragraph (b)(7);
- l. Adding paragraph (b)(8);
- m. Revising paragraph (c) introductory text;
- n. Revising paragraph (c)(1)(v);
- o. Revising paragraph (c)(4)(ii);
- p. Revising paragraph (c)(5);
- q. Revising paragraphs (c)(6) through (11); and
- r. Adding paragraphs (c)(12) and (13).

The revisions and additions read as follows:

**§ 60.5420 What are my notification, reporting, and recordkeeping requirements?**

(a) You must submit the notifications according to paragraphs (a)(1) and (2) of this section if you own or operate one or more of the affected facilities specified in § 60.5365 that was constructed, modified, or reconstructed during the reporting period.

(1) If you own or operate a gas well, pneumatic controller, centrifugal compressor, reciprocating compressor or storage vessel affected facility you are not required to submit the notifications required in § 60.7(a)(1), (3), and (4).

\* \* \* \* \*

(b) Reporting requirements. You must submit annual reports containing the information specified in paragraphs (b)(1) through (6) of this section to the Administrator and performance test reports as specified in paragraph (b)(7) or (8) of this section. The initial annual report is due no later than 90 days after the end of the initial compliance period as determined according to § 60.5410. Subsequent annual reports are due no later than same date each year as the initial annual report. If you own or operate more than one affected facility, you may submit one report for multiple affected facilities provided the report contains all of the information required as specified in paragraphs (b)(1) through (6) of this section. Annual reports may coincide with title V reports as long as all the required elements of the annual report are included. You may arrange with the Administrator a common schedule on which reports required by this part may be submitted as long as the schedule does not extend the reporting period.

\* \* \* \* \*

(3) \* \* \*

(iii) If required to comply with § 60.5380(a)(1), the records specified in paragraphs (c)(6) through (11) of this section.

(4) \* \* \*

(i) The cumulative number of hours of operation or the number of months since initial startup, since October 15, 2012, or since the previous reciprocating compressor rod packing replacement, whichever is later.

\* \* \* \* \*

(5) For each pneumatic controller affected facility, the information specified in paragraphs (b)(5)(i) through (iii) of this section.

(i) An identification of each pneumatic controller constructed, modified or reconstructed during the reporting period, including the

identification information specified in § 60.5390(b)(2) or (c)(2).

\* \* \* \* \*

(6) For each storage vessel affected facility, the information in paragraphs (b)(6)(i) through (vii) of this section.

(i) An identification, including the location, of each storage vessel affected facility for which construction, modification or reconstruction commenced during the reporting period. The location of the storage vessel shall be in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(ii) Documentation of the VOC emission rate determination according to § 60.5365(e).

\* \* \* \* \*

(iv) You must submit a notification identifying each Group 1 storage vessel affected facility in your initial annual report. You must include the location of the storage vessel, in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(v) A statement that you have met the requirements specified in § 60.5410(h)(2) and (3).

(vi) You must identify each storage vessel affected facility that is removed from service during the reporting period as specified in § 60.5395(f)(1).

(vii) You must identify each storage vessel affected facility for which operation resumes during the reporting period as specified in § 60.5395(f)(2)(iii).

(7)(i) Within 60 days after the date of completing each performance test (see § 60.8 of this part) as required by this subpart, except testing conducted by the manufacturer as specified in § 60.5413(d), you must submit the results of the performance tests required by this subpart to the EPA as follows. You must use the latest version of the EPA's Electronic Reporting Tool (ERT) (see <http://www.epa.gov/ttn/chief/ert/index.html>) existing at the time of the performance test to generate a submission package file, which documents the performance test. You must then submit the file generated by the ERT through the EPA's Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed by logging in to the EPA's Central Data Exchange (CDX) (<https://cdx.epa.gov/>). Only data collected using test methods supported by the ERT as listed on the ERT Web site are subject to this requirement for submitting reports electronically. Owners or operators who claim that some of the information being

submitted for performance tests is confidential business information (CBI) must submit a complete ERT file including information claimed to be CBI on a compact disk or other commonly used electronic storage media (including, but not limited to, flash drives) to EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT file with the CBI omitted must be submitted to EPA via CDX as described earlier in this paragraph. At the discretion of the delegated authority, you must also submit these reports, including the confidential business information, to the delegated authority in the format specified by the delegated authority. For any performance test conducted using test methods that are not listed on the ERT Web site, the owner or operator shall submit the results of the performance test to the Administrator at the appropriate address listed in § 60.4.

(ii) All reports, except as specified in paragraph (b)(8) of this section, required by this subpart not subject to the requirements in paragraph (a)(2)(i) of this section must be sent to the Administrator at the appropriate address listed in § 60.4 of this part. The Administrator or the delegated authority may request a report in any form suitable for the specific case (e.g., by commonly used electronic media such as Excel spreadsheet, on CD or hard copy).

(8) For enclosed combustors tested by the manufacturer in accordance with § 60.5413(d), an electronic copy of the performance test results required by § 60.5413(d) shall be submitted via email to [Oil\\_and\\_Gas\\_PT@EPA.GOV](mailto:Oil_and_Gas_PT@EPA.GOV) unless the test results for that model of combustion control device are posted at the following Web site: [epa.gov/airquality/oilandgas/](http://epa.gov/airquality/oilandgas/).

(c) *Recordkeeping requirements.* You must maintain the records identified as specified in § 60.7(f) and in paragraphs (c)(1) through (13) of this section. All records required by this subpart must be maintained either onsite or at the nearest local field office for at least 5 years.

(1) \* \* \*

(v) For each gas well affected facility required to comply with both § 60.5375(a)(1) and (3), if you are using a digital photograph in lieu of the records required in paragraphs (c)(1)(i) through (iv) of this section, you must retain the records of the digital

photograph as specified in § 60.5410(a)(4).

\* \* \* \* \*

(4) \* \* \*

(ii) Records of the demonstration that the use of pneumatic controller affected facilities with a natural gas bleed rate greater than the applicable standard are required and the reasons why.

\* \* \* \* \*

(5) Except as specified in paragraph (c)(5)(v) of this section, for each storage vessel affected facility, you must maintain the records identified in paragraphs (c)(5)(i) through (iv) of this section.

(i) If required to reduce emissions by complying with § 60.5395(d)(1), the records specified in §§ 60.5420(c)(6) through (8), § 60.5416(c)(6)(ii), and § 60.6516(c)(7)(ii) of this subpart.

(ii) Records of each VOC emissions determination for each storage vessel affected facility made under § 60.5365(e) including identification of the model or calculation methodology used to calculate the VOC emission rate.

(iii) Records of deviations in cases where the storage vessel was not operated in compliance with the requirements specified in §§ 60.5395, 60.5411, 60.5412, and 60.5413, as applicable.

(iv) For storage vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), records indicating the number of consecutive days that the vessel is located at a site in the oil and natural gas production segment, natural gas processing segment or natural gas transmission and storage segment. If a storage vessel is removed from a site and, within 30 days, is either returned to or replaced by another storage vessel at the site to serve the same or similar function, then the entire period since the original storage vessel was first located at the site, including the days when the storage vessel was removed, will be added to the count towards the number of consecutive days.

(v) You must maintain records of the identification and location of each storage vessel affected facility.

(6) Records of each closed vent system inspection required under § 60.5416(a)(1) for centrifugal compressors or § 60.5416(c)(1) for storage vessels.

(7) A record of each cover inspection required under § 60.5416(a)(3) for centrifugal compressors or § 60.5416(c)(2) for storage vessels.

(8) If you are subject to the bypass requirements of § 60.5416(a)(4) for centrifugal compressors or

§ 60.5416(c)(3) for storage vessels, a record of each inspection or a record each time the key is checked out or a record of each time the alarm is sounded.

(9) If you are subject to the closed vent system no detectable emissions requirements of § 60.5416(b) for centrifugal compressors, a record of the monitoring conducted in accordance with § 60.5416(b).

(10) For each centrifugal compressor affected facility, records of the schedule for carbon replacement (as determined by the design analysis requirements of § 60.5413(c)(2) or (3)) and records of each carbon replacement as specified in § 60.5412(c)(1).

(11) For each centrifugal compressor subject to the control device requirements of § 60.5412(a), (b), and (c), records of minimum and maximum operating parameter values, continuous parameter monitoring system data, calculated averages of continuous parameter monitoring system data, results of all compliance calculations, and results of all inspections.

(12) For each carbon adsorber installed on storage vessel affected facilities, records of the schedule for carbon replacement (as determined by the design analysis requirements of § 60.5412(d)(2)) and records of each carbon replacement as specified in § 60.5412(c)(1).

(13) For each storage vessel affected facility subject to the control device requirements of § 60.5412(c) and (d), you must maintain records of the inspections, including any corrective actions taken, the manufacturers' operating instructions, procedures and maintenance schedule as specified in § 60.5417(h). You must maintain records of EPA Method 22, 40 CFR part 60, appendix A, section 11 results, which include: company, location, company representative (name of the person

performing the observation), sky conditions, process unit (type of control device), clock start time, observation period duration (in minutes and seconds), accumulated emission time (in minutes and seconds), and clock end time. You may create your own form including the above information or use Figure 22-1 in EPA Method 22, 40 CFR part 60, appendix A. Manufacturer's operating instructions, procedures and maintenance schedule must be available for inspection.

- 14. Section 60.5430 is amended by:
  - a. Adding, in alphabetical order, definitions for the terms "Condensate," "Group 1 storage vessel," "Group 2 storage vessel," "Intermediate hydrocarbon liquid" and "Produced water;" and
  - b. Revising the definitions for "Flow line" and "Storage vessel" to read as follows:

**§ 60.5430 What definitions apply to this subpart?**

\* \* \* \* \*

*Condensate* means hydrocarbon liquid separated from natural gas that condenses due to changes in the temperature, pressure, or both, and remains liquid at standard conditions.

\* \* \* \* \*

*Flow line* means a pipeline used to transport oil and/or gas to a processing facility, a mainline pipeline, re-injection, or routed to a process or other useful purpose.

\* \* \* \* \*

*Group 1 storage vessel* means a storage vessel, as defined in this section, for which construction, modification or reconstruction has commenced after August 23, 2011, and on or before April 12, 2013.

*Group 2 storage vessel* means a storage vessel, as defined in this section, for which construction, modification or

reconstruction has commenced after April 12, 2013.

\* \* \* \* \*

*Intermediate hydrocarbon liquid* means any naturally occurring, unrefined petroleum liquid.

\* \* \* \* \*

*Produced water* means water that is extracted from the earth from an oil or natural gas production well, or that is separated from crude oil, condensate, or natural gas after extraction.

\* \* \* \* \*

*Storage vessel* means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support. For the purposes of this subpart, the following are not considered storage vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), and are intended to be located at a site for less than 180 consecutive days. If you do not keep or are not able to produce records, as required by § 60.5420(c)(5)(iv), showing that the vessel has been located at a site for less than 180 consecutive days, the vessel described herein is considered to be a storage vessel since the original vessel was first located at the site.

(2) Process vessels such as surge control vessels, bottoms receivers or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals and without emissions to the atmosphere.

\* \* \* \* \*

- 15. Tables 1 and 2 to Subpart OOOO of part 60 are revised to read as follows:

TABLE 1 TO SUBPART OOOO OF PART 60—REQUIRED MINIMUM INITIAL SO<sub>2</sub> EMISSION REDUCTION EFFICIENCY (Z<sub>i</sub>)

H <sub>2</sub> S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	2.0≤X≤5.0	5.0<X≤15.0	15.0<X≤300.0	X>300.0
Y≥50 .....	79.0	88.51X <sup>0.0101</sup> Y <sup>0.0125</sup> or 99.9, whichever is smaller.		
20≤Y<50 .....	79.0	88.51X <sup>0.0101</sup> Y <sup>0.0125</sup> or 97.9, whichever is smaller		
10≤Y<20 .....	79.0	88.51X <sup>0.0101</sup> Y <sup>0.0125</sup> or 93.5, whichever is smaller .....	93.5	93.5
Y<10 .....	79.0	79.0 .....	79.0	79.0

58448 Federal Register / Vol. 78, No. 184 / Monday, September 23, 2013 / Rules and Regulations

TABLE 2 TO SUBPART OOOO OF PART 60—REQUIRED MINIMUM SO<sub>2</sub> EMISSION REDUCTION EFFICIENCY (Z<sub>c</sub>)

H <sub>2</sub> S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	2.0≤X≤5.0	5.0<X≤15.0	15.0<X≤300.0	X>300.0
Y≥50 .....	74.0	85.35X <sup>0.0144</sup> Y <sup>0.0128</sup> or 99.9, whichever is smaller.		
20≤Y<50 .....	74.0	85.35X <sup>0.0144</sup> Y <sup>0.0128</sup> or 97.5, whichever is smaller		97.5
10≤Y<20 .....	74.0	85.35X <sup>0.0144</sup> Y <sup>0.0128</sup> or 90.8, whichever is smaller .....	90.8	90.8
Y<10 .....	74.0	74.0 .....	74.0	74.0

X = The sulfur feed rate from the sweetening unit (i.e., the H<sub>2</sub>S in the acid gas), expressed as sulfur, Mg/D(LT/D), rounded to one decimal place.

Y = The sulfur content of the acid gas from the sweetening unit, expressed as mole percent H<sub>2</sub>S (dry basis) rounded to one decimal place.

Z = The minimum required sulfur dioxide (SO<sub>2</sub>) emission reduction efficiency, expressed as percent carried to one decimal place. Z<sub>i</sub> refers to the reduction efficiency required at the initial performance test. Z<sub>c</sub> refers to the reduction efficiency required on a continuous basis after compliance with Z<sub>i</sub> has been demonstrated.

No. 73 MAP 2012  
 Appeal from the Order and Opinion of the Commonwealth Court at No. 284 MD 2012, dated July 26, 2012  
 52 A.3d 463 (Pa. Cmwlth. 2012)

In this matter, multiple issues of constitutional import arise in cross-appeals taken from the decision of the Commonwealth Court ruling upon expedited challenges to Act 13 of 2012, a statute amending the Pennsylvania Oil and Gas Act (“Act 13”).<sup>1</sup> Act 13 comprises sweeping legislation affecting Pennsylvania’s environment and, in particular, the exploitation and recovery of natural gas in a geological formation known as the Marcellus Shale. The litigation proceeded below in an accelerated fashion, in part because the legislation itself was designed to take effect quickly and imposed obligations which required the challengers to formulate their legal positions swiftly; and in part in recognition of the obvious economic importance of the legislation to the Commonwealth and its citizens.

The litigation implicates, among many other sources of law, a provision of this Commonwealth’s organic charter, specifically Section 27 of the Declaration of Rights in the Pennsylvania Constitution, which states:

The people have a right to clean air, pure water, and to the preservation of the natural, scenic, historic and esthetic values of the environment. Pennsylvania’s public natural resources are the common property of all the people, including generations yet to come. As trustee of these resources, the Commonwealth shall conserve and maintain them for the benefit of all the people.

PA. CONST. art. I, § 27 (the “Environmental Rights Amendment”). Following careful deliberation, this Court holds that several challenged provisions of Act 13 are unconstitutional, albeit the Court majority affirming the finding of unconstitutionality is not of one mind concerning the ground for decision. This Opinion, representing the views of this author, Madame Justice Todd, and Mr. Justice McCaffery, finds that

---

<sup>1</sup> Act No. 13 of Feb. 14, 2012, P.L. 87, eff. immediately (in part) and Apr. 16, 2012 (in part), 58 Pa.C.S. §§ 2301-3504.

several core provisions of Act 13 violate the Commonwealth's duties as trustee of Pennsylvania's public natural resources under the Environmental Rights Amendment; other challenges lack merit; and still further issues require additional examination in the Commonwealth Court. Mr. Justice Baer, in concurrence, concurs in the mandate, and joins the Majority Opinion in all parts except Parts III and VI(C); briefly stated, rather than grounding merits affirmance in the Environmental Rights Amendment, Justice Baer would find that the core constitutional infirmity sounds in substantive due process.<sup>2</sup> Accordingly, we affirm in part and reverse in part the Commonwealth Court's decision, and remand for further proceedings consistent with specific directives later set forth in this Opinion. See Part VI (Conclusion and Mandate), infra.

## I. Background

Before the Court are the direct appeals of the Commonwealth, by (a) the Office of the Attorney General and (former) Attorney General Linda L. Kelly, and (b) the Public Utility Commission and its Chairman Robert F. Powelson, and the Department of Environmental Protection and its (former) Secretary Michael L. Krancer (together, the "Commonwealth"). We also decide cross-appeals by several Pennsylvania municipalities; by Brian Coppola and David M. Ball, two residents and elected local officials; by the Delaware Riverkeeper Network, a non-profit environmental group, and its Executive Director Maya Van Rossum; and by Mehernosh Khan, a Pennsylvania physician (together, the "citizens").<sup>3</sup> The parties challenge different aspects of the

---

<sup>2</sup> This Opinion (representing a plurality view on Part III), offers no view on the merits of the due process argument that is the core focus of the three responsive opinions.

<sup>3</sup> In his dissent, Mr. Justice Saylor notes that appellees/cross-appellants, which we denominate citizens, are instead largely discontent municipalities. Political subdivisions (continued...)

Commonwealth Court's decision, a decision which accepted in part and rejected in part numerous constitutional challenges to Act 13 of 2012.

The Marcellus Shale Formation has been a known natural gas reservoir (containing primarily methane) for more than 75 years.<sup>4</sup> Particularly in northeastern Pennsylvania, the shale rock is organic-rich and thick. Early drilling efforts revealed that the gas occurred in "pockets" within the rock formations, and that the flow of natural gas from wells was not continuous. Nonetheless, geological surveys in the 1970s showed that the Marcellus Shale Formation had "excellent potential to fill the needs of users" if expected technological development continued and natural gas prices increased. Those developments materialized and they permitted shale drilling in the Marcellus Formation to start in 2003; production began in 2005.<sup>5</sup>

---

(...continued)

are creations of the General Assembly, but they are places populated by people, created for the benefit of the people that live and work there. See Franklin Twp. v. Commonwealth, 452 A.2d 718, 723 (Pa. 1982) (Opinion Announcing Judgment of Court). Those of the appellees/cross-appellants which are indeed municipalities consist of local governments, with local resident leaders elected by other local residents of the municipalities to represent their interests. Political subdivisions and their leaders frequently find themselves in the position of petitioning the Commonwealth government on behalf of their constituents. See, e.g., City of Philadelphia v. Commonwealth, 838 A.2d 566, 579 (Pa. 2003). And, in this case, as we have very carefully noted, the appellees/cross-appellants include individuals and groups suing **as** citizens, as well as municipal leaders suing both as citizens and as elected officials representing their constituents.

<sup>4</sup> John A. Harper, The Marcellus Shale -- An Old "New" Gas Reservoir in Pennsylvania, *Pennsylvania Geology*, Vol. 38, No. 1, at 2-3 (Spring 2008). *Pennsylvania Geology* is a quarterly published by the Bureau of Topographic and Geologic Survey of the Pennsylvania Department of Conservation and Natural Resources.

<sup>5</sup> Id. at 9. Accord U.S. Dep't of Energy, *Shale Gas: Applying Technology to Solve America's Energy Challenges*, at 1, 3 (March 2011).

In shale formations, organic matter in the soil generates gas molecules that absorb onto the matrix of the rock. Over time, tectonic and hydraulic stresses fracture the rock and natural gas (e.g., methane) migrates to fill the fractures or pockets. In the Marcellus Shale Formation, fractures in the rock and naturally-occurring gas pockets are insufficient in size and number to sustain consistent industrial production of natural gas. The industry uses two techniques that enhance recovery of natural gas from these “unconventional” gas wells: hydraulic fracturing or “fracking” (usually slick-water fracking) and horizontal drilling. Both techniques inevitably do violence to the landscape. Slick-water fracking involves pumping at high pressure into the rock formation a mixture of sand and freshwater treated with a gel friction reducer, until the rock cracks, resulting in greater gas mobility. Horizontal drilling requires the drilling of a vertical hole to 5,500 to 6,500 feet -- several hundred feet above the target natural gas pocket or reservoir -- and then directing the drill bit through an arc until the drilling proceeds sideways or horizontally. One unconventional gas well in the Marcellus Shale uses several million gallons of water.<sup>6</sup> The development of the natural gas industry in the Marcellus Shale Formation prompted enactment of Act 13.

In February 2012, the Governor of Pennsylvania, Thomas W. Corbett, signed Act 13 into law. Act 13 repealed parts of the existing Pennsylvania Oil and Gas Act and added provisions re-codified into six new chapters in Title 58 of the Pennsylvania Consolidated Statutes. The new chapters of the Oil and Gas Act are:

-- Chapter 23, which establishes a fee schedule for the unconventional gas well industry, and provides for the collection and distribution of these fees;

---

<sup>6</sup> See Harper, at 9-12. Accord U.S. Dep’t of Energy, at 5 (“more than 10 million gallons of water may be pumped into a single well during the [well-]completion process”).

- Chapter 25, which provides for appropriation and allocation of funds from the Oil and Gas Lease Fund;
- Chapter 27, which creates a natural gas energy development program to fund public or private projects for converting vehicles to utilize natural gas fuel;
- Chapter 32, which describes the well permitting process and defines statewide limitations on oil and gas development;
- Chapter 33, which prohibits any local regulation of oil and gas operations, including via environmental legislation, and requires statewide uniformity among local zoning ordinances with respect to the development of oil and gas resources;
- Chapter 35, which provides that producers, rather than landowners, are responsible for payment of the unconventional gas well fees authorized under Chapter 23.

See 58 Pa.C.S. §§ 2301-3504. Chapter 23's fee schedule became effective immediately upon Act 13 being signed into law, on February 14, 2012, while the remaining chapters were to take effect sixty days later, on April 16, 2012.

In March 2012, the citizens promptly filed a fourteen-count petition for review in the original jurisdiction of the Commonwealth Court, broadly requesting a declaration that Act 13 is unconstitutional, a permanent injunction prohibiting application of Act 13, and legal fees and costs of litigation.<sup>7</sup> The citizens claimed that Act 13 violated the

---

<sup>7</sup> The citizens also sought a preliminary injunction (Count XIII of the Citizens' Petition for Review), which the Commonwealth Court granted in part via a single judge order. Cmwlth. Ct. Order, 4/11/2012 (Quigley, S.J.). Senior Judge Keith B. Quigley enjoined those parts of Act 13 which preempted pre-existing local ordinances, pending further order of the court. Moreover, Senior Judge Quigley delayed for a period of 120 days the effective date of that section of Act 13, 58 Pa.C.S. § 3309, which required municipalities to amend and conform their zoning ordinances to Act 13. The Commonwealth appealed the order to this Court. In light of the present decision, the two separate appeals from Senior Judge Quigley's order, one filed by the Office of the (continued...)

Pennsylvania Constitution, specifically, Article I, Section 1 (relating to inherent rights of mankind); Article I, Section 10 (relating in relevant part to eminent domain); Article I, Section 27 (relating to natural resources and the public estate); Article III, Section 3 (relating to single subject bills); and Article III, Section 32 (relating in relevant part to special laws). Moreover, the citizens argued that Act 13 was unconstitutionally vague, and violated the separation of powers doctrine and the due process clause of the U.S. Constitution. See Citizens' Petition for Review, 3/29/12, at 1-108 (Counts I-XIV) (citing PA. CONST. art. I, §§ 1, 10, 27; art. II, § 1; art. III, §§ 3, 32 and U.S. CONST. amend. XIV, § 1). The Commonwealth filed preliminary objections to the citizens' petition for review and, while the objections were pending, the parties also filed cross-applications for summary relief. Upon the request of the Public Utility Commission, the Department of Environmental Protection, and their respective executive officials, the matter was expedited and placed on the Commonwealth Court's earliest list for argument *en banc*. See Cmwth. Ct. Order, 5/9/2012 (*per curiam*).<sup>8</sup>

On June 6, 2012, the parties argued the pending objections and motions for summary relief to an *en banc* panel of the Commonwealth Court. In July 2012, the Commonwealth Court sustained the Commonwealth's preliminary objections to eight counts of the citizens' petition for review; overruled objections to four counts of the

---

(...continued)

Attorney General and (former) Attorney General Linda L. Kelly, and the other by the Department of Environmental Protection, the Public Utility Commission, and their respective top officials, are hereby dismissed as moot. See 37 & 40 MAP 2012.

<sup>8</sup> The court also permitted the following *amici curiae* to participate in oral argument, all in support of the Commonwealth: the Pennsylvania Independent Oil and Gas Association, the Marcellus Shale Coalition, MarkWest Liberty Midstream and Resources, LLC, Penneco Oil Company, Inc., and Chesapeake Appalachia, LLC. See Cmwth. Ct. Order, 5/9/2012 (*per curiam*).

petition for review and granted the citizens' application for summary relief on these four counts; and denied the Commonwealth's application for summary relief in its entirety. Accordingly, the *en banc* panel held Act 13 unconstitutional in part and enjoined application of: (1) Section 3215(b)(4) of Chapter 32, and (2) Section 3304 and any "remaining provisions of Chapter 33 that enforce [Section] 3304," *i.e.*, Sections 3305 through 3309. Robinson Twp. v. Commonwealth, 52 A.3d 463, 494 (Pa. Cmwlth. 2012).

The parties filed direct cross-appeals with this Court, which were later consolidated. At the parties' request, briefing and argument were expedited. The Public Utility Commission and its Chairman Robert F. Powelson, along with the Department of Environmental Protection and its then-Secretary Michael L. Krancer filed an appeal and appellants' brief on behalf of the Commonwealth ("Agencies' Brief (as appellants)") separate from the appeal and brief of the Office of the Attorney General and then-Attorney General Linda L. Kelly herself ("OAG's Brief (as appellant)"). The citizens respond to the separate Commonwealth appeals in a joint appellees' brief ("Citizens' Brief (as appellees)"). In the cross-appeals, the citizens file one appellants' brief ("Citizens' Brief (as cross-appellants)"), to which the Commonwealth responds in two separate briefs, *i.e.*, "Agencies' Brief (as cross-appellees)," "OAG's Brief (as cross-appellee)." In the four cross-appeals before this Court, the parties raise a total of fourteen issues (twelve of which are distinct), which we have reordered for clarity.

## **II. Justiciability: Standing, Ripeness, Political Question**

We begin by addressing the several questions of justiciability raised by the parties. See Rendell v. Pa. State Ethics Comm'n, 983 A.2d 708, 717 (Pa. 2009) (standing, ripeness, and political question "give body to the general notions of case or controversy and justiciability"). Issues of justiciability are a threshold matter generally

resolved before addressing the merits of the parties' dispute. Council 13, Am. Fed. of State, County & Mun. Employees, AFL-CIO v. Commonwealth, 986 A.2d 63, 74 n.10 (Pa. 2009) ("Council 13"). The Commonwealth Court sustained the Commonwealth's preliminary objections to the standing to sue of the Delaware Riverkeeper Network and its Executive Director Maya van Rossum, and of Mehernosh Khan, M.D.; overruled objections to the standing to sue and the ripeness of claims of individual citizen-petitioners and of the several municipalities; and overruled objections regarding the application of the political question doctrine to bar this action in its entirety. In their respective cross-appeals, the parties challenge the decisions of the lower court on individual issues that were adverse to their positions.

Parties may raise questions regarding standing, ripeness, and the political question doctrine by filing preliminary objections to a petition for review filed in the original jurisdiction of the Commonwealth Court, similar to those permitted in a civil action. See Pa.R.A.P. 1516(b) and note (Rule 1516(b) is patterned after Rule of Civil Procedure 1017(a) (Pleadings Allowed)). Upon review of a decision sustaining or overruling preliminary objections, "we accept as true all well-pleaded material facts set forth in the [petition for review] and all inferences fairly deducible from those facts." Thierfelder v. Wolfert, 52 A.3d 1251, 1253 (Pa. 2012). We will affirm an order sustaining preliminary objections only if it is clear that the party filing the petition for review is not entitled to relief as a matter of law. See Stilp v. Commonwealth, 940 A.2d 1227, 1232 n.9 (Pa. 2007).

In contrast to the federal approach, notions of case or controversy and justiciability in Pennsylvania have no constitutional predicate, do not involve a court's jurisdiction, and are regarded instead as prudential concerns implicating courts' self-imposed limitations. See Fumo v. City of Philadelphia, 972 A.2d 487, 500 n.5 (Pa.

2009); Rendell, 983 A.2d at 717 & n.9. Justiciability questions are issues of law, over which our standard of review is *de novo* and the scope of review is plenary. Council 13, 986 A.2d at 74 n.10.

### A. Standing and Ripeness

Generally, the doctrine of standing is an inquiry into whether the petitioner filing suit has demonstrated aggrievement, by establishing “a substantial, direct and immediate interest in the outcome of the litigation.” Fumo, 972 A.2d at 496. There is considerable overlap between the doctrines of standing and ripeness, especially where the contentions regarding lack of justiciability are focused on arguments that the interest asserted by the petitioner is speculative, not concrete, or would require the court to offer an advisory opinion. Rendell, 983 A.2d at 718. In this sense, a challenge that a petitioner’s interest in the outcome of the litigation is hypothetical may be pled either as determinative of standing or restyled as a ripeness concern although the allegations are essentially the same. Id. Standing and ripeness are distinct concepts insofar as ripeness also reflects the separate concern that relevant facts are not sufficiently developed to permit judicial resolution of the dispute. Pure questions of law, including those in the present cross-appeals, do not suffer generally from development defects and are particularly well suited for pre-enforcement review. Id. at 718 n.13.

#### 1. *Brian Coppola and David M. Ball*

The Commonwealth Court held that Brian Coppola and David M. Ball had standing as elected officials and “as individual landowners and residents” of their respective townships. According to the court, Coppola and Ball live in a residential district in which, contrary to the prior legal regime, Act 13 now permits oil and gas

operations. The value of Coppola's and Ball's existing homes, the panel stated, is affected negatively because the two can neither enjoy their properties as expected, nor guarantee to potential buyers the enjoyment of these properties without intrusion of burdensome industrial uses in their residential districts. Moreover, in their capacity as elected officials of their municipalities, the court concluded, Coppola and Ball both were aggrieved because, under provisions of Act 13, they would be "required to vote for zoning amendments they believe are unconstitutional." Robinson Twp., 52 A.3d at 475-76.

According to the Commonwealth, local officials do not have any cognizable legal interest in their powers to make land use determinations and, therefore, Coppola and Ball suffered no harm from the General Assembly's decision to alter or remove those powers. OAG's Brief (as appellant) at 22-26. While recognizing that distinct interests are implicated, the Commonwealth does not challenge the standing of Coppola and Ball as landowners and residents of townships whose zoning districts are affected by Act 13. See id. at 23 n.8. The citizens respond by subscribing to the Commonwealth Court's reasoning with respect to the standing of individual citizens to sue. Citizens' Brief (as appellees) at 48-62.

As noted, on appeal to this Court, the Commonwealth does not offer any arguments regarding the interests in the outcome of this litigation of Coppola and Ball in their individual capacities as landowners and residents of townships located in areas atop the Marcellus Shale Formation. We have consistently held that we will not raise standing claims *sua sponte*. Rendell, 983 A.2d at 717-18. Moreover, because Coppola and Ball both have standing to sue as landowners and residents and they assert the

same claims in both individual and official capacities, we need not address whether they have a separate interest as local elected officials sufficient to confer standing.<sup>9</sup>

*2. Robinson Township, Township of Nockamixon, Township of South Fayette, Peters Township, Township of Cecil, Mount Pleasant Township, Borough of Yardley*

The Commonwealth Court also held that Robinson Township, Township of Nockamixon, Township of South Fayette, Peters Township, Township of Cecil, Mount Pleasant Township, and the Borough of Yardley had standing to sue because “Act 13 imposes substantial, direct and immediate obligations on them that affect their government[al] functions.” In the alternative, the court noted that the municipalities’ claims were “inextricably bound” with rights of property owners, who the Commonwealth conceded had standing to challenge the constitutionality of Act 13. Robinson Twp., 52 A.3d at 475. As a related matter, the Commonwealth Court also addressed the Commonwealth’s ripeness challenge to the municipalities’ claims. The court held that the constitutionality of Act 13 was an issue ripe for review as a pre-enforcement challenge because, once Act 13 went into effect, the townships would “be forced to submit to the regulations [that required modification of their zoning codes] and incur cost[s] and burden[s] that the regulations would impose or be forced to defend themselves against sanctions for non-compliance with the law.” The panel thus concluded that the declaratory judgment action was properly filed. Id. at 479 n.17.

On appeal, the Commonwealth characterizes the harm claimed by the municipalities as illusory because local governments (political subdivisions) have no

---

<sup>9</sup> Alternatively, we conclude that, to the extent that the Commonwealth Court addressed the interests in the outcome of this litigation of Ball and Coppola, the court did so persuasively. Accord In re Milton Hershey Sch., 911 A.2d 1258, 1262 (Pa. 2006) (person with special interest in charitable trust may bring action for enforcement of trust).

inherent legal interest in the power to make land use determinations within their boundaries, and because municipalities do not enjoy constitutional protections similar to those of citizens. OAG's Brief (as appellant) at 24. The Commonwealth also asserts that the municipalities' claims are unripe because they are based on what the Commonwealth says is "a wholly speculative parade of horrors" that the municipalities claim "might occur in the future following implementation of Act 13." According to the Commonwealth, the record does not establish that appellee municipalities will be required to modify their zoning ordinances or that they will fail to do so and thereby incur penalties.<sup>10</sup> Agencies' Brief (as appellants) at 40-43.

The citizens respond that the municipalities have standing because Act 13 requires them to act in conflict with their functions, duties, and responsibilities under the Pennsylvania Constitution and other laws. For example, the citizens argue, existing ordinances that address land use in their municipalities were adopted pursuant to powers delegated to them by the General Assembly over a span of years, and provide a balance between citizens' safety, their rights, and orderly community development. The citizens claim that Act 13 displaces existing zoning ordinances and land use interests, prohibits municipalities from discharging their duties to adopt effective legislation to protect the health, safety, and welfare of citizens and the public natural resources from industrial activity, and requires them, instead, to create new exceptions for the oil and gas industry that are inconsistent with long-established municipal land use plans. Moreover, the citizens argue that Act 13 places local government in the untenable

---

<sup>10</sup> Finally, the Commonwealth suggests that the panel's exercise of equitable jurisdiction was in error. This assertion is premised solely upon standing defects. Because, as we have already noted, standing and ripeness are prudential rather than jurisdictional concerns for this Court, the Commonwealth's jurisdictional sub-claim is meritless. See Rendell, 983 A.2d at 717 & n.9.

position of having to choose between either violating certain constitutional obligations or violating Act 13's newly-imposed requirements, which carries a risk of severe monetary penalties that most municipalities cannot afford. Municipalities, according to the citizens, are aggrieved because the effect upon their duty and interest in ensuring a healthy environment and a quality of life for their citizenry is direct, substantial, and immediate. Citizens' Brief (as appellees) at 51-60 (citing, *inter alia*, Franklin Twp. v. Commonwealth, 452 A.2d 718, 720 (Pa. 1982) (Opinion Announcing Judgment of Court)). We do not view this question to be close; we agree with the citizens and affirm the Commonwealth Court's decision with respect to the standing of the municipalities and the ripeness of their claims.

This Court has held that a political subdivision has a substantial, direct, and immediate interest in protecting the environment and the quality of life within its borders, which interest confers upon the political subdivision standing in a legal action to enforce environmental standards. Susquehanna County v. Commonwealth, 458 A.2d 929, 931 (Pa. 1983) (county has standing to appeal executive agency order related to operation of sanitary landfill by corporate permit holder); Franklin Twp., 452 A.2d at 720 (municipality and county have standing to appeal agency's decision to issue permit to operate solid waste facility). Political subdivisions, the Court has recognized, are legal persons, which have the right and indeed the duty to seek judicial relief, and, more importantly, they are "place[s] populated by people." Id. The protection of environmental and esthetic interests is an essential aspect of Pennsylvanians' quality of life and a key part of local government's role. Local government, therefore, has a substantial and direct interest in the outcome of litigation premised upon changes, or serious and imminent risk of changes, which would alter the physical nature of the political subdivision and of various components of the environment. Moreover, the

same interest in the environment and in the citizenry's quality of life cannot be characterized as remote: "[w]e need not wait until an ecological emergency arises in order to find that the interest of the municipality and county faced with such disaster is immediate." Id. at 720-22. See Susquehanna County, 458 A.2d at 931 ("The aesthetic, environmental and quality of life considerations discussed in Franklin Township are equally applicable here.");<sup>11</sup> cf. Pennsylvania Game Comm'n v. Dep't of Env'tl Res., 555 A.2d 812, 815 (Pa. 1989) (unless otherwise explicitly provided, agency invested with duties or responsibilities regarding certain concerns has implicit power to be litigant in matters touching upon those concerns).

The Franklin Township and Susquehanna County decisions are dispositive of the Commonwealth's appeal with respect to the municipalities' standing and to the ripeness of their claims. Contrary to the Commonwealth's characterization, the municipalities' claims are not rooted simply in an asserted narrow legal interest in retaining powers as against the Commonwealth government to make land use determinations relating to oil and gas production. Rather, the municipalities, much like Messrs. Coppola and Ball, maintain claims premised upon threatened fundamental changes to esthetic and environmental values, which implicate the political subdivisions' responsibilities to protect the quality of life of its citizens. The aggrievement alleged by the political subdivisions is not limited to vindication of individual citizens' rights but extends to allegations that the challenged statute interferes with the subdivisions' constitutional duties respecting the environment and, therefore, its interests and functions as a

---

<sup>11</sup> The Franklin Township decision represented a plurality view of three Justices on the Court; three other Justices concurred in the result, and one Justice dissented. One year later, however, the Susquehanna County Court, in a clear majority decision, adopted the reasoning of the Franklin Township plurality.

governing entity. City of Philadelphia v. Commonwealth, 838 A.2d 566, 579 (Pa. 2003) (citing Franklin Twp., *supra*) (city has standing to bring action premised on assertions that challenged statute affects its interests and functions as governing entity). We find that the municipalities' interests are sufficiently substantial, direct, and immediate to confer standing. Furthermore, we also dismiss the Commonwealth's ripeness claim, which is merely a restyling of the remoteness concern already addressed in our standing discussion. See Rendell, 983 A.2d at 718 n.13. The Commonwealth Court's decision is affirmed in this respect.

### 3. *Maya van Rossum and the Delaware Riverkeeper Network*

With respect to Maya van Rossum and the Delaware Riverkeeper Network, the Commonwealth Court sustained the Commonwealth's preliminary objections, and held that these parties failed to plead any direct and immediate interest or harm. According to the court, van Rossum's concern over the negative effect of Act 13 on her personal use and enjoyment of the Delaware River Basin and her work as Executive Director of the Delaware Riverkeeper Network did not amount to a sufficient interest in the outcome of the litigation to confer standing. The Commonwealth Court further explained that, although an association like the Delaware Riverkeeper Network may have standing as a representative of its members who are suffering immediate or threatened injury, the group had "not shown that at least one member has suffered or is threatened with suffering" the requisite type of injury. Robinson Twp., 52 A.3d at 476.

The Delaware Riverkeeper Network challenges the lower court's decision, asserting that its members are residents of areas whose existing protective zoning ordinances "will be eviscerated by Act 13," and that their interests in the values of their homes and businesses (*e.g.*, an organic farm in the Delaware River watershed) are

similar to those of Messrs. Coppola and Ball. The Delaware Riverkeeper Network also emphasizes the deleterious effects of industrial activities close to its members' homes, including effects on their health and their ability to enjoy natural beauty, environmental resources, and recreational activities in the Delaware River corridor, such as fishing, boating, swimming, and bird-watching. The Delaware Riverkeeper Network further explains that drilling guided by Act 13 will affect well water supply as well as the sensitive ecosystems of the Delaware River, from which the group's members derive sustenance and other benefits. Citizens' Brief (as cross-appellants) at 61 (citing Friends of the Earth, Inc. v. Laidlaw Env'tl Servs. (TOC), Inc., 528 U.S. 167, 183 (2000) (“[E]nvironmental plaintiffs adequately allege injury in fact when they aver that they use the affected area and are persons for whom the aesthetic and recreational values of the area will be lessened by the challenged activity.”)). According to these citizens, esthetic and environmental well-being, “like economic well-being, are important ingredients of the quality of life in our society, and the fact that particular environmental interests are shared by the many rather than the few does not make them less deserving of legal protection through the judicial process.” Id. (emphasis omitted) (quoting Unified Sportsmen of Pa. v. Pa. Game Comm'n, 903 A.2d 117, 122-24 (Pa. Cmwlth. 2006) (citing Sierra Club v. C.B. Morton, 405 U.S. 727, 734 (1972))). Van Rossum, as Executive Director of the Delaware Riverkeeper Network, alleges similar concerns in the outcome of this litigation.

The Commonwealth responds that the Commonwealth Court's decision should be affirmed because any harm alleged by these particular parties is speculative and remote. The Commonwealth states that there are other parties better positioned to raise claims regarding Act 13's validity and, therefore, this Court need not recognize that these parties have standing. OAG's Brief (as cross-appellee) at 21-22; Agencies'

Brief (as cross-appellees) at 21-22. Moreover, the Commonwealth notes that this Court “need not address the standing of the [Delaware Riverkeeper Network] and van Rossum” because these two appellants “did not seek any unique relief in their own name” and addressing their standing would not affect the disposition of the present appeals. Agencies’ Brief (as cross-appellees) at 29.<sup>12</sup>

We agree with the citizens and reverse the decision of the Commonwealth Court with respect to the standing of the Delaware Riverkeeper Network and van Rossum, and with respect to the ripeness of their claims. The Commonwealth Court’s finding that the Delaware Riverkeeper Network failed to show that any of its members were threatened with an injury sufficient to confer upon the group associational standing is not supported by the record. In response to preliminary objections, the citizens relied on of-record affidavits to show that individual members of the Delaware Riverkeeper Network are Pennsylvania residents and/or owners of property and business interests in municipalities and zoning districts that either already host or are likely to host active natural gas operations related to the Marcellus Shale Formation. See Citizens’ Consolidated Brief in Opposition to [the Commonwealth’s] Preliminary Objections, 5/14/2012, at 22-24. Like Messrs. Coppola and Ball (as to whom the Commonwealth conceded the standing issue), these members asserted that they are likely to suffer

---

<sup>12</sup> Although the claims of the Delaware Riverkeeper Network and van Rossum may not be significantly different from those of the citizens found by the Commonwealth Court to have standing, a decision to allow or prohibit the Delaware Riverkeeper Network and van Rossum from participating in this matter obviously may have consequences. For example, party status permits these citizens to offer evidence upon remand, or to apply to the court for an order enforcing our decision. In addition, there is nothing to prevent the parties from seeking to develop or supplement their claims, a not-unlikely-prospect given the expedited nature of this legislation and ensuing litigation. The fact that others have standing does not eliminate the standing of these citizens.

considerable harm with respect to the values of their existing homes and the enjoyment of their properties given the intrusion of industrial uses and the change in the character of their zoning districts effected by Act 13. See, e.g., id. at Exh. 15, 16 (affidavits of G. Swartz and T. Kowalchuk). These individual members have a substantial and direct interest in the outcome of the litigation premised upon the serious risk of alteration in the physical nature of their respective political subdivisions and the components of their surrounding environment. This interest is not remote. See Franklin Twp., 452 A.2d at 720-22; Susquehanna County, 458 A.2d at 931; accord Friends of the Earth, Inc., supra, 528 U.S. at 183.

Under Pennsylvania law, an association has standing as representative of its members to bring a cause of action even in the absence of injury to itself, if the association alleges that at least one of its members is suffering immediate or threatened injury as a result of the action challenged. Pennsylvania Med. Soc'y v. Dep't of Pub. Welfare, 39 A.3d 267, 278 (Pa. 2012); accord South Whitehall Twp. Police Serv. v. South Whitehall Twp., 555 A.2d 793, (Pa. 1989) (collective bargaining agent has standing to sue if members are aggrieved, even if action is not related solely to collective bargaining). Several members of the Delaware Riverkeeper Network have alleged sufficient injury to show that they are aggrieved by the enactment of Act 13. As these members' associational representative, the Delaware Riverkeeper Network has standing. Van Rossum, as the Executive Director of the Delaware Riverkeeper Network, is in a similar legal position and, as a result, has standing in her official capacity to represent the membership's interests in this matter. Cf. Pennsylvania Med. Soc'y, supra. Accordingly, the decision of the Commonwealth Court with respect to the standing of the Delaware Riverkeeper Network and Ms. van Rossum is reversed.

#### 4. *Mehernosh Khan, M.D.*

Finally, the Commonwealth Court held that Dr. Khan lacked standing to sue the Commonwealth in this matter because the interest he asserted was remote. The citizens appeal the Commonwealth Court's decision, explaining that Dr. Khan is a physician who treats patients in an area where drilling operations are taking place, and whose interest in the outcome of this litigation is sufficient to confer standing. The doctor claims that Act 13's restrictions on obtaining and sharing information with other physicians regarding the chemicals used in drilling operations impede his ability to diagnose and treat his patients properly. See 58 Pa.C.S. § 3222.1(b)(10)-(11).<sup>13</sup> In

---

<sup>13</sup> Section 3222.1(b) provides, in relevant part:

(10) A vendor, service company or operator shall identify the specific identity and amount of any chemicals claimed to be a trade secret or confidential proprietary information to any health professional who requests the information in writing if the health professional executes a confidentiality agreement and provides a written statement of need for the information indicating all of the following:

- (i) The information is needed for the purpose of diagnosis or treatment of an individual.
- (ii) The individual being diagnosed or treated may have been exposed to a hazardous chemical.
- (iii) Knowledge of information will assist in the diagnosis or treatment of an individual.

(11) If a health professional determines that a medical emergency exists and the specific identity and amount of any chemicals claimed to be a trade secret or confidential proprietary information are necessary for emergency treatment, the vendor, service provider or operator shall immediately disclose the information to the health professional upon a verbal acknowledgment by the health

(continued...)

denying Dr. Khan standing, the Commonwealth Court reasoned that Dr. Khan would not have standing until he actually requested confidential information under Section 3222.1(b) of Act 13, and that information either was not supplied at all or was supplied with restrictions interfering with his ability to provide proper medical care to his patients. The court also noted that, if upon receiving information on chemicals protected as trade secrets by Section 3222.1(b), Dr. Khan believes that the chemicals pose a public health hazard, he would have standing then to challenge the confidentiality provisions. See Robinson Twp., 52 A.3d at 477-78. Although the Commonwealth Court articulated its holding to sustain the Commonwealth's objections in terms of lack of standing, the court's reasoning also addresses the Commonwealth's ripeness argument.

On appeal, Dr. Khan argues that the challenged provision prevents physicians from sharing diagnostic test results (e.g., blood test results), and a patient's history of exposure, including the dose and duration of exposure -- all of which are essential tools of treating patients and practicing medicine competently. Dr. Khan continues that the restrictions on sharing fracking chemicals' composition places medical professionals in a position to choose between abiding by the mandatory provisions of Act 13 and adhering to their ethical and legal duties to report findings in medical records and to make these records available to patients and other medical professionals. Dr. Khan's

---

(...continued)

professional that the information may not be used for purposes other than the health needs asserted and that the health professional shall maintain the information as confidential. The vendor, service provider or operator may request, and the health professional shall provide upon request, a written statement of need and a confidentiality agreement from the health professional as soon as circumstances permit, in conformance with regulations promulgated under this chapter.

injury is therefore actual and immediate, the citizens say, given that the health of patients is jeopardized by a potentially lengthy wait for resolution of a challenge after Section 3222.1(b) goes into effect. Citizens' Brief (as cross-appellants) at 52-56.

The Commonwealth generally subscribes to the Commonwealth Court's reasoning. Additionally, the Commonwealth claims that Dr. Khan's interest is illusory because the restriction Act 13 places upon medical professionals allows the use of confidential information for the health needs of an individual patient, and Dr. Khan does not explain why, as a treating physician, he needs further disclosure for non-medical purposes. OAG's Brief (as cross-appellee) at 22-24. Furthermore, the Commonwealth argues that Dr. Khan's harm is speculative because it is based on the rights of his patients and on "serial 'mights'" which are unfounded. According to the Commonwealth, Section 3222.1(b) is not "a muzzle" on the dissemination of information, but it actually requires disclosures of otherwise protected information. Agencies' Brief (as cross-appellees) at 22-27.

We agree with the citizens that Dr. Khan's interest in the outcome of litigation regarding the constitutionality of Section 3222.1(b) is neither remote nor speculative. Dr. Khan describes the untenable and objectionable position in which Act 13 places him: choosing between violating a Section 3222.1(b) confidentiality agreement and violating his legal and ethical obligations to treat a patient by accepted standards, or not taking a case and refusing a patient medical care. The Commonwealth's attempt to re-define Dr. Khan's interests and minimize the actual harm asserted is unpersuasive. Our existing jurisprudence permits pre-enforcement review of statutory provisions in cases in which petitioners must choose between equally unappealing options and where the third option, here refusing to provide medical services to a patient, is equally undesirable. See, e.g., Cozen O'Connor v. City of Phila. Bd. of Ethics, 13 A.3d 464 (Pa.

2011) (law firm has standing to test validity of Ethics Act provision in advance of undertaking potentially prohibited action where alternative is testing law by defying it and potentially damaging firm's ethical standing and reputation; third option of maintaining client debt on books for decades equally unappealing); Shaulis v. Pa. State Ethics Comm'n, 833 A.2d 123 (Pa. 2003) (attorney has standing to challenge statutory limitation on her practice of law in certain venues without taking prohibited action that would expose her to ethical investigation she was attempting to forestall; third option of foregoing practice in area of expertise equally unappealing); see also Arsenal Coal Co. v. Commonwealth, 477 A.2d 1333 (Pa. 1984) (pre-enforcement review of regulations is appropriate where lengthy process of addressing regulations' validity in enforcement action would result in ongoing uncertainty in industry and potential operational impediments and penalties).

In light of Dr. Khan's unpalatable professional choices in the wake of Act 13, the interest he asserts is substantial and direct. Moreover, Dr. Khan's interest is not remote. A decision in this matter may well affect whether Dr. Khan, and other medical professionals similarly situated, will accept patients and may affect subsequent medical decisions in treating patients -- events which may occur well before the doctor is in a position to request information regarding the chemical composition of fracking fluid from a particular Marcellus Shale industrial operation. Additional factual development that would result from awaiting an actual request for information on behalf of a patient is not likely to shed more light upon the constitutional question of law presented by what is essentially a facial challenge to Section 3222.1(b). Accordingly, we reverse the decision of the Commonwealth Court regarding Dr. Khan's standing and we remand the

matter to the Commonwealth Court for a merits decision of Dr. Khan's substantive claims.<sup>14</sup>

### **B. Political question**

Also in the justiciability rubric, the Commonwealth argues that the Commonwealth Court "went beyond merely assessing the constitutionality of Act 13" and violated the separation of powers doctrine. According to the Commonwealth, the Commonwealth Court interfered with the exercise of the General Assembly's constitutional police powers by "revisiting" and "second-guessing" legislative choices. The Commonwealth accuses the court below of substituting its own "policy judgments and preferences" to dictate how the General Assembly should regulate local government. Citing Article I, Section 27 and Article IX, Section 1 of the Pennsylvania Constitution, the Commonwealth asserts that the General Assembly has the power and exclusive authority to retract local governments' powers to regulate oil and gas operations. See PA. CONST. art. I, § 27; art. XI, § 1 (General Assembly to provide by general law for local government). The lower court, according to the Commonwealth,

---

<sup>14</sup> The Commonwealth also offers arguments regarding the merits of Dr. Khan's distinct claims premised upon Article III, Section 3 (bills to contain single subject) and Article III, Section 32 (special laws), including an assertion that Section 3222.1(b) contains limitations on dissemination of confidential information that are no different than those found in federal government regulations. See Agencies' Brief (as cross-appellees) at 27-29; see also Citizens' Petition for Review, 3/29/12, at 97-106 (Counts XI and XII). In their reply brief, the citizens respond that the federal scheme regarding protection of trade secrets is substantially different from Act 13, and address at some length the merits of Dr. Khan's claims. The Commonwealth Court did not reach the merits, however, having dismissed Dr. Khan from the action on standing grounds. In light of the procedural posture of the matter and the distinct and narrow nature of his challenge, we offer no opinion on the merits in advance of remand. See Cozen O'Connor, 13 A.3d at 471.

should have respected Act 13 as an exercise of legislative branch power and should have refrained from acting in this matter at all.<sup>15</sup>

In support of this global position of non-reviewability, the OAG's Brief asserts that the sovereign is the constitutional trustee of Pennsylvania's public natural resources and the General Assembly is vested with exclusive authority to regulate the oil and gas industry. OAG's Brief (as appellant) at 27 (citing PA. CONST. art. I, § 27). The Commonwealth portrays the citizens here as merely discontent with the General Assembly's policy choices, and their challenge as a veiled attempt to change the result of a political clash within the General Assembly, in which the interests of these particular citizens were defeated. According to the Commonwealth, even proceeding to a merits

---

<sup>15</sup> To support its allegation that the Commonwealth Court engaged in judicial policy-making, the Agencies' Brief cites comments made during oral argument by the Honorable Dan Pellegrini, President Judge of the Commonwealth Court, and the author of the opinion below. In those exchanges, President Judge Pellegrini recounted the legislative efforts of sister states to promote oil and gas development and the legal predicate for the existence of municipalities in Pennsylvania. Agencies' Brief (as appellants) at 34-40. The record does not support the *ad hominem* attack on President Judge Pellegrini by the agencies. Courts explain their decisions with reasoned expressions, and the Commonwealth Court did so here. On appeal, our review is focused on the decision and the legal grounds upon which the decision is rendered, in light of the claims raised by the parties and of the governing law. We review the decision of the lower court for error and not for alleged motivations of individual panel members, just as we view challenged legislation itself according to its terms and not according to any alleged motivations on the part of individual members of the General Assembly. See City of Philadelphia v. Commonwealth, 838 A.2d 566, 580 (Pa. 2003) (with respect to enrolled bill, "subjective, individualized motivations or impressions of specific legislators [are not] an appropriate basis upon which to rest a determination as to [the bill's] validity"). Even if the Commonwealth Court's reasoned expression provided unpersuasive support for the court's positions, the agencies' opinion that President Judge Pellegrini's questioning from the bench revealed that the *en banc* Court majority was making an inappropriate policy-driven decision on a political question would lack merit. We also note that the Commonwealth offered no objection to President Judge Pellegrini's questioning, along the lines of its argument here, at the time the exchange occurred.

decision here interferes with the General Assembly's "discretionary authority," as the Constitution does not articulate any manageable standards by which the judicial branch can reasonably assess the merits of the General Assembly's policy choices regarding the Commonwealth's natural resources. Id. at 27-30.

The citizens respond that the Commonwealth Court simply decided a constitutional challenge to Act 13 properly subject to judicial review, and pointedly note that the General Assembly does not police the constitutionality of its own acts. According to the citizens, the political question doctrine bars courts from deciding "a very limited subset of cases," *i.e.*, those cases in which courts are considering matters that are committed in the constitutional text to a co-equal branch of government and, in addition, which contain no claims that the co-equal branch of government acted outside the scope of its constitutional authority. The citizens characterize their challenges as soundly based upon the question of whether the General Assembly enacted legislation in accordance with constitutional mandates that exist precisely to restrict its powers. The citizens dismiss as an unsubstantiated label the Commonwealth's claims that their challenge is to unreviewable policy determinations by the General Assembly. According to the citizens, the limitations on the General Assembly's powers derive from the Constitution, not from some general body of law, and alleged good intentions of the legislative branch "do not excuse non-compliance with the Constitution." In this regard, the citizens emphasize that courts, and the Pennsylvania Supreme Court in particular, have the power to determine the constitutionality of statutes, and the General Assembly cannot "instruct" courts as to what measures are constitutional, or are beyond the reach of a constitutional challenge. Citizens' Brief (as appellees) at 63-66.

The Commonwealth Court held that the citizens presented a justiciable question. On this point, the *en banc* panel was unanimous. The court noted that it was simply

required to determine whether Act 13 violates the Pennsylvania Constitution, a task implicating a core judicial function. The court rejected the Commonwealth's arguments, reasoning that adopting the Commonwealth's approach to the political question doctrine would mean that no action of the General Assembly, defended as an exercise of its police power, would ever be subject to a constitutional challenge. Robinson Twp., 52 A.3d at 479.

We agree with the core position of the citizens and the Commonwealth Court. The political question doctrine derives from the principle of separation of powers which, although not expressed in our Constitution, is implied by the specific constitutional grants of power to, and limitations upon, each co-equal branch of the Commonwealth's government. Our Constitution vests legislative power in the General Assembly, which consists of the Senate and the House of Representatives. See PA. CONST. art. II, § 1. The General Assembly is charged with the passage of laws generally and, additionally, with passage of specifically authorized legislation. See PA. CONST. art. III, §§ 1-27. Passage of laws is subject to the restrictions of Article III, Sections 28 through 32, and is further limited fundamentally by those rights and powers reserved to the people in Article I. See PA. CONST. art. III, §§ 28-32; art. I, § 25. The judicial power of the Commonwealth is not vested in the General Assembly, but in a unified judicial system, which includes the Commonwealth Court and, ultimately, this Court, which presides over our branch of government. See PA. CONST. art. V, § 1.

In application, the Court has recognized that “[i]t is the province of the Judiciary to determine whether the Constitution or laws of the Commonwealth require or prohibit the performance of certain acts. That our role may not extend to the ultimate carrying out of those acts does not reflect upon our capacity to determine the requirements of the law.” Council 13, 986 A.2d at 75 (quoting Thornburgh v. Lewis, 470 A.2d 952, 955

(Pa. 1983)). This is not a radical proposition in American law. See, e.g., Marbury v. Madison, 1 Cranch 137, 166 (1803) (“where a specific duty is assigned by law [to another branch of government], and individual rights depend upon the performance of that duty, it seems equally clear that the individual who considers himself injured, has a right to resort to the laws of his country for a remedy”).<sup>16</sup> Indeed, “[o]rdinarily, the

<sup>16</sup> In the Federalist Paper #48, James Madison observed on the separation of powers in government:

[I]n a representative republic, where the executive magistracy is carefully limited; both in the extent and the duration of its power; and where the legislative power is exercised by an assembly, which is inspired, by a supposed influence over the people, with an intrepid confidence in its own strength; which is sufficiently numerous to feel all the passions which actuate a multitude, yet not so numerous as to be incapable of pursuing the objects of its passions, by means which reason prescribes; it is against the enterprising ambition of this [legislative] department that the people ought to indulge all their jealousy and exhaust all their precautions.

Federalist Paper #48. Madison continued, quoting Thomas Jefferson’s seminal work, Notes on the State of Virginia, concerning the prospect of the most extreme of abuses:

All the powers of government, legislative, executive, and judiciary, result to the legislative body. The concentrating these in the same hands, is precisely the definition of despotic government. It will be no alleviation, that these powers will be exercised by a plurality of hands, and not by a single one. One hundred and seventy-three despots would surely be as oppressive as one. Let those who doubt it, turn their eyes on the republic of Venice. As little will it avail us, that they are chosen by ourselves. An elective despotism was not the government we fought for; but one which should not only be founded on free principles, but in which the powers of government should be so divided and balanced among several bodies of magistracy, as that no one could transcend their legal limits, without being effectually checked and restrained by the others.

(continued...)

exercise of the judiciary's power to review the constitutionality of legislative action does not offend the principle of separation of powers," and abstention under the political-question doctrine is implicated in limited settings. See Hosp. & Healthsystem Ass'n of Pa. v. Commonwealth, 77 A.3d 587, 596 (Pa. 2013) ("HHAP") (quoting Sweeney v. Tucker, 375 A.2d 698, 705 (Pa. 1977)).

The applicable standards to determine whether a claim warrants the exercise of judicial abstention or restraint under the political question doctrine are well settled. Courts will refrain from resolving a dispute and reviewing the actions of another branch only where "the determination whether the action taken is within the power granted by the Constitution has been entrusted exclusively and finally to the political branches of government for 'self-monitoring.'" Sweeney, 375 A.2d at 706; Council 13, 986 A.2d at 76 (quoting Thornburgh). To illustrate our approach to the political question doctrine, we customarily reference the several formulations by which the U.S. Supreme Court has described a "political question" in Baker v. Carr, 369 U.S. 186, 217 (1962). See, e.g., Council 13; Thornburgh. Cases implicating the political question doctrine include those in which: there is a textually demonstrable constitutional commitment of the disputed issue to a coordinate political department; there is a lack of judicially discoverable and manageable standards for resolving the disputed issue; the issue cannot be decided without an initial policy determination of a kind clearly for non-judicial discretion; a court cannot undertake independent resolution without expressing lack of the respect due coordinate branches of government; there is an unusual need for unquestioning

---

(...continued)

Id.; see also United States v. Brewster, 408 U.S. 501, 546-47 (1972) (Brennan, J., dissenting, joined by Douglas, J.) ("Jefferson looked on the 'tyranny of the legislatures' as 'the most formidable dread at present, and will be for long years.'").

adherence to a political decision already made; and there is potential for embarrassment from multifarious pronouncements by various departments on one question. See Council 13, 986 A.2d at 75 (quoting Baker, 369 U.S. at 217); see also HHAP, 77 A.3d at 596-98 & n.11 (listing examples).

We have made clear, however, that “[w]e will not refrain from resolving a dispute which involves only an interpretation of the laws of the Commonwealth, for the resolution of such disputes is our constitutional duty.” Council 13, 986 A.2d at 76 (quoting Thornburgh). “[T]he need for courts to fulfill their role of enforcing constitutional limitations is particularly acute where the interests or entitlements of individual citizens are at stake.” HHAP, 77 A.3d at 597 (citing Sweeney, 375 A.2d at 709 (“[T]he political question doctrine is disfavored when a claim is made that individual liberties have been infringed.”)); accord Gondelman v. Commonwealth, 554 A.2d 896, 899 (Pa. 1989) (“Any concern for a functional separation of powers is, of course, overshadowed if the [statute] impinges upon the exercise of a fundamental right. . . .”). There is no doubt that the General Assembly has made a policy decision respecting encouragement and accommodation of rapid exploitation of the Marcellus Shale Formation, and such a political determination is squarely within its bailiwick. But, the instant litigation does not challenge that power; it challenges whether, in the exercise of the power, the legislation produced by the policy runs afoul of constitutional command. Responsive litigation rhetoric raising the specter of judicial interference with legislative policy does not remove a legitimate legal claim from the Court’s consideration; the political question doctrine is a shield and not a sword to deflect judicial review. Council 13, 986 A.2d at 75-76. Furthermore, a statute is not exempt from a challenge brought for judicial consideration simply because it is said to be the General Assembly’s expression of policy rendered in a polarized political context. See id. at 76; HHAP, 77 A.3d at 598

("political question doctrine does not exist to remove a question of law from the Judiciary's purview merely because another branch has stated its own opinion of the salient legal issue"). Whatever the context may have been, it produced legislation; and it is the legislation that is being challenged. As the U.S. Supreme Court has stated:

The idea that any legislature, state or federal, can conclusively determine for the people and for the courts that what it enacts in the form of law, or what it authorizes its agents to do, is consistent with the fundamental law, is in opposition to the theory of our institutions. The duty rests upon all courts, federal and state, when their jurisdiction is properly invoked, to see to it that no right secured by the supreme law of the land is impaired or destroyed by legislation. This function and duty of the judiciary distinguishes the American system from all other systems of government. The perpetuity of our institutions, and the liberty which is enjoyed under them, depend, in no small degree, upon the power given the judiciary to declare null and void all legislation that is clearly repugnant to the supreme law of the land.

Smyth v. Ames, 169 U.S. 466, 527-28 (1898), overruled on other grounds by Federal Power Comm'n v. Natural Gas Pipeline Co. of Am., 315 U.S. 575, 602 (1942); accord Nat'l Fed'n of Indep. Bus. v. Sebelius, 132 S.Ct. 2566, 2577-80 (2012) (citing Marbury v. Madison, 1 Cranch at 175-76 ("The powers of the legislature are defined and limited; and that those limits may not be mistaken, or forgotten, the constitution is written. Our respect for Congress's policy judgments thus can never extend so far as to disavow restraints on federal power that the Constitution carefully constructed. . . . And there can be no question that it is the responsibility of this Court to enforce the limits on federal power by striking down acts of Congress that transgress those limits."))).

Here, the Commonwealth does not identify any provision of the Constitution which grants it authority to adopt non-reviewable statutes addressing either oil and gas or policies affecting the environment. Organic constitutional provisions on which the

citizens rely offer, as will become evident in our later discussion, the type of judicially discoverable and manageable standards by which courts are able to measure and resolve the parties' dispute without overstepping the Judiciary's own constitutional bounds. Furthermore, this case presents no prospect that the Court would be required to make an initial policy determination outside our judicial function or undertake independent resolution of a policy matter outside the purview of our judicial authority; nor is there an unusual need for unquestioning adherence to the legislative decision already made. Indeed, in terms of the judicial function, at least, this case is not extraordinary at all: all that is required to resolve the parties' various disputes is that we construe and apply constitutional provisions and determine whether aspects of Act 13 violate our charter. The task is neither more nor less intrusive upon a coordinate branch function than in other matters in which we are called upon to determine the constitutional validity of a legislative act. Accord HHAP, 77 A.3d at 598 & n.12 (noting that notion of "respect" due coordinate branches is relatively narrow criterion in political question jurisprudence; judicial finding that Legislature passed unconstitutional law entails no lack of respect in constitutional sense nor does it create political question).

Litigation polemics aside, Act 13 is a legislative act subject to the strictures of the Pennsylvania Constitution and the U.S. Constitution. The Commonwealth offers no persuasive argument that the citizens' varied challenges raise only questions essentially political in nature regarding the validity of Act 13. The parties' dispute implicates questions of whether Act 13 was adopted pursuant to constitutional procedures, and of whether Act 13 impinges upon the rights reserved to citizens and guaranteed by the Pennsylvania Constitution and the U.S. Constitution. The evident investment of the parties to this dispute in the policies articulated in and the politics behind Act 13 do not serve to alter the nature as "questions of law" of the specific legal issues before us. See

Council 13, 986 A.2d at 76. The nature of the citizens' claims requires nothing more than the exercise of powers within the courts' core province: the vindication of a constitutional right. See Thornburgh, 470 A.2d at 955-56. Accordingly, we conclude that the citizens' claims are justiciable and, as a result, the Commonwealth Court's decision on this point is affirmed.

### III. The Constitutionality of Act 13

As noted, on the merits, the Commonwealth Court held that certain specific provisions of Act 13 were unconstitutional. The *en banc* panel enjoined enforcement of Sections 3215(b)(4) and 3304 of Act 13, and of those provisions of Chapter 33 which enforce Section 3304. See Robinson Twp., 52 A.3d at 485, 493 (citing 58 Pa.C.S. §§ 3215(b)(4), 3304-3309). The effect of the injunction was to prohibit the Department of Environmental Protection from granting waivers of mandatory setbacks from certain types of waters of the Commonwealth, see 58 Pa.C.S. § 3215(b)(4); and to permit local government to enforce existing zoning ordinances, and adopt new ordinances, that diverge from the Act 13 legal regime, without concern for the legal or financial consequences that would otherwise attend non-compliance with Act 13, see 58 Pa.C.S. §§ 3304-3309.

The Commonwealth Court rejected the citizens' remaining claims. Specifically, the panel sustained the Commonwealth's preliminary objections to claims: (1) that provisions of Act 13 violate the Environmental Rights Amendment, Article I, Section 27 of the Pennsylvania Constitution; (2) that Act 13 is a "special law," in violation of Article III, Section 32 of the Pennsylvania Constitution; (3) that Section 3241(a) permits a private taking of property in violation of Article I, Sections 1 and 10 of the Pennsylvania Constitution; (4) that Section 3305(a)-(b) delegates judicial and legislative powers to the Public Utility

Commission, an executive agency, in violation of the separation of powers doctrine; and (5) that provisions of Act 13 are unconstitutionally vague.<sup>17</sup>

On appeal, the Commonwealth challenges the lower court's decision regarding Sections 3215(b)(4) and 3304 through 3309, but supports affirmance of the Commonwealth Court in all other respects. The citizens offer several reasons upon which to affirm the aspects of the Commonwealth Court's decision sustaining their challenges. And, the citizens advance other theories in support of the claim that other provisions of Act 13 and Act 13, in its totality, are unconstitutional.

**A. Article I, Section 27 of the Pennsylvania Constitution (Environmental Rights)**

**Article I, Section 1 of the Pennsylvania Constitution and the Fourteenth Amendment to the U.S. Constitution (Due Process);**

**Article II, Section 1 of the Pennsylvania Constitution (Legislative Power)**

We begin by reviewing the parties' respective claims regarding Sections 3215(b)(4) and (d), 3303, and 3304. See Citizens' Petition for Review, 3/29/12, at 27-49, 63-82, 88-91 (Counts I-III, VI, VIII). The Commonwealth Court granted the citizens summary relief on separation of powers and due process theories, holding that Sections 3215(b)(4) and 3304 are unconstitutional.<sup>18</sup> As we will explain in more detail *infra*,

---

<sup>17</sup> On appeal, the citizens have abandoned the claim that Act 13 is unconstitutionally vague (Counts IX and X of the citizens' petition for review).

<sup>18</sup> In Count VIII of the Citizens' Petition for Review, the citizens sought "a declaration that the delegation of powers to the Pennsylvania Department of Environmental Protection in Act 13, Section 3215(b)(4) . . . is an unconstitutional breach of the doctrine of Separation of Powers. . . ." See Citizens' Petition for Review, 3/29/12, at 88-91 (Count VIII). The citizens claimed that Section 3215(b)(4) violates Article II, Section 1 of the Pennsylvania Constitution, which vests legislative power in the General (continued...)

Section 3215(b)(4) creates a process by which the Department of Environmental Protection grants waivers to oil or gas well permit applicants from statutory protections of certain types of waters of the Commonwealth. Section 3304, meanwhile, implements a uniform and statewide regulatory regime of the oil and gas industry by articulating narrow parameters within which local government may adopt ordinances that impinge upon the development of these resources. See 58 Pa.C.S. §§ 3215(b)(4), 3304. The court sustained the Commonwealth's preliminary objections with respect to the remaining claims.

In enjoining Section 3304, the Commonwealth Court held that the provision violated the citizens' due process rights by requiring local governments to amend their existing zoning ordinances without regard for basic zoning principles and, thereby, failing to protect interests of property owners from harm and altering the character of neighborhoods. Robinson Twp., 52 A.3d at 484-85. The court explained that zoning laws protect landowners' enjoyment of their property by categorizing uses, designating compatible uses to the same district, and generally excluding incompatible uses from districts, with limited exceptions that do not affect the comprehensive land use scheme of the community. Local government, according to the court, relies on public input to produce a rational plan of development, under which "each piece of property pays, in the form of reasonable regulation of its use, for the protection that the plan gives to all property lying within the boundaries of the plan." Id. at 482. The court stated that the goal of zoning is to preserve the rights of property owners within the constraints of the

---

(...continued)

Assembly. The Commonwealth Court disposed of this claim citing the non-delegation doctrine, the theoretical underpinnings of which are in the separation of powers doctrine. 52 A.3d at 490-91 ("Count VIII -- Violation of Non-Delegation Doctrine -- DEP") (citing PA. CONST. art. II, § 1).

maxim “use [your] own property as not to injure your neighbors.” Id. (quoting In re Realen Valley Forge Greenes Assocs., 838 A.2d 718, 728 (Pa. 2003)).

Addressing residential districts in particular, the court noted that “reserving land for single-family residences preserves the character of neighborhoods, securing zones where family values, youth values, and the blessings of quiet seclusion and clean air make the area a sanctuary for people.” Id. at 481 (quoting Village of Belle Terre v. Boraas, 416 U.S. 1, 9 (1974)). But, the court observed, Act 13 requires municipalities to act affirmatively to allow incompatible uses, such as “drilling operations and impoundments, gas compressor stations, storage and use of explosives” in all zoning districts, including residential, and “applies industrial criteria to restrictions on height of structures, screening and fencing, lighting and noise.” Id. at 484-85. The court held that, because it commands unconstitutional zoning outcomes, Section 3304 violates due process.

The court also rejected the Commonwealth’s attempt to justify Act 13’s abrupt disruption of existing zoning schemes as an exercise of police power rationally related to its stated purposes, *i.e.*, the optimal development of the Commonwealth’s natural resources. According to the court, the interests that justify the exercise of police power in zoning and in the development of the oil and gas industry are not the same. This is so because the interest in oil and gas development is centered on efficient production and exploitation of resources, while the interest in zoning focuses on the orderly development and regulation of land use, consistent with local demographic and environmental concerns. Id. at 483 (quoting Huntley & Huntley, Inc. v. Borough Council of Oakmont, 964 A.2d 855, 865 (Pa. 2009)). Accordingly, the court explained, Act 13’s stated purposes, including its main interest in accommodating the exploitation of the Commonwealth’s oil and gas resources, are not a creditable justification for the Section 3304 zoning guidelines; zoning

action is only justified if compliant with the comprehensive plan of the community. Id. at 483-84 (citing 58 Pa.C.S. § 3202).

Regarding Section 3215(b)(4), which the Commonwealth Court also enjoined, the panel explained that the provision lists specific setbacks between a water source and a gas well bore (the physical well bore is the opening in the ground through which gas is extracted and is generally surrounded by the wider disturbed area of a well site). Waiver of planned statutory setbacks is broadly authorized by Section 3215(b)(4) and neither other parts of Section 3215, nor Act 13 generally, constrain or guide the exercise of discretion by the Department of Environmental Protection, an executive agency, as to when setback waivers are appropriate. The panel concluded that Act 13 gives the executive branch “the power to make legislative policy judgments otherwise reserved for the General Assembly” and is, therefore, unconstitutional on that ground. Id. at 493 (citing PA. CONST. art. II, § 1; Pennsylvanians against Gambling Expansion Fund, Inc. v. Commonwealth, 877 A.2d 383 (Pa. 2005) (“PAGE”)).

Finally, the Commonwealth Court briefly discussed and ultimately rejected the citizens’ claims regarding both the enjoined provisions and Sections 3215(d) and 3303, premised upon Article I, Section 27 of the Pennsylvania Constitution.<sup>19</sup> With respect to this Environmental Rights Amendment challenge, the Commonwealth Court stated that any municipal obligation “to strike a balance between oil and gas development and the preservation of natural, scenic, historic and esthetic values of the environment” derived from the Municipalities Planning Code, a General Assembly enactment. Because Act 13

---

<sup>19</sup> Briefly, Section 3215(d) states that the Department of Environmental Protection “may consider” comments from -- in relevant part -- municipalities in making its well permit determinations, and forecloses any appeal by a municipality from permit decisions. Section 3303 purports to occupy the field of environmental regulation to the extent it implicates oil and gas operations, to the exclusion of any existing or future local ordinances. See 58 Pa.C.S. §§ 3215(d), 3303.

preempts environmental obligations, the panel determined that municipalities are “relieved of their responsibilities to strike a balance between oil and gas development and environmental concerns under the [Municipalities Planning Code].” The court thus concluded that the citizens failed to state a claim for relief under Article I, Section 27. *Id.* at 488-89 (citing 53 P.S. § 10301(a)(6); Cmty. Coll. of Del. County v. Fox, 342 A.2d 468 (Pa. Cmwlth. 1975)).

Judge Brobson filed a dissenting opinion, joined by Judges Simpson and Covey. The dissent would have held that Act 13, except for Section 3215(b)(4)’s setback waiver provision, is constitutional. According to the dissent, Section 3304 of Act 13 was a legitimate exercise of the police power and it was not the court’s “role to pass upon the wisdom of a particular legislative enactment.” *Id.* at 497-98 (Brobson, J., dissenting, joined by Simpson, Covey, JJ.).

### *1. The Parties’ Arguments*

As appellant, the Commonwealth argues that the Commonwealth Court erred in granting the citizens summary relief as to Sections 3304 and 3215(b)(4) of Act 13. Regarding Section 3304, the Commonwealth argues that the General Assembly delegated zoning powers to municipalities through the Municipalities Planning Code; the Code, like any other statute, is subject to amendment, alteration, and repeal by subsequent enactments, such as Act 13. According to the Commonwealth, the Commonwealth Court turned the relationship between the General Assembly and local government “upside-down” by concluding that Section 3304 is unconstitutional. Agencies’ Brief (as appellants) at 12-15.

Moreover, the Commonwealth states that Act 13, in its entirety, is constitutional. The Commonwealth notes that the General Assembly exercised its “broad police power”

to enact Act 13, which is “a comprehensive reform of the oil and gas laws of this Commonwealth driven by, among other things, policy determinations of promoting the development of the Commonwealth’s vast natural gas reserves; encouraging economic development, job creation and energy self-sufficiency; providing for impact fees to benefit municipalities where unconventional gas drilling occurs; ensuring uniformity of local zoning ordinances throughout the Commonwealth; and revising and updating the Commonwealth’s environmental regulations related to the oil and gas industry.” According to the Commonwealth, Act 13’s stated purposes are valid legislative objectives, and the means for implementing these objectives is based on the General Assembly’s “informed judgment” regarding the balance of interests at issue. *Id.* at 15. The Commonwealth offers that Act 13 is a non-arbitrary and non-discriminatory exercise of the police power. This power, the Commonwealth states, is one of the “least limitable powers” of the General Assembly, and the burden to prove that the General Assembly exceeded its power is heavy. *Id.* at 17 (quoting Eagle Envtl. II, L.P. v. Commonwealth, 884 A.2d 867, 882 (Pa. 2005)).<sup>20</sup>

---

<sup>20</sup> Business and industry *amici* writing in support of the Commonwealth note the economic and energy benefits to the people expected from the exploitation of natural gas resources in the Marcellus Shale Formation. One brief emphasizes that the Marcellus Shale deposits offer great potential to answer the present and future energy necessities of the Commonwealth and the nation from an affordable domestic source. The deposits are located in proximity to East Coast metropolitan areas and industrial and commercial centers, which promises to keep gas transportation costs to a minimum. Without offering many details about the amount of recoverable natural gas with current or developing technology, *amici* suggest that the Marcellus Shale Formation holds “trillions of cubic feet of natural gas” that will support the burgeoning natural gas industry for several decades. See, e.g., Brief of *Amicus Curiae* American Petroleum Institute at 2.

According to another brief, the natural gas industry is playing a key role in economic recovery by creating jobs and stimulating service industries in communities across Pennsylvania. See, e.g., Brief of *Amici Curiae* The Pennsylvania Independent (continued...)

The standard to overcome the strong presumption of constitutionality of duly-enacted legislation is whether the statute “clearly, palpably, and plainly” violates the Constitution. Id. at 880. The Commonwealth states that the *en banc* panel failed to apply this deferential standard of review to the citizens’ claims regarding Section 3304.<sup>21</sup>

---

(...continued)

Oil and Gas Association *et al.* at 12. The Commonwealth, meanwhile, suggests that the balkanization of land use regulation in the various communities across Pennsylvania has generally hindered the development of the Marcellus Shale play. Act 13, according to the Commonwealth, resolves this problem and fosters optimal development while also adequately respecting property and environmental rights. See Agencies’ Brief at 16 (citing 58 Pa.C.S. § 3202).

<sup>21</sup> According to the Commonwealth, this failure was critical because the lower court was supposedly divided evenly regarding the provision’s constitutionality and, in light of the presumption, the question should have been resolved in favor of constitutionality. Id. at 18 (citing Estate of Fridenberg v. Commonwealth, 33 A.3d 581, 591 (Pa. 2011) (“In reviewing the constitutionality of a statute, we presume the Legislature did not intend for the statute to violate either the United States or this Commonwealth’s Constitution.”)). This particular claim of error involving the standard of review has no merit. The Commonwealth Court has nine commissioned judges. Pursuant to the Commonwealth Court’s Internal Operating Procedures, the present matter was assigned to an *en banc* panel composed of seven commissioned judges of the court chosen in rotation: President Judge Dan Pellegrini, and Judges Bernard L. McGinley, Bonnie Brigance Leadbetter, Robert Simpson, P. Kevin Brobson, Patricia A. McCullough, and Anne E. Covey. See Cmwlth. Ct. I.O.P. §§ 111, 112. The Commonwealth Court has an internal operating procedure by which commissioned judges who did not sit on the panel hearing the case are offered an opportunity to object to the decision, and the writing judge can then make revisions. In close cases concerning whether the entirety of the commissioned judges agree with the result, a majority vote of the commissioned judges determines whether the panel’s opinion will be filed. See id. at §§ 251-256.

In this case, the actual panel hearing the case was divided 4-3. Of the two commissioned judges who were not members of the *en banc* panel, Judge Mary Hannah Leavitt indicated her non-participation, and Judge Renee Cohn Jubelirer indicated her disagreement with the proposed opinion, resulting in a tie vote of the eight participating commissioned judges. As we understand the internal procedure, the disagreement did not oblige or entitle Judge Cohn Jubelirer to file a responsive opinion (continued...)

If the Commonwealth Court had applied the proper standard, the Commonwealth asserts, the court would have concluded that Act 13 is a valid exercise of the police power, and that any and all amendments to local ordinances required by Act 13 would be *a fortiori* valid. Id. at 22-23.<sup>22</sup>

Regarding Section 3215(b)(4), the Commonwealth argues that the lower court erred in determining that the General Assembly failed to make basic policy choices and/or to create adequate standards to guide and restrain the setback waiver decisions

---

(...continued)

and, as a result, change the outcome of the panel vote. Id. Per court rule, the court then filed the proposed opinion (and dissent) as circulated by the *en banc* panel members. See id. at § 256(b). That filed opinion represents the decision of the court.

The limited full-court participation before a decision and opinion is filed is a procedural matter, governed by rules that operate independently of the nature of the claims presented, *e.g.*, constitutional or non-constitutional claims. The judges to whom the case was assigned for decision weighed the presumption of constitutionality into their decision, as a matter of substantive law governing the burden of proof on the citizens; and the dissenting opinion did not dispute the governing standard. A majority of the panel concluded that the citizens met their burden as to two claims. Contrary to the Commonwealth's current contention, the presumption of constitutionality did not require the Commonwealth Court to alter its decisional procedures, and the decision in Estate of Fridenberg is not to the contrary.

In any event, this Court's decisional task in passing upon the questions of law posed on appeal is not affected by the happenstance of which party prevailed below.

<sup>22</sup> The parties also make arguments concerning whether this Court reviews a due process claim in the zoning context under a rationally-related test, *i.e.*, whether the statute "seek[s] to achieve a valid state objective by means that are rationally related to that objective," or under heightened scrutiny. See Agencies' Brief (as appellants) at 20 (quoting Khan v. State Bd. of Auctioneer Examiners, 842 A.2d 936, 946-47 (Pa. 2004); Boundary Drive Assocs. v. Shrewsbury Twp. Bd. of Supervisors, 491 A.2d 86, 90 (Pa. 1985)); Citizens' Brief (as appellees) at 17-20 (citing, *inter alia*, Surrick v. Zoning Hearing Bd., 382 A.2d 105, 108 (Pa. 1977)). In light of our ultimate disposition, we offer no opinion on the issue.

committed to the Department of Environmental Protection. According to the Commonwealth, Section 3215(b)(4) cannot be read separately from the rest of subsection (b), which articulates “rigid setbacks” from particular bodies of water and provides that additional conditions may be employed if necessary to protect the waters of the Commonwealth. The Department, according to the Commonwealth, indeed has discretion to grant waivers but its discretion is restrained by the condition that a permittee must submit a plan identifying additional measures to protect the Commonwealth’s waters. See Agencies’ Brief (as appellants) at 24-28.<sup>23</sup>

From the Commonwealth’s perspective, Section 3215(b) therefore “narrowly” delimits agency discretion and precludes the issuance of arbitrary setback waivers. In addition, under Section 3215(b), the Department may not burden the permittee with more than “necessary” permit conditions. These requirements, according to the Commonwealth, create a floor and a ceiling within which the Department may articulate appropriate permit restrictions. In its determinations, the Commonwealth states, the Department is further “guided and restrained” by the purposes of Act 13 and by the Commonwealth’s other environmental statutes, such as the Clean Water Act. Id. at 29

---

<sup>23</sup> The Commonwealth also notes that Section 3215(b) continues substantially the same regime of review and approval of permit proposals as the prior version of the Oil and Gas Act, suggesting that, as a result, the provision should be found constitutional. We agree with the citizens’ assessment, see infra, that the current setback waiver scheme is substantially different from its predecessor. More importantly, we note that this Court has never addressed a constitutional challenge to the predecessor of Section 3215(b) premised upon the same arguments that the citizens make here. Accordingly, to the extent that the Commonwealth is suggesting that we have tacitly approved Section 3215(b), we cannot credit the assertion. Holt v. Legislative Redistricting Comm’n, 38 A.3d 711, 735-36 (Pa. 2012) (legislative redistricting plan “[wa]s not insulated from attack by decisions of this Court finding prior redistricting plans constitutional, unless a materially indistinguishable challenge was raised and rejected in those decisions”).

(citing 58 Pa.C.S. § 3202); see also OAG's Brief (as appellant) at 37 (citing 58 Pa.C.S. § 3257 (existing rights and remedies preserved and cumulative remedies authorized)). The Commonwealth asserts that this Court has never required the General Assembly "to set forth every detail of what is and is not necessary" or to establish exact setbacks for industrial well drilling. Rather, "details of a general program can be left to the particular agency." Agencies' Brief (as appellants) at 30 (citing Dussia v. Barger, 351 A.2d 667, 672 (Pa. 1976)). In the Commonwealth's view, Section 3215(b) does not simply direct the Department to consider certain standards, but creates a process with definite guidelines and a specific performance standard for the Department to follow in determining whether to grant setback waivers. Id. at 31-32 (citing PAGE, 877 A.2d at 418). The statutory scheme then permits the Department to use its expertise to apply express statutory standards. Id. at 32-33 (citing Eagle Env'tl. II, 884 A.2d at 880-81); OAG's Brief (as appellant) at 36.<sup>24</sup>

In response to the Commonwealth's appeal, the citizens request that we affirm the lower court's decision. To start, the citizens claim that Article I, Section 1 of the Pennsylvania Constitution guarantees an individual's rights "to acquire, possess and protect property and to use that property as the individual sees fit." Citizens' Brief (as appellee) at 8 (citing Appeal of Girsh, 263 A.2d 395, 397 n.3 (Pa. 1970)). This right, according to the citizens, is limited by the Commonwealth's police power. The citizens do not dispute that the General Assembly has the authority to preempt local laws, amend the Oil and Gas Act, or simply remove municipalities' zoning power entirely.

---

<sup>24</sup> The Commonwealth also suggests that review of the citizens' Section 3215(b) claim is premature because the citizens "do not point to any specific waivers which have been granted or any regulations which have been enacted." OAG's Brief (as appellant) at 35. We have addressed at length why the citizens' interest in the outcome of this litigation is neither remote nor speculative. The similar contention in the context of the Section 3215 claim necessarily fails.

But, the citizens argue, having the power does not equate to the conclusion that the exercise of the power in a particular instance is *per se* proper. According to the citizens, while the General Assembly may dissolve the municipalities' power to zone, the General Assembly may not remove the protections created by existing zoning districts only to replace them with a zoning scheme that is inconsistent with constitutional mandates generally imposed on any legislative zoning effort. Id. at 12-15. The citizens emphasize that the exercise of the police power to zone is limited by the Constitution. Thus, a zoning legislative enactment like Act 13 is constitutional only if it ensures that a use of property does not cause harm to neighboring property rights or interests, and it protects "the lives, health, morals, comfort and general welfare of the populace." Id. at 8, 15 (citing Realen, 838 A.2d at 728). According to the citizens, the purpose of zoning is to develop a comprehensive and orderly land use scheme that segregates incompatible uses, based on the unique characteristics of each community; in this sense, "[t]he police power to zone cannot be exercised in an unreasonable or arbitrary manner" but must balance costs and benefits in each community. Id. at 9-11, 15 (citing Village of Euclid v. Ambler Realty Co., 272 U.S. 365, 387-88 (1926); Realen, 838 A.2d at 729)).

The citizens state that the General Assembly cannot justify a zoning action violative of these fundamental parameters by reference to a policy to promote oil and gas development in the Commonwealth. The interests implicated in zoning, the citizens assert, are distinct from, and more complex than, those implicated in the narrow arena of oil and gas development. Accordingly, an action that, when viewed in isolation, is perfectly acceptable to accomplish the resource utilization purposes of Act 13 may be unconstitutional from a zoning perspective. The citizens emphasize that Act 13 is a zoning act that must be assessed in accordance with constitutional standards applicable

to all other zoning legislation. According to the citizens, Act 13 confers no benefits to the community sufficient to justify its disruptive effects, and the Commonwealth's blanket assertion that the statute has an appropriate purpose is insufficient to meet constitutional standards. Id. at 14-17.

By any measure, the citizens argue, Act 13 works a remarkable revolution in zoning in this Commonwealth. The Act introduces heavy-duty industrial uses -- natural gas development and processing, including permission to store wastewater (a drilling by-product) -- into all existing zoning districts as of right, including residential, agricultural, and commercial. The intrusion is made, according to the citizens, regardless of whether the district is suitable for industrial use, whether the industrial use is compatible with existing uses and expectations, and whether dictated accompanying setbacks are sufficient to protect the environmental health, safety, and welfare of residents in particular affected communities. The citizens describe the development process of shale drilling for natural gas:

Unconventional well sites are generally developed in different stages and are on average several acres in size. Initially, a road is constructed and a pad is cleared. The impact is typical of any a [sic] noisy, dusty construction site, and the process can take several months to complete. Upon completion of the pad, drilling generally entails twenty-four (24) hour operation of sizeable drilling rigs accompanied by numerous diesel engines to provide power to the site. There will also be a substantial amount of truck traffic to and from the drill site. Once completed, the well pads will include wellheads, condensate tanks, vapor destruction units with open flames, pipelines and metering stations. These are typically structures that vary tremendously in size, scale and appearance from dwellings or other buildings found in residential and commercial zoning districts. Compressor stations and processing plants are clearly industrial uses as they process raw materials into various products. Unlike

well development, the intensity of activities remains constant.

Id. at 21 n.11. Natural gas extraction, the citizens continue, requires heavy truck traffic, open flames, workers living on-site, and the process unavoidably produces noise, odors, and harmful emissions, including volatile organic compounds and sulfur dioxide, a neurotoxin. Id. at 22, 25.

For example, one affidavit of record recounts the experience of a homeowner in a previously rural, non-industrialized area of Amwell Township, Washington County. See S. Taney Affidavit, 5/3/2012. The homeowner, a nurse, leased her mineral rights and drilling operations (three wells, a fracking fluid impoundment, and a drill cuttings pit) began approximately 1,500 feet from her home. Access to the drilling site occurred mainly via a dirt road running approximately fifteen feet from her residence. The homeowner describes that, during the initial construction process, the access road was used daily and continuously by heavy truck traffic, causing structural damage to her home's foundation, road collapse, as well as large amounts of dust and deterioration to the air quality; the gas company subsequently repaired the damage to her home, and widened and paved the access road to accommodate additional traffic. Moreover, and unsurprisingly, the 24-hour-a-day traffic caused significant noise pollution, which affected the homeowner's ability to enjoy her property.

Once drilling and fracking operations began, and over the next several years, the homeowner noticed significant degradation in the quality of the well water which had supplied her homestead and those of several neighbors with fresh and clean water during the century in which her family had owned the property. In the homeowner's words: "my well water began to stink like rotten eggs and garbage with a sulfur chemical smell[,] . . . when running water to take a bath, my bathtub filled with black sediment and again smelled like rotten eggs." Id. at ¶¶ 12-13. The gas company gave the

homeowner a “water buffalo” as a replacement water source.<sup>25</sup> Air quality also became degraded, beginning “to smell of rotten eggs, sulfur, and chemicals” and seeping into the home and the owner’s belongings. Id. at ¶ 15. Several pets died as a result of their exposure to contaminated water. Finally, upon her physician’s advice, the homeowner abandoned her family home because the exposure to the toxic water and air caused her and her children severe health problems such as constant and debilitating headaches, nosebleeds, nausea, difficulty and shortness of breath, skin rashes and lesions, bone and muscle pain, inability to concentrate, and severe fatigue. Id. at ¶¶ 16, 17.

Moreover, the citizens state, communities “have a reasonable concern over the impact on property values due to the perceived or real risk associated with living near industrial activity.” Property values, according to the citizens, will decrease with the prospect of storing drilling wastewater “less than a football field’s distance from . . . homes,” and the prospect of contamination of the soil, air, and water supply.<sup>26</sup> The citizens state that they “relied on the zoning ordinances in their respective municipalities

---

<sup>25</sup> A “water buffalo” is a fresh water supply tank or trailer originally designed for field hydration by the military. See Military Field Hydration, online at [http://olive-drab.com/od\\_medical\\_other\\_hydration.php](http://olive-drab.com/od_medical_other_hydration.php) (last accessed on May 23, 2013); Wastecorp Pumps, Wastecorp Water Trailers, online at [www.wastecorp.com/mudsucker/water-trailer.html](http://www.wastecorp.com/mudsucker/water-trailer.html) (last accessed on May 23, 2013).

<sup>26</sup> A resident of Damascus, Wayne County, who operates a twelve-acre organic farm, describes the economic impact that she expects as a result of her neighbors leasing their gas rights. See T. Kowalchuk Affidavit, 5/10/2012. This homeowner relates that an exploratory well was constructed approximately a half mile from her home in 2010. Because Act 13 would permit drilling closer to her home and farm, the homeowner expects that an actual contamination event, *i.e.*, “industrial activity, spills, blowouts, or subsurface methane migration,” or even simply the appearance or possibility of such occurrences, will affect her organic farming business substantially. In the homeowner’s words: “because the farm is our primary asset and we have invested heavily in it, a contamination event would wipe us out financially.” Id. at ¶ 30.

to protect their investments in their homes and businesses, and to provide safe, healthy, and desirable places in which to live, work, raise families, and engage in recreational activities.” Act 13’s blunt “one size-fits-all” accommodation of the oil and gas industry, the citizens argue, will change the character of existing residential neighborhoods and affect planning for future orderly growth in municipalities with significant shale gas reserves, the very neighborhoods which zoning laws encouraged and currently protect. One aspect of the new law, for example, provides for setbacks of 300 feet from “existing structures,” which does not account for currently undeveloped properties or large parcels, much less roads and property lines. In more sparsely-populated rural communities, the effect of Act 13 will be, according to the citizens, “unlimited drilling; drilling rigs and transportation of the same; flaring, including carcinogenic and hazardous emissions; damage to roads; an unbridled spider web of pipeline; installation, construction and placement of impoundment areas; compressor stations and processing plants; and unlimited hours of operation, all of which may take place in residentially zoned areas.” The citizens conclude that, as a zoning regulation, Act 13 fails to meet the standards of Article I, Section 1 of the Pennsylvania Constitution, the Fourteenth Amendment of the U.S. Constitution, and the caselaw that interprets those respective constitutional provisions. Citizens’ Brief (as appellants) at 22-27.<sup>27</sup>

---

<sup>27</sup> The township manager of Mount Pleasant Township, Washington County, described the results of operating under Act 13-like conditions. See M.A. Stevenson Affidavit, 5/4/2012. Mount Pleasant is a thirty-six square mile community of approximately 3,500 people. When Marcellus Shale development began, the local zoning ordinance permitted oil and gas drilling operations as a use of right in all zoning districts. Gas drilling, as a result, developed unrestrained in all areas and zoning districts between 2004 and 2010-11. Mount Pleasant has 108 gas wells, of which 97 are active, two compressor stations, one dew point control facility, four fracking fluid impoundment areas, and miles of pipeline. The manager relates that, “Mount Pleasant has experienced an overturned tanker truck, an explosion, a spill, and seven fires at well sites.” The Township was forced to close one road and threatened to close another (continued...)

Regarding Section 3215(b), the citizens argue that the General Assembly has granted the Department of Environmental Protection open-ended and unrestricted authority “to make fundamental policy choices concerning the setback distance from oil and gas wells to sensitive features,” in violation of the separation of powers doctrine. Specifically, Section 3215(b)(4) requires that the Department issue waivers of setbacks, without providing substantive guidance on standards pursuant to which the Department may decide waiver applications. “In practice,” the citizens state, “the General Assembly requires the Department to ignore the oil and gas well location setback restrictions contained elsewhere in Section 3215 and to create and apply totally new setbacks in the absence of any substantive standards, guidelines or benchmarks.”

Unlike its predecessor, the citizens explain, Act 13 requires the Department to issue waivers; the repealed Oil and Gas Act simply allowed waivers at the Department’s discretion. Citizens’ Brief (as appellees) at 44 (comparing 58 Pa.C.S. § 3215(b)(4) (Department “shall waive” setbacks) and 58 P.S. § 601.205 (Department “may waive”

---

(...continued)

in a residential area because the roads had not been built for the “onslaught of heavy truck traffic.” Id. at ¶ 8. Citizen complaints increased, taking a toll on township resources. Subsequently, the Township revised the zoning ordinance, as proposed by a citizens’ committee, to allow oil and gas operations as conditional uses, and to require that the Board of Supervisors undertake site-by-site reviews of proposed drilling. Id. at ¶¶ 13-17.

Other elected officials highlighted additional concerns specific to their townships. See, e.g., A. Schrader Affidavit, 5/3/2012. In Cecil Township, Washington County, a member of the Board of Supervisors noted that one gas drilling company alone has notified the Township that it intends to drill a minimum of 300 wells, on 40 percent of the land within the municipality’s borders. Among other concerns, the supervisor emphasized that some local homes are situated over abandoned coal mines, some of which “have only 10-20 feet of cover above a mine shaft.” Id. at ¶ 36. Such properties are sensitive to seismic testing using dynamite or thumper trucks that could cause subsidence, as well as to explosions of methane gas “typically found in abandon[ed] mines.” Id.

setbacks)). Act 13 provides guidelines which the Department may consider, but it offers no standards of the factors' weight in the waiver determination. Id. at 46 (citing PAGE, 877 A.2d at 418-19). The citizens also reject any comparison between Section 3215(b) and the review process for permit applications under the Solid Waste Management Act, whose constitutionality was at issue in Eagle Environmental II. They note that the permit application provision of the Solid Waste Management Act is part of a comprehensive regulatory scheme and does not stand as the sole basis for approval of an application. Id. (citing Pennsylvania Code provisions implementing Solid Waste Management Act). According to the citizens, Act 13 grants the Department unbridled and unprecedented discretion, when it comes to granting waivers.

The citizens argue further that the standards described by the Commonwealth as implicit in Section 3215(b) are not evident in the plain language of the provision. Section 3215(b) does not require either a meaningful plan, nor a floor and a ceiling for what may be necessary to protect the Commonwealth's waters and the health of communities. Moreover, Section 3202 creates no standards of decision but simply recites general considerations underlying Act 13. None of the non-textual requirements guide the Department's discretion; rather, the agency operates in a legal environment in which its "powers [are] on par with those possessed by the General Assembly," in violation of the separation of powers doctrine. Id. at 48.

Notably, on cross-appeal, the citizens also address their related Environmental Rights Amendment claims, building upon their prior arguments regarding zoning and the protection of local and environmental interests. According to the citizens, municipalities are agents of the Commonwealth, which share the Commonwealth's duties "as trustees to conserve and maintain Pennsylvania's public natural resources for the benefit of [the Commonwealth's] citizens." Citizens' Brief (as cross-appellants) at 32 (citing United

Artists Theater Circ. v. City of Philadelphia, 635 A.2d 612, 620 (Pa. 1993)). Section 27, according to the citizens, creates a public trust for the benefit of all people, including future generations, and the trustee relationship between the Commonwealth and the people requires no implementing legislation to take effect. The citizens recognize that asserting a Section 27 claim does not entitle them to automatic relief, but they argue that “a balancing must take place” between constitutionally-based conservation interests and the exercise of the police power for other purposes. Id. at 33 (quoting Payne v. Kassab, 361 A.2d 263, 273 (Pa. 1976)).

Act 13, the citizens assert, has removed from the municipalities “the ability to strike that balance between oil and gas development and the preservation of the natural, scenic, historic and esthetic values of the environment,” and “essentially requires” that industrial uses be permitted across the Commonwealth. The citizens state that Act 13 eliminated any meaningful role for local government as Section 27 trustee, for example, by removing its principal tool in this regard -- zoning; by denying or constricting any right of community members or local government to be heard in the permitting process; and by prohibiting any appeals by municipalities of Department of Environmental Protection-issued well permits. Id. at 34 (citing 58 Pa.C.S. §§ 3212.1(b) & (c), 3215(d)).<sup>28</sup> The citizens also note that zoning is the primary means by which

---

<sup>28</sup> The citizens further assert that Section 3212.1(b)-(c) is unconstitutional because it prohibits local input into well permit decisions. The provision states that: the Department of Environmental Protection may consider comments and responses of municipalities in accordance with Section 3215(d), relating to well locations, albeit that the Department’s consideration of comments does not extend the period for issuing or denying well permits. 58 Pa.C.S. § 3212.1(b)-(c). The Commonwealth Court rejected this claim in disposing of the citizens’ other Article I, Section 27 arguments, without addressing Section 3212.1 specifically. The citizens fail to develop their arguments to a degree sufficient to permit this Court to render a reasoned conclusion on this discrete point.

municipalities implement statewide environmental statutes, such as the Appalachian Trail Act, the Wild and Scenic Rivers Act, and the Commonwealth's Environmental Master Plan.

According to the citizens, the Commonwealth Court erred in failing to recognize that the municipalities' fiduciary obligation under Section 27 to evaluate short-term and long-term discrete and cumulative effects on public resources continues to exist even though the General Assembly bluntly sought to occupy the field of environmental regulation insofar as the oil and gas industry is concerned. See id. at 37-39 (citing 58 Pa.C.S. § 3303). These oil and gas operations, according to the citizens, present risks and "will cause degradation and diminution of trust resources" protected by the Environmental Rights Amendment. The citizens claim that Act 13 removes the municipalities' capacity to evaluate and react appropriately and meaningfully to the potential impact of oil and gas operations and, as a result, impedes the municipalities' ability to comply with their constitutional duties. The basic error, the citizens state, derives from the conclusion that the Municipalities Planning Code is the source of the municipalities' obligations rather than the Constitution. A statutory enactment such as Act 13 simply cannot eliminate organic constitutional obligations. See id. at 36-38.<sup>29</sup>

The Commonwealth responds that Act 13 does not violate the Environmental Rights Amendment, found in Section 27 of Article I of our charter. According to the Commonwealth, municipalities have no powers outside those granted by the General

---

<sup>29</sup> In the alternative, the citizens assert that Section 3303 of Act 13 (occupying the field of environmental regulation of oil and gas development) should be read narrowly to mean that the municipalities cannot regulate operations (the "how") but allowing zoning restrictions (the "where"). According to the citizens, the narrow reading is the sole application of Section 3303 that is consistent with Article I, Section 27. See Citizens' Brief (as cross-appellants) at 38-39 (citing Huntley, 964 A.2d at 857). In light of our decision, we express no opinion on the merits of this alternative argument.

Assembly, and the General Assembly has acted via Act 13 to preempt the field and excuse any obligation that municipalities may have had previously “to plan for environmental concerns for oil and gas operations.” Agencies’ Brief (as cross-appellees) at 13 (citing Huntley, 964 A.2d at 862). Section 27, the Commonwealth states, is not a basis to expand the trustee role or the powers of governmental entities, such as municipalities, beyond those granted by the General Assembly. Id. (citing Belden & Blake Corp. v. Commonwealth, 969 A.2d 528, 532-33 (Pa. 2009); Fox, supra, 342 A.2d at 483 (Bowman, J., concurring)). The Commonwealth argues that, “[t]hrough the legislative process,” the General Assembly balanced Section 27 concerns, and the constitutional provision does not confer a right upon the municipalities to challenge the General Assembly’s policy judgments or for citizens to oppose actions of the General Assembly with which they disagree. Id. at 12-15.

The Commonwealth adds that Section 27 “provides specific constitutional authority for the [General Assembly] to enact laws like Act 13 which serve to manage and protect the environment while allowing for the development of Pennsylvania’s valuable natural resources.” Moreover, while the Commonwealth agrees that municipalities have some duties and responsibilities under Section 27, the Commonwealth disputes that Section 27 grants municipalities any power to protect public natural resources beyond that granted by the General Assembly. The Commonwealth claims that, as named trustee, the sovereign is “plainly” given “the authority and the obligation to control Pennsylvania’s natural resources.” The municipalities have no power to assert authority under Section 27 “as against the Legislature.” OAG’s Brief (as cross-appellee) at 28-29. In short, the Commonwealth’s position is that the Environmental Rights Amendment recognizes or confers no right upon citizens and no right or inherent obligation upon municipalities; rather, the

constitutional provision exists only to guide the General Assembly, which alone determines what is best for public natural resources, and the environment generally, in Pennsylvania. The Commonwealth thus requests that we affirm the decision of the Commonwealth Court in this respect.

In their reply briefs, all parties generally reprise their initial arguments.

We are asked to determine whether the Commonwealth Court erred in its several decisions regarding the constitutionality of Act 13. As noted, the Commonwealth Court granted the citizens relief on due process and separation of powers grounds, finding merit in the citizens' challenges to discrete provisions of Act 13 governing zoning and agency decision-making. The parties focus their briefing primarily on these issues in their appeals to this Court, while offering overlapping arguments premised upon the Environmental Rights Amendment.

To describe this case simply as a zoning or agency discretion matter would not capture the essence of the parties' fundamental dispute regarding Act 13. Rather, at its core, this dispute centers upon an asserted vindication of citizens' rights to quality of life on their properties and in their hometowns, insofar as Act 13 threatens degradation of air and water, and of natural, scenic, and esthetic values of the environment, with attendant effects on health, safety, and the owners' continued enjoyment of their private property. The citizens' interests, as a result, implicate primarily rights and obligations under the Environmental Rights Amendment -- Article I, Section 27. We will address this basic issue, which we deem dispositive, first.

In doing so, we recognize that the parties do not develop their Environmental Rights Amendment arguments to the same extent as, for example, the due process arguments as to Section 3304 and separation of powers arguments as to Section 3215(b)(4). This is explained, no doubt, by the fact that the citizens were successful in

asserting these claims below, and perhaps by the limited decisional law developed in relation to the Environmental Rights Amendment. In any event, the claims regarding Article I, Section 27 were raised and preserved below and are renewed on appeal; there is no claim of waiver by the Commonwealth. See HHAP, 77 A.3d at 600 & n.15 (internal citations omitted) (“Appellees’ present advocacy intermixes concepts of vested rights under the Due Process Clause and causes of action under the Remedies Clause. Although they place much of their emphasis on the Remedies Clause . . . we consider the due process aspect of Appellees’ argument sufficiently developed to preserve that claim as such.”).

We also perceive no prudential impediment to articulating principles of law that offer guidance to the bench and bar upon the broader legal issue, while providing context to the decision in this case. Accord Scampone v. Highland Park Care Ctr., LLC, 57 A.3d 582, 604-05 (Pa. 2012) (this Court’s “task is not simply to decide this case, but also to provide guidance upon the broader legal issue”); Mercury Trucking, Inc. v. Pa. Pub. Util. Comm’n, 55 A.3d 1056, 1078 (Pa. 2012) (in articulating principle of law, Court is not bound by parties’ agreement on legal point when, in Court’s judgment, legal point is incorrect); Commonwealth v. Collins, 764 A.2d 1056, 1058 n.4 (Pa. 2001) (same). Finally, to the extent a number of the issues in this case, on both sides, have not been better or optimally developed, and the reasoning of the Commonwealth Court on a number of issues likewise is not optimal, we are cognizant of the fact that Act 13 required local government to implement challenged provisions within narrow timeframes, with substantial financial consequences for non-compliance; this necessarily prompted the citizens to commence litigation quickly and to assent to expedited judicial review both below and here. See 58 Pa.C.S. § 3309 (local government has 120 days to amend existing ordinances to comply with Act 13). We are

aware that expedition has salutary features in appropriate cases, such as this one, while the practice also poses burdens and impediments in these cases that we might not see elsewhere.<sup>30</sup>

## 2. *The Scope and Standard of Review*

The constitutional validity of Act 13 presents a pure question of law and, as with any question of law, our review of the lower court's decision is plenary and *de novo*. West Mifflin Area Sch. Dist. v. Zahorchak, 4 A.3d 1042, 1048 (Pa. 2010). In our review, we are not constrained by the Commonwealth Court's reasoning and may affirm on any grounds, as long as the record supports the judgment. Scampone, 57 A.3d at 596.

Regarding any duly enacted statute, courts begin with the presumption that the General Assembly did not intend to violate the Pennsylvania Constitution, "in part because there exists a judicial presumption that our sister branches take seriously their constitutional oaths." Stilp v. Commonwealth, 905 A.2d 918, 938-39 (Pa. 2006); see also 1 Pa.C.S. § 1922(3). Accordingly, a statute is presumed valid and will be declared unconstitutional only if the challenging party carries the heavy burden of proof that the enactment "clearly, palpably and plainly violates the Constitution." See Zahorchak, 4

---

<sup>30</sup> In dissent, Justice Saylor takes a unitary approach to the citizens' claims in a manner that tracks the Commonwealth's framing of the parties' dispute. This approach is to characterize the citizens' arguments, whether premised upon the Environmental Rights Amendment or upon due process grounds, as expressions of some municipalities' discontent with the sovereign's policy decision to limit their zoning powers. But, as we explain, the claims and arguments of the citizens are considerably more nuanced and complex. In addition, for reasons also developed at great length *infra*, we obviously reject the claim that our decision today, enforcing the Environmental Rights Amendment, "completely redefine[s] the role of municipalities relative to the sovereign." Dissenting Slip Op. at 8 (Saylor, J., dissenting).

A.3d at 1048. The practical implication of this presumption is that “[a]ny doubts are to be resolved in favor of a finding of constitutionality.” Stilp, 905 A.2d at 939.

Our decision implicates primarily the construction and application of Article I, Section 27 of our Constitution. In the process of interpretation, “[o]ur ultimate touchstone is the actual language of the Constitution itself.” Id. (quoting Ieropoli v. AC&S Corp., 842 A.2d 919, 925 (Pa. 2004)). “[T]he Constitution’s language controls and must be interpreted in its popular sense, as understood by the people when they voted on its adoption.” Id. Towards this end, we avoid reading the provisions of the Constitution in any “strained or technical manner.” Jubelirer v. Rendell, 953 A.2d 514, 528 (Pa. 2008). Indeed, “we must favor a natural reading which avoids contradictions and difficulties in implementation, which completely conforms to the intent of the framers and which reflects the views of the ratifying voter.” Commonwealth ex rel. Paulinski v. Isaac, 397 A.2d 760, 766 (Pa. 1979).<sup>31</sup>

---

<sup>31</sup> Addressing voter qualifications, this Court in 1868 spoke broadly to the nature of constitutional interpretation in the interplay between rights and state power:

For the orderly exercise of the right [to vote] resulting from these qualifications, it is admitted that the legislature must prescribe necessary regulations, as to the places, mode and manner, and whatever else may be required, to insure its full and free exercise. But this duty and right, inherently imply, that such regulations are to be subordinate to the enjoyment of the right, the exercise of which is regulated. The right must not be impaired by the regulation. It must be regulation purely, not destruction. If this were not an immutable principle, elements essential to the right itself might be invaded, frittered away, or entirely excised under the name or preten[s]e of regulation, and thus would the natural order of things be subverted by making the principle subordinate to the accessory. . . .

Page v. Allen, 58 Pa. 338 at \*8 (Pa. 1868) (citing PA. CONST. art. III, § 1 (1838)).

The Environmental Rights Amendment has no counterpart in the federal charter and, as a result, the seminal, comparative review standard described in Commonwealth v. Edmunds, 586 A.2d 887 (Pa. 1991), is not strictly applicable here. Nonetheless, some of the Edmunds factors obviously are helpful in our analysis. Jubelirer, 953 A.2d at 524-25; see also Edmunds, 586 A.2d at 895.<sup>32</sup> Thus, in addition to our explicatory analysis of the plain language, we may address, as necessary, any relevant decisional law and policy considerations argued by the parties, and any extrajurisdictional caselaw from states that have identical or similar provisions, which may be helpful and persuasive. See Jubelirer, 953 A.2d at 525 n.12. Furthermore, there is a growing body of law and academic commentary concerning how state constitutional interpretation is to be undertaken. As our colleague Mr. Justice Saylor has noted in a scholarly article, “there is some degree of consensus [among courts interpreting state constitutions] that the overarching task is to determine the intent of voters who ratified the constitution. In furtherance of this aim, courts reference, *inter alia*, text; history (including ‘constitutional convention debates, the address to the people, [and] the circumstances leading to the adoption of the provision’); structure; underlying values; and interpretations of other states.” Thomas G. Saylor, Prophylaxis in Modern State Constitutionalism: New Judicial Federalism and the Acknowledged Prophylactic Rule, 59 N.Y.U. Annual Survey of Am. L. 283, 290-91 (2003) (footnotes omitted) (focusing on state provisions that have federal counterparts, and in context of prophylactic rules, author observes that, in era of

---

<sup>32</sup> Accord Blum by Blum v. Merrell Dow Pharm., Inc., 626 A.2d 537, 550 (Pa. 1993) (Larsen, J. concurring, joined by Papadakos, J.) (where appellant grounds claim only upon state constitutional provision, it is unnecessary to subject case to Edmunds analysis; Edmunds analysis “is appropriate only when there is a question of whether our constitution provides a source of individual rights which is alternative to and independent of rights guaranteed by the United States Constitution”).

new federalism, there is diversity but also some consensus among state courts in approach to development of constitutional decisional law).<sup>33</sup>

These observations merely recognize the duty of state court judges to uphold state constitutional provisions along with the provisions of the U.S. Constitution. As a result, state court judges “have an obligation to make some independent assessment of state constitutional provisions.” *Id.* at 289; *see* PA. CONST. art. VI, § 3 (all judicial officers to take solemn oath to “support, obey and defend the Constitution of the United States and the Constitution of this Commonwealth”). Where arguments grounded in the Pennsylvania Constitution have been forwarded or developed, this Court has undertaken the task in earnest. *See, e.g., Blum by Blum v. Merrell Dow Pharm., Inc.*, 626 A.2d 537 (Pa. 1993) (analysis of Article I, Section 6 -- right to trial by jury “as heretofore”); *Byers v. Commonwealth*, 42 Pa. 89 at \*3 (Pa. 1862) (same; stating, *inter alia*, “We do not mean to be understood as asserting that there may not be legislation conferring upon magistrates a power to convict summarily, which would be in violation

---

<sup>33</sup> “New federalism,” a characterization dating back to the 1970s, relates to a pattern of state court decisions that offer an independent analysis of arguments premised upon the state constitution, rather than following U.S. Supreme Court precedent interpreting analogous federal constitutional provisions in lock-step, even where the state and federal constitutional language is identical or similar. *See, generally*, William J. Brennan, Jr., State Constitutions and the Protection of Individual Rights, 90 Harv. L. Rev. 489 (1977); *accord* Saylor, 59 N.Y.U. Annual Survey of Am. L. at 287-88. Of note among academic commentary on state constitutionalism, especially regarding Pennsylvania’s decisional law, is the work of Professor Robert F. Williams. *See, e.g.*, Robert F. Williams, State Courts Adopting Federal Constitutional Doctrine: Case-By-Case Adoptionism or Prospective Lockstepping?, 46 Wm. & Mary L. Rev. 1499 (2005); The Brennan Lecture: Interpreting State Constitutions as Unique Legal Documents, 27 Okla. City U. L. Rev. 189 (2002); A “Row of Shadows”: Pennsylvania’s Misguided Lockstep Approach to Its State Constitutional Equality Doctrine, 3 Widener J. Pub. L. 343 (1993). *See also* Ken Gormley, The Pennsylvania Constitution: A Treatise on Rights and Liberties, at 683-706 (George T. Bisel Company, Inc. 2004) (chapter addressing Article I, Section 27, authored by John C. Dernbach).

of the [C]onstitution. Undoubtedly there may. We speak only of the case before us.”); Edmunds, supra (analysis of Article I, Section 8 -- people secure from searches and seizures); Ieropoli, 842 A.2d at 921 (analysis of Article I, Section 11 -- courts to be open; remedy by due course of law for injury; statute held to be unconstitutional); Commonwealth v. Means, 773 A.2d 143, 151-57 (Pa. 2001) (Opinion Announcing Judgment of Court) (analysis of Article I, Section 13 -- prohibition against excessive bail and fines, and infliction of cruel punishments; statute held to be constitutional); Adoption of Walker, 360 A.2d 603, 605-06 (Pa. 1976) (analysis of Article I, Section 28 -- equality of rights not to be denied or abridged because of sex of individual; statute held to be unconstitutional); Commonwealth v. Butler, 328 A.2d 851, 855 & 858 (Pa. 1974) (same; further noting that denial of equal protection under federal constitution is “independent basis” for decision).

If, in the process of undertaking explication of a provision of the Pennsylvania Constitution, any ambiguity, conflict, or inconsistency becomes apparent in the plain language of the provision, we follow rules of interpretation similar to those generally applicable when construing statutes. See, e.g., Commonwealth v. Omar, 981 A.2d 179, 185 (Pa. 2009). Relevant here, if the constitutional language is clear and explicit, we will not “delimit the meaning of the words used by reference to a supposed intent.” Id. (quoting Commonwealth ex rel. MacCallum v. Acker, 162 A. 159, 160 (Pa. 1932)). If the words of a constitutional provision are not explicit, we may resort to considerations other than the plain language to discern intent, including, in this context, the occasion and necessity for the provision; the circumstances under which the amendment was ratified; the mischief to be remedied; the object to be attained; and the contemporaneous legislative history. 1 Pa.C.S. §§ 1921, 1922; see Mercury Trucking, 55 A.3d at 1068; accord Robert F. Williams, The Brennan Lecture: Interpreting State Constitutions as

Unique Legal Documents, 27 Okla. City U. L. Rev. 189, 195 & 200 (2002) (state constitutions, ratified by electorate, are characterized as “voice of the people,” which invites inquiry into “common understanding” of provision; relevant considerations include constitutional convention debates that reflect collective intent of body, circumstances leading to adoption of provision, and purpose sought to be accomplished); but see Bowers v. Pa. Labor Rels. Bd., 167 A.2d 480, 487 (Pa. 1961) (relevancy of constitutional debates limited). A specific provision will prevail over a general principle found elsewhere but, because the Constitution is an integrated whole, we are cognizant that effect must be given to all of its provisions whenever possible. Jubelirer, 953 A.2d at 528 (quoting Commonwealth ex rel. Specter v. Vignola, 285 A.2d 869, 872 (Pa. 1971) and Cavanaugh v. Davis, 440 A.2d 1380, 1382 (Pa. 1982)).

Furthermore, in circumstances where prior decisional law has obscured the manifest intent of a constitutional provision as expressed in its plain language, engagement and adjustment of precedent as a prudential matter is fairly implicated and salutary. See Holt v. Legislative Redistricting Comm’n, 38 A.3d 711, 759 n.38 (Pa. 2012) (“As a function of our system of government, this Court has the final word on matters of constitutional dimension in Pennsylvania. Our charter . . . is not easily amended and any errant interpretation is not freely subject to correction by any co-equal branch of our government, other than this Court. For this reason, we are not constrained to closely and blindly re-affirm constitutional interpretations of prior decisions which have proven to be unworkable or badly reasoned.”); see also Commonwealth v. Dickson, 918 A.2d 95, 101 (Pa. 2007) (“we cannot simply fall back on an attenuated assertion of *sub silentio* legislative acquiescence and wash our hands of the stain” of prior erroneous interpretation of statutory language); see also Freed v.

Geisinger Med. Ctr., 5 A.3d 212 (Pa. 2010); Commonwealth v. Grant, 813 A.2d 726 (Pa. 2002).

### 3. *The Applicable Constitutional Paradigm*

The General Assembly derives its power from the Pennsylvania Constitution in Article III, Sections 1 through 27. The Constitution grants the General Assembly broad and flexible police powers embodied in a plenary authority to enact laws for the purposes of promoting public health, safety, morals, and the general welfare. See Clifton v. Allegheny County, 969 A.2d 1197, 1211 n.19 (Pa. 2009); Adams Sanitation Co., v. Dep't of Env't'l Prot., 715 A.2d 390, 395 (Pa. 1998); Gambone v. Commonwealth, 101 A.2d 634, 636-37 (Pa. 1954); accord Nat'l Fed. of Indep. Bus. v. Sebelius, 132 S.Ct. 2566, 2577-78 (2012) (federal government is one of enumerated powers; by comparison, state governments have general governance power); Dydell v. Taylor, 332 S.W.3d 848, 853 & n.3 (Mo. 2011) (same). The police power to legislate for the general welfare “embraces regulations designed to promote the public convenience or the general prosperity.” Best v. Zoning Bd. of Adjustment, 141 A.2d 606, 611 (Pa. 1958). But, when the state pursues these ends by regulating or restricting individual rights, the exercise of the police power must be reasonable and non-discriminatory. See United Artists, 635 A.2d at 616 (quoting Andress v. Zoning Bd. of Adjustment, 188 A.2d 709, 712-13 (Pa. 1963)).

Moreover, although plenary, the General Assembly’s police power is not absolute; this distinction matters. Legislative power is subject to restrictions enumerated in the Constitution and to limitations inherent in the form of government chosen by the people of this Commonwealth. See PA. CONST. art. III, §§ 28-32

(enumerating restrictions).<sup>34</sup> Specifically, ours is a government in which the people have delegated general powers to the General Assembly, but with the express exception of certain fundamental rights reserved to the people in Article I of our Constitution. See PA. CONST. art. I, § 25 (reservation of powers in people); see also Nat'l Wood Preservers, Inc. v. Commonwealth, 414 A.2d 37, 44 (Pa. 1980) (citing PA. CONST. art. I, § 27) (“maintenance of the environment is a fundamental objective of state power”). Section 25 of Article I articulates this concept in no uncertain terms: “[t]o guard against transgressions of the high powers which we have delegated, we declare that everything in this article is excepted out of the general powers of government and shall forever remain inviolate.” Accordingly, Article I of our Constitution, as a general matter, is not a discrete textual source of police power delegated to the General Assembly by the people pursuant to which legislation is enacted. See Page, supra, 58 Pa. 338 at \*7; accord Williams, 27 Okla. City U. L. Rev. at 207-08 (*inter alia*, quoting Frank P. Grad, The State Constitution: Its Function and Form for Our Time, 54 Va. L. Rev. 928, 964-65 (1968)) (given nature of state legislatures as bodies already vested with plenary powers, emphasis in state constitutions is on limitations; “very nearly everything that may be included in a state constitution operates as a restriction on the legislature, for both commands and prohibitions directed to the other branches of the government or even to the individual citizen will operate to invalidate inconsistent legislation”).<sup>35</sup>

---

<sup>34</sup> The U.S. Constitution, of course, imposes additional limitations on the exercise of the General Assembly’s police powers. See, e.g., Hughes v. Oklahoma, 441 U.S. 322 (1979) (state may not exercise power to protect natural resources in manner that conflicts with constitutional federal prerogatives); see also Allied Structural Steel Co. v. Spannaus, 438 U.S. 234, 241-42 (1978); Cleaver v. Zoning Bd. of Adjustment, 200 A.2d 408, 412 (Pa. 1964).

<sup>35</sup> A majority of the members of the Court agreed with this construction in Commonwealth v. Nat'l Gettysburg Battlefield Tower, Inc., 311 A.2d 588 (Pa. 1973) (continued...)

Article I is the Commonwealth's Declaration of Rights, which delineates the terms of the social contract between government and the people that are of such "general, great and essential" quality as to be ensconced as "inviolable." PA. CONST. art. I, Preamble & § 25; see also PA. CONST. art. I, § 2 ("All power is inherent in the people, and all free governments are founded on their authority and instituted for their peace, safety and happiness."); accord Edmunds, 586 A.2d at 896 (since 1776, Declaration of Rights has been "organic part" of Constitution, and "appear[s] (not coincidentally) first in that document"). The Declaration of Rights assumes that the rights of the people articulated in Article I of our Constitution -- vis-à-vis the government created by the people -- are inherent in man's nature and preserved rather than created by the Pennsylvania Constitution. See Appeal of Lord, 81 A.2d 533, 537 (Pa. 1951) ("right to acquire and own property, and to deal with it and use it as the owner chooses, so long as the use harms nobody, is a natural right [that] does not owe its origin to constitutions

---

(...continued)

("Gettysburg"), the first case decided by this Court involving the Environmental Rights Amendment. Mr. Justice Roberts wrote that the Commonwealth, prior to the adoption of Article I, Section 27, "possessed the inherent sovereign power to protect and preserve for its citizens the natural and historic resources now enumerated in Section 27. The express language of the constitutional amendment merely recites the 'inherent and independent rights' of mankind relative to the environment which are 'recognized and unalterably established' by Article I, Section 1 of the Pennsylvania Constitution." Id. at 595 (Roberts, J., concurring, joined by Manderino, J.); accord id. at 596 (Jones, C.J., dissenting, joined by Eagen, J.) ("As part of the declaration of rights embraced by Article I, the amendment confers certain enumerated rights upon the people of the Commonwealth and imposes upon the executive branch a fiduciary obligation to protect and enforce those rights."). To the extent that the two-Justice lead opinion in Gettysburg is susceptible to a contrary reading, that opinion is neither precedential, nor supported by the plain language of the Constitution. See id. at 592 (Opinion Announcing Judgment of Court by O'Brien, J., joined by Pomeroy, J.) (Section 27 gave General Assembly new police power to act in areas of purely esthetic or historic concern). Id.

[but] existed before them”); Appeal of White, 134 A. 409, 412 (Pa. 1926) (same); accord Edmunds, 586 A.2d at 896 (Pennsylvania’s original constitution of 1776 “reduce[d] to writing a deep history of unwritten legal and moral codes which had guided the colonists from the beginning of William Penn’s charter in 1681.”). This concept is illustrated in the basic two-part scheme of our Constitution, which has persisted since the original post-colonial document: one part establishes a government and another part limits that government’s powers. See Western Pa. Socialist Workers 1982 Campaign v. Conn. Gen. Life Ins. Co., 515 A.2d 1331, 1334-35 (Pa. 1986) (Opinion Announcing Judgment of Court) (recounting origin and evolution of Article I rights during post-colonial period). The Declaration of Rights is that general part of the Pennsylvania Constitution which limits the power of state government; additionally, “particular sections of the Declaration of Rights represent specific limits on governmental power.” Id. at 1335 (citing O’Neill v. White, 22 A.2d 25 (Pa. 1941). Commonwealth ex rel. Smillie v. McElwee, 193 A. 628 (Pa. 1937); Commonwealth ex rel. McCormick v. Reeder, 33 A. 67 (Pa. 1895)).<sup>36</sup>

---

<sup>36</sup> The Court’s recent decision in Driscoll v. Corbett, 69 A.3d 197 (Pa. 2013) recognized that, in Pennsylvania, “the concept that certain rights are inherent to mankind, and thus are secured rather than bestowed by the Constitution, has a long pedigree in Pennsylvania that goes back at least to the founding of the Republic.” Id. at 208. The Driscoll Court also spoke to, but ultimately did not need to resolve, the question of whether a constitutional provision may be held infirm because it impinged upon Article I rights, and observed that “theoretically at least, there is some possibility that a constitutional amendment might impinge on inherent, inalienable rights otherwise recognized in the Constitution itself.” Id. at 214. The theoretical tension addressed in Driscoll involved whether the right of the people as articulated in Article I of the Constitution were “inviolable” as against the will of the people as expressed elsewhere in the Constitution (in that case in Article V, Section 16(b)). That theoretical tension is not present in this matter, where the citizens are asserting constitutional protection against infringement of their rights by a governmental action -- the enactment of Act 13.

The first section of Article I “affirms, among other things, that all citizens ‘have certain inherent and inalienable rights.’” Pap’s, 812 A.2d at 603 (quoting PA. CONST. art. I, § 1). Among the inherent rights of the people of Pennsylvania are those enumerated in Section 27, the Environmental Rights Amendment:

The people have a right to clean air, pure water, and to the preservation of the natural, scenic, historic and esthetic values of the environment. Pennsylvania’s public natural resources are the common property of all the people, including generations yet to come. As trustee of these resources, the Commonwealth shall conserve and maintain them for the benefit of all the people.

PA. CONST. art. I, § 27 (Natural resources and the public estate).<sup>37</sup>

Before examining the application of Section 27 to the controversy before us, it is necessary to identify and appreciate the rights protected by this provision of the Constitution. See Saylor, 59 N.Y.U. Annual Survey of Am. L. at 309-10 (footnotes omitted) (“Methodologically, it seems to be a shared ideal that courts [conducting state constitutional analyses] should at the outset identify the constitutional value or norm at issue; and this should be accomplished via principles of state constitutional interpretation. Thus, the initial task resides in the domain of state constitutional law, encompassing the attendant debate concerning the fertility of unique state sources, content, and context as bases for independent interpretation.”). Much as is the case with other Declaration of Rights provisions, Article I, Section 27 articulates principles of relatively broad application, whose development in practice often is left primarily to the judicial and legislative branches. Accord Mesivtah Eitz Chaim of Bobov, Inc. v. Pike

---

<sup>37</sup> Unlike the Environmental Rights Amendment, the two other provisions of the Constitution that relate to the environment, which empower the Commonwealth to raise funds for conservation purposes, are included in Article VIII, addressing taxation and finance. See PA. CONST. art. VIII, §§ 15, 16.

County Bd. of Assessment Appeals, 44 A.3d 3, 7 (Pa. 2012) (“Mesivtah”) (“While the General Assembly necessarily must attempt to interpret the Constitution in carrying out its duties, the judiciary is not bound to the legislative judgment concerning the proper interpretation of constitutional terms.”). Articulating judicial standards in the realm of constitutional rights may be a difficult task, as our developing jurisprudence vis-à-vis rights affirmed in the Pennsylvania Constitution well before environmental rights amply shows. See, e.g., Pap’s, 812 A.2d at 603 (freedom of expression); In re D.M., 781 A.2d 1161 (Pa. 2001) (unreasonable searches and seizures); United Artists, 635 A.2d at 615-19 (taking without just compensation). The difficulty of the task, however, is not a ground upon which a court may or should abridge rights explicitly guaranteed in the Declaration of Rights. See Pap’s, 812 A.2d at 607 (uncertainty of constitutional rights under evolving federal standard will not deter this Court “from effectuating [a] separate judgment under the Pennsylvania Constitution”); cf. Commonwealth v. Gilmour Mfg. Co., 822 A.2d 676, 683 (Pa. 2003) (“mere administrative ease cannot justify a regulation which is inconsistent with the language and purpose of the statute”). Nor is the difficulty of articulating standards an appropriate ground upon which a court may abdicate its duty and authority to interpret the Pennsylvania Constitution. Mesivtah, 44 A.3d at 7 (“ultimate power and authority to interpret the Pennsylvania Constitution rests with the Judiciary, and in particular with this Court”). See, generally, Saylor, 59 N.Y.U. Annual Survey of Am. L. at 310 (footnotes omitted) (“Experience teaches that determining the character and scope of vital state constitutional provisions is in itself a difficult task, one that has at times been omitted, perhaps by inadvertence, for convenience, or by necessity for lack of consensus. But there is little foundation for proceeding further absent concrete grounding in some identified, fundamental value. As a threshold matter, a determination should also be made whether the salient, constitutional value is,

in some way, under-protected by the application of the prevailing rule or standard (or the absence of implementing doctrine), since, if impingement is lacking, constitutional rulemaking for the sake of implementation would be unjustified.”).

The actions brought under Section 27 since its ratification, which we will describe further below, have provided this Court with little opportunity to develop a comprehensive analytical scheme based on the constitutional provision. Moreover, it would appear that the jurisprudential development in this area in the lower courts has weakened the clear import of the plain language of the constitutional provision in unexpected ways. As a jurisprudential matter (and, as we explain below, as a matter of substantive law), these precedents do not preclude recognition and enforcement of the plain and original understanding of the Environmental Rights Amendment. See District of Columbia v. Heller, 554 U.S. 570, 625 (2008); Mayle v. Pa. Dep’t of Highways, 388 A.2d 709, 717-18 (Pa. 1978) (overruling long-standing precedent establishing judicial sovereign immunity rule justified in part upon constitutional grounds, as inconsistent with plain language of Constitution); Dickson, 918 A.2d at 108-09 (upon first opportunity to address plain language of statute, Court disapproved long-standing Superior Court precedent as inconsistent with plain language of statute); Gilmour Mfg. Co., 822 A.2d at 681 (upon first opportunity to determine whether long-standing administrative regulation is consonant with enabling statute, court found regulation inconsistent). Accord Saylor, 59 N.Y.U. Annual Survey of Am. L. at 310. The matter now before us offers appropriate circumstances to undertake the necessary explication of the Environmental Rights Amendment, including foundational matters. See Scampone, 57 A.3d at 604-05 (decisional law generally develops incrementally; we render determinations that spring from facts before us, while recognizing that task is not simply to decide this case, but also to provide guidance upon broader legal issue. “By necessity, this undertaking

requires breadth of vision and consideration of both sides of the coin: the facts of a given case on one side, and the law, which will almost always be more conceptual, on the other.”).

#### 4. *Plain language*

Initially, we note that the Environmental Rights Amendment accomplishes two primary goals, via prohibitory and non-prohibitory clauses: (1) the provision identifies protected rights, to prevent the state from acting in certain ways, and (2) the provision establishes a nascent framework for the Commonwealth to participate affirmatively in the development and enforcement of these rights. Section 27 is structured into three mandatory clauses that define rights and obligations to accomplish these twin purposes; and each clause mentions “the people.”<sup>38</sup>

A legal challenge pursuant to Section 27 may proceed upon alternate theories that either the government has infringed upon citizens’ rights or the government has failed in its trustee obligations, or upon both theories, given that the two paradigms, while serving different purposes in the amendatory scheme, are also related and overlap to a significant degree. Accord 1970 Pa. Legislative Journal-House 2269, 2272 (April 14, 1970) (Section 27 “can be viewed almost as two separate bills -- albeit there is considerable interaction between them, and the legal doctrines invoked by each should tend mutually to support and reinforce the other because of their inclusion in a single

---

<sup>38</sup> The Environmental Rights Amendment originated in the Pennsylvania House of Representatives as House Bill No. 958. The bill eventually received unanimous support in both houses and, perhaps as a direct result, its legislative record consists simply of a statement in support offered by its primary sponsor, Representative Franklin L. Kury. The statement includes a pre-adoption “Analysis of HB 958, the Proposed Pennsylvania Environmental Declaration of Rights” by Robert Broughton, Associate Professor of Law at Duquesne University Law School.

amendment.”). Facing a claim premised upon Section 27 rights and obligations, the courts must conduct a principled analysis of whether the Environmental Rights Amendment has been violated. See Payne, 361 A.2d at 273.

To determine the merits of a claim that the General Assembly’s exercise of its police power is unconstitutional, we inquire into more than the intent of the legislative body and focus upon the effect of the law on the right allegedly violated. See, e.g., Lehman v. Pa. State Police, 839 A.2d 265, 270-71 (Pa. 2003). The General Assembly’s declaration of policy does not control the judicial inquiry into constitutionality. Indeed, “for this Court to accept the notion that legislative pronouncements of benign intent can control a constitutional inquiry . . . would be tantamount to ceding our constitutional duty, and our independence, to the legislative branch.” Stilp, 905 A.2d at 945.

#### I. *First Clause of Section 27 -- Individual Environmental Rights*

According to the plain language of Section 27, the provision establishes two separate rights in the people of the Commonwealth. The first -- in the initial, prohibitory clause of Section 27 -- is the declared “right” of citizens to clean air and pure water, and to the preservation of natural, scenic, historic and esthetic values of the environment.<sup>39</sup> This clause affirms a limitation on the state’s power to act contrary to this right. While

---

<sup>39</sup> The Environmental Rights Amendment speaks of the rights of “the people.” The only other constitutional provision similarly formulated is interpreted to guarantee a constitutional right personal to each citizen. Compare PA. CONST. art. I, § 27 with PA. CONST. art. I, § 8 (“The people shall be secure in their persons, houses, papers and possessions from unreasonable searches and seizures . . . .”); see, e.g., Commonwealth v. Russo, 934 A.2d 1199 (Pa. 2007) (criminal defendant’s evidentiary challenge premised upon Section 8 of Article I); Edmunds, 586 A.2d at 898 (unlike federal counterpart, Article I, Section 8 analysis premised, *inter alia*, upon individual right to privacy); accord 1970 Pa. Legislative Journal-House 2269, 2273 (April 14, 1970) (first clause of Section 27 affirms constitutional right “in individual citizens”).

the subject of the right certainly may be regulated by the Commonwealth, any regulation is “subordinate to the enjoyment of the right . . . [and] must be regulation purely, not destruction”; laws of the Commonwealth that unreasonably impair the right are unconstitutional. Page, 58 Pa. 338 at \*8; see also Hartford Accident & Indem. Co. v. Ins. Comm’r, 482 A.2d 542, 548-49 (Pa. 1984); Butler, 328 A.2d at 855-56.

The terms “clean air” and “pure water” leave no doubt as to the importance of these specific qualities of the environment for the proponents of the constitutional amendment and for the ratifying voters. Moreover, the constitutional provision directs the “preservation” of broadly defined values of the environment, a construct that necessarily emphasizes the importance of each value separately, but also implicates a holistic analytical approach to ensure both the protection from harm or damage and to ensure the maintenance and perpetuation of an environment of quality for the benefit of future generations.

Although the first clause of Section 27 does not impose express duties on the political branches to enact specific affirmative measures to promote clean air, pure water, and the preservation of the different values of our environment, the right articulated is neither meaningless nor merely aspirational. The corollary of the people’s Section 27 reservation of right to an environment of quality is an obligation on the government’s behalf to refrain from unduly infringing upon or violating the right, including by legislative enactment or executive action. Clause one of Section 27 requires each branch of government to consider in advance of proceeding the environmental effect of any proposed action on the constitutionally protected features. The failure to obtain information regarding environmental effects does not excuse the

constitutional obligation because the obligation exists *a priori* to any statute purporting to create a cause of action.<sup>40</sup>

Moreover, as the citizens argue, the constitutional obligation binds all government, state or local, concurrently. Franklin Twp., 452 A.2d at 722 & n.8 (citing Section 27, Court stated that protection and enhancement of citizens' quality of life "is a constitutional charge which must be respected by all levels of government in the Commonwealth"); see Hartford, 482 A.2d at 549 (Declaration of Rights provision "circumscribes the conduct of state and local government entities and officials of all levels in their formulation, interpretation and enforcement of statutes, regulations, ordinances and other legislation as well as decisional law."). Meanwhile, as with any constitutional challenge, the role of the judiciary when a proper and meritorious challenge is brought to court includes the obligation to vindicate Section 27 rights. See Pap's, 812 A.2d at 611 (although Court generally looks to federal law in articulating freedom of expression constitutional jurisprudence, where federal law is unsettled, "Pennsylvania citizens should not have the contours of their fundamental rights under our charter rendered uncertain, unknowable, or changeable . . . . There is an entirely different jurisprudential and constitutional imperative at work when this Court, which is the final word on the meaning of our own charter in a properly joined case or controversy, is charged with the duty to render a judgment."); accord Pa. Legislative Journal-House at 2272 (proposed amendment is more than statement of policy; it is intended to create legally enforceable right to protect and enhance environmental quality); Franklin L. Kury, Clean Politics, Clean Streams: A Legislative Autobiography

---

<sup>40</sup> We recognize that there is existing lower court jurisprudence which suggests, to the contrary, that Section 27 rights are merely co-extensive with statutory protections. See, e.g., Larwin Multihousing Pa. Corp. v. Com., 343 A.2d 83, 89 n.9 (Pa. Cmwlth. 1975). This suggestion is discussed in more detail *infra*.

and Reflections, app. C (2011) (appendix includes copy of questions and answers document distributed to public prior to referendum on Environmental Rights Amendment).<sup>41</sup> Courts may fashion an appropriate remedy to vindicate the environmental rights at issue. See Edmunds, 586 A.2d at 905-06 (rejecting federal good faith exception to exclusionary rule -- a judicially-created remedy for constitutional violation -- in search warrant cases, and finding broader protection for privacy under Article I, Section 8 of Pennsylvania Constitution provision addressing search warrants).

Also apparent from the language of the constitutional provision are the substantive standards by which we decide a claim for violation of a right protected by the first clause of Section 27. The right to “clean air” and “pure water” sets plain conditions by which government must abide. We recognize that, as a practical matter,

---

<sup>41</sup> Among the questions and answers distributed prior to the May 18, 1971 referendum and intended to aid voters in understanding the proposed constitutional amendment was the following:

Q. Will the amendment make any real difference in the fight to save the environment?

A. Yes, once [the amendment] is passed and the citizens have a legal right to a decent environment under the State Constitution, every governmental agency or private entity, which by its actions may have an adverse effect on the environment, must consider the people’s rights before it acts. If the public’s rights are not considered, the public could seek protection of its legal rights in the environment by an appropriate law suit . . . .

Q. Will there be any “teeth” in the law, if passed?

A. It will be up to the courts to apply the three broad principles [articulated in the amendment] to legal cases. However, having this law passed will strengthen substantially the legal weapons available to protect our environment from further destruction . . . .

air and water quality have relative rather than absolute attributes. Furthermore, state and federal laws and regulations both govern “clean air” and “pure water” standards and, as with any other technical standards, the courts generally defer to agency expertise in making a factual determination whether the benchmarks were met. Accord 35 P.S. § 6026.102(4) (recognizing that General Assembly “has a duty” to implement Section 27 and devise environmental remediation standards). That is not to say, however, that courts can play no role in enforcing the substantive requirements articulated by the Environmental Rights Amendment in the context of an appropriate challenge. Courts are equipped and obliged to weigh parties’ competing evidence and arguments, and to issue reasoned decisions regarding constitutional compliance by the other branches of government. The benchmark for decision is the express purpose of the Environmental Rights Amendment to be a bulwark against actual or likely degradation of, *inter alia*, our air and water quality. Accord Montana Env’l Info. Ctr. v. Dep’t of Env’l Quality, 988 P.2d 1236, 1249 (Mont. 1999) (constitutional “inalienable . . . right to a clean and healthful environment” did not protect merely against type of environmental degradation “conclusively linked” to ill health or physical endangerment and animal death, but could be invoked to provide anticipatory and preventative protection against unreasonable degradation of natural resources).

Section 27 also separately requires the preservation of “natural, scenic, historic and esthetic values of the environment.” PA. CONST. art. I, § 27. By calling for the “preservation” of these broad environmental values, the Constitution again protects the people from governmental action that unreasonably causes actual or likely deterioration of these features. The Environmental Rights Amendment does not call for a stagnant landscape; nor, as we explain below, for the derailment of economic or social development; nor for a sacrifice of other fundamental values. But, when government

acts, the action must, on balance, reasonably account for the environmental features of the affected locale, as further explained in this decision, if it is to pass constitutional muster. Accord John C. Dernbach, Taking the Pennsylvania Constitution Seriously When It Protects the Environment: Part II – Environmental Rights and Public Trust, 104 Dickinson L. Rev. 97, 17-20 (1999).

The right delineated in the first clause of Section 27 presumptively is on par with, and enforceable to the same extent as, any other right reserved to the people in Article I. See PA. CONST. art. I, § 25 (“everything” in Article I is excepted from government’s general powers and is to remain inviolate); accord 1970 Pa. Legislative Journal-House at 2272 (“If we are to save our natural environment we must therefore give it the same Constitutional protection we give to our political environment.”); Kury, app. C (Questions and answers).<sup>42</sup> This parity between constitutional provisions may serve to limit the extent to which constitutional environmental rights may be asserted against the government if such rights are perceived as potentially competing with, for example, property rights as guaranteed in Sections 1, 9, and 10. PA. CONST. art. I, §§ 1, 9, 10, 27; see, generally, Norton v. Glenn, 860 A.2d 48, 58 (Pa. 2004) (referring to “seesawing balance between the constitutional rights of freedom of expression and of safeguarding one’s reputation: protection of one of those rights quite often leads to diminution of the

---

<sup>42</sup> The questions and answers document also explained the effect of the amendment on governmental power:

Q. Won’t the right of eminent domain still exist?

A. Yes, however, it will have to be exercised in conformity with this amendment. A highway department or utility company could not take land without fully considering the public’s right to a decent environment. [The amendment] should force a much more judicious use of eminent domain.

other”); Driscoll v. Corbett, 69 A.3d 197, 210 (Pa. 2013) (referring to “manifest need” to balance citizens’ competing constitutionally-grounded rights to equal protection of laws and to amend governing charter as they see fit).

Relatedly, while economic interests of the people are not a specific subject of the Pennsylvania Declaration of Rights, we recognize that development promoting the economic well-being of the citizenry obviously is a legitimate state interest. In this respect, and relevant here, it is important to note that we do not perceive Section 27 as expressing the intent of either the unanimous legislative sponsors or the ratifying voters to deprive persons of the use of their property or to derail development leading to an increase in the general welfare, convenience, and prosperity of the people. But, to achieve recognition of the environmental rights enumerated in the first clause of Section 27 as “inviolable” necessarily implies that economic development cannot take place at the expense of an unreasonable degradation of the environment. As respects the environment, the state’s plenary police power, which serves to promote said welfare, convenience, and prosperity, must be exercised in a manner that promotes sustainable property use and economic development. See John C. Dernbach, Taking the Pennsylvania Constitution Seriously When It Protects the Environment: Part I – An Interpretive Framework for Article I, Section 27, 103 Dickinson L. Rev. 693, 718-20 (1999); accord 1970 Pa. Legislative Journal-House at 2270 (“the measure of our progress is not just what we have but how we live, that it is not man who must adapt himself to technology but technology which must be adapted to man”).

## II. *The Second and Third Clauses of Section 27 -- The Public Trust*

The second right reserved by Section 27 is the common ownership of the people, including future generations, of Pennsylvania's public natural resources.<sup>43</sup> On its terms, the second clause of Section 27 applies to a narrower category of "public" natural resources than the first clause of the provision. The drafters, however, left unqualified the phrase public natural resources, suggesting that the term fairly implicates relatively broad aspects of the environment, and is amenable to change over time to conform, for example, with the development of related legal and societal concerns. Accord 1970 Pa. Legislative Journal-House at 2274. At present, the concept of public natural resources includes not only state-owned lands, waterways, and mineral reserves, but also resources that implicate the public interest, such as ambient air, surface and ground water, wild flora, and fauna (including fish) that are outside the scope of purely private property. See, e.g., 30 Pa.C.S. § 721 (fish: acquisition of property by Commonwealth); 34 Pa.C.S. § 103(a) (Commonwealth's ownership of game or wildlife); 71 P.S. §

---

<sup>43</sup> The sovereign's powers flowing from the fiction of public "ownership" over natural resources is limited as recognized in Hughes v. Oklahoma, 441 U.S. 322 (1979) (state may not exercise power over natural resources in manner that conflicts with constitutional federal prerogatives). Hughes overruled a prior case, Geer v. State of Conn., 161 U.S. 519 (1896), in which the Court had recognized a state's power to regulate the taking and limit out-of-state transportation of wildlife based on the premise of the sovereign's ownership of the state's wildlife. The sovereign ownership concept eroded over the years and, in Hughes, the High Court overruled Geer, stating that the state ownership doctrine was a legal fiction, which did not conform to practical realities. Hughes, 441 U.S. at 334-35. In subsequent cases, the Hughes decision has been interpreted not to modify the state government's duties to its citizens that arise under the concept of common ownership of the people or the sovereign's duties as public trustee. See, e.g., Owsichek v. State, Guide Licensing & Control Bd., 763 P.2d 488, 495 n.12 (Alaska 1988); Complaint of Steuart Transp. Co., 495 F.Supp. 38, 40 (E.D. Va. 1980) (right and duty to protect and preserve public's interest in natural wildlife resources does not derive from ownership of resources but from duty owing to the people) (citing Toomer v. Witsell, 334 U.S. 385, 408 (1948)).

1340.302(a) (acquisition and disposition of Commonwealth-owned forests). See also 35 P.S. §§ 691.1, 691.501, 691.503 (pollution of Commonwealth's waters, as broadly defined by act, is public nuisance; protection required); 35 P.S. § 1451 (public interest in quantity of water; authorizes immediate action by governor to conserve natural resources threatened by drought and forest fire); 35 P.S. §§ 4003, 4013 (violation of Air Pollution Control Act and related regulations, orders, permits is public nuisance); 35 P.S. §§ 4501, 4502 (immunity for shooting ranges in public nuisance suits for noise pollution; assumes noise pollution regulated at local level); accord Dernbach, 104 Dickinson L. Rev. at 10-11.

The legislative history of the amendment supports this plain interpretation. In its original draft, the second clause of the proposed Environmental Rights Amendment included an enumeration of the public natural resources to be protected. The resources named were “the air, waters, fish, wildlife, and the public lands and property of the Commonwealth . . . .” But, after members of the General Assembly expressed disquietude that the enumeration of resources would be interpreted “to limit, rather than expand, [the] basic concept” of public natural resources, Section 27 was amended and subsequently adopted in its existing, unrestricted, form. The drafters seemingly signaled an intent that the concept of public natural resources would be flexible to capture the full array of resources implicating the public interest, as these may be defined by statute or at common law. See 1970 Pa. Legislative Journal-House at 2271-75.

The third clause of Section 27 establishes the Commonwealth's duties with respect to Pennsylvania's commonly-owned public natural resources, which are both negative (*i.e.*, prohibitory) and affirmative (*i.e.*, implicating enactment of legislation and regulations). The provision establishes the public trust doctrine with respect to these

natural resources (the corpus of the trust), and designates “the Commonwealth” as trustee and the people as the named beneficiaries. Payne, 361 A.2d at 272. The terms of the trust are construed according to the intent of the settlor which, in this instance, is “the people.” See Estate of Sykes, 383 A.2d 920, 921 (Pa. 1978) (“To ascertain this intent, a court examines the words of the instrument and, if necessary, the scheme of distribution, the circumstances surrounding execution of the [instrument] and other facts bearing on the question.”).

“Trust” and “trustee” are terms of art that carried legal implications well developed at Pennsylvania law at the time the amendment was adopted. Accord 1 Pa.C.S. § 1903(a) (technical words that have acquired peculiar and appropriate meaning to be interpreted according to such meaning); Michigan Coalition of State Employee Unions v. Michigan Civil Serv. Comm’n, 634 N.W.2d 692, 698 (Mich. 2001) (“[I]f a constitutional phrase is a technical legal term or a phrase of art in the law, the phrase will be given the meaning that those sophisticated in the law understood at the time of enactment unless it is clear from the constitutional language that some other meaning was intended.”). The statement offered in the General Assembly in support of the amendment explained the distinction between the roles of proprietor and trustee in these terms:

Under the proprietary theory, government deals at arms['] length with its citizens, measuring its gains by the balance sheet profits and appreciation it realizes from its resources operations. Under the trust theory, it deals with its citizens as a fiduciary, measuring its successes by the benefits it bestows upon all its citizens in their utilization of natural resources under law.

1970 Pa. Legislative Journal-House at 2273. See also Nat’l Audubon Soc’y v. Superior Court, 658 P.2d 709, 724 (Cal. 1983) (“[P]ublic trust is more than an affirmation of state power to use public property for public purposes. It is an affirmation of the duty of the

state to protect the people's common heritage of streams, lakes, marshlands and tidelands, surrendering that right of protection only in rare cases when the abandonment of that right is consistent with the purposes of the trust.""). The trust relationship does not contemplate a settlor placing blind faith in the uncontrolled discretion of a trustee; the settlor is entitled to maintain some control and flexibility, exercised by granting the trustee considerable discretion to accomplish the purposes of the trust. See Lang v. Commonwealth, 528 A.2d 1335, 1345 (Pa. 1987). An exposition here is not necessary on all the ramifications that the term trustee may have in the context of Section 27. As in our discussion of the Environmental Rights Amendment generally, we merely outline foundational principles relevant to our disposition of this matter. See Scampone, supra.

This environmental public trust was created by the people of Pennsylvania, as the common owners of the Commonwealth's public natural resources; this concept is consistent with the ratification process of the constitutional amendment delineating the terms of the trust. The Commonwealth is named trustee and, notably, duties and powers attendant to the trust are not vested exclusively in any single branch of Pennsylvania's government. The plain intent of the provision is to permit the checks and balances of government to operate in their usual fashion for the benefit of the people in order to accomplish the purposes of the trust. This includes local government. See Franklin Twp., 452 A.2d at 722 & n.7; accord Geer v. State of Conn., 161 U.S. 519, 529 (1896) (with development of free institutions, power lodged in state is to be exercised "as trust for the benefit of the people, and not as a prerogative for the advantage of the government as distinct from the people, or for the benefit of private individuals as distinguished from the public good") overruled on other grounds by Hughes v. Oklahoma, 441 U.S. 322 (1979) (see explanatory footnote 43, *supra*).

As trustee, the Commonwealth is a fiduciary obligated to comply with the terms of the trust and with standards governing a fiduciary's conduct. The explicit terms of the trust require the government to "conserve and maintain" the corpus of the trust. See PA. CONST. art. I, § 27. The plain meaning of the terms conserve and maintain implicates a duty to prevent and remedy the degradation, diminution, or depletion of our public natural resources. As a fiduciary, the Commonwealth has a duty to act toward the corpus of the trust -- the public natural resources -- with prudence, loyalty, and impartiality. See In re Mendenhall, 398 A.2d 951, 953 (Pa. 1979) (citing RESTATEMENT (SECOND) OF TRUSTS § 174) (duty of prudence generally requires trustee to exercise ordinary skill, prudence, and caution in managing corpus of trust); Lang, supra, 528 A.2d at 1342 (citing RESTATEMENT (SECOND) OF TRUSTS § 170) (trustee has duty of loyalty to administer trust solely in beneficiary's interest and not his own); In re Hamill's Estate, 410 A.2d 770, 773 (Pa. 1980) (citing RESTATEMENT (SECOND) OF TRUSTS § 232) (trustee has duty of impartiality).

As the parties here illustrate, two separate Commonwealth obligations are implicit in the nature of the trustee-beneficiary relationship. The first obligation arises from the prohibitory nature of the constitutional clause creating the trust, and is similar to other negative rights articulated in the Declaration of Rights. Stated otherwise, the Commonwealth has an obligation to refrain from performing its trustee duties respecting the environment unreasonably, including via legislative enactments or executive action. As trustee, the Commonwealth has a duty to refrain from permitting or encouraging the degradation, diminution, or depletion of public natural resources, whether such degradation, diminution, or depletion would occur through direct state action or indirectly, *e.g.*, because of the state's failure to restrain the actions of private parties. In this sense, the third clause of the Environmental Rights Amendment is complete

because it establishes broad but concrete substantive parameters within which the Commonwealth may act. Compare PA. CONST. art. I, § 27 with, e.g., PA. CONST. art. I, § 28. This Court perceives no impediment to citizen beneficiaries enforcing the constitutional prohibition in accordance with established principles of judicial review. See, e.g., Adoption of Walker, 360 A.2d at 605-06 (Adoption Act provision is unconstitutional because it denies unwed fathers parental privileges accorded to unwed mothers solely on basis of gender, in violation of Article I, Section 28, which states that “[e]quality of rights under the law shall not be denied or abridged in the Commonwealth of Pennsylvania because of the sex of the individual”); Hartford, 482 A.2d at 549 (insurance commissioner’s decision to rescind approval of company’s gender-based rate schedule proper because commissioner had duty to interpret statutory language prohibiting “unfairly discriminatory rates” to include Article I, Section 28 gender-based considerations).

The second obligation peculiar to the trustee is, as the Commonwealth recognizes, to act affirmatively to protect the environment, via legislative action. Accord Geer, 161 U.S. at 534 (trusteeship for benefit of state’s people implies legislative duty “to enact such laws as will best preserve the subject of the trust, and secure its beneficial use in the future to the people of the state”). The General Assembly has not shied from this duty; it has enacted environmental statutes, most notably the Clean Streams Act, see 35 P.S. § 691.1 *et seq.*; the Air Pollution Control Act, see 35 P.S. § 4001 *et seq.*; and the Solid Waste Management Act, see 35 P.S. § 6018.101 *et seq.* As these statutes (and related regulations) illustrate, legislative enactments serve to define regulatory powers and duties, to describe prohibited conduct of private individuals and entities, to provide procedural safeguards, and to enunciate technical standards of environmental protection. These administrative details are appropriately addressed by

legislation because, like other “great ordinances” in our Declaration of Rights, the generalized terms comprising the Environmental Rights Amendment do not articulate them.<sup>44</sup> The call for complementary legislation, however, does not override the otherwise plain conferral of rights upon the people. Accord Jose L. Fernandez, State Constitutions, Environmental Rights Provisions, and the Doctrine of Self-Execution: A Political Question?, 17 Harv. Envtl. L. Rev. 333, 352 (1993) (if constitutional provision appears to be complete and enforceable, language inviting legislative action should not be interpreted “as expressing an intent to withhold enforcement until the legislature acts”). See, e.g., PA. CONST. art. I, § 11 (“All courts shall be open; and every man for an injury done him in his lands, goods, person or reputation shall have remedy by due course of law, and right and justice administered without sale, denial or delay. Suits may be brought against the Commonwealth in such manner, in such courts and in such cases as the Legislature may by law direct.”); Mayle, 388 A.2d at 717-18 (Article I, Section 11 affirms right to remedy by due course of law and second clause, which preserves for General Assembly opportunity to make Commonwealth immune in certain cases, does not establish sovereign immunity as “constitutional rule unless the Legislature decides otherwise.”).

Of course, the trust’s express directions to conserve and maintain public natural resources do not require a freeze of the existing public natural resource stock; rather, as with the rights affirmed by the first clause of Section 27, the duties to conserve and maintain are tempered by legitimate development tending to improve upon the lot of Pennsylvania’s citizenry, with the evident goal of promoting sustainable development.

---

<sup>44</sup> Mr. Justice Holmes famously used the phrase “great ordinances” to describe the provisions of the Bill of Rights of the U.S. Constitution. Springer v. Philippine Islands, 277 U.S. 189, 209 (1928) (Holmes, J., dissenting, joined by Brandeis, J.). Accord Vreeland v. Byrne, 370 A.2d 825, 831-32 (N.J. 1977).

Accord 1970 Pa. Legislative Journal-House at 2273; Nat'l Audubon Soc'y, 658 P.2d at 727-29 (public trust doctrine permits sovereign to utilize trust resources required for prosperity and habitability of state, even if uses harm trust corpus; but, before state courts and agencies approve use of trust resources, they must consider effect of use upon public trust interests and attempt, so far as feasible, to avoid or minimize any harm to those interests; in that dispute, absence of “objective study” of impact on natural resource was deemed to hamper proper decision).

Within the public trust paradigm of Section 27, the beneficiaries of the trust are “all the people” of Pennsylvania, including generations yet to come. The trust’s beneficiary designation has two obvious implications: first, the trustee has an obligation to deal impartially with all beneficiaries and, second, the trustee has an obligation to balance the interests of present and future beneficiaries. See In re Hamill’s Estate, 410 A.2d 770, 773 (Pa. 1980) (citing RESTATEMENT (SECOND) OF TRUSTS § 232). Dealing impartially with all beneficiaries means that the trustee must treat all equitably in light of the purposes of the trust. Accord 20 Pa.C.S. § 7773.<sup>45</sup> Here, the duty of impartiality implicates questions of access to and distribution of public natural resources, including consumable resources such as water, fish, and game. See Dernbach, 104 Dickinson L. Rev. at 14. The second, cross-generational dimension of Section 27 reinforces the conservation imperative: future generations are among the beneficiaries entitled to equal access and distribution of the resources, thus, the trustee cannot be short-sighted. Accord 1970 Pa. Legislative Journal-House at 2273 (“[s]ince the public trust

---

<sup>45</sup> Although the Environmental Rights Amendment creates an express trust that is presumptively subject to the Uniform Trust Act, see 20 Pa.C.S. §§ 7702, 7731, the “ultimate power and authority to interpret” the constitutional command regarding the purposes and obligations of the public trust created by Section 27 “rests with the Judiciary, and in particular with this Court.” Mesivtah, 44 A.3d at 7.

doctrine would implicitly preclude the wasting of resources, the explicit inclusion of future generations as part of the relevant public might be considered superfluous,” although situations may arise where such inclusion may prove wise). Moreover, this aspect of Section 27 recognizes the practical reality that environmental changes, whether positive or negative, have the potential to be incremental, have a compounding effect, and develop over generations. The Environmental Rights Amendment offers protection equally against actions with immediate severe impact on public natural resources and against actions with minimal or insignificant present consequences that are actually or likely to have significant or irreversible effects in the short or long term. See id.<sup>46</sup>

### 5. *Other Considerations*

Section 27 is explicit regarding the respective rights of the people and obligations of the Commonwealth, and considerations upon which we typically rely in statutory construction confirm our development of the basic principles enunciated by its drafters. Among the relevant considerations are the occasion and necessity for the constitutional provision, the legislative history and circumstances of enactment and ratification, the

---

<sup>46</sup> In undertaking its constitutional cross-generational analysis, the Commonwealth trustee should be aware of and attempt to compensate for the inevitable bias toward present consumption of public resources by the current generation, reinforced by a political process characterized by limited terms of office. See Barton H. Thompson Jr., Environmental Policy and State Constitutions: The Potential Role of Substantive Guidance, 27 Rutgers L.J. 863, 900-01 (1996); see, e.g., Fox, 342 A.2d at 482 (“The only environmental result from which any serious injury might result is the possible future loss of current open space to future residential and commercial development, which may be a remote consequence of the installation of the sewer lines. This, however, is not the type of harm which would justify the [Department of Environmental Protection] in now refusing a sewer construction permit, and, as to current pollution, of course, the [Environmental Hearing Board] has clearly found that such would be kept to a minimum.”).

mischief to be remedied and the object to be attained. See Omar, 981 A.2d at 185; 1 Pa.C.S. § 1921(c).

It is not a historical accident that the Pennsylvania Constitution now places citizens' environmental rights on par with their political rights. Approximately three and a half centuries ago, white pine, Eastern hemlock, and mixed hardwood forests covered about 90 percent of the Commonwealth's surface of over 20 million acres. The Pennsylvania Lumber Museum, History, online at [www.lumbermuseum.org/history.php](http://www.lumbermuseum.org/history.php) (last accessed on May 23, 2013). Two centuries later, the state experienced a lumber harvesting industry boom that, by 1920, had left much of Pennsylvania barren. "Loggers moved to West Virginia and to the lake states, leaving behind thousands of devastated treeless acres," abandoning sawmills and sounding the death knell for once vibrant towns. Regeneration of our forests (less the diversity of species) has taken decades. See id.; accord Pa. Dep't of Env'tl. Protection, Pennsylvania Forestry, online at [www.portal.state.pa.us/portal/server.pt?open=514&objID=588459&mode=2](http://www.portal.state.pa.us/portal/server.pt?open=514&objID=588459&mode=2) (last accessed on May 23, 2013).

Similarly, by 1890, "game" wildlife had dwindled "as a result of deforestation, pollution and unregulated hunting and trapping." Pa. Game Comm'n, About the Pennsylvania Game Commission, online at [www.portal.state.pa.us/portal/server.pt?open=514&objID=983474&mode=2](http://www.portal.state.pa.us/portal/server.pt?open=514&objID=983474&mode=2) (last accessed on May 23, 2013). As conservationist John M. Phillips<sup>47</sup> wrote, "In 1890, the

---

<sup>47</sup> John M. Phillips (1861-1953) of Pittsburgh, Pennsylvania, was a founder and long-time president of the Phillips Mine Supply Company. He was also a long-term president of the Board of Game Commissioners of Pennsylvania; a trustee of the American Wildlife Institute; and a member of the National Executive Board of the Boy Scouts of America. Pa. Hist. & Museum Comm'n, The Pennsylvania State Archives, online at [www.phmc.state.pa.us/bah/dam/mg/mg161.htm](http://www.phmc.state.pa.us/bah/dam/mg/mg161.htm) (last accessed on May 23, 2013).

game had practically disappeared from our state. . . . We had but few game laws and those were supposed to be enforced by township constables, most of whom were politicians willing to trade with their friends the lives of our beasts and birds in exchange for votes.” Explore Pa. History, First State Game Lands Historical Marker, online at <http://explorepahistory.com/hmarker.php?markerId=1-A-140> (last accessed on May 23, 2013). In 1895, the General Assembly created the Pennsylvania Game Commission and, two years later, adopted a package of new game laws to protect endangered populations of deer, elk, waterfowl, and other game birds. Over the following decades, the Game Commission sought to restore populations of wildlife, by managing and restocking species endangered or extinct in Pennsylvania, establishing game preserves in state forests, and purchasing state game lands. Sustained efforts of the Game Commission over more than a century (coupled with restoration of Pennsylvania’s forests) returned a bounty of wildlife to the Commonwealth. See id.; see also Pa. Game Comm’n, Wildlife Conservation History (1643 to Present), online at [www.portal.state.pa.us/portal/server.pt?open=514&objID=683433&mode=2](http://www.portal.state.pa.us/portal/server.pt?open=514&objID=683433&mode=2) (last accessed on May 23, 2013).

The third environmental event of great note was the industrial exploitation of Pennsylvania’s coalfields from the middle of the nineteenth well into the twentieth century. During that time, the coal industry and the steel industry it powered were the keystone of Pennsylvania’s increasingly industrialized economy. See Pa. Dep’t of Env’tl. Protection, Operation Scarlift: The After Effects of Over 100 Years of Coal Mining in Pennsylvania and Current Programs to Combat Them (1967), online at [www.portal.state.pa.us/portal/server.pt/community/mine\\_reclamation\\_-\\_operation\\_scarlift](http://www.portal.state.pa.us/portal/server.pt/community/mine_reclamation_-_operation_scarlift) (last accessed on May 23, 2013). The two industries provided employment for large numbers of people and delivered tremendous opportunities for

small and large investors. “[W]hen coal was a reigning monarch,” the industry operated “virtually unrestricted” by either the state or federal government. The result, in the opinion of many, was devastating to the natural environment of the coal-rich regions of the Commonwealth, with long-lasting effects on human health and safety, and on the esthetic beauty of nature. These negative effects include banks of burning or non-burning soft sooty coal and refuse; underground mine fires; pollution of waters from acid mine drainage; subsidence of the soil; and landscapes scarred with strip mining pits and acid water impoundments. See id. In the mid-1960s, the Commonwealth began a massive undertaking to reclaim over 250,000 acres of abandoned surface mines and about 2,400 miles of streams contaminated with acid mine drainage, which did not meet water quality standards. See Pa. Dep’t of Env’tl. Protection, Pennsylvania’s Comprehensive Plan for Abandoned Mine Reclamation (1998), online at [www.portal.state.pa.us/portal/server.pt?open=514&objID=588910&mode=2](http://www.portal.state.pa.us/portal/server.pt?open=514&objID=588910&mode=2) (last accessed on May 23, 2013). The cost of projects to date has been in the hundreds of millions of dollars, and the Department of Environmental Protection has predicted that an estimated 15 billion dollars is in fact necessary to resolve the problem of abandoned mine reclamation alone. Id.

The overwhelming tasks of reclamation and regeneration of the Commonwealth’s natural resources, along with localized environmental incidents (such as the 1948 Donora smog tragedy in which twenty persons died of asphyxiation and 7,000 persons were hospitalized because of corrosive industrial smoke; the 1959 Knox Mine disaster in which the Susquehanna River disappeared into the Pittston Coal Vein; the 1961 Glen Alden mine water discharge that killed more than 300,000 fish; and the Centralia mine fire that started in 1962, is still burning, and led to the relocation of all residents in 1984) has led to the gradual enactment of statutes protecting our environment. The drafters of

the Environmental Rights Amendment recognized and acknowledged the shocks to our environment and quality of life:

We seared and scarred our once green and pleasant land with mining operations. We polluted our rivers and our streams with acid mine drainage, with industrial waste, with sewage. We poisoned our 'delicate, pleasant and wholesome' air with the smoke of steel mills and coke ovens and with the fumes of millions of automobiles. We smashed our highways through fertile fields and thriving city neighborhoods. We cut down our trees and erected eyesores along our roads. We uglified our land and we called it progress.

1970 Pa. Legislative Journal-House at 2270 (quoting anonymous 1698 description of Penn's Woods air).

With these events in the recent collective memory of the General Assembly, the proposed Environmental Rights Amendment received the unanimous assent of both chambers during both the 1969-1970 and 1971-1972 legislative sessions. See Joint Resolution No. 4 of 1970, H.B. No. 958 & Joint Resolution No. 3 of 1971, H.B. No. 31 (enacted); see also PA. CONST. art. XI, § 1 (Proposal of amendments by the General Assembly and their adoption).<sup>48</sup> Pennsylvania voters ratified the proposed amendment

---

<sup>48</sup> During the 1969-1970 session (House Bill 958), the proposed amendment received 188 votes in favor and 0 against in the House, and 39 votes in favor and 0 against in the Senate; on second consideration (House Bill 31), the amendment received similar unanimous support of 199 votes in favor and 0 against in the House, and 45 votes in favor and 0 against in the Senate. Representative Kury of Northumberland, as primary sponsor of the bill, noted that the proposed amendment was "a great step forward in assuring for ourselves and our posterity a natural environment of quality, rather than relegating ourselves to extinction or a mere survival level of existence." 1970 Pa. Legislative Journal-House at 2271. Representative Kury introduced into the record with the unanimous assent of the House a statement and supplemental legal analysis from Professor Robert Broughton, which offered the anticipatory elucidation of the proposed amendment to which we cite throughout this Opinion. See id. at 2272-81.

of the citizens' Declaration of Rights on May 18, 1971, with a margin of nearly four to one, receiving 1,021,342 votes in favor and 259,979 opposed. Dernbach, 103 Dickinson L. Rev. at 695 n.2 (citing Franklin L. Kury, The Environmental Amendment to the Pennsylvania Constitution: Twenty Years Later and Largely Untested, 1 Vill. Envtl. L.J. 123, 123 (1990)); see also Gettysburg, 311 A.2d at 596 n.1 (Jones, C.J., dissenting) (amendment received more affirmative votes than any candidate seeking election to statewide office that same day).<sup>49</sup>

The decision to affirm the people's environmental rights in a Declaration or Bill of Rights, alongside political rights, is relatively rare in American constitutional law. In addition to Pennsylvania, Montana and Rhode Island are the only other states of the Union to do so. See PA. CONST. art. I, § 27 (1971); MT. CONST. art. II, § 3 (1889); R.I. CONST. art. I, § 17 (1970). Three other states -- Hawaii, Illinois, and Massachusetts -- articulate and protect their citizens' environmental rights in separate articles of their charters. See HI. CONST. art. XI, §§ 1, 9 (1978); ILL. CONST. art. XI, §§ 1, 2 (1971-72); MA. CONST. amend. 49 (1972). Of these three states, Hawaii and Illinois, unlike Pennsylvania, expressly require further legislative action to vindicate the rights of the people. By comparison, other state charters articulate a "public policy" and attendant directions to the state legislatures to pass laws for the conservation or protection of either all or enumerated natural resources. See, e.g., AK. CONST. art. VIII, §§ 1-18 (1959); COLO. CONST. art. XXVII, § 1 (1993); LA. CONST. art. IX, § 1 (1974); N.M. CONST.

---

<sup>49</sup> Pennsylvania voters considered five constitutional amendments at the referendum of May 18, 1971. Of the four other proposed amendments, two were adopted by much smaller margins than Section 27, and two were defeated. Dernbach, 103 Dickinson L. Rev. at 695 n.2 (citing Kury, 1 Vill. Envtl. L.J. at 123-24 n.2). To say the Environmental Rights Amendment was broadly supported by the people and their representatives would be an understatement.

art. XX, § 21 (1971); N.Y. CONST. art. XIV, §§ 1-5 (1941); TX. CONST. art. XVI, § 59 (1917); VA. CONST. art. XI, §§ 1-4 (1971).<sup>50</sup> Some charters address the people's rights to fish and hunt, often qualified by the government's right to regulate these activities for the purposes of conservation. See, e.g., KY. CONST. § 255A (2012); VT. CONST. Ch. II, § 67 (1777); WI. CONST. art. I, § 26 (2003). Still other state constitutions simply authorize the expenditure of public money for the purposes of targeted conservation efforts. See, e.g., OR. CONST. art. IX-H, §§ 1-6 (1970); W.V. CONST. art. VI, §§ 55, 56 (1996). Finally, many of the remaining states do not address natural resources in their organic charters at all. See, e.g., NV. CONST. art. I, § 1 *et seq.*

That Pennsylvania deliberately chose a course different from virtually all of its sister states speaks to the Commonwealth's experience of having the benefit of vast natural resources whose virtually unrestrained exploitation, while initially a boon to investors, industry, and citizens, led to destructive and lasting consequences not only for the environment but also for the citizens' quality of life. Later generations paid and continue to pay a tribute to early uncontrolled and unsustainable development financially, in health and quality of life consequences, and with the relegation to history books of valuable natural and esthetic aspects of our environmental inheritance. The drafters and the citizens of the Commonwealth who ratified the Environmental Rights

---

<sup>50</sup> Representative Kury explained that New York State's environmental amendment inspired his proposal for the Pennsylvania amendment. Kury, Clean Politics, Clean Streams, at 69. But, Kury viewed the New York amendment as "too detailed and focused on environmental matters peculiar to that state" and proposed instead an amendment that would give the natural environment the same kind of constitutional protection as had been given to political rights. Id.; compare N.Y. CONST. art. XIV, §§ 1-5 (Conservation) with PA. CONST. art. I § 27. Unlike Pennsylvania's Environmental Rights Amendment, the New York environmental conservation provisions are not part of that State's Bill of Rights. See N.Y. CONST. art. I, § 1 *et seq.*

Amendment, aware of this history, articulated the people's rights and the government's duties to the people in broad and flexible terms that would permit not only reactive but also anticipatory protection of the environment for the benefit of current and future generations. Moreover, public trustee duties were delegated concomitantly to all branches and levels of government in recognition that the quality of the environment is a task with both local and statewide implications, and to ensure that all government neither infringed upon the people's rights nor failed to act for the benefit of the people in this area crucial to the well-being of all Pennsylvanians.<sup>51</sup>

---

<sup>51</sup> We also note that natural gas industry development in the Marcellus Shale Formation affects interests of citizens of neighboring states. The Marcellus Shale Formation underlies approximately two-thirds of Pennsylvania's territory and extends to about 36 percent of the Delaware River Basin. See Delaware River Basin Comm'n, Natural Gas Drilling, online at [www.nj.gov/drbc/programs/natural/](http://www.nj.gov/drbc/programs/natural/) (last accessed on May 23, 2013). The Delaware River Basin Commission is a regional body created by compact between the federal government and the four basin states (Pennsylvania, New York, New Jersey, and Delaware) in 1961 to oversee a unified approach to managing the river system. The Commission includes the four basin state governors and the North Atlantic Division Engineer from the U.S. Army Corps of Engineers, who serves as the federal government's representative. The Commission has legal authority over water quality and water quantity-related issues throughout the Delaware River Basin.

The Commission has suggested that hydraulic fracturing techniques require large amounts of fresh water to release the natural gas. Although a significant amount of the fresh water used is recaptured, the fracking fluid "includes natural gas and chemicals added to facilitate the extraction process, as well as brine and other contaminants released from the formation." Id. In connection with natural gas drilling, the Commission identified "three major areas of concern":

1. Gas drilling projects in the Marcellus Shale or other formations may have a substantial effect on the water resources of the [Delaware River B]asin by reducing the flow in streams and/or aquifers used to supply the significant amounts of fresh water needed in the natural gas mining process.

(continued...)

### 6. Existing Jurisprudence Regarding Article I, Section 27

For the most part, to date, the promise of the Environmental Rights Amendment to protect and conserve the quality of our environment has been realized via legislative enactments and executive agency action. The question of how Article I, Section 27 obligations restrain the exercise of police power by the government (e.g., to regulate an industry), although a significant matter, has not presented itself for judicial resolution and this Court has had no opportunity to address the original understanding of the constitutional provision in this context until now. See Heller, 554 U.S. at 625-26. Subsequent to ratification, the Court entertained claims regarding the application of Section 27 in factual scenarios that generally fell within two categories: (1) challenges to specific private or governmental development projects, which implicated alleged violations of constitutional environmental rights and (2) challenges to local or statewide environmental quality laws, which implicated alleged violations of constitutional property rights. In light of the challenges, precedent has tended to define the broad constitutional rights in terms of compliance with various statutes and, as a result, to minimize the constitutional import of the Environmental Rights Amendment. Moreover, existing precedent has failed to differentiate between challenges based on whether they

---

(...continued)

2. On-site drilling operations may potentially add, discharge or cause the release of pollutants into the ground water or surface water.
3. The recovered “frac[k] water” must be treated and disposed of properly.

Id.

implicated the people's rights under the first or second clauses of Section 27, or the Commonwealth's trustee duties under the second and third clauses, or both. Courts seemingly applied the same analytical scheme to both types of challenges, which introduced additional confusion for the bench and bar and, as a practical matter, has impeded efforts to develop a coherent environmental rights jurisprudence.

### I. *Environmental Challenges to Development Projects*

The leading cases in the first category of decisions are the 1973 decision in Gettysburg, *supra*, and the 1975-76 Commonwealth Court and Supreme Court opinions in Payne, *supra*. In Gettysburg, Commonwealth parties sought to enjoin the construction of an observation tower on private property neighboring the Gettysburg Battlefield, in Cumberland Township, Adams County. 311 A.2d at 589-90. The Commonwealth parties alleged that the proposed construction disrupted the skyline, dominated the setting, and eroded and despoiled the natural beauty and historic environment of the site. Cumberland Township and Adams County, the affected local governments, had no land use legislation to restrict the development, however, and, as a result, the Commonwealth sought relief only under Article I, Section 27 of the Constitution. This Court affirmed the lower court's denial of relief. The decision of the Court was deeply divided: Messrs. Justice O'Brien and Pomeroy would have held that the Environmental Rights Amendment was not self-executing and because, in their view, the Commonwealth could not bring suit absent legislation implementing the amendment, the action had to be dismissed without reaching its merits, *id.* at 590-95; Mr. Justice Nix concurred in the result with no opinion; Messrs. Justice Roberts and Manderino, who did not specifically address the question of self-execution, would have reached the merits of the Commonwealth's claim and would have affirmed, finding no

error with the lower courts' conclusion that the Commonwealth had not carried its burden of proof, id. at 595-96; and finally, Mr. Chief Justice Jones and Mr. Justice Eagen would have held that Section 27 was self-executing and would have reversed on the merits, concluding that the evidence of record did not support the lower court's decision, id. at 597-99.<sup>52</sup> Because no majority rule or reasoning emerged from the several opinions, the Gettysburg decision offered little guidance regarding the standards applicable in deciding an Article I, Section 27 challenge.

The Court's next opportunity to address the substantive standards of proof required to obtain relief under Section 27 likewise offered little guidance. In Payne, residents of the City of Wilkes-Barre sought to enjoin the plan of the Pennsylvania Department of Transportation to widen River Street at the expense of one-half acre of the River Common, a local park; the project also required removal of several large trees

---

<sup>52</sup> One commentator has observed that, "For a constitutional provision to be self-executing, the provision must provide the court with a complete and enforceable rule . . . . [T]he constitutional language must supply a sufficient rule by means of which the right which the provision grants may be enjoyed and protected." Fernandez, 17 Harv. Envtl. L. Rev. at 333; see also Williams, 27 Okla. City U. L. Rev. at 221. On the issue of whether Section 27 of Article I was self-executing, no majority holding or reasoning emerged from the Gettysburg Court. Meanwhile, the Commonwealth Court in that case had held earlier that Section 27 was self-executing. See Commonwealth v. Nat'l Gettysburg Battlefield Tower, Inc., 302 A.2d 886, 892 (Pa. Cmwlth. 1973). The parties here do not dispute the self-executing nature of Section 27 in such terms, albeit aspects of the Commonwealth's arguments concerning justiciability implicate the point. Nor do the parties dispute that the Commonwealth may adopt legislation on the issues addressed in Section 27 pursuant to its police power. We note that the characterization of the Gettysburg Court's ultimate stance on these points in United Artists Theater Circuit, Inc. v. City of Philadelphia, 635 A.2d 612, 620 (Pa. 1993), is erroneous. In United Artists, the Court stated that "a plurality of the [Gettysburg] Court held that [Section 27] was not self-executing, and legislative action was necessary to accomplish [its] goals." In fact, only two of the seven Justices in Gettysburg subscribed to that view; two Justices concluded the opposite; and three Justices did not address the issue. The prevailing view, insofar as the Gettysburg case was concerned, was the Commonwealth Court's holding that the provision was self-executing.

and the elimination of a pedestrian walk. The residents/challengers argued that the Commonwealth violated its duties as trustee of Pennsylvania's public natural resources by approving the River Street project. In affirming the Commonwealth Court's denial of relief, this Court held, *inter alia*, that the residents had not met their burden of proof. 361 A.2d at 273. According to the Court, the residents were seeking automatic relief by merely asserting a common right to a protected value under the trusteeship of the state. But, the Court stated, the proper approach was to balance interests in conservation of natural resources and maintenance of an adequate highway system, a task that the legislation pursuant to which the River Street project had been approved, Act 120 of 1970, already accomplished. See id. (citing 71 P.S. § 511 *et seq.* (Powers and Duties of Department of Transportation)). The residents, therefore, were not entitled to relief under Section 27. Notably, however, the Court directed that in its role as trustee, the Commonwealth (via agency action) had an obligation to avoid any environmental harm if possible but, absent a feasible alternative to the proposed development, had to permit the land use "in such a way as to minimize the environmental or ecological impact of the use." Id. at 272-73.

The Payne Court also addressed a three-part test, which the Commonwealth Court had adopted to explicate the residents' burden of proof under Section 27. The Court did not adopt that test but noted that the standard was equivalent to appellate review of the agency's River Street project decision under Act 120. See id. at 273 n.23; accord Eagle Env'tl. II, 884 A.2d at 879 (although recognizing that balancing must take place, Payne Court did not require any specific balancing test between Commonwealth's duty to protect environment and other duties to public).

The Commonwealth Court in Payne, acting *en banc* and in its original jurisdiction, had dismissed the matter and entered a decree *nisi*. Payne v. Kassab, 312 A.2d 86, 97

(Pa. Cmwlth. 1973). Notably, the court held that Section 27 was intended to allow “controlled development of resources rather than no development,” and rejected the residents’ argument that Section 27 had to be read in absolute terms so as to require an injunction any time a historical area was affected by a proposed development. In the court’s formulation, relief under Section 27 required consideration of the following factors: “(1) Was there compliance with all applicable statutes and regulations relevant to the protection of the Commonwealth’s public natural resources? (2) Does the record demonstrate a reasonable effort to reduce the environmental incursion to a minimum? (3) Does the environmental harm which will result from the challenged decision or action so clearly outweigh the benefits to be derived therefrom that to proceed further would be an abuse of discretion?” Id. at 94. Applying the test it devised, the Commonwealth Court concluded that the River Street project was constitutionally permissible. Subsequently, the court entered a final decree upon its earlier decision, Payne v. Kassab, 323 A.2d 407 (Pa. Cmwlth. 1974); that decision was appealed by the residents and, as explained, our Court affirmed without elaborating further on the applicable substantive standards for obtaining Section 27 relief.

In subsequent cases implicating Section 27 challenges, the Commonwealth Court has generally applied its Payne test to a wide array of factual circumstances. See, e.g., Energy Conservation Council of Pa. v. Pub. Util. Comm’n, 25 A.3d 440, 453 (Pa. Cmwlth. 2011) (Public Utility Commission did not violate Section 27 by approving power line project and permitting construction to begin before receipt of National Park Service permit); Concerned Residents of Yough, Inc. v. Dep’t of Env’tl. Res., 639 A.2d 1265, 1274-75 (Pa. Cmwlth. 1994) (citizens have no Section 27 claim based on esthetic and noise concerns relating to use of property by solid waste management facility; Solid Waste Management Act regulates every aspect of solid waste disposal and balanced

environmental concerns through legislative process); see also Borough of Moosic v. Pa. Pub. Util. Comm'n, 429 A.2d 1237 (Pa. Cmwlth. 1981); Fox, supra, 342 A.2d 468. Notably, although the test was developed in the context of a challenge pursuant to the second and third clauses of Section 27 (implicating trustee duties), the Commonwealth Court has applied it irrespective of the type of environmental rights claim raised.

More importantly, the Payne test appears to have become, for the Commonwealth Court, the benchmark for Section 27 decisions in lieu of the constitutional text. In its subsequent applications, the Commonwealth Court has indicated that the viability of constitutional claims premised upon the Environmental Rights Amendment was limited by whether the General Assembly had acted and by the General Assembly's policy choices, rather than by the plain language of the amendment. See, e.g., Larwin Multihousing Pa. Corp. v. Com., 343 A.2d 83, 89 n.9 (Pa. Cmwlth. 1975) ("It is difficult to understand what protections are afforded by [Section 27] not already supplied by the township zoning ordinance and the comprehensive statutes of the Commonwealth concerning streams, air pollution and sewage disposal."). But, while the Payne test may have answered a call for guidance on substantive standards in this area of law and may be relatively easy to apply, the test poses difficulties both obvious and critical. First, the Payne test describes the Commonwealth's obligations -- both as trustee and under the first clause of Section 27 - - in much narrower terms than the constitutional provision. Second, the test assumes that the availability of judicial relief premised upon Section 27 is contingent upon and constrained by legislative action. And, finally, the Commonwealth Court's Payne decision and its progeny have the effect of minimizing the constitutional duties of executive agencies and the judicial branch, and circumscribing the abilities of these entities to carry out their constitutional duties independent of legislative control. Accord

Fernandez, 17 Harv. Envtl. L. Rev. at 358 (“When a state court declines to enforce a constitutional provision on the ground that it is not self-executing, it restricts its own role in the governing process.”); see, e.g., Borough of Moosic, supra; Fox, supra.<sup>53</sup> The branches of government have independent constitutional duties pursuant to the Environmental Rights Amendment, as these duties are interpreted by the judicial branch and this Court in particular. See Mesivtah, 44 A.3d at 7. Because of these critical difficulties, we conclude that the non-textual Article I, Section 27 test established in

---

<sup>53</sup> In Fox, for example, the Commonwealth Court held that the decision of the former Department of Environmental Resources to grant a permit to run a sewer extension line along a stream was proper under the Clean Streams Act. The panel therefore vacated the decision of the Environmental Quality Board, which had remanded the matter to the Department for consideration, in light of the Department’s constitutional trustee duties, of the impact on constitutional environmental values of the proposed development. In the panel’s view, while the Department could consider such impact pursuant to other environmental statutes, the review of a permit decision under the Clean Streams Act was more limited. According to the Commonwealth Court, the Board’s decision would have required the Department to overstep its statutory authority under the Clean Streams Act, an action which the Environmental Rights Amendment did not authorize. 342 A.2d at 482-83. The Commonwealth Court’s conclusions that the Amendment limits rather than expands executive agency authority, and that executive agency authority to act is limited by its enabling legislation, are certainly reasonable. The difficulty with the Fox decision is in how the court went about reaching those conclusions. Thus, the Commonwealth Court indicated that satisfying the Payne test (pursuant to which legislative enactments are deemed to delineate the parameters of constitutional trustee duties, rather than the plain language of the constitutional provision) was sufficient to dispose of any constitutional challenge to an agency decision. The court seemingly relieved executive agencies of the obligation to apply statutes and exercise their statutory discretion in a manner consonant with the Constitution, indicating that mere compliance with the enabling statute and relevant regulations was sufficient to satisfy constitutional strictures. See Hartford, 482 A.2d at 549. The Commonwealth Court’s subsequent application of Fox in Borough of Moosic reflects this narrow understanding of an agency’s constitutional duties. 429 A.2d at 1240 (borough has no standing to intervene and present evidence of environmental harm to Public Utility Commission because consideration of constitutional environmental concerns falls outside Commission’s statutory authority).

Payne and its progeny is inappropriate to determine matters outside the narrowest category of cases, *i.e.*, those cases in which a challenge is premised simply upon an alleged failure to comply with statutory standards enacted to advance Section 27 interests.

## II. *Challenges that Implicate a Balancing of Article I Rights*

In a second line of decisions, our Court has addressed challenges to environmental legislation intended to protect the rights articulated in the Environmental Rights Amendment. In these matters, the Court has generally cited Section 27 as stating a public policy favoring environmental interests which the legislation sought to implement. See, e.g., Nat'l Wood Preservers, Inc., supra, 414 A.2d 37. In National Wood Preservers, owners leased a property for use by a business interest using chemicals to preserve wood. The business disposed of waste liquids containing toxic chemicals by discharging them into a well, which drained into the groundwater beneath the property and then into a nearby stream. Following an investigation, the then Department of Environmental Resources ordered the owners and the business enterprise to abate the harmful condition, pursuant to Section 316 of the Clean Streams Law. Id. at 39-40 (citing 35 P.S. § 691.1). On appeal, this Court held that the agency orders were appropriate under Section 316. The Court, *inter alia*, rejected the appellants' argument that Section 316 was an impermissible exercise of police power, holding that enforcement of the provision did not constitute a taking under Article I, Section 10 of the Pennsylvania Constitution and the Fourteenth Amendment of the U.S. Constitution. According to the Court, in adopting the provision, the General Assembly acted in the interest of the public because "maintenance of the environment is a fundamental objective of state power," and a duty imposed upon the Commonwealth.

Id. at 44 (citing PA. CONST. art. I, § 27). The Court also rejected the argument that Section 316 was an oppressive exercise of the police power, and held that ownership or occupancy were sufficient predicates for requiring corrective orders under the circumstances: “[t]he notion of fault is least functional . . . when balancing the interests of a state in the exercise of its police power, because the beneficiary is not an individual but the community.” Id. at 47 n.18. See also Commonwealth v. Blosenski Disposal Serv., 566 A.2d 845 (Pa. 1989) (warrantless inspection provisions of Solid Waste Management Act did not violate search and seizure clause of Pennsylvania Constitution, Article I, Section 8, especially because provision implements Section 27); Commonwealth v. Parker White Metal Co., 515 A.2d 1358, 1370 (Pa. 1986) (provisions of Solid Waste Management Act creating criminal sanctions allowing prosecutorial discretion did not violate equal protection clause of Pennsylvania Constitution, Article I, Section 26, but provided flexible and effective means to enforce statute that implements Section 27).

In 1993, the Court rejected another challenge to the constitutionality of legislation adopted to vindicate Section 27 rights. See United Artists, 635 A.2d at 614. Appellant, the owner of the Boyd Theater in Philadelphia, challenged the historic landmark designation of the interior and exterior of the theater as a violation of the takings clauses of the Pennsylvania and U.S. Constitutions. On appeal, this Court vacated the historical designation order because the City had exceeded the scope of its statutory authority by designating the interior of the theater historic. In doing so, the Court nevertheless expressly upheld the constitutionality of the local ordinance, holding that the ordinance did not constitute a taking under either the U.S. Constitution or the Pennsylvania Constitution. Id. at 614-15 (citing Penn Central Transp. Co. v. New York City, 438 U.S. 104, 128-29 (1978)). The Court also rejected the contention that the Pennsylvania

Constitution guaranteed more expansive rights than its federal counterpart with respect to governmental takings. In undertaking its analysis under the then-recent decision in Edmunds, *supra*, which reinvigorated Pennsylvania constitutional law, the Court noted that Section 27 “reflects a state policy encouraging the preservation of historic and aesthetic resources” and that the local ordinance was consistent with the policy. Id. at 620.

Generally, litigation efforts of private interests to limit the exercise of the General Assembly’s police power to protect the environment by asserting competing constitutional rights have been unsuccessful, in recognition of the Section 27 imperative. This second line of precedents is consistent with an interpretation of the Environmental Rights Amendment as encompassing a duty of the General Assembly to act in a manner that protects Pennsylvania’s public natural resources from degradation and diminution.

### III. *The Limitations of Existing Decisional Law in Light of the Present Dispute*

Nothing in this Court’s precedent offers substantive and controlling guidance with respect to the type of claims that the citizens assert in this matter. The two lines of cases described above illustrate simply that the legislative and executive branches have taken the initiative in adding substance to the rights guaranteed by Section 27, as the drafters of the constitutional provision anticipated. Contrary to the same drafters’ expectations, however, the provision has not yet led to the development of an environmental rights jurisprudence comparable to the tradition of political rights jurisprudence. The absence of such jurisprudence, however, does nothing to diminish the textual, organic rights. See Pap’s, 812 A.2d at 605 (absence of earlier jurisprudence involving freedom of expression under Pennsylvania Constitution may be

explained by fact that “Pennsylvania legislators, executives, and judges were all true to their oaths of fidelity to our Constitution”). In any event, this Court has an obligation to vindicate the rights of its citizens where the circumstances require it and in accordance with the plain language of the Constitution. Id.

### **B. The Relevant Provisions of Act 13**

The adoption of Act 13 by the General Assembly accomplished the first major overhaul in nearly three decades of Title 58 of the Pennsylvania Consolidated Statutes, the Oil and Gas Act. The General Assembly declared its intent to permit optimal development of the Commonwealth’s oil and gas resources, to protect the safety of personnel and facilities in covered industries, to protect the safety and property rights of persons residing in areas hosting oil and gas operations, and to protect natural resources, environmental rights and values secured by the Constitution of Pennsylvania. See 58 Pa.C.S. § 3202 (Declaration of purpose of chapter). Act 13 was initially introduced in the House of Representatives (House Bill 1950), where it was adopted on November 17, 2011, by a vote of 107 to 76. On December 14, 2011, the Senate adopted an amended bill by a vote of 28 to 22. Because the House did not concur in the amendments and the Senate insisted on the amendments, House Bill 1950 was sent to a conference committee on February 6, 2012. The conference committee adopted its report the same day and presented it to the two legislative houses on February 7, 2012. Against some protests that the call for votes did not permit further debate and amendment (see, e.g., 2012 Pa. Legislative Journal -- Senate 105, 108), the Senate adopted the conference committee’s report on February 7, 2012, by a vote of 31 to 19, and the House adopted the same report on February 8, 2012, by

a vote of 101 to 90. The General Assembly sent the bill to Governor Corbett on February 10, 2012, and the Governor signed it on February 14, 2012.

On appeal to this Court, the citizens request that we declare Act 13 unconstitutional in its entirety. This request for relief is premised primarily upon claims that discrete provisions central to Act 13 are unconstitutional: Sections 3303, 3304, and 3215(b)(4) and (d); but, the citizens also address other provisions, *i.e.*, Sections 3305 through 3309. 58 Pa.C.S. §§ 3303-3309; 3215(b), (d).<sup>54</sup>

The Chapter 33 provisions -- Sections 3303 through 3309 -- address local ordinances relating to oil and gas operations. Section 3303 states that “environmental acts are of Statewide concern and, to the extent that they regulate oil and gas operations, occupy the entire field of regulation, to the exclusion of all local ordinances.” The General Assembly’s stated intent in Act 13 is to preempt and supersede “local regulation of oil and gas operations regulated by the [statewide] environmental acts, as provided in this chapter[, Chapter 33].”

In addition, Section 3304 institutes uniformity among local ordinances Commonwealth-wide, to allow, as stated, for “the reasonable development of oil and gas resources,” by both precluding local governments from acting in certain ways, and then requiring local government to take certain dictated actions while approving and permitting oil and gas operations within the parameters articulated by the provision. Section 3304 thus commands that all political subdivisions:

- (1) Shall allow well and pipeline location assessment operations, including seismic operations and related activities conducted in accordance with all applicable Federal and State laws and regulations relating to the

---

<sup>54</sup> The citizens also raise discrete claims implicating other provisions of Act 13, which we will address in part IV of this Opinion (Other Claims).

storage and use of explosives throughout every local government.

(2) May not impose conditions, requirements or limitations on the construction of oil and gas operations that are more stringent than conditions, requirements or limitations imposed on construction activities for other industrial uses within the geographic boundaries of the local government.

(3) May not impose conditions, requirements or limitations on the heights of structures, screening and fencing, lighting or noise relating to permanent oil and gas operations that are more stringent than the conditions, requirements or limitations imposed on other industrial uses or other land development within the particular zoning district where the oil and gas operations are situated within the local government.

(4) Shall have a review period for permitted uses that does not exceed 30 days for complete submissions or that does not exceed 120 days for conditional uses.

(5) Shall authorize oil and gas operations, other than activities at impoundment areas, compressor stations and processing plants, as a permitted use in all zoning districts.

(5.1) Notwithstanding section 3215 (relating to well location restrictions), may prohibit, or permit only as a conditional use, wells or well sites otherwise permitted under paragraph (5) within a residential district if the well site cannot be placed so that the wellhead is at least 500 feet from any existing building. In a residential district, all of the following apply:

(i) A well site may not be located so that the outer edge of the well pad is closer than 300 feet from an existing building.

(ii) Except as set forth in paragraph (5) and this paragraph, oil and gas operations, other than the placement, use and repair of oil and gas pipelines, water pipelines, access roads or security facilities, may not take place within 300 feet of an existing building.

(6) Shall authorize impoundment areas used for oil and gas operations as a permitted use in all zoning districts, provided that the edge of any impoundment area shall not be located closer than 300 feet from an existing building.

(7) Shall authorize natural gas compressor stations as a permitted use in agricultural and industrial zoning districts and as a conditional use in all other zoning districts, if the natural gas compressor building meets the following standards:

(i) is located 750 feet or more from the nearest existing building or 200 feet from the nearest lot line, whichever is greater, unless waived by the owner of the building or adjoining lot; and

(ii) the noise level does not exceed a noise standard of 60dbA at the nearest property line or the applicable standard imposed by Federal law, whichever is less.

(8) Shall authorize a natural gas processing plant as a permitted use in an industrial zoning district and as conditional uses in agricultural zoning districts if all of the following apply:

(i) The natural gas processing plant building is located at the greater of at least 750 feet from the nearest existing building or at least 200 feet from the nearest lot line unless waived by the owner of the building or adjoining lot.

(ii) The noise level of the natural gas processing plant building does not exceed a noise standard of 60dbA at the nearest property line or the applicable standard imposed by Federal law, whichever is less.

(9) Shall impose restrictions on vehicular access routes for overweight vehicles only as authorized under 75 Pa.C.S. (relating to vehicles) or the MPC.

(10) May not impose limits or conditions on subterranean operations or hours of operation of compressor stations and processing plants or hours of operation for the drilling of oil

and gas wells or the assembly and disassembly of drilling rigs.

(11) May not increase setback distances set forth in Chapter 32 (relating to development) or this chapter. A local ordinance may impose setback distances that are not regulated by or set forth in Chapter 32 or this chapter if the setbacks are no more stringent than those for other industrial uses within the geographic boundaries of the local government.

58 Pa.C.S. § 3304.

Reviewing the amended Act, few could seriously dispute how remarkable a revolution is worked by this legislation upon the existing zoning regimen in Pennsylvania, including residential zones. In short, local government is required to authorize oil and gas operations, impoundment areas, and location assessment operations (including seismic testing and the use of explosives) as permitted uses in all zoning districts throughout a locality. Local government is also required to authorize natural gas compressor stations as permitted uses in agricultural and industrial districts, and as conditional uses in all other zoning districts. Local governments are also commanded to authorize natural gas processing plants as permitted uses in industrial districts and as conditional uses in agricultural districts. Moreover, Section 3304 limits local government to imposing conditions: on construction of oil and gas operations only as stringent as those on construction activities for industrial uses; and on heights of structures, screening and fencing, lighting and noise only as stringent as those imposed on other land development within the same zoning district. Local government is also simply prohibited from limiting subterranean operations and hours of operation for assembly and disassembly of drilling rigs, and for operation of oil and gas wells, compressor stations, or processing plants. Localities also may not increase setbacks from uses related to the oil and gas industry beyond those articulated by Act 13. In

addition, the dictated approach to setbacks focuses only on “existing buildings,” offering residents and property owners no setback protections should they desire to develop further their own properties. That local government’s zoning role is reduced to *pro forma* accommodation is confirmed by the fact that review under local ordinances of proposed oil and gas-related uses must be completed in 30 days for permitted uses, and in 120 days for conditional uses. The displacement of prior planning, and derivative expectations, regarding land use, zoning, and enjoyment of property is unprecedented.

The subsequent provisions of Chapter 33, Sections 3305 through 3309, create an enforcement mechanism to facilitate implementation of the preceding parts of the Act, Chapter 32 and Sections 3302 through 3304. Thus, Section 3305 authorizes the Public Utility Commission to issue advisory opinions to municipalities regarding the compliance of proposed local ordinances with the dictates of Act 13 and, upon request by a resident or an oil and gas entity, to issue orders to enforce compliance of enacted local ordinances with Act 13 requirements. The Commission’s orders related to enacted ordinances are subject to *de novo* review in the Commonwealth Court, while the advisory opinions are deemed unappealable. Moreover, Section 3306 authorizes civil actions in the Commonwealth Court to enjoin the enforcement of a local ordinance alleged to be contrary to Chapters 32 and 33 of Act 13 or the Municipalities Planning Code.

A failure to comply with Act 13’s requirements that local government act swiftly to accommodate Act 13’s new regimen has significant financial consequences for local government as well. Section 3307(a) authorizes the shifting of attorneys’ fees and costs to local government, if the court determines that “local government enacted or enforced a local ordinance with willful or reckless disregard” of Act 13. Section 3308 also deems a municipality ineligible to receive unconventional gas well fees if the Public Utility

Commission, the Commonwealth Court, or this Court issues an order that a local ordinance violated Act 13. Under Section 3309, local government has but a 120-day grace period following the effective date of Act 13 in which to take action to overturn the locality's prior land use planning scheme and to bring existing local ordinances into compliance with the new regime.

In Chapter 32, Section 3215 imposes modest oil and gas well location restrictions in reference to sensitive water resources, as follows:

(b) Limitation.-- (1) No well site may be prepared or well drilled within 100 feet or, in the case of an unconventional well, 300 feet from the vertical well bore or 100 feet from the edge of the well site, whichever is greater, measured horizontally from any solid blue lined stream, spring or body of water as identified on the most current 7 1/2 minute topographic quadrangle map of the United States Geological Survey.

(2) The edge of the disturbed area associated with any unconventional well site must maintain a 100-foot setback from the edge of any solid blue lined stream, spring or body of water as identified on the most current 7 1/2 minute topographic quadrangle map of the United States Geological Survey.

(3) No unconventional well may be drilled within 300 feet of any wetlands greater than one acre in size, and the edge of the disturbed area of any well site must maintain a 100-foot setback from the boundary of the wetlands.

58 Pa.C.S. § 3215(b)(1)-(3). However, even these modest restrictions can be averted by the gas industry, with the Pennsylvania Department of Environmental Protection given considerable authority under the Act to grant waivers of setbacks:

(4) The department shall waive the distance restrictions upon submission of a plan identifying additional measures, facilities or practices to be employed during well site construction, drilling and operations necessary to protect the

waters of this Commonwealth. The waiver, if granted, shall include additional terms and conditions required by the department necessary to protect the waters of this Commonwealth. Notwithstanding section 3211(e), if a waiver request has been submitted, the department may extend its permit review period for up to 15 days upon notification to the applicant of the reasons for the extension.

58 Pa.C.S. § 3215(b). In short, notwithstanding the purported protection of sensitive waters via setbacks, pursuant to Section 3215(b)(4), oil and gas operators are **entitled** to automatic waivers of setbacks “upon submission of a plan identifying the additional measures, facilities or practices as prescribed by the [Department of Environmental Protection] to be employed during well site construction, drilling and operations.” A waiver “shall include additional terms and conditions required by the [D]epartment necessary to protect the waters of this Commonwealth,” consistent with regulations that “shall” be developed by the Environmental Quality Board. 58 Pa.C.S. § 3215(b)-(c), (e)(1). Remarkably, if a drilling permit that contains Department-imposed conditions is appealed, it is not the industry, but the Department, that “has the burden of proving that the conditions were necessary to protect against a probable harmful impact of [sic] the public resources.” 58 Pa.C.S. § 3215(e)(2).<sup>55</sup>

In a further blanket accommodation of industry and development, Section 3215(d) limits the ability of local government to have any meaningful say respecting drilling permits and well locations in their jurisdictions. Under Act 13, a municipality in

---

<sup>55</sup> Other parts of Section 3215 provide similar measures for granting waivers or variances with respect to development-sensitive features, such as water wells and floodplains. See 58 Pa.C.S. § 3215(a), (f). In each instance, development and disturbance of the environment is preferred over the natural state, along the same statutory approach articulated in Section 3215(b). The citizens do not assert separate claims premised upon either subsection (a) or (f) of Section 3215; nevertheless, in light of our present decision, enforcement of these provisions obviously is constitutionally suspect.

which an unconventional gas well is proposed may submit written comments “describing local conditions or circumstances” which the municipality would like the Department of Environmental Protection to consider. But, the Department is not obligated to act upon local comments, although it may do so. In another remarkable provision, the Act further provides that, “[n]otwithstanding any other law, no municipality . . . shall have a right of appeal or other form of review from the [D]epartment’s decision.” 58 Pa.C.S. § 3215(d).

### **C. Article I, Section 27 Rights in Application**

We underscore that the citizens raise claims which implicate primarily the Commonwealth’s duties as trustee under the Environmental Rights Amendment.<sup>56</sup> The Commonwealth’s position on the municipalities’ role following Act 13’s land use revolution respecting oil and gas operations is similar to its stance regarding the authority of the judiciary to entertain and decide this dispute: in the Commonwealth’s view, there is no role. According to the Commonwealth, the question here is strictly one of policy, which only the General Assembly may formulate pursuant to its police powers and authority as trustee of Pennsylvania’s public natural resources. By the Commonwealth’s reasoning, municipalities have no authority to articulate or implement a different policy, and they have no authority even to claim that the General Assembly’s policy violates the Commonwealth’s organic charter. The Commonwealth suggests that Act 13 is an enactment based on valid legislative objectives and, therefore, falls properly within its exclusive discretionary policy judgment.

---

<sup>56</sup> We recognize that the rights under the first clause of Article I, Section 27 of individual appellants -- Messrs. Ball and Coppola, and Ms. van Rossum -- may also be implicated here. These appellants, however, have not developed arguments regarding the merits of such claims sufficient to enable us to render a reasoned decision. Accordingly, we express no opinion on the issue of whether Act 13 violates the rights of individual plaintiffs under the first clause of the Environmental Rights Amendment.

In contrast, the citizens construe the Environmental Rights Amendment as protecting individual rights and devolving duties upon various actors within the political system; and they claim that breaches of those duties or encroachments upon those rights is, at a minimum, actionable. According to the citizens, this dispute is not about municipal power, statutory or otherwise, to develop local policy, but it is instead about compliance with constitutional duties. Unless the Declaration of Rights is to have no meaning, the citizens are correct.

In relevant part, as we have explained previously, the Environmental Rights Amendment to the Pennsylvania Constitution delineates limitations on the Commonwealth's power to act as trustee of the public natural resources. It is worth reiterating that, insofar as the Amendment's prohibitory trustee language is concerned, the constitutional provision speaks on behalf of the people, to the people directly, rather than through the filter of the people's elected representatives to the General Assembly. See PA. CONST. art. I, §§ 25, 27.

The Commonwealth's obligations as trustee to conserve and maintain the public natural resources for the benefit of the people, including generations yet to come, create a right in the people to seek to enforce the obligations. See Commonwealth ex rel. Logan v. Hiltner, 161 A. 323, 325 (Pa. 1932) ("It is a settled rule of constitutional construction that prohibitive and restrictive provisions are self[-]executing and may be enforced by the courts independently of any legislative action."); accord Payne, 361 A.2d at 272 (Environmental Rights Amendment creates public trust and names Commonwealth trustee; "[n]o implementing legislation is needed to enunciate these broad purposes and establish these relationships; the amendment does so by its own *ipse dixit*."). This view is not an outlier. Washingtonian Home of Chicago v. City of Chicago, 41 N.E. 893, 896 (Ill. 1895) ("[W]here [constitutional] provisions are negative

or prohibitory in their character, they execute themselves. Where [the Constitution] limits the power of either of the departments of the government, or where it prohibits the performance of any act by an officer or person, none would contend that the power might be exercised or the act performed until prohibited by the general assembly. The constitution undeniably has as much vigor in prohibiting the exercise of power or the performance of an act as the general assembly.”); Fernandez, 17 Harv. Envtl. L. Rev. at 353-54 (“If, despite the absence of a remedy, a provision directly vests a right on a party, the court may declare the provision to be self-executing and fashion a remedy itself.”). Statutes and regulations addressing the right are “subordinate to the enjoyment of the right, the exercise of which is regulated. It must be regulation purely, not destruction.” Page v. Allen, 58 Pa. 338 at \*8 (Pa. 1868). As a corollary, the Legislature may not abridge, add to, or alter the constitutional qualification of a right by statute. See id.

We recognize that, along with articulating the people’s rights as beneficiaries of the public trust, the Environmental Rights Amendment also encourages the General Assembly to exercise its trustee powers to enact environmental legislation that serves the purposes of the trust. But, in this litigation, the citizens’ constitutional challenge is not to the General Assembly’s power to enact such legislation; that is a power the General Assembly unquestionably possesses. The question arising from the Commonwealth’s litigation stance is whether the General Assembly can perform the legislative function in a manner inconsistent with the constitutional mandate. See also Goodheart v. Casey, 565 A.2d 757, 760 (Pa. 1989).

Act 13 is not generalized environmental legislation, but is instead a statute that regulates a single, important industry -- oil and gas extraction and development. Oil and gas resources are both privately owned and partly public, *i.e.*, insofar as they are on

public lands. Act 13 does not remotely purport to regulate simply those oil and gas resources that are part of the public trust corpus, but rather, it addresses the exploitation of all oil and gas resources throughout Pennsylvania. Act 13's primary stated purpose is not to effectuate the constitutional obligation to protect and preserve Pennsylvania's natural environment. Rather, the purpose of the statute is to provide a maximally favorable environment for industry operators to exploit Pennsylvania's oil and natural gas resources, including those in the Marcellus Shale Formation. See 58 Pa.C.S. § 3202 (primary purpose is to permit "optimal development of oil and gas resources"). The authority to regulate the oil and gas industry in this context derives, therefore, from the General Assembly's plenary power to enact laws for the purposes of promoting the general welfare, including public convenience and general prosperity, rather than from its corresponding duties as trustee of Pennsylvania's public natural resources. See Clifton, 969 A.2d at 1211 n.19; Best, 141 A.2d at 611. The public natural resources implicated by the "optimal" accommodation of industry here are resources essential to life, health, and liberty: surface and ground water, ambient air, and aspects of the natural environment in which the public has an interest. As the citizens illustrate, development of the natural gas industry in the Commonwealth unquestionably has and will have a lasting, and undeniably detrimental, impact on the quality of these core aspects of Pennsylvania's environment, which are part of the public trust.

As we have explained, Pennsylvania has a notable history of what appears retrospectively to have been a shortsighted exploitation of its bounteous environment, affecting its minerals, its water, its air, its flora and fauna, and its people. The lessons learned from that history led directly to the Environmental Rights Amendment, a measure which received overwhelming support from legislators and the voters alike.

When coal was “King,” there was no Environmental Rights Amendment to constrain exploitation of the resource, to protect the people and the environment, or to impose the sort of specific duty as trustee upon the Commonwealth as is found in the Amendment. Pennsylvania’s very real and mixed past is visible today to anyone travelling across Pennsylvania’s spectacular, rolling, varied terrain. The forests may not be primordial, but they have returned and are beautiful nonetheless; the mountains and valleys remain; the riverways remain, too, not as pure as when William Penn first laid eyes upon his colonial charter, but cleaner and better than they were in a relatively recent past, when the citizenry was less attuned to the environmental effects of the exploitation of subsurface natural resources. But, the landscape bears visible scars, too, as reminders of the past efforts of man to exploit Pennsylvania’s natural assets. Pennsylvania’s past is the necessary prologue here: the reserved rights, and the concomitant duties and constraints, embraced by the Environmental Rights Amendment, are a product of our unique history.

The type of constitutional challenge presented today is as unprecedented in Pennsylvania as is the legislation that engendered it. But, the challenge is in response to history seeming to repeat itself: an industry, offering the very real prospect of jobs and other important economic benefits, seeks to exploit a Pennsylvania resource, to supply an energy source much in demand. The political branches have responded with a comprehensive scheme that accommodates the recovery of the resource. By any responsible account, the exploitation of the Marcellus Shale Formation will produce a detrimental effect on the environment, on the people, their children, and future generations, and potentially on the public purse, perhaps rivaling the environmental effects of coal extraction. The litigation response was not available in the nineteenth

century, since there was no Environmental Rights Amendment. The response is available now.

The challenge here is premised upon that part of our organic charter that now explicitly guarantees the people's right to an environment of quality and the concomitant expressed reservation of a right to benefit from the Commonwealth's duty of management of our public natural resources. The challengers here are citizens -- just like the citizenry that reserved the right in our charter. They are residents or members of local legislative and executive bodies, and several localities directly affected by natural gas development and extraction in the Marcellus Shale Formation. Contrary to the Commonwealth's characterization of the dispute, the citizens seek not to expand the authority of local government but to vindicate fundamental constitutional rights that, they say, have been compromised by a legislative determination that violates a public trust. The Commonwealth's efforts to minimize the import of this litigation by suggesting it is simply a dispute over public policy voiced by a disappointed minority requires a blindness to the reality here and to Pennsylvania history, including Pennsylvania constitutional history; and, the position ignores the reality that Act 13 has the potential to affect the reserved rights of every citizen of this Commonwealth now, and in the future. We will proceed now to the merits.

### *1. Section 3303*

We begin by addressing the citizens' claims regarding the constitutionality of Section 3303 of Act 13. We recognize that, as the Commonwealth states, political subdivisions are "creations of the state with no powers of their own." Fross v. County of Allegheny, 20 A.3d 1193, 1202 (Pa. 2011). Municipalities have only those powers "expressly granted to them by the Constitution of the Commonwealth or by the General

Assembly, and other authority implicitly necessary to carry into effect those express powers.” Id. Within this construct, the General Assembly has the authority to alter or remove any powers granted and obligations imposed by statute upon municipalities. See, e.g., Huntley, 964 A.2d at 862 (even where state has granted powers to act in particular field, such powers do not exist if Commonwealth preempts field). By comparison, however, constitutional commands regarding municipalities’ obligations and duties to their citizens cannot be abrogated by statute. See Mesivtah, 44 A.3d at 9 (statute “cannot excuse the constitutional minimum” for meeting public charity exemption from taxation); Alliance Home of Carlisle, Pa. v. Bd. of Assessment Appeals, 919 A.2d 206, 223 (Pa. 2007) (General Assembly cannot authorize exemption from taxation going beyond what is permitted by constitutional text and, if exemption is deemed to exceed what is authorized, courts are duty-bound to strike it down); Stilp, 905 A.2d at 943 (quoting Jorgensen v. Blagojevich, 811 N.E.2d 652, 669-70 (Ill. 2004) (“No principle of law permits us to suspend constitutional requirements for economic reasons, no matter how compelling those reasons may seem.”)). Moreover, the General Assembly has no authority to remove a political subdivision’s implicitly necessary authority to carry into effect its constitutional duties. Cf. Commonwealth ex rel. Carroll v. Tate, 274 A.2d 193, 196-97 (Pa. 1971) (“Judiciary must possess the inherent power to determine and compel payment of those sums of money which are reasonable and necessary to carry out its mandated responsibilities, and its powers and duties to administer Justice . . .”).

With respect to the public trust, Article I, Section 27 of the Pennsylvania Constitution names not the General Assembly but “the Commonwealth” as trustee. We have explained that, as a result, all existing branches and levels of government derive constitutional duties and obligations with respect to the people. The municipalities

affected by Act 13 all existed before that Act was adopted; and most if not all had land use measures in place. Those ordinances necessarily addressed the environment, and created reasonable expectations in the resident citizenry. To put it succinctly, our citizens buying homes and raising families in areas zoned residential had a reasonable expectation concerning the environment in which they were living, often for years or even decades. Act 13 fundamentally disrupted those expectations, and ordered local government to take measures to effect the new uses, irrespective of local concerns. The constitutional command respecting the environment necessarily restrains legislative power with respect to political subdivisions that have acted upon their Article I, Section 27 responsibilities: the General Assembly can neither offer political subdivisions purported relief from obligations under the Environmental Rights Amendment, nor can it remove necessary and reasonable authority from local governments to carry out these constitutional duties. Indeed, if the General Assembly had subsumed local government entirely by Act 13 -- it did not, instead it required local government essentially to be complicit in accommodating a new environmental regime irrespective of the character of the locale -- the General Assembly could not eliminate the commands of Article I, Section 27. Rather, the General Assembly would simply have shifted the constitutional obligations onto itself. And those obligations include the duty to "conserve and maintain" the public natural resources, including clean air and pure water, "for the benefit of all the people." The Commonwealth, by the General Assembly, declares in Section 3303 that environmental obligations related to the oil and gas industries are of statewide concern and, on that basis, the Commonwealth purports to preempt the regulatory field to the exclusion of all local environmental legislation that might be perceived as affecting oil and gas operations. Act 13 thus commands municipalities to ignore their obligations under Article I, Section 27 and further directs municipalities to

take affirmative actions to undo existing protections of the environment in their localities. The police power, broad as it may be, does not encompass such authority to so fundamentally disrupt these expectations respecting the environment. Accordingly, we are constrained to hold that, in enacting this provision of Act 13, the General Assembly transgressed its delegated police powers which, while broad and flexible, are nevertheless limited by constitutional commands, including the Environmental Rights Amendment.

## 2. Section 3304

Next, we address the Commonwealth's claims regarding the constitutionality of Section 3304, a provision that elaborates upon local regulation of oil and gas development in Pennsylvania. In regulating the oil and gas industry, the General Assembly exercises its constitutional police powers (to promote general welfare, convenience, and prosperity) but it must also exercise its discretion as trustee of the public natural resources (to "conserve and maintain" public natural resources for the benefit of the people), permitting changes to the corpus of the trust to encourage sustainable development where appropriate. See Payne, 361 A.2d at 273 ("[i]t is manifest that a balancing must take place . . ."). Discretion, in the trustee context, equates to a legal discretion cabined by the language of the trust and the trustee's fiduciary duties, rather than to mere subjective judgment. Struthers Coal & Coke Co. v. Union Trust Co., 75 A. 986, 988 (Pa. 1910); see In re Sparks' Estate, 196 A. 48, 57 (Pa. 1938). Proper exercise of a trustee's discretion is measured by benefits "bestow[ed] upon all [the Commonwealth's] citizens in their utilization of natural resources" rather than "by the balance sheet profits and appreciation [the trustee] realizes from its resources operations." See 1970 Pa. Legislative Journal-House at 2273; id. at 2270

("[T]he measure of our progress is not just what we have but how we live. . . ."). In this sense, the trustee may use the assets of the trust only for purposes authorized by the trust or necessary for the preservation of the trust; other uses are beyond the scope of the discretion conferred, even where the trustee claims to be acting solely to advance other discrete interests of the beneficiaries. Metzger v. Lehigh Valley Trust & Safe Deposit Co., 69 A. 1037, 1038 (Pa. 1908).

With respect to Act 13, the General Assembly certainly recognized, among other things, its twin constitutional duties to provide for the general welfare and prosperity by "permit[ting] optimal development of oil and gas resources of this Commonwealth," and for the protection of "natural resources, environmental rights and values secured by the Constitution of Pennsylvania." 58 Pa.C.S. § 3202. A declaration of intent, regardless of its validity or its beneficence, is neither dispositive nor is it even particularly probative of whether the means articulated in the legislative enactment, by which the intent is pursued, are constitutional. See Stilp, 905 A.2d at 945. We pass upon a constitutional challenge to the legislative enactment not by measuring the wisdom of the means chosen by the General Assembly to pursue its policy, but by measuring the enactment against the relevant constitutional command.

We have explained that, among other fiduciary duties under Article I, Section 27, the General Assembly has the obligation to prevent degradation, diminution, and depletion of our public natural resources, which it may satisfy by enacting legislation that adequately restrains actions of private parties likely to cause harm to protected aspects of our environment. We are constrained to hold that Section 3304 falls considerably short of meeting this obligation for two reasons.

First, a new regulatory regime permitting industrial uses as a matter of right in every type of pre-existing zoning district is incapable of conserving or maintaining the

constitutionally-protected aspects of the public environment and of a certain quality of life. In Pennsylvania, terrain and natural conditions frequently differ throughout a municipality, and from municipality to municipality. As a result, the impact on the quality, quantity, and well-being of our natural resources cannot reasonably be assessed on the basis of a statewide average. Protection of environmental values, in this respect, is a quintessential local issue that must be tailored to local conditions. See, e.g., 75 Pa.C.S. § 4706(b.1)(1) & 67 Pa. Code § 177.51 (c)-(f) (vehicle emissions inspection requirements stricter in metropolitan areas, Philadelphia and Pittsburgh). Moreover, the Commonwealth is now over three centuries old, and its citizens settled the territory and built homes and communities long before the exploitation of natural gas in the Marcellus Shale Formation became economically feasible. Oil and gas operations do not function autonomously of their immediate surroundings. Act 13 emerged upon this complex background of settled habitability and ownership interests and expectations.

Despite this variety in the existing environmental and legislative landscape, Act 13 simply displaces development guidelines, guidelines which offer strict limitations on industrial uses in sensitive zoning districts; instead, Act 13 permits industrial oil and gas operations as a use “of right” in **every zoning district throughout the Commonwealth**, including in residential, commercial, and agricultural districts. See 58 Pa.C.S. § 3304(a), (b)(1), (5)-(9). Insofar as Section 3304 permits the fracking operations and exploitation of the Marcellus Shale at issue here, the provision compels exposure of otherwise protected areas to environmental and habitability costs associated with this particular industrial use: air, water, and soil pollution; persistent noise, lighting, and heavy vehicle traffic; and the building of facilities incongruous with the surrounding landscape. The entirely new legal regimen alters existing expectations of communities

and property owners and substantially diminishes natural and esthetic values of the local environment, which contribute significantly to a quality of environmental life in Pennsylvania. Again, protected by their organic charter, these communities and property owners could reasonably rely upon the zoning schemes that municipalities designed at the General Assembly's prompt, schemes in which participation was mandatory and which imposed costs (for example, land use restrictions) upon participants, in addition to benefits. The costs, under the local schemes, presumably were rationally related to the scheme's benefits. For communities and property owners affected by Act 13, however, the General Assembly has effectively disposed of the regulatory structures upon which citizens and communities made significant financial and quality of life decisions, and has sanctioned a direct and harmful degradation of the environmental quality of life in these communities and zoning districts. In constitutional terms, the Act degrades the corpus of the trust. Cf. HHAP, 77 A.3d at 604 & n.20 (passing upon due process challenge, describes effect of challenged retrospective legislation on appellees' settled rights; cites U.S. Supreme Court as "warning that settled expectations should not be lightly disrupted, and highlighting the importance of scrutinizing retrospective laws with particular caution because of the Legislature's unmatched powers to sweep away settled expectations suddenly and without individualized consideration").

A second difficulty arising from Section 3304's requirement that local government permit industrial uses in all zoning districts is that some properties and communities will carry much heavier environmental and habitability burdens than others. Accord Agencies' Brief (as appellees), at 5-9 (admitting that uniform provisions of Act 13, including Section 3304, have "potentially different impacts on differently situated communities and property owners"). This disparate effect is irreconcilable with the express command that the trustee will manage the corpus of the trust for the benefit of

“all the people.” PA. CONST. art. I, § 27. A trustee must treat all beneficiaries equitably in light of the purposes of the trust. See Hamill’s Estate, 410 A.2d at 773; 20 Pa.C.S. § 7773. Again, we do not quarrel with the fact that competing constitutional commands may exist, that sustainable development may require some degradation of the corpus of the trust, and that the distribution of valuable resources may mean that reasonable distinctions are appropriate. But, Act 13’s blunt approach fails to account for this constitutional command at all and, indeed, exacerbates the problem by offering minimal statewide protections while disabling local government from mitigating the impact of oil and gas development at a local level. See 58 Pa.C.S. § 3304(b)(2)-(4), (10)-(11). Section 3304 requires either that no “conditions, requirements or limitations” be imposed on certain aspects of oil and gas location or operations or that such conditions, requirements, or limitations be no “more stringent” than those imposed on other industrial uses in the municipality (relating to construction activities) or other land development in the zoning district (relating to heights of structures, screening and fencing, lighting or noise). Remarkably, Section 3304 then goes even further, as it prohibits local government from tailoring protections for water and air quality (*e.g.*, through increased setbacks) and for the natural, scenic, and esthetic characteristics of the environment (*e.g.*, through increased setbacks, screening, fencing, reduced hours of operation requirements) in the affected areas within a municipality. Id. Imposing statewide environmental and habitability standards appropriate for the heaviest of industrial areas in sensitive zoning districts lowers environmental and habitability protections for affected residents and property owners below the existing threshold and permits significant degradation of public natural resources. The outright ban on local regulation of oil and gas operations (such as ordinances seeking to conform

development to local conditions) that would mitigate the effect, meanwhile, propagates serious detrimental and disparate effects on the corpus of the trust.

To be sure, the Commonwealth and its *amici* make compelling policy arguments that Pennsylvania's populace will benefit from the exploitation of the natural gas found in the Marcellus Shale Formation. Shale gas, according to the Commonwealth and its *amici*, has the potential to be a long-term source of energy that is cheap to transport to large metropolitan centers and businesses on the East Coast, and that can provide a welcome source of tax and other income for the Commonwealth and local communities.<sup>57</sup> The Commonwealth offers that it has devised the best means by which to take advantage of Pennsylvania's rich shale gas resources, including by anticipating what it believes would be local efforts to derail industry development and by preventing what it says would be a "balkanization" of legal regimes with which the industry would have to comply.

If economic and energy benefits were the only considerations at issue, this particular argument would carry more weight. But, the Constitution constrains this Court not to be swayed by counter-policy arguments where the constitutional command is clear. In this sense, the Commonwealth fails to respond in any meaningful way to the citizens' claims that Act 13 falls far short of providing adequate protection to existing

---

<sup>57</sup> The U.S. Department of Energy suggests that in 2011, the U.S. consumed about 23 trillion cubic feet ("Tcf") of natural gas per year, of which 20 Tcf were produced domestically. The Department cited the projection that there are 827 Tcf of recoverable natural gas from all U.S. shales (including Marcellus), which represents an approximately 36-year supply at current consumption levels. In 2009, shale gas production amounted to 14 percent of the total volume of natural gas produced in the U.S. and 12 percent of the natural gas consumed domestically. The Marcellus Shale play contributed to approximately 2 Tcf of a total of 3.5 to 4.5 Tcf of shale gas produced in 2009-2010. By 2035, it is projected that the shale gas share will increase to 45 percent of the total volume of gas produced in the U.S. U.S. Dep't of Energy, *supra*, at 4.

environmental and habitability features of neighborhoods in which they have established homes, schools, businesses that produce or sell food and provide healthcare, and other ventures, which ensure a quality of human life. In our view, the framers and ratifiers of the Environmental Rights Amendment intended the constitutional provision as a bulwark against enactments, like Act 13, which permit development with such an immediate, disruptive effect upon how Pennsylvanians live their lives. To comply with the constitutional command, the General Assembly must exercise its police powers to foster sustainable development in a manner that respects the reserved rights of the people to a clean, healthy, and esthetically-pleasing environment. Cf. Schuylkill Trust Co. v. Schuylkill Mining Co., 57 A.2d 833, (Pa. 1948) (same principle applicable outside trustee/beneficiary relationship, in context where both legal and equitable interests exist: holder of legal title to mining property (owner) has right to mine property and even to exhaust mineral wealth, with no charge of waste by holder of equitable interest not in possession (mortgage holder), except where holder of legal title engages in mining operations in unskilled or careless manner that renders irreparable damage to property).

For these reasons, we are constrained to hold that the degradation of the corpus of the trust and the disparate impact on some citizens sanctioned by Section 3304 of Act 13 are incompatible with the express command of the Environmental Rights Amendment. We recognize the importance of this legislation, and do not question the intentions behind it; we recognize, too, the urgency with which the political branches believe they must act to secure the benefits of developing the unconventional natural gas industry. By any measure, this legislation is of sweeping import. But, in that urgency, it is apparent that the Article I, Section 27 constitutional commands have been swept aside. Act 13's unauthorized use of the public trust assets is unprecedented and constitutionally infirm,

even assuming that the trustee believes it is acting solely and in good faith to advance the economic interests of the beneficiaries. See Metzger, 69 A. at 1038.<sup>58</sup>

### 3. *Section 3215(b)*

Finally, we address the Commonwealth's claims regarding the constitutionality of Section 3215(b)(4). At the outset, we agree with the Commonwealth that Section 3215(b)(4) cannot be considered in isolation, and that we must review the entire decisional process regarding the protection of certain bodies of water described in Section 3215(b) to render a proper decision.<sup>59</sup> Even placed into this broad context, the Commonwealth's characterization of the provision is, nevertheless, unpersuasive.

Section 3215(b) states mandatory setbacks for the gas industry but, even then, the provision also requires the Department of Environmental Protection to waive the setbacks on condition that the permit applicant submit "a plan" to protect Commonwealth waters. The Act requires the Department to articulate protective terms and conditions it deems "necessary," but upon appeal by the applicant, the Department has the burden to justify these conditions. In the process of granting these permits, the Act empowers the

---

<sup>58</sup> Section 3304 also has a similar effect to Section 3303, in that it removes local government's necessary and reasonable authority to carry out its trustee obligations by prohibiting the enactment of ordinances tailored to local conditions. As we explained relative to Section 3303, the General Assembly may not command municipalities to ignore their obligations under Article I, Section 27 and, thereby, abridge citizens' constitutional rights indirectly. See Mesivtah, 44 A.3d at 9 (statute "cannot excuse the constitutional minimum" for meeting public charity exemption from taxation); cf. Carroll, 274 A.2d at 196-97 (Judiciary "must possess" inherent power to carry out its mandated responsibilities). Accordingly, for this additional reason, Section 3304 is unconstitutional.

<sup>59</sup> There is no dispute that regulation of the Commonwealth's waters implicates public natural resources that are a subject of the Article I, Section 27 trust.

Department to “consider” local comments, but it is not required to act upon local concerns. Unlike the industry, local government may not seek review of permit decisions. See 58 Pa.C.S. § 3215(b), (d)-(e); see also 58 Pa.C.S. § 3212.1(b). Section 3215(b) presents twin difficulties.

Initially, neither Section 3215(b), nor any other provision of Act 13, describes what additional measures are “necessary” for a waiver of setbacks to be appropriate. The Commonwealth insists that Act 13 impliedly creates a floor and a ceiling on the type of conditions the Department may impose on a permit applicant. In the Commonwealth’s view, the Department’s discretion is limited by Act 13’s express intent and by the Commonwealth’s various existing environmental statutes. But, predictably enough given the broad language of Section 3215, the Commonwealth fails to identify any actual substantive conditions that may be deemed necessary for the purposes of Act 13. Rather, the necessary protections are determined according to criteria that the Environmental Quality Board shall articulate, which are to account for the impact on public natural resources of oil and gas operations; notably, those criteria must ensure optimal development of the industry. See 58 Pa.C.S. § 3215(e).<sup>60</sup> The direction to the Department

---

<sup>60</sup> The Environmental Quality Board is to articulate criteria for granting permits premised on consideration of the impact on public natural resources, including publicly owned parks, forests, game lands and wildlife areas; national or state scenic rivers; national natural landmarks; habitats of rare and endangered flora and fauna and other critical communities; historical and archaeological sites listed on the federal or state list of historic places; and sources used for public drinking supplies. It is worth noting that the Commonwealth does not specify whether any independent scientific study has been commissioned or what data will be used to assess the impact on any or all of the public natural resources that the Board is to consider in promulgating regulations. In addition to strengthening the citizens’ claims that the statutory scheme offers no clear standards for determining permit applications, the absence of data also suggests that the Commonwealth has failed to discharge its trustee duty of gathering and making available to the beneficiaries complete and accurate information as to the nature and amount of the trust property. In re Rosenblum’s Estate, 328 A.2d 158, 164-65 (Pa. (continued...))

of Environmental Protection then is merely “to consider” the Environmental Quality Board’s criteria in granting well permits. At that point, again, review is limited to industry challenges. Neither local government nor affected citizens may pursue an appeal.

Even accounting for all elements of the statutory scheme in a manner most deferential to Act 13’s statutory purpose, we are constrained to conclude that what the crucial term “necessary” entails in the context of Section 3215(b) remains malleable and unpredictable. The statute does not provide any ascertainable standards by which public natural resources are to be protected if an oil and gas operator seeks a waiver of the Section 3215(b) setbacks. The statement of legislative intent, which simply articulates broad principles, offers no additional clarification regarding the environmental standard governing either the applicant or the Department of Environmental Protection. Moreover, Act 13 offers no reference, however oblique, to any requirement that the Department is obligated to consider the Commonwealth’s environmental statutes in rendering its permit decisions or imposing well permit conditions under Act 13. Section 3257 of Act 13, for example, which the Commonwealth cites as incorporating standards of environmental statutes into the Section 3215(b) decision, declares as a general matter (while offering specific examples) merely that Chapter 32 of Act 13 “provide[s] additional and cumulative remedies to control activities related to drilling for or production of oil and gas in this Commonwealth, and nothing contained in this chapter abridges or alters rights of action or remedies existing, or which existed previously, in equity or under common or statutory law,

---

(...continued)

1974) (citing RESTATEMENT (SECOND) OF TRUSTS § 173) (right of access to trust records is essential part of beneficiary’s right to complete information concerning administration of trust; right of inspection has independent source in beneficiary’s property interest in trust estate); see also RESTATEMENT (SECOND) OF TRUSTS § 173 cmt. c (“[B]eneficiary is always entitled to such information as is reasonably necessary to enable him to enforce his rights under the trust or to prevent or redress a breach of trust.”).

criminal or civil.” 58 Pa.C.S. § 3257. The provision makes no reference to whether or how substantive standards of existing environmental acts enter into a well permit determination, let alone into a Section 3215(b)(4) decision. Considered in its totality, the Section 3215(b) scheme lacks identifiable and readily-enforceable environmental standards for granting well permits or setback waivers, which yields at best arbitrary terms and conditions and, at worst, wholly ineffective protections for the waters of the Commonwealth. In this sense, the Act has failed to ensure compliance with the express command of the Environmental Rights Amendment that the Commonwealth trustee “conserve and maintain,” *inter alia*, the waters of the Commonwealth.

To exacerbate this problem, the decisional process of Section 3215 creates incentives to define “necessary” conditions by nominal standards, and invites arbitrary decision-making with a disparate impact on trust beneficiaries. From the outset, Section 3215(b) appears to provide for nothing more than a set of voluntary setbacks or, as an alternative, the opportunity for a permit applicant to negotiate with the Department of Environmental Protection the terms or conditions of its oil or natural gas well permit. If an applicant appeals permit terms or conditions -- and only the applicant can appeal -- Section 3215 remarkably places the burden on the Department to “prov[e] that the conditions were necessary to protect against a probable harmful impact of [sic] the public resources.” 58 Pa.C.S. § 3215(e). Viewed in terms of the constitutional mandates, this is topsy-turvy: Act 13 places on the Department the burden of proof and persuasion, and the people are allocated thereby the risk of an erroneous decision by the Environmental Quality Board. See Sanchez, 36 A.3d at 65. This naturally invites the Department to articulate “necessary” conditions as minimal standards that an applicant would accept without litigation. The scheme also provides the oil and gas operator leverage in the first instance to negotiate permit terms and conditions to optimize industrial development, even at the expense of

protected environmental and habitability concerns. The statutory scheme overall dilutes the Department's authority to regulate and enforce adequate environmental standards, and fosters departures from the goal of sustainable development.

Finally, Section 3215(d) marginalizes participation by residents, business owners, and their elected representatives with environmental and habitability concerns, whose interests Section 3215 ostensibly protects. See 58 Pa.C.S. § 3202 (Declaration of purpose of chapter). The result is that Section 3215 fosters decisions regarding the environment and habitability that are non-responsive to local concerns; and, as with the uniformity requirement of Section 3304, the effect of failing to account for local conditions causes a disparate impact upon beneficiaries of the trust. Moreover, insofar as the Department of Environmental Protection is not required, but is merely permitted, to account for local concerns in its permit decisions, Section 3215(d) fails to ensure that any disparate effects are attenuated. Again, inequitable treatment of trust beneficiaries is irreconcilable with the trustee duty of impartiality. See Hamill's Estate, 410 A.2d at 773; 20 Pa.C.S. § 7773.

Calling upon agency expertise to make permit decisions that comply with the Commonwealth's trustee obligations does not dissipate the structural difficulties with a statutory scheme that fails both to ensure conservation of the quality and quantity of the Commonwealth's waters and to treat all beneficiaries equitably in light of the purposes of the trust. In these respects, we are constrained to conclude that Act 13 has failed to properly discharge the Commonwealth's duties as trustee of the public natural resources.<sup>61</sup>

---

<sup>61</sup> We note that the citizens challenged only Section 3215(b)(4) and (d) of Act 13, rather than Section 3215 in its entirety.

#### 4. *Mandate*

For these reasons, we agree with the citizens that, as an exercise of police power, Sections 3215(b)(4) and (d), 3303, and 3304 are incompatible with the Commonwealth's duty as trustee of Pennsylvania's public natural resources. Accordingly, we hold that these provisions are unconstitutional. Because we find that Sections 3215(b)(4) and 3304 violate the Environmental Rights Amendment, we do not address the related claims that these provisions violate, respectively, the separation of powers doctrine and the due process clauses of the Pennsylvania Constitution and the U.S. Constitution. See Citizens' Petition for Review, 3/29/12, at 27-49, 88-91 (Counts I-III, VIII).

The Commonwealth Court's decision is affirmed in part, albeit on different grounds, and reversed in part.<sup>62</sup>

---

<sup>62</sup> Mr. Justice Eakin's dissent, which would deny relief *in toto*, joins Justice Saylor's dissent and then addresses four distinct points: (1) standing; (2) waiver of the Environmental Rights Amendment claim; (3) a comment that Act 13 is about the choice between a pipeline and transportation of natural gas by tractor-trailers; and (4) a claim that the finding of unconstitutionality represents a reweighing of policy and a substitution of the Court's judgment for that of the General Assembly, with the Court "act[ing] legislatively" as a result, and not "serv[ing] the Commonwealth as we should." We respectfully disagree with the dissent in all respects.

The issues involved here are considerably less monolithic, and correspondingly more complex, than the dissent allows. The standing and waiver issues have been addressed at length in text. The dissent's bare assertions neither acknowledge nor engage the precedent as cited and applied. The third point, which begins with the statement "This Act is about a pipeline," scarcely implicates the provisions of Act 13 actually challenged here. Gas must be extracted before it is transported.

On the last issue, it is erroneous to state that we are directing what policy choices or laws the General Assembly should make vis-à-vis natural gas extraction; the extent of the holding is that Act 13, as enacted, violates the Environmental Rights Amendment. The Amendment so construed is not "judicial legislation;" it is part of the Declaration of Rights enshrined in the Constitution. We believe it has meaning. The (continued...)

#### IV. Other Claims

##### A. Article III, Section 32 of the Pennsylvania Constitution (Special Laws)

Next, we address the citizens' claims that Sections 3218.1, 3304 through 3307, and Act 13 globally, violate the prescription of the Pennsylvania Constitution against enactment of special laws. See Citizens' Petition for Review, 3/29/12, at 49-61 (Count IV). The Commonwealth Court sustained the Commonwealth's preliminary objections and dismissed Count IV of the citizens' Petition for Review, which articulated these claims. With little analytical development, the court concluded that Section 3304 and, therefore, Act 13 does not violate Article III, Section 32 of the Pennsylvania Constitution because, although the statute treats the oil and gas industry differently than other extraction industries, "the distinction is based on real differences that justify varied classifications for zoning purposes." The court did not address specifically the merits of the citizens' remaining claims regarding Sections 3218.1 and 3305 through 3307 of Act 13. Robinson Twp., 52 A.3d at 487.

The citizens appeal the Commonwealth Court's decision and begin by criticizing the "blanket conclusion" that Act 13's special treatment of the oil and gas industry is justified. According to the citizens, the lower court failed to articulate any explanation

---

(...continued)

Amendment announces rights and obligations to protect environmental values of which legislation cannot run afoul. Some may view the dissent's preference to label the dispute "political" and move on as a refusal to discharge the judicial obligation.

There are constitutional restraints upon all branches of government, and our finding that this particular legislation crosses this constitutional line is not a substitution of our own preferences for those of the General Assembly. It construes the organic command and thereby defines the parameters within which the General Assembly is fully free to act. This is true with all judicial decisions resolving constitutional challenges to legislation. In our view, the notion that judicial decisions passing upon such challenges represent "judicial legislation" -- unless the legislative act is rubber-stamped -- misconceives our own duty.

for why the different treatment of the industry in each of the discrete challenged provisions has a reasonable relationship with the proffered distinction, and is justified by a legitimate state interest. The court's error, the citizens continue, stems from the General Assembly's inability to provide adequate justification in this regard. In this sense, according to the citizens, the preferential treatment the General Assembly has afforded the oil and gas industry cannot be explained solely on the ground that natural gas extraction provides "an economic boost to Pennsylvania communities."

The citizens concede that the oil and gas industry may be inherently different from any other industry. But, they claim that the distinctions offered by the Commonwealth are not reasonably related to, nor do they justify, Act 13's preferential treatment of the oil and gas industry with respect: to zoning restrictions (Section 3304); to the zoning review process (Sections 3304 through 3306); to penalties on local government (Section 3307); and to limitations on the protection of private water systems (Section 3218.1). The citizens offer separate arguments for why each challenged provision violates the constitutional prescription against enactment of special laws. Citizens' Brief (as cross-appellants), at 17-29.<sup>63</sup>

---

<sup>63</sup> Regarding Section 3218.1, the citizens argue that, while Act 13 provides for notification to any public drinking water facility in the event of an oil or gas drilling-related spill, the statute requires no such notifications to any other drinking water sources or persons, including owners of private wells. See 58 Pa.C.S. § 3218.1. But, the citizens note, private water wells are the prevalent drinking water sources in the rural areas where gas drilling will primarily be taking place; and the danger to public health and welfare posed by drilling is exacerbated because private wells are not subject to routine testing and monitoring, as is the case with public water sources. The citizens claim that there is no justification for treating private wells differently than public water sources for the purposes of notification. See Citizens' Brief (as appellants) at 28.

Although arguments related to this provision, more than other arguments forwarded under the "special law" heading, appear to implicate substantive constitutional rights under Article I discussed in other parts of this Opinion, the citizens (continued...)

The Commonwealth responds with a global argument that Act 13 is not a “special law,” stating that its provisions are focused on the industry to permit optimal development of oil and gas resources while protecting health, safety, property and the environment. The Commonwealth says Act 13 applies uniformly throughout the state rather than impermissibly creating an immutable class of one. Moreover, the Commonwealth argues that as long as the General Assembly could reasonably have believed that Act 13’s classifications serve legitimate state purposes, the Court must defer to its judgment.

The Commonwealth further claims that the citizens misconstrue the governing standards, and fail to offer any persuasive precedent for the proposition that the General Assembly cannot articulate statewide standards for an industry. According to the Commonwealth, Section 32 prohibits “granting special privileges to one person, one company, or one county” but not from creating a class consisting of “one type of member.” Moreover, the Commonwealth states that caselaw does not require or authorize a reviewing court “to parse through a law in infinite detail in order to justify every arguable distinction the General Assembly made.” Finally, the Commonwealth dismisses the citizens’ challenges to the individual provisions as mere complaints about “potentially different impacts on differently situated communities and property owners.” According to the Commonwealth, looking at the impact of a statute on individual persons, communities, or municipalities is not a proper basis upon which to find that a

---

(...continued)

here offer this provision only as an example of why Act 13 is a special law, which the General Assembly is prohibited from enacting under Article III, Section 32. The citizens do not develop any substantive arguments regarding Section 3218.1 premised upon Article I rights; accordingly, we express no opinion on the issue.

law is prohibited special legislation. See Agencies' Brief (as appellees), at 5-9; accord OAG's Brief (as appellee), at 24-25.

This part of the citizens' cross-appeal arises from the Commonwealth Court's decision to sustain preliminary objections in the nature of a demurrer to Count IV of the Petition for Review. As already noted, we may affirm an order sustaining preliminary objections only if the party filing the petition for review is not entitled to relief as a matter of law. See Stilp, 940 A.2d at 1232 n.9. In our review, "we accept as true all well-pleaded material facts set forth in the [petition for review] and all inferences fairly deducible from those facts." Thierfelder, 52 A.3d at 1253. "A challenge to the constitutionality of legislation poses a question of law, and thus, our review is plenary and non-deferential." Pennsylvania Tpk. Comm'n v. Commonwealth, 899 A.2d 1085, 1094 (Pa. 2006).

We have previously noted that the overarching purpose of Article III of our Constitution is "to place restraints on the legislative process and encourage an open, deliberative, and accountable government." PAGE, 877 A.2d at 395. Article III enumerates constitutional requirements that govern procedural aspects of legislative enactment. Stilp, 905 A.2d at 951. First adopted in the Pennsylvania Constitution of 1874, Section 32 of Article III was intended to end "the flood of privileged legislation for particular localities and for private purposes which was common in 1873." Pennsylvania Tpk. Comm'n, 899 A.2d at 1094. Over time, Section 32 -- akin to the equal protection clause of the Fourteenth Amendment -- has been recognized as implicating the principle "that like persons in like circumstances should be treated similarly by the sovereign." Id.

This Court does not apply Section 32 to divest the General Assembly of its general authority either to identify classes of persons and the different needs of a class, or to provide for differential treatment of persons with different needs. Our

constitutionally mandated concerns are to ensure that the challenged legislation promotes a legitimate state interest, and that a classification is reasonable rather than arbitrary and “rest[s] upon some ground of difference, which justifies the classification and has a fair and substantial relationship to the object of the legislation.” *Id.* at 1095 (citing Harrisburg Sch. Dist. v. Zogby, 828 A.2d 1079, 1088-89 (Pa. 2003); Curtis v. Kline, 666 A.2d 265, 268 (Pa. 1995)). A legislative classification must be based on “real distinctions in the subjects classified and not on artificial or irrelevant ones used for the purpose of evading the constitutional prohibition.” *Id.* (citing Harrisburg Sch. Dist. v. Hickok, 761 A.2d 1132, 1136 (Pa. 2000)). In its review, a court may hypothesize regarding the reasons why the General Assembly created the classifications. *Id.* Alternately, a court may deem a statute or provision *per se* unconstitutional “if, under the classification, the class consists of one member and is closed or substantially closed to future membership.” *Id.* at 1098.

In our constitutional analysis of a statute, we are also mindful that, although Act 13 does not itself address severability, the Statutory Construction Act creates the presumption that the provisions of every statute are severable. See 1 Pa.C.S. § 1925 (constitutional construction of statutes). In this sense, where a petitioner’s challenge to an act is premised upon claims that discrete provisions of the act violate the Constitution, a proper analysis begins with the application of the law to the individual provisions challenged. See, e.g., Zahorchak, 4 A.3d at 1048-49; PAGE, 877 A.2d at 415-19.<sup>64</sup> The Commonwealth’s suggestion that a reviewing court is not required to

---

<sup>64</sup> In appropriate circumstances, the Court may, of course deem an entire act unconstitutional on the basis that it is special legislation. See, e.g., Pennsylvania Tpk. Comm’n, 899 A.2d at 1098 (First-Level Supervisor Collective Bargaining Act is special law because (1) differential treatment was not justified by any real distinction between Turnpike Commission’s first-level supervisors and other Commonwealth-employed first- (continued...))

parse the law and “justify” every distinction may be appropriate in some circumstances, but we do not find it persuasive here to prohibit the court’s review of the citizens’ properly preserved and articulated individual challenges.

In our view, the Commonwealth Court plainly erred in sustaining the Commonwealth’s preliminary objections and failing to address individually the citizens’ claims regarding the discrete provisions of Act 13 that were challenged. The record shows that, in their Petition for Review, the citizens offered discrete arguments that enumerated provisions of Act 13 violated Article III, Section 32 of our Constitution; the citizens requested, *inter alia*, a declaration that Act 13 was unconstitutional and any other relief the court might find proper. In response, the Commonwealth Court proceeded to assess the constitutionality of Section 3304, and Act 13 as a vague whole, based on an overly broad distinction and absent any analysis of whether the distinction had any fair and substantial relationship to the challenged provisions’ object, in light of the distinct constitutional breaches alleged by the citizens.

In short, the Commonwealth Court sustained the Commonwealth’s preliminary objections upon a basis insufficient as a matter of law. Identifying the oil and gas industry as a class that may be subject to different treatment at law and concluding that regulation of oil and gas operations accomplishes a legitimate state purpose are only the beginning of the special legislation constitutional inquiry. It is neither sufficient to look at the oil and gas industry and determine whether it is different from other industries, nor simply to accept that the declared benign purpose of Act 13 controls the constitutional inquiry, as the Commonwealth argues. See, e.g., Stilp, 905 A.2d at 945.

---

(...continued)

level supervisors and, alternately, (2) Act created one-member class that was closed or substantially closed to future membership).

Rather, the required inquiry is into the effect of the provisions challenged by the citizens, with respect to whether the admitted different treatment of the oil and gas industry represented by Act 13 rests upon some ground of difference that is reasonable rather than arbitrary and has a fair and substantial relationship to the object of each challenged provision. See Pennsylvania Tpk. Comm'n, 899 A.2d at 1094. To illustrate the point, it is simple enough to explain why the oil and gas industry is *sui generis*, and simple enough to declare that a statutory scheme designed to facilitate extraction promises economic benefits. But, those facts hardly explain why, for example, in the event of a “spill,” notice is required to public water suppliers but not to owners of private wells. Finally, to the extent that the citizens also offered the alternate theory, as the Commonwealth suggests, that Act 13 is *per se* unconstitutional because it creates a class of one, the Commonwealth Court also failed to dispose of that claim.

For these reasons, we vacate the decision of the Commonwealth Court in this respect and remand the matter to that court for an appropriate merits disposition in accordance with this Opinion.

**B. Article I, Sections 1 and 10 of the Pennsylvania Constitution and the Fifth Amendment of the U.S. Constitution (Eminent Domain)**

Next, we address the citizens’ claim that Section 3241 authorizes unconstitutional takings of property for private purposes, in violation of the eminent domain provisions of the Pennsylvania Constitution and the U.S. Constitution. See Citizens’ Petition for Review, 3/29/12, at 61-63 (Count V).<sup>65</sup> The Commonwealth Court sustained the Commonwealth’s

---

<sup>65</sup> Section 3241 provides, in relevant part that:

[A] corporation empowered to transport, sell or store natural gas or manufactured gas in this Commonwealth may  
(continued...)

preliminary objections and dismissed the citizens' claim on the ground that the citizens failed "to demonstrate that any of their property has been or is in imminent danger of being taken, with or without just compensation." Moreover, the court held that the citizens failed to follow the appropriate and exclusive procedure to challenge a taking articulated in Section 306 of the Eminent Domain Code and, accordingly, the court concluded that it had no jurisdiction over the matter. See Robinson Twp., 52 A.3d at 487-88 (citing 26 Pa.C.S. § 306(a)(1)).

On appeal, the citizens argue that the Commonwealth Court misapprehended the nature of their claim. According to the citizens, their claim was not an eminent domain challenge but a facial challenge to the constitutionality of the statutory provision, which the court should have addressed on the merits. Regarding the merits of their constitutional claim, the citizens state that Section 3241 permits a private corporation to exercise the state's eminent domain power for the storage of its private natural gas; the private storage of natural gas, according to the citizens, does not serve any public purpose that justifies the taking of private property. Furthermore, the citizens note that the corporations described in Section 3241 do not clearly qualify for the public utility exception to the rule against the taking of property for a private use. Citizens' Brief at 29-31 (citing 26 Pa.C.S. § 204; In re Opening Private Rd. for Benefit of O'Reilly, 5 A.3d 246, 253 n.5, 258 (Pa. 2010)).

---

(...continued)

appropriate an interest in real property located in a storage reservoir or reservoir protective area for injection, storage and removal from storage of natural gas or manufactured gas in a stratum which is or previously has been commercially productive of natural gas.

58 Pa.C.S. § 3241(a).

Relying upon the Commonwealth Court's reasoning, the Commonwealth responds that the citizens' claim is not ripe for consideration because no property has yet been taken. According to the Commonwealth, the Eminent Domain Code provides an adequate avenue for relief if, in the future, the citizens' property will be subject to a taking. Furthermore, the Commonwealth asserts that Section 3241 contains appropriate parameters to ensure that the primary purpose of any taking pursuant to that provision will serve the public. Section 3241(a), the Commonwealth states, is narrow in that only public utilities may appropriate an interest in private property pursuant to the provision. OAG's Brief (as cross-appellee) at 25-27; Agencies' Brief (as cross-appellees) at 10-12.<sup>66</sup> For the reasons that follow, we agree with the citizens that the Commonwealth Court erred in dismissing the citizens' claim premised upon the arguments offered by the Commonwealth and without reaching the merits.

The provision upon which the Commonwealth Court relied to sustain the preliminary objections, Section 306(a)(1) of the Eminent Domain Code, is not applicable here: the citizens have not been served with notice of condemnation and, as a result, the provision's procedure is not applicable on its terms. 26 Pa.C.S. § 306(a)(1) ("Within 30 days after being served with notice of condemnation, the condemnee may file preliminary objections to the declaration of taking."). Indeed, this is not a condemnation matter and, as a result, is not subject to the exclusive procedure of the Eminent Domain Code. See 26 Pa.C.S. § 102(a). Rather, the citizens filed their claim pursuant to the Declaratory Judgment Act. The purpose of the Declaratory Judgment Act "is to settle and to afford relief from uncertainty

---

<sup>66</sup> The Commonwealth also emphasizes that Section 3241 is a recodification of a provision of Act 13's predecessor, Section 601.401. Compare 58 Pa.C.S. § 3241 with 58 P.S. § 601.401. According to the Commonwealth, the eminent domain power in Section 3241 is not new but was codified almost thirty years ago. We note that this is the first opportunity for this Court to address the constitutionality of either provision premised upon the arguments that the citizens make here.

and insecurity with respect to rights, status, and other legal relations, and is to be liberally construed and administered.” 42 Pa.C.S. § 7541(a). According to the Declaratory Judgment Act, “[t]he General Assembly finds and determines that the principle rendering declaratory relief unavailable in circumstances where an action at law or in equity or a special statutory remedy is available has unreasonably limited the availability of declaratory relief and such principle is hereby abolished.” 42 Pa.C.S. § 7541(b). Declaratory relief, according to the Act, is “additional and cumulative” to other available remedies. *Id.* The citizens’ constitutional challenge here seeks relief from uncertainty and insecurity with respect to rights under Section 3241.

According to the citizens, Section 3241 is incompatible with constitutional limitations on the General Assembly’s exercise of police power to permit eminent domain takings. Waiting for a test case implicating a taking under Section 3241 -- and subject to the Eminent Domain Code’s exclusive procedures -- is certainly an available avenue for testing the constitutionality of the provision. But, as a facial challenge to the validity of a statutory provision and pure question of law, the citizens’ claim is also generally appropriate for pre-enforcement review in a declaratory judgment action. *See Bayada Nurses, Inc. v. Commonwealth*, 8 A.3d 866, 874-76 (Pa. 2010). A party challenging the availability of pre-enforcement review may, of course, assert concerns that issues or facts are not adequately developed, and question whether its adversary will suffer any hardships if review is delayed. *Id.* at 874. But, that is not how this litigation developed. Rather, the Commonwealth elected to dispute the availability of pre-enforcement declaratory relief with respect to Section 3241 from a jurisdictional perspective, rather than offering any arguments that the facts or issues are underdeveloped or that delaying review would not cause the citizens any hardship. The Commonwealth Court’s conclusory analysis reflects these arguments and, as a result, was misdirected.

For these reasons, while offering no view on the merits, we vacate the Commonwealth Court's decision on this issue and remand this claim to the lower court for further proceedings consistent with this analysis.

### C. Separation of Powers Doctrine

Finally, we address the citizens' contention that Section 3305(a) and (b) violates the separation of powers doctrine. See Citizens' Petition for Review, 3/29/12, at 82-87 (Count VII).

The separation of powers principle is "[o]ne of the distinct and enduring qualities of our system of government," which has been present in our Constitution since the first convention prepared the document in 1776. Jubelirer, 953 A.2d at 529. Our Constitution vests legislative power in the General Assembly; executive power in the Executive Department consisting, *inter alia*, of the Governor, the Attorney General, and various administrative agencies, as provided by law; and judicial power in a unified judicial system and, ultimately, in the Supreme Court. See PA. CONST. art. II, § 1; art. IV, § 1; art. V, § 1. The judiciary interprets and applies the law, and its proper domain "is in the field of the administration of justice under the law." Commonwealth v. Sutley, 378 A.2d 780, 783 (Pa. 1977). Meanwhile, the duty of the executive branch is to ensure the faithful execution of laws. See PA. CONST. art. IV, § 2.

The core tenet of the separation of powers principle is that a branch of government is prohibited from exercising the functions committed exclusively to a co-equal branch. Sutley, 378 A.2d at 783. Perfect separation of duties between the branches is not required; indeed, the constitutional construct permits "a degree of interdependence and reciprocity between the various branches." Id. Moreover, "dividing lines among the three branches are sometimes indistinct and are probably incapable of any precise definition."

Sweeney, 375 A.2d at 705 (quoting Stander v. Kelley, 250 A.2d 474, 482 (Pa. 1969) (Opinion Announcing Judgment of Court)). We address each of the challenged provisions in light of these general principles.

### 1. Section 3305(b)

In relevant part, Section 3305(b) provides that the Public Utility Commission may issue orders determining whether a local ordinance violates Chapters 32 and 33 of Act 13 or the Municipalities Planning Code, upon request from an owner or operator of an oil or gas operation, or from a local resident. The order is subject to *de novo* review in the Commonwealth Court, where it becomes part of the record. 58 Pa.C.S. § 3305(b). The Commonwealth Court sustained the Commonwealth's preliminary objections to the citizens' challenge to Section 3305(b), holding that this provision did not violate the separation of powers doctrine because the judiciary retains ultimate power to review the constitutionality of local ordinances via *de novo* review of the Public Utility Commission's final order. Robinson Twp., 52 A.3d at 489-90.

On appeal, the citizens challenge the lower court's disposition, renewing their argument below that Section 3305(b) violates the separation of powers doctrine by concentrating judicial power in an executive agency. According to the citizens, only the judicial branch has the authority to pass on the constitutionality of laws; but, by permitting an executive agency to review zoning ordinances, which necessarily implicate constitutional issues, the General Assembly has delegated the exclusive judicial power to pass upon the constitutionality of laws to an executive agency. See Citizens' Brief (as cross-appellants) at 40 (citing Village of Euclid, 272 U.S. at 365; Boundary Drive Assocs. v. Shrewsbury Twp. Bd. Supervisors, 491 A.2d 86, 90 (Pa. 1985); Commonwealth v. Mockaitis, 834 A.2d 488, 499 (Pa. 2003), First Jud. Dist. v. Pa. Human Rels. Comm'n, 727

A.2d 1110, 1112 (Pa. 1999), Marbury, 1 Cranch at 25-26). The Commonwealth Court, the citizens claim, failed to recognize that any review of a zoning ordinance implicates questions of constitutionality.

The citizens assert that the Public Utility Commission is neither a court nor a quasi-judicial tribunal, which distinguishes the agency from zoning hearing boards that have “exclusive jurisdiction” under the Municipalities Planning Code to render adjudications on the validity of land use ordinances. The citizens argue that the Public Utility Commission is not a quasi-judicial tribunal because it is exempt in its Act 13 proceedings from due process requirements, rules against *ex parte* communications, evidentiary rules, Administrative Agency Law procedures, and the Sunshine Act. Act 13 also does not permit appeal of a Commission’s advisory opinion. These defects, according to the citizens, render the Act 13 delegation an improper exercise of quasi-judicial power that permits the Public Utility Commission “to strong-arm financially-strapped municipalities into accepting a slanted administrative ruling.” Id. at 44. The citizens allege that the review process, coupled with the threatened withholding of natural gas revenue and severe penalties, concentrates the power to devise oil and gas policy into the hands of the executive branch. The citizens conclude that the Public Utility Commission is an executive agency that is unconstitutionally exercising judicial power.

The Commonwealth responds that the citizens’ claim “consists primarily of *ad hominem* attacks on the General Assembly, the Governor and the Commission” and that the citizens’ true grievance is that “they do not like the way Act 13 is designed to operate.” Agencies’ Brief (as cross-appellees) at 17. The Commonwealth also argues that Section 3305 merely authorizes the Commission to review ordinances for compliance with Act 13 and the Municipalities Planning Code, and not for constitutionality. Id. at 17. According to the Commonwealth, the citizens set up a false premise with the argument that any zoning

claim involves a constitutional challenge and that whether a zoning claim involves a constitutional challenge cannot be resolved in the abstract. Id. at 18-19 (citing Hoffman Mining Co. v. Zoning Hearing Bd., 32 A.3d 587, 590 (Pa. 2011) (Surface Mining Act does not preempt setback provision of local ordinance)). Moreover, the Commonwealth states, any blanket contention that an executive agency may not address any issue with constitutional overtones is unfounded. Id. at 19 (citing Lehman, 839 A.2d at 276 (agency exercises expertise and develops factual record necessary to decide as-applied constitutional challenge)). The Commonwealth posits that the citizens commit a “fundamental error” in their reasoning by insisting that the General Assembly may not set parameters for local government and enforce them; the Constitution provides the municipalities with no authority as against the General Assembly. Id. at 20. Finally, the Commonwealth adds that Section 3305(b) does not violate the separation of powers principle because a person aggrieved by an order of the Commission may appeal *de novo*, and the Commonwealth Court is the final arbiter of an ordinance’s constitutional validity. OAG’s Brief (as appellee) at 31.

In essence, the citizens base their separation of powers argument regarding Section 3305(b) on two premises: that all zoning challenges necessarily implicate constitutional claims, and that administrative agencies have no authority to pass upon constitutional issues. For the proposition that all zoning cases implicate constitutional issues, the citizens cite two cases: Village of Euclid and Boundary Drive Associates. Although both decisions addressed constitutional claims, neither decision stands for the broad principle for which it is cited. In Village of Euclid and Boundary Drive Associates, the plaintiffs -- industrial concerns -- challenged local ordinances as an unconstitutional taking and a violation of the due process clause, respectively; the U.S. Supreme Court and this Court decided the cases in the context of the arguments presented and the

pertinent constitutional principles. We have explained that court decisions are to be read against their facts because “decisional law generally develops incrementally, within the confines of the circumstances of cases as they come before the Court.” Scampone, 57 A.3d at 604 (quoting Maloney v. Valley Med. Facilities, Inc., 984 A.2d 478, 489–90 (Pa. 2009)). “For one thing, it is very difficult for courts to determine the range of factual circumstances to which a particular rule should apply in light of the often myriad possibilities.” Id. Relevant here, the citizens extrapolate from two cases that the myriad “zoning” claims that result across the range of factual circumstances would all be categorized under a “constitutional” decision rubric. Such a broad proposition does not follow.

But even accepting, for the purposes of decision, the citizens’ first proposition, the conclusion that the General Assembly improperly delegated judicial power to the Public Utility Commission in this instance does not withstand scrutiny. Initially, we note that the cases cited by the citizens for the second proposition (that executive agencies have no authority to pass upon constitutional issues) do not speak directly to the issue for which they are cited; additionally, the citizens fail to explain their reliance upon these cases. See First Jud. Dist., 727 A.2d at 1112 (administrative agency has no jurisdiction “to investigate and adjudicate complaints filed against the judicial branch of government” because such action would interfere with Supreme Court’s exclusive power to supervise practice, procedure, and conduct of all courts); Mockaitis, 834 A.2d at 500 (General Assembly cannot “deputize” judicial employees to perform duties exclusively reserved to legislative or executive branch). Furthermore, decisional law more pertinent to the citizens’ claim is to the contrary.

As a general matter, a claimed lack of “authority” to decide a particular case is based upon either an assertion that the tribunal is not competent to determine

controversies in the general class or a claim that the tribunal lacks power to order or effect certain relief. We explained the distinction in Mockaitis:

Some litigants, while believing they are raising a claim of subject matter jurisdiction, are actually posing a challenge to the tribunal's authority, or power, to act. See Riedel v. Human Rels. Comm'n of Reading, 739 A.2d 121, 124 (Pa. 1999). This confusion between the meaning of the terms "jurisdiction" and "power" is not surprising. While the terms are not synonymous, they are often used interchangeably by judges and litigants alike. Id. In Riedel, we teased out the distinctions between these terms, explicating that "jurisdiction relates solely to the competency of the particular court or administrative body to determine controversies of the general class to which the case then presented for its consideration belongs. Power, on the other hand, means the ability of a decision-making body to order or effect a certain result." Id.

834 A.2d at 495. Here, the citizens suggest that the Public Utility Commission is not competent to decide zoning matters as a class, because such cases necessarily implicate a constitutional issue. They argue that such cases are within the exclusive jurisdiction of courts and zoning hearing boards acting within their quasi-judicial capacity.

Administrative agencies are created by the General Assembly, as part of the executive branch, to aid in the faithful execution of laws. See PA. CONST. art. IV, § 1 ("Executive Department . . . shall consist of[, *inter alia*,] such other officers as the General Assembly may from time to time prescribe."). The General Assembly may assign the administrative agency the task of deciding disputes regarding the application or enforcement of a particular statute, subject to appellate review of right in a court of record. See PA. CONST. art. V, § 9. "Constitutional questions, like all others, can and are legitimately channeled by the legislature in their passage through the judicial process," including administrative review. Borough of Green Tree v. Bd. of Prop.

Assessments, 328 A.2d 819, 823 (Pa. 1974) (Opinion Announcing Judgment of Court). In Borough of Green Tree, the Court rejected the invitation to “dispense[] with the requirement that a litigant follow statutorily-prescribed remedies merely because a constitutional question is present in the case.” Id. at 824; accord Kowenhoven v. County of Allegheny, 901 A.2d 1003, 1012 n.8 (Pa. 2006) (no suggestion “that ordinary administrative review may be bypassed as a matter of course simply by adding a constitutional claim, no matter how tenuous, to an assessment grievance”); Elgin v. Dep’t of Treasury, 132 S.Ct. 2126, 2136 (2012) (exclusivity of statutory remedy does not turn on constitutional nature of plaintiff’s claim). The General Assembly created the Public Utility Commission and, among other duties, empowered the Commission to pass upon the general class of disputes regarding whether local ordinances comply with parts of Act 13. See 66 Pa.C.S. § 301(a); 58 Pa.C.S. § 3305(b). In this sense, the predicate for the Commission’s authority to act in this general class of cases is certainly present. In asserting jurisdiction over disputes pursuant to Section 3305(b) of Act 13, the Public Utility Commission is exercising executive powers duly granted by the General Assembly.

The issue of jurisdiction over Section 3305(b) disputes is distinct from the question of whether the Public Utility Commission has the ability to order requested relief in cases in which a party asserts a question of constitutionality. See Mockaitis, supra. As we noted earlier, our jurisprudence does not preclude administrative agencies from passing upon constitutional claims in the first instance. Kowenhoven, 901 A.2d at 1012 n.8 (court may exercise equitable jurisdiction over dispute implicating “a substantial question of constitutionality (and not a mere allegation) and the absence of an adequate statutory remedy”); accord Elgin, 132 S.Ct. at 2138, (“[W]e see nothing extraordinary in a statutory scheme that vests reviewable factfinding authority in a non-

Article III entity that has jurisdiction over an action but cannot finally decide the legal question[, such as the constitutional claim at issue,] to which the facts pertain.”). Under governing law, therefore, the citizens’ claim that Section 3305(b) violates separation of powers principles must fail. The Commonwealth Court’s decision is affirmed in this respect.<sup>67</sup>

## 2. Section 3305(a)

Section 3305(a), meanwhile, provides that a municipality may request from the Public Utility Commission a written advisory opinion regarding whether a **proposed** local ordinance would violate Chapters 32 and 33 of Act 13 or the Municipalities Planning Code. The advisory opinion statutorily is not subject to appeal. The subsequent provisions of Chapter 33 -- Sections 3306 through 3309 -- create no

---

<sup>67</sup> The citizens also assert broadly that only quasi-judicial bodies, rather than any administrative agencies vested with jurisdiction, may render decisions on constitutional issues. The citizens create a dubious dichotomy: administrative agencies function as quasi-judicial bodies because they have legislative authorization to execute the law in the context of disputes. While Administrative Agency Law compliance issues and complaints of unfairness may raise questions regarding whether the administrative process is adequate, or concerns of due process and of vindication of the right of appeal, these concerns alone do not implicate the principle of separation of powers. The citizens’ challenge here is premised solely upon the separation of powers. We affirm the Commonwealth Court’s decision on a different basis here because, like the parties, the court conflated the separation of powers principle and due process interests. In this regard, we note that the Commonwealth Court’s unexplained conclusion that a right to *de novo* appeal from an order of the Public Utility Commission under Section 3305(b) would *per se* satisfy any valid separation of powers concerns is questionable. See, e.g., Daniels v. W.C.A.B. (Tristate Transport), 828 A.2d 1043, 1051 (Pa. 2003) (statute imposing on administrative agency obligation to “provide the basis for meaningful appellate review” for purpose of facilitating judicial review presumptively raised separation of powers concern; but, obligation was sufficiently broad and statute imposed no specific remedy for failure to comply so that “determination of exactly what is necessary to provide a basis for effective judicial review under the statute ultimately rest[ed] with the judiciary” and raised no valid separation of powers concern).

enforcement mechanism related to Section 3305(a); these provisions address actions commenced by parties other than municipalities seeking declarations that **enacted** local ordinances violate Act 13 or the Municipalities Planning Code, such as matters before the Commission under Section 3305(b). See 58 Pa.C.S. § 3305(b) (orders of the Commission); see also 58 Pa.C.S. §§ 3306-3309.

The citizens argue that the Section 3305(a) process raises a valid separation of powers concern. According to the citizens, the effect of the process employed by Act 13 is to inject the Public Utility Commission into the law-drafting process of zoning ordinances, interfering with the local legislative function. The provision encourages local governments to seek advice from an executive agency in the formulation of zoning ordinances prior to passage by threatening sanctions if, following enactment, the ordinances are found by the Commission or the courts to violate Act 13. See 58 Pa.C.S. §§ 3306-3309. The citizens argue that legislative bodies should not have to and indeed are prohibited from relying on outside entities for guidance during the legislative process because it would “encourage legislative irresponsibility.” Citizens’ Brief (as cross-appellants) at 49 (citing Township of Whitehall v. Oswald, 161 A.2d 348, 349 (Pa. 1960)). The citizens conclude that, as an executive agency, the Public Utility Commission has no authority to render guidance on legislation before its passage. Id. at 40-49.<sup>68</sup>

The Commonwealth responds that, far from providing the coercive process the citizens portray, the provision simply constitutes a resource for municipalities. The General Assembly made basic policy choices and did not delegate to the Public Utility Commission

---

<sup>68</sup> The Township of Whitehall decision offers little support to the citizens’ claim. Township of Whitehall turned on whether a township had standing to file a declaratory judgment action to test the constitutionality of its ordinance, and did not implicate any separation of powers claim. 161 A.2d at 349 (“[I]t can not reasonably be said that the plaintiff township’s ‘rights, status, or other legal relations’ have been adversely [sic] affected by its own deliberately intended enactment.”).

any power to make laws, but conferred upon it authority and discretion to execute Act 13, including through the advisory opinion process. Other agencies that exercise quasi-judicial functions are permitted to issue advisory opinions, e.g., the State Ethics Commission, the Office of Open Records, and the Office of the Attorney General. Agencies' Brief (as cross-appellees) at 20-21 (citing 65 Pa.C.S. § 1107(10); 65 P.S. § 67.1310(a)(2); 71 P.S. § 732-204(a)(1)). According to the Commonwealth, while courts may not render advisory opinions, the citizens' "contention that legislative bodies cannot use or otherwise rely on the expertise of executive agencies in enacting legislation is absurd. So long as the executive branch does not tie the hands of the municipality in enacting local zoning ordinances, it does not infringe on the independence of the legislative process." OAG's Brief (as appellee) at 31. Because the Commission simply issues non-binding opinions, the Commonwealth says, the process does not have the coercive effect of which the citizens complain.

The Commonwealth Court sustained the Commonwealth's preliminary objections, holding that Section 3305(a) did not transfer judicial powers to the Public Utility Commission, an executive agency, because the provision did not give the agency any authority over courts to render opinions on constitutional issues. The agency's opinions are non-binding and advisory and, like other advisory opinions, are not appealable. Robinson Twp., 52 A.3d at 489-90.

Initially, we note that the Commonwealth Court's summary reasoning was not responsive to the citizens' actual claim. Moreover, the citizens correctly point out that Section 3305(a) is peculiar in that it imposes obligations upon an executive agency with the goal of facilitating enactment of local legislation (*i.e.*, pre-enactment review of compliance with statutory requirements). Contrary to the Commonwealth's argument, a Public Utility Commission's obligation under Section 3305(a) is not on par, for purposes

of a separation of powers analysis, with actions of the State Ethics Commission, or of the Office of Open Records, or of the Office of the Attorney General, under the relevant respective provisions permitting advisory opinions. For example, under the State Ethics Act, the State Ethics Commission may issue advisory opinions upon the request of a person, or the appointing authority or employer of that person -- including the legislative and judicial branches. 65 Pa.C.S. § 1107(10). The Ethics Commission purports to offer advice to the various branches in their role as employer or appointing authority; the Commission does not appropriate the branches' respective constitutional duties. In fact, this Court's decision in Kremer v. State Ethics Commission, 469 A.2d 593 (Pa. 1983) suggests that, insofar as the roles overlap, the State Ethics Act does not apply to a coordinate branch (the judiciary in that case) on separation of powers grounds. Id. at 595-96 (insofar as they apply to members of judiciary, financial disclosure provisions of Ethics Act infringe upon Supreme Court's power to supervise courts); see also Shaulis v. State Ethics Comm'n, 833 A.2d 123, 132 (Pa. 2003) (provision restricting practice of attorney/former government employee interferes with judiciary's exclusive power to regulate practice of law and violates separation of powers principle).

Similarly, the Right to Know Law provides that the Office of Open Records shall issue advisory opinions to agencies and requesters. The Office of Open Records renders decisions regarding records requests from Commonwealth and local agencies - - agencies within the Executive Department, but not from state legislative or judicial agencies. See 65 P.S. § 67.503 (appeals from Commonwealth and local agencies to Office of Open Records; judicial and legislative agencies to appoint own appeals officers); 65 P.S. § 67.1310(a)(2) (Office of Open Records established, *inter alia*, to decide appeals and issue advisory opinions). Finally, the Office of the Attorney General has the authority to furnish legal advice only to the Executive Department -- "the Governor

or the head of any Commonwealth agency,” under Section 204 of the Commonwealth Attorneys Act. See 71 P.S. § 732-204(a)(1).

In short, the statutes cited by the Commonwealth do not in fact authorize a Commonwealth agency to issue legal advice to a political subdivision acting within its legislative capacity regarding proposed legislation. Nevertheless, for the reasons that follow, we agree ultimately with the Commonwealth Court that Section 3305(a) does not violate the separation of powers doctrine.

The common paradigm implicating the separation of powers principle involves tension between some combination of the General Assembly, the executive branch, and the judiciary. Bd. of Revision of Taxes v. City of Philadelphia, 4 A.3d 610, 627 n.12 (Pa. 2010). While we have recognized that similar tension may also arise in disputes involving the separate branches at a local level, such questions implicate additional levels of complexity because local government derives power to act through the delegation of authority from the General Assembly. 53 P.S. § 10601 (“governing body of each municipality, in accordance with the conditions and procedures set forth in this act, may enact, amend and repeal zoning ordinances”); see Bd. of Revision of Taxes, 4 A.3d at 627 n.12 (citing Jefferson County Court Appointed Employees Ass’n v. P.L.R.B., 985 A.2d 697, 701 n.3, 706 (Pa. 2009) (county commissioners’ board, acting in legislative capacity, encroached on judicial authority to hire, fire, and supervise its employees)). The parties here do not explain how, if at all, our analysis of a separation of powers claim is affected by the fact that the primary tension here is not between acts of co-equal branches of government but is further removed, *i.e.*, the tension is between local legislative authority and the state executive branch. We will assume, however, for the purposes of decision, that a separation of powers claim is potentially valid in this scenario.

In Daniels v. W.C.A.B. (Tristate Transport), 828 A.2d 1043 (Pa. 2003), this Court addressed a claim comparable to that of the citizens here. A workers' compensation claimant challenged whether the workers' compensation judge submitted a "reasoned decision" which "adequately explaine[d]" the judge's credibility determination, pursuant to Section 422(a) of the Workers' Compensation Act. The Court observed that a statutory obligation upon administrative officials to provide a reasoned decision to facilitate a judicial function was peculiar and raised separation of powers concerns. Upon further review, the Court dismissed the claim, holding that, because the statutory requirements were "broadly stated and no specific remedy [wa]s set forth for a failure to comply," the determination of what was necessary to provide a basis for effective judicial review remained ultimately with the judiciary, as befitting its constitutional role and, accordingly, there was no valid separation of powers concern. Id. at 1051.

Under the Act 13 construct, local governments retain the power to frame local ordinances as they see fit, within the limitations of their delegated powers. See 53 P.S. § 10601 et seq.; 58 Pa.C.S. § 3302. Any strictures upon the contents of local ordinances derive from the General Assembly -- Act 13 -- rather than from the executive branch. Furthermore, Act 13 does not require the municipality to submit to pre-enactment review by the Public Utility Commission; the decision to seek an advisory opinion regarding compliance with legislative limitations rests entirely with the municipality. When a municipality does request an advisory opinion, the Commission has no power to enforce the opinion, as Act 13 provides no express benefit or remedy for a municipality's failure to comply. While a municipality may have financial incentives to abide by Act 13 requirements as interpreted by the Commission, local government nevertheless retains discretion to enact the reviewed ordinance (albeit risking litigation to enjoin enforcement), to amend the ordinance, or to challenge in court the statutory requirement with which the

ordinance purportedly does not comply. The prerogatives of acting upon policy judgments and enacting local legislation, while limited by the General Assembly's enactment, remain ultimately with local government under the Act 13 scheme. No valid separation of powers concern exists regarding Section 3305(a). See 828 A.2d at 1051. As against this claim, the Commonwealth Court's decision is affirmed, on these different grounds.

## V. Severability

The citizens' requested relief is a declaration that Act 13 is unconstitutional in its entirety, based solely on arguments related to the discrete provisions discussed above. We recognize that certain of the provisions we have held to be unconstitutional represent core aspects of Act 13. But, by the same token, several provisions appear relatively independent of other parts of Act 13. See, e.g., 58 Pa.C.S. § 2302 (unconventional gas well fee); § 2505 (appropriations for Marcellus Legacy Fund). Notably, neither the parties nor Act 13 itself address the potential severability of provisions found unconstitutional. Nevertheless, our holding that Sections 3215(b)(4) and (d), 3303, and 3304 violate the Environmental Rights Amendment does not automatically require finding Act 13 unconstitutional in its entirety. Mockaitis, 834 A.2d at 502. Indeed, the presumption is that "[t]he provisions of every statute shall be severable." 1 Pa.C.S. § 1925 (constitutional construction of statutes).<sup>69</sup> Notably, while not citing to the Section 1925 severability

---

<sup>69</sup> Section 1925 of the Statutory Construction Act provides that:

If any provision of any statute . . . is held invalid, the remainder of the statute . . . shall not be affected thereby, unless the court finds that the valid provisions of the statute are so essentially and inseparably connected with, and so depend upon, the void provision . . . that it cannot be presumed the General Assembly would have enacted the remaining valid provisions without the void one; or unless the

(continued...)

presumption expressly, the Commonwealth Court obviously recognized that the issue was implicated because, upon finding Section 3304 unconstitutional, the panel was careful to enjoin only those “provisions of Chapter 33 that enforce 58 Pa.C.S. § 3304.” Robinson Twp., 52 A.3d at 485.

Setting aside the question of global severability -- *i.e.*, whether the specific provisions held to be unconstitutional require that the entire Act be enjoined -- there are obvious consequences of certain of our holdings. Thus, we have already recognized that Section 3215(b)(4), which addresses waivers of the general rule requiring setbacks for the protection of certain waters of the Commonwealth, is a key part of the Section 3215(b) scheme. It would appear that the General Assembly did not intend for the setback provision to operate without allowing industry operators to secure waivers from the setbacks. Absent the enjoined Section 3215(b)(4), the remaining parts of Section 3215(b) - - which the citizens do not challenge on appeal -- are incomplete and incapable of execution in accordance with the legislative intent. Having held that Section 3215(b)(4) is unconstitutional, we conclude that the remaining parts of Section 3215(b) are not severable. Accordingly, application of Section 3215(b) is enjoined.

Moreover, insofar as Section 3215(c) and (e) are part of the Section 3215(b) decisional process, these provisions as well are incomplete and incapable of execution in accordance with legislative intent. Application of Section 3215(c) and (e) is, therefore, also enjoined. Finally, Sections 3305 through 3309 are those parts of the statutory scheme that establish a mechanism by which to enforce compliance with the Municipalities Planning

---

(...continued)

court finds that the remaining valid provisions, standing alone, are incomplete and are incapable of being executed in accordance with the legislative intent.

1 Pa.C.S. § 1925.

Code and with Chapters 32 and 33 of Act 13, including Sections 3215, 3303, and 3304. To the extent that Sections 3305 through 3309 implement or enforce provisions we hold invalid, these provisions are incapable of execution and are enjoined.

We recognize that, in light of the numerous and diverse nature of the constitutional challenges, the parties were not in an optimal position to present arguments on the severability of the various provisions ultimately held to be unconstitutional. In this Opinion, we decide this issue in part, to the extent that its application is obvious and necessary to provide direction to the parties going forward. Nevertheless, we believe that further inquiry into the continued viability of the entire statute or of discrete provisions, including additional provisions deemed unconstitutional on remand, if any, and guided by additional, targeted briefing from the parties, is salutary and necessary. Accordingly, we remand to the Commonwealth Court for a decision, in the first instance, of whether other parts of Act 13 are properly enjoined upon application of severability principles. See also HHAP, 77 A.3d at 606 (clarifying legal issue but remanding for further factual development and ultimate determination regarding statute's constitutionality).

## **VI. Conclusion and Mandate**

For these reasons, the Commonwealth Court's decision is affirmed in part and reversed in part. We hold that:

A. Brian Coppola; David M. Ball; Maya van Rossum; Robinson Township; Township of Nockamixon; Township of South Fayette; Peters Township; Township of Cecil; Mount Pleasant Township; Borough of Yardley; and the Delaware Riverkeeper Network state justiciable claims. The Commonwealth Court's decision on this question is, therefore, affirmed in part and reversed in part.

B. Dr. Mehernosh Khan also states a justiciable claim. The Commonwealth Court's decision on this issue is reversed, and Dr. Khan's claim is remanded for resolution on the merits.

C. Sections 3215(b)(4), 3215(d), 3303, and 3304 violate the Environmental Rights Amendment. We do not reach other constitutional issues raised by the parties with respect to these provisions. As a result, the Commonwealth Court's decision is affirmed with respect to Sections 3215(b)(4) and 3304 (on different grounds), and reversed with respect to Sections 3215(d) and 3303. Accordingly, application and enforcement of Sections 3215(b)(4), 3215(d), 3303, and 3304 is hereby enjoined.

D. The remaining parts of Section 3215(b) are not severable from Section 3215(b)(4) and, as a result, the application or enforcement of Section 3215(b) is enjoined in its entirety. Moreover, Sections 3215(c) and (e), and 3305 through 3309 are not severable to the extent that these provisions implement or enforce those Sections of Act 13 which we have found invalid and, in this respect, their application or enforcement is also enjoined.

E. The Commonwealth Court erred in sustaining the Commonwealth's preliminary objections to Counts IV and V of the citizens' petition for review. The lower court's decision in these respects is reversed and the citizens' claims are remanded for decision on the merits.

F. The citizens failed to state a claim in Count VII of the petition for review; in this respect, the Commonwealth Court's decision is affirmed on different grounds.

G. Upon remand, the Commonwealth Court is also directed to address whether any remaining provisions of Act 13, to the extent they are valid, are severable. The Commonwealth Court may request additional briefing from the parties on the issue of severability.

Jurisdiction relinquished.

Former Justice Orié Melvin did not participate in the consideration or decision of this matter.

Madame Justice Todd and Mr. Justice McCaffery join the Opinion. Mr. Justice Baer joins Parts I, II, IV, V, and VI(A), (B), (D)-(G) of the Opinion.

Mr. Justice Baer files a Concurring Opinion.

Mr. Justice Saylor files a Dissenting Opinion in which Mr. Justice Eakin joins.

Mr. Justice Eakin files a Dissenting Opinion.

· [Email](#)

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since 2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in

the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT

Air Quality Control Commission

REGULATION NUMBER 7

CONTROL OF OZONE VIA OZONE PRECURSORS AND CONTROL OF HYDROCARBONS VIA OIL AND GAS EMISSIONS

(EMISSIONS OF VOLATILE ORGANIC COMPOUNDS AND NITROGEN OXIDES)

5 CCR 1001-9

II.B. Exemptions

Emissions of the organic compounds listed as having negligible photochemical reactivity in the common provisions definition of Negligibly Reactive Volatile Organic Compound are exempt from the provisions of this regulation.

(State Only) Notwithstanding the foregoing exemption, hydrocarbon emissions from oil and gas operations, including methane and ethane, are subject to this regulation as set forth in Sections XVII. and XVIII.

>>>>>>>>

**XVII. (State Only, except Section XVII.E.3.a. which was submitted as part of the Regional Haze SIP) Statewide Controls for Oil and Gas Operations and Natural Gas-Fired Reciprocating Internal Combustion Engines**

XVII.A. (State Only) Definitions

XVII.A.1 "Air Pollution Control Equipment," as used in this Section XVII, means a combustion device or vapor recovery unit. Air pollution control equipment also means alternative emissions control equipment and pollution prevention devices and processes intended to reduce uncontrolled actual emissions that comply with the requirements of Section XVII.B.2.e.

~~XVII.A.2. "Atmospheric", when used to modify the term "condensate storage tank", means a type of condensate storage tank that vents, or is designed to vent, to the atmosphere.~~

XVII.A.2. "Approved Instrument Based Monitoring Method" as used in this Section XVII. means an infra-red camera, Method 21, or other Division approved instrument based monitoring device or method. If an owner/operator elects to use a Division approved Continuous Emission Monitoring program, the Division may approve a streamlined inspection and reporting program for such operations. Any instrument based monitoring method approved by the Division under this definition must be at least as effective as Method 21 or an infra-red camera.

XVII.A.3. "Auto-Igniter" means a device which will automatically attempt to relight the pilot flame in the combustion chamber of a control device in order to combust volatile organic compound emissions.

- XVII.A.3. “Condensate Storage Tank” means any production tank or series of production tanks that are manifolded together that store condensate.
- XVII.A.4. “Component” means each pump seal, compressor seal, flange, pressure relief device, connector, open ended line, and valve that contains or contacts a process stream with hydrocarbons. Process streams consisting of glycol, amine, produced water, or methanol are not components for purposes of this Section XVII.
- XVII.A.5. “Connector” means flanged, screwed, or other jointed fittings used to connect two pipes or a pipe and a piece of process equipment or that close an opening in a pipe that could be connected to another pipe. Joined fittings welded completely around the circumference of the interface are not considered connectors.
- XVII.A.6. “Date of First Production” means the date reported to the COGCC as the “first date of production.”
- XVII.A.47. “Glycol Natural Gas Dehydrator” means any device in which a liquid glycol (including ethylene glycol, diethylene glycol, or triethylene glycol) absorbent directly contacts a natural gas stream and absorbs water.
- XVII.A.8. “Multi-Well Site” means a common well pad from which multiple wells may be drilled to various bottomhole locations.
- XVII.A.9. “Natural Gas Compressor Station” means a facility which contains one or more compressors designed to compress natural gas from well pressure to gathering system pressure and recompress natural gas prior to processing.
- XVII.A.10. “Normal Operation” means all periods of operation, excluding malfunction as defined in Section I.G of the Common Provisions regulation. For storage tanks at well production facilities, normal operation includes but is not limited to liquid dumps from the separator.
- XVII.A.11. “Stabilized” when used to refer to crude oil, condensate, intermediate hydrocarbon liquids, or produced water means that the vapor pressure of the liquid is sufficiently low to prevent the production of vapor phase upon transferring the liquid to an atmospheric pressure in a storage tank, and that any emissions that occur are limited to those commonly referred to within the industry as working, breathing, and standing losses.
- XVII.A.12. “Storage Tank” means any fixed roof storage vessel or series of storage vessels that are manifolded together via liquid line. Storage vessel is as defined in 40 CFR Part 60, Subpart OOOO. Storage tanks may be located at a well production facility or other location.
- XVII.A.13. “Unsafe to Monitor” means a component is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of such monitoring.
- XVII.A.14. “Visible Emissions” means observations of smoke for any period or periods of duration greater than or equal to one (1) minute in any fifteen (15) minute period during normal operation. Visible emissions do not include radiant energy or water vapor.
- XVII.A.15. “Well Production Facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells. This equipment includes, but is

not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline.

#### XVII.B. (State Only) General Provisions

XVII.B.1. General requirements for prevention of emissions and good air pollution control equipment, prevention of leakage, and flares and combustion devices practices for all oil and gas exploration and production operations, well production facilities, natural gas compressor stations, and natural gas processing plants.

XVII.B.1.a.~~XVII.B.1.b.~~ All intermediate hydrocarbon liquid condensate collection, storage, processing, and handling operations, regardless of size, shall be designed, operated, and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

XVII.B.1.b. At all times, including periods of start-up and shutdown, the facility and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions. Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the Division, which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

XVII.B.2. General requirements for air pollution control equipment, flares, and combustion devices used to comply with Section XVII.

XVII.B.2.a.~~XVII.B.1.a.~~ All air pollution control equipment shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file. In addition, all such air pollution control equipment shall be adequately designed and sized to achieve the control efficiency rates required by this Section XVII and to handle reasonably foreseeable fluctuations in emissions of volatile organic compounds and hydrocarbons during normal operations. Fluctuations in emissions that occur when the separator dumps into the tank are reasonably foreseeable.

XVII.B.2.b.~~XVII.B.1.c.~~ If a flare or other combustion device is used to control emissions of hydrocarbons~~volatile organic compounds to comply with Section XVII~~, it shall be enclosed, have no visible emissions during normal operations, and be designed so that an observer can, by means of visual observation from the outside of the enclosed flare or combustion device, or by other convenient means approved by the Division, determine whether it is operating properly.

XVII.B.2.c.~~XVII.B.1.d.~~ Any of the effective dates for installation of controls on condensate storage tanks, dehydrators, and/or internal combustion engines may be extended at the air pollution control-Division's discretion for good cause shown.

XVII.B.2.d. Auto-igniters

All combustion devices used to control emissions of hydrocarbons shall be equipped with and operate an auto-igniter as follows:

XVII.B.2.d.(i) All combustion devices installed on or after May 1, 2014, will be equipped with an operational auto-igniter upon installation of the combustion device.

XVII.B.2.d.(ii) All combustion devices installed before May 1, 2014, will be equipped with an operational auto-igniter by or before May 1, 2016, or after the next combustion device planned shutdown, whichever comes first.

XVII.B.2.e.XVII.B.2. Alternative emissions control equipment shall qualify as air pollution control equipment, and may be used in lieu of, or in combination with, combustion devices and vapor recovery units to achieve the emission reductions required by this Section XVII, if the Division approves the equipment, device or process. As part of the approval process the Division, at its discretion, may specify a different control efficiency than the control efficiencies required by this Section XVII.

XVII.B.3. Oil refineries are not subject to ~~this section of the rule~~Section XVII.

XVII.B.4. ~~Condensate tanks, Glycol natural gas~~ dehydrators and internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard ("NSPS") under 40 CFR Part 60 are not subject to this Section XVII.

XVII.C. (State Only) Emission reduction from ~~condensate~~ storage tanks at oil and gas exploration and production operations, well production facilities, natural gas compressor stations, ~~natural gas drip stations~~ and natural gas processing plants.

XVII.C.1. Control requirements for storage tanks

XVII.C.1.a. Beginning May 1, 2008, owners or operators of all ~~atmospheric condensate~~ storage tanks storing condensate with uncontrolled actual emissions of volatile organic compounds equal to or greater than twenty (20) tons per year based on a rolling twelve-month total ~~shall must~~ operate air pollution control equipment that has an average control efficiency of at least 95% for VOCs ~~on such tanks.~~

XVII.C.1.b. Owners or operators of all storage tanks with uncontrolled actual emissions of volatile organic compounds equal to or greater than six (6) tons per year based on a rolling twelve-month total must operate air pollution control equipment that achieves an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.C.1.b.(i) A storage tank constructed on or after May 1, 2014, must be in compliance by the date that the storage tank commences operation.

XVII.C.1.b.(ii) A storage tank constructed before May 1, 2014, must be in compliance by May 1, 2015.

XVII.C.1.b.(iii) A storage tank not otherwise subject to Sections XVII.C.1.b.(i) or XVII.C.1.b.(ii), above, that increases uncontrolled actual emissions to six tons VOC or more per year on a rolling twelve month basis after May 1,

2014, must be in compliance within sixty days of discovery of the emissions increase.

XVII.C.1.c. Control requirements within 90 days of the date of first production.

XVII.C.1.c.(i) Beginning May 1, 2014, owners or operators of storage tanks at well production facilities shall collect and control emissions by routing emissions to operating air pollution control equipment during the first 90 calendar days after the date of first production. The air pollution control equipment shall achieve an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons. Except that this requirement does not apply to storage tanks that are projected to have emissions less than 1.5 tons of VOC during the first 90 days after the date of first production.

XVII.C.1.c.(ii) The air pollution control equipment and any associated monitoring equipment required pursuant to Section XVII.C.1.c., above may be removed at any time after the first 90 calendar days as long as the source can demonstrate that uncontrolled actual emissions from the storage tank are below the threshold in Section XVII.C.1.b., above.

~~XVII.C.2. For condensate storage tanks with past, uncontrolled actual emissions of volatile organic compounds of less than 20 tons per year based on a rolling twelve-month total that may become subject to Section XVII.C.1. by virtue of the addition of a newly drilled well or the recompletion or stimulation of an existing well, owners or operators of such tanks shall have until 90 days after the date of 1<sup>st</sup> production of the newly drilled, recompleted or stimulated well to install and operate any required air pollution control equipment. If the owner or operator determines that emissions of volatile organic compounds will be below the 20-ton per year threshold, the owner or operator shall notify the Division of this determination in writing and include an explanation of the methodology used to make this determination.~~

XVII.C.2. Capture requirements for storage tanks that are fitted with air pollution control equipment as required by Sections XII.D. or XVII.C.1.

XVII.C.2.a. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall route all hydrocarbon emissions to air pollution control equipment, and shall operate without venting hydrocarbon emissions from the thief hatch (or other access point to the tank) or pressure relief device during normal operation unless venting is reasonably required for maintenance, gauging, or safety of personnel and equipment.

XVII.C.2.b. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall develop, certify, and implement a documented Storage Tank Emission Management System (STEM) plan to identify appropriate strategies to minimize emissions from venting at thief hatches (or other access points to a storage tank) and pressure relief devices during normal operation. As part of STEM, owners and operators shall evaluate and employ appropriate control technologies, monitoring practices, operational practices, and/or other strategies designed to meet the requirements set forth in Section XVII.C.2.a., above, and will update the STEM plan as necessary to achieve or maintain compliance. Owners and operators are not required to develop and implement STEM for storage tanks containing only stabilized liquids. The minimum elements of STEM are listed below.

XVII.C.2.b.(i) STEM must include a monitoring strategy that incorporates the minimum monitoring frequency set forth in Section XVII.F.5.e., procedures for evaluating ongoing storage tank emission capture performance, and, if applicable, the selected strategies.

XVII.C.2.b.(ii) STEM must include a certification by the owner or operator that the selected STEM strategy or strategies are designed to minimize emissions from storage tanks and associated equipment components at the facility or facilities, including thief hatches and pressure relief devices.

### XVII.C.3. Monitoring

~~:- The owner or operator of any condensate storage tank that is required to control volatile organic compound emissions pursuant to this Section XVII.C. shall visually inspect or monitor the Air Pollution Control Equipment to ensure that it is operating at least as often as condensate is loaded out from the tank, unless a more frequent inspection or monitoring schedule is followed. In addition, if a flare or other combustion device is used, the owner or operator shall visually inspect the device for visible emissions at least as often as condensate is loaded out from the tank. The monitoring strategy of each STEM plan must include monitoring in accordance with Approved Instrument Based Monitoring Methods, as specified in Section XVII.F.5.~~

XVII.C.3.a. In addition to any applicable Approved Instrument Based Monitoring Methods, audio, visual, olfactory ("AVO") inspection of the storage tank and any associated equipment (i.e. separator, air pollution control equipment, or other pressure reducing equipment), must be completed as often as liquids are loaded out from the storage tank. However, AVO inspection is required no more frequently than every seven (7) days or less frequently than every thirty (30) days. AVO monitoring is not required for components and tanks that are unsafe to monitor. AVO inspection must include, at a minimum:

XVII.C.3.a.(i) Visual inspection of any thief hatch, pressure relief valve, or other access point to ensure that they are closed and properly sealed;

XVII.C.3.a.(ii) Visual inspection or monitoring of the air pollution control equipment to ensure that it is operating, including that the pilot light is lit on combustion devices used as air pollution control equipment;

XVII.C.3.a.(iii) If a flare or other combustion device is used, visual inspection of the auto-igniter and valves for piping of gas to the pilot light, to ensure they are functioning properly;

XVII.C.3.a.(iv) Visual inspection of the air pollution control equipment to ensure that the valves for the piping from the storage tank to the air pollution control equipment are open; and

XVII.C.3.a.(v) If a flare or other combustion device is used, inspection of the device for the presence or absence of smoke. If smoke is observed, either the equipment will be immediately shut-in to investigate the potential cause for smoke and perform repairs, as necessary, or Method

22 shall be conducted to determine whether visible emissions are present for a period of at least one (1) minute in fifteen (15) minutes.

XVII.C.4. Recordkeeping

The owner or operator of each storage tank subject to XII.D. or XVII.C. must maintain records of STEM as applicable, including the plan, any updates, and the certification, to be made available to the Division upon request. In addition, for a period of two years, the owner or operator must maintain records of any required monitoring and make them available to the Division upon request, including:

- XVII.C.4.a. The AIRS ID for the storage tank.
- XVII.C.4.b. The date and duration of any period where the thief hatch, pressure relief device, or other access point are found to be venting hydrocarbon emissions.
- XVII.C.4.c. The date and duration of any period where the air pollution control equipment is not operating.
- XVII.C.4.d. Where a flare or other combustion device is being used, the date and result of any Method 22 test.
- XVII.C.4.e. The timing of and efforts made to eliminate venting, restore operation of air pollution control equipment, and mitigate visible emissions.

XVII.D. (State Only) Emission reductions from glycol natural gas dehydrators

XVII.D.1. Beginning May 1, 2008, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.2., shall reduce uncontrolled actual emissions of volatile organic compounds by at least 90 percent through the use of a condenser or air pollution control equipment.

XVII.D.2. The control requirement in Section XVII.D.1. shall apply where:

XVII.D.2.a. Actual uncontrolled emissions of volatile organic compounds from the glycol natural gas dehydrator are equal to or greater than two tons per year; and

XVII.D.2.b. The sum of actual uncontrolled emissions of volatile organic compounds from any single glycol natural gas dehydrator or grouping of glycol natural gas dehydrators at a stationary source is equal to or greater than 15 tons per year. To determine if a grouping of dehydrators meets or exceeds the 15 tons per year threshold, sum the total actual uncontrolled emissions of volatile organic compounds from all individual dehydrators at a stationary source, including those with emissions less than two tons per year.

XVII.D.3. Beginning May 1, 2015, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, and drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.4., shall reduce uncontrolled actual emissions of hydrocarbons by at least 95 percent on a rolling twelve-month basis through the use of a condenser or air pollution control equipment. If a

combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.D.4. The control requirement in Section XVII.D.3. shall apply where:

XVII.D.4.a. Actual uncontrolled emissions of volatile organic compounds from a single new glycol natural gas dehydrator are equal to or greater than two tons per year; or

XVII.D.4.b. Actual uncontrolled emissions of volatile organic compounds from a single existing glycol natural gas dehydrator are equal to or greater than six (6) tons per year, or two (2) tons per year if the glycol natural gas dehydrator is located within 1,320 feet of a building unit or designated outside activity area.

XVII.D.4.d. For purposes of Section XVII.D.4:

XVII.D.4.d.(i) Building Unit shall mean a residential building unit, and every five thousand (5,000) square feet of building floor area in commercial facilities or every fifteen thousand (15,000) square feet of building floor area in warehouses that are operating and normally occupied during working hours.

XVII.D.4.d.(ii) A designated outside activity area shall mean an outdoor venue or recreation area, such as a playground, permanent sports field, amphitheater, or other similar place of public assembly owned or operated by a local government, which the local government seeks to have established as a Designated Outside Activity Area; or an outdoor venue or recreation area where ingress to or egress from could be impeded in the even of an emergency condition at an oil and gas location less than three hundred and fifty (350) feet from the venue due to the configuration of the venue and the number of persons known or expected to simultaneously occupy the venue on a regular basis.

XVII.E. Control of emissions from new, modified, existing, and relocated natural gas fired reciprocating internal combustion engines.

XVII.E.1. (State Only) The requirements of this Section XVII.E. shall not apply to any engine having actual uncontrolled emissions below permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.2. (State Only) New, Modified and Relocated Natural Gas Fired Reciprocating Internal Combustion Engines

XVII.E.2.a. Except as provided in Section XVII.E.2.b. below, the owner or operator on any natural gas fired reciprocating internal combustion engine that is either constructed or relocated to the state of Colorado from another state, on or after the date listed in the table below shall operate and maintain each engine according to the manufacturer's written instructions or procedures to the extent practicable and consistent with technological limitations and good engineering and maintenance practices over the entire life of the engine so that it achieves the emission standards required in Section XVII.E.2.b. Table 1, below.

XVII.E.2.b. Actual emissions from natural gas fired reciprocating internal combustion engines shall not exceed the emission performance standards in Table 1, below as expressed in units of grams per horsepower-hour (G/hp-hr)

TABLE 1				
Maximum Engine Hp	Construction or Relocation Date	Emission Standards is G/hp-hr		
		NOx	CO	VOC
< 100 Hp	Any	NA	NA	NA
≥100 Hp and < 500 Hp	On or after January 1, 2008	2.0	4.0	1.0
	On or after January 1, 2011	1.0	2.0	0.7
≥500 Hp	On or after January 1, 2011	1.0	2.0	0.7
	On or after July 1, 2007	2.0	4.0	1.0
	On or after July 1, 2010	1.0	2.0	0.7
	On or after July 1, 2010	1.0	2.0	0.7

### XVII.E.3. Existing Natural Gas Fired Reciprocating Internal Combustion Engines

#### XVII.E.3.a. (Regional Haze SIP) Rich Burn Reciprocating Internal Combustion Engines

XVII.E.3.a.(i) Except as provided in Sections XVII.3.1.(i)(b) and (c) and XVII.E.3.a.(ii), all rich burn reciprocating internal combustion engines with a manufacturer's name plate design rate greater than 500 horsepower, constructed or modified before February 1, 2009 shall install and operate both a non-selective catalytic reduction system and an air fuel controller by July 1, 2010. A rich burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of less than 2% by volume.

XVII.E.3.a.(i)(a) All control equipment required by this Section XVII.E.3.a. shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file.

XVII.E.3.a.(i)(b) Internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard under 40 CFR Part 60 are not subject to this Section XVII.E.3.a.

XVII.E.3.a.(i)(c) The requirements of this Section XVII.E.3.a. shall not apply to any engine having actual uncontrolled emissions permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.3.a.(ii) Any rich burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of combined volatile organic compound and nitrogen oxides emission reductions (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.a. Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.E.3.b. (State Only) Lean Burn Reciprocating Internal Combustion Engines

XVII.E.3.b.(i) Except as provided in Section XVII.E.3.b.(ii), all lean burn reciprocating internal combustion engines with a manufacturer's nameplate design rate greater than 500 horsepower shall install and operate an oxidation catalyst by July 1, 2010. A lean burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of 2% by volume, or greater.

XVII.E.3.b.(ii) Any lean burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of volatile organic compound emission reduction (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.b.(i). Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.F. [\(State Only\) Leak detection and repair program for well production facilities, storage tanks, and compressor stations](#)

[XVII.F.1. Beginning January 1, 2015, owners and operators of well production facilities and compressor stations will identify and repair leaks from components at these facilities in accordance with the requirements of this Section XVII.F. The following shall apply in lieu of any directed inspection and maintenance program requirements established pursuant to Regulation Number 3, Part B, Section III.D.2.](#)

[XVII.F.2. Owners and operators of well production facilities or natural gas compressor stations that monitor components as part of this Section XVII.F. may opt to estimate emissions from components for the purpose of evaluating the applicability of component fugitive emissions to Regulation Number 3 by utilizing the emission factors defined as less than 10,000 ppmv of Table 2-8 of the 1995 EPA Protocol for Equipment Leak Emission Estimates \(Document EPA-453/R-95-017\).](#)

[XVII.F.3. Owners and operators of well production facilities or natural gas compressor stations shall utilize the Approved Instrument Based Monitoring Method and AVO program as outlined in Section XVII.F. AVO monitoring is not required of components and tanks that are unsafe to monitor or inaccessible to monitor, pursuant to XVII.F.5.g.](#)

XVII.F.4. Inspection schedules for natural gas compressor stations

Beginning January 1, 2015, owners and operators of natural gas compressor stations shall inspect components for leaks using an Approved Instrument Based Monitoring Method, in accordance with the following Table 2, except for components subject to XVII.F.5.g. For purposes of this Section XVII.F.4., fugitive emissions shall be calculated using the emission factors of Table 2-4 of the 1995 EPA Protocol for Equipment Leak Emission Estimates (Document EPA-453/R-95-017), or another Division approved method.

<b>TABLE 2</b>	
<u>Fugitive VOC Emissions (tpy)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 12</u>	<u>Annually</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly</u>
<u>&gt; 50</u>	<u>Monthly</u>

XVII.F.5. Requirements for well production facilities and/or storage tanks

XVII.F.5.a. Beginning August 1, 2014, all new well production facilities shall have a documented pressure test performed on all equipment and piping prior to start up. Documentation of this 90 day testing and monitoring shall be provided in the first annual report to the Division, as required by Section XVII.F.9.

XVII.F.5.b. Beginning January 1, 2015, within 90 days of startup of all new well production facilities and/or storage tanks, owners and/or operators shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method. Such action shall qualify as an inspection pursuant to the inspection frequency schedule in Table 3.

XVII.F.5.c. Consistent with the provisions of XVII.F.5.f., owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks using an Approved Instrument Based Monitoring Method, in accordance with the implementation schedule in XVII.F.5.e. Inspection frequency shall be determined according to Table 3.

XVII.F.5.d. Consistent with the provisions of XVII.F.5.f., owners and operators of new well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method beginning on January 1, 2015. Inspection frequency shall be determined according to Table 3.

XVII.F.5.e. The estimated uncontrolled actual emissions from storage tanks determine the frequency at which inspections must be performed. If no storage tanks are located at a well production facility or multi-well site, operators will rely on the potential to emit of VOC for all of the emissions sources, including emissions from components located at the facility. All components at a well production facility or storage tank must be inspected:

<b>TABLE 3</b>	
<u>Threshold (per XVII.F.5.e.) VOC Emissions (tpy, uncontrolled actual for sites with tanks or PTE for sites without tanks)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 6</u>	<u>One time using Approved Instrument Based Monitoring Method and thereafter using monthly AVO</u>
<u>&gt; 6 and &lt; 12</u>	<u>Annually with monthly AVO</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly with monthly AVO</u>
<u>&gt; 50</u>	<u>Monthly</u>
<u>Multi-well sites without storage tanks after April 15, 2014, that have a PTE &gt; 20 tpy VOC</u>	<u>Monthly</u>

XVII.F.5.f. Phase-in of Approved Instrument Based Monitoring Methods

Owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method, in accordance with the following schedule:

XVII.F.5.f.(i) Beginning January 1, 2015, facilities with uncontrolled actual VOC emissions greater than 50 tpy or multi-well sites.

XVII.F.5.f.(ii) Beginning July 1, 2015, facilities with uncontrolled actual VOC emissions greater than 20 tpy but less than or equal to 50 tpy.

XVII.F.5.f.(iii) Beginning January 1, 2016, facilities with uncontrolled actual VOC emissions greater than 6 tpy but less than or equal to 20 tpy.

XVII.F.5.f.(iv) By July 1, 2016, facilities with uncontrolled actual VOC emissions less than or equal to 6 tpy.

XVII.F.5.g. If a component is difficult, unsafe, or inaccessible to monitor, the owner or operator shall not be required to monitor the component until it becomes feasible to do so.

XVII.F.5.g.(i) Difficult to monitor components are those that cannot be monitored without elevating the monitoring personnel more than two meters above a supported surface or are unable to be reached via a wheeled scissor-lift or hydraulic type scaffold that allows access to components up to 7.6 meters (25 feet) above the ground.

XVII.F.5.g.(ii) Unsafe to monitor components are those that cannot be monitored without exposing monitoring personnel to an immediate danger as a consequence of completing the monitoring.

XVII.F.5.g.(iii) Inaccessible to monitor components are those that are buried, insulated in a manner that prevents access to the components by

a monitor probe, or obstructed by equipment or piping that prevents access to the components by a monitor probe.

XVII.F.6. Leak detection requiring repair

Leaks shall be identified utilizing the methods listed in this Section XVII.F.6.a. through XVII.F.6.d. Only leaks detected pursuant to this Section XVII.F.6. shall require repair under Section XVII.F.

XVII.F.6.a. For Method 21 monitoring at existing facilities, a leak is any concentration of hydrocarbon above 2,000 parts per million (ppm), except for existing well production facilities where leak is defined as any concentration of hydrocarbon above 500 ppm.

XVII.F.6.b. For Method 21 monitoring at facilities constructed after May 1, 2014, a leak is any concentration of hydrocarbon above 500 ppm.

XVII.F.6.c. For infra-red camera and AVO monitoring, a leak is any detectable emissions not associated with normal equipment operation, such as pneumatic device actuation and crank case ventilation.

XVII.F.6.d. For other Division approved monitoring devices or methods, leak identification requiring repair will be established as set forth in the Division's approval.

XVII.F.7. Repair and remonitoring

XVII.F.7.a. First attempt to repair a leak shall be made no later than five (5) working days after discovery, unless parts are unavailable, the equipment requires shutdown to complete repair, or other good cause exists. If parts are unavailable, they shall be ordered promptly and the repair shall be made within fifteen (15) working days of receipt of the parts. If shutdown is required, the leak shall be repaired during the next scheduled shutdown. If delay is attributable to other good cause, repairs shall be completed within fifteen (15) working days after the cause of delay ceases to exist.

XVII.F.7.b. Within fifteen (15) working days of completion of a repair, the leak shall be remonitored to verify the repair was effective.

XVII.F.7.c. Leaks discovered pursuant to the leak detection methods of Section XVII.F. shall not be subject to enforcement by the Division unless the owner or operator fails to perform the required repairs in accordance with Section XVII.F.7.

XVII.F.7.d. For leaks identified using an Approved Instrument Based Monitoring Method, owners and operators have the option of either repairing the leak in accordance with the repair schedule set forth in Section XVII.F.7. or conducting follow-up monitoring using Method 21 within five (5) working days of the leak detected. If the follow-up Method 21 monitoring shows that the leak concentration is less than or equal to 2,000 ppm hydrocarbon for existing facilities (other than existing well production facilities), or 500 ppm for new facilities or existing well production facilities, then the emission shall not be considered a leak for purposes of this Section.

XVII.F.8. Recordkeeping

The owner or operator of each facility subject to the inspection and maintenance requirements in this Section XVII.F. shall maintain the following for a period of two (2) years and make them available to the Division upon request.

XVII.F.8.a. Documentation of the pre-start-up pressure tests for new well production facilities;

XVII.F.8.b. The date and site information for each inspection;

XVII.F.8.c. A list of the leaking components and the monitoring method used to determine the presence of the leak;

XVII.F.8.d. The date of first attempt to repair the leak and, if necessary, any additional attempt to repair the leak;

XVII.F.8.e. The date the leak was repaired;

XVII.F.8.f. The delayed repair list including the basis for placing leaks on the list;

XVII.F.8.g. The date the leak was remonitored to verify the effectiveness of the repair, and the results of the remonitoring; and

XVII.F.8.h. A list of identification numbers for components that are designated as unsafe or inaccessible to monitor, as described in Section XVII.F.5.g., an explanation for each component stating why the component is so designated, and the plan for monitoring such component(s).

XVII.F.9. Reporting

The owner or operator of each facility subject to the inspection and maintenance requirements in Section XVII.F. shall submit a single annual report on or before April 30th of each year summarizing inspection and maintenance activities at all of their subject facilities during the previous calendar year. This report shall contain at a minimum the following information:

XVII.F.9.a. The number of facilities inspected;

XVII.F.9.b. The total number of inspections;

XVII.F.9.c. The total number of leaks identified, broken out by component type;

XVII.F.9.d. The total number of leaks repaired;

XVII.F.9.e. The number of leaks on the delayed repair list as of December 31st; and

XVII.F.9.f. Each report shall be accompanied by a self-certification form. The form shall contain a certification by a responsible official of the truth, accuracy, and completeness of such form, report, or certification stating that, based on information and belief formed after reasonable

inquiry, the statements and information in the document are true, accurate, and complete.

XVII.G. (State Only) Control of emissions from well production facilities.

XVII.G.1. Well Operation and Maintenance.

On or after August 1, 2014, during normal operation gas coming off of a separator produced from any newly constructed, hydraulically fractured, or recompleted oil or gas well must be either routed to a gas gathering line or controlled by air pollution control equipment that achieves an average hydrocarbon control efficiency of 95% from the date of first production. If a combustion device is used, it shall have a design destruction efficiency of at least 98% of hydrocarbons.

XVII.H. (State Only) Venting during downhole well maintenance and unloading events.

XVII.H.1. Well Maintenance.

Beginning May 1, 2014, hydrocarbon emissions from flowing wells must be captured or controlled during downhole well maintenance or servicing activities, unless venting is necessary for safety.

XVII.H.1.a. Operators shall use best management practices to minimize the need for well venting associated with downhole well maintenance and liquids unloading. During liquids unloading events, any means of creating differential pressure will first be used to attempt to unload the liquids from the well without venting. If these methods are not successful in unloading the liquids from the well, the well may be vented to the atmosphere to create the necessary differential pressure to bring the liquids to the surface.

XVII.H.1.b. Venting will be minimized to the extent possible, using best management practices during the well maintenance and liquids unloading events in XVII.H.1.a. The owner and/or operator shall be present on-site during any planned well maintenance and liquids unloading event in XVII.H.1.a. and shall ensure that any venting to the atmosphere is limited to the maximum extent practicable.

XVII.H.1.c. Records of the cause, date, time, and duration of venting events under this Section XVII.H. will be kept and made available to the Division upon request.

XVIII. (State Only) Natural Gas-Actuated Pneumatic Controllers Associated with Oil and Gas Operations ~~in the 8-Hour Ozone Control Area or Any Ozone Nonattainment or Attainment/Maintenance Area~~

XVIII.A. \_\_\_\_\_ Applicability

This section applies to pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations) ~~in the 8-Hour Ozone Control Area or any Ozone Nonattainment or Attainment/Maintenance Area.~~

XVIII.B. \_\_\_\_\_ Definitions

XVIII.B.1. “Affected Operations” shall mean pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations).

XVIII.B.2. “Enhanced Maintenance” is specific to high-bleed devices and shall include but is not limited to cleaning, tuning, and repairing leaking gaskets, tubing fittings, and seals; tuning to operate over a broader range of proportional band; and eliminating unnecessary valve positioners.

XVIII.B.3. “High-Bleed Pneumatic Controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits in excess of 6 standard cubic feet per hour (scfh) of natural gas to the atmosphere.

XVIII.B.4. “Low-Bleed Pneumatic controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits less than or equal to 6 scfh of natural gas to the atmosphere.

XVIII.B.5. “Natural Gas Processing Plant” shall mean any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both.

XVIII.B.6. ~~“No-bleed Pneumatic Controller” shall mean any pneumatic controller that is not using hydrocarbon gas as the valve’s actuating gas.~~

XVIII.B.67. “Pneumatic Controller” shall mean an instrument that is actuated using natural gas pressure and used to control or monitor process parameters such as liquid level, gas level, pressure, valve position, liquid flow, gas flow, and temperature.

XVIII.C. \_\_\_\_\_ Emission Reduction Requirements

The owners and operators of affected operations shall reduce emissions of volatile organic compounds from pneumatic controllers associated with affected operations as follows:

XVIII.C.1. \_\_\_\_\_ In the 8-Hour Ozone Control Area:

[XVIII.C.1.a.](#) All pneumatic controllers placed in service on or after February 1, 2009, shall emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.2.1.b.](#) All high-bleed pneumatic controllers in service prior to February 1, 2009 shall be replaced or retrofit such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, by May 1, 2009, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.31.c.](#) All high-bleed pneumatic controllers that must remain in service -due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.

[XVIII.C.3-a.1.c.\(i\)](#) For high-bleed pneumatic controllers in service prior to February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and /or process purposes by March 1, 2009. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.3-b.1.c.\(ii\)](#) For high-bleed pneumatic controllers placed in service on or after February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to be installed due to safety and /or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.2.](#) [Statewide:](#)

[XVIII.C.2.a.](#) [All pneumatic controllers placed in service on or after May 1, 2014, shall:](#)

[XVIII.C.2.a.\(i\)](#) [Emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.; or](#)

[XVIII.C.2.a.\(ii\)](#) [Utilize no-bleed pneumatic controllers where on-site electrical grid power is being used and is technically and economically feasible.](#)

[XVIII.C.2.b.](#) [All high-bleed pneumatic controllers in service prior to May 1, 2014, shall be replaced or retrofitted by May 1, 2015, such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.](#)

[XVIII.C.2.c.](#) [All high-bleed pneumatic controllers that must remain in service due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.](#)

[XVIII.C.2.c.\(i\)](#) [For high-bleed pneumatic controllers in service prior to May 1, 2014, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and/or process purposes by March 1, 2015. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.](#)

[XVIII.C.2.c.\(ii\)](#) [For high-bleed pneumatic controllers placed in service on or after May 1, 2014, the owner/operator shall submit justification for high-bleed](#)

pneumatic controllers to be installed due to safety and/or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

#### XVIII.D. Monitoring

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

##### XVIII.D.1. In the 8-Hour Ozone Control Area:

XVIII.D.1.a. Effective May 1, 2009, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.1.b. Effective May 1, 2009, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

##### XVIII.D.2. Statewide:

XVIII.D.2.a. Effective May 1, 2015, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.b. Effective May 1, 2015, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

#### XVIII.E. Recordkeeping

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

XVIII.E.1. The owner or operator of affected operations shall maintain a log of the total number of high-bleed pneumatic controllers and their associated controller numbers per facility, the total number of high-bleed pneumatic controllers per company and the associated justification that the high-bleed pneumatic controllers must be used pursuant to SectionSections XVIII.C.31.c. and XVIII.C.2.c. The log shall be updated on a monthly basis.

XVIII.E.2. The owner or operator shall maintain a log of enhanced maintenance which shall include, at a minimum, inspection dates, the date of the maintenance activity, high-bleed pneumatic controller number, description of the maintenance performed, results and date of any corrective action taken, and the printed name and signature of the individual performing the maintenance. The log shall be updated on a monthly basis.

XVIII.E.3. Records of enhanced maintenance of pneumatic controllers shall be maintained for a minimum of three years and readily made available to the ~~division~~Division upon request.

## Colorado Fracking Rules to Target Methane

Ninety percent of wells in Colorado are fracked.(Amy Harder)

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since 2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in 2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT

Air Quality Control Commission

REGULATION NUMBER 7

CONTROL OF OZONE VIA OZONE PRECURSORS AND CONTROL OF HYDROCARBONS VIA OIL AND GAS EMISSIONS

(EMISSIONS OF VOLATILE ORGANIC COMPOUNDS AND NITROGEN OXIDES)

5 CCR 1001-9

II.B. Exemptions

Emissions of the organic compounds listed as having negligible photochemical reactivity in the common provisions definition of Negligibly Reactive Volatile Organic Compound are exempt from the provisions of this regulation.

(State Only) Notwithstanding the foregoing exemption, hydrocarbon emissions from oil and gas operations, including methane and ethane, are subject to this regulation as set forth in Sections XVII. and XVIII.

>>>>>>>>

**XVII. (State Only, except Section XVII.E.3.a. which was submitted as part of the Regional Haze SIP) Statewide Controls for Oil and Gas Operations and Natural Gas-Fired Reciprocating Internal Combustion Engines**

XVII.A. (State Only) Definitions

XVII.A.1 "Air Pollution Control Equipment," as used in this Section XVII, means a combustion device or vapor recovery unit. Air pollution control equipment also means alternative emissions control equipment and pollution prevention devices and processes intended to reduce uncontrolled actual emissions that comply with the requirements of Section XVII.B.2.e.

~~XVII.A.2. "Atmospheric", when used to modify the term "condensate storage tank", means a type of condensate storage tank that vents, or is designed to vent, to the atmosphere.~~

XVII.A.2. "Approved Instrument Based Monitoring Method" as used in this Section XVII. means an infra-red camera, Method 21, or other Division approved instrument based monitoring device or method. If an owner/operator elects to use a Division approved Continuous Emission Monitoring program, the Division may approve a streamlined inspection and reporting program for such operations. Any instrument based monitoring method approved by the Division under this definition must be at least as effective as Method 21 or an infra-red camera.

XVII.A.3. "Auto-Igniter" means a device which will automatically attempt to relight the pilot flame in the combustion chamber of a control device in order to combust volatile organic compound emissions.

- XVII.A.3. “Condensate Storage Tank” means any production tank or series of production tanks that are manifolded together that store condensate.
- XVII.A.4. “Component” means each pump seal, compressor seal, flange, pressure relief device, connector, open ended line, and valve that contains or contacts a process stream with hydrocarbons. Process streams consisting of glycol, amine, produced water, or methanol are not components for purposes of this Section XVII.
- XVII.A.5. “Connector” means flanged, screwed, or other jointed fittings used to connect two pipes or a pipe and a piece of process equipment or that close an opening in a pipe that could be connected to another pipe. Joined fittings welded completely around the circumference of the interface are not considered connectors.
- XVII.A.6. “Date of First Production” means the date reported to the COGCC as the “first date of production.”
- XVII.A.47. “Glycol Natural Gas Dehydrator” means any device in which a liquid glycol (including ethylene glycol, diethylene glycol, or triethylene glycol) absorbent directly contacts a natural gas stream and absorbs water.
- XVII.A.8. “Multi-Well Site” means a common well pad from which multiple wells may be drilled to various bottomhole locations.
- XVII.A.9. “Natural Gas Compressor Station” means a facility which contains one or more compressors designed to compress natural gas from well pressure to gathering system pressure and recompress natural gas prior to processing.
- XVII.A.10. “Normal Operation” means all periods of operation, excluding malfunction as defined in Section I.G of the Common Provisions regulation. For storage tanks at well production facilities, normal operation includes but is not limited to liquid dumps from the separator.
- XVII.A.11. “Stabilized” when used to refer to crude oil, condensate, intermediate hydrocarbon liquids, or produced water means that the vapor pressure of the liquid is sufficiently low to prevent the production of vapor phase upon transferring the liquid to an atmospheric pressure in a storage tank, and that any emissions that occur are limited to those commonly referred to within the industry as working, breathing, and standing losses.
- XVII.A.12. “Storage Tank” means any fixed roof storage vessel or series of storage vessels that are manifolded together via liquid line. Storage vessel is as defined in 40 CFR Part 60, Subpart OOOO. Storage tanks may be located at a well production facility or other location.
- XVII.A.13. “Unsafe to Monitor” means a component is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of such monitoring.
- XVII.A.14. “Visible Emissions” means observations of smoke for any period or periods of duration greater than or equal to one (1) minute in any fifteen (15) minute period during normal operation. Visible emissions do not include radiant energy or water vapor.
- XVII.A.15. “Well Production Facility” means all equipment at a single stationary source directly associated with one or more oil wells or gas wells. This equipment includes, but is

not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline.

#### XVII.B. (State Only) General Provisions

XVII.B.1. General requirements for prevention of emissions and good air pollution control equipment, prevention of leakage, and flares and combustion devices practices for all oil and gas exploration and production operations, well production facilities, natural gas compressor stations, and natural gas processing plants.

XVII.B.1.a.~~XVII.B.1.b.~~ All intermediate hydrocarbon liquid condensate collection, storage, processing, and handling operations, regardless of size, shall be designed, operated, and maintained so as to minimize emission of volatile organic compounds to the atmosphere to the extent reasonably practicable.

XVII.B.1.b. At all times, including periods of start-up and shutdown, the facility and air pollution control equipment shall be maintained and operated in a manner consistent with good air pollution control practices for minimizing emissions. Determination of whether or not acceptable operating and maintenance procedures are being used will be based on information available to the Division, which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

XVII.B.2. General requirements for air pollution control equipment, flares, and combustion devices used to comply with Section XVII.

XVII.B.2.a.~~XVII.B.1.a.~~ All air pollution control equipment shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file. In addition, all such air pollution control equipment shall be adequately designed and sized to achieve the control efficiency rates required by this Section XVII and to handle reasonably foreseeable fluctuations in emissions of volatile organic compounds and hydrocarbons during normal operations. Fluctuations in emissions that occur when the separator dumps into the tank are reasonably foreseeable.

XVII.B.2.b.~~XVII.B.1.c.~~ If a flare or other combustion device is used to control emissions of hydrocarbons~~volatile organic compounds to comply with Section XVII~~, it shall be enclosed, have no visible emissions during normal operations, and be designed so that an observer can, by means of visual observation from the outside of the enclosed flare or combustion device, or by other convenient means approved by the Division, determine whether it is operating properly.

XVII.B.2.c.~~XVII.B.1.d.~~ Any of the effective dates for installation of controls on condensate storage tanks, dehydrators, and/or internal combustion engines may be extended at the air pollution control-Division's discretion for good cause shown.

XVII.B.2.d. Auto-igniters

All combustion devices used to control emissions of hydrocarbons shall be equipped with and operate an auto-igniter as follows:

XVII.B.2.d.(i) All combustion devices installed on or after May 1, 2014, will be equipped with an operational auto-igniter upon installation of the combustion device.

XVII.B.2.d.(ii) All combustion devices installed before May 1, 2014, will be equipped with an operational auto-igniter by or before May 1, 2016, or after the next combustion device planned shutdown, whichever comes first.

XVII.B.2.e.XVII.B.2. Alternative emissions control equipment shall qualify as air pollution control equipment, and may be used in lieu of, or in combination with, combustion devices and vapor recovery units to achieve the emission reductions required by this Section XVII, if the Division approves the equipment, device or process. As part of the approval process the Division, at its discretion, may specify a different control efficiency than the control efficiencies required by this Section XVII.

XVII.B.3. Oil refineries are not subject to ~~this section of the rule~~Section XVII.

XVII.B.4. ~~Condensate tanks, Glycol natural gas~~ dehydrators and internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard ("NSPS") under 40 CFR Part 60 are not subject to this Section XVII.

XVII.C. (State Only) Emission reduction from ~~condensate~~ storage tanks at oil and gas exploration and production operations, well production facilities, natural gas compressor stations, ~~natural gas drip stations~~ and natural gas processing plants.

XVII.C.1. Control requirements for storage tanks

XVII.C.1.a. Beginning May 1, 2008, owners or operators of all ~~atmospheric condensate~~ storage tanks storing condensate with uncontrolled actual emissions of volatile organic compounds equal to or greater than twenty (20) tons per year based on a rolling twelve-month total ~~shall must~~ operate air pollution control equipment that has an average control efficiency of at least 95% for VOCs ~~on such tanks.~~

XVII.C.1.b. Owners or operators of all storage tanks with uncontrolled actual emissions of volatile organic compounds equal to or greater than six (6) tons per year based on a rolling twelve-month total must operate air pollution control equipment that achieves an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.C.1.b.(i) A storage tank constructed on or after May 1, 2014, must be in compliance by the date that the storage tank commences operation.

XVII.C.1.b.(ii) A storage tank constructed before May 1, 2014, must be in compliance by May 1, 2015.

XVII.C.1.b.(iii) A storage tank not otherwise subject to Sections XVII.C.1.b.(i) or XVII.C.1.b.(ii), above, that increases uncontrolled actual emissions to six tons VOC or more per year on a rolling twelve month basis after May 1,

2014, must be in compliance within sixty days of discovery of the emissions increase.

XVII.C.1.c. Control requirements within 90 days of the date of first production.

XVII.C.1.c.(i) Beginning May 1, 2014, owners or operators of storage tanks at well production facilities shall collect and control emissions by routing emissions to operating air pollution control equipment during the first 90 calendar days after the date of first production. The air pollution control equipment shall achieve an average hydrocarbon control efficiency of 95%. If a combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons. Except that this requirement does not apply to storage tanks that are projected to have emissions less than 1.5 tons of VOC during the first 90 days after the date of first production.

XVII.C.1.c.(ii) The air pollution control equipment and any associated monitoring equipment required pursuant to Section XVII.C.1.c., above may be removed at any time after the first 90 calendar days as long as the source can demonstrate that uncontrolled actual emissions from the storage tank are below the threshold in Section XVII.C.1.b., above.

~~XVII.C.2. For condensate storage tanks with past, uncontrolled actual emissions of volatile organic compounds of less than 20 tons per year based on a rolling twelve-month total that may become subject to Section XVII.C.1. by virtue of the addition of a newly drilled well or the recompletion or stimulation of an existing well, owners or operators of such tanks shall have until 90 days after the date of 1<sup>st</sup> production of the newly drilled, recompleted or stimulated well to install and operate any required air pollution control equipment. If the owner or operator determines that emissions of volatile organic compounds will be below the 20-ton per year threshold, the owner or operator shall notify the Division of this determination in writing and include an explanation of the methodology used to make this determination.~~

XVII.C.2. Capture requirements for storage tanks that are fitted with air pollution control equipment as required by Sections XII.D. or XVII.C.1.

XVII.C.2.a. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall route all hydrocarbon emissions to air pollution control equipment, and shall operate without venting hydrocarbon emissions from the thief hatch (or other access point to the tank) or pressure relief device during normal operation unless venting is reasonably required for maintenance, gauging, or safety of personnel and equipment.

XVII.C.2.b. Beginning on the applicable compliance date specified in Section XVII.C.1.b., owners and operators of storage tanks shall develop, certify, and implement a documented Storage Tank Emission Management System (STEM) plan to identify appropriate strategies to minimize emissions from venting at thief hatches (or other access points to a storage tank) and pressure relief devices during normal operation. As part of STEM, owners and operators shall evaluate and employ appropriate control technologies, monitoring practices, operational practices, and/or other strategies designed to meet the requirements set forth in Section XVII.C.2.a., above, and will update the STEM plan as necessary to achieve or maintain compliance. Owners and operators are not required to develop and implement STEM for storage tanks containing only stabilized liquids. The minimum elements of STEM are listed below.

XVII.C.2.b.(i) STEM must include a monitoring strategy that incorporates the minimum monitoring frequency set forth in Section XVII.F.5.e., procedures for evaluating ongoing storage tank emission capture performance, and, if applicable, the selected strategies.

XVII.C.2.b.(ii) STEM must include a certification by the owner or operator that the selected STEM strategy or strategies are designed to minimize emissions from storage tanks and associated equipment components at the facility or facilities, including thief hatches and pressure relief devices.

### XVII.C.3. Monitoring

~~:- The owner or operator of any condensate storage tank that is required to control volatile organic compound emissions pursuant to this Section XVII.C. shall visually inspect or monitor the Air Pollution Control Equipment to ensure that it is operating at least as often as condensate is loaded out from the tank, unless a more frequent inspection or monitoring schedule is followed. In addition, if a flare or other combustion device is used, the owner or operator shall visually inspect the device for visible emissions at least as often as condensate is loaded out from the tank. The monitoring strategy of each STEM plan must include monitoring in accordance with Approved Instrument Based Monitoring Methods, as specified in Section XVII.F.5.~~

XVII.C.3.a. In addition to any applicable Approved Instrument Based Monitoring Methods, audio, visual, olfactory ("AVO") inspection of the storage tank and any associated equipment (i.e. separator, air pollution control equipment, or other pressure reducing equipment), must be completed as often as liquids are loaded out from the storage tank. However, AVO inspection is required no more frequently than every seven (7) days or less frequently than every thirty (30) days. AVO monitoring is not required for components and tanks that are unsafe to monitor. AVO inspection must include, at a minimum:

XVII.C.3.a.(i) Visual inspection of any thief hatch, pressure relief valve, or other access point to ensure that they are closed and properly sealed;

XVII.C.3.a.(ii) Visual inspection or monitoring of the air pollution control equipment to ensure that it is operating, including that the pilot light is lit on combustion devices used as air pollution control equipment;

XVII.C.3.a.(iii) If a flare or other combustion device is used, visual inspection of the auto-igniter and valves for piping of gas to the pilot light, to ensure they are functioning properly;

XVII.C.3.a.(iv) Visual inspection of the air pollution control equipment to ensure that the valves for the piping from the storage tank to the air pollution control equipment are open; and

XVII.C.3.a.(v) If a flare or other combustion device is used, inspection of the device for the presence or absence of smoke. If smoke is observed, either the equipment will be immediately shut-in to investigate the potential cause for smoke and perform repairs, as necessary, or Method

22 shall be conducted to determine whether visible emissions are present for a period of at least one (1) minute in fifteen (15) minutes.

XVII.C.4. Recordkeeping

The owner or operator of each storage tank subject to XII.D. or XVII.C. must maintain records of STEM as applicable, including the plan, any updates, and the certification, to be made available to the Division upon request. In addition, for a period of two years, the owner or operator must maintain records of any required monitoring and make them available to the Division upon request, including:

- XVII.C.4.a. The AIRS ID for the storage tank.
- XVII.C.4.b. The date and duration of any period where the thief hatch, pressure relief device, or other access point are found to be venting hydrocarbon emissions.
- XVII.C.4.c. The date and duration of any period where the air pollution control equipment is not operating.
- XVII.C.4.d. Where a flare or other combustion device is being used, the date and result of any Method 22 test.
- XVII.C.4.e. The timing of and efforts made to eliminate venting, restore operation of air pollution control equipment, and mitigate visible emissions.

XVII.D. (State Only) Emission reductions from glycol natural gas dehydrators

XVII.D.1. Beginning May 1, 2008, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.2., shall reduce uncontrolled actual emissions of volatile organic compounds by at least 90 percent through the use of a condenser or air pollution control equipment.

XVII.D.2. The control requirement in Section XVII.D.1. shall apply where:

XVII.D.2.a. Actual uncontrolled emissions of volatile organic compounds from the glycol natural gas dehydrator are equal to or greater than two tons per year; and

XVII.D.2.b. The sum of actual uncontrolled emissions of volatile organic compounds from any single glycol natural gas dehydrator or grouping of glycol natural gas dehydrators at a stationary source is equal to or greater than 15 tons per year. To determine if a grouping of dehydrators meets or exceeds the 15 tons per year threshold, sum the total actual uncontrolled emissions of volatile organic compounds from all individual dehydrators at a stationary source, including those with emissions less than two tons per year.

XVII.D.3. Beginning May 1, 2015, still vents and vents from any flash separator or flash tank on a glycol natural gas dehydrator located at an oil and gas exploration and production operation, natural gas compressor station, and drip station or gas-processing plant subject to control requirements pursuant to Section XVII.D.4., shall reduce uncontrolled actual emissions of hydrocarbons by at least 95 percent on a rolling twelve-month basis through the use of a condenser or air pollution control equipment. If a

combustion device is used, it shall have a design destruction efficiency of at least 98% for hydrocarbons.

XVII.D.4. The control requirement in Section XVII.D.3. shall apply where:

XVII.D.4.a. Actual uncontrolled emissions of volatile organic compounds from a single new glycol natural gas dehydrator are equal to or greater than two tons per year; or

XVII.D.4.b. Actual uncontrolled emissions of volatile organic compounds from a single existing glycol natural gas dehydrator are equal to or greater than six (6) tons per year, or two (2) tons per year if the glycol natural gas dehydrator is located within 1,320 feet of a building unit or designated outside activity area.

XVII.D.4.d. For purposes of Section XVII.D.4:

XVII.D.4.d.(i) Building Unit shall mean a residential building unit, and every five thousand (5,000) square feet of building floor area in commercial facilities or every fifteen thousand (15,000) square feet of building floor area in warehouses that are operating and normally occupied during working hours.

XVII.D.4.d.(ii) A designated outside activity area shall mean an outdoor venue or recreation area, such as a playground, permanent sports field, amphitheater, or other similar place of public assembly owned or operated by a local government, which the local government seeks to have established as a Designated Outside Activity Area; or an outdoor venue or recreation area where ingress to or egress from could be impeded in the even of an emergency condition at an oil and gas location less than three hundred and fifty (350) feet from the venue due to the configuration of the venue and the number of persons known or expected to simultaneously occupy the venue on a regular basis.

XVII.E. Control of emissions from new, modified, existing, and relocated natural gas fired reciprocating internal combustion engines.

XVII.E.1. (State Only) The requirements of this Section XVII.E. shall not apply to any engine having actual uncontrolled emissions below permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.2. (State Only) New, Modified and Relocated Natural Gas Fired Reciprocating Internal Combustion Engines

XVII.E.2.a. Except as provided in Section XVII.E.2.b. below, the owner or operator on any natural gas fired reciprocating internal combustion engine that is either constructed or relocated to the state of Colorado from another state, on or after the date listed in the table below shall operate and maintain each engine according to the manufacturer's written instructions or procedures to the extent practicable and consistent with technological limitations and good engineering and maintenance practices over the entire life of the engine so that it achieves the emission standards required in Section XVII.E.2.b. Table 1, below.

XVII.E.2.b. Actual emissions from natural gas fired reciprocating internal combustion engines shall not exceed the emission performance standards in Table 1, below as expressed in units of grams per horsepower-hour (G/hp-hr)

TABLE 1				
Maximum Engine Hp	Construction or Relocation Date	Emission Standards is G/hp-hr		
		NOx	CO	VOC
< 100 Hp	Any	NA	NA	NA
≥100 Hp and < 500 Hp	On or after January 1, 2008	2.0	4.0	1.0
	On or after January 1, 2011	1.0	2.0	0.7
≥500 Hp	On or after January 1, 2011	1.0	2.0	0.7
	On or after July 1, 2007	2.0	4.0	1.0
	On or after July 1, 2010	1.0	2.0	0.7
	On or after July 1, 2010	1.0	2.0	0.7

### XVII.E.3. Existing Natural Gas Fired Reciprocating Internal Combustion Engines

#### XVII.E.3.a. (Regional Haze SIP) Rich Burn Reciprocating Internal Combustion Engines

XVII.E.3.a.(i) Except as provided in Sections XVII.3.1.(i)(b) and (c) and XVII.E.3.a.(ii), all rich burn reciprocating internal combustion engines with a manufacturer's name plate design rate greater than 500 horsepower, constructed or modified before February 1, 2009 shall install and operate both a non-selective catalytic reduction system and an air fuel controller by July 1, 2010. A rich burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of less than 2% by volume.

XVII.E.3.a.(i)(a) All control equipment required by this Section XVII.E.3.a. shall be operated and maintained pursuant to manufacturer specifications or equivalent to the extent practicable, and consistent with technological limitations and good engineering and maintenance practices. The owner or operator shall keep manufacturer specifications or equivalent on file.

XVII.E.3.a.(i)(b) Internal combustion engines that are subject to an emissions control requirement in a federal maximum achievable control technology ("MACT") standard under 40 CFR Part 63, a Best Available Control Technology ("BACT") limit, or a New Source Performance Standard under 40 CFR Part 60 are not subject to this Section XVII.E.3.a.

XVII.E.3.a.(i)(c) The requirements of this Section XVII.E.3.a. shall not apply to any engine having actual uncontrolled emissions permitting thresholds listed in Regulation Number 3, Part B.

XVII.E.3.a.(ii) Any rich burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of combined volatile organic compound and nitrogen oxides emission reductions (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.a. Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.E.3.b. (State Only) Lean Burn Reciprocating Internal Combustion Engines

XVII.E.3.b.(i) Except as provided in Section XVII.E.3.b.(ii), all lean burn reciprocating internal combustion engines with a manufacturer's nameplate design rate greater than 500 horsepower shall install and operate an oxidation catalyst by July 1, 2010. A lean burn reciprocating internal combustion engine is one with a normal exhaust oxygen concentration of 2% by volume, or greater.

XVII.E.3.b.(ii) Any lean burn reciprocating internal combustion engine constructed or modified before February 1, 2009, for which the owner or operator demonstrates to the Division that retrofit technology cannot be installed at a cost of less than \$ 5,000 per ton of volatile organic compound emission reduction (this value shall be adjusted for future applications according to the current day consumer price index) is exempt complying with Section XVII.E.3.b.(i). Installation costs and the best information available for determining control efficiency shall be considered in determining such costs. In order to qualify for such exemption, the owner or operator must submit an application making such a demonstration, together with all supporting documents, to the Division by August 1, 2009.

XVII.F. [\(State Only\) Leak detection and repair program for well production facilities, storage tanks, and compressor stations](#)

[XVII.F.1. Beginning January 1, 2015, owners and operators of well production facilities and compressor stations will identify and repair leaks from components at these facilities in accordance with the requirements of this Section XVII.F. The following shall apply in lieu of any directed inspection and maintenance program requirements established pursuant to Regulation Number 3, Part B, Section III.D.2.](#)

[XVII.F.2. Owners and operators of well production facilities or natural gas compressor stations that monitor components as part of this Section XVII.F. may opt to estimate emissions from components for the purpose of evaluating the applicability of component fugitive emissions to Regulation Number 3 by utilizing the emission factors defined as less than 10,000 ppmv of Table 2-8 of the 1995 EPA Protocol for Equipment Leak Emission Estimates \(Document EPA-453/R-95-017\).](#)

[XVII.F.3. Owners and operators of well production facilities or natural gas compressor stations shall utilize the Approved Instrument Based Monitoring Method and AVO program as outlined in Section XVII.F. AVO monitoring is not required of components and tanks that are unsafe to monitor or inaccessible to monitor, pursuant to XVII.F.5.g.](#)

XVII.F.4. Inspection schedules for natural gas compressor stations

Beginning January 1, 2015, owners and operators of natural gas compressor stations shall inspect components for leaks using an Approved Instrument Based Monitoring Method, in accordance with the following Table 2, except for components subject to XVII.F.5.g. For purposes of this Section XVII.F.4., fugitive emissions shall be calculated using the emission factors of Table 2-4 of the 1995 EPA Protocol for Equipment Leak Emission Estimates (Document EPA-453/R-95-017), or another Division approved method.

<b>TABLE 2</b>	
<u>Fugitive VOC Emissions (tpy)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 12</u>	<u>Annually</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly</u>
<u>&gt; 50</u>	<u>Monthly</u>

XVII.F.5. Requirements for well production facilities and/or storage tanks

XVII.F.5.a. Beginning August 1, 2014, all new well production facilities shall have a documented pressure test performed on all equipment and piping prior to start up. Documentation of this 90 day testing and monitoring shall be provided in the first annual report to the Division, as required by Section XVII.F.9.

XVII.F.5.b. Beginning January 1, 2015, within 90 days of startup of all new well production facilities and/or storage tanks, owners and/or operators shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method. Such action shall qualify as an inspection pursuant to the inspection frequency schedule in Table 3.

XVII.F.5.c. Consistent with the provisions of XVII.F.5.f., owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks using an Approved Instrument Based Monitoring Method, in accordance with the implementation schedule in XVII.F.5.e. Inspection frequency shall be determined according to Table 3.

XVII.F.5.d. Consistent with the provisions of XVII.F.5.f., owners and operators of new well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method beginning on January 1, 2015. Inspection frequency shall be determined according to Table 3.

XVII.F.5.e. The estimated uncontrolled actual emissions from storage tanks determine the frequency at which inspections must be performed. If no storage tanks are located at a well production facility or multi-well site, operators will rely on the potential to emit of VOC for all of the emissions sources, including emissions from components located at the facility. All components at a well production facility or storage tank must be inspected:

<b>TABLE 3</b>	
<u>Threshold (per XVII.F.5.e.) VOC Emissions (tpy, uncontrolled actual for sites with tanks or PTE for sites without tanks)</u>	<u>Inspection Frequency</u>
<u>&gt; 0 and &lt; 6</u>	<u>One time using Approved Instrument Based Monitoring Method and thereafter using monthly AVO</u>
<u>&gt; 6 and &lt; 12</u>	<u>Annually with monthly AVO</u>
<u>&gt; 12 and &lt; 50</u>	<u>Quarterly with monthly AVO</u>
<u>&gt; 50</u>	<u>Monthly</u>
<u>Multi-well sites without storage tanks after April 15, 2014, that have a PTE &gt; 20 tpy VOC</u>	<u>Monthly</u>

XVII.F.5.f. Phase-in of Approved Instrument Based Monitoring Methods

Owners and operators of existing well production facilities and/or storage tanks shall identify and repair leaks from components using an Approved Instrument Based Monitoring Method, in accordance with the following schedule:

XVII.F.5.f.(i) Beginning January 1, 2015, facilities with uncontrolled actual VOC emissions greater than 50 tpy or multi-well sites.

XVII.F.5.f.(ii) Beginning July 1, 2015, facilities with uncontrolled actual VOC emissions greater than 20 tpy but less than or equal to 50 tpy.

XVII.F.5.f.(iii) Beginning January 1, 2016, facilities with uncontrolled actual VOC emissions greater than 6 tpy but less than or equal to 20 tpy.

XVII.F.5.f.(iv) By July 1, 2016, facilities with uncontrolled actual VOC emissions less than or equal to 6 tpy.

XVII.F.5.g. If a component is difficult, unsafe, or inaccessible to monitor, the owner or operator shall not be required to monitor the component until it becomes feasible to do so.

XVII.F.5.g.(i) Difficult to monitor components are those that cannot be monitored without elevating the monitoring personnel more than two meters above a supported surface or are unable to be reached via a wheeled scissor-lift or hydraulic type scaffold that allows access to components up to 7.6 meters (25 feet) above the ground.

XVII.F.5.g.(ii) Unsafe to monitor components are those that cannot be monitored without exposing monitoring personnel to an immediate danger as a consequence of completing the monitoring.

XVII.F.5.g.(iii) Inaccessible to monitor components are those that are buried, insulated in a manner that prevents access to the components by

a monitor probe, or obstructed by equipment or piping that prevents access to the components by a monitor probe.

XVII.F.6. Leak detection requiring repair

Leaks shall be identified utilizing the methods listed in this Section XVII.F.6.a. through XVII.F.6.d. Only leaks detected pursuant to this Section XVII.F.6. shall require repair under Section XVII.F.

XVII.F.6.a. For Method 21 monitoring at existing facilities, a leak is any concentration of hydrocarbon above 2,000 parts per million (ppm), except for existing well production facilities where leak is defined as any concentration of hydrocarbon above 500 ppm.

XVII.F.6.b. For Method 21 monitoring at facilities constructed after May 1, 2014, a leak is any concentration of hydrocarbon above 500 ppm.

XVII.F.6.c. For infra-red camera and AVO monitoring, a leak is any detectable emissions not associated with normal equipment operation, such as pneumatic device actuation and crank case ventilation.

XVII.F.6.d. For other Division approved monitoring devices or methods, leak identification requiring repair will be established as set forth in the Division's approval.

XVII.F.7. Repair and remonitoring

XVII.F.7.a. First attempt to repair a leak shall be made no later than five (5) working days after discovery, unless parts are unavailable, the equipment requires shutdown to complete repair, or other good cause exists. If parts are unavailable, they shall be ordered promptly and the repair shall be made within fifteen (15) working days of receipt of the parts. If shutdown is required, the leak shall be repaired during the next scheduled shutdown. If delay is attributable to other good cause, repairs shall be completed within fifteen (15) working days after the cause of delay ceases to exist.

XVII.F.7.b. Within fifteen (15) working days of completion of a repair, the leak shall be remonitored to verify the repair was effective.

XVII.F.7.c. Leaks discovered pursuant to the leak detection methods of Section XVII.F. shall not be subject to enforcement by the Division unless the owner or operator fails to perform the required repairs in accordance with Section XVII.F.7.

XVII.F.7.d. For leaks identified using an Approved Instrument Based Monitoring Method, owners and operators have the option of either repairing the leak in accordance with the repair schedule set forth in Section XVII.F.7. or conducting follow-up monitoring using Method 21 within five (5) working days of the leak detected. If the follow-up Method 21 monitoring shows that the leak concentration is less than or equal to 2,000 ppm hydrocarbon for existing facilities (other than existing well production facilities), or 500 ppm for new facilities or existing well production facilities, then the emission shall not be considered a leak for purposes of this Section.

XVII.F.8. Recordkeeping

The owner or operator of each facility subject to the inspection and maintenance requirements in this Section XVII.F. shall maintain the following for a period of two (2) years and make them available to the Division upon request.

XVII.F.8.a. Documentation of the pre-start-up pressure tests for new well production facilities;

XVII.F.8.b. The date and site information for each inspection;

XVII.F.8.c. A list of the leaking components and the monitoring method used to determine the presence of the leak;

XVII.F.8.d. The date of first attempt to repair the leak and, if necessary, any additional attempt to repair the leak;

XVII.F.8.e. The date the leak was repaired;

XVII.F.8.f. The delayed repair list including the basis for placing leaks on the list;

XVII.F.8.g. The date the leak was remonitored to verify the effectiveness of the repair, and the results of the remonitoring; and

XVII.F.8.h. A list of identification numbers for components that are designated as unsafe or inaccessible to monitor, as described in Section XVII.F.5.g., an explanation for each component stating why the component is so designated, and the plan for monitoring such component(s).

XVII.F.9. Reporting

The owner or operator of each facility subject to the inspection and maintenance requirements in Section XVII.F. shall submit a single annual report on or before April 30th of each year summarizing inspection and maintenance activities at all of their subject facilities during the previous calendar year. This report shall contain at a minimum the following information:

XVII.F.9.a. The number of facilities inspected;

XVII.F.9.b. The total number of inspections;

XVII.F.9.c. The total number of leaks identified, broken out by component type;

XVII.F.9.d. The total number of leaks repaired;

XVII.F.9.e. The number of leaks on the delayed repair list as of December 31st; and

XVII.F.9.f. Each report shall be accompanied by a self-certification form. The form shall contain a certification by a responsible official of the truth, accuracy, and completeness of such form, report, or certification stating that, based on information and belief formed after reasonable

inquiry, the statements and information in the document are true, accurate, and complete.

XVII.G. (State Only) Control of emissions from well production facilities.

XVII.G.1. Well Operation and Maintenance.

On or after August 1, 2014, during normal operation gas coming off of a separator produced from any newly constructed, hydraulically fractured, or recompleted oil or gas well must be either routed to a gas gathering line or controlled by air pollution control equipment that achieves an average hydrocarbon control efficiency of 95% from the date of first production. If a combustion device is used, it shall have a design destruction efficiency of at least 98% of hydrocarbons.

XVII.H. (State Only) Venting during downhole well maintenance and unloading events.

XVII.H.1. Well Maintenance.

Beginning May 1, 2014, hydrocarbon emissions from flowing wells must be captured or controlled during downhole well maintenance or servicing activities, unless venting is necessary for safety.

XVII.H.1.a. Operators shall use best management practices to minimize the need for well venting associated with downhole well maintenance and liquids unloading. During liquids unloading events, any means of creating differential pressure will first be used to attempt to unload the liquids from the well without venting. If these methods are not successful in unloading the liquids from the well, the well may be vented to the atmosphere to create the necessary differential pressure to bring the liquids to the surface.

XVII.H.1.b. Venting will be minimized to the extent possible, using best management practices during the well maintenance and liquids unloading events in XVII.H.1.a. The owner and/or operator shall be present on-site during any planned well maintenance and liquids unloading event in XVII.H.1.a. and shall ensure that any venting to the atmosphere is limited to the maximum extent practicable.

XVII.H.1.c. Records of the cause, date, time, and duration of venting events under this Section XVII.H. will be kept and made available to the Division upon request.

XVIII. (State Only) Natural Gas-Actuated Pneumatic Controllers Associated with Oil and Gas Operations ~~in the 8-Hour Ozone Control Area or Any Ozone Nonattainment or Attainment/Maintenance Area~~

XVIII.A. \_\_\_\_\_ Applicability

This section applies to pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations) ~~in the 8-Hour Ozone Control Area or any Ozone Nonattainment or Attainment/Maintenance Area.~~

XVIII.B. \_\_\_\_\_ Definitions

XVIII.B.1. “Affected Operations” shall mean pneumatic controllers that are actuated by natural gas, and located at, or upstream of natural gas processing plants (upstream activities include: oil and gas exploration and production operations, natural gas compressor stations, and/or natural gas drip stations).

XVIII.B.2. “Enhanced Maintenance” is specific to high-bleed devices and shall include but is not limited to cleaning, tuning, and repairing leaking gaskets, tubing fittings, and seals; tuning to operate over a broader range of proportional band; and eliminating unnecessary valve positioners.

XVIII.B.3. “High-Bleed Pneumatic Controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits in excess of 6 standard cubic feet per hour (scfh) of natural gas to the atmosphere.

XVIII.B.4. “Low-Bleed Pneumatic controller” shall mean a pneumatic controller that is designed to have a constant bleed rate that emits less than or equal to 6 scfh of natural gas to the atmosphere.

XVIII.B.5. “Natural Gas Processing Plant” shall mean any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both.

XVIII.B.6. “No-bleed Pneumatic Controller” shall mean any pneumatic controller that is not using hydrocarbon gas as the valve’s actuating gas.

XVIII.B.67. “Pneumatic Controller” shall mean an instrument that is actuated using natural gas pressure and used to control or monitor process parameters such as liquid level, gas level, pressure, valve position, liquid flow, gas flow, and temperature.

XVIII.C. \_\_\_\_\_ Emission Reduction Requirements

The owners and operators of affected operations shall reduce emissions of volatile organic compounds from pneumatic controllers associated with affected operations as follows:

XVIII.C.1. \_\_\_\_\_ In the 8-Hour Ozone Control Area:

[XVIII.C.1.a.](#) All pneumatic controllers placed in service on or after February 1, 2009, shall emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.2.1.b.](#) All high-bleed pneumatic controllers in service prior to February 1, 2009 shall be replaced or retrofit such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, by May 1, 2009, unless allowed pursuant to Section XVIII.C.[31.c.](#)

[XVIII.C.31.c.](#) All high-bleed pneumatic controllers that must remain in service -due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.

[XVIII.C.3-a.1.c.\(i\)](#) For high-bleed pneumatic controllers in service prior to February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and /or process purposes by March 1, 2009. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.3-b.1.c.\(ii\)](#) For high-bleed pneumatic controllers placed in service on or after February 1, 2009, the owner/operator shall submit justification for high-bleed pneumatic controllers to be installed due to safety and /or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

[XVIII.C.2.](#) [Statewide:](#)

[XVIII.C.2.a.](#) [All pneumatic controllers placed in service on or after May 1, 2014, shall:](#)

[XVIII.C.2.a.\(i\)](#) [Emit VOCs in an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.; or](#)

[XVIII.C.2.a.\(ii\)](#) [Utilize no-bleed pneumatic controllers where on-site electrical grid power is being used and is technically and economically feasible.](#)

[XVIII.C.2.b.](#) [All high-bleed pneumatic controllers in service prior to May 1, 2014, shall be replaced or retrofitted by May 1, 2015, such that VOC emissions are reduced to an amount equal to or less than a low-bleed pneumatic controller, unless allowed pursuant to Section XVIII.C.2.c.](#)

[XVIII.C.2.c.](#) [All high-bleed pneumatic controllers that must remain in service due to safety and/or process purposes must have Division approval and comply with Sections XVIII.D. and XVIII.E.](#)

[XVIII.C.2.c.\(i\)](#) [For high-bleed pneumatic controllers in service prior to May 1, 2014, the owner/operator shall submit justification for high-bleed pneumatic controllers to remain in service due to safety and/or process purposes by March 1, 2015. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.](#)

[XVIII.C.2.c.\(ii\)](#) [For high-bleed pneumatic controllers placed in service on or after May 1, 2014, the owner/operator shall submit justification for high-bleed](#)

pneumatic controllers to be installed due to safety and/or process purposes prior to installation. The Division shall be deemed to have approved the justification if it does not object to the owner/operator within 30-days upon receipt.

#### XVIII.D. Monitoring

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

##### XVIII.D.1. In the 8-Hour Ozone Control Area:

XVIII.D.1.a. Effective May 1, 2009, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.1.b. Effective May 1, 2009, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

##### XVIII.D.2. Statewide:

XVIII.D.2.a. Effective May 1, 2015, each high-bleed pneumatic controller shall be physically tagged by the owner/operator identifying it with a unique high-bleed pneumatic controller number that is assigned and maintained by the owner/operator.

XVIII.D.2.b. Effective May 1, 2015, each high-bleed pneumatic controller shall be inspected on a monthly basis, perform necessary enhanced maintenance as defined in Section XVIII.B.2 , and maintain the device according to manufacturer specifications to ensure that the controller's VOC emissions are minimized.

#### XVIII.E. Recordkeeping

This section applies only to high-bleed pneumatic controllers identified in SectionSections XVIII.C.31.c. and XVIII.C.2.c.

XVIII.E.1. The owner or operator of affected operations shall maintain a log of the total number of high-bleed pneumatic controllers and their associated controller numbers per facility, the total number of high-bleed pneumatic controllers per company and the associated justification that the high-bleed pneumatic controllers must be used pursuant to SectionSections XVIII.C.31.c. and XVIII.C.2.c. The log shall be updated on a monthly basis.

XVIII.E.2. The owner or operator shall maintain a log of enhanced maintenance which shall include, at a minimum, inspection dates, the date of the maintenance activity, high-bleed pneumatic controller number, description of the maintenance performed, results and date of any corrective action taken, and the printed name and signature of the individual performing the maintenance. The log shall be updated on a monthly basis.

XVIII.E.3. Records of enhanced maintenance of pneumatic controllers shall be maintained for a minimum of three years and readily made available to the ~~division~~Division upon request.

Democratic Gov. John Hickenlooper of Colorado plans to announce a framework targeting methane—a potent greenhouse gas—as part of his state's regulations controlling fracking.

"We are very close now—within the week—to hammering out a specific methane regulatory framework that I think will make sure people's air is much cleaner than what some of their fears would lead them to believe," Hickenlooper said in an interview with National Journal Tuesday. His office confirmed an announcement is expected next week.

In both politics and energy production, Colorado is a bellwether state. So how Hickenlooper moves forward on these issues will be a key indicator of how other states and the country as a whole move forward.

Colorado, which has traditionally ranked in the top 10 of the country's oil and natural-gas producing states, has more than doubled its oil production and increased its gas production by 30 percent since 2005. In that same period, another trend began: Colorado's politics shifted from red, where they were in the 1990's and early 2000's, to blue. After George W. Bush won the state with 52 percent of the vote in

2004, Barack Obama carried the state comfortably in both 2008 and 2012.

It's already known that Hickenlooper's administration is in the process of writing air-quality rules that are expected to be released early next week. This inclusion of methane, a greenhouse gas whose heat-trapping power is 20 times more potent than carbon dioxide in the short-term—is a new development. Concerns about methane have grown as the country shifts from coal to natural gas, which burns half as many carbon emissions as coal. The methane could cancel out the other climate benefits, some environmentalists and experts worry.

"No one has really broken down methane," Hickenlooper said of states' fracking rules.

The news is coming on the heels of four cities in Colorado—Fort Collins, Boulder, Lafayette, and Broomfield—voting on anti-fracking measures. The first three passed the initiatives by comfortable margins. The measure in Broomfield, the most conservative community, initially failed, but its result was overturned in a recount Thursday. Another recount is now expected.

Meanwhile, the House is expected to vote on legislation next week that bans the Obama administration from regulating fracking, an extraction technique that involves blasting large amounts of sand and water along with chemicals into shale formations to release oil and gas. It's key to developing unconventional fossil resources but controversial for its impact on the environment.

Counsel -

I have just learned that EPA may sign the Wood Heaters NSPS proposed rule later this week. (Eileen is out of the office until January 6, so I am contacting you directly. In fact, I am on leave until January 6, but EPA folks were able to reach me about this.)

In addition, Acting AA Janet McCabe may be making courtesy calls to interested parties that have contacted her about this rule.

National Journal

Energy

By Ben Geman

December 22, 2013

Energy Secretary Ernest Moniz is ending the year with a reminder: Carbon dioxide is the biggest enemy

in the fight against climate change.

Moniz, in a new interview, offers a quick tour of recent studies on methane emissions from natural-gas development—a topic that's plenty controversial amid the U.S. fracking boom.

"We need more data," he tells the news service Platts. But, he adds, methane is far from public enemy No. 1. That's carbon dioxide.

"We do have, after all, measurements of the methane concentrations in the atmosphere and what they tell us is that the carbon dioxide concentrations remain by far the biggest forcer of climate change," he said in an interview that aired Sunday.

"So CO<sub>2</sub> remains the dominant concern for us," Moniz said on Platts' Energy Week TV.

The comments are the latest sign that Moniz does not see methane leaks undercutting the climate advantages that natural gas holds over coal.

Natural gas, which has been eating into coal's market share in power generation, emits just half as much carbon dioxide when burned to create electricity.

It's one of the major reasons U.S. carbon emissions are falling, and Moniz sees gas as an ally in the fight against global warming—at least for a while, although he believes that eventually much steeper carbon cuts will be needed.

But leaks of methane from gas wells and elsewhere on the supply chain, critics say, threaten to erode a big part of that carbon advantage over coal (or all of it, according to a Cornell University professor's controversial and contrarian analysis).

Moniz is not dismissive of the threat from methane—a gas that's pound-for-pound about 20 times more heat-trapping than carbon dioxide, but emitted in much lower volumes and doesn't stick around nearly as long.

His department is part of an interagency group crafting a methane strategy under President Obama's second-term climate plan.

And Moniz is keeping up on his reading. In the interview, he cited the recent University of Texas study, a product of work with the Environmental Defense Fund that had industry funding, which found low methane emissions from gas wells surveyed.

Moniz, in noting that more data is needed, also cited more troubling research: A recent Harvard University study that found overall U.S. methane emissions are far above EPA estimates. That study looked at a wider array of sources, including gas distribution infrastructure.

But Moniz, a former Massachusetts Institute of Technology physics professor, offers a quick lesson.

"Carbon dioxide has a very, very long residence time in the atmosphere. We are talking centuries. If we emit CO<sub>2</sub> now, we are living with that, our children are living with it, our grandchildren are living with it," Moniz said.

"Methane, you are talking more the order of a decade. If we can clamp down, measure . . . reduce those methane emissions, a lot of that will, in fact, go away in a one or two decades time scale," he said.

Elsewhere in the interview, Moniz reiterated his view that it's time to revisit laws and policies that effectively ban U.S. crude oil exports.

Check out the full interview [here](#).

Everyone,

EPA just announced the proposed rule. Their release is live now. The proposal with added information is at <http://www2.epa.gov/residential-wood-heaters>. "EPA expects to issue a final rule in 2015."

Attached is our statement.

Happy new year,

Janice

The EPA Administrator signed the proposed rule for the Wood Heaters NSPS on Friday, Jan 3. The pre-publication notice and related materials are available online at <http://www2.epa.gov/residential-wood-heaters/proposed-new-source-performance-standards-residential-wood-heaters>. We do not yet know exactly when it will be published in the Fed. Reg.

## New Study — Web of Entities Invests Heavily in Obstructing Climate and Clean Energy Progress

By Vickie Patton | Bio | Published: January 6, 2014|Edit

A few days ago, the Wall Street Journal reported that Peabody Coal Company is one of the top five worst performing stocks of 2013.

In a year when the S&P 500 was up 29 percent and the Dow rose by 26 percent, Peabody Coal's stock plummeted by 28 percent.

While most investors recognize the serious environmental and financial risks associated with coal and its pollution, not all do.

Drexel University Professor Robert Brulle reviewed IRS data from 2003 to 2010 and found a web of entities investing over \$900 million annually in organizations dedicated to obstructing climate progress and fighting the deployment of safe, clean energy in America.

If you take a closer look at those specific organizations identified in Brulle's study, you'll find that several of them are involved – now – in extensive efforts to obstruct climate and clean energy progress under the nation's clean air laws and leading state programs.

Take a look at these examples:

The Landmark Legal Foundation, Competitive Enterprise Institute and FreedomWorks all just filed briefs before the U.S. Supreme Court challenging the Clean Air Act's requirement that, at the time of their design and construction, large industrial sources deploy cost-effective modern pollution control technologies to mitigate their climate pollution.

In its challenge to clean air measures for climate pollution, the Competitive Enterprise Institute and FreedomWorks brief (filed along with Southeastern Legal Foundation) relies extensively — and chillingly — on the tobacco industry case *FDA v. Brown & Williamson Tobacco Corp.* and the legal attacks on our nation's efforts to eliminate the scourge of youth tobacco addiction:

“The Court's approach to FDA's assertion of regulatory authority over tobacco products has direct relevance in the present case and should control the outcome here.”

(That's from page 7 of their brief. The Supreme Court has already considered – and rejected – this misguided legal attack in the context of EPA's authority to regulate climate pollution.)

Earlier this year, the Landmark Legal Foundation unsuccessfully asked the U.S. Supreme Court to review EPA's science-based determination that six greenhouse gases endanger the health and welfare of current and future generations. They tried to challenge EPA's determination, anchored in extensive science reflecting decades of research, by ridiculously questioning whether this finding is a "scientific judgment." (see page 11 of their brief)

The Competitive Enterprise Institute also litigated to overturn New York Republican Governor George Pataki's leading efforts to cap and reduce the climate pollution from fossil fuel power plants in New York and to participate in a broader regional pollution control program, the Regional Greenhouse Gas Initiative.

On December 5th, New York's appellate court affirmed the decision of the state's trial court firmly rejecting these legal attacks.

In his study, Brulle also chronicles the "evidence of a trend toward concealing the sources of [climate obstructionism] funding through the use of donor directed philanthropies" such as the Donors Trust.

A closer look at funding by the Donors Trust through its most recent IRS Form 990 (2011) indicates \$1,189,730 in grant funding provided to an organization called the Committee for a Constructive Tomorrow (CFACT). CFACT is a major outlet for climate denialism.

CFACT, too, just filed a brief with the U.S. Supreme Court in which it asserts that the overwhelming scientific consensus on human-induced climate change is "tenuous, biased, inaccurate, incomplete, unsupported by actual observations, and lacking in scientific integrity."

The recent scientific findings of the world's leading scientists set out in the Fifth Assessment Report of the Intergovernmental Panel on Climate Change found that climate change is unequivocal and its impacts are unprecedented and profound.

Another organization that has received support from the Donors Trust according to the Trust's IRS Form 990 (2011) is the Judicial Education Project.

They also just filed a brief with the U.S. Supreme Court challenging the federal government's authority to regulate greenhouse gas emissions from the nation's largest sources of such pollution. The brief alleges that the Environmental Protection Agency exceeded its authority under the U.S. Supreme Court's 2007 landmark case, *Massachusetts v. EPA*, in which the Court stated that the "harms associated with climate change are serious and well recognized."

Earlier this year, the Mercatus Center — another group identified by Brulle's research — submitted adverse comments on proposed clean air standards for cars and gasoline by calling into question the extensive body of peer reviewed science linking particulate pollution and mortality.

It is well documented that these clean air standards for cars and gasoline will provide healthier, longer lives. They have also won the support of diverse interests, including the American Lung Association and the U.S. auto industry, because of the dual benefits of reducing health-harming pollutants and enabling more efficient clean car technologies.

Recently, the Landmark Legal Foundation joined by the Cato Institute — both groups identified in Brulle's research — challenged the Department of Energy's adoption of improved appliance efficiency standards for microwaves.

The microwave standards will lead to less energy use, consumer cost savings and pollution reductions.

Landmark Legal Foundation and the Cato Institute objected to DOE's consideration of the societal benefits of mitigating carbon pollution. Patrick Michaels, a well-known climate denialist, co-authored the Cato comments. Landmark asked DOE to immediately halt implementation and rescind the Rule.

DOE has denied the request to upend these common sense energy conservation standards for our nation.

And it is not surprising that Peabody Coal Company, too, has just filed a brief in the U.S. Supreme Court objecting to the Clean Air Act requirement that our nation's largest industrial emitters use modern pollution controls to mitigate climate pollution.

Peabody's brief begins by asserting that "[w]hether and how to regulate GHGs [greenhouse gases] remains a highly debated, contentious issue in Congress, agencies and the courts." (Page 2 of their brief)

But Brulle's research elucidates how Peabody's assertion is a tautology. Through massive funding of groups dedicated to climate obstructionism, Brulle documents how climate change remains contentious because there is a vast climate change counter-movement dedicated to making it so:

"[A] number of conservative think tanks, trade associations, and advocacy organizations are the key organizational components of a well-organized climate change counter-movement (CCCM) that has not only played a major role in confounding public understanding of climate science, but also successfully delayed meaningful government policy actions to address the issue."

Climate change is happening. The toll exacted from extreme weather — fueled in part by climate change — on human life and our economy is profound, and reaches from the ravages wrought on New York and New Jersey by Hurricane Sandy to the tragic flooding in the Rockies.

However, the solutions are at hand.

In 2012, wind power was "the number one source of new U.S. electric generation capacity for the first time—representing 43 percent of all new electric additions and accounting for \$25 billion in U.S. investment."

And even more recently, in November 2013, 100 percent — ALL — of the new electrical power in America came from renewable energy.

While Peabody's stock falls and its rhetoric rises, and while the forces of obstructionism fight clean energy, the winds of change are blowing briskly.

Brulle's study is a clarion call for moms, dads, grandparents, aunts, and uncles to resolve that in 2014 we will work together to fight for clean air and clean energy for our children — and for all children.

In spite of a well-funded group of obstructionists, we can prevail.

We can secure climate progress and clean energy for our nation, for our communities and for our future.

I would like to schedule a call next week to discuss plaintiffs' response to EPA's settlement proposal. Because the industry association has been granted intervention, it is appropriate that they should be included. Of course, I am not sure if plaintiffs have completed their discussions with their clients, which would have to happen before we talk further. To keep everything moving, I would like to set a time for us to talk next week. I propose Jan. 14 (Tues) or 16 (Thurs) between 10:00 and 2:00. Please let me know if you are available. I will send out a call-in number once we settle on a time. Thank you.

New Study — Web of Entities Invests Heavily in Obstructing Climate and Clean Energy Progress

By Vickie Patton | Bio | Published: January 6, 2014|Edit

A few days ago, the Wall Street Journal reported that Peabody Coal Company is one of the top five worst performing stocks of 2013.

In a year when the S&P 500 was up 29 percent and the Dow rose by 26 percent, Peabody Coal's stock plummeted by 28 percent.

While most investors recognize the serious environmental and financial risks associated with coal and

its pollution, not all do.

Drexel University Professor Robert Brulle reviewed IRS data from 2003 to 2010 and found a web of entities investing over \$900 million annually in organizations dedicated to obstructing climate progress and fighting the deployment of safe, clean energy in America.

If you take a closer look at those specific organizations identified in Brulle's study, you'll find that several of them are involved – now – in extensive efforts to obstruct climate and clean energy progress under the nation's clean air laws and leading state programs.

Take a look at these examples:

The Landmark Legal Foundation, Competitive Enterprise Institute and FreedomWorks all just filed briefs before the U.S. Supreme Court challenging the Clean Air Act's requirement that, at the time of their design and construction, large industrial sources deploy cost-effective modern pollution control technologies to mitigate their climate pollution.

In its challenge to clean air measures for climate pollution, the Competitive Enterprise Institute and FreedomWorks brief (filed along with Southeastern Legal Foundation) relies extensively — and chillingly — on the tobacco industry case *FDA v. Brown & Williamson Tobacco Corp.* and the legal attacks on our nation's efforts to eliminate the scourge of youth tobacco addiction:

“The Court's approach to FDA's assertion of regulatory authority over tobacco products has direct relevance in the present case and should control the outcome here.”

(That's from page 7 of their brief. The Supreme Court has already considered – and rejected – this misguided legal attack in the context of EPA's authority to regulate climate pollution.)

Earlier this year, the Landmark Legal Foundation unsuccessfully asked the U.S. Supreme Court to review EPA's science-based determination that six greenhouse gases endanger the health and welfare of current and future generations. They tried to challenge EPA's determination, anchored in extensive science reflecting decades of research, by ridiculously questioning whether this finding is a “scientific judgment.” (see page 11 of their brief)

The Competitive Enterprise Institute also litigated to overturn New York Republican Governor George Pataki's leading efforts to cap and reduce the climate pollution from fossil fuel power plants in New York and to participate in a broader regional pollution control program, the Regional Greenhouse Gas Initiative.

On December 5th, New York's appellate court affirmed the decision of the state's trial court firmly rejecting these legal attacks.

In his study, Brulle also chronicles the “evidence of a trend toward concealing the sources of [climate obstructionism] funding through the use of donor directed philanthropies” such as the Donors Trust.

A closer look at funding by the Donors Trust through its most recent IRS Form 990 (2011) indicates \$1,189,730 in grant funding provided to an organization called the Committee for a Constructive Tomorrow (CFACT). CFACT is a major outlet for climate denialism.

CFACT, too, just filed a brief with the U.S. Supreme Court in which it asserts that the overwhelming scientific consensus on human-induced climate change is “tenuous, biased, inaccurate, incomplete, unsupported by actual observations, and lacking in scientific integrity.”

The recent scientific findings of the world's leading scientists set out in the Fifth Assessment Report of the Intergovernmental Panel on Climate Change found that climate change is unequivocal and its impacts are unprecedented and profound.

Another organization that has received support from the Donors Trust according to the Trust's IRS Form 990 (2011) is the Judicial Education Project.

They also just filed a brief with the U.S. Supreme Court challenging the federal government's authority to regulate greenhouse gas emissions from the nation's largest sources of such pollution. The brief alleges that the Environmental Protection Agency exceeded its authority under the U.S. Supreme Court's 2007 landmark case, *Massachusetts v. EPA*, in which the Court stated that the "harms associated with climate change are serious and well recognized."

Earlier this year, the Mercatus Center — another group identified by Brulle's research — submitted adverse comments on proposed clean air standards for cars and gasoline by calling into question the extensive body of peer reviewed science linking particulate pollution and mortality.

It is well documented that these clean air standards for cars and gasoline will provide healthier, longer lives. They have also won the support of diverse interests, including the American Lung Association and the U.S. auto industry, because of the dual benefits of reducing health-harming pollutants and enabling more efficient clean car technologies.

Recently, the Landmark Legal Foundation joined by the Cato Institute — both groups identified in Brulle's research — challenged the Department of Energy's adoption of improved appliance efficiency standards for microwaves.

The microwave standards will lead to less energy use, consumer cost savings and pollution reductions. Landmark Legal Foundation and the Cato Institute objected to DOE's consideration of the societal benefits of mitigating carbon pollution. Patrick Michaels, a well-known climate denialist, co-authored the Cato comments. Landmark asked DOE to immediately halt implementation and rescind the Rule.

DOE has denied the request to upend these common sense energy conservation standards for our nation.

And it is not surprising that Peabody Coal Company, too, has just filed a brief in the U.S. Supreme Court objecting to the Clean Air Act requirement that our nation's largest industrial emitters use modern pollution controls to mitigate climate pollution.

Peabody's brief begins by asserting that "[w]hether and how to regulate GHGs [greenhouse gases] remains a highly debated, contentious issue in Congress, agencies and the courts." (Page 2 of their brief)

But Brulle's research elucidates how Peabody's assertion is a tautology. Through massive funding of groups dedicated to climate obstructionism, Brulle documents how climate change remains contentious because there is a vast climate change counter-movement dedicated to making it so:

"[A] number of conservative think tanks, trade associations, and advocacy organizations are the key organizational components of a well-organized climate change counter-movement (CCCM) that has not only played a major role in confounding public understanding of climate science, but also successfully delayed meaningful government policy actions to address the issue."

Climate change is happening. The toll exacted from extreme weather — fueled in part by climate change — on human life and our economy is profound, and reaches from the ravages wrought on New York and New Jersey by Hurricane Sandy to the tragic flooding in the Rockies.

However, the solutions are at hand.

In 2012, wind power was "the number one source of new U.S. electric generation capacity for the first time—representing 43 percent of all new electric additions and accounting for \$25 billion in U.S.

investment.”

And even more recently, in November 2013, 100 percent – ALL – of the new electrical power in America came from renewable energy.

While Peabody’s stock falls and its rhetoric rises, and while the forces of obstructionism fight clean energy, the winds of change are blowing briskly.

Brulle’s study is a clarion call for moms, dads, grandparents, aunts, and uncles to resolve that in 2014 we will work together to fight for clean air and clean energy for our children — and for all children.

In spite of a well-funded group of obstructionists, we can prevail.

We can secure climate progress and clean energy for our nation, for our communities and for our future.

I would like to schedule a call next week to discuss plaintiffs' response to EPA's settlement proposal. Because the industry association has been granted intervention, it is appropriate that they should be included. Of course, I am not sure if plaintiffs have completed their discussions with their clients, which would have to happen before we talk further. To keep everything moving, I would like to set a time for us to talk next week. I propose Jan. 14 (Tues) or 16 (Thurs) between 10:00 and 2:00. Please let me know if you are available. I will send out a call-in number once we settle on a time. Thank you.

**IN THE SUPERIOR COURT OF THE STATE OF DELAWARE**

**IN AND FOR SUSSEX COUNTY**

DAVID T. STEVENSON, :  
R. CHRISTIAN HUDSON, :  
JOHN W. MOORE, and :  
JACK PETERMAN, :

Plaintiffs, :

C.A. No. S13C-12- :  
:

DELAWARE DEPARTMENT :  
OF NATURAL RESOURCES AND :  
ENVIRONMENTAL CONTROL, an :  
agency of the State, and COLIN O'MARA, :  
in his capacity as Secretary of the :  
Department of Natural Resources and :  
Environmental Control, :

Defendants. :

**COMPLAINT**

Plaintiffs David T. Stevenson, R. Christian Hudson, John W. Moore, and Jack Peterman bring this action for Declaratory Relief regarding illegal state regulations pursuant to the Administrative Procedures Act, based upon the following:

**THE PARTIES**

1. Plaintiff David T. Stevenson ("Stevenson") is a Sussex County, Delaware resident, currently residing at 37524 Golden Eagle Boulevard in Lewes, Delaware. Stevenson is an electric power customer of Delaware Electric Cooperative, Inc.

2. Plaintiff R. Christian Hudson ("Hudson") is a Sussex County, Delaware resident, with offices at 30045 Eagle Crest Road in Milton, Delaware, with businesses known as Sam Yoder And Son, LLC and Hudson Management. Hudson is an electric power customer of Delmarva Power and one of his businesses is a customer of Delaware Electric Cooperative, Inc.

3. Plaintiff John W. Moore (“Moore”) is a New Castle County, Delaware resident. Moore is an electric power customer of Delmarva Power.

4. Plaintiff Jack Peterman (“Peterman”) is a Kent County, Delaware resident, currently living at 595 Log Cabin Road in Milford, Delaware, and currently serves as a member of the Delaware State House of Representatives, representing the 33<sup>rd</sup> District. Peterman is an electric power customer of Delaware Electric Cooperative, Inc.

5. Defendant Delaware Department of Natural Resources And Environmental Control (“DNREC”) is an agency of the State of Delaware, created and empowered pursuant to the provisions of 29 *Del. C.* Ch. 80 and Title 7 of the Delaware Code.

6. Defendant Colin O’Mara is the Secretary of DNREC (the “Secretary”), and is named solely in his official capacity.

### **JURISDICTION**

7. This Court has jurisdiction over this action pursuant to provisions of 10 *Del. C.* § 541, Article IV, § 7 of the Delaware Constitution, and 29 *Del. C.* § 10141.

### **THE FACTS**

8. In December of 2005, the State of Delaware entered into a Memorandum of Understanding with six (6) other states located in the northeast section of the United States regarding a Regional Greenhouse Gas Initiative (the “MOU”). The MOU was executed by the then Governor of Delaware, and was ultimately approved by six (6) other states: Connecticut; Maine; New Hampshire; New Jersey; New York; and Vermont. New Jersey subsequently withdrew from the MOU, and Massachusetts and Rhode Island joined in.

9. Under the MOU, the seven (7) states committed to propose for legislative and/or regulatory approval a program reflected in the MOU's "Model Rule," with a launch date for the program of January 1, 2009.

10. The MOU proposed to establish a Carbon Dioxide (CO<sub>2</sub>) trading program (the "Program") for, *inter alia*, Electric Generation facilities. It also set regional and individual State Carbon Dioxide emission caps, which were to remain constant through 2014 and be reduced by 2.5% per year in the years 2015 through 2018.

11. The MOU also provided that each State would: 1) allocate "allowances" to emit Carbon Dioxide which would not exceed the individual State cap amounts; and 2) conduct a comprehensive review of the Program in the year 2012, in order to evaluate success, impacts, further reductions, and status of sales of CO<sub>2</sub> emission allowances. But in no event were cap amounts to be reduced prior to 2018.

12. In furtherance of the commitments made by the State of Delaware in the MOU, the Delaware General Assembly enacted the Regional Greenhouse Gas Initiative Act as 7 *Del. C.* §§ 6043-6047 in 2008 (the "RGGI Act").

13. The RGGI Act: 1) declared Carbon Dioxide to constitute an "air contaminant" subject to state regulation; 2) established a "cap and trade" allowance program to control CO<sub>2</sub> emissions; and 3) provided that Delaware Electric Generation facilities would be required to hold sufficient government-issued "CO<sub>2</sub> allowances" to cover their respective annual CO<sub>2</sub> emission levels.

14. In turn, 7 *Del. C.* §§ 6001(2)-(3) and 6003 subject "air contaminant" generators to the permitting and regulatory authority of DNREC and the Secretary.

15. The RGGI Act establishes mandatory requirements that Electric Generation facilities purchase “CO<sub>2</sub> allowances” in order to emit Carbon Dioxide. Delmarva Power and Delaware Electric Cooperative, Inc. both purchase electricity to distribute to customers from Delaware Electric Generation facilities that must purchase “CO<sub>2</sub> allowances.”

16. DNREC has sold CO<sub>2</sub> allowances for monetary consideration in order to enable Electric Generation companies to continue functioning and providing electricity as their business purposes require. CO<sub>2</sub> allowances are only good for a short number of years, after which new ones must be purchased.

17. No Electric Generation facility in Delaware may legally operate unless it purchases the mandatory CO<sub>2</sub> allowances from DNREC in return for a required monetary payment, which DNREC sets the minimum price for. Thus, a CO<sub>2</sub> allowance effectively constitutes a “permit” (the “CO<sub>2</sub> Permit”).

18. After adoption of the RGGI Act, the Secretary of DNREC adopted regulations consistent with the MOU.

19. On November 19, 2013, DNREC issued Secretary’s Order No. 2013-A-0054, approving final amendments to 7 DE Admin. Co. 1147: Carbon Dioxide (CO<sub>2</sub>) Budget Trading Program – Regional Greenhouse Gas Initiative, which had an effective date of December 11, 2013 (the “New RGGI Regulations”). The New RGGI Regulations were published in the Delaware Register of Regulations on December 1, 2013.

20. The New RGGI Regulations include changes in: 1) the size and structure of the CO<sub>2</sub> allowance cap; and 2) the effective price of a CO<sub>2</sub> Permit.

21. Pursuant to 7 *Del. C.* §§ 6043 and 6044, the Secretary of DNREC is authorized to participate in the Regional Greenhouse Gas Initiative and to promulgate regulations to

implement the RGGI cap and trade program consistent with the MOU. Thus, the Secretary's delegated powers are expressly limited by and subject to the MOU terms.

22. The New RGGI Regulations illegally decreased the CO<sub>2</sub> cap for Delaware below the levels provided for in the MOU. Based on principles of supply and demand, the lower CO<sub>2</sub> cap provisions in the New RGGI Regulations will directly and proximately increase the cost of CO<sub>2</sub> Permits, which will concomitantly increase electric power rates charged to customers.

23. The New RGGI Regulations also illegally establish a higher price floor and a new method for the trade of CO<sub>2</sub> allowances, which will cause the price of CO<sub>2</sub> Permits for Electric Generating facilities to increase. But the General Assembly never approved an increase in such permit rates by the required three-fifths (3/5<sup>ths</sup>) vote.

24. The Plaintiffs are aggrieved *per se* by the New RGGI Regulations' violation of Article VIII, § 10 of the Delaware State Constitution. And they are also aggrieved since their electric power rates will rise as a result of increased costs to the Electric Generation facilities stemming from higher CO<sub>2</sub> Permit rates driven by the RGGI Regulations.

**COUNT I – DECLARATORY JUDGMENT –  
STATE CONSTITUTIONAL ILLEGALITY**

25. The contents of paragraphs 1. through 24. are hereby restated as if fully set forth herein.

26. Pursuant to the Delaware Administrative Procedures Act, 29 *Del. C.* § 10141, persons claiming the unlawfulness of a regulation may bring a complaint for declaratory relief in this Court.

27. Additionally, this Court has the authority to declare the actions of government agents such as DNREC and O'Mara to be invalid under the Delaware Code pursuant to the Declaratory Judgment Act, 10 *Del. C.* Ch. 65.

28. As adopted, the New RGGI Regulations would permit DNREC and O'Mara to administratively increase CO<sub>2</sub> Permit rates.

29. The New RGGI Regulations are unconstitutional in contravention of Article VIII, § 10 of the Delaware Constitution since the CO<sub>2</sub> Permit fees that result therefrom were not expressly approved by a three-fifths (3/5<sup>ths</sup>) vote of the Delaware General Assembly.

**COUNT II – DECLARATORY JUDGMENT –  
RGGI ACT AND DELEGATION DOCTRINE ILLEGALITY**

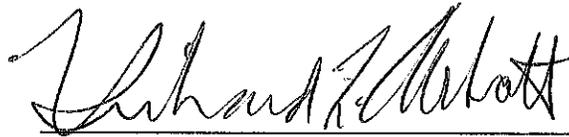

30. The contents of paragraphs 1. through 29. are hereby restated as if fully set forth herein.

31. The New RGGI Regulations also run afoul of the RGGI Act since the new, lower CO<sub>2</sub> emissions cap provisions are not consistent with the MOU. The MOU is expressly required to be followed pursuant to the RGGI Act.

32. Under the principles of legislative delegation, DNREC and the Secretary are required to act in strict conformance with the conditions of their delegated authority in the RGGI Act. Since the New RGGI Regulations stray from the emissions cap provisions of the MOU contrary to the express terms of the legislative delegation in the RGGI Act, such regulatory action is illegal.

WHEREFORE, the Plaintiffs David T. Stevenson, R. Christian Hudson, John W. Moore, and Jack Peterman respectfully request that this Court enter a Judgment in their favor and against Defendants DNREC and O'Mara pursuant to the Administrative Procedures Act by declaring that the New RGGI Regulations are invalid based upon their contravention of the Delaware Constitution and the RGGI Act.

---

Eileen, we have a response to your proposal, and would propose to have a call this week in advance of the call with industry next week. We're available Thurs. from 230-on and Friday from 9-11, 2-3, or 4-5, if one of those slots works for Scott and you. Figure on about 30-45 min. With respect to next week's call, did you intend that we'd take up the "meet and confer" items in Rule 16, or that we'd schedule a separate call to discuss those? Per the court's scheduling order, we have until Jan. 29 to submit the meet and confer statement. Thanks.—Mike

Michael J. Myers

Subject: Wood heaters

I would like to schedule a call next week to discuss plaintiffs' response to EPA's settlement proposal. Because the industry association has been granted intervention, it is appropriate that they should be included. Of course, I am not sure if plaintiffs have completed their discussions with their clients, which would have to happen before we talk further. To keep everything moving, I would like to set a time for us to talk next week. I propose Jan. 14 (Tues) or 16 (Thurs) between 10:00 and 2:00. Please let me know if you are available. I will send out a call-in number once we settle on a time. Thank you.

#### In the News

INCR Members Say "2014 the Year for a Smart Carbon Tax"

Joe Keefe, INCR member and President and CEO of Pax World Mgmt, and Pax World Funds, writes in The Green Money Journal that a credible alliance between sustainable investors and the fossil fuel industry might help fashion climate change solutions, especially through a Smart Carbon Tax.

#### Events

Shareholder Initiative on Climate and Sustainability (SICS) Working Group Call

Wednesday, January 8  
2:00 - 3:00 pm ET

The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change- related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge, Director, Investor Programs.

INCR Policy Working Group Call

Tuesday, January 21

1:00 - 2:00 pm ET

Join this month's INCR Policy working group call to hear from guest speakers, Ceres staff and investor peers. The discussion will focus on upcoming engagements, investor opportunities and new regulations. To register and learn more, contact Brandon Smithwood, Senior Manager, Policy Program.

#### INCR Sustainable Stock Exchanges Working Group Call

Thursday, January 30  
12:00 - 1:00 pm ET

INCR Sustainable Stock Exchanges Working Group Call - The SSE Working Group will meet to discuss the upcoming launch of the Listing Standards Comment Period by global stock exchanges, among other items. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Programs.

#### Investors File Carbon Asset Risk Resolutions with World's Largest Fossil Fuel Companies

Coal Power Plant 1In September 2013, INCR members and other global investors managing over \$3 trillion of collective assets sent letters to 45 of the world's largest fossil fuel companies urging them to report on how they will mitigate the risk of stranded assets in a low carbon future. Now, a subset of these investors is following up by filing shareholder resolutions with 11 fossil fuel companies. Filers include: Arjuna Capital, As You Sow, Connecticut Office of the State Treasurer, First Affirmative Financial Network, NY State Common Retirement Fund, Trillium Asset Management and the Unitarian Universalist Association.

Exxon Mobil, Peabody Energy Corporation, Alpha Natural Resources, and The Southern Company are among the fossil fuel producers and fossil fuel-consuming utilities that received resolutions. Resolution text can be found on the Ceres online Resolution Database.

The Office of the New York State Comptroller filed resolutions with FirstEnergy Corp, an electric utility, and Devon Energy Corp, an oil and gas producer. Citing a HSBC report that found that "the equity valuation of oil producers could drop below 40 to 60% under a low emissions scenario," the Devon resolution states, "without additional disclosure, it is difficult for shareholders to determine whether Devon is adequately managing these risks or seizing related opportunities."

"We believe that oil and coal companies in our portfolios need to go back to the drawing board to determine the long-term financial risks that climate change poses to their business plans," wrote Thomas DiNapoli, the New York State Comptroller, and Anne Stausboll, the CEO of CalSTRS in a recent Huffington Post Op-Ed.

The letters and resolutions are part of the Carbon Asset Risk Initiative through which investors are addressing the growing concern that, "No more than one-third of proven reserves of fossil fuels can be consumed prior to 2050 if the world is to achieve the 2 °C goal," as stated by the International Energy Agency.

View a current list of 2014 filings, including Carbon Asset Risk and other climate and sustainability resolutions filed by INCR members and partners.

For more information on the initiative or the resolutions, contact Ryan Salmon.

#### INCR Member-Communications Merge to Weekly Mailing

The INCR Bulletin and associated Events Calendar, regularly sent every Friday and Monday, will now be combined into one streamlined mailing to be circulated to members every Monday morning.

This weekly email will follow the same format of the INCR Bulletin and feature stories and information about INCR, its members, and sustainable investing. Focusing on one INCR email a week will allow us to provide members with relevant information in a concise and timely manner.

INCR Communication Tools Include:

- \*INCR Bulletin / Events Calendar (Now Merged)
- \*INCR Members-Only Listserv ([incr@ceres.org](mailto:incr@ceres.org))
- \*INCR Twitter- @INCRnews
- \*Monthly/Quarterly INCR Working Group Calls
- \*INCR webinars
- \*INCR meetings

INCR members are encouraged to op-into the INCR listserv forum – a members only email platform that allows investors to connect with their peers, share news stories, events and their successes. Interested investors should contact Tracey Rembert, Senior Manager of Investor Programs, to be added to the listserv.

For questions or to learn more about INCR communications, please contact Rebecca Bar, Coordinator, Investor Programs.

Attachments: Court Order re Briefing Schedule (12-9-13).pdf

---

Happy New Year!

I hope everyone is doing well at the start of the new year! I was just browsing PACER, and came across this court order regarding the briefing schedule. I assume we will discuss the scope of our brief after January 28, 2014 (when the Intervenors in support of Petitioner submit their joint brief), but I just wanted to check in with all of you to find out if there is another plan.

Best,

Kristen

Last Modified: Tue Jan 07 14:00:21 EST 2014

---

**United States Court of Appeals**  
FOR THE DISTRICT OF COLUMBIA CIRCUIT

**No. 11-1485**

**September Term, 2013**

Joint Brief of Amici Curiae  
in Support of Respondent  
(not to exceed 7,000 words)

March 14, 2014

Petitioner’s Reply Brief  
(not to exceed 8,500 words)

March 31, 2014

Joint Reply Brief of Intervenors  
in Support of Petitioner  
(not to exceed 5,125 words)

April 15, 2014

The briefs will cite to the previously-filed appendix.

The parties will be notified by separate order of the oral argument date and composition of the merits panel. The court reminds the parties that

In cases involving direct review in this court of administrative actions, the brief of the appellant or petitioner must set forth the basis for the claim of standing. . . . When the appellant’s or petitioner’s standing is not apparent from the administrative record, the brief must include arguments and evidence establishing the claim of standing.

See D.C. Cir. Rule 28(a)(7).

Parties are strongly encouraged to hand deliver the paper copies of their briefs to the Clerk’s office on the date due. Filing by mail may delay the processing of the brief. Additionally, counsel are reminded that if filing by mail, they must use a class of mail that is at least as expeditious as first-class mail. See Fed. R. App. P. 25(a). All briefs and appendices must contain the date that the case is scheduled for oral argument at the top of the cover. See D.C. Cir. Rule 28(a)(8).

New Study — Web of Entities Invests Heavily in Obstructing Climate and Clean Energy Progress

By Vickie Patton | Bio | Published: January 6, 2014|Edit

A few days ago, the Wall Street Journal reported that Peabody Coal Company is one of the top five worst performing stocks of 2013.

In a year when the S&P 500 was up 29 percent and the Dow rose by 26 percent, Peabody Coal's stock plummeted by 28 percent.

While most investors recognize the serious environmental and financial risks associated with coal and its pollution, not all do.

Drexel University Professor Robert Brulle reviewed IRS data from 2003 to 2010 and found a web of entities investing over \$900 million annually in organizations dedicated to obstructing climate progress and fighting the deployment of safe, clean energy in America.

If you take a closer look at those specific organizations identified in Brulle's study, you'll find that several of them are involved – now – in extensive efforts to obstruct climate and clean energy progress under the nation's clean air laws and leading state programs.

Take a look at these examples:

The Landmark Legal Foundation, Competitive Enterprise Institute and FreedomWorks all just filed briefs before the U.S. Supreme Court challenging the Clean Air Act's requirement that, at the time of their design and construction, large industrial sources deploy cost-effective modern pollution control technologies to mitigate their climate pollution.

In its challenge to clean air measures for climate pollution, the Competitive Enterprise Institute and FreedomWorks brief (filed along with Southeastern Legal Foundation) relies extensively — and chillingly — on the tobacco industry case *FDA v. Brown & Williamson Tobacco Corp.* and the legal attacks on our nation's efforts to eliminate the scourge of youth tobacco addiction:

“The Court's approach to FDA's assertion of regulatory authority over tobacco products has direct relevance in the present case and should control the outcome here.”

(That's from page 7 of their brief. The Supreme Court has already considered – and rejected – this misguided legal attack in the context of EPA's authority to regulate climate pollution.)

Earlier this year, the Landmark Legal Foundation unsuccessfully asked the U.S. Supreme Court to review EPA's science-based determination that six greenhouse gases endanger the health and welfare of current and future generations. They tried to challenge EPA's determination, anchored in extensive science reflecting decades of research, by ridiculously questioning whether this finding is a “scientific judgment.” (see page 11 of their brief)

The Competitive Enterprise Institute also litigated to overturn New York Republican Governor George Pataki's leading efforts to cap and reduce the climate pollution from fossil fuel power plants in New York and to participate in a broader regional pollution control program, the Regional Greenhouse Gas Initiative.

On December 5th, New York's appellate court affirmed the decision of the state's trial court firmly rejecting these legal attacks.

In his study, Brulle also chronicles the “evidence of a trend toward concealing the sources of [climate obstructionism] funding through the use of donor directed philanthropies” such as the Donors Trust.

A closer look at funding by the Donors Trust through its most recent IRS Form 990 (2011) indicates \$1,189,730 in grant funding provided to an organization called the Committee for a Constructive Tomorrow (CFACT). CFACT is a major outlet for climate denialism.

CFACT, too, just filed a brief with the U.S. Supreme Court in which it asserts that the overwhelming scientific consensus on human-induced climate change is “tenuous, biased, inaccurate, incomplete, unsupported by actual observations, and lacking in scientific integrity.”

The recent scientific findings of the world’s leading scientists set out in the Fifth Assessment Report of the Intergovernmental Panel on Climate Change found that climate change is unequivocal and its impacts are unprecedented and profound.

Another organization that has received support from the Donors Trust according to the Trust’s IRS Form 990 (2011) is the Judicial Education Project.

They also just filed a brief with the U.S. Supreme Court challenging the federal government’s authority to regulate greenhouse gas emissions from the nation’s largest sources of such pollution. The brief alleges that the Environmental Protection Agency exceeded its authority under the U.S. Supreme Court’s 2007 landmark case, *Massachusetts v. EPA*, in which the Court stated that the “harms associated with climate change are serious and well recognized.”

Earlier this year, the Mercatus Center — another group identified by Brulle’s research — submitted adverse comments on proposed clean air standards for cars and gasoline by calling into question the extensive body of peer reviewed science linking particulate pollution and mortality.

It is well documented that these clean air standards for cars and gasoline will provide healthier, longer lives. They have also won the support of diverse interests, including the American Lung Association and the U.S. auto industry, because of the dual benefits of reducing health-harming pollutants and enabling more efficient clean car technologies.

Recently, the Landmark Legal Foundation joined by the Cato Institute — both groups identified in Brulle’s research — challenged the Department of Energy’s adoption of improved appliance efficiency standards for microwaves.

The microwave standards will lead to less energy use, consumer cost savings and pollution reductions. Landmark Legal Foundation and the Cato Institute objected to DOE’s consideration of the societal benefits of mitigating carbon pollution. Patrick Michaels, a well-known climate denialist, co-authored the Cato comments. Landmark asked DOE to immediately halt implementation and rescind the Rule.

DOE has denied the request to upend these common sense energy conservation standards for our nation.

And it is not surprising that Peabody Coal Company, too, has just filed a brief in the U.S. Supreme Court objecting to the Clean Air Act requirement that our nation’s largest industrial emitters use modern pollution controls to mitigate climate pollution.

Peabody’s brief begins by asserting that “[w]hether and how to regulate GHGs [greenhouse gases] remains a highly debated, contentious issue in Congress, agencies and the courts.” (Page 2 of their brief)

But Brulle’s research elucidates how Peabody’s assertion is a tautology. Through massive funding of groups dedicated to climate obstructionism, Brulle documents how climate change remains contentious because there is a vast climate change counter-movement dedicated to making it so:

“[A] number of conservative think tanks, trade associations, and advocacy organizations are the key organizational components of a well-organized climate change counter-movement (CCCM) that has not

only played a major role in confounding public understanding of climate science, but also successfully delayed meaningful government policy actions to address the issue.”

Climate change is happening. The toll exacted from extreme weather — fueled in part by climate change — on human life and our economy is profound, and reaches from the ravages wrought on New York and New Jersey by Hurricane Sandy to the tragic flooding in the Rockies.

However, the solutions are at hand.

In 2012, wind power was “the number one source of new U.S. electric generation capacity for the first time—representing 43 percent of all new electric additions and accounting for \$25 billion in U.S. investment.”

And even more recently, in November 2013, 100 percent – ALL – of the new electrical power in America came from renewable energy.

While Peabody’s stock falls and its rhetoric rises, and while the forces of obstructionism fight clean energy, the winds of change are blowing briskly.

Brulle’s study is a clarion call for moms, dads, grandparents, aunts, and uncles to resolve that in 2014 we will work together to fight for clean air and clean energy for our children — and for all children.

In spite of a well-funded group of obstructionists, we can prevail.

We can secure climate progress and clean energy for our nation, for our communities and for our future.

Dated: January 11, 2006

## CERTIFICATE AS TO PARTIES, RULINGS, AND RELATED CASES

Pursuant to Circuit Rule 28(a)(1), the undersigned counsel of record certify as follows:

### A. PARTIES AND AMICI

#### 1. Parties to the Challenges to the EPA Delisting Rule: 70 Fed. Reg. 15994 (March 29, 2005)

##### Petitioners

The following parties appear in these consolidated cases as petitioners:

In case no. 05-1097, filed March 29, 2005, the State of New Jersey, State of California, State of Connecticut, State of Maine, Commonwealth of Massachusetts, State of New Hampshire, State of New Mexico, State of New York, State of Vermont.

In case no. 05-1104, filed April 1, 2005, the Commonwealth of Pennsylvania, Department of Environmental Protection.

In case no. 05-1116, filed April 11, 2005, the State of Delaware.

In case no. 05-1118, filed April 8, 2005, the State of Wisconsin.

In case no. 05-1158, filed May 18, 2005, Chesapeake Bay Foundation, Inc., Conservation Law Foundation, Waterkeeper Alliance.

In case no. 05-1159, filed May 18, 2005, Environmental Defense, National Wildlife Federation and Sierra Club.

In case no. 05-1160, filed May 18, 2005, Natural Resources Council of Maine, Ohio Environmental Council and U.S. Public Interest Research Group.

In case no. 05-1163, filed May 18, 2005, Natural Resources Defense Council.

In case no. 05-1174, filed May 27, 2005, State of Illinois.

In case no. 05-1176, filed May 27, 2005, the State of Minnesota.

Respondent

The United States Environmental Protection Agency is respondent in these consolidated cases.

Intervenors

The following parties have intervened in these consolidated cases for Respondent: Utility Air Regulatory Group, Cinergy Corp., PPL Corp., PSEG Fossil LLC, NRG Energy, Inc., Florida Power & Light Company, State of Alabama, State of Indiana, State of Kansas, State of Nebraska, State of North Dakota, State of South Dakota.

The following parties have intervened in these consolidated cases for Petitioners: Physicians for Social Responsibility, American Nurses Association, The American Public Health Association, American Academy of Pediatrics, Adirondack Mountain Club, Aroostook Band of Micmac Indians, Houlton Band of Maliseet Indians, Penobscot Indian Nation, The Passamaquoddy Tribe at Pleasant Point (Sipayik), The Passamaquoddy Tribe at Indian Township, The City of Baltimore.

Amici

The following parties appear as amici in these consolidated cases:

In support of respondent EPA: Washington Legal Foundation

- 2. Parties to the Challenges to the EPA Clean Air Mercury Rule: 70 Fed. Reg. 28606 (May 18, 2005)**

Petitioners

The following parties appear in these consolidated cases as petitioners:

In case no. 05-1162, filed May 18, 2005, the State of New Jersey, State of California, State of Connecticut, State of Maine, Commonwealth of Massachusetts, State of New Hampshire, State of New Mexico, State of New York, Commonwealth of Pennsylvania, State of Vermont, State of Wisconsin.

In case 05-1164, filed May 19, 2005, Ohio Environmental Council, Natural Resources Council of Maine, U.S. Public Interest Research Group.

In case 05-1167, filed May 19, 2005, Natural Resources Defense Council.

In case 05-1175, filed May 27, 2005, State of Minnesota.

In case 05-1183, filed May 31, 2005, State of Delaware.

In case 05-1189, filed May 27, 2005, State of Illinois.

In case 05-1263, filed July 12, 2005, Mayor and City Council of Baltimore.

In case 05-1264, filed July 13, 2005, Southern Montana Electric Generation & Transmission Cooperative, Inc.

In case 05-1267, filed July 14, 2005, Chesapeake Bay Foundation, Inc., Environmental Defense, National Wildlife Federation, Sierra Club, Waterkeeper Alliance.

In case 05-1270, filed July 15, 2005, American Coal for Balanced Mercury Regulation, Alabama Coal Association, Coal Operators & Associates, Inc., Maryland Coal Association, Ohio Coal Association, Pennsylvania Coal Association, Virginia Coal Association, West Virginia Coal Association.

In case 05-1271, filed July 15, 2005, ARIPPA.

In case 05-1275, filed July 18, 2005, Utility Air Regulatory Group.

In case 05-1277, filed July 18, 2005, United Mine Workers of America, AFL-CIO.

In case 05-1280, filed July 18, 2005, Producers for Electric Reliability.

Respondent

The United States Environmental Protection Agency is respondent in these consolidated cases.

Intervenors

The following parties have intervened in these consolidated cases for Respondent:

Utility Air Regulatory Group, Edison Electric Institute, State of Alabama, State of Kansas, State of Nebraska, State of South Dakota, State of North Dakota, Producers for Electric Reliability.

The following party has intervened in these consolidated cases for Petitioners: Michigan Department of Environmental Quality.

Amici

No parties appear as amici in these consolidated cases:

3. **Parties to the Challenges to EPA's Final Action on Reconsideration: 71 Fed. Reg. 33388 (June 9, 2006)**

Petitioners

The following parties appear in these consolidated cases as petitioners:

In case no. 06-1211, filed June 19, 2006, the State of New Jersey, State of California, State of Connecticut, State of Delaware, State of Illinois, State of Maine, State of Minnesota, State of New Hampshire, State of New Mexico, State of New York, State of Rhode Island, State of Vermont, State of Wisconsin, the Commonwealths of Massachusetts and Pennsylvania, and the Michigan Department of Environmental Quality.

In case no. 06-1220, filed June 23, 2006, National Congress of American Indians, Little River Band of Ottawa Indians, Bay Mills Indian Community, Grand Traverse Band of Ottawa and Chippewa Indians, Jamestown S'Klallam Tribe, Lac Courte Oreilles Band of Lake Superior Chippewa Indians, Little Traverse Bay Bands of Odawa Indians, Lower Elwha Klallam Tribe, Lummi Nation, Minnesota Chippewa Tribe, Nisqually Tribe, Swinomish Indian Tribe Community.

In case no. 06-1231, filed June 26, 2006, American Nurses Association, The American Public Health Association, American Academy of Pediatrics, Chesapeake Bay Foundation, Inc., Conservation Law Foundation, Environmental Defense, National Wildlife Federation, Natural Resources Council of Maine, Natural Resources Defense Council, Ohio Environmental Council, Physicians for Social Responsibility, Sierra Club, U.S. Public Interest Research Group, Water Keeper Alliance.

In case no. 06-1287, filed July 26, 2006, Mayor & City Council of Baltimore.

In case no. 06-1291, filed August 8, 2006, American Coal for Balanced Mercury Regulation, Alabama Coal Association, Coal Operators and Associates of Kentucky, Maryland Coal Association, Ohio Coal Association, Pennsylvania Coal Association, Virginia Coal Association, West Virginia Coal Association.

In case no. 06-1293, filed August 8, 2006, ARIPPA.

In case no. 06-1294, filed August 8, 2006, Alaska Industrial Development and Export Authority.

Respondent

The United States Environmental Protection Agency is respondent in these consolidated cases.

Intervenors

No parties appear as intervenors in these consolidated cases.

Amici

No parties appear as amici in these consolidated cases.

B. RULINGS UNDER REVIEW

Petitioners State of New Jersey et al, in these consolidated cases seek review of final actions by EPA:

1. A rule entitled “Revision of December 2000 Regulatory Finding on the Emissions of Hazardous Air Pollutants from Electric Utility Steam Generating Units and the Removal of Coal- and Oil-Fired Electric Utility Steam Generating Units from the Section 112(c) List,” 70 Fed. Reg. 15,994 (March 29, 2005).

2. A rule entitled “Standards of Performance for New and Existing Stationary Sources: Electric Utility Steam Generating Units,” 70 Fed. Reg. 28,606 (May 18, 2005).

3. A rule entitled “Revision of December 2000 Clean Air Act Section 112(n) Finding Regarding Electric Utility Steam Generating Units; and Standards of Performance for New and Existing Electric Utility Steam Generating Units: Reconsideration, Final Rule” published at 71 Fed. Reg. 33,388 (June 9, 2006).

C. RELATED CASES

The matter on review has not been previously heard in this or any other court. There are no related cases pending before the Court.

**TABLE OF CONTENTS**

	<b><u>PAGE</u></b>
CERTIFICATE AS TO PARTIES, RULINGS, AND RELATED CASES .....	i

STATEMENT OF FACTS .....	4
A.    Hazardous Air Pollutant Regulation Under the Clean Air Act .....	4
B.    EGU Study and Appropriate and Necessary Determination .....	6
C.    2004 Proposed Rulemaking .....	7
D.    The Final Rules .....	8
SUMMARY OF ARGUMENT .....	9
STANDARD OF REVIEW .....	11
ARGUMENT .....	12
POINT I .....	12
EPA EXCEEDED ITS STATUTORY AUTHORITY AND VIOLATED THE CLEAN AIR ACT BY REMOVING EGUS FROM THE SECTION 112 LIST WITHOUT COMPLYING WITH THE MANDATED PROCEDURE .....	12
A.    EPA exceeded its statutory authority in revising the 112(n) determination .....	12
B.    EPA’s Delisting Rule Contravenes the Plain Language of Section 112(c)(9) .....	14

POINT II ..... 17

EPA’S ACTION VIOLATES THE CAA BY EXEMPTING EGUS FROM SECTION 112 BASED ON AN ERRONEOUS “NEW INTERPRETATION” OF SECTION 112(n) AND CAMR AND CAIR ..... 17

- A. EPA’s Interpretation Ignores the Purpose, Structure and Context of Section 112(n). ..... 18
- B. CAMR And CAIR Do Not Obviate The Need For, Or Appropriateness Of, EGU Regulation Under Section 112 ..... 22
- C. EPA’s Public Health Conclusion in the Delisting Rule is Contrary to the Act and Arbitrary and Capricious ..... 24

POINT III ..... 26

CAMR’S REGULATION OF MERCURY UNDER SECTION 111 IS CONTRARY TO THE STATUTE ..... 26

- A. EPA’s Attempt to Regulate Mercury Under Section 111 is Contrary to the Plain Language of the Act ..... 27
- B. Even if EPA Has Authority to Regulate Mercury Emissions from EGUs Under Section 111, CAMR Violates the Requirements of That Section. .... 29
  - 1. CAMR Violates Section 111 Because Currently Utilized Control Technologies and Source Specific Mercury Controls Achieve Substantially Greater Emission Reductions Than CAMR Requires. .... 29
  - 2. CAMR Violates Section 111 Because the Rule Will Result in Emission Increases in Some States Even Beyond 2018 31
  - 3. CAMR Cannot Be The Best System of Emission Reduction Adequately Demonstrated Because EPA Ignored Critical Nonair Quality Health and Environmental Impacts Resulting From the Cap-and-Trade Program ..... 32

CONCLUSION ..... 35

## GLOSSARY

Pursuant to Circuit Rule 28(a)(3), the following is a glossary of all acronyms and abbreviations used in this brief:

<b>112(c) List</b>	List of Sources Subject to Regulation Pursuant to 42 U.S.C. § 7412
<b>Act/CAA</b>	Clean Air Act, 42 U.S.C. §§ 7401 et seq.
<b>CAIR</b>	Clean Air Interstate Rule, 70 Fed. Reg. 72,268 (Nov. 22, 2005)
<b>CAMR</b>	Clean Air Mercury Rule, 70 Fed. Reg. 28,606 (May 18, 2005)
<b>Delisting Action/Rule</b>	70 Fed. Reg. 15,994 (March 29, 2005)
<b>EGUs</b>	Electric utility steam generating units
<b>EPA</b>	United States Environmental Protection Agency
<b>Government Petitioners</b>	State and municipal petitioners
<b>HAPs</b>	Hazardous air pollutants, 42 U.S.C. §§ 7412(a)(6); 7412(b)
<b>ICR</b>	Information collection request
<b>MACT</b>	Maximum achievable control technology, 42 U.S.C. § 7412(d)
<b>NOAA</b>	National Oceanic and Atmospheric Administration
<b>NO<sub>x</sub></b>	Nitrogen oxides
<b>NSPS</b>	New source performance standards
<b>RTC</b>	EPA Utility Report to Congress, 65 Fed. Reg. 79,825 (Dec. 20, 2000)
<b>SO<sub>2</sub></b>	Sulfur dioxide
<b>Title IV program</b>	42 U.S.C. §§ 7651-7651

## JURISDICTIONAL STATEMENT

This Court has exclusive jurisdiction to review any “nationally applicable regulations promulgated, or any final action taken” by EPA under the Act. 42 U.S.C. § 7607(b). In these consolidated cases, Government Petitioners challenge EPA’s nationally applicable regulations at 70 Fed. Reg. 15,994 (Mar. 29, 2005), and 70 Fed. Reg. 28,606 (May 18, 2005), and its final action on reconsideration of these regulations at 71 Fed. Reg. 33,389 (June 9, 2006). As set forth in the Certificate as to Parties, supra, Government Petitioners filed petitions for review of these regulatory actions within the sixty-day period provided in 42 U.S.C. § 7607(b).

## STANDING

Government Petitioners suffer injuries due to EPA’s mercury rules sufficient to confer standing. First, the rules impose a regulatory and economic burden on the states to either participate in a cap-and-trade program promulgated under section 111 of the Act, or obtain reductions in mercury emissions through other mechanisms. States have incurred economic costs in either promulgating state plans or joining the cap-and-trade program, and will continue to incur costs through the lifetime of the regulations. See Aff. of William O’Sullivan (“O’Sullivan Aff.”) ¶ 4; 71 Fed. Reg. 75,117 (Dec. 14, 2006). Second, the rules will make it more difficult for states to comply with water quality standards required under the Clean Water Act. See O’Sullivan Aff. ¶ 7; 33 U.S.C. § 1313(d); West Virginia v. EPA, 362 F.3d 861, 868 (D.C. Cir. 2004) (Injury sufficient to confer standing found where an EPA rule made the state task of devising an adequate state implementation plan more difficult). Finally, the rules injure the interests of Government Petitioners by allowing continued high levels of mercury emissions from power plants. These emissions play a significant contributory role in ongoing impacts to the

natural resources of, and economic burden on, Government Petitioners. See Idaho v. ICC, 35 F.3d 585, 591 (D.C. Cir. 1994) (State standing established based on pollution damage to its natural resources)’ O’Sullivan Aff. ¶¶ 8-9; Decl. of Ray Vaughan (“Vaughan Decl”) ¶¶ 3, 6-13; Comments of Hubbard Brook Research Foundation (“Hubbard Brook Comments”) at 7-9, OAR-2002-0056-2038 [JA\_]. These injuries can be redressed by a ruling from this Court vacating EPA’s mercury rules and requiring the agency to establish source-specific emissions standards for all power plants as required under section 112 of the Act. See O’Sullivan Aff. ¶¶ 8-9; Vaughan Decl. ¶¶ 14-17; Hubbard Brook Comments at 13; 42 U.S.C. § 7412(d).

### STATEMENT OF ISSUES

1. In December 2000, EPA added EGUs to the list of sources subject to regulation under section 112 of the CAA, 42 U.S.C. § 7412, but has now removed EGUs from that list without satisfying the removal criteria in section 112(c)(9). Did EPA exceed its statutory authority, fail to observe procedure required by law, or otherwise act arbitrarily or capriciously?

2. In the Delisting Action, EPA rescinded its December 2000 conclusion that EGUs should be regulated pursuant to CAA section 112. Was EPA’s decision to rescind the December 2000 conclusion in excess of statutory authority, arbitrary, capricious, or an abuse of discretion?

3. Through CAMR, EPA uses CAA section 111 to establish a cap-and-trade system for the regulation of a hazardous air pollutant, mercury. Did EPA exceed its statutory authority under CAA section 111(d) which prohibits the use of section 111 to regulate hazardous air pollutants and/or act arbitrarily and capriciously in light of the requirements for a “standard of performance” under section 111?

## STATUTES AND REGULATIONS

The relevant provisions of the Act are 42 U.S.C. §§ 7411 (Standards of performance for new stationary sources), and 7412 (Hazardous air pollutants). The rules were promulgated at 40 C.F.R. Parts 60, 63, 72, and 75. The rules, together with relevant portions of statutory and regulatory provisions and legislative history, are contained in the Addendum.

## STATEMENT OF THE CASE

State and municipal petitioners (“Government Petitioners”) seek review of two rules promulgated by the Environmental Protection Agency (“EPA”) relating to the emission of hazardous air pollutants (“HAPs”) from electric utility steam generating units (“EGUs” or “power plants”). In 2000, EPA concluded that such emissions, including mercury, warranted regulation pursuant to section 112 of the Clean Air Act (“Act”) and added power plants to a list of sources subject to such regulation (the “112(c) List”). 65 Fed. Reg. 79,825, 79,830-31 (Dec. 20, 2000). Having taken that action, EPA was required to establish plant-specific limits on power plant emissions reflecting the maximum degree of reduction in HAP emissions achievable for similar sources. See 42 U.S.C. § 7412(d)(3). EPA was further prohibited from removing power plants from the 112(c) List unless certain criteria were met. See 42 U.S.C. § 7412(c)(9).

EPA failed to meet its statutory duties and instead published two rules that seek to exempt power plants - emitters of more than 150,000 tons of HAPs annually, including over 30% of the nation’s mercury emissions, U.S. EPA, Mercury Study Report to Congress, EPA-452/R-97-005 (Dec. 1997) (“RTC”), at ES-5, 14-1 [JA\_] - from the stringent regulatory framework of section 112. In the first rule, the “De-Listing Action,” EPA removed EGUs from the 112(c) List without attempting to satisfy the statutory removal criteria. 70 Fed. Reg. at 16,002-16,008. EPA

then promulgated in the second rule, the “Clean Air Mercury Rule” (“CAMR”), regulations under section 111 that govern power plant mercury emissions through a cap-and-trade scheme, not the statutorily-required plant-specific approach. 70 Fed. Reg. at 28,624-30. Petitioners ask this Court to correct EPA’s legal errors, vacate the rules, and direct the agency to promulgate emission standards for the hazardous air pollutants emitted by power plants under section 112 as required by the Act. By orders dated December 8, 2005, and August 21, 2006, this Court consolidated these petitions and designated New Jersey v. EPA (No. 05-1097) as the lead case.

### STATEMENT OF FACTS

#### A. Hazardous Air Pollutant Regulation Under the Clean Air Act

The 1970 Amendments added section 112 to the Act, which specified that the EPA Administrator must list each “hazardous air pollutant for which he intends to establish an emission standard.” Pub.L. 91-604, § 4(a), 84 Stat. 1685. After a pollutant was listed, the Act required EPA to propose emission standards set at a level that “provides an ample margin of safety to protect the public health” from the pollutant. Id.

Between 1970 and 1990 when the Act was again amended, EPA established standards under section 112 for only seven hazardous air pollutants. Nat’l Mining Ass’n v. EPA, 59 F.3d 1351, 1353 and n.1 (D.C. Cir. 1995) (citing S. Rep. No. 228, 101<sup>st</sup> Cong., at 131 (1989)). Of these seven, mercury, along with asbestos and beryllium, were the first pollutants listed as hazardous. See 36 Fed. Reg. 5,991 (Mar. 31, 1971). For even these listed pollutants, EPA established emission standards for only a small subset of their sources. Nat’l Mining Ass’n, 59 F.3d at 1353 and n.1 (citing S. Rep. No. 228, 101<sup>st</sup> Cong., at 128 (1989) and H.R. Rep. No. 490(I), 101<sup>st</sup> Cong., at 322 (1990)).

To address the slow pace of EPA's regulatory action, the 1990 Amendments to the Act completely restructured the regulation of HAPs under section 112. Id. These amendments continued the Act's distinct treatment of HAPs<sup>1</sup>, and required EPA to set the "most stringent standards achievable" for sources of HAPs which are standards "based on the maximum reduction in emissions which can be achieved by application of [the] best available control technology" ("MACT Standards").<sup>2</sup> Cement Kiln Recycling Coalition v. EPA, 255 F.3d 855, 857 (D.C. Cir. 2001). The new amendments established a list of 188 HAPs, 42 U.S.C. § 7412(b)(1), set a mandatory schedule for issuing emissions standards for the major sources of these pollutants, 42 U.S.C. §§ 7412(c) and (e), and established a "non-discretionary duty" on EPA to promulgate technology-based emission standards for all categories of major emitting sources of listed HAPs. See S. Rep. 101-228, at 3385, 3518, 3541, reprinted in 1991 U.S.C.C.A.N.; 42 U.S.C. § 7412(b),(c), and (e). The only exception to the mandatory standards applies to source categories either: a) listed for regulation because of a single HAP which was later removed from the list of HAPs under section 112; or b) for which EPA makes a formal determination that the emissions of no source in the category exceeds risk thresholds set by Congress. See 42 U.S.C. § 7412(c)(9)(B).

The 1990 Amendments imposed an additional requirement on EPA before regulating EGUs under section 112. Section 112(n) required EPA to perform by 1993 a study of the health

---

<sup>1</sup> See H.R. Rep. No. 101-490, at 3339 (May 21, 1990) ("The Clean Air Act distinguishes between two categories of pollutants: hazardous air pollutants and criteria or conventional air pollutants.")

<sup>2</sup> For existing major sources of HAPs, MACT standards must be no less stringent than the "average emission limitation achieved by the best performing 12 percent of the existing sources." 42 U.S.C. § 7412(d)(3)(A).

hazards posed by toxic substances emitted from EGUs and determine whether it is “appropriate and necessary” to regulate such emissions as HAPs under section 112. 42 U.S.C. § 7412(n). Once such a determination was made and EGUs were placed on the source category list, Congress required that EPA “shall” regulate EGUs under section 112 through the promulgation of MACT standards. *Id.*

**B. EGU Study and Appropriate and Necessary Determination**

EPA undertook the study of hazards to public health reasonably expected to be caused by power plant emissions and in February 1998, five years after the statutory deadline, the agency released its utility report to Congress and the public. 65 Fed. Reg. 79,825 (Dec. 20, 2000). EPA concluded that “mercury from coal-utilities is the HAP of greatest potential concern,” RTC, at ES-26, [JA\_ ], and estimated that approximately sixty percent of the total mercury deposited in the United States comes from “U.S. anthropogenic air emission sources; the percentage is estimated to be even higher in certain regions (e.g., northeast U.S.).” 65 Fed. Reg. at 79,827.

On December 20, 2000, after years of peer-reviewed scientific and technical study including a National Academy of Sciences report, numerous public hearings, and extensive public comment, EPA published its regulatory finding on the emissions of HAPs from EGUs. 65 Fed. Reg. 79,825. In this action, EPA added EGUs to the section 112 List of source categories after concluding that the “regulation of HAP emissions from [EGUs] under section 112 of the [Act] is appropriate and necessary.” *Id.* at 79,826 (“[T]his notice adds coal- and oil-fired [EGUs] to the list of source categories under section 112(c) of the CAA.”). EPA determined that: “[m]ercury is highly toxic, persistent, and bioaccumulates in food chains”; “[m]ost of the U.S. population consumes fish and is exposed to methylmercury as a result”; and “[m]ost of the

mercury currently entering U.S. water bodies and contaminating fish is the result of air emissions.” Id. at 79,829-30. The agency further found that EGUs:

are the largest source of mercury emissions in the U.S., estimated to emit about 30 percent of current anthropogenic emissions. There is a plausible link between emissions of mercury from anthropogenic sources (including coal-fired electric steam generating units) and methylmercury in fish. Therefore, mercury emissions from [EGUs] are considered a threat to public health and the environment.<sup>3</sup>

Id. at 79,827. In 2002, EPA formally revised the section 112(c) List to reflect the addition of EGUs pursuant to the December 20, 2000 notice. 67 Fed. Reg. 6,521 (Feb. 12, 2002).

### **C. 2004 Proposed Rulemaking**

On January 30, 2004, EPA proposed two regulatory alternatives to control mercury emissions from EGUs. 69 Fed. Reg. 4,652 (Jan. 30, 2004). The first alternative maintained EPA’s December 2000 listing of EGUs and “appropriate and necessary” determination and sought to regulate EGU emissions under section 112 either through MACT standards, or a cap-and-trade plan under section 112. Id. at 4,659-83. Under the second regulatory alternative, EPA proposed to remove EGUs from the section 112(c) List by revising its December 2000 “appropriate and necessary” determination, id. at 4,683-89, and instead use section 111 of the Act to set standards and a cap-and-trade program for mercury emissions from coal-fired EGUs and nickel emissions from oil-fired EGUs, id. at 4,689-4,706.

---

<sup>3</sup> Mercury converts to methylmercury, a toxic compound, after mercury is “precipitated from the air and deposited into water bodies or land.” 70 Fed. Reg. at 16,011. For the sake of simplicity, this brief will refer to mercury concentrations in waterbodies and fish tissue, while recognizing that the actual compound at issue is frequently methylmercury.

#### D. The Final Rules

In the final Delisting Rule, EPA followed the second regulatory alternative of the proposed rule and removed EGUs from the 112(c) List. See 70 Fed. Reg. 15,994. This delisting did not follow the removal requirements of section 112(c)(9), but was instead based solely on the agency's rescission of the December 2000 "appropriate and necessary" determination. Id. at 16,002. As support, EPA "newly interpreted" section 112(n)(1)(A) to require EGU regulation under section 112 only if no other authorities under the Act, "if implemented," would eliminate the public health threat posed by EGU emissions. Id. at 15,997-99. EPA concluded that mercury reductions from two rules yet to be finalized - the Clean Air Interstate Rule ("CAIR") and CAMR - addressed mercury from EGUs sufficiently so that their regulation under section 112 was neither appropriate nor necessary. Id. at 15,997-16,002.<sup>4</sup>

CAIR was published on May 12, 2005, 70 Fed. Reg. 25,162 (May 12, 2005), and CAMR followed six days later. CAMR regulates mercury emissions from EGUs under section 111 of the Act, entitled "Standards of performance for new stationary sources." 42 U.S.C. § 7411. The rule establishes performance standards for new sources under section 111(b) and a cap-and-trade system for mercury from existing power plants under section 111(d). 70 Fed. Reg. at 28,624-30. This system caps nationwide mercury emissions from coal-fired EGUs at thirty-eight tons beginning in 2010 and fifteen tons beginning in 2018, reductions of 21% and 69% respectively from the approximately forty-eight tons currently emitted from EGUs. 69 Fed. Reg. at 4,691; 71

---

<sup>4</sup> CAIR establishes budgets for emissions of nitrogen oxides ("NO<sub>x</sub>") and sulfur dioxide ("SO<sub>2</sub>") for the twenty-eight states in the eastern United States. 70 Fed. Reg. at 28,618. CAIR does not regulate EGUs directly and contains no mercury reduction requirements. See id.; 70 Fed. Reg. at 25,209.

Fed. Reg. at 33,395. Regulated power plants can either reduce their mercury emissions under the plan or buy credits for such reductions from other plants. 70 Fed. Reg. at 28,632. Credits can also be “banked” to meet future compliance requirements, potentially substantially delaying full implementation of the plan.<sup>5</sup> *Id.* at 28,629. EPA predicts that as of 2020 — two years after mercury emissions are supposed to be capped at fifteen tons per year — actual mercury emissions will still be at least twenty-four tons per year. *Id.* at 28,619.

Several parties petitioned for reconsideration of the rules, and on October 28, 2005, EPA granted reconsideration on several issues. 70 Fed. Reg. 62,200. On June 9, 2006, EPA issued its decision on reconsideration to continue with the final Delisting Rule. The agency made only two changes to CAMR relating to state mercury allocations under the cap-and-trade plan and the standards of performance for certain new sources. 71 Fed. Reg. 33,389.

### SUMMARY OF ARGUMENT

Both the plain language and purpose of the Act dictate a ruling in petitioners’ favor as EPA’s mercury rules violate the Act in at least three ways, each warranting that the rules be vacated.

EPA’s first error is to disregard the plain language of section 112. The Delisting Rule, which removed EGUs from the list of regulated sources under section 112, is based solely on EPA’s rescission of its December 2000 regulatory determination under section 112(n). Section 112(n), however, grants EPA no authority to make such a rescission, and the agency has thus

---

<sup>5</sup>See Congressional Research Service, Mercury Emissions from Electric Power Plants: An Analysis of EPA’s Cap-and-Trade Regulations, The Library of Congress (Apr. 15, 2005), OAR-2002-0056-5686 [JA\_\_] (reporting that EPA officials do not expect full compliance with the 2018 cap until 2025 or beyond).

exceeded its statutory authority with the rule. Moreover, a rescission of the December 2000 determination provides no basis to remove EGUs from the section 112(c) List. Section 112(c)(9) alone establishes the requirements necessary to remove “any” source from the list of regulated sources and applies unambiguously to all such sources. EPA admits that it has not met those requirements in the Delisting Rule but contends that section 112(n) somehow exempts power plants from the requirements of section 112(c)(9) and allows the agency to arbitrarily reverse course regarding their regulation. The plain language of the Act, however, belies EPA’s claims as section 112(n) evinces a clear congressional desire that EPA “shall regulate [EGUs] under this section” following an appropriate and necessary determination.

EPA’s second legal error is its “new interpretation” of a discrete portion of section 112(n) to support a “revised” determination that regulation of EGUs under section 112 is no longer appropriate and necessary. EPA’s legal interpretation of section 112(n) contravenes the Act and cannot be squared with Congress’s clear desire that all major sources of HAPs be regulated in an expeditious manner through the implementation of plant-specific technology-based standards to address the unique public health threat that HAPs pose. Neither CAIR nor CAMR provide any basis on which EPA may “revise” its determination.

EPA’s third error is to disregard the scope of, and requirements for, regulation under section 111 of the Act. CAMR establishes mercury emissions standards through a cap-and-trade system under section 111. Subsection (d) of section 111, however, explicitly limits the scope of that section to those air pollutants that are not “emitted from a source category which is regulated under section 7412 of this title.” Mercury is a listed HAP under section 112, emitted from a number of source categories currently regulated by section 112, and therefore not subject to

regulation by section 111. Even if EPA can regulate mercury under section 111, CAMR fails to meet the requirement that standards of performance under that section reflect the “best system of emission reduction . . . adequately demonstrated.” 42 U.S.C. § 7411(a). CAMR fails to meet this standard as the rule: a) will allow many power plants to increase their mercury emissions for years; b) sets emission reduction standards that are already significantly exceeded by numerous existing power plants; c) is expected to take at least two decades to reach full implementation; and d) fails to address public health impacts of mercury “hot-spots” near power plants.

### STANDARD OF REVIEW

The Court should reverse an agency action if it is arbitrary, in excess of statutory authority, or without observance of procedure required by law. 42 U.S.C. § 7607(d)(9). An agency rule is arbitrary and capricious if the agency relied on factors that Congress did not intend it to consider, failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the record, or is so implausible that it could not be the product of agency expertise. Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Ins. Co., 463 U.S. 29, 43 (1983).

In evaluating EPA’s interpretation of the statute, the Court must first “determine whether, based on the Act’s language, legislative history, structure and purpose, ‘Congress has directly spoken to the precise question at issue.’ If so, EPA must obey.” New York v. EPA, 413 F.3d 3, 18 (D.C. Cir. 2005) (quoting Chevron v. NRDC, 467 U.S. 837, 842 (1984)). If that evaluation is inconclusive, EPA’s interpretation must nevertheless be rejected under Chevron if “it appears from the statute or its legislative history that the accommodation is not one that Congress would have sanctioned.” Chevron, 467 U.S. at 845.

## ARGUMENT

### POINT I

#### **EPA EXCEEDED ITS STATUTORY AUTHORITY AND VIOLATED THE CLEAN AIR ACT BY REMOVING EGUS FROM THE SECTION 112 LIST WITHOUT COMPLYING WITH THE MANDATED PROCEDURE**

EPA acted without statutory authority and contravened the clear expression of Congress's intent when the agency removed EGUs from the list of source categories without following the procedure laid out in section 112(c)(9). An agency is bound by the limits of the authority delegated to it, and where the language is clear, as here, the agency simply has no discretion to deviate from the statute's mandate. See Arlington Cent. School Dist. Bd. of Educ. v. Murphy, 126 S. Ct. 2455, 2459 (2006).

#### **A. EPA exceeded its statutory authority in revising the 112(n) determination**

EPA's delisting action is based solely on the agency's revision of its six-year-old determination pursuant to section 112(n) of the Act that EGUs should be regulated under section 112. 70 Fed. Reg. at 16,002. The plain language of section 112(n), however, clearly indicates that Congress gave EPA only limited authority to make a single regulatory determination. See 42 U.S.C. § 7412(n). EPA's action was thus unlawful and must be vacated.

Section 112(n) requires EPA to "perform a study of the hazards to public health reasonably anticipated to occur as a result of emissions by EGUs," report the results of that study to Congress by 1993, and requires that the agency "shall regulate [EGUs] under this section, if the Administrator finds such regulation is appropriate and necessary after considering the results of the study." 42 U.S.C. § 7412(n)(1)(A). Nothing in this language authorizes EPA to revisit the appropriate and necessary determination once made. If the initial listing was in error, the

regulatory avenue Congress provided EPA to delist EGUs is section 112(c)(9). See 42 U.S.C. § 7412(c)(9) (“Deletions from the list”). Indeed, if Congress had wanted to authorize EPA to periodically revisit its determination - as EPA asserts - Congress would have done so, as it did in other subsections of the Act. See, e.g., 42 U.S.C. § 7412(b) (EPA shall “periodically review the list established by [112(b)]. . . and, where appropriate, revise such list by rule”); 42 U.S.C. § 7409(d)(1) (EPA to perform periodic review of national air quality standards). No such provision is present in section 112(n), however, and “it is generally presumed that Congress acts intentionally and purposely when it includes particular language in one section of a statute but omits it in another.” City of Chicago v. Envtl. Def. Fund, 511 U.S. 318, 338 (1994).

EPA attempts to avoid the plain language of the Act by asserting an “implied” authority based solely on the lack of a deadline in section 112(n)(1)(A) by which EPA must make its appropriate and necessary determination. See 70 Fed. Reg. at 16,001-16,002. From this, EPA claims “sufficient discretion under section 112(n)(1)(A) - in terms of both the substance and the timing of the appropriate and necessary finding - that nothing precludes us from revising our. . . finding.” Id. (emphasis added). The tenets of statutory construction, however, do not require Congress to employ superfluous language to proscribe the bounds of agency authority. See Louisiana Pub. Serv. Comm’n v. FCC, 476 U.S. 355, 374 (1986) (“an agency literally has no power to act . . . unless and until Congress confers power upon it”); New York v. EPA, 443 F.3d at 880, 887 (D.C. Cir. 2006) (“Only in a Humpty Dumpty world would Congress be required to use superfluous words while an agency could ignore an expansive word that Congress did use.”).

Moreover, the context of the 1990 amendments to the Act, see infra at I.B., indicate that Congress - far from providing implied authority and discretion to EPA - moved to limit the

agency's discretion to promote rapid regulation of HAPs. See S. Coast Air Quality Mgmt. District, No. 04-1200, slip op. at 20 (D.C. Cir. 2006) ("EPA's interpretation of the Act in a manner to maximize its own discretion is unreasonable because the clear intent of Congress in enacting the 1990 Amendments was to the contrary."). Indeed, because of Congress' concern for the prompt and effective regulation of HAP emissions, section 112 does not allow judicial review of the listing until emissions standards are promulgated. See 42 U.S.C. § 7412(e)(4); 65 Fed. Reg. at 79,831; S. Rep. No. 101-228, at 3559 ("The Administrator's determination of priorities is given insulation from court challenge because of the complexity of the balancing involved and the extended nature of the litigation that might ensue if all of the schedule were open to challenge in court."). The provision for judicial review at such time does not render the listing any less final. As "[a]n agency construction of a statute cannot survive judicial review if a contested regulation reflects an action that exceeds the agency's authority," EPA's Delisting Rule, based on a faulty claim of implied authority, must fail. Aid Ass'n for Lutherans v. U.S. Postal Serv., 321 F.3d 1166, 1174 (D.C. Cir. 2003).

**B. EPA's Delisting Rule Contravenes the Plain Language of Section 112(c)(9)**

Even if EPA has authority to revise its appropriate and necessary determination, EPA still may not remove EGUs from the section 112(c) List without following the mandated procedure. Once a source is listed – as EGUs were with the December 20, 2000 Notice of Regulatory Finding, 65 Fed. Reg. 79,825 – EPA is authorized to remove that source from the list under only two circumstances, neither of which is the case here. See 42 U.S.C. § 7412(c)(9).

First, under 112(c)(9)(A), EPA shall delete a source if "the sole reason" that the source was included on the list is the emission of a unique chemical substance and EPA determines that

“there is adequate data on the health and environmental effects of the substance to determine that emissions, ambient concentrations, bioaccumulation or deposition of the substance may not reasonably be anticipated to cause any adverse effects to the human health or adverse environmental effects.” 42 U.S.C. §§ 7412(c)(9)(A); 7412(b)(3)(9)(C). Here, EPA acknowledges, and the scientific literature and the Act itself are clear, that mercury causes significant adverse impacts to both human health and the environment. See, e.g., 42 U.S.C. § 7412(b); 70 Fed. Reg. at 16,011-12; 69 Fed. Reg. at 4,657; RTC, at 7-13 to -18 [JA\_].

Second, under section 112(c)(9)(B), EPA “may delete any source category from the list under this subsection . . . whenever the Administrator makes the [applicable] determination.” 42 U.S.C. § 7412(c)(9)(B). For non-cancerous pollutants such as mercury, section 112(c)(9) requires “a determination that emissions from no source in the category or subcategory concerned . . . exceed a level which is adequate to protect public health with an ample margin of safety and no adverse environmental effect will result from emissions from any source.” 42 U.S.C. § 7412(c)(9)(B)(ii).

Here, EPA failed to make the determination that is a mandatory prerequisite to removing EGUs from the list of regulated sources under section 112. Indeed, EPA has plainly acknowledged that the agency used section 112(n) itself as the basis for delisting EGUs. See 70 Fed. Reg. at 15,994 (“The EPA is revising the regulatory finding that it issued in December 2000 pursuant to section 112(n)(1)(A) of the [Act], and based on that revision, removing coal- and oil-fired [EGUs] from the CAA section 112(c) source category list.”) (emphasis added)).

EPA offers no justification for its action sufficient to depart from the literal interpretation of the Act. The agency’s argument rests on its claim that section 112(n)(1)(A) “occupies the

field in section 112 with regard to Utility Units,” and therefore EGUs are not subject to the section 112(c)(9) delisting requirements. 70 Fed. Reg. at 16,032-33. However, “[f]or EPA to avoid a literal interpretation . . . it must show either that, as a matter of historical fact, Congress did not mean what it appears to have said, or that, as a matter of logic and statutory structure, it almost surely could not have meant it.” Friends of the Earth v. EPA, 446 F.3d 140, 146 (D.C. Cir. 2006) (quoting Engine Mfrs. Ass’n v. EPA, 88 F.3d 1075, 1089 (D.C. Cir. 2006)). The language of section 112(n)(1)(a) itself provides that EPA “shall” regulate EGUs under section 112 if the “appropriate and necessary” determination is made. 42 U.S.C. § 7412(n)(1)(A). Section 112(n), in other words, plays a threshold role, not a preemptive one. The presence of an express exemption for EGUs from section 112(c)(6), where no such exemption exists in section 112(c)(9) further supports the conclusion that Congress did not mean to preempt the regulatory scheme of section 112 through section 112(n)(1)(A). Compare 42 U.S.C. § 7412(c)(6) with 42 U.S.C. § 7412(c)(9); see Russello v. United States, 464 U.S. 16, 23 (1983) (“where Congress includes language in one section of a statute, but omits it in another . . . it is generally presumed that Congress acts intentionally . . . in the disparate inclusion or exclusion”).

The legislative framework and history of the 1990 Amendments supports the Act’s plain language. First, Congress created a strict framework for effective and expeditious regulation of HAPs, “precisely because it believed EPA had failed to regulate enough HAPs under previous air toxics provisions.” Nat’l Lime Ass’n v. EPA, 233 F.3d 625, 634 (D.C. Cir. 2000). Because “very little has been done since the passage of the 1970 Act to identify and control hazardous air pollutants” Congress greatly restricted EPA’s discretion. See S. Rep. No. 101-228, at 3, 1990 U.S.C.C.A.N. at 3389. It is only logical, then, that Congress intended section 112(c)(9) to apply

to EGUs once listed as the delisting requirements complement the legislature's desire to limit EPA's discretion and promote regulation of all major sources of HAPs.

Second, section 112(n) was the product of a congressional compromise and introduced only to "determine the nature of utility boiler emissions and whether their control is warranted enacted as part of the 1990 amendments to the Act." S. Rep. 101-228, at 414, 1990 U.S.C.C.A.N. at 3794. EPA's broad claims of discretion to avoid the requirements of section 112(c)(9) must fail as the agency may not interpret the Act "in a way that completely nullifies textually applicable provisions meant to limit its discretion." Whitman v. Am. Trucking Ass'ns, 531 U.S. 457, 458 (2001).

## POINT II

### **EPA'S ACTION VIOLATES THE CAA BY EXEMPTING EGUS FROM SECTION 112 BASED ON AN ERRONEOUS "NEW INTERPRETATION" OF SECTION 112(n) AND CAMR AND CAIR**

EPA ignored section 112(c)(9) and removed power plants from the 112(c) List based solely on its rescission of its December 2000 appropriate and necessary determination. 70 Fed. Reg. at 16,002. Even assuming EPA had the authority to take such action, EPA's Delisting Rule must still be vacated because EPA's rescission of the December 2000 determination relies on a "new" interpretation of section 112(n) that is contrary to the language and purpose of the Act. The agency's regulatory conclusion – that CAMR and CAIR obviate the need for EGU regulation – is similarly contrary to clear congressional intent and lacks support in the record.

**A. EPA's Interpretation Ignores the Purpose, Structure and Context of Section 112(n).**

EPA's Delisting Rule rescinds the agency's listing of EGUs as a source regulated under section 112 based on a new legal interpretation of section 112(n). See 70 Fed. Reg. 15,997-99. According to EPA's new interpretation, two threshold questions must be answered affirmatively before EPA can conclude that regulation of EGUs is appropriate and necessary. The first question is: Are the power plant mercury emissions that remain after the CAA's other requirements have been implemented (the "Remaining Emissions") – standing alone – responsible for causing hazards to human health? See 70 Fed. Reg. at 15,997-16,002 (explaining EPA's new understanding of 42 U.S.C. § 7412(n)(1)(A)); 70 Fed. Reg. at 16,022-25 (concluding that the Remaining Emissions do not result in hazards to human health); 70 Fed. Reg. at 16,028 (insisting that EPA cannot consider the effects of power plant emissions in combination with emissions from other sources). If the answer is "no," EPA concludes that it is not "appropriate" to regulate power plant emissions under section 112 and the inquiry ends. See 70 Fed. Reg. at 16,000.

EPA also concludes that even if regulation of power plant emissions under section 112 is "appropriate," it may not be "necessary." According to EPA, such regulation is "necessary" "only if there are no other authorities available under the CAA that would, if implemented, effectively address the remaining HAP emissions from Utility Units." 70 Fed. Reg. at 16,001 (emphases added).

EPA's approach based on EPA's new legal interpretation contravenes the Act. First, section 112(n) does not limit EPA to consider public health impacts arising solely from EGU

emissions. Rather, the section requires EPA to assess the “hazards to public health reasonably anticipated to occur as a result of emissions from [EGUs].” 42 U.S.C. § 7412(n)(1)(A) (emphasis added). EPA’s interpretation therefore inserts a new requirement into the act as it reads “as a result of” to mean “solely as a result of.” If Congress had intended EPA to focus on hazards resulting solely as a result of EGU emissions, it would have used the word “solely,” as it has numerous times even within section 112. See 42 U.S.C. §§ 7412 (b)(2); 7412(b)(3)(A); 7412(r)(4)(B). Cf. New York v. EPA, 443 F.3d 880, 887 (D.C. Cir. 2006) (rejecting EPA’s expansive interpretation as “the court must presume that Congress acted ‘intentionally and purposely’” when Congress expressly includes a limitation). This statutory context reinforces the plain meaning of “as a result of” to include results that are caused by EGU emissions acting in concert with other sources of mercury. Cf. Kreindler & Kreindler v. United Tech. Corp., 985 F.2d 1148, 1158 (2d Cir. 1993) (the phrase “based upon” does not mean based “solely” upon).

Second, the Act requires EPA to study the hazards posed by EGU emissions after imposition of the “requirements” of the Act, not those emissions projected to be remaining after “authorities” not yet enacted take effect. See 42 U.S.C. § 7412(n)(1)(A). The plain meaning of “requirement” as something “necessary” or “an essential condition” indicates that Congress wanted EPA to look at existing requirements actually imposed on EGUs by the 1990 Amendments such as the Title IV program for SO<sub>2</sub>, not authorities that may be implemented as EPA asserts. See New Webster’s Dictionary 815 (1984). Here, EPA identifies CAIR and CAMR as available authorities and then looks to the year 2020 to determine if any EGU emissions then remaining pose a threat. Nothing in section 112(n) suggests that the legislature, in 1990, intended that EPA look ahead thirty years and consider the effects of regulatory programs that

would not be promulgated for fifteen years to determine whether regulating EGUs under section 112 was appropriate and necessary. On the contrary, Congress gave EPA until 1993 to study the health hazards reasonably anticipated to occur as a result of EGU mercury emissions, 42 U.S.C. § 7412(n)(1)(A), and clearly expected an appropriate and necessary determination shortly thereafter. EPA utterly fails to explain how its interpretation can possibly comport with the congressional intent for rapid and stringent HAP regulation found in the 1990 Amendments.

Finally, EPA's interpretation would "abrogate[] the enacted statutory text" of section 112. See Sierra Club v. EPA, 294 F.3d 155, 161 (D.C. Cir. 2002) (citing Appalachian Power Co. v. EPA, 249 F.3d 1032, 1041 (D.C. Cir. 2001)). Rather than considering the purpose, structure and context of Section 112(n), see Chemical Manuf. Ass'n v. EPA, 217 F.3d 861, 864-67 (D.C. Cir. 2000), EPA's new interpretation focuses on one sentence: "The Administrator shall perform a study of the hazards to public health reasonably anticipated to occur as a result of emissions by [EGUs] of [HAPs] after the imposition of the requirements of this chapter." 70 Fed. Reg. at 15,997. From this sentence, EPA "extrapolates" its new questions for determining whether regulation of power plant HAP emissions pursuant to section 112 is "appropriate and necessary." Id.

This new interpretation leads EPA to ignore three critical aspects of section 112. The framework of section 112 establishes that regulation provide for an ample margin of safety for public health, 42 U.S.C. § 7412(d)(4); (c)(9)(B)(ii), and address environmental impacts of HAPs, 42 U.S.C. § 7412(f);(c)(9)(B)(ii), and is generally structured to recognize the contributory impacts of the various sources of HAPs by requiring MACT standards for all major sources regardless of the significance of their respective emissions. EPA, however, determines that, in

assessing whether EGU regulation under section 112 is appropriate and necessary, the agency does not have to provide for an ample margin of safety for public health, 70 Fed. Reg. at 15,998, and does not have to address the environmental impacts of EGU emissions in the Delisting Rule, but rather only public health impacts, 70 Fed. Reg. at 15,997-98. EPA also determines that the Act constrains it to examine only the health effects caused solely by power plant emissions, i.e., in isolation from all other mercury source emissions, and cannot consider the contributory impacts of EGU emissions to overall mercury loading in our waterbodies. See 70 Fed. Reg. at 16,028-29. EPA, in other words, determines that Congress meant for all of the facets of effective regulation under section 112 to be abandoned simply because they are not referenced in the single line of text EPA chose to consider.

Congress, however, does not modify fundamental aspects of a regulatory scheme in vague terms or ancillary provisions. Gonzales v. Oregon, 126 S. Ct. 904, 921 (2006) (quoting Whitman v. Am. Trucking Ass'ns, 531 U.S. at 468). It is also “emphatically not within an agency’s authority to set regulatory priorities that clearly conflict with those established by Congress.” See Sierra Club v. Johnson, 444 F. Supp. 2d 46, 58 (D.D.C. 2006). The plain language of section 112 exhibits Congress’s priorities for the regulation of HAPs that cannot be disregarded on the weight of a single “extrapolated” line of statutory text. See Sierra Club v. EPA, 294 F.3d at 161 (“the most reliable guide to congressional intent is the legislation the Congress enacted”).

**B. CAMR And CAIR Do Not Obviate The Need For, Or Appropriateness Of, EGU Regulation Under Section 112**

EPA's conclusion that EGU regulation is not appropriate under section 112 because of CAMR and CAIR also contravenes the Act and is unsupported by the record such that the Delisting Rule must be vacated. Section 112 provides a regulatory framework evincing congressional priorities for HAP regulation. First, the MACT emission standards of section 112 "require the maximum degree of reduction in emissions." 42 U.S.C. § 7412(d)(2)(emphasis added). Second, MACT standards under section 112 apply to all major sources of the listed pollutants. 42 U.S.C. § 7412(f)(4). These technology-based standards are designed to protect both the environment and public health. See, e.g., 42 U.S.C. § 7412(d) (permitting EPA to create so-called "beyond-the-floor" standards based on "environmental impacts and energy requirements"). Third, after standards are set, section 112 requires the installation of pollution controls and full compliance within three years. 42 U.S.C. § 7412(i)(3). In other words, section 112 is designed to address the pressing public health threat posed by HAPs.

In contrast, CAMR and CAIR fail to effect any of the congressional priorities for HAP regulation. While a MACT standard for power plants under section 112 would require approximately 90% reductions of mercury emissions<sup>6</sup>, CAMR requires only a 20% reduction for the next decade. As a cap-and-trade program, CAMR will also only reduce emissions at those power plants that do not buy credits for emission reductions and will do nothing to protect

---

<sup>6</sup> MACT standards require emission standards for existing sources to be no less stringent than the average emission limitation achieved by the best performing 12% of existing sources. 42 U.S.C. § 7412(d)(3). Of the eighty EGUs for which EPA has data, the top 12% have an average control efficiency for mercury of more than 93%. See 69 Fed. Reg. at 4,673; EPA Memoranda by Bill Maxwell ("Maxwell Memoranda") (Nov. 26, 2003), OAR-2002-0056-0006 [JA\_] and (Oct. 21, 2005), OAR-2002-0056-6305 [JA\_].

communities and areas near such plants. In fact, EPA's own modeling predicts mercury emission increases under the plan in sixteen states and numerous individual plants until 2018. Compare <http://www.epa.gov/ttn/atw/combust/utiltox/unitxunit2.xls> (Column F) (listing EPA's unit-specific 1999 emission data) with EPA's Final CAMR Unit Mercury Allowances (final two columns), OAR-2002-0056-6155 [JA\_]. Finally, CAMR's timeline for compliance is drastically longer than section 112 regulation as CAMR requires no significant reductions until 2018 when its second-phase cap becomes effective. See 70 Fed. Reg. at 28,606. Compliance with the second-phase cap is expected to be significantly delayed due to the banking of emission credits; a 69% reduction in mercury emissions from EGUs will not likely occur until at least 2025. See 70 Fed. Reg. at 28,619 (EPA estimating that under CAMR, EGU mercury emissions in 2020 will still be 24.3 tons); see also Congressional Research Service, supra note 5.

EPA also asserts that the indirect reduction in mercury emissions from EGUs resulting from CAIR provides an alternative basis for its determination that it is not appropriate to regulate EGUs under section 112. 70 Fed. Reg. at 16,004. CAIR, however, is limited to the establishment of emission budgets for NO<sub>x</sub> and SO<sub>2</sub> for twenty-eight states in the eastern portion of the country and the District of Columbia, and EPA expects mercury emissions increases under CAIR in areas not addressed. See 70 Fed. Reg. at 28,639. Furthermore, states may seek to comply with CAIR by regulating sources other than power plants, and even if they do regulate power plants, nothing in CAIR requires states to address mercury emissions. See 70 Fed. Reg. at 25,162. Thus, EPA's assertion that CAIR will reduce mercury emissions from power plants to levels protecting public health is based purely on an assumption of the indirect benefits to mercury emissions that EPA speculates will result from control technologies used to reduce NO<sub>x</sub>

and SO<sub>2</sub> emissions. This assumption is tenuous at best as there is no guarantee that EGUs, even if they are regulated, will use the pollution controls that EPA expects. In light of the congressional mandate in the 1990 Amendments to rapidly and effectively control HAP emissions such as mercury, EPA's assumptions and speculation provide no basis for removing EGUs from section 112.

In sum, CAMR and CAIR will take decades longer to reach full implementation than section 112, while providing for only a portion of the mercury emission reductions achieved under section 112 and no comparable public health assessment to address lingering threats. While EPA may believe its cap-and-trade plan to be better policy, the agency may not impose such policy choices over the statute's express mandate, and its approach must be rejected. See Sierra Club v. Johnson, 444 F. Supp. 2d at 58.

**C. EPA's Public Health Conclusion in the Delisting Rule is Contrary to the Act and Arbitrary and Capricious**

Finally, EPA based its "revised" delisting determination on a public health analysis that considered only those impacts on public health that result solely from EGU mercury emissions and only one pathway of exposure. This approach fails to protect the public and defies the plain language of the Act, and must be rejected.

First, as mercury moves from power plants, to waterways, and to fish, the mercury bioaccumulates, getting more concentrated at every level of the food chain, and joins with mercury from other sources such as incinerators. See RTC [JA\_], 65 Fed. Reg. at 79,827; Hubbard Brook Comments, at 6 [JA\_]. The impact on an individual is then determined by the cumulative level of mercury in fish consumed, regardless of where that mercury originated. Any

individual who consumes more than 0.1 micrograms of mercury per kilogram of his or her body weight per day is exceeding health safety criteria. See 65 Fed. Reg. at 79827. EPA's limited analysis, however, recognizes a health threat only where this safety level is exceeded solely because of mercury from EGUs.

EPA's approach has been rejected by this Court and must be rejected here. This Court has recognized that "an analysis cannot treat an identified environmental concern in a vacuum," but must address the accumulated impacts of various sources. Grand Canyon Trust v. FAA, 290 F.3d 339, 346 (D.C. Cir. 2002); see also Michigan v. EPA, 213 F.3d 663 (D.C. Cir. 2000). Research indicates that approximately 630,000 U.S. babies are annually born to mothers whose blood levels of mercury exceed safety levels. See Comments of New Jersey et al., Decl. of Alan Stern ¶¶ 7-8, OAR-2002-0056-5460 [JA\_]. For these babies, each additional increment of utility-attributable mercury carries a predictable risk of additional IQ loss and other neurological effects. Id. at ¶ 10; see also National Research Council, Toxicological Effects of Methylmercury at 56-60 and 112-117, OAR-2002-0056-5927; 5928; 5929 [JA\_]. EPA's health analysis fails to address these incremental impacts and consequently, leaves unaddressed these thousands of babies affected by EGU mercury emissions.

Second, EPA considered only a single pathway through which people are exposed to mercury: "freshwater fish caught and consumed by recreational and subsistence anglers." 70 Fed. Reg. at 16,012. Thus, EPA's analysis disregarded all marine fish, commercially caught fish, and fish caught in estuaries such as the Chesapeake Bay. Id. These pathways account for millions of pounds of fish consumed by U.S. citizens annually and are significant pathways through which mercury reaches people. See e.g., EPA Technical Support Document ("TSD") at

24, OAR-2002-0056-6186 [JA\_] (recognizing that marine fish represent more than four million metric tons of caught fish in the United States annually).

EPA attempts to justify its disregard of other pathways of mercury exposure by claiming that analysis of U.S. EGU mercury impacts on marine and estuarine fish is uncertain, and that commercial fish do not represent a significant dietary pathway of U.S. EGU mercury. See EPA TSD, at 34 [JA\_]. The statutory responsibility facing EPA, however, is to assess all impacts from EGU emissions that are “reasonably anticipated.” 42 U.S.C. § 7412(n)(1)(A). Individuals who ingest mercury through marine and commercial fish can be expected to suffer health impacts by the mercury additionally ingested through the single pathway EPA considered. By excluding the pathways through which individuals are exposed to mercury, EPA has disregarded the plain language of section 112(n) and abdicated its statutory responsibility. EPA’s approach must be rejected.

### POINT III

#### **CAMR’S REGULATION OF MERCURY UNDER SECTION 111 IS CONTRARY TO THE STATUTE**

As EPA concedes, if the Delisting Rule is unlawful, CAMR similarly cannot stand. See Letter from Jeffrey R. Holmstead, EPA, to Peter C. Harvey, Attorney General of New Jersey (June 24, 2005) attached to Comments of New Jersey et al., OAR2002-0056-6282 [JA\_] (“staying the final section 112 rule would necessitate staying the final CAMR rule.”); EPA’s Opp. to Mot. for Stay Pending Review at 20 (July 18, 2005)(admitting same). Assuming, however, that EPA may exempt EGUs from regulation under section 112 – which EPA may not, as demonstrated

above – EPA still violates the Act by regulating mercury, a potent neurotoxin, under section 111 with a cap-and-trade program.

**A. EPA’s Attempt to Regulate Mercury Under Section 111 is Contrary to the Plain Language of the Act**

Section 111 authorizes EPA to promulgate New Source Performance Standards (“NSPS”), technology-based standards for new sources of “air pollution which may reasonably be anticipated to endanger public health and welfare.” 42 U.S.C. § 7411(b)(1)(A). Subsection (d) of Section 111 provides authority for regulation of existing sources, but is explicitly limited to those air pollutants that are not “emitted from a source category which is regulated under section 7412 of this title.” 42 U.S.C. § 7411(d)(1). Thus, listed HAPs emitted from source categories regulated under section 112 are not to be regulated under section 111. *Id.* Mercury is a listed HAP under section 112, 42 U.S.C. §§ 7412(b)(1), 7412(c)(6), and is emitted from a number of source categories currently regulated by section 112. *E.g.*, 71 Fed. Reg. 76,518 (Dec. 20, 2006) (establishing emission standards for HAPs including mercury from Portland Cement manufacturers); 69 Fed. Reg. 55,238 (Sept. 13, 2004) (establishing emission standards for mercury emissions from Industrial, Commercial, and Institutional Boilers and Process Heaters). Therefore, EPA may not regulate mercury emissions from EGUs under section 111, *See Arlington Cent. School Dist. Bd. of Educ.*, 126 S. Ct. at 2459 (statutory construction analysis begins with the statute’s plain language).

EPA attempts to avoid this clear limit on the scope of section 111(d) by claiming a conflict between the 1990 House and Senate versions of the amendments to section 111(d). *See* 70 Fed. Reg. at 16,030. Slightly differing language in the versions, however, does not alter

Congress' expressed intent that section 111 was not meant to regulate HAPs. See 42 U.S.C. § 7411(d)(1). Ambiguity between the amendment versions cannot be relied upon to avoid the plain meaning of the statute, but rather, the versions must be harmonized in light of the Act as a whole. See, e.g., FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 133 (2000); Citizens to Save Spencer County v. EPA, 600 F.2d 844, 851, 890 (D.C. Cir. 1979). Under these established canons of statutory interpretation, EPA's attempt to regulate existing sources of mercury under section 111 must be rejected.

The regulatory framework and legislative history of the Act further support the finding that listed HAPs emitted from source categories regulated under section 112 may not be regulated under section 111. First, the statutory limits on the applicability of section 111(d) demonstrate that it serves a backstop role in the Act to account for existing sources of air pollutants that are not controlled under any other provision. 42 U.S.C. § 111(d)(1). Second, as noted supra, Congress explicitly recognized the differences between sections 112 and 111 and the need to regulate HAPs under the former. See S. Rep. No. 101-228, at 167, 1990 U.S.C.C.A.N. at 3552 ("An emissions limitation based on section 112(d) will, in most cases, be more stringent than a new source performance standard for the same category of sources or pollutants . . . that is appropriate as this program is for the control of extremely harmful air pollutants"). Section 112 was enacted to address the public health threat posed by HAPs and required EPA to set standards at a level providing an ample margin of safety to protect the public health. 42 U.S.C. § 7412(c)(9)(B)(ii). In contrast, section 111 was largely designed as a technology forcing provision to promote long-term economic benefits through nationalized standards. See H.R. Rep. 95-294,

at 186 (1977), reprinted in 1977 U.S.C.C.A.N. 1077, 1264 (“[T]he best technology requirement [of Section 111] was intended to create incentives for improved technology”).

**B. Even if EPA Has Authority to Regulate Mercury Emissions from EGUs Under Section 111, CAMR Violates the Requirements of That Section.**

Section 111 requires EPA to set a standard of performance defined as an air pollutant emissions standard that “reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any nonair quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.” 42 U.S.C. § 7411(a)(1) (emphasis added). See also 42 U.S.C. §§ 7411(g)(4)(B), 7602. CAMR violates this express mandate of section 111 because: (1) existing sources already utilize control technologies that achieve much greater emission reductions than what CAMR requires; (2) the rule will actually result in future emission increases in many states; and (3) the rule will perpetuate dangerous, local “hot-spots” of mercury severely endangering public health. As CAMR conflicts with the language, purpose and intent of the CAA, and is not supported by a reasoned analysis, the Court should vacate CAMR as an abuse of discretion and arbitrary and capricious rulemaking. 42 U.S.C. § 7607(d)(9)(A); see Nat’l Asphalt Pavement Assoc. v. Train, 539 F.2d 775, 786 (D.C. Cir. 1976).

**1. CAMR Violates Section 111 Because Currently Utilized Control Technologies and Source Specific Mercury Controls Achieve Substantially Greater Emission Reductions Than CAMR Requires.**

Section 111 requires EPA to propose regulations establishing air pollutant emission standards that, applying the “best system of emission reduction,” reflect the degree of achievable

emission limitation. 42 U.S.C. §§ 7411(a)(1) (emphasis added) and (f)(1). CAMR will result in a 21% emission reduction by 2010 through an annual emissions cap of thirty-eight tons from a 1999 base line level of forty-eight tons. In contrast, EPA's estimates predict that existing sources will already have reduced their emissions to thirty-one tons - seven tons better than CAMR's phase one requirement - as of 2010. 70 Fed. Reg. at 28,619. EPA offers no explanation for how a cap set at a level seven tons above what the agency expects EGUs to be emitting at the time it becomes operational can possibly reflect the best system of reduction.

Full implementation of CAMR will ultimately result in reductions of mercury emissions from power plants of 69% somewhere around 2025. See 69 Fed. Reg. at 4,691; 71 Fed. Reg. at 33,395; Congressional Research Service, supra note 5. EPA's data, however, demonstrates that the current best performing power plants reduce their mercury emissions by an average of 93%.<sup>7</sup> EPA in fact concluded that currently available control technologies have shown "mercury capture in excess of 90 percent." 65 Fed. Reg. 79,828. Thus CAMR requires only a fraction of the efficiency achieved by existing and available control technologies. In fact, existing power plants of every category established by EPA currently exceed CAMR's performance standards for new sources.<sup>8</sup> These weak standards are unsupportable given Section 111's express language. See 42 U.S.C. § 7411(a)(1).

---

<sup>7</sup> This percentage is derived from the average of the actual emissions achieved by the top 12% of the eighty coal-fired sources for which EPA has data (ten units, two that are coal-refuse-fired units and eight that are bituminous-fired). See 69 Fed. Reg. at 4,673; EPA Maxwell Memoranda [JA\_].

<sup>8</sup> For instance, CAMR's new source limit is 74% for plants burning bituminous coal while the best performing bituminous plant (Mecklenberg Co-Gen Facility) achieves 98.8% reductions in its mercury emissions. See October 21, 2005 Memorandum from Bill Maxwell to Robert Wayland at 7-10, OAR-2002-0056-6305 [JA\_]; 70 Fed. Reg. at 28,610 (establishing emissions limits which were converted to a percentage reduction format).

The weak standards are further diluted by EPA's subcategorization scheme in establishing the NSPS. 70 Fed. Reg. at 28,612. Although EPA "may" subcategorize based upon different classes, types, and sizes, 42 U.S.C. § 7411(b)(2), EPA is nevertheless statutorily required to implement standards that "reflect the degree of emission limitation achievable through the application of the best system of emission reduction." 42 U.S.C. § 7411(a)(1). EPA's subcategorization scheme, based on the different types of coal EGUs burn, fails to reflect that "a number of Utility Units co-fire different ranks of coal." 70 Fed. Reg. at 28,612-13. Moreover, EPA further subcategorizes units burning subbituminous coal based upon the type of pollution control that is being utilized. *Id.* at 28,615 (EPA setting different NSPS limits for subbituminous-coal burning EGUs based on the type of Flue Gas Desulfurization or "FGD" system used); EPA's Response to Significant Public Comments at 265, OAR-2002-0056-6722 [JA\_]. Subcategorization based on technology, however, defeats the very purpose of establishing NSPS limits, because, as EPA itself acknowledged, subcategorization based on the type of air pollution control device "leads to situations where floors are established based on performance of sources that are not the best performing." 69 Fed. Reg. 394, 403 (Jan. 5, 2004). CAMR presents this situation, as a power plant using a wet FGD system is allowed to emit twice the amount of mercury as a power plant similar in every other respect except its use of a dry FGD system. 70 Fed. Reg. at 62,216.

**2. CAMR Violates Section 111 Because the Rule Will Result in Emission Increases in Some States Even Beyond 2018.**

CAMR further violates section 111's requirement that standards reflect the best system of emission reduction achievable because EPA's program will actually result in emission increases

in numerous states and individual plants. Comparing CAMR budgets to 2003 actual mercury emissions, sixteen states can increase their mercury emissions between now and 2018 while four states can continue to lawfully increase their emissions even beyond 2018. Compare Unit specific estimated mercury emission rates in 1999, at <http://www.epa.gov/ttn/atw/combust/utitlox/unitxunit2.xls> with 70 Fed. Reg. at 28,649-50. The difference between the allowed emissions under CAMR and states' actual emissions amounts to eighteen tons of excess mercury for the period between 2010 and 2018, a result that Congress could not have intended in enacting section 111. A program that allows emissions increases clearly violates section 111. See 42 U.S.C. § 7411(a)(1).

**3. CAMR Cannot Be The Best System of Emission Reduction Adequately Demonstrated Because EPA Ignored Critical Nonair Quality Health and Environmental Impacts Resulting From the Cap-and-Trade Program**

Finally, section 111 requires a standard of performance that takes into account “any nonair quality health and environmental impact.” 42 U.S.C. § 7411(a)(1). Well-documented and adverse health and environmental impacts from mercury emissions include mercury “hot-spots,” areas where the species living in waterbodies exhibit consistently high levels of mercury contamination. See Decl. of David Evers, Ex. B at 19, OAR-2002-0056-5460 [JA\_]. At least nine such hot-spots have been identified in the area from New York to Nova Scotia, affecting both the environment and public health in those areas. Id.; see also Decl. of Charles Driscoll ¶ 4, OAR-2002-0056-5460 [JA\_]; Hubbard Brooks Comments, at 13-14 [JA\_].

Research has repeatedly noted that EGU air mercury emissions play a significant role in the creation of these hot-spots. Hubbard Brooks Comments, at 7-11 [JA\_]. An EPA-funded

study found that approximately 70% of mercury wet deposition in Steubenville, Ohio, which is located in close proximity to several major coal-fired power plants, is attributable to the local sources. See Gerald J. Keeler et al., Sources of Mercury Wet Deposition in Eastern Ohio, USA, 40 Environ. Sci. & Technol. 5874 (2006), OAR-2002-0056-6748 [JA \_]. Emission reductions from local source contributors have also been accompanied by significant decreases in the mercury concentrations in fish in local waterbodies, highlighting the role these local sources play. See Hubbard Brook Comments at 13-14 [JA \_]. The record therefore reflects that individual EGUs can have significant impacts on local hot-spots of mercury contamination and a cap-and-trade program allowing individual plants to avoid any reduction can reasonably be anticipated to impact public health and the environment.

EPA has previously recognized the potential impacts of a cap-and-trade system for hazardous pollutants. See EPA, Tools of the Trade, A Guide to Designing and Operating a Cap and Trade Program for Pollution Control at 2-5 (June 2003), available at <http://www.epa.gov/airmarkets/international/tools.pdf> [JA \_] (command and control regulations work better than cap-and-trade programs where emissions are toxic and have serious local health impacts). In fact, a cap-and-trade program has never been attempted for a neurotoxin such as mercury and EPA's Office of Inspector General concluded that CAMR as initially proposed failed to adequately address either the potential for hot-spots or the potential impact on children. See EPA Office of Inspector General, Evaluation Report: Additional Analyses of Mercury Emissions Needed Before EPA Finalizes Rules for Coal-Fired Electric Utilities (Feb. 3, 2005), OAR-2002-0056-5686 [JA \_].

In the final mercury rules, EPA neglects the potential impacts of a cap-and-trade program for mercury, instead erroneously concluding that the final rule is “not significant” in light of CAIR, 70 Fed. Reg. at 28,639, and referring to the CAMR docket generally for a discussion of any impacts, 70 Fed. Reg. at 28,616. First, EPA’s reliance on CAIR is misplaced as the agency acknowledges that CAIR will result in “both increases and decreases in [mercury] deposition” with increases expected in areas not covered by CAIR. 70 Fed. Reg. at 28,639. Thus, CAIR provides no assurance to individuals living in the twenty-two states not under its authority. See 70 Fed. Reg. at 28,618.

Second, the rest of the CAMR docket also fails to address the environmental and public health impacts of the cap-and-trade plan. The rulemaking relied on a modeling program to estimate the levels of mercury deposition in the future and concluded, “we do not currently have any facts before us that would lead us to conclude that utility-attributable hot spots exist.” See 70 Fed. Reg. at 16,027-28 (emphasis added). By looking solely for “utility-attributable” hot-spots, however, EPA ignores the threats to public health posed by mercury hot-spots created by EGU emissions acting with other sources of the pollutant. As noted supra, EPA coined the “utility-attributable” term in the context of its flawed interpretation of section 112(n)(1)(A). Just as EPA’s interpretation was unlawful for section 112, the interpretation equally contradicts the mandate by section 111 that EPA consider both the health and environmental impacts resulting from a promulgated performance standard. See 42 U.S.C. § 7411(a)(1).

Finally, EPA’s reliance on large-scale modeling to predict future hot-spots is misplaced. Hot-spots are frequently created not by generalized mercury deposition over large areas, but rather by local sources such as those studied in Ohio and watershed characteristics such as the

terrain and surrounding ground cover. See Comments of New Jersey et al., Evers Decl., Ex. B at 4, 19 [JA\_]. EPA's model averages the impacts from mercury emissions over 500 square miles using thirty-six square kilometer grids, and misses the local hot-spots that pose threats to the public and the environment. See Comments of The New Hampshire Department of Environmental Services at 3, OAR-2002-0056-6490 [JA\_].

For these reasons, EPA set standards that contravene Congress' intent that standards of performance in Section 111 drive technology and provide for the best system of emission reduction and must be overturned.

### CONCLUSION

Because EPA exceeded its statutory authority and acted arbitrarily and capriciously, Government Petitioners respectfully request that the Court vacate the Delisting Rule, 70 Fed. Reg. 15,994, and vacate CAMR, 70 Fed. Reg. 28,606, with instructions to EPA to promulgate emissions standards for HAPs emitted by EGUs under section 112 of the Act.

### SUMMARY OF ARGUMENT

In its initial brief, the Environmental Protection Agency (“EPA”) ignores the statutory framework and plain language of section 112 by claiming inherent authority to: (1) reconsider and reverse its December 2000 determination that regulation of electric utility steam generating units (“power plants”) is appropriate and necessary under section 112 of the Clean Air Act, 42 U.S.C. §§ 7401 *et seq.* (“CAA” or “Act”); and (2) remove power plants from the section 112(c) list of source categories without following the express provisions of section 112(c)(9). EPA’s De-listing Rule, 70 Fed. Reg. 15,994 (Mar. 29, 2005), violates the Act because first, section 112(c)(9) explicitly sets the criteria necessary to remove a currently listed source category, and second, the plain language of section 112(n) reveals Congress’ unambiguous intent to constrain EPA discretion and impose on EPA a mandatory duty to regulate power plants under section 112 following the December 2000 determination.

The Clean Air Mercury Rule (“CAMR”), 70 Fed. Reg. 28,606 (May 18, 2005), is further based on an unreasonable interpretation of section 112(n)(1)(A) that contravenes first, the Act’s structure and purpose, and second, the plain language of section 111(d) precluding mercury regulation under that section. Finally, CAMR is arbitrary and capricious because it does not meet the requirements for a standard of performance under section 111 and fails to address hotspots of mercury contamination, allowing certain sources to continue or even increase their mercury emissions for decades to come.

## ARGUMENT

### **I. EPA may not avoid the express provisions of the Clean Air Act through claims of inherent authority.**

Section 112 provides a clear framework for the regulation of hazardous air pollutants (“HAP”) from power plants. See Opening Brief of Government Petitioners (“Gov. Br.”) at 5-6. To avoid the Act’s mandate, Respondents invoke claims of inherent authority and rely on a fundamentally flawed interpretation of the Act.<sup>1</sup> Respondents’ claims of timeless and standardless agency discretion are without basis and must be rejected.

#### **A. In claiming inherent authority, EPA ignores the Act’s statutory framework.**

Given the plain language requirements of section 112, EPA’s burden is clear: “it must show either that, as a matter of historical fact, Congress did not mean what it appears to have said, or that, as a matter of logic and statutory structure, it almost surely could not have meant it.” Friends of the Earth v. EPA, 446 F.3d 140, 146 (D.C. Cir. 2006) (citation omitted).

Respondents’ arguments fail to meet this burden.

EPA’s argument relies on the “fundamental principle of administrative law that an agency has inherent authority to reverse an earlier administrative decision.” EPA Br. at 22. From this claim of inherent authority, EPA asserts the discretion to: (1) reconsider and revoke its determination that power plant regulation under section 112 is appropriate and necessary, EPA Br. at 21-23; and (2) remove power plants from the section 112(c) list of regulated source categories without following the express requirements of section 112(c)(9), EPA Br. at 24-33. EPA, however, has no inherent authority to reconsider and remove a listed source category from

---

<sup>1</sup> Respondents in this matter include State Respondent-Intervenors, and Industry Respondent-Intervenors (“Respondents”).

section 112 regulation because Congress provided a clear statutory mechanism for de-listing “any” source category.<sup>2</sup> See 42 U.S.C. § 7412(c)(9); American Methyl Corp. v. EPA, 749 F.2d 826, 835 (D.C. Cir. 1984) (“when Congress has provided a mechanism capable of rectifying mistaken action . . . it is not reasonable to infer authority to reconsider agency action”); see also Nat’l Railroad Passenger Corp. v. Nat’l Assn. of Railroad Passengers, 414 U.S. 453, 458 (1974).<sup>3</sup> EPA’s argument is therefore foreclosed by section 112 itself. See American Methyl, 749 F.2d at 835; Ethyl Corp. v. EPA, 51 F.3d 1053, 1061 (D.C. Cir. 1995).

EPA’s attempts to distinguish American Methyl are entirely misguided. The ruling there was not dependent on legislative history as EPA asserts, EPA Br. at 30, but on the presence of a statutory mechanism by which EPA could correct a mistakenly granted waiver under section 211(f).<sup>4</sup> See American Methyl, 749 F.2d at 835 (“Congress has provided a mechanism for

---

<sup>2</sup> EPA’s attempt to analogize this matter to previous delistings is misguided. The attempted delisting here is not based on an error in the initial listing, but on a re-interpretation of the Act. See Gov. Pet. Comments In Re Petition for Reconsideration at 20-21, OAR-2002-0056 Item 6280 [JA\_\_].

<sup>3</sup> The caselaw cited by EPA is misapplied in light of American Methyl and Ethyl Corp. EPA Br. at 21-24. The general premise of the cited cases - that administrative agencies possess the some power to reconsider decisions reached in the course of exercising quasi-judicial powers - is not at issue here. It is the application of claimed inherent authority to section 112 in light of the plain language and regulatory framework of that section that is at issue. See NRDC v. Abraham, 355 F.3d 179, 202 (2d Cir. 2004) (distinguishing Dun & Bradstreet Corp. Foundation v. USPS, 946 F.2d 189 (2d Cir. 1991)). None of the cases relied upon by EPA present either a regulatory framework or statutory language comparable to section 112.

<sup>4</sup> Notably, section 211(f) - which the court found to provide no inherent revocation authority to EPA - granted EPA more discretion than that found in Section 112(n). Compare 42 U.S.C. § 7545(f)(4) (“Administrator . . . may waive the prohibitions . . . if he determines that the applicant has established [the criteria for a waiver]”) with 42 U.S.C. § 7412(n)(1)(A) (“Administrator shall regulate [power plants] under this section if the Administrator finds such regulation is appropriate and necessary”) (emphases added).

correcting error”); see also Ethyl Corp., 51 F. 3d at 1061 (“[t]he language of section 211(c)(1) demonstrates that Congress crafted a very definite scheme in which the Administrator was to consider certain criteria before taking certain actions.”) (emphasis added). Section 112(c)(9) exhibits a definite scheme for delisting sources and EPA fails to show why American Methyl should not control here.<sup>5</sup>

**B. EPA’s interpretation contravenes the plain language of section 112.**

The plain language of section 112 further belies the agency’s claims of broad discretion and inherent authority. Having made the appropriate and necessary determination in December 2000 and placed power plants on the section 112(c) list, EPA “shall” regulate under section 112 and removing “any” listed source category must meet section 112(c)(9) requirements.

Congress’ use of “shall” normally conveys a mandatory obligation. See, e.g., Lexecon Inc. v. Milberg Weiss Bershad Hynes & Lerach, 523 U.S. 26, 35 (1998). In fact, the import of “shall” was clear to EPA as recently as October 2006 when the agency, in interpreting section 202 of the Act, argued:

use of the word “shall” in Section 202(a)(1) reflects a congressional judgment that, once EPA has devoted the resources necessary to determine whether particular emissions cause air pollution that may reasonably be anticipated to endanger the public health or welfare, and has concluded that the statutory

---

<sup>5</sup> EPA’s remaining arguments to distinguish American Methyl are similarly unfounded. EPA Br. at 31. It is incorrect to ignore section 112(c)(9) because “section 112(n)(1)(A) alone specifically addresses power plants.” Id. There is no language in section 112(n)(1)(A) that exempts a determination under that section from the delisting requirements in section 112(c)(9), which expressly applies to “any source category.” 42 U.S.C. § 7412(c)(9). EPA also cannot rely on the lack of an express timeline for the section 112(n) determination to distinguish American Methyl because the question in both cases remains whether EPA has inherent authority to revoke previous determinations after they were made in light of express statutory provisions for such revocations, not how much time the agency was allowed to make the initial determinations.

endangerment standard is satisfied, the directive that EPA must prescribe standards is an acceptable constraint on the agency's usual rulemaking discretion.

Brief for the Federal Respondent at 41-42, Massachusetts v. EPA, 127 S. Ct. 1438 (2007) (No. 05-1120). Applied to section 112, EPA, having devoted the resources necessary to make the December 2000 determination, is now under a "directive" to prescribe maximum achievable control technology standards for power plants as required under section 112(d), and cannot claim the discretion to refute that directive based on inherent authority.

It is similarly clear that section 112(c)(9) applies to "any" listed source category, *i.e.*, "indiscriminately of whatever kind," as long as the category is on the section 112(c) list – which power plants are. See Dep't of Housing and Urban Dev. v. Rucker, 535 U.S. 125, 131 (2002) ("any" has an expansive meaning"); United States v. Gonzales, 520 U.S. 1, 5 (1997); NRDC v. EPA, 2007 U.S. App. LEXIS 13388, 16 (D.C. Cir. 2007). EPA's only response is to suggest disregarding section 112(c)(9) because "the section 112(n)(1)(A) language takes precedence." EPA Br. at 26. Section 112(n)(1)(A), however, does not address the delisting of a regulated source category - the action at issue here. Pursuant to the rules of statutory construction, the specific terms section of 112(c)(9) therefore prevail over any implied authority the agency may assert over power plants generally in section 112(n)(1)(A). See EPA Br. at 26 (quoting Ginsberg & Sons v. Popkin, 285 U.S. 204, 208 (1932)).<sup>6</sup>

---

<sup>6</sup> Respondent-intervenors attempt to justify EPA's avoidance of its mandatory duty by arguing that the December 2000 determination was not a final action and cannot bind subsequent EPA administrators to the provisions of section 112(c)(9). Respondent-intervenors Br. at 16-18. Section 112(c)(9), however, is not limited to source categories listed in final agency actions but instead applies to any listed source category. See New Jersey et al., Comments to Final Delisting Rule, OAR-2002-0056, Item 6280 at 19-22 [JA\_\_]. While section 112(e)(4) forecloses judicial review of listing actions, this limitation was designed to promote rapid promulgation of section

EPA nonetheless urges the Court towards Chevron's step two by asserting that Congress has failed to "unambiguously express[] an intent to compel unnecessary and inappropriate regulation of power plants." EPA Br. at 26. EPA's only support for this position is the absence of any "preclusive language" in the statute restricting its inherent authority to revise the section 112(n) determination. EPA Br. at 23. This argument contravenes the established need to utilize normal tools of statutory construction in interpreting a statute. Chevron v. NRDC, 467 U.S. 837, 861 (1984). Moreover, "to suggest, as the [agency] effectively does, that Chevron step two is implicated any time a statute does not expressly negate the existence of a claimed administrative power . . . is both flatly unfaithful to the principles of administrative law . . . and refuted by precedent." Oil, Chemical and Atomic Workers Internat'l Union AFL-CIO v. NLRB, 46 F.3d 82 (D.C. Cir. 1995) (citation omitted).

Here, it is clear that Congress did express an entirely unambiguous intent that: (1) EPA regulate power plants under section 112 following an affirmative appropriate and necessary determination; and (2) once sources are listed under section 112(c), they be delisted pursuant to section 112(c)(9). Section 112 reveals no gap in the regulation of power plant emissions through which EPA can assert either discretion or inherent authority. See Chevron, 467 U.S. at 843-44 (agency discretion "is warranted only when Congress has left a gap for the agency to fill."); South Coast Air Quality Management District v. EPA, 2007 U.S. App. LEXIS 13368, 7 (D.C. Cir. 2007) (EPA can not rely upon its policy preferences where Congress sought to reduce the agency's discretion).

---

112 emission standards, not to grant EPA additional discretion to reconsider determinations and delay regulation of HAPs. See Gov. Br. at 14; Env. Br. at 16-18.

Taken to its logical conclusion, EPA's interpretation of section 112 could place power plants in perpetual regulatory limbo. According to EPA, by simply asserting "a principled basis for doing so," it can reverse the appropriate and necessary determination of its predecessor and either remove power plants from, or add power plants to, the list of sources regulated under section 112,<sup>7</sup> thereby removing power plants from any meaningful regulation in perpetuity without ever complying with the provisions of section 112(c)(9).<sup>8</sup> EPA Br. at 23. It is inconceivable Congress intended to allow such unfettered agency discretion given the regulatory framework's goal of placing all major sources of HAPs under emission standards by the year 2000. See 42 U.S.C. § 7412(e); cf. NRDC v. Abraham, 355 F.3d at 197, 200 (rejecting DOE's interpretation that would "eviscerate" provisions meant to limit the department's discretion).

**II. Through CAMR, EPA exceeds its statutory authority and violates clear Congressional intent and the policy goals of the CAA.**

Assuming *arguendo* that EPA possesses the inherent authority to disregard section 112(c)(9) and revise its December 2000 section 112 determination, the agency's rulemaking still violates the Act. First, the agency argues incorrectly that the language of section 112(n)(1)(A) can be reasonably interpreted to require an analysis contrary to the well-established policy goals

---

<sup>7</sup> Respondent-intervenors cite Thomas v. New York, 802 F.2d 1443 (D.C. Cir. 1986)) as supporting this position. Thomas, however, dealt with a different regulatory framework and centered on a letter from the then-EPA Administrator to the Secretary of State. Id. The determination here, required by statute and a settlement agreement, see Env. Br. at 6, fn 16, 16-18, based on years of study, a report to Congress, and extensive public comment, and published in the Federal Register is easily distinguishable from the record presented in Thomas. See Gov. Br. at 6-7; 65 Fed. Reg. 79,825 (Dec. 20, 2000).

<sup>8</sup> Cf. OAR-2002-0056-2430, JA [ \_\_\_ ] (Comments of a coalition of state air agencies, identifying MACT permits that were issued based on EPA's December 2000 decision) and EPA Br. at 28 (dismissing these permits as being "during the period" of EPA's now reversed appropriate and necessary determination).

of the Act generally, and section 112 specifically. Second, EPA errs in interpreting section 111(d) to allow regulation of mercury from power plants under that subsection. Finally, EPA is badly misguided in arguing that an appropriate standard of performance for mercury from power plants could include the proposed plan under CAMR.

**A. EPA's interpretation of the phrase "appropriate and necessary" in section 112(n)(1)(A) violates the Act.**

According to EPA's new interpretation, regulation is "appropriate and necessary" under section 112(n)(1)(A) only if power plant mercury emissions acting in isolation will pose a threat to only human health after the year 2020. See EPA Br. at 40, 46; Govt Br. at 18. Based on a deeply flawed public health analysis, Govt Br. at 24-26, EPA finds regulation is not appropriate and necessary and seeks to exempt the single largest source of mercury emissions in the United States from regulation under section 112 of the Act. EPA's unreasonable interpretation of section 112(n)(1)(A) must be rejected.

First, an agency's construction of a statute is permissible only to the extent that it is consistent with the statute's purpose and "[t]he [CAA's] purpose is to 'protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population.'" Chemical Manufacturers Ass'n v. EPA, 217 F.3d 861, 866 (D.C. Cir. 2000).<sup>9</sup> Section 112 furthers this congressional purpose by requiring regulation of both major sources and area sources of HAPs.<sup>10</sup> See 42 U.S.C. § 7412(c)(3); Govt. Br. at 18-

---

<sup>9</sup> While EPA limits its analysis to public health (disregarding environmental impacts), the CAA's core provisions all protect welfare as well as human health. See 42 U.S.C. § 7602(h) (defining welfare broadly to include environmental impacts); Govt. Br. at 18-21.

<sup>10</sup> See 1990 CAA Leg. History 8338, 8491 (Separate Addendum to Govt. Br. at Tab 14) (discussing area source regulation and the need for regulations of both large and small sources).

21. Here, EPA's re-interpretation of "appropriate and necessary" hinges on EPA's interpretation of the phrase "as a result of." EPA Br. at 35. Although EPA acknowledges that "as a result of" can be read to encompass actions that are a contributing cause to an ultimate harm, the agency chose to redefined the phrase to mean "solely as a result of."<sup>11</sup> EPA Br. at 36. By doing so, EPA impermissibly abandoned the Act's public health goals and left unaddressed those hundreds of thousands of individuals who are annually exposed to mercury levels above safety thresholds<sup>12</sup> and for whom any reduction in their exposure to mercury will yield health benefits.<sup>13</sup> See Chao v. Mallard Bay Drilling, 534 U.S. 235, 245 n.9 (2002) (rejecting agency interpretation inconsistent with Congressional intent to protect safety of every worker).

The true question – which EPA studiously avoids – is whether the contribution by power plants to the public health threat posed by mercury in the environment warrants section 112 regulation, not whether power plants, acting alone, cause unsafe mercury levels in individuals.<sup>14</sup>

---

<sup>11</sup> This construction is also the genesis for EPA's arbitrary and capricious health analysis, which similarly fails to protect public health. See Gov. Br. at 24-26; N.J. et al., Comments In Re Reconsideration of the Mercury Rules (Dec. 19, 2005), OAR-2002-0056 at 6-13 [JA\_\_].

<sup>12</sup> See New Jersey et al., Comments to Proposed Rule, OAR-2002-0056, Item 2823 at 6-8 [JA\_\_].

<sup>13</sup> See Govt. Petitioners Comments to Final Delisting Rule at 37-38, OAR-2002-0056, Item 6280 [JA\_\_] (every additional increment of mercury to babies already excessively exposed to the toxin causes an additional, incremental impact including IQ loss). Indeed, since power plant mercury emissions account for as much as 67% of the mercury deposition in areas such as Steubenville, Ohio, reductions in those emissions may be the difference between safe and unsafe levels of mercury in many people. Even using EPA's flawed deposition modeling, reduction of power plant mercury is expected to result in a 16% decline in the mercury deposited in certain watersheds. EPA Br. at 67.

<sup>14</sup> In the true spirit of an *ignoratio elenchi*, EPA attempts to recast the question as whether Congress intended to require regulation of power plants where they "made some non-zero

EPA's construction of "appropriate and necessary," interpreting the phrase "as a result of" in a manner that fails to protect public health, and disregarding the contributory impact of power plant emissions on public health frustrates the policy that Congress sought to implement and cannot be squared with the purpose of the Act or section 112. See Chemical Manufacturers Ass'n v. NRDC, 470 U.S. 116, 151 (1985) (citation omitted).

Second, EPA's statutory construction gives no effect to the clear congressional intent for the expeditious regulation of HAPs. The agency's interpretation of "appropriate" in section 112(n)(1)(A) looks to the year 2020 – thirty years after the 1990 amendments that enacted section 112(n) – to determine whether hazards to public health are anticipated to occur at that time as a result of power plant emissions. EPA Br. at 34, 46. To justify this extremely attenuated timeline, EPA points to the lack of a deadline by which the agency is required to make the appropriate and necessary determination. EPA Br. at 54. EPA then claims that the language in section 112(n) requiring EPA to examine hazards to public health "after imposition of the requirements of [the Act]" justifies looking to the outer limits of the Clean Air Interstate Rule ("CAIR") and CAMR, regulations that were not finalized until 2006 and whose benefits will not occur until years, if not decades, later.<sup>15</sup> EPA's justifications, however, contravene the well-established rule that "in expounding a statute, we must not be guided by a single sentence or member of a sentence, but look to the provisions of the whole law, and to its object and policy."

---

contribution to the global pool of mercury." EPA Br. at 37. Far from a non-zero contribution, power plants emit more than 150,000 tons of HAPs annually including approximately 48 tons of mercury.

<sup>15</sup> See 71 Fed. Reg. 33,388 (June 9, 2006) (CAMR Final Rule on Reconsideration); 71 Fed. Reg. 25,304 (Apr. 28, 2006) (CAIR Reconsideration; Final Rule).

U.S. Nat'l Bank of Oregon v. Independent Ins. Agents of Am., Inc., 508 U.S. 439, 455 (1993).

Section 112(e)(1) sets a clear timeline by which emission standards for all source categories were to be set by November 2000. 42 U.S.C. § 7412(e)(1).<sup>16</sup> For EPA to now claim that “nothing precludes” it from looking thirty years beyond the 1990 amendments is therefore patently unreasonable and would negate the desired finality in agency decisions such as the December 2000 determination. See EPA Br. at 53; Dun & Bradstreet Corp. v. U.S. Postal Service, 946 F.2d at 193-194 (noting the “desirability of finality” in agency determinations).

**B. EPA plainly errs in interpreting section 111(d) to allow regulation of mercury emissions from power plants under section 111.**

The plain language of section 111(d) precludes regulating emissions of HAPs from existing power plants, including mercury, through a new source performance standard. Govt. Br. at 27-29; Env. Br. at 20-25. The controlling Statutes at Large contain provisions from each of the congressional chambers prohibiting HAP regulation under section 111(d). Taken together, these provisions prohibit section 111(d) from applying to: (1) any air pollutant “included on a list published under section . . . 112(b)” (Senate Amendment); or (2) “any air pollutant . . . emitted from a source category which is regulated under Section 112” (House Amendment). CAA Amendments, Pub. L. No. 101-549, §§ 108, 302, 104 Stat. 2399, 2467, 2574 (1990).

EPA’s assertion of a conflict between the text of the House and Senate amendments, EPA Br. at 104, is quickly dispatched by simply applying the facts of this case to both amendments.

---

<sup>16</sup> Section 112(n)’s requirement that EPA shall regulate power plants “under this section” reinforces the conclusion that emission standards for mercury from power plants were to be set by November 2000. 42 U.S.C. § 7412(n)(1)(A). The November 2000 deadline is further supported by the requirement that EPA consider, as the basis of its determination, a 1993 study. Id.; see also 42 U.S.C. § 7412(n)(1)(B) (requiring a study of mercury emissions from power plants by November 1994).

Mercury is included on the list of HAPs listed under section 112(b) and is thus barred from regulation under section 111(d) by the Senate Amendment. See 42 U.S.C. § 112(b)(1) (listing “mercury compounds”). Mercury is also emitted from numerous source categories regulated under section 112 and is therefore also barred from regulation under section 111(d) by the House Amendment. See Gov. Br. at 27 (noting mercury emission standards for several source categories). Rather than presenting a conflict, applying either, or both, of the amendments to the present issue yields the same result: regulation of mercury under section 111(d) is expressly barred by that section’s plain language.

Undaunted, EPA gamely asserts that “pertinent legislative history supports EPA’s conclusion that the House and Senate amendments to section 111(d) conflict.” EPA Br. at 104. However, “where the language of a statute is clear and unambiguous on its face, the thrust of that language should not be controverted by seeking to show an inconsistent legislative intent.” United States v. Western Pacific Railroad Co., 385 F.2d 161, 163 (10<sup>th</sup> Cir. 1967), cert. denied, 391 U.S. 919 (1968); see also Citizens to Save Spencer County v. EPA, 600 F.2d 844, 870 (D.C. Cir. 1979) (“It is a cardinal rule of statutory construction, however, that ambiguities should not be found where statutes are clear on their face.”). Nevertheless, the history behind the 1990 amendments, even if relevant, clearly reveals Congress’s desire to limit EPA discretion pertaining to HAP regulation. See Govt. Br. at 14, 16; Nat’l Lime Ass’n v. EPA, 233 F.3d 625, 634 (D.C. Cir. 2000) (Congress established the section 112 regulatory framework “precisely because it believed EPA had failed to regulate enough HAPs under previous air toxics provisions”). Avoiding this history, EPA instead pointed to “proposed changes to section 112” – most of which were never enacted – “that would have given EPA broad discretion” (emphasis

added). EPA Br. at 109. Despite EPA's apparent belief, however, legislative history linked to failed proposals does not trump the express language of actually enacted statutes and the legislative history of those provisions.<sup>17</sup>

**C. CAMR exceeds EPA's statutory authority and is arbitrary and capricious.**

After thirty years of regulating HAPs under the HAP section of the Act, CAMR is the first EPA rule to adopt a market based cap-and-trade program under section 111 for a potent neurotoxin. Even if this program is not barred by section 111(d), CAMR exceeds EPA's statutory authority, is not supported by the evidence in the record, and violates section 111(a)'s requirement that standards reflect the best demonstrated system of emission reduction. 42 U.S.C. § 7411(a)(1).

The agency argues at length that the definition of a standard of performance under section 111 can be stretched to include a cap-and-trade program. EPA Br. at 119-133. Where Congress wanted to authorize a pollutant trading program, however, it has shown the ability to explicitly do so. See 42 U.S.C. §§ 7651 et seq. EPA incredibly claims sufficient statutory authority, based on a single line of definitional text, to implement a regulatory trading program through CAMR that is comparable to the SO<sub>2</sub> trading program – to which Congress devoted an entire title. Id. This is true interpretive hubris as Congress “does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions – it does not, one might say, hide elephants in

---

<sup>17</sup> In this argument, EPA badly misapplies Citizens to Save Spencer County, 600 F.2d at 853, which dealt with a clear conflict between two sections of the Act and there is no such conflict here. Importantly, Spencer County emphasized the rule that “statutory provisions, whenever possible, should be construed so as to be consistent with each other.” Id. at 870. EPA acknowledged that such a construction is possible here, EPA Br. at 114, but declined to implement it.

mouseholes.” Whitman v. Am. Trucking Ass'ns, 531 U.S. 457, 468 (2001) (citation omitted).

EPA’s position, moreover, fails to distinguish between the Act’s regulatory framework for HAPs and the regulatory framework for criteria pollutants. While there is ample indicia of Congress’s comfort with capping and trading criteria pollutants, see EPA Br. at 128-129; Michigan v. EPA, 213 F.3d 663, 685-88 (D.C. Cir. 2000), no such comfort with trading HAPs is evident, as nothing in section 112’s language or legislative history suggests that Congress contemplated, let alone authorized, trading HAPs.<sup>18</sup> “Where Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally . . . in the disparate inclusion or exclusion.” Russello v. United States, 464 U.S. 16, 23 (1983) (citation omitted).<sup>19</sup>

Even if EPA is authorized to cap-and-trade mercury under section 111, CAMR remains unlawful. EPA claims that just two elements are necessary in any promulgated standards to meet the statutory requirements of section 111: (1) limits that will achieve “real and meaningful nationwide emission reductions”; and (2) a structure that will achieve results in “as cost-effective a manner as is possible.” EPA Br. at 135-136. The language of section 111, however, requires standards to reflect the “best system of emission reduction which . . . the Administrator determines has been adequately demonstrated.” 42 U.S.C. § 7411(a)(1).

EPA concedes that CAMR will only result in a 50% reduction in mercury emissions from

---

<sup>18</sup> See also ASARCO, Inc. v. EPA, 578 F.2d 319 (D.C. Cir. 1978) (section 111 trading program contravened Congress’s intent that NSPS standards force “all newly constructed or modified . . . facilities” to employ the best demonstrated controls); Env. Br. at 28-29.

<sup>19</sup> Section 112(n)(5) further supports this position as it exhibits Congress’s ability to specifically authorize HAP regulation under section 111. 42 U.S.C. § 7412(n)(5).

existing power plants by the year 2020, EPA Br. at 135. The record reveals that such reductions do not reflect the best demonstrated system of emission reduction. EPA concedes that the CAMR emissions caps until 2018 are based not on the best demonstrated system, but rather the co-benefits to mercury reduction expected from CAIR. EPA Br. at 135. The best performing power plants, burning every type of coal possible, already surpass the emission reductions required by CAMR in 2020. Govt. Br. at 29-31. Setting emission reduction targets for 2020 that are 43% weaker than the results currently achieved by the top 12% of existing power plants is a clear abuse of any discretion EPA may have under section 111 to consider costs of potential controls.<sup>20</sup> *Id.* at n.7.

EPA's only response to the contrast between current best performers and CAMR is that while "individual" power plants may do better than CAMR, this is irrelevant in a "national" standard of performance. EPA Br. at 137. EPA, however, tacitly admits that CAMR does not reflect the best demonstrated system nationally as it predicts that power plants in total will do seven tons per year better than the Phase I cap. *See* 70 Fed. Reg. at 28,619; Govt. Br. at 30. Even disregarding the achievements of best performing units, the agency has offered no reasoned explanation for why CAMR did not set the Phase One cap *at least* at the level that EPA has modeled as being achieved under CAIR. It is incongruous for EPA to suggest that a mercury cap that will be achieved with a seven ton per year margin the moment it becomes effective by power plants employing no mercury specific control technologies equates to the best system of mercury

---

<sup>20</sup> The NSPS standards for new power plants are also arbitrary and capricious as they rely on a scheme that subcategorizes based on emission control technology, and fails to reflect the emission reductions achieved by existing plants. Gov. Br. at 29-31; Gov. Pet. Comments In Re Reconsideration of Mercury Rules at 24-32, OAR-2002-0056, Item 6479 [JA \_\_\_].

reduction adequately demonstrated.

Finally, EPA's arguments confirm that the agency did not consider the health and environmental impacts of CAMR as required by law. See 42 U.S.C. § 7411(a)(1). Hotspots of mercury pollution exist and impact public health, and a cap-and-trade plan by its nature raises the very real risk of continuing or even exacerbating these hotspots as power plants avoid emission reductions by purchasing credits. Govt. Br. at 32-36. The agency's entire response to Petitioners' challenges on this matter was a general reference back to the section 112(n) health analysis and EPA's "utility hotspot analysis" in particular. EPA Br. at 142. No basis exists, however, for EPA's reliance on the utility hotspot analysis to satisfy the performance standard requirements of section 111. Govt. Br. at 24-26. They are, on their face, different requirements, and EPA has offered no explanation for why an analysis based entirely on its interpretation of section 112(n)(1)(A) suffices under section 111 where EPA's focus on "utility attributable" hotspots is baseless.

### CONCLUSION

The rules at issue here should be vacated, and EPA directed to promulgate emission standards for all HAPs emitted by power plants pursuant to section 112(d) of the Clean Air Act.

Hi Mike and Morgan, do you by any chance have ready access to the State petitioners brief in the CAMR (NJ v. EPA, 517 F.3d 574 (D.C. Cir. 2008)) litigation? In case it's helpful the DC Circuit lead case number was 05-1097). Thanks, Ben

Kristen:

Happy New Year to you, as well.

We haven't had discussions about this matter in a while. I guess we need to see what the petitioner's brief looks like and then reconnoiter.

Best,

Fred

Happy New Year!

I hope everyone is doing well at the start of the new year! I was just browsing PACER, and came across this court order regarding the briefing schedule. I assume we will discuss the scope of our brief after January 28, 2014 (when the Intervenors in support of Petitioner submit their joint brief), but I just wanted to check in with all of you to find out if there is another plan.

Best,

Kristen

#### In the News

##### Green Bonds Take Root in Maturing Market

Green bonds, intended to finance environmentally friendly projects, are set to become a key part of investors' fixed income portfolios. Recent issues of green bonds by development banks and corporate issuers, strong investor demand and Zurich Insurance Group's recent decision to invest \$1 billion in green bonds are transforming the market.

#### Events

##### INCR Policy Working Group Call

Tuesday, January 21  
1:00 - 2:00 pm ET

Join this month's INCR Policy working group call to hear from guest speakers, Ceres staff and investor peers. The discussion will focus on upcoming engagements, investor opportunities and new regulations. To register and learn more, contact Brandon Smithwood, Senior Manager, Policy Program.

##### INCR Sustainable Stock Exchanges Working Group Call

Thursday, January 30  
12:00 - 1:00 pm ET

INCR Sustainable Stock Exchanges Working Group Call - The SSE Working Group will meet to discuss the upcoming launch of the Listing Standards Comment Period by global stock exchanges, among other items. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Program.

#### Shareholder Initiative on Climate and Sustainability (SICS) Working Group Call

Wednesday, February 5  
2:00- 3:00 pm ET

The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change- related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge, Director, Shareholder Engagement, Investor Program.

#### 2014 Investor Summit on Climate Risk and INCR Meeting

UN Building This week Ceres will be holding the biennial Investor Summit on Climate Risk at the United Nations on Wednesday, January 15th following the Investor Network on Climate Risk members meeting being held Tuesday, January 14th.

These events will highlight the latest analysis and thinking on climate and carbon risk, clean energy investment opportunities, what leading international investors are doing to address these issues, and investors' role in necessary policy changes to address these growing risks and enhance related investment opportunities.

Watch the Investor Summit live starting at 9:00 a.m. EST on January 15th at <http://webtv.un.org>.

#### Welcome to New Investor Team Staff

We are delighted to announce that Rebecca Bar and Noah Klein-Markman have joined the Ceres Investor Program, providing staff support to INCR members.

Rebecca, our new Program Coordinator, will be filling Siobhan Collins' shoes, as Siobhan moves to the Ceres Water Program team. Rebecca is a graduate of Boston University, with a major in Environmental Analysis & Policy, and comes to Ceres from the Environmental Business Council of New England. You can reach Rebecca at [bar@ceres.org](mailto:bar@ceres.org).

Noah, a graduate of Wesleyan University and a former Ceres Investor Program intern, will serve as Coordinator for our Shareholder Initiative on Climate and Sustainability. Noah will be working closely with Rob Berridge to support shareholder proposals and company engagement efforts, and will also work with Tracey Rembert in supporting our Sustainable Stock Exchanges initiative and working group. You can reach Noah at [klein-markman@ceres.org](mailto:klein-markman@ceres.org).

Please join us in welcoming Rebecca and Noah to our team and program!

Subject: Community Webinar on Executive Order 13650

## Community Webinar on Executive Order 13650: Improving Chemical Facility Safety and Security

\*Do you have questions about improving chemical facility safety and security?

\*Are you aware of the federal programs that address chemical plant safety and security?

\*Do you have ideas on improving chemical plant safety and security?

\*Do you want to know what actions the federal government is taking to improve coordination and information sharing?

\*Do you want to know more about what federal regulations are doing to safeguard chemical facilities and communities?

\*In August 2013, President Obama issued Executive Order (EO) 13650 - Improving Chemical Facility Safety and Security to improve the safety and security of chemical facilities and reduce the risks of hazardous chemical to owners and operators, workers, and communities. Do you want to know how community members can provide comments and feedback on the Executive Order in order to help improve the safety and security of chemical facilities?

If so, please join EPA's Technical Assistance for Communities (TASC) program on Thursday, January 16 from 6pm to 8pm Eastern for a webinar about the Executive Order 13650 on Improving Chemical Facility Safety and Security to learn how this order will reduce worker and community risks from hazardous chemical releases.

Who should attend: Community members and grass roots organizations, including first responders, interested in improving the safety and security of chemical facilities.

### Webinar Details

Thursday, January 16, 6pm – 8pm Eastern (another introduction webinar will be offered in the next 3-4 weeks)

\*For more information and to register for the webinar, visit [https://epa.connectsolutions.com/chemical-facility-safety-011613/event/event\\_info.html](https://epa.connectsolutions.com/chemical-facility-safety-011613/event/event_info.html).

\*Please test your computer before attending the meeting at [http://admin.adobeconnect.com/common/help/en/support/meeting\\_test.htm](http://admin.adobeconnect.com/common/help/en/support/meeting_test.htm). The Connection Test checks your computer to make sure all system requirements are met. If you pass the first three steps of the test, then you are ready to participate in a meeting. If you do not pass the test, perform the suggested actions and run the test again.

UNITED STATES DISTRICT COURT  
FOR THE DISTRICT OF COLUMBIA

STATE OF NEW YORK, et al.,	)	
	)	
Plaintiffs,	)	Civil Action
	)	No. 13 -1553 (GK)
v.	)	
	)	and consolidated case
GINA MCCARTHY, Administrator,	)	
Environmental Protection Agency, and	)	Civil Action
ENVIRONMENTAL PROTECTION AGENCY,	)	No. 13 -1555 (GK)
	)	
Defendants.	)	
_____	)	

**CONSENT MOTION TO AMEND SCHEDULE  
AND CONTINUE STATUS HEARING**

Defendants, Gina McCarthy, Administrator, and the United States Environmental Protection Agency (jointly referred to as “EPA”) request a 30-day extension of the deadlines for answering Plaintiffs’ complaints and for filing the Joint Meet and Confer Statement. EPA further requests that the Initial Scheduling Conference scheduled for February 3, 2014, be continued.

The parties have been engaged in settlement negotiations that may resolve this matter within the next month. The requested extensions will allow the parties to focus their attention on settlement negotiations. The requested continuance will allow the Court to avoid spending time on a Conference that may prove unnecessary.

Under the Court’s Order of December 13, 2013, the answers to Plaintiffs’ complaints are due on January 22, 2014. EPA requests that this deadline be extended to February 21, 2014. EPA further requests that the deadline for filing the Joint Meet and Confer Statement set by the Court’s order of December 27, 2013, ECF 21, be extended from January 29, 2014, to February 28, 2014.

Counsel for Plaintiffs and Intervenor-Plaintiff have consented to this motion.

Respectfully submitted,

ROBERT G. DREHER  
Acting Assistant Attorney General  
Environment and Natural Resources Division

/s/ EILEEN T. MCDONOUGH

**ORDER**

Upon consideration of the consent motion for extension of time and continuance filed by Defendants Gina McCarthy, Administrator, and the United States Environmental Protection Agency, it is hereby ordered that the motion is granted. Defendants will respond to the Plaintiffs' complaints no later than February 21, 2014. The Parties will file the Joint Meet and Confer Statement no later than February 28, 2014. The Initial Scheduling Conference scheduled for February 3, 2014, is cancelled.

Executed this \_\_\_\_ day of January, 2014.

Eileen,

Mike noticed that the proposed order says the initial scheduling conference of Feb. 3 is cancelled. But as the motion asks for the conference to be continued, we think it would be more accurate to state that "The Initial Scheduling Conference scheduled for February 3, 2014, is cancelled and will be rescheduled."

The rest looks OK to the enviro groups as well.

Thanks for drafting this.

Hi Mike,

The NGOs had a call earlier today to discuss the status and next steps on the oil and gas NSPS. We'd like to touch base with you to do the same. Is there a time Tuesday that works for you? I'm open except 1-2 and 4-5 ET.

Joanne

Energy & Environment

Under Investor Pressure, Utility to Study Emissions

By DIANE CARDWELLJAN. 14, 2014

FirstEnergy, one of the country's largest electric companies, has agreed to work toward reducing its carbon emissions in response to pressure from shareholders including New York State and Connecticut pension funds, New York Comptroller Thomas P. DiNapoli said on Tuesday.

The company, which operates in six states, including Ohio, Pennsylvania and New Jersey, promised to study and report on what it could do to help meet President Obama's goal of reducing carbon emissions by 80 percent by 2050. As a result, Mr. DiNapoli, the State of Connecticut and As You Sow, a shareholder advocacy group, agreed to withdraw a shareholder resolution they had filed for First Energy's annual meeting this year.

Mr. DiNapoli said the decision could speed the adoption of agreements for environmental planning at other energy companies.

"Many of our energy holdings obviously have been very profitable for us in the short run," he said. "What we're trying to ensure is that in the long run that profitability is sustainable. We do see tremendous risk if issues of climate change are not incorporated into corporate strategy."

The Bruce Mansfield Power Station in Shippingport, Pa., is owned by FirstEnergy. Philip G. Pavely/Pittsburgh Tribune-Review, via Associated Press

The agreement comes as investors are increasingly pressuring corporations into action on climate change.

A movement to get universities, foundations and governments to rid themselves of investments in fossil-fuel companies has had some successes. Three former treasury secretaries and two billionaires

— former Mayor Michael R. Bloomberg and Tom Steyer — have started an effort called Risky Business to assess the economic risks posed if climate change is left unaddressed. And the use of shareholder resolutions calling for more focus on areas like climate change and sustainability, energy extraction procedures, energy efficiency and recycling is rising, a report from Ernst & Young said.

In the 2013 proxy season, shareholder submissions grew more than 6 percent compared with the year before, with environmental and social proposals representing the largest category, at just under 40 percent.

Many such sustainability proposals meet with success, said Allie Rutherford, director of corporate governance at Ernst & Young, given that shareholders often withdraw them in favor of discussions with the companies or actions taken by them.

“Investors have been pushing on some of these issues for a long time, and I think there’s been broader acceptance among the investor community. And that’s evident in the rising support for certain of these proposals,” Ms. Rutherford said. “I also think there’s growing recognition on the company side.”

In the case of FirstEnergy, Mr. DiNapoli and his partners filed the proposal as part of a larger effort with Ceres, a coalition of environmentalists and investors, to make companies more environmentally responsive. The New York State pension fund owns 1,205,383 shares of FirstEnergy, according to the comptroller’s office, worth about \$38 million at the market’s close on Tuesday. More than half of the power sources for the utility are coal, according to its website, but it says it has been working to reduce emissions and pollution over the last two decades by closing plants and installing more emissions-control equipment.

“The company has aggressive plans in place to further reduce emissions into the future,” Stephanie Walton, a spokeswoman for FirstEnergy, wrote in an email. “In response to shareholder interest, FirstEnergy has agreed to provide additional transparency by outlining these plans in its 2014 Sustainability Report, which will be published later this year.”

Mr. DiNapoli’s office has won settlements with a dozen companies, including coal-dependent utilities and food businesses like Dunkin’ Donuts and Smucker’s that use palm oil, whose harvesting practices can harm the environment. The office has outstanding submissions with CMS Energy, Ameren and Safeway.

As an approach, using shareholder resolutions is a “fairly blunt instrument,” said Dan Bakal, director of electric power programs at Ceres, but it was proving to be a successful one.

Although the resolutions are not binding, Mr. Bakal said, they are influential. “What it really is about is whether or not a company thinks there’s a significant number of their shareholders that are going to be concerned about how a company is addressing an issue,” he said. “Companies are not likely to respond or make commitments unless they think there’s some significant portion of their shareholders that are going to be interested.”

Correction: January 17, 2014

An article on Wednesday about FirstEnergy’s agreement to work toward reduction of carbon emissions in response to pressure from shareholders described imprecisely the shareholder proposals that Allie Rutherford, a corporate governance executive at Ernst & Young, said were meeting with success. They are proposals involving environmental or social issues, not shareholder proposals over all.

## AIR POLLUTION:

Judge is asked to impose deadline for EPA ozone rule

Jason Plautz, E&E reporter

Published: Wednesday, January 22, 2014

Environmental groups are asking a federal judge to set a deadline for U.S. EPA to issue its long-delayed rule limiting ozone emissions, saying the agency is in violation of the Clean Air Act for stalling on the proposal.

The Sierra Club, American Lung Association, Natural Resources Defense Council and Environmental Defense Fund are seeking a court-ordered deadline of Dec. 1 for EPA to issue a proposal for its National Ambient Air Quality Standard for ozone. The final rules would be due out by Oct. 1, 2015, under the request.

In a filing with the U.S. District Court for the Northern District of California, the groups say that EPA is nearly a year past when it should have completed its regular five-year review for the NAAQS, which was last set at 75 parts per billion in 2008.

The same groups filed a lawsuit in that court in June seeking to force EPA to set the ozone standards.

The agency is still doing some analytical work but has requested a meeting of its Clean Air Scientific Advisory Council in March to consider the NAAQS review. In a statement, EPA said it would respond to the motion by Feb. 25, a date set by the court.

"The agency is continuing to work with its independent scientific advisors on the ongoing review of the ozone standard based on the extensive body of research that will inform EPA's decision," the agency said. "EPA is following its normal open and transparent review process that allows for extensive public comment."

A federal agenda for rulemaking in November didn't give a date for release of the ozone proposal (Greenwire, Nov. 27).

Ozone, a major component of smog, is linked to a host of health problems, including asthma and respiratory ailments and respiratory diseases, and EPA has said it is linked to climate change.

The agency had reviewed the current NAAQS soon after President Obama took office, but the White

House in 2011 stopped a proposal to set a tighter standard between 60 and 70 ppb. Public health groups have sought a standard set on the lower end of that range.

"The evidence is really strong that the existing standard needs to be strengthened, and that was EPA's conclusion back in 2010," said Janice Nolen of the American Lung Association. "This is always a complicated standard ... and we certainly know it can be hard to get it all lined up if there's no firm deadline."

##### Investing in the Clean Trillion: Closing the Clean Energy Gap

In order to limit global warming to 2°C and avoid the worst effects of climate change, the world needs to invest an additional \$36 trillion in clean energy by 2050—an average of \$1 trillion per year for the next 36 years. Ceres is calling this clean energy investment gap the Clean Trillion. Closing this gap will be a tremendous challenge, but it is possible if businesses, investors and policymakers join forces.

#### Shareholder Initiative on Climate and Sustainability (SICS) Working Group Call

Wednesday, February 5  
2:00- 3:00 pm ET

The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change- related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge, Director, Shareholder Engagement, Investor Program.

#### 2014 Investor Summit on Climate Risk

Clean Trillion Report Cover On January 15, more than 500 global investors and financial leaders gathered at the United Nation to discuss the growing urgency of climate change and investor actions that are needed to mitigate escalating economic risks. The biennial Investor Summit on Climate Risk has become the preeminent forum for leading global investors to discuss the implications of climate change for capital markets.

Leaders from many of the world's largest pension funds, asset management firms, and corporations articulated how they are rising to the climate challenge, with a clear message: tacking climate change and transitioning to a clean energy future is one of the greatest opportunities of the 21st century. Speakers included Christiana Figueres, UN Framework Convention on Climate Change; Tom Steyer, Farallon Capital Management; Nick Robins, HSBC; Robert E. Rubin, former Secretary of the U.S. Treasury; Richard Trumka, AFL-CIO; Timothy E. Wirth, UN Foundation.

At the Summit, Ceres released a report detailing 10 key recommendations for achieving the Clean Trillion,--an average of \$1 trillion per year in clean energy investment, necessary to ensure a safe and livable climate future. Scaling clean energy investment to this level will require concerted actions by investors, companies and policymakers to implement the steps outlined in the paper.

View video footage of the event, materials from the Summit and selected press clips.

#### INCR Meeting Investigates Investor Actions on Carbon Risk, Low Carbon Investment Solutions

Representatives from 65 INCR member organizations and a number of international guests met on January 14, 2014 to discuss actions members can take to address climate-related risks in their portfolios and to invest profitably in solutions to climate change. Speakers included Christopher Rowe, Chief of Staff at Prudential Investment Management and a sponsor of the meeting and the Investor Summit, Jack Ehnes, CEO of CalSTRS and Chair of INCR's Executive Committee, and David Blood, Managing Director of Generation Investments.

During panel discussions moderated by Maryland State Treasurer Nancy Kopp and Jack Ehnes members examined carbon asset risks in portfolios and steps investors can take to assess, manage and reduce those risks, strategies for low carbon investing in clean energy and other solutions to climate change across multiple asset classes. A final panel included representatives of the international investor networks on climate change comprising the Global Investor Coalition on Climate Change, who reported on clean energy investment and policy initiatives in their regions.

View the full agenda and list of speakers.

## INCR Meeting Highlights:

\*A panel moderated by Maryland State Treasurer Nancy Kopp examined carbon asset risks in portfolios and steps investors can take to assess, manage and reduce those risks. Panelists included Julie Gorte of PAX World Management, Bill McGrew of CalPERS and Nick Robins of HSBC.

\*Jack Ehnes moderated a panel to address strategies for low carbon investing in clean energy and other solutions to climate change across multiple asset classes. Panelists included Ian Simm, CEO of Impax Investments, Damon Silvers, Director of Policy and Special Counsel at AFL-CIO, Jimmy Yan of the New York City Comptroller's Office, and Sean Kidney, CEO of the Climate Bonds Initiative.

\*A panel of representatives of the international investor networks on climate change comprising the Global Investor Coalition on Climate Change, who reported on clean energy investment and policy initiatives in their regions. Panelists included Stephanie Pfeifer, CEO of IGCC (Europe), Nathan Fabian, CEO of IGCC (Australia/New Zealand) and Alexandra Tracy, Senior Advisor to AIGCC (Asia). Members and guests continued the discussion at a post-meeting reception.

## Investors Explore Water Risks and Opportunities in the Investment Process

A group of 60 investors and other financial leaders met at Bloomberg Headquarters to discuss the state of current ESG and water risk integration into the investment management process and explore future directions to broaden and deepen this integration.

Expert panelists including INCR member Robert Fernandez at Breckinridge Capital Advisors, Sasja Beslik, from Nordea Investment Management and Piet Klop at PGGM Investments, engaged the group by sharing ideas on innovative practices and identified next steps for the evolution of ESG and water analysis. Monika Freyman of Ceres' Water Program highlighted some of the trends in practices and investor aspirations emerging from the global investor survey currently underway. "We need to evolve water risk integration to capture the risk of cost of discontinuities, capital expenditures, and license to grow," said Piet Klop, Senior Advisor of Responsible Investment at PGGM. "Capturing the business value at water risk still remains unclear as data is rarely comparable and meaningful."

The group broke out into working sessions to explore current and projected ESG and water trends with a focus on equity, fixed income and private equity asset classes. Investors voiced a need for resource monetization and metrics around the extent and frequency of distribution of operations and supply. The group also expressed the need for continued improvement of data granularity and standardization. Since water is very product, sector and regional specific, it is important to mitigate risks and engage policymakers on this critical resource. The need to better understand how the human right to water integrates into investor and engagement decisions was also expressed.

For additional information about the event or the water survey, contact Monika Freyman, Senior Manager, Water Program.

## Leaders within Rapidly Growing Green Bonds Market Gather in New York

Ceres cosponsored the Green Bonds Dinner with Ernst & Young. Nearly 60 attendees joined in animated conversation on the rapidly growing green bonds market. Speakers expressed their appreciation that Ceres had convened this unprecedented cross section of green bond issuers, underwriters, purchasers, international organizations and NGOs around building the supply, demand and standards for green bonds as a source of investment and finance for low carbon and other environmentally beneficial projects. Green bonds promise to be a major 2014 "down payment" on the Clean Trillion.

Participating organizations included:

Bank of America, Citi, JP Morgan, BlackRock, State Street (SSgA), Prudential (PIM), Deutsche Bank,

SEB, TIAA-CREF, CalSTRS, CA Treasurer, CT Treasurer, NYS Common Fund, PA Treasury, Breckinridge, Calvert, Zurich, The Hartford, Manulife, AIG ,Munich Re, the World Bank, the International Finance Corporation and the UN Secretary General's Office.

Ceres is an advocate for sustainability leadership that mobilizes a powerful network of investors, companies and public interest groups to build a sustainable global economy. Ceres is a non-profit organization. All gifts are tax deductible. Ceres has received high ratings from charity watchdog groups, a reflection of our effectiveness, integrity and impact.

Hi Mike,

The NGOs had a call earlier today to discuss the status and next steps on the oil and gas NSPS. We'd like to touch base with you to do the same. Is there a time Tuesday that works for you? I'm open except 1-2 and 4-5 ET.

Hi Mike,

The NGOs had a call earlier today to discuss the status and next steps on the oil and gas NSPS. We'd like to touch base with you to do the same. Is there a time Tuesday that works for you? I'm open except 1-2 and 4-5 ET.

Hi Mike,

The NGOs had a call earlier today to discuss the status and next steps on the oil and gas NSPS. We'd like to touch base with you to do the same. Is there a time Tuesday that works for you? I'm open except 1-2 and 4-5 ET.

#### Events

INCR Sustainable Stock Exchanges Working Group Call

Thursday, January 30  
12:00 - 1:00 pm ET

The SSE Working group will meet this week to discuss the formal launch of our Listing Standards work scheduled for late February. Evan Harvey, Managing Director of Corporate Sustainability at NASDAQ OMX will brief attendees on the creation of a Sustainability Working Group at the World Federation of Exchanges, among other items. Register here. For more information, contact Tracey Rembert, Senior Manager, Investor Engagement, Investor Program.

Shareholder Initiative on Climate and Sustainability (SICS) Working Group Call

Wednesday, February 5

2:00 - 3:00 pm ET

The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change-related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge, Director, Shareholder Engagement, Investor Program.

#### Policy Working Group Gears Up for Federal Tax and Regulatory Efforts

Coal Power Plant 1 Coming into an election year and the ongoing negotiations toward an international GHG emissions reduction agreement in 2015, INCR members held their monthly Policy Working Group call on January 21st. They were joined by the Solar Energy Industries Association's Director of Federal Affairs, Emily Duncan, and Peter Shattuck, the head of Market Initiatives at Environment Northeast. Peter and Emily touched on the two developments most pivotal to federal policy (and in turn, international policy) for the coming year: the Carbon Pollution Standards for power plants and the debate over tax reform.

The Carbon Pollution Standards are a cornerstone of the President's Climate Action Plan, and key to his administration's commitment at the international level to reduce U.S. greenhouse gas emissions by 17% below 2005 levels by 2020. The tax code is the primary mechanism through which the federal government incentivizes renewable energy deployment. Faltering efforts to move tax reform have left one key incentive, the Production Tax Credit for wind, expired and leave the future of other key incentives, such as the Investment Tax Credit, uncertain.

On the regulatory front, the Environmental Protection Agency enters a key phase as it develops standards for existing power plants, where most emissions reduction potential lies. Stay up to speed on these developments and learn about opportunities for engagement with policymakers via monthly policy working group calls. Contact Brandon Smithwood with questions or to be added to the distribution list.

#### Investors Raise New Set of Issues with Companies on Public Policy and Climate

Investors have engaged companies for over 20 years on climate change. This year, as part of a larger investor climate initiative, "Raising the Bar", there is a new set of shareholder resolutions challenging companies to evaluate their public policy advocacy related to climate change.

One category of resolutions presses fossil fuel companies and major energy producers to review their public policy positions and lobbying activities related to energy policy and climate change. Timothy Smith, Director of Shareowner Engagement at Walden Asset Management, a leader in the campaign notes, "There is a widespread public perception that energy companies have regularly opposed new legislation or regulation addressing climate change. It is time for companies to evaluate their public policy positions and lobbying on climate and fully disclose the results to investors."

Recognizing the influence of trade associations like the U.S. Chamber of Commerce, which has spent more than \$1 billion on lobbying since 1998, the resolution addresses both direct advocacy by the companies, as well as through trade associations. Six companies have received such a resolution: American Electric Power, Chevron, ConocoPhillips, Devon Energy, Dominion Resources, and Exxon Mobil. Some have challenged the resolution at the Securities and Exchange Commission.

A second category of resolution calls for companies to review lobbying, including at the state level, and was filed with companies that provided financial support to the American Legislative Exchange Council ("ALEC"). ALEC has been actively promoting a wide range of public policies by creating model legislation for submission to state legislatures. Of particular concern for sustainable investors is ALEC's campaign against regulations and legislation supporting renewable energy.

ALEC's broad-based partisan agenda and controversial policy positions have prompted a review of this relationship by numerous companies. To date over 50 companies have severed ties to ALEC.

Companies receiving this resolution include: Dominion Resources, Microsoft, Occidental Petroleum, Pfizer, Time Warner Cable, United Parcel Service, and Visa. Filers include the pension plans of New York State and the State of Connecticut, various foundations, religious investors and sustainable investment firms.

View a current list of 2014 filings, including public policy and other climate and sustainability resolutions filed by INCR members and partners. For more information on the initiative or the resolutions, contact Timothy Smith or visit the Walden website.

40 CFR Part 60

Standards of Performance for New Residential Wood Heaters, New Residential Hydronic Heaters and Forced-Air Furnaces, and New Residential Masonry Heaters; Proposed Rule

**ENVIRONMENTAL PROTECTION  
AGENCY****40 CFR Part 60**

[EPA-HQ-OAR-2009-0734; FRL-9904-05-OAR]

RIN 2060-AP93

**Standards of Performance for New Residential Wood Heaters, New Residential Hydronic Heaters and Forced-Air Furnaces, and New Residential Masonry Heaters**

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

**SUMMARY:** The EPA is proposing to amend the Standards of Performance for New Residential Wood Heaters and to add two new subparts: Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces and Standards of Performance for New Residential Masonry Heaters. This proposal is aimed at achieving several objectives for new residential wood heaters and other wood-burning appliances, including applying updated emission limits that reflect the current best systems of emission reduction; eliminating exemptions over a broad suite of residential wood combustion devices; strengthening test methods as appropriate; and streamlining the certification process. This proposal does not include any requirements for heaters solely fired by gas, oil or coal. In addition, it does not include any requirements associated with appliances that are already in use. The EPA continues to encourage state, local, tribal, and consumer efforts to changeout (replace) older heaters with newer, cleaner, more efficient heaters, but that is not part of this federal rulemaking.

Particulate pollution from wood heaters is a significant national air pollution problem and human health issue. Health benefits associated with these proposed regulations are valued to be much greater than the cost to manufacture cleaner, lower emitting appliances. These proposed regulations would significantly reduce particulate matter (PM) emissions and many other pollutants from these appliances, including carbon monoxide (CO), volatile organic compounds (VOC), and hazardous air pollutants (HAP). Emissions from wood stoves occur near ground level in residential communities across the country, and setting these new requirements for cleaner stoves into the future will result in substantial reductions in exposure and improved public health.

**DATES:** Comments must be received on or before May 5, 2014. Under the Paperwork Reduction Act, comments on the information collection provisions are best assured of having full effect if the Office of Management and Budget (OMB) receives a copy of your comments on or before March 5, 2014.

**Public Hearing.** The EPA will hold a public hearing on this proposed rule on February 26, 2014, in Boston, Massachusetts. The hearing will be at the following location: EPA New England Regional Office, 5 Post Office Square, Suite 100, Leighton Hall, Boston, MA. For directions and public transportation, visit: <http://www.epa.gov/region1/directions/>. Please note that 5 Post Office Square is a federal building, and proper identification is required for entry.

The public hearing will provide interested parties the opportunity to present data, views or arguments concerning the proposed rule. The EPA may ask clarifying questions during the oral presentations, but will not respond to the presentations at that time. Written statements and supporting information submitted during the comment period will be considered with the same weight as any oral comments and supporting information presented at the public hearing. Written comments must be postmarked by the last day of the 90-day comment period.

If you would like to present oral testimony at the hearing, please register on-line (preferred method for registering) at <http://www2.epa.gov/residential-wood-heaters> no later than February 19, 2014, to request a general time slot for you to speak and any special equipment. If this method is not available to you, please notify Mr. David Cole no later than February 19, 2014, by email: [cole.david@epa.gov](mailto:cole.david@epa.gov); or by telephone: (919) 541-5565. The EPA will make every effort to follow the schedule as closely as possible on the day of the hearing. The public hearing will begin each day at 9 a.m. (local time) and continue into the evening until 7 p.m. (local time). The EPA will make every effort to accommodate all other speakers who arrive and register before 7 p.m. (local time) on the day of the hearing. The EPA is scheduling lunch breaks from 12:30 until 2 p.m. (local time).

Testimony will be limited to five (5) minutes for each commenter to address the proposal. We will not be providing equipment for commenters to show overhead slides or make computerized slide presentations unless we receive special requests in advance. The EPA encourages commenters to provide written versions of their oral testimonies

either electronically on computer disk or CD-ROM or in paper copy.

The hearing schedule, including lists of speakers, will be posted on the EPA's Web page for the proposal at: <http://www2.epa.gov/residential-wood-heaters> prior to the hearing. Verbatim transcript of the hearing and written statements will be included in the rulemaking docket.

**ADDRESSES:** Submit your comments, identified by Docket ID No. EPA-HQ-OAR-2009-0734, by one of the following methods:

- [www.regulations.gov](http://www.regulations.gov): Follow the on-line instructions for submitting comments.
- **Email:** [a-and-r-docket@epa.gov](mailto:a-and-r-docket@epa.gov), Attention Docket ID No. EPA-HQ-OAR-2009-0734.
- **Fax:** (202) 566-9744, Attention Docket ID No. EPA-HQ-OAR-2009-0734.
- **Mail:** United States (U.S.) Postal Service, send comments to EPA Docket Center, EPA West (Air Docket), Attention Docket ID Number EPA-HQ-OAR-2009-0734, U.S. Environmental Protection Agency, Mailcode: 2822T, 1200 Pennsylvania Ave. NW., Washington, DC 20004. Please include a total of two copies. In addition, please mail a copy of your comments on the information collection provisions to the Office of Information and Regulatory Affairs, Office of Management and Budget, Attn: Desk Officer for EPA, 735 17th St. NW., Washington, DC 20503.
- **Hand Delivery:** EPA Docket Center, EPA West (Air Docket), Room 3334, 1301 Constitution Avenue NW., Washington, DC, Attention Docket ID Number EPA-HQ-OAR-2009-0734. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

**Instructions:** Direct your comments to Docket ID No. EPA-HQ-OAR-2009-0734. The EPA's policy is that all comments received will be included in the public docket without change and may be made available online at [www.regulations.gov](http://www.regulations.gov), including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI, or otherwise protected, through [www.regulations.gov](http://www.regulations.gov) or email. The [www.regulations.gov](http://www.regulations.gov) Web site is an "anonymous access" system, which means the EPA will not know your identity or contact information unless you provide it in the body of

your comment. If you send an email comment directly to the EPA without going through [www.regulations.gov](http://www.regulations.gov), your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD-ROM you submit. If the EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, the EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about the EPA's public docket, visit the EPA Docket Center homepage at [www.epa.gov/epahome/dockets.htm](http://www.epa.gov/epahome/dockets.htm). For additional instructions on submitting comments, go to section I.D.2 of the **SUPPLEMENTARY INFORMATION** section of this document.

**Docket:** The EPA has established a docket for this rulemaking under Docket ID Number EPA-HQ-OAR-2009-0734. All documents in the docket are listed in the [www.regulations.gov](http://www.regulations.gov) index. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy form. Publicly available docket materials are available either electronically in [www.regulations.gov](http://www.regulations.gov) or in hard copy at the EPA Docket Center, EPA West, Room 3334, 1301 Constitution Ave. NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the Air Docket is (202) 566-1742.

**FOR FURTHER INFORMATION CONTACT:** For questions about this proposed action, contact Mr. Gil Wood, Office of Air Quality Planning and Standards, Outreach and Information Division, Community and Tribal Programs Group (C304-03), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541-5272; fax number: (919) 541-0242; email address: [wood.gil@epa.gov](mailto:wood.gil@epa.gov).

**SUPPLEMENTARY INFORMATION:** The information in this preamble is organized as follows:

## I. General Information

### A. Executive Summary

#### 1. Purpose of the Regulatory Action

The purpose of this action is to propose amendments to the Standards of Performance for New Residential Wood Heaters (40 CFR part 60, subpart AAA) and to add two new subparts: Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces and Standards of Performance for New Residential Masonry Heaters (40 CFR part 60, subparts QQQQ and RRRR). This proposal was developed following a Clean Air Act (CAA) section 111(b)(1)(B) periodic review of the current residential wood heaters new source performance standards (NSPS). We concur with numerous stakeholders that the current body of evidence justifies revision of the current residential wood heaters NSPS to capture the improvements in performance of such units and to expand the applicability of this NSPS to include additional wood-burning residential heating devices that are in the market. The proposed changes are aimed at achieving several objectives, including applying updated emission limits that reflect the current best systems of emission reduction (BSER); eliminating exemptions over a broad suite of residential wood combustion devices; strengthening test methods as appropriate; and streamlining the certification process. This proposal does not include any requirements for heaters solely fired by gas, oil or coal. In addition, it does not include any requirements associated with wood heaters or other wood-burning appliances that are already in use. The EPA continues to encourage state, local, tribal, and consumer efforts to changeout (replace) older heaters with newer, cleaner, more efficient heaters, but that is not part of this federal rulemaking.

These revisions will help reduce the health impacts of fine particle pollution, of which wood smoke is a contributing factor in many areas. Residential wood smoke contains fine particles with an aerodynamic diameter of 2.5 micrometers or less (PM<sub>2.5</sub>), CO, toxic air pollutants (e.g., benzene and formaldehyde), and climate-forcing emissions (e.g., methane and black carbon). Residential wood smoke can increase PM<sub>2.5</sub> to levels that cause significant health concerns. Populations that are at greater risk for experiencing health effects related to fine particle exposures include older adults, children and individuals with pre-existing heart

or lung disease. Each year, smoke from wood heaters contributes hundreds of thousands of tons of fine particles throughout the country—mostly during the winter months. Nationally, residential wood combustion accounts for 44 percent of total stationary and mobile polycyclic organic matter (POM) emissions, nearly 25 percent of all area source air toxics cancer risks and 15 percent of noncancer respiratory effects.<sup>1</sup> Residential wood smoke causes many counties in the U.S. to either exceed the EPA's health-based national ambient air quality standards (NAAQS) for fine particles or places them on the cusp of exceeding those standards.<sup>2</sup> To the degree that older, higher emitting, less efficient wood heaters are replaced by newer heaters that meet the requirements of this rule, or better, the emissions would be reduced, the efficiencies would be increased and fewer health impacts should occur.

This action is conducted under the authority of section 111 of the CAA, "Standards of Performance for New Stationary Sources," under which the EPA establishes federal standards of performance for new sources within source categories that cause or contribute significantly to air pollution, which may reasonably be anticipated to endanger public health or welfare. Consistent with section 111(h), if it is not feasible to prescribe or enforce a standard of performance, the Administrator may instead promulgate a design, equipment, work practice, or operational standard, or combination thereof, that reflects the best system of continuous emission reduction, which (taking into consideration the cost of achieving such emission reduction, and any non-air quality, health, and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.

## 2. Summary of the Major Provisions of This Proposed Regulatory Action

In response to the results of the NSPS review, we are proposing to amend 40 CFR part 60, subpart AAA, Standards of Performance for New Residential Wood Heaters. The current regulation applies to affected appliances manufactured after 1988. The current emission limits would remain in effect for the heaters

and model lines manufactured before the effective date of this rule until their current EPA certification expires (maximum of 5 years) or is revoked. After the certification expires or is revoked, these heaters and other new heaters would have to meet updated emission standards. We propose to broaden the applicability of the regulation beyond adjustable burn rate wood heaters (the focus of the original regulation), to specifically include all single burn rate wood heaters/stoves and pellet heaters/stoves. (Some pellet heaters/stoves were not affected by the 1988 regulation.) Note that this preamble uses the following terms interchangeably: heaters, stoves and heaters/stoves. Heaters/stoves and model lines manufactured after the effective date of the rule would be required to meet PM standards.

As with the 1988 regulation, the source category covered by this NSPS is fundamentally different from the typical NSPS source category in several ways. For example, most NSPS source categories focus on industrial or commercial facilities, and typically these heaters are installed and operated in residences, not industrial or commercial facilities. Also, residential wood heaters, hydronic heaters, forced-air furnaces, and most masonry heaters are mass-produced consumer items, rather than industrial processes typically regulated by NSPS. Therefore, as in 1988, we are proposing that manufacturers participate in a certification program that tests a representative heater per model line rather than requiring testing each heater. If the representative heater meets the applicable emission limits, the entire model line may be certified and the manufacturer would not be required to test every heater. Individual heaters within the model line would still be subject to all other requirements, including labeling and operational requirements. Manufacturers would be required to have quality assurance programs to ensure that all heaters within the model line conform to the certified design and meet the applicable emission limits. The EPA would continue to have the authority to conduct audits to ensure compliance. We ask for comments on all aspects of this approach, especially whether more than one representative heater should be tested prior to certification of the model line.

The 1988 regulation also addressed some of the specific characteristics of this source category by developing a two-step compliance approach that provided a reasonable, phased implementation of emission limits for

manufacturers. We believe such an approach is prudent this time also to allow manufacturers lead time to develop, test, field evaluate and certify current technologies across their consumer product lines. In 1988, there were "logjam" concerns about the capacity of accredited laboratories to conduct certifications tests and time for the EPA to review the tests and adequately assure compliance if all the NSPS requirements were to be immediate. Those concerns have been expressed this time also. Thus, upon the effective date of this rule, new heaters/stoves would be required to meet Step 1. Five years later, new heaters/stoves would be required to meet Step 2. The rule also would require that each unit be equipped with a permanent NSPS label. The two-step approach would apply to all the heater types addressed in this rulemaking except for masonry heaters. For masonry heaters, we are not proposing a second more stringent emission limit.

Additional requirements would apply to entities other than the manufacturer. The wood heater test laboratory would be subject to quality assurance requirements. The rule would continue to require the proper burn practices that currently apply to the owner or operator of a wood heating appliance. In addition, new pellet heater/stove owners and operators would be required to use only the grade of licensed pellet fuels that are included in the heater/stove certification tests, or better. We are proposing to streamline the current enforcement and audit provisions of the current subpart to reflect changes in industry practices and development of new tools and procedures. We are proposing improvements to the previous test methods as well as new test methods.

We are also proposing new subpart QQQQ, which would apply to new wood-fired residential hydronic heaters and forced-air furnaces, and new subpart RRRR, which would apply to new residential masonry heaters. These new subparts are being proposed to address the remaining heater appliance types in the 1987 residential wood heater source category listing that were not regulated by the 1988 NSPS. Both subparts are designed using principles similar to those in subpart AAA, *i.e.*, certification testing of a representative unit in a model line, label requirements, associated quality assurance requirements and phased implementation. Subpart RRRR has some additional features to address very small volume manufacturers, including a proposed compliance extension and the ability to use a software certification

<sup>1</sup> *Strategies for Reducing Residential Wood Smoke*. EPA-456/B-13-001, March 2013. Prepared by Outreach and Information Division, Air Quality Planning Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, NC 27711. pp. 4-5.

<sup>2</sup> Air Quality and Emissions Data; Supporting Information for the Residential Wood Heater New Source Performance Standard, August 14, 2013.

approach rather than a laboratory emission test.

The proposed PM standards for subparts QQQQ and RRRR would be implemented in two steps. For subpart QQQQ, upon the effective date of the rule, hydronic heaters would be required to meet a Step 1 PM limit of 0.32 pound per million British thermal unit (lb/MMBtu) output and forced-air furnaces would be required to meet a Step 1 PM limit of 0.93 lb/MMBtu heat output. Five years after the effective date of the rule, both hydronic heaters and forced-air furnaces would be required to meet a Step 2 PM limit of 0.06 lb/MMBtu heat output. For subpart RRRR (masonry heaters), upon the effective date of the rule, large manufacturers (defined as manufacturers constructing greater than

or equal to 15 masonry heaters per year) would be required to meet a PM limit of 0.32 lb/MMBtu heat output. Five years after the effective date of the rule, small volume masonry heater manufacturers (defined as manufacturers constructing less than 15 masonry heaters per year) would be required to meet the 0.32 lb/MMBtu heat output PM limit.

3. Costs and Benefits

Consistent with Executive Order 13563, "Improving Regulation and Regulatory Review," we have estimated the cost and benefits of the proposed rule. The estimated net benefits of our proposed rule at a 3 percent discount rate are \$1.8 billion to \$4.1 billion or \$1.7 billion to \$3.7 billion at a 7 percent discount rate. The non-monetized benefits include 33,000 tons of CO

reductions; 3,200 tons of VOC reductions; reduced exposure to HAP, including formaldehyde, benzene, and POM; reduced climate effects due to reduced black carbon emissions; reduced ecosystem effects; and reduced visibility impairments. Table 1 is a summary of the results of the analysis per type of residential wood heater. We have provided estimates reflecting average annual impacts for the 2014 to 2022 timeframe, which are the implementation years for the options analyzed in the RIA for this proposal. Monetized benefits are not currently available for masonry heaters. We ask for emission and projected sales data per model that would help us prepare emission reduction estimates and corresponding monetized benefits estimates for masonry heaters.

TABLE 1—SUMMARY OF COMPLIANCE COSTS, MONETIZED BENEFITS, AND MONETIZED NET BENEFITS (2010 DOLLARS) BY TYPE OF HEATER IN THE 2014–2022 TIME FRAME FOR THE PROPOSED RULE

Type of heater	Total annualized costs (\$ millions)	Monetized benefits (\$ millions) <sup>a b</sup>	Monetized net benefits (\$ millions)
Wood stoves .....	\$4.2	\$62 to \$140 .....	\$62 to \$140.
Single burn rate stoves .....	0.9	\$290 to \$650 .....	\$290 to \$650.
Pellet stoves .....	3.5	\$19 to \$43 .....	\$19 to \$43.
Forced-air furnaces .....	2.3	\$1,000 to \$2,200 .....	\$1,000 to \$2,200.
Masonry heaters .....	0.3	N/A <sup>c</sup> .....	N/A.
Hydronic heating systems .....	4.5	\$480 to \$1,100 .....	\$480 to \$1,100.

<sup>a</sup> All estimates are for the time frame from 2014 to 2022 inclusive. These results include units anticipated to come online and the lowest cost disposal assumption. Total annualized costs are estimated at a 7 percent interest rate.

<sup>b</sup> Total monetized benefits are estimated at a 3 percent discount rate. The total monetized benefits reflect the human health benefits associated with reducing exposure to PM<sub>2.5</sub> through reductions of directly emitted PM<sub>2.5</sub>. It is important to note that the monetized benefits include many but not all health effects associated with PM<sub>2.5</sub> exposure. Benefits are shown as a range from Krewski et al. (2009) to Lepeule et al. (2012). These models assume that all fine particles, regardless of their chemical composition, are equally potent in causing premature mortality because the scientific evidence is not yet sufficient to allow differentiation of effect estimates by particle type. Because these estimates were generated using benefit-per-ton estimates, we do not break down the total monetized benefits into specific components.

<sup>c</sup> The monetized benefits for masonry heaters are not available because we do not have national estimates of the potential emission reductions.

B. Does this action apply to me?

The potentially regulated sources that are the subject of this proposal are listed in Table 2 of this preamble. Table 2 is

not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this proposed action. This standard, and any changes considered in this rulemaking,

would be directly applicable to sources as a federal program. Thus, federal, state, local and tribal government entities are not affected by this proposed action.

TABLE 2—POTENTIALLY REGULATED ENTITIES

Category	NAICS <sup>a</sup> Code	Examples of regulated entities
Residential Wood Heating ...	333414—Heating Equipment (except Warm Air Furnaces) Manufacturing.	Manufacturers, owners and operators of wood heaters, pellet heaters/stoves, hydronic heaters, and masonry heaters.
	333415—Air-Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment Manufacturing.	Manufacturers, owners and operators of forced-air furnaces.
	238140—Masonry Contractors .....	Manufacturers, owners, operators and testers of masonry heaters.
Testing Laboratories .....	541380—Testing Laboratories (except Medical, Veterinary).	Testers of wood heaters, pellet heaters/stoves, hydronic heaters and masonry heaters.

<sup>a</sup> North American Industry Classification System.

*C. Where can I get a copy of this document?*

In addition to being available in the docket, an electronic copy of this proposal, following signature by the EPA Administrator, will be posted at the following address: <http://www2.epa.gov/residential-wood-heaters>.

*D. What should I consider as I prepare my comments for the EPA?*

1. Submitting CBI

Do not submit information containing CBI to the EPA through [www.regulations.gov](http://www.regulations.gov) or email. Instead, clearly mark the part or all of the information that you claim to be CBI and send or deliver only to the following address: Roberto Morales, OAQPS Document Control Officer (C404-02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, Attention Docket ID Number EPA-HQ-OAR-2009-0734. For CBI information on a disk or CD-ROM that you mail to the EPA, mark the outside of the disk or CD-ROM as CBI and then identify electronically within the disk or CD-ROM the specific information that you claim as CBI. In addition to one complete version of the comment that includes information claimed as CBI, you must submit a copy of the comment that does not contain the information claimed as CBI for inclusion in the public docket. If you submit a disk or CD-ROM that does not contain CBI, mark the outside of the disk or CD-ROM clearly that it does not contain CBI. Information not marked as CBI will be included in the public docket and the EPA's electronic public docket without prior notice. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

2. Tips for Preparing Your Comments

When submitting comments, remember to:

- Identify the rulemaking by docket number and other identifying information (subject heading, **Federal Register** date and page number).
- Follow directions. Respond to specific questions and organize comments by a section number.
- Explain why you agree or disagree; suggest alternatives and substitute language for your requested changes.
- Describe any assumptions and provide any technical information and/or data that you used.
- If you estimate potential costs or burdens, explain how you arrived at

your estimate in sufficient detail to allow it to be reproduced.

- Provide specific examples to illustrate your concerns and suggest alternatives.
- Explain your views as clearly as possible, avoiding the use of profanity or personal threats or character assassination.
- Make sure to submit your comments by the comment period deadline.

**II. Background**

*A. What is the NSPS program?*

Under section 111 of the CAA, "Standards of Performance for New Stationary Sources," the EPA lists categories of sources that, in the EPA's judgment, cause or contribute significantly to air pollution, which may reasonably be anticipated to endanger public health or welfare pursuant to section 111(b)(1)(A), and then promulgates federal standards of performance for new sources within such categories under section 111(b)(1)(B). At the time the EPA proposes and establishes standards for certain pollutants for a source category, the EPA prepares an analysis of the potential costs and benefits associated with the NSPS, which includes the benefits from reductions in pollutants for which the standards do not set limits. For example, emission reductions associated with the requirements of this proposed rule will generate health benefits by reducing emissions of PM<sub>2.5</sub>, other criteria pollutants, such as CO, and non-criteria HAP. Consistent with section 111(h), if it is not feasible to prescribe or enforce a standard of performance, the Administrator may instead promulgate a design, equipment, work practice, or operational standard, or combination thereof, which reflects the best system of continuous emission reduction which (taking into consideration the cost of achieving such emission reduction, and any non-air quality, health, and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated. The NSPS do not establish standards of performance for existing sources. However, numerous states have acted independent of this rule to address new and existing sources as part of state implementation plan (SIP) measures necessary to ensure attainment and maintenance of the NAAQS. Several examples are discussed in section II.E of this preamble.

The level of control prescribed by section 111 of the CAA historically has

been referred to as "Best Demonstrated Technology" or BDT. To better reflect that section 111 was amended in 1990 to clarify that "best systems" may or may not be "technology," the EPA is now using the term "best systems of emission reduction" or BSER. As was done previously in analyzing BDT, the EPA uses available information and considers the emissions reductions and incremental costs for different systems available at reasonable cost. The residential wood heaters source category is different from most NSPS source categories in that it is for mass-produced residential consumer products. Thus, important elements in determining that BSER include the significant costs and environmental impacts of delaying production while models with those systems are being designed, tested, field evaluated and certified. As noted earlier and discussed more fully later in this preamble, the 2-step approach that the EPA is proposing considers these factors. That is, for this rulemaking, the EPA has determined the appropriate emission limits and compliance deadlines that together are representative of BSER. Details of the BSER determinations are included in section V.B. of this preamble.

Section 111(b)(1)(B) of the CAA requires the EPA to periodically (every 8 years) review an NSPS unless it determines "that such review is not appropriate in light of readily available information on the efficacy of such standard." If needed, the EPA must revise the standards of performance to reflect improvements in methods for reducing emissions, including consideration of what emissions limitation is achieved in practice. Numerous stakeholders have suggested that the current body of evidence justifies the revision of the current residential wood heaters NSPS to capture the improvements in performance of such units and to expand the applicability of this NSPS to include additional residential wood-burning heating devices that are available today. The states of New York, Connecticut, Maryland, Massachusetts, Oregon, Rhode Island and Vermont, as well as the Puget Sound Clean Air Agency, have filed in U.S. District Court in Washington, DC, to ask the court to order the EPA to promptly review, propose and adopt necessary updates to the NSPS for residential wood heaters. Likewise, the American Lung Association, the Environmental Defense Fund, the Clean Air Council, and Environment and Human Health, Inc., have filed a similar request. Also, some stakeholders have suggested that the

EPA develop additional NSPS to regulate residential heating devices that burn fuels other than or in addition to wood, *e.g.*, coal, corn or grass. This proposal does not include any requirements for heaters that solely burn fuels other than wood.

*B. Why was the original residential wood heaters NSPS developed?*

The development of the residential wood heater regulations began in the mid-1980s in response to the growing concern that wood smoke contributes to ambient air quality-related health problems. Several state and local governments developed their own regulations for wood heaters. Then, in response to a lawsuit filed by New York State and the Natural Resources Defense Council (NRDC), the EPA agreed to initiate a residential wood heaters NSPS rulemaking, with a schedule calling for final action by January 31, 1988. The original standard was developed using a regulatory negotiation process with the key stakeholders (the wood heating industry, state governments, and environmental and consumer groups) under the Federal Advisory Committee Act (FACA).

Pursuant to CAA section 111(b)(1)(A), the EPA listed the residential wood heater source category based on its determination that residential wood heaters cause, or contribute significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare (52 FR 5065, February 18, 1987). The EPA also proposed regulations for residential wood heaters (52 FR 4994, February 18, 1987). The final standards were published on February 26, 1988 (53 FR 5860). At the time the original NSPS was proposed, the EPA estimated that a typical pre-NSPS conventional wood heater emits about 60 to 70 g/hr of PM and that a wood heater complying with the NSPS would emit 75 to 86 percent less than conventional wood heaters.

*C. What are the requirements of the current 1988 NSPS?*

The current subpart AAA defines a wood heater as an enclosed, wood-burning appliance capable of and intended for space heating or domestic water heating that meets all of the following criteria:

1. An air-to-fuel ratio (ratio of the mass of combustion air introduced into the firebox to the mass of dry fuel consumed) in the combustion chamber averaging less than 35-to-1 as determined by the test procedure prescribed in 40 CFR 60.534 performed at an accredited laboratory;

2. A usable firebox volume of less than 0.57 cubic meters (20 cubic feet);

3. A minimum burn rate (weight of dry test fuel consumed per hour) of less than 5 kilograms per hour (kg/hr) (11 pounds per hour (lb/hr)) as determined by the test procedure prescribed in 40 CFR 60.534 performed at an accredited laboratory; and

4. A maximum weight of 800 kg (1,760 lb), excluding fixtures and devices that are normally sold separately, such as flue pipe, chimney, and masonry components that are not an integral part of the appliance or heat distribution ducting.

In the 1988 rulemaking, the EPA identified several types of residential wood combustion appliances that are not subject to the current 1988 NSPS:

- Open masonry fireplaces constructed on site
- Boilers/Heaters
- Furnaces
- Cook Stoves

In addition, the current 1988 NSPS exempts the following from the emission limits:

- Wood heaters used solely for research and development (R&D) purposes
- Wood heaters manufactured for export
- Coal-only heaters

As noted earlier, because of the specific characteristics of this source category (*e.g.*, it applies to mass-produced residential consumer items), the residential wood heaters NSPS (also sometimes informally referred to as the wood stove NSPS) allows compliance for model lines to be certified “pre-sale” by the manufacturers. A typical NSPS source category approach that imposes emission standards and then requires a unit-specific compliance demonstration would have been very costly and impractical. Therefore, the 1988 NSPS was designed to allow manufacturers of wood heaters to use a certification program to test representative wood heaters on a model line basis. Once a model line is certified, all of the individual units within the model line are subject to labeling, operational and other requirements. Manufacturers are then required to conduct a quality assurance program to ensure that appliances produced within a model line conform to the certified design and meet the applicable emission limits. There are also provisions for the EPA to conduct audits to ensure compliance.

As discussed in the 1988 rulemaking, the standards limiting PM emissions from wood heaters in the current 1988 NSPS were phased in for this source category because of the need to consider the costs of delayed production while

new models were being developed and certified. Advanced technology heaters/stoves including both catalytic and noncatalytic systems were considered to be BDT (now called BSER), because the net emissions of both systems over time were estimated to be similar (even though the initial certification test results were lower for catalytic models) due to possible degradation and lack of catalyst replacement. The EPA considered requiring catalyst replacement on a regular schedule but determined that enforcement of such a requirement would be difficult or impractical. The EPA did require manufacturers to provide 2-year unconditional warranties on the catalysts and prohibited the operation of catalytic heaters/stoves without a catalyst. Principally because of these concerns, the EPA wanted to ensure that both catalytic and noncatalytic technology would continue to be options for manufacturers to use and further develop. The Subpart AAA Phase I standards issued in 1988 were very similar to the Oregon Department of Environmental Quality standards that had been in existence for a few years. The Subpart AAA Phase II standards, issued in 1988 and which are still in effect, are more stringent and had to be met within 2 years of publication of the final rule, *i.e.*, by 1990. Models equipped with a catalytic combustor cannot emit more than a weighted average of 4.1 g of PM per hour. Models that are not equipped with a catalytic combustor cannot emit more than a weighted average of 7.5 g of PM per hour. The lower initial emission limit for the catalytic combustor-equipped models incorporates an expected deterioration rate for the catalysts such that after 5 years the emissions from those models were expected to be similar to the emissions from noncatalytic models.

*D. What are the major developments since the original NSPS was published?*

New systems for residential wood heating devices are commercially available in the U.S. that perform at significantly lower g/hr emission rates than required under the current 1988 NSPS. Furthermore, even greater performance potentially can be achieved by greater deployment of the best U.S. systems and the typical systems already widely employed in Europe, especially for outdoor and indoor hydronic heaters. The EPA has conducted a research project “Environmental Characterization of Outdoor Wood-fired Hydronic Heaters” through a cooperative R&D agreement with the New York State Energy Research and

Development Authority (NYSERDA) that evaluated four types of technology ranging from a common outdoor wood boiler/heater to a state-of-the-art, high-efficiency pellet boiler/heater from Austria. The study showed considerable emission reduction due to a 2-stage combustion technology that includes gasification of the fuel and more complete combustion.<sup>3</sup>

Many stakeholders have expressed concern to the EPA about a broad range of residential wood heating appliances that do not have emission standards in the current 1988 NSPS. These include single burn rate wood heaters; pellet heaters/stoves that are not subject to the current standard via the NSPS air-to-fuel ratio; wood “boilers” (hydronic heaters); forced-air furnaces; and masonry heaters. Some stakeholders have also expressed an interest in regulating non-“heater” devices, such as indoor and outdoor fireplaces, fire pits, cook stoves and pizza ovens.

One category of wood heating appliances that has undergone significant growth is wood heaters/boilers or “hydronic heaters.” (Note that these units are technically called heaters rather than boilers because many are not pressurized and do not boil the liquid.) Hydronic heaters are typically located outside the buildings they heat in small sheds with short smokestacks. These appliances burn wood to heat a liquid (water or a water-antifreeze mixture) that is piped to provide heat and hot water to occupied buildings, such as homes. Often, in addition to supplying heat for homes, the same unit is used to provide heat for barns and greenhouses and to provide warm water for swimming pools. Hydronic heaters may also be located indoors and may use other biomass (such as corn or wood pellets) or coal or a combination for fuel.

Studies have shown that PM<sub>2.5</sub> concentrations in proximity to a typical outdoor hydronic heater (aka outdoor wood boiler) can exceed the 24-hour NAAQS.<sup>4</sup> Thus, the EPA developed a hydronic heater voluntary partnership program in order to encourage manufacturers to reduce impacts on air quality and health through developing

and distributing cleaner hydronic heaters for those locations where local jurisdictions allow hydronic heaters. We developed the voluntary partnership program with the goal of bringing cleaner models to market faster than the traditional federal regulatory process. Properly operated Phase 1<sup>5</sup> emission level (0.60 lb/MMBtu heat input) qualifying<sup>6</sup> units are approximately 70 percent cleaner than typical unqualified units. After March 31, 2010, units that only meet the Phase 1 emission level are no longer considered “qualified models” under the voluntary partnership program. Properly operated Phase 2 emission level (0.32 lb/MMBtu heat output) qualifying units are estimated to be approximately 90 percent cleaner than typical unqualified units. Typically, qualified models have improved insulation, secondary combustion, separation of the firebox from the water jacket, and the addition of improved heat exchangers.

In addition to the voluntary partnership program, the EPA provided technical and financial support for the Northeast States for Coordinated Air Use Management (NESCAUM) to develop a model rule that several states have adopted to regulate hydronic heaters. The model rule is a starting point for local regulatory authorities to consider, and additional actions may be needed due to site-specific concerns, *e.g.*, local terrain, meteorology, proximity of neighbors and other exposed individuals. Thus, some regulatory authorities have instituted additional requirements, such as limits on proximity to neighbors, limits on visible emissions and limits on use in non-heating seasons. Some authorities have banned hydronic heaters entirely in some areas.

The EPA also developed a similar voluntary partnership program for low mass fireplaces (engineered, pre-fabricated fireplaces) and site-built masonry fireplaces. Fireplaces were not included in the 1988 NSPS for residential wood heaters because typical fireplaces are not considered to be effective “heaters.” Most of the heat content from the wood burned in a

typical fireplace is lost out the chimney rather than heating a room. The voluntary program began in February 2009, and pertained only to low mass fireplaces at that time. In July 2009, the program was expanded to masonry fireplaces. Under this program, cleaner burning fireplaces are ones that qualify for the Phase 1 emissions level of 7.3 grams of particles emitted per kilogram (g/kg) of fuel burned (approximately 57 percent cleaner than unqualified models) or the Phase 2 emissions level of 5.1 g/kg (approximately 70 percent cleaner than unqualified models). So far, 36 models (of hundreds of models on the market) have qualified under this voluntary partnership program at the Phase 2 level. Typically, qualified models have improved insulation and added secondary combustion and/or a catalyst to reduce emissions. Some manufacturers have added doors to reduce the excess air and thus improve combustion. The Phase 2 emission level in the voluntary fireplace program has been considered as a starting point for some local regulatory authorities, and additional actions have also been considered due to site-specific concerns, *e.g.*, local terrain, meteorology, proximity of neighbors and other exposed individuals, and magnitude of other emissions in the airshed. Thus, some regulatory authorities have instituted additional requirements (*e.g.*, “no burn” days on which the fireplaces cannot be operated) and some have banned new wood-burning fireplaces in some areas.

The current 1988 NSPS in subpart AAA have been in effect for over 25 years and manufacturers and test laboratories have gained considerable experience in complying with the requirements of the program. As a result, many manufacturers and test laboratories have suggested changes to the certification process to better implement the program, such as developing an electronic system for submittals and approval. Many manufacturers and test laboratories have also questioned the effectiveness of some of the current audit procedures. In addition, they have participated in the development of new test methods and test method improvements as part of the efforts of ASTM International (formerly known as the American Society of Testing and Materials). The 1988 NSPS left a placeholder for development of an efficiency test method for use in subpart AAA. On June 1, 2007, the EPA approved the Canadian Standards Association (CSA) stack loss method in B415 as an alternative for wood heater efficiency testing in subpart AAA

<sup>3</sup> *Environmental, Energy Market, And Health Characterization Of Wood-Fired Hydronic Heater Technologies*. Prepared by U.S. EPA Office of Research and Development, *et al.*, prepared for NYSERDA. June 2012.

<sup>4</sup> For more information on wood smoke health effects, see: “Smoke Gets in Your Lungs: Outdoor Wood Boilers in New York State,” prepared by Judith Schrieber, Ph.D., *et al.*, for the Office of the Attorney General of New York. August 2005. See also: “Assessment of Outdoor Wood-fired Boilers,” prepared by NESCAUM, March 2006 (revised June 2006).

<sup>5</sup> “Phase 1” and “Phase 2” emission levels refer to levels established in EPA voluntary partnership programs. The earlier use of the term “Phase II” (with a Roman numeral) standard refers to standards established in the current subpart AAA for residential wood heaters.

<sup>6</sup> The terms “qualified” and “unqualified,” or other similar terms, refer to models that meet or have not been shown to meet the voluntary partnership program performance levels. Later use of the terms “certified” and “uncertified,” or other similar terms, refers to models that are deemed to be in compliance or noncompliance with the NSPS emission limits.

provided that the tests use the same burn rate categories specified in the EPA Reference Method 28. We are now proposing that the current version of this method be used for efficiency testing (CSA B415.1–10). We are also proposing EPA Method 28 WHH (wood-fired hydronic heaters) that has been used for qualification testing of hydronic heaters in the EPA voluntary partnership program and numerous state regulations. Other issues that have been identified over the years regarding test methods and emissions calculations include emissions averaging, burn rate weightings, hot start versus cold start, emission caps per burn rate, and catalyst degradation. Another issue is whether to change current requirements to conduct certification tests with “crib” wood to “cord” wood. “Crib wood” is a specified configuration and quality of dimensional lumber and spacers, which was intended to improve the repeatability of the test method in 1988. “Cord wood” is a different specified configuration and quality of wood that more closely resembles what a typical homeowner would use. We address all these issues as part of this proposal.

#### *E. Why is residential wood smoke a concern?*

1. Health and air quality concerns. There is increasing recognition of the health impacts of particle pollution, to which wood smoke is a contributing factor in many areas. Wood smoke contains a mixture of gases and fine particles that can cause immediate effects, including burning eyes, runny nose and bronchitis. Exposure to fine particles has been associated with a range of health effects, including aggravation of heart or respiratory problems (as indicated by increased hospital admissions and emergency department visits), changes in lung function and increased respiratory symptoms, as well as premature death. Populations at greater risk for experiencing health effects related to fine particle exposures include older adults, children and individuals with pre-existing heart or lung disease.<sup>7</sup> Residential wood smoke contains fine particles and toxic air pollutants (e.g., benzene and formaldehyde). Each year, smoke from wood heaters contributes hundreds of thousands of tons of fine particles throughout the country—mostly during the winter months. Nationally, residential wood combustion accounts for 44 percent of total stationary and mobile POM emissions, nearly 25 percent of all area

source air toxics cancer risks, and 15 percent of noncancer respiratory effects.<sup>8</sup>

In a number of communities, residential wood smoke increases particle pollution to levels that cause significant health concerns. Several areas with wood smoke problems either exceed the EPA’s health-based NAAQS for fine particles or are on the cusp of exceeding those standards. For example, in places such as Keene, New Hampshire; Sacramento, California; Tacoma, Washington; and Fairbanks, Alaska; wood combustion can contribute over 50 percent of daily wintertime fine particle emissions.<sup>9</sup>

In December 2012, the EPA issued revised NAAQS for PM to provide increased protection of public health and welfare. The 2012 NAAQS for PM strengthened the annual NAAQS for fine particles to 12 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) from the 1997 standard of 15  $\mu\text{g}/\text{m}^3$  and retained the existing 24-hour fine particle standard of 35  $\mu\text{g}/\text{m}^3$  issued in 2006. The 2012 NAAQS for PM also retains the current 24-hour PM<sub>10</sub> standards for health and environmental effects at a level of 150  $\mu\text{g}/\text{m}^3$  to continue to provide protection against effects associated with exposure to thoracic coarse particles. Areas that do not meet the standards must take steps to reduce PM emissions. The National Association of Clean Air Agencies (NACAA), the Environmental Council of States (ECOS), NESCAUM, the Western States Air Resources Council (WESTAR), and the Lake Michigan Air Directors Consortium (LADCO) have argued that more stringent standards for new wood heating devices would provide a much needed tool for states and local communities to use in addressing the growth of pollution from these sources.<sup>10 11</sup> Recent health studies considered in the review of the PM NAAQS confirm the impacts on public health. The latest information on the PM NAAQS reviews is at <http://www.epa.gov/pm/actions.html>.

<sup>8</sup> Strategies for Reducing Residential Wood Smoke. EPA–456/B–13–001, March 2013. Prepared by Outreach and Information Division, Air Quality Planning Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, NC 27711. pp. 4–5.

<sup>9</sup> Memorandum dated April 4, 2013, from David Cole, EPA, to Docket ID No. EPA–HQ–OAR–2009–0734.

<sup>10</sup> Arthur Marin, Executive Director of NESCAUM and Dan Johnson, Executive Director of WESTAR, to Steve Page, Director OAQPS/EPA. April 28, 2008.

<sup>11</sup> Arthur Marin, Executive Director of NESCAUM, to Gina McCarthy, Assistant Administrator for Air and Radiation/EPA. January 14, 2011.

There is also concern about the health effects of other pollutants found in wood smoke. In addition to PM, wood smoke contains harmful chemical substances such as CO, formaldehyde and other organic gases, and nitrogen oxides (NO<sub>x</sub>).

Health effects from CO include:

- Interference with the blood’s ability to carry oxygen to the brain, which impairs thinking and reflexes

- Heart pain
- Lower birth weights and increased deaths in newborns

- Death

Health effects from formaldehyde and other organic gases include:

- Irritation of eyes, nose, and throat
- Inflammation of mucous membranes, irritation of the throat and sinuses

- Interference with lung function
- Allergic reactions
- Nose and throat cancer in animals and cancer in humans

Nitrogen oxide can irritate the eyes and respiratory system, may damage the immune system by impairing the body’s ability to fight respiratory infection and can affect lung function.<sup>12</sup>

Residential wood combustion emissions contain potentially carcinogenic compounds including formaldehyde, polycyclic aromatic hydrocarbons (PAHs), benzene, and dioxin, which are toxic air pollutants, but their effects on human health via exposure to wood smoke have not been studied as extensively.<sup>13</sup>

2. Concerns about existing sources. Many areas of the country are struggling with reducing PM emissions due to residential wood smoke from existing wood-burning appliances. Existing wood heaters will not be affected by this rule. In addition, due to the long life span of wood-burning appliances and slow turnover, it may be many years before the full benefits of these regulations on new appliances will be shown. However, there are strategies to reduce wood smoke that states, counties and townships can take to reduce wood smoke independent of this rule.<sup>14</sup> Some states have direct legislative authority, and all states have authority to address new and existing sources as SIP measures necessary to ensure attainment and maintenance of the NAAQS. For examples, the State of

<sup>12</sup> Department of Ecology, State of Washington, Brochure on Wood Smoke and Your Health. September 2008. <http://www.ecy.wa.gov/pubs/91br023.pdf>.

<sup>13</sup> EPA Burn Wise (Health Effects of Breathing Wood Smoke), [http://www.epa.gov/burnwise/pdfs/woodsmoke\\_health\\_effects\\_jan07.pdf](http://www.epa.gov/burnwise/pdfs/woodsmoke_health_effects_jan07.pdf).

<sup>14</sup> “Strategies for Reducing Residential Wood Smoke,” EPA–456/B–13–001. March 2013.

Oregon, Washoe County (NV), and Township of Mammoth Lakes (CA) have required that, when a home is sold, existing wood heaters that have not been certified to meet the NSPS be removed and destroyed and not resold. As additional SIP strategies, some states and local authorities have banned wood burning during certain high PM events, restricted the amount of burning, and regulated the type of materials being burned. Non-regulatory programs, such as education programs to teach the public how to use their wood-burning appliances in ways that minimize emissions, have also been implemented. The EPA has also implemented programs that encourage good burning practices, which can have a significant impact on emissions. The EPA, some state and local agencies, and other stakeholders, including the Hearth, Patio and Barbecue Association (HPBA), have been active in promoting wood heater/stove changeout programs to replace older, higher-emitting heaters/stoves with lower-emitting EPA-certified heaters/stoves, pellet heaters/stoves, or other cleaner burning appliances.

*F. What are the major issues that drove the review process?*

We received several requests to conduct a review of the residential wood heaters NSPS, including a joint letter from WESTAR and NESCAUM that urged us to update and develop regulations relating to a variety of wood combustion devices. The authors cited concerns that many communities are measuring ambient conditions above or very close to the PM<sub>2.5</sub> NAAQS and that, in many instances, emissions from wood smoke are a large contributor to those high PM<sub>2.5</sub> levels. In addition, wood heater technology has greatly improved since the last revision of the NSPS. The standards we are proposing today recognize the cleaner, more efficient technologies developed in recent years. Other states, environmental groups, and HPBA have also recommended several changes to the NSPS. The HPBA Outdoor Wood-fired Hydronic Heater (OWHH) Manufacturers Caucus wrote the EPA to express their unanimous support for the EPA to develop a federal regulation for OWHH.<sup>15</sup>

Specific requests from stakeholders include:

- Tightening emission standards based on current performance data

- Addressing other pollutants of concern
- Reviewing the format of the standards, including adding requirements to document the tested efficiency of the unit
- Reevaluating exemptions, such as those based on air-to-fuel ratios and size and weight
- Adding other wood heating devices such as pellet heaters/stoves, hydronic heaters, and masonry heaters to the NSPS
- Regulating fireplaces and other “non-heater” devices (e.g., cook stoves)
- Regulating heating devices that burn fuel other than wood (e.g., other solid biomass and coal)
- Updating test methods
- Streamlining the certification process to use electronic data submittals/reviews
- Considering use of International Organization for Standardization (ISO)-accredited labs and ISO-accredited certifying bodies
- Improving compliance assurance/enforceability and quality assurance/quality control
- Making the rule more consumer friendly by making more information readily available on-line

### III. Summary of Proposed Residential Wood Heater Appliance Amendments

We are proposing to amend 40 CFR part 60, subpart AAA, Standards of Performance for New Residential Wood Heaters. We are also proposing two new subparts to address additional types of residential wood heating appliances. Specifically, we are proposing subpart QQQQ, Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces, and subpart RRRR, Standards of Performance for New Residential Masonry Heaters. The following sections describe the major provisions of each subpart. This proposal does not include any requirements that would apply to heaters that are fueled solely by gas, oil or coal. In addition, this proposal does not include any requirements associated with wood heaters or other wood-burning appliances that are already in use. The EPA continues to encourage state, local, tribal, and consumer efforts to changeout (replace) older heaters with newer, cleaner, more efficient heaters, but that is not part of this federal rulemaking.

#### A. Room Heaters

The current 1988 regulation (subpart AAA) applies to affected appliances manufactured since 1988. The current emission limits would remain in effect for the heaters and model lines

manufactured before the effective date of this rule until their current EPA certification expires (maximum of 5 years) or is revoked. After the certification expires or is revoked, these heaters and other new heaters would have to meet updated emission standards. We propose to broaden the applicability of the wood heaters regulation beyond adjustable burn rate wood heaters (the focus of the original regulation) to specifically also include single burn rate wood heaters/stoves, pellet heaters/stoves, and any other affected appliance as defined in the proposed subpart AAA as a “room heater.” The proposed subpart AAA does not apply to new residential hydronic heaters, new residential forced-air furnaces and new residential masonry heaters because they would be subject to their own subparts. Like the 1988 current subpart AAA, the proposed subpart AAA does not apply to fireplaces. This proposal tightens the definition for “cook stoves” and adds definitions for “camp stoves” and “traditional Native American bake ovens” to clarify that they would not be subject to the standard other than appropriate labeling for cook stoves and camp stoves. Finally, the proposed subpart AAA clarifies that the emission limits would only apply to wood-burning devices (*i.e.*, not to devices that only burn fuels other than wood, *e.g.*, gas, oil or coal).

As discussed in section II, NSPS determinations of BSER must consider costs. The fact that this source category is for consumer products manufactured for residential sale results in cost considerations that are different from those for industrial process source categories that are typical for most NSPS. Specifically, if production and sales were to be suspended while designing, testing, field evaluating and certifying cleaner models, the cost of potential lost revenues would be significant, which necessitates reasonable lead times for compliance with proposed emission limitations. This was true in 1988, and is still true today. Thus, we propose to allow a transition period so that heaters/stoves with EPA certification currently in effect can continue to be manufactured and sold until the current certification expires (5 years from date of certification) or is revoked by the Administrator, whichever date is earlier. We would not allow renewal of these certifications. That is, in the near term, we are proposing to retain the current Phase II PM emission limits (issued in the current 1988 standards for compliance in 1990) for adjustable burn

<sup>15</sup> HPBA OWHH Caucus letter to Greg Green, Director, Outreach and Information Division, EPA, September 27, 2007.

rate wood heaters and pellet heaters/stoves with a current EPA certification issued prior to the effective date of this rule. While our top priorities are to ensure that emission reductions occur in a timely manner and that there is no backsliding from the improvements that many manufacturers have already made, it is also important to avoid unreasonable economic impacts on those manufacturers (mostly small businesses) who need additional time to develop a full range of cleaner models. The compliance schedule should also help avoid potential “logjams” at laboratories conducting certification testing. We ask for specific comments on the length of this proposed transition and the degree to which there would be any critical economic impacts on manufacturers who have heaters with current certifications if we were to not allow up to the full 5-year certification period for units manufactured after the effective date of the final rule. We also ask for specific comments on allowing grandfathering of Step 1 models that are tested in good faith according to the proposed test methods and the proposed emission limits, even though the final test methods may differ from this proposal, and if so, for how long.

We are proposing a two-step compliance approach (referred to herein

as the “Proposed Approach”) that would apply to all new adjustable burn rate wood heaters, single burn rate wood heaters and pellet heaters/stoves. Under this Proposed Approach, the Proposed Step 1 emission limits for these sources would apply to each source (a) manufactured on or after the effective date of the final rule or (b) sold at retail on or after the date 6 months from the effective date of the final rule. Proposed Step 2 emission limits for these sources would apply to each adjustable rate wood heater, single burn rate wood heater and pellet heater/stove manufactured or sold on or after the date 5 years after the effective date of the final rule. We ask for specific comments on the Proposed Approach and the degree to which these dates could be sooner.

We are also asking for comments on a three-step compliance approach (referred to herein as the “Alternative Approach”) for all adjustable rate wood heaters, single burn rate wood heaters and pellet heaters/stoves. Under this Alternative Approach, the Alternative Step 1 emission limits would apply to each source: (a) manufactured on or after the effective date of the final rule, or (b) sold at retail on or after the date 6 months from the effective date of the final rule. (Step 1 under the Alternative

Approach is the same as Step 1 under the Proposed Approach.) The Alternative Step 2 emission limits would apply to each source manufactured or sold on or after the date 3 years after the effective date of the final rule. The Alternative Step 3 emission limits would apply to each source manufactured or sold on or after the date 8 years following the effective date of the final rule (thus providing 5 years between the Alternative Step 2 and Alternative Step 3). We ask for specific comments on this Alternative Approach, including data and potential environmental and economic impacts on this alternative, and the degree to which the Alternative Approach emission levels and dates could be considered BSER. Our current preference is the Proposed Approach, but we intend to finalize a single compliance approach after fully considering the comments received during the public comment period on this proposed rulemaking.

Table 3 summarizes the PM emissions standards that would apply to each wood heater appliance under this Proposed Approach at each step. Table 4 summarizes the PM emissions standards that would apply to each wood heater appliance under each step of the Alternative Approach.

TABLE 3—PROPOSED APPROACH SUBPART AAA PM EMISSIONS LIMITS

Appliance	Phases/steps	PM emissions limit
Adjustable Rate Wood Heaters or Pellet Heaters/Stoves with current EPA certification issued prior to the effective date of the Final Rule.	Transition period from 1988 rule through the later of the effective date of the final revised rule or expiration of current certification (maximum of 5 years certification and no renewal).	4.1 g/hr for catalytic heaters/stoves and 7.5 g/hr for noncatalytic heaters/stoves.
All Other Adjustable Rate Wood Heaters, Single Burn Rate Wood Heaters or Pellet Heaters/Stoves (includes currently certified heaters after the certification expires, catalytic and noncatalytic).	Step 1: upon the effective date of final rule ..... Step 2: 5 years after the effective date of the final rule.	4.5 g/hr. 1.3 g/hr.

TABLE 4—ALTERNATIVE APPROACH SUBPART AAA PM EMISSIONS LIMITS

Appliance	Phases/steps	PM emissions limit
Adjustable Rate Wood Heaters or Pellet Heaters/Stoves with Current EPA Certification Issued Prior to the effective date of Final Rule.	Transition period from 1988 rule through the later of the effective date of the final revised rule or expiration of current certification (maximum of 5 years certification and no renewal).	4.1 g/hr for catalytic heaters/stoves and 7.5 g/hr for noncatalytic heaters/stoves.
All Other Adjustable Rate Wood Heaters, Single Burn Rate Wood Heaters or Pellet Heaters/Stoves (includes currently certified heaters after the certification expires, catalytic and noncatalytic).	Step 1: upon the effective date of final rule ..... Step 2: 3 years after the effective date of the final rule. Step 3: 8 years after the effective date of the final rule.	4.5 g/hr. 2.5 g/hr. 1.3 g/hr.

Although the 1988 promulgated subpart AAA (53 FR 5860, February 26, 1988) included an additional 1-year compliance extension for low-volume manufacturers, *i.e.*, companies that

manufacture (or export to the U.S.) fewer than 2,000 heaters per year, this proposal does not include a similar compliance extension. We are not proposing a delay for adjustable burn

rate wood heaters or pellet heaters/stoves because the majority of these appliances already comply with the proposed Step 1 emission levels. See section V.C. of this preamble for more

discussion of this topic. However, we are requesting comments on the possible need for such a compliance extension for single burn rate wood heaters, which are not subject to the current subpart AAA requirements.

We are proposing to make a single determination of BSER for both catalytic and noncatalytic heater systems. The EPA considered requiring catalyst replacement on a regular schedule but determined that federal enforcement of such a requirement would be difficult. As in the current 1988 rule, we are proposing to require manufacturers to provide warranties on the catalysts and prohibit the operation of catalytic heaters/stoves without a catalyst. In addition, we are proposing to require warranties for noncatalytic heaters/stoves. Though we are not proposing efficiency standards at this time, we are proposing to require testing and reporting of these data; however, we are requesting specific comment on the need to propose efficiency standards and any data to support the basis for these standards.

We are also proposing to require emission testing and reporting based on both crib wood and cord wood for the proposed Step 1 compliance, and allowing manufacturers to choose whether to certify with crib wood or cord wood for the proposed Step 1 upon the effective date of the final rule. For the proposed Step 2 compliance 5 years after the effective date of the final rule, we would require certifying with cord wood only. As discussed earlier in this preamble, “crib wood” is a specified configuration and quality of dimensional lumber and spacers that was intended to improve the repeatability of the test method in 1988. “Cord wood” is a different specified configuration and quality of wood that more closely resembles what a typical homeowner would use. We ask for comments and test data to compare heater performance with crib wood and cord wood.

Although we lack sufficient data to propose a separate CO emissions standard at this time, we propose to require that the manufacturer determine CO emissions during the compliance test and report those results to the EPA. We specifically request emission and cost data for systems that reduce CO emissions. If those systems warrant inclusion in the final rule, we would consider doing so. In addition, we ask for specific comments on whether the final rule should explicitly require indoor CO monitors as a critical safety component for heaters installed in occupied buildings or other buildings or enclosures in which the operator would

enter to add fuel to the heater or conduct other normal operation and maintenance of the heater. Numerous stakeholders have indicated that an explicit requirement is needed.

Like the current 1988 subpart, the EPA is using its authority under section 114 of the CAA to require each manufacturer to submit certifications of compliance with this rule for all models and all units. As in the 1988 rule, provided that the certifications are timely, complete, and accurate, the EPA is proposing to allow certification to be determined based on testing of a representative unit within the model line. As in 1988, the cost of testing each unit would be an order of magnitude greater than the cost of a wood heater/stove and would be economically prohibitive. In addition, as in 1988, the testing of each unit could create a potential “logjam” that would stymie the certification of cleaner model lines. However, as discussed earlier, we are asking for specific comments on whether we should require testing of more than one representative unit prior to certification of a model line. The proposed subpart revises the definition of “Accredited Test Laboratory,” from only EPA-accredited laboratories to laboratories approved by the EPA after being accredited by a nationally recognized accrediting body to perform testing for each of the test methods specified in this NSPS under ISO–IEC<sup>16</sup> Standard 17025, to conduct the certification testing. The laboratories would have to register their credentials with the EPA and be approved by the EPA prior to conducting any certification testing or related work used as a basis for compliance with this rule. Also, they would be required to report any changes in their accreditation and any deficiencies found under ISO 17025, and the EPA may revoke the approval if appropriate. Our proposal is this laboratory definition revision be effective upon the effective date of the final rule. However, we request specific comments on whether we should allow a transition period.

The proposal would require a “Certifying-Body-Based Certification Process,” upon the effective date of the final rule. Under this process, after testing is complete, a certification of conformity with the PM emissions standards must be issued by a certifying body with whom the manufacturer has entered into contract for certification services. The certification body would

have to be accredited under ISO–IEC Standard 17065 and register their credentials with the EPA and receive EPA approval prior to conducting any certifications or related work used as a basis for compliance with this rule and report any changes in their accreditation and any deficiencies found under ISO 17065. We believe any certifying body that is approved by the EPA and is ISO-accredited should be expected to act in such a way that will not create a conflict of interest. The EPA would oversee the certification body’s work and retain the right to revoke the approval if appropriate. Upon review of the test report and quality control plan submitted by the manufacturer, the certifying body may certify compliance and submit the required documentation to the EPA’s Office of Enforcement and Compliance Assurance for review, approval and listing of the certified appliance. Our preference is to require the new expanded certification process (*i.e.*, inclusion of ISO-accredited and EPA-approved certifying bodies) for certifications that occur after the effective date of the final rule. However, we request specific comments on whether we should allow a transition period; that is, whether we should retain the current “Administrator Approval Process” to review the certification application, including test results, for the first year following the effective date of the final rule. Note that models certified prior to the effective date of the final rule would not have to be re-tested until the certification expires or is revoked.

As in the current 1988 NSPS, each affected unit would be required to have an applicable permanent label and have an owner’s manual that contains specified information. We are proposing that permanent labels would be required for each affected unit on the effective date of the final rule. We propose to clarify that the permanent label must be installed so that it is readily visible both before and after the unit is installed. This clarification is needed to document the use of complying heaters that may be required by state and local rules and/or to determine the unit’s applicability to any future changeout programs. We also request specific comments on how to best assure that manufacturers and retailers and online marketers of wood heaters only use valid certification test data and not exaggerated claims.

In the current (1988) NSPS, temporary labels (*aka*, hangtags) were required for wood heaters that are subject to the standards and also for ones that are not (*e.g.*, coal heaters/stoves). These temporary labels were intended primarily to contain information useful

<sup>16</sup> The International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC) prepare and publish international standards.

to consumers and prospective heater purchasers to be able to compare different appliance models and to inform the consumer about the importance of proper operation and maintenance. These temporary labels included the wood heater's compliance status, comparative emission and efficiency performance data, and heat output rates and explicitly stated that the appliance will achieve low smoke output and high efficiency only if properly operated and maintained. The EPA no longer believes these temporary labels are necessary for all certified heaters because we have developed and are continuing to improve our education and outreach program for consumers on selecting the cleanest certified appliances and wood fuel with appropriate moisture content and on the effective use and operation of these appliances. Consequently, we are proposing to remove the requirement for temporary labels on certified heaters. Consumers can get additional information that would normally be contained on the temporary labels at <http://www.epa.gov/compliance/monitoring/programs/caa/woodheaters.html>. We request comment on the potential impact that deleting this requirement might have on a consumer's ability to select wood heaters that meet the proposed standards and are the cleanest and whether we should consider developing a voluntary labeling program for the cleanest of the clean. As discussed elsewhere, we also ask for specific comments on language that we should require manufacturers and retailers to provide to consumers to help explain the relative benefits of high-performing heaters versus lower-performing heaters and how to reduce exaggerated claims.

In addition to the PM emissions standards, we are proposing to continue to require the proper burn practices that already apply to the owner or operator of a wood heating appliance. That is, the current 1988 standards already include the requirement that the owner or operator must operate the heater consistent with the owner's manual and not burn improper fuels and manufacturers typically void their warranties in cases of improper operation. Numerous states have expressed their support for the continuation of these requirements. Some states and local jurisdictions have enforced similar requirements, and this proposal would allow potential delegation of enforcement authority of these NSPS requirements upon the EPA approval of state requests.

The proposed revision clarifies that the current requirement to operate

according to the owner's manual continues to include a list of prohibited fuel types that create poor or even hazardous combustion conditions and includes operation of pellet fuel appliances only with the grades of pellet fuels that are included in the certification tests, or better. We propose that pellets for the certification tests be only those that have been produced under a licensing agreement with the Pellet Fuels Institute (PFI), or equivalent (after request and subsequent approval by the EPA), to meet certain minimum requirements and procedures for a quality assurance process. Details of the PFI program are available at <http://pelletheat.org/pfi-standards/pfi-standards-program/>. We are not aware of any other U.S. organization that has a pellet fuel quality assurance program similar in quality to the PFI program. However, we request specific comments on whether another high quality program exists. Manufacturers' data show that pellet fuel quality assurance is necessary to ensure that the appliances operate properly such that emissions are reduced as intended. We ask for specific comments on how to determine equivalency for fuel pellets, and whether we should include other requirements of best burn practices or adjustments to help ensure proper operation, e.g., chimney height and draft specifications, moisture content of wood and limits on visible emissions.

The proposed subpart AAA still contains the crucial quality assurance provisions in the current 1988 NSPS. A comprehensive discussion of the rationale is included in the 1988 preamble. For example, a model line must be recertified whenever any change is made in the original design that could affect the emissions rate for that model line or when any of several specified tolerances of key components are changed. The 1988 requirements for manufacturer quality assurance programs would be superseded by a Certifying-Body-Based Quality Assurance program. (As noted earlier in this preamble, we would not require retesting for models that are certified prior to the effective date of the final rule until the certification expires or is revoked.) The certifying body would conduct regular, unannounced audits to ensure that the manufacturer's quality control plan is being implemented properly.

The EPA audit testing programs of the 1988 NSPS will be maintained under the proposed changes, although they will be streamlined and simplified to better ensure compliance and to clarify that audits can be based on any information the EPA has available and

do not have to be statistically random. Also, we clarify that the EPA and states are allowed to be present during the audits and that states (and other entities, including the public) may provide the EPA with information that may ultimately be used in the EPA enforcement and compliance assurance efforts.

As discussed earlier, the EPA developed Method 28 in 1987 and 1988 as part of our efforts on the 1988 NSPS. We received input at that time from manufacturers, laboratories, and some states. Oregon Method 7 was the starting point for Method 28 and, thus, Method 28 has many aspects similar to Oregon Method 7. The details on the history and development of Method 28 are contained in the February 18, 1987, proposal in the **Federal Register** (52 FR 5003) and the February 26, 1988, final rule in the **Federal Register** (53 FR 5866).

The manufacturers, laboratories, states and the EPA have more than 25 years of experience with Method 28, and it has been very useful for certifying hundreds of model lines of wood heaters/stoves. We asked the manufacturers, EPA-accredited laboratories and states for their insights on Method 28. Many stakeholders agree that changes should be made to improve the reproducibility and repeatability of the test procedures and to address concerns about how to best ensure protection across the entire U.S. when various operating scenarios are used and various wood species and densities are used. For example, to address some of these concerns, ASTM has used a "consensus-based" process to develop E2515-10 "Standard Method for Determination of Particulate Matter Emissions in a Dilution Tunnel." The EPA is proposing that this sampling and analysis method be used for all of the appliances in this rulemaking. As with all test methods, there are opportunities for continual improvement, and the EPA requests specific comments and supporting data for additional potential improvements to E2515-10.

A number of states have expressed concern about ASTM's Intellectual Property Policy which requires all participants to give their intellectual property rights to ASTM so that, in turn, ASTM can control distribution of the drafts and final test methods and sell the final test methods to potential users. Attorneys General for several states have indicated that state employees in their states cannot give to ASTM the property rights for property that their states paid for via the employee salaries and other expenditures and thus cannot participate in ASTM's "consensus-

based” process. For this rulemaking, ASTM is allowing public review, for no charge, of the ASTM test methods and draft work products relevant to this proposed rule at [www.astm.org/epa](http://www.astm.org/epa). The EPA requests specific comments and supporting data on the substance of all of the test methods relevant to this rulemaking and specific comments on the ASTM process and ways to ameliorate the process concerns.

The ASTM methods E2779–10 “Standard Test Method for Determining Particulate Emissions from Pellet Heaters” and E2780–10 “Standard Test Method for Determining Particulate Emissions from Wood Heaters” are being considered for potentially replacing the wood heater fueling and operation requirements in Method 28 for pellet heaters and wood heaters, respectively. Note that ASTM intends to use the same E2515–10 for the sampling and analysis portion for all the appliances and then separate methods per appliance types for the fueling and operation portions of these methods. The EPA believes E2525–10 is a sound method for sampling and analysis and we are proposing its use. The EPA also believes that E2779–10 is a sound method for measuring emissions from pellet heaters/stoves and includes reasonable measures to reduce testing costs for continuously-fed appliances, and we are proposing its use. However, because, as noted earlier, some states were not able to participate in the ASTM method development process, we specifically request comments and supporting data of all aspects of not only these test methods but also all the proposed methods as part of the comments on this proposed rule.

Similarly, the EPA believes that ASTM Method E2780–10 includes improvements for testing adjustable and single burn rate wood heaters, and we are proposing many of the improvements today. For example, we are proposing the use of the E2780–10 appendix for testing single burn rate appliances. However, we, and some states, do not agree with all the changes that ASTM has made for adjustable burn rate wood heaters, and some provisions are not as protective as we, and some states, now believe they need to be. As noted above, several states are concerned about how to best ensure that the methods are protective for the entire U.S., considering differences in wood species, density, and homeowner operation. The EPA and the states are particularly concerned about scenarios in which heaters/stoves will have higher emissions in home use than the emissions measured in the laboratories. For example, the states and the EPA are

concerned about the ASTM changes on burn rate categories, *i.e.*, easing or eliminating the lowest burn rates that often occur in home operations and are typically the highest emitting and least efficient. The EPA is asking for specific comments on these issues and recommendations and supporting data for other changes. The following paragraphs discuss some of the key test method provisions we are proposing and not proposing. Additional information on the methods is at <http://www2.epa.gov/residential-wood-heaters> and at [www.astm.org/epa](http://www.astm.org/epa).

1. We do not agree with the ASTM changes to the burn rate categories, low burn rate requirement, and weightings in Method 28. Several states are very concerned that easing these items would create the potential for backsliding. Also, we are aware of several design changes being considered by a number of manufacturers that are relatively inexpensive (*i.e.*, less than \$20 dollars) and will reduce the emissions during periods when operated at low burn rates. We instead propose that the original provisions in Method 28 be retained for the burn rate categories and low burn rate requirement. We considered the weightings and believe that if weightings are to be used, they should be the same as the original requirements in Method 28. We are also proposing that the burn rates not be weighted at all for the Step 2 standards but rather that the emission limits be separate for Burn Rate Category 1 (lowest burn rate category) and Burn Rate Category 4 (maximum burn rate category) and that compliance for each be shown separately.

2. We propose to not allow 5 minutes for startup before closing the doors because startup is often the highest emitting part of the wood heater operation, and manufacturers need to ensure that startup emissions are also reduced. Again, relatively inexpensive means exist to reduce these emissions.

3. We are not proposing to use the new ASTM equation for converting the emission test values between the EPA Reference Method 5G “Determination of Particulate Emissions From Wood Heaters From a Dilution Tunnel Sampling Location” and the EPA Reference Method 5H “Determination of Particulate Emissions From Wood Heaters From a Stack Location” currently allowed in the NSPS. Rather, we are proposing that Method 5G(3) test values be reported as tested for heaters that have valid certifications prior to the effective date of this rule and ASTM E2515–10 for all other heaters and that Method 5H not be used for testing for certifications after the effective date of

this rule. We request data to help inform our decision for the final rulemaking.

4. We are not proposing to allow manufacturers to specify a smaller volume of the firebox for testing because of our concerns about how to ensure that homeowners do not circumvent such a specification during operation, thereby increasing emissions beyond the levels that are measured during testing.

5. We are proposing several tighter specifications on the test fuel moisture content, fuel load and coal bed depth in order to improve the reproducibility and repeatability of the certification tests. This part of the proposal is based on recommendations from one of the original EPA-accredited laboratories. We specifically request comments and supporting data regarding the following proposed tighter specifications for the laboratory test: (a) tightening fuel load dry-basis moisture content tightened from the Method 28-allowed 6 percentage-point range from 19 percent to 25 percent  $\pm$  1 percent; (b) tightening the Method 28-allowed range for fuel load weight from 7.0 lb/ft<sup>3</sup>  $\pm$  10 percent of the fuel load weight (or 7 lb/ft<sup>3</sup>  $\pm$  0.7 lb/ft<sup>3</sup>) to 7 lb/ft<sup>3</sup>  $\pm$  1 percent (or 7 lb  $\pm$  0.07 lb) of the fuel load weight, calculated in accordance with Method 28; and (c) tightening the Method-28-allowed range for the test-initiation coal-bed weight from 20 percent to 25 percent of the fuel load weight to 22 percent  $\pm$  1 percent of the fuel load weight.

6. We propose to require efficiency testing according to CSA B415.1–10<sup>17</sup> using the stack loss method. That is, during each test run, data must be obtained and presented for the purpose of calculation of overall efficiency as specified in CSA B415.1–10. This would include CO and carbon dioxide (CO<sub>2</sub>), flue gas temperature and appliance mass. CSA B415.1–10 was developed by a “consensus” process, but no states were part of the process. Thus, we specifically request comments on our proposal to require use of this method.

7. We propose that electronic test report submittals include the locked spreadsheets so the formulas used and relevant calculations can be evaluated in detail. We request comments on this specific proposal.

8. We propose that the test report include a narrative detailing specifics about test conditions and operations, such as how the test was run, operating conditions, issues and special procedures.

<sup>17</sup> “CSA B415.1–10: Performance testing of solid-fuel-burning heating appliances,” Canadian Standards Association, Mississauga, Ontario, Canada. 2010.

9. We propose that each individual moisture content reading must be in the range of 18 to 28 percent on a dry basis and the average moisture content of each piece of test fuel must be in the range of 19 to 25 percent. Also, we propose the following procedure for the moisture measurements: "Using a fuel moisture meter as specified, determine the fuel moisture for each test fuel piece used for the test fuel load by averaging at least five fuel moisture meter readings, one from each of three sides, measured parallel to the wood grain. Penetration of the moisture meter insulated electrodes shall be  $\frac{1}{4}$  (one-fourth) the thickness of the fuel piece or 19 millimeters (mm) ( $\frac{3}{4}$  in.), whichever is less, for 3 of the measurements made at approximately 3 inches from each end and the center. Two additional measurements at approximately one-third the thickness shall be made centered between the other three locations."

10. We also propose this alternate procedure developed by Brookhaven National Laboratory:<sup>18</sup> "Select three pieces of cord wood from the same batch of wood as the test fuel and the same weight as the average weight of the pieces in the test load  $\pm 1.0$  lb. From each of these three pieces, cut three slices. Each slice shall be  $\frac{1}{2}$ " to  $\frac{3}{4}$ " thick. One slice shall be cut across the center of the length of the piece. The other two slices shall be cut half way between the center and the end. Immediately measure the mass of each piece in pounds. Dry each slice in an oven at 220 °F for 24 hours or until no further weight change occurs. The slices shall be arranged in the oven so as to provide separation between faces. Remove from the oven and measure the mass of each piece again as soon as practical in pounds. The moisture content of each slice, on a dry basis, shall be calculated as:

$$MC_{\text{slice}} = 100 \cdot (W_{\text{SliceWet}} - W_{\text{SliceDry}}) / W_{\text{SliceDry}}$$

Where:  $W_{\text{SliceWet}}$  = weight of the slice before drying in pounds;  $W_{\text{SliceDry}}$  = weight of the slice after drying in pounds; [and]  $MC_{\text{slice}}$  = moisture content of the slice in % dry basis."

11. We propose to require two Step 1 tests, one using crib wood and one using cord wood and reasonable additional non-binding tests with a range of fuels for which the appliance is designed for warranted and/or advertized operation. These tests are needed to show how

emissions and efficiency vary according to test methods, operating scenarios, wood species and density and other variables such as cord wood versus crib wood. We believe that such testing would help assure consumers, neighbors and other stakeholders that the appliances perform as well on all manufacturer-listed fuels and operating scenarios as they do for the EPA laboratory test scenarios. Proposed Step 2 tests will use cord wood and not crib wood. The EPA, industry and states believe that moving to cord wood testing will help address concerns about actual emissions from heaters/stoves in home use versus test laboratories. We are working with states and industry on a cord wood test method and evaluating potential revisions to the current version of the ASTM E2780–10 cord wood test method. Industry is conducting tests now using the cord wood test method, and we will consider the results of that testing when it becomes available during the public comment period of this rulemaking.

#### *B. Central Heaters: Hydronic Heaters and Forced-Air Furnaces*

The proposed subpart QQQQ would apply to new wood-fired residential hydronic heaters and forced-air furnaces and any other affected appliance as defined in subpart QQQQ as a "central heater." We believe this new "central heater" categorization will better ensure that all appliances potentially affected under new proposed subpart QQQQ are included in this proposed action. The provisions of subpart QQQQ would apply to each affected unit that is manufactured or sold on or after April 4, 2014. This proposal does not include any requirements for heaters that are fueled solely by gas, oil or coal. In addition, this proposal does not include any requirements associated with appliances that are already in use. The EPA continues to encourage state, local, tribal and consumer efforts to changeout (replace) older heaters with newer, cleaner, more efficient heaters, but that is not part of this federal rulemaking.

As discussed earlier in this preamble, subpart QQQQ affects a source category of mass-produced residential consumer products rather than typical industrial processes. Thus, this proposed NSPS has many aspects that are similar to those in Subpart AAA, e.g., certification of model lines and phased implementation. This Proposed Approach would apply to all new

residential hydronic heaters and forced-air furnaces. Under the Proposed Approach, the Proposed Step 1 emission limit for residential hydronic heaters and forced air heaters would apply upon the effective date of the final rule. The Proposed Step 2 emission limit for residential hydronic heaters and forced air heaters would apply 5 years after the effective date of the final rule. We ask for specific comments on the Proposed Approach and the degree to which these dates could be sooner.

We also considered an alternative three-step approach (Alternative Approach) for residential hydronic heaters and forced air heaters. Under this Alternative Approach, as in the Proposed Approach, the Alternative Step 1 emission limits for residential hydronic heaters and forced air heaters would apply upon the effective date of the final rule. The Proposed Step 1 emission limits and the Alternative Approach Step 1 emission limits are identical. The Alternative Step 2 emission limit for residential hydronic heaters and forced air heaters would apply 3 years after the effective date of the final rule. The Alternative Step 3 emission limit for residential hydronic heaters and forced air heaters would apply 8 years after the effective date of the final rule (thus providing 5 years between the Alternative Step 2 and the Alternative Step 3). The Proposed Step 2 emission limits and the Alternative Approach Step 3 emission limits are identical. We ask for specific comments on this Alternative Approach and the degree to which these dates could be sooner.

Table 5 summarizes the proposed PM emissions standards that would apply under this Proposed Approach at each step. Table 6 summarizes the PM emissions standards that would apply under each step of the Alternative Approach. Similar to the proposed requirements for subpart AAA, we are not proposing a standard for CO or efficiency, but we are proposing to require manufacturers to collect and report CO emissions and efficiency data during certification tests. Some regulatory authorities have instituted additional requirements such as limits on visible emissions and limits on use in non-heating seasons and we ask for specific comments on the appropriateness of such limits and other requirements in this NSPS.

<sup>18</sup> "A Test Method for Certification of Cord Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage: Measurement of Particulate Matter

(PM) and Carbon Monoxide (CO) Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage." Prepared

for NYSERDA by Brookhaven National Laboratory, February 15, 2013.

TABLE 5—PROPOSED APPROACH SUBPART QQQQ PM EMISSIONS STANDARDS

Appliance	Steps	Particulate matter emissions limits
Residential Hydronic Heater .....	Step 1: Upon the effective date of the final rule .....	0.32 lb/MMBtu heat output and a cap of 7.5 g/hr for individual test runs.
	Step 2: 5 years after the effective date of final rule .....	0.06 lb/MMBtu.
Forced-Air Furnace .....	Step 1: Upon the effective date of the final rule .....	0.93 lb/MMBtu.
	Step 2: 5 years after the effective date of final rule .....	0.06 lb/MMBtu.

TABLE 6—ALTERNATIVE APPROACH SUBPART QQQQ PM EMISSIONS STANDARDS

Appliance	Steps	Particulate matter emissions limits
Residential Hydronic Heater .....	Step 1: Upon the effective date of the final rule .....	0.32 lb/MMBtu heat output and a cap of 7.5 g/hr for individual test runs.
	Step 2: 3 years after the effective date of final rule .....	0.15 lb/MMBtu.
	Step 3: 8 years after the effective date of the final rule .....	0.06 lb/MMBtu.
Forced-Air Furnace .....	Step 1: Upon the effective date of the final rule .....	0.93 lb/MMBtu.
	Step 2: 3 years after the effective date of final rule .....	0.15 lb/MMBtu.
	Step 3: 8 years after the effective date of final rule .....	0.06 lb/MMBtu.

Unlike the 1988 subpart AAA requirements, the subpart QQQQ requirements would not provide an additional time period for the sale of unsold units manufactured before the compliance date. No additional time is prudent because cleaner EPA-qualified Phase 2 hydronic heaters systems have already been readily available for several years, the older systems have caused numerous complaints nationwide, and this proposal publication is ample notice for the remaining old high-emitting units. For the same reasons, the subpart QQQQ requirements would not include a small volume manufacturer compliance extension. See section V.C. of this preamble for more discussion of this topic. We ask for comments on the timing for implementation.

As in the current subpart AAA for wood heaters/stoves, we are proposing a list of prohibited fuels because their use would cause poor combustion or even hazardous conditions. We request comment on these requirements and data to support additional requirements, if warranted. Also, as in the current subpart AAA for wood heaters/stoves, we are proposing that the owner or operator must not operate the hydronic heater or forced-air furnace in a manner that is inconsistent with the owner's manual. For pellet-fueled appliances, this proposal makes it clear that operation according to the owner's manual includes operation only with pellet fuels that have been used in the certification test and have been graded and marked under a licensing agreement with the PFI, or equivalent (after request and subsequent approval by the EPA), to meet certain minimum requirements

and procedures for a quality assurance process. Details of the PFI program are available at <http://pelletheat.org/pfi-standards/pfi-standards-program/>. Data show that quality assurance provisions are necessary to ensure that the appliances operate properly such that emissions are reduced as intended. We ask for specific comments on the use of the PFI program and the PFI specifications, especially the degree to which the PFI program will adequately ensure the absence of construction and demolition waste (and associated toxic contaminants) in the pellets. (No other organization has volunteered to develop such a quality program.)

The proposed labeling requirements and owner's manual requirements are similar to the guidelines in the EPA's current voluntary hydronic heater program with some improvements. We request specific comments on ways to improve the delivery of information on the permanent label and in the owner's manual and whether different information might be useful to the consumer and to the regulatory authorities.

The structure of the rest of the proposed subpart QQQQ is similar to the proposed subpart AAA certification and quality assurance process. We request specific comments on changes or improvements to that process that might be needed to address any special concerns related to the certification of hydronic heaters and forced-air furnaces.

As discussed earlier, the EPA developed Method 28 OWHH, in 2006, as part of our efforts for voluntary qualification of cleaner hydronic heaters. We received input at that time

from manufacturers, laboratories, and some states in order to quickly develop a mostly consensus-based method that we incorporated into the program partnership agreements. We used Method 28 for wood heaters/stoves as the foundation. Thus, Method 28 OWHH has many aspects similar to Method 28. Three significant differences are: (1) Method 28 OWHH uses larger cribs because hydronic heater fireboxes are typically much larger than wood heater fireboxes; (2) Method 28 OWHH uses red oak instead of Douglas fir because red oak is the more common fuel in the U.S.; and (3) Method 28 OWHH includes procedures for determining 8-hour heat output and efficiency. The manufacturers, laboratories, states and the EPA have now had over 7 years of experience with Method 28 OWHH and its successor Method 28 WHH (improved and expanded to include indoor heaters, not just outdoor heaters).

All the stakeholders that have provided input on the test methods agree that the methods should be thoroughly vetted and changed as necessary to improve the method's accuracy and precision and to address concerns about how to best ensure protection across the entire U.S. when various operating scenarios and wood species and densities are used. ASTM has developed E2618–13 to address some of these concerns, and the EPA believes that E2618–13 does include some improvements. However, as with the wood heater/stove methods, we and some states do not agree with all the changes that ASTM has made. For example, the states of Washington and Oregon are very concerned that Method

28 WHH and ASTM E2618–13 do not specify fueling with Douglas Fir, which is used in EPA Method 28 for wood heaters/stoves and which these states require in their regulations for residential wood heaters, including hydronic heaters. They are concerned that hydronic heaters tested with red oak will have higher emissions when fueled with Douglas Fir and other less dense species typical in their states and have provided test data that shows higher emissions. Thus, they require testing with Douglas Fir in their states. Also, a number of states and the EPA are concerned about the ASTM changes to the burn rate categories, *i.e.*, easing or eliminating testing at the lowest burn rates, which often occur in home operations and are typically the highest-emitting and least efficient. For several years, we have been communicating with European certification laboratories to learn how they conduct their tests under EN 303–5 and to consider if incorporating some of their testing procedures might improve our test methods.

More recently, because of initial concerns about some surprisingly high laboratory test efficiencies for a couple of the EPA voluntary partnership program Phase 2 qualified partial heat storage models, the EPA, the Northeast states that regulate hydronic heaters, laboratories (including EPA-accredited laboratories and Brookhaven National Laboratory) and manufacturers have conducted a review of voluntary partnership program qualifying test reports. All of the stakeholders that provided input on the test methods agree that we need a change in the test method for testing of non-integral partial heat storage models (*i.e.*, models that have separate heat storage but the storage does not have the capacity to safely handle all the heat generated by a full load of fuel). ASTM has been leading an effort to develop an Appendix X2 to the test method for such models but has not completed that effort as of this proposal. Brookhaven National Laboratory recommended a method to the New York State Department of Environmental Conservation (NYSDEC) and NYSDEC is requiring that method be used for certification of such models in their states. We are proposing that method be used for certification of the NSPS for hydronic heaters equipped with a partial heat storage unit.<sup>19</sup>

Further, we are proposing revisions to Method 28 WHH that would require that all affected non-pellet hydronic heaters, subject to new subpart QQQQ, conduct

certification compliance testing using both crib wood and cord wood for the Step 1 emission limits upon the effective date of the final rule and solely cord wood for the Step 2 emission limits 5 years after the effective date of the final rule.

We are asking for specific comments on whether the EPA should use: (1) One or more of the draft versions of Appendix X2 being considered as part of ASTM work product WK26581; (2) the European Union test method EN303–05 as the Maine Department of Environmental Protection approved for certification of hydronic heaters in their state as equivalent to the EPA Method 28 WHH; (3) the partial thermal storage test method developed by Brookhaven National Laboratory; and/or (4) some other test method(s). For use of any of the test methods, the EPA would require that the amount of heat storage for the actual sale and installation of the hydronic heaters be no less than the amount used for the certification tests. Because EN303–05 does not currently use heat storage during the certification test, if the EPA were to use EN303–05 test results, the EPA would require the installed heater to have heat storage that can safely handle at least 60 percent of the maximum heat output of the heater or a greater level if the manufacturer specifies a greater level. The EPA is asking for specific comments on the appropriateness of this heat storage level or other levels. The EPA will consider any or all of these options as the preferred reference test methods or as acceptable emission testing alternatives. (ASTM previously developed an Appendix X1 for testing of models that have “full” heat storage that can safely accept the heat from the full load of fuel.) We request comments on all aspects of heater testing and are especially interested in emission test data that compare the results for testing by these different methods.

Also, the review discussed above found a number of areas in the methods to improve the quality of the data and reduce anomalies. In June 2011, the voluntary partnership program stakeholders agreed to a number of changes to Method 28 OWHH, and we are proposing the revised method as EPA Reference Method 28 WHH. The EPA is asking for specific comments on this method and recommendations and supporting data for other changes or acceptable alternatives. The following paragraphs discuss some of the changes we are proposing for comment. Additional information on the EPA methods is available at <http://www2.epa.gov/residential-wood-heaters>. The ASTM methods and draft work

products are available at [www.astm.org/epa](http://www.astm.org/epa).

#### 1. Heater (*aka* Boiler) Temperature Range

We propose that for all tests, the return water temperature to the heater must be 120 °F or greater. We additionally propose that if the manufacturer specifies a thermal control valve or other arrangement to be installed and set to control the return temperature at 120 °F or higher, the valve must be installed and set per the manufacturer’s written instructions.

#### 2. Efficiency Calculations

We propose to require the use of thermopiles to measure the temperature change “delta T” and verify accuracy of the load side flow meter. The accuracy of the flow meter is determined separately by direct weighing of timed water collection. Thermocouples must measure water temperature at the inlet and outlet of the load side heat exchanger. We propose to delete the requirement for supply side flow measurements and require one load side reading with thermopiles (using a commercial system or a homemade system). Efficiency would be measured on the output (load) side of the heat exchanger. The flow meter would be calibrated before and after each test run within the flow range used for the test.

#### 3. Time Period for Recording Temperatures

We propose that all water temperatures, differential water temperatures and water flow rates must be recorded at time intervals of 1 minute or less. This data file must be submitted with the test report. For determination of heat output, the data for these parameters must be measured in equal time intervals no greater than 10 minutes or at a frequency that results in a minimum of 50 equal intervals per test run, whichever is greater.

#### 4. Test Fuel Moisture Content

We propose that each individual test fuel moisture content reading must be in the range of 18 to 28 percent on a dry basis and the average moisture content of each piece of test fuel must be in the range of 19 to 25 percent.

We also propose the following moisture measurement procedure: Using a fuel moisture meter as specified in the test method, determine the fuel moisture for each test fuel piece used for the test fuel load by averaging at least five fuel moisture meter readings, one from each of three sides, measured parallel to the wood grain. Penetration of the moisture meter insulated

<sup>19</sup> See footnote 18.

electrodes must be one-fourth the thickness of the fuel piece or 19 mm (3/4 in.), whichever is less for 3 of the measurements made at approximately 3 inches from each end and the center. Two additional measurements at approximately one-third the thickness shall be made centered between the other three locations. We request specific comments on the moisture content limits and the procedures for determining the moisture content and the typical variances due to the measurement procedures.

We also request specific comments on the following approach for determining moisture content. "Select three pieces of cord wood from the same batch of wood as the test fuel and the same weight as the average weight of the pieces in the test load  $\pm$  1.0 lb. From each of these three pieces, cut three slices. Each slice shall be 1/2" to 3/4" thick. One slice shall be cut across the center of the length of the piece. The other two slices shall be cut half way between the center and the end. Immediately measure the mass of each piece in pounds. Dry each slice in an oven at 220 °F for 24 hours or until no further weight change occurs. The slices shall be arranged in the oven so as to provide separation between faces. Remove from the oven and measure the mass of each piece again as soon as practical in pounds. The moisture content of each slice, on a dry basis shall be calculated as:

$$MC_{Slice} = 100 \cdot (W_{SliceWet} - W_{SliceDry}) / W_{SliceDry}$$

Where:  $W_{SliceWet}$  = weight of the slice before drying in pounds;  $W_{SliceDry}$  = weight of the slice after drying in pounds; [and]  $MC_{Slice}$  = moisture content of the slice in % dry basis."<sup>20</sup>

Also, we propose that moisture must not be added to previously dried fuel pieces except by storage under high humidity conditions and temperature up to 100 °F. Fuel moisture must be measured no more than 4 hours before using the fuel for a test. The test report must describe the source and storage history of the test fuel.

#### 5. Water Density

a. We propose that the measured volumetric flow from the flow meter be converted to mass basis by using the water density based on water temperature. The same method must be used on both the load and supply side if the optional supply side meter is used.

b. We propose that the water density be calculated using the water temperature measured at the flow meter.

#### 6. Calculations

a. We propose that the electronic test reports submittals include all data within the locked spreadsheets so the formulas used and relevant calculations can be reviewed in detail.

b. To ensure common application, we propose to require averages to be calculated on each 10-minute reading rather than averaging over the entire test run.

#### 7. Overall Efficiency (CSA B415.1–10 Stack Loss Method)

We propose that during each test run, data must be obtained and presented for the purpose of calculation of overall efficiency as specified in the stack loss method in CSA B415.1–10. This includes CO and CO<sub>2</sub>, flue gas temperature, and appliance mass (remaining fuel weight). Overall efficiency for each run must be determined as per CSA B415.1–10 and reported. Whenever the CSA B415.1–10 overall efficiency is found to be lower than the overall efficiency based on the load side measurements, as determined by this method, the report must include a discussion of the reasons for this result.

#### 8. Wood Loading

Test fuel loads would be determined by multiplying the firebox volume by 4.54 kg (10 lb) of wood (as used, wet weight) per cubic foot, or a higher load density as recommended by the manufacturer's operating instructions. As discussed earlier, the EPA will require separate tests in the proposed Step 1 using cribs and using cord wood. In the proposed Step 2, the tests would all be using cord wood. There are ongoing discussions on how to improve both types of tests. We are working with states and industry on a cord wood test method and evaluating making revisions to the current version of the ASTM cord wood test method and states' ideas on cord wood testing. Also, we are reviewing European experiences with cord wood testing.

#### 9. Drawing of Test Apparatus

The test report would be required to contain a drawing of the test apparatus, including thermocouples, piping arrangements including any recirculation loops, the thermopile and flow meter(s).

#### 10. Aquastat Settings

Aquastat or other heater output control device settings that are adjustable would be set using manufacturer specifications, either as factory set or in accordance with the

owner's manual, and must remain the same for all burn categories.

#### 11. Narrative

The test report would be required to include a statement that the test was conducted according to the method specified. If there are any deviations from the test procedure requirements, the test report would need to include a section identifying those deviations, the reasons for those deviations, and an evaluation of the data quality implications, if any, of such deviations on the test results.

12. The test report would include a standard summary page as a quick check for the reviewer that results are within method specifications.

13. We propose to require testing with a range of all fuels for which the appliance is designed, per the manufacturer's warranty and owner's manual, to show how emissions and efficiency vary according to species and density and cord wood versus crib wood.

In addition, ASTM has developed a draft test method that uses cord wood rather than crib wood to better represent real world conditions. All stakeholders agree that a test method that better represents real world conditions would be a significant improvement and help ameliorate concerns that some heaters do not perform as well in home use as they do in laboratories. We are also interested in real-time emission test methods that measure cold or warm startup emissions and emission peaks/durations. We are also interested in field test methods and less expensive test methods that regulators and neighbors can use to better quantify impacts in the real world. The EPA is asking for specific comments and data on all these potential methods, issues and recommendations.

The EPA is proposing to rely on the test method that has been developed by the CSA for forced-air furnaces. All CSA standards are developed through a consensus development process approved by the Standards Council of Canada. This process brings together volunteers representing varied viewpoints and interests to achieve consensus and develop a standard. CSA worked for years on development of this test method that has its roots in earlier U.S. efforts on wood heaters/stoves. The current version of CSA B415.1–10 was published in March 2010, and it includes not only the forced-air furnace test method but also new Canadian emission performance specifications for indoor and outdoor central heating appliances.

<sup>20</sup> See footnote 19.

Although the CSA B415.1–10 technical committee included numerous U.S. manufacturers and laboratories, it did not include any states or environmental groups, and the EPA participation was minimal during the development. Now that we have reviewed this method in substantively, we are satisfied that it warrants proposal for this rulemaking. We request specific comments and supporting data. We ask for specific comments on the appropriateness of using the CSA test method in its entirety, including the use of cord wood instead of crib wood that are used in current versions of Method 28 and Method 28 WHH. To review the CSA test method, please go to [www.csa.ca](http://www.csa.ca).

### C. Masonry Heaters

The proposed subpart RRRR would apply to new residential masonry heaters. The provisions apply to each affected unit that is manufactured on or after April 4, 2014. We are proposing that, as of the effective date of the final rule, no person would manufacture or sell a residential masonry heater that does not meet the proposed emission limit of 0.32 lb of PM per MMBtu heat output. We are also proposing a 5-year small volume manufacturer compliance extension that would apply to companies that construct fewer than 15 masonry heaters per year. See section V.C. of this preamble for more discussion of compliance date related issues. We request specific comments on the degree to which these dates can be sooner. As in the case of subpart AAA and subpart QQQQ, we are proposing requirements that would apply to the operator of the masonry heater, including a provision to operate the unit in compliance with the owner's manual; a prohibition on use of certain fuels; and a requirement to use licensed wood pellets or equivalent, if applicable. We are not proposing efficiency or CO standards for new residential masonry heaters at this time because sufficient data are not yet available to support the basis for such standards.

The EPA is proposing to rely on ASTM method E2817–11 for masonry heaters. The laboratories, some states and the masonry heater industry worked for years on drafts of this method that has its roots in earlier regulatory efforts in Colorado. The EPA has participated in the discussions from time to time over the years and has provided comments and suggestions. The current ASTM methods are ASTM E2817–11 “Standard Test Method for Test Fueling Masonry Heaters” and the draft work product ASTM WK26558 “Specification

for Calculation Method for Custom Designed, Site-built Masonry Heaters.” (<http://www.astm.org/DATABASE.CART/WORKITEMS/WK26558.htm>.) We propose that they be used for this rulemaking. We request specific comments on these methods and any changes that should be considered and supporting data for those changes. We request specific comments and supporting emission test data on the use of “Annex A1. Cordwood Fuel” and “Annex A2. Cribwood Fueling.” ASTM is allowing public review, for no charge, of the ASTM test methods and draft work products relevant to this rule at [www.astm.org/epa](http://www.astm.org/epa).

As an alternative to testing, we are proposing that manufacturers of masonry heaters may choose to submit a computer model simulation program, such as ASTM WK 26558 noted above, for the EPA's review and approval. Masonry heater manufacturers and laboratories developed computer simulations as a way to encourage good designs without having to conduct emission tests for slight variations, especially because there are so few masonry heaters built every year per manufacturer. Since these units are built on-site, it is not easy to test each of them. These units are typically cleaner than pre-NSPS certified wood stoves. Considering all of these factors, we believe a simple computer simulation showing how new models would perform may be all that is necessary for many of these models.

The structure of the rest of the proposed new subpart RRRR is similar to the proposed subpart AAA certification and quality assurance process and contains similar requirements for labels, owner's manual, etc. One difference, however, is that for small custom unit manufacturers, we are requiring less stringent quality control (QC) procedures. Specifically, we are proposing that the initial certification for these custom units is sufficient and that no further QC is necessary since each unit is a unique model and subject to certification. We request comment on changes or improvements that might be needed to address special concerns related to certification of masonry heaters.

### IV. Summary of Environmental, Cost, Economic, and Non-Air Health and Energy Impacts

The EPA estimates the proposed NSPS's total annualized average nationwide costs would be \$15.7 million (\$2010) over the 2014 through 2022 period. The economic impacts for

industries affected by this proposed rule over this same period range from 4.3 percent for manufacture of wood heater/stove models to 6.4 percent compliance cost-to-sales estimate for manufacture of single burn rate wood heater models. These impacts do not presume any pass-through of impacts to consumers. With pass-through to consumers, these impact estimates to manufacturers will decline proportionate to the degree of pass-through.

#### A. What are the air quality impacts?

To determine the air quality impacts, we developed emission factors for each appliance type and then applied those emission factors to shipment data for each of the appliance types subject to the proposed NSPS.<sup>21</sup> We developed the emission factors using the EPA Residential Wood Combustion (RWC) emission estimation tool,<sup>22</sup> which is a Microsoft Access database that compiles nationwide RWC emissions using county-level, process-specific data and calculations. The compilation of such data is a large, important, continually improving effort by the EPA and the states to ensure that we and the states have access to the best information available. We summed the estimated nationwide number of appliances and the estimated total tons of wood burned for each of the relevant product categories in the inventory and then made some adjustments/assumptions to the baseline RWC inventory to reflect emission characteristics specific to new units.

We used the resulting subset of the RWC database to calculate an average emission rate per appliance for each category, as follows. First, we multiplied the total tons of wood burned by devices within the category by the category emission factor to calculate the total tons of emissions for each of the pollutants PM<sub>2.5</sub>, VOC and CO emissions for that category. Then we divided these values by the number of appliances in the category to calculate the average emissions of PM<sub>2.5</sub>, VOC and CO per individual appliance. We then developed adjusted emission factors to reflect the NSPS options and then used the adjusted factors to calculate average tons of emissions of each of these three pollutants per appliance for each category.

<sup>21</sup> Memo to Gil Wood, USEPA, from EC/R, Inc. Estimated Emissions from Wood Heaters. February 15, 2013.

<sup>22</sup> [rwc\\_2008\\_tToolv4.1\\_feb09\\_2010.zip](#) available in the docket.

We used data in the Frost & Sullivan Market (F&S) report<sup>23</sup> on 2008 shipments by product category and F&S revenue forecasts, which incorporated the weak economy in years 2009 and 2010, to calculate the reduced number of shipments in years 2009 and 2010. We adjusted these data to include appliances not covered in the F&S report (e.g., forced-air furnaces). For years 2011 through 2038, we estimated shipments based on a forecasted revenue growth rate of 2.0 percent, in keeping with the average annual growth in real gross domestic product (GDP) predicted by the U.S. Bureau of Economic Analysis.<sup>24</sup> Historically wood heater shipments have most closely corresponded to GDP, housing starts, and price of wood relative to gas. We think the overall trend in the projection is reasonable in the absence of additional specific shipment projections. We did not change the relative percentages of one type of residential wood heater versus other types of residential wood heaters over this time period. We ask for comments

and data that would support improved projections.

The next step was to calculate the total emissions per appliance category. First, we multiplied the emission factor for each category by the inventory value of total tons of wood burned by all appliances within that category, and then divided by the number of appliances in the inventory population. The appliance value was then multiplied by the number of units shipped to calculate total emissions from each category per year using the baseline conditions emission factors (i.e., in the absence of a revised NSPS). Using the same procedure, category emissions were then calculated using the emission factors for the proposed NSPS.

Table 7 is a summary of the average emissions reductions over years 2014 through 2022 resulting from implementing the proposed NSPS compared to baseline conditions (for the years analyzed in the RIA). Note that we do not have national emission impacts from masonry heaters because they are

not included in the RWC emission estimation tool. Because of the relatively high cost of emission testing versus the current small number of masonry heaters sold per manufacturer, and in total, there are few emission test data from masonry heater manufacturers and laboratories. Based on the limited data we have, we believe that nationwide emissions from masonry heaters are relatively low, given the low number of sales. Thus, we also believe that the total emission reductions from masonry heaters will be relatively low. However, the limited data we have do show that the emission reductions could be significant for some models that do not follow current best designs, perhaps as high as 70 percent for some designs. We do not know how many of these typically custom-made heaters already use best practice designs versus other designs and thus we do not have nationwide estimates of baseline emissions. We ask for comments and data to help us prepare emission estimates.

TABLE 7—ESTIMATED ANNUAL AVERAGE (2014–2022) AIR QUALITY IMPACTS<sup>25</sup>

Appliance type	PM <sub>2.5</sub> (tons)			VOC (tons)			CO (tons)		
	Baseline	Revised NSPS	Emission reduction	Baseline	Revised NSPS	Emission reduction	Baseline	Revised NSPS	Emission reduction
Wood Heaters	548	385	163	781	551	230	7,857	5,448	2,409
Single Burn Rate Heaters	932	178	754	1,614	244	1,370	7,029	2,860	4,169
Pellet Heaters/Stoves ...	199	150	49	3	2	1	1,035	778	257
Furnace: Indoor, Cord Wood ....	3,044	434	2,610	1,290	184	1,106	20,294	2,896	17,398
Hydronic Heating Systems	1,332	84	1,249	565	35	530	8,883	557	8,326
Total ..	6,055	1,230	4,825	4,253	1,016	3,237	45,098	12,538	32,559

Note: This table only includes the emissions during the first year of the life of each wood heater. That is, this table *does not include* the emissions that continue for the duration of the lifetime of each appliance's use, typically greater than 20 years.

*B. What are the benefits?*

Emission reductions associated with the requirements of this rule will generate health benefits by reducing emissions of PM<sub>2.5</sub>, HAP, as well as criteria pollutants and their precursors, including CO and VOC. VOC are precursors to PM<sub>2.5</sub> and ozone. For this rule, we were only able to quantify the

health co-benefits associated with reduced exposure to PM<sub>2.5</sub> from directly emitted PM<sub>2.5</sub>. Our benefits reflect the average of annual PM<sub>2.5</sub> emission reductions occurring between 2014 and 2022 (inclusive). We estimate the monetized PM<sub>2.5</sub>-related health benefits of the proposed residential wood heaters NSPS in the 2014–2022 timeframe to be \$1,800 million to \$4,100

million (2010 dollars) at a 3-percent discount rate and \$1,700 million to \$3,700 million (2010 dollars) at a 7-percent discount rate. Using alternate relationships between PM<sub>2.5</sub> and premature mortality supplied by

<sup>23</sup> Market Research and Report on North American Residential Wood Heaters, Fireplaces, and Hearth Heating Products Market. Prepared by Frost & Sullivan. April 26, 2010, pp. 31–32.

<sup>25</sup> See footnote 24.

experts, higher and lower benefits estimates are plausible, but most of the expert-based estimates fall between these two estimates.<sup>26</sup> A summary of the emission reduction and monetized

benefits estimates for this rule at discount rates of 3 percent and 7 percent is in Table 8 of this preamble, except for masonry heaters. As requested earlier in this preamble, we

ask for emission and sales data per model that would help us prepare emission reduction estimates and corresponding monetized health benefits for masonry heaters.

**TABLE 8—SUMMARY OF MONETIZED PM<sub>2.5</sub>-RELATED HEALTH BENEFITS FOR PROPOSED RESIDENTIAL WOOD HEATERS NSPS IN 2014–2022 TIMEFRAME**  
[millions of 2010 dollars]<sup>a, b, c</sup>

Pollutant	Estimated emission reductions (tpy)	Total monetized benefits (3% discount rate)	Total monetized benefits (7% discount rate)
Directly emitted PM <sub>2.5</sub> .....	4,825	\$1,800 to \$4,200 .....	\$1,700 to \$3,700.
PM <sub>2.5</sub> Precursors			
VOC .....	3,250	— .....	—

<sup>a</sup> All estimates are for the 2014–2022 timeframe (inclusive) and are rounded to two significant figures so numbers may not sum across rows. The total monetized benefits reflect the human health benefits associated with reducing exposure to PM<sub>2.5</sub> through reductions of PM<sub>2.5</sub> precursors, such as NO<sub>x</sub>, and directly emitted PM<sub>2.5</sub>. It is important to note that the monetized benefits do not include reduced health effects from exposure to HAP, direct exposure to NO<sub>2</sub>, exposure to ozone, VOC, ecosystem effects or visibility impairment.

<sup>b</sup> PM benefits are shown as a range from Krewski, *et al.* (2009) to Lepeule, *et al.* (2012). These models assume that all fine particles, regardless of their chemical composition, are equally potent in causing premature mortality because the scientific evidence is not yet sufficient to allow differentiation of effects estimates by particle type.

<sup>c</sup> The emission reductions and monetized benefits for masonry heaters are not included in this summary.

These benefits estimates represent the monetized human health benefits for populations exposed to less PM<sub>2.5</sub> from emission limits established to reduce air pollutants in order to meet this rule. Due to analytical limitations, it was not possible to conduct air quality modeling for this rule. Instead, we used a “benefit-per-ton” approach to estimate the benefits of this rulemaking. To create the benefit-per-ton estimates, this approach uses a model to convert emissions of PM<sub>2.5</sub> precursors into changes in ambient PM<sub>2.5</sub> levels and another model to estimate the changes in human health associated with that change in air quality, which are then divided by the emissions in specific sectors. These benefit-per-ton estimates were derived using the approach published in Fann *et al.* (2012),<sup>27</sup> but they have since been updated to reflect these studies and population data in the 2012 p.m. NAAQS RIA.<sup>28</sup> Specifically, we multiplied the benefit-per-ton estimates from the “Residential Wood Heaters” category by the corresponding emission reductions.<sup>29</sup> All national-

average benefit-per-ton estimates reflect the geographic distribution of the modeled emissions, which may not exactly match the emission reductions in this rulemaking, and thus they may not reflect the local variability in population density, meteorology, exposure, baseline health incidence rates, or other local factors for any specific location. More information regarding the derivation of the benefit-per-ton estimates for this category is available in the technical support document, which is referenced in the footnote below and is available in the docket.

These models assume that all fine particles, regardless of their chemical composition, are equally potent in causing premature mortality because the scientific evidence is not yet sufficient to allow differentiation of effects estimates by particle type. Even though we assume that all fine particles have equivalent health effects, the benefit-per-ton estimates vary between precursors depending on the location and magnitude of their impact on PM<sub>2.5</sub>

levels, which drive population exposure.

It is important to note that the magnitude of the PM<sub>2.5</sub> benefits is largely driven by the concentration response function for premature mortality. We cite two key empirical studies, one based on the American Cancer Society cohort study<sup>30</sup> and the extended Six Cities cohort study.<sup>31</sup> In the Regulatory Impact Analysis (RIA) for this rule, which is available in the docket, we also include benefits estimates derived from expert judgments (Roman *et al.*, 2008) as a characterization of uncertainty regarding the PM<sub>2.5</sub>-mortality relationship.

Considering a substantial body of published scientific literature, reflecting thousands of epidemiology, toxicology, and clinical studies, the EPA’s Integrated Science Assessment for Particulate Matter<sup>32</sup> documents the association between elevated PM<sub>2.5</sub> concentrations and adverse health effects, including increased premature mortality. This assessment, which was

reviewed twice by the EPA's independent Science Advisory Board, concluded that the scientific literature consistently finds that a no-threshold model most adequately portrays the PM-mortality concentration-response relationship. Therefore, in this analysis, the EPA assumes that the health impact function for fine particles is without a threshold.

In general, we are more confident in the magnitude of the risks we estimate from simulated PM<sub>2.5</sub> concentrations that coincide with the bulk of the observed PM concentrations in the epidemiological studies that are used to estimate the benefits. Likewise, we are less confident in the risk we estimate from simulated PM<sub>2.5</sub> concentrations that fall below the bulk of the observed data in these studies. Concentration benchmark analyses (e.g., lowest measured level [LML] or one standard deviation below the mean of the air quality data in the study) allow readers to determine the portion of population exposed to annual mean PM<sub>2.5</sub> levels at or above different concentrations, which provides some insight into the level of uncertainty in the estimated PM<sub>2.5</sub> mortality benefits. There are uncertainties inherent in identifying any particular point at which our confidence in reported associations becomes appreciably less, and the scientific evidence provides no clear dividing line. However, the EPA does not view these concentration benchmarks as a concentration threshold below which we would not quantify health benefits of air quality improvements.

For this analysis, policy-specific air quality data are not available. Thus, we are unable to estimate the percentage of premature mortality associated with this specific rule's emission reductions at each PM<sub>2.5</sub> level. As a surrogate measure of mortality impacts, we provide the percentage of the population exposed at each PM<sub>2.5</sub> level using the source apportionment modeling used to calculate the benefit-per-ton estimates for this sector. Using the Krewski, *et al.* (2009) study, 93 percent of the population is exposed to annual mean PM<sub>2.5</sub> levels at or above the LML of 5.8 µg/m<sup>3</sup>. Using the Lepeule, *et al.* (2012) study, 67 percent of the population is exposed above the LML of 8 µg/m<sup>3</sup>. It is important to note that baseline exposure is only one parameter in the health impact function, along with baseline incidence rates, population, and change in air quality. Therefore, caution is warranted when interpreting the LML assessment for this rule because these results are not consistent with results from rules that had air quality modeling.

Every benefit analysis examining the potential effects of a change in environmental protection requirements is limited, to some extent, by data gaps, model capabilities (such as geographic coverage) and uncertainties in the underlying scientific and economic studies used to configure the benefit and cost models. Despite these uncertainties, we believe the benefit analysis for this rule provides a reasonable indication of the expected health benefits of the rulemaking under a set of reasonable assumptions. In addition, we have not conducted air quality modeling for this rule, and using a benefit-per-ton approach adds another important source of uncertainty to the benefits estimates. The 2012 PM<sub>2.5</sub> NAAQS benefits analysis provides an indication of the sensitivity of our results to various assumptions.

One should note that the monetized benefits estimates provided above do not include benefits from several important benefit categories, including exposure to HAP, VOC and ozone exposure, as well as ecosystem effects and visibility impairment. Although we do not have sufficient information or modeling available to provide monetized estimates for these benefits in this rule, we include a qualitative assessment of these unquantified benefits in the RIA <sup>33</sup> for this proposal.

For more information on the benefits analysis, please refer to the RIA for this rule, which is available in the docket.

### C. What are the cost impacts?

In analyzing the potential cost impacts of the proposed NSPS, we considered two types of impacts. The first was the impact to the manufacturer to comply with the proposed standards. The second was the increase in price of the affected unit. In both of these cases, we considered the same input variables: R&D cost to develop and certify complying model lines, certification costs (where these are separate from R&D), reporting and recordkeeping costs, numbers of shipments of each appliance category (modified, from Frost & Sullivan report), number of manufacturers, and number of models per manufacturer. This section of the preamble contains a summary of these costs. For more detailed information, see the manufacturer cost impact

memo <sup>34</sup> and unit cost memo <sup>35</sup> in the docket. Unless otherwise specified, all costs are in 2010 dollars.

To develop average R&D costs, we reviewed information provided by manufacturers. Based on this information, we estimated <sup>36</sup> average costs to develop a new model line, including testing, of 356,250 for certified wood heaters and pellet heaters/stoves. We also assumed 356,250 for single burn rate wood heaters, which may be high if currently available units can meet the standards without significant modifications as some manufacturers have suggested. We also assumed development costs for forced-air furnaces and hydronic heaters of 356,250. Finally, we also assumed development costs of 356,250 for the masonry heaters. The estimates of the cost of R&D are crucial to our estimates of overall costs and economic impacts and greatly influence our decisions on BSE, implementation lead times and small volume provisions. Thus, we request specific comments on these estimates, including whether they should be reduced and thus allow greater emission reductions sooner.

We annualized the R&D costs over 6 years, applied the NSPS implementation assumptions, and estimated the average manufacturing cost per model line per manufacturer. Under the proposed rules, pellet heaters/stoves will only face certification (testing) costs (no R&D should be required), so we estimated certification costs of 10,000 per model line. Similarly, many masonry heater model lines that would comply with the proposed standards have already been developed. These manufacturers would also face certification costs of 10,000 per model line. We estimated post R&D period certification costs for hydronic heaters and forced-air furnaces at 20,000 per model line.

The masonry heater compliance costs included implementation of a software package based on a European masonry heater design standard. This software has been verified in the laboratory and under field conditions to produce masonry heaters that would meet the proposed NSPS emission limits. The cost of this software to the user is approximately \$1,500 for the package with an approximately \$450 annual fee

<sup>34</sup> Memo to Gil Wood, USEPA, from EC/R, Inc. Residential Heater Manufacturer Cost Impacts. February 22, 2013.

<sup>35</sup> Memo to Gil Wood, USEPA, from EC/R, Inc. Unit Cost Estimates of Residential Wood Heating Appliances. February 21, 2013.

<sup>36</sup> In developing average R&D costs, the EPA used the highest industry R&D estimates supplied, in order to avoid under-estimating potential costs per model line and to avoid understating the number of model lines that would undergo R&D nationwide.

<sup>33</sup> Regulatory Impact Analysis (RIA) for Residential Wood Heaters NSPS. [INSERT DATE RULE IS SIGNED].

that commences in the second year following purchase. In addition, we believe that some manufacturers will use this approach to demonstrate that “similar” model designs meet the proposed emissions standards.

The estimate of the number of model types was derived from information provided by HPBA, individual manufacturers, and Internet searches of

product offerings. For numbers of manufacturers, we started with HPBA data and modified the dataset based on Internet searches of manufacturers of the major appliance types. Table 9 is a summary of the nationwide average annual NSPS-related cost increases to manufacturers. The average annual cost increases are presented over the 2014 to 2022 period consistent with the years

analyzed in the RIA,<sup>37</sup> as well as over the 2013 to 2038 period. The 2013 to 2038 period encompasses the first year of estimated NSPS-related costs (2013 since some companies have already started in anticipation of the NSPS) through the life span of models designed to meet the NSPS, as explained further below and in our background analyses.<sup>38</sup>

TABLE 9—SUMMARY OF NATIONWIDE AVERAGE ANNUAL COST INCREASES [2010\$]

Appliance Type	2014–2022 Period	2013–2038 Period
Wood Heaters .....	\$4,212,303	\$1,749,726
Single Burn Rate Heaters .....	901,732	456,316
Pellet Heaters/Stoves .....	3,460,489	1,702,796
Forced-Air Furnaces .....	2,252,284	1,171,222
Hydronic Heating Systems .....	4,554,152	2,221,551
Masonry Heaters .....	307,511	228,896
<b>Total Average Annual Cost .....</b>	<b>15,688,471</b>	<b>7,530,507</b>

To develop estimates of potential unit cost increases, we used major variables including the estimated number of units shipped per year, the costs to develop new models, baseline costs of models, and the schedule by which the proposed revised NSPS would be implemented. Both the number of shipped units and the baseline costs of models were based on data from the Frost & Sullivan report with modifications to address additional appliances or subsets of appliances. The 20-year model design life span and 20-year use/emitting appliance life span are based on actual historical design certification and heater use data. That is, the data show that many models developed for the current 1988 NSPS are still being sold (after 25 years), many “new” models still have the same internal working parts with merely exterior cosmetic changes, and most residential wood heaters in consumer homes emit for at least 20 years and often much longer. Therefore, our analysis tracks shipments and costs through year 2038 (*i.e.*, 19 years after a model designed to meet the NSPS Step 2 emission limits expected to be implemented in 2020 has completed development and is shipped). Finally, we also estimated the potential additional manufacturing costs to make NSPS complying models. These expenses result from the use of more

expensive structural materials, components to enhance good combustion, etc. We estimated the following additional manufacturer price increases per unit based on appliance type:

- Certified wood heaters and pellet heaters/stoves represent a well-developed technology, and we could not identify price differences between models due solely to lower emission levels compared to models with higher emission levels. Rather, price differences are more closely related to cosmetic differences and output. Therefore, we have assumed no additional manufacturing costs.
- One manufacturer estimated that it will cost an average of 100 more to manufacture a lower emitting single burn rate product.
- We have seen a range of estimates for additional price increases for manufacture of a cleaner hydronic heater, with an average being approximately 3,000 (as compared to a typical pre-regulation sales price of 7,500).
- We estimate that the additional price increases to manufacture a certified forced-air furnace will be comparable to the price increases for manufacturing certified hydronic heaters, *i.e.*, \$3,000 (as compared to a typical pre-regulation price of \$900).

Our next step was to develop the following incremental cost formula: Cost of R&D multiplied by number of units shipped per year divided by number of models multiplied by model life equals the incremental cost of developing a new unit, spread over the number of units expected to be sold during the model life. In developing this calculation, we included the concept that the R&D costs per model line are recovered in the sales price of future models, which means that the more units that are sold or the longer the model life, the lower the incremental cost per unit. For our unit cost analysis, we assumed a flat growth rate in shipments—that is, we assumed future shipments over the 20 years of model design life would be equal to the shipments estimated in the first NSPS compliance year. We did not assume lower sales due to market competition with other wood heaters or non-wood heaters. We did not assume lower projected sales for increased prices because of the uncertainty of other demand factors. Where there are additional manufacturing costs as discussed above, we added these to the unit cost number. Table 10 is a summary of the baseline unit costs, NSPS unit costs, and incremental cost increase.

<sup>37</sup> See footnote 36.

<sup>38</sup> Memo to Gil Wood, USEPA, from EC/R, Inc. Residential Heater Cost Effectiveness Analysis. February 26, 2013.

TABLE 10—SUMMARY OF UNIT COST IMPACTS  
[2010\$]

Appliance type	Baseline	Post-NSPS	Incremental increase
Certified Wood Heaters .....	\$859	\$883	\$24
Single Burn Rate Heaters .....	253	479	226
Pellet Heaters/Stoves .....	1,295	1,319	24
Forced-Air Furnaces .....	912	4,174	3,262
Masonry Heaters .....	9,157	9,245–9,997	88–840
Hydronic Heating Systems .....	7,528	13,986	6,458

We request specific comments on these estimates, which significantly affect the estimates of costs per model lines and per unit sold and potential changes in sales and, thus, affect decisions on the affordability of candidate BSER. For example, if the number of model lines was less and the number of heaters per model line was greater, then the cost per unit sold would be less and more stringent options for BSER could potentially be implemented sooner.

#### D. What are the economic impacts?

The economic impacts of the proposed rule are estimated using industry-level estimates of annualized compliance cost to value of shipments (receipts) for affected industries. In this case, cost-to-receipts ratios approximate the maximum price increase needed for a producer to fully recover the annualized compliance costs associated with a regulation. Essentially, the revenues to producers will likely fully cover the annualized compliance cost incurred by producers at this maximum price increase. Any price increase above the cost-to-receipts ratio provides revenues that exceed the compliance costs. These industry level cost-to-receipts ratios can be interpreted as an average impact on potentially affected firms in these industries. Cost-to-receipts ratios for the affected product types range from 2.3 percent for pellet heaters/stoves up to 6.4 percent for single burn rate wood heaters for the proposed option. More information on how these impacts are estimated can be found in Chapters 5 and 6 of the RIA. In estimating the net benefits of regulation, the appropriate cost measure is “social costs.” Social costs represent the welfare costs of the rule to society. We believe that the social costs are best approximated by the compliance costs estimated for this rule. Thus, the annualized social costs for this proposal are best estimated to be \$15.7 million for the proposed option, based on the estimate of costs to manufacturers for the proposal and assuming no cost pass-through to consumers. More information

on how these social costs are estimated can be found in Chapter 5 of the RIA.

#### E. What are the non-air quality health and energy impacts?

These proposed NSPS are anticipated to have no impacts or only negligible impacts on water quality or quantity, waste disposal, radiation or noise. To the extent new NSPS models are more efficient, that would lead to reduced wood consumption, thereby saving timber and preserving woodlands and vegetation for aesthetics, erosion control, carbon sequestration, and ecological needs.

It is difficult to determine the precise energy impacts that might result from this proposed rule. On the one hand, to the extent that the NSPS wood-fueled appliance is more efficient, energy outputs per mass of wood fuel consumed will rise. However, wood-fueled appliances compete with other biomass forms as well as more traditional oil, electricity, and natural gas. We have not determined the potential for consumers to choose other types of fuels and their associated appliances if the consumer costs of wood-fueled appliances increase and at what level that increase would drive consumer choice. Similarly, we have not determined the degree to which better information on the energy efficiency of the NSPS appliances will encourage consumers to choose new wood-fueled appliances over other new appliances.

#### V. Rationale for Proposed Amendments

##### A. Why are we proposing to expand the scope of appliances subject to the NSPS?

As described in section II, the EPA has had ongoing discussions with many stakeholders regarding the need to expand the scope of the current residential wood heater regulation. Stakeholders described adverse health and environmental impacts arising from the increasing use of some appliances, actions taken at the state and local levels to address such concerns, and growth in types and numbers of

appliances that are currently on the market. Numerous states (e.g., Vermont, New York, Maine, Michigan, Minnesota) have indicated to us that individuals’ concerns about smoke from residential wood burning, particularly by hydronic heaters, are the top source of environmental complaints. In the case of masonry heaters, we believe EPA certification of these typically cleaner devices, would allow them to be excellent emission reduction alternatives to replace pre-NSPS wood heaters and be a good consumer alternative in parts of the country that currently ban uncertified appliances (contingent upon approval by the local jurisdiction). We also saw a need to address the residential heating market in a way that recognizes that some heaters and fuels are substitutes for each other. Regulating only one type of heater may result in unintended incentives for consumers to favor purchase and use of unregulated and potentially higher emitting devices. We felt a comprehensive assessment was needed. Therefore, as part of the NSPS review process, we evaluated a wide range of residential biomass heating devices and non-heating devices (such as cook stoves and fireplaces) to determine what expansions in scope might be needed.<sup>39</sup>

The residential wood heaters NSPS is a “standard of performance” as defined by section 111(a) of the CAA. The term “standard of performance” means a “standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any non-air quality health and environmental impacts and energy requirements) the Administrator determines has been adequately demonstrated.” As discussed earlier, the level of control prescribed by section 111 historically has been commonly referred to as “Best Demonstrated

<sup>39</sup> Subpart AAA—Standards of Performance for New Residential Wood Heaters: Revised Draft Review Document. Prepared for EPA by EC/R Incorporated. December 30, 2009.

Technology” or BDT. To better reflect that section 111 was amended in 1990 to clarify that “best systems” may or may not be “technology,” the EPA is now using the term “best systems of emission reduction” or BSER. As previously with BDT, in determining BSER, the EPA uses available information and considers the emissions reductions and incremental costs for different systems available at reasonable cost. The residential wood heaters source category is mass-produced residential consumer products, fundamentally different from the typical NSPS source category that regulated industrial processes. Thus, for the residential wood heaters source category important elements in determining BSER include the significant costs and environmental impacts of delaying production and sales while models with those systems are being designed, tested, field evaluated, and certified. The EPA determines the appropriate emission limits representative of BSER. After the emission limits are established, in general, the source may use whatever systems meet the emission limits. In developing the proposed rule, we evaluated possible systems both at baseline conditions (conditions in the absence of additional regulation) and under other scenarios. In most cases, candidate BSER for residential wood heaters is based on improved combustion techniques, primarily improvements in model-specific combinations of time, temperature, and turbulence. That is, the improved combustion models have greater airflow residence time, better insulation to increase temperatures, and passageways and directed flows to improve mixing and turbulence. In addition, some heaters also use catalytic combustors to reduce emissions. Each manufacturer has a potential myriad of combinations of specific designs that could incorporate these key aspects. Many systems reduce emissions significantly, increase efficiency, and provide good operator flexibility. The key differences tend to be confidential business information as to the specifics of the combination that the manufacturer uses and does not share with other manufacturers but rather holds as proprietary. Similarly, the industry trade association cannot facilitate exchange of such information because of antitrust regulations. Because each appliance type has a potentially unique emissions profile, market niche, and manufacturer profile, we made BSER determinations for each heater type, as described below.

For certain types of devices, information is lacking. For example, we have no information or very limited information on emissions and emission reduction techniques for cook stoves, pizza ovens, chimineas, coal stoves and biomass (other than wood or wood pellet) stoves/furnaces (e.g., fueled with grass, corn, cherry pits). We are interested in receiving data for contributions to air quality, endangerment of public health and welfare, emissions, potential emission reductions, costs, prices, and sales of coal stoves and biomass stoves because we believe we do not have sufficient information at this time to list these sources under section 111(b) and develop proposed standards. For example, usage rates of some of these appliances are limited both in numbers of new units and in the number of markets they occupy. Also, some stakeholders have stated that use of coal stoves is more common in some coal mining regions, where the consumer may have access to free or cheap coal, but such stoves are not typically used in other areas. We request data on any of these appliances that might help us potentially develop national programs or standards for these devices in the future.

We are also deferring any regulatory action addressing emissions from wood-burning fireplaces at this time. Fireplaces typically are not designed to be “wood heaters” and thus are not within the current scope of the “residential wood heater” source category listed on February 18, 1987, pursuant to the authority of section 111(b). (Fireplaces are typically used for ambience and most of the heat content of the wood is lost out the chimney with the relatively large amounts of excess combustion air rather than heating the room. For effective heating, some homeowners have inserted a new EPA certified wood stove into an otherwise open masonry fireplace. In those cases, new wood heaters/stoves are regulated under the current 1988 rule and would be regulated by this proposal. Also, some fireplaces have restricted excess combustion air to less than 35:1 air-to-fuel ratio and are certified under the current 1988 NSPS.) Fireplaces are addressed in the current EPA voluntary partnership program that encourages the development and sale of lower-emitting wood-burning fireplaces over the sale of higher-emitting fireplaces. The EPA’s fireplace program covers new masonry and prefabricated (low-mass) fireplaces and retrofit devices for existing fireplaces. See the voluntary partnership program Web site for more information:

[www.epa.gov/burnwise/participation.html#fireplace](http://www.epa.gov/burnwise/participation.html#fireplace). We request comments and additional data on contributions to air quality, endangerment of public health and welfare, emissions, potential emission reductions, costs, prices, and sales of fireplaces. We request data that might help us potentially develop new or revised national programs or a source category listing and standards under section 111(b) for these devices in the future. We are especially interested in data on current and projected sales of new wood-burning fireplaces versus gas-fired fireplaces, current and projected usage patterns for new fireplaces versus existing fireplaces, current and projected quantities of wood burned per existing and new fireplaces, current and projected best systems of emission reduction for new fireplaces versus existing fireplaces and costs of current and projected best systems versus current costs of fireplaces. Also, we are interested in national data and how these data vary by state and local areas.

*B. How did we determine BSER and the proposed emission standards?*

As discussed earlier in this preamble, the proposed subparts AAA, QQQQ, and RRRR recognize that the sources covered by these subparts are fundamentally different from the typical NSPS source category in that residential wood heaters are mass-produced residential consumer products whereas most NSPS regulate industrial processes. Discussions in sections V.B.1 through V.B.4 of this preamble focus on the analysis of PM emission reductions under our proposed two-step phased-in standards for each appliance type affected by this proposal. In general, for this rulemaking, we have determined that the proposed first step represents the emission levels that almost all models can readily achieve now using today’s designs and technology. Further, we have determined that the proposed second step represents stronger emission levels achievable for all appliance types at reasonable cost, but allows appropriate lead times for manufacturers to redesign their model lines to accommodate the improved technology across multiple model lines and test, field evaluate, and certify the new model lines. See section V.B.5 for a discussion of the Alternative Approach we considered to reduce PM emissions based on three-step phased-in standards, under which the strongest emission standard would be 8 years after the effective date of the final rule rather than the proposed 5 years. Section V.B.6 discusses other provisions

we considered and for which we request additional data and information from commenters.

For these source categories, our BSER determination rests on: (1) the achievability of the proposed emission levels (*i.e.*, the fact that top-performing models for each appliance type are already achieving the proposed emission levels); and (2) the cost effectiveness of the proposed standards when considering the design life span and the emitting life span of the appliances in residences. The net monetized benefits of the proposal far exceed the costs for all options considered. Realistic model design and appliance emitting life span assumptions are essential components for a meaningful cost effectiveness analysis. As explained above in section IV.C. and in our background documentation,<sup>40</sup> a model design life

span of 20 years is supported by the historical data that show that the non-cosmetic aspects of wood heaters designed to meet the 1988 NSPS are still being used today in some model lines. While some manufacturers may choose to make more frequent cosmetic changes to their models, the internal design changes a manufacturer must make to a wood heater model line to comply with the NSPS are longer lasting. Furthermore, once installed in consumer homes, wood heaters emit for at least 20 years and many are operated in residences for much longer time periods (a key fact motivating wood heater/stove changeout programs). Once purchased, consumers tend to only replace appliances when they no longer serve their functional purpose. Wood heaters tend to serve the basic function of producing heat for well over 20 years.

Table 11 presents our estimated cumulative costs, PM<sub>2.5</sub> emission reductions, and associated cost per ton for our proposed limits, based on a model design life span of 20 years and an appliance emitting life span of 20 years.

For all of the standards proposed in this **Federal Register** notice, the EPA invites specific comments on the data and analyses on which we base the proposed standards. Moreover, the EPA invites specific comments that provide additional data and analyses that would support a different standard. Interested persons should note that the EPA will consider promulgating a more stringent or less stringent standard than what we are proposing for any of these categories, if the record contains data or analyses that support a different standard.

TABLE 11—COST EFFECTIVENESS OF PM<sub>2.5</sub> EMISSION REDUCTIONS OF PROPOSED STANDARDS AND EMISSION CO-REDUCTIONS BASED ON CUMULATIVE ANALYSIS [2013–2057]<sup>41</sup>

Appliance type	Nationwide cumulative cost (2010\$)	PM <sub>2.5</sub> reductions		VOC Co-Reductions		CO Co-Reductions	
		Cumulative emission reduction (tons)	Cost per ton (2010\$)	Cumulative emission reduction (tons)	Cost per ton (2010\$)	Cumulative emission reduction (tons)	Cost per ton (2010\$)
Cord Wood Stoves ..... Single Burn Rate	\$45,492,874	96,523	\$471	136,293	\$334	1,426,240	\$32

\* NOTE: Masonry Heaters are not included in this analysis because representative emission tons per appliance could not be determined.

1. Room Heaters

The current subpart AAA definition of “wood heater” specifies certain conditions, including that affected sources are those that have an air-to-fuel ratio of less than 35:1. As part of the regulatory negotiation for the current 1988 NSPS, the EPA included the air-to-fuel criterion in the rule primarily to exclude typical fireplaces from the affected source definition. An unintended side effect, however, is that it also resulted in the exclusion of the majority of pellet heaters/stoves. Also included in the current 1988 NSPS definition of “wood heater” is an exclusion of heaters that have a minimum burn rate of greater than 5 kg/

hr. The definition and test methods had the effect of excluding a large number of single burn rate wood heaters. As described below, we are proposing to change the applicability of subpart AAA to include all three types of “room heater” appliances: adjustable burn rate wood heaters, pellet heaters/stoves and single burn rate wood heaters. Our intent is that this rule will be stated in broad enough terms to regulate any future room heater appliances that may come into the U.S. market and function as room heaters.

a. Adjustable Burn Rate Wood Heaters

Adjustable burn rate wood heaters include freestanding heaters and heaters modified to fit within a firebox

(sometimes called fireplace inserts). These units were the primary focus of the 1988 NSPS and are subject to current NSPS limits of 7.5 g/hr for noncatalytic heaters and 4.1 g/hr for catalytic heaters. As discussed in the February 26, 1988, final rule (53 FR 5865) and earlier in this preamble, the EPA considered the performance of catalytic heaters and noncatalytic heaters co-BDT (now called BSER) because the net emissions over time were estimated to be similar (even though the initial certification test results are typically lower for catalytic models) assuming possible degradation of the catalyst and lack of catalyst replacement by the operator. The EPA considered requiring catalyst

<sup>40</sup> See footnotes 24, 36 and 38.

<sup>41</sup> Analysis period assumes that manufacturers will incur R&D costs beginning in 2013, in anticipation of final rule. Analysis is 2013 through 2057, based on assumption that the internal

emission-related components of a model designed to meet the proposed Step 2 emission limit will be manufactured/shipped for 20 years, and shipped models will emit in residences for another 20 years. See footnotes 24, 36 and 38. PM<sub>2.5</sub>, VOC and CO

costs per ton are calculated independently for illustrative purposes, even though VOC and CO reductions would actually occur with no additional cost as the PM<sub>2.5</sub> reductions are achieved.

replacement on a regular schedule, but determined that enforcement of such a requirement would be difficult. The EPA did require manufacturers to provide 2-year unconditional warranties on the catalysts and prohibited the operation of catalytic heaters/stoves without a catalyst. Additionally, because of these concerns, the EPA wanted to ensure that further development of both noncatalytic and catalytic technology would continue.

Since the 1988 NSPS was developed, the state of Washington issued standards in 1995 imposing limits of 4.5 g/hr for noncatalytic heaters and 2.5 g/hr for catalytic heaters. In developing the proposed revisions to the NSPS, we evaluated and identified these “improved” catalytic and noncatalytic systems and associated emission levels as the proposed Step 1. This analysis showed that the state of Washington level of 4.5 g/hr is achieved by 107 out of 121 (88 percent) of the EPA-certified adjustable burn rate wood heater models in production and sold in the U.S. today (noncatalytic and catalytic models combined). This statistic includes 92 of the 106 certified noncatalytic wood heater models (87 percent) and 15 of the 15 certified catalytic models (100 percent). The median certification value for noncatalytic models was 3.2 g/hr and for all certified models was 3.4 g/hr. Details of the analysis are in the docket.<sup>42</sup>

For the proposed Step 2 (5 years after the effective date of the final standard), we considered “state-of-the-art” systems that achieve a certification value of 1.3 g/hr (using crib wood as the test fuel as specified in Method 28 as required by the 1988 NSPS). This is approximately 50 percent less than the 1995 state of Washington standard for catalytic models (2.5 g/hr). The EPA certification test data show that a level of 1.3 g/hr is achieved by 27 adjustable burn rate wood heater models as of December 2013. This includes 11 certified noncatalytic wood heater models and 16 certified catalytic models. There were no apparent break points other than the current state of Washington initial certification level of 4.5 g/hr for noncatalytic heaters. That is, the distribution of certification values was relatively linear with no step functions other than at the state of Washington level of 4.5 g/hr. We ask for comments and emission test data using cord wood to help us determine if the proposed emission levels should be adjusted for

any differences between crib wood and cord wood.

This source category is fundamentally different from the typical NSPS source category composed of industrial processes. This source category involves the manufacture and sale of mass-produced residential consumer products that are significantly affected by production and sales volumes and timing of testing and certification. Thus, we are proposing implementing the proposed Step 2 BSEER emission limit 5 years after the effective date of the final standard to allow for longer lead times for redesign, testing, field evaluation and certification. This also spreads the costs over a longer time and a larger number of units. The intent behind the proposed Step 2 BSEER emission limit is to recognize that current state-of-the-art level of performance appears to be significantly better than the state of Washington limit of 4.5 g/hr met by over 85 percent of the heaters sold today on a sales-weighted basis (*i.e.*, 92 out of 106 noncatalytic models and 15 out of 15 catalytic models), and furthermore better than the state of Washington catalytic limit of 2.5 g/hr for over 25 percent of the adjustable burn rate wood heaters sold in the U.S. today (*i.e.*, 20 out of 106 or approximately 19 percent of noncatalytic models and 13 out of 15 or approximately 87 percent of catalytic models). As noted earlier and discussed more fully in the paragraphs below, our decisions on BSEER for this source category have fully considered not only the emission performance but also the cost and economic impacts, including the costs to accommodate the best systems in additional model lines. The net monetized benefits far exceed the costs of all options considered.

The cost impacts of the proposed Step 1 are very small. This is because, despite being a limit that was originally developed for only one state, over 85 percent of currently EPA-certified noncatalytic and catalytic heaters that are in active production already meet the state of Washington initial certification test values. We also believe production of any certified heaters that do not meet the proposed Step 1 standard would be discontinued, as manufacturers would likely focus on models that already comply with the proposed standard in the short term. While implementing the proposed Step 1 standard would not impose any significant additional costs on most of the manufacturers, it also would not achieve a large amount of new emissions reductions for most of the models. However, implementing an emission standard associated with the proposed Step 1 would have the benefit of ensuring consistent nationwide

standards and ensuring that the remaining 15 percent of non-complying adjustable burn rate wood heater models could no longer be sold. It would also ensure that wood heater/stove changeout programs aimed at reducing emissions from old, pre-NSPS or pre-state of Washington heaters/stoves would result in replacement models that meet the state of Washington levels or better.

The proposed Step 1 limit eliminates the distinction between catalytic and non-catalytic heater models, which we view as progress. It is important to remember that the lower emission level catalytic standards were initially instituted because of concerns that the early generation catalysts would degrade over time, resulting in eventual real world emission levels comparable to non-catalytic units. After 25 years of catalyst heater development experience, manufacturers have demonstrated that the performance of these heaters typically remains consistently good over the course of proper operation because of changes manufacturers have made to improve heater design to protect the catalysts from flame impingement and other factors that previously caused catalysts to degrade significantly. For example, one recent study of four catalytic combustors from the two selected heaters/stoves showed that the combustors maintained substrate integrity without substantial PM emissions performance reduction.<sup>43</sup> Therefore, establishing a separate limit to accommodate “degradation” seems to create a distinction where none exists and adds unnecessary confusion to the overall regulation.

We recognize that there may be concern that a single limit based on the Washington State non-catalytic limit could result in “backsliding” of current catalytic heater models. We think that the likelihood of actual backsliding is extremely low because of other factors driving the wood heater market. Given the pending implementation of the proposed Step 2 limits described below and that some manufacturers have heaters that already achieve Step 2, all manufacturers would have market incentives to improve performance as soon as possible rather than degrade performance. Also, with consumer education regarding the impacts of PM emission levels, we believe that consumer pressure will favor better performing units that in general are more energy efficient and lower

<sup>42</sup> Attachment A of Residential Wood Heaters Manufacturer Cost Memorandum to Gil Wood, USEPA, from EC/R Inc. February 22, 2013.

<sup>43</sup> The Interim Wood Stove Catalytic Combustor Longevity Study, Prepared for the Catalytic Hearth Coalition by L. Pitzman *et al.*, OMNI Environmental Services. January 4, 2010.

emitting at reasonable cost, especially as they compare wood heaters and gas heaters. However, we are requesting comments on whether we should maintain a separate, lower limit for catalytic heater models for the proposed Step 1 emission limits, based on the current state of Washington catalytic standard of 2.5 g/hr.

The proposed Step 2 state-of-the-art BSER cost and economic impacts would be significant, but our analysis shows a very reasonable cost per ton of emission reduction when considering the typical design and appliance life spans.<sup>44</sup> Our data show that at the proposed Step 2 BSER emission level of 1.3 g/hr, about 20 percent of catalytic models and 5 percent of noncatalytic models currently manufactured would already comply with the proposed Step 2 standard. Thus, manufacturers would need to either modify noncomplying lines or develop new ones to continue production for approximately 95 percent of the current market. Some unknown fraction of manufacturers may be able to switch some of their production from noncomplying models to complying models. Because we do not know this fraction, because the total of complying units is only 6 percent (combined catalytic and non-catalytic models) at this time, and because many manufacturers have no complying models at this time, we have assumed this fraction to be zero for our analysis. Historically, those manufacturers that chose to comply with the 1988 NSPS did so for a full range of models. Thus, our analysis shows the potential emission and cost impacts for the approximately 95 percent of adjustable burn rate wood heater models projected to undertake R&D needed to develop the heater-specific combinations of time, temperature, and turbulence to achieve higher efficiencies and lower (proposed Step 2 compliant) emissions. That is, although the manufacturers know the factors that are important for good combustion and low emissions, they still need to develop and test the laboratory-specific combinations that can be incorporated into the design of specific model lines. Alternatively, some manufacturers might convert noncatalytic models to catalytic models or hybrids as ways to reduce emissions.

We estimated the resulting nationwide costs based on the cost assumptions explained in section IV.C. The average annual cost increase to manufacturers of adjustable burn rate wood heaters during the 2014 through 2022 period analyzed in the RIA is approximately \$4.2 million. Estimated

nationwide annual PM<sub>2.5</sub> emissions, averaged over this same period (2014–2022), are projected to be 548 tons/year under baseline conditions versus 385 tons/year under the proposed two-step BSER, an average reduction of 163 tons/year, considering only the first year of emissions for each new heater sold. Given that limited snapshot for these cost and emission estimates, the average cost of reducing each new ton of PM<sub>2.5</sub> emissions during the 2014–2022 period would be approximately \$26,000 per ton annually. As explained in section IV.C, the cost-to-sales ratio, which is an indicator of the ability of the manufacturer to successfully absorb the regulatory impacts, is high at 4.3 percent. However, when considering the total costs and cumulative emission reductions over the more representative full model design life span and appliance emitting life span of 20 years; the overall cost effectiveness is approximately \$500 per ton (shown above in Table 11).<sup>45</sup>

Given the reasonable cost effectiveness of imposing the two-step BSER when considering total costs and cumulative emission reductions, and given the 6-year lead time (from the date of these proposed standards) until models must meet the proposed Step 2 emission limit, we determined that the two-step phased-in emission limits represent BSER for these residential consumer product appliances at this time. Thus, we are proposing a two-step standard for adjustable burn rate wood heaters, in which Proposed Step 1 is required upon the effective date of the final rule and Proposed Step 2 is required 5 years after the effective date of the final rule. Section V.B.5 discusses a three-step alternative approach that we also considered for adjustable burn rate wood heaters, and on which we are seeking comment.

We note that there have been some technical questions associated with measuring the emission levels associated with the proposed Step 2, which we are addressing in this proposed rule. That is, the currently available laboratory proficiency test results cast some doubt on the reproducibility of test results at lower levels of the standard for the current EPA Test Method 28. An HPBA analysis<sup>46</sup> found that the repeatability and reproducibility of the current test method for wood heater emissions, as demonstrated by the EPA-accredited

laboratory proficiency test data, may be poor based on the scope of their analysis. Their analysis stated:

- “At the 95-percent confidence level, repeatability for the EPA weighted average emission rate is at best  $\pm 2.9$  g/hr and ranged as high as  $\pm 5.4$  g/hr.”
- “The reproducibility was no better than  $\pm 4.5$  g/hr and ranged as high as  $\pm 6.4$  g/hr.”

We believe some mitigating factors are not accounted for in their analysis, such as the lack of regulatory requirements or incentives for the test laboratories to achieve highly reproducible results in proficiency testing (*i.e.*, the laboratories are not required to meet a certain proficiency level; they are not paid for the proficiency tests, but rather they absorb the costs as part of their overhead; and, in some cases, they intentionally staged the test to demonstrate that variability was possible within the current protocol). Also, these factors do not reflect the proposed changes to improve the repeatability and reproducibility of the test method. Consequently, we believe the previous results merit consideration of concerns about implementing a lower emission standard, but they do not mean that lower emission standards cannot be measured accurately. For example, the State of Washington Department of Ecology has successfully used lower emission levels in their regulations since 1995, and the Oregon Department of Environmental Quality has used lower levels for tax credits for low-emitting pellet heaters/stoves.

As noted earlier in this section, we ask for comments and emission test data using cord wood to help us determine if the proposed emission levels should be adjusted for any differences between crib wood and cord wood.

#### b. Pellet Heaters/Stoves

Several certified pellet heaters/stoves are subject to current subpart AAA. However, most models currently offered for sale are exempt due to air-to-fuel ratios greater than 35:1. We considered candidate options similar to those discussed earlier for wood heaters/stoves, *i.e.*, improved catalytic and improved noncatalytic systems and state-of-the-art systems. Our data set for currently manufactured U.S. pellet heaters/stoves, for which we have reproducible emissions data, contains 24 models, of which 23 would meet the 4.5 g/hr proposed Step 1 BSER emission limit. We also compared the listings of certified pellet heaters/stoves for both the EPA and the state of Washington. Of the 224 pellet heater/stove models from both lists, 221 models produced by 35 manufacturers would meet the state of

<sup>45</sup> See footnotes 24, 36 and 38.

<sup>46</sup> Final Report: EPA Wood Heater Emission Test Method Comparison Study. Prepared by Robert Ferguson, Ferguson, Andors & Company for the Hearth, Patio and Barbecue Association. December 1, 2010.

<sup>44</sup> See footnotes 24, 36 and 38.

Washington emission standard. Only three models produced by three manufacturers would not meet the standard. Assuming that the rest of the pellet heater/stove market has comparable performance, we would expect to see only a small cost impact of requiring the proposed Step 1 BSER emission levels of 4.5 g/hr for noncatalytic and catalytic pellet heaters in terms of having to redesign units to meet the proposed Step 1 BSER.

Even though additional R&D would not be required to meet the proposed Step 1 BSER, manufacturers would need to test and certify their heaters/stoves to sell them after the effective date of the final rule, which we expect to occur in 2015. Some manufacturers of pellet heaters/stoves have started incurring costs in anticipation of the final rule. They would also incur ongoing recertification costs for the fraction of heaters/stoves with expiring certifications.

Some stakeholders have argued that pellet heaters/stoves are relatively cleaner burning than other wood heaters and that regulation is not needed. Other stakeholders have argued that pellet heater/stove standards should be tighter to show how clean they are and encourage consumers to purchase pellet heaters/stoves instead of cord wood heaters/stoves. Considering both positions, and because pellet heaters/stoves are cleaner burning in general, we think there is environmental value in ensuring they have an EPA certification so they can be sold in jurisdictions that require such certification of any wood-burning appliance (contingent upon approval by the local jurisdiction). This would help avoid a competitive imbalance regarding wood heaters. Also, we believe there is environmental value in having third-party accredited laboratory test results available in all areas so that consumers can make informed choices among competing residential heaters.

We are also proposing implementation of a Step 2 state-of-the-art BSER 5 years after the effective date of the final rule. We estimate that at least 30 percent of current U.S. pellet heater/stove models already meet the proposed Step 2 emission level. We assume that manufacturers will either modify the remaining models or invest in developing new model lines that can meet the proposed Step 2 emission level. This assumption may somewhat overstate the potential cost and economic impacts of requiring a proposed Step 2 BSER, because some noncomplying models will be dropped and manufacturers may consolidate their model lines in the short term.

However, we do not know how many models will be dropped. This industry has a history of manufacturing a wide range of choices of models for the marketplace.

The nationwide annualized total costs are significant based on our cost assumptions explained in section IV.C and in our background documentation.<sup>47</sup> The average annual cost increase to manufacturers of pellet heaters/stoves during the 2014 through 2022 period analyzed in the RIA is approximately \$3.5 million. Estimated nationwide annual PM<sub>2.5</sub> emissions, averaged over this same period (2014–2022), are projected to be 199 tons/year under baseline conditions versus 150 tons/year under the proposed two-step BSER, an average reduction of 49 tons/year, considering only the first year of emissions for each new heater sold. Given this limited snapshot for these cost and emission estimates, the average cost of reducing each new ton of PM<sub>2.5</sub> emissions during the 2014–2022 period is approximately \$71,000 per ton annually as compared to the monetized health benefits of \$360,000 per ton to \$810,000 per ton of reducing direct PM<sub>2.5</sub>. The annualized cost-to-sales ratio is 2.3 percent. However, when considering the total costs and cumulative emission reductions over the more representative full model design life span and appliance emitting life span of pellet heaters/stoves, the overall cost effectiveness is approximately \$1,500 per ton (shown above in Table 11).<sup>48</sup>

Given the reasonable cost effectiveness of imposing the proposed two-step BSER when considering total costs and cumulative emission reductions, and given the 6-year lead time (from the date of these proposed standards) until model lines must come into compliance with the proposed Step 2 limit, we determined that the two-step phased-in limits represent BSER for these residential consumer appliances at this time. Thus, we are proposing a two-step standard for pellet heaters/stoves, in which Proposed Step 1 is required upon the effective date of the final rule, and Proposed Step 2 is required 5 years after the effective date of the final rule. Section V.B.5 discusses a three-step alternative approach that we also considered for pellet heater/stoves, and on which we are seeking comment.

#### c. Single Burn Rate Wood Heaters

Single burn rate wood heaters represent a huge regulatory exemption in the current residential wood heater

market. We estimate that over 40,000 of these units are sold per year. We evaluated all of the available emission data and discussed the state of R&D with manufacturers of single burn rate wood heaters. The data show that the BSER for single burn rate wood heaters based on improved combustion could achieve the same emission levels for one individual burn rate category as adjustable burn rate category wood heaters do for the weighted average of four burn rates. To compare single burn rate emissions to adjustable burn rate emissions, however, one must remember that single burn rate wood heaters are by definition incapable of operating at the lowest burn rates, and that these low burn rates result in the greatest level of emissions in an adjustable burn rate wood heater. Thus, the certification test method for single burn rate wood heaters must be modified to take the single burn rate into account (instead of the multiple burn rates for the adjustable rate heaters). For example a rate of 3.0 g/hr could be considered to be equivalent to the state of Washington standards (of 4.5 g/hr for adjustable burn rate wood heaters) adjusted to the single burn rate.

Considering that single burn rate wood heaters will not be expected to operate at the typically higher-emitting burn rates, we expect the majority of single burn rate wood heaters to meet the proposed Step 1 BSER limit of 4.5 g/hr for adjustable burn rate wood heaters, if the design is focused on one optimal single burn rate. However, some models would require modifications to ensure that they consistently pass the test and to add tamper-proof settings to ensure that operators do not circumvent the intent of the NSPS. For our analyses, we assumed that all existing models would need to be modified through R&D, resulting in significant emission reductions to achieve the proposed Step 1 BSER. We request specific data and comments regarding these assumptions. Since 2009, single burn rate wood heater designs have been undergoing R&D in anticipation of the proposed NSPS, and the information that we have from industry is that cleaner designs are nearly market-ready.<sup>49</sup> Nonetheless, because these devices were previously unregulated and may need to transfer technology from adjustable burn rate wood heaters, our cost analysis assumed that R&D efforts would intensify in order to meet the proposed Step 1 standard while also beginning R&D to develop models to meet the more stringent proposed Step 2 BSER limit. Specifically, for single burn rate wood

<sup>47</sup> See footnotes 36 and 38.

<sup>48</sup> See footnotes 24, 36, and 38.

<sup>49</sup> See footnote 36.

heaters, we doubled our R&D estimate of \$356,250 per model for other appliances in these early years.

The nationwide annualized total costs are based on the cost assumptions explained in section IV.B and in the background documentation.<sup>50</sup> The average annual cost increase to manufacturers of single burn rate heaters during the 2014 through 2022 period analyzed in the RIA is approximately \$902,000. Estimated nationwide annual PM<sub>2.5</sub> emissions, averaged over this same period (2014–2022), are projected to be 932 tons/year under the baseline (unregulated) condition versus 178 tons/year under the proposed two-step BSER, an average reduction of 754 tons/year, considering only the first year of emissions for each new heater sold. Given this limited snapshot for these cost and emission estimates, the average cost of reducing each new ton of PM<sub>2.5</sub> emissions during the 2014–2022 period is approximately \$1,200 per ton annually as compared to the monetized health benefits of \$360,000 per ton to \$810,000 per ton of reducing direct PM<sub>2.5</sub>. The cost-to-sales ratio is 6.4 percent and is calculated based on only the initial 5-year period. However, when considering the total costs and cumulative emission reductions over the more representative full model design life span and appliance emitting life span, the overall cost effectiveness is approximately \$50 per ton (shown above in Table 11).<sup>51</sup>

Given the reasonable cost effectiveness of imposing the two-step BSER when considering total costs and cumulative emission reductions, and given the 6-year lead time (from the date of these proposed standards) until new model lines must meet the proposed Step 2 emission limit, we determined that the two-step phased-in limits represent BSER for these residential consumer appliances at this time. Thus, we are proposing a two-step standard for single burn rate wood heaters, in which Proposed Step 1 is required upon the effective date of the final rule and Proposed Step 2 is required 5 years after the effective date of the final rule. Section V.B.5 discusses a three-step alternative approach that we also considered for single burn rate wood heaters, and on which we are seeking comment.

## 2. Central Heaters

We are proposing subpart QQQQ for wood-burning appliances that function as “central heaters” with the purpose of heating the entire residence, including

current new residential hydronic heaters and forced-air furnaces. Our intent is that this rule will be stated in broad enough terms to regulate any future central heater wood-burning appliances that may come into the U.S. market and function as central heaters. In this section, we describe our rationale for determining BSER and the associated proposed emission standards for both hydronic heating systems (“hydronic heaters”) and forced-air furnaces. As discussed earlier in this preamble, the source categories to be regulated by proposed subparts AAA, QQQQ, and RRRR are fundamentally different from the typical NSPS source category that includes industrial processes whereas subparts AAA, QQQQ, and RRRR include mass-produced residential consumer products. Thus, additional factors are included in the analyses presented today. Section V.B.2.a. below discusses hydronic heaters. Section V.B.2.b. discusses forced-air furnaces.

### a. Hydronic Heaters

As described in section II.D, hydronic heaters (commonly known as “outdoor wood boilers” although there are indoor units as well) are the subject of an EPA voluntary partnership program, started in January 2007. The EPA’s voluntary partnership program provided criteria in 2007 for qualification of units to be approximately 70 percent cleaner than unqualified models (Phase 1, “orange hangtag”). In October 2008, the program evolved to Phase 2, and EPA-qualified Phase 2 (“white hangtag”) units are approximately 90 percent cleaner than older, pre-program unqualified units. Under the Phase 2 voluntary partnership program, new qualified models must emit no more than 0.32 lb/MMBtu of heat output and have a cap of 18 g/hr on any individual test run conducted during the qualifying test. (As noted in the hydronic heaters test method discussion in this preamble, the EPA, the manufacturers, the laboratories, and key states conducted an additional review of the test reports to support these qualifications and made some changes to the test methods to improve the reliability and reproducibility of the test results.)

The proposed Step 1 emission limit for hydronic heaters is the Phase 2 qualifying level of the hydronic heater voluntary partnership program, 0.32 lb/MMBtu. There are currently 36 models (27 cord wood and 9 pellet models) built by 17 U.S. manufacturers that have been qualified to meet the 2008 Phase

2 level of 0.32 lb/MM BTU.<sup>52</sup> In almost all cases, the manufacturers developed models that rely upon improved combustion techniques, primarily improvements in time, temperature, and turbulence. That is, the improved combustion models have greater residence time, separation of the firebox and the water jacket and the addition of better heat exchangers and better insulation to increase temperatures, and passageways and directed flows to improve mixing and turbulence. In some cases, manufacturers are also using catalyst technology. Each manufacturer has developed their own confidential business combinations of specific designs that incorporate these key aspects and some other techniques.

In addition to the voluntary partnership program, the EPA provided technical and financial support for NESCAUM to develop a model rule for outdoor hydronic heaters, which several states have adopted or plan to adopt to regulate those units in their jurisdictions. The model rule Phase 2 emission limits and the voluntary partnership program Phase 2 emission levels/caps are identical, and are the same as our proposed Step 1 limit. In several states, the Phase 2 emission levels have become regulatory requirements for new units. Based on our experience with the hydronic heater market through the voluntary partnership program, we understand that it is dominated by a few manufacturers in terms of the bulk of sales, and each of these manufacturers has at least one qualifying model already.

For these reasons, we consider the Phase 2 voluntary partnership program level the appropriate emission level for the NSPS proposed Step 1 BSER, effective upon the effective date of the final rule. As noted above, there are currently 36 models (27 cord wood and 9 pellet models) built by 17 U.S. manufacturers that have already been qualified to meet the Phase 2 voluntary partnership program level of 0.32 lb/MM BTU.

The EPA believes the proposed Step 2 limit for hydronic heaters is achievable for some manufacturers now and would be achievable for all manufacturers 5 years after the effective date of the final rule. We consider this compliance period a reasonable amount of time for manufacturers to complete development across model lines and complete testing, field evaluation, and

<sup>52</sup> A list of cleaner hydronic heaters participating in the EPA’s voluntary partnership program is located at <http://www.epa.gov/burnwise/owhhlst.html>.

<sup>50</sup> See footnotes 24, 36 and 38.

<sup>51</sup> See footnotes 24, 36 and 38.

certification so that sufficient models are ready for sale. We reviewed all the hydronic heater emission data available, and we found our proposed Step 2 emission limit of 0.06 lb/MMBtu is already met by 4 hydronic heater models (2 cord wood and 2 pellet models) built by 2 U.S. manufacturers (using crib wood as specified in Method 28 WHH in the voluntary partnership program),<sup>53</sup> as well as over 50 European models per test method EN 303-05 (which uses cord wood).<sup>54</sup> We ask for comments and emission test data using cord wood and different test methods to help us determine if the proposed emission levels should be adjusted for any differences in test methods and test fuels, *e.g.*, between crib wood and cord wood.

Our review of the available data also showed a break point at the emission level of 0.15 lb/MMBtu heat output. We considered this break point as a candidate for interim Step 2 in the three-step Alternative Approach, as discussed in section III above. Several years ago, we discussed the 0.15 lb/MMBtu level with the voluntary program stakeholders, including states and manufacturers, as a potential future "Phase 3" interim target in the voluntary partnership program to reduce emissions to approximately one-half of the Phase 2 voluntary partnership program level. Some of the manufacturers responded quickly to this informal target and now 11 of the 36 models (6 cord wood and 5 pellet models) that currently qualify under the Phase 2 voluntary partnership program already qualify at an emission level of 0.15 lb/MMBtu or better.

The proposed BSER levels include both outdoor hydronic heaters and indoor hydronic heaters. The initial manufacturers who actively participated in the voluntary partnership program were primarily manufacturers of outdoor units, due to the very large concern about the health effects of emissions from the outdoor units and the fact that over 90 percent of hydronic heater sales were and still are for outdoor models. When we moved to Phase 2 of the voluntary partnership program in October 2008, we explicitly included indoor units to more strongly encourage cleaner indoor units and to provide another tool for the states and

local jurisdictions, especially since some states were concerned that some high-emitting indoor units were avoiding rules that only specified outdoor units. Indoor and outdoor models compete in the marketplace and having standards on only outdoor units would provide a market advantage to indoor models. Indoor and outdoor models both can use currently available improved combustion and improved heat transfer techniques to achieve similar emission levels. Given the number of years the voluntary partnership program has already been in existence, we believe our proposed Step 1 limit upon the effective date of the final rule and the proposed Step 2 limit 5 years after the effective date of the final standard provide reasonable lead time to incorporate BSER in both outdoor and indoor residential consumer models. We ask for specific comments and data on this determination and the degree to which other options would be appropriate.

We estimate that there are 30 manufacturers producing approximately 120 hydronic heater models for sale in the U.S. On a sales-weighted basis, less than 25 percent of the models currently sold would need to undertake R&D to meet the proposed Step 1 BSER limit, with a higher percentage that would need to undertake R&D to meet the proposed Step 2 BSER limit. We assumed that any manufacturer undertaking R&D to develop a new model would aim to meet the proposed Step 2 limit to maximize the lifetime of the resulting product, while shifting production to models that already meet the proposed Step 1 limit. For our cost analysis, we assumed that 100 percent of the 120 hydronic heater models would incur NSPS-related R&D costs to achieve the proposed Step 2 BSER limit. Considering typical R&D lead times, and even the different starting dates for outdoor versus indoor manufactures, we concluded that 5 years after the effective date of the final standard is an achievable compliance deadline for both outdoor and indoor models, even if they were just starting their R&D now. As discussed earlier in this preamble, most manufacturers have known of the hydronic heater emission concerns for over 7 years already.

We also investigated the performance of European models in considering BSER options. Several European countries have already established emission limits, and they are considering more stringent limits in the near future. This has encouraged the European industry to develop more energy efficient and lower emitting technologies. Most of these state-of-the-

art models use multiple-stage combustion and some use oxygen sensors and CO sensors and automated feedback controls to help optimize combustion conditions. A concern in comparing the emission performance of European models with North American models is the difference in test methods. All European models are tested on cord wood fuel in Europe by European laboratories to meet European standards. Few have been imported to the U.S. (by U.S. companies) and very few have been tested in the U.S. according to U.S. testing requirements. However, a recent report<sup>55</sup> included an effort to compare the performance of the European models to U.S. type performance standards. Although a perfect comparison is not possible due to differences in duty-cycle (*i.e.*, proportion of time the unit is operating) to be evaluated in the test and the emissions sampling and analysis protocols, the analysis indicates that the top 20 percent performing European wood boilers (*i.e.*, hydronic heaters) in the size range of 120,000–170,000 Btu would meet an output-based emission rate of 0.06 lb/MMBtu using the European test methods. The underlying test data and limited comparative testing show that over 50 European models would likely be considered state-of-the-art BSER and be capable of meeting the proposed Step 2 BSER associated emission level of 0.06 lb/MMBtu heat output, using EN 303-05, which specifies cord wood as the test fuel. We ask for comments and emission test data using different test methods and cord wood to help us determine if the proposed emission levels should be adjusted for any differences in test methods and between fuels, *e.g.*, crib wood and cord wood.

The nationwide annualized total costs are based on the cost assumptions explained in section IV.C and in the background documentation.<sup>56</sup> The average annual cost increase to manufacturers of hydronic heaters during the 2014 through 2022 period analyzed in the RIA is approximately \$4.6 million. Estimated nationwide annual PM<sub>2.5</sub> emissions, averaged over this same period (2014–2022), are projected to be 1,332 tons/year under the baseline (unregulated) condition versus 84 tons/year under the proposed two-step BSER, an average reduction of 1,249 tons/year, considering only the first year of emissions for each new heater sold. Given this limited snapshot for these cost and emission estimates, the average cost of reducing each new

<sup>53</sup> See footnote 54.

<sup>54</sup> European Wood-Heating Technology Survey: An Overview of Combustion Principles and the Energy and Emissions Performance Characteristics of Commercially Available Systems in Austria, Germany, Denmark, Norway, and Sweden; Final Report; Prepared for the New York State Energy Research and Development Authority; NYSERDA Report 10-01; April 2010.

<sup>55</sup> See footnotes 24, 36 and 38.

<sup>56</sup> See footnotes 36 and 38.

ton of PM<sub>2.5</sub> emissions during the 2014–2022 period is approximately \$3,600 per ton annually. The annualized cost-to-sales ratio is 3.3 percent for hydronic heater models. However, when considering the total costs and cumulative emission reductions over the more representative full model design life span and appliance emitting life span, the overall cost effectiveness is approximately \$160 per ton (shown above in Table 11).<sup>57</sup>

Given the reasonable cost effectiveness of imposing the two-step BSER, and given the 6-year lead time (from the date of these proposed standards) until model lines must come into compliance with the proposed Step 2 limit, we determined that the two-step phased-in limits represent BSER for these residential consumer appliances at this time. Thus, we are proposing a two-step standard for hydronic heaters, in which Proposed Step 1 is required upon the effective date of the final rule, and Proposed Step 2 is required 5 years after publication of the final rule. Section V.B.5 discusses a three-step alternative approach that we also considered for hydronic heaters, and on which we are seeking comment.

#### b. Forced-air Furnaces

Emissions from wood-fired, forced-air furnaces have not previously received much attention in the U.S. However, industry information suggests that there are three times more sales of wood-fired, forced-air furnaces each year compared to wood-fired hydronic heaters. These units are relatively easy to retrofit into existing structures, and their sales price is substantially less than hydronic heaters but greater than gas or oil furnaces. Because they are whole-house heating systems, they have the capacity to generate large amounts of emissions. Also, they compete with wood-fired hydronic heaters, which we propose to regulate. Not regulating wood-fired, forced-air furnaces could create an adverse competitive imbalance with the wood-fired hydronic heater market segment of the residential wood heater source category. Both forced-air furnaces and hydronic heaters compete with oil and gas furnaces. Consumer choices vary with consideration of upfront sales price, financing costs, and operating costs, *e.g.*, the cost of obtaining seasoned wood versus oil or gas.

Wood-fired, forced-air furnaces are not currently regulated in the U.S. (with the exceptions of broader bans or use limits on wood-burning appliances), but they are beginning to be regulated in

Canada. The main regulatory mechanisms are local and provincial regulations requiring listing per CSA B415.1–10, which is the CSA specification for emission performance of solid-fuel-burning heating appliances.<sup>58</sup> All CSA standards are developed through a consensus standards development process approved by the Standards Council of Canada. This process brings together stakeholder volunteers representing varied viewpoints and interests to achieve consensus and develop a standard. The most recent B415.1–10 Committee consisted of manufacturers, Environment Canada,<sup>59</sup> provincial agency staff, test laboratories and the EPA. The current version of B415.1–10 was published in March 2010, and it includes new requirements for indoor and outdoor central heating appliances, including wood-fired forced-air furnaces. In addition to establishing performance test requirements, B415.1–10 also includes emissions requirements for PM. Section 4.2.1(c) of the CSA standard establishes an average particulate emission rate of less than or equal to 0.40 g/MJ, which is equivalent to 0.93 lb/MMBtu. Manufacturers anticipate that CSA Standard B415.1–10 will effectively establish the minimum requirements for future units sold in Canada. For example, the province of British Columbia has enacted regulations limiting the sale of wood-burning appliances to those that comply with B415.1–10 (or the U.S. NSPS when the EPA issues such a standard), and other provinces and municipalities in Canada are in the process of amending their regulations to apply to central heating systems, including forced-air furnaces.

In developing the B415.1–10 emissions limit of 0.40 g/MJ (0.93 lb/MMBtu) for solid-fuel central heating systems, the CSA committee thoroughly reviewed the best systems available, developed a test method for such systems and supported emission testing of candidate best systems. A B415.1–10 validation-testing program performed by Intertek in Middleton, Wisconsin, included both a high-tech furnace and a conventional furnace. The high-tech furnace achieved average particulate emissions of 0.46 g/MJ output (1.067 lb/

MMBtu). The conventional furnace achieved average particulate emissions of 1.65 g/MJ (3.828 lb/MMBtu) output. Thus, the CSA limit of 0.40 g/MJ (0.93 lb/MMBtu) output corresponds to a 75 percent reduction in emissions when using the average particulate emissions of the conventional furnace tested by Intertek as part of the CSA B415.1–10 validation program.

We also investigated the performance of European production forced-air furnace models to determine whether their performance might be better than what CSA found in North America. However, forced-air furnaces are not commonly used in Europe because they are considered to be an inferior technology for home heating in Europe; thus we had no European candidate BSER to consider.

Manufacturers are actively conducting R&D in response to both the current CSA standard and the anticipated NSPS we are proposing. For example, one company has recently had an EPA-certified laboratory test two of their newest models. These tests, using the test method in CSA B415.1–10, show particle emissions below 0.1 lb/MMBtu heat output. Considering all of the above, we believe that BSER for forced-air furnaces may be demonstrated at the same emission levels as for hydronic heaters. We have considered proposing standards for forced-air furnaces that match the Step 1 and Step 2 standards we are proposing for hydronic heaters, that is, a proposed Step 1 BSER of 0.32 lb/MMBtu heat output and a cap of 18 g/hr as determined by the test methods and procedures in CSA B415.1–10 upon the effective date of the final standard and a proposed Step 2 BSER of 0.06 lb/MMBtu heat output as determined by the test methods and procedures in CSA B415.1–10, 5 years after the effective date of the final standard. However, we have concerns that only one U.S. manufacturer currently has models that have been tested by CSA B415.1–10 and shown to achieve these levels, and, thus, we are proposing that the Step 1 BSER for forced-air furnaces match the current CSA B415.1–10 level of 0.93 lb/MMBtu heat output. We are also proposing, however, that by 5 years after the effective date of the final standard, forced-air furnaces be subject to the same standards as hydronic heaters and be required to meet the proposed Step 2 BSER of 0.06 lb/MMBtu that hydronic heaters must meet then under this proposal.

Given that the largest U.S. forced-air furnace manufacturer already has a catalytic model meeting 0.06 lb/MMBtu, we think the 6 years of lead time is sufficient time in which to conduct R&D

<sup>58</sup> CSA B415.1–10: Performance testing of solid-fuel-burning heating appliances, Canadian Standards Association, Mississauga, Ontario, Canada. March 2010.

<sup>59</sup> Environment Canada was created in 1971, and has the responsibility to implement the Government of Canada's environmental agenda including, but not limited to, Canada's environmental and wildlife legislation, enforcement activities and other efforts to protect, conserve and enhance the environment.

<sup>57</sup> See footnotes 36 and 38.

to produce comparably lower emitting model lines, although we are seeking comment on an alternative 3-step approach with a longer lead time. Since there are limited emissions data available for forced-air furnaces that reflect hydronic heater proposed Step 1 and proposed Step 2 BSER, we request specific comments and data on the proposed emission levels and compliance deadlines, as well as the environmental impacts and market implications for setting emission limits that match what we are proposing for hydronic heaters.

The nationwide annualized total costs are based on the cost assumptions explained in section IV.C and in the background documentation.<sup>60</sup> The average annual cost increase to manufacturers of forced air furnaces during the 2014 through 2022 period analyzed in the RIA is approximately \$2.3 million. Estimated nationwide annual PM<sub>2.5</sub> emissions, averaged over this same period (2014–2022), are projected to be 3,044 tons/year under the baseline (unregulated) condition versus 434 tons/year under the proposed two-step BSER, an average reduction of 2,610 tons/year, considering only the first year of emissions for each new heater sold. Given this limited snapshot for these cost and emission estimates, the average cost of reducing each ton of PM<sub>2.5</sub> emissions during the 2014–2022 period is approximately \$860 per ton annually, as compared to the monetized health benefits of \$360,000 per ton to \$810,000 per ton of reducing direct PM<sub>2.5</sub>. The cost-to-sales ratio is 2.4 percent. However, when considering the total costs and cumulative emission reductions over the more representative full model design life span and appliance emitting life span, the overall cost effectiveness is approximately \$40 per ton (shown above in Table 11).<sup>61</sup>

Given the reasonable cost effectiveness of imposing the two-step BSER, and given the 6-year lead time (from the date of these proposed standards) until new model lines must come into compliance with the proposed Step 2 limit, we determined that the two-step phased-in limits represent BSER for these residential consumer appliances at this time. Thus, we are proposing a two-step standard for forced air furnaces, in which Proposed Step 1 is required upon the effective date of the final rule and Proposed Step 2 is required 5 years after the effective date of the final rule. Section V.B.5 discusses the three-step

alternative approach that we also considered for forced air furnaces, and on which we are seeking comment.

### 3. Masonry Heaters

We are proposing subpart RRRR for new masonry heaters. With a few exceptions, masonry heater emissions are not subject to specific PM emission limits in North America or Europe. Some states and local areas do not allow any residential wood heaters that are not certified to meet the current residential wood heater NSPS. The states of Colorado and Washington have set 6 grams of particles emitted per kilogram of wood burned (g/kg) and 7.3 g/kg limits, respectively (each of which is based on different test methods), and a small number of appliances have been tested and certified for those states. (The BSER level we are proposing below uses a different format but is commonly accepted to be only slightly more stringent than the Colorado and Washington limits.) We considered various forms for a masonry heater standard, and we believe that an appropriate format could be a daily average g/hr limit for the heating cycle coupled with a limit for emissions per heat output (lb/MMBtu output). The daily average over the heating cycle format seems to be well adapted to the nature of the technology of masonry heater operation, which involves one or two short high burn rate cycles where hot gases are generated during combustion of a fuel load in the firebox and then pass through the channels, saturating the masonry mass with heat. The masonry mass then radiates heat into the area around the masonry heater for 12 to 24 hours. Unfortunately, we lack sufficient data to set the level of a daily average data approach, so we are proposing instead a heat output format. The heat output format has the advantage of providing a good metric for consumers and regulatory agencies to compare emissions of competing residential heating appliances for an equivalent heat output. We ask for specific comments on whether a g/kg format would be better.

We had numerous discussions with states, masonry heater manufacturers, and laboratories on heater designs, test methods and heater emissions and performance. The best performing improved combustion technology masonry heaters have well-engineered designs with long channels to maximize complete combustion and heat transfer. The manufacturers provided all available current emissions data. For example, one manufacturer provided an archive of available data. The data set included results from 31 tests

(measuring emissions per heat output) that ranged from 0.07 g/MJ to 0.51 g/MJ (~0.17 to 1.22 lb/MMBtu), with an average rate of 0.26 g/MJ (0.621 lb/MMBtu). As we discussed earlier in this preamble, we do not have good information on how many heaters emit at each of these levels and thus have not developed a good estimate of baseline emissions and we ask for data that would help inform us. However, looking at this data set in more detail, we can see that the best “improved combustion” systems have an emission level of 0.13 g/MJ (0.32 lb/MMBtu) heat output. We note that this level is consistent with the proposed Step 1 BSER for hydronic heaters.

As discussed earlier in this preamble, the source categories to be regulated by the proposed subparts AAA, QQQQ, and RRRR are fundamentally different from the typical NSPS source category in that most NSPS regulate industrial processes whereas the source categories in subparts AAA, QQQQ, and RRRR include mass-produced residential consumer products. Thus, additional factors are included in the analyses presented today as compared to typical NSPS. For example, we considered whether we should allow longer lead time over which small manufacturers/builders could spread their R&D costs in order to stay in business. The Small Business Regulatory Enforcement Act Panel strongly recommended that we consider allowing more time. See section V.C of this preamble for discussion of this topic.

We estimated proposed Step 1 improved combustion BSER emissions and cost and economic impacts based on four groups of costs. The first group of costs consisted of the two large manufacturers that we know have already developed potentially complying models and would only face the costs of certification tests. For the second group of costs, we estimated the costs incurred by an additional two large manufacturers that conduct R&D to develop a total of four new model lines. For the third group of costs, we estimated the cost of one of the manufacturers using the computer simulation approach to certify additional model lines. Finally, for the fourth group of costs, we estimated the cost for all of the small, custom-built manufacturers using the computer simulation approach to certify their model lines. We do not anticipate a large nationwide emission reduction resulting from requiring the proposed Step 1 BSER versus what most manufacturers would have done in the absence of a rule; however we believe there are some masonry heaters that do

<sup>60</sup> See footnotes 37 and 38.

<sup>61</sup> See footnotes 24, 36 and 38.

not use current best designs and for those heaters there can be an emission reduction of 70 percent or more. We believe it is important to ensure that all new models achieve the BSER emission levels and avoid backsliding.

The nationwide annualized total costs are based on the cost assumptions explained in section IV.C and in the background documentation.<sup>62</sup> The average annual cost increase to manufacturers of masonry heaters during the 2014 through 2022 period analyzed in the RIA is approximately \$294,000. The estimated cost-to-sales ratio is 4.8 percent. If one were to spread the costs over the much longer typical lifetimes of masonry heaters (over 40 years), the average annual costs would be much lower. We concluded that the proposed Step 1 BSER level of 0.32 lb/MMBtu heat output is appropriate for these appliances.

For masonry heaters, we are proposing that large manufacturers of masonry heaters (defined as those manufacturers constructing 15 or more masonry heaters per year) would be required to comply with these standards upon the effective date of the final rule. We are proposing that small manufacturers (defined as those manufacturers of less than 15 masonry heaters per year) would be required to comply with these standards 5 years after the effective date of the final rule.

We are requesting specific comments on the proposed BSER option and data that might support alternative findings and enhance our impact analyses. For example, if we were to develop a g/hr average format in addition to the lb/MMBtu heat output format, are there products that might meet a daily average over the heating period versus the averaging only over the combustion period, and if so, how would this affect levels of performance and impacts on the environment? Further, we are seeking comment on the degree to which these dates could be sooner.

4. Alternative Approach for Comment

As noted in section III, in addition to the proposed two-step standards described above for appliances regulated as “room heaters” under subpart AAA (currently catalytic and noncatalytic adjustable burn rate wood heaters, single burn rate wood heaters, and pellet heaters/stoves) and for appliances regulated as “central heaters” under subpart QQQQ (currently hydronic heaters and forced-air furnaces), we also considered a different approach, an “alternative three-step approach” for subparts AAA and QQQQ. We seek comments on whether the final rule should be our (preferred) proposed two-step approach or whether the final rule should be this alternative three-step approach. We do

not intend for the final rule to allow a choice between the two approaches. We did not develop a three-step approach for masonry heaters under subpart RRRR, since it is a one-emission-level standard, but we are seeking comments on our proposed 5-year compliance extension for small volume masonry heater manufacturers.

We compared unit cost increases,<sup>63</sup> nationwide manufacturer cost estimates,<sup>64</sup> emission reductions,<sup>65</sup> and overall cost effectiveness of the two-step proposal to the three-step alternative approach considered.<sup>66</sup> Table 12 compares the unit cost increase, nationwide average cost to manufacturers and the annual particulate emission reductions, during the 2014 through 2022 period analyzed in the RIA, for appliances currently affected by this proposal, considering only the first year of emissions for each new heater sold. Based on the cost and emission reduction estimates presented in this table, the overall cost effectiveness for this proposal over the 2014–2022 period is \$3,250 per ton, but \$5,800 per ton for the alternative approach considered (assuming no emission reductions for masonry heaters, for the sake of this analysis). Additional information on the impacts is included in the RIA in the docket.

TABLE 12—COMPARISON OF PROPOSAL AND ALTERNATIVE APPROACH (2014–2022)

We are seeking comment and information on potential justifications for implementing such a three-step standard, instead of our proposed two-step standard for each of the appliances affected by this proposed rule, to provide additional flexibility for manufacturers that have different capabilities and resources to ultimately reach the most stringent BSER. The proposed two-step standards rely on the

assumption that the proposed Step 2 BSER, already demonstrated by various models in each appliance category affected by the proposed rule, is achievable within 5 years of the proposed Step 1 BSER. There is a significant emission reduction achieved by the proposed Step 2 BSER compared to the proposed Step 1 BSER in each appliance category discussed above in section V, but there are no proposed

interim emission limits imposed during the transition from the proposed Step 1 to the proposed Step 2. In the alternative approach considered, there is a longer transition period of 8 years between Step 1 and Step 3 (with the same significant emission reduction achieved between our proposed Step 1 and proposed Step 2), but there is an interim Step 2 limit which manufacturers must meet 3 years after

<sup>62</sup> See footnotes 24, 36 and 38.

<sup>63</sup> See footnote 38.

<sup>64</sup> See footnote 24, 36 and 38.

<sup>65</sup> See footnote 24.

<sup>66</sup> See footnote 24, 36 and 38.

the proposed Step 1. If we were to give a longer timeframe to redesign across model lines to accommodate the best systems, test, field evaluate, and certify a wide range of model lines, we believe there would be benefit to establishing required interim limits to codify progress in reducing emissions and to focus positive attention on early achievers as they show compliance in the period between 2015 and 2023.

We expect that the manufacturers that do not already meet the strongest emission limits would like the longer time to meet the Alternative Approach Step 3 but would prefer to not have an interim Step 2 requirement. However, we do not currently see adequate justification for allowing extra time without also requiring satisfactory progress, especially because numerous models already achieve the strongest emission levels. We also have concerns about the complexity of a 3-step approach and whether it would be harder for the EPA to enforce. Thus, we seek comment, including data and potential environmental and economic justifications, on whether the described Alternative Approach Step 2 emission limits represent BSER within 3 years of the effective date of the final rule. We also seek comment on whether an additional 5 years would be necessary to transition from the Alternative Approach Step 2 to the Alternative Approach Step 3 limit, or whether such a transition could be made in a shorter time period. Finally, for single burn rate wood heaters and forced-air furnaces, we are seeking comment on whether the alternative Step 1 limit should become effective upon the effective date of the final rule or after a 1-year "adjustment" period. The EPA seeks to encourage national achievement of the (proposed Step 2) BSER for each appliance category as soon as possible and as efficiently as possible, which is why we prefer the proposal over the alternative approach we considered. However, we also seek to balance industry's R&D needs with timely and efficient standards, and so we are seeking comment on the alternative approach outlined immediately above and in section III.

## 5. Other Proposed Emissions Testing and Reporting

### a. Efficiency Testing and Reporting

While the CAA gives the EPA authority to set standards for emissions, and we have issued final rules that have used a variety of formats for such standards, including efficiency, we lack sufficient data to propose efficiency standards for residential wood heaters at

this time. We are proposing only to require testing and reporting but not a minimum efficiency standard. Current data and other information from manufacturers and testing laboratories and the NYSERDA "European Wood-Heating Technology Survey" discussed earlier in this preamble show that, in general, the same types of improved combustion BSER designs that tend to reduce PM<sub>2.5</sub> emissions also tend to increase combustion efficiency, reduce CO emissions and improve efficiency. Current subpart AAA allows sources to either measure efficiency or report a default efficiency value. We believe these proposed subparts are an excellent opportunity to standardize the collection and reporting of such data.

Most industry members support the collection and reporting of tested efficiency values, but some do not necessarily support an efficiency standard because they have concerns that efficiency standards would encourage a "ratings race" and worry that some manufacturers would sacrifice operational viability in the field for a higher efficiency rating. We agree that some heat loss is necessary to ensure adequate draft out the chimney/stack and not backdrafting into living areas. However, we do not expect manufacturers to jeopardize their reputation or operator safety for a higher rating, and we believe that competition among manufacturers to increase their heaters/stoves' efficiencies is good for consumers and the environment. We request specific comments and supporting data that would help inform the need for and level of a possible efficiency standard. Also, we ask for specific comments on how, in the meantime, to best ensure consumers have access to the best information on efficiency performance, e.g., labels, owner's manual, Burn Wise Web site and/or other means.

### b. CO Testing and Reporting

We considered developing CO emission limits for all new residential wood heaters. However, our current data for CO emissions performance and methods of control are not sufficiently robust to support strong CO emission limits, and it would delay the NSPS if we were to seek additional data elsewhere at this time to support strong CO emission limits. We expect the CO emissions to be reduced as a result of the control of PM, because meeting the PM standards will be achieved primarily by BSER based on good combustion (and in some cases catalysts and hybrids) which will also result in good CO reductions without additional standards for CO. However, we are

proposing that manufacturers measure and report CO. We believe this information will be useful to consumers and state and local regulators. Requiring manufacturers to measure and report CO emissions would also result in the collection of data that could be used in the future to establish a CO emissions limit. We are requesting specific comments and supporting data on the need for and level of a possible CO emissions standard. Also, we ask for comments on whether we should require CO monitors to help ensure proper operation of the heater and to reduce health and safety concerns for appliances that are installed in occupied areas.

### c. Pellet Fuel Requirements

A wide variety of pellet fuels is available for purchase. However, in some cases, quality claims on the pellet fuel bag do not necessarily reflect what is in the bag and there can be variable performance. Manufacturers' data show that some fuel qualities have worse burning characteristics and operational characteristics than others, which results not only in heater performance problems but also increased emissions of PM. The PFI, an industry trade organization, has had pellet fuel quality standards in place since 1995, with updated standards issued in 2005, and again, most recently in 2011 (<http://pelletheat.org/wp-content/uploads/2011/11/PFI-Standard-Specification-November-2011.pdf>), in response to the EPA's planned revisions to the residential wood heaters NSPS. We have reviewed the PFI program and believe it is a good program that obviates the need for the EPA to develop our own program at this time. Under the proposed NSPS, pellet burning appliances would be tested using PFI (or, upon request to the EPA Administrator, an equivalent organization's) graded pellet fuel(s). Once certified, pellet burning appliances would only be allowed to burn the grade of fuel that the appliance manufacturer chose for the appliance certification test and the manufacturer specifies in their owner's manual for the operator to use. As discussed above, use of inferior grades would cause heater operational problems and increase emissions. The overall intent of the certification process is to increase the consistency and quality of pelletized fuel throughout the industry, and, thus, reducing appliance operational problems and helping certified appliances perform at the emission levels to which they are certified. Heater manufacturers have indicated to us that market competition will compel them to specify the widest range of grades for

which their heaters will properly perform.

The PFI is also implementing a quality assurance program to ensure that manufacturers reliably produce graded fuels. We propose to require adherence to this program (or equivalent) as a condition of producing graded pellet fuels to be used in obtaining certification under the NSPS. Similar to the NSPS quality assurance program, the PFI quality assurance program relies on use of accreditation and auditing bodies that:

- Accredit auditing agencies and testing laboratories
- Implement and enforce the program, including testing that the pellet fuels meet the grading specifications
- Maintain the enforcement regulations
- Administer a laboratory proficiency program
- Pursue product complaints

In addition, accredited auditing agencies perform the following tasks:

- Certify the production of densified fuel manufacturers
- Authorize production facilities to use PFI's "grading mark"
- Conduct regular audits and extracts samples for third party verification
- Revoke authority to use the PFI mark, if necessary

Accredited testing laboratories perform the following activities:

- Provide QA/QC testing for fuel producers—"as needed"

- Provide testing for samples collected by auditing agencies
- Participate in the accreditation body's proficiency testing program

Finally, the densified fuel producers perform the following activities:

- Develop an in-house QA/QC program based on the PFI QA/QC handbook and the PFI standard specification
- Select an auditing agency and test lab
- Demonstrate compliance with grading system component
- Maintain compliance through periodic audits, inspection and testing

As noted earlier, we have reviewed the PFI program and believe it is a good program that obviates the need for the EPA to develop our own program at this time. We ask for specific comments on this decision and the PFI program.

d. Prohibited Fuel Types

As regulated in the current 1988 subpart AAA standards for residential wood heaters/stoves, operation according to the owner's manual requires operation with the appropriate fuels because the choice of fuels to burn in any appliance can have a major impact on emissions and efficient operation of the appliance. For clarity, we are proposing a list of prohibited fuel types (e.g., trash, plastics, yard waste) to emphasize the responsibility of owners and operators to use appropriate fuels that will result in the performance of the unit as certified, to avoid the creation of possibly hazardous fumes from burning inappropriate

materials, and to ensure that appliance continues to operate as designed. Even with burning clean wood, one of the key factors affecting emissions is the moisture content. Some advocates have suggested that we only allow use of wood certified to a certain moisture level and that we include visible emission limits as a tool to help with practical enforceability of the requirements for proper operation and maintenance. Manufacturers typically include in their owner's manuals information on proper maintenance and operation and state that the wood must be properly seasoned so that the moisture content is not too high for proper operation. Some manufacturers include moisture meters for the operators. We are proposing to require commercial owners (direct distribution manufacturers and retailers) to provide a moisture meter with the wood heater at the time of sale, along with the owner's manual and a copy of the warranty. We request specific comments on whether we should include more specific requirements on proper operations, such as the moisture content of the wood and visible emission limitations.

C. How did we establish the proposed compliance timelines?

The following table summarizes the proposed compliance timelines for the appliances covered by the three subparts.

TABLE 13—SUMMARY OF PROPOSED COMPLIANCE DATES

Appliance type	Compliance date
Adjustable Rate Wood Heaters or Pellet Heaters/Stoves with Current EPA Certification Issued Prior to the Effective Date of the Final Rule.	1988 requirements remain in effect for these heaters/stoves through the later of the effective date of the final revised rule or expiration of current certification (maximum of 5 years after certification and no renewal).
All Other Adjustable Rate Wood Heaters or Pellet Heaters/Stoves (includes currently certified heaters after the certification expires).	Step 1: upon the effective date of the final rule. Step 2: 5 years after the effective date of the final rule.
Single Burn Rate Heaters	Step 1: Upon the effective date of the final rule. Step 2: 5 years after the effective date of the final rule.
Hydronic Heaters	Step 1: Upon the effective date of the final rule. Step 2: 5 years after the effective date of the final rule.
Forced-Air Furnaces	Step 1: Upon the effective date of the final rule. Step 2: 5 years after the effective date of the final rule.
Masonry Heaters	Large manufacturers: Upon the effective date of the final rule for large manufacturers. Small manufacturers: 5 years after the effective date of the final rule.

The proposed compliance dates are tied to the effective date of the final standards. As stated earlier, an element of the BSER determination includes reasonable lead time for R&D to develop and certify cleaner units. We think limited or no R&D is needed to comply with the proposed Step 1 BSER standards. This allows manufacturers

approximately 1 year between the date of this proposal and the date of the final rule to meet proposed compliance standards and limits. This 1-year period is in addition to the time that manufacturers have had leading up to this proposed rule.

We allowed small producers of masonry heaters that do not have a

history of federal or extensive state regulation, or experience with voluntary partnership programs, 5 years after the effective date of the final rule to come into compliance with the same emission standards as larger masonry heater manufacturers in order to ensure a reasonable lead-time.

Finally, we think our proposal for a 6-year lead time before the Step 2 BSEER limits (*i.e.*, 5 years after the effective date of the final rule) would allow manufacturers a reasonable time to develop complying models, access the necessary capital to develop them, and complete the certification process.

We are proposing a 6-month "sold at retail" provision for adjustable burn rate wood heaters, single burn rate heaters/stoves, and pellet heaters/stoves that were manufactured prior to the effective date of the final rule, but not yet sold. This "sold at retail" provision is similar to that provided in the current subpart AAA, and provides a reasonable transition for manufacturers to recoup their investment in their stock on hand. We believe this provision would have a nominal impact on air quality, because the majority of these appliances are already expected to achieve the Step 1 emission limits. For small producers of masonry heaters, we are proposing an additional 5-year lead-time. We are not proposing to apply these extensions to other sources regulated by this proposal. We do not believe that an additional "sold at retail" provision is needed for outdoor and indoor hydronic heaters and forced-air furnaces. In the case of hydronic heaters, we believe that any delay of the compliance deadline for sales would also result in the sale and long-term use of non-complying units, with a potentially adverse quality impact. We request specific comments on whether there are other factors we should consider regarding this "sold at retail" window and what length of time might be considered appropriate in specific circumstances.

While the original subpart AAA created a 1-year compliance extension for wood heater manufacturers producing less than 2,000 heaters per year, this proposed rule does not include a compliance extension provision for single burn rate heaters. The purpose of the original NSPS compliance date extension was to reduce the potential for a testing logjam and to provide small manufacturers additional time to conduct R&D, obtain financing, or purchase complying designs likely to meet the proposed standards. We believe that manufacturers and testing facilities have now had sufficient time and have gained the expertise necessary to meet these standards as proposed and that meeting the proposed compliance dates will impose no undue imposition on manufacturers or testing facilities. We request comment on the need for such a compliance extension and the number of models that might qualify as a small single burn rate heater manufacturer.

As stated above, we are proposing a 5-year compliance date extension for masonry heater manufacturers that sell fewer than 15 units per year. We also seek comments on whether we should have a cap on the total units sold in the 5 years, perhaps 50 units. Most of these manufacturers are very small companies. There are only a few major producers. According to one manufacturer, the Finnish firm, Tulikivi, manufactures and supplies about one-half of the U.S. masonry heater units installed yearly through its network of installing distributors. The second largest producer is a Canadian firm, Temp-Cast, which manufactures and exports a large percentage of the remainder as internal core components only to U.S. dealer/installers and homeowners. This manufacturer states that the remainder of the industry is dozens of small producers and installers who produce only a few units, most of which are custom and individually designed. This manufacturer also stated that over 80 percent of U.S. masonry heater installations use manufactured core product installation and are not custom site built (brick-by-brick).

Because of the resources required to develop, test, and certify masonry heaters (estimated by industry to be approximately \$250,000 per model, although our cost analysis used a larger estimate), we have concluded that a manufacturer of a small number of custom site-built model(s) of masonry heaters would likely be unable to recover the total cost of R&D and certification testing costs in a reasonable timeframe. Similarly, a company that makes core components or sells design kits would be unable to recover total costs if only a few such components or kits are sold per year. We estimated that the annualized cost for developing, testing and certifying a single model is approximately \$60,000, most of which is the cost of R&D. If a seller makes \$5,000 of profit on each model sold, he or she would need to sell 12 units per year to break even. The masonry heater industry recognized concerns about these costs, and it has developed an alternative compliance method based on computer simulations. The industry expects that this alternative will allow sharing licensing of cleaner designs such that the initial software purchase would cost approximately \$1,500 but ongoing annual licensing cost will be approximately \$450 per manufacturer. We believe the 5-year compliance date extension discussed above for masonry heater manufacturers that sell fewer than 15 units per year will allow sufficient time for manufacturers to

become comfortable with this alternative, and use it to demonstrate compliance.

We considered proposing a compliance exemption for small manufacturers of masonry heaters because of the overall small size of the market. However, we were concerned that this might encourage installation of cheaper, low-performing models, which would place complying models at a potential disadvantage. We request comment on the need for either a compliance date extension or a compliance date exemption for masonry heaters and the length of time that we should allow.

We are not proposing any extensions or exemptions for small manufacturers of adjustable burn rate wood heaters or pellet heaters/stoves. Adjustable burn rate wood heaters are already subject to the NSPS, and we have estimated that they should not face any R&D expenses to comply with the Step 1 standards. To reduce unnecessary certification costs, we are proposing to allow a one-time waiver from performance testing for the first certification period for any manufacturer that has previously conducted a valid certification test that demonstrates the wood heaters in the model line meet the proposed standards. We also believe that pellet heaters/stoves would not face any R&D costs to comply with the proposed Step 1 standards, and we estimate that certification costs will only pose a minor impact. We request comment on whether there are other factors we should consider regarding a small manufacturer compliance extension for these appliances.

We also are not proposing a small manufacturer compliance extension for the Step 1 standards for new residential hydronic heaters or forced-air furnaces. There are currently 36 hydronic heater models built by 17 U.S. manufacturers that have already been qualified to meet the Phase 2 voluntary partnership program level of 0.32 lb/MM BTU. Manufacturers of hydronic heaters and forced-air furnaces have known for several years that we were drafting this proposal and that the states have been very concerned about emissions from the models that may not meet the proposed standards; and we do not want to perpetuate sales and use of models unless they demonstrate they do meet the standards. Once again, we request comment on whether there are other factors we should consider regarding a small manufacturer compliance extension for these appliances and what number of appliances sold would constitute a small volume manufacturer.

As discussed above, we recognize there is some concern, as there was with the initial NSPS compliance dates, that testing laboratories capacity may not be able to meet the demand for certification tests in the first few years. However, we believe that the steps we have already proposed, the availability of additional ISO-accredited labs, the advance notice that industry has had concerning the NSPS prior to this proposal, and the time between this proposal and the proposed compliance date of the final rule, should ensure that adequate compliance certification resources are available. The logjam provisions of the current 1988 NSPS were never invoked, and we do not think they are needed at this time. However, we are taking comment on this issue. We also request comment on whether these compliance timelines strike the right balance between avoiding undue economic burdens and the need to get better performing models on the market as soon as possible to reduce emissions, and whether other compliance dates would be appropriate.

*D. How are we proposing to streamline the requirements for certification, quality assurance and laboratory accreditation?*

As part of the NSPS review process, several stakeholders stated the need to improve the current certification and quality assurance requirements. For example, some pellet heaters/stove manufacturers said one reason they avoid certifying their heaters/stoves is because they are concerned that the current process is a barrier to rapid product development and making changes to respond to market demand. Many manufacturers were also concerned that, as the scope of the NSPS program expands to include multiple appliance types, the certification program would act as a logjam. Some states are concerned, however, that moving away from the EPA certification might result in less effective oversight. At the EPA, we are also looking for ways to use our enforcement resources more effectively.

We believe that the proposed changes, described in section III.A regarding a third-party certification program by an ISO-accredited certifying body and testing at ISO-accredited labs, will facilitate the development of improved designs by providing a faster approval process and reducing redundancies in quality assurance for emissions testing and safety testing, and will improve enforcement by providing for more frequent on-site inspections of manufacturing facilities and laboratories. For example, safety

certification audits take place quarterly and include the random inspection of manufactured units for compliance with design and safety factors. The experience of the voluntary partnership programs' ISO process has shown that the third-party approach can work.

We also reviewed the list of design changes (the "k" list; See 40 CFR, subpart AAA, § 60.633(k)) that would result in a need to recertify a model line when certain tolerances are exceeded. We reviewed this list based on the experience we have to date on the types of changes that are significant and knowledge about current manufacturing processes that help prevent these changes from occurring. The resulting list focuses on the following key tolerances:

- Firebox dimensions
- Air introduction systems
- Dimensions and locations of the baffle, catalyst, refractory/insulation, flue gas exit, and the outer shielding and covering
- Dimensions and fit of the gaskets for the door and catalyst bypass
- Fuel feed system
- Forced air combustion system

We believe these changes will focus resources on the significant changes that could affect emissions performance of the model in question. We ask for specific comments on this list and the level of appropriate tolerances.

We propose to revise the requirement for manufacturers to conduct quality assurance emission tests once a specified number of units are sold. Instead, we propose to replace this numerical trigger with a requirement to retest when manufacturer-specific quality assurance criteria (e.g., multiple errors in safety tests) are exceeded. We believe that development of a manufacturer-specific quality assurance plan with specific criteria and approval by an ISO-accredited certifying body (or EPA-approved equivalent) and required follow-up by that certifying body is a more direct measure of possible performance issues, but we request comment on the exact event(s) that should be used as the trigger(s) to retest and whether the triggering event(s) should vary by appliance type.

We are proposing to retain final EPA approval of the certification, and we also propose to require the manufacturer to submit with the application for certification a statement signed by a responsible official that the manufacturer has complied with all requirements of the subpart and that the manufacturer understands that he or she remains responsible for compliance regardless of noncompliance by the

certifying body. We believe this combination of requirements would provide meaningful EPA oversight, assign clear lines of responsibility, and free up resources to do more on-site inspections and other quality assurance activities, such as addressing issues of counterfeit certificates or absence of certificates.

The current random compliance audit testing of the certification testing program is considered underused by many. The EPA recognized this and has recently initiated such testing.

A key element of the current 1988 NSPS laboratory audit program is the "round robin" test program. In this program, the EPA purchases a wood heater and sends it to each of the accredited laboratories to conduct emissions tests (two runs at each burn rate for a total of eight runs). The EPA then compares the results to determine inter-laboratory performance. The EPA recognizes that we have not given this program as much attention as was envisioned in 1988. Thus, we propose to strengthen this program by specifying that every laboratory conducting certification tests under the NSPS must participate in the round robin tests every other year. If a lab's results are not within  $\pm 10$  percent of the value at which the heater was certified, then the lab must conduct another 8 runs. Also, we will remind the manufacturers that, as always, the EPA may potentially use this information to help determine the need for manufacturer audits and potential enforcement actions. We think that these requirements and reminders, combined with the proposed changes in test methods (described in greater detail in the test methods discussion in this preamble) and implementation of the ISO process will help improve inter-laboratory repeatability and reproducibility.

*E. What changes and additions to the allowed test methods are we proposing?*

As described earlier in this preamble, we are proposing changes to the test methods required by subpart AAA. We are also proposing test methods for the new subparts QQQQ and RRRR (as described earlier). In addition, we are proposing new requirements for testing and ultimately certifying using cord wood, which is what the consumer burns. All affected devices required to be tested using Method 28 or Method 28 WHH would now be required to conduct such tests using crib wood and cord wood. Under Proposed Step 1, manufacturers would have the option of selecting which of these test results to use to show compliance with the emissions standards. In other words, we

are proposing to require manufacturers to conduct two separate tests, one with crib wood and one with cord wood. We are also proposing that manufacturers be required to report the results of both tests to the EPA, but manufacturers can choose to certify with either crib or cord wood under Proposed Step 1. Under Proposed Step 2, manufacturers would be required to show compliance testing with cord wood.

We are also proposing to revise the test methods to require the addition of 1-hour filters for each test run to gather data regarding startup and anticipated peaks. Further, we are proposing new compliance requirements for Step 2 with emissions limits at the lowest burn rate (Category 1) and the maximum burn rate (Category 4), not a weighted average of the four burn rates, as in the current 1988 NSPS.

Based on the extensive consensus development process, history of the subpart AAA NSPS and hydronic heater voluntary partnership program emission test experience, and review of similar international standards, we believe the proposed methods reflect state-of-the-art test methods. However, we request specific comment on test method related issues and any data supporting such issues or concerns.

*F. What other changes and additions to the administrative requirements are we proposing?*

Consistent with Executive Order 13563: Improving Regulation and Regulatory Relief, we reviewed the entire current subpart AAA to identify information that is no longer relevant or useful and removed associated reporting and recordkeeping requirements. For example, because of the changes in the audit procedures, we do not believe it is necessary for manufacturers to keep records of the number of affected appliances that are sold each year, by certified model lines, for purposes of these subparts.

The prohibitions section in each of the proposed subparts (§§ 60.538, 60.5480, 60.5492) is based substantially on the current prohibitions section in subpart AAA. Similarly, the delegation section in each proposed subpart (§§ 60.539a, 60.5482, 60.5494) is based primarily on the current delegation section in subpart AAA. In general, we believe these delegations have worked well and are still appropriate with some clarifications and additions. The intent of the prohibitions section is to clarify the responsibility of owners and operators and manufacturers to comply with the proposed subparts. Key provisions for owners and operators emphasize that appliances must be

operated in accordance with the owner's manual and the appliances must not be altered in any way to circumvent the design and operation of a certified appliance. Key provisions for manufacturers emphasize the importance of complying with the label requirements and the need to maintain current certification for all heaters that are offered for sale. The intent of the delegation section is to clarify the regulatory provisions for which the EPA has retained sole enforcement authority (definitions, compliance and certification, test methods and procedures, laboratory accreditation, reporting and recordkeeping, revocation of certification, and hearings and appeals procedures). However, we have proposed to include the ability to delegate provisions to state, local or tribal agencies where local enforcement is essential, such as enforcement of permanent labels and owner's manual content, and presentation of false or misleading information. Note that when the EPA "delegates" enforcement authority, we retain our authority to enforce while allowing the delegates also to be able to enforce the delegated provisions. Also note that the delegations are upon request, not a requirement by the EPA.

We are proposing to replace the current subpart AAA hearing and appeal procedures with a streamlined Petition for Review process and also use this process in subparts QQQQ and RRRR. This process would allow accredited laboratories and manufacturers to contest audit test findings, laboratory accreditations, certification denials, and certification revocations by submitting a written request and supporting documentation to the EPA. This process would allow for expedited review and resolution. We request specific comments on this proposed process and other ways to improve or streamline procedures while preserving the integrity of the program.

**VI. Statutory and Executive Order Reviews**

*A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review*

Under Section 3(f)(1) of Executive Order 12866 (58 FR 51735, October 4, 1993), this action is an "economically significant regulatory action" because it is likely to have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or

state, local, or tribal governments or communities. The \$100 million threshold can be triggered by either costs or benefits, or a combination of them. Accordingly, the EPA submitted this action to OMB for review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011) and any changes made in response to OMB recommendations have been documented in the docket for this action.

In addition, the EPA prepared an analysis of the potential costs and benefits associated with this action. This analysis is contained in the RIA for this proposed rule. A copy of the analysis is available in the docket for this action.

A summary of the monetized benefits and net benefits for the proposed rule at discount rates of 3 percent and 7 percent is in Table 8 of this preamble, and a more detailed discussion of the benefits is found in section IV.B of this preamble. For more information on the benefits analysis, please refer to the RIA for this rulemaking, which is available in the docket.

*B. Paperwork Reduction Act*

The information collection requirements in this proposed rule have been submitted for approval to OMB under the *Paperwork Reduction Act*, 44 U.S.C. 3501 *et seq.* Information Collection Request (ICR) documents have been prepared for each proposed subpart. The subpart AAA ICR has been assigned the EPA ICR number 1176.10, which is a revision of the currently approved ICR number 1176.09. The subpart QQQQ ICR is a new collection, which has been assigned the EPA ICR number 2442.01. The subpart RRRR ICR also is a new collection, which has been assigned the EPA ICR number 2443.01. The new information collection requirements are not enforceable until OMB approves them.

The proposed rules would require manufacturers of new residential wood heating devices to submit applications for certification of model lines, to submit results of emissions tests conducted to demonstrate that the model lines would comply with the standards and produce certified units according to a quality control plan approved by an independent certifying body. Manufacturers must submit a notification of the initial test and biennial reports that each certified model line remains unchanged. They must also maintain records of all certification data, maintain results of quality assurance program inspections and emissions test data, and seal and store the tested appliance.

Consistent with the current ICR for subpart AAA, we have included costs to manufacture and apply permanent labels (for all models) on each applicable unit prior to sale. These labels provide important compliance information to enforcement officials.

Test laboratories that want to conduct NSPS certification testing would need to apply for accreditation, conduct initial and biennial proficiency testing and report the results of all such testing. Accredited test laboratories would also be required to participate in an audit compliance program. Finally, the accredited laboratories must maintain records of all certification tests, proficiency tests and compliance audit test data.

The required notifications are used to inform the agency when a new model line is expected to be tested. The EPA may then observe the testing operation, if desired. Emissions test reports are needed as these are the agency's record of a model line's initial capability to comply with the emission standard, and serve as a record of the operating conditions under which compliance was achieved.

Adequate recordkeeping and reporting are necessary to ensure compliance with these standards as required by the CAA. The information collected from recordkeeping and reporting requirements is also used for targeting inspections and is of sufficient quality to be used as evidence in court. As discussed earlier, we have reviewed all the current requirements and are proposing to remove the portions of the recordkeeping that are not necessary.

The estimated burden for proposed subpart AAA is based on an estimated 72 respondents (66 manufacturers and 6 testing laboratories) that would be subject to the rule. The number of total annual responses for subpart AAA is estimated at 265. The annual burden for this information collection averaged over the first 3 years of this ICR is estimated to be a total of 6,489 labor hours per year at a total labor cost of \$516,188 per year. The ICR estimates that capital and the associated operation and maintenance (O&M) costs for these systems would be \$1,452,177 per year. The average annual labor burden per response is 24 hours.

The estimated burden for proposed subpart QQQQ is based on an estimated 41 respondents (37 manufacturers and 4 testing laboratories) that would be subject to the rule. The number of total annual responses for subpart QQQQ is estimated at 67. The annual burden for this information collection averaged over the first 3 years of this ICR is estimated to be a total of 2,134 labor

hours per year at a total labor cost of \$169,745 per year. The ICR estimates that capital and operation and maintenance (O&M) costs would be \$715,796 per year. The average annual labor burden per response is 32 hours.

The estimated burden for proposed subpart RRRR is based on an estimated 48 respondents (45 manufacturers and 3 testing laboratories) that would be subject to the rule. The number of total annual responses for subpart RRRR is estimated at 108. The annual burden for this information collection averaged over the first 3 years of this ICR is estimated to be a total of 2,044 labor hours per year at a total labor cost of \$162,589 per year. The ICR estimates that capital and operation and maintenance (O&M) costs would be \$89,037 per year. The average annual labor burden per response is 19 hours. Burden is defined at 5 CFR 1320.3(b).

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

To comment on the agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, the EPA has established a public docket for this rule, which includes this ICR, under Docket ID number EPA-HQ-OAR-2009-0734. Submit any comments related to the ICR to the EPA and OMB. See **ADDRESSES** section at the beginning of this notice for where to submit comments to the EPA. Send ICR-related comments to OMB at the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street NW., Washington, DC 20503, Attention: Desk Office for EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after February 3, 2014, a comment to OMB is best assured of having its full effect if OMB receives it by March 5, 2014. The final rule will respond to any OMB or public comments on the information collection requirements contained in this proposal.

### C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities

include small businesses, small organizations and small governmental jurisdictions.

For purposes of assessing the impacts of this proposed rule on small entities, small entity is defined as: (1) A small business that is primarily engaged in manufacturing heating equipment (except electric and warm air furnaces), such as heating boilers (heaters), heating stoves, floor and wall furnaces, and wall and baseboard heating units, as defined by NAICS code 333414 with fewer than 500 employees, or is primarily engaged in manufacturing air-conditioning and warm air heating equipment as defined by NAICS code 333415 with fewer than 750 employees, or is primarily engaged in masonry contracting, as defined by NAICS code 238140 with annual receipts less than 14 million dollars (based on Small Business Administration size standards); (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

Pursuant to section 603 of the RFA, the EPA prepared an initial regulatory flexibility analysis (IRFA) that examines the impact of the proposed rule on small entities along with regulatory alternatives that could reduce that impact. The IRFA contained within the RIA for this proposed rule is available for review in the docket and is summarized below:

- Reason Why Action Is Being Considered. As discussed earlier in this preamble, this proposal was developed following CAA section 111(b)(1)(B) review of the existing residential wood heater NSPS.

- Statement of Objectives and Legal Basis of Proposed Rule. As discussed earlier in this preamble, the EPA is proposing to amend Standards of Performance for New Residential Wood Heaters and to add two new subparts: Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces and Standards of Performance for New Residential Masonry Heaters. This proposal would achieve several objectives, including applying updated emission limits that reflect BSEI; improving coverage of the broad suite of residential wood heaters; improving the test methods; and streamlining the certification process. This proposal does not include any requirements on heaters that are solely fired by gas or oil. This proposal does not affect existing heaters. This proposal

was developed under the authority of CAA section 111.

- Description and Estimate of the Number of Small Entities. As discussed earlier in this preamble, small entities that the EPA anticipates being affected by this proposal would include almost all manufacturers of residential wood heaters. We estimate that roughly 250–300 U.S. companies manufacture residential wood heaters. We believe that approximately 90 percent of these manufacturers meet the SBA small-entity definition of having fewer than 500 employees.

- Description of reporting, recordkeeping and other compliance requirements. The reporting and recordkeeping requirements are described in the section immediately above (*B. Paperwork Reduction Act*). As discussed there, the information collection requirements (ICR), including reporting and recordkeeping, in this proposed rule have been submitted for approval to OMB under the *Paperwork Reduction Act*, 44 U.S.C. 3501 *et seq.* For subpart AAA, we estimated the potential annual burden averaged over the first 3 years of the ICR to be a total of 6,489 labor hours per year at a total labor cost of \$516,188 per year and an average annual labor burden per response of 24 hours. For subpart QQQQ, we estimated 2,134 labor hours per year at a total labor cost of \$169,745 per year and an average annual labor burden per response of 32 hours. For subpart RRRR, we estimated 2,044 labor hours per year at a total labor cost of \$162,589 per year and an average annual labor burden per response of 19 hours.

- Description of other compliance requirements. As described earlier in this preamble, this proposal would apply updated emission limits that reflect the current best systems of emission reduction and improve the coverage of the expanded variety of types of residential wood heaters. We estimate the proposed NSPS's total annualized average nationwide costs would be \$15.7 million (2010\$) over the 2014 through 2022 period. The economic impacts for industries affected by this proposed rule over this same period range from 4.3 percent for manufacture of wood heater/stove models to as much as an 6.4 percent compliance cost-to-sales estimate for manufacture of single burn rate wood heater models. These impacts do not presume any pass-through of impacts to consumers. With pass-through to consumers, these impact estimates to manufacturers will decline proportionate to the degree of pass-through. We estimate that small entities

will have annualized costs of greater than 1 percent of their sales in all industries except NAICS 332510, 333414 and 423720 with fewer than 20 employees, and NAICS 236115, 238140 and 442299 with receipts less than \$10 million. Those establishments in NAICS 332510, 333414 and 423720 with cost-to-receipt ratios higher than 1 percent account for 80 percent of small entities affected in these industries. Establishments in NAICS 236115, 238140 and 442299 with cost-to-receipt ratios higher than 1 percent account for 99 percent of small entities affected in these industries.

- Relevant federal rules that may overlap or conflict with this proposal. There are no other relevant federal rules.

- Significant alternatives. The significant alternatives to this proposal, especially those that might minimize potential impacts on small entities, are presented in the remainder of this section.

As required by section 609(b) of the RFA, as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA), the EPA also convened a Small Business Advocacy Review Panel (Panel) to obtain advice and recommendations of representatives of the small entities that potentially would be subject to the rule's requirements. The following paragraphs describe the process, the type of small entity representatives, the outreach efforts and the Panel members.

Well before beginning the formal SBREFA process, the EPA actively engaged in outreach with HPBA, the Masonry Heater Association (MHA) and PFI and many of their member companies to discuss the rule under development and to provide these contacts with an early opportunity to ask questions and discuss their concerns.<sup>67</sup> The EPA provided each small business with general information on the SBREFA process and background information on the NSPS rulemaking process and current schedule.

Based on consultations with the Small Business Administration, and resulting from solicited self-nominations, we prepared a list of 30 potential Small Entity Representatives (SERs), from residential wood heating appliance manufacturers (wood heaters, pellet heaters/stoves, hydronic heaters, forced-air furnaces and masonry heaters), other

wood-burning appliance manufacturers (fireplaces, cook stoves), equipment suppliers, chimney sweeps, test laboratories, masons and trade associations. Once the official pre-Panel process began and potential SERs were identified, the EPA held an outreach meeting with the potential SERs and invited representatives from the Office of Advocacy of the Small Business Administration (OA/SBA) and the Office of Information and Regulatory Affairs within the Office of Management and Budget (OIRA/OMB) on June 29, 2010, to solicit their feedback on the upcoming proposed rulemaking. Representatives from 26 of the 30 companies and organizations that we selected as potential SERs for this SBREFA process participated in the meeting (in person and by phone). At that meeting, the EPA solicited written comments from the potential SERs, which were later summarized and shared with the Panel as part of the convening document.

The SBAR Panel convened on August 4, 2010. The Panel consisted of representatives of the EPA, OA/SBA and OIRA/OMB. The Panel held a formal outreach meeting/teleconference with the SERs on August 25, 2010. To help the SERs prepare for this meeting, on August 11, 2010, the Panel sent a list of questions, preliminary cost information and other materials to each of the SERs via email. Additional materials were emailed to the SERs on August 19, 2010. The Panel provided the opportunity for questions and comment during the meeting on various aspects of the proposal being developed, including the expanded scope of the rule, changes to the current requirements under consideration, preliminary cost information and follow up from the June 29, 2010, meeting on the SERs' ideas for regulatory flexibility. During the August 25 meeting, SERs voiced general support for the planned proposed rule and shared specific concerns with the Panel members. As a result of this meeting, the EPA received many useful verbal comments, and the EPA received many helpful written comments by September 10, 2010.

Consistent with the RFA/SBREFA requirements, the Panel evaluated the assembled materials and small-entity comments on issues related to elements of the IRFA. A copy of the Panel final report is included in the docket for this proposed rule. We invite comments on the report. A summary of the Panel recommendations is presented below. We have attempted to follow the Panel's recommendations to the degree we can while also ensuring that the options are practicable, enforceable,

<sup>67</sup> Also, as noted in this preamble in the discussion of development of the hydronic heater emission limits, the EPA worked with the hydronic heater industry in 2006 to develop a voluntary partnership program to encourage manufacture of cleaner models, [www.epa.gov/burnwise/participation](http://www.epa.gov/burnwise/participation).

environmentally sound and consistent with the CAA. For those recommendations not adopted by the EPA, we have included an explanation for why we rejected them.

Many of the SERs and the Panel had concerns about the breadth of this rulemaking and the challenges the EPA faces in conducting rulemaking for all of these source categories at one time and the challenges that the small businesses will face in having to comply with standards for all of these source categories at one time. The Panel recommended that the EPA should consider focusing efforts first on emissions sources that have the greatest potential to impact public health through the magnitude of emissions and population exposure. We have focused our efforts. The Panel noted the adverse effects of the 1988 NSPS on numerous wood heater/stove manufacturers, and the need to carefully develop a rule that will minimize business closures, while still achieving significant emission reductions. All Panel members believed that the EPA had adequate information to move forward with developing revisions that apply to the residential wood heater categories that are already regulated by the 1988 NSPS. However, two Panel members recommended that the EPA Administrator consider taking more time to collect additional information to better determine BSE for the certified wood heater category. They concluded that the EPA did present to the Panel enough information to justify regulation of this subcategory, but the EPA did not adequately inform the SERs about the other categories. These two Panel members believed it was unclear whether adoption of a more stringent standard for new sources would slow the adoption of new, cleaner burning heaters, potentially delaying improvements in air quality. The two Panel members further believed, based on the information available from the EPA and the SERs at that time, that they could not conclude that a nationwide NSPS limit on the other categories would be the preferred approach for reducing wood heater emissions.

Following the Panel's convening on August 4, 2010, the EPA collected additional information, and we refined the economic and technical analyses based, in part, on input from the SERs as the basis for this proposal. The Panel recommended that the EPA Administrator consider assessing the availability of data to better characterize each source category prior to considering proposal of standards. In particular, the Panel recommended that the EPA consider characterizing the

emissions per unit, operating hours per year, and the distribution of emissions across the unit types within each category under discussion at that time to better understand the magnitude of emissions reductions that may or may not be reduced through alternative regulatory and non-regulatory mechanisms. As discussed earlier, the EPA has considered such characterizations and alternatives.

The following is a list of Panel recommendations and how we incorporated them into this proposal:

- The Panel recommended that the EPA should consider focusing efforts first on emissions sources that have the greatest potential to impact public health through the magnitude of emissions and population exposure. *This proposal focuses on those sources.*

- The Panel encouraged the EPA to consider flexibilities that will most directly minimize the small business burdens, for example delayed compliance dates for low volume production. The delayed compliance approach was predicated on the concept that it will take a number of years for manufacturers to recover the costs of the R&D investment in order to achieve compliance. *This proposal has incorporated a stepped approach for emission limits and asks for comments on other alternative approaches.*

- The Panel recommended that the EPA consider the availability and feasibility of certification, testing labs, testing standards and other requirements. In particular, the Panel recommended that the EPA consider ways to streamline compliance certification, identifying flexible approaches and procedures that will reduce the burden and time for manufacturers to complete the application, testing and approval process for new model lines. For example, the Panel recommended that the EPA consider allowing the use of International Standards Organization (ISO)-accredited laboratories and certifying bodies to expand the number of facilities that would be required for testing and certification of the new residential solid biomass combustion appliances. Additionally, the Panel recommended that the EPA consider different compliance time frames for different product categories to reduce the potential for logjams at test labs and the overall impact on companies that manufacture multiple categories. *This proposal includes stepped emission limits for different categories and adds ISO-accredited laboratories and ISO-accredited certifying bodies to increase the availability of laboratories and*

*certifiers. Further, this proposal asks for specific comments on the schedules.*

- The Panel recommended that the EPA continue to allow manufacturers to test a representative unit for a model line rather than testing and reporting results for each individual unit. *This proposal continues to allow that.*

- The Panel recommended that the EPA consider emphasizing that the NSPS will address only new units. *This proposal emphasizes that it does not affect existing units.*

- In the Panel Report, SBA and OMB recommended that the EPA not move forward with proposed emission limits for pellet stoves, indoor hydronic heaters, biomass pellet stoves, masonry heaters, masonry fireplace kits, site-built masonry fireplaces, coal stoves, cook stoves, bake ovens (including Native American Traditional Bake Ovens), camp stoves, outdoor fireplaces and chimineas. *This proposal establishes emission limits for pellet stoves/heaters, which compete with adjustable burn rate wood stoves/heaters in the "room heaters" consumer marketplace. There is confusion in the marketplace as to why some pellet stoves are regulated and why some are not. As discussed earlier in this preamble, the potential exclusion of pellet stoves with greater than 35-to-1 air-to-fuel ratio is an unintended consequence of the 1988 actual intention of not setting emission limits for open fireplaces with high excess combustion air that do not operate as effective heaters. We believe that not moving forward on pellet stoves now would contribute to further confusion and an uneven playing field in the marketplace. Further, the emission levels we are proposing for pellet stoves/heaters are at the same level as the proposed wood stove/heater standards and are already achieved by most pellet stove/heater models and thus do not impose substantial compliance costs. Similarly, masonry heaters compete in the residential wood heaters consumer marketplace and there is confusion as to why they are regulated by some states, but not the EPA, and are even banned by some air districts because masonry heaters are not EPA-certified. Most masonry heaters are effective heaters and relatively clean and efficient, especially compared to pre-NSPS wood stoves. Requiring valid certification testing and reporting and providing that information to regulators and consumers and the public will help inform all as they strive to make appropriate choices on wood heating and air quality. That is, the masonry heaters can be an excellent emission reduction choice for replacing higher emission pre-NSPS wood stoves and*

should be encouraged over old wood stoves in most air sheds. Further, the emission levels we are proposing are already achieved by most masonry heater designs and we allow extra time for small manufacturers. This proposal addresses indoor hydronic heaters because they compete with outdoor hydronic heaters and forced-air furnaces in the “central heaters” consumer marketplace and there already is confusion as to why some are regulated by some states and some are not. Further, the magnitude of their emissions is of great concern and BSER controls are highly justified on cost-benefit grounds. The remainder of the appliances listed above are not included in this proposal.

- In the Panel report, SBA and OMB recommended that “where EPA estimates that the nationwide emissions are less than 300 tons per year (or some other value) . . . the EPA Administrator should consider options of not issuing an NSPS but rather consider allowing Regions and States to control such sources and consider other efforts, including voluntary standards to lower emissions.” We considered this recommendation but we could not find a legal or policy justification for an arbitrary cutoff and it is not included in this proposal. Also, we note that many states are prohibited from setting control requirements more stringent than the EPA requirements and all states have concerns about the lack of resources necessary to develop and adopt and implement state standards or voluntary programs, especially when most believe it is the EPA’s responsibility, and some have sued the EPA for failure to review and promulgate national standards on time as statutorily required. Further, the EPA does not agree with this recommendation, especially considering the strong recommendations by many states that the EPA regulate all residential wood heaters as soon as possible to provide another tool to help them with their efforts to reduce wood smoke emissions. As stated elsewhere in this proposal, the EPA is not proposing standards at this time for biomass pellet heater/stoves that are designed to only combust biomass other than wood, bake ovens, fireplaces, coal-only stoves, chimineas, ceremonial fires and commercial pizza ovens.

- Two Panel members recommended that if the EPA decides to later pursue regulation of categories other than certified wood heaters, the EPA should convene another Panel to address those subcategories at the appropriate time. The EPA does not agree with this recommendation for residential wood

heaters because the EPA believes that the SERs already have had multiple opportunities to address those subcategories. Furthermore, the EPA has conducted numerous meetings after the Panel process was completed to provide much additional information (e.g., technical discussions of refined alternatives) and updates to stakeholders including the SERs and other small businesses and other interested parties. We emphasize that this proposal is not a final rule but rather it is a proposal for public review and comment. We welcome comments and data on all aspects of this proposal that will help us prepare the final rulemaking.

As noted earlier, a copy of the Panel final full report is included in the docket for this proposed rule. We invite comments on the report and on all aspects of the proposal and its impacts on small entities.

#### *D. Unfunded Mandates Reform Act*

This proposed rule contains no federal mandates under the provisions of Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), 2 U.S.C. 1531–1538 that may result in expenditures of \$100 million or more for state, local or tribal governments, in the aggregate, or to the private sector in any 1 year. This proposed action imposes no enforceable duty on any state, local or tribal governments. The nationwide annualized average compliance cost of this proposed rule for directly affected appliances is \$15.7 million/yr in the 2014–2022 timeframe (2010\$). Therefore, this proposed rule would not be subject to the requirements of sections 202 or 205 of the UMRA.

This proposed rule would also not be subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. The proposed rule would not apply to such governments and would impose no obligations upon them.

#### *E. Executive Order 13132: Federalism*

Executive Order 13132 (64 FR 43255, August 10, 1999) requires the EPA to develop an accountable process to ensure “meaningful and timely input by state and local officials in the development of regulatory policies that have federalism implications.” “Policies that have federalism implications” are defined in the Executive Order to include regulations that have “substantial direct effects on the states, on the relationship between the national government and the states, or on the

distribution of power and responsibilities among the various levels of government.”

This proposed rule does not have federalism implications. It would not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The proposed rule would not impose any requirements on state and local governments. Thus, Executive Order 13132 does not apply to this proposed rule. Although section 6 of Executive Order 13132 does not apply to this proposed action, the EPA did consult with representatives of state and local governments in developing this action. In the spirit of Executive Order 13132 and consistent with the EPA policy to promote communications between the EPA and state and local governments, the EPA specifically solicits comment on this proposed rule from state and local officials.

#### *F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments*

This proposed action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). This proposed rule would not impose any requirements on tribal governments; thus, Executive Order 13175 does not apply to this action. Although Executive Order 13175 does not apply to this action, we recognize that the air quality and public health benefits to be achieved by this rule would benefit tribes, and we conducted outreach to tribal environmental staff and consulted with representatives of tribal officials in developing this action.

During the development of this proposed rulemaking, the EPA conducted outreach with numerous tribal representatives to provide opportunities for input prior to development of the proposed rule. We provided information at the July 2010, National Tribal Forum/National Tribal Air Association (NTAA) meeting in Albuquerque, New Mexico, and the November 2010, EPA Region 10 Tribal Leaders Summit in Juneau, Alaska. We also presented information on this proposed rulemaking in the April 2010, issue of Tribal Air News and during the EPA/NTAA tribal workgroup conference calls (April 2010, July 2010, August 2010, and May 2013). Specifically, we received input from the EPA/NTAA tribal workgroup members on culturally relevant exclusions from the proposed

standards. We agreed with their input, clarified that we do not intend to regulate ceremonial fires, and added a definition to the rule to exclude traditional Native American bake ovens.

On February 18, 2011, the EPA mailed letters to about 600 elected tribal leaders in the U.S. offering an opportunity for consultation on this proposal. We received requests from six tribes. These tribes agreed to discuss this proposal with us in a conference call held on March 22, 2011. The tribes were very supportive of this proposal and provided some helpful clarifications of definitions (e.g., Native American bake ovens) that we have incorporated in this proposal.

We plan to continue to provide updates on the rule on the EPA/NTAA conference calls and to offer opportunities to tribal leaders for consultation. The EPA specifically solicits additional comment on this proposed action from tribal officials.

#### *G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks*

Executive Order 13045, “Protection of Children from Environmental Health Risks and Safety Risks” (62 FR 19885, April 23, 1997), applies to any rule that: (1) Is determined to be “economically significant,” as defined under Executive Order 12866; and (2) concerns an environmental health or safety risk that the EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, the EPA must evaluate the environmental health or safety effects of the planned rule on children and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

This proposed rule is not subject to Executive Order 13045 (62 FR 19885, April 23, 1997) because the agency does not believe the environmental health risks or safety risks addressed by this action present a disproportionate risk to children. The report, “Analysis of Exposure to Residential Wood Combustion Emissions for Different Socio-Economic Groups,”<sup>68</sup> shows that on a nationwide basis, cancer risks due to residential wood smoke emissions among disadvantaged population groups generally are lower than the risks for the

general population due to residential wood smoke emissions. One of the demographic variables examined for this report was that of children 18 years and younger.

This proposed rule is expected to reduce environmental impacts for everyone, including children. This action proposes emissions limits at the levels based on BSER, as required by the CAA. Based on our analysis, we believe this rule would not have a disproportionate impact on children, and, in fact, will result in improvements to children’s health.

The public is invited to submit comments or identify peer-reviewed studies and data that assess effects of early life exposure to smoke from residential wood heaters.

#### *H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use*

This proposed rule is not a “significant energy action” as defined in Executive Order 13211 (66 FR 28355, May 22, 2001), because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Further, we have concluded that this rule is not likely to have any significant adverse energy effects. In general, we expect the NSPS to improve technology, including energy efficiency. Reducing emissions and increasing efficiency might increase the use of wood fuel, which would relieve pressure on traditional coal or petroleum based energy sources. However, as described in section IV.E, it is difficult to determine the precise energy impacts that might result from this rule. This is because wood-fueled appliances compete with other biomass forms as well as more traditional oil, electricity and natural gas. We have not determined the potential conversion to other types of fuels and their associated appliances if the consumer costs of wood-fueled appliances increase and at what level that increase would drive consumer choice.

#### *I. National Technology Transfer and Advancement Act*

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (“NTTAA”), Public Law 104–113 (15 U.S.C. 272 note) directs the EPA to use voluntary consensus standards (VCS) in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. VCS are technical standards (e.g., materials specifications, test methods, sampling procedures and business practices) that

are developed or adopted by VCS bodies. The NTTAA directs the EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards.

This proposed rulemaking involves technical standards. The EPA proposes to use several VCS test methods, in full or in part, including the following methods available for review at the ASTM Web site [www.astm.org/EPA-review](http://www.astm.org/EPA-review): E2515–10 “Standard Test Method for Determination of Particulate Matter Emissions Collected by a Dilution Tunnel” (See also ASTM WK20442 proposed revision and ASTM WK31433 proposed revision); E2779–10 “Standard Test Method for Determining Particulate Matter Emissions from Pellet Heaters;” E2780–10 “Standard Test Method for Determining Particulate Matter Emissions from Wood Heaters;” E2618–13 “Standard Test Method for Measurement of Particulate Matter Emissions and Heating Efficiency of Outdoor Solid Fuel-Fired Hydronic Heating Appliances;” ASTM E2817–11 “Standard Test Method for Test Fueling Masonry Heaters;” ASTM WK26558 “Specification for Calculation Method for Custom Designed, Site Built Masonry Heaters.” Also, we propose to use, in part, the following test method available for review at the CSA Web site <http://shop.csa.ca/en/canada/fuel-burning-equipment/b4151-10/inv/27013322010/>: CSA B415.1–10 “Performance Testing of Solid-fuel-burning Heating Appliances.” Finally, we propose to use, in part, the following test method prepared by the European Union: EN 303–5 “Heating boilers for solid fuels, hand and automatically stoked nominal heat output of up to 1025 MBtu—Terminology, requirements, testing, and marketing.” We believe that all the methods listed above have some positive aspects that can help stakeholders determine emissions under various operation conditions. For more details on each method, please refer to the discussions in Section III of this preamble.

In addition, we determined that the VCS ASTM E871–82 (2006), “Standard Test Method for Moisture Analysis of Particulate Wood Fuels” is acceptable as an alternative to Methods 5H and 28.

The search identified five other VCS that were potentially applicable for this rule in lieu of the EPA reference methods. However, the EPA determined that the five candidate VCS would not be practical due to lack of equivalency, documentation, validation data and other important technical and policy considerations. The five VCS and other information and conclusion, including

<sup>68</sup> “Analysis of Exposure to Residential Wood Combustion Emissions for Different Socio-Economic Groups, Revised Draft Report.” Prepared for Gil Wood, U.S. EPA, Office of Air Quality Planning and Standards, Research Triangle Park, NC. Prepared by EC/R Inc., EPA Contract No. EP–D–05–085, Work Assignment No. 4–3. April 22, 2010.

the search and review results, are in the docket for this proposed rule. The EPA welcomes comments on this aspect of the proposed rulemaking. Specifically, we invite the public to identify potentially applicable voluntary consensus standards and to explain why such standards, in whole or in part, should or should not be used in this regulation.

*J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations*

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies and activities on minority populations and low-income populations in the U.S. The EPA defines "Environmental Justice" to include meaning involvement of all people regardless of race, color, national origin or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies.

As discussed earlier, the report, "Analysis of Exposure to Residential Wood Combustion Emissions for Different Socio-Economic Groups," shows that on a nationwide basis, cancer risks due to residential wood smoke emissions among disadvantaged population groups generally are lower than the risks for the general population due to residential wood smoke emissions. Thus, we have determined that this proposed rule would not have disproportionately high and adverse human health or environmental effects on minority, low-income or indigenous populations because it increases the level of environmental protection for all affected populations without having any disproportionately high and adverse human health or environmental effects on any population, including any minority low-income or indigenous population.<sup>69</sup> This proposed rule establishes national standards that would reduce primarily PM emissions

<sup>69</sup> "Analysis of Exposure to Residential Wood Combustion Emissions for Different Socio-Economic Groups, Revised Draft Report." Prepared for Gil Wood, U.S. EPA, Office of Air Quality Planning and Standards, Research Triangle Park, NC. Prepared by EC/R Inc., EPA Contract No. EP-D-05-085, Work Assignment No. 4-3. April 22, 2010.

from new residential wood heaters and, thus, would decrease the amount of these emissions to which all affected populations are exposed.

**List of Subjects in 40 CFR Part 60**

Environmental protection, Administrative practice and procedure, Air pollution control, Carbon monoxide, Hazardous substances, Intergovernmental relations, Particulate matter, Reporting and recordkeeping requirements.

Dated: January 3, 2014.

**Gina McCarthy,**  
*Administrator.*

For the reasons stated in the preamble, title 40, chapter I, of the Code of Federal Regulations is proposed to be amended as follows:

**PART 60—STANDARDS OF PERFORMANCE FOR NEW SOURCES**

- 1. The authority citation for part 60 continues to read as follows:

**Authority:** 42 U.S.C. 7401-7671q.

**Subpart A—GENERAL PROVISIONS**

- 2. Section 60.17 is amended by:
  - a. Adding paragraphs (a)(109) through (a)(115); and
  - b. Adding paragraph (p) to read as follows:

**§ 60.17 Incorporations by reference.**

\* \* \* \* \*

(a) \* \* \*

(109) ASTM E871-82 (2006), Standard Test Methods for Moisture Analysis of Particulate Wood Fuels, IBR approved for appendix A: Method 5H and Method 28.

(110) ASTM E2515-10, Standard Test Method for Determination of Particulate Matter Emissions Collected by a Dilution Tunnel, IBR approved for § 60.534(c), § 60.5476(b) and § 60.5488(b).

(111) ASTM E2779-10, Standard Test Method for Determining Particulate Matter Emissions from Pellet Heaters, IBR approved for § 60.534(a)(2).

(112) ASTM E2618-13 Standard Test Method for Measurement of Particulate Matter Emissions and Heating Efficiency of Outdoor Solid Fuel-Fired Hydronic Heating Appliances, IBR approved for § 60.5476(a)(2).

(113) ASTM E2780-10, Standard Test Method for Determining Particulate Matter Emissions from Wood Heaters, IBR approved for § 60.534(a)(2).

(114) ASTM E2817-11, Standard Test Method for Test Fueling Masonry Heaters, IBR approved for § 60.5488(a).

(115) ASTM WK26558, New Specification for Calculation Method for

Custom Designed, Site Built Masonry Heaters, IBR approved for § 60.5488(c)(1).

(p) This material is available for purchase from the Canadian Standards Association (CSA) at <http://shop.csa.ca/en/canada/fuel-burning-equipment/b4151-10/inv/27013322010/>.

(1) CSA B415.1-10, Performance Testing of Solid-fuel-burning Heating Appliances, IBR approved for § 60.534(d) and § 60.5476(c) and (d).

(2) [Reserved]

- 3. Revise subpart AAA to read as follows:

**Subpart AAA—Standards of Performance for New Residential Wood Heaters**

Sec.

- 60.530 Am I subject to this subpart?
- 60.531 What definitions must I know?
- 60.532 What standards and associated requirements must I meet and by when?
- 60.533 What compliance and certification requirements must I meet and by when?
- 60.534 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?
- 60.535 What procedures must I use for laboratory accreditation or certifying body accreditation?
- 60.536 What requirements must I meet for permanent labels and owner's manuals?
- 60.537 What records must I keep and what reports must I submit?
- 60.538 What activities are prohibited under this subpart?
- 60.539 What Petition for Review procedures apply to me?
- 60.539a Who implements and enforces this subpart?
- 60.539b What parts of the General Provisions do not apply?

**Subpart AAA—Standards of Performance for New Residential Wood Heaters**

**§ 60.530 Am I subject to this subpart?**

(a) You are subject to this subpart if you operate, manufacture, sell, offer for sale, import for sale, distribute, offer to distribute, introduce, or deliver for introduction, into commerce in the United States, an affected wood heater specified in paragraphs (a)(1) or (a)(2) of this section:

(1) Each adjustable burn rate wood heater with a current EPA certificate of compliance, single burn rate wood heaters with a current EPA certificate of compliance, and each pellet stove with a current EPA certificate of compliance issued prior to [EFFECTIVE DATE OF FINAL RULE] according to the certification procedures in effect in this subpart at the time of certification that are manufactured on or after July 1, 1988 are affected wood heaters.

(2) All other residential wood heaters under this subpart manufactured or sold on or after [EFFECTIVE DATE OF FINAL RULE] are affected wood heaters.

(b) Each affected wood heater must comply with the provisions of this subpart unless exempted under paragraphs (b)(1) through (b)(6) of this section.

(1) Affected wood heaters manufactured in the United States for export are exempt from the applicable emission limits of § 60.532 and the requirements of § 60.533.

(2) Affected wood heaters used for research and development purposes that are never offered for sale or sold and that are not used for the purpose of providing heat are exempt from the applicable emission limits of § 60.532 and the requirements of § 60.533. No more than 50 wood heaters manufactured per model line can be exempted for this purpose.

(3) Appliances that do not burn wood or wood pellets (such as coal-only heaters that meet the definition in § 60.531 or corn-only pellet stoves) are exempt from the applicable emission limits of § 60.532 and the requirements of § 60.533.

(4) Cook stoves that meet the definition in § 60.531 are exempt from the applicable emission limits of § 60.532 and the requirements of § 60.533.

(5) Camp stoves that meet the definition in § 60.531 are exempt from the applicable emission limits of § 60.532 and the requirements of § 60.533.

(6) Modification or reconstruction, as defined in § 60.14 and § 60.15 of Subpart A will not, by itself, make a wood heater an affected facility under this subpart.

(c) The following are not affected wood heaters and are not subject to this subpart:

(1) Residential hydronic heaters and residential forced-air furnaces subject to subpart QQQQ of this part.

(2) Residential masonry heaters subject to subpart RRRR of this part.

(3) Appliances that are not residential heating devices (for example, manufactured or site-built masonry fireplaces).

(4) Traditional Native American bake ovens that meet the definition in § 60.531.

#### § 60.531 What definitions must I know?

As used in this subpart, all terms not defined herein have the meaning given them in the Clean Air Act and subpart A of this part.

*Adjustable burn rate wood heater* means an enclosed, wood-burning

appliance capable of and intended for residential space heating or domestic water heating that is equipped with or installed with a damper or other mechanism to allow the operator to vary burn rate conditions, regardless of whether it is internal or external to the appliance. This definition does not distinguish between heaters that are free standing or fireplace inserts.

*Accredited test laboratory* means a test laboratory that is accredited for wood heater certification testing under § 60.535 or is an independent third-party test laboratory that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17025 to perform testing using the test methods specified in § 60.534 and approved by the EPA for conducting testing under this subpart.

*At retail* means the sale by a commercial owner of a wood heater to the ultimate purchaser.

*Camp stove* (sometimes also called cylinder stove or wall tent stove) means a portable stove equipped with a pipe or chimney exhaust capable of burning wood or coal intended for use in a tent or other temporary structure used for hunting, camping, fishing, or other outdoor recreation. The primary purpose of the stove is to provide space heating, although cooking and heating water may be additional functions.

*Catalytic combustor* means a device coated with a noble metal used in a wood heater to lower the temperature required for combustion.

*Certifying entity* means an independent third party that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17020 to perform certifications, inspections and audits under ISO-IEC Guide 17065 and approved by the EPA for conducting certifications, inspections and audits under this subpart.

*Coal-only heater* means an enclosed, coal-burning appliance capable of space heating, or domestic water heating, which has all of the following characteristics:

(1) An opening for emptying ash that is located near the bottom or the side of the appliance;

(2) A system that admits air primarily up and through the fuel bed;

(3) A grate or other similar device for shaking or disturbing the fuel bed or power-driven mechanical stoker;

(4) Installation instructions that state that the use of wood in the stove, except for coal ignition purposes, is prohibited by law; and

(5) The model is listed by a nationally recognized safety-testing laboratory for

use of coal only, except for coal ignition purposes.

*Commercial owner* means any person who owns or controls a wood heater in the course of the business of the manufacture, importation, distribution (including shipping and storage), or sale of the wood heater.

*Cookstove* means a wood-fired appliance that is designed primarily for cooking food and that has the following characteristics:

(1) An oven, with volume of 0.028 cubic meters (1 cubic foot) or greater, and an oven rack;

(2) A device for measuring oven temperatures;

(3) A flame path that is routed around the oven;

(4) An ash pan;

(5) An ash clean-out door below the oven;

(6) The absence of a fan or heat channels to dissipate heat from the appliance;

(7) A cooking surface measured in square inches or square feet that is 1.5 times greater than the firebox, which is measured in cubic inches or cubic feet. Example: A firebox of 2 cubic feet would have a cooking surface of at least 3 square feet;

(8) A portion of at least four sides of the oven is exposed to the flame path during the heating cycle of the oven. A flue gas bypass may exist for temperature control.

*Manufactured* means completed and ready for shipment (whether or not packaged).

*Manufacturer* means any person who constructs or imports into the United States a wood heater.

*Model line* means all wood heaters offered for sale by a single manufacturer that are similar in all material respects.

*Particulate matter (PM)* means total particulate matter including coarse PM (PM<sub>10</sub>) and fine PM (PM<sub>2.5</sub>).

*Pellet stove* means an enclosed, solid fuel burning device capable of and intended for residential space heating or domestic water heating that is designed specifically to burn wood pellet fuel that incorporates induced air flow, is installed with an automatic pellet feeder, and is a free standing room heater or fireplace insert.

*Representative affected wood heater* means an individual wood heater that is similar in all material respects to other wood heaters within the model line it represents.

*Room heater* means an enclosed, wood-burning appliance capable of and intended for residential space heating. Unless otherwise specified, these devices include adjustable burn rate wood heaters, single burn rate wood heaters and pellet stoves.

*Sale* means the transfer of ownership or control, except that a transfer of control of an affected wood heater for research and development purposes within the scope of § 60.530(b)(2) is not a sale.

*Seasoned wood* means wood with a moisture content of 20 percent or less.

*Similar in all material respects* means that the construction materials, exhaust and inlet air system, and other design features are within the allowed tolerances for components identified in § 60.533(k).

*Single burn rate wood heater* means an enclosed, wood-burning appliance capable of and intended for residential space heating or domestic water heating that is not equipped with or installed with a damper to allow the operator to vary burn rate conditions.

*Traditional Native American bake oven* means a wood or other solid fuel burning appliance that is designed primarily for use by Native Americans for food preparation, cooking, warming, or for instructional, recreational, cultural or ceremonial purposes.

*Valid certification test* means a test that meets the following criteria:

(1) The Administrator was notified about the test in accordance with § 60.534(f);

(2) The test was conducted by an accredited test laboratory;

(3) The test was conducted on a wood heater similar in all material respects to other wood heaters of the model line that is to be certified; and

(4) The test was conducted in accordance with the test methods and procedures specified in § 60.534.

*Wood heater* means an enclosed, wood burning-appliance capable of and intended for residential space heating or domestic water heating. Unless otherwise specified, these devices include adjustable burn rate wood heaters, single burn rate wood heaters and pellet stoves.

*Wood pellet fuel* means refined and densified wood shaped into small pellets or briquettes that are uniform in size, shape, moisture, density and energy content.

**§ 60.532 What standards and associated requirements must I meet and by when?**

(a) *1990 Particulate Matter Standards.* Unless exempted under § 60.530, each adjustable burn rate wood heater and pellet stove with a current EPA certification issued prior to [EFFECTIVE DATE OF FINAL RULE], according to the certification procedures in effect in this subpart at the time of certification, must comply with the following particulate matter emission limits as determined by the applicable test

methods and procedures in § 60.534(a) through (c) until the current certification expires as specified in § 60.533(h)(1), or it is revoked by the Administrator as specified in § 60.533(l), whichever is first. After the certificate expires or is revoked, individual wood heaters in that model line can no longer be manufactured or sold unless the manufacturer receives a new certificate of compliance from the Administrator.

(1) An affected wood heater equipped with a catalytic combustor must not discharge into the atmosphere any gases that contain particulate matter in excess of a weighted average of 4.1 g/hr (0.009 lb/hr) as specified in the applicable test method. Particulate matter emissions during any test run at any burn rate that is required to be used in the weighted average as specified in the applicable test method must not exceed the value calculated for "C" (rounded to 2 significant figures) calculated using the following equation:

(i) At burn rates less than or equal to 2.82 kg/hr (6.2 lb/hr),  
 $C = K_1 BR + K_2$

Where:

BR = Burn rate in kg/hr (lb/hr)

C = Actual particulate matter emission rate in g/hr (lb/hr) per burn rate in a given test run

$K_1 = 3.55 \text{ g/kg (0.00355 lb/lb)}$

$K_2 = 4.98 \text{ g/hr (0.011 lb/hr)}$

(ii) At burn rates greater than 2.82 kg/hr (6.2 lb/hr),  $C = 15 \text{ g/hr (0.033 lb/hr)}$ .

(2) An affected wood heater not equipped with a catalytic combustor must not discharge into the atmosphere any gases that contain particulate matter in excess of a weighted average of 7.5 g/hr (0.017 lb/hr) as specified in the applicable test method. Particulate matter emissions must not exceed 15 g/hr (0.033 lb/hr) during any test run at a burn rate less than or equal to 1.5 kg/hr (3.3 lb/hr) that is required to be used in the weighted average as specified in the applicable test method and particulate matter emissions must not exceed 18 g/hr (0.040 lb/hr) during any test run at a burn rate greater than 1.5 kg/hr (3.3 lb/hr) that is required to be used in the weighted average as specified in the applicable test method.

(3) As an alternative, an affected wood heater subject to paragraph (a) of this section may elect to comply with the requirements in paragraph (b) of this section.

(b) *2015 Particulate Matter Standards.* Unless exempted under § 60.530 or subject to the standards specified in paragraph (a) of this section, each adjustable burn rate wood heater or pellet stove manufactured on or after

[EFFECTIVE DATE OF FINAL RULE] or sold at retail for use in the United States on or after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] must comply with the emission limits specified in paragraphs (b)(1) or (b)(2) of this section, as applicable. Unless exempted under § 60.530, each single burn rate wood heater manufactured on or after [EFFECTIVE DATE OF FINAL RULE] or sold at retail on or after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] must comply with the emission limit specified in paragraph (b)(3) of this section. Compliance for all sources must be determined by the test methods and procedures in § 60.534.

(1) An adjustable burn rate wood heater or pellet stove that is an affected wood heater equipped with a catalytic combustor must not discharge into the atmosphere any gases that contain particulate matter in excess of a weighted average of 4.5 g/hr (0.01 lb/hr).

(2) An adjustable burn rate wood heater or pellet stove that is an affected wood heater not equipped with a catalytic combustor and capable of making burn rate adjustments must not discharge into the atmosphere any gases that contain particulate matter in excess of a weighted average of 4.5 g/hr (0.01 lb/hr).

(3) A single burn rate wood heater that is an affected wood heater must not discharge into the atmosphere any gases that contain particulate matter in excess of 4.5 g/hr (0.01 lb/hr).

(c) *2020 Particulate Matter Standards.* Unless exempted under § 60.530 or subject to the standards specified in paragraph (a) of this section, each adjustable burn rate wood heater, pellet stove or single burn rate wood heater manufactured or sold at retail for use in the United States on or after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE] must not discharge into the atmosphere any gases that contain particulate matter in excess of 1.3 g/hr (0.003 lb/hr) for any burn rate. Compliance for all sources must be determined by the test methods and procedures in § 60.534.

(d) [Reserved]

(e) *Pellet Fuel Requirements.* Operators of wood heaters that are certified to burn pellet fuels may only burn pellets that have been produced under a licensing agreement with the Pellet Fuels Institute or an equivalent organization approved by the EPA. The pellet fuel must meet the following minimum requirements:

(1) Density: consistent hardness and energy content with a minimum density of 38 pounds/cubic foot;

(2) Dimensions: maximum length of 1.5 inches and diameter between 0.230 and 0.285 inches;

(3) Inorganic fines: less than or equal to 1 percent;

(4) Chlorides: less than or equal to 300 parts per million by weight;

(5) Ash content: no more than 2 percent; and

(6) A quality assurance process licensed by the Pellet Fuels Institute or equivalent organization approved by EPA.

(f) *Prohibited Fuel Types.* No person is permitted to burn any of the following materials in an affected wood heater:

(1) Residential or commercial garbage;

(2) Lawn clippings or yard waste;

(3) Materials containing rubber, including tires;

(4) Materials containing plastic;

(5) Waste petroleum products, paints or paint thinners, or asphalt products;

(6) Materials containing asbestos;

(7) Construction or demolition debris;

(8) Paper products, cardboard, plywood, or particleboard. The prohibition against burning these materials does not prohibit the use of fire starters made from paper, cardboard, saw dust, wax and similar substances for the purpose of starting a fire in an affected wood heater;

(9) Railroad ties or pressure treated wood;

(10) Manure or animal remains; or

(11) Salt water driftwood or other previously salt water saturated materials.

(g) *Owner's Manual.* A person must not operate an affected residential wood heater in a manner inconsistent with the owner's manual. The owner's manual must clearly specify that operation in a manner inconsistent with the owner's manual would violate the warranty.

(h) *Temperature Sensor Requirement.* An affected wood heater equipped with a catalytic combustor must be equipped with a temperature sensor that can monitor combustor gas stream temperatures within or immediately downstream [within 2.54 centimeters (1 inch)] of the catalytic combustor surface.

#### **§ 60.533 What compliance and certification requirements must I meet and by when?**

(a) *Certification Requirement.* Each affected wood heater must be certified to be in compliance with the applicable emission standards and other requirements of this subpart. For each model line manufactured or sold by a single entity, e.g., company or manufacturer, compliance with applicable emission standards of § 60.532 may be determined based on testing of representative affected wood

heaters within the model line. If one entity, licenses a model line to another entity, each entity's model line must be certified. If an entity changes the name of the entity or the name of the model, the manufacturer must apply for a new certification.

(1) Prior to [EFFECTIVE DATE OF FINAL RULE], the manufacturer must submit to the EPA the information required in paragraph (b) of this section and follow either the certification process in paragraphs (b) through (e) of this section or the certifying entity based application process specified in paragraph (f) of this section.

(2) On or after [EFFECTIVE DATE OF FINAL RULE], the manufacturer must submit the information required in paragraph (b) of this section and follow the certifying entity based application process specified in paragraph (f) of this section.

(b) *Application for Certificate of Compliance.* Any manufacturer of an affected wood heater must apply to the Administrator for a certificate of compliance for each model line. The application must be submitted to: Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program). The application must be signed by a responsible representative of the manufacturer or an authorized representative and must contain the following:

(1) The model name and/or design number and responsible contact information for the manufacturer and all authorized representatives, including name, affiliation, physical address, telephone number, and email address.

(2) Engineering drawings and specifications of components that may affect emissions (including specifications for each component listed in paragraph (k) of this section). Manufacturers may use complete assembly or design drawings that have been prepared for other purposes, but must designate on the drawings the dimensions of each component listed in paragraph (k) of this section.

Manufacturers must identify tolerances of components of the tested unit listed in paragraph (k)(2) of this section that are different from those specified in that paragraph, and show that such tolerances may not reasonably be anticipated to cause wood heaters in the model line to exceed the applicable emission limits. The drawings must identify how the emission critical parts, such as air tubes and catalyst, can be readily inspected and replaced. The drawings may be submitted either in hard copy or electronic format.

(3) A statement whether the firebox or any firebox component (including the

materials listed in paragraph (k)(3) of this section) will be composed of material different from the material used for the firebox or firebox component in the wood heater on which certification testing was performed and a description of any such differences.

(4) Clear identification of any confidential business information. Submit such information under separate cover to the EPA CBI Office; Attn: Residential Wood Heater Compliance Program. Note that emissions data, including information necessary to determine emission rates in the format of the standard, cannot be claimed as confidential business information.

(5) All documentation pertaining to a valid certification test, including the complete test report and, for all test runs: raw data sheets, laboratory technician notes, calculations, and test results. Documentation must include the items specified in the applicable test methods. The test report must include a summary table that clearly presents the individual and overall emission rates, efficiencies, and heat output range. Submit the test report and all associated required information according to the procedures for electronic reporting specified in § 60.537(f).

(6) A copy of the warranties for the model line, including a statement that the warranties are void if the unit is used to burn materials for which the unit is not certified by the EPA.

(7) A statement that the manufacturer or certifying entity will conduct a quality assurance program for the model line that satisfies the requirements of paragraph (m) of this section.

(8) A statement describing how the tested unit was sealed by the laboratory after the completion of certification testing and that such unit will be stored by the manufacturer in the sealed state until 1 year after the certification expires.

(9) Statements that the wood heaters manufactured under this certificate will be—

(i) Similar in all material respects as defined in this subpart to the wood heater submitted for certification testing, and

(ii) Labeled as prescribed in § 60.536.

(iii) Accompanied by an owner's manual that meets the requirements in § 60.536. In addition, a copy of the owner's manual must be submitted to the EPA and be available on the manufacturer's Web site.

(10) A statement that the manufacturer has entered into a contract with an accredited laboratory that satisfies the requirements of paragraph (e) of this section.

(11) A statement that the accredited certifying body is allowed to submit information on behalf of the manufacturer.

(c)(1) *Administrator Approval Process.* The Administrator will electronically issue a certificate of compliance for a model line if the Administrator determines, based on all information submitted by the applicant and any other relevant information available, that:

(i) A valid certification test demonstrates that the representative affected wood heater complies with the applicable emission standards in § 60.532,

(ii) Any tolerances for components listed in paragraph (k)(2) of this section that are different from those specified in those paragraphs may not reasonably be anticipated to cause wood heaters in the model line to exceed the applicable emission limits; and

(iii) The requirements of paragraph (b) of this section have been met.

(2) The Administrator will deny certification if the Administrator determines that the criteria in paragraph (c)(1) of this section have not been satisfied. Upon denying certification under this paragraph, the Administrator will give written notice to the manufacturer setting forth the basis for this determination.

(d) Prior to [EFFECTIVE DATE OF THE FINAL RULE], the Administrator will issue the certificate for the most stringent particulate matter emission standard that the unit meets under § 60.532(a) or (b), as applicable.

(e) To receive EPA certification, a manufacturer must enter into a contract with the accredited laboratory that performed the certification test, under which the laboratory will:

(1) Conduct the compliance audit test at no additional cost to the manufacturer if the EPA selects that laboratory to conduct the test; or

(2) Pay the manufacturer the cost of a compliance audit test (as determined by the EPA) if the EPA selects any other laboratory to conduct the test.

(f) *Certifying Entity-Based Application Process.*

(1) Any manufacturer of an affected wood heater must apply to the Administrator for a certificate of compliance for each model line. The manufacturer must meet the following requirements:

(i) The manufacturer must contract with a certifying entity for certification services.

(ii) The manufacturer must submit the materials specified in paragraph (b) of this section and a quality control plan that meets the requirements of

paragraph (m)(4) of this section to the certifying entity. The quality control plan must ensure that units within a model line accurately reflect emission-critical components of the model line design, and it must include design drawings for the model line.

(iii) The manufacturer must apply to the certifying entity for a certification of conformity with the applicable requirements of this subpart for the model line.

(A) After testing by an accredited test laboratory is complete, certification of conformity with the emission standards in § 60.532 must be performed by the manufacturer's contracted certifying entity.

(B) The certifying entity can certify conformity if the emission tests have been conducted per the appropriate guidelines and the test report is complete and accurate and the instrumentation is properly calibrated and the test report shows that the representative affected wood heater meets the applicable emission limits specified in § 60.532 and the quality control plan is adequate to ensure that units within the model line will be similar in all material respects to the wood heater submitted for certification testing.

(iv) The manufacturer must then request that the certifying entity electronically submit, on behalf of the manufacturer, an application for EPA certification that includes the certification of conformity, quality control plan, test report and supporting documentation.

(v) The submission must include a statement signed by a responsible official of the manufacturer that the manufacturer has complied with all requirements of this subpart and that the manufacturer remains responsible for compliance regardless of any error by the certifying entity.

(2) The Administrator will electronically issue to the manufacturer a certificate of compliance for a model line if it is determined, based on all of the information submitted in the application for certification and any other relevant information, that:

(i) A valid certification of conformity has demonstrated that the representative affected wood heater complies with the applicable emission standards in § 60.532; and

(ii) Any tolerances or materials for components listed in paragraph (k)(2) or (3) of this section that are different from those specified in those paragraphs may not be reasonably anticipated to cause wood heaters in the model line to exceed the applicable emission limits.

(iii) The requirements of paragraphs (b) of this section have been met.

(iv) A valid certificate of conformity for the model line has been prepared and submitted.

(3) The Administrator will deny certification if the Administrator determines that the criteria in paragraph (f)(2) of this section have not been satisfied. Upon denying certification under this paragraph, the Administrator will give written notice to the manufacturer setting forth the basis for the determination.

(g) *Waiver from Submitting Test Results.* An applicant for certification may apply for a potential waiver of the requirement to submit the results of a certification test pursuant to paragraph (b)(3) of this section, if the wood heater meets either of the following conditions:

(1) The wood heaters of the model line are similar in all material respects, as defined in this subpart, to another model line that has already been issued a certificate of compliance. A manufacturer that seeks a waiver of certification testing must identify the model line that has been certified, and must submit a copy of an agreement with the owner of the design permitting the applicant to produce wood heaters of that design.

(2) The manufacturer has previously conducted a valid certification test to demonstrate that the wood heaters of the model line meet the applicable standard specified in § 60.532(a), and that test also demonstrates that the wood heaters of the model line meet the applicable standard specified in § 60.532(b). This option is only potentially available a maximum of one time per model line.

(h) *Certification Period.* Unless revoked sooner by the Administrator, a certificate of compliance will be valid for the following periods as applicable:

(1) For a model line certified as meeting the emission standards in § 60.532(a), a certificate of compliance will be valid for 5 years from the date of issuance.

(2) For a model line certified as meeting emission standards in § 60.532(b), a certificate of compliance will be valid for 5 years from the date of issuance.

(3) For a model line certified as meeting emission standards in § 60.532(c), a certificate of compliance will be valid for 5 years from the date of issuance.

(i) *Renewal of Certification.*

(1) The certificate must be recertified or renewed every 5 years or the manufacture may choose to no longer manufacture or sell that model. If the manufacturer chooses to no longer

manufacture or sell that model, then the manufacturer must submit a statement to EPA for that model. A manufacturer of an affected wood heater may apply to the Administrator for potential renewal of their certificate by submitting the material specified in § 60.533(b) and following the procedures specified in § 60.533(f) or by affirming in writing that the wood heater has been subject to no changes that would impact emissions and requesting a potential waiver from certification testing.

(2) If the Administrator grants a renewal of certification, the Administrator will give written notice to the manufacturer setting forth the basis for the determination and issue a certification renewal.

(3) If the Administrator denies the request for a renewal of certification, the Administrator will give written notice to the manufacturer setting forth the basis for the determination.

(j) *[Reserved]*

(k) *Recertification.*

(1) The manufacturer must recertify a model line whenever any change is made in the design submitted pursuant to paragraph (b)(2) of this section that is presumed to affect the particulate matter emission rate for that model line. The manufacturer of an affected wood heater must apply to the Administrator for potential recertification by submitting the material specified in § 60.533(b) and following the procedures specified in § 60.533(f) or by affirming in writing that the wood heater has been subject to no changes that would impact emissions and requesting a potential waiver from certification testing. The Administrator may potentially waive this requirement upon written request by the manufacturer, if it is determined that the change may not reasonably be anticipated to cause wood heaters in the model line to exceed the applicable emission limits. The granting of such a waiver does not relieve the manufacturer of any compliance obligations under this subpart.

(2) Any change in the design tolerances of any of the following components (where such components are applicable) is presumed to affect particulate matter and carbon monoxide emissions and efficiency if that change exceeds  $\pm 0.64$  cm ( $\pm 1/4$  inch) for any linear dimension and  $\pm 5$  percent for any cross-sectional area relating to air introduction systems and catalyst bypass gaps unless other dimensions and cross-sectional areas are previously approved by the Administrator under paragraph (c)(1)(ii) of this section:

(i) Firebox: Dimensions;

(ii) Air introduction systems: Cross-sectional area of restrictive air inlets and outlets, location and method of control;

(iii) Baffles: Dimensions and locations;

(iv) Refractory/insulation: Dimensions and location;

(v) Catalyst: Dimensions and location;

(vi) Catalyst bypass mechanism and catalyst bypass gap tolerances (when bypass mechanism is in closed position): Dimensions, cross-sectional area, and location;

(vii) Flue gas exit: Dimensions and location;

(viii) Door and catalyst bypass gaskets: Dimensions and fit;

(ix) Outer shielding and coverings: Dimensions and location;

(x) Fuel feed system: For wood heaters that are designed primarily to burn wood pellets and other wood heaters equipped with a fuel feed system, the fuel feed rate, auger motor design and power rating, and the angle of the auger to the firebox; and

(xi) Forced air combustion system: For wood heaters so equipped, the location and horsepower of blower motors and the fan blade size.

(3) Any change in the materials used for the following components is presumed to affect particulate matter emissions and efficiency:

(i) Refractory/insulation; or

(ii) Door and catalyst bypass gaskets.

(4) A change in the make, model, or composition of a catalyst is presumed to affect particulate matter and carbon monoxide emissions and efficiency, unless the change has been approved in advance by the Administrator, based on test data in the same model stove that demonstrate that the replacement catalyst is equivalent to or better than the original catalyst in terms of particulate matter emission reduction.

(l) *Criteria for Revocation of Certification.*

(1) The Administrator may revoke certification if it is determined that the wood heaters being manufactured or sold in that model line do not comply with the requirements of this subpart. Such a determination will be based on all available evidence, including but not limited to:

(i) Test data from a retesting of the original unit on which the certification test was conducted or a similar unit;

(ii) A finding that the certification test was not valid. (iii) A finding that the labeling of the wood heater model line or the owner's manual or marketing information does not comply with the requirements of § 60.536;

(iii) Failure by the manufacturer to comply with reporting and recordkeeping requirements under § 60.537;

(iv) Physical examination showing that a significant percentage (as defined in the quality assurance plan, but no larger than 1 percent) of production units inspected is not similar in all material respects to the representative affected wood heater submitted for testing; or

(v) Failure of the manufacturer to conduct a quality assurance program in conformity with paragraph (m) of this section.

(2) Revocation of certification under this paragraph will not take effect until the manufacturer concerned has been given written notice by the Administrator setting forth the basis for the proposed determination and an opportunity to request a review under § 60.539.

(m) *Quality Assurance Program.*

(1) On or after [EFFECTIVE DATE OF FINAL RULE], for each certified model line, the manufacturer must conduct a quality assurance program that satisfies the requirements of this section. The quality assurance program requirements of this section supersede the quality assurance plan requirements specified in § 60.533(o) of the 1988 rule. By [60 DAYS AFTER EFFECTIVE DATE OF FINAL RULE], for model lines that had a valid EPA certification on [60 DAYS AFTER EFFECTIVE DATE OF FINAL RULE], manufacturers must submit the quality assurance plan to the EPA Administrator for review and approval.

(i) The manufacturer must prepare and operate according to a quality assurance plan for each certified model line that has specific inspection and testing requirements for ensuring that units within a model line accurately reflect emission-critical components of the model line design and meet the emissions standards in § 60.532.

(ii) The quality assurance plan must be approved within 30 days by the certifying entity as part of the certification of conformity process specified in paragraph (f) of this section.

(iii) Within 30 days after approval by the certifying entity, the quality control plan must also be submitted to EPA for review and approval.

(iv) The certifying entity must conduct quarterly unannounced audits under ISO-IEC Guide 17065 and ISO-IEC Standard 17020 to ensure that the manufacturer's quality control plan is being implemented.

(v) The certifying entity must prepare a report for each audit under ISO-IEC Guide 17065 and ISO-IEC Standard 17020 that fully documents the results of the audit, and the manufacturer must include in their contract with the certifying entity the authorization and requirement to submit all such reports

to the EPA within 30 days. In the audit report, the certifying entity must identify deviations from the manufacturer's quality control plan and specify the corrective actions that need to be taken to address each identified deficiency.

(vi) The manufacturer must report within 30 days to the certifying entity and to the EPA its responses to any deficiencies identified in an audit report.

(n) *EPA Compliance Audit Testing.*

(1)(i) The Administrator may select by written notice wood heaters for compliance audit testing to determine compliance with the emission standards in § 60.532.

(ii) The written notification shall be forwarded to the manufacturer by the Administrator and shall include the name and address of the laboratory selected to perform the audit test and the model name and serial number of the wood heater(s) selected to undergo audit testing.

(2)(i) The Administrator may test, or direct the manufacturer to have tested, the wood heater(s) selected under paragraph (n)(1)(i) of this section in a laboratory accredited under § 60.535 that is selected pursuant to paragraph (n)(3) of this section.

(ii) The expense of the compliance audit test is the responsibility of the wood heater manufacturer. A manufacturer may require the laboratory that performed the certification test to bear the expense of an audit test by means of the contract required under paragraph (e) of this section. The manufacturer will bear the cost of audit testing if the laboratory with which the manufacturer had a contract has ceased business or is otherwise legally unable to honor the contract. The manufacturer will also bear the cost of audit testing if the manufacturer has not entered into contract with an accredited test laboratory to perform audit testing.

(iii) The test must be conducted using the same test method and procedure used to obtain certification or a new test method approved by the EPA Administrator. If the certification test consisted of more than one particulate matter sampling test method, the Administrator may direct the test laboratory as to which of these methods to use for the purpose of audit testing. The Administrator will notify the manufacturer at least 1 week prior to any test under this paragraph, and allow the manufacturer and/or his authorized representatives to observe the test.

(3) The Administrator may select any accredited test laboratory or federal laboratory for audit testing.

(4) *Revocation of Certification.*

(i) If emissions from a wood heater tested under paragraph (n)(2) of this section exceed the certification emission values limit by more than 50 percent, the Administrator will notify the manufacturer that certification for that model line is suspended effective 72 hours from the receipt of the notice, unless the suspension notice is withdrawn by the Administrator. The suspension will remain in effect until withdrawn by the Administrator, or 30 days from its effective date (if a revocation notice under paragraph (n)(5)(ii) of this section is not issued within that period), or the date of final agency action on revocation, whichever occurs earlier.

(ii)(A) If emissions from a wood heater tested under paragraph (n)(2) of this section exceed the applicable emission limit, the Administrator will notify the manufacturer that certification is revoked for that model line.

(B) A suspension under paragraph (n)(4)(i) or a revocation notice under paragraph (n)(4)(ii)(A) of this section will become final and effective 60 days after receipt by the manufacturer, unless it is withdrawn, a supplemental review is requested under § 60.539, or the deadline for requesting a supplemental review is extended.

(C) The Administrator may extend the deadline for requesting a supplemental review for up to 60 days for good cause.

(D) A manufacturer may extend the deadline for requesting a supplemental review for up to 6 months, by agreeing to a voluntary suspension of certification.

(iii) Any notification under paragraph (n)(4)(i) or (n)(4)(ii) of this section will include a copy of a preliminary test report from the accredited test laboratory or federal test laboratory. The test laboratory must provide a preliminary test report to the Administrator within 10 days of the completion of testing, if a wood heater exceeds the applicable emission limit in § 60.532. The test laboratory must provide the Administrator and the manufacturer, within 30 days of the completion of testing, all documentation pertaining to the test, including the complete test report and raw data sheets, laboratory technician notes, and test results for all test runs.

(iv) Upon receiving notification of a test failure under paragraph (n)(4)(ii) of this section, the manufacturer may request up to four additional wood heaters from the same model line be selected under paragraph (n)(1) of this section for testing at the manufacturer's expense, at the test laboratory that

performed the emissions test for the Administrator.

(v) Whether or not the manufacturer proceeds under paragraph (n)(4)(iv) of this section, the manufacturer may submit any relevant information to the Administrator, including any other test data generated pursuant to this subpart. The manufacturer must pay the expense of any additional testing.

(vi) The Administrator will withdraw any notice issued under paragraph (n)(4)(ii) of this section if tests under paragraph (n)(4)(iv) of this section show either—

(A) That all wood heaters tested for the manufacturer met the applicable emission limits; or

(B) That the second and third wood heaters selected met the applicable emission limits and the average of all three (including the original audit test) was below the applicable emission limits.

(C) The Administrator will revise the certification values based on the test data and other relevant information and the manufacturer must revise the labels and marketing information accordingly.

(vii) The Administrator may withdraw any proposed revocation, if the Administrator finds that an audit test failure has been rebutted by information submitted by the manufacturer under paragraph (n)(4)(iv) of this section and/or (n)(4)(v) of this section or by any other relevant information available to the Administrator.

**§ 60.534 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?**

Test methods and procedures specified in this section or in appendices of this part, except as provided under § 60.8(b), must be used to determine compliance with the standards and requirements for certification under §§ 60.532 and 60.533 as follows:

(a)(1) Method 28 of appendix A–8 of this part must be used to establish the certification test conditions and the particulate matter emission values for affected wood heaters subject to the 1990 particulate matter standards specified in § 60.532(a).

(2) For affected wood heaters subject to the 2015 particulate matter standards specified in § 60.532(b), you must conduct testing according to paragraphs § 60.534(a)(2)(i) and (ii) of this section and submit the full test reports. You have the option of submitting the test results of either (a)(2)(i) or (ii) of this section to the Administrator as specified under § 60.537 for certification compliance.

(i) Conduct testing with crib wood using EPA Method 28R of appendix A-8 of this part to establish the certification test conditions and the particulate matter emission values.

(ii) Conduct testing with cord wood using EPA Method 28R of appendix A-8 of this part to establish the certification test conditions and the particulate matter emission values.

(3) For affected wood heaters subject to the 2020 particulate matter standards specified in § 60.532(c), you must conduct testing with cord wood using EPA Method 28R of appendix A-8 of this part to establish the certification test conditions, except that you should first test Burn Rate Categories 1 and 4 and then test 2 more times for whichever burn rate category is worse and then report the results separately per burn rate category.

(b) For affected wood heaters subject to the 1990 particulate matter standards specified in § 60.532(a), emission concentrations must be measured with Method 5G of appendix A-3 of this part, *i.e.*, using a dilution tunnel sampling location. Method 5H is no longer allowed for certification testing.

(c) For affected wood heaters subject to the 2015 and 2020 particulate matter standards specified in § 60.532(b) and (c), emission concentrations must be measured with ASTM E2515-10.

(d) Canadian Standards Administration Method B415.1-10, section 13.7, must be used to measure the efficiency and carbon monoxide output of the tested appliance.

(e) [Reserved]

(f) The manufacturer of an affected wood heater must notify the Administrator of the date that certification testing is scheduled to begin by email to Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program). This notice must be received by the EPA at least 30 days before the start of testing. The notification of testing must include the manufacturer's name and physical and email addresses, the accredited test laboratory's name and physical and email addresses, certifying entity name, the model name and number (or, if unavailable, some other way to distinguish between models), and the dates of testing.

(g) The accredited test laboratory must allow the manufacturer, the EPA and delegated states to observe certification testing. However, manufacturers must not involve themselves in the conduct of the test after the pretest burn has begun. Communications between the manufacturer and laboratory or certifying entity personnel regarding operation of the wood heater must be

limited to written communications transmitted prior to the first pretest burn of the certification series. Written communications between the manufacturer and laboratory personnel may be exchanged during the certification test only if deviations from the test procedures are observed that constitute improper conduct of the test. All communications must be included in the test documentation required to be submitted pursuant to § 60.533(b)(3) and must be consistent with instructions provided in the owner's manual required under § 60.536(f), except to the extent that they address details of the certification tests that would not be relevant to owners or regulators.

**§ 60.535 What procedures must I use for laboratory accreditation or certifying body accreditation?**

(a)(1) A laboratory must apply to the Administrator for accreditation as an EPA accredited test laboratory by submitting documentation that the laboratory is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17025 to perform testing using the test methods specified under § 60.534.

(2) As part of the application, the test laboratory must:

(i) Agree to enter into a contract as described in § 60.533(e) with each wood heater manufacturer for whom a certification test has been performed;

(ii) Agree to participate biennially in a proficiency testing program conducted by the Administrator;

(iii) Agree to allow the Administrator and delegated states and certifying bodies access to observe certification testing;

(iv) Agree to comply with reporting and recordkeeping requirements that affect testing laboratories; and

(v) Agree to perform a compliance audit test (as determined by the Administrator) at the cost normally charged to manufacturers if it is selected to conduct the compliance audit test of a model line originally tested for certification at another laboratory.

(vi) Have no conflict of interest and receive no financial benefit from the outcome of certification testing conducted pursuant to § 60.533.

(vii) Agree to not perform initial certification tests on any models manufactured by a manufacturer for which the laboratory has conducted research and development tests within the last 5 years.

(3) If the EPA approves the accreditation, the Administrator will provide the test laboratory with a certificate of accreditation. If the EPA denies the accreditation, the

Administrator will give written notice to the laboratory setting forth the basis for the determination.

(b)(1) The Administrator may revoke the EPA laboratory accreditation if it is determined that the laboratory:

(i) Is no longer is accredited by the nationally recognized ISO certifying entity;

(ii) Does not follow required procedures or practices;

(iii) Has falsified data or otherwise misrepresented emission data;

(iv) Failed to participate in a proficiency testing program, in accordance with its commitment under paragraph (a)(2)(ii) of this section; or

(v) Failed to seal the wood heater in accordance with paragraph (d) of this section.

(2) Revocation of accreditation under this paragraph will not take effect until the laboratory concerned has been given written notice by the Administrator setting forth the basis for the proposed determination and an opportunity for a Petition for Supplemental Review under § 60.539. However, if revocation is ultimately upheld, all tests conducted by the laboratory after written notice was given will, at the discretion of the Administrator, be declared invalid.

(c)(1) With the exception of laboratories meeting the provisions of paragraph (c)(2) of this section, and unless revoked sooner, a certificate of accreditation as an accredited test laboratory granted by the Administrator is valid for 5 years from the date of issuance.

(2) Laboratories accredited by the EPA by February 3, 2014 under the provisions of § 60.535 in effect prior to that date may continue to be accredited until [1 YEAR AFTER EFFECTIVE DATE OF FINAL RULE], at which time the accreditation ends unless the laboratory has obtained accreditation under § 60.535 as in effect beginning on [EFFECTIVE DATE OF FINAL RULE].

(d) A laboratory accredited by the Administrator must seal any wood heater on which it performed certification tests, immediately upon completion or suspension of certification testing, by using a laboratory-specific seal. For any tests that are suspended, the laboratory must email the EPA immediately with the date suspended, the reason(s) why, and the projected date for re-starting. The laboratory must submit the operation and test data obtained, even if the test is not completed.

(e)(1) A Certifying Entity may apply to the Administrator for approval to be an EPA-approved certifying entity by submitting credentials demonstrating that they have been accredited by a

nationally recognized accrediting entity to perform certifications and inspections under ISO-17025, ISO-IEC Standard 17065 and ISO-IEC Standard 10720.

(2) As part of the application, the certifying entity must:

(i) Agree to enter into a contract as described in § 60.533(e) with each wood heater manufacturer for whom a certification test has been performed and a test report has been received and reviewed;

(ii) Agree to periodically conduct audits as described in § 60.534 and manufacturer's QA/QC Plan;

(iii) Agree to participate biennially in a proficiency testing program conducted by the Administrator;

(iv) Agree to comply with reporting and recordkeeping requirements that affect accredited wood heater testing laboratories and certifying entities;

(v) Have no conflict of interest and receive no financial benefit from the outcome of certification testing conducted pursuant to § 60.533;

(vi) Agree to make available to the EPA supporting documentation for each wood heater certification and audit; and

(vii) Agree to not perform initial certification reviews on any models manufactured by a manufacturer for which the certifying entity has conducted research and development within the last 5 years.

(3) If approved, the Administrator will provide the certifying entity with a certificate of accreditation. The accreditation will expire 5 years after being issued unless renewed by the certifying entity. If the EPA denies the accreditation, the Administrator will give written notice to the certifying entity for the basis for the determination.

(f)(1) The Administrator will revoke the EPA certifying entity accreditation if it is determined that the certifying entity:

(i) Is no longer accredited by the nationally recognized ISO certifying entity

(ii) Does not follow required procedures or practices;

(iii) Has falsified certification data or otherwise misrepresented emission data; or

(iv) Failed to participate in the EPA proficiency testing program.

(2) Revocation of accreditation under this paragraph will not take effect until the certifying entity concerned is given written notice by the Administrator setting forth the basis for the proposed determination and an opportunity for a Petition for Supplemental Review under § 60.539. However, if revocation is upheld, all tests reviewed by the

certifying entity will, at the discretion of the Administrator, be declared invalid.

**§ 60.536 What requirements must I meet for permanent labels and owner's manuals?**

(a) *Permanent Label Requirements.* (1) Each affected wood heater manufactured on or after the date the applicable standards come into effect as specified in § 60.532, must have a permanent label affixed to it that meets the requirements of this section.

(2) Except for wood heaters subject to § 60.530(b)(1) through (b)(5), the permanent label must contain the following information:

(i) Month and year of manufacture of the individual unit;

(ii) Model name or number; and

(iii) Serial number.

(3) The permanent label must:

(i) Be affixed in a readily visible or accessible location in such a manner that it can be easily viewed before and after the appliance is installed;

(ii) Be at least 8.9 cm long and 5.1 cm wide (3½ inches long and 2 inches wide);

(iii) Be made of a material expected to last the lifetime of the wood heater;

(iv) Present required information in a manner so that it is likely to remain legible for the lifetime of the wood heater; and

(v) Be affixed in such a manner that it cannot be removed from the appliance without damage to the label.

(4) The permanent label may be combined with any other label, as long as the required information is displayed, the integrity of the permanent label is not compromised, and the permanent label still meets the requirements in § 60.536(a)(3).

(5) Any label statement under paragraph (b) or (c) of this section constitutes a representation by the manufacturer as to any wood heater that bears it:

(i) That certification of compliance was in effect at the time the wood heater left the possession of the manufacturer;

(ii) That the manufacturer was, at the time the label was affixed, conducting a quality assurance program in conformity with § 60.533(o); and

(iii) That any wood heater individually tested for emissions by the manufacturer under § 60.533(o)(2) or (o)(4) met the applicable emissions limits.

(b) If the adjustable burn rate wood heater or pellet stove belongs to a model line certified under § 60.533, and it has been found to meet the applicable emission limits or tolerances through quality assurance testing, one of the following statements, as appropriate, must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 1990 particulate emission standards. Not approved for sale or operation after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] or

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2015 particulate emission standards. Not approved for sale or operation after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE] or

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2020 particulate emission standards.

(c) If the single burn rate wood heater belongs to a model line certified under § 60.533, and it has been found to meet the applicable emission limits or tolerances through quality assurance testing, the following statements must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2015 particulate emission standards. Not approved for sale or operation after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE] or

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2020 particulate emission standards.

(d)(1) If an affected wood heater is manufactured in the United States for export as provided in § 60.530(b)(1), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Export stove. May not be sold or operated within the United States.

(2) If an affected wood heater is manufactured for use for research and development purposes as provided in § 60.530(b)(2), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Not certified. Research Stove. Not approved for sale or for operation other than research.

(3) If an affected wood heater is exclusively a non wood-burning heater as provided § 60.530(b)(3) the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This heater is not certified for wood burning. Use of any wood fuel is a violation of federal law.

(4) If an affected wood heater is a cookstove that meets the applicable definition in § 60.531, the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This unit is not a certified residential wood heater. The primary use for this unit is for cooking or baking.

(5) If an affected wood heater is a camp stove that meets the applicable definition in § 60.531, the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This unit is not a certified residential wood heater. For portable and temporary use only.

(e) The permanent label for all certified wood heaters must also contain the following statement:

“This wood heater needs periodic inspection and repair for proper operation. Consult owner’s manual for further information. It is against the law to operate this wood heater in a manner inconsistent with operating instructions in the owner’s manual.”

(f) *Owner’s Manual.*

(1) Each affected wood heater offered for sale by a commercial owner must be accompanied by an owner’s manual that must contain the information listed in paragraphs (f)(2) and (f)(3) of this section. Such information must be adequate to enable consumers to achieve optimal emissions performance. Such information must be consistent with the operating instructions provided by the manufacturer to the accredited test laboratory for operating the wood heater during certification testing, except for details of the certification test that would not be relevant to the ultimate purchaser. The commercial owner must also make current and historical owner’s manuals available on the company Web site and upon request to the EPA.

(2) Installation information: Requirements for achieving proper draft.

(3) Operation and maintenance information:

(i) Fuel loading procedures, recommendations on fuel selection, and warnings on what fuels not to use, such as treated wood, colored paper, cardboard, solvents, trash and garbage.

(ii) Fire starting procedures

(iii) Proper use of air controls

(iv) Ash removal procedures

(v) Instructions for replacement of gaskets, air tubes and other parts that are critical to the emissions performance of the unit and other maintenance and repair instructions

(vi) For catalytic models, information on the following pertaining to the catalytic combustor: Procedures for achieving and maintaining catalyst activity, maintenance procedures, procedures for determining deterioration or failure, procedures for replacement, and information on how to exercise warranty rights

(vii) For catalytic models, the following statement:

“This wood heater contains a catalytic combustor, which needs periodic inspection and replacement for proper operation. It is against federal law to operate this wood heater in a manner inconsistent with operating instructions in this manual, or if the catalytic element is deactivated or removed.”

(viii) For noncatalytic models, the following statement:

“This wood heater needs periodic inspection and repair for proper operation. It is against federal law to operate this wood heater in a manner inconsistent with operating instructions in this manual.”

(4) Any manufacturer using the EPA-recommended language contained in appendix I of this part to satisfy any requirement of this paragraph (f) will be considered to be in compliance with that requirement, provided that the particular language is printed in full, with only such changes as are necessary to ensure accuracy for the particular wood heater model line.

(5) Wood heaters that are affected by this subpart, but that have been owned and operated by a noncommercial owner, are not subject to paragraphs (f) of this section when offered for resale.

#### **§ 60.537 What records must I keep and what reports must I submit?**

(a)(1) Each manufacturer who holds a certificate of compliance under § 60.533(c) or (f) for a model line must maintain records containing the information required by paragraph (a) of this section with respect to that model line.

(2) All documentation pertaining to the certification test used to obtain certification, including the full test report and raw data sheets, laboratory technician notes, calculations, and the test results for all test runs.

(3) Results of the quality assurance program inspections required by § 60.533(m).

(4) For emissions tests conducted pursuant to the quality assurance program required by § 60.533(o), all test reports, data sheets, laboratory technician notes, calculations, and test results for all test runs, the remedial actions taken, if any, and any follow-up actions such as additional testing.

(b) Each accredited test laboratory and certifying entity must maintain records consisting of all documentation pertaining to each certification test, QA/QC inspection and audit test, including the full test report and raw data sheets, technician notes, calculations, and the test results for all test runs. Each accredited test laboratory must submit initial and biennial proficiency test results to the Administrator. Each

certifying entity must submit each certification test, QA/QC inspection report and ISO IEC accreditation credentials to the Administrator.

(c) Each manufacturer must retain each wood heater upon which certification tests were performed based upon which certification was granted under § 60.533(c) or (f) at the manufacturer’s facility for as long as the model line in question is manufactured. Each heater or furnace must remain sealed and unaltered. Any such wood heater must be made available to the Administrator upon request for inspection and testing.

(d) Each manufacturer of an affected wood heater certified under § 60.533(c) or (f) must submit a report to the Administrator every 2 years following issuance of a certificate of compliance for each model line. This report must include the sales for each model by state and certify that no changes in the design or manufacture of this model line have been made that require recertification under § 60.533(k).

(e)(1) Unless otherwise specified, all records required under this section must be maintained by the manufacturer, commercial owner of the affected wood heater, accredited test laboratory or certifying entity for a period of no less than 5 years.

(2) Unless otherwise specified, all reports to the Administrator required under this subpart must be made to: Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program).

(f) Within 60 days after the date of completing each performance test, each manufacturer or accredited test laboratory or certifying entity must submit performance test data electronically to the EPA’s Central Data Exchange (CDX) by using the Electronic Reporting Tool (ERT) (<http://www.epa.gov/ttn/chief/ert/index.html>). Only data collected using test methods compatible with ERT are subject to this requirement to be submitted electronically to the EPA’s CDX.

Manufacturers may submit compliance reports to the EPA via regular mail at the address listed below if the test methods they use are not compatible with ERT or if ERT is not available to accept reports at the time the final rule is published. Owners or operators who claim that some of the information being submitted for performance tests is confidential business information (CBI) must submit a completed ERT file, including information claimed to be CBI on a compact disk or other commonly used electronic storage media (including, but not limited to, flash drives), to the EPA, and the same ERT

file, with the CBI omitted, to the EPA via CDX as described earlier in this paragraph. The compact disk must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. Emission data, including all information necessary to determine compliance, except sensitive engineering drawings and sensitive detailed material specifications, may not be claimed as CBI.

**§ 60.538 What activities are prohibited under this subpart?**

(a) No person is permitted to operate an affected wood heater that does not have affixed to it a permanent label pursuant to § 60.536 (b), (c), or (d)(2) through (d)(5).

(b) No commercial owner is permitted to advertise for sale, offer for sale, or sell an affected wood heater labeled under § 60.536(d)(1) except for export.

(c)(1) No commercial owner is permitted to advertise for sale, offer for sale or sell an affected wood heater permanently labeled under § 60.536 (b) or (c) unless:

(i) The affected wood heater has been certified to comply with 2020 particulate emission standards. This prohibition does not apply to wood heaters affected by this subpart that have been previously owned and operated by a noncommercial owner; and

(ii) The commercial owner provides any purchaser or transferee with an owner's manual that meets the requirements of § 60.536(f), a copy of the warranty and a moisture meter.

(2) No commercial owner is permitted to advertise for sale, offer for sale, or sell an affected wood heater permanently labeled under § 60.536(d)(3), unless the affected wood heater has been certified to comply with 2020 particulate emission. This prohibition does not apply to wood heaters affected by this subpart that have been previously owned and operated by a noncommercial owner.

(3) A commercial owner other than a manufacturer complies with the requirements of paragraph (c)(1) of this section if the commercial owner:

(i) Receives the required documentation from the manufacturer or a previous commercial owner; and

(ii) Provides that documentation unaltered to any person to whom the wood heater that it covers is sold or transferred.

(d)(1) In any case in which the Administrator revokes a certificate of compliance either for the knowing submission of false or inaccurate

information or other fraudulent acts, or based on a finding under § 60.533(l)(1)(ii) that the certification test was not valid, the Administrator may give notice of that revocation and the grounds for it to all commercial owners.

(2) On and after the date of receipt of the notice given under paragraph (d)(1) of this section, no commercial owner is permitted to sell any wood heater covered by the revoked certificate (other than to the manufacturer) unless the model line has been recertified in accordance with this subpart.

(e) No person is permitted to install or operate an affected wood heater except in a manner consistent with the instructions on its permanent label and in the owner's manual pursuant to § 60.536(f).

(f) No person is permitted to operate an affected wood heater that was originally equipped with a catalytic combustor if the catalytic element is deactivated or removed.

(g) No person is permitted to operate an affected wood heater that has been physically altered to exceed the tolerance limits of its certificate of compliance.

(h) No person is permitted to alter, deface, or remove any permanent label required to be affixed pursuant to § 60.536.

(i) No certifying entity is permitted to certify its own certification test report.

**§ 60.539 What Petition for Review procedures apply to me?**

(a)(1) In any case where the Administrator—

(i) Denies an application under § 60.530(c) or § 60.533(f);

(ii) Issues a notice of revocation of certification under § 60.533(l);

(iii) Denies an application for laboratory accreditation under § 60.535(a); or

(iv) Issues a notice of revocation of laboratory accreditation under § 60.535(b), the manufacturer or laboratory affected may submit to the EPA, a Petition for Review request under this section within 30 days following receipt of the required notification of the action in question.

(2) In any case where the Administrator issues a notice of revocation under § 60.533(p), the manufacturer may submit to the EPA a Petition for Review request under this section with the time limits set out in § 60.533(p)(4).

(b) Any Petition for Review request must be in writing, must be signed by an authorized representative of the petitioning manufacturer or laboratory, and must include a statement and

supporting documentation setting forth with particularity the petitioner's objection to the Administrator's determination or proposed determination.

(c) Upon receipt of a Petition for Review under paragraph (a) of this section, the Administrator shall provide a written response within 45 days.

**§ 60.539a Who implements and enforces this subpart?**

(a) In delegating implementation and enforcement authority to a state under section 111(c) of the Act, the authorities contained in paragraph (b) of this section must be retained by the Administrator and not transferred to a state.

(b) Authorities that must not be delegated to states:

(1) Section 60.531, Definitions;

(2) Section 60.533, Compliance and certification;

(3) Section 60.534, Test methods and procedures; and

(4) Section 60.535, Laboratory accreditation.

**§ 60.539b What parts of the General Provisions do not apply to me?**

The following provisions of subpart A of part 60 do not apply to this subpart:

(a) Section 60.7;

(b) Section 60.8(a), (c), (d), (e), (f) and (g); and

(c) Section 60.15(d).

■ 4. Add subpart QQQQ to read as follows:

**Subpart QQQQ—Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces**

Sec.

60.5472 Am I subject to this subpart?

60.5473 What definitions must I know?

60.5474 What standards and requirements must I meet and by when?

60.5475 What compliance and certification requirements must I meet and by when?

60.5476 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?

60.5477 What procedures must I use for laboratory accreditation?

60.5478 What requirements must I meet for permanent labels and owner's manuals?

60.5479 What records must I keep and what reports must I submit?

60.5480 What activities are prohibited under this subpart?

60.5481 What Petition for Review procedures apply to me?

60.5482 Who implements and enforces this subpart?

60.5483 What parts of the General Provisions do not apply to me?

### Subpart QQQQ—Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces

#### § 60.5472 Am I subject to this subpart?

(a) You are subject to this subpart if you operate, manufacture, sell, offer for sale, import for sale, distribute, offer to distribute, introduce, or deliver for introduction, into commerce in the United States, residential hydronic heater or forced-air furnace manufactured on or after [EFFECTIVE DATE OF FINAL RULE].

(b) Each residential hydronic heater or forced-air furnace must comply with the provisions of this subpart unless exempted under paragraphs (b)(1) through (b)(3) of this section.

(1) Affected residential hydronic heaters or forced-air furnaces manufactured in the United States for export are exempt from the applicable emission limits of § 60.5474 and the requirements of § 60.5475.

(2) Affected residential hydronic heaters or forced-air furnaces used for research and development purposes that are never offered for sale or sold and that are not used to provide heat are exempt from the applicable emission limits of § 60.5474 and the requirements of § 60.5475. No more than 12 affected residential hydronic heaters or forced-air furnaces manufactured per model line may be exempted for this purpose.

(3) Appliances that do not burn wood or wood pellets (such as coal-only hydronic heaters or forced-air furnaces that meet the definition in § 60.5473 or corn-only hydronic heaters or forced-air furnaces) are exempt from the applicable emission limits of § 60.5474 and the requirements of § 60.5475.

(c) The following are not affected residential hydronic heaters or forced-air furnaces and are not subject to this subpart:

(1) Residential wood heaters subject to subpart AAA of this part.

(2) Residential masonry heaters subject to subpart RRRR of this part.

#### § 60.5473 What definitions must I know?

As used in this subpart, all terms not defined herein have the same meaning given them in the Clean Air Act and subpart A of this part.

*Accredited test laboratory* means a test laboratory that is accredited for residential hydronic heater or forced-air furnace certification testing under § 60.5477 and is an independent third-party test laboratory that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17025 to perform testing using the test methods specified in § 60.5476 and approved by

the EPA for conducting certification tests under this subpart.

*At retail* means the sale by a commercial owner of a residential hydronic heater or forced-air furnace to the ultimate purchaser.

*Central heater* means a fuel-burning device designed to burn wood or wood pellet fuel that warms spaces other than the space where the device is located, by the distribution of air heated by the furnace through ducts or liquid heated in the device and distributed typically through pipes. Unless otherwise specified, these devices include residential forced-air furnaces and residential hydronic heaters.

*Certifying entity* means an independent third party that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17020 to perform certifications, inspections and audits under ISO-IEC Guide 17065 and approved by the EPA for conducting certifications, inspections and audits under this subpart.

*Coal-only hydronic heater or forced-air furnace* means an enclosed, coal-burning appliance capable of space heating or domestic water heating that has all of the following characteristics:

(1) Installation instructions that state that the use of wood in the appliance, except for coal ignition purposes, is prohibited by law; and

(2) The model is listed by a nationally recognized safety-testing laboratory for coal use only, except for coal ignition purposes.

*Commercial owner* means any person who owns or controls a residential hydronic heater or forced-air furnace in the course of the business of the manufacture, importation, distribution, or sale of the unit.

*Manufactured* means completed and ready for shipment (whether or not packaged) for purposes of determining the date of manufacture.

*Manufacturer* means any person who constructs or imports into the United States a residential hydronic heater or forced-air furnace.

*Model line* means all residential hydronic heaters or forced-air furnaces offered for sale by a single manufacturer that are similar in all material respects as defined in this section.

*Particulate matter (PM)* means total particulate matter including PM<sub>10</sub> and PM<sub>2.5</sub>.

*Pellet fuel* means refined and densified solid wood shaped into small pellets or briquettes that are uniform in size, shape, moisture, density and energy content.

*Representative residential hydronic heater or forced-air furnace* means an

individual residential hydronic heater or forced-air furnace that is similar in all material respects as defined in this section to other residential hydronic heaters or forced-air furnaces within the model line it represents.

*Residential forced-air furnace* means a fuel burning device designed to burn wood or wood pellet fuel that warms spaces other than the space where the furnace is located, by the distribution of air heated by the furnace through ducts.

*Residential hydronic heater* means a fuel burning device designed to burn wood or wood pellet fuel for the purpose of heating building space and/or water through the distribution, typically through pipes, of a fluid heated in the device, typically water or a water and antifreeze mixture.

*Sale* means the transfer of ownership or control, except that a transfer of control of an affected residential hydronic heater or forced-air furnace for research and development purposes within the scope of § 60.5472(b)(2) is not a sale.

*Seasoned wood* means wood with a moisture content of 20 percent or less.

*Similar in all material respects* means that the construction materials, exhaust and inlet air system, and other design features are within the allowed tolerances for components identified in § 60.533(k).

*Valid certification test* means a test that meets the following criteria:

(1) The Administrator was notified about the test in accordance with § 60.5476(f);

(2) The test was conducted by an accredited test laboratory as defined in this section;

(3) The test was conducted on a residential hydronic heater or forced-air furnace similar in all material respects as defined in this section to other residential hydronic heaters or forced-air furnaces of the model line that is to be certified; and

(4) The test was conducted in accordance with the test methods and procedures specified in § 60.5476.

#### § 60.5474 What standards and requirements must I meet and by when?

(a) *Particulate Matter Standards.* Unless exempted under § 60.5472, no person is permitted to:

(1) On or after [EFFECTIVE DATE OF FINAL RULE], manufacture or sell at retail a residential hydronic heater unless it has been certified to meet the 2015 particulate matter emission limits in paragraph (b)(1) of this section.

(2) On or after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE] manufacture or sell at retail a residential hydronic heater unless it has been

certified to meet the 2020 particulate matter emission limit in paragraph (b)(2) of this section.

(3) On or after [EFFECTIVE DATE OF FINAL RULE], manufacture or sell at retail a residential forced-air furnace unless it has been certified to meet the 2015 particulate matter emission limits in paragraph (b)(3) of this section.

(4) On or after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE] manufacture or sell at retail a residential forced-air furnace unless it has been certified to meet the 2020 particulate matter emission limit in paragraph (b)(4) of this section.

(b)(1) 2015 residential hydronic heater particulate matter emission limit: 0.32 lb/million Btu (0.137 g/megajoule) heat output and 7.5 g/hr (0.017 lb/hr) as determined by the test methods and procedures in § 60.5476.

(2) 2020 residential hydronic heater particulate matter emission limit: 0.06 lb/million Btu (0.026 g/megajoule) heat output as determined by the test methods and procedures in § 60.5476.

(3) 2015 forced-air furnace particulate matter emission limit: 0.93 lb/million Btu (0.40 g/megajoule) heat output and 7.5 g/hr (0.017 lb/hr) as determined by the test methods and procedures in § 60.5476.

(4) 2020 forced-air furnace particulate matter emission limit: 0.06 lb/million Btu (0.026 g/megajoule) heat output as determined by the test methods and procedures in § 60.5476.

(c) [Reserved]

(d) [Reserved]

(e) *Pellet Fuel Requirements.*

Operators of outdoor residential hydronic heaters, indoor residential hydronic heaters, or residential forced-air furnaces that are certified to burn pellet fuels may only burn pellets that have been produced under a licensing agreement with the Pellet Fuels Institute or an equivalent organization approved by the EPA. The pellet fuel must meet the following minimum requirements:

(1) Density: consistent hardness and energy content with a minimum density of 38 pounds/cubic foot;

(2) Dimensions: maximum length of 1.5 inches and diameter between 0.230 and 0.285 inches;

(3) Inorganic fines: less than or equal to 1 percent;

(4) Chlorides: less than or equal to 300 parts per million by weight; and

(5) Ash content: no more than 2 percent.

(6) A quality assurance process licensed by the Pellet Fuel Institute or equivalent organization approved by EPA.

(f) *Prohibited Fuel Types.* No person is permitted to burn any of the following

materials in an outdoor residential hydronic heater, indoor residential hydronic heater, or residential forced-air furnace:

(1) Residential or commercial garbage;

(2) Lawn clippings or yard waste;

(3) Materials containing rubber, including tires;

(4) Materials containing plastic;

(5) Waste petroleum products, paints or paint thinners, or asphalt products;

(6) Materials containing asbestos;

(7) Construction or demolition debris;

(8) Paper products; cardboard,

plywood or particleboard. The prohibition against burning these materials does not prohibit the use of fire starters made from paper, cardboard, saw dust, wax and similar substances for the purpose of starting a fire in an affected residential hydronic heater or forced-air furnace;

(9) Railroad ties or pressure treated lumber;

(10) Manure or animal remains;

(11) Salt water driftwood or other or other previously salt water saturated materials;

(12) Unseasoned wood; or

(13) Any materials that were not included in the certification tests for the subject heater or furnace.

(g) *Owner's Manual.* A person must not operate an outdoor residential hydronic heater, indoor residential hydronic heater, or residential forced-air furnace in a manner inconsistent with the owner's manual. The owner's manual must clearly specify that operation in a manner inconsistent with the owner's manual would violate the warranty.

**§ 60.5475 What compliance and certification requirements must I meet and by when?**

(a)(1) *Certification Requirement.* Each affected residential hydronic heater and forced-air furnace must be certified to be in compliance with the applicable emission standards and other requirements of this subpart. For each model line manufactured or sold by a single entity, *e.g.*, company or manufacturer, compliance with applicable emission standards of § 60.5474(b) must be determined based on testing of representative affected residential hydronic heaters and forced-air furnaces within the model line. If one entity licenses a model line to another entity, each entity's model line must be certified. If a entity changes the name of the entity or the name of the model, the manufacturer must apply for a new certification.

(2) The manufacturer of each model line must submit the information required in § 60.533(b) and follow the

certification procedure specified in § 60.533(f) except that, for the purposes of this paragraph, the references in § 60.533(f) to the "emission standards" in § 60.532 must be understood to refer to the emission limits in § 60.5474(b).

(b) *Waiver from Submitting Test Results.* An applicant for certification may apply for a potential waiver of the requirements to submit the results of a certification test pursuant to the certification procedures specified in § 60.533(f) according to the procedure specified in § 60.533(g)(1).

(c) *Certification Period.* Unless revoked sooner by the Administrator, a certificate of compliance will be valid 5 years from the date of issuance.

(d) *Renewal of Certification.* (1) Any manufacturer of an affected residential hydronic heater or forced-air furnace may apply to the Administrator for potential renewal of a certificate of compliance by submitting the material specified in § 60.533(b) and following the procedures specified in § 60.533(f).

(2) The certificate must be recertified or renewed every 5 years or the manufacture may choose to no longer manufacture or sell that model. If the manufacturer chooses to no longer manufacture or sell that model, then the manufacturer must submit a statement to the EPA for that model. A manufacturer may apply for potential renewal of their certificate by submitting certification information in accordance with § 60.533(b) or by affirming in writing that the wood heater has been subject to no changes that would impact emissions and request a potential waiver from certification testing.

(3) If the Administrator grants or waives certification testing under paragraph (d)(2) of this section, the Administrator will give written notice to the manufacturer setting forth the basis for the determination and issue a certification renewal.

(4) If the Administrator denies the request for a renewal of certification, the Administrator will give written notice to the manufacturer setting forth the basis for the determination.

(e) *Recertification.* The procedure specified in § 60.533(k) must be used to determine when a product line must be recertified.

(f) *Criteria for Revocation of Certification.* (1) The Administrator may revoke certification of a product line if it is determined that the residential hydronic heaters or forced-air furnaces being manufactured or sold in that model line do not comply with the requirements of this subpart. Such a determination will be based on all

available evidence, including but not limited to:

- (i) Test data from retesting of the original unit on which the certification was conducted or a similar unit;
- (ii) A finding that the certification test was not valid. The finding will be based on problems or irregularities with the certification test or its documentation, but may be supplemented by other information;
- (iii) A finding that the labeling of the residential hydronic heater or forced-air furnace model line or the owner's manual or marketing information does not comply with the requirements of § 60.5478;
- (iv) Failure by the manufacturer to comply with the reporting and recordkeeping requirements of § 60.5479;
- (v) Physical examination showing that a significant percentage (as defined in the quality assurance plan, but no larger than 1 percent) of production units inspected is not similar in all material respects as defined in this subpart to the representative affected hydronic heater or forced-air furnace submitted for testing; or
- (vi) Failure of the manufacturer to conduct a quality assurance program in conformity with paragraph (g) of this section.

(2) Revocation of certification under this paragraph will not take effect until the manufacturer concerned has been given written notice by the Administrator setting forth the basis for the proposed determination and an opportunity to request a review under § 60.5481.

(g) *Quality Assurance Program.* For each certified model line, the manufacturer must conduct a quality assurance program according to the requirements of § 60.533(m).

(h) *EPA Compliance Audit Testing.* The Administrator will conduct compliance audit testing according to the requirements of § 60.533(n). For the purposes of this paragraph, references in § 60.533(n) to §§ 60.532 through 60.535 must be understood to refer to the comparable paragraphs in §§ 60.5474 through 60.5477 and the associated test methods specified in this subpart.

**§ 60.5476 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?**

Test methods and procedures specified in this section or in appendix A of this part, except as provided under § 60.8(b), must be used to determine compliance with the standards and requirements for certification under §§ 60.5474 and 60.5475 as follows:

(a)(1) Method 28 WHH must be used to measure the heat output (million Btu/hr) of outdoor and indoor residential hydronic heaters.

(2) If the model is subject to the 2015 particulate matter standards specified in § 60.5474(a)(1) and is equipped with an external heat storage unit, you must conduct testing according to paragraph § 60.5476(a)(2)(i) and (ii) of this section. You have the option of submitting the test results of either (a)(2)(i) or (ii) of this section to the Administrator as specified under § 60.5479 for certification compliance.

(i) Conduct testing using crib wood as specified in Method 28 WHH. The heat input and heat output measurements must be performed according to ASTM method E2618–13 entitled “Standard Test Method for Determining Particulate Matter Emissions and Heating of Outdoor Solid Fuel-fired Hydronic Heating Appliances.” Testing conducted with continuously fed biomass as the fuel(s) must be conducted according to the relevant section of the ASTM method.

(ii) Conduct testing using cord wood as specified in “A Test Method for Certification of Cord Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage: Measurement of Particulate Matter (PM) and Carbon Monoxide (CO) Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage.”

(3) If the model is subject to the 2020 particulate matter standards specified in § 60.5474(a)(2) and is equipped with an external partial heat storage unit, you must conduct cord wood testing according to the test methods and procedures of “A Test Method for Certification of Cord Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage: Measurement of Particulate Matter (PM) and Carbon Monoxide (CO) Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances with Partial Thermal Storage.”

(b) Method 28 WHH in conjunction with ASTM E2515–10 must be used to measure the particulate matter emission rate (lb/million Btu heat output) of outdoor and indoor residential hydronic heaters, except that for the 2020 standards, you should first test Burn Rate Categories 1 and 4 and then test 2 more times for whichever burn rate category is worse on a lb/million BTU heat output basis and report the results separately per burn rate category.

(c) Canadian Standards Administration (CSA) Method B415.1–10 must be used to measure the heat output (million Btu/hr) and particulate

matter emission rate (lb/million Btu heat output) of forced-air furnaces, except that for the 2020 standards, you should first test Burn Rate Categories 1 and 4 and then test 2 more times for whichever burn rate category is worse on a lb/million BTU heat output basis and report the results separately per burn rate category.

(d) CSA Method B415.1–10, section 13.7, must be used to measure the thermal efficiency of outdoor and indoor residential hydronic heaters.

(e) [Reserved]

(f) The manufacturer of an affected residential hydronic heater or forced-air furnace must notify the Administrator of the date that certification testing is to begin, by email, to Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program). This notice must be at least 30 days before the start of testing. The notification of testing must include the manufacturer's name and address, the accredited test laboratory's name and address, certifying entity name, the model name and number (or, if unavailable, some other way to distinguish between models), and the dates of testing.

(g) The accredited test laboratory must allow the manufacturer, the EPA and delegated states to observe certification testing. However, manufacturers must not involve themselves in the conduct of the test after the pretest burn (as defined by EPA Method 28 WHH) has begun. Communications between the manufacturer and laboratory or certifying entity personnel regarding operation of the hydronic heater must be limited to written communications transmitted prior to the first pretest burn of the certification series. Written communications between the manufacturer and laboratory personnel may be exchanged during the certification test only if deviations from the test procedures are observed that constitute improper conduct of the test. All communications must be included in the test documentation required to be submitted pursuant to § 60.533(b)(3) and must be consistent with instructions provided in the owner's manual required under § 60.5478(f), except to the extent that they address details of the certification tests that would not be relevant to owners.

**§ 60.5477 What procedures must I use for laboratory accreditation?**

The accreditation procedure specified in § 60.535 must be used to certify test laboratories under this subpart.

**§ 60.5478 What requirements must I meet for permanent labels and owner's manuals?****(a) Permanent Label Requirements.**

(1) Each affected residential hydronic heater or forced-air furnace manufactured or sold on or after the date the applicable standards come into effect as specified in § 60.5474, must have a permanent label affixed to it that meets the requirements of this section.

(2) The permanent label must contain the following information:

(i) Month and year of manufacture of the individual unit;

(ii) Model name or number; and

(iii) Serial number.

(3) The permanent label must:

(i) Be affixed in a readily visible or accessible location in such a manner that it can be easily viewed before and after the appliance is installed;

(ii) Be at least 8.9 cm long and 5.1 cm wide (3 1/2 inches long and 2 inches wide);

(iii) Be made of a material expected to last the lifetime of the residential hydronic heater or forced-air furnace;

(iv) Present required information in a manner so that it is likely to remain legible for the lifetime of the residential hydronic heater or forced-air furnace; and

(v) Be affixed in such a manner that it cannot be removed without damage to the label.

(4) The permanent label may be combined with any other label, as long as the required information is displayed, the integrity of the permanent label is not compromised, and the requirements of § 60.5478(a)(3) are still met.

(b) If the residential hydronic heater or forced-air furnace belongs to a model line certified under § 60.5475, and it has been found to meet the applicable emission limits or tolerances through quality assurance testing, one of the following statements, as appropriate, must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2015 particulate emission standards.

or  
U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2020 particulate emission standards.

(c) The label under paragraph (b) of this section must also contain the following statement on the permanent label:

“This appliance needs periodic inspection and repair for proper operation. Consult owner’s manual for further information. It is against the law to operate this appliance in a manner inconsistent with operating instructions in the owner’s manual.”

(d) Any label statement under paragraph (b) of this section constitutes

a representation by the manufacturer as to any residential hydronic heater or forced-air furnace that bears it:

(1) That the certification of compliance was in effect at the time the residential hydronic heater or forced-air furnace left the possession of the manufacturer;

(2) That the manufacturer was, at the time the label was affixed, conducting a quality assurance program in conformity with the manufacturer’s quality assurance program; and

(3) That as to any residential hydronic heater or forced-air furnace individually tested for emissions by the manufacturer under § 60.5475(f), it met the applicable emission limit.

(e)(1) If an affected residential hydronic heater or forced-air furnace is manufactured in the United States for export as provided in § 60.5472(b)(1), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Export appliance. May not be operated in the United States.

(2) If an affected residential hydronic heater or forced-air furnace is manufactured for use for research and development purposes as provided in § 60.5472(b)(2), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Not certified. Research Appliance. Not approved for sale.

(3) If an affected residential hydronic heater or forced-air furnace is a non wood-burning hydronic heater or forced-air furnace exclusively as provided in § 60.5472(b)(3) the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This appliance is not certified for wood burning. Use of any wood fuel is a violation of federal law.

(f) *Owner’s Manual.* (1) Each affected residential hydronic heater or forced-air furnace offered for sale by a commercial owner must be accompanied by an owner’s manual that must contain the information listed in paragraph (f)(2) of this section (pertaining to installation), and paragraph (f)(3) of this section (pertaining to operation and maintenance). Such information must be adequate to enable consumers to achieve optimal emissions performance. Such information must be consistent with the operating instructions provided by the manufacturer to the accredited test laboratory for operating the residential hydronic heater or forced-air furnace during certification testing, except for details of the certification test that would not be relevant to the

ultimate purchaser. The commercial owner must also make current and historical owner’s manuals available on the company Web site.

(2) Installation information:

Requirements for achieving proper draft.

(3) Operation and maintenance information:

(i) Fuel loading procedures, recommendations on fuel selection, and warnings on what fuels not to use, such as treated wood, colored paper, cardboard, solvents, trash and garbage.

(ii) Fire starting procedures

(iii) Proper use of air controls

(iv) Ash removal procedures

(v) Instructions for replacement of gaskets and other parts that are critical to the emissions performance of the unit and other maintenance and repair instructions

(vi) The following statement: “This wood heating appliance needs periodic inspection and repair for proper operation. It is against federal law to operate this wood heating appliance in a manner inconsistent with operating instructions in the manual.”

(4) Any manufacturer using the EPA model language contained in appendix I of this part to satisfy any requirement of this paragraph (f) will be considered to be in compliance with that requirement, provided that the particular model language is printed in full, with only such changes as are necessary to ensure accuracy for the particular model line.

(5) Residential hydronic heaters and forced-air furnaces that are affected by this subpart but have been operated by a noncommercial owner are not subject to paragraph (f) of this section when offered for resale.

**§ 60.5479 What records must I keep and what reports must I submit?**

(a) Each manufacturer who holds a certificate of compliance pursuant to § 60.5475(a)(2) for a model line must maintain records containing the following information with respect to that model line.

(1) All documentation pertaining to the certification test used to obtain certification, including the full test report and raw data sheets, laboratory technician notes, calculations, and the test results for all test runs.

(2) Results of the quality assurance program inspections required pursuant to § 60.5475(g).

(3) For emissions tests conducted pursuant to the quality assurance program required by § 60.5475(g), all test reports, data sheets, laboratory technician notes, calculations, and test results for all test runs, the corrective actions taken, if any, and any follow-up actions such as additional testing.

(b) Each accredited test laboratory must maintain records consisting of all documentation pertaining to each certification test and audit test, including the full test report and raw data sheets, laboratory technician notes, calculations, and the test results for all test runs. Each accredited test laboratory must submit initial and biennial proficiency test results to the Administrator.

(c) Each manufacturer must retain each residential hydronic heater and forced-air furnace upon which certification tests were performed and certification granted under § 60.5475(a)(2) at the manufacturer's facility for as long as the model line is manufactured. Each heater or furnace must remain sealed and unaltered. Any such residential hydronic heater or forced-air furnace must be made available upon request to the Administrator for inspection and testing.

(d) Each manufacturer of an affected residential hydronic heater or forced-air furnace certified pursuant to § 60.5475(a)(2) must submit a report to the Administrator every 2 years following issuance of a certificate of compliance for each model line. This report must include the sales for each model by state and certify that no changes in the design or manufacture of the model line have been made that require recertification pursuant to § 60.5475(e).

(e)(1) Unless otherwise specified, all records required under this section must be maintained by the manufacturer, commercial owner of the affected residential hydronic heater or forced-air furnace, accredited test laboratory or certifying entity for a period of no less than 5 years.

(2) Unless otherwise specified, all reports to the Administrator required under this subpart must be made to: Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program).

(f) Within 60 days after the date of completing each performance test, each manufacturer or accredited test laboratory or certifying entity must submit performance test data electronically to the EPA's Central Data Exchange (CDX) by using the Electronic Reporting Tool (ERT) (<http://www.epa.gov/ttn/chief/ert/index.html>). Only data collected using test methods compatible with ERT are subject to this requirement to be submitted electronically to EPA's CDX.

Manufacturers may submit compliance reports to the EPA via regular mail at the address listed below if the test methods they use are not compatible

with ERT or if ERT is not available to accept reports at the time the final rule is published. Owners or operators who claim that some of the information being submitted for performance tests is confidential business information (CBI) must submit a completed ERT file, including information claimed to be CBI on a compact disk or other commonly used electronic storage media (including, but not limited to, flash drives), to the EPA and the same ERT file, with the CBI omitted, to the EPA via CDX as described earlier in this paragraph. The compact disk must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. Emission data and all information necessary to determine compliance, except sensitive engineering drawings and sensitive detailed material specifications, may not be claimed as CBI.

#### **§ 60.5480 What activities are prohibited under this subpart?**

(a) No person is permitted to operate an affected residential hydronic heater or forced-air furnace that does not have affixed to it a permanent label pursuant to § 60.5478(b) or (c).

(b)(1) No commercial owner is permitted to advertise for sale, offer for sale, or sell an affected residential hydronic heater or forced-air furnace that does not have affixed to it a permanent label pursuant to § 60.5478(b) or (e)(3).

(2) No commercial owner is permitted to advertise for sale, offer for sale, or sell an affected residential hydronic heater or forced-air furnace labeled under § 60.5478(e)(1) except for export.

(c)(1) No commercial owner is permitted to advertise for sale, offer for sale, or sell an affected residential hydronic heater or forced-air furnace permanently labeled under § 60.5478(b) or (e)(3) unless:

(i) The affected appliance has been certified to comply with 2020 particulate emission standards. This prohibition does not apply to affected residential hydronic heaters or forced-air furnaces regulated under this subpart that have been previously owned and operated by a noncommercial owner; and

(ii) The commercial owner provides any purchaser or transferee with an owner's manual that meets the requirements of § 60.5478(f), a copy of the warranty and a moisture meter.

(2) A commercial owner other than a manufacturer complies with the requirements of paragraph (c)(1) of this section if the commercial owner:

(i) Receives the required documentation from the manufacturer or a previous commercial owner; and

(ii) Provides that documentation unaltered to any person to whom the residential hydronic heater or forced-air furnace that it covers is sold or transferred.

(d)(1) In any case in which the Administrator revokes a certificate of compliance either for the knowing submission of false or inaccurate information or other fraudulent acts, or based on a finding under § 60.5475(e)(1)(ii) that the certification test was not valid, the Administrator may give notice of that revocation and the grounds for it to all commercial owners.

(2) On and after the date of receipt of the notice given under paragraph (d)(1) of this section, no commercial owner is permitted to sell any residential hydronic heater or forced-air furnace covered by the revoked certificate (other than to the manufacturer) unless the model line has been recertified in accordance with this subpart.

(e) No person is permitted to install or operate an affected residential hydronic heater or forced-air furnace except in a manner consistent with the instructions on its permanent label and in the owner's manual pursuant to § 60.5478(f), including only using fuels for which the unit is certified.

(f) No person is permitted to operate an affected residential hydronic heater or forced-air furnace that has been physically altered to exceed the tolerance limits of its certificate of compliance.

(g) No person is permitted to alter, deface, or remove any permanent label required to be affixed pursuant to § 60.5478.

(h) No certifying entity is permitted to certify its own certification test report.

#### **§ 60.5481 What Petition for Review procedures apply to me?**

(a) In any case where the Administrator:

(1) Denies an application under § 60.5475(a)(2);

(2) Issues a notice of revocation of certification pursuant to § 60.5475(e);

(3) Denies an application for laboratory accreditation pursuant to § 60.5477; or

(4) Issues a notice of revocation of laboratory accreditation pursuant to § 60.5477, the manufacturer or laboratory affected may submit to the EPA a request for review under this section pursuant to the procedures specified in § 60.539 within 30 days following receipt of the required notification of the action in question.

(b) In any case where the Administrator issues a notice of revocation pursuant to § 60.5475(g), the manufacturer may submit to the EPA a Petition for Review request under this section with the time limits set out in § 60.533(p)(4).

**§ 60.5482 Who implements and enforces this subpart?**

(a) In delegating implementation and enforcement authority to a state under section 111(c) of the Clean Air Act, the authorities contained in paragraph (b) of this section must be retained by the Administrator and not transferred to a state.

(b) Authorities that must not be delegated to states:

- (1) Section 60.5473, Definitions;
- (2) Section 60.5475, Compliance and certification;
- (3) Section 60.5476, Test methods and procedures; and
- (4) Section 60.5477, Laboratory accreditation.

**§ 60.5483 What parts of the General Provisions do not apply to me?**

The following provisions of subpart A of part 60 do not apply to this subpart:

- (a) Section 60.7;
- (b) Section 60.8(a), (c), (d), (e), (f) and (g); and
- (c) Section 60.15(d).

■ 5. Add subpart RRRR to read as follows:

**Subpart RRRR—Standards of Performance for New Residential Masonry Heaters**

Sec.

- 60.5484 Am I subject to this subpart?  
 60.5485 What definitions must I know?  
 60.5486 What standards and requirements must I meet and by when?  
 60.5487 What compliance and certification requirements must I meet and by when?  
 60.5488 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?  
 60.5489 What procedures must I use for laboratory accreditation?  
 60.5490 What requirements must I meet for permanent labels and owner's manuals?  
 60.5491 What records must I keep and what reports must I submit?  
 60.5492 What activities are prohibited under this subpart?  
 60.5493 What Petition for Review procedures apply to me?  
 60.5494 Who implements and enforces this subpart?  
 60.5495 What parts of the General Provisions do not apply to me?

**Subpart RRRR—Standards of Performance for New Residential Masonry Heaters**

**§ 60.5484 Am I subject to this subpart?**

(a) You are subject to this subpart if you operate, manufacture, sell, offer for

sale, import for sale, distribute, offer to distribute, introduce, or deliver for introduction, into commerce in the United States, a residential masonry heater manufactured on or after [EFFECTIVE DATE OF FINAL RULE].

(b) Each affected masonry heater must comply with the provisions of this subpart unless exempted under paragraphs (b)(1) through (b)(3) of this section.

(1) Affected masonry heaters manufactured in the United States for export are exempt from the applicable emission limits of § 60.5486 and the requirements of § 60.5487.

(2) Affected masonry heaters used for research and development purposes that are never offered for sale or sold and that are not used to provide heat are exempt from the applicable emission limits of § 60.5486 and the requirements of § 60.5487. No more than six affected masonry heaters manufactured per model line may be exempted for this purpose.

(3) Affected masonry heaters that do not burn wood or wood pellets (such as coal-only heaters that meet the definition in § 60.5485 or corn-only heaters) are exempt from the applicable emission limits of § 60.5486 and the requirements of § 60.5487.

(c) The following are not affected masonry heaters and are not subject to this subpart:

- (1) Residential wood heaters subject to subpart AAA of this part.
- (2) Residential hydronic heaters and forced-air furnaces subject to subpart QQQQ of this part.

**§ 60.5485 What definitions must I know?**

As used in this subpart, all terms not defined herein have the same meaning given them in the Clean Air Act and subpart A of this part.

*Accredited test laboratory* means a test laboratory that is accredited for masonry heater certification testing under § 60.5489 or is an independent third party test laboratory that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17025 to perform testing using the test methods specified in § 60.5488 and approved by the EPA for conducting certification tests under this subpart.

*At retail* means the sale by a commercial owner of a residential masonry heater to the ultimate purchaser.

*Certifying entity* means an independent third party that is accredited by a nationally recognized accrediting entity under ISO-IEC Standard 17020 to perform certifications and inspections under ISO-IEC Guide

17065 and approved by the EPA for conducting certifications, inspections and audits under this subpart.

*Coal-only heater* means an enclosed, coal-burning appliance capable of space heating or domestic water heating which has all of the following characteristics:

- (1) Installation instructions that state that the use of wood in the heater, except for coal ignition purposes, is prohibited by law; and
- (2) The model is listed by a nationally recognized safety-testing laboratory for coal use only, except for coal ignition purposes.

*Commercial owner* means any person who owns or controls a residential masonry heater in the course of the business of the manufacture, importation, distribution, or sale of the unit.

*Manufactured* means completed and ready for shipment (whether or not packaged) or installed in a residence in the case of custom-built masonry heaters for purposes of determining the date of manufacture.

*Manufacturer* means any person who constructs or imports into the United States a residential masonry heater.

*Model line* means all residential masonry heaters offered for sale by a single manufacturer that are similar in all material respects as defined in this section.

*Particulate matter (PM)* means total particulate matter including PM<sub>10</sub> and PM<sub>2.5</sub>.

*Pellet fuel* means refined and densified wood shaped into small pellets or briquettes that are uniform in size, shape, moisture, density and energy content.

*Representative affected masonry heater* means an individual residential masonry heater that is similar in all material respects as defined in this section to other residential masonry heaters within the model line it represents.

*Residential masonry heater* means a factory-built or site-built wood-burning device that has the following characteristics:

- (1) The device has a core constructed primarily of manufacturer-built, supplied, or specified masonry materials (such as stone, cemented aggregate, clay, tile, or other non-combustible, non-metallic solid materials) that weighs at least 1700 pounds;

(2) The firebox effluent of the masonry heater travels horizontally and/or downward through one or more heat absorbing masonry duct(s) for a distance at least the length of the largest single internal firebox dimension before

leaving the masonry heater. These parameters are determined as follows:

(i) Horizontal or downward travel distance is defined as the net horizontal and/or downward internal duct length, measured from the top of the uppermost firebox door opening(s) to the exit of the masonry heater as traveled by any effluent on a single pathway through duct channel(s) within the heater (or average of net internal duct lengths for multiple pathways of different lengths, if applicable). Net internal duct length is measured from the center of the internal side or top surface of a duct, horizontally or vertically to the center of the opposite side or the bottom surface of the same duct, and summed for multiple ducts or directions on a single pathway, if applicable. For duct channel(s) traversing horizontal angles of less than ninety degrees from vertical, only the net actual horizontal distance traveled is included in the total duct length; and

(ii) The largest single internal firebox dimensions is defined as the longest of either the length or the width of the firebox hearth and the height of the firebox, measured from the hearth to the top of the uppermost firebox door opening(s);

(3) The device has one or more air-controlling doors for fuel-loading that are designed to be closed during the combustion of fuel loads, and that control the entry of combustion air (beyond simple spark arresting screens) to one or more inlets as prescribed by the masonry heater manufacturer; and

(4) The device is assembled in conformance with Underwriters Laboratories' and/or manufacturer's specifications for its assembly and, if the core is constructed with a substantial portion of materials not supplied by the manufacturer, is certified by a representative of the manufacturer to be substantially in conformance with those specifications.

*Sale* means the transfer of ownership or control, except that a transfer of control of an affected heater for research and development purposes within the scope of § 60.5484(b)(2) is not a sale.

*Seasoned wood* means wood with a moisture content of 20 percent or less.

*Similar in all material respects* means that the construction materials, exhaust and inlet air system, and other design features are within the allowed tolerances for components identified in § 60.533(k).

*Valid certification test* means a test that meets the following criteria:

(1) The Administrator was notified about the test in accordance with § 60.5488(d)

(2) The test was conducted by an accredited test laboratory as defined in this section;

(3) The test was conducted on a residential masonry heater similar in all material respects as defined in this section to other residential masonry heaters of the model line that is to be certified; and

(4) The test was conducted in accordance with the test methods and procedures specified in § 60.5488.

**§ 60.5486 What standards and requirements must I meet and by when?**

(a) *Particulate Matter Standard.*

Unless exempted under § 60.5484:

(1) On or after [EFFECTIVE DATE OF FINAL RULE], no person is permitted to manufacture and, on or after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE], no person is permitted to sell at retail a residential masonry heater unless the heater has been certified to meet the particulate matter emission limit in paragraph (b) of this section or the manufacturer is a small manufacturer as defined in paragraph (a)(2) of this section.

(2) On or after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE], no small manufacturer is permitted to manufacture a residential masonry heater unless it has been certified to meet the particulate matter emission limit in paragraph (b) of this section. For the purposes of this subpart, a small manufacturer is defined as a manufacturer that constructs less than 15 residential masonry heaters per year. A small manufacturer may elect to comply with the emission limit in paragraph (b) of this section earlier than specified in this paragraph.

(b) Residential masonry heater particulate matter emission limit: 0.32 lb/million Btu (0.137 g/megajoule) heat output as determined by the test methods and procedures in § 60.5488.

(c) *Pellet Fuel Requirements.*

Operators of masonry heaters that are certified to burn pellet fuels may only burn pellets that have been produced under a licensing agreement with the Pellet Fuel Institute or an equivalent organization approved by EPA. The pellet fuel must meet the following minimum requirements:

(1) Density: consistent hardness and energy content with a minimum density of 38 pounds/cubic foot;

(2) Dimensions: maximum length of 1.5 inches and diameter between 0.230 and 0.285 inches;

(3) Inorganic fines: less than or equal to 1 percent;

(4) Chlorides: less than or equal to 300 parts per million by weight; and

(5) Ash content: no more than 2 percent.

(6) A quality assurance process licensed by the Pellet Fuel Institute or equivalent organization approved by the EPA.

(d) *Prohibited Fuel Types.* No person is permitted to burn any of the following materials in a residential masonry heater:

(1) Residential or commercial garbage;

(2) Lawn clippings or yard waste;

(3) Materials containing rubber, including tires;

(4) Materials containing plastic;

(5) Waste petroleum products, paints or paint thinners, or asphalt products;

(6) Materials containing asbestos;

(7) Construction or demolition debris;

(8) Paper products, cardboard, plywood, or particleboard. The prohibition against burning these materials does not prohibit the use of fire starters made from paper, cardboard, saw dust, wax and similar substances for the purpose of starting a fire in an affected masonry heater;

(9) Railroad ties or pressure treated wood;

(10) Manure or animal remains; or

(11) Salt water driftwood or other

previously salt water saturated materials.

(e) *Owner's Manual.* A person must not operate a residential masonry heater in a manner inconsistent with the owner's manual. The owner's manual must clearly specify that operation in a manner inconsistent with the owner's manual would violate the warranty.

**§ 60.5487 What compliance and certification requirements must I meet and by when?**

(a)(1) *Certification Requirement.* Each affected residential masonry heater must be certified to be in compliance with the applicable emission standards and other requirements of this subpart. For each model line manufactured or sold by a single entity, e.g., company or manufacturer, compliance with applicable emission standards of § 60.5486(b) must be determined based on testing of representative affected appliances within the model line. If one entity licenses a model line to another entity, each entity's model line must be certified. If an entity changes the name of the entity or the name of the model, the manufacturer must apply for a new certification.

(2) The manufacturer of each model line must submit to the EPA the information required in paragraph (b) of this section and follow the certification procedure specified in § 60.533(f) except that, for the purposes of this paragraph, the reference in § 60.533(f) to the emission limits in § 60.532 must be understood to refer to the emission

limits in § 60.5486(b) and the associated test methods are those specified in this subpart.

(3) As an alternative to the certification process described in paragraph (a)(2) of this section, an applicant may choose to submit a computer model simulation program for review and certification by the certifying entity and subsequent review and approval by the Administrator for use as a surrogate for emissions testing. The Administrator will post the certified model on the EPA Burnwise Web site.

(b) *Waiver from Submitting Test Results.*

(1) An applicant for certification may apply for a potential waiver of the requirements to submit the results of a certification test pursuant to the certification procedures specified in § 60.533(f) according to the procedure specified in § 60.533(g)(1).

(2) Alternatively, an applicant may submit results using a validated computer model simulation program that demonstrates the masonry heater design meets the emission limit in § 60.5486(b).

(c) *Certification Period.*

(1) Unless revoked sooner by the Administrator, a certificate of compliance will be valid for 5 years from the date of issuance.

(2) If the manufacturer qualifies as a small manufacturer as defined in § 60.5486(a)(2) and the model was certified using the procedure defined in paragraph (a)(3) of this section, the certificate of compliance will be valid for the life of the model line unless it is revoked by the Administrator.

(d) *Renewal of Certification.*

(1) Any manufacturer of an affected masonry heater may apply to the Administrator for potential renewal of a certificate of compliance by submitting the material specified in § 60.533(b) and following the process specified in § 60.533(f).

(2) A certificate issued pursuant to paragraph (c)(1) of this section must be recertified or renewed every 5 years or the manufacture may choose to no longer manufacture or sell that model. If the manufacturer chooses to no longer manufacture or sell that model, then the manufacturer must submit a statement to EPA for that model. A manufacturer may apply to the Administrator for potential renewal of their certificate by submitting certification information in accordance with § 60.533(b) or by affirming in writing that the wood heater has been subject to no changes that would impact emissions and request a potential waiver from certification testing.

(3) If the Administrator waives certification testing under paragraph (c)(2) of this section, the Administrator will give written notice to the manufacturer setting forth the basis for the determination and issue a certification.

(4) If the Administrator denies the request, the Administrator will give written notice to the manufacturer setting forth the basis for the determination.

(e) *Recertification.*

(1) The procedure specified in § 60.533(k) must be used to determine when a model line must be recertified.

(2) If the manufacturer qualifies as a small manufacturer as defined in § 60.5486(a)(2) and the model line was certified using the procedure defined in paragraph (a)(3) of this section, the recertification provisions of paragraph (e)(1) of this section do not apply.

(f) *Criteria for Revocation of Certification.*

(1) The Administrator may revoke certification of a model line if it is determined that the residential masonry heaters produced in that model line do not comply with the requirements of this subpart. Such a determination will be based on all available evidence, including but not limited to:

- (i) Test data from retesting of the original unit on which the certification was conducted or a similar unit;
- (ii) A finding that the certification test or model simulation was not valid;
- (iii) A finding that the labeling of the residential masonry heater model line or the associated owner's manual or marketing information does not comply with the requirements of § 60.5490;
- (iv) Failure by the manufacturer to comply with the reporting and recordkeeping requirements of § 60.5491;

(v) Physical examination showing that an inspected production unit is not similar in all material respects as defined in this subpart to the representative affected masonry heater submitted for testing; or

(vi) Failure of the manufacturer to conduct a quality assurance program in conformity with paragraph (f) of this section.

(2) Revocation of certification under this paragraph will not take effect until the manufacturer concerned has been given written notice by the Administrator setting forth the basis for the proposed determination and an opportunity to request a Petition for Review under § 60.5493.

(g) *Quality Assurance Program.* For each certified model line, except for any model line at small manufacturers as defined in § 60.5486(a)(2) and where the

model line was certified using the procedure defined in paragraph (a)(3) of this section, the manufacturer must conduct a quality assurance program according to the requirements of § 60.533(m).

(h) *EPA Compliance Audit Testing.*

The Administrator may conduct compliance audit testing according to the requirements of § 60.533(n). For the purposes of this paragraph, references in § 60.533(p) to §§ 60.532 through 60.535 must be understood to refer to the comparable paragraphs in § 60.5486 through 60.5489, respectively. The requirements of this paragraph do not apply to small manufacturers as defined in § 60.5486(a)(2) and where the model line was certified using the procedure defined in paragraph (a)(3) of this section.

**§ 60.5488 What test methods and procedures must I use to determine compliance with the standards and requirements for certification?**

Test methods and procedures specified in this section or in appendix A of this part, except as provided under § 60.8(b), must be used to determine compliance with the standards and requirements for certification under §§ 60.5486 and 60.5487 as follows:

(a) ASTM E2817–11, Standard Test Method for Test Fueling Masonry Heaters, must be used to measure the heat output (million Btu/hr) of residential masonry heaters.

(b) ASTM E2515–10 must be used in conjunction with ASTM E2817–11 to measure the particulate emission rate (lb/million BTU heat output) of residential masonry heaters.

(c)(1) ASTM WK26558, New Specification for Calculation Method for Custom Designed, Site Built Masonry Heaters may be used as an alternative to certification testing as specified in paragraphs (a), (b) and (d) of this section.

(2) If the Administrator approves an alternative computer model simulation program pursuant to § 60.5487(a)(3), the approved simulation program also may be used as an alternative to certification testing as specified in paragraphs (a) and (b) of this section.

(d) Method 10 in appendix A–4 of this part must be used to measure CO emissions of residential masonry heaters.

(e) The manufacturer of an affected masonry heater must notify the Administrator of the date that certification testing is to begin, by email, to Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program). This notice must be received at least 30 days

before the start of testing. The notification of testing must include the manufacturer's name and address, the accredited test laboratory's name and address, certifying entity name, the model name and number (or, if unavailable, some other way to distinguish between models), and the dates of testing.

(f) The accredited test laboratory must allow the manufacturer, the EPA and delegated states to observe certification testing. However, manufacturers must not involve themselves in the conduct of the test after the pretest burn (as defined by ASTM E2817-11) has begun. Communications between the manufacturer and laboratory or certifying entity personnel regarding operation of the masonry heater must be limited to written communications transmitted prior to the first pretest burn of the certification series. Written communications between the manufacturer and laboratory personnel may be exchanged during the certification test only if deviations from the test procedures are observed that constitute improper conduct of the test. All communications must be included in the test documentation required to be submitted pursuant to § 60.533(b)(3) and must be consistent with instructions provided in the owner's manual required under § 60.5490(g), except to the extent that they address details of the certification tests that would not be relevant to owners.

**§ 60.5489 What procedures must I use for laboratory accreditation?**

The accreditation procedure specified in § 60.535 must be used to certify test laboratories under this subpart.

**§ 60.5490 What requirements must I meet for permanent labels and owner's manuals?**

(a) *Permanent Label Requirements.*

(1) Each affected masonry heater manufactured on or after the date the applicable standards come into effect as specified in § 60.5486, must have a permanent label affixed to it that meets the requirements of this section.

(2) The permanent label must contain the following information:

(i) Month and year of manufacture of the individual unit;

(ii) Model name or number; and

(iii) Serial number.

(3) The permanent label must:

(i) Be affixed in a readily visible or accessible location in such a manner that it can be easily viewed before and after the appliance is installed;

(ii) Be at least 8.9 cm long and 5.1 cm wide (3 1/2 inches long and 2 inches wide);

(iii) Be made of a material expected to last the lifetime of the residential masonry heater;

(iv) Present required information in a manner so that it is likely to remain legible for the lifetime of the residential masonry heater; and

(v) Be affixed in such a manner that it cannot be removed without damage to the label.

(4) The permanent label may be combined with any other label, as long as the required information is displayed, the integrity of the permanent label is not compromised, and the requirements of § 60.5490(3) are still met.

(b)(1) If the residential masonry heater belongs to a model line certified under § 60.5487, and it has been found to meet the applicable emission limits or tolerances through quality assurance testing, the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Certified to comply with 2015 particulate emissions standards.

(2) If the masonry heater belongs to a model line owned by a manufacturer that qualifies for the small volume manufacturer delay as specified in § 60.5486(a)(2), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This masonry heater was produced by a small volume manufacturer that manufactures or exports to the United States fewer than 15 masonry heaters per year. This appliance cannot be sold after [5 YEARS AFTER EFFECTIVE DATE OF FINAL RULE].

(c) The label under paragraph (b) of this section must also contain the following statement on the permanent label: "This appliance needs periodic inspection and repair for proper operation. Consult owner's manual for further information. It is against the law to operate this appliance in a manner inconsistent with operating instructions in the owner's manual."

(d) Any label statement under paragraph (b) of this section constitutes a representation by the manufacturer as to any residential masonry heater that bears it:

(1) That the certification was in effect at the time the residential masonry heater left the possession of the manufacturer;

(2) That the manufacturer was, at the time the label was affixed, conducting a quality assurance program in conformity with the manufacturer's quality assurance program; and

(3) That as to any residential masonry heater individually tested for emissions

by the manufacturer under § 60.5487(f), it met the applicable emission limit.

(e)(1) If an affected masonry heater is manufactured in the United States for export as provide in § 60.5484(b)(1), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Export unit. May not be operated in the United States.

(2) If an affected masonry heater is manufactured for research and development purposes as provided in § 60.5484(b)(2), the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY Not certified. Research unit. Not approved for sale.

(3) If an affected masonry heater is a non wood-burning masonry heater exclusively as provided § 60.5484(b)(3) the following statement must appear on the permanent label:

U.S. ENVIRONMENTAL PROTECTION AGENCY This appliance is not certified for wood burning. Use of any wood fuel is a violation of federal law.

(f) *Owner's Manual.*

(1) Each affected masonry heater offered for sale by a commercial owner must be accompanied by an owner's manual that must contain the information listed in paragraph (f)(2) of this section (pertaining to installation), and paragraph (f)(3) of this section (pertaining to operation and maintenance). Such information must be adequate to enable consumers to achieve optimal emissions performance. Such information must be consistent with the operating instructions provided by the manufacturer to the accredited test laboratory for operating the residential masonry heater, except for details of the certification test that would not be relevant to the ultimate purchaser. The commercial owner must also make current and historical owner's manuals available on the company Web site.

(2) Installation information: Requirements for achieving proper draft.

(3) Operation and maintenance information:

(i) Fuel loading procedures, recommendations on fuel selection, and warnings on what fuels not to use, such as treated wood, colored paper, cardboard, solvents, trash and garbage.

(ii) Fire starting procedures

(iii) Proper use of air controls

(iv) Ash removal procedures

(v) Instructions for replacement of gasket and other parts that are critical to the emissions performance of the unit and other maintenance and repair instructions

(vi) The following statement: “This wood heating appliance needs periodic inspection and repair for proper operation. It is against federal law to operate this wood heating appliance in a manner inconsistent with operating instructions in the manual.”

(4) Any manufacturer using the EPA model language contained in appendix I of this part to satisfy any requirement of this paragraph (f) will be considered to be in compliance with that requirement, provided that the particular model language is printed in full, with only such changes as are necessary to ensure accuracy for the particular model line.

(5) Residential masonry heaters that are affected by this subpart but have been operated by a noncommercial owner are not subject to paragraph (f) of this section when offered for resale.

**§ 60.5491 What records must I keep and what reports must I submit?**

(a) Each manufacturer who holds a certificate of compliance pursuant to § 60.5487(a)(2) for a model line must maintain records containing the information required by this paragraph (a) with respect to that model line.

(1) All documentation pertaining to the certification test or computer simulation used to obtain certification.

(i) For certification tests, this includes the full test report and raw data sheets, laboratory technician notes, calculations, and the test results for all test runs.

(ii) For computer simulations, this includes all data input into the simulation program and all computer-generated output.

(2) Results of the quality assurance program inspections required pursuant to § 60.5487(f).

(3) For emissions tests conducted pursuant to the quality assurance program required by § 60.5487(f), all test reports, data sheets, laboratory technician notes, calculations, and test results for all test runs, the remedial actions taken, if any, and any follow-up actions such as additional testing.

(4) If a masonry heater manufacturer qualifies as a small volume manufacturer as specified in § 60.5486(a)(2) and elects to defer compliance as allowed by that paragraph, records of the number of masonry heaters produced or constructed per year during the deferral period.

(b) Each accredited test laboratory must maintain records consisting of all documentation pertaining to each certification test, audit test, or computer simulation, including the full test report and raw data sheets, laboratory

technician notes, calculations, and the test results for all test runs. Each accredited test laboratory must submit initial and biennial proficiency test results to the Administrator.

(c) Each manufacturer must retain each residential masonry heater upon which certification tests were performed and certification granted pursuant to § 60.5487(a)(2) at the manufacturer's facility for as long as the model line is manufactured. Each masonry heater must remain sealed and unaltered. Any such residential masonry heater must be made available upon request to the Administrator for inspection and testing.

(d)(1) Each manufacturer of an affected masonry heater certified pursuant to § 60.5487 must submit a report to the Administrator every 2 years following issuance of a certificate of compliance for each model line. This report must include the sales for each model by state and certify that no changes in the design or manufacture of the model line have been made that require recertification pursuant to § 60.5487(d).

(2) If the manufacturer qualifies as a small manufacturer as defined in § 60.5486(b)(2) and the model line was certified using the procedure defined in paragraph (a)(3) of this section, the reporting provision of paragraph (d)(1) of this section does not apply.

(e)(1) Unless otherwise specified, all records required under this section must be maintained by the manufacturer, commercial owner of the affected masonry heater, accredited test laboratory or certifying entity for a period of no less than 5 years.

(2) Unless otherwise specified, all reports to the Administrator required under this subpart must be made to: Wood Heater NSPS Compliance Program at [www.epa.gov/Wood\\_Heater\\_NSPS\\_Compliance\\_Program](http://www.epa.gov/Wood_Heater_NSPS_Compliance_Program).

(f) Within 60 days after the date of completing each performance test, each manufacturer or accredited test laboratory or certifying entity must submit performance test data, except opacity data, electronically to the EPA's Central Data Exchange (CDX) by using the Electronic Reporting Tool (ERT) (<http://www.epa.gov/ttn/chief/ert/index.html>). Only data collected using test methods compatible with ERT are subject to this requirement to be submitted electronically to the EPA's CDX. Manufacturers may submit compliance reports to the EPA via regular mail at the address listed below if the test methods they use are not compatible with ERT or if ERT is not available to accept reports at the time the final rule is published. Owners or

operators who claim that some of the information being submitted for performance tests is confidential business information (CBI) must submit a completed ERT file, including information claimed to be CBI, on a compact disk or other commonly used electronic storage media (including, but not limited to, flash drives), to the EPA, and the same ERT file, with the CBI omitted, to the EPA via CDX as described earlier in this paragraph. The compact disk must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. Emission data and all information necessary to determine compliance, except sensitive engineering drawings and sensitive detailed material specifications, may not be claimed as CBI.

**§ 60.5492 What activities are prohibited under this subpart?**

(a) No person is permitted to operate an affected masonry heater manufactured after [EFFECTIVE DATE OF FINAL RULE] or sold at retail after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] that does not have affixed to it a permanent label pursuant to § 60.5490.

(b)(1) No manufacturer or commercial owner is permitted to advertise for sale, offer for sale, or sell an affected masonry heater manufactured after [EFFECTIVE DATE OF FINAL RULE] or sold at retail after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] that does not have affixed to it a permanent label pursuant to § 60.5490.

(2) No manufacturer or commercial owner is permitted to advertise for sale, offer for sale, or sell an affected masonry heater manufactured after [EFFECTIVE DATE OF FINAL RULE] or sold at retail after [6 MONTHS AFTER EFFECTIVE DATE OF FINAL RULE] labeled under § 60.5490(d)(1) except for export.

(c)(1) No commercial owner is permitted to advertise for sale, offer for sale or sell an affected masonry heater permanently labeled under § 60.5490(b) unless:

(i) The affected appliance regulated under this subpart was previously owned and operated by a noncommercial owner;

(ii) The commercial owner provides any purchaser or transferee with an owner's manual that meets the requirements of § 60.5490(g), a copy of the warranty and a moisture meter.

(2) A commercial owner other than a manufacturer complies with the requirements of paragraph (c) of this section if the commercial owner:

(i) Receives the required documentation from the manufacturer or a previous commercial owner; and

(ii) Provides that documentation unaltered to any person to whom the residential masonry heater that it covers is sold or transferred.

(d)(1) In any case in which the Administrator revokes a certificate of compliance either for the knowing submission of false or inaccurate information or other fraudulent acts, or based on a finding under § 60.5487(e)(1)(ii) that the certification test was not valid, the Administrator may give notice of that revocation and the grounds for it to all commercial owners.

(2) On and after the date of receipt of the notice given under paragraph (d)(1) of this section, no commercial owner is permitted to sell any residential masonry heater covered by the revoked certificate (other than to the manufacturer) unless the model line has been recertified in accordance with this subpart.

(e) No person is permitted to install or operate an affected masonry heater except in a manner consistent with the instructions on its permanent label and in the owner's manual pursuant to § 60.5490(g), including only using fuels for which the unit is certified.

(f) No person is permitted to operate an affected masonry heater that has been physically altered to exceed the tolerance limits of its certificate of compliance.

(g) No person is permitted to alter, deface, or remove any permanent label required to be affixed pursuant to § 60.5490.

(h) No certifying entity is permitted to certify its own certification test report.

#### **§ 60.5493 What Petition for Review procedures apply to me?**

(a) In any case where the Administrator:

(1) Denies an application under § 60.5487(a)(2);

(2) Issues a notice of revocation of certification under § 60.5487(e);

(3) Denies an application for laboratory accreditation pursuant to § 60.5489; or

(4) Issues a notice of revocation of laboratory accreditation pursuant to § 60.5489, the manufacturer or laboratory affected may submit to the EPA a Petition for Review request under this section pursuant to the procedures specified in § 60.593 within 30 days following receipt of the required notification of the action in question.

(b) In any case where the Administrator issues a notice of revocation under § 60.5487(e), the

manufacturer may submit to the EPA a Petition for Review request under this section pursuant to the procedures specified in § 60.5493 with the time limits set out in § 60.533(p)(4).

#### **§ 60.5494 Who implements and enforces this subpart?**

(a) In delegating implementation and enforcement authority to a state under section 111(c) of the Clean Air Act, the authorities contained in paragraph (b) of this section must be retained by the Administrator and not transferred to a state.

(b) Authorities that must not be delegated to states:

- (1) Section 60.5473, Definitions;
- (2) Section 60.5475, Compliance and certification;
- (3) Section 60.5476, Test methods and procedures; and
- (4) Section 60.5477, Laboratory accreditation.

#### **§ 60.5495 What parts of the General Provisions do not apply to me?**

The following provisions of subpart A of part 60 do not apply to this subpart:

- (a) Section 60.7;
- (b) Section 60.8(a), (c), (d), (e), and (f); and
- (c) Section 60.15(d).

6. Part 60 Appendix A–8 is amended by adding Methods 28R, 28WHH, and 28WHH–PTS to follow Method 28A to read as follows:

#### **Appendix A–8 to Part 60—Test Methods 26 through 30B**

\* \* \* \* \*

#### **Test Method 28R for Certification and Auditing of Wood Heaters**

##### **1.0 Scope and Application**

1.1 This test method applies to certification and auditing of wood-fired room heaters and fireplace inserts.

1.2 The test method covers the fueling and operating protocol for measuring particulate emissions, as well as determining burn rates, heat output and efficiency.

1.3 Particulate emissions are measured by the dilution tunnel method as specified in ASTM E2515–10 *Standard Test Method for Determination of Particulate Matter Emissions Collected in a Dilution Tunnel*.

##### **2.0 Procedures**

2.1 This method incorporates the provisions of ASTM E2780–10 except as follows:

2.1.1 The burn rate categories, low burn rate requirement, and weightings in Method 28 shall be used.

2.1.2 The startup procedures shall be the same as in Method 28.

2.1.3 The equation for converting the emission test values between the EPA Reference Method 5G “Determination of Particulate Emissions From Wood Heaters From a Dilution Tunnel Sampling Location”

and EPA Reference Method 5H “Determination of Particulate Emissions From Wood Heaters From a Stack Location” shall be the same as in Method 28.

2.1.4 Manufacturers shall not specify a smaller volume of the firebox for testing than the full usable firebox.

2.1.5 The test fuel moisture content, fuel load, and coal bed depth shall be as follows:

(a) The fuel load dry-basis moisture content shall be within a range of 22.5 percent  $\pm$  1 percent;

(b) The fuel load weight shall be 7 lb/ft<sup>3</sup>  $\pm$  1 percent (or 7 lb  $\pm$  0.07 lb) of the fuel load weight, calculated in accordance with Method 28; and

(c) The range for the test-initiation coal-bed weight shall be 22 percent  $\pm$  1 percent of the fuel load weight.

#### **Test Method 28 WHH for Measurement of Particulate Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances**

##### **1.0 Scope and Application**

1.1 This test method applies to wood-fired hydronic heating appliances. The units typically transfer heat through circulation of a liquid heat exchange media such as water or a water-antifreeze mixture.

1.2 The test method measures particulate emissions and delivered heating efficiency at specified heat output rates based on the appliance's rated heating capacity.

1.3 Particulate emissions are measured by the dilution tunnel method as specified in ASTM E2515–10 *Standard Test Method for Determination of Particulate Matter Emissions Collected in a Dilution Tunnel*.

Delivered Efficiency is measured by determining the heat output through measurement of the flow rate and temperature change of water circulated through a heat exchanger external to the appliance and determining the input from the mass of dry wood fuel and its higher heating value. Delivered efficiency does not attempt to account for pipeline loss.

1.4 Products covered by this test method include both pressurized and non-pressurized heating appliances intended to be fired with wood. These products are wood-fired hydronic heating appliances that the manufacturer specifies for indoor or outdoor installation. They are often connected to a heat exchanger by insulated pipes and normally include a pump to circulate heated liquid. They are used to heat structures such as homes, barns and greenhouses and can heat domestic hot water, spas or swimming pools.

1.5 Distinguishing features of products covered by this standard include:

1.5.1 Manufacturer specifies for indoor or outdoor installation.

1.5.2 A firebox with an access door for hand loading of fuel.

1.5.3 Typically an aquastat that controls combustion air supply to maintain the liquid in the appliance within a predetermined temperature range provided sufficient fuel is available in the firebox.

1.5.4 A chimney or vent that exhausts combustion products from the appliance.

1.6 The values stated are to be regarded as the standard whether in I–P or SI units. The

values given in parentheses are for information only.

## 2.0 Summary of Method and References

2.1 Particulate matter emissions are measured from a wood-fired hydronic heating appliance burning a prepared test fuel crib in a test facility maintained at a set of prescribed conditions. Procedures for determining burn rates, and particulate emissions rates and for reducing data are provided.

### 2.2 Referenced Documents

#### 2.2.1 EPA Standards

##### 2.2.1.1 Method 28 Certification and Auditing of Wood Heaters

##### 2.2.2 Other Standards

2.2.2.1 ASTM E2515–10 *Standard Test Method for Determination of Particulate Matter Emissions Collected in a Dilution Tunnel*.

2.2.2.2 CAN/CSA–B415.1–2010 *Performance Testing of Solid-Fuel-Burning Heating Appliances*.

## 3.0 Terminology

### 3.1 Definitions

3.1.1 Hydronic Heating—A heating system in which a heat source supplies energy to a liquid heat exchange media such as water that is circulated to a heating load and returned to the heat source through pipes.

3.1.2 Aquastat—A control device that opens or closes a circuit to control the rate of fuel consumption in response to the temperature of the heating media in the heating appliance.

3.1.3 Delivered Efficiency—The percentage of heat available in a test fuel charge that is delivered to a simulated heating load as specified in this test method.

3.1.4 Manufacturer's Rated Heat Output Capacity—The value in BTU/hr (MJ/hr) that the manufacturer specifies that a particular model of hydronic heating appliance is capable of supplying at its design capacity as verified by testing, in accordance with Section 13.

3.1.5 Burn rate—The rate at which test fuel is consumed in an appliance. Measured in pounds (lbs) of wood (dry basis) per hour (kg/hr).

3.1.6 Firebox—The chamber in the appliance in which the test fuel charge is placed and combusted.

3.1.7 Test fuel charge—The collection of Test Fuel layers placed in the appliance at the start of the emission test run.

3.1.8 Test Fuel Layer—Horizontal arrangement of Test Fuel Units.

3.1.9 Test Fuel Unit—One or more Test Fuel Pieces with 3/4 inch (19 mm) spacers attached to the bottom and to one side. If composed of multiple Test Fuel Pieces, the bottom spacer may be one continuous piece.

3.1.10 Test Fuel Piece—A single 4 x 4 (4 ± 0.25 inches by 4 ± 0.25 inches)[100 ± 6 mm by 100 ± 6 mm] white or red oak wood piece cut to the length required.

3.1.11 Test Run—An individual emission test that encompasses the time required to consume the mass of the test fuel charge.

3.1.12 Overall Efficiency (SLM)—The efficiency for each test run as determined using the CSA B415.1–2010 Stack Loss Method.

3.1.13 Thermopile—A device consisting of a number of thermocouples connected in series, used for measuring differential temperature.

## 4.0 Summary of Test Method

4.1 Dilution Tunnel. Emissions are determined using the “dilution tunnel” method specified in ASTM E2515 *Standard Test Method for Determination of Particulate Matter Emissions Collected in a Dilution Tunnel*. The flow rate in the dilution tunnel is maintained at a constant level throughout the test cycle and accurately measured.

Samples of the dilution tunnel flow stream are extracted at a constant flow rate and drawn through high efficiency filters. The filters are dried and weighed before and after the test to determine the emissions catch and this value is multiplied by the ratio of tunnel flow to filter flow to determine the total particulate emissions produced in the test cycle.

4.2 Efficiency. The efficiency test procedure takes advantage of the fact that this type of appliance delivers heat through circulation of the heated liquid (water) from the appliance to a remote heat exchanger and back to the appliance. Measurements of the water temperature difference as it enters and exits the heat exchanger along with the measured flow rate allow for an accurate determination of the useful heat output of the appliance. The input is determined by weight of the test fuel charge, adjusted for moisture content, multiplied by the Higher Heating Value. Additional measurements of the appliance weight and temperature at the beginning and end of a test cycle are used to correct for heat stored in the appliance. Overall Efficiency (SLM) is determined using the CSA B415.1–2010 stack loss method for data quality assurance purposes.

4.3 Operation. Appliance operation is conducted on a hot-to-hot test cycle meaning that the appliance is brought to operating temperature and a coal bed is established prior to the addition of the test fuel charge and measurements are made for each test fuel charge cycle. The measurements are made under constant heat draw conditions within predetermined ranges. No attempt is made to modulate the heat demand to simulate an indoor thermostat cycling on and off in response to changes in the indoor environment. Four test categories are used. These are:

4.3.1 Category I: A heat output of 15 percent or less of Manufacturer's Rated Heat Output Capacity.

4.3.2 Category II: A heat output of 16 percent to 24 percent of Manufacturer's Rated Heat Output Capacity.

4.3.3 Category III: A heat output of 25 percent to 50 percent of Manufacturer's Rated Heat Output Capacity.

4.3.4 Category IV: Manufacturer's Rated Heat Output Capacity.

## 5.0 Significance and Use

5.1 The measurement of particulate matter emission rates is an important test method widely used in the practice of air pollution control.

5.1.1 These measurements, when approved by state or federal agencies, are

often required for the purpose of determining compliance with regulations and statutes.

5.1.2 The measurements made before and after design modifications are necessary to demonstrate the effectiveness of design changes in reducing emissions and make this standard an important tool in manufacturers' research and development programs.

5.2 Measurement of heating efficiency provides a uniform basis for comparison of product performance that is useful to the consumer. It is also required to relate emissions produced to the useful heat production.

5.3 This is a laboratory method and is not intended to be fully representative of all actual field use. It is recognized that users of hand-fired, wood-burning equipment have a great deal of influence over the performance of any wood-burning appliance. Some compromises in realism have been made in the interest of providing a reliable and repeatable test method.

## 6.0 Test Equipment

6.1 Scale. A platform scale capable of weighing the appliance under test and associated parts and accessories when completely filled with water to an accuracy of ±1.0 pound (±0.5 kg).

6.2 Heat exchanger. A water-to-water heat exchanger capable of dissipating the expected heat output from the system under test.

6.3 Water Temperature Difference Measurement. A Type-T ‘special limits’ thermopile with a minimum of 5 pairs of junctions shall be used to measure the temperature difference in water entering and leaving the heat exchanger. The temperature difference measurement uncertainty of this type of thermopile is equal to or less than ± 0.05 °F (± 0.25 °C). Other temperature measurement methods may be used if the temperature difference measurement uncertainty is equal to or less than, ± 0.50 °F (± 0.25 °C).

6.4 Water flow meter. A water flow meter shall be installed in the inlet to the load side of the heat exchanger. The flow meter shall have an accuracy of ± 1 percent of measured flow.

6.4.1 Optional—Appliance side water flow meter. A water flow meter with an accuracy of ± 1 percent of the flow rate is recommended to monitor supply side water flow rate.

6.5 Optional Recirculation Pump. Circulating pump used during test to prevent stratification of liquid being heated.

6.6 Water Temperature Measurement—Thermocouples or other temperature sensors to measure the water temperature at the inlet and outlet of the load side of the heat exchanger. Must meet the calibration requirements specified in 10.1.

6.7 Wood Moisture Meter—Calibrated electrical resistance meter capable of measuring test fuel moisture to within 1 percent moisture content. Must meet the calibration requirements specified in 10.4.

6.8 Flue Gas Temperature Measurement—Must meet the requirements of CSA B415.1–2010, Clause 6.2.2.

6.9 Test Room Temperature Measurement—Must meet the requirements of CSA B415.1–2010, Clause 6.2.1.

6.10 Flue Gas Composition Measurement—Must meet the requirements of CSA B415.1–2010, Clauses 6.3.1 through 6.3.3.

## 7.0 Safety

7.1 These tests involve combustion of wood fuel and substantial release of heat and products of combustion. The heating system also produces large quantities of very hot water and the potential for steam production and system pressurization. Appropriate precautions must be taken to protect personnel from burn hazards and respiration of products of combustion.

## 8.0 Sampling, Test Specimens and Test Appliances

8.1 Test specimens shall be supplied as complete appliances including all controls and accessories necessary for installation in the test facility. A full set of specifications and design and assembly drawings shall be provided when the product is to be placed under certification of a third-party agency. The manufacturer's written installation and operating instructions are to be used as a guide in the set-up and testing of the appliance.

## 9.0 Preparation of Test Equipment

9.1 The appliance is to be placed on a scale capable of weighing the appliance fully loaded with a resolution of  $\pm 1.0$  lb (0.5 kg).

9.2 The appliance shall be fitted with the type of chimney recommended or provided by the manufacturer and extending to  $15 \pm 0.5$  feet ( $4.6 \pm 0.15$  m) from the upper surface of the scale. If no flue or chimney system is recommended or provided by the manufacturer, connect the appliance to a flue of a diameter equal to the flue outlet of the appliance. The flue section from the appliance flue collar to  $8 \pm 0.5$  feet above the scale shall be single wall stove pipe and the remainder of the flue shall be double wall insulated class A chimney.

### 9.3 Optional Equipment Use

9.3.1 A recirculation pump may be installed between connections at the top and bottom of the appliance to minimize thermal stratification if specified by the manufacturer. The pump shall not be installed in such a way as to change or affect the flow rate between the appliance and the heat exchanger.

9.3.2 If the manufacturer specifies that a thermal control valve or other device be installed and set to control the return water temperature to a specific set point, the valve or other device shall be installed and set per the manufacturer's written instructions.

9.4 Prior to filling the tank, weigh and record the appliance mass.

### 9.5 Heat Exchanger

9.5.1 Plumb the unit to a water-to-water heat exchanger with sufficient capacity to draw off heat at the maximum rate anticipated. Route hoses, electrical cables, and instrument wires in a manner that does not influence the weighing accuracy of the scale as indicated by placing dead weights on the platform and verifying the scale's accuracy.

9.5.2 Locate thermocouples to measure the water temperature at the inlet and outlet of the load side of the heat exchanger.

9.5.3 Install a thermopile meeting the requirements of 6.3 to measure the water temperature difference between the inlet and outlet of the load side of the heat exchanger.

9.5.4 Install a calibrated water flow meter in the heat exchanger load side supply line. The water flow meter is to be installed on the cooling water inlet side of the heat exchanger so that it will operate at the temperature at which it is calibrated.

9.5.5 Place the heat exchanger in a box with 2 in. (50 mm) of expanded polystyrene (EPS) foam insulation surrounding it to minimize heat losses from the heat exchanger.

9.5.6 The reported efficiency and heat output rate shall be based on measurements made on the load side of the heat exchanger.

9.5.7 Temperature instrumentation per 6.6 shall be installed in the appliance outlet and return lines. The average of the outlet and return water temperature on the supply side of the system shall be considered the average appliance temperature for calculation of heat storage in the appliance ( $TF_{avg}$  and  $TI_{avg}$ ). Installation of a water flow meter in the supply side of the system is optional.

9.6 Fill the system with water. Determine the total weight of the water in the appliance when the water is circulating. Verify that the scale indicates a stable weight under operating conditions. Make sure air is purged properly.

## 10.0 Calibration and Standardization

10.1 Water Temperature Sensors. Temperature measuring equipment shall be calibrated before initial use and at least semi-annually thereafter. Calibrations shall be in compliance with National Institute of Standards and Technology (NIST) Monograph 175, Standard Limits of Error. 10.2 Heat Exchanger Load Side Water Flow Meter.

10.2.1 The heat exchanger load side water flow meter shall be calibrated within the flow range used for the test run using NIST Traceable methods. Verify the calibration of the water flow meter before and after each test run and at least once during each test run by comparing the water flow rate indicated by the flow meter to the mass of water collected from the outlet of the heat exchanger over a timed interval. Volume of the collected water shall be determined based on the water density calculated from section 13, Eq. 8, using the water temperature measured at the flow meter. The uncertainty in the verification procedure used shall be 1 percent or less. The water flow rate determined by the collection and weighing method shall be within 1 percent of the flow rate indicated by the water flow meter.

10.3 Scales. The scales used to weigh the appliance and test fuel charge shall be calibrated using NIST Traceable methods at least once every 6 months.

10.4 Moisture Meter. The moisture meter shall be calibrated per the manufacturer's instructions and checked before each use.

10.5 Flue Gas Analyzers—In accordance with CSA B415.1–2010, Clause 6.8.

## 11.0 Conditioning

11.1 Prior to testing, the noncatalytic appliance is to be operated for a minimum

of 10 hours using a medium heat draw rate. Catalytic units shall be operated for a minimum of 50 hours using a medium heat draw rate. The pre-burn for the first test can be included as part of the conditioning requirement. If conditioning is included in pre-burn, then the appliance shall be aged with fuel meeting the specifications outlined in sections 12.2 with a moisture content between 19 and 25 percent on a dry basis. Operate the appliance at a medium burn rate (Category II or III) for at least 10 hours for noncatalytic appliances and 50 hours for catalytic appliances. Record and report hourly flue gas exit temperature data and the hours of operation. The aging procedure shall be conducted and documented by a testing laboratory.

## 12.0 Procedure

12.1 Appliance Installation. Assemble the appliance and parts in conformance with the manufacturer's written installation instructions. Clean the flue with an appropriately sized, wire chimney brush before each certification test series.

12.2 Fuel. Test fuel charge fuel shall be red (*Quercus ruba L.*) or white (*Quercus alba*) oak 19 to 25 percent moisture content on a dry basis. Piece length shall be 80 percent of the firebox depth rounded down to the nearest 1 inch (25mm) increment. For example, if the firebox depth is 46 inches (1168mm) the  $4 \times 4$  piece length would be 36 inches ( $46 \text{ inches} \times 0.8 = 36.8 \text{ inches}$  round down to 36 inches). Pieces are to be placed in the firebox parallel to the longest firebox dimension. For fireboxes with sloped surfaces that create a non-uniform firebox length, the piece length shall be adjusted for each layer based on 80 percent of the length at the level where the layer is placed. Pieces are to be spaced  $\frac{3}{4}$  inches (19 mm) apart on all faces. The first fuel layer may be assembled using fuel units consisting of multiple  $4 \times 4$ s consisting of single pieces with bottom and side spacers of 3 or more pieces if needed for a stable layer. The second layer may consist of fuel units consisting of no more than two pieces with spacers attached on the bottom and side. The top two layers of the fuel charge must consist of single pieces unless the fuel charge is only three layers. In that instance only the top layer must consist of single units. Three-quarter inch (19 mm) by 1.5 inch (38 mm) spacers shall be attached to the bottom of piece to maintain a  $\frac{3}{4}$  inch (19 mm) separation. When a layer consists of two or more units of  $4 \times 4$ s an additional  $\frac{3}{4}$  inch (19 mm) thick by 1.5 inch (38 mm) wide spacer shall be attached to the vertical face of each end of one  $4 \times 4$ , such that the  $\frac{3}{4}$  inch (19 mm) space will be maintained when two  $4 \times 4$  units or pieces are loaded side by side. In cases where a layer contains an odd number of  $4 \times 4$ s one piece shall not be attached, but shall have spacers attached in a manner that will provide for the  $\frac{3}{4}$  inch (19 mm) space to be maintained. (See Figure 1). Spacers shall be attached perpendicular to the length of the  $4 \times 4$ s such that the edge of the spacer is  $1 \pm 0.25$  inch from the end of the  $4 \times 4$ s in the previous layers. Spacers shall be red or white oak and will be attached with either nails (non-galvanized), brads or

oak dowels. The use of kiln-dried wood is not allowed.

12.2.1 Using a fuel moisture meter as specified in 6.7 of the test method, determine the fuel moisture for each test fuel piece used for the test fuel load by averaging at least five fuel moisture meter readings measured parallel to the wood grain. Penetration of the moisture meter insulated electrodes for all readings shall be  $\frac{1}{4}$  the thickness of the fuel piece or 19 mm ( $\frac{3}{4}$  in.), whichever is lesser. One measurement from each of three sides shall be made at approximately 3 inches from each end and the center. Two additional measurements shall be made centered between the other three locations. Each individual moisture content reading shall be in the range of 18 to 28 percent on a dry basis. The average moisture content of each piece of test fuel shall be in the range of 19 to 25 percent. It is not required to measure the moisture content of the spacers. Moisture shall not be added to previously dried fuel pieces except by storage under high humidity conditions and temperature up to 100 °F. Fuel moisture shall be measured within four hours of using the fuel for a test.

12.2.2 Firebox Volume. Determine the firebox volume in cubic feet. Firebox volume shall include all areas accessible through the fuel loading door where firewood could reasonably be placed up to the horizontal plane defined by the top of the loading door. A drawing of the firebox showing front, side and plan views or an isometric view with interior dimensions shall be provided by the manufacturer and verified by the laboratory. Calculations for firebox volume from computer aided design (CAD) software programs are acceptable and shall be included in the test report if used. If the firebox volume is calculated by the laboratory the firebox drawings and calculations shall be included in the test report.

12.2.3 Test Fuel charge. Test fuel charges shall be determined by multiplying the firebox volume by 10 pounds (4.54 kg) per ft<sup>3</sup> (28L), or a higher load density as recommended by the manufacturer's printed operating instructions, of wood (as used wet weight). Select the number of pieces of standard fuel that most nearly match this target weight. This is the standard fuel charge for all tests. For example, if the firebox loading area volume is 10 ft<sup>3</sup> (280L) and the firebox depth is 46 inches (1168 mm), test fuel charge target is 100 lbs (45 kg) minimum and the piece length is 36 inches (914 mm). If 8-4 × 4s, 36 inches long weigh 105 lbs (48 kg), use 8 pieces for each test fuel charge. All test fuel charges will be of the same configuration.

12.3 Sampling Equipment. Prepare the particulate emission sampling equipment as defined by ASTM E2515-10 "Standard Test Method For Determination of Particulate Matter Emissions Collected In a Dilution Tunnel."

12.4 Appliance Startup. The appliance shall be fired with wood fuel of any species, size and moisture content at the laboratories discretion to bring it up to operating temperature. Operate the appliance until the water is heated to the upper operating control limit and has cycled at least two times. Then

remove all unburned fuel, zero the scale and verify the scales accuracy using dead weights.

12.4.1 Pre-Test Burn Cycle. Reload appliance with oak wood and allow it to burn down to the specified coal bed weight. The Pre-Test burn cycle fuel charge weight shall be within  $\pm 10$  percent of the test fuel charge weight. Piece size and length shall be selected such that charcoaling is achieved by the time the fuel charge has burned down to the required coal bed weight. Pieces with a maximum thickness of approximately 2 inches have been found to be suitable. Charcoaling is a general condition of the test fuel bed evidenced by an absence of large pieces of burning wood in the coal bed and the remaining fuel pieces being brittle enough to be broken into smaller charcoal pieces with a metal poker. Manipulations to the fuel bed prior to the start of the test run are to be done to achieve charcoaling while maintaining the desired heat output rate. During the pre-test burn cycle and at least one hour prior to starting the test run, adjust water flow to the heat exchanger to establish the target heat draw for the test. For the first test run the heat draw rate shall be equal to the manufacturer's rated heat output capacity.

12.4.1.1 Allowable Adjustments. Fuel addition or subtractions, and coal bed raking shall be kept to a minimum but are allowed up to 15 minutes prior to the start of the test run. For the purposes of this method, coal bed raking is the use of a metal tool (poker) to stir coals, break burning fuel into smaller pieces, dislodge fuel pieces from positions of poor combustion, and check for the condition of charcoaling. Record all adjustments to and additions or subtractions of fuel, and any other changes to the appliance operations that occur during pretest ignition period. During the 15-minute period prior to the start of the test run, the wood heater loading door shall not be open more than a total of 1 minute. Coal bed raking is the only adjustment allowed during this period.

12.4.2 Coal Bed Weight. The appliance is to be loaded with the test fuel charge when the coal bed weight is between 10 percent and 20 percent of the test fuel charge weight. Coals may be raked as necessary to level the coal bed but may only be raked and stirred once between 15 to 20 minutes prior to the addition of the test fuel charge.

12.5 Test Runs. For all test runs, the return water temperature to the hydronic heater must be equal to or greater than 120 °F. Aquastat or other heater output control device settings that are adjustable shall be set using manufacturer specifications, either as factory set or in accordance with the owner's manual, and shall remain the same for all burn categories.

Complete a test run in each heat output rate category, as follows:

12.5.1 Test Run Start. Once the appliance is operating normally and the pretest coal bed weight has reached the target value per 12.4.2, tare the scale and load the full test charge into the appliance. Time for loading shall not exceed 5 minutes. The actual weight of the test fuel charge shall be measured and recorded within 30 minutes prior to loading. Start all sampling systems.

12.5.1.1 Record all water temperatures, differential water temperatures and water flow rates at time intervals of one minute or less.

12.5.1.2 Record particulate emissions data per the requirements of ASTM E2515.

12.5.1.3 Record data needed to determine Overall Efficiency (SLM) per the requirements of CSA B415.1-2010 Clauses 6.2.1, 6.2.2, 6.3, 8.5.7, 10.4.3(a), 10.4.3(f), and 13.7.9.3.

12.5.1.3.1 Measure and record the test room air temperature in accordance with the requirements of Clauses 6.2.1, 8.5.7 and 10.4.3(g).

12.5.1.3.2 Measure and record the flue gas temperature in accordance with the requirements of Clauses 6.2.2, 8.5.7 and 10.4.3(f).

12.5.1.3.3 Determine and record the Carbon Monoxide (CO) and Carbon Dioxide (CO<sub>2</sub>) concentrations in the flue gas in accordance with Clauses 6.3, 8.5.7 and 10.4.3(i) and (j).

12.5.1.3.4 Measure and record the test fuel weight per the requirements of Clauses 8.5.7 and 10.4.3(h).

12.5.1.3.5 Record the test run time per the requirements of Clause 10.4.3(a).

12.5.1.4 Monitor the average heat output rate on the load side of the heat exchanger. If the heat output rate gets close to the upper or lower limit of the target range ( $\pm 5$  percent) adjust the water flow through the heat exchanger to compensate. Make changes as infrequently as possible while maintaining the target heat output rate. The first test run shall be conducted at the category IV heat output rate to validate that the appliance is capable of producing the manufacturer's rated heat output capacity.

12.5.2 Test Fuel Charge Adjustment. It is acceptable to adjust the test fuel charge (*i.e.*, reposition) once during a test run if more than 60 percent of the initial test fuel charge weight has been consumed and more than 10 minutes have elapsed without a measurable (1 lb or 0.5 kg) weight change while the operating control is in the demand mode. The time used to make this adjustment shall be less than 60 seconds.

12.5.3 Test Run Completion. The test run is completed when the remaining weight of the test fuel charge is 0.0 lb (0.0 kg). End the test run when the scale has indicated a test fuel charge weight of 0.0 lb (0.0 kg) or less for 30 seconds.

12.5.3.1 At the end of the test run, stop the particulate sampling train and Overall Efficiency (SLM) measurements, and record the run time, and all final measurement values.

12.5.4 Heat Output Capacity Validation. The first test run must produce a heat output rate that is within 10 percent of the manufacturer's rated heat output capacity (Category IV) throughout the test run and an average heat output rate within 5 percent of the manufacturer's rated heat output capacity. If the appliance is not capable of producing a heat output within these limits, the manufacturer's rated heat output capacity is considered not validated and testing is to be terminated. In such cases, the tests may be restarted using a lower heat output capacity if requested by the manufacturer.

12.5.5 Additional Test Runs. Using the Manufacturer's Rated Heat Output Capacity as a basis, conduct a test for additional heat output categories as specified in 4.3. It is not required to run these tests in any particular order.

12.5.6 Alternative Heat Output Rate for Category I. If an appliance cannot be operated in the category I heat output range due to stopped combustion, two test runs shall be conducted at heat output rates within Category II. When this is the case, the weightings for the weighted averages indicated in Table 2 shall be the average of the category I and II weightings and shall be applied to both category II results. Appliances that are not capable of operation within Category II (<25 percent of maximum) cannot be evaluated by this test method.

12.5.6.1 Stopped Fuel Combustion. Evidence that an appliance cannot be operated at a category I heat output rate due to stopped fuel combustion shall include documentation of two or more attempts to operate the appliance in burn rate Category I and fuel combustion has stopped prior to complete consumption of the test fuel charge. Stopped fuel combustion is evidenced when an elapsed time of 60 minutes or more has occurred without a measurable (1 lb or 0.5 kg) weight change in the test fuel charge while the appliance operating control is in the demand mode. Report the evidence and the reasoning used to determine that a test in burn rate Category I cannot be achieved. For example, two unsuccessful attempts to operate at an output rate of 10 percent of the rated output capacity are not sufficient evidence that burn rate Category I cannot be achieved.

12.5.7 Appliance Overheating. Appliances shall be capable of operating in all heat output categories without overheating to be rated by this test method. Appliance overheating occurs when the rate of heat withdrawal from the appliance is lower than the rate of heat production when the unit control is in the idle mode. This condition results in the water in the appliance continuing to increase in temperature well above the upper limit setting of the operating control. Evidence of overheating includes: 1 Hour or more of appliance water temperature increase above the upper temperature set-point of the operating control, exceeding the temperature limit of a safety control device (independent from the operating control), boiling water in a non-pressurized system or activation of a pressure or temperature relief valve in a pressurized system.

12.6 Additional Test Runs. The testing laboratory may conduct more than one test run in each of the heat output categories specified in section 4.4.1. If more than one test run is conducted at a specified heat output rate, the results from at least two-thirds of the test runs in that heat output rate category shall be used in calculating the weighted average emission rate (See section 15.1.14). The measurement data and results of all test runs shall be reported regardless of which values are used in calculating the weighted average emission rate.

### 13.0 Calculation of Results

#### 13.1 Nomenclature

$E_T$ —Total particulate emissions for the full test run as determined per ASTM E2515 in grams.

$E_g/MJ$ —Emissions rate in grams per mega joule of heat output.

$E_{lb/mmBtu\ output}$ —Emissions rate in pounds per million Btu's of heat output.

$E_g/kg$ —Emissions factor in grams per kilogram of dry fuel burned.

$E_g/hr$ —Emissions factor in grams per hour.

HHV—Higher Heating Value of fuel = 8600 Btu/lb (19.990 MJ/kg).

LHV—Lower Heating Value of fuel = 7988 Btu/lb (18.567 MJ/kg).

$\Delta T$ —Temperature difference between water entering and exiting the heat exchanger.

$Q_{out}$ —Total heat output in BTU's (mega joules).

$Q_{in}$ —Total heat input available in test fuel charge in BTU's (mega joules).

$M$ —Mass flow rate of water in lb/min (kg/min).

$V_i$ —Volume of water indicated by a totalizing flow meter at the  $i$ th reading in gallons (liters).

$V_f$ —Volumetric Flow rate of water in heat exchange system in gallons per minute (liters/min).

$\Theta$ —Total length of test run in hours

$t_i$ —Data sampling interval in minutes.

$\eta_{del}$ —Delivered heating efficiency in percent.

$F_i$ —Weighting factor for heat output category  $i$ . (See Tables 2A and 2B)

$T_1$ —Temperature of water at the inlet on the supply side of the heat exchanger.

$T_2$ —Temperature of the water at the outlet on the supply side of the heat exchanger.

$T_3$ —Temperature of water at the inlet on the load side of the heat exchanger.

$T_{avg}$ —Average temperature of the appliance and water at start of the test.

$$T_{I_{avg}} = (T_1 + T_2)/2 \text{ at the start of the test, } ^\circ\text{F} \quad \text{Eq. 1}$$

$T_{F_{avg}}$ —Average temperature of the appliance and water at the end of the test.

$$T_{F_{avg}} = (T_1 + T_2)/2 \text{ at the end of the test, } ^\circ\text{F} \quad \text{Eq. 2}$$

MC—Fuel moisture content in percent dry basis.

$MC_i$ —Average moisture content of individual  $4 \times 4$  fuel pieces in percent dry basis.

$MC_{sp}$ —Moisture content of spacers assumed to be 10 percent dry basis.

$\sigma$ —Density of water in pounds per gallon.

$C_p$ —Specific Heat of Water in Btu/lb  $^\circ\text{F}$ .

$C_{steel}$ —Specific Heat of Steel (0.1 Btu/lb  $^\circ\text{F}$ ).

$W_{fuel}$ —Fuel charge weight in pounds (kg).

$W_i$ —Weight of individual fuel  $4 \times 4$  pieces in pounds (kg).

$W_{sp}$ —Weight of all spacers used in a fuel load in pounds (kg).

$W_{app}$ —Weight of empty appliance in pounds.

$W_{wat}$ —Weight of water in supply side of the system in pounds.

13.2 After the test is completed, determine the particulate emissions  $E_T$  in accordance with ASTM E2515.

#### 13.3 Determine Average Fuel Load Moisture Content

$$MC_{Ave} = [ [ \sum W_i \times MC_i ] + [ W_{sp} \times MC_{sp} ] ] \div W_{fuel}, \% \quad \text{Eq. 3}$$

### 13.4 Determine heat input

$$Q_{in} = (W_{fuel}/(1+(MC/100))) \times HHV, \text{ BTU} \quad \text{Eq. 4}$$

$$Q_{in\ LHV} = (W_{fuel}/(1+(MC/100))) \times LHV, \text{ BTU} \quad \text{Eq. 5}$$

13.5 Determine heat output and efficiency.

13.5.1 Determine heat output as:

$Q_{out} = \Sigma$  [Heat output determined for each sampling time interval]+ Change in heat stored in the appliance.

$$Q_{out} = \left[ \sum (C_{pi} \cdot \Delta T_i \cdot \dot{M}_i \cdot t_i) \right] + (W_{app} \cdot C_{Steel} + C_{pa} W_{water}) \cdot (TF_{avg} - TI_{avg}), \text{ BTU Eq. 6}$$

Note: The subscript (i) indicates the parameter value for sampling time interval  $t_i$ .

$M_i$  = Mass flow rate = gal/min x Density of Water (lb/gal) = lb/min

$$M_i = V_{fi} \cdot \sigma_i, \text{ lb/min Eq. 7}$$

$$\Sigma_i = (62.56 + (-.0003413 \times T_{3i}) + (-.00006225 \times T_{3i}^2)) 0.1337, \text{ lbs/gal Eq. 8}$$

$$C_p = 1.0014 + (-.000003485 \times T_{3i}) \text{ Btu/lb-}^\circ\text{F Eq. 9}$$

$$C_{steel} = 0.1 \text{ Btu/lb-}^\circ\text{F}$$

$$C_{pa} = 1.0014 + (-.000003485 \times (TI_{avg} + TF_{avg})/2), \text{ Btu/lb-}^\circ\text{F Eq. 10}$$

$$V_{fi} = (V_i - V_{i-1}) / (t_i - t_{i-1}), \text{ gal/min Eq. 11}$$

Note:  $V_i$  is the total water volume at the end of interval  $i$  and  $V_{i-1}$  is the total water volume at the beginning of the time interval. This calculation is necessary when a totalizing type water meter is used.

13.5.2 Determine Heat output rate as:

$$\text{Heat Output Rate} = Q_{out} / \Theta, \text{ BTU/hr Eq. 12}$$

13.5.3 Determine Emission Rates and Emission Factors as:

$$E_{g/MJ} = E_T / (Q_{out} \times 0.001055), \text{ g/MJ Eq. 13}$$

$$E_{lb/MMBTU \text{ output}} = (E_T / 453.59) / (Q_{output} \times 10^{-6}), \text{ lb/MMBtu Out Eq. 14}$$

$$E_{g/kg} = E_T / (W_{fuel} / (1 + MC/100)), \text{ g/dry kg Eq. 15}$$

$$E_{g/hr} = E_T / \Theta, \text{ g/hr Eq. 16}$$

13.5.4 Determine delivered efficiency as:

$$\eta_{del} = (Q_{out} / Q_{in}) \times 100, \% \text{ Eq. 17}$$

$$\eta_{del \text{ LHV}} = (Q_{out} / Q_{in \text{ LHV}}) \times 100, \% \text{ Eq. 18}$$

13.5.5 Determine  $\eta_{SLM}$ —Overall Efficiency (SLM) using Stack Loss For determination of the average overall thermal efficiency ( $\eta_{SLM}$ ) for the test run, use the data collected over the full test run and the calculations in accordance with CSA B415.1–2010, Clause 13.7 except for 13.7.2 (e), (f), (g), and (h), use the following average fuel properties for oak: percent C = 50.0, percent H = 6.6, percent O = 43.2, percent Ash = 0.2 percent.

13.5.5.1 Whenever the CSA B415.1–2010 overall efficiency is found to be lower than the overall efficiency based on load side measurements, as determined by Eq. 16 of this method, section 14.1.7 of the test report must include a discussion of the reasons for this result.

13.6 Weighted Average Emissions and Efficiency

13.6.1 Determine the weighted average emission rate and delivered efficiency from

the individual tests in the specified heat output categories. The weighting factors ( $F_i$ ) are derived from an analysis of ASHRAE Bin Data which provides details of normal building heating requirements in terms of percent of design capacity and time in a particular capacity range—or “bin”—over the course of a heating season. The values used in this method represent an average of data from several cities located in the northern United States.

$$\text{Weighted average delivered efficiency: } \eta_{avg} = \sum \eta_i \times F_i, \% \quad \text{Eq. 17}$$

$$\text{Weighted average emissions: } E_{avg} = \sum E_i \times F_i, \% \quad \text{Eq. 18}$$

13.7 Average Heat Output ( $Q_{out-8hr}$ ) and Efficiency ( $\eta_{avg-8hr}$ ) for 8 hour burn time.

13.7.1 Units tested under this standard typically require infrequent fuelling, 8 to 12

hours intervals being typical. Rating unit's based on an Average Output sustainable over an 8 hour duration will assist consumers in

appropriately sizing units to match the theoretical heat demand of their application.

13.7.2 Calculations:

$$Q_{out-8hr} = X1 + \{ (8 - Y1) \times [ (X2 - X1) / (Y2 - Y1) ] \}, \% \quad \text{Eq. 19}$$

$$\eta_{avg-8hr} = \eta_{del1} + \{ (8 - Y1) \times [ (\eta_{del2} - \eta_{del1}) / (Y2 - Y1) ] \}, \% \quad \text{Eq. 20}$$

Where:

- Y1 = Test Duration just above 8 hrs
- Y2 = Test Duration just below 8 hrs
- X1 = Actual Load for duration Y1
- X2 = Actual Load for duration Y2

$\eta_{del1}$  = Average Delivered Efficiency for duration Y1

$\eta_{del2}$  = Average Delivered Efficiency for duration Y2

13.7.2.1 Determine the Test Durations and Actual Load for each Category as recorded in Table 1A.

13.7.2.2 Determine the data point that has the nearest duration greater than 8 hrs. X1 = Actual Load,

Y1 = Test Duration and  $\eta_{del1}$  = Average Delivered Efficiency for this data point.

13.7.2.3 Determine the data point that has the nearest duration less than 8 hrs.

X2 = Actual Load, Y2 = Test Duration and  $\eta_{del2}$  = Average Delivered Efficiency for this data point.

13.7.2.4 Example:

**CATEGORY ACTUAL LOAD DURATION**  
[Category Actual Load Duration  $\eta_{del}$ ]

	(Btu/Hr)	(Hr)	(%)
1	15,000 .....	10.2	70.0
2	26,000 .....	8.4	75.5
3	50,000 .....	6.4	80.1
4	100,000 .....	4.7	80.9

Category 2 Duration is just above 8 hours, therefore: X1 = 26,000 BTU/hr,  $\eta_{del1}$  = 75.5% and Y1 = 8.4 Hrs

Category 3 Duration is just below 8 hours, therefore: X2 = 50,000 BTU/hr,  $\eta_{del2}$  = 80.1% and Y2 = 6.4 Hrs

$$Q_{out-8hr} = 26,000 + \{ (8 - 8.4) \times [(50,000 - 26,000) / (6.4 - 8.4)] \}$$

$$= 30,800 \text{ BTU/hr}$$

$$\eta_{avg-8hr} = 75.5 + \{ (8 - 8.4) \times [(80.1 - 75.5) / (6.4 - 8.4)] \} = 76.4\%$$

**14.0 Report**

14.1.1 The report shall include the following.

14.1.2 Name and location of the laboratory conducting the test.

14.1.3 A description of the appliance tested and its condition, date of receipt and dates of tests.

14.1.4 A statement that the test results apply only to the specific appliance tested.

14.1.5 A statement that the test report shall not be reproduced except in full, without the written approval of the laboratory.

14.1.6 A description of the test procedures and test equipment including a schematic or other drawing showing the location of all required test equipment. Also, a description of test fuel sourcing, handling and storage practices shall be included.

14.1.7 Details of deviations from, additions to or exclusions from the test method, and their data quality implications on the test results (if any), as well as information on specific test conditions, such as environmental conditions.

14.1.8 A list of participants and observers present for the tests.

14.1.9 Data and drawings indicating the fire box size and location of the fuel charge.

14.1.10 Drawings and calculations used to determine firebox volume.

14.1.11 Information for each test run fuel charge including piece size, moisture content, and weight.

14.1.12 All required data for each test run shall be provided in spreadsheet format. Formulae used for all calculations shall be accessible for review.

14.1.13 Test run duration for each test.

14.1.14 Calculated results for delivered efficiency at each burn rate and the weighted average Emissions reported as total emissions in grams, pounds per million Btu of delivered heat, grams per mega-joule of delivered heat, grams per kilogram of dry fuel and grams per hour. Results shall be reported for each heat output category and the weighted average.

14.1.15 Tables 1A, 1B, 1C and 2 must be used for presentation of results in test reports.

14.1.16 A statement of the estimated uncertainty of measurement of the emissions and efficiency test results.

14.1.17 Raw data, calibration records, and other relevant documentation shall be retained by the laboratory for a minimum of 7 years.

**15.0 Precision and Bias**

15.1 Precision—It is not possible to specify the precision of the procedure in Draft Test because the appliance

operation and fueling protocols and the appliances themselves produce variable amounts of emissions and cannot be used to determine reproducibility or repeatability of this measurement method.

15.2 Bias—No definitive information can be presented on the bias of the procedure in Draft Test Method 28 WHH for measuring solid fuel burning hydronic heater emissions because no

material having an accepted reference value is available.

**16.0 Keywords**

16.1 Solid fuel, hydronic heating appliances, wood-burning hydronic heaters.

Table 1A. Data Summary Part A

Category	Run No	Load % Capacity	Target Load BTU/hr	Actual Load BTU/hr	Act Load % of max	$\Theta$	$W_{fuel}$	$MC_{ave}$	$Q_{in}$	$Q_{out}$

**Method 28WHH-PTS A Test Method for Certification of Cord Wood-Fired Hydronic Heating Appliances With Partial Thermal Storage: Measurement of Particulate Matter (PM) and Carbon Monoxide (CO) Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances With Partial Thermal Storage**

**1.0 Scope and Application**

1.1 This test method applies to wood-fired hydronic heating appliances with heat storage external to the appliance. The units typically transfer heat through circulation of a liquid heat exchange media such as water or a water-antifreeze mixture. Throughout this document, the term “water” will be used to denote any of the heat transfer liquids approved for use by the manufacturer.

1.2 The test method measures PM and CO emissions and delivered heating efficiency at specified heat output rates referenced against the appliance’s rated heating capacity as specified by the manufacturer and verified under this test method.

1.3 PM emissions are measured by the dilution tunnel method as specified in the EPA Method 28 WHH and the standards referenced therein with the exceptions noted in Section 12.5.9. Delivered Efficiency is measured by determining the fuel energy input and appliance output. Heat output is determined through measurement of the flow rate and temperature change of water circulated through a heat exchanger external to the appliance and the increase in energy of the external storage. Heat input is determined from the mass of dry wood fuel and its higher heating value (HHV). Delivered efficiency does not attempt to account for pipeline loss.

1.4 Products covered by this test method include both pressurized and non-pressurized hydronic heating appliances intended to be fired with wood and for which the manufacturer specifies for indoor or outdoor installation. The system, which includes the heating appliance and external storage, is commonly connected to a heat exchanger by insulated pipes and normally includes a pump to circulate heated liquid. These systems are used to heat structures such as homes, barns and greenhouses. They also provide heat for domestic hot water, spas and swimming pools.

1.5 Distinguishing features of products covered by this standard include:

1.5.1 The manufacturer specifies the application for either indoor or outdoor installation.

1.5.2 A firebox with an access door for hand loading of fuel.

1.5.3 Typically an aquastat mounted as part of the appliance that controls combustion air supply to maintain the liquid in the appliance within a predetermined temperature range provided sufficient fuel is available in the firebox. The appliance may be equipped with other devices to control combustion.

1.5.4 A chimney or vent that exhausts combustion products from the appliance.

1.5.5 A liquid storage system, typically water, which is not large enough to accept all of the heat produced when a full load of wood is burned and the storage system starts a burn cycle at 125 °F.

1.5.6 The heating appliances require external thermal storage and these units will only be installed as part of a system which includes thermal storage. The manufacturer specifies the minimum amount of thermal storage required. However, the storage system shall be large enough to ensure that the boiler (heater) does not cycle, slumber, or go into an off-mode when operated in a Category III load condition (See section 4.3).

1.6 The values stated are to be regarded as the standard whether in I-P or SI units. The values given in parentheses are for information only.

**2.0 Summary of Method and References**

2.1 PM and CO emissions are measured from a wood-fired hydronic heating appliance burning a prepared test fuel charge in a test facility maintained at a set of prescribed conditions. Procedures for determining heat output rates, PM and CO emissions, and efficiency and for reducing data are provided.

**2.2 Referenced Documents**

2.2.1 EPA Standards

2.2.1.1 Method 28 Certification and Auditing of Wood Heaters

2.2.1.2 Method 28 WHH Measurement of Particulate Emissions and Heating Efficiency of Wood-Fired Hydronic Heating Appliances and the standards referenced therein.

2.2.2 Other Standards

2.2.2.1 CAN/CSA-B415.1-2010 *Performance Testing of Solid-Fuel-Burning Heating Appliances*

**3.0 Terminology**

**3.1 Definitions**

3.1.1 Hydronic Heating—A heating system in which a heat source supplies energy to a liquid heat exchange media such as water that is circulated to a heating load and returned to the heat source through pipes.

3.1.2 Aquastat—A control device that opens or closes a circuit to control the rate of fuel consumption in response to the temperature of the heating media in the heating appliance.

3.1.3 Delivered Efficiency—The percentage of heat available in a test fuel charge that is delivered to a simulated heating load or the storage system as specified in this test method.

3.1.4 Emission factor—the emission of a pollutant expressed in mass per unit of energy (typically) output from the boiler/heater

3.1.5 Emission index—the emission of a pollutant expressed in mass per unit mass of fuel used

3.1.6 Emission rate—the emission of a pollutant expressed in mass per unit time

3.1.7 Manufacturer’s Rated Heat Output Capacity – The value in Btu/hr (MJ/hr) that the manufacturer specifies that a particular model of hydronic heating appliance is capable of supplying at its design capacity as verified by testing, in accordance with section 12.5.4.

3.1.8 Heat output rate—The average rate of energy output from the appliance during a specific test period in Btu/hr (MJ/hr)

3.1.9 Firebox—The chamber in the appliance in which the test fuel charge is placed and combusted.

3.1.10 NIST—National Institute of Standards and Technology

3.1.11 Test fuel charge—The collection of test fuel placed in the appliance at the start of the emission test run.

3.1.12 Test Run—An individual emission test which encompasses the time required to consume the mass of the test fuel charge. The time of the test run also considers the time for the energy to be drawn from the thermal storage.

3.1.13 Test Run Under “Cold-to-Cold” Condition—under this test condition the test fuel is added into an empty chamber along with kindling and ignition materials (paper). The boiler/heater at the start of this test is typically 125° to 130° F.

3.1.14 Test Run Under “Hot-to-Hot” Condition—under this test condition the test fuel is added onto a still-burning bed of charcoals produced in a pre-burn period. The boiler/heater water is near its operating control limit at the start of the test.

3.1.15 Overall Efficiency, also known as Stack Loss Efficiency—The efficiency for each test run as determined using the CSA B415.1-2010 Stack Loss Method (SLM).

3.1.16 Phases of a Burn Cycle. The “startup phase” is defined as the period from the start of the test until 15 percent of the test fuel charge is consumed. The “steady state phase” is defined as the period from the end of the startup phase to a point at which 80 percent of the test fuel charge is consumed. The “end phase” is defined as the time from the end of the steady state period to the end of the test.

3.1.17 Thermopile—A device consisting of a number of thermocouples connected in series, used for measuring differential temperature.

3.1.18 Slumber Mode—This is a mode in which the temperature of the water in the boiler/heater has exceeded the operating control limit and the control has changed the boiler/heater fan speed, dampers, and/or other operating parameters to minimize the heat output of the boiler/heater.

**4.0 Summary of Test Method**

4.1 Dilution Tunnel. Emissions are determined using the “dilution tunnel” method specified in EPA Method 28 WHH and the standards referenced therein. The flow rate in the dilution tunnel is maintained at a constant level throughout the test cycle and accurately measured. Samples of the dilution tunnel flow stream are extracted at a constant flow rate and drawn through high efficiency filters. The filters are dried and weighed before and after the test to determine the emissions collected and this value is multiplied by the ratio of tunnel flow to filter flow to determine the total particulate emissions produced in the test cycle.

4.2 Efficiency. The efficiency test procedure takes advantage of the fact that this type of system delivers heat through circulation of the heated liquid (water) from the system to a remote heat exchanger (e.g. baseboard radiators in a room) and back to the system. Measurements of the cooling

water temperature difference as it enters and exits the test system heat exchanger along with the measured flow rate allow for an accurate determination of the useful heat output of the appliance. Also included in the heat output is the change in the energy content in the storage system during a test run. Energy input to the appliance during the test run is determined by weight of the test fuel charge, adjusted for moisture content, multiplied by the Higher Heating Value. Additional measurements of the appliance weight and temperature at the beginning and end of a test cycle are used to correct for heat stored in the appliance. Overall Efficiency (SLM) is determined using the CSA B415.1–2010 stack loss method for data quality assurance purposes.

4.3 Operation. Four test categories are defined for use in this method. These are:

4.3.1 Category I: A heat output of 15 percent or less of Manufacturer's Rated Heat Output Capacity.

4.3.2 Category II: A heat output of 16 percent to 24 percent of Manufacturer's Rated Heat Output Capacity.

4.3.3 Category III: A heat output of 25 percent to 50 percent of Manufacturer's Rated Heat Output Capacity.

4.3.4 Category IV: Manufacturer's Rated Heat Output Capacity. These heat output categories refer to the output from the system by way of the load heat exchanger installed for the test. The output from just the boiler/heater part of the system may be higher for all or part of a test, as part of this boiler/heater output goes to storage.

For the Category III and IV runs, appliance operation is conducted on a hot-to-hot test cycle meaning that the appliance is brought to operating temperature and a coal bed is established prior to the addition of the test fuel charge and measurements are made for each test fuel charge cycle. The measurements are made under constant heat draw conditions within pre-determined ranges. No attempt is made to modulate the heat demand to simulate an indoor thermostat cycling on and off in response to changes in the indoor environment.

For the Category I and II runs, the unit is tested with a "cold start." At the manufacturer's option, the Category II and III runs may be waived and it may be assumed that the particulate emission values and efficiency values determined in the startup, steady-state, and end phases of Category I are applicable in Categories II and III for the purpose of determining the annual averages in lb/MMBtu and g/MJ (See section 13). For the annual average in g/hr, the length of time for stored heat to be drawn from thermal storage shall be determined for the test load requirements of the respective Category.

All test operations and measurements shall be conducted by personnel of the laboratory responsible for the submission of the test report.

## 5.0 Significance and Use

5.1 The measurement of particulate matter emission and CO rates is an important test method widely used in the practice of air pollution control.

5.1.1 These measurements, when approved by state or federal agencies, are

often required for the purpose of determining compliance with regulations and statutes.

5.1.2 The measurements made before and after design modifications are necessary to demonstrate the effectiveness of design changes in reducing emissions and make this standard an important tool in manufacturer's research and development programs.

5.2 Measurement of heating efficiency provides a uniform basis for comparison of product performance that is useful to the consumer. It is also required to relate emissions produced to the useful heat production.

5.3 This is a laboratory method and is not intended to be fully representative of all actual field use. It is recognized that users of hand-fired, wood-burning equipment have a great deal of influence over the performance of any wood-burning appliance. Some compromises in realism have been made in the interest of providing a reliable and repeatable test method.

## 6.0 Test Equipment

6.1 Scale. A platform scale capable of weighing the boiler/heater under test and associated parts and accessories when completely filled with water to an accuracy of  $\pm 1.0$  pound ( $\pm 0.5$  kg) and a readout resolution of  $\pm 0.2$  pound ( $\pm 0.1$  kg).

6.2 Heat Exchanger. A water-to-water heat exchanger capable of dissipating the expected heat output from the system under test.

6.3 Water Temperature Difference Measurement. A Type-T 'special limits' thermopile with a minimum of 5 pairs of junctions shall be used to measure the temperature difference in water entering and leaving the heat exchanger. The temperature difference measurement uncertainty of this type of thermopile is equal to or less than  $\pm 0.50$  °F ( $\pm 0.25$  °C). Other temperature measurement methods may be used if the temperature difference measurement uncertainty is equal to or less than  $\pm 0.50$  °F ( $\pm 0.25$  °C). This measurement uncertainty shall include the temperature sensor, sensor well arrangement, piping arrangements, lead wire, and measurement/recording system. The response time of the temperature measurement system shall be less than half of the time interval at which temperature measurements are recorded.

6.4 Water Flow Meter. A water flow meter shall be installed in the inlet to the load side of the heat exchanger. The flow meter shall have an accuracy of  $\pm 1$  percent of measured flow.

6.4.1 Optional—Appliance side water flow meter. A water flow meter with an accuracy of  $\pm 1$  percent of the flow rate is recommended to monitor supply side water flow rate.

6.5 Optional Recirculation Pump. Circulating pump used during test to prevent stratification, in the boiler/heater, of liquid being heated.

6.6 Water Temperature Measurement—Thermocouples or other temperature sensors to measure the water temperature at the inlet and outlet of the load side of the heat exchanger must meet the calibration requirements specified in 10.1 of this method.

6.7 Lab Scale—For measuring the moisture content of wood slices as part of the overall wood moisture determination. Accuracy of  $\pm 0.01$  pounds.

6.8 Flue Gas Temperature Measurement—Must meet the requirements of CSA B415.1–2010, Clause 6.2.2.

6.9 Test Room Temperature Measurement—Must meet the requirements of CSA B415.1–2010, Clause 6.2.1.

6.10 Flue Gas Composition Measurement—Must meet the requirements of CSA B415.1–2010, Clauses 6.3.1 through 6.3.3.

6.11 Dilution Tunnel CO Measurement—In parallel with the flue gas composition measurements, the CO concentration in the dilution tunnel shall also be measured and reported at time intervals not to exceed one minute. This analyzer shall meet the zero and span drift requirements of CSA B415.1–2012. In addition the measurement repeatability shall be better than  $\pm 15$  ppm over the range of CO levels observed in the dilution tunnel.

## 7.0 Safety

7.1 These tests involve combustion of wood fuel and substantial release of heat and products of combustion. The heating system also produces large quantities of very hot water and the potential for steam production and system pressurization. Appropriate precautions must be taken to protect personnel from burn hazards and respiration of products of combustion.

## 8.0 Sampling, Test Specimens and Test Appliances

8.1 Test specimens shall be supplied as complete appliances, as described in marketing materials, including all controls and accessories necessary for installation in the test facility. A full set of specifications, installation and operating instructions, and design and assembly drawings shall be provided when the product is to be placed under certification of a third-party agency. The manufacturer's written installation and operating instructions are to be used as a guide in the set-up and testing of the appliance and shall be part of the test record.

8.2 The size, connection arrangement, and control arrangement for the thermal storage shall be as specified in the manufacturer's documentation. It is not necessary to use the specific storage system that the boiler/heater will be marketed with. However, the capacity of the system used in the test cannot be greater than that specified as the minimum allowable for the boiler/heater.

8.3 All system control settings shall be the as-shipped, default settings. These default settings shall be the same as those communicated in a document to the installer or end user. These control settings and the documentation of the control settings as to be provided to the installer or end user shall be part of the test record.

8.4 Where the manufacturer defines several alternatives for the connection and loading arrangement, one shall be defined in the appliance documentation as the default or standard installation. It is expected that this will be the configuration for use with a simple baseboard heating system. This is the

configuration to be followed for these tests. The manufacturer's documentation shall define the other arrangements as optional or alternative arrangements.

## 9.0 Preparation of Test Equipment

9.1 The appliance is to be placed on a scale capable of weighing the appliance fully loaded with a resolution of  $\pm 0.2$  lb (0.1 kg).

9.2 The appliance shall be fitted with the type of chimney recommended or provided by the manufacturer and extending to  $15 \pm 0.5$  feet ( $4.6 \pm 0.15$  m) from the upper surface of the scale. If no flue or chimney system is recommended or provided by the manufacturer, connect the appliance to a flue of a diameter equal to the flue outlet of the appliance. The flue section from the appliance flue collar to  $8 \pm 0.5$  feet above the scale shall be single wall stove pipe and the remainder of the flue shall be double wall insulated class A chimney.

### 9.3 Optional Equipment Use

9.3.1 A recirculation pump may be installed between connections at the top and bottom of the appliance to minimize thermal stratification if specified by the manufacturer. The pump shall not be installed in such a way as to change or affect the flow rate between the appliance and the heat exchanger.

9.3.2 If the manufacturer specifies that a thermal control valve or other device be installed and set to control the return water temperature to a specific set point, the valve or other device shall be installed and set per the manufacturer's written instructions.

9.4 Prior to filling the boiler/heater with water, weigh and record the appliance mass.

### 9.5 Heat Exchanger

9.5.1 Plumb the unit to a water-to-water heat exchanger with sufficient capacity to draw off heat at the maximum rate anticipated. Route hoses and electrical cables and instrument wires in a manner that does not influence the weighing accuracy of the scale as indicated by placing dead weights on the platform and verifying the scale's accuracy.

9.5.2 Locate thermocouples to measure the water temperature at the inlet and outlet of the load side of the heat exchanger.

9.5.3 Install a thermopile (or equivalent instrumentation) meeting the requirements of section 6.3 to measure the water temperature difference between the inlet and outlet of the load side of the heat exchanger.

9.5.4 Install a calibrated water flow meter in the heat exchanger load side supply line. The water flow meter is to be installed on the cooling water inlet side of the heat exchanger so that it will operate at the temperature at which it is calibrated.

9.5.5 Place the heat exchanger in a box with 2 in. (50 mm) of expanded polystyrene (EPS) foam insulation surrounding it to minimize heat losses from the heat exchanger.

9.5.6 The reported efficiency and heat output rate shall be based on measurements made on the load side of the heat exchanger.

9.5.7 Temperature instrumentation per section 6.6 shall be installed in the appliance outlet and return lines. The average of the outlet and return water temperature on the supply side of the system shall be considered the average appliance temperature for calculation of heat storage in the appliance ( $TF_{avg}$  and  $TI_{avg}$ ). Installation of a water flow meter in the supply side of the system is optional.

9.6 Storage Tank. The storage tank shall include a destratification pump as illustrated in Figure 1. The pump will draw from the bottom of the tank and return to the top as illustrated. Temperature sensors (TS1 and TS2 in Figure 1) shall be included to measure the temperature in the recirculation loop. The valve plan in Figure 1 allows the tank recirculation loop to operate and the boiler/heater-to-heat exchanger loop to operate at the same time but in isolation. This would typically be done before the start of a test or following completion of a test to determine the end of test average tank temperature. The nominal flow rate in the storage tank recirculation loop can be estimated based on pump manufacturer's performance curves and any significant restriction in the recirculation loop.

9.7 Fill the system with water. Determine the total weight of the water in the appliance when the water is circulating. Verify that the scale indicates a stable weight under operating conditions. Make sure air is purged properly.

## 10.0 Calibration and Standardization

10.1 Water Temperature Sensors. Temperature measuring equipment shall be calibrated before initial use and at least semi-annually thereafter. Calibrations shall be in compliance with National Institute of Standards and Technology (NIST) Monograph 175, Standard Limits of Error.

10.2 Heat Exchanger Load Side Water Flow Meter.

10.2.1 The heat exchanger load side water flow meter shall be calibrated within the flow range used for the test run using NIST-traceable methods. Verify the calibration of the water flow meter before and after each test run and at least once during each test run by comparing the water flow rate indicated by the flow meter to the mass of water collected from the outlet of the heat exchanger over a timed interval. Volume of the collected water shall be determined based on the water density calculated from section 13, Eq. 12, using the water temperature measured at the flow meter. The uncertainty in the verification procedure used shall be 1 percent or less. The water flow rate determined by the collection and weighing method shall be within 1 percent of the flow rate indicated by the water flow meter.

10.3 Scales. The scales used to weigh the appliance and test fuel charge shall be calibrated using NIST-traceable methods at least once every 6 months.

10.4 Flue Gas Analyzers—In accordance with CSA B415.1–2010, Clause 6.8.

## 11.0 Conditioning

11.1 Prior to testing, a non-catalytic appliance is to be operated for a minimum of 10 hours using a medium heat draw rate. Catalytic units shall be operated for a minimum of 50 hours using a medium heat draw rate. The pre-burn for the first test can be included as part of the conditioning requirement. If conditioning is included in pre-burn, then the appliance shall be aged with fuel meeting the specifications outlined in section 12.2 with a moisture content between 19 and 25 percent on a dry basis. Operate the appliance at a medium heat output rate (Category II or III) for at least 10 hours for non-catalytic appliances and 50 hours for catalytic appliances. Record and report hourly flue gas exit temperature data and the hours of operation. The aging procedure shall be conducted and documented by a testing laboratory.

## 12.0 Procedure

12.1 Appliance Installation. Assemble the appliance and parts in conformance with the manufacturer's written installation instructions. Clean the flue with an appropriately sized, wire chimney brush before each certification test series.

12.2 Fuel. Test fuel charge fuel shall be red (*Quercus ruba L.*) or white (*Quercus Alba*) oak 19 to 25 percent moisture content on a dry basis. Piece length shall be 80 percent of the firebox depth rounded down to the nearest 1 inch (25mm) increment. For example, if the firebox depth is 46 inches (1168mm) the piece length would be 36 inches ( $46 \text{ inches} \times 0.8 = 36.8$  inches round down to 36 inches). Pieces are to be placed in the firebox parallel to the longest firebox dimension. For fireboxes with sloped surfaces that create a non-uniform firebox length, the piece length shall be adjusted for each layer based on 80 percent of the length at the level where the layer is placed. The test fuel shall be cord wood with cross section dimensions and weight limits as defined in CSA B415.1–2010, section 8.3, Table 4. The use of dimensional lumber is not allowed.

12.2.1 Select three pieces of cord wood from the same batch of wood as the test fuel and the same weight as the average weight of the pieces in the test load  $\pm 1.0$  lb. From each of these three pieces, cut three slices. Each slice shall be  $\frac{1}{2}$  inch to  $\frac{3}{4}$  inch thick. One slice shall be cut across the center of the length of the piece. The other two slices shall be cut half way between the center and the end. Immediately measure the mass of each piece in pounds. Dry each slice in an oven at 220 °F for 24 hours or until no further weight change occurs. The slices shall be arranged in the oven so as to provide separation between faces. Remove from the oven and measure the mass of each piece again as soon as practical in pounds.

The moisture content of each slice, on a dry basis shall be calculated as:

$$MC_{\text{slice}} = 100 \cdot (W_{\text{SliceWet}} - W_{\text{SliceDry}})$$

$$W_{\text{SliceDry}}$$

Where:

$W_{\text{SliceWet}}$  = weight of the slice before drying in pounds

$W_{\text{SliceDry}}$  = weight of the slice after drying in pounds

$MC_{\text{Slice}}$  = moisture content of the slice in % dry basis

The average moisture content of the entire test load (MC) shall be determined using Eq. 6. Each individual slice shall have a moisture content in the range of 18 percent to 28 percent on a dry basis. The average moisture content for the test fuel load shall be in the range of 19 percent to 25 percent. Moisture shall not be added to previously dried fuel pieces except by storage under high humidity conditions and temperature up to 100 °F. Fuel moisture measurement shall begin within four hours of using the fuel batch for a test. Use of a pin-type meter to estimate the moisture content prior to a test is recommended.

12.2.2 Firebox Volume. Determine the firebox volume in cubic feet. Firebox volume shall include all areas accessible through the fuel loading door where firewood could reasonably be placed up to the horizontal plane defined by the top of the loading door. A drawing of the firebox showing front, side and plan views or an isometric view with interior dimensions shall be provided by the manufacturer and verified by the laboratory. Calculations for firebox volume from computer aided design (CAD) software programs are acceptable and shall be included in the test report if used. If the firebox volume is calculated by the laboratory the firebox drawings and calculations shall be included in the test report.

12.2.3 Test Fuel charge. Test fuel charges shall be determined by multiplying the firebox volume by 10 pounds (4.54 kg) per ft<sup>3</sup> (28L), or a higher load density as recommended by the manufacturer's printed operating instructions, of wood (as used wet weight). Select the number of pieces of cord wood that most nearly match this target weight. However, the test fuel charge cannot be less than the target of 10 pounds (4.54 kg) per ft<sup>3</sup> (28L).

12.3 Sampling Equipment. Prepare the particulate emission sampling equipment as defined by EPA Method 28 WHH and the standards referenced therein.

12.4 Appliance Startup. The appliance shall be fired with wood fuel of any species, size and moisture content at the laboratories discretion to bring it up to operating temperature. Operate the appliance until the water is heated to the upper operating control limit and has cycled at least two times. Then remove all unburned fuel, zero the scale and verify the scales accuracy using dead weights.

12.4.1 Startup Procedure for Category III and IV Test Runs, "Hot-to-Hot"

12.4.1.1 Pre-Test Burn Cycle. Following appliance startup (section 12.4), reload

appliance with oak cord wood and allow it to burn down to the specified coal bed weight. The pre-test burn cycle fuel charge weight shall be within ±10 percent of the test fuel charge weight. Piece size and length shall be selected such that charcoaling is achieved by the time the fuel charge has burned down to the required coal bed weight. Pieces with a maximum thickness of approximately 2 inches have been found to be suitable. Charcoaling is a general condition of the test fuel bed evidenced by an absence of large pieces of burning wood in the coal bed and the remaining fuel pieces being brittle enough to be broken into smaller charcoal pieces with a metal poker. Manipulations to the fuel bed prior to the start of the test run are to be done to achieve charcoaling while maintaining the desired heat output rate. During the pre-test burn cycle and at least one hour prior to starting the test run, adjust water flow to the heat exchanger to establish the target heat draw for the test. For the first test run the heat draw rate shall be equal to the manufacturer's rated heat output capacity.

12.4.1.2 Allowable Adjustments. Fuel addition or subtractions, and coal bed raking shall be kept to a minimum but are allowed up to 15 minutes prior to the start of the test run. For the purposes of this method, coal bed raking is the use of a metal tool (poker) to stir coals, break burning fuel into smaller pieces, dislodge fuel pieces from positions of poor combustion, and check for the condition of charcoaling. Record all adjustments to and additions or subtractions of fuel, and any other changes to the appliance operations that occur during pretest ignition period. During the 15-minute period prior to the start of the test run, the wood heater loading door shall not be open more than a total of 1 minute. Coal bed raking is the only adjustment allowed during this period.

12.4.1.3 Coal Bed Weight. The appliance is to be loaded with the test fuel charge when the coal bed weight is between 10 percent and 20 percent of the test fuel charge weight. Coals may be raked as necessary to level the coal bed but may only be raked and stirred once between 15 to 20 minutes prior to the addition of the test fuel charge.

12.4.1.4 Storage. The Category III and IV test runs may be done either with or without the thermal storage. If thermal storage is used the initial temperature of the storage must be 125 °F or greater at the start of the test. The storage may be heated during the pre-test burn cycle or it may be heated by external means. If thermal storage is used, prior to the start of the test run, the storage tank destratification pump, shown in Figure 1, shall be operated until the total volume pumped exceeds 1.5 times the tank volume and the difference between the temperature at the top and bottom of the storage tank (TS<sub>1</sub> and TS<sub>2</sub>) is less than 1 °F. These two temperatures shall then be recorded to determine the starting average tank temperature. The total volume pumped may

be based on the nominal flow rate of the destratification pump (See section 9.6). If the Category III and IV runs are done with storage, it is recognized that during the last hour of the pre-burn cycle the storage tank must be mixed to achieve a uniform starting temperature and cannot receive heat from the boiler/heater during this time. During this time period the boiler/heater might cycle or go into a steady reduced output mode. (Note—this would happen, for example, in a Category IV run if the actual maximum output of the boiler/heater exceed the manufacturer's rated output.) A second storage tank may be used temporarily to enable the boiler/heater to operate during this last hour of the pre-burn period as it will during the test period. The temperature of this second storage tank is not used in the calculations but the return water to the boiler/heater (after mixing device if used) must be 125 °F or greater.

12.4.2 Startup Procedure for Category I and II test runs, "cold-to-cold."

12.4.2.1 Initial Temperatures. This test shall be started with both the boiler/heater and the storage at a minimum temperature of 125 °F. The boiler/heater maximum temperature at the start of this test shall be 135 °F. The boiler/heater and storage may be heated through a pre-burn or it may be heated by external means.

12.4.2.2 Firebox Condition at Test Start. Prior to the start of this test remove all ash and charcoal from the combustion chamber(s). The loading of the test fuel and kindling should follow the manufacturer's recommendations, subject to the following constraints: Up to 10 percent kindling and paper may be used which is in addition to the fuel load. Further, up to 10 percent of the fuel load (*i.e.*, included in the 10 lb/ft<sup>3</sup>) may be smaller than the main fuel. This startup fuel shall still be larger than 2 inches.

12.4.2.3 Storage. The Category I and II test runs shall be done with thermal storage. The initial temperature of the storage must be 125 °F or greater at the start of the test. The storage may be heated during the pre-test burn cycle or it may be heated by external means. Prior to the start of the test run, the storage tank destratification pump, shown in Figure 1, shall be operated until the total volume pumped exceeds 1.5 times the tank volume and the difference between the temperature at the top and bottom of the storage tank (TS<sub>1</sub> and TS<sub>2</sub>) is less than 1 °F. These two temperatures shall then be recorded to determine the starting average tank temperature. The total volume pumped may be based on the nominal flow rate of the destratification pump (See section 9.6).

12.5 Test Runs. For all test runs, the return water temperature to the hydronic heater must be equal to or greater than 120 °F (this is lower than the initial tank temperature to allow for any pipeline losses). Where the storage system is used, flow of water from the boiler/heater shall be divided between the storage tank and the heat

exchanger such that the temperature change of the circulating water across the heat exchanger shall be  $30 \pm 5$  °F, averaged over the entire test run. This is typically adjusted using the system valves.

Complete a test run in each heat output rate category, as follows:

12.5.1 Test Run Start. For Category III and IV runs: once the appliance is operating normally and the pretest coal bed weight has reached the target value per 12.4.1, tare the scale and load the full test charge into the appliance. Time for loading shall not exceed 5 minutes. The actual weight of the test fuel charge shall be measured and recorded within 30 minutes prior to loading. Start all sampling systems.

For Category I and II runs: once the appliance has reached the starting temperature, tare the scale and load the full test charge, including kindling into the appliance. The actual weight of the test fuel charge shall be measured and recorded within 30 minutes prior to loading. Light the fire following the manufacturer's written normal startup procedure. Start all sampling systems.

12.5.1.1 Record all water temperatures, differential water temperatures and water flow rates at time intervals of one minute or less.

12.5.1.2 Record particulate emissions data per the requirements of EPA Method 28 WHH and the standards referenced therein.

12.5.1.3 Record data needed to determine Overall Efficiency (SLM) per the requirements of CSA B415.1–2010 Clauses 6.2.1, 6.2.2, 6.3, 8.5.7, 10.4.3 (a), 10.4.3(f), and 13.7.9.3

12.5.1.3.1 Measure and record the test room air temperature in accordance with the requirements of Clauses 6.2.1, 8.5.7 and 10.4.3 (g).

12.5.1.3.2 Measure and record the flue gas temperature in accordance with the requirements of Clauses 6.2.2, 8.5.7 and 10.4.3 (f).

12.5.1.3.3 Determine and record the Carbon Monoxide (CO) and Carbon Dioxide (CO<sub>2</sub>) concentrations in the flue gas in accordance with Clauses 6.3, 8.5.7 and 10.4.3 (i) and (j).

12.5.1.3.4 Measure and record the test fuel weight per the requirements of Clauses 8.5.7 and 10.4.3 (h).

12.5.1.3.5 Record the test run time per the requirements of Clause 10.4.3 (a).

12.5.1.3.6 Record and document all settings and adjustments, if any, made to the boiler/heater as recommended/required by manufacturer's instruction manual for different combustion conditions or heat loads. These may include temperature setpoints, under and over-fire air adjustment, or other adjustments that could be made by an operator to optimize or alter combustion. All such settings shall be included in the report for each test run.

12.5.1.4 Monitor the average heat output rate on the load side of the heat exchanger based on water temperatures and flow. If the heat output rate over a 10 minute averaging period gets close to the upper or lower limit of the target range ( $\pm 5$  percent), adjust the water flow through the heat exchanger to compensate. Make changes as infrequently as

possible while maintaining the target heat output rate. The first test run shall be conducted at the category IV heat output rate to validate that the appliance is capable of producing the manufacturer's rated heat output capacity.

12.5.2 Test Fuel Charge Adjustment. It is acceptable to adjust the test fuel charge (*i.e.*, reposition) once during a test run if more than 60 percent of the initial test fuel charge weight has been consumed and more than 10 minutes have elapsed without a measurable (1 lb or 0.5 kg) weight change while the operating control is in the demand mode. The time used to make this adjustment shall be less than 60 seconds.

12.5.3 Test Run Completion. For the Category III and IV, "hot-to-hot" test runs, the test run is completed when the remaining weight of the test fuel charge is 0.0 lb (0.0 kg). ( $W_{FuelBurned} = W_{fuel}$ ) End the test run when the scale has indicated a test fuel charge weight of 0.0 lb (0.0 kg) or less for 30 seconds.

For the Category I and II "cold-to-cold" test runs, the test run is completed; and the end of a test is defined at the first occurrence of any one of the following:

(a) The remaining weight of the test fuel charge is less than 1 percent of the total test fuel weight ( $W_{FuelBurned} > 0.99 \cdot W_{fuel}$ );

(b) The automatic control system on the boiler/heater switches to an off mode. In this case the boiler/heater fan (if used) is typically stopped, and all air flow dampers are closed by the control system. Note that this off mode cannot be an "overheat" or emergency shutdown which typically requires a manual reset; or

(c) If the boiler/heater does not have an automatic off mode: After 90 percent of the fuel load has been consumed and the scale has indicated a rate of change of the test fuel charge of less than 1.0 lb/hr for a period of 10 minutes or longer. Note—this is not considered "stopped fuel combustion." See section 12.5.6.1.

12.5.3.1 At the end of the test run, stop the particulate sampling train and Overall Efficiency (SLM) measurements, and record the run time, and all final measurement values.

12.5.3.2 At the end of the test run, continue to operate the storage tank destratification pump until the total volume pumped exceeds 1.5 times the tank volume. The maximum average of the top and bottom temperatures measured after this time may be taken as the average tank temperature at the end of the tests (TFSavg, See section 13.1). The total volume pumped may be based on the nominal flow rate of the destratification pump (See section 9.6).

12.5.3.3 For the Category I and II test runs, there is a need to determine the energy content of the unburned fuel remaining in the chamber if the remaining mass in the chamber is greater than 1 percent of the test fuel weight. Following the completion of the test, as soon as safely practical, this remaining fuel is removed from the chamber, separated from the remaining ash and weighed. This separation could be implemented with a slotted "scoop" or similar tool. A ¼ inch opening size in the separation tool shall be used to separate the

ash and charcoal. This separated char is assigned a heating value of 12,500 Btu/lb.

12.5.4 Heat Output Capacity Validation. The first test run must produce a heat output rate that is within 10 percent of the manufacturer's rated heat output capacity (Category IV) throughout the test run and an average heat output rate within 5 percent of the manufacturer's rated heat output capacity. If the appliance is not capable of producing a heat output within these limits, the manufacturer's rated heat output capacity is considered not validated and testing is to be terminated. In such cases, the tests may be restarted using a lower heat output capacity if requested by the manufacturer. Alternatively, during the Category IV run, if the rated output cannot be maintained for a 15 minute interval, the manufacturer may elect to reduce the rated output to match the test and complete the Category IV run on this basis. The target outputs for Cat I, II, and III shall then be recalculated based on this change in rated output capacity.

12.5.5 Additional Test Runs. Using the Manufacturer's Rated Heat Output Capacity as a basis, conduct a test for additional heat output categories as specified in 4.3. It is not required to run these tests in any particular order.

12.5.6 Alternative Heat Output Rate for Category I. If an appliance cannot be operated in the Category I heat output range due to stopped combustion, two test runs shall be conducted at heat output rates within Category II. When this is the case, the weightings for the weighted averages indicated in section 15.1.14 shall be the average of the Category I and II weightings and shall be applied to both Category II results. Appliances that are not capable of operation within Category II (<25 percent of maximum) cannot be evaluated by this test method.

12.5.6.1 Stopped Fuel Combustion. Evidence that an appliance cannot be operated at a Category I heat output rate due to stopped fuel combustion shall include documentation of two or more attempts to operate the appliance in heat output rate Category I and fuel combustion has stopped prior to complete consumption of the test fuel charge. Stopped fuel combustion is evidenced when an elapsed time of 60 minutes or more has occurred without a measurable (1 lb or 0.5 kg) weight change in the test fuel charge while the appliance operating control is in the demand mode. Report the evidence and the reasoning used to determine that a test in heat output rate Category I cannot be achieved. For example, two unsuccessful attempts to operate at an output rate of 10 percent of the rated output capacity are not sufficient evidence that heat output rate Category I cannot be achieved.

12.5.7 Appliance Overheating. Appliances with their associated thermal storage shall be capable of operating in all heat output categories without overheating to be rated by this test method. Appliance overheating occurs when the rate of heat withdrawal from the appliance is lower than the rate of heat production when the unit control is in the idle mode. This condition results in the water in the appliance continuing to increase in temperature well

above the upper limit setting of the operating control. Evidence of overheating includes: 1 hour or more of appliance water temperature increase above the upper temperature set-point of the operating control, exceeding the temperature limit of a safety control device (independent from the operating control—typically requires manual reset), boiling water in a non-pressurized system or activation of a pressure or temperature relief valve in a pressurized system.

12.5.8 Option to Eliminate Tests in Category II and III. Following successful completion of a test run in Category I, the manufacturer may eliminate the Cat II and III tests. For the purpose of calculating the annual averages for particulates and efficiency, the values obtained in the Category I run shall be assumed to apply also to Category II and Category III. It is envisioned that this option would be applicable to systems which have sufficient thermal storage such that the fuel load in the Cat I test can be completely consumed without the system reaching its upper operating temperature limit. In this case the boiler/heater would likely be operating at maximum thermal output during the entire test and this output rate may be higher than the Manufacturer's Rated Heat Output Capacity. The Category II and III runs would then be the same as the Category I run. It may be assumed that the particulate emission values and efficiency values determined in the startup, steady-state, and end phases of Category I are applicable in Categories II and III, for the purpose of determining the annual averages in lb/MMBtu and g/MJ (See section 13). For the annual average in g/hr, the length of time for stored heat to be drawn from thermal storage shall be determined for the test load requirements of the respective Category.

12.5.9 Modification to Measurement Procedure in EPA Method 28 WHH to Determine Emissions Separately During the Startup, Steady-State and End Phases. With one of the two particulate sampling trains used, filter changes shall be made at the end of the startup phase and the steady state phase (See section 3.0). This shall be done to determine the particulate emission rate and particulate emission index for the startup, steady state, and end phases individually. For this one train, the particulates measured during each of these three phases shall be added together to also determine the particulate emissions for the whole run.

12.5.10 Modification to Measurement Procedure in EPA Method 28 WHH and the standards referenced therein on Averaging Period for Determination of Efficiency by the Stack Loss Method. The methods currently defined in Method 28 WHH allow averaging over 10 minute time periods for flue gas temperature, flue gas CO<sub>2</sub>, and flue gas CO for the determination of the efficiency with the Stack Loss Method. However, under some cycling conditions the "on" period may be short relative to this 10 minute period. For

this reason, during cycling operation the averaging period for these parameters may not be longer than the burner on period divided by 10. The averaging period need not be shorter than one minute. During the off period, under cycling operation, averaging periods as specified in EPA Method 28 WHH and the standards referenced therein may be used. Where short averaging times are used, however, the averaging period for fuel consumption may still be at 10 minutes. This average wood consumption rate shall be applied to all of the smaller time intervals included.

12.6 Additional Test Runs. The testing laboratory may conduct more than one test run in each of the heat output categories specified in section 4.3. If more than one test run is conducted at a specified heat output rate, the results from at least two-thirds of the test runs in that heat output rate category shall be used in calculating the weighted average emission rate. The measurement data and results of all test runs shall be reported regardless of which values are used in calculating the weighted average emission rate.

### 13.0 Calculation of Results

#### 13.1 Nomenclature.

CO<sub>s</sub>—Carbon monoxide measured in the dilution tunnel at arbitrary time in ppm dry basis.  
 CO<sub>g/min</sub>—Carbon monoxide emission rate in g/min.  
 CO<sub>T</sub>—Total carbon monoxide emission for the full test run in grams.  
 CO<sub>1</sub>—Startup period carbon monoxide emissions in grams.  
 CO<sub>2</sub>—Steady-state period carbon monoxide emission in grams.  
 CO<sub>3</sub>—End period carbon monoxide emission in grams.  
 E<sub>T</sub>—Total particulate emissions for the full test run as determined per EPA Method 28 WHH and the standards referenced therein in grams.  
 E<sub>1</sub> = Startup period particulate emissions in grams.  
 E<sub>2</sub> = Steady-state period particulate emissions in grams.  
 E<sub>3</sub> = End period particulate emissions in grams.  
 E<sub>1\_g/kg</sub> = Startup period particulate emission index in grams per kg fuel.  
 E<sub>2\_g/kg</sub> = Steady-state period particulate emission index in grams per kg fuel.  
 E<sub>3\_g/kg</sub> = End period particulate emission index in grams per kg fuel.  
 E<sub>1\_g/hr</sub> = Startup period particulate emission rate in grams per hour.  
 E<sub>2\_g/hr</sub> = Steady-state period particulate emission rate in grams per hour.  
 E<sub>3\_g/hr</sub> = End period particulate emission rate in grams per hour.  
 E<sub>g/MJ</sub>—Emission rate in grams per MJ of heat output.  
 E<sub>lb/mmBtu output</sub>—Emissions rate in pounds per million Btu's of heat output.

E<sub>g/kg</sub>—Emissions factor in grams per kilogram of dry fuel burned.

E<sub>g/hr</sub>—Emission factor in grams per hour.

HHV—Higher Heating Value of fuel = 8600 Btu/lb (19.990 MJ/kg).

LHV—Lower Heating Value of fuel = 7988 Btu/lb (18.567 MJ/kg).

ΔT—Temperature difference between cooling water entering and exiting the heat exchanger.

Q<sub>out</sub>—Total heat output in Btu's (MJ).

Q<sub>in</sub>—Total heat input available in test fuel charge in Btu's (MJ).

Q<sub>std</sub>—Volumetric flow rate in dilution tunnel in dscfm.

M—Mass flow rate of water in lb/min (kg/min).

V<sub>i</sub>—Volume of water indicated by a totalizing flow meter at the i<sub>th</sub> reading in gallons (liters).

V<sub>r</sub>—Volumetric flow rate of water in heat exchange system in gallons per minute (liters/min).

Θ—Total length of burn period in hours (Θ<sub>1</sub> + Θ<sub>2</sub> + Θ<sub>3</sub>).

Θ<sub>1</sub>—Length of time of the startup period in hours.

Θ<sub>2</sub>—Length of time of the steady state period in hours.

Θ<sub>3</sub>—Length of time of the end period in hours.

Θ<sub>4</sub>—Length of time for stored heat to be used following a burn period in hours.

t<sub>i</sub>—Data sampling interval in minutes.

η<sub>del</sub>—Delivered heating efficiency in percent.

F<sub>i</sub>—Weighting factor for heat output category i. See Table 2.

T<sub>1</sub>—Temperature of water at the inlet on the supply side of the heat exchanger, °F.

T<sub>2</sub>—Temperature of the water at the outlet on the supply side of the heat exchanger, °F.

T<sub>3</sub>—Temperature of cooling water at the inlet to the load side of the heat exchanger, °F.

T<sub>4</sub>—Temperature of cooling water at the outlet of the load side of the heat exchanger, °F.

T<sub>5</sub>—Temperature of the hot water supply as it leaves the boiler/heater, °F.

T<sub>6</sub>—Temperature of return water as it enters the boiler/heater, °F.

T<sub>7</sub>—Temperature in the boiler/heater optional destratification loop at the top of the boiler/heater, °F.

T<sub>8</sub>—Temperature in the boiler/heater optional destratification loop at the bottom of the boiler/heater, °F.

TI<sub>avg</sub>—Average temperature of the appliance and water at start of the test.

TIS<sub>1</sub>—Temperature at the inlet to the storage system at the start of the test.

TIS<sub>2</sub>—Temperature at the outlet from the storage system at the start of the test.

TFS<sub>1</sub>—Temperature at the inlet to the storage system at the end of the test.

TFS<sub>2</sub>—Temperature at the outlet from the storage system at the end of the test.

TIS<sub>avg</sub>—Average temperature of the storage system at the start of the test.

$$T_{I_{avg}} = (T_5 + T_6)/2 \text{ at the start of the test, } ^\circ\text{F.} \quad \text{Eq. 1}$$

$T_{F_{avg}}$  – Average temperature of the appliance and water at the end of the test.

$$T_{F_{avg}} = (T_5 + T_6)/2 \text{ at the end of the test, } ^\circ\text{F.} \quad \text{Eq. 2}$$

$$T_{IS_{avg}} = (T_{IS_1} + T_{IS_2})/2 \text{ at the end of the test.} \quad \text{Eq. 3}$$

$T_{FS_{avg}}$  – Average temperature of the storage system at the end of the test.

$$T_{FS_{avg}} = (T_{FS_1} + T_{FS_2})/2. \quad \text{Eq. 4}$$

MC—Fuel moisture content in percent dry basis.

$\sigma$ —Density of water in pounds per gallon.

$\sigma_{Initial}$ —Density of water in the boiler/heater system at the start of the test in pounds per gallons.

$\sigma_{boiler/heater}$ —Density of water in the boiler/heater system at arbitrary time during the test in pounds per gallon.

$C_p$ —Specific heat of water in Btu/lb  $-\ ^\circ\text{F}$ .

$C_{steel}$ —Specific heat of steel (0.1 Btu/lb  $-\ ^\circ\text{F}$ ).

$V_{boiler/heater}$ —total volume of water in the boiler/heater system on the weight scale in gallons.

$W_{fuel}$ —Fuel charge weight, as-fired or “wet”, in pounds (kg).

$W_{fuel_1}$ —Fuel consumed during the startup period in pounds (kg).

$W_{fuel_2}$ —Fuel consumed during the steady state period in pounds (kg).

$W_{fuel_3}$ —Fuel consumed during the end period in pounds (kg).

$W_{FuelBurned}$ —Weight of fuel that has been burned from the start of the test to an arbitrary time, including the needed correction for the change in density and weight of the water in the boiler/heater system on the scale in pounds (kg).

$W_{RemainingFuel}$ —weight of unburned fuel separated from the ash at the end of a test. Useful only for Cat I and Cat II tests.

$W_{app}$ —Weight of empty appliance in pounds (kg).

$W_{wat}$ —Weight of water in supply side of the system in pounds (kg).

$W_{ScaleInitial}$ —weight reading on the scale at the start of the test, just after the test load has been added in pounds (kg).

$W_{Scale}$ —Reading of the weight scale at arbitrary time during the test run in pounds (kg).

$W_{StorageTank}$ —Weight of the storage tank empty in pounds (kg).

$W_{WaterStorage}$ —Weight of the water in the storage tank at  $T_{IS_{avg}}$  in pounds (kg).

13.2 After the test is completed, determine the particulate emissions ET in accordance with EPA Method 28 WHH and the standards referenced therein.

13.3 Determination of the weight of fuel that has been burned at arbitrary time

For the purpose of tracking the consumption of the test fuel load during a test run the following may be used to calculate the weight of fuel that burned since the start of the test:

$$W_{FuelBurned} = (W_{ScaleInitial} - W_{Scale}) + V_{Boiler/heater} \cdot (\sigma_{Initial} - \sigma_{boiler/heater}) \quad \text{Eq. 5}$$

Water density,  $\sigma$ , is calculated using Equation 12.

### 13.4 Determine Average Fuel Load Moisture Content.

$$MC = \frac{\sum W_{SliceWet_i} - MC_{Slice_i}}{\sum W_{SliceWet_i}} \quad \text{Eq. 6}$$

$$\sum W_{SliceWet_i}$$

### 13.5 Determine heat input.

$$Q_{in} = (W_{fuel}/(1+(MC/100))) \times HHV, \text{ Btu (MJ)}. \quad \text{Eq. 7}$$

$$Q_{inLHV} = (W_{fuel}/(1+(MC/100))) \times LHV, \text{ Btu (MJ)}. \quad \text{Eq. 8}$$

13.5.1 Correction to  $Q_{in}$  for the Category I and II tests, where there is greater than 1 percent of the test fuel charge in the chamber at the end of the test period.

$$Q_{InCorrected} = Q_{in} - \frac{W_{Remaining} \cdot 12,500 \text{ Btu}}{lb} \quad \text{Eq. 9}$$

13.6 Determine heat output, efficiency, and emissions  $Q_{out} = \Sigma$  [Heat output determined for each sampling time interval] + Change in heat stored in the appliance + Change in heat in storage tank.

13.6.1 Determine heat output as:

$$Q_{out} = \Sigma [C_{pi} \cdot \Delta T_i \cdot M_i \cdot t_i] + (W_{app} \cdot C_{steel} + W_{water} \cdot C_{pa}) \cdot (TF_{avg} - TI_{avg}) + (W_{StorageTank} \cdot C_{steel} + W_{WaterStorage} \cdot C_{pa}) \cdot (TFS_{avg} - TIS_{avg}) \text{ Btu (MJ)} \quad \text{Eq. 10}$$

Note: The subscript (i) indicates the parameter value for sampling time interval t.  $M_i$  = Mass flow rate = gal/min  $\times$  Density of Water (lb/gal) = lb/min.

$$M_i = V_{fi} \cdot \sigma_i, \text{ lb/min.} \quad \text{Eq. 11}$$

$$\sigma_i = (62.56 + (-0.0003413 \times T_{3i}) + (-0.00006225 \times T_{3i}^2)) 0.1337, \text{ lbs/gal.} \quad \text{Eq. 12}$$

$$C_p = 1.0014 + (-0.000003485 \times T_{3i}) \text{ Btu/lb-}^\circ\text{F.} \quad \text{Eq. 13}$$

$$C_{steel} = 0.1 \text{ Btu/lb-}^\circ\text{F.}$$

$$C_{pa} = 1.0014 + (-0.000003485 \times (TI_{avg} + TF_{avg})/2), \text{ Btu/lb-}^\circ\text{F.} \quad \text{Eq. 14}$$

$$V_{fi} = (V_i - V_{i-1})/(t_i - t_{i-1}), \text{ gal/min.} \quad \text{Eq. 15}$$

Note:  $V_i$  is the total water volume at the end of interval i and  $V_{i-1}$  is the total water volume at the beginning of the time interval.

This calculation is necessary when a totalizing type water meter is used.

13.6.2 Determine Heat Output Rate Over Burn Period ( $\Theta_1 + \Theta_2 + \Theta_3$ ) as:

$$\text{Heat Output Rate} = Q_{out}/\Theta, \text{ Btu/hr (MJ/hr).} \quad \text{Eq. 16}$$

13.6.3 Determine Emission Rates and Emission Factors as:

$$E_{g/MJ} = E_T/(Q_{out} \times 0.001055), \text{ g/MJ.} \quad \text{Eq. 17}$$

$$E_{lb/MM \text{ Btu output}} = (E_T/453.59)/(Q_{out} \times 10^{-6}), \text{ lb/MMBtu Out.} \quad \text{Eq. 18}$$

$$E_{g/kg} = E_T/(W_{fuel}/(1+MC/100)), \text{ g/dry kg.} \quad \text{Eq. 19}$$

$$E_{g/hr} = E_T/(\Theta_1 + \Theta_2 + \Theta_3 + \Theta_4), \text{ g/hr.} \quad \text{Eq. 20}$$

$$\Theta_4 = (W_{StorageTank} \cdot C_{steel} + W_{WaterStorage} \cdot C_{pa}) \cdot (TFS_{avg} - TIS_{avg})/(Q_{out}/\Theta) \quad \text{Eq. 21}$$

If thermal storage is not used in a Category III or IV run, then  $\Theta_4 = 0$

$$E_{1_g/kg} = E_1/(W_{fuel_1}/(1+MC/100)), \text{ g/dry kg}$$

$$E_{2_g/kg} = E_2/(W_{fuel_2}/(1+MC/100)), \text{ g/dry kg}$$

$$E_{3_g/kg} = E_3/(W_{fuel_3}/(1+MC/100)), \text{ g/dry kg}$$

$$E_{1_g/hr} = E_1/\Theta_1, \text{ g/hr}$$

$$E_{2_g/hr} = E_2/\Theta_2, \text{ g/hr}$$

$$E_{3_g/hr} = E_3/\Theta_3, \text{ g/hr}$$

13.6.4 Determine delivered efficiency as:

$$\eta_{del} = (Q_{out}/Q_{InCorrected}) \times 100, \% \quad \text{Eq. 22}$$

$$\eta_{del \text{ LHV}} = (Q_{out}/Q_{in \text{ LHV}}) \times 100, \% \quad \text{Eq. 23}$$

13.6.5 Determine  $\eta_{SLM}$ —Overall Efficiency, also known as Stack Loss Efficiency, using Stack Loss Method (SLM).

For determination of the average overall thermal efficiency ( $\eta_{SLM}$ ) for the test run, use the data collected over the full test run and the calculations in accordance with CSA

B415.1–2010, Clause 13.7 except for 13.7.2 (e), (f), (g), and (h), use the following average fuel properties for oak: %C = 50.0, %H = 6.6, %O = 43.2, %Ash = 0.2.

13.6.5.1 Whenever the CSA B415.1–2010 overall efficiency is found to be lower than the overall efficiency based on load side

measurements, as determined by Eq. 22 of this method, section 14.1.7 of the test report must include a discussion of the reasons for this result. For a test where the CSA B415.1–2010 overall efficiency SLM is less than 2 percentage points lower than the overall efficiency based on load side measurements,

the efficiency based on load side measurements shall be considered invalid. [Note on the rationale for the 2 percentage points limit. The SLM method does not include boiler/heater jacket losses and, for this reason, should provide an efficiency which is actually higher than the efficiency

based on the energy input and output measurements or "delivered efficiency." A delivered efficiency that is higher than the efficiency based on the SLM could be considered suspect. A delivered efficiency greater than 2 percentage points higher than

the efficiency based on the SLM, then, clearly indicates a measurement error.]

13.6.6 Carbon Monoxide Emissions  
For each minute of the test period, the carbon monoxide emission rate shall be calculated as:

$$CO_{g/min} = Q_{std} \cdot CO_s \cdot 3.298 \times 10^{-5} \quad \text{Eq. 24}$$

Total CO emissions for each of the three test periods (CO<sub>1</sub>, CO<sub>2</sub>, CO<sub>3</sub>) shall be calculated as the sum of the emission rates for each of the 1 minute intervals. Total CO emission for the test run, CO<sub>T</sub>, shall be calculated as the sum of CO<sub>1</sub>, CO<sub>2</sub>, and CO<sub>3</sub>.

13.7 Weighted Average Emissions and Efficiency.

13.7.1 Determine the weighted average emission rate and delivered efficiency from the individual tests in the specified heat output categories. The weighting factors (F<sub>i</sub>) are derived from an analysis of ASHRAE Bin Data which provides details of normal

building heating requirements in terms of percent of design capacity and time in a particular capacity range—or "bin"—over the course of a heating season. The values used in this method represent an average of data from several cities located in the northern United States.

$$\text{Weighted average delivered efficiency: } \eta_{\text{avg}} = \sum \eta_i \times F_i, \% \quad \text{Eq. 25}$$

$$\text{Weighted average emissions: } E_{\text{avg}} = \sum E_i \times F_i, \% \quad \text{Eq. 26}$$

If, as discussed in section 12.5.8, the option to eliminate tests in Category II and III is elected, the values of efficiency and particulate emission rate as measured in Category I, shall be assigned also to Category II and III for the purpose of determining the annual averages.

#### 14.0 Report

14.1.1 The report shall include the following:

14.1.2 Name and location of the laboratory conducting the test.

14.1.3 A description of the appliance tested and its condition, date of receipt and dates of tests.

14.1.4 A description of the minimum amount of external thermal storage that is required for use with this system. This shall be specified both in terms of volume in gallons and stored energy content in Btu with a storage temperature ranging from 125 °F to the manufacturer's specified setpoint temperature.

14.1.5 A statement that the test results apply only to the specific appliance tested.

14.1.6 A statement that the test report shall not be reproduced except in full, without the written approval of the laboratory.

14.1.7 A description of the test procedures and test equipment including a schematic or other drawing showing the location of all required test equipment. Also, a description of test fuel sourcing, handling and storage practices shall be included.

14.1.8 Details of deviations from, additions to or exclusions from the test

method, and their data quality implications on the test results (if any), as well as information on specific test conditions, such as environmental conditions.

14.1.9 A list of participants and their roles and observers present for the tests.

14.1.10 Data and drawings indicating the fire box size and location of the fuel charge.

14.1.11 Drawings and calculations used to determine firebox volume.

14.1.12 Information for each test run fuel charge including piece size, moisture content and weight.

14.1.13 All required data and applicable blanks for each test run shall be provided in spreadsheet format both in the printed report and in a computer file such that the data can be easily analyzed and calculations easily verified. Formulas used for all calculations shall be accessible for review.

14.1.14 For each test run, Θ<sub>1</sub>, Θ<sub>2</sub>, Θ<sub>3</sub>, the total CO and particulate emission for each of these three periods, and Θ<sub>4</sub>.

14.1.15 Calculated results for delivered efficiency at each heat output rate and the weighted average emissions reported as total emissions in grams, pounds per million Btu of delivered heat, grams per MJ of delivered heat, grams per kilogram of dry fuel and grams per hour. Results shall be reported for each heat output category and the weighted average.

14.1.16 Tables 1A, 1B, 1C, 1D, 1E and 2 must be used for presentation of results in test reports.

14.1.17 A statement of the estimated uncertainty of measurement of the emissions and efficiency test results.

14.1.18 A plot of CO emission rate in grams/minute vs. time, based on 1 minute averages, for the entire test period, for each run.

14.1.19 A plot of estimated boiler/heater energy release rate in Btu/hr based on 10 minute averages, for the entire test period, for each run. This will be calculated from the fuel used, the wood heating value and moisture content, and the SLM efficiency during each 10 minute period.

14.1.20 Raw data, calibration records, and other relevant documentation shall be retained by the laboratory for a minimum of 7 years.

#### 15.0 Precision and Bias

15.1 Precision—It is not possible to specify the precision of the procedure in this test method because the appliance operation and fueling protocols and the appliances themselves produce variable amounts of emissions and cannot be used to determine reproducibility or repeatability of this test method.

15.2 Bias—No definitive information can be presented on the bias of the procedure in this test method for measuring solid fuel burning hydronic heater emissions because no material having an accepted reference value is available.

#### 16.0 Keywords

16.1 Solid fuel, hydronic heating appliances, wood-burning hydronic heaters, partial thermal storage.

TABLE 1A—DATA SUMMARY PART A

■ 7. Revise Appendix I to Part 60 to read as follows:

**Appendix I to Part 60—Owner’s Manuals for Wood-Burning Heaters Subject to Subparts AAA, QQQQ, and RRRR of Part 60**

**1. Introduction**

The purpose of this appendix is to provide specific instructions to manufacturers for compliance with the owner’s manual provisions of subparts AAA, QQQQ, and RRRR of this part.

**2. Instructions for Preparation of Wood Heater Owner’s Manuals**

**2.1 Introduction**

Although the owner’s manuals do not require premarket approval, EPA will monitor the contents to ensure that sufficient information is included to provide heater operation and maintenance information affecting emissions to consumers. The purpose of this section is to provide instructions to manufacturers for compliance with the owner’s manual provisions of § 60.536(f) of subpart AAA that applies to wood heaters, § 60.5478(f) of subpart QQQQ that applies to hydronic heaters and forced-air furnaces, and § 60.5490(g) of subpart RRRR that applies to masonry heaters. A checklist of topics and illustrative language

is provided as instructions. Owner’s manuals should be tailored to specific wood heater models, as appropriate.

**2.2 Topics Required To Be Addressed in Owner’s Manual**

- (a) Wood heater description and compliance status;
- (b) Tamper warning;
- (c) Catalyst information and warranty (if catalyst equipped);
- (d) Fuel selection;
- (e) Achieving and maintaining catalyst light-off (if catalyst equipped);
- (f) Catalyst monitoring (if catalyst equipped);
- (g) Troubleshooting catalytic equipped heaters (if catalyst equipped);
- (h) Catalyst replacement (if catalyst equipped);
- (i) Wood heater operation and maintenance; and
- (j) Wood heater installation: achieving proper draft.

**2.3 Sample Text/Descriptions**

(a) The following are example texts and/or further descriptions illustrating the topics identified above. Although the regulation requires manufacturers to address (where applicable) the ten topics identified above, the exact language is not specified. Manuals should be written specific to the model and design of the wood heater. The following

instructions are composed of generic descriptions and texts.

(b) If manufacturers choose to use the language provided in the example, the portion in italics should be revised as appropriate. Any manufacturer electing to use the EPA example language will be considered to be in compliance with owner’s manual requirements provided that the particular language is printed in full with only such changes as are necessary to ensure accuracy.

Example language is not provided for certain topics, since these areas are generally heater specific. For these topics, manufacturers should develop text that is specific to the operation and maintenance of their particular products.

**2.3.1 Wood Heater Description and Compliance Status**

Owner’s Manuals must include:

- (a) Manufacturer and model;
- (b) Compliance status (exempt, 1990 std., 2015 std., etc.); and
- (c) Heat output range.

Exhibit 1—Example Text covering (a), (b), and (c) above:

“This manual describes the installation and operation of the Brand X, Model 0 catalytic equipped wood heater. This heater meets the U.S. Environmental Protection Agency’s emission limits for wood heaters sold after January 1, 2015. Under specific test

conditions this heater has been shown to deliver heat at rates ranging from 8,000 to 35,000 Btu/hr.”

### 2.3.2 Tamper Warning

The following statement must be included in the owner's manual for catalyst-equipped units:

“This wood heater contains a catalytic combustor, which needs periodic inspection and replacement for proper operation. It is against the law to operate this wood heater in a manner inconsistent with operating instructions in this manual, or if the catalytic element is deactivated or removed.”

### 2.3.3 Catalyst Information

The following information must be included with or supplied in the owner's and warranty manuals:

- (a) Catalyst manufacturer and model;
- (b) Catalyst warranty details; and
- (c) Instructions for warranty claims.

Exhibit 2—Example Text covering (a), (b), and (c):

“The combustor supplied with this heater is a Brand Z, Long Life Combustor. Consult the catalytic combustor warranty also supplied with this wood heater. Warranty claims should be addressed to:

Stove or Catalyst Manufacturer \_\_\_\_\_

Address \_\_\_\_\_

Phone # \_\_\_\_\_

2.3.3.1 This section should also provide clear instructions on how to exercise the warranty (how to package for return shipment, etc.).

### 2.3.4 Fuel Selection

Owner's manuals must include:

- (a) Instructions on acceptable fuels; and
- (b) Warning against inappropriate fuels.

Exhibit 3—Example Text covering (a) and (b):

“This heater is designed to burn natural wood only. Higher efficiencies and lower emissions generally result when burning air dried seasoned hardwoods, as compared to softwoods or to green or freshly cut hardwoods.

DO NOT BURN:

- Treated Wood
- Coal
- Garbage
- Cardboard
- Solvents
- Colored Paper
- Trash

Burning treated wood, garbage, solvents, colored paper or trash may result in release of toxic fumes and may poison or render ineffective the catalytic combustor. Burning coal, cardboard, or loose paper can produce soot, or large flakes of char or fly ash that can coat the combustor, causing smoke spillage into the room, and rendering the combustor ineffective.”

### 2.3.5 Achieving and Maintaining Catalyst Light-Off

Owner's manuals must describe in detail proper procedures for:

- (a) Operation of catalyst bypass (stove specific),
- (b) Achieving catalyst light-off from a cold start, and

(c) Achieving catalyst light-off when refueling.

2.3.5.1 No example text is supplied for describing operation of catalyst bypass mechanisms (Item (a) above) since these are typically stove-specific. Manufacturers must provide instructions specific to their model describing:

(1) Bypass position during startup;

(2) Bypass position during normal operation; and

(3) Bypass position during reloading.

Exhibit 4—Example Text for Item (b):

“The temperature in the stove and the gases entering the combustor must be raised to between 500° to 700°F for catalytic activity to be initiated. During the startup of a cold stove, a medium to high firing rate must be maintained for about 20 minutes. This ensures that the stove, catalyst, and fuel are all stabilized at proper operating temperatures. Even though it is possible to have gas temperatures reach 600°F within 2 to 3 minutes after a fire is started, if the fire is allowed to die down immediately it may go out or the combustor may stop working. Once the combustor starts working, heat generated in it by burning the smoke will keep it working.”

Exhibit 5—Example Text for Item (c):

“REFUELING: During the refueling and rekindling of a cool fire, or a fire that has burned down to the charcoal phase, operate the stove at a medium to high firing rate for about 10 minutes to ensure that the catalyst reaches approximately 600 °F.”

### 2.3.6 Catalyst Monitoring

Owner's manuals must include:

(a) Recommendation to visually inspect combustor at least three times during the heating season;

(b) Discussion on expected combustor temperatures for monitor-equipped units; and

(c) Suggested monitoring and inspection techniques.

Exhibit 6—Example Text covering (a), (b) and (c):

“It is important to periodically monitor the operation of the catalytic combustor to ensure that it is functioning properly and to determine when it needs to be replaced. A non-functioning combustor will result in a loss of heating efficiency, and an increase in creosote and emissions. Following is a list of items that should be checked on a periodic basis:

- Combustors should be visually inspected at least three times during the heating season to determine if physical degradation has occurred. Actual removal of the combustor is not recommended unless more detailed inspection is warranted because of decreased performance. If any of these conditions exists, refer to Catalyst Troubleshooting section of this owner's manual.

- This catalytic heater is equipped with a temperature probe to monitor catalyst operation. Properly functioning combustors typically maintain temperatures in excess of 500 °F, and often reach temperatures in excess of 1,000 °F. If catalyst temperatures are not in excess of 500 °F, refer to Catalyst Troubleshooting section of this owner's manual.

- You can get an indication of whether the catalyst is working by comparing the amount of smoke leaving the chimney when the smoke is going through the combustor and catalyst light-off has been achieved, to the amount of smoke leaving the chimney when the smoke is not routed through the combustor (bypass mode).

Step 1—Light stove in accordance with instructions in 3.3.5.

Step 2—With smoke routed through the catalyst, go outside and observe the emissions leaving the chimney.

Step 3—Engage the bypass mechanism and again observe the emissions leaving the chimney.

Significantly more smoke should be seen when the exhaust is not routed through the combustor (bypass mode). Be careful not to confuse smoke with steam from wet wood.”

### 2.3.7 Catalyst Troubleshooting

The owner's manual must provide clear descriptions of symptoms and remedies to common combustor problems. It is recommended that photographs of catalyst peeling, plugging, thermal cracking, mechanical cracking, and masking be included in the manual to aid the consumer in identifying problems and to provide direction for corrective action.

### 2.3.8 Catalyst Replacement

The owner's manual must provide clear step-by-step instructions on how to remove and replace the catalytic combustor. The section should include diagrams and/or photographs.

### 2.3.9 Wood Heater Operation and Maintenance

Owner's manual must include:

- (a) Recommendations about building and maintaining a fire;
- (b) Instruction on proper use of air controls;
- (c) Ash removal and disposal;
- (d) Instruction on gasket replacement; and
- (e) Warning against overfiring.

2.3.9.1 No example text is supplied for (a), (b), and (d) since these items are model specific. Manufacturers should provide detailed instructions on building and maintaining a fire including selection of fuel pieces, fuel quantity, and stacking arrangement. Manufacturers should also provide instruction on proper air settings (both primary and secondary) for attaining minimum and maximum heat outputs and any special instructions for operating thermostatic controls. Step-by-step instructions on inspection and replacement of gaskets should also be included. Manufacturers should provide diagrams and/or photographs to assist the consumer. Gasket type and size should be specified.

Exhibit 7—Example Text for Item (c):

“Whenever ashes get 3 to 4 inches deep in your firebox or ash pan, and when the fire has burned down and cooled, remove excess ashes. Leave an ash bed approximately 1 inch deep on the firebox bottom to help maintain a hot charcoal bed.”

“Ashes should be placed in a metal container with a tight-fitting lid. The closed container of ashes should be placed on a noncombustible floor or on the ground, away

from all combustible materials, pending final disposal. The ashes should be retained in the closed container until all cinders have thoroughly cooled.”

Exhibit 8—Example Text covering Item (e):  
“DO NOT OVERFIRE THIS HEATER”

“Attempts to achieve heat output rates that exceed heater design specifications can result in permanent damage to the heater and to the catalytic combustor if so equipped.”

2.3.10 Wood Heater Installation:

Achieving Proper Draft

Owner’s manual must include:

(a) Importance of proper draft;  
(b) Conditions indicating inadequate draft;  
and

(c) Conditions indicating excessive draft.  
Exhibit 9—Example Text for Item (a):

“Draft is the force which moves air from the appliance up through the chimney. The amount of draft in your chimney depends on the length of the chimney, local geography, nearby obstructions, and other factors. Too much draft may cause excessive temperatures in the appliance and may damage the catalytic combustor. Inadequate draft may

cause backpuffing into the room and ‘plugging’ of the chimney or the catalyst.”

Exhibit 10—Example Text for Item (b):  
“Inadequate draft will cause the appliance to leak smoke into the room through appliance and chimney connector joints.”

Exhibit 11—Example Text for Item (c):  
“An uncontrollable burn or a glowing red stove part or chimney connector indicates excessive draft.”

Hon. Joseph J. Martens  
Commissioner  
New York State Department of Environmental Conservation  
625 Broadway  
Albany, NY 12233-1010

**Re: Global Companies LLC Port of Albany Crude Oil Shipments: Request to Withdraw Notice of Complete Application, Rescind Negative Declaration and Issue Positive Declaration, Revoke Prior Permit Modification, and Comply With Environmental Justice Policy**

Dear Commissioner Martens:

Earthjustice submits this letter on behalf of Sierra Club Atlantic Chapter, the Ezra Prentice Homes Tenants' Association, the Center for Biological Diversity, Riverkeeper, Inc., Natural Resources Defense Council, Environmental Advocates of New York, Catskill Mountainkeeper, Albany City Council President Carolyn McLaughlin, Albany City Councilmember Leah Golby, Albany City Councilmember Dorcey Appliers, Albany City Councilmember Judd Krasher, Albany City Councilmember Vivian Kornegay, Albany County Legislator Bryan M. Clenahan, Albany County Legislator Doug Bullock, People of Albany United for Safe Energy, MoveOn.Org Capital Region Council, Transition Albany, Save the Pine Bush, Bethlehem Neighbors for Peace, Restore Our Waterfront, Occupy Albany, the Muslim Solidarity Committee, and the Solidarity Committee of the Capital Region to request that the New York State Department of Environmental Conservation ("DEC" or "Department") take immediate action to address the environmental and public health and safety threat posed by massive rail shipments of volatile crude oil into the Port of Albany. Within the past year, over one billion gallons of explosive Bakken crude oil has been shipped into the Port by rail; hundreds of crude oil rail cars are being stored just feet away from homes and playgrounds; and long lines of crude oil rail cars routinely stretch for miles along Route 787 through the heart of downtown Albany. All of this has occurred without the thorough environmental review required by state law, and without any attempt to engage the residential communities that are bearing the brunt of this unprecedented industrial activity as required by the Department's Environmental Justice Policy.

For the reasons set forth in this letter, we urge DEC to require a full environmental impact statement and environmental justice analysis and process for (1) the pending application by Global Companies, LLC ("Global") for a modification of the Clean Air Act Title V Air Facility Permit ("Title V Permit") for Global's Port of Albany Terminal, and (2) the prior modification to the Title V Permit, approved by DEC in November 2012, which allowed Global to double the throughput of Bakken crude oil at the Albany Terminal.

NORTHEAST 48 WALL STREET, 19<sup>TH</sup> FLOOR NEW YORK, NY 10005

T: 212.845.7376 F: 212.918.1556 NEOFFICE@EARTHJUSTICE.ORG WWW.EARTHJUSTICE.ORG

FOIL 140072 008578

In 2011, the Department determined that Global's Albany Terminal operations potentially affect an environmental justice area within the meaning of DEC's Environmental Justice Policy, Commissioner's Policy 29, Environmental Justice and Permitting (March 19, 2003) ("CP-29"). This determination was reiterated by the Department on July 25, 2013. We respectfully bring to your attention the fact that, despite these determinations, neither Global nor DEC have complied with the environmental justice policies and procedures set forth in CP-29 regarding either Global's November 2011 Title V Permit modification or Global's pending Title V Permit modification.

Specifically, Global has failed to prepare and submit to DEC – much less implement – a written Public Participation Plan as required by CP-29. Moreover, the Department issued a Notice of Complete Application despite the fact that CP-29 explicitly requires that a Public Participation Plan be prepared and submitted to DEC before an application potentially affecting an environmental justice community can be considered complete. Additionally, the Department has failed to conduct a coordinated review with the City of Albany Planning Board as required by CP-29. As a result of the joint failure by Global and DEC to comply with the Department's Environmental Justice Policy, the neighboring environmental justice communities and their elected officials were not provided with adequate notification or information regarding Global's prior and current proposals to significantly increase dangerous industrial activities at the Albany Terminal. Consequently, the neighboring environmental justice communities bearing a disproportionate share of the environmental and public health risks from Global's industrial operations have been excluded from the permit review process, and the health and safety concerns of families living within feet of those operations have been neither solicited nor considered.

Additionally, neither Global nor DEC has addressed the broader concerns of those who live and work in Albany regarding the potentially catastrophic environmental and public health consequences of an accident involving Global's Bakken crude oil shipments or the newly proposed import of (what we believe to be) tar sands oil. As discussed in detail below, the recent epidemic of derailments and explosions involving Bakken crude rail shipments make clear that a similar accident at or near the Albany Terminal could have horrific consequences. The proximity of the Albany Terminal to thousands of homes and to downtown Albany – and the concentration at the Terminal of hundreds of tank rail cars carrying Bakken crude – make it likely that an accident will result in serious loss of human life and destruction of homes and businesses. Moreover, the location of the Albany Terminal in the floodplain of the Hudson River and the massive transfers of crude oil at the Terminal onto river barges create a serious threat of long-term and potentially irreversible environmental harm in the event of an explosion or spill, particularly one involving viscous tar sands oil.

In light of these concerns, we respectfully request that the Department withdraw its Notice of Complete Application regarding Global's application for a Title V Permit modification unless and until Global and the Department comply with the requirements of CP-29, and unless and until Global specifically identifies the origin and type of crude oil that it seeks to heat. Upon information and belief, Global is applying for new heating capability at the Albany Terminal in order to import, store and transfer tar sands oil. Because tar sands oil has potentially significant

adverse environmental impacts that are different in type and degree from oil currently handled at the Albany Terminal, and because the Albany Terminal is located in the floodplain of the Hudson River and is adjacent to or directly upstream of several areas designated as Significant Coastal Fish and Wildlife Habitats, Global should be required to fully evaluate and avoid or mitigate those potential impacts as required by the State Environmental Quality Review Act, Environmental Conservation Law Article 8 ("SEQRA").

Because Global and the Department have failed to comply with CP-29 and have failed to address the environmental impacts associated with the proposed handling of tar sands oil, we also request that the Department rescind the Negative Declaration previously issued for the proposed modification to the Title V Permit and issue a Positive Declaration requiring that an environmental impact statement be prepared as required by SEQRA.

We also respectfully request that the Department exercise its authority under the Uniform Procedures Act and the Department's implementing regulations to revoke the November 2012 modification to Global's Title V Permit because (i) Global made materially false and inaccurate statements in its permit application claiming that the doubling of throughput of crude oil would result in no additional train traffic at the Albany Terminal; (ii) significant and material new information has become available since the prior Title V Permit modification demonstrating that Bakken crude oil poses significant environmental and public health and safety threats that were not considered or addressed in the prior modification; and (iii) Global and DEC failed to comply with CP-29 during the prior Title V Permit modification.

We respectfully submit that the above actions are necessary and proper in order to fulfill the directives set forth in Executive Order 125 issued by Governor Cuomo on January 29, 2014, Directing the Department of Environmental Conservation, the Department of Transportation, the Division of Homeland Security and Emergency Services, the Department of Health, and the New York State Energy Research and Development Authority to Take Action to Strengthen the State's Oversight of Shipments of Petroleum Products ("Executive Order 125"), annexed hereto as Exhibit A. Executive Order 125 requires, among other things, that DEC and the other agencies named in the Order submit a report to the Governor by April 30, 2014 that includes:

- (i) a summary of the State's readiness to prevent and respond to rail and water accidents involving petroleum products;
- (ii) recommendations concerning statutory, regulatory, or administrative changes needed at the State level to better prevent and respond to accidents involving the transportation of crude oil and other petroleum products by rail, ship, and barge;
- (iii) recommendations concerning the role that local governments across the State have in protecting their communities and their residents from spill of petroleum products shipped by rail and water; and
- (iv) recommendations concerning enhanced coordination between the State and federal agencies in order to improve the State's capacity to prevent and respond to accidents involving the transportation of crude oil and other petroleum products by rail, ship and barge.

Exhibit A at 2.

The Executive Order's requirement that DEC and the other named agencies assess the State's readiness to prevent and respond to rail and water accidents involving petroleum products and make recommendations concerning ways to better prevent and respond to accidents makes clear that a comprehensive review of crude oil operations at the Albany Terminal, and the environmental and public health and safety risks posed by those operations, must be conducted and included in the report to the Governor. In fact, Executive Order 125 specifically references the significant increase in shipments of Bakken crude oil to the Albany Terminal as grounds for requiring the report. *See* Exhibit A at 1 ("there has been a significant expansion in the use of the Port of Albany in the distribution and transportation of crude oil and other petroleum products by rail, ship and barge"). The most expedient, thorough, and publicly accountable way to conduct such a comprehensive review is through an environmental impact statement ("EIS") prepared pursuant to SEQRA. Consequently, we urge the Department to immediately suspend its review of Global's pending application, revoke the prior permit modification, issue a Positive Declaration requiring Global to prepare an EIS concerning all aspects of its Albany Terminal operations, and ensure that the requirements of the Department's Environmental Justice Policy are complied with by Global and Department staff.

#### **I. DEC's Environmental Justice Policy**

The Department's Environmental Justice Policy "provides guidance for incorporating environmental justice concerns into the [DEC] environmental permit review process and the DEC application of the State Environmental Quality Review Act." CP-29 at 1. The policy was issued to address "the lack of meaningful public participation by minority or low-income communities in the permit process; the unavailability or inaccessibility of certain information to the public early in the permit process; and the failure of the permit process to address disproportionate adverse environmental impacts on minority and low-income communities." *Id.* In order to address these concerns, CP-29 establishes "the general policy of DEC to promote environmental justice and incorporate measures for achieving environmental justice into its programs, policies, regulations, legislative proposals and activities." *Id.* at 2. Furthermore, CP-29 provides that "[t]his policy is specifically intended to ensure that DEC's environmental permit process promotes environmental justice." *Id.* (emphasis added).

CP-29 defines "environmental justice" as:

the fair treatment and meaningful involvement of all people regardless of race, color, or income with respect to the development, implementation, and enforcement of environmental laws, regulations and policies. Fair treatment means that no group of people, including a racial, ethnic, or socioeconomic group, should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies.

*Id.* at 3.

CP-29 directs that, upon receipt of a permit application subject to the policy, DEC must conduct a preliminary screen to identify whether the proposed action is in or near a potential environmental justice area and determine whether potential adverse environmental impacts related to the proposed action are likely to affect a potential environmental justice area. *Id.* at 7. Where a potential environmental justice area is identified by the preliminary screen, DEC must provide the applicant with relevant information on environmental justice. *Id.* at 8.

The centerpiece of CP-29 is its requirement for enhanced public participation for actions potentially affecting an environmental justice area. The policy provides that, “[w]here a potential environmental justice area is identified by the preliminary screen, *the applicant shall submit a written public participation plan as part of its complete application.*” *Id.* at 8; (emphasis added). The policy requires that, at a minimum, the Public Participation Plan identify stakeholders, including nearby residents, local elected officials, community-based organizations, and community residents; provide for distribution and posting of written information on the proposed action and permit review process; provide for public information meetings to keep the public informed about the proposed action and permit review process; and establish easily accessible document repositories in or near the potential environmental justice area to make available pertinent information. *Id.* The applicant is also required to submit a report summarizing progress on implementing the plan, all substantive concerns raised, all resolved and outstanding issues, the components of the plan yet to be implemented, and an expected timeline for completing the plan. Upon completion of the plan, the applicant must submit a written certification that it has complied with the plan, including an updated status report. *Id.*

CP-29 also requires that where a potential environmental justice area is identified by the preliminary screen, a full environmental assessment form must be completed for Type I and Unlisted actions, and specifies that “DEC shall coordinate the review of the action with the other involved state and local agencies.” *Id.* at 9.

## II. Global’s Massive Increase in Industrial Operations at the Albany Terminal

On or about November 14, 2011, Global submitted an application for a Title V Permit modification to allow it to double crude oil storage and loading capabilities at the Albany terminal to 1.8 million gallons calculated on a 12-month rolling basis. By letter dated December 14, 2011, DEC requested additional information regarding the proposed change in terminal operations and the potential environmental impacts associated with the requested permit modification. The DEC letter also notified Global that the requested permit modification “is considered to be a major modification with respect to your Air permit *and your facility is located within an area that has been identified as a potential Environmental Justice area . . . Therefore, as part of the review process for this proposed modification, you will need to address CP-29 as it relates to your proposal.*” Letter from Angelo Marcuccio, DEC Environmental Analyst to Thomas Keefe, Global Companies, LLC (Dec. 14, 2011) (“Marcuccio Letter”) at 2 (emphasis added). A copy of the Marcuccio Letter is annexed as Exhibit B.

Global responded to the Marcuccio Letter by letter dated March 2, 2012 from its consultant, Ingalls & Associates, LLP, stating that the proposed terminal modifications included reconfiguring an existing intermodal rail yard to permit offloading of petroleum products via rail,

expansion of Global's existing rail loading/unloading rack, and expansion of the existing marine loading terminal. Letter from Ameila Leonard, Environmental Specialist, Ingalls & Associates, LLP, to Angelo Marcuccio, DEC (March 2, 2012) ("Ingalls Letter"), annexed hereto (without attachments) as Exhibit C, at 1. The Ingalls Letter stated that construction activities associated with the proposed modifications would disturb approximately seven acres of land at the Albany terminal. *Id.* at 2.

Despite the fact that Global was seeking to double crude oil throughput at the Albany Terminal and that the increase would require 7 to 10 additional barges per month, Global made the remarkable claim that "future train traffic will be almost identical to existing train traffic." *Id.* at 3. As discussed below, this claim constitutes a materially false and inaccurate statement within the meaning of 6 NYCRR § 621.13(a)(1).

With respect to the environmental justice issue raised in the Marcuccio Letter, Global responded as follows:

While we recognize that the requested permit modification is considered to be a major modification with respect to the Air Permit, and that the Albany Terminal is located within a potential Environmental Justice Area, no potential adverse environmental impacts related to the proposed action are likely to affect the area. In fact, the project will likely result in environmental benefits for residents of the area of concern. As a result, no further EJ review is required of the proposed project based on the preliminary screening criteria detailed in CP-29.

*Id.* at 4.

This statement is flawed in several respects. First, the claim that "no potential adverse environmental impacts related to the proposed action are likely to affect the [environmental justice] area" is contradicted by the fact that the application sought a massive expansion of operations at Global's Albany terminal, with the attendant increased risk of fire, explosion and spills. Second, the claim that the project would result in environmental benefits for nearby residents is lacking in credibility, to say the least, and was made without any effort to solicit the views of the affected neighboring community. Third, even if Global's environmental claims were true, the statement that no further environmental justice review was required by CP-29 is simply wrong. CP-29 requires an enhanced public participation plan to be prepared, submitted and implemented if a potential environmental justice area is identified by the preliminary screen, regardless of an applicant's claim that the area will not be adversely affected by the project. *See* CP-29 at 8 ("Where a potential environmental justice area is identified by the preliminary screen, *the applicant shall submit a written public participation plan as part of its complete application*") (emphasis added).

Unfortunately, the Department apparently never questioned Global's environmental claims and failed to correct Global's misinterpretation of CP-29. As a result, no Public Participation Plan was prepared by Global, and the enhanced public participation requirements of CP-29 were ignored. Despite CP-29's clear mandate that a written Public Participation Plan must be submitted before an application may be deemed complete, the Department issued a

Notice of Complete Application, ignoring Global's failure to comply with this key requirement.<sup>1</sup> See Notice of Complete Application (July 25, 2012), annexed hereto as Exhibit D.

On or about July 25, 2012, the Department announced in the Environmental Notice Bulletin ("ENB") that it had prepared a draft Title V Permit approving Global's application and that the Department had issued a Negative Declaration for the project. ENB Region 4 Completed Applications Albany County (July 25, 2012), annexed hereto as Exhibit E. Despite that fact that Global had stated in its application that building permits for the proposed project were required from the City of Albany, see Exhibit C at 2, the Department's ENB notice stated that no coordinated review had been performed. *Id.* This was in derogation of CP-29's explicit requirement that projects potentially affecting environmental justice areas be subject to coordinated review. CP-29 at 9. Indeed, the ENB notice makes no mention of the fact that Global's proposed project had been determined by DEC to potentially affect an environmental justice area and was therefore subject to the requirements of CP-29. See Exhibit E.

Subsequently, on or about June 1, 2013, Global submitted another application to modify its Title V Permit to expand the capabilities at the Albany Terminal to include the storage of heated petroleum products. The proposed project involves the installation of seven gas-fired boilers, reconfiguration of an existing intermodal rail yard to allow offloading of those heated petroleum products, and the installation of emission controls in one tank (Tank 33) to allow for the storage of crude oil. By Notice of Incomplete Application dated July 25, 2013, DEC notified Global that "[t]he facility is located within a potential Environmental Justice area . . . Please provide a response indicating how the applicant is proposing to comply with the Department's Environmental Justice and Permitting Policy, CP-29." DEC Notice of Incomplete Application (July 25, 2013) (emphasis added), annexed hereto as Exhibit F.

By letter dated September 6, 2013, Global responded to the Notice of Incomplete Application through its consultant, EnviroSpec Engineering, PLLC. With respect to the environmental justice issue, Global again misinterpreted and misapplied CP-29:

The nearest residences to the proposed project are located approximately 800 feet northwest of Kenwood Yard on Franklin Street. The Port area has been industrialized for many years and Global's activities do not alter the character of the area, nor do any emissions, noise or lighting conditions substantially change the status quo that has existed to the east of the Interstate. The attached Expanded Narrative addresses environmental concerns associated with the proposed heated product project, including a traffic analysis, visual analysis, noise analysis and a

---

<sup>1</sup> This error was compounded by the Department's conclusion in its subsequent Notice of Complete Application that "[i]t has been determined that the proposed project is not subject to CP-29." The basis for DEC's about-face on the applicability of CP-29 was not explained. There is no indication that DEC had concluded that its preliminary screening analysis was in error, nor is there any reference to any provision of CP-29 supporting the revised determination of CP-29 inapplicability. In fact, the determination directly contradicts DEC's initial determination on December 14, 2011 that the project was subject to CP-29, and DEC's reiteration of that determination in July 2013 (discussed below).

review of odor control at the Terminal. As the Expanded Narrative indicates, the proposed project will not have any adverse environmental impacts. As a result, no further environmental justice analysis is required, consistent with the methodology for conducting a preliminary screen found in DEC Policy CP-29.

Letter from Nicole Brower, PE, Envirospec Engineering, PLLC, to Karen M. Gaidasz, DEC Region 4 (Sept. 6, 2013), annexed hereto as Exhibit G, at 2.

Global apparently relied on this self-serving analysis to justify its failure to comply with the requirement of CP-29 that a Public Participation Plan be prepared and implemented – a requirement that applies regardless of the applicant’s claim (made without any input from the affected communities) that neighboring environmental justice communities will not be adversely affected by the proposed project.

On November 21, 2013, the Department issued a Notice of Complete Application and subsequently published notice of the application, together with notification that a Negative Declaration had been issued for the proposed modification, in the ENB. *See* ENB Region 4 Completed Applications Albany County (Dec. 31, 2013) annexed hereto as Exhibit H. DEC issued the Notice of Complete Application even though Global had again failed to comply with CP-29’s requirement that a Public Participation Plan be submitted as part of its application. Also, as was the case with the prior permit modification, DEC failed to conduct the coordinated review required by CP-29. *See id.* at 2.

### **III. The Notice of Complete Application Should Be Withdrawn**

Because neither Global nor the Department has complied with the requirements of CP-29, the Notice of Complete Application should be withdrawn. As noted above, once the preliminary screen has identified an environmental justice community, the applicant must prepare and submit a Public Participation Plan as part of its application. CP-29 at 8. This requirement applies regardless of an applicant’s claims that its project will have no adverse impact on the identified environmental justice community. Because Global has failed to submit a written Public Participation Plan, its application is incomplete and the Notice of Complete Application was erroneously issued.

### **IV. The Negative Declaration Should Be Rescinded and a Positive Declaration Issued**

As Global acknowledges in its application, the need for installation of new heating processes at the Albany Terminal is the result of the viscosity of the new product (which Global has not identified) that will be coming into the Terminal. Upon information and belief, the new product will include crude oil extracted from tar sands in western Canada. Neither Global nor the Department has adequately addressed the potential adverse environmental and human health impacts that may result from an accident involving tar sands oil. In fact, those potential impacts make clear that the issuance of a Negative Declaration for this project was in error.

The impacts of a spill of tar sands oil could be disastrous. Unlike oil from other sources, tar sands oil often arrives into the United States from Canada as diluted bitumen, “a highly corrosive, acidic, and potentially unstable blend of thick raw bitumen and volatile natural gas liquid condensate.”<sup>2</sup> A leak or spill of diluted bitumen presents an elevated risk to the environment and public safety. The chemicals used to dilute the bitumen are hazardous and more likely to ignite or explode than conventional crude. An explosion of diluted bitumen may produce hydrogen sulfide, a highly toxic gas which can cause suffocation. Diluted bitumen also contains benzene, polycyclic aromatic hydrocarbons, and other toxins that can affect the human central nervous system.<sup>3</sup>

In addition, a spill of tar sands oil into water is extremely difficult to clean up because bitumen sinks, placing waterways and sources of drinking water at greater risk. More than three years after the spill of tar sands oil into Talmadge Creek and the Kalamazoo River in Michigan, the river’s bottom sediment remains contaminated and the U.S. Environmental Protection Agency estimates that 180,000 gallons of oil have yet to be recovered.<sup>4</sup> Health impacts ranging from headaches to chronic coughing have been reported by individuals living close to the Kalamazoo River.<sup>5</sup>

The potential environmental impacts associated with a tar sands oil explosion or spill meet the criteria for significance set forth in DEC’s SEQRA regulations. Specifically, they meet the criteria in 6 NYCRR §§ 617.7(c)(1)(i) (“a substantial adverse change in existing air quality, ground or surface water quality”); 617.7(c)(1)(ii) (“other significant adverse impacts to natural resources”); 617.7(c)(1)(v) (“the impairment of . . . existing community or neighborhood character”); and 617.7(c)(1)(vii) (“the creation of a hazard to human health”).

Moreover, the SEQRA regulations require that the significance of a likely consequence be assessed in connection with its setting, probability of occurrence, duration, irreversibility, geographic scope, magnitude, and number of people affected. 6 NYCRR § 617.7(c)(3). Here, the effects of a potential spill or explosion could be catastrophic, given the close proximity of Global’s Albany Terminal to residential housing, the Hudson River, and to the Normanskill, Paps cane Marsh and Creek, Shad and Schermerhorn Islands, and Schodack, Houghtaling Islands and Schodack Creek Significant Coastal Fish and Wildlife Habitats. For these reasons, the Department erred in issuing a Negative Declaration. See *Anderson v. Town of Chili Planning Board*, 12 N.Y.3d 901 (2009) (town planning board violated SEQRA by failing to consider effects of potential explosion and fire at proposed metal shredder); *Riverhead Bus. Imp. Dist. Mgmt. Ass’n, Inc. v. Stark*, 253 A.D.2d 752, 753 (2d Dep’t 1998) (annulling town board’s negative declaration because possible release of toxic or hazardous materials into groundwater

<sup>2</sup> Natural Resources Defense Council, *Tar Sands Pipelines Safety Risks*, 5 (Feb. 2011).

<sup>3</sup> *Ibid.*

<sup>4</sup> U.S. Environmental Protection Agency, *Dredging Begins on Kalamazoo River* (Aug. 2013), available at [http://www.epa.gov/region05/enbridgespill/pdfs/enbridge\\_fs\\_201308.pdf](http://www.epa.gov/region05/enbridgespill/pdfs/enbridge_fs_201308.pdf).

<sup>5</sup> CBC News, *Enbridge’s Kalamazoo cleanup dredges up 3-year-old oil spill* (Sept. 6, 2013), available at <http://www.cbc.ca/news/politics/enbridge-s-kalamazoo-cleanup-dredges-up-3-year-old-oil-spill-1.1327268>.

and potential for accidental release or explosion were significant effects requiring preparation of an EIS); *Price v. Common Council of City of Buffalo*, 3 Misc. 3d 625 (Sup. Ct. Erie County 2004) (holding that city council violated SEQRA by failing to take “hard look” at hospital’s helipad proposal because it failed to consider potential danger to surrounding neighborhood of fire and explosion of liquid oxygen tanks); *see also Gov’t of the Province of Manitoba v. Salazar*, 691 F. Supp. 2d 37, 50 (D.D.C. 2010) (“It may be that the risk of a breach is low given the pipeline’s construction, but that is not an excuse . . . to refuse entirely to analyze the consequences. When the degree of potential harm could be great, *i.e.*, catastrophic, the degree of analysis and mitigation should also be great”) (emphasis in original); *San Luis Obispo Mothers for Peace v. Nuclear Regulatory Comm’n*, 449 F.3d 1016, 1033 (9th Cir. 2006) (requiring preparation of an EIS due to “events with potentially catastrophic consequences ‘even if their probability of occurrence is low, provided that the analysis of impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason’”) (internal citations omitted); *Tri-Valley Cares v. Dep’t of Energy*, 203 F. App’x 105, 107 (9th Cir. 2006) (holding that potential terrorist attack on proposed biological weapons laboratory required to be considered as part of National Environmental Policy Act environmental assessment).

Moreover, because Global failed in its application for a modification to the Title V Permit to specifically identify that it is proposing to import, for the first time, tar sands oil to the Albany Terminal, this constitutes discovery of “new information” and a “change in circumstance . . . not previously considered” providing grounds for rescission of the Negative Declaration. *See* 6 NYCRR §§ 617.7(f)(1)(ii) and (iii). The SEQRA regulations specifically allow rescission of a Negative Declaration “at any time prior to [an agency’s] decision to undertake, fund or approve an action.” 6 NYCRR § 617.7(f). Since no final decision on Global’s application has been made, rescission of the Negative Declaration is permissible and appropriate.

**V. The Department Should Revoke the November 2012 Permit Modification Based on Global’s False and Inaccurate Statements, the Availability of Material New Information Regarding Bakken Crude Oil, and the Failure to Comply With CP-29**

DEC’s regulations implementing the Uniform Procedures Act authorize the Department to revoke a permit if there are “materially false or inaccurate statements in the permit application or supporting papers,” or based on “newly discovered material information . . .” 6 NYCRR §§ 621.13(a)(1) and (4). In this case, both grounds exist for initiating a permit modification with respect to the Title V Permit modification approved by DEC in November 2012. Additionally, neither Global nor the Department complied with the requirements of CP-29 during the prior Title V permit modification, and the prior permit modification should be revoked for this reason as well.

**A. Materially False and Inaccurate Statements**

As noted above, in its application materials for the prior Title V Permit modification, Global repeatedly claimed that its doubling of crude oil throughput at the Albany Terminal would result in no increase in rail traffic. *See* Exhibit C at 2-3 (“future train traffic will be almost identical to existing train traffic”); *id.* at 5 (“the project will result in no increase in rail traffic”).

It is perplexing how this claim could have gone unquestioned by DEC. It defies credibility that Global could *double* the throughput of crude oil at the Albany Terminal without *any* increase in rail traffic – particularly since Global also predicted a “substantial decrease” in truck traffic. *Id.* at 2-3. Moreover, Global’s acknowledgement in its application that an additional 7 to 10 barges would be required each month to handle the increased throughput should have raised red flags concerning its specious assertion that all of this additional crude oil would arrive at the Albany Terminal without any increase in rail traffic.

In any event, Global’s claim appears to be demonstrably false. As anyone who lives or works in Albany or has traveled along Route 787 can attest, Global’s expansion of crude oil throughput appears to have vastly increased rail traffic at and near the Albany Terminal. Hundreds of tank rail cars are routinely parked directly adjacent to the Ezra Prentice Homes and in the Port of Albany rail yard, and lines of tank cars stretch for miles on the tracks running along Route 787 through the heart of downtown Albany and right past DEC headquarters. Indeed, the vast increase in rail traffic at the Albany Terminal is specifically recognized in Executive Order 125. *See* Exhibit A at 1 (“there has been a significant expansion in the use of the Port of Albany in the distribution and transportation of crude oil and other petroleum products by rail, ship and barge . . .”). Photographs depicting the tank rail car congestion and its proximity to homes and downtown Albany are annexed hereto as Exhibit I.

To put it bluntly, Global knew or should have known that doubling the throughput at the Albany Terminal would likely result in a significant increase in rail traffic. Its statements to the contrary were thus materially false and inaccurate, and provide grounds for DEC to revoke the prior permit modification in order to fully evaluate the environmental justice, environmental, and public health and safety impacts associated with the increased rail traffic.

#### B. Material New Information

Even if Global’s claims regarding rail traffic were true, DEC should revoke the prior permit modification based on material new information regarding the dangers associated with rail transport of highly flammable, explosive Bakken crude oil. Multiple derailments in the last six months of trains carrying Bakken crude oil have resulted in enormous conflagrations of burning crude, millions of gallons of oil spilled into nearby water bodies, and, in a single accident, significant loss of human life. As Executive Order 125 recognizes, “Bakken crude oil has a lower flashpoint and is therefore more prone to ignite during a rail accident.” Exhibit A at 1. The environmental and public safety issues associated with Global’s massive shipments of highly volatile Bakken crude oil were not addressed in the prior permit modification. Those issues must be addressed now before a potentially catastrophic accident occurs in the heart of downtown Albany.

Currently, hundred-car trains are carrying Bakken crude<sup>6</sup> southward along the western shore of Lake Champlain and to the Port of Albany, and are also converging on Albany and the

<sup>6</sup> Anderson, Eric, “Warning issued for crude oil: Agency says Bakken shale variety fire risk may be higher,” *Albany Times Union*, Jan. 2, 2014, available at <http://www.timesunion.com/business/article/Warning-issued-for-crude-oil-5109728.php#photo-5674154>.

Hudson River Valley from west-east rail lines. This volatile cargo has been the cause of numerous recent environmental and public safety incidents, including:

- the fiery derailment of a train at Casselton, North Dakota;<sup>7</sup>
- the evacuation of a New Brunswick town following a derailment and fire;<sup>8</sup>
- a train derailment in Pickens County, Alabama,<sup>9</sup> that caused an explosion and fire and spilled oil into a wetland feeding the Tombigbee River;<sup>10</sup> and
- on July 6, 2013, one of the worst train accidents ever in North America occurred at Lac-Mégantic, Quebec, when a 72-tanker<sup>11</sup> train carrying Bakken crude careened, unmanned, into town in the middle of the night, killing 47 people and incinerating the downtown area. Roughly 1.6 million gallons of crude oil spilled from the train, some of it reaching the lake that served as the focal point for this popular tourist town. Oil has been found as far as 74 miles downstream from the spill site.<sup>12</sup>

Earlier this month, in response to the recent spate of blazing derailments of trains carrying Bakken crude, the federal Pipeline and Hazardous Materials Safety Administration (PHMSA) issued a rare safety alert,<sup>13</sup> stating that crude oil produced in the Bakken region may be more flammable and therefore more dangerous than other types of crude oil. The alert included a reminder to emergency responders that light sweet crude, such as that from the Bakken region, has a flash point of below 73° F, and therefore “pose[s] significant fire risk if released from the package in an accident.”

Unfortunately PHMSA’s alert does nothing to reduce the risk of another disastrous derailment of a train carrying Bakken crude. While the recent North Dakota and Alabama wrecks occurred outside of populated areas and resulted in no human injuries, the consequences of a derailment in downtown Albany could be equally catastrophic as the Lac-Mégantic incident. And whether a derailment occurs in a town or in a rural area, spilled crude threatens surface and groundwater sources, wetlands, streams, rivers, and lakes, and other sensitive wildlife habitats.

<sup>9</sup> Karlamangla, Soumya, “Train in Alabama Oil Spill Was Carrying 2.7 Million Gallons of Crude,” *Los Angeles Times*, Nov. 9, 2013, available at <http://articles.latimes.com/2013/nov/09/nation/la-na-nn-train-crash-alabama-oil-20131109>.

<sup>10</sup> “Train carrying oil derails, explodes in Alabama,” *Al Jazeera America*, Nov. 8, 2013, available at <http://america.aljazeera.com/articles/2013/11/8/train-carrying-ilderailsexplodesinalabama.html>.

<sup>11</sup> McNish, Jacquie and Grant Robertson, “The Deadly Secret Behind the Lac-Mégantic Inferno.” *The Globe and Mail*, Dec. 3, 2013, available at <http://www.theglobeandmail.com/report-on-business/industry-news/energy-and-resources/the-hazardous-history-of-the-oil-that-levelled-lac-megantic/article15733700/?page=all>; see also Executive Order 125, Exhibit A at 1 (referencing the train derailment in Lac-Mégantic).

<sup>12</sup> Beaudin, Monique, “Lac-Mégantic Oil Spill Even Worse Than First Feared, Investigation Shows.” *Montreal Gazette*, Oct. 22, 2013, available at <http://www.montrealgazette.com/news/Mégantic+spill+even+worse+than+first+feared+investigation+shows/9063521/story.html>.

<sup>13</sup> “Preliminary Guidance from Operation Classification,” PHMSA, (Jan. 2, 2014), available at [http://phmsa.dot.gov/staticfiles/PHMSA/DownloadableFiles/1\\_2\\_14%20Rail\\_Safety\\_Alert.pdf](http://phmsa.dot.gov/staticfiles/PHMSA/DownloadableFiles/1_2_14%20Rail_Safety_Alert.pdf).

The environmental and public safety concerns associated with Bakken crude shipments into the Port of Albany are heightened by the rapid and significant increase in those shipments. In the last two years, the “Port of Albany has become a major transshipment point for Bakken crude.”<sup>14</sup> In addition to crude oil shipments on the Canadian Pacific line, CSX Transportation and Burlington Northern Santa Fe also ship Bakken crude by rail through the Albany area.<sup>15</sup> Moreover, plans are in the works to further escalate the amount of Bakken crude moving through upstate New York, as Albany and the Hudson River corridor become a major transportation funnel for oil shipped from the western United States and Canada to East Coast refineries.<sup>16</sup> As much as one-quarter of the shale oil being produced in North Dakota may now be moving by rail to the Port of Albany.<sup>17</sup>

The threat of derailment is not merely speculative. More oil was spilled due to train derailments in 2013 than in the previous 40 years combined.<sup>18</sup> Given the significant increase in crude oil rail traffic, the question is not *whether* a derailment will occur in the Albany area, but *when* it will occur.

Global’s prior false and inaccurate claims regarding the lack of increased rail traffic, together with the material new information concerning the dangers posed by Bakken crude, provide ample grounds for DEC to initiate a permit modification which should fully evaluate the environmental and public safety issues raised by Global’s massive increase in shipments of Bakken crude oil into the Port of Albany. Such a permit modification would provide the Department with a new opportunity to conduct a SEQRA review which almost certainly would require preparation of an environmental impact statement.

The potential environmental impacts associated with an accident involving Bakken crude oil meet the criteria for significance set forth in DEC’s SEQRA regulations. Specifically, they meet the criteria in 6 NYCRR §§ 617.7(c)(1)(i) (“a substantial adverse change in existing air quality, ground or surface water quality”); 617.7(c)(1)(ii) (“other significant adverse impacts to natural resources”); 617.7(c)(1)(v) (“the impairment of . . . existing community or neighborhood character”); and 617.7(c)(1)(vii) (“the creation of a hazard to human health”).

<sup>17</sup> Anderson, Eric, “Oil Shipments are Albany-bound: North Dakota Crude Will Be Shipped by Rail to Port, Loaded on Barges,” *Albany Times-Union*, Aug. 8, 2012, available at <http://www.timesunion.com/business/article/Oil-shipments-are-Albany-bound-3773979.php>.

<sup>18</sup> Tate, Curtis, “More oil spilled from trains in 2013 than in previous 4 decades,” MSN News, Jan. 21, 2014, available at <http://news.msn.com/us/more-oil-spilled-from-trains-in-2013-than-in-previous-4-decades>.

Moreover, as noted above, the SEQRA regulations require that the significance of a likely consequence be assessed in connection with its setting, probability of occurrence, duration, irreversibility, geographic scope, magnitude, and number of people affected. 6 NYCRR § 617.7(c)(3). Here, the effects of a potential spill or explosion could be catastrophic, given the fact that hundreds of rail cars sit in the rail yard at the Albany Terminal and on the tracks leading to the Terminal running through downtown Albany along heavily traveled Route 787, as well as the close proximity of residential housing, the Hudson River, and several Significant Coastal Fish and Wildlife Habitats. *See Anderson v. Town of Chili Planning Board*, 12 N.Y.3d 901 (town planning board violated SEQRA by failing to consider effects of potential explosion and fire at proposed metal shredder); *Riverhead Bus. Imp. Dist.*, 253 A.D.2d at 753 (annulling town board's negative declaration because possible release of toxic or hazardous materials into groundwater and potential for accidental release or explosion were significant effects requiring preparation of an EIS); *Price v. Common Council of City of Buffalo*, 3 Misc. 3d 625 (holding that city council violated SEQRA by failing to take "hard look" at hospital's helipad proposal because it failed to consider potential danger to surrounding neighborhood of fire and explosion of liquid oxygen tanks); *see also Gov't of the Province of Manitoba*, 691 F. Supp. 2d at 50 ("It may be that the risk of a breach is low given the pipeline's construction, but that is not an excuse . . . to refuse entirely to analyze the consequences. When the degree of potential harm could be great, i.e., catastrophic, the degree of analysis and mitigation should also be great") (emphasis in original); *San Luis Obispo Mothers for Peace*, 449 F.3d at 1033 (requiring preparation of an EIS due to "events with potentially catastrophic consequences 'even if their probability of occurrence is low, provided that the analysis of impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason'") (internal citations omitted); *Tri-Valley Cares*, 203 F. App'x at 107 (holding that potential terrorist attack on proposed biological weapons laboratory required to be considered as part of National Environmental Policy Act environmental assessment).

### C. Failure to Comply With CP-29

As noted above, despite the fact that the Department informed Global in December 2011 that its proposal to double crude oil throughput at the Albany Terminal would potentially affect an identified environmental justice community, neither Global nor DEC complied with the requirements of CP-29. *See Exhibit B*. No written public participation plan was prepared by Global, and the enhanced public participation requirements of CP-29 were ignored. Despite the fact that CP-29 clearly requires that, for projects for which an environmental justice community has been identified, a written public participation must be submitted before an application can be deemed complete, the Department noticed Global's application as complete in the absence of such a plan. *See CP-29 at 8; Exhibit D*. Moreover, despite the fact that Global notified the Department in its application that the proposed project required building permits from the City of Albany, DEC failed to conduct a coordinated review as required by CP-29. *See Exhibit C at 2; CP-29 at 9*. The failure of Global and DEC to comply with the Department's Environmental Justice Policy completely undermined the purposes of the Policy by denying the affected environmental justice community adequate notice of Global's proposed project and depriving that community of the opportunity to evaluate and voice their concerns about the project. Accordingly, to remedy this failure, we ask that you revoke the November 2012 permit modification and require Global and Department staff to comply with CP-29.

## VI. Conclusion

For the reasons set forth herein, we respectfully request that the Department (i) withdraw the Notice of Complete Application for the pending Title V Permit modification so that Global and DEC can comply with the requirements of CP-29; (ii) rescind the Negative Declaration for the pending Title V Permit modification and issue a Positive Declaration because tar sands oil has potentially significant adverse environmental impacts that are different in type and degree from oil currently handled at the Albany terminal, and because the Albany terminal is located in the floodplain of the Hudson River; and (iii) initiate a permit modification for Global's Albany Terminal based on Global's materially false and inaccurate statements in its prior permit application and based on material new information concerning the environmental and public safety hazards posed by rail shipment of Bakken crude oil. We believe these measures are necessary and prudent in order for the Department to comply with the letter and intent of Executive Order 125.

Thank you for the opportunity to submit these comments.

Sincerely,

Christopher Amato  
Staff Attorney

## Directing DEC, DOT, DHSES, DOH, and NYSERDA to Strengthen the State's Oversight of Shipments of Petroleum Products

[Printer-friendly version](#)

### Directing The Department of Environmental Conservation, The Department of Transportation, The Division of Homeland Security and Emergency Services, The Department of Health, and The New York State Energy Research and Development Authority to Take Action to Strengthen the State's Oversight of Shipments of Petroleum Products

WHEREAS, on July 6, 2013, a train derailment in Lac-Mégantic, Québec involving tank cars carrying crude oil caused the devastation of an entire community, the deaths of 47 persons, and the evacuation of thousands; and

WHEREAS, on December 30, 2013, a train derailment in Casselton, North Dakota caused 18 tank cars carrying crude oil to be punctured, spilling more than 400,000 gallons of crude oil into the environment, and causing a fire which resulted in the evacuation of more than one thousand Casselton residents; and

WHEREAS, rail cars transporting crude oil traverse 1,000 miles of New York State's 3,500-mile freight rail network, from Western New York along the Mohawk River and its communities to the Port of Albany, and from Canada across the border at Rouse's Point along Lake Champlain and through communities to the Port of Albany, where it is then transported south by rail, ship, and barge on or along the Hudson River and along or through New York communities to refineries in mid-Atlantic states; and

WHEREAS, much of the increase in the volume of crude oil transported is due to increased production from the Bakken formation in North Dakota, Montana, and Canada, which, due to lack of pipeline capacity, must be transported by rail; and

WHEREAS, historically, rail transport of crude oil is safer and more environmentally protective than truck transport; and

WHEREAS, there has been a significant expansion in the use of the Port of Albany in the distribution and transportation of crude oil and other petroleum products by rail, ship, and barge for shipment on and along the Hudson River and along or through our communities to out-of-state refineries and storage facilities; and

WHEREAS, the increase in frequency and numbers of rail cars, ships, and barges carrying crude oil and other petroleum products through hundreds of New York communities increases the public's vulnerability to a serious accident; and

WHEREAS, New York's waterways, including the Hudson River, Mohawk River, and Lake Champlain, on or along which rail cars, ships, and barges travel, are unique ecological, cultural, economic, natural, and recreational resources upon which millions of New Yorkers rely, which makes these waterways especially vulnerable to spills of crude oil and other petroleum products; and

WHEREAS, Bakken crude oil has a lower flashpoint and is therefore more prone to ignite during a rail accident; and

WHEREAS, the U.S. Department of Transportation (USDOT) is in the process of designating new safety standards and requirements for rail tank cars and evaluating potential new rules for the transportation of flammable liquids; and

WHEREAS, recognizing the value of these efforts, New York nevertheless cannot await the final outcome of these federal assessments before taking action; and

WHEREAS, New York is preempted by federal law from regulating rail freight transportation and rail car safety standards, and the navigation of vessels operating on the State's navigable waterways; and

**WHEREAS**, the New York State Department of Environmental Conservation (DEC) has jurisdiction over air permitting, oil spill response, and storage of petroleum products in bulk tanks; and

**WHEREAS**, the New York State Department of Transportation (DOT) has jurisdiction to inspect freight rail track and equipment; and

**WHEREAS**, the New York State Division of Homeland Security and Emergency Services (DHSES) provides assistance and support to local entities relating to emergency planning, training, and response to incidents, including petroleum spills and fires; and

**WHEREAS**, the New York State Department of Health (DOH) assesses and monitors the human exposure and public health impact of petroleum spills and fires, advises on the safe handling of hazardous materials and the cleanup of such materials, and provides public information on health impacts and protective measures; and

**WHEREAS**, the New York State Energy Research and Development Authority (NYSERDA) acts as a central clearinghouse for energy resource information, monitors and regularly reports on liquid fuel supply and market trends, and maintains data on major liquid fuel storage terminals;

**NOW, THEREFORE, I, Andrew M. Cuomo**, Governor of the State of New York, by virtue of the authority vested in me by the Constitution and the Laws of the State of New York, do hereby direct that:

1. DEC, DHSES, DOT, and DOH shall promptly petition USDOT, the U.S. Department of Energy (USDOE), the U.S. Department of Homeland Security (USDHS), and the U.S. Coast Guard (USCG) to upgrade tanker car and rail line safety, assess federal agency needs and risks, and pre-deploy appropriate spill response equipment and resources to protect New York State's communities, residents, land, and waterways from accidents involving the transportation of crude oil and other petroleum products by rail, ship, and barge; and
2. DEC and DHSES, working with DOT, DOH, and NYSERDA, shall, in consultation with USDOT, USDOE, USCG, and USDHS, conduct an assessment of the State's spill prevention and response rules and inspection programs governing the transportation of crude oil and other petroleum products by rail, ship, and barge; and
3. On or about April 30, 2014, DEC and DHSES, with DOT, DOH, and NYSERDA, shall submit to me a consolidated report summarizing the State's existing capacity to prevent and respond to accidents involving the transportation of crude oil and other petroleum products by rail, ship, and barge; and
4. This consolidated report shall include but shall not be limited to: (i) a summary of the State's readiness to prevent and respond to rail and water accidents involving petroleum products; (ii) recommendations concerning statutory, regulatory, or administrative changes needed at the State level to better prevent and respond to accidents involving the transportation of crude oil and other petroleum products by rail, ship, and barge; (iii) recommendations concerning the role that local governments across the State have in protecting their communities and their residents from spills of petroleum products shipped by rail and water; and (iv) recommendations concerning enhanced coordination between the State and federal agencies in order to improve the State's capacity to prevent and respond to accidents involving the transportation of crude oil and other petroleum products by rail, ship, and barge.

G I V E N under my hand and the Privy Seal of the  
State in the City of Albany this twenty-  
eighth day of January in the year two  
thousand fourteen.

BY THE GOVERNOR

Secretary to the Governor

Joe Martens  
Commissioner

December 14, 2011

Thomas Keefe  
Global Companies, LLC  
800 South Street  
PO Box 9161  
Waltham, MA 02454-9161

Re: DEC Application #4-0101-00112/00029  
Global Companies - Albany Terminal  
Air Title V permit modification application  
City of Albany, Albany County

Dear Mr. Keefe:

We reviewed the Title V permit modification application that Envirospec Engineering, PLLC submitted to the Department on your behalf on November 14, 2011. The application indicates that Global Companies proposes to modify the current Air Title V permit for this facility by expanding the crude oil storage and loading capabilities at the terminal by increasing the marine crude loading throughput to 1,850 million gallons of crude calculated on a 12-month rolling basis. Further, a second vapor combustion unit is also proposed for installation at the marine loading dock. Lastly, Global is also requesting to load 100 million gallons of distillates at a new rail loading area.

As part of the overall permit application review process the Department is required to evaluate the potential environmental impacts that the proposed modification may have, and to assure that the project meets the requirements of the Department of State Coastal Consistency Policy. In order for us to do so, and to continue with our review of the application, please provide the following information:

1. A site plan of the facility that shows the location of the proposed new Vapor Combustion Unit (VCU).
2. Please provide the manufacturer's specifications (model number, etc.) for the VCU to be installed at the marine dock unit.
3. Please provide details of the VCU including its dimensional height, width, color and what the final height would be after installation. Please indicate whether installation of the unit will involve new ground disturbance or will it occur on a previously disturbed area, or mounted on a building or other structure. Confirm that the new unit would not be in the flood plain or that Global Companies has received approval from the City of Albany to locate the new unit at its proposed location. A few photos showing the area where the VCU will be installed that are taken from different directions would be very helpful in determining how well the new unit will fit in with the surrounding features.

Thomas Keefe, Global Companies

Page 2

December 14, 2011

4. Please provide the same type of information for the new rail yard area such as dimensions of the area to be disturbed, photos, and any structures to be constructed, flood plain status, etc.
5. Describe and quantify any proposed increase in rail, truck, and barge traffic that would result from the increase in the amounts of crude oil and distillates proposed to be handled at this facility.
6. Describe current hours of operation and any changes that would occur should the proposed modification be approved.
7. Please discuss and quantify any increases in noise levels that would occur in the neighborhood as a result of the new rail operations and expanded marine operations. Noise levels should be evaluated based on the levels that would occur at the property line. Noise will be evaluated in accordance with the DEC Noise Policy, which is available for review on the DEC website.
8. Please discuss potential issues with regard to odors that would be associated with the operation of the new rail area and at the marine facility.
9. Please provide MSDS sheets for the crude oil products to be handled at the facility and specifics on the additives that will be stored in the tanks.

10. Environmental Justice Policy -

The permit modification you are proposing is considered to be a major modification with respect to your Air permit and your facility is located within an area that has been identified as a potential Environmental Justice area. NYS DEC Commissioner's Policy 29 (CP-29) provides guidance for incorporating environmental justice concerns into the New York State Department of Environmental Conservation (DEC) environmental permit review process and the DEC application of the State Environmental Quality Review Act. The policy is written to assist DEC staff, the regulated community, and the public in understanding the requirements and review process.

Therefore, as part of the review process for this proposed modification, you will need to address CP-29 as it relates to your proposal. Details of the policy and procedures may be found on the Department's website.

Should you have any questions about the information requested in this letter, please feel free to contact Donald Welsted at 518-357-2359 or me at 357-2446.

Sincerely,

Angelo Marcuccio  
Environmental Analyst

**Re: Global Companies LLC – Albany Terminal  
Air Title V Permit Modification Application  
City of Albany, Albany County, New York  
NYSDEC Application #4-0101-00112/00029**

Dear Mr. Marcuccio:

We are in receipt of your letter to Thomas Keefe of Global Companies, LLC, dated December 14, 2011 with comments regarding a Title V permit application previously submitted by Envirospec Engineering, PLLC on November 14, 2011. Prior to responding to your comments, please allow me to further describe the proposed project, as previous application materials inaccurately described it as construction of a new rail yard rather than the reconfiguration of an existing railyard.

The project consists of three elements: 1) reconfiguration of an existing intermodal rail yard to allow offloading of petroleum products via rail, 2) expansion of Global's existing rail loading/unloading rack (Rack 2) to allow loading of additional distillate product onto railcars and 3) expansion of an existing marine loading facility, including installation of a second vapor combustion unit (VCU).

The project involves proposed changes to the existing Canadian Pacific Railroad (CP) "Kenwood Yard," which is located on the western side of Church Street, northwest of the Global terminal. Until February 2012, Canadian Pacific operated the northern portion of the Kenwood Yard as an intermodal facility where shipping containers were brought in via freight train and transferred to tractor trailer trucks via large gantry container cranes for distribution. The intermodal facility operated 24 hours a day, and typically performed between 25,000 and 36,000 rail-truck transloading movements or "lifts" per year. In conjunction with the proposed project, Global intends to lease the portion of the Kenwood Yard which is currently owned and operated by CP. In January 2012, CP's intermodal operations were moved to another site to allow construction of the proposed offloading facility. Upon receiving the necessary approvals, Global plans to reconfigure the yard to allow offloading of petroleum via rail in place of the existing intermodal operations. This will entail reconfiguring the tracks in the Kenwood Yard and installing secondary containment, pumps, piping and stormwater conveyances to allow offloading of petroleum products from rail cars into existing tanks at the adjacent Global terminal. In addition, Global plans to expand its existing marine loading facility to enable it to load additional barges. Emissions from this activity will be controlled through installation of a second VCU along the shoreline immediately north of the existing marine loading dock.

Ingalls & Associates, LLP  
consulting, civil & environmental engineering

FOIL 140072 008600

In response to your comments, we offer the following:

**Comment 1:** *(Please provide) A site plan of the facility that shows the location of the proposed new Vapor Combustion Unit (VCU).*

**Response 1:** Please see the attached "Marine VCU #2 Site Plan, Global Companies LLC", prepared by Ingalls & Associates, LLP and dated February 13, 2012.

**Comment 2:** *Please provide the manufacturer's specifications (model number, etc.) for the VCU to be installed at the marine dock unit.*

**Response 2:** Please see the attached schematics prepared by John Zink Company, LLC.

**Comment 3:** *Please provide details of the VCU including its dimensional height, width, color, and what the final height would be after installation. Please indicate whether installation of the unit will involve new ground disturbance or will it occur on a previously disturbed area, or mounted on a building or other structure. Confirm that the new unit would not be in the floodplain or that Global Companies has received approval from the City of Albany to locate the new unit at its proposed location. A few photos showing the area where the VCU will be installed that are taken from different directions would be very helpful in determining how well the new unit will fit in with the surrounding features.*

**Response 3:** Please see the attached schematics prepared by John Zink Company, LLC for height and width dimensions. The unit will be placed on a concrete pad which will be constructed immediately north of the existing VCU. As with the existing VCU, the additional VCU will be located within the floodplain. A NYS Licensed Surveyor of Ingalls & Associates has already completed the elevation certificate, which will be submitted to the City of Albany with the request for building permit. Given that the proposed unit is almost a duplicate of the existing unit, and that the City previously approved the existing unit, we expect the City will approve the proposed unit as well. Verification of their approval will be obtained upon receipt of the building permit, as the City does not have a separate floodplain permit process. I have attached several photos of the existing VCU and the area immediately north of the existing unit, where the second unit will be constructed.

**Comment 4:** *Please provide the same type of information for the new rail yard area such as dimensions of the area to be disturbed, photos, and any structures to be constructed, floodplain status, etc.*

**Response 4:** Please note that a new rail yard will NOT be constructed as part of this proposal. Global is simply going to be the new tenant of an existing rail yard owned and operated by Canadian Pacific. As previously noted, Global will reconfigure existing rail tracks to better suit its needs for offloading product and install secondary containment, pumps, piping and stormwater conveyances. The only structures that will be constructed in the Kenwood Yard are concrete pads for pumping equipment, and secondary containment as necessary. Building permits, including floodplain review by the City of Albany, shall be obtained as necessary prior to construction. Since the project will disturb an area of approximately seven acres, Global will submit to NYSDEC a Notice of Intent and Stormwater Pollution Prevention Plan under the SPDES General Permit for Stormwater Discharges from Construction Activity - GP-0-10-001 (PDF) along with an MS4 Acceptance Form from the City of Albany.

**Comment 5:** *Describe and quantify any proposed increase in rail, truck, and barge traffic that would result from the increase in the amounts of crude oil and distillates proposed to be handled at this facility.*

# ingalls

## **Response 5:**

**Rail Traffic** – According to CP Rail, 360 trains came into and went out of Kenwood Yard during 2011, for a total of 720 train trips per year. Global estimates that one train per day will be unloaded at Kenwood Yard after the project is completed, so future train traffic will be almost identical to existing train traffic.

**Truck Traffic** – A substantial decrease in truck traffic is expected as a result of the proposed project. Until February 2012, CP Rail operated a rail-truck intermodal facility, requiring tractor trailers to transport cargo to and from Kenwood Yard. If Global leases Kenwood Yard and implements the proposed project little, if any, truck traffic will be required for facility operations, as the tanker cars will offload cargo into storage tanks. CP Rail's annual operations involved the transfer of approximately 25,000 containers (trucks) per year; once the project is implemented, truck traffic will be reduced by approximately this amount.

**Barge Traffic** – Global currently loads approximately four barges full of product per month. Given the proposed increase in throughput, loaded barges are expected to increase to approximately 14 barges per month. Currently, nearly all loading occurs onto barges that carried incoming cargos so there has not been a significant increase in barge traffic as a result of loading operations. Global anticipates continuing to operate the loading operation in this manner; however, due to the increased volume we anticipate approximately 7 – 10 additional barges per month to access the marine dock.

**Comment 6:** *Describe current hours of operation and any changes that would occur should the proposed modification be approved.*

**Response 6:** The terminal currently operates 24 hours per day, 365 days per year. No change in hours of operation is proposed.

**Comment 7:** *Please discuss and quantify any increases in noise levels that would occur in the neighborhood as a result of the new rail operations and expanded marine operations. Noise levels should be evaluated based on the levels that would occur at the property line. Noise will be evaluated in accordance with the DEC Noise Policy, which is available for review on the DEC website.*

**Response 7:** Ingalls & Associates has completed a Noise Impact Evaluation for the proposed project, utilizing a NIST-certified noise meter, in accordance with DEC Program Policy "Assessing and Mitigating Noise Impacts", dated October 6, 2000 and revised February 2, 2001. The Evaluation did not identify any noise impact related to the project. Please see attached.

**Comment 8:** *Please discuss potential issues with regard to odors that would be associated with the operation of the new rail area and at the marine facility.*

**Response 8:** Again, no new rail area is proposed. Global is simply proposing to continue use of an existing rail yard currently owned and operated by Canadian Pacific. The reconfigured rail area will be utilized to offload tanker cars via mechanical pumping systems. As the cars are emptied, ambient air is drawn into the cars therefore, offloading activities will not result in the release of fugitive vapors that would result in significant odor impacts. At the marine dock and the existing rail loading rack, the VCUs will address any potential vapors generated from loading operations. The existing VCUs at the dock and rail loading/unloading rack currently function in the same capacity to eliminate potential odors associated with transfer of products. The proposed new VCU at the marine loading area will serve to handle the additional proposed capacity.

# ingalls

**Comment 9:** *Please provide MSDS sheets for the crude oil products to be handled at the facility and specifics on the additives that will be stored in the tanks.*

**Response 9:** The MSDS for sweet crude oil is attached. Sweet crude oil and ethanol are expected to be the primary products brought into the terminal via the Kenwood Yard. However, other products currently permitted at the terminal (gasoline, blendstocks and distillate products) and other renewable fuels (biodiesel) may also offloaded. Global's terminal currently has several above ground storage tanks for storage of petroleum products including: gasoline, diesel, home heating fuel, kerosene, ethanol, and crude oil. Gasoline and distillate fuel additives are currently stored in small (500 to 12,000 gallon tanks) in the immediate vicinity of the loading racks. However, the project will not result in new additives being handled at the facility, nor is it expected to result in an increase in the quantities of additives stored.

**Comment 10:** *Environmental Justice Policy – The permit modification you are proposing is considered to be a major modification with respect to your Air permit and your facility is located within an area that has been identified as a potential Environmental Justice Area. NYS DEC Commissioner's Policy 29 (CP-29) provides guidance for incorporating environmental justice concerns into the New York State Department of Environmental Conservation (DEC) environmental permit review process and the DEC application of the State Environmental Quality Review Act. The policy is written to assist DEC staff, the regulated community, and the public in understanding the requirements and review process. Therefore, as part of the review process for this proposed modification, you will need to address CP-29 as it relates to your proposal. Details of the policy and procedures may be found on the Department's website.*

**Response 10:** While we recognize that the requested permit modification is considered to be a major modification with respect to the Air permit, and that the Albany Terminal is located within a potential Environmental Justice (EJ) Area, no potential adverse environmental impacts related to the proposed action are likely to affect the area. In fact, the project will likely result in environmental benefits for residents of the area of concern. As a result, no further EJ review is required of the proposed project based on the preliminary screening criteria detailed in CP-29.

The overall land use surrounding the Global Albany Terminal and proposed Kenwood Yard lease parcel may be described as industrial and interstate highway. The site topography is generally flat and minimal vegetation is found throughout the Global terminal property and Kenwood Yard, both of which are heavily used for industrial purposes. Much of the Kenwood Yard has a gravel base, while the Global terminal is a mixture of asphalt pavement, gravel, and sparsely vegetated areas within the tank farm. The nearest residences to all proposed operations are located approximately 750' southwest of the Kenwood Yard on NYS Route 32 and approximately 800' northwest of Kenwood Yard on Franklin Street. Both nearest sensitive receptors are on the opposite side of Interstate 787 from the subject site. Interstate 787 is a major multilane highway that separates the Port of Albany from the nearest residences. The eastern boundary of the site is formed by the Hudson River, which is flanked on both the western and eastern shores by several industrial properties in the vicinity of the terminal. The closest residences to the east of the site are located on the eastern side of the Hudson River, on Riverside Avenue, and are approximately 1400 feet from the terminal. Nearby receptors were verified through use of existing surveys, aerial photographs, topographic maps and site visits.

As previously noted, the project calls for expanding the existing marine loading facility. However, potential impacts to air quality, including odors, will be fully mitigated by installation of a second VCU at the marine dock. Global conducted a DAR-1 analysis to evaluate the impacts associated with the release of Hazardous Air Pollutants (HAPs) related to the project. The DAR-1 analysis determined that there were no significant impacts

## *ingalls*

associated with HAPs related to the project. Details of the DAR-1 Analysis were included with the Air Permit Modification.

With respect to noise, the proposed reconfiguration of the railroad tracks, and continued use of the Kenwood Yard as a rail facility will actually improve noise levels at nearby sensitive receptors. The project will eliminate the need for cranes to offload shipping containers. In their place, the reconfigured facility will use mechanical pumps to offload crude oil from tanker cars, a change that will vastly decrease the noise perceived by nearby receptors.

Additionally, as demonstrated in the attached Noise Impact Evaluation, the additive effects of having two VCUs in operation versus having a single VCU in operation will have no perceptible effect on nearby receptors. The VCUs are located immediately adjacent to the Hudson River, at the marine dock, and are approximately 2700' from the nearest residence to the west, and approximately 1900' from the nearest residence to the east. The addition of a second VCU will only cause a 3 dB increase in noise over ambient conditions at the terminal. However, given the decrease in sound pressure level over the distance between the terminal and nearest sensitive receptors, no perceptible change will be realized by any nearby sensitive receptors.

More generally, several factors completely unassociated with proposed rail and terminal activities, particularly traffic from the adjacent interstate highway, have a more significant impact on nearby receptors than the modifications proposed by Global.

As previously noted, the reconfiguration of the facility contemplated by the project will result in no increase in rail traffic and the elimination of at least 25,000 estimated truck trips per year due to the replacement of intermodal freight transfer operations with rail to fuel tank offloading operations. The project will result in approximately 7-10 additional barges accessing the marine dock; however, this is more than offset by the reduction in truck traffic, and will result in a net benefit to the surrounding community. As the above summary shows, there are no significant adverse environmental impacts related to the proposed project. In fact, the project will result in significant reductions in noise and truck traffic and so will provide environmental benefits to the surrounding community. Because the project will not result in potential adverse environmental impacts, no further environmental justice analysis is required.

Thank you in advance for your review of the above information, and issuance of the requested permit. If you have any questions or require additional information, please contact me at (518) 393-7725, ext. 109.

Sincerely,  
Ingalls & Associates, LLP

  
Antelia Leonard

## **Exhibit D**

**THIS IS NOT A PERMIT**

**New York State Department of Environmental Conservation  
Notice of Complete Application**

*Date:* 07/23/2012

*Applicant:* GLOBAL COMPANIES LLC  
800 SOUTH STREET  
WALTHAM, MA 02453

*Facility:* GLOBAL COMPANIES LLC - ALBANY TERMINAL  
50 CHURCH ST - PORT OF ALBANY  
ALBANY, NY 12202

*Application ID:* 4-0101-00112/00029

*Permits(s) Applied for:* 1 - Article 19 Air Title V Facility

*Project is located:* in ALBANY in ALBANY COUNTY

*Project Description:*

The Department has prepared a draft permit and has made a tentative determination to issue a modification to the Title V Air Facility Permit for the operation of the Global Companies LLC – Albany Terminal facility located at 50 Church Street in the Port of Albany, City of Albany, County of Albany, owned by Global Companies LLC.

The facility proposes to expand crude oil loading operations at the terminal by increasing the marine crude loading throughput to 1.8 billion gallons of crude, calculated on a 12-month rolling total basis. Existing tracks at the rail yard will reconfigured to facilitate off-loading of distillate product and to allow for construction of secondary containment, pumps and piping. A new vapor combustion unit will be constructed at the marine loading dock to control emissions to a 3 mg/liter limit for the marine loading operations of crude oil.

The company recalculated their facility's emission profile using existing throughput caps vapor control limits and emission netting to show that they are below the thresholds for the applicability of 6 NYCRR 231-6. The facility is major for Volatile Organic Compounds (VOC). The facility is not applicable to 40 CFR 63, Subpart R because the facility is not major for Hazardous Air Pollutants (HAP). The facility is subject to 6 NYCRR 212.10 for VOC emission standard for crude oil loading operations.

In accordance with 6 NYCRR Parts 621.7(b)(9) and 201-6.4(c), the Administrator of the United States Environmental Protection Agency (USEPA) has the authority to bar issuance of any Title V Facility Permit if it is determined not to be in compliance with applicable requirements of the Clean Air Act or 6 NYCRR Part 201.

Persons wishing to inspect the subject Title V files, including the application with all relevant supporting materials, the draft permit, and all other materials available to the DEC (the "permitting authority") that are relevant to this permitting decision should contact the DEC representative listed below. The Draft Permit and Permit Review Report may be viewed and printed from the Department web site at:  
<http://www.dec.ny.gov/chemical/32249.html>.

DEC will evaluate the application and the comments received on it to determine whether to hold a public hearing. Comments and requests for a public hearing should be in writing and addressed to the Department representative listed below. A copy of the Department's permit hearing procedures is available upon request or on the Department web site at: <http://www.dec.ny.gov/permits/6234.html>

*Availability of Application Documents:*

Filed application documents, and Department draft permits where applicable, are available for inspection during normal business hours at the address of the contact person. To ensure timely service at the time of inspection, it is recommended that an appointment be made with the contact person.

*State Environmental Quality Review (SEQR) Determination*

Project is an Unlisted Action and will not have a significant impact on the environment. A Negative Declaration is on file. A coordinated review was not performed.

*SEQR Lead Agency* None Designated

*State Historic Preservation Act (SHPA) Determination*

Cultural resource lists and map have been checked. No registered, eligible or inventoried archaeological sites or historic structures were identified at the project location. No further review in accordance with SHPA is required.

*Coastal Management*

This project is located in a Coastal Management area and is subject to the Waterfront Revitalization and Coastal Resources Act.

*DEC Commissioner Policy 29, Environmental Justice and Permitting (CP-29)*

It has been determined that the proposed action is not subject to CP-29.

*Availability For Public Comment*

Comments on this project must be submitted in writing to the Contact Person no later than 08/24/2012 or 30 days after the publication date of this notice, whichever is later.

*Contact Person*

---

**Your application for Permit is incomplete. The following items are required:**

Department staff have reviewed the above referenced application received on June 12, 2013 and submitted by Envirospec Engineering, PLLC on behalf of Global Companies LLC (Global). Staff have the following comments on the application:

- 1) Please include the following information in the application:
  - a) Exempt sources permit application pages.
  - b) Populate the gasoline vapor service and propane vapor service on fuel consumption spreadsheet in submitted application.
  
- 2) Please provide a completed, signed full Environmental Assessment Form (EAF) for the proposed project. It is recommended that the EAF include an expanded narrative which addresses any potentially significant environmental impacts which may result from the activity including impacts to air, noise, traffic, visual resources, etc. The EAF and expanded narrative should address all aspects of the proposed project including the reconfiguration of the existing intermodal rail yard, the additional offloading stations for heated rail cars, etc.
  
- 3) The facility is located within a potential Environmental Justice (EJ) area. A determination will need to be made as to whether the project will result in potential adverse environmental impacts that are likely to affect this potential Environmental Justice area. More information on Environmental Justice can be found on the Department's website at: <http://www.dec.ny.gov/public/333.html>. Please provide a response indicating how the applicant is proposing to comply with the Department's Environmental Justice and Permitting Policy (CP-29) (attached).
  
- 4) Please provide a list of all required permits and approvals for this project, including any local, county, state or federal permits.
  
- 5) The Department has recently been contacted about other projects that Global is contemplating, including an additional dock and associated dredging on the Hudson River and a new ethanol treatment method for the on-site wastewater treatment system. Please indicate how these projects are related to the submitted application and include them in the EAF and expanded narrative, if appropriate. For the purposes of the State Environmental Quality Review (SEQR) process, the Department needs to consider the "whole" action being contemplated by the applicant.

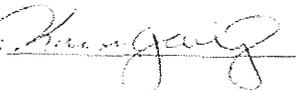

- 6) Please indicate the total area of disturbance for the entire project. If the project will disturb more than one acre of land, the applicant must comply with the State Pollutant Discharge Elimination System (SPDES) Phase II regulations for Stormwater Discharges Associated with Construction Activities.
- 7) Please include a site location map and site plan which outline the limits of disturbance for every element of the proposed project, including activities at the Terminal and the CP Kenwood Yard.
- 8) During our review of the application we consulted the New York State Historic Preservation Office (SHPO) website and determined that a portion of the project area may be located within a mapped archeo-sensitive area. The Department is required to evaluate whether a project may have an impact on significant historical structures or archeological sites pursuant to the State Historic Preservation Act (SHPA). Please provide documentation that this project has been evaluated by a qualified professional archeologist or provide a copy of correspondence from the State Historic Preservation Office (SHPO). Alternatively, if the entire project will impact only previously disturbed areas, please provide documentation which supports prior disturbance including photographs and a written description.

# CP- 29 Environmental Justice and Permitting

New York State Department of Environmental Conservation

## DEC Policy

Issuing Authority: Commissioner Erin M. Crotty

Date Issued: 3/19/03

Latest Date Revised: 3/19/03

### I. Summary:

This policy provides guidance for incorporating environmental justice concerns into the New York State Department of Environmental Conservation (DEC) environmental permit review process and the DEC application of the State Environmental Quality Review Act. The policy also incorporates environmental justice concerns into some aspects of the DEC's enforcement program, grants program and public participation provisions. The policy is written to assist DEC staff, the regulated community and the public in understanding the requirements and review process.

This policy amends the DEC environmental permit process by identifying potential environmental justice areas; providing information on environmental justice to applicants with proposed projects in those communities; enhancing public participation requirements for proposed projects in those communities; establishing requirements for projects in potential environmental justice areas with the potential for at least one significant adverse environmental impact; and providing alternative dispute resolution opportunities to allow communities and project sponsors to resolve issues of concern to the community.

This policy will promote the fair involvement of all people in the DEC environmental permit process. It will do this by training and educating DEC staff on environmental justice; providing public access to DEC permit information; incorporating environmental justice concerns into DEC's permit review process; and pursuing technical assistance grants to enable community groups in potential environmental justice areas to more effectively participate in the environmental permit review process.

This policy contains groundbreaking elements which will lead the nation in environmental justice. As such, the DEC expects that the policy will be revised regularly to account for new information in the area of environmental justice and other issues encountered during the implementation of this policy.

### II. Purpose and Background:

In 1998, various and diverse parties interested in environmental justice, including a number of environmental justice advocates and minority and low-income community representatives from across New York State, met with the DEC Commissioner to express concern over environmental justice issues. Concerns raised by interested parties included, but were not limited to: the lack of meaningful public participation by minority or low-income communities in the permit process; the unavailability or inaccessibility of certain information to the public early in the permit process; and the failure of the permit process to address disproportionate adverse environmental impacts on minority and low-income communities.

On October 4, 1999, in response to the concerns raised by parties interested in environmental justice, DEC announced a new program to address environmental justice concerns and ensure community participation in the state's environmental permitting process. DEC named an Environmental Justice Coordinator to oversee the Office of Environmental Justice and develop DEC's Environmental Justice Program, and created two staff positions in the Division of Environmental Permits. DEC also established the New York State Environmental Justice Advisory Group (Advisory Group) comprising representatives from state, local and federal government, community groups, environmental groups, and the regulated community. The Advisory Group, chaired by the Environmental Justice Coordinator, was asked to develop recommendations for an environmental justice permit policy and recommend elements for an effective environmental justice program.

On January 2, 2002, the Advisory Group submitted a report to DEC Commissioner Erin M. Crotty containing its recommendations for creating an effective environmental justice program. The report: *Recommendations for the New York State Department of Environmental Conservation Environmental Justice Program* focuses on the environmental permit process and is intended to ensure DEC's programs are open and responsive to environmental justice concerns. Additional recommendations for an environmental justice program are also included in the report.

The DEC held public meetings state-wide to solicit public comment on the Advisory Group report and accepted public comment for a period in excess of 50 days, through February 22, 2002. This policy is based on the Advisory Group report, public comment on the report and DEC staff recommendations.

On August 7, 2002, a draft of this policy was released for public review and comment. The comment period exceeded 90 days, ending on October 11, 2002. Numerous detailed comments were received by the DEC and are reflected in this policy and in the implementation of this policy.

### **III. Policy:**

It is the general policy of DEC to promote environmental justice and incorporate measures for achieving environmental justice into its programs, policies, regulations, legislative proposals and activities. This policy is specifically intended to ensure that DEC's environmental permit process promotes environmental justice. This policy supports the DEC's continued funding and implementation of environmental programs that promote environmental justice, such as urban forestry, environmental education, the "I Fish NY" program and watershed enhancement projects. This policy also encourages DEC efforts to implement other programs, policies, regulations, legislative proposals and activities related to environmental justice.

This policy shall become effective 30 days after the full text of this policy, or a summary thereof, along with information on how the full text may be obtained, has been published in the Environmental Notice Bulletin, as defined in Environmental Conservation Law 70-0105. Any application for a permit received after the effective date of this policy will be subject to the provisions of this policy.

This policy shall be reviewed at least 18 months from the effective date and revised, as necessary, to consider the policy's applicability to various DEC Programs, incorporate evolving information on environmental justice and reflect the best available environmental protection information and resources. The 18-month period shall enable DEC to further develop implementation procedures, better identify resources needed to implement the policy, and determine appropriate legislative, regulatory and policy changes that can be implemented. Thereafter, DEC shall periodically evaluate the need for further revision, as implementation experience is gained.

This policy will not be construed to create any right or benefit, substantive or procedural, enforceable by law or by equity by a party against the DEC or any right to judicial review. This policy may be subject to change at the discretion of DEC.

**A. Definitions.** For purposes of this policy, the following definitions shall apply.

1. *Census block group* means a unit for the U.S. Census used for reporting. Census block groups generally contain between 250 and 500 housing units.
2. *Environmental justice* means the fair treatment and meaningful involvement of all people regardless of race, color, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people, including a racial, ethnic, or socioeconomic group, should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies.
3. *Low-income community* means a census block group, or contiguous area with multiple census block groups, having a low-income population equal to or greater than 23.59% of the total population.
4. *Low-income population* means a population having an annual income that is less than the poverty threshold. For purposes of this policy, poverty thresholds are established by the U.S. Census Bureau.
5. *Major project* means any action requiring a permit identified in section 621.2 of title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York (6 NYCRR Part 621.2), which is not specifically defined as minor.
6. *Minority community* means a census block group, or contiguous area with multiple census block groups, having a minority population equal to or greater than 51.1% in an urban area and 33.8% in a rural area of the total population.
7. *Minority population* means a population that is identified or recognized by the U.S. Census Bureau as Hispanic, African-American or Black, Asian and Pacific Islander or American Indian.

---

The percent threshold relies on 2000 U.S. Census data. The percent threshold may be adjusted as U.S. Census data is revised.

8. *Potential environmental justice area* means a minority or low-income community that may bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies.

9. *Rural area* means territory, population, and housing units that are not classified as an urban area. See definition for "urban area" below. For purposes of this policy, rural classifications are established by the U.S. Census Bureau.

10. *Urban area* means all territory, population, and housing units located in urbanized areas and in places of 2,500 or more inhabitants outside of an urbanized area. An urbanized area is a continuously built-up area with a population of 50,000 or more. For purposes of this policy, urban classifications are established by the U.S. Census Bureau.

**B. Policy Directives.** With respect to this policy, DEC shall:

1. Upon the effective date of this policy, provide enhanced accessibility to public permit information held by the DEC, including access to DEC permit information on the DEC Website and a toll free environmental justice hotline to enable the public to access the Office of Environmental Justice during business hours;
2. Upon the effective date of this policy, use geographic information system screening tools and U.S. Census data to identify potential environmental justice areas within New York State;
3. Upon the effective date of this policy, use enhanced public participation and public notification mechanisms, including those which are most effective in potential environmental justice areas.
4. Upon the effective date of this policy, DEC shall make guidance available to assist permit applicants in complying with the Public Participation Plan requirements of this policy. The guidance shall contain tools and information, including those that will better enable the applicant to engage community residents in potential environmental justice areas in the environmental permit review process;
5. Upon the effective date of this policy, facilitate alternative dispute resolution between permit applicants and the public to resolve conflicts in the permit review process;
6. Upon the effective date of this policy, educate permit applicants with respect to environmental justice, the environmental review process, the requirements of this policy and the methodology for identifying a potential environmental justice area by distributing information on environmental justice to permit applicants;

7. Upon the effective date of this policy, provide to interested members of the public such information on environmental justice that is provided to permit applicants. Within six months from the effective date of this policy, the DEC shall identify and begin conducting workshops to educate the public with respect to environmental justice, the environmental review process, the requirements of this policy and the methodology for identifying a potential environmental justice area;
8. Upon the effective date of this policy, establish two work groups to assist DEC to develop and incorporate critical environmental justice information into the DEC environmental review process. Each work group shall report its results to the DEC Commissioner no later than six months after the effective date of this policy. The results will be considered by the DEC Commissioner when revising this policy:
  - i. One work group shall develop recommendations for conducting a disproportionate adverse environmental impact analysis as a component of the environmental impact statement. Although the Advisory Group report recommended a basic methodology for conducting such an analysis, further definition and specific criteria are needed;
  - ii. A second work group to be established in conjunction with the New York State Department of Health, shall identify reliable sources of existing human health data and recommend means to incorporate such data into the environmental review process;
9. Within three months from the effective date of this policy, educate DEC staff with respect to environmental justice, the environmental review process and the requirements of this policy. The DEC Office of Environmental Justice shall develop a curriculum and begin implementation of formal training on environmental justice to affected staff in the Divisions of Air Resources, Solid & Hazardous Materials, Water, Environmental Permits, Public Affairs and Education, and other divisions. DEC staff charged with policy implementation have already received training;
10. Within three months from the effective date of this policy, begin conducting supplemental compliance and enforcement inspections of regulated facilities to ensure that facilities are operating in compliance with the Environmental Conservation Law. Supplemental enforcement and compliance inspections will apply to facilities located in potential environmental justice areas where there is reason to believe that such facilities are not operating in compliance with the Environmental Conservation Law;
11. Within three months from the effective date of this policy, translate information on the DEC environmental permit process for comprehension by non-English speakers. The DEC Office of Environmental Justice shall translate the following documents into Spanish: What is SEQR?; A Citizen's Guide to SEQR; The SEQR Cookbook; How to Apply for a DEC Permit; the Guide to Permit Hearings; and the Guide to Mediation Services. The DEC shall also evaluate the need for translation to other languages;
12. Within three months from the effective date of this policy, draft legislation to establish funding and criteria for a technical assistance grant program to assist the public in the permit review process. Funding for the technical assistance grant program shall be derived from the Environmental Protection Fund and may be supplemented by other funding opportunities;

13. Within six months from the effective date of this policy, draft regulations to enhance the effectiveness and strengthen the elements of this policy and address potential adverse environmental impacts that may bear disproportionately on potential environmental justice areas, including regulations to establish mandatory public participation requirements; regulations to require the electronic submission of environmental impact statements; regulations to establish additional criteria for determining significance pursuant to 6 NYCRR 617.7. The DEC will also review the list of Type I actions at 6 NYCRR 617.4, evaluate the need for amendments to include actions that may bear disproportionately on potential environmental justice areas and draft regulations based upon the evaluation;

14. Within six months from the effective date of this policy, propose draft revisions to the full environmental assessment form to, among other things, include information that can be used to identify adverse environmental impacts which bear disproportionately on potential environmental justice areas, and

15. Ensure compliance with the procedural elements of this policy.

#### **IV. Responsibility:**

The Office of General Counsel shall provide oversight to ensure compliance with this policy. Each DEC division and office affected by this policy, including those responsible for the permit programs listed in section V.A.1 of this policy, is expected to provide support to fulfill the elements of this policy.

#### **V. Procedure:**

The following procedure shall be incorporated into the DEC permit review process when the DEC serves as Lead Agency under the State Environmental Quality Review Act (SEQR). Where the DEC is not the Lead Agency under SEQR, the DEC shall implement the following procedure to the extent permitted by law, including Applicability, the Preliminary Screen, Guidance to Permit Applicants, Enhanced Public Participation, Environmental Impact Assessment, Coordinated Review and Alternative Dispute Resolution. All other requirements related to SEQR shall be strongly encouraged.

##### **A. Applicability.**

I. Except as provided for below, the policy shall apply to applications for major projects and major modifications for the permits authorized by the following sections of the Environmental Conservation Law:

- i. titles 7 and 8 of article 17, state pollutant discharge elimination system (SPDES) (implemented by 6 NYCRR Part 750 et seq.);
- ii. article 19, air pollution control (implemented by 6 NYCRR Part 201 et seq.);

- iii. title 7 of article 27, solid waste management (implemented by 6 NYCRR Part 360): including minor modifications involving any tonnage increases beyond the approved design capacity and minor modifications involving an increase in the amount of putrescible solid waste beyond the amount that has already been approved in the existing permit;
- iv. title 9 of article 27, industrial hazardous waste management (implemented by 6 NYCRR Part 373); and
- v. title 11 of article 27, siting of industrial hazardous waste facilities (implemented by 6 NYCRR Part 361).

2. This policy shall not apply to permit applications for minor modifications, except as provided above, nor to renewals, registrations or general permits.

3. Permits authorized by delegation for sources subject to the federal requirements of prevention of significant deterioration (PSD) are subject to a review process under federal regulations and will undergo an environmental justice analysis consistent with EPA policy and guidance. Sources subject to the federal requirements of PSD will also be subject to other state permits applicable under this policy which will trigger the requirements of this policy in addition to the environmental justice analysis required by EPA policy and guidance.

**B. Methodology for Conducting Preliminary Screen.** Upon receipt of an application for a permit covered by this policy, the DEC Division of Environmental Permits shall conduct a preliminary screen to identify whether the proposed action is in or near a potential environmental justice area(s) and determine whether potential adverse environmental impacts related to the proposed action are likely to affect a potential environmental justice area(s).

1. **Identify Potential Adverse Environmental Impacts and Area to be Affected.** DEC staff in the Division of Environmental Permits and the affected environmental quality divisions shall identify potential adverse environmental impacts associated with the proposed action. Environmental quality program staff shall also identify the area to be affected by the potential adverse environmental impacts.

2. **Determine Whether Potential Adverse Environmental Impacts are Likely to Affect a Potential Environmental Justice Area.** An integrated geographic information system and demographic application (GIS Application), shall be used to determine whether potential adverse environmental impacts from the proposed action are likely to affect a potential environmental justice area. Using the information from section V.B.1 above, Environmental Permits staff will determine if any census block groups, meeting the GIS application thresholds for a potential environmental justice area, are within the affected area. The census block groups meeting the GIS application thresholds for a potential environmental justice area should fall substantially within the affected area. If no census block group(s) meeting the GIS application thresholds for a potential environmental justice area is identified, the proposed action is not likely to affect a potential environmental justice area and the permit review process may continue independent of the elements of this policy. If a census block group(s) meeting the GIS application thresholds for a potential environmental justice area is identified, the proposed action is likely to affect a potential environmental justice area and the remainder of these policy requirements shall be incorporated into the review process.

**C. Guidance to Permit Applicants.** Where a potential environmental justice area is identified by the preliminary screen, the DEC Division of Environmental Permits shall provide the applicant with relevant information on environmental justice. This may include a copy of this policy, the methodology for identifying a potential environmental justice area, guidance developed to implement the policy (e.g., guidance for developing and implementing a public participation plan), information on the alternative dispute resolution process and other documents as applicable.

**D. Enhanced Public Participation Plan.** Public participation in the DEC environmental permit review process means a program of activities that provides opportunities for citizens to be informed about and involved in the review of a proposed action. To ensure meaningful and effective public participation, this policy requires applicants for permits covered by this policy to actively seek public participation throughout the permit review process. Applicants are encouraged to consider implementing the public participation plan components prior to application submission.

1. Where a potential environmental justice area is identified by the preliminary screen, the applicant shall submit a written public participation plan as part of its complete application. At a minimum, the plan must demonstrate that the applicant will:

- i. Identify stakeholders to the proposed action, including residents adjacent to the proposed action site, local elected officials, community-based organizations and community residents located in a potential environmental justice area;
- ii. Distribute and post written information on the proposed action and permit review process. Information shall be presented in an easy-to-read, understandable format, using plain language and, when appropriate, public notice materials shall be translated into languages other than English for comprehension by non-English speaking stakeholders;
- iii. Hold public information meetings to keep the public informed about the proposed action and permit review status. Meetings should be held throughout the permit review process at locations and times convenient to the stakeholders to the project;
- iv. Establish easily accessible document repositories in or near the potential environmental justice area to make available pertinent project information, including but not limited to: application material, studies, reports, meeting presentation materials and media releases. The applicant may also establish a repository on the internet.

2. As part of the public participation plan submission, the applicant shall include a report which summarizes: all progress to-date in implementing the plan; all substantive concerns raised to-date; all resolved and outstanding issues; the components of the plan yet to be implemented and an expected time line for completion of the plan.

3. Upon completion of the public participation plan, the applicant shall submit written certification that it has complied with the plan. As part of the certification, the applicant shall submit a revised report detailing activity which occurred subsequent to the initial submission of the report. The certification shall be signed by the applicant, or the applicant's agent, and submitted to DEC prior to a final decision on the application.

**E. Full Environmental Assessment Form.** Where a potential environmental justice area is identified by the preliminary screen, a full environmental assessment form shall be completed for those actions classified as Unlisted in 6 NYCRR Part 617 and meeting the applicability requirements of this policy. (A full environmental assessment form is currently required for all Type I actions.)

**F. Environmental Impact Assessment.** Under existing regulations, as part of its impact review, DEC must consider other sources of pollution or similar facility types in the project area in order to establish the baseline conditions against which project impacts will be assessed. DEC shall continue to consider sources of pollution or similar facility types in the respective airshed, watershed, or wasteshed for the project under consideration.

**G. Coordinated Review.** Where a potential environmental justice area is identified by the preliminary screen, the action is classified in 6 NYCRR Part 617 as either Type I or Unlisted and the project involves more than one agency, the DEC shall coordinate the review of the action with the other involved state and local agencies.

**H. Determining Significance.** Where the DEC is the lead agency, the Division of Environmental Permits staff based on comments from the affected environmental quality divisions, shall determine the significance of a Type I or Unlisted action, pursuant to criteria established in 6 NYCRR 617.7. If the DEC determines that there will be no adverse environmental impacts or that the identified adverse environmental impacts will not be significant, no further environmental justice analysis is required. If the DEC determines that the action may include the potential for at least one significant adverse environmental impact, 6 NYCRR 617.7 requires the preparation of an environmental impact statement (EIS) and the remainder of the policy requirements shall be incorporated into the review process.

**I. Scoping.** Where the DEC is the lead agency, a potential environmental justice area is identified by the preliminary screen and an EIS is required, scoping, pursuant to 6 NYCRR 617.8, shall be conducted. Scoping shall include an opportunity for meaningful and effective public participation consistent with the procedures set forth in this policy.

**J. Environmental Impact Statement Content.** Where the DEC is the lead agency, a potential environmental justice area is identified by the preliminary screen and an EIS is required, the draft EIS shall identify the potential environmental justice area to be affected, describe the existing environmental burden on the potential environmental justice area and evaluate the additional burden of any significant adverse environmental impact on the potential environmental justice area. The detail and depth of analysis for this evaluation will be identified by the DEC during the scoping process.

**K. Environmental Impact Statement Procedure.** When a draft EIS includes an evaluation of additional burdens on a potential environmental justice area, the DEC shall conduct a public hearing regarding the proposed action and shall receive comments on the draft EIS for no fewer than 60 calendar days from the first filing and circulation of the notice of complete application, or no fewer than ten calendar days following the completion of the public hearing, whichever is later.

**L. Alternative Dispute Resolution.** At any time prior to a final decision on the permit, the permit applicant and the public may voluntarily avail themselves of the alternative dispute resolution process to resolve conflict in the permit review process. Prior to issuance of the notice of public hearing, pursuant to 6 NYCRR 621.7, the parties shall be encouraged to seek alternative dispute resolution services from an independent provider. After issuance of the notice of public hearing, the parties shall be encouraged to seek alternative dispute resolution services from the DEC Office of Hearings and Mediation Services (OHMS). Where issues raised in ADR are resolved with enforceable permit conditions, the DEC shall incorporate those enforceable permit conditions into the permit. Where issues raised in ADR are resolved with conditions beyond the enforceable authority of the DEC, the conditions may be incorporated into a private agreement between the non-DEC parties and enforceable by those parties.

**M. Decision and Findings Requirement.** Consistent with existing regulations, any adverse environmental impact related to an action must be avoided or minimized to the greatest extent practicable.

Re: DEC Permit Application #4-0101-00112/00029  
Global Companies LLC - Albany, NY Terminal  
Air Title V Facility  
City of Albany, Albany County

Dear Mrs. Gaidasz;

On behalf of Global Companies, LLC (Global), Envirospec Engineering, PLLC (Envirospec) is submitting this letter in response to your comment letter dated July 25, 2013.

- Comment 1. Please include the following information in the application:
- a) Exempt Sources permit application pages.
  - b) Populate the gasoline vapor service and propane vapor service on fuel consumption spreadsheet in submitted application.
- Response 1. Please find the Exempt Sources permit application page, enclosed as Attachment 1. The fuel consumption spreadsheet submitted in the original application was populated; however, an insufficient amount of significant figures were displayed. A revised spreadsheet is enclosed as Attachment 2.
- Comment 2. Please provide a completed, signed full Environmental Assessment Form (EAF) for the proposed project. It is recommended that the EAF include an expanded narrative which addresses any potentially significant environmental impacts which may result from the activity including impacts to air, noise, traffic, visual resources, etc. The EAF and expanded narrative should address all aspects of the proposed project including the reconfiguration of the existing intermodal rail yard, the additional offloading stations for heated rail cars, etc.
- Response 2. A completed Full Environmental Assessment Form (Full EAF) is enclosed as Attachment 3, as well as an Expanded Narrative (Attachment 4). The Expanded Narrative includes an overall description of the facility and a review of the environmental impacts to traffic, noise and visual resources resulting from the project.
- Comment 3. The facility is located within a potential Environmental Justice (EJ) area. A determination will need to be made as to whether the project will result in potential adverse environmental impacts that are likely to affect this potential Environmental Justice area. More information on Environmental Justice can be found on the Department's website at:

<http://www.dec.ny.gov/public/333.html>. Please provide a response indicating how the applicant is proposing to comply with the Department's Environmental Justice and Permitting Policy (CP-29) (attached).

- Response 3. DEC Policy CP-29 provides methodology for conducting a preliminary screen to identify if a proposed project is in or near an EJ area and to determine whether potential environmental impacts are likely to affect that area. The land surrounding the Terminal is predominantly industrial, transportation corridor and Interstate Highway. Interstate 787 is a major transportation route that is active 24 hours per day with heavy passenger, small truck and large tractor trailer vehicles. There is a constant flow of heavy traffic, including large diesel fuel powered trucks that dwarf any vehicular activity at the Global Terminal. The Interstate traffic noise is constant. In addition to the industrial activity on the east side of the highway, there also exists a variety of commercial activity. This activity includes, but is not limited to: a recycling facility, wholesale distribution business, transportation services provider, management consultant, boat house and a moving and storage service. The nearest residences to the proposed project are located approximately 800 feet northwest of Kenwood Yard on Franklin Street. The Port area has been industrialized for many years and Global's activities do not alter the character of the area, nor do any emissions, noise or lighting conditions substantially change the status quo that has existed to the east of the Interstate. The attached Expanded Narrative addresses environmental concerns associated with the proposed heated product project, including a traffic analysis, visual analysis, noise analysis and a review of odor control at the Terminal. As the Expanded Narrative indicates, the proposed project will not have any adverse environmental impacts. As a result, no further environmental justice analysis is required, consistent with the methodology for conducting a preliminary screen found in DEC Policy CP-29.
- Comment 4. Please provide a list of all required permits and approvals for this project, including any local, county, state or federal permits.
- Response 4. Required permits and approvals for this project include a Title V Air Permit Modification and a local building permit.
- Comment 5. The Department has recently been contacted about other projects that Global is contemplating, including an additional dock and associated dredging on the Hudson River and a new ethanol treatment method for the on-site wastewater treatment system. Please indicate how these projects are related to the submitted application and include them in the EAF and expanded narrative, if appropriate. For the purposes of the State Environmental Quality Review (SEQR) process, the Department needs to consider the "whole" action being contemplated by the applicant.

*A Woman Owned Business Enterprise (WBE)*

FOIL 140072 008627

Page 2220 of 2254

- Response 5. The other projects being considered by Global are unrelated to the project submitted for the Title V Air Permit Modification. The proposed additional dock and associated dredging would increase physical dock capacity to better accommodate incoming vessels. However, dock throughput will not increase. The potential dock project is unrelated to this current project, which is for offloading and storing heated products. Moreover, the dock project is currently in the investigation phase and there are no definite plans to proceed. Global is seeking to modify existing wastewater treatment operations to more efficiently treat ethanol. The wastewater treatment work is not associated with this project.
- Comment 6. Please indicate the total area of disturbance for the entire project. If the project will disturb more than one acre of land, the applicant must comply with the State Pollutant Discharge Elimination System (SPDES) Phase II regulations for Stormwater Discharges Associated with Construction Activities.
- Response 6. A Storm Water Pollution Prevention Plan (SWPPP) currently exists for the first phase of work in Kenwood Yard and permit No. NYR10V212 was assigned. The total area of disturbance for this phase of the project is greater than one acre of land. The existing SWPPP will be amended and filed with the MS4 coordinator. The amendments are currently under development.
- Comment 7. Please include a site location map and site plan which outlines the limits of disturbance for every element of the proposed project, including activities at the Terminal and the CP Kenwood Yard.
- Response 7. The limits of disturbance are outlined in the attached site plans (Attachment 5). We have also included a site location map as Attachment 6.
- Comment 8. During our review of the application we consulted the New York State Historic Preservation Office (SHPO) website and determined that a portion of the project area may be located within a mapped archeo-sensitive area. The Department is required to evaluate whether a project may have an impact on significant historical structures or archeological sites pursuant to the State Historic Preservation Act (SHPA). Please provide documentation that this project has been evaluated by a qualified professional archeologist or provide a copy of correspondence from the State Historic Preservation Office (SHPO). Alternatively, if the entire project will impact only previously disturbed areas, please provide documentation which supports prior disturbance including photographs and a written description.
- Response 8. The project will impact only previously disturbed areas. Tank 33 is an existing tank that will be converted to store volatile petroleum products. The additional offloading stations for heated rail cars will be a reconfiguration of an already existing intermodal rail yard. The proposed boilers will be

Page 2221 of 2254

installed in the active terminal and the rail yard, which are already developed. The locations of the proposed boilers can also be observed in the site plans (Attachment 5).

Should you have any questions please feel free to contact me at (518) 453-2203 or Tom Keefe of Global at (781) 398-4132.

Sincerely,

Nicole Brower, PE

**Permit(s) Applied for:**

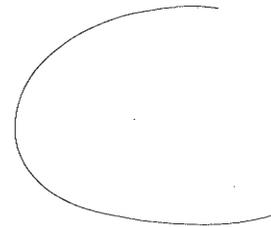

Article 19 Air Title V Facility

**Project is Located:**

Albany, Albany County

**Project Description:**

The Department has prepared a draft permit and has made a tentative determination to issue a modification to the facility's Title V Air Facility Permit to expand the capabilities at the Terminal to include the storage of heated petroleum products, including crude oil and biofuels. The heated petroleum products will be subject to the existing throughput caps in the Title V Permit; as a result, no increase to the Terminal's existing throughput caps are being requested. The products require heating to be pumped and will be heated to varying temperatures based on the viscosity of the product. The emissions from the heated petroleum products are lower than the emissions from the crude oil that is currently permitted for storage at the facility; therefore the facility's potential to emit (PTE) will not change as a result of this modification.

##### Global Investor Statement Supports CCAC Methane Emissions partnership

A statement released by Institutional Investor Group on Climate Change (IIGCC) of Europe, the Investor Group on Climate Change (IGCC) of Australia/New Zealand, and INCR was issued last week at the World Economic Forum in Davos in support of the Climate and Clean Air Coalition (CCAC) Oil & Gas Methane Partnership. The statement voices investors' concern about the volume of methane - a potent greenhouse gas - emitted to the atmosphere through venting, leakage, or flaring from oil and gas production.

##### Shareholder Initiative on Climate and Sustainability (SICS) Working Group Call

Wednesday, February 5  
2:00 - 3:00 pm ET

The SICS Working Group will convene its monthly call to coordinate investors engaging with companies to foster improved sustainability and climate change-related business practices. Investors will coordinate engagements for the 2014 Proxy Season. For more information, contact Rob Berridge, Director, Shareholder Engagement, Investor Program.

## INCR Listing Standards Proposal Moves Forward with Global Exchanges

Stocks 5The INCR Sustainable Stock Exchanges Working Group met to discuss how draft global sustainability listing rule recommendations will be presented to the world's exchanges in 2014. Later this month, Ceres is planning a public launch of the INCR Listing Standards Proposal: Sustainability Disclosure Listing Standard for Global Stock Exchanges, concurrently with the World Federation of Exchanges receiving the INCR proposal and submitting it to its members for consideration during a three-month global comment period that launches at that time.

Evan Harvey, Managing Director of Corporate Sustainability at NASDAQ OMX, further provided an update to the SSE Working Group on the formation of a Sustainability Working Group within the World Federation of Exchanges (WFE). The WFE Sustainability Working Group, which is on track to be formally launched in March, will include NASDAQ, NYSE, ICE, Deutsche Borse, Johannesburg, BM&F Bovespa, Singapore, Bombay, CBOE and CME Group.

The group's primary mandate is to debate sustainability disclosure trends and expectations across the globe-including the INCR Listing Standards Proposal, to review comments from exchanges on that proposal, to gather additional research on the state of ESG reporting globally and on ESG investment products, and to make a set of recommendations on ESG disclosure to the broader exchange community that will be voted on at the 2014 WFE annual meeting.

Participants in the INCR SSE Working Group plan communication and advocacy efforts throughout 2014 to engage exchanges, investors, and regulators in this pivotal discussion. For more information, contact Tracey Rembert or Noah Klein-Markman.

Ceres is an advocate for sustainability leadership that mobilizes a powerful network of investors, companies and public interest groups to build a sustainable global economy. Ceres is a non-profit organization. All gifts are tax deductible. Ceres has received high ratings from charity watchdog groups, a reflection of our effectiveness, integrity and impact.

\*Privileged and Confidential Settlement Communication\*

Eileen and Scott—Following up on our call from last Friday, I have spoken to counsel for the other state and local government petitioners. We accept, subject to formal review and approval of the consent decree by our respective managements, a settlement pursuant to which EPA would sign the final NSPS for wood heaters within 1 year of the date of publication of the proposal, i.e., by February 3, 2015. Tim Ballo will be emailing you separately with the environmental petitioners' position. Thank you for your efforts to resolve this matter.—Mike

Eileen and Scott,

I have confirmed with all the enviro group plaintiffs that the Feb. 3 date is acceptable.

Thanks for taking on the first draft of the decree.

-Tim

UNITED STATES DISTRICT COURT  
FOR THE DISTRICT OF COLUMBIA

STATE OF NEW YORK, et al.,	)	
	)	
Plaintiffs,	)	Civil Action
	)	No. 13 -1553 (GK)
v.	)	
	)	and consolidated case
GINA MCCARTHY, Administrator,	)	
Environmental Protection Agency, and	)	Civil Action
ENVIRONMENTAL PROTECTION AGENCY,	)	No. 13 -1555 (GK)
	)	
Defendants.	)	
_____	)	

**CONSENT DECREE**

WHEREAS, Plaintiffs, the States of New York, Connecticut, Maryland, Oregon, Rhode Island, and Vermont; the Commonwealth of Massachusetts; and Puget Sound Clean Air Agency (jointly referred to as “State Plaintiffs”), filed Civil Action No. 13-1553 (GK) pursuant to Clean Air Act (“CAA”) section 304(a)(2), 42 U.S.C. § 7604(a)(2), against Defendants Gina McCarthy, Administrator, and the United States Environmental Protection Agency (jointly referred to as “EPA”);

WHEREAS, Plaintiffs, American Lung Association; Environmental Defense Fund; Clean Air Council; and Environment and Human Health, Inc. (jointly referred to as “Environmental Plaintiffs”), filed Civil Action No. 13-1555 (GK) pursuant to Clean Air Act (“CAA”) section 304(a)(2), 42 U.S.C. § 7604(a)(2), against EPA;

WHEREAS, the Court consolidated Civil Action Nos. 13-1553 and 13-1555 (GK);

WHEREAS, the Court granted the motion to intervene as Plaintiff filed by the Hearth, Patio & Barbecue Association (“Association Plaintiff”);

WHEREAS, the complaints filed by the State, Environmental, and Association Plaintiffs each allege that EPA failed to perform a nondiscretionary duty under CAA section 111(b)(1)(B), 42 U.S.C. § 7411(b)(1)(B) to, at least every 8 years, review and, if appropriate, revise the new performance standards for new residential wood heaters that were promulgated by EPA in 1988. 40 C.F.R. Part 60, Subpart AAA (“Wood Heater NSPS Standards”).

WHEREAS, it is in the interest of the public, the parties, and judicial economy to resolve claims without further litigation;

WHEREAS, the State, Environmental, and Association Plaintiffs and EPA (jointly referred to as “Parties”) have agreed to a settlement of all claims asserted by all Plaintiffs in their Complaints, without any admission or adjudication of fact or law, which they consider to be a just, fair, adequate and equitable resolution of said claims;

WHEREAS, the Court finds and determines that the settlement represents a just, fair, adequate and equitable resolution of said claims;

WHEREAS, by entering into this Consent Decree, the State, Environmental, and Association Plaintiffs do not waive any claims and EPA does not waive any defenses, on any grounds, related to any matters asserted in this action that are not resolved by this Decree;

NOW THEREFORE, it is hereby ORDERED, ADJUDGED AND DECREED as follows:

1. This Court has jurisdiction over the claims set forth in the Complaints in these consolidated actions and may order the relief contained in the Consent Decree. Venue is proper in the District of Columbia.

2. No later than February 3, 2015, EPA shall sign a Federal Register notice taking final action with respect to the Wood Heater NSPS Standards, 40 C.F.R. Part 60, Subpart AAA,

with such modifications as EPA deems appropriate under CAA section 111(b)(1)(B), 42 U.S.C. § 7411(b)(1)(B).

3. EPA shall deliver to the Office of the Federal Register for publication the notices of proposed and final rulemaking covered by this Decree no later than ten business days after signature of such notices. Following such delivery, EPA shall not take any action (other than as necessary to correct any typographical error or other errors in form) to delay or otherwise interfere with publication of such notices in the Federal Register. In addition, EPA shall make available copies of said notices to the State, Environmental, and Association Plaintiffs within five business days after signature.

4. The deadline in Paragraph 2 above may be extended by written stipulation executed by counsel for EPA, and the State, Environmental, and Association Plaintiffs and filed with the Court, or by the Court upon motion made pursuant to the Federal Rules of Civil Procedure by EPA and upon consideration of any response by any Plaintiff and reply by EPA.

5. EPA agrees that the State, Environmental, and Association Plaintiffs are entitled to recover costs of litigation (including attorneys' fees) ("litigation costs") incurred in this matter pursuant to 42 U.S.C. § 7604(d). The deadline for the filing of any motion for litigation costs for activities performed prior to the lodging of this decree with the Court is hereby extended for a period of 120 days. During this time the Parties shall seek to resolve informally any claim for litigation costs, and if they cannot reach a resolution, the State, Environmental, and Association Plaintiffs may seek such litigation costs from the Court. The Court shall retain jurisdiction to resolve any request for litigation costs. The State, Environmental, and Association Plaintiffs reserves their right to seek litigation costs for any work performed after the lodging of this Consent Decree. EPA does not concede that the State, Environmental, and Association Plaintiffs

will be entitled to fees for any work performed after the lodging of the Consent Decree, and the parties reserve all claims and defenses with respect to any future costs of litigation claim.

6. The State, Environmental, and Association Plaintiffs and EPA shall not challenge the terms of this Consent Decree or this Court's jurisdiction to enter and enforce this Consent Decree.

7. The State, Environmental, and Association Plaintiffs and EPA agree that this Consent Decree shall constitute a complete and final settlement of all claims that the State, Environmental, and Association Plaintiffs asserted against the United States, including EPA, under any provision of law, in State of New York, et al. v. EPA, Case No. 1:13-cv-1553-GK (and consolidated case). The State, Environmental, and Association Plaintiffs therefore discharge and covenant not to sue the United States, including EPA, for such claims. The Parties agree that this discharge and covenant not to sue shall not apply to any claim that may arise if any final rule signed pursuant to Paragraph 2 is vacated or withdrawn. EPA retains all rights and defenses, including jurisdictional challenges, in the event any such claim is filed by the State, Environmental, and Association Plaintiffs.

8. Nothing in this Consent Decree shall be construed to limit or modify any discretion accorded EPA by the CAA or by general principles of administrative law in taking the actions which are the subject of this Consent Decree, including the discretion to alter, amend, or revise any final actions contemplated by this Consent Decree. EPA's obligation to perform the action specified by Paragraph 2 does not constitute a limitation or modification of EPA's discretion within the meaning of this paragraph.

9. Nothing in this Consent Decree shall be construed as an admission of any issue of fact or law or to waive or limit any claim or defense, on any grounds, related to any final action EPA may take with respect to the rulemakings identified in Paragraph 2 of this Consent Decree.

10. Nothing in this Consent Decree shall be construed to confer upon the district court jurisdiction to review any final decision made by EPA pursuant to this Consent Decree. Nothing in this Consent Decree shall be construed to confer upon the district court jurisdiction to review any issues that are within the exclusive jurisdiction of the United States Court of Appeals pursuant to 42 U.S.C. § 7607(b)(1). Nothing in this Consent Decree shall be construed to waive any remedies or defenses the Parties may have under 42 U.S.C. § 7607(b)(1).

11. The Parties recognize and acknowledge that the obligations imposed upon EPA under this Consent Decree can only be undertaken using appropriated funds legally available for such purpose. No provision of this Consent Decree shall be interpreted as or constitute a commitment or requirement that EPA obligate or pay funds in contravention of the Anti-Deficiency Act, 31 U.S.C. § 1341, or any other applicable provision of law.

12. Any notices required or provided for by this Consent Decree shall be made in writing or by email and sent to the following:

13. In the event of a dispute among the Parties concerning the interpretation or implementation of any aspect of this Consent Decree, the disputing Party shall provide the other Party with a written notice outlining the nature of the dispute and requesting informal negotiations. The parties shall meet and confer to attempt to resolve the dispute. If the Parties

cannot reach an agreed-upon resolution after ten (10) business days following receipt of the written notice, any Party may move the Court to resolve the dispute.

14. No motion or other proceeding seeking to enforce this Consent Decree or for contempt of court shall be properly filed unless the Party seeking to enforce this Consent Decree has followed the procedure set forth in Paragraph 13.

15. The Court shall retain jurisdiction to determine and effectuate compliance with this Consent Decree, to resolve any disputes thereunder, and to consider any requests for costs of litigation (including reasonable attorneys' fees). After EPA's obligations under Paragraphs 1 and 2 have been completed, EPA may move to have this Consent Decree terminated. Sierra Club shall have 14 days in which to respond to such motion.

16. It is hereby expressly understood and agreed that this Consent Decree was jointly drafted by the Parties and that any and all rules of construction to the effect that ambiguity is construed against the drafting party shall be inapplicable in any dispute concerning the terms, meaning, or interpretation of this Consent Decree.

17. The undersigned certify that they are fully authorized by the Party or Parties they represent to bind that Party or those Parties to the terms of this Consent Decree.

SO ORDERED this \_\_\_ day of \_\_\_\_\_, 2014.
