Dominic,

Attached please find a slide set from IEA presented at last week's Climate meeting in Durban.

Slide 5 illustrates an example of the added costs to society if countries invest more in high-emitting coal capacity in the near-term. The text below from the full IEA report explains the scenario.

To summarize, continuing investment in coal power plants lacking CCS through 2015 (compared to acting now to end additional investments in such facilities) avoids about \$150 billion in global investments that would be made in the no delay scenario. But to compensate for the emissions added by such short-sighted investment will require an additional \$650 billion in global expenditures after 2020.

While this example is a global one, the same phenomenon will apply in the US: for any path the US adopts to limit cumulative emissions to a level consistent with preserving 450 ppm as an option, continuing to invest in high carbon power sources even for a few more years will result in substantially higher added costs later.

I'd be pleased to discuss this further.

David Hawkins

IEA, WEO 2011 (p. 235):

The cost of lock-in

If action is delayed until 2015, emissions from the power sector will overshoot the trajectory of the 450 Scenario in the early years of the projection period. These additional emissions must be offset by reductions later in the period. The additional abatement could, theoretically, occur in the power sector or elsewhere. Our analysis shows that in most countries the power sector still offers the cheapest abatement. We therefore assume that the additional reductions will be made in this sector. Postponing the compensating abatement until later than 2035 means that emissions would have to become negative, i.e. widespread use of biomass generation with CCS would be needed. As this technology is not proven at commercial scale, and therefore cannot be counted upon, we assume that the majority of the additional power sector abatement takes place, over the Outlook period, by other means. Given a delay in action to 2015, containing cumulative emissions from the power sector to a level compatible with stabilisation of the atmospheric concentration of greenhouse gases at 450 ppm CO<sub>2</sub>-eq over the Outlook period would require the following actions, from the cheapest to the most expensive:

! Retrofitting plants with CCS, when this is more economic than early retirement. In this case, the associated capital cost is the cost of retrofit (and there may be some additional operating costs).

! Shut down of plants that are beyond their economic lifetime, but still safe and profitable to operate, i.e. plants for which the initial investment has been repaid. This will reduce revenues compared to the New Policies Scenario.

! Retirement of plants before the end of their economic lifetime, i.e. before the upfront

investment has been fully recovered. In this case there will be a lost sunk cost, as well as a loss of revenues.

! Additional investment in low-carbon generation.

Delay in action results in some financial savings in the early years of the projection period, relative to the 450 Scenario. While there is increased investment in fossil fuel-based generation, particularly in cheaper, inefficient plants, there would be a reduction in investment in highly efficient and low-carbon plants. Over the decade 2011 to 2020, we estimate that the net effect would be to avoid \$150 billion of investment, relative to the 450 Scenario. After 2020, the additional abatement to compensate for higher emissions earlier in the period means that more low-carbon plants and equipment need to be installed, relative to the 450 Scenario, with a net effect of adding \$650 billion to investment over the period 2021 to 2035 (Figure 6.16). In other words, for every \$1 of avoided investment between 2011 and 2020, either through reduced low-carbon investment or adoption of cheaper fossil-fuel investment options, an additional \$4.3 would need to be spent between 2021 and 2035 to compensate.

Dominic,

Thank you for meeting with us today. As promised, here is the Executive Summary of the International Energy Agency's World Energy Outlook for 2011. The calculation that I mentioned is described on page 2 of the Executive Summary.

## INTERNATIONAL ENERGY AGENCY

The International Energy Agency (IEA), an autonomous agency, was established in November 1974. Its primary mandate was – and is – two-fold: to promote energy security amongst its member countries through collective response to physical disruptions in oil supply, and provide authoritative research and analysis on ways to ensure reliable, affordable and clean energy for its 28 member countries and beyond. The IEA carries out a comprehensive programme of energy co-operation among its member countries, each of which is obliged to hold oil stocks equivalent to 90 days of its net imports. The Agency's aims include the following objectives:

- Secure member countries' access to reliable and ample supplies of all forms of energy; in particular, through maintaining effective emergency response capabilities in case of oil supply disruptions.
- Promote sustainable energy policies that spur economic growth and environmental protection in a global context – particularly in terms of reducing greenhouse-gas emissions that contribute to climate change.
  - Improve transparency of international markets through collection and analysis of energy data.
    - Support global collaboration on energy technology to secure future energy supplies and mitigate their environmental impact, including through improved energy efficiency and development and deployment of low-carbon technologies.
    - Find solutions to global energy challenges through engagement and dialogue with non-member countries, industry, international organisations and other stakeholders.

IEA member countries:

Australia  
Austria  
Belgium  
Canada  
Czech Republic  
Denmark  
Finland  
France  
Germany  
Greece  
Hungary  
Ireland  
Italy  
Japan  
Korea (Republic of)  
Luxembourg  
Netherlands  
New Zealand  
Norway  
Poland  
Portugal  
Slovak Republic  
Spain  
Sweden  
Switzerland  
Turkey  
United Kingdom  
United States

## EXECUTIVE SUMMARY

### **“If we don’t change direction soon, we’ll end up where we’re heading”**

**There are few signs that the urgently needed change in direction in global energy trends is underway.** Although the recovery in the world economy since 2009 has been uneven, and future economic prospects remain uncertain, global primary energy demand rebounded by a remarkable 5% in 2010, pushing CO<sub>2</sub> emissions to a new high. Subsidies that encourage wasteful consumption of fossil fuels jumped to over \$400 billion. The number of people without access to electricity remained unacceptably high at 1.3 billion, around 20% of the world’s population. Despite the priority in many countries to increase energy efficiency, global energy intensity worsened for the second straight year. Against this unpromising background, events such as those at the Fukushima Daiichi nuclear power plant and the turmoil in parts of the Middle East and North Africa (MENA) have cast doubts on the reliability of energy supply, while concerns about sovereign financial integrity have shifted the focus of government attention away from energy policy and limited their means of policy intervention, boding ill for agreed global climate change objectives.

**This *Outlook* assesses the threats and opportunities facing the global energy system based on a rigorous quantitative analysis of energy and climate trends.** The analysis includes three global scenarios and multiple case studies. The central scenario for this *Outlook* is the New Policies Scenario, in which recent government policy commitments are assumed to be implemented in a cautious manner – even if they are not yet backed up by firm measures. Comparison with the results of the Current Policies Scenario, which assumes no new policies are added to those in place as of mid-2011, illustrates the value of these commitments and plans. From another angle, comparison is also instructive with the 450 Scenario, which works back from the international goal of limiting the long-term increase in the global mean temperature to two degrees Celsius (2°C) above pre-industrial levels, in order to trace a plausible pathway to that goal. **The wide difference in outcomes between these three scenarios underlines the critical role of governments to define the objectives and implement the policies necessary to shape our energy future.**

### **Short-term uncertainty does little to alter the longer-term picture**

**Despite uncertainty over the prospects for short-term economic growth, demand for energy in the New Policies Scenario grows strongly, increasing by one-third from 2010 to 2035.** The assumptions of a global population that increases by 1.7 billion people and 3.5% annual average growth in the global economy generate ever-higher demand for energy services and mobility. A lower rate of global GDP growth in the short-term than assumed in this *Outlook* would make only a marginal difference to longer-term trends.

**The dynamics of energy markets are increasingly determined by countries outside the OECD.** Non-OECD countries account for 90% of population growth, 70% of the increase in economic output and 90% of energy demand growth over the period from 2010 to 2035.

China consolidates its position as the world's largest energy consumer: in 2035 it consumes nearly 70% more energy than the United States, the second-largest consumer, even though, by then, per-capita energy consumption in China is still less than half the level in the United States. The rates of growth in energy consumption in India, Indonesia, Brazil and the Middle East are even faster than in China.

**Global investment in energy supply infrastructure of \$38 trillion (in year-2010 dollars) is required over the period 2011 to 2035.** Almost two-thirds of the total investment is in countries outside of the OECD. Oil and gas collectively account for almost \$20 trillion, as both the need for upstream investment and the associated cost rise in the medium and long term. The power sector claims most of the remainder, with over 40% of this being for transmission and distribution networks.

**The age of fossil fuels is far from over, but their dominance declines.** Demand for all fuels rises, but the share of fossil fuels in global primary energy consumption falls slightly from 81% in 2010 to 75% in 2035; natural gas is the only fossil fuel to increase its share in the global mix over the period to 2035. In the power sector, renewable energy technologies, led by hydropower and wind, account for half of the new capacity installed to meet growing demand.

## Steps in the right direction, but the door to 2°C is closing

**We cannot afford to delay further action to tackle climate change** if the long-term target of limiting the global average temperature increase to 2°C, as analysed in the 450 Scenario, is to be achieved at reasonable cost. In the New Policies Scenario, the world is on a trajectory that results in a level of emissions consistent with a long-term average temperature increase of more than 3.5°C. Without these new policies, we are on an even more dangerous track, for a temperature increase of 6°C or more.

**Four-fifths of the total energy-related CO<sub>2</sub> emissions permissible by 2035 in the 450 Scenario are already "locked-in" by our existing capital stock** (power plants, buildings, factories, etc.). If stringent new action is not forthcoming by 2017, the energy-related infrastructure then in place will generate all the CO<sub>2</sub> emissions allowed in the 450 Scenario up to 2035, leaving no room for additional power plants, factories and other infrastructure unless they are zero-carbon, which would be extremely costly. Delaying action is a false economy: for every \$1 of investment avoided in the power sector before 2020 an additional \$4.3 would need to be spent after 2020 to compensate for the increased emissions.

**New energy efficiency measures make a difference, but much more is required.** Energy efficiency improves in the New Policies Scenario at a rate twice as high as that seen over the last two-and-a-half decades, stimulated by tighter standards across all sectors and a partial phase-out of subsidies to fossil fuels. In the 450 Scenario, we need to achieve an even higher pace of change, with efficiency improvements accounting for half of the additional reduction in emissions. The most important contribution to reaching energy security and climate goals comes from the energy that we do not consume.

## Rising transport demand and upstream costs reconfirm the end of cheap oil

**Short-term pressures on oil markets may be eased by slower economic growth and by the expected return of Libyan oil to the market, but trends on both the oil demand and supply sides maintain pressure on prices.** We assume that the average IEA crude oil import price remains high, approaching \$120/barrel (in year-2010 dollars) in 2035 (over \$210/barrel in nominal terms) in the New Policies Scenario although, in practice, price volatility is likely to remain.

**All of the net increase in oil demand comes from the transport sector in emerging economies, as economic growth pushes up demand for personal mobility and freight.** Oil demand (excluding biofuels) rises from 87 million barrels per day (mb/d) in 2010 to 99 mb/d in 2035. The total number of passenger cars doubles to almost 1.7 billion in 2035. Sales in non-OECD markets exceed those in the OECD by 2020, with the centre of gravity of car manufacturing shifting to non-OECD countries before 2015. The rise in oil use comes despite some impressive gains in fuel economy in many regions, notably for passenger vehicles in Europe and for heavy freight in the United States. Alternative vehicle technologies emerge that use oil much more efficiently or not at all, such as electric vehicles, but it takes time for them to become commercially viable and penetrate markets. With limited potential for substitution for oil as a transportation fuel, the concentration of oil demand in the transport sector makes demand less responsive to changes in the oil price (especially where oil products are subsidised).

**The cost of bringing oil to market rises as oil companies are forced to turn to more difficult and costly sources to replace lost capacity and meet rising demand.** Production of conventional crude oil – the largest single component of oil supply – remains at current levels before declining slightly to around 68 mb/d by 2035. To compensate for declining crude oil production at existing fields, 47 mb/d of gross capacity additions are required, twice the current total oil production of all OPEC countries in the Middle East. A growing share of output comes from natural gas liquids (over 18 mb/d in 2035) and unconventional sources (10 mb/d). The largest increase in oil production comes from Iraq, followed by Saudi Arabia, Brazil, Kazakhstan and Canada. Biofuels supply triples to the equivalent of more than 4 mb/d, bolstered by \$1.4 trillion in subsidies over the projection period.

**Oil imports to the United States, currently the world's biggest importer, drop as efficiency gains reduce demand and new supplies such as light tight oil are developed, but increasing reliance on oil imports elsewhere heightens concerns about the cost of imports and supply security.** Four-fifths of oil consumed in non-OECD Asia comes from imports in 2035, compared with just over half in 2010. Globally, reliance grows on a relatively small number of producers, mainly in the MENA region, with oil shipped along vulnerable supply routes. In aggregate, the increase in production from this region is over 90% of the required growth in world oil output, pushing the share of OPEC in global production above 50% in 2035.

**A shortfall in upstream investment in the MENA region could have far-reaching consequences for global energy markets.** Such a shortfall could result from a variety of

factors, including higher perceived investment risks, deliberate government policies to develop production capacity more slowly or constraints on upstream domestic capital flows because priority is given to spending on other public programmes. If, between 2011 and 2015, investment in the MENA region runs one-third lower than the \$100 billion per year required in the New Policies Scenario, consumers could face a substantial near-term rise in the oil price to \$150/barrel (in year-2010 dollars).

## Golden prospects for natural gas

**There is much less uncertainty over the outlook for natural gas: factors both on the supply and demand sides point to a bright future, even a golden age, for natural gas.** Our *Outlook* reinforces the main conclusions of a *WEO* special report released in June 2011: gas consumption rises in all three scenarios, underlining how gas does well under a wide range of future policy directions. In the New Policies Scenario, demand for gas all but reaches that for coal, with 80% of the additional demand coming from non-OECD countries. Policies promoting fuel diversification support a major expansion of gas use in China; this is met through higher domestic production and through an increasing share of LNG trade and Eurasian pipeline imports. Global trade doubles and more than one-third of the increase goes to China. Russia remains the largest gas producer in 2035 and makes the largest contribution to global supply growth, followed by China, Qatar, the United States and Australia.

**Unconventional gas now accounts for half of the estimated natural gas resource base and it is more widely dispersed than conventional resources, a fact that has positive implications for gas security.** The share of unconventional gas rises to one-fifth of total gas production by 2035, although the pace of this development varies considerably by region. The growth in output will also depend on the gas industry dealing successfully with the environmental challenges: a golden age of gas will require golden standards for production. Natural gas is the cleanest of the fossil fuels, but increased use of gas in itself (without carbon capture and storage) will not be enough to put us on a carbon emissions path consistent with limiting the rise in average global temperatures to 2°C.

## Renewables are pushed towards centre stage

**The share of non-hydro renewables in power generation increases from 3% in 2009 to 15% in 2035, underpinned by annual subsidies to renewables that rise almost five-times to \$180 billion.** China and the European Union drive this expansion, providing nearly half of the growth. Even though the subsidy cost per unit of output is expected to decline, most renewable-energy sources need continued support throughout the projection period in order to compete in electricity markets. While this will be costly, it is expected to bring lasting benefits in terms of energy security and environmental protection. Accommodating more electricity from renewable sources, sometimes in remote locations, will require additional investment in transmission networks amounting to 10% of total transmission investment: in the European Union, 25% of the investment in transmission networks is needed for this purpose. The contribution of hydropower to global power generation remains at around 15%, with China, India and Brazil accounting for almost half of the 680 gigawatts of new capacity.

## Treading water or full steam ahead for coal?

**Coal has met almost half of the increase in global energy demand over the last decade. Whether this trend alters and how quickly is among the most important questions for the future of the global energy economy.** Maintaining current policies would see coal use rise by a further 65% by 2035, overtaking oil as the largest fuel in the global energy mix. In the New Policies Scenario, global coal use rises for the next ten years, but then levels off to finish 25% above the levels of 2009. Realisation of the 450 Scenario requires coal consumption to peak well before 2020 and then decline. The range of projections for coal demand in 2035 across the three scenarios is nearly as large as total world coal demand in 2009. The implications of policy and technology choices for the global climate are huge.

**China's consumption of coal is almost half of global demand and its Five-Year Plan for 2011 to 2015, which aims to reduce the energy and carbon intensity of the economy, will be a determining factor for world coal markets.** China's emergence as a net coal importer in 2009 led to rising prices and new investment in exporting countries, including Australia, Indonesia, Russia and Mongolia. In the New Policies Scenario, the main market for traded coal continues to shift from the Atlantic to the Pacific, but the scale and direction of international trade flows are highly uncertain, particularly after 2020. It would take only a relatively small shift in domestic demand or supply for China to become a net-exporter again, competing for markets against the countries that are now investing to supply its needs. India's coal use doubles in the New Policies Scenario, so that India displaces the United States as the world's second-largest coal consumer and becomes the largest coal importer in the 2020s.

**Widespread deployment of more efficient coal-fired power plants and carbon capture and storage (CCS) technology could boost the long-term prospects for coal, but there are still considerable hurdles.** If the average efficiency of all coal-fired power plants were to be five percentage points higher than in the New Policies Scenario in 2035, such an accelerated move away from the least efficient combustion technologies would lower CO<sub>2</sub> emissions from the power sector by 8% and reduce local air pollution. Opting for more efficient technology for new coal power plants would require relatively small additional investments, but improving efficiency levels at existing plants would come at a much higher cost. In the New Policies Scenario, CCS plays a role only towards the end of the projection period. Nonetheless, CCS is a key abatement option in the 450 Scenario, accounting for almost one-fifth of the additional reductions in emissions that are required. If CCS is not widely deployed in the 2020s, an extraordinary burden would rest on other low-carbon technologies to deliver lower emissions in line with global climate objectives.

## Second thoughts on nuclear would have far-reaching consequences

**Events at Fukushima Daiichi have raised questions about the future role of nuclear power, although it has not changed policies in countries such as China, India, Russia and Korea that are driving its expansion.** In the New Policies Scenario, nuclear output rises by more than 70% over the period to 2035, only slightly less than projected last year. However, we

also examine the possible implications of a more substantial shift away from nuclear power in a Low Nuclear Case, which assumes that no new OECD reactors are built, that non-OECD countries build only half of the additions projected in our New Policies Scenario and that the operating lifespan of existing nuclear plants is shortened. While creating opportunities for renewables, such a low-nuclear future would also boost demand for fossil fuels: the increase in global coal demand is equal to twice the level of Australia's current steam coal exports and the rise in gas demand is equivalent to two-thirds of Russia's current natural gas exports. The net result would be to put additional upward pressure on energy prices, raise additional concerns about energy security and make it harder and more expensive to combat climate change. The consequences would be particularly severe for those countries with limited indigenous energy resources which have been planning to rely relatively heavily on nuclear power. It would also make it considerably more challenging for emerging economies to satisfy their rapidly growing demand for electricity.

### **The world needs Russian energy, while Russia needs to use less**

**Russia's large energy resources underpin its continuing role as a cornerstone of the global energy economy over the coming decades.** High prospective demand and international prices for fossil fuels might appear to guarantee a positive outlook for Russia, but the challenges facing Russia are, in many ways, no less impressive than the size of its resources. Russia's core oil and gas fields in Western Siberia will decline and a new generation of higher-cost fields need to be developed, both in the traditional production areas of Western Siberia and in the new frontiers of Eastern Siberia and the Arctic. A responsive Russian fiscal regime will be needed to provide sufficient incentives for investment. Oil production plateaus around 10.5 mb/d before starting a slight decline to 9.7 mb/d in 2035; gas production increases by 35% to 860 billion cubic metres (bcm) in 2035, with the Yamal peninsula becoming the new anchor of Russian supply.

**As the geography of Russian oil and gas production changes, so does the geography of export.** The majority of Russia's exports continue to go westwards to traditional markets in Europe, but a shift towards Asian markets gathers momentum. Russia gains greater diversity of export revenues as a result: the share of China in Russia's total fossil-fuel export earnings rises from 2% in 2010 to 20% in 2035, while the share of the European Union falls from 61% to 48%.

**Russia aims to create a more efficient economy, less dependent on oil and gas, but needs to pick up the pace of change.** If Russia increased its energy efficiency in each sector to the levels of comparable OECD countries, it could save almost one-third of its annual primary energy use, an amount similar to the energy used in one year by the United Kingdom. Potential savings of natural gas alone, at 180 bcm, are close to Russia's net exports in 2010. New energy efficiency policies and continued price reforms for gas and electricity bring some improvements but, in our analysis, do not unlock more than a part of Russia's efficiency potential. Faster implementation of efficiency improvements and energy market reforms would accelerate the modernisation of the Russian economy and thereby loosen its dependency on movements in international commodity prices.

## Achieving energy for all will not cost the earth

**We estimate that, in 2009, around \$9 billion was invested globally to provide first access to modern energy, but more than five-times this amount, \$48 billion, needs to be invested each year if universal access is to be achieved by 2030.** Providing energy access for all by 2030 is a key goal announced by the UN Secretary-General. Today, 1.3 billion people do not have electricity and 2.7 billion people still rely on the traditional use of biomass for cooking. The investment required is equivalent to around 3% of total energy investment to 2030. Without this increase, the global picture in 2030 is projected to change little from today and in sub-Saharan Africa it gets worse. Some existing policies designed to help the poorest miss their mark. Only 8% of the subsidies to fossil-fuel consumption in 2010 reached the poorest 20% of the population.

**International concern about the issue of energy access is growing. The United Nations has declared 2012 to be the “International Year of Sustainable Energy for All” and the Rio+20 Summit represents an important opportunity for action.** More finance, from many sources and in many forms, is needed to provide modern energy for all, with solutions matched to the particular challenges, risks and returns of each category of project. Private sector investment needs to grow the most, but this will not happen unless national governments adopt strong governance and regulatory frameworks and invest in capacity building. The public sector, including donors, needs to use its tools to leverage greater private sector investment where the commercial case would otherwise be marginal. Universal access by 2030 would increase global demand for fossil fuels and related CO<sub>2</sub> emissions by less than 1%, a trivial amount in relation to the contribution made to human development and welfare.

# WORLD ENERGY OUTLOOK 2011

*World Energy Outlook 2011* brings together the latest data, policy developments, and the experience of another year to provide robust analysis and insight into global energy markets, today and for the next 25 years. This edition of the IEA's flagship WEO publication gives the latest energy demand and supply projections for different future scenarios, broken down by country, fuel and sector. It also gives special focus to such topical energy sector issues as:

- **Russia's energy prospects** and their implications for global markets.
- The role of **coal in driving economic growth** in an emissions-constrained world.
- The implications of a possible **delay in oil and gas sector investment** in the Middle East and North Africa.
- How **high-carbon infrastructure "lock-in"** is making the 2°C climate change goal more challenging and expensive to meet.
- The scale of **fossil fuel subsidies** and **support for renewable energy** and their impact on energy, economic and environmental trends.
- A "**Low Nuclear Case**" to investigate what a rapid slowdown in the use of nuclear power would mean for the global energy landscape.
- The scale and type of investment needed to provide **modern energy to the billions of the world's poor** that do not have it.

## World Energy Outlook 2011

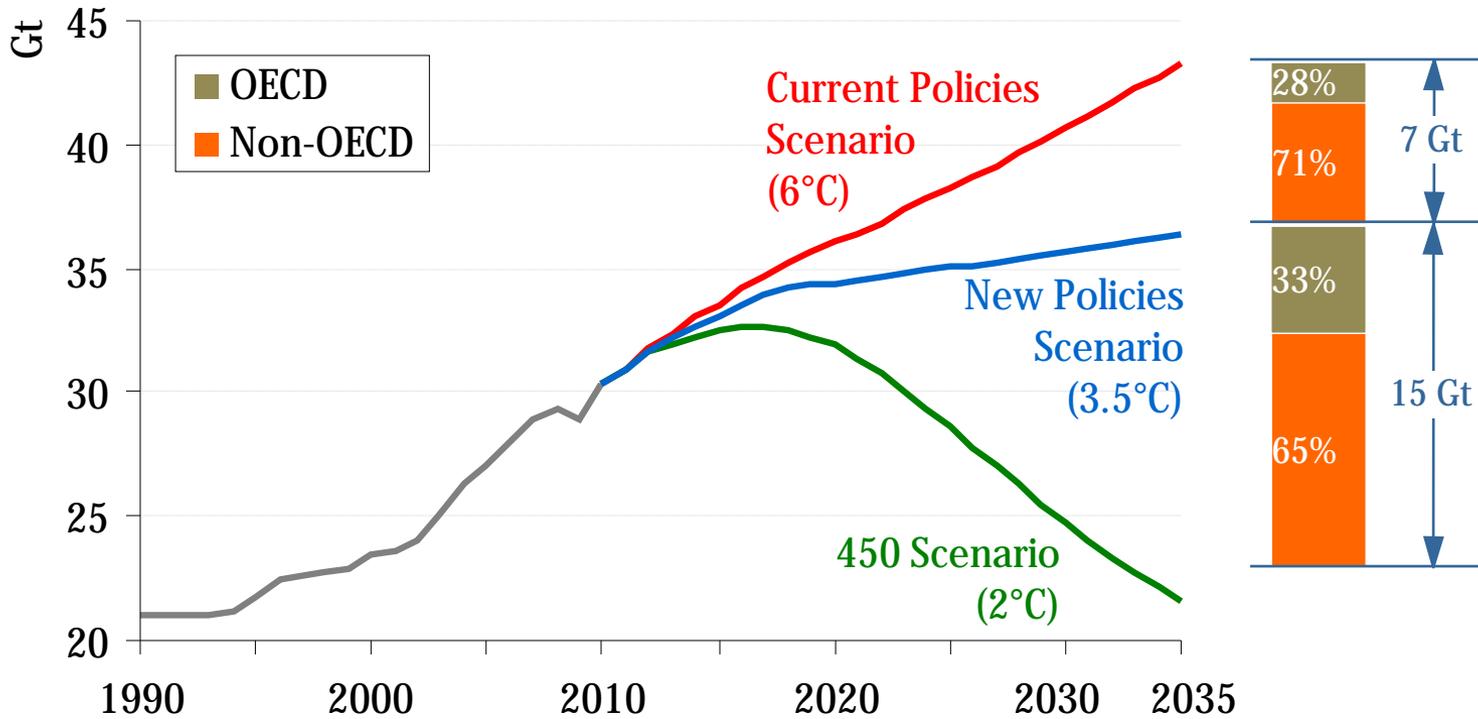

**Laura Cozzi**  
**Deputy Head, Office of the Chief Economist**  
**Durban, COP17, 5 December 2011**

Welcome and good morning/afternoon/evening...

During the next 25/30 minutes I will be presenting the key findings of the WEO-2011.

# Energy policies will determine long-term temperature increase

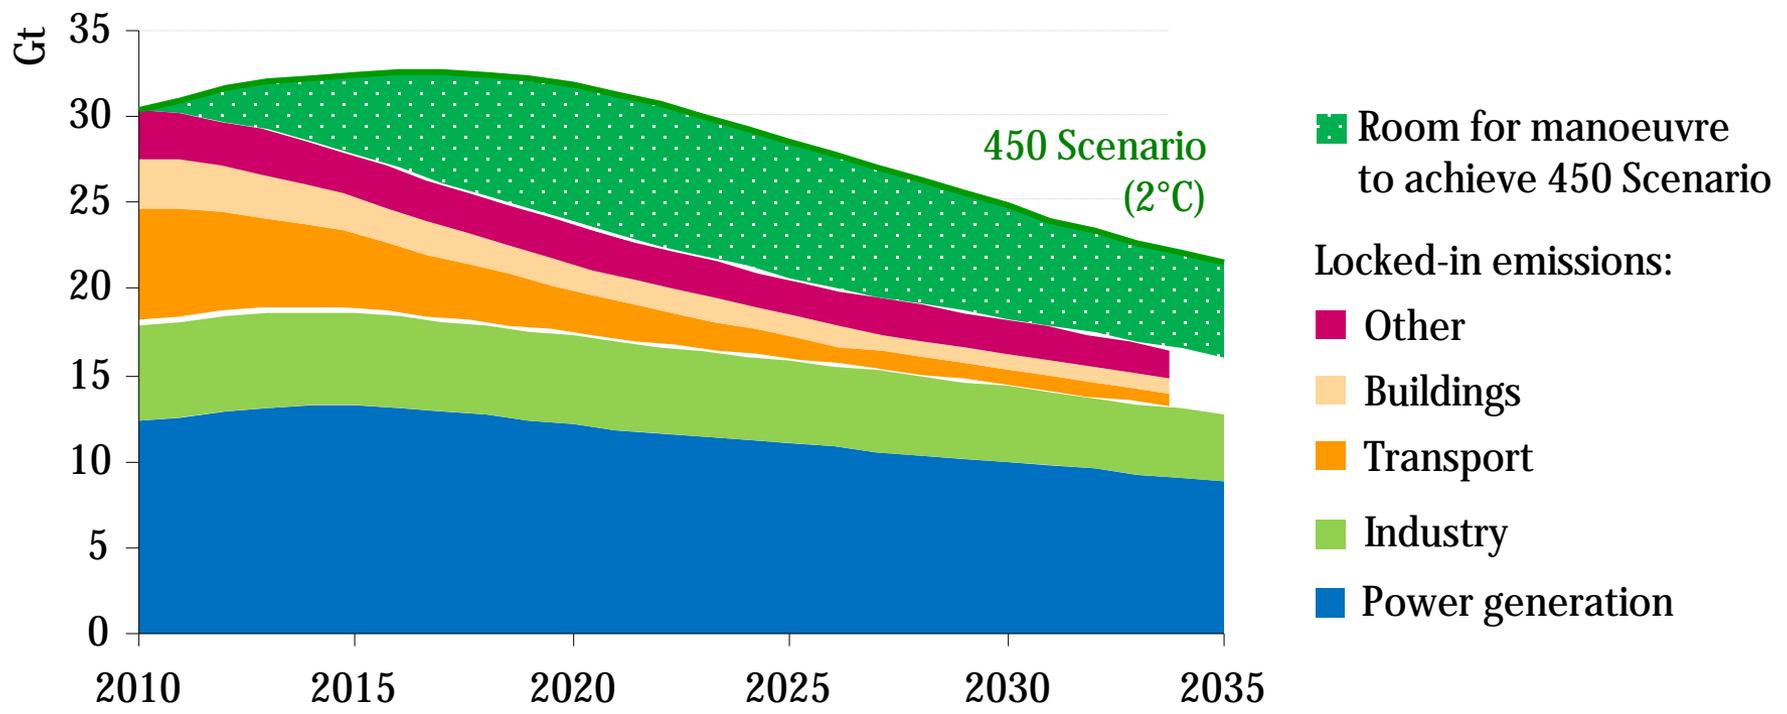

**World energy-related CO<sub>2</sub> emissions by scenario**

**Without further energy and climate policy action, we are committing to a trajectory leading to up to 6 degrees long-term temperature increase**

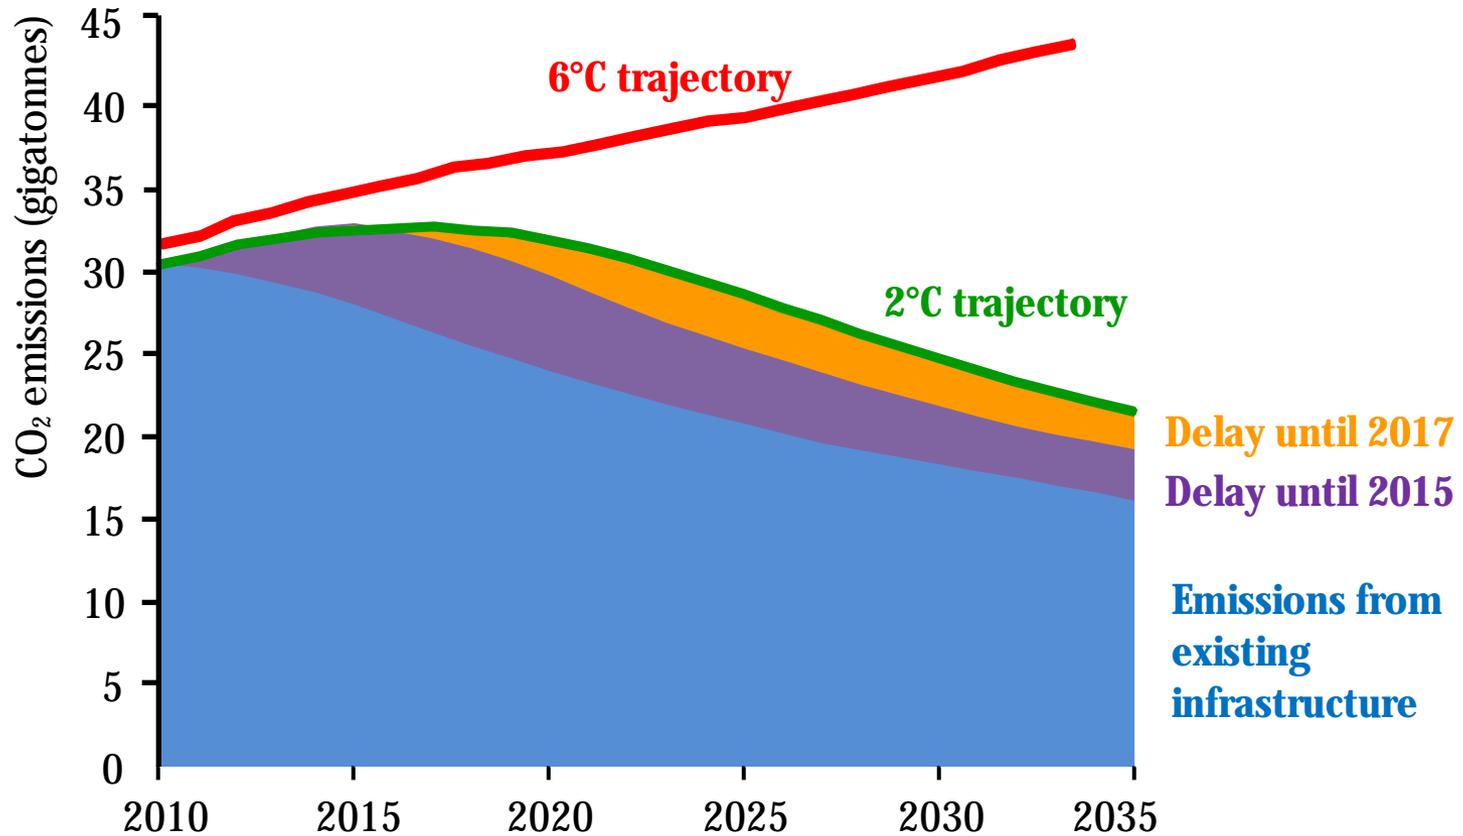

# Lock-in of current infrastructure

**World energy-related CO2 emissions from locked-in infrastructure in 2010 & room to manoeuvre to achieve the 450 Scenario**

**Infrastructure currently in place or being built accounts for 80% of permissible emissions under a 450 Scenario, significantly limiting the room of manoeuvre**

# The door to 2°C is closing, but will we be “locked-in” ?

Without further action, by 2017 all CO<sub>2</sub> emissions permitted in the 450 Scenario will be “locked-in” by existing power plants, factories, buildings, etc

## **ANIMATION**

CO<sub>2</sub> emissions in the New Policies Scenario put us on track for a dangerous level of climate change, inducing a temperature increase of more than 3.5°C. Without these new policies, current trends put us on an even more worrying track, for a temperature rise of 6°C

WEO-2011 also presents a 450 Scenario that sets out what it would take to reach the international goal of limiting the long-term increase to 2°C

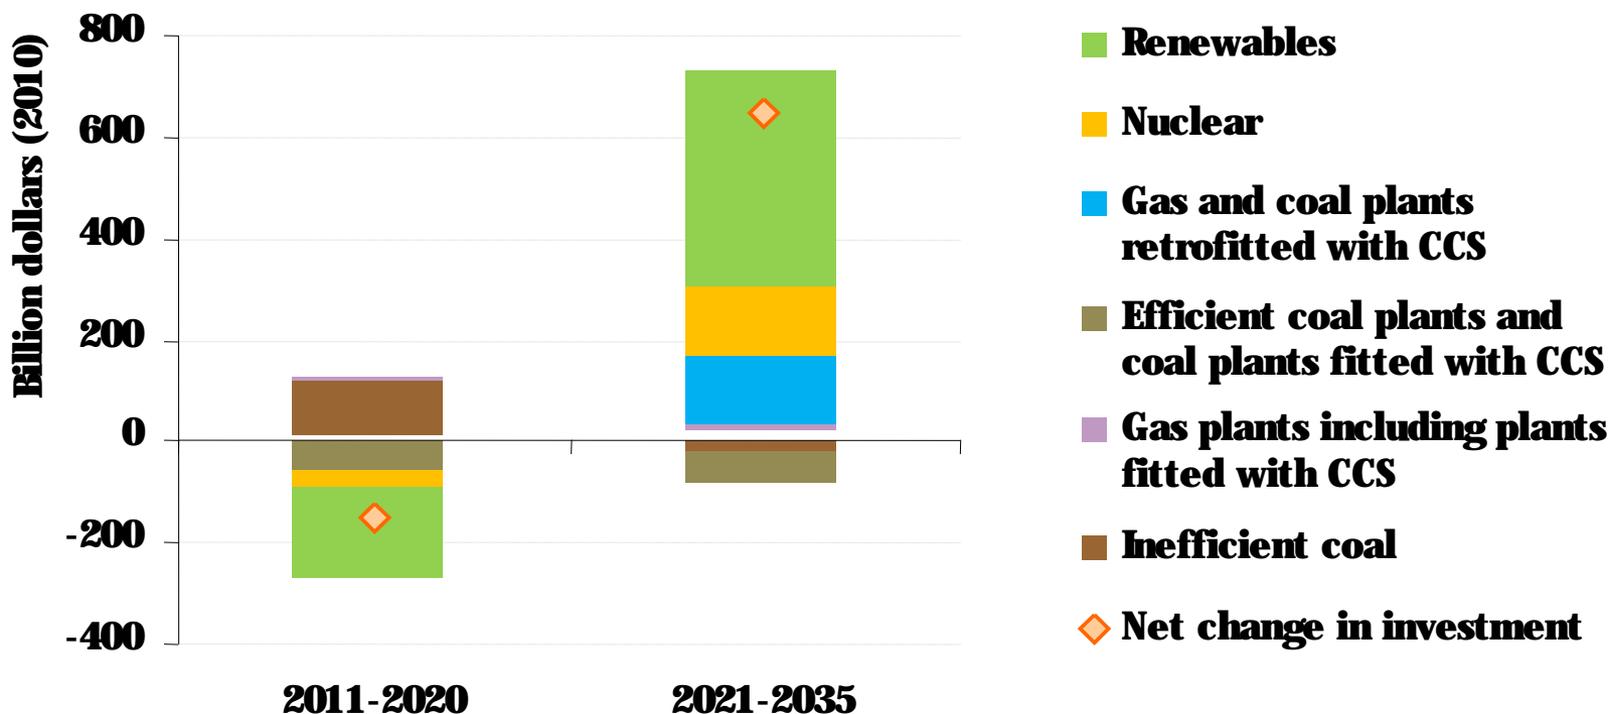

This year, we are here to warn that the door to achieve 2°C, is quickly closing.

– 80% of the total CO<sub>2</sub> emissions permissible by 2035 are already “locked-in” by our existing capital stock (power plants, buildings and factories).

– Without serious new efforts by 2015, the energy-related infrastructure in place will generate more than 90% of the allowed emissions by 2035.

# Delaying action is a false economy

**Change in investment in power generation in the Delayed 450 Case, relative to the 450 Scenario**

*For every \$1 of avoided investment in the power sector before 2020, an additional \$4.3 would need to be spent after 2020*

# What implications for energy policy?

**Power sector – which set of policies can trigger early retirement of as much as 45% of global fossil-fuel capacity?**

**Industry – how to incentivize investment in more efficient productions and CCS in developing countries?**

**Leave the fossils under ground?**

- **Emissions budget to 2050 for 2 degrees = 1176 Gt**
- **Potential emissions from burning remaining reserves = 2423 Gt**

As the presentation has just highlighted, there are few signs that the urgently needed shift in global energy trends is underway or forthcoming. Quite simply, if we don't change direction soon, we'll end up where we're heading – which is towards an unsustainable energy future

We have heard that global energy demand is set continue its increase with rising prosperity and population.

Oil supply will become more geographically concentrated, intensifying economic and energy security risks.

Natural gas is set to play an even more prominent role in the global energy mix, coal continues to support development in emerging economies.

Drilling Critics Face a Divide Over the Goal of Their Fight

By PETER APPLEBOME

With a deadline looming this week for the public to weigh in on gas drilling in New York State, the antifracking movement itself has become divided over what its goal should be: securing the nation's toughest regulations, or winning an outright ban?

The question is pitting brand-name organizations like the Sierra Club, the Natural Resources Defense Council and the Nature Conservancy, which are working nationwide for stringent rules, against an ever-growing universe of grass-roots groups demanding a prohibition on the kind of intensive shale gas drilling being proposed in the state. And it is reflecting the tightrope being walked by Gov. Andrew M. Cuomo between an economically potent industry and many landowners eager for drilling on one side, and on the other a movement that has become one of the most powerful environmental and citizens campaigns in state history.

Whatever the result, the split among the industry critics reflects how the opposition has exponentially hardened since fracking emerged as a statewide issue in 2008.

"When we started out, what we wanted was more information on what this means for New York," said Wes Gillingham, program director for Catskill Mountainkeeper, one of the first groups to focus on the issue. "No one had any thought about calling for a ban. But the more you find out about gas drilling and how it's been practiced by the industry today, the more you realize it can't be done safely. It would just be a disaster for New York State."

Mr. Gillingham said he had worked closely and effectively with national groups. Still, he said: "For the average person on the ground over the Marcellus Shale who is living with this issue, the fact that the national groups are not saying, 'Not here, no way,' is shocking to them."

Wednesday is the deadline for comments about the state's proposed drilling regulations and

environmental impact statement to guide gas development in New York. So far, the State Department of Environmental Conservation has received 20,800 comments, far more than any other issue in its history. Officials say they do not know of any other issue that received 1,000 comments.

Drilling could start up after the state adopts new regulations, perhaps this spring. After previously indicating his agency expected drilling to resume at some point this year, Joseph Martens, commissioner of the conservation department, said in October that it was not clear whether any drilling would proceed this year.

Representatives of national groups, like Kate Sinding of the Natural Resources Defense Council and Roger Downs of the Sierra Club, are widely regarded as key players who asked the right questions and provided the technical expertise that helped produce what has, in effect, been an almost four-year moratorium on new gas drilling in New York State. At issue is a process called high-volume hydraulic fracturing, or hydrofracking, which involves injecting millions of gallons of chemically treated water underground to break up shale formations and release natural gas.

Questions about the safety of the process have helped move some environmentalists from an enthusiastic embrace of gas to a much more measured one that still sees it as an essential part of the available energy mix.

"I guess I would say that, in fairness, the N.R.D.C.'s position has evolved — in New York and more broadly as well," Ms. Sinding said. "So we're very concerned not only with having the best regulations in place, but with the extent to which drilling is going to be allowed to happen at all in the state.

"But we haven't called for a ban because we continue to believe that, in all likelihood, some amount of drilling is going to happen, and it's important to be present at the table so we have regulations that ensure that whatever is done will be done as safely as possible."

Many of those involved said it was unlikely that Governor Cuomo would turn his back on the gas industry and ban drilling in the rich Marcellus and Utica shale deposits covering much of the economically depressed southern and western reaches of the state. But a push for local and statewide bans has become an increasing focus of the opposition.

Drilling critics have far outnumbered supporters during the public comment period, but the conservation department has also heard from the gas industry and landowners who hoped to lease their property for drilling. Many of them say New York has already delayed for too long, and is paying a price.

"I think the governor's office recognizes that this has gotten much beyond the science and has become an emotional issue or a cause célèbre for certain elements," said Dennis Holbrook, executive vice president of Norse Energy in Buffalo, who has been active in the industry in the state for 35 years. "It's time to move the process forward."

National environmental groups have a complicated history with natural gas. Several, particularly the Sierra Club, have seen it as a bridge fuel toward renewable sources that was cleaner than coal and oil, and a preferred alternative to common mining practices. The relationship between the gas industry and some environmentalists has frayed as the potential impacts of gas drilling, particularly the effects on drinking water supplies, have become apparent in the Western States and in Pennsylvania. Now some former advocates of gas see it not just as an alternative to oil and coal, but also as something crowding out renewable resources like wind and solar power.

But many fracking critics still see the old ties at work.

Claire Sandberg was one of the two founders of Frack Action, which started up in 2010 largely because some antifracking activists worried that established environmentalists seemed resigned to living with gas drilling.

"I think the national groups got themselves in a real bind," she said. "They entered into a marriage of convenience with natural gas because it was too daunting to try to take on coal and gas at the same time. Now they find themselves with a mutiny on their hands."

"It's time for the environmental movement to grow a spine," she added.

Many close to the process say that the fight will become far more complicated than simply deciding whether to ban or to regulate. Options in between could include a ban until further studies are done; rules so tough they amount to a de facto prohibition; bans in parts of the state, like those close to water supplies; regulations that would keep out all but the most responsible companies; and allowing drilling to resume with a pilot program in an area with a history of drilling.

Some involved with the issue say that despite differences, diverse fracking opponents have found ways to work together, and that they will almost certainly need the technical knowledge and the procedural savvy of longtime environmentalists, as well as the passion of the grass-roots groups.

"You have a lot of bricks being thrown at the national organizations, but I don't really think there's as much difference as some people want to see," said Bruce Ferguson, a founding member of Catskill Citizens for Safe Energy, which supports a ban. "No one wants to see fracking go forward under the current regime or the way it's being done in Pennsylvania. Everyone agrees on that."

Court Vacates EPA Stay Of Combustion Air Rules But Few Effects Seen

Posted: January 10, 2012

A federal district court has vacated and remanded EPA's indefinite stay of its controversial boiler and incinerator air rules after finding the agency failed to adequately justify the delay -- a mixed ruling for activists as it means the delayed rules are again in effect though EPA is slated to amend them in April 2012, well before they take effect as early as 2014.

Although the court found EPA's stay of the combustion rule package was unlawful in this case, the ruling suggests EPA could issue such a stay in the future if it follows the right procedures.

In a Jan. 9 opinion, Judge Paul Friedman of the U.S. District Court for the District of Columbia ruled that the agency's self-imposed stay of the air rules is unlawful because the agency did not meet a previously established four-part test for a stay that it was bound to use. Friedman also said that the agency erred in failing to base its stay on pending legal challenges to those rules, as required under section 705 of the Administrative Procedure Act (APA).

The ruling means that EPA's boiler air toxics rule and a related emissions rule for commercial and industrial solid waste incinerators (CISWI) are once again in effect, sources say, though existing facilities do not have to comply with the rules until 2014 or 2015 at the earliest. Sources say the ruling will have little short-term effect given the 2014-2015 compliance date, and EPA has announced plans to revise and delay those deadlines to 2015 or 2016.

In a Jan. 10 statement, Earthjustice said the court rejected EPA's "attempt to suspend health protections against the toxic pollution from industrial boilers. . . . The health protections will save thousands of lives every year by reducing the major amounts of toxic air pollution such as mercury, lead, arsenic, and chromium that these plants emit."

But the American Forest & Paper Association (AF&PA) -- suing over the merits of the rules in the U.S. Court of Appeals for the District of Columbia Circuit -- issued a statement Jan. 10 saying the ruling reinforces the need to pass legislation delaying the rules in order to give EPA time to "fully analyze and prepare a new rule."

But prospects for a legislative fix are unclear at best, as several senators that previously supported the bill say they welcome the agency's December proposal to overhaul key provisions of the two rules.

EPA issued the final boiler and CISWI rules in February 2011, alongside an announcement it would reconsider several aspects of the rules to address industry concerns that the rules are unachievable.

In May the agency then issued a stay that halted the rules' implementation pending the outcome of either the lawsuit, or the reconsideration, depending on which occurs first. EPA proposed revised versions of the combustion rules in December, and has told the district court in briefs that it intends to issue final versions by April 2012.

Sierra Club and Earthjustice sued over the stay in the district court, saying EPA lacked authority under APA to issue the stay, and also arguing that the Clean Air Act does not allow stays pending reconsideration longer than three months. A Sierra Club source says, "I think we're happy with the decision," because it says the agency cannot issue indefinite stays of rules pending reconsideration.

EPA did not respond to a request for comment by press time.

#### Precedent For Stays

Ruling in the suit, *Sierra Club v. EPA*, Friedman said EPA's stay was arbitrary and capricious, and did not satisfy its or the court's own four-part test for stays. The agency is "bound by its own precedents to apply the four-part test for stays and injunctions unless it provides a reasoned decision for its change of position, which it has not done," according to Friedman. The judge said that EPA's use of APA section 705 authority for the stay also means that it was required to "justify the stay must be based on the underlying litigation in the court of appeals," but it did not.

Friedman said that stays initiated by the court or initiated by EPA are governed by the same criteria, which weighs the likelihood of plaintiffs succeeding in their suit, the prospects for the plaintiff or others to be irreparably harmed and the public interest in granting a stay. Ruling to vacate the stay, Friedman said EPA "neither employed nor mentioned" these criteria in its stay notice, and that the agency "has failed to advance any persuasive reason why it should be treated differently from a court when staying agency actions pending judicial review."

The court also finds that, "Even if EPA were not required as a matter of law to employ the four-part preliminary injunction test in granting a stay under Section 705 of the APA, EPA previously has done so in its review of requests to stay its rules," including its May 2011 Federal Register notice to deny in part and grant in part industry requests to reconsider air toxics and criteria pollutant rules for the Portland cement industry.

Given that the agency had previously weighed these various factors in determining whether or not to stay a rule, it was required to provide justification for why it departed from this precedent, the court says, which it failed to do. The court adds that "EPA therefore has failed . . . to come to grips with its prior precedents."

The court further finds that EPA -- when using APA section 705 authority to stay a rule pending judicial review when it finds that "justice so requires" -- is required to base the stay on pending legal challenges to the affected rule, but notes EPA did not cite the pending appeals court suits over the combustion rules when it stayed them.

Friedman said EPA's stay "makes no effort to ground the stay on the existence or consequences of the pending litigation in that court. In fact, the reasons that EPA provided in the delay notice for staying the effectiveness of the boiler rule and the CISWI rule have nothing to do with the judicial review of the boiler rule and the CISWI rule. The purpose and effect of the delay notice plainly are to stay the rules pending reconsideration, not litigation."

Friedman said EPA "must have articulated, at a minimum, a rational connection between its stay and the underlying litigation in the court of appeals." While EPA in briefs argued that the reasons provided in the stay notice "establish litigation risk" and thus justify the stay, the court notes that EPA says in the notice that it believes that the boiler and CISWI rules "reflect reasonable approaches consistent with the requirements of the Clean Air Act."

## Path For Future Stays

Although the court vacated EPA's stay, Friedman appears to have laid out a path for the agency to issue future stays of rules. Friedman rejected Sierra Club's claim that EPA lacked the authority to issue the notice under APA Section 705. Activists argued that EPA is limited by the Clean Air Act to issue stays pending reconsideration of no more than three months, and that the DC Circuit had barred such stays outside of that authority in 1992's Natural Resources Defense Council (NRDC) v. Reilly. But Friedman finds that NRDC addresses a different question than the one in the boiler case, and thus the case does not control the Sierra Club litigation over the boiler rule stay.

Friedman also said the Clean Air Act is ambiguous on whether the three-month limit on stays while it reconsiders regulations "eliminates EPA's authority to stay rules pending judicial review under section 705 of the APA" and does not specifically say whether APA section 705 does not apply to the relevant provisions of the air law.

Assessing Congress' intent, Friedman finds that APA section 705's omission from the list of exclusions in the Clean Air Act to be "significant," noting that the relevant section of the air law applies to both the court and EPA and "one cannot find a principled analysis by which to preserve the courts' authority to grant stays pending judicial review under section 705 while simultaneously concluding that the agency has been deprived of such authority."

Friedman said "the canon of statutory construction *expressio unius est exclusio alterius*" -- namely, that the express mention of one thing means the exclusion of others -- would offer that "when Congress enacts specific limitations in a general statute it is presumed to allow other circumstances not included in those limitations[.]"

Therefore, according to the ruling, "Congress did not intend to prohibit EPA or the federal courts from staying the effective date of emission standards pending judicial review under Section 705 of the APA."

Friedman also rejected activists' claims that EPA erred by failing to take notice and comment on its stay. Friedman said the stay "does not constitute a substantive rulemaking . . . and therefore is not subject to notice and comment requirements."

The court notes that "the central question . . . [is] whether the stay of the boiler rule and the CISWI rule constitutes substantive rulemaking" and that Sierra Club does not disagree with "EPA's characterization of the delay notice as 'a temporary procedural device . . . that maintains the status quo with respect to boilers and CISWI units.'" -- Bobby McMahan (bmcMahon@iwpnews.com)

Dear All,

I just wanted to give you a brief update on the status of our project selection process in the Yale Environmental Protection Clinic and to inform you of important first steps if your project is chosen.

Yesterday, the Clinic had its first joint-class meeting, where we discussed all of the project proposals with the students. The students must submit their rankings of their top project choices by this evening. We hope to finalize teams and let you know if your project has been selected by Friday at the very latest.

As Kit Kennedy mentioned in her original solicitation email, however, we have a quick turn-around between finalizing project teams and our first project team conference call with the sponsors of the chosen projects, which will take place on Monday, January 30. As such, we wanted to let you know that if your project is selected, we plan to schedule a call with you on Monday, January 30 between 12:00pm and 2:00pm. To the extent that you can try to leave this block of time available for a phone call, we would greatly appreciate it as it will make the meeting scheduling process go much more smoothly. Apologies in advance for the short notice and thank you for working with us to ensure the semester gets off to a smooth start!

Best,

Hayley Jade Fink

**CERTIFICATE AS TO PARTIES, RULINGS AND RELATED CASES**

I, the undersigned counsel for Respondent United States Environmental Protection Agency, hereby certify pursuant to Rule 28(a)(1) of the Rules of the United States Court of Appeals for the District of Columbia Circuit, to the best of my knowledge, information and belief, the following:

A. Parties and Amici

(i) Parties, intervenors, and amici who appeared below.

The requirement in Circuit Rule 28(a)(1)(A) to identify parties, intervenors and amici who appeared in the district court below is inapplicable because the instant petition seeks direct review of agency rulemaking.

(ii) Parties, intervenors, and amici in this Court.

**Petitioners:**

1. In Case No. 08-1250: Natural Resources Defense Council (“NRDC”) and Sierra Club
2. In Case No. 09-1102: NRDC and Sierra Club
3. In Case No. 11-1430: American Lung Association, Medical Advocates for Healthy Air, NRDC and Sierra Club

**Respondent:** United States Environmental Protection Agency (“EPA”)

**Intervenors:**

- National Environmental Development Association’s Clean Air Project
- Utility Air Regulatory Group
- Fine Particle Litigation Group
- National Petrochemical & Refiners Association and American Petroleum Institute
- National Cattlemen’s Beef Association

**Amici:** None

B. Rulings Under Review

Petitioners seek review of two final rules promulgated by EPA under the Clean Air Act, both of which govern implementation of the fine particulate matter (“PM<sub>2.5</sub>”) national ambient air quality standard originally established in 1997. See

72 Fed. Reg. 20,586 (Apr. 25, 2007) (“Clean Air Fine Particle Implementation Rule”); 73 Fed. Reg. 28,321 (May 16, 2008) (“Implementation of the New Source Review (NSR) Program for [PM<sub>2.5</sub>]”). These rules are included in the Addendum of Pertinent Statutes and Regulations to EPA’s Brief.

C. Related Cases

Case No. 07-1227 (and consolidated cases) is related. Petitioners in these consolidated cases challenge the “Clean Air Fine Particle Implementation Rule,” 72 Fed. Reg. 20,586. On June 27, 2011, Petitioners in Case No. 08-1250 moved jointly with EPA, and without opposition by any other party, to consolidate with Case No. 08-1250 certain common issues presented in Case No. 07-1227 so that they could be litigated together with Case No. 08-1250. The Court granted that motion on November 8, 2011. In all other respects, Case No. 07-1227 remains held in abeyance pending EPA’s consideration of an administrative petition requesting reconsideration of the Implementation Rule.

Dated: February 27, 2012

STANDARD OF REVIEW ..... 21

SUMMARY OF ARGUMENT ..... 22

ARGUMENT ..... 25

I. SUBPART 4 EXPRESSLY APPLIES TO THE PM<sub>10</sub> NAAQS AND DOES NOT SPECIFY NAAQS IMPLEMENTATION REQUIREMENTS FOR PM<sub>2.5</sub>. ..... 25

    A. Petitioners’ Challenge Is Untimely. .... 25

    B. Because the Plain Text of Subpart 4 Makes Clear that it Applies Only to the PM<sub>10</sub> NAAQS, EPA’s Interpretation Should Be Upheld Under *Chevron* Step One. .... 29

    C. Whitman’s Analysis of Subpart 2 Is Inapplicable Because the Text of Subpart 4 Materially Differs From That of Subpart 2. .... 34

    D. Even If the Court Finds the Statutory Text Ambiguous, Legislative History Supports EPA’s Reading. .... 38

    E. EPA’s Reading of the Act Is, at Minimum, a “Permissible” Interpretation Entitled to Deference Under *Chevron* Step Two. .... 41

II. EPA REASONABLY DETERMINED THAT AMMONIA AND VOLATILE ORGANIC COMPOUNDS SHOULD NOT BE PRESUMPTIVELY SUBJECT TO CONTROL REQUIREMENTS IN ALL PM<sub>2.5</sub> NONATTAINMENT AREAS. .... 43

A. EPA Indisputably Has Discretion Under 42 U.S.C. § 7602(g) to Determine Which Emissions Should Be Identified As “Precursors” For Specific Regulatory Purposes Such As NAAQS Implementation Pursuant to Subpart 1. .... 44

B. EPA Reasonably Determined That Ammonia and VOC Emissions Should Be Subject to PM<sub>2.5</sub> Nonattainment Planning and NSR Requirements Only Where Those Emissions Are Demonstrated to Significantly Contribute to PM<sub>2.5</sub> Concentrations. .... 46

1. EPA’s policies for SO<sub>2</sub> and NO<sub>x</sub> ..... 47

2. EPA reasonably addressed ammonia differently than SO<sub>2</sub> and NO<sub>x</sub> by adopting a rebuttable presumption that ammonia is not a PM<sub>2.5</sub> attainment plan precursor. .... 49

3. EPA also provided a reasonable explanation for adopting a rebuttable presumption that VOCs are not a PM<sub>2.5</sub> attainment plan and NSR precursor. .... 53

C. EPA’s Rules Do Not Improperly Delegate the Decision to Regulate Ammonia or VOCs Solely to Each State’s Discretion. .... 55

III. IMPOSITION OF A DEADLINE ON REMAND WOULD BE INCONSISTENT WITH PRECEDENT AND IS UNNECESSARY. .... 59

CONCLUSION ..... 60

SOA	Secondary Organic Aerosol
TSP	Total Suspended Particles
VOC	Volatile Organic Compound

## **JURISDICTION**

This case concerns two final rules promulgated by the United States Environmental Protection Agency (“EPA”) under the Clean Air Act (“CAA” or “Act”) governing implementation of the fine particulate matter (“PM<sub>2.5</sub>”) national ambient air quality standard (“NAAQS”) originally established in 1997. See 72 Fed. Reg. 20,586 (Apr. 25, 2007) (“Clean Air Fine Particle Implementation Rule”); 73 Fed. Reg. 28,321 (May 16, 2008) (“Implementation of the New Source Review (NSR) Program for [PM<sub>2.5</sub>]”).

EPA does not contest any party’s standing. 42 U.S.C. § 7607(b)(1) creates subject-matter jurisdiction. All petitions were timely filed, except that objections to a determination EPA originally published prior to the instant rulemaking are untimely. Infra Argument I.A.

## **STATUTES AND REGULATIONS**

An attached addendum contains all relevant provisions.

## **STATEMENT OF ISSUES**

1. Does the Act require, or in the alternative did EPA reasonably interpret the Act to allow, implementation of the PM<sub>2.5</sub> NAAQS under subpart 1 rather than subpart 4 of Part D of Title I, since the text of subpart 4 expressly applies to the coarse particulate matter (“PM<sub>10</sub>”) NAAQS?

2. Did EPA reasonably exercise its authority under 42 U.S.C. § 7602(g) to “identify” certain precursors as “air pollutants” presumptively subject to PM<sub>2.5</sub> NAAQS implementation and New Source Review requirements, while determining that the available scientific data supported the opposite presumption for other precursors?

### **STATEMENT OF THE CASE**

#### **I. NATURE OF THE CASE**

Petitioners in this case challenge certain aspects of two EPA regulations governing implementation of the 1997 NAAQS for fine particulate matter or “PM<sub>2.5</sub>.” The Implementation Rule, promulgated in 2007, generally addresses how emissions control measures and other requirements under Title I, Part D of the Act apply through State Implementation Plans (“SIPs”) to areas designated “nonattainment” for the 1997 PM<sub>2.5</sub> NAAQS. 72 Fed. Reg. 20,586. The provisions of this rule are codified in 40 C.F.R. Part 51. The NSR Rule, promulgated in 2008, addresses how such areas are to comply with statutory “New Source Review” (“NSR”) permitting requirements. 73 Fed. Reg. 28,321. The provisions of this rule are codified in 40 C.F.R. Parts 51 and 52.

Petitioners challenge, as an initial matter, EPA’s determination in each of these final rules that nonattainment requirements for PM<sub>2.5</sub> are governed by subpart 1, rather than subpart 4, of Part D of Title I of the Act. Secondly, Petitioners

challenge EPA's decision to adopt a presumption that emissions of ammonia and volatile organic compounds do not require regulation for purposes of PM<sub>2.5</sub> nonattainment planning and NSR, except for those nonattainment areas as to which a State or EPA makes a technical demonstration that emissions of ammonia or volatile organic compounds significantly contribute to PM<sub>2.5</sub> concentrations in the nonattainment area.

## **II. GENERAL BACKGROUND REGARDING THE NAAQS PROVISIONS**

The CAA, enacted in 1970 and extensively amended in 1977 and 1990, establishes a comprehensive program for controlling and improving the nation's air quality through a combination of state and federal regulation. Under Title I, EPA identifies air pollutants anticipated to endanger the public health and welfare, and formulates NAAQS, which establish maximum permissible concentrations of those pollutants in the ambient air. 42 U.S.C. §§ 7408-09; 40 C.F.R. pt. 50. "Primary" NAAQS protect against adverse effects on public health, while "secondary" NAAQS protect the public welfare. 42 U.S.C. § 7409(a)-(b). To ensure that NAAQS will keep pace with advances in scientific knowledge, the statute provides for EPA to review the NAAQS at least once every five years and revise them as "appropriate in accordance with [42 U.S.C. § 7408 and 7409(b)]." 42 U.S.C. § 7409(d)(1).

Within two years of promulgating a new or revised NAAQS, EPA must “designate” areas of the country as either “attainment” (i.e., meeting that NAAQS), “nonattainment” (i.e., not meeting that NAAQS), or “unclassifiable.” Id. § 7407(d)(1)(A). The Act then calls on the States to establish State Implementation Plans (“SIPs”), which impose controls on sources of air pollution as necessary to attain the NAAQS. Id. § 7410; see Lead Indus. Ass’n v. EPA, 647 F.2d 1130, 1137 (D.C. Cir. 1980).

### **III. PARTICULATE MATTER POLLUTION AND THE PM NAAQS**

#### **A. “Fine” and “Coarse” Particulate Matter**

The term “particulate matter” embraces a broad class of discrete, but chemically and physically diverse, solid particles and liquid droplets in the ambient air. 70 Fed. Reg. 65,984, 65,992 (Nov. 1, 2005). Such particles may range from less than a micrometer to more than 30 micrometers in diameter. Id. There are two relevant and generally distinct types of particulate matter or “PM”: fine and coarse. Although the terms “fine” and “coarse” are sometimes used solely in relation to particle size, they also refer to a particle’s chemistry and mechanism of formation. Id.

Fine particles derive primarily from combustion by-products that volatilize and quickly condense or form gases (such as sulfur oxides, nitrogen oxides, volatile organic compounds and ammonia) that react and transform in the

atmosphere. Id. Coarse particles are emitted by some of the same industrial sources that emit fine particles, but (unlike fine particles) primarily are formed by mechanical processes such as crushing, grinding and abrasion, and by the suspension of dust. Id. Coarse particles include suspended soils and street dusts, combustion fly ash, agricultural soils and residues, and organic carbon from abrasion of tires and asphalt. Id.

The 1997 PM NAAQS uses “PM<sub>2.5</sub>” (referring to “[a]irborne particles generally less than or equal to 2.5 micrometers in diameter”) as the “indicator” for fine particles and “PM<sub>10</sub>” (i.e., airborne particles generally less than or equal to 10 micrometers in diameter) as the indicator for coarse particles. See, e.g., 72 Fed. Reg. at 20,587; infra at 8 n.1 (explaining “indicator”).

#### **B. Background Regarding “Secondary” Fine Particle Pollution and “Precursors”**

Fine particles that are either emitted directly into the air in a solid or liquid chemical form, or formed near their source by condensation processes, are referred to as “primary” particles. 70 Fed. Reg. at 65,992. Sources of primary particles include soot from diesel engines, a wide variety of organic compounds condensed from incomplete combustion or cooking operations, and compounds that condense from vapor formed during combustion or smelting. Id. “Secondary” particles are those resulting from chemical reactions of gas-phase “precursors” in the

atmosphere, which reactions either form new particles or condense onto other particles in the air. Id. Most of the sulfate and nitrate and a portion of the organic compounds in the atmosphere are formed by such chemical reactions. Id. Secondary PM formation depends on numerous factors including the concentrations of precursors; the concentrations of other gaseous reactive species such as ozone; atmospheric conditions including solar radiation, temperature, and relative humidity; and the interactions of precursors and pre-existing particles with cloud or fog droplets. Id.

The main precursor gases or chemicals associated with fine particle formation are sulfur dioxide (SO<sub>2</sub>), oxides of nitrogen (NO<sub>x</sub>), volatile organic compounds (VOCs) and ammonia. 72 Fed. Reg. at 20,589; see also 70 Fed. Reg. at 65,995-97. However, the relative contributions of these gases to PM<sub>2.5</sub> formation vary significantly among the different regions of the United States. See 70 Fed. Reg. at 65,992-94 and Tables 2-3. Thus, in the rulemakings under review here, EPA considered how States should address PM<sub>2.5</sub> precursors given that “the refinement of emissions inventories, the overall contribution of different fine particle precursors to PM<sub>2.5</sub> formation, and the efficacy of alternative potential control measures will vary by location.” 72 Fed. Reg. at 20,589; infra at V.B.

### C. Evolution of the PM NAAQS

Particulate matter was one of six pollutants covered by the original NAAQS promulgated in 1971. 36 Fed. Reg. 8186 (Apr. 30, 1971). The indicator in the first PM NAAQS was Total Suspended Particles (“TSP”), which was measured by a device that captured most particles smaller than 25-45 micrometers (“ $\mu\text{m}$ ”) in diameter.

In 1987, when EPA first revised the PM NAAQS, EPA refined the standards to focus on “inhalable” particles. EPA changed the PM indicator from TSP to  $\text{PM}_{10}$  based on evidence that the risk of adverse health effects associated with particles of  $10\mu\text{m}$  or less, which can penetrate into the trachea, bronchi and deep lungs, was “markedly greater” than that associated with larger particles. 52 Fed. Reg. 24,634, 24,639 (July 1, 1987).

EPA revised the PM NAAQS a second time in 1997. 62 Fed. Reg. 38,652 (July 18, 1997). In that review, EPA determined it was appropriate to set separate standards for fine particles and coarse particles, based on evidence that serious health effects were associated with short- and long-term exposure to fine particles in areas that met the existing  $\text{PM}_{10}$  standards. *Id.* at 38,665-68; see also American Trucking Ass’ns v. EPA, 283 F.3d 355, 365 (D.C. Cir. 2002) (“ATA III”).

Accordingly, EPA adopted two new health-based (primary) standards with a  $\text{PM}_{2.5}$  indicator – an annual and a 24-hour standard – as well as welfare-based

(secondary) standards identical to the primary standards. See 72 Fed. Reg. at 20,587 (describing the 1997 rulemaking). To address the separate health risks associated with exposure to coarse particles, EPA modified the form, but not the level, of the existing 24-hour PM<sub>10</sub> standard and retained the existing annual PM<sub>10</sub> standard.<sup>1/</sup>

In response to petitions for review of both the 1997 PM NAAQS and the 1997 ozone NAAQS, this Court upheld EPA's decision to create a NAAQS for fine particles, including the use of PM<sub>2.5</sub> as the indicator for fine particles, the form of the standard, and the levels EPA chose. ATA III, 283 F.3d at 368-75. In an earlier opinion, the Court also upheld EPA's decision to establish PM<sub>2.5</sub> secondary standards (to address adverse effects on visibility) that were identical to the primary standards. American Trucking Ass'ns v. EPA, 175 F.3d 1027, 1056-57 (D.C. Cir.) ("ATA I"), modified on reh'g, 195 F.3d 4 (D.C. Cir. 1999) ("ATA II"), rev'd in part on other grounds, Whitman v. American Trucking Ass'ns, 531 U.S. 457 (2001). Finally, the Court upheld EPA's decision to have separate standards

---

<sup>1/</sup> There are four components to a NAAQS, all of which can affect the degree of health or welfare protection: (1) the indicator, e.g., PM<sub>2.5</sub>; (2) the averaging time, e.g., 24-hour; (3) the level – for example, the level of the 24-hour PM<sub>2.5</sub> standard established in 1997 is 35 micrograms per cubic meter (µg/m<sup>3</sup>); and (4) the form – for instance, EPA determines whether the 24-hour PM<sub>2.5</sub> standard established in 1997 is met by looking at the 3-year average of the 98<sup>th</sup> percentile of 24-hour PM<sub>2.5</sub> concentrations, whereas another standard (i.e., with a different form) might require a different averaging protocol.

for coarse particles, but held that EPA had failed to reasonably explain its use of the PM<sub>10</sub> indicator for that purpose, and hence vacated and remanded the PM<sub>10</sub> standards. ATA I, 175 F.3d at 1053-55, 1057.

EPA most recently revised the PM NAAQS in 2006. 71 Fed. Reg. 61,144 (Oct. 17, 2006). The 2006 NAAQS rule continues the use of separate PM<sub>2.5</sub> and PM<sub>10</sub> standards to address the respective health and welfare effects of fine and coarse particles. In American Farm Bureau Fed'n v. EPA, 559 F.3d 512, 531-39 (D.C. Cir. 2009), this Court denied all petitions for review with respect to the PM<sub>10</sub> NAAQS. The Court specifically held that EPA reasonably explained its use of PM<sub>10</sub> as the indicator for coarse particles. Id. at 535-36.

#### **IV. STATUTORY BACKGROUND REGARDING NAAQS IMPLEMENTATION**

##### **A. State Implementation Plans**

Congress “delegated to the States primary responsibility for implementing the NAAQS.” Louisiana Env'tl. Action Network (“LEAN”) v. EPA, 382 F.3d 575, 578-79 (5th Cir. 2004). For each area within its borders failing to meet a NAAQS, a State is required to submit to EPA a state implementation plan or “SIP” setting forth the required pollution control measures and other programs the State will use to timely attain the NAAQS in that area. 42 U.S.C. §§ 7410(a), 7502(b).

SIPs submissions are adopted by the State after reasonable public notice and a hearing. Id. § 7410(a)(1). EPA then reviews each submitted plan for compliance with the applicable provisions of the Act. Id. § 7410(k). If EPA approves the SIP submission in whole or in part, the approved provisions become federally enforceable. Id. §§ 7413, 7604. If EPA does not approve or finds the submission incomplete, the State may be subject to sanctions and, eventually, federally imposed clean air measures. Id. §§ 7410(c), 7509.

### **B. Requirements under Part D, Subpart 1**

The Act's 1990 amendments established a complex program for implementing existing and revised NAAQS in Part D, Subparts 1-5 of the Act. Under Subpart 1, EPA may – but is not required to – classify areas designated nonattainment for any new or revised NAAQS. Id. § 7502(a)(1)(A). For all nonattainment areas, EPA must establish attainment dates that “can be achieved as expeditiously as practicable,” but are no later than five years from the date the area is designated nonattainment, or up to ten years from designation if “appropriate” based on specified considerations. Id. § 7502(a)(2)(A). Subpart 1 specifies control measures and other programs that States must include in SIPs for all nonattainment areas, except as modified by requirements under other subparts. Id. § 7502(b)-(c).

**C. Nonattainment Area Requirements for “PM10” under Subpart 4**

Subpart 4 establishes a classification scheme and imposes more specific requirements for the adoption of pollution control measures by certain nonattainment areas. 42 U.S.C. §§ 7513-13b. Although the subpart is generically titled “Additional Provisions for Particulate Matter Nonattainment Areas,” the statutory text invariably makes particular reference to “PM-10” as the subject of each specified requirement. *See, e.g., id.* §§ 7513(c) (“Except as provided under subsection (d) [concerning extension of attainment dates], the attainment dates for *PM-10* nonattainment areas shall be as follows . . . .”) (emphasis added); 7513a(b)(3) (defining “major sources” and “major stationary sources” in “serious” nonattainment areas as those that emit, or have the potential to emit, “at least 70 tons per year of PM-10”); 7513a(e) (requirements for “PM-10 precursors”).

**D. New Source Review**

The Act requires new or modified stationary sources to obtain construction permits under what is collectively called the “New Source Review” program. As amended in 1990, Subpart 1 provides that permits to construct and operate a new or modified major stationary source in an area designated nonattainment for any NAAQS may be issued if, among other things, “sufficient offsetting emissions reductions have been obtained, such that total allowable emissions . . . will be sufficiently less than total emissions from existing sources . . . so as to represent

... reasonable further progress.” 42 U.S.C. § 7503(a)(1)(A). Subpart 1 imposes several other preconditions for issuing new source permits in areas designated nonattainment. *E.g.*, *id.* § 7503(a)(2)-(5). These “Nonattainment New Source Review” requirements are implemented through SIPs. *Id.* § 7502(c)(5).

The Act also establishes a preconstruction permitting program for “major emitting facilities” in areas designated attainment or unclassifiable. *Id.* § 7475. This part of the NSR program is known as “Prevention of Significant Deterioration” (“PSD”). 73 Fed. Reg. at 28,323.

Finally, the Act imposes a general duty on each State to include a program in its SIP regulating the modification and construction “of any stationary source ... as necessary to assure that [NAAQS] are achieved, including a permit program as required in parts C and D.” 42 U.S.C. § 7410(a)(2)(C); 73 Fed. Reg. at 28,323.

## **V. SUMMARY OF THE RULEMAKING**

EPA published a proposed rule governing implementation of the 1997 PM<sub>2.5</sub> NAAQS in 2005, following this Court’s final resolution of the legal challenges to that NAAQS in *ATA III*. 70 Fed. Reg. 65,984 (“Proposed Rule”). EPA subsequently took final action in two stages, initially promulgating a general implementation rule in 2007, and then a second final rule in 2008 to address NSR requirements. 72 Fed. Reg. 20,586 (“Implementation Rule”); 73 Fed. Reg. 28,321 (“NSR Rule”). These two rulemakings are summarized in pertinent part below.

## **A. Implementation Pursuant to Subpart 1 Rather Than Subpart 4**

### **1. 1997 NAAQS Preamble Statement**

EPA originally set forth its position on the applicability of subpart 1 for purposes of PM<sub>2.5</sub> NAAQS implementation in the preamble to the 1997 final rule that established the PM<sub>2.5</sub> NAAQS, after receiving public comments suggesting that Congress' enactment of subpart 4 had restricted EPA's authority to promulgate a separate standard for PM<sub>2.5</sub>. In that final rule preamble, EPA observed that "Congress clearly specified an approach to the implementation of the PM<sub>10</sub> standard in the provisions of subpart 4 of Part D of Title I of the Act," and concluded that "the clear and express linkage of that approach to the PM<sub>10</sub> standard indicates that a different PM standard [such as the one for PM<sub>2.5</sub>] should be implemented under the general principles of subpart 1 of Part D of Title 1 of the Act." 62 Fed. Reg. at 38,695. In a separate passage of the preamble discussing the final rule's impact on small entities, EPA was equally direct in stating its determination that subpart 1, not subpart 4, would govern SIP requirements for PM<sub>2.5</sub>: "The SIP requirements of subpart 4 of Part D of Title I of the Act apply to SIPs for areas designated as not attaining NAAQS for PM<sub>10</sub>. Those requirements will not apply to SIPs to implement the PM<sub>2.5</sub> NAAQS." *Id.* at 38,704 n.96.

## 2. ATA litigation

In the ensuing litigation concerning the 1997 ozone and PM NAAQS, this Court and the Supreme Court reviewed challenges to EPA's determination in the preamble to the ozone NAAQS final rule that subpart 1 rather than subpart 2 would govern implementation of the revised ozone NAAQS. See 62 Fed. Reg. 38,856, 38,885 (July 18, 1997) (ozone NAAQS final rule preamble); ATA I, 175 F.3d at 1048-50; Whitman, 531 U.S. at 477-86. However, *no* challenge was raised to EPA's conclusion in the PM NAAQS preamble that *subpart 4's* requirements were inapplicable to implementation of the PM<sub>2.5</sub> NAAQS.

## 3. The Implementation Rule and NSR Rule

In the 2005 Proposed Rule, EPA reiterated its conclusion that subpart 1 exclusively governs PM<sub>2.5</sub> NAAQS implementation: "Part D includes a general subpart 1 which applies to all NAAQS for which a specific subpart does not exist. Because the PM standards were not established until 1997, the nonattainment plan provisions found in section 172 of subpart 1 apply." 70 Fed. Reg. at 66,002; see also id. at 66,037 ("EPA does not interpret subpart 4 of [P]art D of the Act . . . to apply to PM<sub>2.5</sub>."). EPA did not specifically request public comments on whether the Act could be construed to make PM<sub>2.5</sub> NAAQS implementation subject to subpart 4, nor did EPA otherwise suggest that it was reevaluating the question it had resolved in 1997.

Accordingly, consistent with its previously-stated view, EPA explained how States would address the various requirements of subpart 1 (in addition to the general SIP requirements in 42 U.S.C. § 7410), such as the provisions in CAA section 172(c) concerning reasonably available control technology (“RACT”), reasonable available control measures (“RACM”), reasonable further progress (“RFP”), contingency measures, emission inventory requirements, and NSR. 42 U.S.C. § 7502(c); see, e.g., 70 Fed. Reg. at 66,002-04, 66,010-21, 66,036-38.

Both the final Implementation Rule and NSR Rule, like the proposal, implemented the PM<sub>2.5</sub> NAAQS under subpart 1 rather than subpart 4. See, e.g., 72 Fed. Reg. at 20,598-99; 73 Fed. Reg. at 28,331-32. As noted above, EPA had not specifically sought comments on this issue. Nonetheless, EPA received a number of comments expressing concern about the legal validity of EPA’s approach (as well as other comments supporting EPA’s approach). EPA therefore responded by explaining in detail its conclusion that the Act, as construed in Whitman, not only does not “mandate” that EPA implement the PM<sub>2.5</sub> NAAQS under subpart 4, but in fact expressly limits the applicability of that subpart to the PM<sub>10</sub> NAAQS. See 72 Fed. Reg. at 20,598-99 (2007 final rule preamble); 2007 Response to Comments

(“RTC”)<sup>2/</sup> at 9-14 (JA xx); 73 Fed. Reg. at 28,331-32 (2008 final rule preamble); 2008 RTC<sup>3/</sup> at 24-27, 29-30 (JA xx).

## **B. Regulation of Precursors**

The Act authorizes EPA to regulate criteria pollutant precursors. In 42 U.S.C. § 7602(g), the Act defines the term “air pollutant” to include “any precursors to the formation of any air pollutant, to the extent the Administrator has identified such precursor or precursors for the particular purpose for which the term ‘air pollutant’ is used.” Id. As EPA explained in its Proposed Rule preamble, “the second clause of [this] sentence indicates that the Administrator has discretion to identify which pollutants should be classified as precursors for particular regulatory purposes.” 70 Fed. Reg. at 65,998. Hence, as part of this rulemaking, EPA considered whether each of the following should be regulated as precursors for purposes of PM<sub>2.5</sub> NAAQS attainment planning and NSR requirements: sulfur dioxide, ammonia, NO<sub>x</sub> and VOCs. See generally 70 Fed. Reg. at 65,998-66,000; 72 Fed. Reg. at 20,590-95; 73 Fed. Reg. at 28,325-31; 2007 RTC at 25-78 (JA xx); 2008 RTC at 7-21 (JA xx).

---

<sup>2/</sup> EPA, “Responses to Significant Comments on the 2005 Proposed Rule to Implement the Fine Particle [NAAQS],” Dkt. No. OAR-2003-0062-0251 (Mar. 29, 2007) (JA xx).

<sup>3/</sup> EPA, “Implementation of the New Source Review (NSR) Program for [PM<sub>2.5</sub>]: Response to Comments,” Dkt. No. OAR-2003-0062-0278 (Mar. 2008) (JA xx).

EPA's Proposed Rule provided: (a) that SIPs in all PM<sub>2.5</sub> nonattainment areas would be required to address sulfur dioxide as a PM<sub>2.5</sub> attainment plan precursor; (b) that all such SIPs also would be required to address NO<sub>x</sub> as a PM<sub>2.5</sub> attainment plan precursor "unless the State and EPA make[] a finding that NO<sub>x</sub> emissions from sources in the State do not significantly contribute to the PM<sub>2.5</sub> problem in a given area or to other downwind air quality concerns"; and (c) that such SIPs would *not* be required to address ammonia or VOCs as PM<sub>2.5</sub> attainment plan precursors "unless the State or EPA makes a technical demonstration that ammonia emissions from sources in the State significantly contribute to the PM<sub>2.5</sub> problem in a given nonattainment area or to other downwind air quality concerns." 70 Fed. Reg. at 66,999-66,000.

EPA requested comments "on all aspects" of its proposed policies for addressing precursor emissions, and requested that such comments be accompanied by detailed technical supporting information. Id. EPA also noted that "[a]ny State or EPA technical demonstration to modify the presumptive policy approach for ammonia, NO<sub>x</sub> or VOC should be developed well in advance of the SIP submittal date." Id. at 66,000. "In addition, the development of such a technical demonstration should include consultation with appropriate State, local, and EPA technical representatives representing air quality and transportation agencies." Id.

Both the final Implementation Rule and NSR Rule maintained the same policies that EPA had proposed. Thus, the rules require States to address sulfur dioxide as a PM<sub>2.5</sub> attainment plan and NSR precursor in all areas, and to address NO<sub>x</sub> as such a precursor unless there is “a finding that NO<sub>x</sub> emissions from sources in the State do not significantly contribute to PM<sub>2.5</sub> concentrations in the relevant nonattainment area.” 72 Fed. Reg. at 20,594-95; accord 73 Fed. Reg. at 28,327-28. Conversely, both rules provide that States are *not* required to address ammonia or VOCs as a PM<sub>2.5</sub> attainment plan or NSR precursor unless a technical demonstration by the State or EPA shows that ammonia or VOC emissions “significantly contribute to PM<sub>2.5</sub> concentrations in a given nonattainment area.” 72 Fed. Reg. at 20,591-93; 73 Fed. Reg. at 28,329-31.

EPA’s final rules eliminated the language from the proposal that had referred to “other downwind air quality concerns” as a consideration in determining whether to reverse presumptions, in order to “clarify that identification of attainment plan precursors involves evaluation of the impact on PM<sub>2.5</sub> levels in a nonattainment area of precursor emissions from sources within the state(s) where the nonattainment area is located.” 72 Fed. Reg. at 20,591. This change from the Proposed Rule was appropriate because “[o]ther parts of the Act, notably [42 U.S.C. §§ 7410(a)(2)(D) and 7426], focus on interstate transport of pollutants.” 72 Fed. Reg. at 20,591; accord 73 Fed. Reg. at 28,328.

EPA discussed what data and analysis should be included in a technical demonstration to support reversing a PM<sub>2.5</sub> precursor presumption. 72 Fed. Reg. at 20,591-92, 20,596-97. Additionally, EPA made clear that, “if in the State’s SIP planning and adoption process a commenter provides additional information suggesting an alternative policy for regulating a particular precursor, the State will need to respond to this information in its rulemaking action.” Id. at 20,591.

## **VI. LITIGATION BACKGROUND AND ADMINISTRATIVE RECONSIDERATION PROCEEDINGS**

Petitioners the American Lung Association, Medical Advocates for Healthy Air, Natural Resources Defense Council and Sierra Club challenged the Implementation Rule in Case No. 07-1233, which was consolidated under Case No. 07-1227.<sup>4</sup> Later, Petitioners Natural Resources Defense Council and Sierra Club challenged the NSR Rule in Case No. 08-1250. The Petitioners also submitted administrative petitions to EPA requesting reconsideration of both rules. Accordingly, both judicial cases were held in abeyance for several years while EPA considered the petitions for reconsideration.

EPA Administrator Lisa P. Jackson issued a letter granting reconsideration as to four specific provisions or aspects of the NSR Rule on April 24, 2009. See

---

<sup>4</sup> Other parties also filed petitions challenging the Implementation Rule, which remain held in abeyance pending administrative reconsideration. Here, “Petitioners” refers only to the four parties listed above.

74 Fed. Reg. 48,153, 48,154 (Sept. 22, 2009). EPA subsequently took several actions to address issues on which it had granted reconsideration. In May 2011, EPA promulgated a final rule entitled “Implementation of the [NSR] Program for [PM<sub>2.5</sub>]; Final Rule to Repeal Grandfather Provision,” which repealed a provision of the federal PM<sub>2.5</sub> PSD permit program that Petitioners had challenged, and confirmed that application of an Agency policy that was also challenged by Petitioners (the “1997 PM<sub>10</sub> Surrogate Policy”) had ended on May 16, 2011. 76 Fed. Reg. 28,646, 28,648, 28,659 (May 18, 2011). In July 2011, Assistant Administrator Gina McCarthy issued a guidance document entitled “Revised Policy to Address Reconsideration of Interpollutant Trading Provisions for [PM<sub>2.5</sub>],” which offered guidance to States wishing to develop area-specific pollutant trading ratios and explained EPA’s reconsideration of certain ratios that the NSR Rule previously had provided would be presumptively approvable if adopted in SIP submissions.<sup>51</sup>

Administrator Jackson also issued a letter granting reconsideration as to three issues pertaining to the Implementation Rule on April 25, 2011. EPA’s evaluation of the petition for reconsideration relating to the Implementation Rule is ongoing.

---

<sup>51</sup> This guidance document may be found at <http://epa.gov/nsr/guidance.html>.

On June 27, 2011, Petitioners and EPA jointly moved to lift the stay of litigation in the NSR Rule case, enter a schedule for briefing with respect to any NSR Rule-related issues that were not resolved or mooted in the course of reconsideration, and consolidate with the NSR Rule case certain common issues raised by Petitioners' challenges to the Implementation Rule. The parties requested that the remainder of the Implementation Rule case continue to be held in abeyance pending administrative reconsideration. The Court granted this motion on November 8, 2011.

### **STANDARD OF REVIEW**

The Court must determine whether EPA's action was arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law. 42 U.S.C. § 7607(d)(9)(A). EPA's findings must be upheld if the Agency "examine[d] the relevant data and articulate[d] a satisfactory explanation for its action including a rational connection between the facts found and the choice made." Milk Indus. Found. v. Glickman, 132 F.3d 1467, 1476 (D.C. Cir. 1998) (internal quotation omitted); Small Refiner Lead Phase-Down Task Force v. EPA, 705 F.2d 506, 521 (D.C. Cir. 1983) (action must "conform to certain minimal standards of rationality") (internal quotation omitted). The Court "is guided by the deference traditionally given to agency expertise, particularly when dealing with a statutory

scheme as unwieldy and science-driven as the [CAA].” Appalachian Power Co. v. EPA, 135 F.3d 791, 801-02 (D.C. Cir. 1998); see also ATA III, 283 F.3d at 374.

In reviewing EPA’s statutory interpretation, the Court must inquire whether Congress “has directly spoken to the precise question at issue” and, if so, must give effect to Congress’ “unambiguously expressed intent.” Chevron, U.S.A., Inc. v. NRDC, 467 U.S. 837, 842-43 (1984). If the statute is silent or ambiguous, the Court considers “whether the agency’s answer is based on a permissible construction.” Id. at 843. Where “Congress has explicitly left a gap” to be filled, EPA’s regulation is “given controlling weight unless . . . arbitrary, capricious, or manifestly contrary to the statute.” Id. at 843-44. If the delegation is “implicit,” the Court “may not substitute its own construction . . . for [EPA’s] reasonable interpretation.” Id. at 844. EPA need not articulate “the best” interpretation, only a reasonable one. Smiley v. Citibank, 517 U.S. 735, 744-45 (1996).

### **SUMMARY OF ARGUMENT**

Both the Implementation Rule and NSR Rule specify NAAQS implementation requirements for PM<sub>2.5</sub> nonattainment areas pursuant to subpart 1 of Title I, Part D of the Act. This is consistent with EPA’s conclusion in 1997 that the Act makes subpart 4 applicable to implementation of the PM<sub>10</sub> NAAQS, but not the PM<sub>2.5</sub> NAAQS. Petitioners’ challenge to this interpretation has long since become untimely, as it should have been raised in response to the 1997 PM

NAAQS rule and the associated preamble statement in which EPA first published that interpretation. Challenges to EPA's similar conclusion concerning the 8-hour ozone NAAQS (*i.e.*, that implementation of that NAAQS should proceed under subpart 1 rather than subpart 2 of Title I, Part D), were not only timely raised in 1997 but were litigated to the merits before the Supreme Court in Whitman - the *same* case in which various challenges to the 1997 PM<sub>2.5</sub> and PM<sub>10</sub> NAAQS were litigated. Any dispute over whether subpart 4 should govern PM<sub>2.5</sub> NAAQS implementation was no less ripe for judicial review in 1997. Therefore, the instant petition is untimely with respect to this issue.

If the Court reaches the merits, it should defer to EPA's reasonable interpretation of the statute. The text of subpart 4 expressly refers to the "PM-10" NAAQS as being subject to its provisions. Importantly, Congress was aware when it wrote these provisions that the "PM-10" NAAQS was *not* the only potential NAAQS for particulate matter. Had Congress intended subpart 4's provisions to apply globally to any and all separate standards EPA might establish in the future for particulate matter, it could easily have substituted the all-encompassing phrase "particulate matter" for "PM-10," which would have been consistent with the type of language it used in the other subparts (*e.g.*, the provisions of subpart 2 refer generally to "ozone" nonattainment areas as being subject to their requirements). EPA's interpretation that subpart 4 applies only to the PM<sub>10</sub> NAAQS is thus

consistent with how Congress wrote the statute, and it is further supported by the legislative history of the 1990 Amendments. Finally, to the extent the Court finds any ambiguity in the text, EPA's interpretation is at least a "permissible" reading of the statute. Therefore, it must be upheld.

Petitioners also challenge EPA's decision in the Implementation and NSR Rules to adopt a rebuttable presumption that emissions of ammonia and volatile organic compounds ("VOCs") need not be regulated as PM<sub>2.5</sub> precursors for purposes of PM<sub>2.5</sub> nonattainment planning and NSR. They do not dispute, however, that 42 U.S.C. § 7602(g) gave EPA the discretion to adopt such a presumption. Contrary to Petitioners' argument, EPA identified a reasonable basis for its decision, explaining that there was significant uncertainty concerning the contribution of ammonia and VOC emissions to PM<sub>2.5</sub> concentrations in many nonattainment areas, as well as the potential that ammonia emissions reductions in certain areas could lead to adverse health impacts. EPA also explained how either the State or EPA could reverse the presumption with a technical demonstration that ammonia or VOC emissions "significantly contribute" to PM<sub>2.5</sub> concentrations in a particular nonattainment area. EPA's scientific judgment in this matter merits heightened deference, and the Rules' treatment of ammonia and VOCs should be upheld as a reasonable exercise of EPA's discretion under 42 U.S.C. § 7602(g).

For these reasons and those stated below, the Court should deny the petition for review. Moreover, if the Court grants the petition, it should deny Petitioners' extraordinary request that the Court impose a one-year deadline on EPA's remand proceedings.

## ARGUMENT

### **I. SUBPART 4 EXPRESSLY APPLIES TO THE $PM_{10}$ NAAQS AND DOES NOT SPECIFY NAAQS IMPLEMENTATION REQUIREMENTS FOR $PM_{2.5}$ .**

#### **A. Petitioners' Challenge Is Untimely.**

EPA originally announced its decision to implement the  $PM_{2.5}$  NAAQS under subpart 1 rather than subpart 4 in 1997, in the preamble to the final rule establishing that NAAQS. Supra at 13. In ATA I and Whitman, respectively, both this Court and the Supreme Court reached the merits of petitioners' challenges to analogous statements in the preamble to the 1997 *ozone* NAAQS final rule announcing EPA's decision to implement that NAAQS under subpart 1 rather than subpart 2. Supra at 14. Furthermore, the Supreme Court considered and expressly rejected EPA's arguments that those preamble statements did not constitute final agency action and that the subpart 1/subpart 2 issue was not yet ripe for review. Whitman, 531 U.S. at 477-80. But none of the parties in that litigation challenged EPA's decision to implement the separate  $PM_{2.5}$  standard under subpart 1, including *after* the Whitman opinion was issued and the case was remanded to this

Court for (among other things) further judicial review of the PM<sub>2.5</sub> NAAQS. See generally ATA III, 283 F.3d 355.<sup>67</sup> Petitioners did not seek review of this issue until commencing the present action challenging the Implementation Rule (and subsequently the NSR Rule), which means they are a decade too late. See 42 U.S.C. § 7607(b)(1) (petition for judicial review of final action of the Administrator must be filed within 60 days after publication in Federal Register).

EPA expressly stated in its 2007 Response to Comments that comments on the subpart 1/subpart 4 issue were untimely, noting “that the commenters should have raised their concerns with implementation of the PM<sub>2.5</sub> NAAQS under Subpart 1, rather than Subpart 4, at the time EPA issued the NAAQS in 1997.” 2007 RTC at 12 (JA xx). EPA observed that the Whitman Court’s analysis concerning the 1997 ozone NAAQS rule preamble statements was equally applicable to the statements in the PM<sub>2.5</sub> NAAQS rule preamble, and further noted: “EPA’s conclusion that the implementation of the PM<sub>2.5</sub> standard is governed by the provisions of subpart 1 of Part D, not subpart 4, is consistent with the analysis and views expressed by the Agency over nine years ago in final rulemaking when it first promulgated the PM<sub>2.5</sub> NAAQS.” Id.

---

<sup>67</sup> By then at the very latest, if not earlier, any interested party would have been on notice regarding the ripeness of the subpart 1/subpart 4 issue based on the Whitman holding.

This Court has long held that “[w]hen an agency invites debate on some aspects of a broad subject, . . . it does not automatically reopen all related aspects including those already decided.” National Ass’n of Reversionary Prop. Owners v. Surface Transp. Bd., 158 F.3d 135, 142 (D.C. Cir. 1998). Instead, the statutory time limit for review may only be reopened with respect to issues that the Agency “either explicitly or implicitly reconsider[s]” in a subsequent rulemaking. West Virginia v. EPA, 362 F.3d 861, 872 (D.C. Cir. 2004). Here, nothing in EPA’s 2005 Proposed Rule preamble suggested that the Agency was reevaluating whether subpart 4 applies to the PM<sub>2.5</sub> NAAQS. See 70 Fed. Reg. at 66,002, 66,036-37. Rather, EPA merely *re-stated* its prior conclusion that only subpart 1 applies, and later gave more explanation in response to unsolicited comments. Supra at 14-16.

Such mere restatement of prior conclusions does not re-open an issue. As this Court repeatedly has stated,

if a party were allowed to “goad an agency into a reply, and then sue on the grounds that the agency . . . re-opened the issue,” American Iron & Steel Inst. v. EPA, 886 F.2d 390, 398 (D.C. Cir. 1989), the agency’s thorough answer would put it at risk of “reopening,” while a taciturn response would put it at risk of being faulted for acting without reasoned decisionmaking.

American Road & Transp. Builders Ass’n v. EPA, 588 F.3d 1109, 1114 (D.C. Cir. 2009) (citation omitted). Since EPA did not *reevaluate* the issue of subpart 4 applicability, the reopener doctrine does not apply. Accord NRDC v. EPA, 571

F.3d 1245, 1264-66, 1269-70 (D.C. Cir. 2009) (petition for review of “Phase 2 Implementation Rule” for the 1997 ozone NAAQS was untimely to the extent it challenged certain NSR-related regulatory policies that were originally established in earlier rulemakings and were not reconsidered).

Although “[u]nder some circumstances an issue may be ‘deemed to have been constructively reopened even though it was not actually reopened’ in a literal sense,” those circumstances are not present here. NRDC, 571 F.3d at 1266 (quoting Kennecott Utah Copper Corp. v. DOI, 88 F.3d 1191, 1214 (D.C. Cir. 1996)). “A constructive reopening occurs if the revision of accompanying regulations significantly alters the stakes of judicial review as the result of a change that could [not have] been reasonably anticipated.” NRDC, 571 F.3d at 1266 (internal quotation omitted). In Kennecott, for example, the Court found that certain existing regulations “may not have been worth challenging” originally, but were constructively reopened when the revision of related regulations “gave them a new significance.” 88 F.3d at 1227. But here, unlike Kennecott, the precise question Petitioners seek to present now – whether subpart 4 or subpart 1 governs implementation of the PM<sub>2.5</sub> NAAQS – clearly was ripe for review in 1997 (or, at the very latest, in 2001 following Whitman). Moreover, there is no reason to think the “significance” of the issue was any less evident at that time, since the parallel

question of whether subpart 2 governs implementation of the 1997 ozone NAAQS was litigated to the merits before the Supreme Court.

Finally, Petitioners may argue that they should be allowed to pursue their challenge despite its untimeliness because they are contending that EPA's NAAQS implementation approach is unlawful. But such a claim may be raised outside of a statutory limitations period only "by filing a petition for amendment or rescission of the agency's regulations, and challenging the denial of that petition."

Environmental Defense v. EPA, 467 F.3d 1329, 1333 (D.C. Cir. 2006); see also Motor Equip. Mfrs. Ass'n v. Nichols, 142 F.3d 449, 460 (D.C. Cir. 1998) (60-day filing period under 42 U.S.C. § 7607(b)(1) is jurisdictional and may not be enlarged by the courts); NRDC, 571 F.3d at 1265 (same).

Accordingly, the instant petition should be dismissed as untimely with respect to the issues presented in Argument I of Petitioners' brief (pp. 17-29). If the Court nonetheless reaches the merits, it should deny the petition for the additional reasons stated below.

**B. Because the Plain Text of Subpart 4 Makes Clear That It Applies Only to the PM<sub>10</sub> NAAQS, EPA's Interpretation Should Be Upheld under *Chevron* Step One.**

As noted above, subpart 1 sets forth provisions regarding classifications and attainment dates that apply to all nonattainment areas except those "for which [requirements] are specifically provided for under other provisions of this part."

42 U.S.C. § 7502(a)(1)(C), (2)(D). Subpart 1 also contains NAAQS implementation requirements that apply generally to all nonattainment areas, except where modified by subpart 2, 3, 4 or 5. E.g., id. § 7502(c)(1)-(9).

Subpart 4 is titled “Additional Provisions for Particulate Matter Nonattainment Areas,” but the operative provisions of subpart 4 make no reference to “particulate matter” and do not actually prescribe requirements for *all* particulate matter nonattainment areas. Instead, the text expressly and repeatedly refers to “PM-10” and “PM-10 nonattainment areas.” Supra at 11 (citing examples). As EPA noted in its Response to Comments, “[t]he statute explicitly refers to ‘PM-10’ in the operative provisions across the board, from initial classifications . . . to attainment dates . . . to nonattainment plan requirements . . . to milestone requirements . . . to the consequences of failure to attain . . . .” 2007 RTC at 10 (JA xx); 42 U.S.C. §§ 7513(a), (c), 7513a(a)-(d). “Indeed, there are more than thirty separate references to ‘PM-10’ throughout the three statutory sections that comprise Subpart 4.” 2007 RTC at 10 (JA xx). Moreover, “[i]n the relatively few subsections that do not explicitly include the term ‘PM-10,’ it is undeniable from the context that they implicitly refer to PM-10, whether by internal cross-reference

or by juxtaposition with adjoining provisions.” Id.; see, e.g., 42 U.S.C.

§ 7513a(c)(1)-(2).<sup>7</sup>

“PM-10” is defined in section 302(t) of the Act to mean “particulate matter with an aerodynamic diameter less than or equal to a nominal ten micrometers,” 42 U.S.C. § 7602(t). Petitioners suggest that because particles meeting EPA’s regulatory definition of “PM<sub>2.5</sub>” necessarily have a diameter less than or equal to 10 micrometers, subpart 4’s references to “PM-10” should be deemed to apply to the PM<sub>2.5</sub> NAAQS. See Pet. Br. at 17-18. However, subpart 4 does not merely refer to “PM-10,” but rather contains requirements that expressly are based upon the form of the PM<sub>10</sub> NAAQS.<sup>8</sup> Specifically, subpart 4 allows attainment date extensions for “moderate” PM<sub>10</sub> nonattainment areas only if (among other conditions) “no more than one exceedance of the 24-hour [NAAQS] level for PM-10 has occurred in the area in the year preceding the Extension Year, and the annual mean concentration of PM-10 in the area for such year is less than or equal to the standard level.” 42 U.S.C. § 7513(d)(2). These criteria precisely track the form of

---

<sup>7</sup> The title of subpart 4 thus carries no weight in construing the subpart’s applicability. See Whitman, 531 U.S. at 483 (where statutory text is clear, it “eliminates the interpretive role of the title, which may only shed light on some unambiguous word or phrase in the statute itself”) (internal quotation and alteration omitted).

<sup>8</sup> As explained above, form is one of four key elements of a NAAQS, and is the air quality statistic used as a basis for determining compliance with a standard. Supra at 8 n.1.

the 1987 24-hour and annual PM<sub>10</sub> standards. See 2007 RTC at 10-11 and n.1 (JA xx). Thus, subpart 4 is properly read as imposing implementation requirements on a specific set of standards – the PM<sub>10</sub> standards. See 2007 RTC at 11 (JA xx) (“Given the wording of provisions of Subpart 4, EPA does not believe that Congress intended the provisions to apply to any and all NAAQS for particulate matter that EPA might have in the future, particularly those that might reflect different size particles or have a different form.”)

Moreover, in the rulemaking that culminated in the 1987 PM<sub>10</sub> NAAQS, EPA had considered whether to establish a separate NAAQS for fine particles, using PM<sub>2.5</sub> as the indicator. See 52 Fed. Reg. at 24,639 (observing that the fine and coarse fractions “tend to have different origins and composition,” but explaining that EPA had declined to follow several commenters’ suggestion to adopt a separate PM<sub>2.5</sub> standard). Although EPA decided not to establish a PM<sub>2.5</sub> standard in 1987, it retained the discretion to do so in the course of future NAAQS reviews if necessary to protect public health and welfare with an adequate margin of safety. It must be presumed that Congress was aware of this possibility, just as it was aware that prior to 1987, the particulate matter NAAQS had a TSP indicator rather than a PM<sub>10</sub> indicator. Supra at 7 (explaining “TSP”).<sup>92</sup>

---

<sup>92</sup> Cf. Community Futures Trading Comm’n v. Schor, 478 U.S. 833, 845-46 (1986) (Congress is presumed to be aware of agency positions or interpretations set forth in regulation).

Notably, the Act's 1990 amendments required continued implementation of that TSP standard: "Any designation for particulate matter (measured in terms of [TSP]) that the Administrator promulgated pursuant to this subsection (as in effect immediately before November 15, 1990) shall remain in effect . . . until the Administrator determines that such designation is no longer necessary . . . ." 42 U.S.C. § 7407(d)(4)(B). As EPA observed in its Response to Comments, "[h]ad Congress intended Subpart 4 to cover all possible particulate matter standards, past or future, actual or potential, it would not have needed to provide for this separate treatment for TSP." 2007 RTC at 11 (JA xx).

Furthermore, "[h]ad Congress meant to require EPA to implement any future particulate matter standard under subpart 4 it could have easily used the general term 'particulate matter,' rather than the specific term 'PM-10,' in the provisions of the subpart, rather than only in the title . . . ."). 2007 RTC at 13 (JA xx). Instead, subpart 4 makes repeated reference to "PM-10" and even more specifically to the form of the PM<sub>10</sub> NAAQS, as shown above. Among all of the subparts that impose NAAQS implementation requirements additional to those in subpart 1, subpart 4 is the *only* one in which the text of the operative provisions consistently refers to a specific NAAQS such as PM-10 instead of generally to an ambient air pollutant. Compare 42 U.S.C. §§ 7513-13b (subpart 4 requirements for "PM-10"), with id. §§ 7511-11f (subpart 2 provisions are expressed as NAAQS implementation

requirements for “ozone”), 7512-12a (subpart 3 provisions are expressed as requirements for “carbon monoxide”), and 7514-14a (subpart 5 provisions are expressed as requirements for “sulfur oxides, nitrogen dioxide, or lead”). Congress could have drafted subpart 4 in a manner identical to all of the other subparts by using the term “particulate matter” in the text of subpart 4's operative provisions. It chose instead to refer specifically to “PM-10,” and that choice must be regarded as meaningful; “[i]t is generally presumed that Congress acts intentionally and purposely when it includes particular language in one section of a statute but omits it in another.” South Coast Air Quality Mgmt. Dist. v. EPA, 472 F.3d 882, 894 (D.C. Cir. 2006) (internal quotation omitted); see, e.g., City of Chicago v. Environmental Def. Fund, 511 U.S. 328, 337-38 (1994).

**C. Whitman's Analysis of Subpart 2 Is Inapplicable Because the Text of Subpart 4 Materially Differs From That of Subpart 2.**

Subpart 4 differs from subpart 2 in several key respects. Therefore, EPA's reading of subpart 4 is not foreclosed by Whitman's holding that implementation of the 1997 ozone NAAQS is governed at least in part by subpart 2. See Pet. Br. at 26-29.

In 1997, EPA determined that the existing ozone standards – which were based on a “design value” (i.e., method for determining compliance) that measured ozone concentrations over a 1-hour sampling period, and set an annual compliance

level of 0.12 parts per million – were not adequate to protect public health based on evidence linking prolonged ozone exposures (six to eight hours) to adverse health effects. Accordingly, EPA promulgated a more protective, revised standard based on an 8-hour design value and an annual compliance level of 0.08 parts per million. 62 Fed. Reg. at 38,859. The pre-existing and revised standards were commonly referred to as the “1-hour” and “8-hour” ozone NAAQS, respectively. EPA planned to implement the 8-hour standard exclusively under subpart 1. *Id.* at 38,884-85.

Because the Act states that subpart 1's provisions on nonattainment area classifications and attainment dates “shall not apply with respect to nonattainment areas for which [classifications and attainment dates] are specifically provided under” other subparts, 42 U.S.C. § 7502(a)(1)(C), (2)(D), in *Whitman* the Court examined whether subpart 2 “provides for” the classification of ozone nonattainment areas. 531 U.S. at 481-82. Central to the Court’s analysis was Table 1 in 42 U.S.C. § 7511(a)(1), which “defines five categories of ozone nonattainment areas and prescribes attainment deadlines for each.” *Whitman*, 531 U.S. at 482. The Court concluded that subpart 2 “funnels all [ozone] nonattainment areas into the table for classification” by “declaring that ‘[e]ach area designated nonattainment for ozone . . . shall be classified at the time of such designation, under table 1, by operation of law,’” and by providing specific

calendar deadlines for attainment for each classification listed in the table.

Whitman, 531 U.S. at 482 (quoting 42 U.S.C. § 7511(a)(1)).

Although the title of 42 U.S.C. § 7511(a)(1) is “Classification and attainment dates for 1989 nonattainment areas,” the text makes clear that Table 1 applies not only to areas that were in nonattainment in 1989, but also to areas that later become designated as nonattainment for ozone. See 42 U.S.C. § 7511(b)(1) (“Any area that is designated attainment or unclassifiable for ozone . . . and that is subsequently redesignated to nonattainment for ozone . . . shall, at the time of the designation, be classified by operation of law in accordance with table 1 . . . .”). Accordingly, the Court found that subpart 2 governs implementation of the 1997 revised ozone standard at least in part, although “some provisions of Subpart 2 [were] ill fitted to implementation of the revised standard” and thus implied “some limited applicability of Subpart 1” as well. Whitman, 531 U.S. at 483, 484.

For several reasons, the analysis in Whitman does not compel a similar conclusion here. First, the text of subpart 2 refers in general terms to “ozone” nonattainment areas as being subject to its requirements. In contrast, as shown above, virtually every provision of subpart 4 makes explicit reference to the “PM-10” NAAQS or “PM-10” nonattainment areas. Thus, the text of subpart 2 on its face applies to *any* “ozone” standard, whereas the text of subpart 4 applies specifically to the PM<sub>10</sub> NAAQS. Accord 2007 RTC at 10 (JA xx).

Second, subpart 4 contains no provision that comprehensively prescribes classifications and attainment dates for all particulate matter nonattainment areas in the way that 42 U.S.C. § 7511 and Table 1 do for ozone nonattainment areas. Rather, the classification and attainment date requirements in 42 U.S.C. § 7513 apply specifically to areas “designated nonattainment for PM-10,” and the statute explicitly directs EPA to continue implementing a *different* particulate matter NAAQS – the TSP standard – separately from the PM<sub>10</sub> NAAQS implementation scheme. See 42 U.S.C. § 7407(d)(4)(B). Thus, unlike subpart 2, it is apparent from the text of subpart 4 that “Congress did not intend Subpart 4 to cover all possible standards for particulate matter.” 2007 RTC at 11 (JA xx).

Finally, the Whitman Court was principally concerned that by replacing the 1-hour ozone NAAQS with an 8-hour ozone NAAQS and implementing the latter standards exclusively under subpart 1, EPA’s approach would have rendered subpart 2 entirely meaningless. See 62 Fed. Reg. at 38,894 (describing conditions under which 1-hour ozone NAAQS eventually would be revoked); 69 Fed. Reg. 23,951, 23,954 (Apr. 30, 2004) (modified revocation approach); Whitman, 531 U.S. at 484 (“Whatever effect may be accorded the gaps in Subpart 2 as implying some limited applicability of Subpart 1, they cannot be thought to render Subpart 2’s carefully designed restrictions . . . utterly nugatory once a new standard has been promulgated.”). “In contrast, EPA promulgated the PM<sub>2.5</sub> NAAQS as an

*additional* standard that did not replace the PM<sub>10</sub> NAAQS.” 2008 RTC at 27 (JA xx) (emphasis added). Thus, unlike Whitman, reading the operative provisions of subpart 4 to apply specifically and only to the PM<sub>10</sub> NAAQS does not render subpart 4 a nullity, because EPA continues to maintain separate PM<sub>10</sub> standards which are implemented in accordance with subpart 4's requirements. See 2007 RTC at 12 (JA xx) (“EPA has decided to retain the 24-hour PM-10 NAAQS, thus preserving a PM-10 NAAQS and an implementation regime for that NAAQS governed by subpart 4.”) (citing 71 Fed. Reg. at 61,202); see also 75 Fed. Reg. 39,366, 39,369 (July 8, 2010) (partially disapproving SIP submission for the Imperial Valley PM<sub>10</sub> nonattainment area due to non-compliance with the “best available control measures” requirement of 42 U.S.C. § 7513a(b)(1)(B)). In short, EPA’s approach fulfills the Act’s directives on implementation of the PM<sub>10</sub> NAAQS as well as its command that any NAAQS not otherwise specifically provided for – such as the PM<sub>2.5</sub> NAAQS – must comply with subpart 1.

**D. Even If the Court Finds the Statutory Text Ambiguous, Legislative History Supports EPA’s Reading.**

If the Court finds the statute to be clear in providing that subpart 4 specifically applies to the PM<sub>10</sub> NAAQS, there is no need to resort to legislative history to divine Congress’ intent. See, e.g., Donnelly v. FAA, 411 F.3d 267, 272 (D.C. Cir. 2005) (“[W]e need not resort to legislative history where the statute

itself is clear.”); Halverson v. Slater, 129 F.3d 180, 187 and n.10 (D.C. Cir. 1997) (“[O]rdinarily we have no need to refer to legislative history at Chevron step one . . . .”); Engine Mfrs. Ass’n v. EPA, 88 F.3d 1075, 1088 (D.C. Cir. 1996) (“The plain meaning of legislation should be conclusive, except in the rare cases in which the literal application of a statute will produce a result demonstrably at odds with the intentions of its drafters.”) (internal quotation and alteration omitted).

However, even if the Court finds the statute to be ambiguous, the legislative history corroborates EPA’s interpretation that Congress intended in subpart 4 to alter the implementation schedule and nonattainment area requirements specifically for the PM<sub>10</sub> NAAQS. The statement of Representative Murtha quoted in Petitioners’ Brief (at 18-19) confirms this understanding: “The Title I PM-10 provisions of H.R. 3030 somewhat reschedule the attainment dates that would otherwise apply *under the PM-10 standards as promulgated by EPA.*” A Legislative History of the Clean Air Act Amendments of 1990 (“Legislative History”) at 2996 (Comm. Print 1993) (JA xx) (emphasis added).

Petitioners are correct in observing that, in 1990, EPA had not yet promulgated a separate PM<sub>2.5</sub> NAAQS, and that the 1987 PM<sub>10</sub> NAAQS had been designed to protect against the health and welfare risks (as understood based on the science available at the time) of both fine and coarse particles. Pet. Br. at 17-25. But as shown above, Congress was well aware that PM<sub>10</sub> was not the only NAAQS

indicator used for particulate matter, since the TSP standard was also in effect. And Congress presumably understood that other particulate matter NAAQS using new indicators (such as the separate  $PM_{2.5}$  NAAQS EPA had considered but decided not to establish in 1987) might be promulgated in the future. Despite this knowledge, Congress elected to impose implementation requirements specifically for “PM-10” rather than using the obvious alternative phrase – *i.e.*, “particulate matter” – that would have encompassed any possible NAAQS indicator EPA might use in the future. Thus, it takes a substantial and unsupported leap of logic to conclude that, by imposing requirements for implementation of “the PM-10 standards as promulgated by EPA,” Congress also intended to direct how a potential future “ $PM_{2.5}$ ” NAAQS would be implemented.

Petitioners cite nothing in the legislative history that gives credence to their position. Primarily, they assert that because there is at least some overlap between the health risks and emission sources associated with  $PM_{2.5}$  and  $PM_{10}$  pollution, Congress would have wanted a  $PM_{2.5}$  NAAQS to be implemented in the same manner it expressly mandated for the  $PM_{10}$  NAAQS. See Pet. Br. at 21-25. The problem with this line of reasoning, however, is that one could just as easily argue that the *ozone* NAAQS should be subject to subpart 4's requirements because  $NO_x$  is a relevant precursor pollutant for both particulate matter and ozone. Compare, *e.g.*, 42 U.S.C. § 7511a(b)(1)(A) (subpart 2 provision requiring  $NO_x$  and VOC

emission reductions in order to demonstrate “reasonable further progress” towards attainment of the ozone NAAQS in moderate ozone nonattainment areas), with Legislative History at 2501 (identifying “nitrates” and other secondary particles as a source of PM<sub>10</sub> pollution). Therefore, this is not a reliable basis for determining Congress’ intent regarding the applicability of subpart 4.<sup>10/</sup>

**E. EPA’s Reading of the Act Is, at Minimum, a “Permissible” Interpretation Entitled to Deference under *Chevron* Step Two.**

As EPA explained throughout the course of the rulemaking, and for the reasons discussed above in Arguments I.B and C, EPA believes the statute is clear and unambiguous in requiring that PM<sub>10</sub> NAAQS implementation be governed by subpart 4 and that PM<sub>2.5</sub> NAAQS implementation be governed by subpart 1. See 70 Fed. Reg. at 66,037 (“We do not believe the Act gives us the discretion to promulgate a lower major source threshold for pollutants such as PM<sub>2.5</sub> that are only subject to Subpart 1 of part D of the Act.”); 72 Fed. Reg. at 20,599 (“EPA . . . agrees with comments stating that subpart 4 on its face applies only to the PM<sub>10</sub> standard.”); 73 Fed. Reg. at 28,332 (“Subpart 4 was added to the Act by Congress specifically to address the PM<sub>10</sub> NAAQS.”). If, however, the Court concludes that

---

<sup>10/</sup> Although EPA emphasized the differences between PM<sub>2.5</sub> and PM<sub>10</sub> pollution in response to comments asserting that PM<sub>2.5</sub> was merely a “subset” of PM<sub>10</sub>, see 2007 RTC at 13-14 (JA xx), that was not EPA’s primary rationale for concluding that subpart 4 applies only to PM<sub>10</sub>. Rather, EPA based its interpretation on the statutory text. See 2007 RTC at 9-12 (JA xx); supra Arguments I.B and C.

the statute is ambiguous, it should defer to EPA's interpretation of the statute pursuant to Chevron step two. Even if the Court disagrees that EPA's reading is the *only* plausible way to interpret the text of subpart 4, at the very least it is a "permissible" interpretation for the reasons explained in Arguments I.B and C. Additionally, it is supported by legislative history as shown in Argument I.D.

This is *not* a case where EPA advances an interpretation grounded in policy preferences that are at odds with Congress' clearly expressed intent. See Engine Mfrs., 88 F.3d at 1089 (agency may not avoid "Congressional intent clearly expressed in the text simply by asserting that its preferred approach would be better policy"). For example, in South Coast, where the Court reviewed EPA's rule addressing (among other things) how subpart 1 and 2 would interact for purposes of implementing the 8-hour ozone NAAQS, the Court described "[t]he main thrust of EPA's interpretation" as an argument that subpart 1 "is best because it maximizes EPA's ability to tailor a SIP to the situation of that state." 472 F.3d at 894. The Court rejected that rationale because it found that EPA had failed to "explain how its interpretation fits with the 1990 Amendments." Id. Here, by contrast, EPA's interpretation is based directly on the language Congress elected to use in drafting subpart 4, which differs materially from the key subpart 2 provisions that drove the courts' analyses in Whitman and South Coast. In this case, EPA's interpretation is entirely consistent with both the text and structure of

the statute, and it therefore constitutes, at a minimum, a “permissible construction” to which the Court should defer. Chevron, 467 U.S. at 843.<sup>117</sup>

**II. EPA REASONABLY DETERMINED THAT AMMONIA AND VOLATILE ORGANIC COMPOUNDS SHOULD NOT BE PRESUMPTIVELY SUBJECT TO CONTROL REQUIREMENTS IN ALL PM<sub>2.5</sub> NONATTAINMENT AREAS.**

Petitioners also claim that EPA acted arbitrarily and capriciously in adopting a rebuttable presumption that PM<sub>2.5</sub> nonattainment area SIPs need not include controls on ammonia and VOC emissions. Pet. Br. at 30-33. Contrary to Petitioners’ contention, EPA reasonably exercised its discretion under 42 U.S.C. § 7602(g) to “identif[y]” which emissions should, or should not, be considered “precursors” for purposes of PM<sub>2.5</sub> attainment planning and NSR. Moreover, EPA articulated a reasonable explanation for treating ammonia and VOC emissions differently than sulfur dioxide (“SO<sub>2</sub>”) emissions, for which States are required to evaluate emissions controls in all PM<sub>2.5</sub> nonattainment areas, and emissions of oxides of nitrogen (“NO<sub>x</sub>”), for which States presumptively must evaluate controls.

---

<sup>117</sup> Petitioners’ contention (Pet. Br. at 29) that subpart 4 should be construed to apply to the PM 2.5 NAAQS because it would lead to stricter control requirements is, in the context of this case, precisely the type of construction that the Court found inadequate in South Coast. That is, it emphasizes a policy rationale to support an interpretation for which there is no support in the statutory text.

**A. EPA Indisputably Has Discretion under 42 U.S.C. § 7602(g) to Determine Which Emissions Should Be Identified As “Precursors” for Specific Regulatory Purposes Such As NAAQS Implementation Pursuant to Subpart 1.**

The Act’s provision defining the term “air pollutant” gives EPA discretionary authority to determine which emissions constitute “precursors” for particular regulatory purposes. See 42 U.S.C. § 7602(g). This provision states as follows:

The term “air pollutant” means any air pollutant agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, spent nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air. *Such term includes any precursors to the formation of any air pollutant, to the extent the Administrator has identified such precursor or precursors for the particular purpose for which the term “air pollutant” is used.*

Id. (emphasis added).

As EPA explained during the rulemaking, the second sentence of this definition “explicitly authorizes the Administrator to identify and regulate precursors as air pollutants under other parts of the CAA,” and the second clause of that second sentence “indicates that the Administrator has discretion to identify which pollutants should be classified as precursors for particular regulatory purposes.” 70 Fed. Reg. at 65,998; accord 72 Fed. Reg. at 20,590, and 73 Fed. Reg. at 28,325-26. Hence, even if a particular substance is known to contribute to the formation of a criteria air pollutant – and thus constitutes a “precursor” from a

scientific perspective – 42 U.S.C. § 7602(g) contemplates that the substance might not be “*identif[ied]* . . . as an air pollutant for *all* regulatory purposes, where it can be demonstrated that various Clean Air Act programs address different aspects of the air pollutant problem.” 70 Fed. Reg. at 65,998 (emphasis added). Similarly, section 7602(g) indicates that EPA is not required to “treat all precursors of a particular pollutant the same under any one program when there is a basis to distinguish between such precursors.” 70 Fed. Reg. at 65,998; accord 70 Fed. Reg. 24,280 (May 6, 2005) (transportation conformity rulemaking adopted different approaches for some PM<sub>2.5</sub> precursors based on the degree to which the various precursors emitted by transportation-related sources contributed to the PM<sub>2.5</sub> air quality problem); cf. Association of Irrigated Residents v. EPA, 423 F.3d 989, 996-97 (9th Cir. 2005) (upholding EPA’s approval of PM<sub>10</sub> SIP that included controls on NO<sub>x</sub> but not ammonia, based on EPA’s finding that ammonia did not contribute significantly to PM<sub>10</sub> concentrations in the nonattainment area).<sup>12/</sup>

---

<sup>12/</sup> 42 U.S.C. § 7513a(e), which was at issue in Association of Irrigated Residents, provides that control requirements “applicable under plans in effect under this part . . . shall also apply to major stationary sources of PM-10 precursors, except where the Administrator determines that such sources do not contribute significantly to PM-10 levels which exceed the standard in the area.” Id.; see Association of Irrigated Residents, 423 F.3d at 996. However, for the reasons stated in Argument I, this provision (like other subpart 4 provisions) does not apply to PM<sub>2.5</sub> NAAQS implementation. Petitioners acknowledge that 42 U.S.C. § 7602(g) does not impose a mandatory presumption in favor of regulating ammonia and VOC as PM<sub>2.5</sub> attainment plan and NSR precursors. See Pet. Br. at 30.

Petitioners do not challenge EPA's interpretation of section 7602(g). Instead, they argue that EPA's decision to adopt rebuttable presumptions against control requirements for ammonia and VOCs was arbitrary and capricious. Pet. Br. at 30-33. The record shows otherwise, as discussed further below.

**B. EPA Reasonably Determined That Ammonia and VOC Emissions Should Be Subject to PM<sub>2.5</sub> Nonattainment Planning and NSR Requirements Only Where Those Emissions Are Demonstrated to Significantly Contribute to PM<sub>2.5</sub> Concentrations.**

EPA's final rules establish: (1) a requirement that States address SO<sub>2</sub> for purposes of PM<sub>2.5</sub> attainment planning and NSR in all areas; (2) a presumption that States must also address NO<sub>x</sub> for these purposes, which may be reversed by a technical demonstration showing that NO<sub>x</sub> emissions do not significantly contribute to PM<sub>2.5</sub> concentrations in a particular area; and (3) a presumption that States need not initially address ammonia and VOCs for these purposes, which again may be reversed by a technical demonstration indicating that consideration of ammonia or VOCs as a PM<sub>2.5</sub> attainment plan and NSR precursor would be appropriate for a particular area. EPA intended the presumptions, "which should be valid for the majority of areas, to reduce the overall burden on States of documenting which pollutants are attainment plan precursors." 2007 RTC at 61 (JA xx).

## 1. EPA's policies for SO<sub>2</sub> and NO<sub>x</sub>

In the Implementation Rule, EPA determined that States would be required to address SO<sub>2</sub> as a PM<sub>2.5</sub> attainment plan precursor and evaluate SO<sub>2</sub> for possible control measures in all areas. 72 Fed. Reg. at 20,595. EPA later adopted a similar policy in the NSR Rule. 73 Fed. Reg. at 28,327. EPA explained that this policy was appropriate because SO<sub>2</sub> “is a significant contributor (e.g., ranging from 9 percent to 40 percent) to PM<sub>2.5</sub> concentrations in nonattainment areas and to other air quality problems in all regions of the country.” 72 Fed. Reg. at 20,595; see also 70 Fed. Reg. at 65,993, Table 2 (PM<sub>2.5</sub> chemical composition data by region). Even after accounting for the regional reductions in sulfur dioxide emissions that EPA was then projecting would occur in the eastern United States as a result of implementing the Clean Air Interstate Rule (“CAIR”), 70 Fed. Reg. 25,162 (May 12, 2005), “sulfate [was] still projected to be a key contributor to PM<sub>2.5</sub> concentrations in the future.” 72 Fed. Reg. at 20,595. Moreover, EPA noted that SO<sub>2</sub> emissions “lead to sulfate formation on both regional and local scales,” which necessitates consideration of area-specific controls on local sulfur dioxide sources in addition to regional measures such as CAIR. Id. Therefore, for purposes of PM<sub>2.5</sub> NAAQS attainment planning, “each State will need to consider whether controls on local SO<sub>2</sub> sources would be cost-effective and would be needed to attain expeditiously.” Id.; see 73 Fed. Reg. at 28,327 (parallel approach for NSR).

In discussing its policy for NO<sub>x</sub> emissions, EPA noted that “[t]he sources of NO<sub>x</sub> are numerous and widespread,” and that “nitrate concentrations vary significantly across the country.” 72 Fed. Reg. at 20,594. EPA also noted that nitrate formation in the atmosphere – a process that involves a reaction between nitric acid and other species such as ammonia (thereby creating ammonium nitrate) – is “dependent upon the relative degree of nearby SO<sub>2</sub> emissions because ammonia reacts preferentially with SO<sub>2</sub> over NO<sub>x</sub>.” *Id.*; see also 70 Fed. Reg. at 65,997 (“The NARSTO Fine Particle Assessment<sup>13/</sup> indicates that sulfates form preferentially over nitrates . . .”). EPA expected NO<sub>x</sub> emission reductions to reduce PM<sub>2.5</sub> concentrations in “most” areas. 72 Fed. Reg. at 20,594. However, it was possible that “in a limited number of areas, NO<sub>x</sub> control would result in increased PM<sub>2.5</sub> mass by disrupting the ozone cycle and leading to increased oxidation of SO<sub>2</sub> to form sulfate particles, which are heavier than nitrate particles.” *Id.* Therefore, rather than *universally* requiring that States address NO<sub>x</sub> in all PM<sub>2.5</sub> nonattainment areas as it had done for SO<sub>2</sub>, EPA used a presumptive approach under which States must address NO<sub>x</sub> as a PM<sub>2.5</sub> attainment plan precursor “unless the State and EPA make a finding that NO<sub>x</sub> emissions from sources in the State do

---

<sup>13/</sup> North American Research Strategy for Tropospheric Ozone and Particulate Matter (“NARSTO”), “Particulate Matter Assessment for Policy Makers: A NARSTO Assessment” (2004), Dkt. No. EPA-HQ-OAR-2003-0062-0263 (JA xx).

not significantly contribute to PM<sub>2.5</sub> concentrations in the relevant nonattainment area.” Id.; accord 73 Fed. Reg. at 28,328.

**2. EPA reasonably addressed ammonia differently than SO<sub>2</sub> and NO<sub>x</sub> by adopting a rebuttable presumption that ammonia is not a PM<sub>2.5</sub> attainment plan and NSR precursor.**

In contrast to SO<sub>2</sub> and NO<sub>x</sub>, EPA found that a different policy was appropriate for ammonia due to certain aspects of the complex and still not fully understood relationship between ammonia emissions and air quality. Among other things, EPA noted the potential of adverse environmental and health impacts in some areas if ammonia emissions were reduced. As EPA explained, “[a]mmonia serves an important role in neutralizing acids in clouds, precipitation and particles. In particular, ammonia neutralizes sulfuric acid and nitric acid, the two key contributors to [acid rain].” 70 Fed. Reg. at 65,997. Where concentrations of sulfate (with which ammonia reacts preferentially over nitrates, as noted above) are high, “decreasing ammonia emissions . . . can reduce PM<sub>2.5</sub> mass concentrations, but may also increase particle and precipitation acidity.” Id. at 65,997 and n.38 (citing NARSTO Fine Particle Assessment at S-31 (Table S.4) (JA xx)). “An increase in particle acidity is suspected to be linked with human health effects and with an increase in the formation of secondary organic compounds” in the atmosphere. 72 Fed. Reg. at 20,591; accord 70 Fed. Reg. at 65,997; id. at 65,996

and n.30 (citing study by Jang, et al.). “Moreover, the relationship between ammonia and [the] sulfate-nitrate equilibrium may also impact [secondary organic aerosol (“SOA”)] formation, although this link is not well understood.” 70 Fed. Reg. at 65,997.

In addition to these potentially adverse effects of ammonia emissions reductions under certain atmospheric conditions, EPA also noted that there was substantial uncertainty in the available information concerning ammonia. EPA observed that the “[e]mission inventories for ammonia are considered to be among the most uncertain of any species related to PM,” and that “[t]he control techniques for ammonia and the analytical tools to quantify the impact of reducing ammonia emissions on atmospheric aerosol formation are both evolving sciences.” Id.

Given all of these factors, EPA explained in the Proposed Rule preamble that “it seems prudent to continue research on ammonia control technologies and the ammonia-sulfate-nitrate-SOA equilibrium before one undertakes broad national programs to reduce ammonia emissions.” Id.; see also id. at 65,997/3 (“At this time . . . reducing SO<sub>2</sub> and NO<sub>x</sub> will allow us to move with greater certainty towards achieving our nation’s air quality goals.”). The available data and analysis indicated that “there may be considerable ambiguity concerning the results of reducing ammonia emissions and in some cases, there may be undesired consequences of ammonia reductions.” Id. at 65,997. At the same time, EPA

recognized that “as States and EPA develop a greater understanding over the coming years about the potential air quality effects of reducing ammonia emissions in specific nonattainment areas, it may be appropriate for ammonia reduction strategies to be included in future SIPs.” Id. For these reasons, a policy requiring States to address ammonia in their PM<sub>2.5</sub> attainment planning area only where a technical demonstration supported such a requirement appeared to be the best fit, as it “showed consideration for the uncertainties about ammonia emissions inventories and about the potential efficacy of ammonia control measures by providing for a case-by-case approach.” 72 Fed. Reg. at 20,591.

The final Implementation and NSR Rules maintained the approach EPA had proposed. EPA retained this approach because of “continued uncertainties regarding ammonia emission inventories and the effects of ammonia emission reductions.” Id. at 20,592. Additionally, EPA observed that “data necessary to understand the atmospheric composition and balance of ammonia and nitric acid in an area are not widely available across PM<sub>2.5</sub> nonattainment areas, making it difficult to predict the results of potential ammonia emission reductions.” Id. EPA further explained that “[a]mmonia reductions may be effective and appropriate for reducing PM<sub>2.5</sub> concentrations in selected locations, but in other locations such reductions may lead to minimal reductions in PM<sub>2.5</sub> concentrations and increased atmospheric acidity.” Id. For these reasons, EPA remained of the view that

ammonia should be subject to the case-by-case policy approach it had proposed, which would “ensure[] that ammonia will be addressed in areas in which reductions will be beneficial, while avoiding potential disbenefits in other areas.” 2007 RTC at 47 (JA xx); accord 73 Fed. Reg. at 28,330-31.

Given the state of the scientific understanding of ammonia’s interaction with other chemicals in the processes described above, and the potential that ammonia emissions reductions in some areas might be ineffective in reducing PM<sub>2.5</sub> concentrations or even result in adverse health effects due to increased acidification, it was reasonable for EPA to adopt a case-by-case approach for ammonia rather than presumptively or categorically to require States to regulate ammonia emissions in all areas. Accordingly, the Court should defer to EPA’s technical evaluation of the science and uphold this aspect of the final Implementation and NSR Rules. See NRDC, 571 F.3d at 1253-55 (upholding provision of 8-hr ozone NAAQS implementation rule that presumes the validity of “reasonably available control technology” (“RACT”) determinations developed under the 1-hr ozone NAAQS, while allowing for case-by-case consideration of any information indicating that the prior RACT determination should be updated); National Wildlife Fed’n v. EPA, 286 F.3d 554, 566-67 (D.C. Cir. 2002) (upholding decision not to establish nationwide standards under the Clean Water Act for discharges of color pollution, where EPA found that “the potential for significant

aesthetic or aquatic impacts from color discharges is driven by highly site-specific conditions” and was thus better addressed in individual permits where necessary).

**3. EPA also provided a reasonable explanation for adopting a rebuttable presumption that VOCs are not a PM<sub>2.5</sub> attainment plan and NSR precursor.**

As EPA explained in the preamble to the Implementation Rule, “[t]he primary rationale for not including VOC as a PM<sub>2.5</sub> attainment plan precursor in every nonattainment area is the uncertainty regarding the contribution of anthropogenic VOCs to the formation of the organic carbon portion of fine particles.” 72 Fed. Reg. at 20,593. “The organic component of ambient particles is a complex mixture of hundreds or even thousands of organic compounds [that] are either emitted directly from sources (i.e. primary organic aerosol) or can be formed by reactions in the ambient air (i.e. secondary organic aerosol, or SOA).” *Id.* at 20,592. These compounds include low molecular weight VOCs – which participate in the formation of secondary organic aerosol, sulfates and nitrates – and intermediate weight VOCs, which “often exhibit a range of volatilities and can exist in both the gas and aerosol phase at ambient conditions.” *Id.* at 20,592-93.

EPA further explained that, “[d]espite significant advances in understanding the origins and properties of [secondary organic aerosol], it remains probably the least understood component of PM<sub>2.5</sub>.” *Id.* at 20,593. Scientific research thus far “ha[s] been able to quantify the concentrations of hundreds of organic compounds

representing only 10-20 percent of the total organic aerosol mass.” Id.; cf. id. at 20,593/2 (noting that most research to date has been performed only in California). EPA thus “recognized that further research and technical tools are needed to better characterize emissions inventories for specific VOC compounds, and to determine the extent of the contribution of specific VOC compounds to organic PM mass.”

Id.

These factors supported the case-by-case approach EPA adopted for VOCs in the Implementation Rule, under which States are not required to address VOCs in their attainment plans and evaluate potential control measures for such pollutants “unless the State or EPA makes a technical demonstration that emissions of VOCs from sources in the State significantly contribute to PM<sub>2.5</sub> concentrations in a given nonattainment area.” Id.; accord 73 Fed. Reg. at 28,328-29 (adopting same policy in NSR rule). As EPA explained in the NSR Rule preamble, “[w]here the effect of a pollutant’s emissions on ambient PM<sub>2.5</sub> concentrations is subject to this degree of uncertainty, we do not have justification to establish a nationally-applicable presumption that the pollutant is . . . subject to [PM<sub>2.5</sub> NSR] requirements.” 73 Fed. Reg. at 28,329; see also id. at 28,329/3 (“[W]e do not find it appropriate to utilize the same approach for NO<sub>x</sub> because the scientific data and modeling analyses provide more certainty that NO<sub>x</sub> emissions are a significant contributor to ambient PM<sub>2.5</sub> concentrations.”). Because EPA articulated a

reasonable explanation, supported by information in the record, for applying the initial, rebuttable “presumed-out” approach to VOCs in the context of PM<sub>2.5</sub> attainment planning and NSR, this part of the Implementation and NSR Rules also should be upheld. See supra Argument II.B.2 (citing cases).

**C. EPA’s Rules Do Not Improperly Delegate the Decision to Regulate Ammonia or VOCs Solely to Each State’s Discretion.**

Petitioners’ primary objection to EPA’s treatment of ammonia and VOCs stems from the inaccurate premise that “the regulation of precursors [is] entirely dependent on the State’s willingness to make a significant contribution demonstration.” Pet. Br. at 32. In fact, EPA clearly stated that “[w]hile the rule establishes a presumption that ammonia and VOC[s] need not be regulated, States are required to address information brought to their attention during the planning and rule adoption process” that precedes the submission of their SIPs to EPA for approval. 2007 RTC at 33 (JA xx). Information brought to the State’s attention by interested members of the public or otherwise submitted or developed during that process may rebut the presumption and support regulation of ammonia or VOC emissions in a particular PM<sub>2.5</sub> nonattainment area. See id. at 51 (JA xx) (Explaining that “[w]hile this policy does not require States to regulate ammonia in the first instance, it does require relevant information to be considered in the public

record during the SIP process, and requires States to use the weight of best available information to determine whether ammonia should be controlled.”).

Moreover, EPA explicitly provided that it would review the validity of the presumptions for a given nonattainment area during its own rulemaking process when evaluating whether to approve a SIP submission. As the Agency explained, “EPA retains the ability to reverse a presumption in any area,” 2007 RTC at 33 (JA xx), and has its own obligation to respond to comments during the SIP submission approval process that may indicate regulation of ammonia or VOC emissions in a particular nonattainment area. See 72 Fed. Reg. at 20,597. EPA thus made clear that “both EPA *and* the state or local agency have the obligation to ensure regulation of precursors which have been demonstrated to have significant contribution, including consideration of public comments.” 2007 RTC at 43 (JA xx) (emphasis added); see also 72 Fed. Reg. at 20,596 (any technical demonstration by the State must be approved by EPA).

This Court previously has recognized that the public comment opportunities associated with SIP development and adoption at the state level and subsequent SIP approval by EPA provide a safeguard to ensure that the attainment planning process will include consideration of all pertinent information on a case-by-case basis. NRDC, 571 F.3d at 1254-55. There, the Court upheld EPA’s decision in the “Phase 2” implementation rule for the 1997 8-hour ozone NAAQS to allow States

to presumptively rely on pre-existing 1-hour ozone RACT determinations except where new information showed that an old RACT determination was no longer valid. Id. Though the petitioners in that case argued that EPA should have revised the existing nationally-applicable RACT guidance as part of the 8-hour NAAQS implementation rule, this Court concluded that it was reasonable under the circumstances to forego revising the guidance and rely instead on a case-by-case approach to update the RACT analysis where appropriate. Id. The Court observed that “if additional information is presented during notice-and-comment rulemaking, both the state and EPA are required to consider that information as part of the rulemaking,” id. at 1254, and that “persons disagreeing with a particular RACT certification can seek judicial review of a particular SIP approval.” Id. at 1255. The same is true here with regard to any comments or supporting data submitted during the SIP development and SIP approval processes that may indicate the presumption against regulating ammonia and VOCs is not valid for a particular PM<sub>2.5</sub> nonattainment area.

Petitioners also claim that States may not regulate ammonia or VOCs regardless of whether available information rebuts the validity of the presumption for a particular nonattainment area, because of “various state laws that limit the ability of state officials to take environmental regulatory action beyond the bare minimum mandated by federal law.” Pet. Br. at 33. However, EPA clearly stated

that “[w]here a finding is made by either a state *or* EPA [that ammonia or VOCs significantly contributes to PM<sub>2.5</sub> concentrations in a particular nonattainment area], ammonia or VOCs must then be regulated as appropriate.” 2007 RTC at 51 (JA xx). “Since consideration of relevant data is required[,] EPA does not believe that a finding of significance would be more stringent than required by federal regulation,” and thus it would apply in any State for which such a finding is made, “even those with limitations on their authority” as described by Petitioners. *Id.* “If the state or EPA makes a technical demonstration showing that VOC or ammonia significantly contribute, then this federal rule *requires* that the State assess whether there are controls for VOC or ammonia that constitute RACT or RACM, and whether there are reasonable measures to address intrastate transport” that would facilitate NAAQS attainment as expeditiously as practicable. *Id.* at 41-42 (JA xx) (emphasis in original)<sup>14</sup>; cf. *NRDC*, 571 F.3d at 1253 (“When control technology is necessary to advance attainment, it is ‘reasonably available’” within the meaning of the RACT requirement in 42 U.S.C. § 7502(c)(1) as construed by EPA).

Nor do the final rules permit States to avoid the potential necessity for regulating ammonia and VOCs in certain PM<sub>2.5</sub> nonattainment areas merely by opting not to conduct technical demonstrations. EPA made clear that “[i]f

---

<sup>14</sup> “RACM” refers to the requirement under 42 U.S.C. § 7502(c)(1) that SIPs must “provide for the implementation of all reasonably available control measures [*i.e.*, “RACM”] as expeditiously as practicable . . . .”

information brought forward by commenters or the State in the SIP development process shows that the presumption in this rule for ammonia, VOC or NO<sub>x</sub> is not technically justified for a particular nonattainment area,” submittal of a technical demonstration is not optional. 72 Fed. Reg. at 20,597; accord 2007 RTC at 78 (JA xx).

In summary, 42 U.S.C. § 7602(g) authorizes EPA to establish a presumption either for or against identifying a substance as a “precursor” for a particular regulatory purpose. Here, EPA reasonably explained why the presumptions it adopted for ammonia and VOCs were appropriate starting points for its nationwide PM<sub>2.5</sub> NAAQS implementation approach, as well as how those presumptions could be reversed for individual areas through the use of technical demonstrations. Furthermore, EPA expressly provided procedural safeguards to ensure that interested parties can actively participate in the decisions concerning which precursors must be addressed in a given PM<sub>2.5</sub> nonattainment area. Accordingly, the Court should uphold the Implementation and NSR Rules.

### **III. IMPOSITION OF A DEADLINE ON REMAND WOULD BE INCONSISTENT WITH PRECEDENT AND IS UNNECESSARY.**

Petitioners ask that, if their petition is granted, the Court not only remand the Implementation and NSR Rules to EPA, but also impose a one-year deadline for such further administrative proceedings as may be necessary to respond to the

Court's mandate, retain jurisdiction over the case, and require regular status reports from EPA. Pet. Br. at 33-36. In recent decisions, this Court repeatedly has declined such requests, correctly observing that, were EPA to delay unreasonably in responding to the Court's mandate, the appropriate remedy would be to petition the Court for a writ of mandamus. See, e.g., NRDC v. EPA, 489 F.3d 1364, 1375 (D.C. Cir. 2007) ("We decline to set a two year limit on EPA's proceedings on remand as the NRDC requests; mandamus affords a remedy for undue delay."); North Carolina v. EPA, 550 F.3d 1176, 1178 (D.C. Cir. 2008) (per curiam) (declining to set deadline for proceedings in response to remand of CAIR rule, and noting availability of mandamus relief if appropriate); cf. Portland Cement Ass'n v. EPA, 665 F.3d 177, 194 (D.C. Cir. 2011) (petitioners could file a citizen suit under 42 U.S.C. § 7604 in the event of unreasonable delay). Thus, even if the Court grants the instant petition, it should decline Petitioners' extraordinary request for a one-year deadline on remand, consistent with the above-cited decisions.

### **CONCLUSION**

For the foregoing reasons, the Court should deny the petition for review.

Respectfully submitted,

IGNACIA S. MORENO  
Assistant Attorney General  
Environment and Natural Resources  
Division

**Effective: January 23, 2004**

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

▢ [Subchapter I. Programs and Activities](#)

▢ [Part A. Air Quality and Emissions Limitations \(Refs & Annos\)](#)

→→ **§ 7407. Air quality control regions**

(a) Responsibility of each State for air quality; submission of implementation plan

Each State shall have the primary responsibility for assuring air quality within the entire geographic area comprising such State by submitting an implementation plan for such State which will specify the manner in which national primary and secondary ambient air quality standards will be achieved and maintained within each air quality control region in such State.

(b) Designated regions

For purposes of developing and carrying out implementation plans under [section 7410](#) of this title--

(1) an air quality control region designated under this section before December 31, 1970, or a region designated after such date under subsection (c) of this section, shall be an air quality control region; and

(2) the portion of such State which is not part of any such designated region shall be an air quality control region, but such portion may be subdivided by the State into two or more air quality control regions with the approval of the Administrator.

(c) Authority of Administrator to designate regions; notification of Governors of affected States

The Administrator shall, within 90 days after December 31, 1970, after consultation with appropriate State and local authorities, designate as an air quality control region any interstate area or major intrastate area which he deems necessary or appropriate for the attainment and maintenance of ambient air quality standards. The Administrator shall immediately notify the Governors of the affected States of any designation made under this subsection.

(d) Designations

(1) Designations generally

(A) Submission by Governors of initial designations following promulgation of new or revised standards

By such date as the Administrator may reasonably require, but not later than 1 year after promulgation of a new or revised national ambient air quality standard for any pollutant under [section 7409](#) of this title, the Governor of each State shall (and at any other time the Governor of a State deems appropriate the Governor may) submit to the Administrator a list of all areas (or portions thereof) in the State, designating as--

- (i) nonattainment, any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant,
- (ii) attainment, any area (other than an area identified in clause (i)) that meets the national primary or secondary ambient air quality standard for the pollutant, or
- (iii) unclassifiable, any area that cannot be classified on the basis of available information as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

The Administrator may not require the Governor to submit the required list sooner than 120 days after promulgating a new or revised national ambient air quality standard.

(B) Promulgation by EPA of designations

(i) Upon promulgation or revision of a national ambient air quality standard, the Administrator shall promulgate the designations of all areas (or portions thereof) submitted under subparagraph (A) as expeditiously as practicable, but in no case later than 2 years from the date of promulgation of the new or revised national ambient air quality standard. Such period may be extended for up to one year in the event the Administrator has insufficient information to promulgate the designations.

(ii) In making the promulgations required under clause (i), the Administrator may make such modifications as the Administrator deems necessary to the designations of the areas (or portions thereof) submitted under subparagraph (A) (including to the boundaries of such areas or portions thereof). Whenever the Administrator intends to make a modification, the Administrator shall notify the State and provide such State with an opportunity to demonstrate why any proposed modification is inappropriate. The Administrator shall give such notification no later than 120 days before the date the Administrator promulgates the designation, including any modification thereto. If the Governor fails to submit the list in whole or in part, as required under subparagraph (A), the Administrator shall promulgate the designation that the Administrator deems appropriate for any area (or portion thereof) not designated by the State.

(iii) If the Governor of any State, on the Governor's own motion, under subparagraph (A), submits a list of areas (or portions thereof) in the State designated as nonattainment, attainment, or unclassifiable, the Administrator shall act on such designations in accordance with the procedures under paragraph (3) (relating to redesignation).

(iv) A designation for an area (or portion thereof) made pursuant to this subsection shall remain in effect until the area (or portion thereof) is redesignated pursuant to paragraph (3) or (4).

(C) Designations by operation of law

(i) Any area designated with respect to any air pollutant under the provisions of paragraph (1)(A), (B), or (C) of this subsection (as in effect immediately before November 15, 1990) is designated, by operation of law, as a nonattainment area for such pollutant within the meaning of subparagraph (A)(i).

(ii) Any area designated with respect to any air pollutant under the provisions of paragraph (1)(E) (as in effect immediately before November 15, 1990) is designated by operation of law, as an attainment area for such pollutant within the meaning of subparagraph (A)(ii).

(iii) Any area designated with respect to any air pollutant under the provisions of paragraph (1)(D) (as in effect immediately before November 15, 1990) is designated, by operation of law, as an unclassifiable area for such pollutant within the meaning of subparagraph (A)(iii).

(2) Publication of designations and redesignations

(A) The Administrator shall publish a notice in the Federal Register promulgating any designation under paragraph (1) or (5), or announcing any designation under paragraph (4), or promulgating any redesignation under paragraph (3).

(B) Promulgation or announcement of a designation under paragraph (1), (4) or (5) shall not be subject to the provisions of [sections 553 through 557 of Title 5](#) (relating to notice and comment), except nothing herein shall be construed as precluding such public notice and comment whenever possible.

(3) Redesignation

(A) Subject to the requirements of subparagraph (E), and on the basis of air quality data, planning and control considerations, or any other air quality-related considerations the Administrator deems appropriate, the Administrator may at any time notify the Governor of any State that available information indicates that the designation of any area or portion of an area within the State or interstate area should be revised. In issuing such notification, which shall be public, to the Governor, the Administrator shall provide such information as the Administrator may have available explaining the basis for the notice.

(B) No later than 120 days after receiving a notification under subparagraph (A), the Governor shall submit to the Administrator such redesignation, if any, of the appropriate area (or areas) or portion thereof within the State or interstate area, as the Governor considers appropriate.

(C) No later than 120 days after the date described in subparagraph (B) (or paragraph (1)(B)(iii)), the Administrator shall promulgate the redesignation, if any, of the area or portion thereof, submitted by the Governor in

accordance with subparagraph (B), making such modifications as the Administrator may deem necessary, in the same manner and under the same procedure as is applicable under clause (ii) of paragraph (1)(B), except that the phrase “60 days” shall be substituted for the phrase “120 days” in that clause. If the Governor does not submit, in accordance with subparagraph (B), a redesignation for an area (or portion thereof) identified by the Administrator under subparagraph (A), the Administrator shall promulgate such redesignation, if any, that the Administrator deems appropriate.

**(D)** The Governor of any State may, on the Governor's own motion, submit to the Administrator a revised designation of any area or portion thereof within the State. Within 18 months of receipt of a complete State redesignation submittal, the Administrator shall approve or deny such redesignation. The submission of a redesignation by a Governor shall not affect the effectiveness or enforceability of the applicable implementation plan for the State.

**(E)** The Administrator may not promulgate a redesignation of a nonattainment area (or portion thereof) to attainment unless--

**(i)** the Administrator determines that the area has attained the national ambient air quality standard;

**(ii)** the Administrator has fully approved the applicable implementation plan for the area under [section 7410\(k\)](#) of this title;

**(iii)** the Administrator determines that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions;

**(iv)** the Administrator has fully approved a maintenance plan for the area as meeting the requirements of [section 7505a](#) of this title; and

**(v)** the State containing such area has met all requirements applicable to the area under [section 7410](#) of this title and part D of this subchapter.

**(F)** The Administrator shall not promulgate any redesignation of any area (or portion thereof) from nonattainment to unclassifiable.

(4) Nonattainment designations for ozone, carbon monoxide and particulate matter (PM-10)

(A) Ozone and carbon monoxide

**(i)** Within 120 days after November 15, 1990, each Governor of each State shall submit to the Administrator a list that designates, affirms or reaffirms the designation of, or redesignates (as the case may be), all areas (or portions thereof) of the Governor's State as attainment, nonattainment, or unclassifiable with respect to

the national ambient air quality standards for ozone and carbon monoxide.

(ii) No later than 120 days after the date the Governor is required to submit the list of areas (or portions thereof) required under clause (i) of this subparagraph, the Administrator shall promulgate such designations, making such modifications as the Administrator may deem necessary, in the same manner, and under the same procedure, as is applicable under clause (ii) of paragraph (1)(B), except that the phrase “60 days” shall be substituted for the phrase “120 days” in that clause. If the Governor does not submit, in accordance with clause (i) of this subparagraph, a designation for an area (or portion thereof), the Administrator shall promulgate the designation that the Administrator deems appropriate.

(iii) No nonattainment area may be redesignated as an attainment area under this subparagraph.

(iv) Notwithstanding paragraph (1)(C)(ii) of this subsection, if an ozone or carbon monoxide nonattainment area located within a metropolitan statistical area or consolidated metropolitan statistical area (as established by the Bureau of the Census) is classified under part D of this subchapter as a Serious, Severe, or Extreme Area, the boundaries of such area are hereby revised (on the date 45 days after such classification) by operation of law to include the entire metropolitan statistical area or consolidated metropolitan statistical area, as the case may be, unless within such 45-day period the Governor (in consultation with State and local air pollution control agencies) notifies the Administrator that additional time is necessary to evaluate the application of clause (v). Whenever a Governor has submitted such a notice to the Administrator, such boundary revision shall occur on the later of the date 8 months after such classification or 14 months after November 15, 1990, unless the Governor makes the finding referred to in clause (v), and the Administrator concurs in such finding, within such period. Except as otherwise provided in this paragraph, a boundary revision under this clause or clause (v) shall apply for purposes of any State implementation plan revision required to be submitted after November 15, 1990.

(v) Whenever the Governor of a State has submitted a notice under clause (iv), the Governor, in consultation with State and local air pollution control agencies, shall undertake a study to evaluate whether the entire metropolitan statistical area or consolidated metropolitan statistical area should be included within the nonattainment area. Whenever a Governor finds and demonstrates to the satisfaction of the Administrator, and the Administrator concurs in such finding, that with respect to a portion of a metropolitan statistical area or consolidated metropolitan statistical area, sources in the portion do not contribute significantly to violation of the national ambient air quality standard, the Administrator shall approve the Governor's request to exclude such portion from the nonattainment area. In making such finding, the Governor and the Administrator shall consider factors such as population density, traffic congestion, commercial development, industrial development, meteorological conditions, and pollution transport.

(B) PM-10 designations

By operation of law, until redesignation by the Administrator pursuant to paragraph (3)--

(i) each area identified in [52 Federal Register 29383 \(Aug. 7, 1987\)](#) as a Group I area (except to the extent

that such identification was modified by the Administrator before November 15, 1990) is designated non-attainment for PM-10;

(ii) any area containing a site for which air quality monitoring data show a violation of the national ambient air quality standard for PM-10 before January 1, 1989 (as determined under [part 50, appendix K of title 40 of the Code of Federal Regulations](#)) is hereby designated nonattainment for PM-10; and

(iii) each area not described in clause (i) or (ii) is hereby designated unclassifiable for PM-10.

Any designation for particulate matter (measured in terms of total suspended particulates) that the Administrator promulgated pursuant to this subsection (as in effect immediately before November 15, 1990) shall remain in effect for purposes of implementing the maximum allowable increases in concentrations of particulate matter (measured in terms of total suspended particulates) pursuant to [section 7473\(b\)](#) of this title, until the Administrator determines that such designation is no longer necessary for that purpose.

#### (5) Designations for lead

The Administrator may, in the Administrator's discretion at any time the Administrator deems appropriate, require a State to designate areas (or portions thereof) with respect to the national ambient air quality standard for lead in effect as of November 15, 1990, in accordance with the procedures under subparagraphs (A) and (B) of paragraph (1), except that in applying subparagraph (B)(i) of paragraph (1) the phrase "2 years from the date of promulgation of the new or revised national ambient air quality standard" shall be replaced by the phrase "1 year from the date the Administrator notifies the State of the requirement to designate areas with respect to the standard for lead".

#### (6) Designations

##### (A) Submission

Notwithstanding any other provision of law, not later than February 15, 2004, the Governor of each State shall submit designations referred to in paragraph (1) for the July 1997 PM<sub>2.5</sub> national ambient air quality standards for each area within the State, based on air quality monitoring data collected in accordance with any applicable Federal reference methods for the relevant areas.

##### (B) Promulgation

Notwithstanding any other provision of law, not later than December 31, 2004, the Administrator shall, consistent with paragraph (1), promulgate the designations referred to in subparagraph (A) for each area of each State for the July 1997 PM<sub>2.5</sub> national ambient air quality standards.

#### (7) Implementation plan for regional haze

## (A) In general

Notwithstanding any other provision of law, not later than 3 years after the date on which the Administrator promulgates the designations referred to in paragraph (6)(B) for a State, the State shall submit, for the entire State, the State implementation plan revisions to meet the requirements promulgated by the Administrator under [section 7492\(e\)\(1\)](#) of this title (referred to in this paragraph as “regional haze requirements”).

## (B) No preclusion of other provisions

Nothing in this paragraph precludes the implementation of the agreements and recommendations stemming from the Grand Canyon Visibility Transport Commission Report dated June 1996, including the submission of State implementation plan revisions by the States of Arizona, California, Colorado, Idaho, Nevada, New Mexico, Oregon, Utah, or Wyoming by December 31, 2003, for implementation of regional haze requirements applicable to those States.

## (e) Redesignation of air quality control regions

(1) Except as otherwise provided in paragraph (2), the Governor of each State is authorized, with the approval of the Administrator, to redesignate from time to time the air quality control regions within such State for purposes of efficient and effective air quality management. Upon such redesignation, the list under subsection (d) of this section shall be modified accordingly.

(2) In the case of an air quality control region in a State, or part of such region, which the Administrator finds may significantly affect air pollution concentrations in another State, the Governor of the State in which such region, or part of a region, is located may redesignate from time to time the boundaries of so much of such air quality control region as is located within such State only with the approval of the Administrator and with the consent of all Governors of all States which the Administrator determines may be significantly affected.

(3) No compliance date extension granted under [section 7413\(d\)\(5\)](#) of this title (relating to coal conversion) shall cease to be effective by reason of the regional limitation provided in [section 7413\(d\)\(5\)](#) of this title if the violation of such limitation is due solely to a redesignation of a region under this subsection.

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

▾ [Subchapter I. Programs and Activities](#)

▾ [Part A. Air Quality and Emissions Limitations \(Refs & Annos\)](#)

→→ **§ 7408. Air quality criteria and control techniques**

- (a) Air pollutant list; publication and revision by Administrator; issuance of air quality criteria for air pollutants
- (1) For the purpose of establishing national primary and secondary ambient air quality standards, the Administrator shall within 30 days after December 31, 1970, publish, and shall from time to time thereafter revise, a list which includes each air pollutant--
- (A) emissions of which, in his judgment, cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare;
- (B) the presence of which in the ambient air results from numerous or diverse mobile or stationary sources; and
- (C) for which air quality criteria had not been issued before December 31, 1970, but for which he plans to issue air quality criteria under this section.
- (2) The Administrator shall issue air quality criteria for an air pollutant within 12 months after he has included such pollutant in a list under paragraph (1). Air quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities. The criteria for an air pollutant, to the extent practicable, shall include information on--
- (A) those variable factors (including atmospheric conditions) which of themselves or in combination with other factors may alter the effects on public health or welfare of such air pollutant;
- (B) the types of air pollutants which, when present in the atmosphere, may interact with such pollutant to produce an adverse effect on public health or welfare; and
- (C) any known or anticipated adverse effects on welfare.

(b) Issuance by Administrator of information on air pollution control techniques; standing consulting committees for air pollutants; establishment; membership

(1) Simultaneously with the issuance of criteria under subsection (a) of this section, the Administrator shall, after consultation with appropriate advisory committees and Federal departments and agencies, issue to the States and appropriate air pollution control agencies information on air pollution control techniques, which information shall include data relating to the cost of installation and operation, energy requirements, emission reduction benefits, and environmental impact of the emission control technology. Such information shall include such data as are available on available technology and alternative methods of prevention and control of air pollution. Such information shall also include data on alternative fuels, processes, and operating methods which will result in elimination or significant reduction of emissions.

(2) In order to assist in the development of information on pollution control techniques, the Administrator may establish a standing consulting committee for each air pollutant included in a list published pursuant to subsection (a)(1) of this section, which shall be comprised of technically qualified individuals representative of State and local governments, industry, and the academic community. Each such committee shall submit, as appropriate, to the Administrator information related to that required by paragraph (1).

(c) Review, modification, and reissuance of criteria or information

The Administrator shall from time to time review, and, as appropriate, modify, and reissue any criteria or information on control techniques issued pursuant to this section. Not later than six months after August 7, 1977, the Administrator shall revise and reissue criteria relating to concentrations of NO<sub>2</sub> over such period (not more than three hours) as he deems appropriate. Such criteria shall include a discussion of nitric and nitrous acids, nitrites, nitrates, nitrosamines, and other carcinogenic and potentially carcinogenic derivatives of oxides of nitrogen.

(d) Publication in Federal Register; availability of copies for general public

The issuance of air quality criteria and information on air pollution control techniques shall be announced in the Federal Register and copies shall be made available to the general public.

(e) Transportation planning and guidelines

The Administrator shall, after consultation with the Secretary of Transportation, and after providing public notice and opportunity for comment, and with State and local officials, within nine months after November 15, 1990, and periodically thereafter as necessary to maintain a continuous transportation-air quality planning process, update the June 1978 Transportation-Air Quality Planning Guidelines and publish guidance on the development and implementation of transportation and other measures necessary to demonstrate and maintain attainment of national ambient air quality standards. Such guidelines shall include information on--

(1) methods to identify and evaluate alternative planning and control activities;

- (2) methods of reviewing plans on a regular basis as conditions change or new information is presented;
- (3) identification of funds and other resources necessary to implement the plan, including interagency agreements on providing such funds and resources;
- (4) methods to assure participation by the public in all phases of the planning process; and
- (5) such other methods as the Administrator determines necessary to carry out a continuous planning process.
- (f) Information regarding processes, procedures, and methods to reduce or control pollutants in transportation; reduction of mobile source related pollutants; reduction of impact on public health
- (1) The Administrator shall publish and make available to appropriate Federal, State, and local environmental and transportation agencies not later than one year after November 15, 1990, and from time to time thereafter--
- (A) information prepared, as appropriate, in consultation with the Secretary of Transportation, and after providing public notice and opportunity for comment, regarding the formulation and emission reduction potential of transportation control measures related to criteria pollutants and their precursors, including, but not limited to--
- (i) programs for improved public transit;
- (ii) restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or high occupancy vehicles;
- (iii) employer-based transportation management plans, including incentives;
- (iv) trip-reduction ordinances;
- (v) traffic flow improvement programs that achieve emission reductions;
- (vi) fringe and transportation corridor parking facilities serving multiple occupancy vehicle programs or transit service;
- (vii) programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration particularly during periods of peak use;
- (viii) programs for the provision of all forms of high-occupancy, shared-ride services;

(ix) programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;

(x) programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;

(xi) programs to control extended idling of vehicles;

(xii) programs to reduce motor vehicle emissions, consistent with subchapter II of this chapter, which are caused by extreme cold start conditions;

(xiii) employer-sponsored programs to permit flexible work schedules;

(xiv) programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;

(xv) programs for new construction and major reconstructions of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation when economically feasible and in the public interest. For purposes of this clause, the Administrator shall also consult with the Secretary of the Interior; and

(xvi) program to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.

(B) information on additional methods or strategies that will contribute to the reduction of mobile source related pollutants during periods in which any primary ambient air quality standard will be exceeded and during episodes for which an air pollution alert, warning, or emergency has been declared;

(C) information on other measures which may be employed to reduce the impact on public health or protect the health of sensitive or susceptible individuals or groups; and

(D) information on the extent to which any process, procedure, or method to reduce or control such air pollutant may cause an increase in the emissions or formation of any other pollutant.

(2) In publishing such information the Administrator shall also include an assessment of--

(A) the relative effectiveness of such processes, procedures, and methods;

(B) the potential effect of such processes, procedures, and methods on transportation systems and the provision of transportation services; and

(C) the environmental, energy, and economic impact of such processes, procedures, and methods.

(g) Assessment of risks to ecosystems

The Administrator may assess the risks to ecosystems from exposure to criteria air pollutants (as identified by the Administrator in the Administrator's sole discretion).

(h) RACT/BACT/LAER clearinghouse

The Administrator shall make information regarding emission control technology available to the States and to the general public through a central database. Such information shall include all control technology information received pursuant to State plan provisions requiring permits for sources, including operating permits for existing sources.

**Effective:[See Text Amendments]**

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

▢ [Subchapter I. Programs and Activities](#)

▢ [Part A. Air Quality and Emissions Limitations \(Refs & Annos\)](#)

→→ **§ 7409. National primary and secondary ambient air quality standards**

(a) Promulgation

(1) The Administrator--

(A) within 30 days after December 31, 1970, shall publish proposed regulations prescribing a national primary ambient air quality standard and a national secondary ambient air quality standard for each air pollutant for which air quality criteria have been issued prior to such date; and

(B) after a reasonable time for interested persons to submit written comments thereon (but no later than 90 days after the initial publication of such proposed standards) shall by regulation promulgate such proposed national primary and secondary ambient air quality standards with such modifications as he deems appropriate.

(2) With respect to any air pollutant for which air quality criteria are issued after December 31, 1970, the Administrator shall publish, simultaneously with the issuance of such criteria and information, proposed national primary and secondary ambient air quality standards for any such pollutant. The procedure provided for in paragraph (1)(B) of this subsection shall apply to the promulgation of such standards.

(b) Protection of public health and welfare

(1) National primary ambient air quality standards, prescribed under subsection (a) of this section shall be ambient air quality standards the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health. Such primary standards may be revised in the same manner as promulgated.

(2) Any national secondary ambient air quality standard prescribed under subsection (a) of this section shall specify a level of air quality the attainment and maintenance of which in the judgment of the Administrator, based on such criteria, is requisite to protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air. Such secondary standards may be revised in the same manner as promulgated.

## (c) National primary ambient air quality standard for nitrogen dioxide

The Administrator shall, not later than one year after August 7, 1977, promulgate a national primary ambient air quality standard for NO<sub>2</sub> concentrations over a period of not more than 3 hours unless, based on the criteria issued under [section 7408\(c\)](#) of this title, he finds that there is no significant evidence that such a standard for such a period is requisite to protect public health.

## (d) Review and revision of criteria and standards; independent scientific review committee; appointment; advisory functions

(1) Not later than December 31, 1980, and at five-year intervals thereafter, the Administrator shall complete a thorough review of the criteria published under [section 7408](#) of this title and the national ambient air quality standards promulgated under this section and shall make such revisions in such criteria and standards and promulgate such new standards as may be appropriate in accordance with [section 7408](#) of this title and subsection (b) of this section. The Administrator may review and revise criteria or promulgate new standards earlier or more frequently than required under this paragraph.

(2)(A) The Administrator shall appoint an independent scientific review committee composed of seven members including at least one member of the National Academy of Sciences, one physician, and one person representing State air pollution control agencies.

(B) Not later than January 1, 1980, and at five-year intervals thereafter, the committee referred to in subparagraph (A) shall complete a review of the criteria published under [section 7408](#) of this title and the national primary and secondary ambient air quality standards promulgated under this section and shall recommend to the Administrator any new national ambient air quality standards and revisions of existing criteria and standards as may be appropriate under [section 7408](#) of this title and subsection (b) of this section.

(C) Such committee shall also (i) advise the Administrator of areas in which additional knowledge is required to appraise the adequacy and basis of existing, new, or revised national ambient air quality standards, (ii) describe the research efforts necessary to provide the required information, (iii) advise the Administrator on the relative contribution to air pollution concentrations of natural as well as anthropogenic activity, and (iv) advise the Administrator of any adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance of such national ambient air quality standards.

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

▢ [Subchapter I](#). Programs and Activities

▢ [Part A](#). Air Quality and Emissions Limitations ([Refs & Annos](#))

→→ **§ 7410. State implementation plans for national primary and secondary ambient air quality standards**

(a) Adoption of plan by State; submission to Administrator; content of plan; revision; new sources; indirect source review program; supplemental or intermittent control systems

(1) Each State shall, after reasonable notice and public hearings, adopt and submit to the Administrator, within 3 years (or such shorter period as the Administrator may prescribe) after the promulgation of a national primary ambient air quality standard (or any revision thereof) under [section 7409](#) of this title for any air pollutant, a plan which provides for implementation, maintenance, and enforcement of such primary standard in each air quality control region (or portion thereof) within such State. In addition, such State shall adopt and submit to the Administrator (either as a part of a plan submitted under the preceding sentence or separately) within 3 years (or such shorter period as the Administrator may prescribe) after the promulgation of a national ambient air quality secondary standard (or revision thereof), a plan which provides for implementation, maintenance, and enforcement of such secondary standard in each air quality control region (or portion thereof) within such State. Unless a separate public hearing is provided, each State shall consider its plan implementing such secondary standard at the hearing required by the first sentence of this paragraph.

(2) Each implementation plan submitted by a State under this chapter shall be adopted by the State after reasonable notice and public hearing. Each such plan shall--

(A) include enforceable emission limitations and other control measures, means, or techniques (including economic incentives such as fees, marketable permits, and auctions of emissions rights), as well as schedules and timetables for compliance, as may be necessary or appropriate to meet the applicable requirements of this chapter;

(B) provide for establishment and operation of appropriate devices, methods, systems, and procedures necessary to--

(i) monitor, compile, and analyze data on ambient air quality, and

(ii) upon request, make such data available to the Administrator;

(C) include a program to provide for the enforcement of the measures described in subparagraph (A), and regulation of the modification and construction of any stationary source within the areas covered by the plan as necessary to assure that national ambient air quality standards are achieved, including a permit program as required in parts C and D of this subchapter;

(D) contain adequate provisions--

(i) prohibiting, consistent with the provisions of this subchapter, any source or other type of emissions activity within the State from emitting any air pollutant in amounts which will--

(I) contribute significantly to nonattainment in, or interfere with maintenance by, any other State with respect to any such national primary or secondary ambient air quality standard, or

(II) interfere with measures required to be included in the applicable implementation plan for any other State under part C of this subchapter to prevent significant deterioration of air quality or to protect visibility,

(ii) insuring compliance with the applicable requirements of [sections 7426](#) and [7415](#) of this title (relating to interstate and international pollution abatement);

(E) provide (i) necessary assurances that the State (or, except where the Administrator deems inappropriate, the general purpose local government or governments, or a regional agency designated by the State or general purpose local governments for such purpose) will have adequate personnel, funding, and authority under State (and, as appropriate, local) law to carry out such implementation plan (and is not prohibited by any provision of Federal or State law from carrying out such implementation plan or portion thereof), (ii) requirements that the State comply with the requirements respecting State boards under [section 7428](#) of this title, and (iii) necessary assurances that, where the State has relied on a local or regional government, agency, or instrumentality for the implementation of any plan provision, the State has responsibility for ensuring adequate implementation of such plan provision;

(F) require, as may be prescribed by the Administrator--

(i) the installation, maintenance, and replacement of equipment, and the implementation of other necessary steps, by owners or operators of stationary sources to monitor emissions from such sources,

(ii) periodic reports on the nature and amounts of emissions and emissions-related data from such sources, and

(iii) correlation of such reports by the State agency with any emission limitations or standards established pursuant to this chapter, which reports shall be available at reasonable times for public inspection;

(G) provide for authority comparable to that in [section 7603](#) of this title and adequate contingency plans to implement such authority;

(H) provide for revision of such plan--

(i) from time to time as may be necessary to take account of revisions of such national primary or secondary ambient air quality standard or the availability of improved or more expeditious methods of attaining such standard, and

(ii) except as provided in paragraph (3)(C), whenever the Administrator finds on the basis of information available to the Administrator that the plan is substantially inadequate to attain the national ambient air quality standard which it implements or to otherwise comply with any additional requirements established under this chapter;

(I) in the case of a plan or plan revision for an area designated as a nonattainment area, meet the applicable requirements of part D of this subchapter (relating to nonattainment areas);

(J) meet the applicable requirements of [section 7421](#) of this title (relating to consultation), [section 7427](#) of this title (relating to public notification), and part C of this subchapter (relating to prevention of significant deterioration of air quality and visibility protection);

(K) provide for--

(i) the performance of such air quality modeling as the Administrator may prescribe for the purpose of predicting the effect on ambient air quality of any emissions of any air pollutant for which the Administrator has established a national ambient air quality standard, and

(ii) the submission, upon request, of data related to such air quality modeling to the Administrator;

(L) require the owner or operator of each major stationary source to pay to the permitting authority, as a condition of any permit required under this chapter, a fee sufficient to cover--

(i) the reasonable costs of reviewing and acting upon any application for such a permit, and

(ii) if the owner or operator receives a permit for such source, the reasonable costs of implementing and enforcing the terms and conditions of any such permit (not including any court costs or other costs associated

with any enforcement action),

until such fee requirement is superseded with respect to such sources by the Administrator's approval of a fee program under subchapter V of this chapter; and

(M) provide for consultation and participation by local political subdivisions affected by the plan.

(3)(A) Repealed. Pub.L. 101-549, Title I, § 101(d)(1), Nov. 15, 1990, 104 Stat. 2409

(B) As soon as practicable, the Administrator shall, consistent with the purposes of this chapter and the Energy Supply and Environmental Coordination Act of 1974 [15 U.S.C.A. § 791 et seq.], review each State's applicable implementation plans and report to the State on whether such plans can be revised in relation to fuel burning stationary sources (or persons supplying fuel to such sources) without interfering with the attainment and maintenance of any national ambient air quality standard within the period permitted in this section. If the Administrator determines that any such plan can be revised, he shall notify the State that a plan revision may be submitted by the State. Any plan revision which is submitted by the State shall, after public notice and opportunity for public hearing, be approved by the Administrator if the revision relates only to fuel burning stationary sources (or persons supplying fuel to such sources), and the plan as revised complies with paragraph (2) of this subsection. The Administrator shall approve or disapprove any revision no later than three months after its submission.

(C) Neither the State, in the case of a plan (or portion thereof) approved under this subsection, nor the Administrator, in the case of a plan (or portion thereof) promulgated under subsection (c) of this section, shall be required to revise an applicable implementation plan because one or more exemptions under section 7418 of this title (relating to Federal facilities), enforcement orders under section 7413(d) of this title, suspensions under subsection (f) or (g) of this section (relating to temporary energy or economic authority), orders under section 7419 of this title (relating to primary nonferrous smelters), or extensions of compliance in decrees entered under section 7413(e) of this title (relating to iron- and steel-producing operations) have been granted, if such plan would have met the requirements of this section if no such exemptions, orders, or extensions had been granted.

(4) Repealed. Pub.L. 101-549, Title I, § 101(d)(2), Nov. 15, 1990, 104 Stat. 2409

(5)(A)(i) Any State may include in a State implementation plan, but the Administrator may not require as a condition of approval of such plan under this section, any indirect source review program. The Administrator may approve and enforce, as part of an applicable implementation plan, an indirect source review program which the State chooses to adopt and submit as part of its plan.

(ii) Except as provided in subparagraph (B), no plan promulgated by the Administrator shall include any indirect source review program for any air quality control region, or portion thereof.

(iii) Any State may revise an applicable implementation plan approved under this subsection to suspend or re-

voke any such program included in such plan, provided that such plan meets the requirements of this section.

**(B)** The Administrator shall have the authority to promulgate, implement and enforce regulations under subsection (c) of this section respecting indirect source review programs which apply only to federally assisted highways, airports, and other major federally assisted indirect sources and federally owned or operated indirect sources.

**(C)** For purposes of this paragraph, the term “indirect source” means a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution. Such term includes parking lots, parking garages, and other facilities subject to any measure for management of parking supply (within the meaning of subsection (c)(2)(D)(ii) of this section), including regulation of existing off-street parking but such term does not include new or existing on-street parking. Direct emissions sources or facilities at, within, or associated with, any indirect source shall not be deemed indirect sources for the purpose of this paragraph.

**(D)** For purposes of this paragraph the term “indirect source review program” means the facility-by-facility review of indirect sources of air pollution, including such measures as are necessary to assure, or assist in assuring, that a new or modified indirect source will not attract mobile sources of air pollution, the emissions from which would cause or contribute to air pollution concentrations--

(i) exceeding any national primary ambient air quality standard for a mobile source-related air pollutant after the primary standard attainment date, or

(ii) preventing maintenance of any such standard after such date.

**(E)** For purposes of this paragraph and paragraph (2)(B), the term “transportation control measure” does not include any measure which is an “indirect source review program”.

**(6)** No State plan shall be treated as meeting the requirements of this section unless such plan provides that in the case of any source which uses a supplemental, or intermittent control system for purposes of meeting the requirements of an order under [section 7413\(d\)](#) of this title or [section 7419](#) of this title (relating to primary nonferrous smelter orders), the owner or operator of such source may not temporarily reduce the pay of any employee by reason of the use of such supplemental or intermittent or other dispersion dependent control system.

(b) Extension of period for submission of plans

The Administrator may, wherever he determines necessary, extend the period for submission of any plan or portion thereof which implements a national secondary ambient air quality standard for a period not to exceed 18 months from the date otherwise required for submission of such plan.

(c) Preparation and publication by Administrator of proposed regulations setting forth implementation plan;

transportation regulations study and report; parking surcharge; suspension authority; plan implementation

(1) The Administrator shall promulgate a Federal implementation plan at any time within 2 years after the Administrator--

(A) finds that a State has failed to make a required submission or finds that the plan or plan revision submitted by the State does not satisfy the minimum criteria established under subsection (k)(1)(A) of this section, or

(B) disapproves a State implementation plan submission in whole or in part,

unless the State corrects the deficiency, and the Administrator approves the plan or plan revision, before the Administrator promulgates such Federal implementation plan.

(2)(A) Repealed. [Pub.L. 101-549, Title I, § 101\(d\)\(3\)\(A\)](#), Nov. 15, 1990, 104 Stat. 2409

(B) No parking surcharge regulation may be required by the Administrator under paragraph (1) of this subsection as a part of an applicable implementation plan. All parking surcharge regulations previously required by the Administrator shall be void upon June 22, 1974. This subparagraph shall not prevent the Administrator from approving parking surcharges if they are adopted and submitted by a State as part of an applicable implementation plan. The Administrator may not condition approval of any implementation plan submitted by a State on such plan's including a parking surcharge regulation.

(C) Repealed. [Pub.L. 101-549, Title I, § 101\(d\)\(3\)\(B\)](#), Nov. 15, 1990, 104 Stat. 2409

(D) For purposes of this paragraph--

(i) The term "parking surcharge regulation" means a regulation imposing or requiring the imposition of any tax, surcharge, fee, or other charge on parking spaces, or any other area used for the temporary storage of motor vehicles.

(ii) The term "management of parking supply" shall include any requirement providing that any new facility containing a given number of parking spaces shall receive a permit or other prior approval, issuance of which is to be conditioned on air quality considerations.

(iii) The term "preferential bus/carpool lane" shall include any requirement for the setting aside of one or more lanes of a street or highway on a permanent or temporary basis for the exclusive use of buses or carpools, or both.

(E) No standard, plan, or requirement, relating to management of parking supply or preferential bus/carpool lanes shall be promulgated after June 22, 1974, by the Administrator pursuant to this section, unless such pro-

mulgation has been subjected to at least one public hearing which has been held in the area affected and for which reasonable notice has been given in such area. If substantial changes are made following public hearings, one or more additional hearings shall be held in such area after such notice.

(3) Upon application of the chief executive officer of any general purpose unit of local government, if the Administrator determines that such unit has adequate authority under State or local law, the Administrator may delegate to such unit the authority to implement and enforce within the jurisdiction of such unit any part of a plan promulgated under this subsection. Nothing in this paragraph shall prevent the Administrator from implementing or enforcing any applicable provision of a plan promulgated under this subsection.

(4) Repealed. Pub.L. 101-549, Title I, § 101(d)(3)(C), Nov. 15, 1990, 104 Stat. 2409

(5)(A) Any measure in an applicable implementation plan which requires a toll or other charge for the use of a bridge located entirely within one city shall be eliminated from such plan by the Administrator upon application by the Governor of the State, which application shall include a certification by the Governor that he will revise such plan in accordance with subparagraph (B).

(B) In the case of any applicable implementation plan with respect to which a measure has been eliminated under subparagraph (A), such plan shall, not later than one year after August 7, 1977, be revised to include comprehensive measures to:

(i) establish, expand, or improve public transportation measures to meet basic transportation needs, as expeditiously as is practicable; and

(ii) implement transportation control measures necessary to attain and maintain national ambient air quality standards,

and such revised plan shall, for the purpose of implementing such comprehensive public transportation measures, include requirements to use (insofar as is necessary) Federal grants, State or local funds, or any combination of such grants and funds as may be consistent with the terms of the legislation providing such grants and funds. Such measures shall, as a substitute for the tolls or charges eliminated under subparagraph (A), provide for emissions reductions equivalent to the reductions which may reasonably be expected to be achieved through the use of the tolls or charges eliminated.

(C) Any revision of an implementation plan for purposes of meeting the requirements of subparagraph (B) shall be submitted in coordination with any plan revision required under part D of this subchapter.

(d), (e) Repealed. Pub.L. 101-549, Title I, § 101(d)(4), (5), Nov. 15, 1990, 104 Stat. 2409

(f) National or regional energy emergencies; determination by President

(1) Upon application by the owner or operator of a fuel burning stationary source, and after notice and opportunity for public hearing, the Governor of the State in which such source is located may petition the President to determine that a national or regional energy emergency exists of such severity that--

(A) a temporary suspension of any part of the applicable implementation plan or of any requirement under [section 7651j](#) of this title (concerning excess emissions penalties or offsets) may be necessary, and

(B) other means of responding to the energy emergency may be inadequate.

Such determination shall not be delegable by the President to any other person. If the President determines that a national or regional energy emergency of such severity exists, a temporary emergency suspension of any part of an applicable implementation plan or of any requirement under [section 7651j](#) of this title (concerning excess emissions penalties or offsets) adopted by the State may be issued by the Governor of any State covered by the President's determination under the condition specified in paragraph (2) and may take effect immediately.

(2) A temporary emergency suspension under this subsection shall be issued to a source only if the Governor of such State finds that--

(A) there exists in the vicinity of such source a temporary energy emergency involving high levels of unemployment or loss of necessary energy supplies for residential dwellings; and

(B) such unemployment or loss can be totally or partially alleviated by such emergency suspension.

Not more than one such suspension may be issued for any source on the basis of the same set of circumstances or on the basis of the same emergency.

(3) A temporary emergency suspension issued by a Governor under this subsection shall remain in effect for a maximum of four months or such lesser period as may be specified in a disapproval order of the Administrator, if any. The Administrator may disapprove such suspension if he determines that it does not meet the requirements of paragraph (2).

(4) This subsection shall not apply in the case of a plan provision or requirement promulgated by the Administrator under subsection (c) of this section, but in any such case the President may grant a temporary emergency suspension for a four month period of any such provision or requirement if he makes the determinations and findings specified in paragraphs (1) and (2).

(5) The Governor may include in any temporary emergency suspension issued under this subsection a provision delaying for a period identical to the period of such suspension any compliance schedule (or increment of progress) to which such source is subject under [section 1857c-10](#) of this title, as in effect before August 7, 1977, or [section 7413\(d\)](#) of this title, upon a finding that such source is unable to comply with such schedule (or incre-

ment) solely because of the conditions on the basis of which a suspension was issued under this subsection.

(g) Governor's authority to issue temporary emergency suspensions

(1) In the case of any State which has adopted and submitted to the Administrator a proposed plan revision which the State determines--

(A) meets the requirements of this section, and

(B) is necessary (i) to prevent the closing for one year or more of any source of air pollution, and (ii) to prevent substantial increases in unemployment which would result from such closing, and

which the Administrator has not approved or disapproved under this section within 12 months of submission of the proposed plan revision, the Governor may issue a temporary emergency suspension of the part of the applicable implementation plan for such State which is proposed to be revised with respect to such source. The determination under subparagraph (B) may not be made with respect to a source which would close without regard to whether or not the proposed plan revision is approved.

(2) A temporary emergency suspension issued by a Governor under this subsection shall remain in effect for a maximum of four months or such lesser period as may be specified in a disapproval order of the Administrator. The Administrator may disapprove such suspension if he determines that it does not meet the requirements of this subsection.

(3) The Governor may include in any temporary emergency suspension issued under this subsection a provision delaying for a period identical to the period of such suspension any compliance schedule (or increment of progress) to which such source is subject under [section 1857c-10](#) of this title as in effect before August 7, 1977, or under [section 7413\(d\)](#) of this title upon a finding that such source is unable to comply with such schedule (or increment) solely because of the conditions on the basis of which a suspension was issued under this subsection.

(h) Publication of comprehensive document for each State setting forth requirements of applicable implementation plan

(1) Not later than 5 years after November 15, 1990, and every 3 years thereafter, the Administrator shall assemble and publish a comprehensive document for each State setting forth all requirements of the applicable implementation plan for such State and shall publish notice in the Federal Register of the availability of such documents.

(2) The Administrator may promulgate such regulations as may be reasonably necessary to carry out the purpose of this subsection.

(i) Modification of requirements prohibited

Except for a primary nonferrous smelter order under [section 7419](#) of this title, a suspension under subsection (f) or (g) of this section (relating to emergency suspensions), an exemption under [section 7418](#) of this title (relating to certain Federal facilities), an order under [section 7413\(d\)](#) of this title (relating to compliance orders), a plan promulgation under subsection (c) of this section, or a plan revision under subsection (a)(3) of this section, no order, suspension, plan revision, or other action modifying any requirement of an applicable implementation plan may be taken with respect to any stationary source by the State or by the Administrator.

(j) Technological systems of continuous emission reduction on new or modified stationary sources; compliance with performance standards

As a condition for issuance of any permit required under this subchapter, the owner or operator of each new or modified stationary source which is required to obtain such a permit must show to the satisfaction of the permitting authority that the technological system of continuous emission reduction which is to be used will enable such source to comply with the standards of performance which are to apply to such source and that the construction or modification and operation of such source will be in compliance with all other requirements of this chapter.

(k) Environmental Protection Agency action on plan submissions

(1) Completeness of plan submissions

(A) Completeness criteria

Within 9 months after November 15, 1990, the Administrator shall promulgate minimum criteria that any plan submission must meet before the Administrator is required to act on such submission under this subsection. The criteria shall be limited to the information necessary to enable the Administrator to determine whether the plan submission complies with the provisions of this chapter.

(B) Completeness finding

Within 60 days of the Administrator's receipt of a plan or plan revision, but no later than 6 months after the date, if any, by which a State is required to submit the plan or revision, the Administrator shall determine whether the minimum criteria established pursuant to subparagraph (A) have been met. Any plan or plan revision that a State submits to the Administrator, and that has not been determined by the Administrator (by the date 6 months after receipt of the submission) to have failed to meet the minimum criteria established pursuant to subparagraph (A), shall on that date be deemed by operation of law to meet such minimum criteria.

(C) Effect of finding of incompleteness

Where the Administrator determines that a plan submission (or part thereof) does not meet the minimum criteria established pursuant to subparagraph (A), the State shall be treated as not having made the submission (or, in the Administrator's discretion, part thereof).

(2) Deadline for action

Within 12 months of a determination by the Administrator (or a determination deemed by operation of law) under paragraph (1) that a State has submitted a plan or plan revision (or, in the Administrator's discretion, part thereof) that meets the minimum criteria established pursuant to paragraph (1), if applicable (or, if those criteria are not applicable, within 12 months of submission of the plan or revision), the Administrator shall act on the submission in accordance with paragraph (3).

(3) Full and partial approval and disapproval

In the case of any submittal on which the Administrator is required to act under paragraph (2), the Administrator shall approve such submittal as a whole if it meets all of the applicable requirements of this chapter. If a portion of the plan revision meets all the applicable requirements of this chapter, the Administrator may approve the plan revision in part and disapprove the plan revision in part. The plan revision shall not be treated as meeting the requirements of this chapter until the Administrator approves the entire plan revision as complying with the applicable requirements of this chapter.

(4) Conditional approval

The Administrator may approve a plan revision based on a commitment of the State to adopt specific enforceable measures by a date certain, but not later than 1 year after the date of approval of the plan revision. Any such conditional approval shall be treated as a disapproval if the State fails to comply with such commitment.

(5) Calls for plan revisions

Whenever the Administrator finds that the applicable implementation plan for any area is substantially inadequate to attain or maintain the relevant national ambient air quality standard, to mitigate adequately the interstate pollutant transport described in [section 7506a](#) of this title or [section 7511c](#) of this title, or to otherwise comply with any requirement of this chapter, the Administrator shall require the State to revise the plan as necessary to correct such inadequacies. The Administrator shall notify the State of the inadequacies, and may establish reasonable deadlines (not to exceed 18 months after the date of such notice) for the submission of such plan revisions. Such findings and notice shall be public. Any finding under this paragraph shall, to the extent the Administrator deems appropriate, subject the State to the requirements of this chapter to which the State was subject when it developed and submitted the plan for which such finding was made, except that the Administrator may adjust any dates applicable under such requirements as appropriate (except that the Administrator may not adjust any attainment date prescribed under part D of this subchapter, unless such date has elapsed).

(6) Corrections

Whenever the Administrator determines that the Administrator's action approving, disapproving, or promulgating any plan or plan revision (or part thereof), area designation, redesignation, classification, or reclassification was in error, the Administrator may in the same manner as the approval, disapproval, or promulgation revise such action as appropriate without requiring any further submission from the State. Such determination

and the basis thereof shall be provided to the State and public.

(l) Plan revisions

Each revision to an implementation plan submitted by a State under this chapter shall be adopted by such State after reasonable notice and public hearing. The Administrator shall not approve a revision of a plan if the revision would interfere with any applicable requirement concerning attainment and reasonable further progress (as defined in [section 7501](#) of this title), or any other applicable requirement of this chapter.

(m) Sanctions

The Administrator may apply any of the sanctions listed in [section 7509\(b\)](#) of this title at any time (or at any time after) the Administrator makes a finding, disapproval, or determination under paragraphs (1) through (4), respectively, of [section 7509\(a\)](#) of this title in relation to any plan or plan item (as that term is defined by the Administrator) required under this chapter, with respect to any portion of the State the Administrator determines reasonable and appropriate, for the purpose of ensuring that the requirements of this chapter relating to such plan or plan item are met. The Administrator shall, by rule, establish criteria for exercising his authority under the previous sentence with respect to any deficiency referred to in [section 7509\(a\)](#) of this title to ensure that, during the 24-month period following the finding, disapproval, or determination referred to in [section 7509\(a\)](#) of this title, such sanctions are not applied on a statewide basis where one or more political subdivisions covered by the applicable implementation plan are principally responsible for such deficiency.

(n) Savings clauses

(1) Existing plan provisions

Any provision of any applicable implementation plan that was approved or promulgated by the Administrator pursuant to this section as in effect before November 15, 1990, shall remain in effect as part of such applicable implementation plan, except to the extent that a revision to such provision is approved or promulgated by the Administrator pursuant to this chapter.

(2) Attainment dates

For any area not designated nonattainment, any plan or plan revision submitted or required to be submitted by a State--

**(A)** in response to the promulgation or revision of a national primary ambient air quality standard in effect on November 15, 1990, or

**(B)** in response to a finding of substantial inadequacy under subsection (a)(2) of this section (as in effect immediately before November 15, 1990),

shall provide for attainment of the national primary ambient air quality standards within 3 years of Novem-

ber 15, 1990, or within 5 years of issuance of such finding of substantial inadequacy, whichever is later.

(3) Retention of construction moratorium in certain areas

In the case of an area to which, immediately before November 15, 1990, the prohibition on construction or modification of major stationary sources prescribed in subsection (a)(2)(I) of this section (as in effect immediately before November 15, 1990) applied by virtue of a finding of the Administrator that the State containing such area had not submitted an implementation plan meeting the requirements of [section 7502\(b\)\(6\)](#) of this title (relating to establishment of a permit program) (as in effect immediately before November 15, 1990) or [7502\(a\)\(1\)](#) of this title (to the extent such requirements relate to provision for attainment of the primary national ambient air quality standard for sulfur oxides by December 31, 1982) as in effect immediately before November 15, 1990, no major stationary source of the relevant air pollutant or pollutants shall be constructed or modified in such area until the Administrator finds that the plan for such area meets the applicable requirements of [section 7502\(c\)\(5\)](#) of this title (relating to permit programs) or subpart 5 of part D of this subchapter (relating to attainment of the primary national ambient air quality standard for sulfur dioxide), respectively.

(o) Indian tribes

If an Indian tribe submits an implementation plan to the Administrator pursuant to [section 7601\(d\)](#) of this title, the plan shall be reviewed in accordance with the provisions for review set forth in this section for State plans, except as otherwise provided by regulation promulgated pursuant to [section 7601\(d\)\(2\)](#) of this title. When such plan becomes effective in accordance with the regulations promulgated under [section 7601\(d\)](#) of this title, the plan shall become applicable to all areas (except as expressly provided otherwise in the plan) located within the exterior boundaries of the reservation, notwithstanding the issuance of any patent and including rights-of-way running through the reservation.

(p) Reports

Any State shall submit, according to such schedule as the Administrator may prescribe, such reports as the Administrator may require relating to emission reductions, vehicle miles traveled, congestion levels, and any other information the Administrator may deem necessary to assess the development effectiveness, need for revision, or implementation of any plan or plan revision required under this chapter.

▢ [Subchapter I. Programs and Activities](#)

▢ [Part A. Air Quality and Emissions Limitations \(Refs & Annos\)](#)

→→ **§ 7413. Federal enforcement**

(a) In general

(1) Order to comply with SIP

Whenever, on the basis of any information available to the Administrator, the Administrator finds that any person has violated or is in violation of any requirement or prohibition of an applicable implementation plan or permit, the Administrator shall notify the person and the State in which the plan applies of such finding. At any time after the expiration of 30 days following the date on which such notice of a violation is issued, the Administrator may, without regard to the period of violation (subject to section 2462 of Title 28)--

(A) issue an order requiring such person to comply with the requirements or prohibitions of such plan or permit,

(B) issue an administrative penalty order in accordance with subsection (d) of this section, or

(C) bring a civil action in accordance with subsection (b) of this section.

(2) State failure to enforce SIP or permit program

Whenever, on the basis of information available to the Administrator, the Administrator finds that violations of an applicable implementation plan or an approved permit program under subchapter V of this chapter are so widespread that such violations appear to result from a failure of the State in which the plan or permit program applies to enforce the plan or permit program effectively, the Administrator shall so notify the State. In the case of a permit program, the notice shall be made in accordance with subchapter V of this chapter. If the Administrator finds such failure extends beyond the 30th day after such notice (90 days in the case of such permit program), the Administrator shall give public notice of such finding. During the period beginning with such public notice and ending when such State satisfies the Administrator that it will enforce such plan or permit program (hereafter referred to in this section as “period of federally assumed enforcement”), the Administrator may enforce any requirement or prohibition of such plan or permit program with respect to any person by--

(A) issuing an order requiring such person to comply with such requirement or prohibition,

(B) issuing an administrative penalty order in accordance with subsection (d) of this section, or

(C) bringing a civil action in accordance with subsection (b) of this section.

(3) EPA enforcement of other requirements

Except for a requirement or prohibition enforceable under the preceding provisions of this subsection, whenever, on the basis of any information available to the Administrator, the Administrator finds that any person has violated, or is in violation of, any other requirement or prohibition of this subchapter, [section 7603](#) of this title, subchapter IV-A, subchapter V, or subchapter VI of this chapter, including, but not limited to, a requirement or prohibition of any rule, plan, order, waiver, or permit promulgated, issued, or approved under those provisions or subchapters, or for the payment of any fee owed to the United States under this chapter (other than subchapter II of this chapter), the Administrator may--

(A) issue an administrative penalty order in accordance with subsection (d) of this section,

(B) issue an order requiring such person to comply with such requirement or prohibition,

(C) bring a civil action in accordance with subsection (b) of this section or [section 7605](#) of this title, or

(D) request the Attorney General to commence a criminal action in accordance with subsection (c) of this section.

(4) Requirements for orders

An order issued under this subsection (other than an order relating to a violation of [section 7412](#) of this title) shall not take effect until the person to whom it is issued has had an opportunity to confer with the Administrator concerning the alleged violation. A copy of any order issued under this subsection shall be sent to the State air pollution control agency of any State in which the violation occurs. Any order issued under this subsection shall state with reasonable specificity the nature of the violation and specify a time for compliance which the Administrator determines is reasonable, taking into account the seriousness of the violation and any good faith efforts to comply with applicable requirements. In any case in which an order under this subsection (or notice to a violator under paragraph (1)) is issued to a corporation, a copy of such order (or notice) shall be issued to appropriate corporate officers. An order issued under this subsection shall require the person to whom it was issued to comply with the requirement as expeditiously as practicable, but in no event longer than one year after the date the order was issued, and shall be nonrenewable. No order issued under this subsection shall prevent the State or the Administrator from assessing any penalties nor otherwise affect or limit the State's or the United States authority to enforce under other provisions of this chapter, nor affect any person's obligations to comply with any section of this chapter or with a term or condition of any permit or ap-

plicable implementation plan promulgated or approved under this chapter.

(5) Failure to comply with new source requirements

Whenever, on the basis of any available information, the Administrator finds that a State is not acting in compliance with any requirement or prohibition of the chapter relating to the construction of new sources or the modification of existing sources, the Administrator may--

(A) issue an order prohibiting the construction or modification of any major stationary source in any area to which such requirement applies; [\[FN1\]](#)

(B) issue an administrative penalty order in accordance with subsection (d) of this section, or

(C) bring a civil action under subsection (b) of this section.

Nothing in this subsection shall preclude the United States from commencing a criminal action under subsection (c) of this section at any time for any such violation.

(b) Civil judicial enforcement

The Administrator shall, as appropriate, in the case of any person that is the owner or operator of an affected source, a major emitting facility, or a major stationary source, and may, in the case of any other person, commence a civil action for a permanent or temporary injunction, or to assess and recover a civil penalty of not more than \$25,000 per day for each violation, or both, in any of the following instances:

(1) Whenever such person has violated, or is in violation of, any requirement or prohibition of an applicable implementation plan or permit. Such an action shall be commenced (A) during any period of federally assumed enforcement, or (B) more than 30 days following the date of the Administrator's notification under subsection (a)(1) of this section that such person has violated, or is in violation of, such requirement or prohibition.

(2) Whenever such person has violated, or is in violation of, any other requirement or prohibition of this subchapter, [section 7603](#) of this title, subchapter IV-A, subchapter V, or subchapter VI of this chapter, including, but not limited to, a requirement or prohibition of any rule, order, waiver or permit promulgated, issued, or approved under this chapter, or for the payment of any fee owed the United States under this chapter (other than subchapter II of this chapter).

(3) Whenever such person attempts to construct or modify a major stationary source in any area with respect to which a finding under subsection (a)(5) of this section has been made.

Any action under this subsection may be brought in the district court of the United States for the district in which the violation is alleged to have occurred, or is occurring, or in which the defendant resides, or where the defendant's principal place of business is located, and such court shall have jurisdiction to restrain such violation, to require compliance, to assess such civil penalty, to collect any fees owed the United States under this chapter (other than subchapter II of this chapter) and any noncompliance assessment and nonpayment penalty owed under [section 7420](#) of this title, and to award any other appropriate relief. Notice of the commencement of such action shall be given to the appropriate State air pollution control agency. In the case of any action brought by the Administrator under this subsection, the court may award costs of litigation (including reasonable attorney and expert witness fees) to the party or parties against whom such action was brought if the court finds that such action was unreasonable.

(c) Criminal penalties

(1) Any person who knowingly violates any requirement or prohibition of an applicable implementation plan (during any period of federally assumed enforcement or more than 30 days after having been notified under subsection (a)(1) of this section by the Administrator that such person is violating such requirement or prohibition), any order under subsection (a) of this section, requirement or prohibition of [section 7411\(e\)](#) of this title (relating to new source performance standards), [section 7412](#) of this title, [section 7414](#) of this title (relating to inspections, etc.), [section 7429](#) of this title (relating to solid waste combustion), [section 7475\(a\)](#) of this title (relating to preconstruction requirements), an order under [section 7477](#) of this title (relating to preconstruction requirements), an order under [section 7603](#) of this title (relating to emergency orders), [section 7661a\(a\)](#) or [7661b\(c\)](#) of this title (relating to permits), or any requirement or prohibition of subchapter IV-A of this chapter (relating to acid deposition control), or subchapter VI of this chapter (relating to stratospheric ozone control), including a requirement of any rule, order, waiver, or permit promulgated or approved under such sections or subchapters, and including any requirement for the payment of any fee owed the United States under this chapter (other than subchapter II of this chapter) shall, upon conviction, be punished by a fine pursuant to Title 18, or by imprisonment for not to exceed 5 years, or both. If a conviction of any person under this paragraph is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both the fine and imprisonment.

(2) Any person who knowingly--

(A) makes any false material statement, representation, or certification in, or omits material information from, or knowingly alters, conceals, or fails to file or maintain any notice, application, record, report, plan, or other document required pursuant to this chapter to be either filed or maintained (whether with respect to the requirements imposed by the Administrator or by a State);

(B) fails to notify or report as required under this chapter; or

(C) falsifies, tampers with, renders inaccurate, or fails to install any monitoring device or method required to be maintained or followed under this chapter [\[FN2\]](#)

shall, upon conviction, be punished by a fine pursuant to Title 18, or by imprisonment for not more than 2 years, or both. If a conviction of any person under this paragraph is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both the fine and imprisonment.

(3) Any person who knowingly fails to pay any fee owed the United States under this subchapter, subchapter III, IV-A, V, or VI of this chapter shall, upon conviction, be punished by a fine pursuant to Title 18, or by imprisonment for not more than 1 year, or both. If a conviction of any person under this paragraph is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both the fine and imprisonment.

(4) Any person who negligently releases into the ambient air any hazardous air pollutant listed pursuant to [section 7412](#) of this title or any extremely hazardous substance listed pursuant to [section 11002\(a\)\(2\)](#) of this title that is not listed in [section 7412](#) of this title, and who at the time negligently places another person in imminent danger of death or serious bodily injury shall, upon conviction, be punished by a fine under Title 18, or by imprisonment for not more than 1 year, or both. If a conviction of any person under this paragraph is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both the fine and imprisonment.

(5)(A) Any person who knowingly releases into the ambient air any hazardous air pollutant listed pursuant to [section 7412](#) of this title or any extremely hazardous substance listed pursuant to [section 11002\(a\)\(2\)](#) of this title that is not listed in [section 7412](#) of this title, and who knows at the time that he thereby places another person in imminent danger of death or serious bodily injury shall, upon conviction, be punished by a fine under Title 18, or by imprisonment of not more than 15 years, or both. Any person committing such violation which is an organization shall, upon conviction under this paragraph, be subject to a fine of not more than \$1,000,000 for each violation. If a conviction of any person under this paragraph is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both the fine and imprisonment. For any air pollutant for which the Administrator has set an emissions standard or for any source for which a permit has been issued under subchapter V of this chapter, a release of such pollutant in accordance with that standard or permit shall not constitute a violation of this paragraph or paragraph (4).

(B) In determining whether a defendant who is an individual knew that the violation placed another person in imminent danger of death or serious bodily injury--

(i) the defendant is responsible only for actual awareness or actual belief possessed; and

(ii) knowledge possessed by a person other than the defendant, but not by the defendant, may not be attributed to the defendant;

except that in proving a defendant's possession of actual knowledge, circumstantial evidence may be used, including evidence that the defendant took affirmative steps to be shielded from relevant information.

(C) It is an affirmative defense to a prosecution that the conduct charged was freely consented to by the person endangered and that the danger and conduct charged were reasonably foreseeable hazards of--

(i) an occupation, a business, or a profession; or

(ii) medical treatment or medical or scientific experimentation conducted by professionally approved methods and such other person had been made aware of the risks involved prior to giving consent.

The defendant may establish an affirmative defense under this subparagraph by a preponderance of the evidence.

(D) All general defenses, affirmative defenses, and bars to prosecution that may apply with respect to other Federal criminal offenses may apply under subparagraph (A) of this paragraph and shall be determined by the courts of the United States according to the principles of common law as they may be interpreted in the light of reason and experience. Concepts of justification and excuse applicable under this section may be developed in the light of reason and experience.

(E) The term "organization" means a legal entity, other than a government, established or organized for any purpose, and such term includes a corporation, company, association, firm, partnership, joint stock company, foundation, institution, trust, society, union, or any other association of persons.

(F) The term "serious bodily injury" means bodily injury which involves a substantial risk of death, unconsciousness, extreme physical pain, protracted and obvious disfigurement or protracted loss or impairment of the function of a bodily member, organ, or mental faculty.

(6) For the purpose of this subsection, the term "person" includes, in addition to the entities referred to in [section 7602\(e\)](#) of this title, any responsible corporate officer.

(d) Administrative assessment of civil penalties

(1) The Administrator may issue an administrative order against any person assessing a civil administrative penalty of up to \$25,000, per day of violation, whenever, on the basis of any available information, the Administrator finds that such person--

(A) has violated or is violating any requirement or prohibition of an applicable implementation plan (such order shall be issued (i) during any period of federally assumed enforcement, or (ii) more than thirty days following the date of the Administrator's notification under subsection (a)(1) of this section of a finding that such person has violated or is violating such requirement or prohibition); or

(B) has violated or is violating any other requirement or prohibition of this subchapter or subchapter III, IV-A, V, or VI of this chapter, including, but not limited to, a requirement or prohibition of any rule, order, waiver,

permit, or plan promulgated, issued, or approved under this chapter, or for the payment of any fee owed the United States under this chapter (other than subchapter II of this chapter); or

(C) attempts to construct or modify a major stationary source in any area with respect to which a finding under subsection (a)(5) of this section has been made.

The Administrator's authority under this paragraph shall be limited to matters where the total penalty sought does not exceed \$200,000 and the first alleged date of violation occurred no more than 12 months prior to the initiation of the administrative action, except where the Administrator and the Attorney General jointly determine that a matter involving a larger penalty amount or longer period of violation is appropriate for administrative penalty action. Any such determination by the Administrator and the Attorney General shall not be subject to judicial review.

(2)(A) An administrative penalty assessed under paragraph (1) shall be assessed by the Administrator by an order made after opportunity for a hearing on the record in accordance with [sections 554 and 556 of Title 5](#). The Administrator shall issue reasonable rules for discovery and other procedures for hearings under this paragraph. Before issuing such an order, the Administrator shall give written notice to the person to be assessed an administrative penalty of the Administrator's proposal to issue such order and provide such person an opportunity to request such a hearing on the order, within 30 days of the date the notice is received by such person.

(B) The Administrator may compromise, modify, or remit, with or without conditions, any administrative penalty which may be imposed under this subsection.

(3) The Administrator may implement, after consultation with the Attorney General and the States, a field citation program through regulations establishing appropriate minor violations for which field citations assessing civil penalties not to exceed \$5,000 per day of violation may be issued by officers or employees designated by the Administrator. Any person to whom a field citation is assessed may, within a reasonable time as prescribed by the Administrator through regulation, elect to pay the penalty assessment or to request a hearing on the field citation. If a request for a hearing is not made within the time specified in the regulation, the penalty assessment in the field citation shall be final. Such hearing shall not be subject to [section 554 or 556 of Title 5](#), but shall provide a reasonable opportunity to be heard and to present evidence. Payment of a civil penalty required by a field citation shall not be a defense to further enforcement by the United States or a State to correct a violation, or to assess the statutory maximum penalty pursuant to other authorities in the chapter, if the violation continues.

(4) Any person against whom a civil penalty is assessed under paragraph (3) of this subsection or to whom an administrative penalty order is issued under paragraph (1) of this subsection may seek review of such assessment in the United States District Court for the District of Columbia or for the district in which the violation is alleged to have occurred, in which such person resides, or where such person's principal place of business is located, by filing in such court within 30 days following the date the administrative penalty order becomes final under paragraph (2), the assessment becomes final under paragraph (3), or a final decision following a hearing under paragraph (3) is rendered, and by simultaneously sending a copy of the filing by certified mail to the Administrator

and the Attorney General. Within 30 days thereafter, the Administrator shall file in such court a certified copy, or certified index, as appropriate, of the record on which the administrative penalty order or assessment was issued. Such court shall not set aside or remand such order or assessment unless there is not substantial evidence in the record, taken as a whole, to support the finding of a violation or unless the order or penalty assessment constitutes an abuse of discretion. Such order or penalty assessment shall not be subject to review by any court except as provided in this paragraph. In any such proceedings, the United States may seek to recover civil penalties ordered or assessed under this section.

(5) If any person fails to pay an assessment of a civil penalty or fails to comply with an administrative penalty order--

(A) after the order or assessment has become final, or

(B) after a court in an action brought under paragraph (4) has entered a final judgment in favor of the Administrator,

the Administrator shall request the Attorney General to bring a civil action in an appropriate district court to enforce the order or to recover the amount ordered or assessed (plus interest at rates established pursuant to [section 6621\(a\)\(2\) of Title 26](#) from the date of the final order or decision or the date of the final judgment, as the case may be). In such an action, the validity, amount, and appropriateness of such order or assessment shall not be subject to review. Any person who fails to pay on a timely basis a civil penalty ordered or assessed under this section shall be required to pay, in addition to such penalty and interest, the United States enforcement expenses, including but not limited to attorneys fees and costs incurred by the United States for collection proceedings and a quarterly nonpayment penalty for each quarter during which such failure to pay persists. Such nonpayment penalty shall be 10 percent of the aggregate amount of such person's outstanding penalties and nonpayment penalties accrued as of the beginning of such quarter.

(e) Penalty assessment criteria

(1) In determining the amount of any penalty to be assessed under this section or [section 7604\(a\)](#) of this title, the Administrator or the court, as appropriate, shall take into consideration (in addition to such other factors as justice may require) the size of the business, the economic impact of the penalty on the business, the violator's full compliance history and good faith efforts to comply, the duration of the violation as established by any credible evidence (including evidence other than the applicable test method), payment by the violator of penalties previously assessed for the same violation, the economic benefit of noncompliance, and the seriousness of the violation. The court shall not assess penalties for noncompliance with administrative subpoenas under [section 7607\(a\)](#) of this title, or actions under [section 7414](#) of this title, where the violator had sufficient cause to violate or fail or refuse to comply with such subpoena or action.

(2) A penalty may be assessed for each day of violation. For purposes of determining the number of days of violation for which a penalty may be assessed under subsection (b) or (d)(1) of this section, or [section 7604\(a\)](#) of this title, or an assessment may be made under [section 7420](#) of this title, where the Administrator or an air pollu-

tion control agency has notified the source of the violation, and the plaintiff makes a prima facie showing that the conduct or events giving rise to the violation are likely to have continued or recurred past the date of notice, the days of violation shall be presumed to include the date of such notice and each and every day thereafter until the violator establishes that continuous compliance has been achieved, except to the extent that the violator can prove by a preponderance of the evidence that there were intervening days during which no violation occurred or that the violation was not continuing in nature.

(f) Awards

The Administrator may pay an award, not to exceed \$10,000, to any person who furnishes information or services which lead to a criminal conviction or a judicial or administrative civil penalty for any violation of this subchapter or subchapter III, IV-A, V, or VI of this chapter enforced under this section. Such payment is subject to available appropriations for such purposes as provided in annual appropriation Acts. Any officer, or employee of the United States or any State or local government who furnishes information or renders service in the performance of an official duty is ineligible for payment under this subsection. The Administrator may, by regulation, prescribe additional criteria for eligibility for such an award.

(g) Settlements; public participation

At least 30 days before a consent order or settlement agreement of any kind under this chapter to which the United States is a party (other than enforcement actions under this section, [section 7420](#) of this title, or subchapter II of this chapter, whether or not involving civil or criminal penalties, or judgments subject to Department of Justice policy on public participation) is final or filed with a court, the Administrator shall provide a reasonable opportunity by notice in the Federal Register to persons who are not named as parties or intervenors to the action or matter to comment in writing. The Administrator or the Attorney General, as appropriate, shall promptly consider any such written comments and may withdraw or withhold his consent to the proposed order or agreement if the comments disclose facts or considerations which indicate that such consent is inappropriate, improper, inadequate, or inconsistent with the requirements of this chapter. Nothing in this subsection shall apply to civil or criminal penalties under this chapter.

(h) Operator

For purposes of the provisions of this section and [section 7420](#) of this title, the term “operator”, as used in such provisions, shall include any person who is senior management personnel or a corporate officer. Except in the case of knowing and willful violations, such term shall not include any person who is a stationary engineer or technician responsible for the operation, maintenance, repair, or monitoring of equipment and facilities and who often has supervisory and training duties but who is not senior management personnel or a corporate officer. Except in the case of knowing and willful violations, for purposes of subsection (c)(4) of this section, the term “a person” shall not include an employee who is carrying out his normal activities and who is not a part of senior management personnel or a corporate officer. Except in the case of knowing and willful violations, for purposes of paragraphs (1), (2), (3), and (5) of subsection (c) of this section the term “a person” shall not include an employee who is carrying out his normal activities and who is acting under orders from the employer.

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▢ [Part C](#). Prevention of Significant Deterioration of Air Quality

▢ [Subpart I](#). Clean Air ([Refs & Annos](#))

→→ **§ 7475. Preconstruction requirements**

(a) Major emitting facilities on which construction is commenced

No major emitting facility on which construction is commenced after August 7, 1977, may be constructed in any area to which this part applies unless--

(1) a permit has been issued for such proposed facility in accordance with this part setting forth emission limitations for such facility which conform to the requirements of this part;

(2) the proposed permit has been subject to a review in accordance with this section, the required analysis has been conducted in accordance with regulations promulgated by the Administrator, and a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of such source, alternatives thereto, control technology requirements, and other appropriate considerations;

(3) the owner or operator of such facility demonstrates, as required pursuant to [section 7410\(j\)](#) of this title, that emissions from construction or operation of such facility will not cause, or contribute to, air pollution in excess of any (A) maximum allowable increase or maximum allowable concentration for any pollutant in any area to which this part applies more than one time per year, (B) national ambient air quality standard in any air quality control region, or (C) any other applicable emission standard or standard of performance under this chapter;

(4) the proposed facility is subject to the best available control technology for each pollutant subject to regulation under this chapter emitted from, or which results from, such facility;

(5) the provisions of subsection (d) of this section with respect to protection of class I areas have been complied with for such facility;

(6) there has been an analysis of any air quality impacts projected for the area as a result of growth associated with such facility;

(7) the person who owns or operates, or proposes to own or operate, a major emitting facility for which a permit is required under this part agrees to conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or is having, on air quality in any area which may be affected by emissions from such

source; and

(8) in the case of a source which proposes to construct in a class III area, emissions from which would cause or contribute to exceeding the maximum allowable increments applicable in a class II area and where no standard under [section 7411](#) of this title has been promulgated subsequent to August 7, 1977, for such source category, the Administrator has approved the determination of best available technology as set forth in the permit.

(b) Exception

The demonstration pertaining to maximum allowable increases required under subsection (a)(3) of this section shall not apply to maximum allowable increases for class II areas in the case of an expansion or modification of a major emitting facility which is in existence on August 7, 1977, whose allowable emissions of air pollutants, after compliance with subsection (a)(4) of this section, will be less than fifty tons per year and for which the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur oxides will not cause or contribute to ambient air quality levels in excess of the national secondary ambient air quality standard for either of such pollutants.

(c) Permit applications

Any completed permit application under [section 7410](#) of this title for a major emitting facility in any area to which this part applies shall be granted or denied not later than one year after the date of filing of such completed application.

(d) Action taken on permit applications; notice; adverse impact on air quality related values; variance; emission limitations

(1) Each State shall transmit to the Administrator a copy of each permit application relating to a major emitting facility received by such State and provide notice to the Administrator of every action related to the consideration of such permit.

(2)(A) The Administrator shall provide notice of the permit application to the Federal Land Manager and the Federal official charged with direct responsibility for management of any lands within a class I area which may be affected by emissions from the proposed facility.

(B) The Federal Land Manager and the Federal official charged with direct responsibility for management of such lands shall have an affirmative responsibility to protect the air quality related values (including visibility) of any such lands within a class I area and to consider, in consultation with the Administrator, whether a proposed major emitting facility will have an adverse impact on such values.

(C)(i) In any case where the Federal official charged with direct responsibility for management of any lands within a class I area or the Federal Land Manager of such lands, or the Administrator, or the Governor of an adjacent State containing such a class I area files a notice alleging that emissions from a proposed major emitting facility may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such facility demonstrates that emissions of particulate matter and sulfur dioxide will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area.

**(ii)** In any case where the Federal Land Manager demonstrates to the satisfaction of the State that the emissions from such facility will have an adverse impact on the air quality-related values (including visibility) of such lands, notwithstanding the fact that the change in air quality resulting from emissions from such facility will not cause or contribute to concentrations which exceed the maximum allowable increases for a class I area, a permit shall not be issued.

**(iii)** In any case where the owner or operator of such facility demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such facility will have no adverse impact on the air quality-related values of such lands (including visibility), notwithstanding the fact that the change in air quality resulting from emissions from such facility will cause or contribute to concentrations which exceed the maximum allowable increases for class I areas, the State may issue a permit.

**(iv)** In the case of a permit issued pursuant to clause (iii), such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides and particulates from such facility will not cause or contribute to concentrations of such pollutant which exceed the following maximum allowable increases over the baseline concentration for such pollutants:

	Maximum allowable increase (in micrograms per cubic meter)
<b>Particulate matter:</b>	
Annual geometric mean	19
Twenty-four-hour maximum	37
<b>Sulfur dioxide:</b>	
Annual arithmetic mean	20
Twenty-four-hour maximum	91
Three-hour maximum	32

5

**(D)(i)** In any case where the owner or operator of a proposed major emitting facility who has been denied a certification under subparagraph (C)(iii) demonstrates to the satisfaction of the Governor, after notice and public hearing, and the Governor finds, that the facility cannot be constructed by reason of any maximum allowable increase for sulfur dioxide for periods of twenty-four hours or less applicable to any class I area and, in the case of Federal mandatory class I areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If such variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph.

**(ii)** In any case in which the Governor recommends a variance under this subparagraph in which the Federal Land Manager does not concur, the recommendations of the Governor and the Federal Land Manager shall be transmitted to the President. The President may approve the Governor's recommendation if he finds that such variance is in the national interest. No Presidential finding shall be reviewable in any court. The variance shall take effect if the President approves the Governor's recommendations. The President shall approve or disapprove such recommendation within ninety days after his receipt of the recommendations of the Governor and the Federal Land Manager.

(iii) In the case of a permit issued pursuant to this subparagraph, such facility shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such facility will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period:

MAXIMUM ALLOWABLE INCREASE		
[In micrograms per cubic meter]		
	Low terrain areas	High terrain areas
24-hr maximum	36	62
3-hr maximum	13	221
	0	

(iv) For purposes of clause (iii), the term “high terrain area” means with respect to any facility, any area having an elevation of 900 feet or more above the base of the stack of such facility, and the term “low terrain area” means any area other than a high terrain area.

(e) Analysis; continuous air quality monitoring data; regulations; model adjustments

(1) The review provided for in subsection (a) of this section shall be preceded by an analysis in accordance with regulations of the Administrator, promulgated under this subsection, which may be conducted by the State (or any general purpose unit of local government) or by the major emitting facility applying for such permit, of the ambient air quality at the proposed site and in areas which may be affected by emissions from such facility for each pollutant subject to regulation under this chapter which will be emitted from such facility.

(2) Effective one year after August 7, 1977, the analysis required by this subsection shall include continuous air quality monitoring data gathered for purposes of determining whether emissions from such facility will exceed the maximum allowable increases or the maximum allowable concentration permitted under this part. Such data shall be gathered over a period of one calendar year preceding the date of application for a permit under this part unless the State, in accordance with regulations promulgated by the Administrator, determines that a complete and adequate analysis for such purposes may be accomplished in a shorter period. The results of such analysis shall be available at the time of the public hearing on the application for such permit.

(3) The Administrator shall within six months after August 7, 1977, promulgate regulations respecting the analysis required under this subsection which regulations--

(A) shall not require the use of any automatic or uniform buffer zone or zones,

(B) shall require an analysis of the ambient air quality, climate and meteorology, terrain, soils and vegetation, and vis-

ibility at the site of the proposed major emitting facility and in the area potentially affected by the emissions from such facility for each pollutant regulated under this chapter which will be emitted from, or which results from the construction or operation of, such facility, the size and nature of the proposed facility, the degree of continuous emission reduction which could be achieved by such facility, and such other factors as may be relevant in determining the effect of emissions from a proposed facility on any air quality control region,

(C) shall require the results of such analysis shall be available at the time of the public hearing on the application for such permit, and

(D) shall specify with reasonable particularity each air quality model or models to be used under specified sets of conditions for purposes of this part.

Any model or models designated under such regulations may be adjusted upon a determination, after notice and opportunity for public hearing, by the Administrator that such adjustment is necessary to take into account unique terrain or meteorological characteristics of an area potentially affected by emissions from a source applying for a permit required under this part.

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas▣ [Subpart 1](#). Nonattainment Areas in General ([Refs & Annos](#))→ → **§ 7502. Nonattainment plan provisions in general**

(a) Classifications and attainment dates

(1) Classifications

(A) On or after the date the Administrator promulgates the designation of an area as a nonattainment area pursuant to [section 7407\(d\)](#) of this title with respect to any national ambient air quality standard (or any revised standard, including a revision of any standard in effect on November 15, 1990), the Administrator may classify the area for the purpose of applying an attainment date pursuant to paragraph (2), and for other purposes. In determining the appropriate classification, if any, for a nonattainment area, the Administrator may consider such factors as the severity of nonattainment in such area and the availability and feasibility of the pollution control measures that the Administrator believes may be necessary to provide for attainment of such standard in such area.

(B) The Administrator shall publish a notice in the Federal Register announcing each classification under subparagraph (A), except the Administrator shall provide an opportunity for at least 30 days for written comment. Such classification shall not be subject to the provisions of [sections 553 through 557 of Title 5](#) (concerning notice and comment) and shall not be subject to judicial review until the Administrator takes final action under [subsection \(k\)](#) or [\(l\) of section 7410](#) of this title (concerning action on plan submissions) or [section 7509](#) of this title (concerning sanctions) with respect to any plan submissions required by virtue of such classification.

(C) This paragraph shall not apply with respect to nonattainment areas for which classifications are specifically provided under other provisions of this part.

(2) Attainment dates for nonattainment areas

(A) The attainment date for an area designated nonattainment with respect to a national primary ambient air quality standard shall be the date by which attainment can be achieved as expeditiously as practicable, but no later than 5 years from the date such area was designated nonattainment under [section 7407\(d\)](#) of this title, except that the Administrator may extend the attainment date to the extent the Administrator determines appropriate.

ropriate, for a period no greater than 10 years from the date of designation as nonattainment, considering the severity of nonattainment and the availability and feasibility of pollution control measures.

**(B)** The attainment date for an area designated nonattainment with respect to a secondary national ambient air quality standard shall be the date by which attainment can be achieved as expeditiously as practicable after the date such area was designated nonattainment under [section 7407\(d\)](#) of this title.

**(C)** Upon application by any State, the Administrator may extend for 1 additional year (hereinafter referred to as the "Extension Year") the attainment date determined by the Administrator under subparagraph (A) or (B) if--

**(i)** the State has complied with all requirements and commitments pertaining to the area in the applicable implementation plan, and

**(ii)** in accordance with guidance published by the Administrator, no more than a minimal number of exceedances of the relevant national ambient air quality standard has occurred in the area in the year preceding the Extension Year.

No more than 2 one-year extensions may be issued under this subparagraph for a single nonattainment area.

**(D)** This paragraph shall not apply with respect to nonattainment areas for which attainment dates are specifically provided under other provisions of this part.

**(b) Schedule for plan submissions**

At the time the Administrator promulgates the designation of an area as nonattainment with respect to a national ambient air quality standard under [section 7407\(d\)](#) of this title, the Administrator shall establish a schedule according to which the State containing such area shall submit a plan or plan revision (including the plan items) meeting the applicable requirements of subsection (c) of this section and [section 7410\(a\)\(2\)](#) of this title. Such schedule shall at a minimum, include a date or dates, extending no later than 3 years from the date of the nonattainment designation, for the submission of a plan or plan revision (including the plan items) meeting the applicable requirements of subsection (c) of this section and [section 7410\(a\)\(2\)](#) of this title.

**(c) Nonattainment plan provisions**

The plan provisions (including plan items) required to be submitted under this part shall comply with each of the following:

**(1) In general**

Such plan provisions shall provide for the implementation of all reasonably available control measures as ex-

peditionally as practicable (including such reductions in emissions from existing sources in the area as may be obtained through the adoption, at a minimum, of reasonably available control technology) and shall provide for attainment of the national primary ambient air quality standards.

(2) RFP

Such plan provisions shall require reasonable further progress.

(3) Inventory

Such plan provisions shall include a comprehensive, accurate, current inventory of actual emissions from all sources of the relevant pollutant or pollutants in such area, including such periodic revisions as the Administrator may determine necessary to assure that the requirements of this part are met.

(4) Identification and quantification

Such plan provisions shall expressly identify and quantify the emissions, if any, of any such pollutant or pollutants which will be allowed, in accordance with [section 7503\(a\)\(1\)\(B\)](#) of this title, from the construction and operation of major new or modified stationary sources in each such area. The plan shall demonstrate to the satisfaction of the Administrator that the emissions quantified for this purpose will be consistent with the achievement of reasonable further progress and will not interfere with attainment of the applicable national ambient air quality standard by the applicable attainment date.

(5) Permits for new and modified major stationary sources

Such plan provisions shall require permits for the construction and operation of new or modified major stationary sources anywhere in the nonattainment area, in accordance with [section 7503](#) of this title.

(6) Other measures

Such plan provisions shall include enforceable emission limitations, and such other control measures, means or techniques (including economic incentives such as fees, marketable permits, and auctions of emission rights), as well as schedules and timetables for compliance, as may be necessary or appropriate to provide for attainment of such standard in such area by the applicable attainment date specified in this part.

(7) Compliance with section 7410(a)(2)

Such plan provisions shall also meet the applicable provisions of [section 7410\(a\)\(2\)](#) of this title.

(8) Equivalent techniques

Upon application by any State, the Administrator may allow the use of equivalent modeling, emission inventory, and planning procedures, unless the Administrator determines that the proposed techniques are, in the ag-

gregate, less effective than the methods specified by the Administrator.

(9) Contingency measures

Such plan shall provide for the implementation of specific measures to be undertaken if the area fails to make reasonable further progress, or to attain the national primary ambient air quality standard by the attainment date applicable under this part. Such measures shall be included in the plan revision as contingency measures to take effect in any such case without further action by the State or the Administrator.

(d) Plan revisions required in response to finding of plan inadequacy

Any plan revision for a nonattainment area which is required to be submitted in response to a finding by the Administrator pursuant to [section 7410\(k\)\(5\)](#) of this title (relating to calls for plan revisions) must correct the plan deficiency (or deficiencies) specified by the Administrator and meet all other applicable plan requirements of [section 7410](#) of this title and this part. The Administrator may reasonably adjust the dates otherwise applicable under such requirements to such revision (except for attainment dates that have not yet elapsed), to the extent necessary to achieve a consistent application of such requirements. In order to facilitate submittal by the States of adequate and approvable plans consistent with the applicable requirements of this chapter, the Administrator shall, as appropriate and from time to time, issue written guidelines, interpretations, and information to the States which shall be available to the public, taking into consideration any such guidelines, interpretations, or information provided before November 15, 1990.

(e) Future modification of standard

If the Administrator relaxes a national primary ambient air quality standard after November 15, 1990, the Administrator shall, within 12 months after the relaxation, promulgate requirements applicable to all areas which have not attained that standard as of the date of such relaxation. Such requirements shall provide for controls which are not less stringent than the controls applicable to areas designated nonattainment before such relaxation.

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas

▣ [Subpart 1](#). Nonattainment Areas in General ([Refs & Annos](#))

→→ **§ 7503. Permit requirements**

(a) In general

The permit program required by [section 7502\(b\)\(6\)](#) of this title shall provide that permits to construct and operate may be issued if--

(1) in accordance with regulations issued by the Administrator for the determination of baseline emissions in a manner consistent with the assumptions underlying the applicable implementation plan approved under [section 7410](#) of this title and this part, the permitting agency determines that--

(A) by the time the source is to commence operation, sufficient offsetting emissions reductions have been obtained, such that total allowable emissions from existing sources in the region, from new or modified sources which are not major emitting facilities, and from the proposed source will be sufficiently less than total emissions from existing sources (as determined in accordance with the regulations under this paragraph) prior to the application for such permit to construct or modify so as to represent (when considered together with the plan provisions required under [section 7502](#) of this title) reasonable further progress (as defined in [section 7501](#) of this title); or

(B) in the case of a new or modified major stationary source which is located in a zone (within the nonattainment area) identified by the Administrator, in consultation with the Secretary of Housing and Urban Development, as a zone to which economic development should be targeted, that emissions of such pollutant resulting from the proposed new or modified major stationary source will not cause or contribute to emissions levels which exceed the allowance permitted for such pollutant for such area from new or modified major stationary sources under [section 7502\(c\)](#) of this title;

(2) the proposed source is required to comply with the lowest achievable emission rate;

(3) the owner or operator of the proposed new or modified source has demonstrated that all major stationary sources owned or operated by such person (or by any entity controlling, controlled by, or under common con-

trol with such person) in such State are subject to emission limitations and are in compliance, or on a schedule for compliance, with all applicable emission limitations and standards under this chapter; and [FN1]

(4) the Administrator has not determined that the applicable implementation plan is not being adequately implemented for the nonattainment area in which the proposed source is to be constructed or modified in accordance with the requirements of this part; and

(5) an analysis of alternative sites, sizes, production processes, and environmental control techniques for such proposed source demonstrates that benefits of the proposed source significantly outweigh the environmental and social costs imposed as a result of its location, construction, or modification.

Any emission reductions required as a precondition of the issuance of a permit under paragraph (1) shall be federally enforceable before such permit may be issued.

(b) Prohibition on use of old growth allowances

Any growth allowance included in an applicable implementation plan to meet the requirements of [section 7502\(b\)\(5\)](#) of this title (as in effect immediately before November 15, 1990) shall not be valid for use in any area that received or receives a notice under [section 7410\(a\)\(2\)\(H\)\(ii\)](#) of this title (as in effect immediately before November 15, 1990) or under [section 7410\(k\)\(1\)](#) of this title that its applicable implementation plan containing such allowance is substantially inadequate.

(c) Offsets

(1) The owner or operator of a new or modified major stationary source may comply with any offset requirement in effect under this part for increased emissions of any air pollutant only by obtaining emission reductions of such air pollutant from the same source or other sources in the same nonattainment area, except that the State may allow the owner or operator of a source to obtain such emission reductions in another nonattainment area if (A) the other area has an equal or higher nonattainment classification than the area in which the source is located and (B) emissions from such other area contribute to a violation of the national ambient air quality standard in the nonattainment area in which the source is located. Such emission reductions shall be, by the time a new or modified source commences operation, in effect and enforceable and shall assure that the total tonnage of increased emissions of the air pollutant from the new or modified source shall be offset by an equal or greater reduction, as applicable, in the actual emissions of such air pollutant from the same or other sources in the area.

(2) Emission reductions otherwise required by this chapter shall not be creditable as emissions reductions for purposes of any such offset requirement. Incidental emission reductions which are not otherwise required by this chapter shall be creditable as emission reductions for such purposes if such emission reductions meet the requirements of paragraph (1).

(d) Control technology information

The State shall provide that control technology information from permits issued under this section will be promptly submitted to the Administrator for purposes of making such information available through the RACT/BACT/LAER clearinghouse to other States and to the general public.

(e) Rocket engines or motors

The permitting authority of a State shall allow a source to offset by alternative or innovative means emission increases from rocket engine and motor firing, and cleaning related to such firing, at an existing or modified major source that tests rocket engines or motors under the following conditions:

(1) Any modification proposed is solely for the purpose of expanding the testing of rocket engines or motors at an existing source that is permitted to test such engines on November 15, 1990.

(2) The source demonstrates to the satisfaction of the permitting authority of the State that it has used all reasonable means to obtain and utilize offsets, as determined on an annual basis, for the emissions increases beyond allowable levels, that all available offsets are being used, and that sufficient offsets are not available to the source.

(3) The source has obtained a written finding from the Department of Defense, Department of Transportation, National Aeronautics and Space Administration or other appropriate Federal agency, that the testing of rocket motors or engines at the facility is required for a program essential to the national security.

(4) The source will comply with an alternative measure, imposed by the permitting authority, designed to offset any emission increases beyond permitted levels not directly offset by the source. In lieu of imposing any alternative offset measures, the permitting authority may impose an emissions fee to be paid to such authority of a State which shall be an amount no greater than 1.5 times the average cost of stationary source control measures adopted in that area during the previous 3 years. The permitting authority shall utilize the fees in a manner that maximizes the emissions reductions in that area.

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas▣ [Subpart 1](#). Nonattainment Areas in General ([Refs & Annos](#))→ → **§ 7509. Sanctions and consequences of failure to attain**

(a) State failure

For any implementation plan or plan revision required under this part (or required in response to a finding of substantial inadequacy as described in [section 7410\(k\)\(5\)](#) of this title), if the Administrator--

(1) finds that a State has failed, for an area designated nonattainment under [section 7407\(d\)](#) of this title, to submit a plan, or to submit 1 or more of the elements (as determined by the Administrator) required by the provisions of this chapter applicable to such an area, or has failed to make a submission for such an area that satisfies the minimum criteria established in relation to any such element under [section 7410\(k\)](#) of this title,

(2) disapproves a submission under [section 7410\(k\)](#) of this title, for an area designated nonattainment under [section 7407](#) of this title, based on the submission's failure to meet one or more of the elements required by the provisions of this chapter applicable to such an area,

(3)(A) determines that a State has failed to make any submission as may be required under this chapter, other than one described under paragraph (1) or (2), including an adequate maintenance plan, or has failed to make any submission, as may be required under this chapter, other than one described under paragraph (1) or (2), that satisfies the minimum criteria established in relation to such submission under [section 7410\(k\)\(1\)\(A\)](#) of this title, or

(B) disapproves in whole or in part a submission described under subparagraph (A), or

(4) finds that any requirement of an approved plan (or approved part of a plan) is not being implemented,

unless such deficiency has been corrected within 18 months after the finding, disapproval, or determination referred to in paragraphs (1), (2), (3), and (4), one of the sanctions referred to in subsection (b) of this section shall apply, as selected by the Administrator, until the Administrator determines that the State has come into compli-

ance, except that if the Administrator finds a lack of good faith, sanctions under both paragraph (1) and paragraph (2) of subsection (b) of this section shall apply until the Administrator determines that the State has come into compliance. If the Administrator has selected one of such sanctions and the deficiency has not been corrected within 6 months thereafter, sanctions under both paragraph (1) and paragraph (2) of subsection (b) of this section shall apply until the Administrator determines that the State has come into compliance. In addition to any other sanction applicable as provided in this section, the Administrator may withhold all or part of the grants for support of air pollution planning and control programs that the Administrator may award under [section 7405](#) of this title.

(b) Sanctions

The sanctions available to the Administrator as provided in subsection (a) of this section are as follows:

(1) Highway sanctions

(A) The Administrator may impose a prohibition, applicable to a nonattainment area, on the approval by the Secretary of Transportation of any projects or the awarding by the Secretary of any grants, under Title 23 other than projects or grants for safety where the Secretary determines, based on accident or other appropriate data submitted by the State, that the principal purpose of the project is an improvement in safety to resolve a demonstrated safety problem and likely will result in a significant reduction in, or avoidance of, accidents. Such prohibition shall become effective upon the selection by the Administrator of this sanction.

(B) In addition to safety, projects or grants that may be approved by the Secretary, notwithstanding the prohibition in subparagraph (A), are the following--

(i) capital programs for public transit;

(ii) construction or restriction of certain roads or lanes solely for the use of passenger buses or high occupancy vehicles;

(iii) planning for requirements for employers to reduce employee work-trip-related vehicle emissions;

(iv) highway ramp metering, traffic signalization, and related programs that improve traffic flow and achieve a net emission reduction;

(v) fringe and transportation corridor parking facilities serving multiple occupancy vehicle programs or transit operations;

(vi) programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration particularly during periods of peak use, through road use charges, tolls, parking surcharges, or other pricing mechanisms, vehicle restricted zones or periods, or vehicle registration programs;

(vii) programs for breakdown and accident scene management, nonrecurring congestion, and vehicle information systems, to reduce congestion and emissions; and

(viii) such other transportation-related programs as the Administrator, in consultation with the Secretary of Transportation, finds would improve air quality and would not encourage single occupancy vehicle capacity.

In considering such measures, the State should seek to ensure adequate access to downtown, other commercial, and residential areas, and avoid increasing or relocating emissions and congestion rather than reducing them.

(2) Offsets

In applying the emissions offset requirements of [section 7503](#) of this title to new or modified sources or emissions units for which a permit is required under this part, the ratio of emission reductions to increased emissions shall be at least 2 to 1.

(c) Notice of failure to attain

(1) As expeditiously as practicable after the applicable attainment date for any nonattainment area, but not later than 6 months after such date, the Administrator shall determine, based on the area's air quality as of the attainment date, whether the area attained the standard by that date.

(2) Upon making the determination under paragraph (1), the Administrator shall publish a notice in the Federal Register containing such determination and identifying each area that the Administrator has determined to have failed to attain. The Administrator may revise or supplement such determination at any time based on more complete information or analysis concerning the area's air quality as of the attainment date.

(d) Consequences for failure to attain

(1) Within 1 year after the Administrator publishes the notice under subsection (c)(2) of this section (relating to notice of failure to attain), each State containing a nonattainment area shall submit a revision to the applicable implementation plan meeting the requirements of paragraph (2) of this subsection.

(2) The revision required under paragraph (1) shall meet the requirements of [section 7410](#) of this title and [section 7502](#) of this title. In addition, the revision shall include such additional measures as the Administrator may reasonably prescribe, including all measures that can be feasibly implemented in the area in light of technological achievability, costs, and any nonair quality and other air quality-related health and environmental impacts.

(3) The attainment date applicable to the revision required under paragraph (1) shall be the same as provided in the provisions of [section 7502\(a\)\(2\)](#) of this title, except that in applying such provisions the phrase "from the date of the notice under section 7509(c)(2) of this title" shall be substituted for the phrase "from the date such

area was designated nonattainment under [section 7407\(d\)](#) of this title” and for the phrase “from the date of designation as nonattainment”.

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▢ [Part D](#). Plan Requirements for Nonattainment Areas

▢ [Subpart 2](#). Additional Provisions for Ozone Nonattainment Areas ([Refs & Annos](#))

→→ **§ 7511. Classifications and attainment dates**

(a) Classification and attainment dates for 1989 nonattainment areas

(1) Each area designated nonattainment for ozone pursuant to [section 7407\(d\)](#) of this title shall be classified at the time of such designation, under table 1, by operation of law, as a Marginal Area, a Moderate Area, a Serious Area, a Severe Area, or an Extreme Area based on the design value for the area. The design value shall be calculated according to the interpretation methodology issued by the Administrator most recently before November 15, 1990. For each area classified under this subsection, the primary standard attainment date for ozone shall be as expeditiously as practicable but not later than the date provided in table 1.

TABLE 1		
Area class	Design value <sup>[FN*]</sup>	Primary standard attainment date <sup>[FN**]</sup>
Marginal	0.121 up to 0.138	3 years after November 15, 1990
Moderate	0.138 up to 0.160	6 years after November 15, 1990
Serious	0.160 up to 0.180	9 years after November 15, 1990
Severe	0.180 up to 0.280	15 years after November 15, 1990
Extreme	0.280 and above	20 years after November 15, 1990

<sup>[FN\*]</sup> The design value is measured in parts per million (ppm).

<sup>[FN\*\*]</sup> The primary standard attainment date is measured from November 15, 1990.

(2) Notwithstanding table 1, in the case of a severe area with a 1988 ozone design value between 0.190 and 0.280 ppm,

the attainment date shall be 17 years (in lieu of 15 years) after November 15, 1990.

(3) At the time of publication of the notice under [section 7407\(d\)\(4\)](#) of this title (relating to area designations) for each ozone nonattainment area, the Administrator shall publish a notice announcing the classification of such ozone nonattainment area. The provisions of [section 7502\(a\)\(1\)\(B\)](#) of this title (relating to lack of notice and comment and judicial review) shall apply to such classification.

(4) If an area classified under paragraph (1) (Table 1) would have been classified in another category if the design value in the area were 5 percent greater or 5 percent less than the level on which such classification was based, the Administrator may, in the Administrator's discretion, within 90 days after the initial classification, by the procedure required under paragraph (3), adjust the classification to place the area in such other category. In making such adjustment, the Administrator may consider the number of exceedances of the national primary ambient air quality standard for ozone in the area, the level of pollution transport between the area and other affected areas, including both intrastate and interstate transport, and the mix of sources and air pollutants in the area.

(5) Upon application by any State, the Administrator may extend for 1 additional year (hereinafter referred to as the "Extension Year") the date specified in table 1 of paragraph (1) of this subsection if--

(A) the State has complied with all requirements and commitments pertaining to the area in the applicable implementation plan, and

(B) no more than 1 exceedance of the national ambient air quality standard level for ozone has occurred in the area in the year preceding the Extension Year.

No more than 2 one-year extensions may be issued under this paragraph for a single nonattainment area.

(b) New designations and reclassifications

(1) New designations to nonattainment

Any area that is designated attainment or unclassifiable for ozone under [section 7407\(d\)\(4\)](#) of this title, and that is subsequently redesignated to nonattainment for ozone under [section 7407\(d\)\(3\)](#) of this title, shall, at the time of the redesignation, be classified by operation of law in accordance with table 1 under subsection (a) of this section. Upon its classification, the area shall be subject to the same requirements under [section 7410](#) of this title, subpart 1 of this part, and this subpart that would have applied had the area been so classified at the time of the notice under subsection (a)(3) of this section, except that any absolute, fixed date applicable in connection with any such requirement is extended by operation of law by a period equal to the length of time between November 15, 1990, and the date the area is classified under this paragraph.

(2) Reclassification upon failure to attain

(A) Within 6 months following the applicable attainment date (including any extension thereof) for an ozone nonattain-

ment area, the Administrator shall determine, based on the area's design value (as of the attainment date), whether the area attained the standard by that date. Except for any Severe or Extreme area, any area that the Administrator finds has not attained the standard by that date shall be reclassified by operation of law in accordance with table 1 of subsection (a) of this section to the higher of--

(i) the next higher classification for the area, or

(ii) the classification applicable to the area's design value as determined at the time of the notice required under subparagraph (B).

No area shall be reclassified as Extreme under clause (ii).

(B) The Administrator shall publish a notice in the Federal Register, no later than 6 months following the attainment date, identifying each area that the Administrator has determined under subparagraph (A) as having failed to attain and identifying the reclassification, if any, described under subparagraph (A).

(3) Voluntary reclassification

The Administrator shall grant the request of any State to reclassify a nonattainment area in that State in accordance with table 1 of subsection (a) of this section to a higher classification. The Administrator shall publish a notice in the Federal Register of any such request and of action by the Administrator granting the request.

(4) Failure of Severe Areas to attain standard

(A) If any Severe Area fails to achieve the national primary ambient air quality standard for ozone by the applicable attainment date (including any extension thereof), the fee provisions under [section 7511d](#) of this title shall apply within the area, the percent reduction requirements of [section 7511a\(c\)\(2\)\(B\)](#) and (C) of this title (relating to reasonable further progress demonstration and NO<sub>x</sub> control) shall continue to apply to the area, and the State shall demonstrate that such percent reduction has been achieved in each 3-year interval after such failure until the standard is attained. Any failure to make such a demonstration shall be subject to the sanctions provided under this part.

(B) In addition to the requirements of subparagraph (A), if the ozone design value for a Severe Area referred to in subparagraph (A) is above 0.140 ppm for the year of the applicable attainment date, or if the area has failed to achieve its most recent milestone under [section 7511a\(g\)](#) of this title, the new source review requirements applicable under this subpart in Extreme Areas shall apply in the area and the term [FN1] "major source" and "major stationary source" shall have the same meaning as in Extreme Areas.

(C) In addition to the requirements of subparagraph (A) for those areas referred to in subparagraph (A) and not covered by subparagraph (B), the provisions referred to in subparagraph (B) shall apply after 3 years from the applicable attainment date unless the area has attained the standard by the end of such 3-year period.

(D) If, after November 15, 1990, the Administrator modifies the method of determining compliance with the national primary ambient air quality standard, a design value or other indicator comparable to 0.140 in terms of its relationship to the standard shall be used in lieu of 0.140 for purposes of applying the provisions of subparagraphs (B) and (C).

(c) References to terms

(1) Any reference in this subpart to a “Marginal Area”, a “Moderate Area”, a “Serious Area”, a “Severe Area”, or an “Extreme Area” shall be considered a reference to a Marginal Area, a Moderate Area, a Serious Area, a Severe Area, or an Extreme Area as respectively classified under this section.

(2) Any reference in this subpart to “next higher classification” or comparable terms shall be considered a reference to the classification related to the next higher set of design values in table 1.

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas▣ [Subpart 2](#). Additional Provisions for Ozone Nonattainment Areas ([Refs & Annos](#))→→ **§ 7511a. Plan submissions and requirements**

## (a) Marginal Areas

Each State in which all or part of a Marginal Area is located shall, with respect to the Marginal Area (or portion thereof, to the extent specified in this subsection), submit to the Administrator the State implementation plan revisions (including the plan items) described under this subsection except to the extent the State has made such submissions as of November 15, 1990.

## (1) Inventory

Within 2 years after November 15, 1990, the State shall submit a comprehensive, accurate, current inventory of actual emissions from all sources, as described in [section 7502\(c\)\(3\)](#) of this title, in accordance with guidance provided by the Administrator.

## (2) Corrections to the State implementation plan

Within the periods prescribed in this paragraph, the State shall submit a revision to the State implementation plan that meets the following requirements--

## (A) Reasonably available control technology corrections

For any Marginal Area (or, within the Administrator's discretion, portion thereof) the State shall submit, within 6 months of the date of classification under [section 7511\(a\)](#) of this title, a revision that includes such provisions to correct requirements in (or add requirements to) the plan concerning reasonably available control technology as were required under [section 7502\(b\)](#) of this title (as in effect immediately before November 15, 1990), as interpreted in guidance issued by the Administrator under [section 7408](#) of this title before November 15, 1990.

## (B) Savings clause for vehicle inspection and maintenance

(i) For any Marginal Area (or, within the Administrator's discretion, portion thereof), the plan for which already includes, or was required by [section 7502\(b\)\(11\)\(B\)](#) of this title (as in effect immediately before November 15, 1990) to have included, a specific schedule for implementation of a vehicle emission control inspection and maintenance program, the State shall submit, immediately after November 15, 1990, a revision that includes any provisions necessary to provide for a vehicle inspection and maintenance program of no less stringency than that of either the program defined in House Report Numbered 95-294, 95th Congress, 1st Session, 281-291 (1977) as interpreted in guidance of the Administrator issued pursuant to [section 7502\(b\)\(11\)\(B\)](#) of this title (as in effect immediately before November 15, 1990) or the program already included in the plan, whichever is more stringent.

(ii) Within 12 months after November 15, 1990, the Administrator shall review, revise, update, and republish in the Federal Register the guidance for the States for motor vehicle inspection and maintenance programs required by this chapter, taking into consideration the Administrator's investigations and audits of such program. The guidance shall, at a minimum, cover the frequency of inspections, the types of vehicles to be inspected (which shall include leased vehicles that are registered in the nonattainment area), vehicle maintenance by owners and operators, audits by the State, the test method and measures, including whether centralized or decentralized, inspection methods and procedures, quality of inspection, components covered, assurance that a vehicle subject to a recall notice from a manufacturer has complied with that notice, and effective implementation and enforcement, including ensuring that any retesting of a vehicle after a failure shall include proof of corrective action and providing for denial of vehicle registration in the case of tampering or misfueling. The guidance which shall be incorporated in the applicable State implementation plans by the States shall provide the States with continued reasonable flexibility to fashion effective, reasonable, and fair programs for the affected consumer. No later than 2 years after the Administrator promulgates regulations under [section 7521\(m\)\(3\)](#) of this title (relating to emission control diagnostics), the State shall submit a revision to such program to meet any requirements that the Administrator may prescribe under that section.

(C) Permit programs

Within 2 years after November 15, 1990, the State shall submit a revision that includes each of the following:

(i) Provisions to require permits, in accordance with [sections 7502\(c\)\(5\)](#) and [7503](#) of this title, for the construction and operation of each new or modified major stationary source (with respect to ozone) to be located in the area.

(ii) Provisions to correct requirements in (or add requirements to) the plan concerning permit programs as were required under [section 7502\(b\)\(6\)](#) of this title (as in effect immediately before November 15, 1990), as interpreted in regulations of the Administrator promulgated as of November 15, 1990.

(3) Periodic inventory

(A) General requirement

No later than the end of each 3-year period after submission of the inventory under paragraph (1) until the area is redesignated to attainment, the State shall submit a revised inventory meeting the requirements of subsection (a)(1) of this section.

(B) Emissions statements

(i) Within 2 years after November 15, 1990, the State shall submit a revision to the State implementation plan to require that the owner or operator of each stationary source of oxides of nitrogen or volatile organic compounds provide the State with a statement, in such form as the Administrator may prescribe (or accept an equivalent alternative developed by the State), for classes or categories of sources, showing the actual emissions of oxides of nitrogen and volatile organic compounds from that source. The first such statement shall be submitted within 3 years after November 15, 1990. Subsequent statements shall be submitted at least every year thereafter. The statement shall contain a certification that the information contained in the statement is accurate to the best knowledge of the individual certifying the statement.

(ii) The State may waive the application of clause (i) to any class or category of stationary sources which emit less than 25 tons per year of volatile organic compounds or oxides of nitrogen if the State, in its submissions under subparagraphs [FN1] (1) or (3)(A), provides an inventory of emissions from such class or category of sources, based on the use of the emission factors established by the Administrator or other methods acceptable to the Administrator.

(4) General offset requirement

For purposes of satisfying the emission offset requirements of this part, the ratio of total emission reductions of volatile organic compounds to total increased emissions of such air pollutant shall be at least 1.1 to 1.

The Administrator may, in the Administrator's discretion, require States to submit a schedule for submitting any of the revisions or other items required under this subsection. The requirements of this subsection shall apply in lieu of any requirement that the State submit a demonstration that the applicable implementation plan provides for attainment of the ozone standard by the applicable attainment date in any Marginal Area. Section 7502(c)(9) of this title (relating to contingency measures) shall not apply to Marginal Areas.

(b) Moderate Areas

Each State in which all or part of a Moderate Area is located shall, with respect to the Moderate Area, make the submissions described under subsection (a) of this section (relating to Marginal Areas), and shall also submit the revisions to the applicable implementation plan described under this subsection.

(1) Plan provisions for reasonable further progress

(A) General rule

(i) By no later than 3 years after November 15, 1990, the State shall submit a revision to the applicable im-

plementation plan to provide for volatile organic compound emission reductions, within 6 years after November 15, 1990, of at least 15 percent from baseline emissions, accounting for any growth in emissions after 1990. Such plan shall provide for such specific annual reductions in emissions of volatile organic compounds and oxides of nitrogen as necessary to attain the national primary ambient air quality standard for ozone by the attainment date applicable under this chapter. This subparagraph shall not apply in the case of oxides of nitrogen for those areas for which the Administrator determines (when the Administrator approves the plan or plan revision) that additional reductions of oxides of nitrogen would not contribute to attainment.

(ii) A percentage less than 15 percent may be used for purposes of clause (i) in the case of any State which demonstrates to the satisfaction of the Administrator that--

(I) new source review provisions are applicable in the nonattainment areas in the same manner and to the same extent as required under subsection (e) of this section in the case of Extreme Areas (with the exception that, in applying such provisions, the terms "major source" and "major stationary source" shall include (in addition to the sources described in [section 7602](#) of this title) any stationary source or group of sources located within a contiguous area and under common control that emits, or has the potential to emit, at least 5 tons per year of volatile organic compounds);

(II) reasonably available control technology is required for all existing major sources (as defined in subclause (I)); and

(III) the plan reflecting a lesser percentage than 15 percent includes all measures that can feasibly be implemented in the area, in light of technological achievability.

To qualify for a lesser percentage under this clause, a State must demonstrate to the satisfaction of the Administrator that the plan for the area includes the measures that are achieved in practice by sources in the same source category in nonattainment areas of the next higher category.

(B) Baseline emissions

For purposes of subparagraph (A), the term "baseline emissions" means the total amount of actual VOC or NO<sub>x</sub> emissions from all anthropogenic sources in the area during the calendar year 1990, excluding emissions that would be eliminated under the regulations described in clauses (i) and (ii) of subparagraph (D).

(C) General rule for creditability of reductions

Except as provided under subparagraph (D), emissions reductions are creditable toward the 15 percent required under subparagraph (A) to the extent they have actually occurred, as of 6 years after November 15, 1990, from the implementation of measures required under the applicable implementation plan, rules promulgated by the Administrator, or a permit under subchapter V of this chapter.

(D) Limits on creditability of reductions

Emission reductions from the following measures are not creditable toward the 15 percent reductions required under subparagraph (A):

- (i) Any measure relating to motor vehicle exhaust or evaporative emissions promulgated by the Administrator by January 1, 1990.
- (ii) Regulations concerning Reid Vapor Pressure promulgated by the Administrator by November 15, 1990, or required to be promulgated under [section 7545\(h\)](#) of this title.
- (iii) Measures required under subsection (a)(2)(A) of this section (concerning corrections to implementation plans prescribed under guidance by the Administrator).
- (iv) Measures required under subsection (a)(2)(B) of this section to be submitted immediately after November 15, 1990 (concerning corrections to motor vehicle inspection and maintenance programs).

(2) Reasonably available control technology

The State shall submit a revision to the applicable implementation plan to include provisions to require the implementation of reasonably available control technology under [section 7502\(c\)\(1\)](#) of this title with respect to each of the following:

- (A) Each category of VOC sources in the area covered by a CTG document issued by the Administrator between November 15, 1990, and the date of attainment.
- (B) All VOC sources in the area covered by any CTG issued before November 15, 1990.
- (C) All other major stationary sources of VOCs that are located in the area.

Each revision described in subparagraph (A) shall be submitted within the period set forth by the Administrator in issuing the relevant CTG document. The revisions with respect to sources described in subparagraphs (B) and (C) shall be submitted by 2 years after November 15, 1990, and shall provide for the implementation of the required measures as expeditiously as practicable but no later than May 31, 1995.

(3) Gasoline vapor recovery

(A) General rule

Not later than 2 years after November 15, 1990, the State shall submit a revision to the applicable implementation plan to require all owners or operators of gasoline dispensing systems to install and operate, by

the date prescribed under subparagraph (B), a system for gasoline vapor recovery of emissions from the fueling of motor vehicles. The Administrator shall issue guidance as appropriate as to the effectiveness of such system. This subparagraph shall apply only to facilities which sell more than 10,000 gallons of gasoline per month (50,000 gallons per month in the case of an independent small business marketer of gasoline as defined in [section 7625-1 \[FN2\]](#) of this title).

(B) Effective date

The date required under subparagraph (A) shall be--

- (i) 6 months after the adoption date, in the case of gasoline dispensing facilities for which construction commenced after November 15, 1990;
- (ii) one year after the adoption date, in the case of gasoline dispensing facilities which dispense at least 100,000 gallons of gasoline per month, based on average monthly sales for the 2-year period before the adoption date; or
- (iii) 2 years after the adoption date, in the case of all other gasoline dispensing facilities.

Any gasoline dispensing facility described under both clause (i) and clause (ii) shall meet the requirements of clause (i).

(C) Reference to terms

For purposes of this paragraph, any reference to the term "adoption date" shall be considered a reference to the date of adoption by the State of requirements for the installation and operation of a system for gasoline vapor recovery of emissions from the fueling of motor vehicles.

(4) Motor vehicle inspection and maintenance

For all Moderate Areas, the State shall submit, immediately after November 15, 1990, a revision to the applicable implementation plan that includes provisions necessary to provide for a vehicle inspection and maintenance program as described in subsection (a)(2)(B) of this section (without regard to whether or not the area was required by [section 7502\(b\)\(11\)\(B\)](#) of this title (as in effect immediately before November 15, 1990) to have included a specific schedule for implementation of such a program).

(5) General offset requirement

For purposes of satisfying the emission offset requirements of this part, the ratio of total emission reductions of volatile organic compounds to total increase emissions of such air pollutant shall be at least 1.15 to 1.

(c) Serious Areas

Except as otherwise specified in paragraph (4), each State in which all or part of a Serious Area is located shall, with respect to the Serious Area (or portion thereof, to the extent specified in this subsection), make the submissions described under subsection (b) of this section (relating to Moderate Areas), and shall also submit the revisions to the applicable implementation plan (including the plan items) described under this subsection. For any Serious Area, the terms “major source” and “major stationary source” include (in addition to the sources described in [section 7602](#) of this title) any stationary source or group of sources located within a contiguous area and under common control that emits, or has the potential to emit, at least 50 tons per year of volatile organic compounds.

(1) Enhanced monitoring

In order to obtain more comprehensive and representative data on ozone air pollution, not later than 18 months after November 15, 1990, the Administrator shall promulgate rules, after notice and public comment, for enhanced monitoring of ozone, oxides of nitrogen, and volatile organic compounds. The rules shall, among other things, cover the location and maintenance of monitors. Immediately following the promulgation of rules by the Administrator relating to enhanced monitoring, the State shall commence such actions as may be necessary to adopt and implement a program based on such rules, to improve monitoring for ambient concentrations of ozone, oxides of nitrogen and volatile organic compounds and to improve monitoring of emissions of oxides of nitrogen and volatile organic compounds. Each State implementation plan for the area shall contain measures to improve the ambient monitoring of such air pollutants.

(2) Attainment and reasonable further progress demonstrations

Within 4 years after November 15, 1990, the State shall submit a revision to the applicable implementation plan that includes each of the following:

(A) Attainment demonstration

A demonstration that the plan, as revised, will provide for attainment of the ozone national ambient air quality standard by the applicable attainment date. This attainment demonstration must be based on photochemical grid modeling or any other analytical method determined by the Administrator, in the Administrator's discretion, to be at least as effective.

(B) Reasonable further progress demonstration

A demonstration that the plan, as revised, will result in VOC emissions reductions from the baseline emissions described in subsection (b)(1)(B) of this section equal to the following amount averaged over each consecutive 3-year period beginning 6 years after November 15, 1990, until the attainment date:

- (i) at least 3 percent of baseline emissions each year; or

(ii) an amount less than 3 percent of such baseline emissions each year, if the State demonstrates to the satisfaction of the Administrator that the plan reflecting such lesser amount includes all measures that can feasibly be implemented in the area, in light of technological achievability.

To lessen the 3 percent requirement under clause (ii), a State must demonstrate to the satisfaction of the Administrator that the plan for the area includes the measures that are achieved in practice by sources in the same source category in nonattainment areas of the next higher classification. Any determination to lessen the 3 percent requirement shall be reviewed at each milestone under subsection (g) of this section and revised to reflect such new measures (if any) achieved in practice by sources in the same category in any State, allowing a reasonable time to implement such measures. The emission reductions described in this subparagraph shall be calculated in accordance with subsection (b)(1)(C) and (D) of this section (concerning creditability of reductions). The reductions creditable for the period beginning 6 years after November 15, 1990, shall include reductions that occurred before such period, computed in accordance with subsection (b)(1) of this section, that exceed the 15-percent amount of reductions required under subsection (b)(1)(A) of this section.

(C) NO<sub>x</sub> control

The revision may contain, in lieu of the demonstration required under subparagraph (B), a demonstration to the satisfaction of the Administrator that the applicable implementation plan, as revised, provides for reductions of emissions of VOC's and oxides of nitrogen (calculated according to the creditability provisions of subsection (b)(1)(C) and (D) of this section), that would result in a reduction in ozone concentrations at least equivalent to that which would result from the amount of VOC emission reductions required under subparagraph (B). Within 1 year after November 15, 1990, the Administrator shall issue guidance concerning the conditions under which NO<sub>x</sub> control may be substituted for VOC control or may be combined with VOC control in order to maximize the reduction in ozone air pollution. In accord with such guidance, a lesser percentage of VOCs may be accepted as an adequate demonstration for purposes of this subsection.

(3) Enhanced vehicle inspection and maintenance program

(A) Requirement for submission

Within 2 years after November 15, 1990, the State shall submit a revision to the applicable implementation plan to provide for an enhanced program to reduce hydrocarbon emissions and NO<sub>x</sub> emissions from in-use motor vehicles registered in each urbanized area (in the nonattainment area), as defined by the Bureau of the Census, with a 1980 population of 200,000 or more.

(B) Effective date of State programs; guidance

The State program required under subparagraph (A) shall take effect no later than 2 years from November 15, 1990, and shall comply in all respects with guidance published in the Federal Register (and from time to time revised) by the Administrator for enhanced vehicle inspection and maintenance programs. Such guidance shall include--

(i) a performance standard achievable by a program combining emission testing, including on-road emission testing, with inspection to detect tampering with emission control devices and misfueling for all light-duty vehicles and all light-duty trucks subject to standards under [section 7521](#) of this title; and

(ii) program administration features necessary to reasonably assure that adequate management resources, tools, and practices are in place to attain and maintain the performance standard.

Compliance with the performance standard under clause (i) shall be determined using a method to be established by the Administrator.

(C) State program

The State program required under subparagraph (A) shall include, at a minimum, each of the following elements--

(i) Computerized emission analyzers, including on-road testing devices.

(ii) No waivers for vehicles and parts covered by the emission control performance warranty as provided for in [section 7541\(b\)](#) of this title unless a warranty remedy has been denied in writing, or for tampering-related repairs.

(iii) In view of the air quality purpose of the program, if, for any vehicle, waivers are permitted for emissions-related repairs not covered by warranty, an expenditure to qualify for the waiver of an amount of \$450 or more for such repairs (adjusted annually as determined by the Administrator on the basis of the Consumer Price Index in the same manner as provided in subchapter V of this chapter).

(iv) Enforcement through denial of vehicle registration (except for any program in operation before November 15, 1990, whose enforcement mechanism is demonstrated to the Administrator to be more effective than the applicable vehicle registration program in assuring that noncomplying vehicles are not operated on public roads).

(v) Annual emission testing and necessary adjustment, repair, and maintenance, unless the State demonstrates to the satisfaction of the Administrator that a biennial inspection, in combination with other features of the program which exceed the requirements of this chapter, will result in emission reductions which equal or exceed the reductions which can be obtained through such annual inspections.

(vi) Operation of the program on a centralized basis, unless the State demonstrates to the satisfaction of the Administrator that a decentralized program will be equally effective. An electronically connected testing system, a licensing system, or other measures (or any combination thereof) may be considered, in accordance with criteria established by the Administrator, as equally effective for such purposes.

(vii) Inspection of emission control diagnostic systems and the maintenance or repair of malfunctions or system deterioration identified by or affecting such diagnostics systems.

Each State shall biennially prepare a report to the Administrator which assesses the emission reductions achieved by the program required under this paragraph based on data collected during inspection and repair of vehicles. The methods used to assess the emission reductions shall be those established by the Administrator.

(4) Clean-fuel vehicle programs

(A) Except to the extent that substitute provisions have been approved by the Administrator under subparagraph (B), the State shall submit to the Administrator, within 42 months of November 15, 1990, a revision to the applicable implementation plan for each area described under part C of subchapter II of this chapter to include such measures as may be necessary to ensure the effectiveness of the applicable provisions of the clean-fuel vehicle program prescribed under part C of subchapter II of this chapter, including all measures necessary to make the use of clean alternative fuels in clean-fuel vehicles (as defined in part C of subchapter II of this chapter) economic from the standpoint of vehicle owners. Such a revision shall also be submitted for each area that opts into the clean fuel-vehicle program as provided in part C of subchapter II of this chapter.

(B) The Administrator shall approve, as a substitute for all or a portion of the clean-fuel vehicle program prescribed under part C of subchapter II of this chapter, any revision to the relevant applicable implementation plan that in the Administrator's judgment will achieve long-term reductions in ozone-producing and toxic air emissions equal to those achieved under part C of subchapter II of this chapter, or the percentage thereof attributable to the portion of the clean-fuel vehicle program for which the revision is to substitute. The Administrator may approve such revision only if it consists exclusively of provisions other than those required under this chapter for the area. Any State seeking approval of such revision must submit the revision to the Administrator within 24 months of November 15, 1990. The Administrator shall approve or disapprove any such revision within 30 months of November 15, 1990. The Administrator shall publish the revision submitted by a State in the Federal Register upon receipt. Such notice shall constitute a notice of proposed rulemaking on whether or not to approve such revision and shall be deemed to comply with the requirements concerning notices of proposed rulemaking contained in [sections 553 through 557 of Title 5](#) (related to notice and comment). Where the Administrator approves such revision for any area, the State need not submit the revision required by subparagraph (A) for the area with respect to the portions of the Federal clean-fuel vehicle program for which the Administrator has approved the revision as a substitute.

(C) If the Administrator determines, under [section 7509](#) of this title, that the State has failed to submit any portion of the program required under subparagraph (A), then, in addition to any sanctions available under [section 7509](#) of this title, the State may not receive credit, in any demonstration of attainment or reasonable further progress for the area, for any emission reductions from implementation of the corresponding aspects of the Federal clean-fuel vehicle requirements established in part C of subchapter II of this chapter.

(5) Transportation control

(A) [FN3] Beginning 6 years after November 15, 1990, and each third year thereafter, the State shall submit a demonstration as to whether current aggregate vehicle mileage, aggregate vehicle emissions, congestion levels, and other relevant parameters are consistent with those used for the area's demonstration of attainment. Where such parameters and emissions levels exceed the levels projected for purposes of the area's attainment demonstration, the State shall within 18 months develop and submit a revision of the applicable implementation plan that includes a transportation control measures program consisting of measures from, but not limited to, [section 7408\(f\)](#) of this title that will reduce emissions to levels that are consistent with emission levels projected in such demonstration. In considering such measures, the State should ensure adequate access to downtown, other commercial, and residential areas and should avoid measures that increase or relocate emissions and congestion rather than reduce them. Such revision shall be developed in accordance with guidance issued by the Administrator pursuant to [section 7408\(e\)](#) of this title and with the requirements of [section 7504\(b\)](#) of this title and shall include implementation and funding schedules that achieve expeditious emissions reductions in accordance with implementation plan projections.

(6) De minimis rule

The new source review provisions under this part shall ensure that increased emissions of volatile organic compounds resulting from any physical change in, or change in the method of operation of, a stationary source located in the area shall not be considered de minimis for purposes of determining the applicability of the permit requirements established by this chapter unless the increase in net emissions of such air pollutant from such source does not exceed 25 tons when aggregated with all other net increases in emissions from the source over any period of 5 consecutive calendar years which includes the calendar year in which such increase occurred.

(7) Special rule for modifications of sources emitting less than 100 tons

In the case of any major stationary source of volatile organic compounds located in the area (other than a source which emits or has the potential to emit 100 tons or more of volatile organic compounds per year), whenever any change (as described in [section 7411\(a\)\(4\)](#) of this title) at that source results in any increase (other than a de minimis increase) in emissions of volatile organic compounds from any discrete operation, unit, or other pollutant emitting activity at the source, such increase shall be considered a modification for purposes of [section 7502\(c\)\(5\)](#) of this title and [section 7503\(a\)](#) of this title, except that such increase shall not be considered a modification for such purposes if the owner or operator of the source elects to offset the increase by a greater reduction in emissions of volatile organic compounds concerned from other operations, units, or activities within the source at an internal offset ratio of at least 1.3 to 1. If the owner or operator does not make such election, such change shall be considered a modification for such purposes, but in applying [section 7503\(a\)\(2\)](#) of this title in the case of any such modification, the best available control technology (BACT), as defined in [section 7479](#) of this title, shall be substituted for the lowest achievable emission rate (LAER). The Administrator shall establish and publish policies and procedures for implementing the provisions of this paragraph.

(8) Special rule for modifications of sources emitting 100 tons or more

In the case of any major stationary source of volatile organic compounds located in the area which emits or

has the potential to emit 100 tons or more of volatile organic compounds per year, whenever any change (as described in [section 7411\(a\)\(4\)](#) of this title) at that source results in any increase (other than a de minimis increase) in emissions of volatile organic compounds from any discrete operation, unit, or other pollutant emitting activity at the source, such increase shall be considered a modification for purposes of [section 7502\(c\)\(5\)](#) of this title and [section 7503\(a\)](#) of this title, except that if the owner or operator of the source elects to offset the increase by a greater reduction in emissions of volatile organic compounds from other operations, units, or activities within the source at an internal offset ratio of at least 1.3 to 1, the requirements of [section 7503\(a\)\(2\)](#) of this title (concerning the lowest achievable emission rate (LAER)) shall not apply.

(9) Contingency provisions

In addition to the contingency provisions required under [section 7502\(c\)\(9\)](#) of this title, the plan revision shall provide for the implementation of specific measures to be undertaken if the area fails to meet any applicable milestone. Such measures shall be included in the plan revision as contingency measures to take effect without further action by the State or the Administrator upon a failure by the State to meet the applicable milestone.

(10) General offset requirement

For purposes of satisfying the emission offset requirements of this part, the ratio of total emission reductions of volatile organic compounds to total increase emissions of such air pollutant shall be at least 1.2 to 1.

Any reference to “attainment date” in subsection (b) of this section, which is incorporated by reference into this subsection, shall refer to the attainment date for serious areas.

(d) Severe Areas

Each State in which all or part of a Severe Area is located shall, with respect to the Severe Area, make the submissions described under subsection (c) of this section (relating to Serious Areas), and shall also submit the revisions to the applicable implementation plan (including the plan items) described under this subsection. For any Severe Area, the terms “major source” and “major stationary source” include (in addition to the sources described in [section 7602](#) of this title) any stationary source or group of sources located within a contiguous area and under common control that emits, or has the potential to emit, at least 25 tons per year of volatile organic compounds.

(1) Vehicle miles traveled

(A) Within 2 years after November 15, 1990, the State shall submit a revision that identifies and adopts specific enforceable transportation control strategies and transportation control measures to offset any growth in emissions from growth in vehicle miles traveled or numbers of vehicle trips in such area and to attain reduction in motor vehicle emissions as necessary, in combination with other emission reduction requirements of this subpart, to comply with the requirements of subsection [\[FN4\]](#) (b)(2)(B) and (c)(2)(B) of this section (pertaining to periodic emissions reduction requirements). The State shall consider measures specified in [section 7408\(f\)](#) of this title, and choose from among and implement such measures as necessary to demonstrate

attainment with the national ambient air quality standards; in considering such measures, the State should ensure adequate access to downtown, other commercial, and residential areas and should avoid measures that increase or relocate emissions and congestion rather than reduce them.

(B) The State may also, in its discretion, submit a revision at any time requiring employers in such area to implement programs to reduce work-related vehicle trips and miles travelled by employees. Such revision shall be developed in accordance with guidance issued by the Administrator pursuant to [section 7408\(f\)](#) of this title and may require that employers in such area increase average passenger occupancy per vehicle in commuting trips between home and the workplace during peak travel periods. The guidance of the Administrator may specify average vehicle occupancy rates which vary for locations within a nonattainment area (suburban, center city, business district) or among nonattainment areas reflecting existing occupancy rates and the availability of high occupancy modes. Any State required to submit a revision under this subparagraph (as in effect before December 23, 1995) containing provisions requiring employers to reduce work-related vehicle trips and miles travelled by employees may, in accordance with State law, remove such provisions from the implementation plan, or withdraw its submission, if the State notifies the Administrator, in writing, that the State has undertaken, or will undertake, one or more alternative methods that will achieve emission reductions equivalent to those to be achieved by the removed or withdrawn provisions.

(2) Offset requirement

For purposes of satisfying the offset requirements pursuant to this part, the ratio of total emission reductions of VOCs to total increased emissions of such air pollutant shall be at least 1.3 to 1, except that if the State plan requires all existing major sources in the nonattainment area to use best available control technology (as defined in [section 7479\(3\)](#) of this title) for the control of volatile organic compounds, the ratio shall be at least 1.2 to 1.

(3) Enforcement under section 7511d

By December 31, 2000, the State shall submit a plan revision which includes the provisions required under [section 7511d](#) of this title.

Any reference to the term “attainment date” in subsection (b) or (c) of this section, which is incorporated by reference into this subsection (d), shall refer to the attainment date for Severe Areas.

(e) Extreme Areas

Each State in which all or part of an Extreme Area is located shall, with respect to the Extreme Area, make the submissions described under subsection (d) of this section (relating to Severe Areas), and shall also submit the revisions to the applicable implementation plan (including the plan items) described under this subsection. The provisions of clause (ii) of subsection (c)(2)(B) of this section (relating to reductions of less than 3 percent), the provisions of paragraphs [FN5] (6), (7) and (8) of subsection (c) of this section (relating to de minimus rule and modification of sources), and the provisions of clause (ii) of subsection (b)(1)(A) of this section (relating to reductions of less than 15 percent) shall not apply in the case of an Extreme Area. For any Extreme Area, the

terms “major source” and “major stationary source” includes (in addition to the sources described in [section 7602](#) of this title) any stationary source or group of sources located within a contiguous area and under common control that emits, or has the potential to emit, at least 10 tons per year of volatile organic compounds.

(1) Offset requirement

For purposes of satisfying the offset requirements pursuant to this part, the ratio of total emission reductions of VOCs to total increased emissions of such air pollutant shall be at least 1.5 to 1, except that if the State plan requires all existing major sources in the nonattainment area to use best available control technology (as defined in [section 7479\(3\)](#) of this title) for the control of volatile organic compounds, the ratio shall be at least 1.2 to 1.

(2) Modifications

Any change (as described in [section 7411\(a\)\(4\)](#) of this title) at a major stationary source which results in any increase in emissions from any discrete operation, unit, or other pollutant emitting activity at the source shall be considered a modification for purposes of [section 7502\(c\)\(5\)](#) of this title and [section 7503\(a\)](#) of this title, except that for purposes of complying with the offset requirement pursuant to [section 7503\(a\)\(1\)](#) of this title, any such increase shall not be considered a modification if the owner or operator of the source elects to offset the increase by a greater reduction in emissions of the air pollutant concerned from other discrete operations, units, or activities within the source at an internal offset ratio of at least 1.3 to 1. The offset requirements of this part shall not be applicable in Extreme Areas to a modification of an existing source if such modification consists of installation of equipment required to comply with the applicable implementation plan, permit, or this chapter.

(3) Use of clean fuels or advanced control technology

For Extreme Areas, a plan revision shall be submitted within 3 years after November 15, 1990, to require, effective 8 years after November 15, 1990, that each new, modified, and existing electric utility and industrial and commercial boiler which emits more than 25 tons per year of oxides of nitrogen--

(A) burn as its primary fuel natural gas, methanol, or ethanol (or a comparably low polluting fuel), or

(B) use advanced control technology (such as catalytic control technology or other comparably effective control methods) for reduction of emissions of oxides of nitrogen.

For purposes of this subsection, the term “primary fuel” means the fuel which is used 90 percent or more of the operating time. This paragraph shall not apply during any natural gas supply emergency (as defined in title III of the Natural Gas Policy Act of 1978 [[15 U.S.C.A. § 3361 et seq.](#)] ).

(4) Traffic control measures during heavy traffic hours

For Extreme Areas, each implementation plan revision under this subsection may contain provisions establishing traffic control measures applicable during heavy traffic hours to reduce the use of high polluting vehicles or heavy-duty vehicles, notwithstanding any other provision of law.

(5) New technologies

The Administrator may, in accordance with [section 7410](#) of this title, approve provisions of an implementation plan for an Extreme Area which anticipate development of new control techniques or improvement of existing control technologies, and an attainment demonstration based on such provisions, if the State demonstrates to the satisfaction of the Administrator that--

(A) such provisions are not necessary to achieve the incremental emission reductions required during the first 10 years after November 15, 1990; and

(B) the State has submitted enforceable commitments to develop and adopt contingency measures to be implemented as set forth herein if the anticipated technologies do not achieve planned reductions.

Such contingency measures shall be submitted to the Administrator no later than 3 years before proposed implementation of the plan provisions and approved or disapproved by the Administrator in accordance with [section 7410](#) of this title. The contingency measures shall be adequate to produce emission reductions sufficient, in conjunction with other approved plan provisions, to achieve the periodic emission reductions required by subsection (b)(1) or (c)(2) of this section and attainment by the applicable dates. If the Administrator determines that an Extreme Area has failed to achieve an emission reduction requirement set forth in subsection (b)(1) or (c)(2) of this section, and that such failure is due in whole or part to an inability to fully implement provisions approved pursuant to this subsection, the Administrator shall require the State to implement the contingency measures to the extent necessary to assure compliance with subsections (b)(1) and (c)(2) of this section.

Any reference to the term "attainment date" in subsection (b), (c), or (d) of this section which is incorporated by reference into this subsection, shall refer to the attainment date for Extreme Areas.

(f) NO<sub>x</sub> requirements

(1) The plan provisions required under this subpart for major stationary sources of volatile organic compounds shall also apply to major stationary sources (as defined in [section 7602](#) of this title and subsections (c), (d), and (e) of this section) of oxides of nitrogen. This subsection shall not apply in the case of oxides of nitrogen for those sources for which the Administrator determines (when the Administrator approves a plan or plan revision) that net air quality benefits are greater in the absence of reductions of oxides of nitrogen from the sources concerned. This subsection shall also not apply in the case of oxides of nitrogen for--

(A) nonattainment areas not within an ozone transport region under [section 7511c](#) of this title, if the Administrator determines (when the Administrator approves a plan or plan revision) that additional reductions of ox-

ides of nitrogen would not contribute to attainment of the national ambient air quality standard for ozone in the area, or

**(B)** nonattainment areas within such an ozone transport region if the Administrator determines (when the Administrator approves a plan or plan revision) that additional reductions of oxides of nitrogen would not produce net ozone air quality benefits in such region.

The Administrator shall, in the Administrator's determinations, consider the study required under [section 7511f](#) of this title.

**(2)(A)** If the Administrator determines that excess reductions in emissions of NO<sub>x</sub> would be achieved under paragraph (1), the Administrator may limit the application of paragraph (1) to the extent necessary to avoid achieving such excess reductions.

**(B)** For purposes of this paragraph, excess reductions in emissions of NO<sub>x</sub> are emission reductions for which the Administrator determines that net air quality benefits are greater in the absence of such reductions. Alternatively, for purposes of this paragraph, excess reductions in emissions of NO<sub>x</sub> are, for--

**(i)** nonattainment areas not within an ozone transport region under [section 7511c](#) of this title, emission reductions that the Administrator determines would not contribute to attainment of the national ambient air quality standard for ozone in the area, or

**(ii)** nonattainment areas within such ozone transport region, emission reductions that the Administrator determines would not produce net ozone air quality benefits in such region.

**(3)** At any time after the final report under [section 7511f](#) of this title is submitted to Congress, a person may petition the Administrator for a determination under paragraph (1) or (2) with respect to any nonattainment area or any ozone transport region under [section 7511c](#) of this title. The Administrator shall grant or deny such petition within 6 months after its filing with the Administrator.

**(g) Milestones**

**(1) Reductions in emissions**

6 years after November 15, 1990, and at intervals of every 3 years thereafter, the State shall determine whether each nonattainment area (other than an area classified as Marginal or Moderate) has achieved a reduction in emissions during the preceding intervals equivalent to the total emission reductions required to be achieved by the end of such interval pursuant to subsection (b)(1) of this section and the corresponding requirements of subsections (c)(2)(B) and (C), (d), and (e) of this section. Such reduction shall be referred to in this section as an applicable milestone.

(2) Compliance demonstration

For each nonattainment area referred to in paragraph (1), not later than 90 days after the date on which an applicable milestone occurs (not including an attainment date on which a milestone occurs in cases where the standard has been attained), each State in which all or part of such area is located shall submit to the Administrator a demonstration that the milestone has been met. A demonstration under this paragraph shall be submitted in such form and manner, and shall contain such information and analysis, as the Administrator shall require, by rule. The Administrator shall determine whether or not a State's demonstration is adequate within 90 days after the Administrator's receipt of a demonstration which contains the information and analysis required by the Administrator.

(3) Serious and Severe Areas; State election

If a State fails to submit a demonstration under paragraph (2) for any Serious or Severe Area within the required period or if the Administrator determines that the area has not met any applicable milestone, the State shall elect, within 90 days after such failure or determination--

(A) to have the area reclassified to the next higher classification,

(B) to implement specific additional measures adequate, as determined by the Administrator, to meet the next milestone as provided in the applicable contingency plan, or

(C) to adopt an economic incentive program as described in paragraph (4).

If the State makes an election under subparagraph (B), the Administrator shall, within 90 days after the election, review such plan and shall, if the Administrator finds the contingency plan inadequate, require further measures necessary to meet such milestone. Once the State makes an election, it shall be deemed accepted by the Administrator as meeting the election requirement. If the State fails to make an election required under this paragraph within the required 90-day period or within 6 months thereafter, the area shall be reclassified to the next higher classification by operation of law at the expiration of such 6-month period. Within 12 months after the date required for the State to make an election, the State shall submit a revision of the applicable implementation plan for the area that meets the requirements of this paragraph. The Administrator shall review such plan revision and approve or disapprove the revision within 9 months after the date of its submission.

(4) Economic incentive program

(A) An economic incentive program under this paragraph shall be consistent with rules published by the Administrator and sufficient, in combination with other elements of the State plan, to achieve the next milestone. The State program may include a nondiscriminatory system, consistent with applicable law regarding interstate commerce, of State established emissions fees or a system of marketable permits, or a system of State fees on sale or manufacture of products the use of which contributes to ozone formation, or any combination of the foregoing or other similar measures. The program may also include incentives and requirements to re-

duce vehicle emissions and vehicle miles traveled in the area, including any of the transportation control measures identified in [section 7408\(f\)](#) of this title.

**(B)** Within 2 years after November 15, 1990, the Administrator shall publish rules for the programs to be adopted pursuant to subparagraph (A). Such rules shall include model plan provisions which may be adopted for reducing emissions from permitted stationary sources, area sources, and mobile sources. The guidelines shall require that any revenues generated by the plan provisions adopted pursuant to subparagraph (A) shall be used by the State for any of the following:

**(i)** Providing incentives for achieving emission reductions.

**(ii)** Providing assistance for the development of innovative technologies for the control of ozone air pollution and for the development of lower-polluting solvents and surface coatings. Such assistance shall not provide for the payment of more than 75 percent of either the costs of any project to develop such a technology or the costs of development of a lower-polluting solvent or surface coating.

**(iii)** Funding the administrative costs of State programs under this chapter. Not more than 50 percent of such revenues may be used for purposes of this clause.

**(5) Extreme Areas**

If a State fails to submit a demonstration under paragraph (2) for any Extreme Area within the required period, or if the Administrator determines that the area has not met any applicable milestone, the State shall, within 9 months after such failure or determination, submit a plan revision to implement an economic incentive program which meets the requirements of paragraph (4). The Administrator shall review such plan revision and approve or disapprove the revision within 9 months after the date of its submission.

**(h) Rural transport areas**

**(1)** Notwithstanding any other provision of [section 7511](#) of this title or this section, a State containing an ozone nonattainment area that does not include, and is not adjacent to, any part of a Metropolitan Statistical Area or, where one exists, a Consolidated Metropolitan Statistical Area (as defined by the United States Bureau of the Census), which area is treated by the Administrator, in the Administrator's discretion, as a rural transport area within the meaning of paragraph (2), shall be treated by operation of law as satisfying the requirements of this section if it makes the submissions required under subsection (a) of this section (relating to marginal areas).

**(2)** The Administrator may treat an ozone nonattainment area as a rural transport area if the Administrator finds that sources of VOC (and, where the Administrator determines relevant, NO<sub>x</sub>) emissions within the area do not make a significant contribution to the ozone concentrations measured in the area or in other areas.

**(i) Reclassified areas**

Each State containing an ozone nonattainment area reclassified under [section 7511\(b\)\(2\)](#) of this title shall meet such requirements of subsections (b) through (d) of this section as may be applicable to the area as reclassified, according to the schedules prescribed in connection with such requirements, except that the Administrator may adjust any applicable deadlines (other than attainment dates) to the extent such adjustment is necessary or appropriate to assure consistency among the required submissions.

(j) Multi-State ozone nonattainment areas

(1) Coordination among States

Each State in which there is located a portion of a single ozone nonattainment area which covers more than one State (hereinafter in this section referred to as a “multi-State ozone nonattainment area”) shall--

(A) take all reasonable steps to coordinate, substantively and procedurally, the revisions and implementation of State implementation plans applicable to the nonattainment area concerned; and

(B) use photochemical grid modeling or any other analytical method determined by the Administrator, in his discretion, to be at least as effective.

The Administrator may not approve any revision of a State implementation plan submitted under this part for a State in which part of a multi-State ozone nonattainment area is located if the plan revision for that State fails to comply with the requirements of this subsection.

(2) Failure to demonstrate attainment

If any State in which there is located a portion of a multi-State ozone nonattainment area fails to provide a demonstration of attainment of the national ambient air quality standard for ozone in that portion within the required period, the State may petition the Administrator to make a finding that the State would have been able to make such demonstration but for the failure of one or more other States in which other portions of the area are located to commit to the implementation of all measures required under this section (relating to plan submissions and requirements for ozone nonattainment areas). If the Administrator makes such finding, the provisions of [section 7509](#) of this title (relating to sanctions) shall not apply, by reason of the failure to make such demonstration, in the portion of the multi-State ozone nonattainment area within the State submitting such petition.

## C

**Effective:[See Text Amendments]**United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas▣ [Subpart 4](#). Additional Provisions for Particulate Matter Nonattainment Areas→→ **§ 7513. Classifications and attainment dates**

## (a) Initial classifications

Every area designated nonattainment for PM-10 pursuant to [section 7407\(d\)](#) of this title shall be classified at the time of such designation, by operation of law, as a moderate PM-10 nonattainment area (also referred to in this subpart as a “Moderate Area”) at the time of such designation. At the time of publication of the notice under [section 7407\(d\)\(4\)](#) of this title (relating to area designations) for each PM-10 nonattainment area, the Administrator shall publish a notice announcing the classification of such area. The provisions of [section 7502\(a\)\(1\)\(B\)](#) of this title (relating to lack of notice-and-comment and judicial review) shall apply with respect to such classification.

## (b) Reclassification as Serious

## (1) Reclassification before attainment date

The Administrator may reclassify as a Serious PM-10 nonattainment area (identified in this subpart also as a “Serious Area”) any area that the Administrator determines cannot practicably attain the national ambient air quality standard for PM-10 by the attainment date (as prescribed in subsection (c) of this section) for Moderate Areas. The Administrator shall reclassify appropriate areas as Serious by the following dates:

**(A)** For areas designated nonattainment for PM-10 under [section 7407\(d\)\(4\)](#) of this title, the Administrator shall propose to reclassify appropriate areas by June 30, 1991, and take final action by December 31, 1991.

**(B)** For areas subsequently designated nonattainment, the Administrator shall reclassify appropriate areas within 18 months after the required date for the State's submission of a SIP for the Moderate Area.

## (2) Reclassification upon failure to attain

Within 6 months following the applicable attainment date for a PM-10 nonattainment area, the Administrator shall determine whether the area attained the standard by that date. If the Administrator finds that any Moderate Area is not in attainment after the applicable attainment date--

(A) the area shall be reclassified by operation of law as a Serious Area; and

(B) the Administrator shall publish a notice in the Federal Register no later than 6 months following the attainment date, identifying the area as having failed to attain and identifying the reclassification described under subparagraph (A).

(c) Attainment dates

Except as provided under subsection (d) of this section, the attainment dates for PM-10 nonattainment areas shall be as follows:

(1) Moderate Areas

For a Moderate Area, the attainment date shall be as expeditiously as practicable but no later than the end of the sixth calendar year after the area's designation as nonattainment, except that, for areas designated nonattainment for PM-10 under [section 7407\(d\)\(4\)](#) of this title, the attainment date shall not extend beyond December 31, 1994.

(2) Serious Areas

For a Serious Area, the attainment date shall be as expeditiously as practicable but no later than the end of the tenth calendar year beginning after the area's designation as nonattainment, except that, for areas designated nonattainment for PM-10 under [section 7407\(d\)\(4\)](#) of this title, the date shall not extend beyond December 31, 2001.

(d) Extension of attainment date for Moderate Areas

Upon application by any State, the Administrator may extend for 1 additional year (hereinafter referred to as the "Extension Year") the date specified in paragraph [\[FN1\]](#) (c)(1) if--

(1) the State has complied with all requirements and commitments pertaining to the area in the applicable implementation plan; and

(2) no more than one exceedance of the 24-hour national ambient air quality standard level for PM-10 has occurred in the area in the year preceding the Extension Year, and the annual mean concentration of PM-10 in the area for such year is less than or equal to the standard level.

No more than 2 one-year extensions may be issued under the subsection for a single nonattainment area.

(e) Extension of attainment date for Serious Areas

Upon application by any State, the Administrator may extend the attainment date for a Serious Area beyond the

date specified under subsection (c) of this section, if attainment by the date established under subsection (c) of this section would be impracticable, the State has complied with all requirements and commitments pertaining to that area in the implementation plan, and the State demonstrates to the satisfaction of the Administrator that the plan for that area includes the most stringent measures that are included in the implementation plan of any State or are achieved in practice in any State, and can feasibly be implemented in the area. At the time of such application, the State must submit a revision to the implementation plan that includes a demonstration of attainment by the most expeditious alternative date practicable. In determining whether to grant an extension, and the appropriate length of time for any such extension, the Administrator may consider the nature and extent of nonattainment, the types and numbers of sources or other emitting activities in the area (including the influence of uncontrollable natural sources and transboundary emissions from foreign countries), the population exposed to concentrations in excess of the standard, the presence and concentration of potentially toxic substances in the mix of particulate emissions in the area, and the technological and economic feasibility of various control measures. The Administrator may not approve an extension until the State submits an attainment demonstration for the area. The Administrator may grant at most one such extension for an area, of no more than 5 years.

(f) Waivers for certain areas

The Administrator may, on a case-by-case basis, waive any requirement applicable to any Serious Area under this subpart where the Administrator determines that anthropogenic sources of PM-10 do not contribute significantly to the violation of the PM-10 standard in the area. The Administrator may also waive a specific date for attainment of the standard where the Administrator determines that nonanthropogenic sources of PM-10 contribute significantly to the violation of the PM-10 standard in the area.

Title 42. The Public Health and Welfare

Chapter 85. Air Pollution Prevention and Control ([Refs & Annos](#))

Subchapter I. Programs and Activities

▣ [Part D](#). Plan Requirements for Nonattainment Areas▣ [Subpart 4](#). Additional Provisions for Particulate Matter Nonattainment Areas→ → **§ 7513a. Plan provisions and schedules for plan submissions**

(a) Moderate Areas

(1) Plan provisions

Each State in which all or part of a Moderate Area is located shall submit, according to the applicable schedule under paragraph (2), an implementation plan that includes each of the following:

(A) For the purpose of meeting the requirements of [section 7502\(c\)\(5\)](#) of this title, a permit program providing that permits meeting the requirements of [section 7503](#) of this title are required for the construction and operation of new and modified major stationary sources of PM-10.

(B) Either (i) a demonstration (including air quality modeling) that the plan will provide for attainment by the applicable attainment date; or (ii) a demonstration that attainment by such date is impracticable.

(C) Provisions to assure that reasonably available control measures for the control of PM-10 shall be implemented no later than December 10, 1993, or 4 years after designation in the case of an area classified as moderate after November 15, 1990.

(2) Schedule for plan submissions

A State shall submit the plan required under subparagraph (1) no later than the following:

(A) Within 1 year of November 15, 1990, for areas designated nonattainment under [section 7407\(d\)\(4\)](#) of this title, except that the provision required under subparagraph (1)(A) shall be submitted no later than June 30, 1992.

(B) 18 months after the designation as nonattainment, for those areas designated nonattainment after the designations prescribed under [section 7407\(d\)\(4\)](#) of this title.

(b) Serious Areas

(1) Plan provisions

In addition to the provisions submitted to meet the requirements of paragraph [FN1] (a)(1) (relating to Moderate Areas), each State in which all or part of a Serious Area is located shall submit an implementation plan for such area that includes each of the following:

(A) A demonstration (including air quality modeling)--

(i) that the plan provides for attainment of the PM-10 national ambient air quality standard by the applicable attainment date, or

(ii) for any area for which the State is seeking, pursuant to [section 7513\(e\)](#) of this title, an extension of the attainment date beyond the date set forth in [section 7513\(c\)](#) of this title, that attainment by that date would be impracticable, and that the plan provides for attainment by the most expeditious alternative date practicable.

(B) Provisions to assure that the best available control measures for the control of PM-10 shall be implemented no later than 4 years after the date the area is classified (or reclassified) as a Serious Area.

(2) Schedule for plan submissions

A State shall submit the demonstration required for an area under paragraph (1)(A) no later than 4 years after reclassification of the area to Serious, except that for areas reclassified under [section 7513\(b\)\(2\)](#) of this title, the State shall submit the attainment demonstration within 18 months after reclassification to Serious. A State shall submit the provisions described under paragraph (1)(B) no later than 18 months after reclassification of the area as a Serious Area.

(3) Major sources

For any Serious Area, the terms “major source” and “major stationary source” include any stationary source or group of stationary sources located within a contiguous area and under common control that emits, or has the potential to emit, at least 70 tons per year of PM-10.

(c) Milestones

(1) Plan revisions demonstrating attainment submitted to the Administrator for approval under this subpart shall contain quantitative milestones which are to be achieved every 3 years until the area is redesignated attainment and which demonstrate reasonable further progress, as defined in [section 7501\(1\)](#) of this title, toward attainment by the applicable date.

(2) Not later than 90 days after the date on which a milestone applicable to the area occurs, each State in which all or part of such area is located shall submit to the Administrator a demonstration that all measures in the plan approved under this section have been implemented and that the milestone has been met. A demonstration under this subsection shall be submitted in such form and manner, and shall contain such information and analysis, as the Administrator shall require. The Administrator shall determine whether or not a State's demonstration under this subsection is adequate within 90 days after the Administrator's receipt of a demonstration which contains the information and analysis required by the Administrator.

(3) If a State fails to submit a demonstration under paragraph (2) with respect to a milestone within the required period or if the Administrator determines that the area has not met any applicable milestone, the Administrator shall require the State, within 9 months after such failure or determination to submit a plan revision that assures that the State will achieve the next milestone (or attain the national ambient air quality standard for PM-10, if there is no next milestone) by the applicable date.

(d) Failure to attain

In the case of a Serious PM-10 nonattainment area in which the PM-10 standard is not attained by the applicable attainment date, the State in which such area is located shall, after notice and opportunity for public comment, submit within 12 months after the applicable attainment date, plan revisions which provide for attainment of the PM-10 air quality standard and, from the date of such submission until attainment, for an annual reduction in PM-10 or PM-10 precursor emissions within the area of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared for such area.

(e) PM-10 precursors

The control requirements applicable under plans in effect under this part for major stationary sources of PM-10 shall also apply to major stationary sources of PM-10 precursors, except where the Administrator determines that such sources do not contribute significantly to PM-10 levels which exceed the standard in the area. The Administrator shall issue guidelines regarding the application of the preceding sentence.

United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

▣ [Chapter 85. Air Pollution Prevention and Control \(Refs & Annos\)](#)

▣ [Subchapter III. General Provisions](#)

→→ **§ 7602. Definitions**

When used in this chapter--

(a) The term “Administrator” means the Administrator of the Environmental Protection Agency.

(b) The term “air pollution control agency” means any of the following:

(1) A single State agency designated by the Governor of that State as the official State air pollution control agency for purposes of this chapter.

(2) An agency established by two or more States and having substantial powers or duties pertaining to the prevention and control of air pollution.

(3) A city, county, or other local government health authority, or, in the case of any city, county, or other local government in which there is an agency other than the health authority charged with responsibility for enforcing ordinances or laws relating to the prevention and control of air pollution, such other agency.

(4) An agency of two or more municipalities located in the same State or in different States and having substantial powers or duties pertaining to the prevention and control of air pollution.

(5) An agency of an Indian tribe.

(c) The term “interstate air pollution control agency” means--

(1) an air pollution control agency established by two or more States, or

(2) an air pollution control agency of two or more municipalities located in different States.

**(d)** The term “State” means a State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands.

**(e)** The term “person” includes an individual, corporation, partnership, association, State, municipality, political subdivision of a State, and any agency, department, or instrumentality of the United States and any officer, agent, or employee thereof.

**(f)** The term “municipality” means a city, town, borough, county, parish, district, or other public body created by or pursuant to State law.

**(g)** The term “air pollutant” means any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air. Such term includes any precursors to the formation of any air pollutant, to the extent the Administrator has identified such precursor or precursors for the particular purpose for which the term “air pollutant” is used.

**(h)** All language referring to effects on welfare includes, but is not limited to, effects on soils, water, crops, vegetation, manmade materials, animals, wildlife, weather, visibility, and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being, whether caused by transformation, conversion, or combination with other air pollutants.

**(i)** The term “Federal land manager” means, with respect to any lands in the United States, the Secretary of the department with authority over such lands.

**(j)** Except as otherwise expressly provided, the terms “major stationary source” and “major emitting facility” mean any stationary facility or source of air pollutants which directly emits, or has the potential to emit, one hundred tons per year or more of any air pollutant (including any major emitting facility or source of fugitive emissions of any such pollutant, as determined by rule by the Administrator).

**(k)** The terms “emission limitation” and “emission standard” mean a requirement established by the State or the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice or operational standard promulgated under this chapter.. [\[FN1\]](#)

**(l)** The term “standard of performance” means a requirement of continuous emission reduction, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction.

**(m)** The term “means of emission limitation” means a system of continuous emission reduction (including the use of specific technology or fuels with specified pollution characteristics).

(n) The term “primary standard attainment date” means the date specified in the applicable implementation plan for the attainment of a national primary ambient air quality standard for any air pollutant.

(o) The term “delayed compliance order” means an order issued by the State or by the Administrator to an existing stationary source, postponing the date required under an applicable implementation plan for compliance by such source with any requirement of such plan.

(p) The term “schedule and timetable of compliance” means a schedule of required measures including an enforceable sequence of actions or operations leading to compliance with an emission limitation, other limitation, prohibition, or standard.

(q) For purposes of this chapter, the term “applicable implementation plan” means the portion (or portions) of the implementation plan, or most recent revision thereof, which has been approved under [section 7410](#) of this title, or promulgated under [section 7410\(c\)](#) of this title, or promulgated or approved pursuant to regulations promulgated under [section 7601\(d\)](#) of this title and which implements the relevant requirements of this chapter.

(r) **Indian tribe.**--The term “Indian tribe” means any Indian tribe, band, nation, or other organized group or community, including any Alaska Native village, which is Federally recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians.

(s) **VOC.**--The term “VOC” means volatile organic compound, as defined by the Administrator.

(t) **PM-10.**--The term “PM-10” means particulate matter with an aerodynamic diameter less than or equal to a nominal ten micrometers, as measured by such method as the Administrator may determine.

(u) **NAAQS and CTG.**--The term “NAAQS” means national ambient air quality standard. The term “CTG” means a Control Technique Guideline published by the Administrator under [section 7408](#) of this title.

(v) **NO<sub>x</sub>.**--The term “NO<sub>x</sub>” means oxides of nitrogen.

(w) **CO.**--The term “CO” means carbon monoxide.

(x) **Small source.**--The term “small source” means a source that emits less than 100 tons of regulated pollutants per year, or any class of persons that the Administrator determines, through regulation, generally lack technical ability or knowledge regarding control of air pollution.

(y) **Federal implementation plan.**--The term “Federal implementation plan” means a plan (or portion thereof) promulgated by the Administrator to fill all or a portion of a gap or otherwise correct all or a portion of an

inadequacy in a State implementation plan, and which includes enforceable emission limitations or other control measures, means or techniques (including economic incentives, such as marketable permits or auctions of emissions allowances), and provides for attainment of the relevant national ambient air quality standard.

**(z) Stationary source.**--The term "stationary source" means generally any source of an air pollutant except those emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in [section 7550](#) of this title.

**Effective:[See Text Amendments]**United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

- ▣ [Chapter 85](#). Air Pollution Prevention and Control ([Refs & Annos](#))

- ▣ [Subchapter III](#). General Provisions

- **§ 7604. Citizen suits**

(a) Authority to bring civil action; jurisdiction

Except as provided in subsection (b) of this section, any person may commence a civil action on his own behalf-

(1) against any person (including (i) the United States, and (ii) any other governmental instrumentality or agency to the extent permitted by the Eleventh Amendment to the Constitution) who is alleged to have violated (if there is evidence that the alleged violation has been repeated) or to be in violation of (A) an emission standard or limitation under this chapter or (B) an order issued by the Administrator or a State with respect to such a standard or limitation,

(2) against the Administrator where there is alleged a failure of the Administrator to perform any act or duty under this chapter which is not discretionary with the Administrator, or

(3) against any person who proposes to construct or constructs any new or modified major emitting facility without a permit required under part C of subchapter I of this chapter (relating to significant deterioration of air quality) or part D of subchapter I of this chapter (relating to nonattainment) or who is alleged to have violated (if there is evidence that the alleged violation has been repeated) or to be in violation of any condition of such permit.

The district courts shall have jurisdiction, without regard to the amount in controversy or the citizenship of the parties, to enforce such an emission standard or limitation, or such an order, or to order the Administrator to perform such act or duty, as the case may be, and to apply any appropriate civil penalties (except for actions under paragraph (2)). The district courts of the United States shall have jurisdiction to compel (consistent with paragraph (2) of this subsection) agency action unreasonably delayed, except that an action to compel agency action referred to in [section 7607\(b\)](#) of this title which is unreasonably delayed may only be filed in a United States District Court within the circuit in which such action would be reviewable under [section 7607\(b\)](#) of this title. In any such action for unreasonable delay, notice to the entities referred to in subsection (b)(1)(A) of this section shall be provided 180 days before commencing such action.

## (b) Notice

No action may be commenced--

**(1)** under subsection (a)(1) of this section--

**(A)** prior to 60 days after the plaintiff has given notice of the violation (i) to the Administrator, (ii) to the State in which the violation occurs, and (iii) to any alleged violator of the standard, limitation, or order, or

**(B)** if the Administrator or State has commenced and is diligently prosecuting a civil action in a court of the United States or a State to require compliance with the standard, limitation, or order, but in any such action in a court of the United States any person may intervene as a matter of right.

**(2)** under subsection (a)(2) of this section prior to 60 days after the plaintiff has given notice of such action to the Administrator,

except that such action may be brought immediately after such notification in the case of an action under this section respecting a violation of [section 7412\(i\)\(3\)\(A\)](#) or [\(f\)\(4\)](#) of this title or an order issued by the Administrator pursuant to [section 7413\(a\)](#) of this title. Notice under this subsection shall be given in such manner as the Administrator shall prescribe by regulation.

(c) Venue; intervention by Administrator; service of complaint; consent judgment

**(1)** Any action respecting a violation by a stationary source of an emission standard or limitation or an order respecting such standard or limitation may be brought only in the judicial district in which such source is located.

**(2)** In any action under this section, the Administrator, if not a party, may intervene as a matter of right at any time in the proceeding. A judgment in an action under this section to which the United States is not a party shall not, however, have any binding effect upon the United States.

**(3)** Whenever any action is brought under this section the plaintiff shall serve a copy of the complaint on the Attorney General of the United States and on the Administrator. No consent judgment shall be entered in an action brought under this section in which the United States is not a party prior to 45 days following the receipt of a copy of the proposed consent judgment by the Attorney General and the Administrator during which time the Government may submit its comments on the proposed consent judgment to the court and parties or may intervene as a matter of right.

(d) Award of costs; security

The court, in issuing any final order in any action brought pursuant to subsection (a) of this section, may award costs of litigation (including reasonable attorney and expert witness fees) to any party, whenever the court de-

termines such award is appropriate. The court may, if a temporary restraining order or preliminary injunction is sought, require the filing of a bond or equivalent security in accordance with the Federal Rules of Civil Procedure.

(e) Nonrestriction of other rights

Nothing in this section shall restrict any right which any person (or class of persons) may have under any statute or common law to seek enforcement of any emission standard or limitation or to seek any other relief (including relief against the Administrator or a State agency). Nothing in this section or in any other law of the United States shall be construed to prohibit, exclude, or restrict any State, local, or interstate authority from--

- (1) bringing any enforcement action or obtaining any judicial remedy or sanction in any State or local court, or
- (2) bringing any administrative enforcement action or obtaining any administrative remedy or sanction in any State or local administrative agency, department or instrumentality,

against the United States, any department, agency, or instrumentality thereof, or any officer, agent, or employee thereof under State or local law respecting control and abatement of air pollution. For provisions requiring compliance by the United States, departments, agencies, instrumentalities, officers, agents, and employees in the same manner as nongovernmental entities, see [section 7418](#) of this title.

(f) "Emission standard or limitation under this chapter" defined

For purposes of this section, the term "emission standard or limitation under this chapter" means--

- (1) a schedule or timetable of compliance, emission limitation, standard of performance or emission standard,
- (2) a control or prohibition respecting a motor vehicle fuel or fuel additive, or [\[FN1\]](#)
- (3) any condition or requirement of a permit under part C of subchapter I of this chapter (relating to significant deterioration of air quality) or part D of subchapter I of this chapter (relating to nonattainment), [\[FN2\]section 7419](#) of this title (relating to primary nonferrous smelter orders), any condition or requirement under an applicable implementation plan relating to transportation control measures, air quality maintenance plans, vehicle inspection and maintenance programs or vapor recovery requirements, [section 7545\(e\)](#) and [\(f\)](#) of this title (relating to fuels and fuel additives), [section 7491](#) of this title (relating to visibility protection), any condition or requirement under subchapter VI of this chapter (relating to ozone protection), or any requirement under [section 7411](#) or [7412](#) of this title (without regard to whether such requirement is expressed as an emission standard or otherwise); [\[FN3\]](#) or
- (4) any other standard, limitation, or schedule established under any permit issued pursuant to subchapter V of this chapter or under any applicable State implementation plan approved by the Administrator, any permit

term or condition, and any requirement to obtain a permit as a condition of operations. [FN4]

which is in effect under this chapter (including a requirement applicable by reason of [section 7418](#) of this title) or under an applicable implementation plan.

(g) Penalty fund

(1) Penalties received under subsection (a) of this section shall be deposited in a special fund in the United States Treasury for licensing and other services. Amounts in such fund are authorized to be appropriated and shall remain available until expended, for use by the Administrator to finance air compliance and enforcement activities. The Administrator shall annually report to the Congress about the sums deposited into the fund, the sources thereof, and the actual and proposed uses thereof.

(2) Notwithstanding paragraph (1) the court in any action under this subsection to apply civil penalties shall have discretion to order that such civil penalties, in lieu of being deposited in the fund referred to in paragraph (1), be used in beneficial mitigation projects which are consistent with this chapter and enhance the public health or the environment. The court shall obtain the view of the Administrator in exercising such discretion and selecting any such projects. The amount of any such payment in any such action shall not exceed \$100,000.

**Effective:[See Text Amendments]**United States Code Annotated [Currentness](#)

Title 42. The Public Health and Welfare

- ▣ [Chapter 85](#). Air Pollution Prevention and Control ([Refs & Annos](#))

- ▣ [Subchapter III](#). General Provisions

- → **§ 7607. Administrative proceedings and judicial review**

(a) Administrative subpoenas; confidentiality; witnesses

In connection with any determination under [section 7410\(f\)](#) of this title, or for purposes of obtaining information under [section 7521\(b\)\(4\)](#) or [7545\(c\)\(3\)](#) of this title, any investigation, monitoring, reporting requirement, entry, compliance inspection, or administrative enforcement proceeding under the [\[FN1\]](#) chapter (including but not limited to [section 7413](#), [section 7414](#), [section 7420](#), [section 7429](#), [section 7477](#), [section 7524](#), [section 7525](#), [section 7542](#), [section 7603](#), or [section 7606](#) of this title), [\[FN2\]](#) the Administrator may issue subpoenas for the attendance and testimony of witnesses and the production of relevant papers, books, and documents, and he may administer oaths. Except for emission data, upon a showing satisfactory to the Administrator by such owner or operator that such papers, books, documents, or information or particular part thereof, if made public, would divulge trade secrets or secret processes of such owner or operator, the Administrator shall consider such record, report, or information or particular portion thereof confidential in accordance with the purposes of [section 1905 of Title 18](#), except that such paper, book, document, or information may be disclosed to other officers, employees, or authorized representatives of the United States concerned with carrying out this chapter, to persons carrying out the National Academy of Sciences' study and investigation provided for in [section 7521\(c\)](#) of this title, or when relevant in any proceeding under this chapter. Witnesses summoned shall be paid the same fees and mileage that are paid witnesses in the courts of the United States. In case of contumacy or refusal to obey a subpoena served upon any person under this subparagraph, the district court of the United States for any district in which such person is found or resides or transacts business, upon application by the United States and after notice to such person, shall have jurisdiction to issue an order requiring such person to appear and give testimony before the Administrator to appear and produce papers, books, and documents before the Administrator, or both, and any failure to obey such order of the court may be punished by such court as a contempt thereof.

(b) Judicial review

(1) A petition for review of action of the Administrator in promulgating any national primary or secondary ambient air quality standard, any emission standard or requirement under [section 7412](#) of this title, any standard of performance or requirement under [section 7411](#) of this title, [\[FN2\]](#) any standard under [section 7521](#) of this title (other than a standard required to be prescribed under [section 7521\(b\)\(1\)](#) of this title), any determination under [section 7521\(b\)\(5\)](#) of this title, any control or prohibition under [section 7545](#) of this title, any standard under [section 7571](#) of this title, any rule issued under [section 7413](#), [7419](#), or under [section 7420](#) of this title, or any other nationally applicable regulations promulgated, or final action taken, by the Administrator under this

chapter may be filed only in the United States Court of Appeals for the District of Columbia. A petition for review of the Administrator's action in approving or promulgating any implementation plan under [section 7410](#) of this title or [section 7411\(d\)](#) of this title, any order under [section 7411\(j\)](#) of this title, under [section 7412](#) of this title,, [\[FN2\]](#) under [section 7419](#) of this title, or under [section 7420](#) of this title, or his action under [section 1857c-10\(c\)\(2\)\(A\)](#), (B), or (C) of this title (as in effect before August 7, 1977) or under regulations thereunder, or revising regulations for enhanced monitoring and compliance certification programs under [section 7414\(a\)\(3\)](#) of this title, or any other final action of the Administrator under this chapter (including any denial or disapproval by the Administrator under subchapter I of this chapter) which is locally or regionally applicable may be filed only in the United States Court of Appeals for the appropriate circuit. Notwithstanding the preceding sentence a petition for review of any action referred to in such sentence may be filed only in the United States Court of Appeals for the District of Columbia if such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination. Any petition for review under this subsection shall be filed within sixty days from the date notice of such promulgation, approval, or action appears in the Federal Register, except that if such petition is based solely on grounds arising after such sixtieth day, then any petition for review under this subsection shall be filed within sixty days after such grounds arise. The filing of a petition for reconsideration by the Administrator of any otherwise final rule or action shall not affect the finality of such rule or action for purposes of judicial review nor extend the time within which a petition for judicial review of such rule or action under this section may be filed, and shall not postpone the effectiveness of such rule or action.

(2) Action of the Administrator with respect to which review could have been obtained under paragraph (1) shall not be subject to judicial review in civil or criminal proceedings for enforcement. Where a final decision by the Administrator defers performance of any nondiscretionary statutory action to a later time, any person may challenge the deferral pursuant to paragraph (1).

(c) Additional evidence

In any judicial proceeding in which review is sought of a determination under this chapter required to be made on the record after notice and opportunity for hearing, if any party applies to the court for leave to adduce additional evidence, and shows to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for the failure to adduce such evidence in the proceeding before the Administrator, the court may order such additional evidence (and evidence in rebuttal thereof) to be taken before the Administrator, in such manner and upon such terms and conditions as to [\[FN3\]](#) the court may deem proper. The Administrator may modify his findings as to the facts, or make new findings, by reason of the additional evidence so taken and he shall file such modified or new findings, and his recommendation, if any, for the modification or setting aside of his original determination, with the return of such additional evidence.

(d) Rulemaking

(1) This subsection applies to--

(A) the promulgation or revision of any national ambient air quality standard under [section 7409](#) of this title,

(B) the promulgation or revision of an implementation plan by the Administrator under [section 7410\(c\)](#) of this title,

(C) the promulgation or revision of any standard of performance under [section 7411](#) of this title, or emission standard or limitation under [section 7412\(d\)](#) of this title, any standard under [section 7412\(f\)](#) of this title, or any regulation under [section 7412\(g\)\(1\)\(D\)](#) and (F) of this title, or any regulation under [section 7412\(m\)](#) or (n) of this title,

(D) the promulgation of any requirement for solid waste combustion under [section 7429](#) of this title,

(E) the promulgation or revision of any regulation pertaining to any fuel or fuel additive under [section 7545](#) of this title,

(F) the promulgation or revision of any aircraft emission standard under [section 7571](#) of this title,

(G) the promulgation or revision of any regulation under subchapter IV-A of this chapter (relating to control of acid deposition),

(H) promulgation or revision of regulations pertaining to primary nonferrous smelter orders under [section 7419](#) of this title (but not including the granting or denying of any such order),

(I) promulgation or revision of regulations under subchapter VI of this chapter (relating to stratosphere and ozone protection),

(J) promulgation or revision of regulations under part C of subchapter I of this chapter (relating to prevention of significant deterioration of air quality and protection of visibility),

(K) promulgation or revision of regulations under [section 7521](#) of this title and test procedures for new motor vehicles or engines under [section 7525](#) of this title, and the revision of a standard under [section 7521\(a\)\(3\)](#) of this title,

(L) promulgation or revision of regulations for noncompliance penalties under [section 7420](#) of this title,

(M) promulgation or revision of any regulations promulgated under [section 7541](#) of this title (relating to warranties and compliance by vehicles in actual use),

(N) action of the Administrator under [section 7426](#) of this title (relating to interstate pollution abatement),

- (O) the promulgation or revision of any regulation pertaining to consumer and commercial products under [section 7511b\(e\)](#) of this title,
- (P) the promulgation or revision of any regulation pertaining to field citations under [section 7413\(d\)\(3\)](#) of this title,
- (Q) the promulgation or revision of any regulation pertaining to urban buses or the clean-fuel vehicle, clean-fuel fleet, and clean fuel programs under part C of subchapter II of this chapter,
- (R) the promulgation or revision of any regulation pertaining to nonroad engines or nonroad vehicles under [section 7547](#) of this title,
- (S) the promulgation or revision of any regulation relating to motor vehicle compliance program fees under [section 7552](#) of this title,
- (T) the promulgation or revision of any regulation under subchapter IV-A of this chapter (relating to acid deposition),
- (U) the promulgation or revision of any regulation under [section 7511b\(f\)](#) of this title pertaining to marine vessels, and
- (V) such other actions as the Administrator may determine.

The provisions of [section 553](#) through [557](#) and [section 706 of Title 5](#) shall not, except as expressly provided in this subsection, apply to actions to which this subsection applies. This subsection shall not apply in the case of any rule or circumstance referred to in subparagraphs (A) or (B) of subsection 553(b) of Title 5.

(2) Not later than the date of proposal of any action to which this subsection applies, the Administrator shall establish a rulemaking docket for such action (hereinafter in this subsection referred to as a “rule”). Whenever a rule applies only within a particular State, a second (identical) docket shall be simultaneously established in the appropriate regional office of the Environmental Protection Agency.

(3) In the case of any rule to which this subsection applies, notice of proposed rulemaking shall be published in the Federal Register, as provided under [section 553\(b\) of Title 5](#), shall be accompanied by a statement of its basis and purpose and shall specify the period available for public comment (hereinafter referred to as the “comment period”). The notice of proposed rulemaking shall also state the docket number, the location or locations of the docket, and the times it will be open to public inspection. The statement of basis and purpose shall include a summary of--

- (A) the factual data on which the proposed rule is based;
- (B) the methodology used in obtaining the data and in analyzing the data; and
- (C) the major legal interpretations and policy considerations underlying the proposed rule.

The statement shall also set forth or summarize and provide a reference to any pertinent findings, recommendations, and comments by the Scientific Review Committee established under [section 7409\(d\)](#) of this title and the National Academy of Sciences, and, if the proposal differs in any important respect from any of these recommendations, an explanation of the reasons for such differences. All data, information, and documents referred to in this paragraph on which the proposed rule relies shall be included in the docket on the date of publication of the proposed rule.

(4)(A) The rulemaking docket required under paragraph (2) shall be open for inspection by the public at reasonable times specified in the notice of proposed rulemaking. Any person may copy documents contained in the docket. The Administrator shall provide copying facilities which may be used at the expense of the person seeking copies, but the Administrator may waive or reduce such expenses in such instances as the public interest requires. Any person may request copies by mail if the person pays the expenses, including personnel costs to do the copying.

(B)(i) Promptly upon receipt by the agency, all written comments and documentary information on the proposed rule received from any person for inclusion in the docket during the comment period shall be placed in the docket. The transcript of public hearings, if any, on the proposed rule shall also be included in the docket promptly upon receipt from the person who transcribed such hearings. All documents which become available after the proposed rule has been published and which the Administrator determines are of central relevance to the rulemaking shall be placed in the docket as soon as possible after their availability.

(ii) The drafts of proposed rules submitted by the Administrator to the Office of Management and Budget for any interagency review process prior to proposal of any such rule, all documents accompanying such drafts, and all written comments thereon by other agencies and all written responses to such written comments by the Administrator shall be placed in the docket no later than the date of proposal of the rule. The drafts of the final rule submitted for such review process prior to promulgation and all such written comments thereon, all documents accompanying such drafts, and written responses thereto shall be placed in the docket no later than the date of promulgation.

(5) In promulgating a rule to which this subsection applies (i) the Administrator shall allow any person to submit written comments, data, or documentary information; (ii) the Administrator shall give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions; (iii) a transcript shall be kept of any oral presentation; and (iv) the Administrator shall keep the record of such proceeding open for thirty days after completion of the proceeding to provide an opportunity for submission of rebuttal and supplementary information.

**(6)(A)** The promulgated rule shall be accompanied by (i) a statement of basis and purpose like that referred to in paragraph (3) with respect to a proposed rule and (ii) an explanation of the reasons for any major changes in the promulgated rule from the proposed rule.

**(B)** The promulgated rule shall also be accompanied by a response to each of the significant comments, criticisms, and new data submitted in written or oral presentations during the comment period.

**(C)** The promulgated rule may not be based (in part or whole) on any information or data which has not been placed in the docket as of the date of such promulgation.

**(7)(A)** The record for judicial review shall consist exclusively of the material referred to in paragraph (3), clause (i) of paragraph (4)(B), and subparagraphs (A) and (B) of paragraph (6).

**(B)** Only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. If the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within such time or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule, the Administrator shall convene a proceeding for reconsideration of the rule and provide the same procedural rights as would have been afforded had the information been available at the time the rule was proposed. If the Administrator refuses to convene such a proceeding, such person may seek review of such refusal in the United States court of appeals for the appropriate circuit (as provided in subsection (b) of this section). Such reconsideration shall not postpone the effectiveness of the rule. The effectiveness of the rule may be stayed during such reconsideration, however, by the Administrator or the court for a period not to exceed three months.

**(8)** The sole forum for challenging procedural determinations made by the Administrator under this subsection shall be in the United States court of appeals for the appropriate circuit (as provided in subsection (b) of this section) at the time of the substantive review of the rule. No interlocutory appeals shall be permitted with respect to such procedural determinations. In reviewing alleged procedural errors, the court may invalidate the rule only if the errors were so serious and related to matters of such central relevance to the rule that there is a substantial likelihood that the rule would have been significantly changed if such errors had not been made.

**(9)** In the case of review of any action of the Administrator to which this subsection applies, the court may reverse any such action found to be--

**(A)** arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law;

**(B)** contrary to constitutional right, power, privilege, or immunity;

**(C)** in excess of statutory jurisdiction, authority, or limitations, or short of statutory right; or

(D) without observance of procedure required by law, if (i) such failure to observe such procedure is arbitrary or capricious, (ii) the requirement of paragraph (7)(B) has been met, and (iii) the condition of the last sentence of paragraph (8) is met.

(10) Each statutory deadline for promulgation of rules to which this subsection applies which requires promulgation less than six months after date of proposal may be extended to not more than six months after date of proposal by the Administrator upon a determination that such extension is necessary to afford the public, and the agency, adequate opportunity to carry out the purposes of this subsection.

(11) The requirements of this subsection shall take effect with respect to any rule the proposal of which occurs after ninety days after August 7, 1977.

(e) Other methods of judicial review not authorized

Nothing in this chapter shall be construed to authorize judicial review of regulations or orders of the Administrator under this chapter, except as provided in this section.

(f) Costs

In any judicial proceeding under this section, the court may award costs of litigation (including reasonable attorney and expert witness fees) whenever it determines that such award is appropriate.

(g) Stay, injunction, or similar relief in proceedings relating to noncompliance penalties

In any action respecting the promulgation of regulations under [section 7420](#) of this title or the administration or enforcement of [section 7420](#) of this title no court shall grant any stay, injunctive, or similar relief before final judgment by such court in such action.

(h) Public participation

It is the intent of Congress that, consistent with the policy of subchapter II of chapter 5 of Title 5, the Administrator in promulgating any regulation under this chapter, including a regulation subject to a deadline, shall ensure a reasonable period for public participation of at least 30 days, except as otherwise expressly provided in section [\[FN4\]](#) 7407(d), 7502(a), 7511(a) and (b), and 7512(a) and (b) of this title.

RIN 2060-AK74

**Clean Air Fine Particle Implementation Rule****AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Final rule.

**SUMMARY:** This final action provides rules and guidance on the Clean Air Act (CAA) requirements for State and Tribal plans to implement the 1997 fine particle (PM<sub>2.5</sub>) national ambient air quality standards (NAAQS). Fine particles and precursor pollutants are emitted by a wide range of sources, including power plants, cars, trucks, industrial sources, and other burning or combustion-related activities. Health effects that have been associated with exposure to PM<sub>2.5</sub> include premature death, aggravation of heart and lung disease, and asthma attacks. Those particularly sensitive to PM<sub>2.5</sub> exposure include older adults, people with heart and lung disease, and children.

Air quality designations became effective on April 5, 2005 for 39 areas (with a total population of 90 million) that were not attaining the 1997 PM<sub>2.5</sub> standards. By April 5, 2008, each State having a nonattainment area must submit to EPA an attainment demonstration and adopted regulations ensuring that the area will attain the standards as expeditiously as practicable, but no later than 2015. This rule and preamble describe the requirements that States and Tribes must meet in their implementation plans for attainment of the 1997 fine particle NAAQS. (Note that this rule does not include final PM<sub>2.5</sub> requirements for the new source review (NSR) program; the final NSR rule will be issued at a later date.)

**DATES:** This rule is effective on May 29, 2007.

**ADDRESSES:** The EPA has established a docket for this action under Docket ID EPA-HQ-OAR-2003-0062. All documents relevant to this action are listed in the Federal docket management system at [www.regulations.gov](http://www.regulations.gov). Although listed in the index, some information is not publicly available (e.g. Confidential Business Information or other information whose disclosure is restricted by statute). Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy

form. Publicly available docket materials are available either electronically through [www.regulations.gov](http://www.regulations.gov) or in hard copy format at the EPA Docket Center, EPA/DC, EPA West, Room 3334, 1301 Constitution Avenue, NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the Office of Air and Radiation Docket and Information Center is (202) 566-1742. A variety of information and materials related to the fine particle NAAQS and implementation program are also available on EPA's Web site: <http://www.epa.gov/air/particles>.

**FOR FURTHER INFORMATION CONTACT:** For general information, contact Mr. Richard Damberg, U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Mail Code C539-01, Research Triangle Park, NC 27711, phone number (919) 541-5592 or by e-mail at: [damberg.rich@epa.gov](mailto:damberg.rich@epa.gov).

**SUPPLEMENTARY INFORMATION:****General Information***A. Does this action apply to me?*

Entities potentially regulated by this action are State and local air quality agencies.

*B. Where can I get a copy of this document and other related information?*

In addition to being available in the docket, an electronic copy of this final rule will also be available on the World Wide Web. Following signature by the EPA Administrator, a copy of this final rule will be posted at <http://www.epa.gov/particles/actions.html>.

**I. Background**

Fine particles in the atmosphere are comprised of a complex mixture of components. Common constituents include: sulfate (SO<sub>4</sub>); nitrate (NO<sub>3</sub>); ammonium; elemental carbon; a great variety of organic compounds; and inorganic material (including metals, dust, sea salt, and other trace elements) generally referred to as "crustal" material, although it may contain material from other sources. Airborne particles generally less than or equal to 2.5 micrometers in diameter are considered to be "fine particles" (also referred to as PM<sub>2.5</sub>). (A micrometer is one-millionth of a meter, and 2.5 micrometers is less than one-seventh the average width of a human hair.) "Primary" particles are emitted directly into the air as a solid or liquid particle (e.g., elemental carbon from diesel engines or fire activities, or condensable organic particles from gasoline engines). "Secondary" particles (e.g., sulfate and nitrate) form in the atmosphere as a result of various chemical reactions. (Section II of the proposed rule included detailed technical discussion on PM<sub>2.5</sub>, its precursors, formation processes, and emissions sources.)

The EPA established air quality standards for PM<sub>2.5</sub> based on evidence from numerous health studies demonstrating that serious health effects are associated with exposures to elevated levels of PM<sub>2.5</sub>. Epidemiological studies have shown statistically significant correlations between elevated PM<sub>2.5</sub> levels and premature mortality. Other important

of Federal Regulations is amended as follows:

■ 1. The authority citation for part 51 continues to read as follows:

**Authority:** 23 U.S.C. 101; 42 U.S.C. 7401-7671q.

■ 2. A new Subpart Z is added to read as follows:

**Subpart Z—Provisions for Implementation of PM<sub>2.5</sub> National Ambient Air Quality Standards**

Sec.	
51.1000	Definitions.
51.1001	Applicability of part 51.
51.1002	Submittal of State implementation plan.
51.1003	[Reserved]
51.1004	Attainment dates.
51.1005	One-year extensions of the attainment date.
51.1006	Redesignation to nonattainment following initial designations for the PM <sub>2.5</sub> NAAQS.
51.1007	Attainment demonstration and modeling requirements.
51.1008	Emission inventory requirements for the PM <sub>2.5</sub> NAAQS.
51.1009	Reasonable further progress (RFP) requirements.
51.1010	Requirements for reasonably available control technology (RACT) and reasonably available control measures (RACM).
51.1011	Requirements for mid-course review.
51.1012	Requirements for contingency measures.

**§ 51.1000 Definitions.**

The following definitions apply for purposes of this subpart. Any term not defined herein shall have the meaning as defined in 40 CFR 51.100.

*Act* means the Clean Air Act as codified at 42 U.S.C. 7401-7671q. (2003).

*Attainment date* means the date by which an area, under an approved State implementation plan, is required to attain the PM<sub>2.5</sub> NAAQS (based on the average of three consecutive years of ambient air quality data).

*Baseline year inventory* for the RFP plan is the emissions inventory for the year also used as the base year for the attainment demonstration.

*Benchmark RFP plan* means the reasonable further progress plan that requires generally linear emission reductions in pollutants from the baseline emissions year through the milestone inventory year.

*Date of designation* means the effective date of the PM<sub>2.5</sub> area designation as promulgated by the Administrator.

*Direct PM<sub>2.5</sub> emissions* means solid particles emitted directly from an air emissions source or activity, or gaseous

emissions or liquid droplets from an air emissions source or activity which condense to form particulate matter at ambient temperatures. Direct PM<sub>2.5</sub> emissions include elemental carbon, directly emitted organic carbon, directly emitted sulfate, directly emitted nitrate, and other inorganic particles (including but not limited to crustal material, metals, and sea salt).

*Existing control measure* means any Federally enforceable national, State, or local control measure that has been approved in the SIP and that results in reductions in emissions of PM<sub>2.5</sub> or PM<sub>2.5</sub> precursors in a nonattainment area.

*Full implementation inventory* is the projected RFP emission inventory for the year preceding the attainment date, representing a level of emissions that demonstrates attainment.

*Milestone year inventory* is the projected RFP emission inventory for the applicable RFP milestone year (i.e. 2009 and, where applicable, 2012).

*PM<sub>2.5</sub> NAAQS* means the particulate matter national ambient air quality standards (annual and 24-hour) codified at 40 CFR 50.7.

*PM<sub>2.5</sub> design value* for a nonattainment area is the highest of the three-year average concentrations calculated for the monitors in the area, in accordance with 40 CFR part 50, appendix N.

*PM<sub>2.5</sub> attainment plan precursor* means SO<sub>2</sub> and those other PM<sub>2.5</sub> precursors emitted by sources in the State which the State must evaluate for emission reduction measures to be included in its PM<sub>2.5</sub> nonattainment area or maintenance area plan.

*PM<sub>2.5</sub> precursor* means those air pollutants other than PM<sub>2.5</sub> direct emissions that contribute to the formation of PM<sub>2.5</sub>. PM<sub>2.5</sub> precursors include SO<sub>2</sub>, NO<sub>x</sub>, volatile organic compounds, and ammonia.

*Reasonable further progress (RFP)* means the incremental emissions reductions toward attainment required under sections 172(c)(2) and 171(1).

*Subpart 1* means the general attainment plan requirements found in subpart 1 of part D of title I of the Act.

**§ 51.1001 Applicability of part 51.**

The provisions in subparts A through X of this part apply to areas for purposes of the PM<sub>2.5</sub> NAAQS to the extent they are not inconsistent with the provisions of this subpart.

**§ 51.1002 Submittal of State implementation plan.**

(a) For any area designated by EPA as nonattainment for the PM<sub>2.5</sub> NAAQS, the State must submit a State

implementation plan satisfying the requirements of section 172 of the Act and this subpart to EPA by the date prescribed by EPA which will be no later than 3 years from the date of designation.

(b) The State must submit a plan consistent with the requirements of section 110(a)(2) of the Act unless the State already has fulfilled this obligation for the purposes of implementing the PM<sub>2.5</sub> NAAQS.

(c) *Pollutants contributing to fine particle concentrations.* The State implementation plan must identify and evaluate sources of PM<sub>2.5</sub> direct emissions and PM<sub>2.5</sub> attainment plan precursors in accordance with §§ 51.1009 and 51.1010. After January 1, 2011, for purposes of establishing emissions limits under 51.1009 and 51.1010, States must establish such limits taking into consideration the condensable fraction of direct PM<sub>2.5</sub> emissions. Prior to this date, States are not prohibited from establishing source emission limits that include the condensable fraction of direct PM<sub>2.5</sub>.

(1) The State must address sulfur dioxide as a PM<sub>2.5</sub> attainment plan precursor and evaluate sources of SO<sub>2</sub> emissions in the State for control measures.

(2) The State must address NO<sub>x</sub> as a PM<sub>2.5</sub> attainment plan precursor and evaluate sources of NO<sub>x</sub> emissions in the State for control measures, unless the State and EPA provide an appropriate technical demonstration for a specific area showing that NO<sub>x</sub> emissions from sources in the State do not significantly contribute to PM<sub>2.5</sub> concentrations in the nonattainment area.

(3) The State is not required to address VOC as a PM<sub>2.5</sub> attainment plan precursor and evaluate sources of VOC emissions in the State for control measures, unless:

(i) the State provides an appropriate technical demonstration for a specific area showing that VOC emissions from sources in the State significantly contribute to PM<sub>2.5</sub> concentrations in the nonattainment area, and such demonstration is approved by EPA; or

(ii) The EPA provides such a technical demonstration.

(4) The State is not required to address ammonia as a PM<sub>2.5</sub> attainment plan precursor and evaluate sources of ammonia emissions from sources in the State for control measures, unless:

(i) The State provides an appropriate technical demonstration for a specific area showing that ammonia emissions from sources in the State significantly contribute to PM<sub>2.5</sub> concentrations in the

nonattainment area, and such demonstration is approved by EPA; or

(ii) The EPA provides such a technical demonstration.

(5) The State must submit a demonstration to reverse any presumption in this rule for a PM<sub>2.5</sub> precursor with respect to a particular nonattainment area, if the administrative record related to development of its SIP shows that the presumption is not technically justified for that area.

#### § 51.1003 [Reserved]

#### § 51.1004 Attainment dates.

(a) Consistent with section 172(a)(2)(A) of the Act, the attainment date for an area designated nonattainment for the PM<sub>2.5</sub> NAAQS will be the date by which attainment can be achieved as expeditiously as practicable, but no more than five years from the date of designation. The Administrator may extend the attainment date to the extent the Administrator determines appropriate, for a period no greater than 10 years from the date of designation, considering the severity of nonattainment and the availability and feasibility of pollution control measures.

(b) In the SIP submittal for each of its nonattainment areas, the State must submit an attainment demonstration justifying its proposed attainment date. For each nonattainment area, the Administrator will approve an attainment date at the same time the Administrator approves the attainment demonstration for the area, consistent with the attainment date timing provision of section 172(a)(2)(A) and paragraph (a) of this section.

(c) Upon a determination by EPA that an area designated nonattainment for the PM<sub>2.5</sub> NAAQS has attained the standard, the requirements for such area to submit attainment demonstrations and associated reasonably available control measures, reasonable further progress plans, contingency measures, and other planning SIPs related to attainment of the PM<sub>2.5</sub> NAAQS shall be suspended until such time as: the area is redesignated to attainment, at which time the requirements no longer apply; or EPA determines that the area has violated the PM<sub>2.5</sub> NAAQS, at which time the area is again required to submit such plans.

#### § 51.1005 One-year extensions of the attainment date.

(a) Pursuant to section 172(a)(2)(C)(ii) of the Act, a State with an area that fails to attain the PM<sub>2.5</sub> NAAQS by its attainment date may apply for an initial 1-year attainment date extension if the

State has complied with all requirements and commitments pertaining to the area in the applicable implementation plan, and:

(1) For an area that violates the annual PM<sub>2.5</sub> NAAQS as of its attainment date, the annual average concentration for the most recent year at each monitor is 15.0 µg/m<sup>3</sup> or less (calculated according to the data analysis requirements in 40 CFR part 50, appendix N).

(2) For an area that violates the 24-hour PM<sub>2.5</sub> NAAQS as of its attainment date, the 98th percentile concentration for the most recent year at each monitor is 65 µg/m<sup>3</sup> or less (calculated according to the data analysis requirements in 40 CFR part 50, appendix N).

(b) An area that fails to attain the PM<sub>2.5</sub> NAAQS after receiving a 1-year attainment date extension may apply for a second 1-year attainment date extension pursuant to section 172(a)(2)(C)(ii) if the State has complied with all requirements and commitments pertaining to the area in the applicable implementation plan, and:

(1) For an area that violates the annual PM<sub>2.5</sub> NAAQS as of its attainment date, the two-year average of annual average concentrations at each monitor, based on the first extension year and the previous year, is 15.0 µg/m<sup>3</sup> or less (calculated according to the data analysis requirements in 40 CFR part 50, appendix N).

(2) For an area that violates the 24-hour PM<sub>2.5</sub> NAAQS as of its attainment date, the two-year average of annual 98th percentile concentrations at each monitor, based on the first extension year and the previous year, is 65 µg/m<sup>3</sup> or less (calculated according to the data analysis requirements in 40 CFR part 50, appendix N).

#### § 51.1006 Redesignation to nonattainment following initial designations for the PM<sub>2.5</sub> NAAQS.

Any area that is initially designated "attainment/unclassifiable" for the PM<sub>2.5</sub> NAAQS may be subsequently redesignated to nonattainment if ambient air quality data in future years indicate that such a redesignation is appropriate. For any such area that is redesignated to nonattainment for the PM<sub>2.5</sub> NAAQS, any absolute, fixed date that is applicable in connection with the requirements of this part is extended by a period of time equal to the length of time between the effective date of the initial designation for the PM<sub>2.5</sub> NAAQS and the effective date of redesignation, except as otherwise provided in this subpart.

#### § 51.1007 Attainment demonstration and modeling requirements.

(a) For any area designated as nonattainment for the PM<sub>2.5</sub> NAAQS, the State must submit an attainment demonstration showing that the area will attain the annual and 24-hour standards as expeditiously as practicable. The demonstration must meet the requirements of § 51.112 and Appendix W of this part and must include inventory data, modeling results, and emission reduction analyses on which the State has based its projected attainment date. The attainment date justified by the demonstration must be consistent with the requirements of § 51.1004(a). The modeled strategies must be consistent with requirements in § 51.1009 for RFP and in § 51.1010 for RACT and RACM. The attainment demonstration and supporting air quality modeling should be consistent with EPA's PM<sub>2.5</sub> modeling guidance.

(b) *Required time frame for obtaining emissions reductions.* For each nonattainment area, the State implementation plan must provide for implementation of all control measures needed for attainment as expeditiously as practicable, but no later than the beginning of the year prior to the attainment date. Consistent with section 172(c)(1) of the Act, the plan must provide for implementation of all RACM and RACT as expeditiously as practicable. The plan also must include RFP milestones in accordance with § 51.1009, and control measures needed to meet these milestones, as necessary.

#### § 51.1008 Emission inventory requirements for the PM<sub>2.5</sub> NAAQS.

(a) For purposes of meeting the emission inventory requirements of section 172(c)(3) of the Act for nonattainment areas, the State shall, no later than three years after designation:

(1) Submit to EPA Statewide emission inventories for direct PM<sub>2.5</sub> emissions and emissions of PM<sub>2.5</sub> precursors. For purposes of defining the data elements for these inventories, the PM<sub>2.5</sub> and PM<sub>2.5</sub> precursor-relevant data element requirements under subpart A of this part shall apply.

(2) Submit any additional emission inventory information needed to support an attainment demonstration and RFP plan ensuring expeditious attainment of the annual and 24-hour PM<sub>2.5</sub> standards.

(b) For inventories required for submission under paragraph (a) of this section, a baseline emission inventory is required for the attainment demonstration required under § 51.1007 and for meeting RFP requirements

under § 51.1009. As determined on the date of designation, the base year for this inventory shall be the most recent calendar year for which a complete inventory was required to be submitted to EPA pursuant to subpart A of this part. The baseline emission inventory for calendar year 2002 or other suitable year shall be used for attainment planning and RFP plans for areas initially designated nonattainment for the PM<sub>2.5</sub> NAAQS in 2004–2005.

**§ 51.1009 Reasonable further progress (RFP) requirements.**

(a) Consistent with section 172(c)(2) of the Act, State implementation plans for areas designated nonattainment for the PM<sub>2.5</sub> NAAQS must demonstrate reasonable further progress as provided in § 51.1009(b) through (h).

(b) If the State submits to EPA an attainment demonstration and State implementation plan for an area which demonstrates that it will attain the PM NAAQS within five years of the date of designation, the State is not required to submit a separate RFP plan. Compliance with the emission reduction measures in the attainment demonstration and State implementation plan will meet the requirements for achieving reasonable further progress for the area.

(c) For any area for which the State submits to EPA an approvable attainment demonstration and State implementation plan that demonstrates the area needs an attainment date of more than five years from the date of designation, the State also must submit an RFP plan. The RFP plan must describe the control measures that provide for meeting the reasonable further progress milestones for the area, the timing of implementation of those measures, and the expected reductions in emissions of direct PM<sub>2.5</sub> and PM<sub>2.5</sub> attainment plan precursors. The RFP plan is due to EPA within three years of the date of designation.

(1) For any State that submits to EPA an approvable attainment demonstration and State implementation plan justifying an attainment date of more than five and less than nine years from the date of designation, the RFP plan must include 2009 emissions milestones for direct PM<sub>2.5</sub> and PM<sub>2.5</sub> attainment plan precursors demonstrating that reasonable further progress will be achieved for the 2009 emissions year.

(2) For any area that submits to EPA an approvable attainment demonstration and State implementation plan justifying an attainment date of nine or ten years from the date of designation, the RFP plan must include 2009 and 2012 emissions milestones for direct PM<sub>2.5</sub> and PM<sub>2.5</sub> attainment plan

precursors demonstrating that reasonable further progress will be achieved for the 2009 and 2012 emissions years.

(d) The RFP plan must demonstrate that in each applicable milestone year, emissions will be at a level consistent with generally linear progress in reducing emissions between the base year and the attainment year.

(e) For a multi-State nonattainment area, the RFP plans for each State represented in the nonattainment area must demonstrate RFP on the basis of common multi-State inventories. The States within which the area is located must provide a coordinated RFP plan. Each State in a multi-State nonattainment area must ensure that the sources within its boundaries comply with enforceable emission levels and other requirements that in combination with the reductions planned in other state(s) will provide for attainment as expeditiously as practicable and demonstrate reasonable further progress.

(f) In the benchmark RFP plan, the State must identify direct PM<sub>2.5</sub> emissions and PM<sub>2.5</sub> attainment plan precursors regulated under the PM<sub>2.5</sub> attainment plan and specify target emission reduction levels to be achieved during the milestone years. In developing the benchmark RFP plan, the State must develop emission inventory information for the geographic area included in the plan and conduct the following calculations:

(1) For direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor addressed in the attainment strategy, the full implementation reduction is calculated by subtracting the full implementation inventory from the baseline year inventory.

(2) The “milestone date fraction” is the ratio of the number of years from the baseline year to the milestone inventory year divided by the number of years from the baseline year to the full implementation year.

(3) For direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor addressed in the attainment strategy, a benchmark emission reduction is calculated by multiplying the full implementation reduction by the milestone date fraction.

(4) The benchmark emission level in the milestone year is calculated for direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor by subtracting the benchmark emission reduction from the baseline year emission level. The benchmark RFP plan is defined as a plan that achieves benchmark emission levels for direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub>

attainment plan precursor addressed in the attainment strategy for the area.

(5) In comparing inventories between baseline and future years for direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor, the inventories must be derived from the same geographic area. The plan must include emissions estimates for all types of emitting sources and activities in the geographic area from which the emission inventories for direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor addressed in the plan are derived.

(6) For purposes of establishing motor vehicle emissions budgets for transportation conformity purposes (as required in 40 CFR part 93) for a PM<sub>2.5</sub> nonattainment area, the State shall include in its RFP submittal an inventory of on-road mobile source emissions in the nonattainment area.

(g) The RFP plan due three years after designation must demonstrate that emissions for the milestone year are either:

(1) At levels that are roughly equivalent to the benchmark emission levels for direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor to be addressed in the plan; or

(2) At levels included in an alternative scenario that is projected to result in a generally equivalent improvement in air quality by the milestone year as would be achieved under the benchmark RFP plan.

(h) The equivalence of an alternative scenario to the corresponding benchmark plan must be determined by comparing the expected air quality changes of the two scenarios at the design value monitor location. This comparison must use the information developed for the attainment plan to assess the relationship between emissions reductions of the direct PM<sub>2.5</sub> emissions and each PM<sub>2.5</sub> attainment plan precursor addressed in the attainment strategy and the ambient air quality improvement for the associated ambient species.

**§ 51.1010 Requirements for reasonably available control technology (RACT) and reasonably available control measures (RACM).**

(a) For each PM<sub>2.5</sub> nonattainment area, the State shall submit with the attainment demonstration a SIP revision demonstrating that it has adopted all reasonably available control measures (including RACT for stationary sources) necessary to demonstrate attainment as expeditiously as practicable and to meet any RFP requirements. The SIP revision shall contain the list of the potential measures considered by the State, and

information and analysis sufficient to support the State's judgment that it has adopted all RACM, including RACT.

(b) In determining whether a particular emission reduction measure or set of measures must be adopted as RACM under section 172(c)(1) of the Act, the State must consider the cumulative impact of implementing the available measures. Potential measures that are reasonably available considering technical and economic feasibility must be adopted as RACM if, considered collectively, they would advance the attainment date by one year or more.

**§ 51.1011 Requirements for mid-course review.**

(a) Any State that submits to EPA an approvable attainment plan for a PM<sub>2.5</sub>

nonattainment area justifying an attainment date of nine or ten years from the date of designation also must submit to EPA a mid-course review six years from the date of designation.

(b) The mid-course review for an area must include:

(1) A review of emissions reductions and progress made in implementing control measures to reduce emissions of direct PM<sub>2.5</sub> and PM<sub>2.5</sub> attainment plan precursors contributing to PM<sub>2.5</sub> concentrations in the area;

(2) An analysis of changes in ambient air quality data for the area;

(3) Revised air quality modeling analysis to demonstrate attainment;

(4) Any new or revised control measures adopted by the State, as necessary to ensure attainment by the

attainment date in the approved SIP of the nonattainment area.

**§ 51.1012 Requirement for contingency measures.**

Consistent with section 172(c)(9) of the Act, the State must submit in each attainment plan specific contingency measures to be undertaken if the area fails to make reasonable further progress, or fails to attain the PM<sub>2.5</sub> NAAQS by its attainment date. The contingency measures must take effect without significant further action by the State or EPA.

[FR Doc. E7-6347 Filed 4-24-07; 8:45 am]

BILLING CODE 6560-50-P

No comments objecting to the proposal were received. Class E airspace areas extending from 700 feet or more above the surface of the earth are published in paragraphs 6005 of FAA Order 7400.96, signed August 14, 2007, and effective September 15, 2007, which is incorporated by reference in 14 CFR 71.1. The class airspace designation listed in this document will be published subsequently in the Order.

**The Rule**

The FAA is amending Title 14, Code of Federal Regulations (14 CFR) part 71 to modify Class E airspace at Waynesburg, PA, by providing additional controlled airspace for aircraft executing the RNAV (GPS) Runway 09/27 to the Green County Airport. This action also corrects the geographic position coordinates of the airport.

The FAA has determined that this regulation only involves an established body of technical regulations for which frequent and routine amendments are necessary to keep them operationally current. It, therefore, (1) is not a "significant regulatory action" under Executive Order 12866; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034; February 26, 1979); and (3) does not warrant preparation of a Regulatory Evaluation as the anticipated impact is so minimal. Since this is a routine matter that will only affect air traffic procedures and air navigation, it is certified that this rule, when promulgated, will not have a significant economic impact on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

The FAA's authority to issue rules regarding aviation safety is found in the Title 49 of the United States Code. Subtitle I, Section 106 describes the authority of the FAA administrator. Subtitle VII, Aviation Programs, describes in more detail the scope of the agency's authority.

This rulemaking is promulgated under the authority described in Subtitle VII, Part A, Subpart I, Section 40103. Under that section, the FAA is charged with prescribing regulations to assign the use of airspace necessary to ensure the safety of aircraft and the efficient use of airspace. This regulation is within the scope of that authority as it modifies Class E Airspace at Waynesburg, PA.

**List of Subjects in 14 CFR Part 71**

Airspace, Incorporation by reference, Navigation (air).

**Adoption of the Amendment**

In consideration of the foregoing, the Federal Aviation Administration amends 14 CFR part 71 as follows:

**PART 71—DESIGNATION OF CLASS A, CLASS B, CLASS C, CLASS D, AND CLASS E AIRSPACE AREAS; AIRWAYS; ROUTES; AND REPORTING POINTS**

1. The authority citation for part 71 continues to read as follows:

**Authority:** 49 U.S.C. 106(g); 40103, 40113, 40120; E.O. 10854, 24 FR 9565, 3 CFR, 1959–1963 Comp., p. 389.

**§ 71.1 [Amended]**

2. The incorporation by reference in 14 CFR 71.1 of Federal Aviation Administration Order 7400.9R, Airspace Designations and Reporting Points, signed August 15, 2007, and effective September 15, 2007, is amended as follows:

*Paragraph 6005 Class E Airspace Areas Extending Upward from 700 feet or More Above the Surface of the Earth.*

\* \* \* \* \*

**AEA PA E5 Waynesburg, PA [Revised]**  
 Green County Airport, PA  
 (Lat. 39°54'04" N., long. 80°07'51" W.)

That airspace extending upward from 700 feet above the surface of the Earth within an 8.3-mile radius of Green County Airport.

**BILLING CODE 4910-13-M**

**DEPARTMENT OF HOMELAND SECURITY**

**Coast Guard**

**33 CFR Part 165**

[Docket No. USCG-2008-0366]

**Security Zone; Portland Rose Festival on Willamette River**

**AGENCY:** Coast Guard, DHS.  
**ACTION:** Notice of enforcement of regulation.

**SUMMARY:** The Coast Guard will enforce the Portland Rose Festival Security Zone on the Willamette River from 1 a.m. on June 4, 2008 until 10 a.m. June 10, 2008. This action is necessary for the security of public vessels on a portion

of the Willamette River during the fleet week of the Rose Festival. This security zone provides for the regulation of vessel traffic in the vicinity of the moored public vessels. During the enforcement period, entry into this zone is prohibited unless authorized by the Captain of the Port or his designee.

**DATES:** The regulations in 33 CFR 165.1312 will be enforced commencing from 1 a.m. on June 4, 2008 until 10 a.m. June 10, 2008.

**FOR FURTHER INFORMATION CONTACT:** MST1 Lucia Mack, Coast Guard Sector Portland, 6767 N. Basin Ave, Portland, OR 97217, telephone 503-240-9311.

**SUPPLEMENTARY INFORMATION:** The Coast Guard will enforce the Rose Festival Security Zone established by 33 CFR 165.1312 from 1 a.m. on June 4, 2008 until 10 a.m. June 10, 2008.

Under the provisions of 33 CFR 165.33 a vessel may not enter the regulated area, unless it receives permission from the Captain of the Port or his designee. The Coast Guard may be assisted by other Federal, State, or local law enforcement agencies in enforcing this regulation.

This notice is issued under authority of 33 CFR 165.1312 and 5 U.S.C. 552(a). In addition to this notice in the **Federal Register**, the Coast Guard will provide the maritime community with extensive advance notification of this enforcement period via the Local Notice to Mariners and marine information broadcasts.

Dated: May 6, 2008.

**F.G. Myer,**

**ENVIRONMENTAL PROTECTION AGENCY**

**40 CFR Parts 51 and 52**

[EPA-HQ-OAR-2003-0062; FRL-8566-1]  
**RIN 2060-AN86**

**Implementation of the New Source Review (NSR) Program for Particulate Matter Less Than 2.5 Micrometers (PM<sub>2.5</sub>)**

**AGENCY:** Environmental Protection Agency (EPA).  
**ACTION:** Final rule.

**SUMMARY:** The EPA is finalizing regulations to implement the New Source Review (NSR) program for fine particulate matter (that is, particles with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers,

NSR portions of this action should also be subject to the provisions of section 307(d) to ensure consistency. All of the procedural requirements of section 307(d), e.g., docketing, hearing, and comment periods, have been complied with during the course of this rulemaking.

**VII. Statutory Authority**

The statutory authority for this action is provided by sections 101, 110, 165, 169, 172, 173, 301, and 302 of the Act as amended (42 U.S.C. 7401, 7410, 7475, 7479, 7502, 7503, 7601, and 7602). This rulemaking is also subject to section 307(d) of the Act (42 U.S.C. 7407(d)).

**List of Subjects**

*40 CFR Part 51*

Environmental protection, Administrative practices and procedures, Air pollution control, Intergovernmental relations.

*40 CFR Part 52*

Environmental protection, Administrative practices and procedures, Air pollution control, Intergovernmental relations.

Dated: May 8, 2008.

Stephen L. Johnson,  
 Administrator.

■ For the reasons stated in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows.

**PART 51—[AMENDED]**

■ 1. The authority citation for part 51 continues to read as follows:

Authority: 23 U.S.C. 101; 42 U.S.C. 7401–7671q.

**Subpart I—[Amended]**

■ 2. Section 51.165 is amended as follows:

- a. By revising paragraph (a)(1)(x)(A);
- b. By removing the word “or” at the end of paragraph (a)(1)(xxxvii)(B);
- c. By revising paragraph (a)(1)(xxxvii)(C);
- d. By adding paragraph (a)(1)(xxxvii)(D);
- e. By redesignating paragraphs (a)(9)(i) through (iii) as paragraphs (a)(9)(ii) through (iv), respectively, and adding a new paragraph (a)(9)(i);
- f. By removing from newly redesignated paragraph (a)(9)(iii) the reference to “paragraph (a)(9)(i)” and adding in its place “paragraph (a)(9)(ii)”; and
- g. By adding paragraph (a)(11).

**§ 51.165 Permit requirements.**

(a) \* \* \*

(1) \* \* \*  
 (x)(A) *Significant* means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

**Pollutant Emission Rate**

- Carbon monoxide: 100 tons per year (tpy).
- Nitrogen oxides: 40 tpy
- Sulfur dioxide: 40 tpy
- Ozone: 40 tpy of volatile organic compounds or nitrogen oxides
- Lead: 0.6 tpy
- PM<sub>10</sub>: 15 tpy
- PM<sub>2.5</sub>: 10 tpy of direct PM<sub>2.5</sub> emissions; 40 tpy of sulfur dioxide emissions; 40 tpy of nitrogen oxide emissions unless demonstrated not to be a PM<sub>2.5</sub> precursor under paragraph (a)(1)(xxxvii) of this section

(xxxvii) \* \* \*  
 (C) Any pollutant that is identified under this paragraph (a)(1)(xxxvii)(C) as a constituent or precursor of a general pollutant listed under paragraph (a)(1)(xxxvii)(A) or (B) of this section, provided that such constituent or precursor pollutant may only be regulated under NSR as part of regulation of the general pollutant. Precursors identified by the Administrator for purposes of NSR are the following:

- (1) Volatile organic compounds and nitrogen oxides are precursors to ozone in all ozone nonattainment areas.
- (2) Sulfur dioxide is a precursor to PM<sub>2.5</sub> in all PM<sub>2.5</sub> nonattainment areas.
- (3) Nitrogen oxides are presumed to be precursors to PM<sub>2.5</sub> in all PM<sub>2.5</sub> nonattainment areas, unless the State demonstrates to the Administrator’s satisfaction or EPA demonstrates that emissions of nitrogen oxides from sources in a specific area are not a significant contributor to that area’s ambient PM<sub>2.5</sub> concentrations.
- (4) Volatile organic compounds and ammonia are presumed not to be precursors to PM<sub>2.5</sub> in any PM<sub>2.5</sub> nonattainment area, unless the State demonstrates to the Administrator’s satisfaction or EPA demonstrates that emissions of volatile organic compounds or ammonia from sources in a specific area are a significant contributor to that area’s ambient PM<sub>2.5</sub> concentrations; or

(D) PM<sub>2.5</sub> emissions and PM<sub>10</sub> emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011 (or any earlier date established in the upcoming rulemaking

codifying test methods), such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM<sub>2.5</sub> and PM<sub>10</sub> in nonattainment major NSR permits. Compliance with emissions limitations for PM<sub>2.5</sub> and PM<sub>10</sub> issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

\* \* \* \* \*

(9)(i) The plan shall require that in meeting the emissions offset requirements of paragraph (a)(3) of this section, the ratio of total actual emissions reductions to the emissions increase shall be at least 1:1 unless an alternative ratio is provided for the applicable nonattainment area in paragraphs (a)(9)(ii) through (a)(9)(iv) of this section.

\* \* \* \* \*

(11) The plan shall require that in meeting the emissions offset requirements of paragraph (a)(3) of this section, the emissions offsets obtained shall be for the same regulated NSR pollutant unless interprecursor offsetting is permitted for a particular pollutant as specified in this paragraph. The plan may allow the offset requirements in paragraph (a)(3) of this section for direct PM<sub>2.5</sub> emissions or emissions of precursors of PM<sub>2.5</sub> to be satisfied by offsetting reductions in direct PM<sub>2.5</sub> emissions or emissions of any PM<sub>2.5</sub> precursor identified under paragraph (a)(1)(xxxvii)(C) of this section if such offsets comply with the interprecursor trading hierarchy and ratio established in the approved plan for a particular nonattainment area.

\* \* \* \* \*

■ 3. Section 51.166 is amended as follows:

- a. By revising paragraphs (b)(23)(i) and (b)(49)(i);
- b. By removing the word “or” at the end of paragraph (b)(49)(iii);
- c. By adding and reserving paragraph (b)(49)(v);
- d. By adding paragraph (b)(49)(vi); and
- e. By revising paragraphs (i)(5)(ii) and (i)(5)(iii).

**§ 51.166 Prevention of significant deterioration of air quality.**

\* \* \* \* \*

(b) \* \* \*

(23)(i) *Significant* means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

**Pollutant and Emissions Rate**

- Carbon monoxide: 100 tons per year (tpy)
- Nitrogen oxides: 40 tpy
- Sulfur dioxide: 40 tpy
- Particulate matter: 25 tpy of particulate matter emissions. 15 tpy of PM<sub>10</sub> emissions
- PM<sub>2.5</sub>: 10 tpy of direct PM<sub>2.5</sub> emissions; 40 tpy of sulfur dioxide emissions; 40 tpy of nitrogen oxide emissions unless demonstrated not to be a PM<sub>2.5</sub> precursor under paragraph (b)(49) of this section
- Ozone: 40 tpy of volatile organic compounds or nitrogen oxides
- Lead: 0.6 tpy
- Fluorides: 3 tpy
- Sulfuric acid mist: 7 tpy
- Hydrogen sulfide (H<sub>2</sub>S): 10 tpy
- Total reduced sulfur (including H<sub>2</sub>S): 10 tpy
- Reduced sulfur compounds (including H<sub>2</sub>S): 10 tpy
- Municipal waste combustor organics (measured as total tetra-through octa-chlorinated dibenzo-p-dioxins and dibenzofurans): 3.2 × 10<sup>-6</sup> megagrams per year (3.5 × 10<sup>-6</sup> tons per year)
- Municipal waste combustor metals (measured as particulate matter): 14 megagrams per year (15 tons per year)
- Municipal waste combustor acid gases (measured as sulfur dioxide and hydrogen chloride): 36 megagrams per year (40 tons per year)
- Municipal solid waste landfill emissions (measured as nonmethane organic compounds): 45 megagrams per year (50 tons per year)

\* \* \* \* \*

(49) \* \* \*

(i) Any pollutant for which a national ambient air quality standard has been promulgated and any pollutant identified under this paragraph (b)(49)(i) as a constituent or precursor to such pollutant. Precursors identified by the Administrator for purposes of NSR are the following:

(a) Volatile organic compounds and nitrogen oxides are precursors to ozone in all attainment and unclassifiable areas.

(b) Sulfur dioxide is a precursor to PM<sub>2.5</sub> in all attainment and unclassifiable areas.

(c) Nitrogen oxides are presumed to be precursors to PM<sub>2.5</sub> in all attainment and unclassifiable areas, unless the State demonstrates to the Administrator's satisfaction or EPA demonstrates that emissions of nitrogen oxides from sources in a specific area are not a significant contributor to that area's ambient PM<sub>2.5</sub> concentrations.

(d) Volatile organic compounds are presumed not to be precursors to PM<sub>2.5</sub> in any attainment or unclassifiable area, unless the State demonstrates to the Administrator's satisfaction or EPA demonstrates that emissions of volatile organic compounds from sources in a specific area are a significant contributor to that area's ambient PM<sub>2.5</sub> concentrations.

\* \* \* \* \*

(v) [Reserved.]

(vi) Particulate matter (PM) emissions, PM<sub>2.5</sub> emissions, and PM<sub>10</sub> emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011 (or any earlier date established in the upcoming rulemaking codifying test methods), such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> in PSD permits. Compliance with emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

\* \* \* \* \*

(i) \* \* \*

(5) \* \* \*

(ii) The concentrations of the pollutant in the area that the source or modification would affect are less than the concentrations listed in paragraph (i)(5)(i) of this section; or

(iii) The pollutant is not listed in paragraph (i)(5)(i) of this section.

\* \* \* \* \*

■ 4. Appendix S to Part 51 is amended as follows:

■ a. By revising paragraphs II.A.10(i) and II.A.31;

■ b. By revising paragraph IV.A, Condition 3;

■ c. By redesignating paragraphs IV.G.1 through IV.G.3 as paragraphs IV.G.2

through IV.G.4, respectively, and adding new paragraph IV.G.1;

■ d. By removing from newly redesignated paragraph IV.G.3 the reference to "paragraph IV.G.1" and adding in its place "paragraph IV.G.2"; and

■ e. By adding paragraph IV.G.5.

**Appendix S to Part 51—Emission Offset Interpretative Ruling**

\* \* \* \* \*

II. \* \* \*

A. \* \* \*

10. (i) *Significant* means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

**Pollutant and Emissions Rate**

- Carbon monoxide: 100 tons per year (tpy)
- Nitrogen oxides: 40 tpy
- Sulfur dioxide: 40 tpy
- Ozone: 40 tpy of volatile organic compounds or nitrogen oxides
- Lead: 0.6 tpy
- Particulate matter: 25 tpy of particulate matter emissions
- PM<sub>10</sub>: 15 tpy
- PM<sub>2.5</sub>: 10 tpy of direct PM<sub>2.5</sub> emissions; 40 tpy of sulfur dioxide emissions

\* \* \* \* \*

31. *Regulated NSR pollutant*, for purposes of this Ruling, means the following:

(i) Nitrogen oxides or any volatile organic compounds;

(ii) Any pollutant for which a national ambient air quality standard has been promulgated;

(iii) Any pollutant that is identified under this paragraph II.A.31(iii) as a constituent or precursor of a general pollutant listed under paragraph II.A.31(i) or (ii) of this Ruling, provided that such constituent or precursor pollutant may only be regulated under NSR as part of regulation of the general pollutant. Precursors identified by the Administrator for purposes of NSR are the following:

(a) Volatile organic compounds and nitrogen oxides are precursors to ozone in all ozone nonattainment areas.

(b) Sulfur dioxide is a precursor to PM<sub>2.5</sub> in all PM<sub>2.5</sub> nonattainment areas; or

(iv) Particulate matter (PM) emissions, PM<sub>2.5</sub> emissions and PM<sub>10</sub> emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011 (or any earlier date established in the upcoming rulemaking codifying test methods), such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> in permits issued under this ruling. Compliance with emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be

considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

\* \* \* \* \*

IV. \* \* \*  
 A. \* \* \*

**Condition 3.** Emission reductions (*offsets*) from existing sources<sup>5</sup> in the area of the proposed source (whether or not under the same ownership) are required such that there will be reasonable progress toward attainment of the applicable NAAQS.<sup>6</sup> Except as provided in paragraph IV.G.5 of this Ruling (addressing PM<sub>2.5</sub> and its precursors), only intrapollutant emission offsets will be acceptable (e.g., hydrocarbon increases may not be offset against SO<sub>2</sub> reductions).

<sup>5</sup> Subject to the provisions of paragraph IV.C of this Ruling.

<sup>6</sup> The discussion in this paragraph is a proposal, but represents EPA's interim policy until final rulemaking is completed.

\* \* \* \* \*

G. *Offset ratios.*

1. In meeting the emissions offset requirements of paragraph IV.A, Condition 3 of this Ruling, the ratio of total actual emissions reductions to the emissions increase shall be at least 1:1 unless an alternative ratio is provided for the applicable nonattainment area in paragraphs IV.G.2 through IV.G.4.

\* \* \* \* \*

5. *Interpollutant offsetting.* In meeting the emissions offset requirements of paragraph IV.A, Condition 3 of this Ruling, the emissions offsets obtained shall be for the same regulated NSR pollutant unless interpollutant offsetting is permitted for a particular pollutant as specified in this paragraph IV.G.5. The offset requirements of paragraph IV.A, Condition 3 of this Ruling for direct PM<sub>2.5</sub> emissions or emissions of precursors of PM<sub>2.5</sub> may be satisfied by offsetting reductions of direct PM<sub>2.5</sub> emissions or emissions of any PM<sub>2.5</sub> precursor identified under paragraph II.A.31 (iii) of this Ruling if such offsets comply with an interprecursor trading hierarchy and ratio approved by the Administrator.

\* \* \* \* \*

**PART 52—[AMENDED]**

■ 5. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

**Subpart A—[Amended]**

■ 6. Section 52.21 is amended as follows:

- a. By revising paragraphs (b)(23)(i) and (b)(50)(i);
- b. By removing the word “or” at the end of paragraph (b)(50)(iii);
- c. By adding and reserving paragraph (b)(50)(v);
- d. By adding paragraphs (b)(50)(vi) and (i)(1)(xi);
- e. By revising paragraph (i)(5)(ii); and
- f. By adding paragraph (i)(5)(iii).

**§ 52.21 Prevention of significant deterioration of air quality.**

\* \* \* \* \*

(b) \* \* \*

(23)(i) Significant means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

**Pollutant and Emissions Rate**

- Carbon monoxide: 100 tons per year (tpy)
- Nitrogen oxides: 40 tpy
- Sulfur dioxide: 40 tpy
- Particulate matter: 25 tpy of particulate matter emissions
- PM<sub>10</sub>: 15 tpy
- PM<sub>2.5</sub>: 10 tpy of direct PM<sub>2.5</sub> emissions; 40 tpy of sulfur dioxide emissions; 40 tpy of nitrogen oxide emissions unless demonstrated not to be a PM<sub>2.5</sub> precursor under paragraph (b)(50) of this section
- Ozone: 40 tpy of volatile organic compounds or nitrogen oxides
- Lead: 0.6 tpy
- Fluorides: 3 tpy
- Sulfuric acid mist: 7 tpy
- Hydrogen sulfide (H<sub>2</sub>S): 10 tpy
- Total reduced sulfur (including H<sub>2</sub>S): 10 tpy
- Reduced sulfur compounds (including H<sub>2</sub>S): 10 tpy
- Municipal waste combustor organics (measured as total tetra-through octa-chlorinated dibenzo-p-dioxins and dibenzofurans): 3.2 × 10<sup>6</sup> megagrams per year (3.5 × 10<sup>6</sup> tons per year)
- Municipal waste combustor metals (measured as particulate matter): 14 megagrams per year (15 tons per year)
- Municipal waste combustor acid gases (measured as sulfur dioxide and hydrogen chloride): 36 megagrams per year (40 tons per year)
- Municipal solid waste landfills emissions (measured as nonmethane organic compounds): 45 megagrams per year (50 tons per year)

\* \* \* \* \*

(50) \* \* \*

(i) Any pollutant for which a national ambient air quality standard has been promulgated and any pollutant identified under this paragraph (b)(50)(i) as a constituent or precursor for such pollutant. Precursors identified by the Administrator for purposes of NSR are the following:

- (a) Volatile organic compounds and nitrogen oxides are precursors to ozone in all attainment and unclassifiable areas.
- (b) Sulfur dioxide is a precursor to PM<sub>2.5</sub> in all attainment and unclassifiable areas.

(c) Nitrogen oxides are presumed to be precursors to PM<sub>2.5</sub> in all attainment and unclassifiable areas, unless the State demonstrates to the Administrator's satisfaction or EPA demonstrates that emissions of nitrogen oxides from sources in a specific area are not a significant contributor to that area's ambient PM<sub>2.5</sub> concentrations.

(d) Volatile organic compounds are presumed not to be precursors to PM<sub>2.5</sub> in any attainment or unclassifiable area, unless the State demonstrates to the Administrator's satisfaction or EPA demonstrates that emissions of volatile organic compounds from sources in a specific area are a significant contributor to that area's ambient PM<sub>2.5</sub> concentrations.

\* \* \* \* \*

(v) [Reserved.]

(vi) Particulate matter (PM) emissions, PM<sub>2.5</sub> emissions and PM<sub>10</sub> emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011 (or any earlier date established in the upcoming rulemaking codifying test methods), such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> in PSD permits. Compliance with emissions limitations for PM, PM<sub>2.5</sub> and PM<sub>10</sub> issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

\* \* \* \* \*

(i) \* \* \*

(1) \* \* \*

(xi) The source or modification was subject to 40 CFR 52.21, with respect to PM<sub>2.5</sub>, as in effect before July 15, 2008, and the owner or operator submitted an application for a permit under this section before that date consistent with EPA recommendations to use PM<sub>10</sub> as a surrogate for PM<sub>2.5</sub>, and the Administrator subsequently determines that the application as submitted was complete with respect to the PM<sub>2.5</sub> requirements then in effect, as interpreted in the EPA memorandum entitled “Interim Implementation of New Source Review Requirements for PM<sub>2.5</sub>” (October 23, 1997). Instead, the requirements of paragraphs (j) through

(r) of this section, as interpreted in the aforementioned memorandum, that were in effect before July 15, 2008 shall apply to such source or modification.

\* \* \* \* \*

(5) \* \* \*

(ii) The concentrations of the pollutant in the area that the source or modification would affect are less than the concentrations listed in paragraph (i)(5)(i) of this section; or

(iii) The pollutant is not listed in paragraph (i)(5)(i) of this section.

\* \* \* \* \*

[FR Doc. E8-10768 Filed 5-15-08; 8:45 am]  
 BILLING CODE 6560-50-P

**DEPARTMENT OF HOMELAND SECURITY**

**Federal Emergency Management Agency**

**44 CFR Part 67**

**Final Flood Elevation Determinations**

**AGENCY:** Federal Emergency Management Agency, DHS.

**ACTION:** Final rule.

**SUMMARY:** Base (1% annual chance) Flood Elevations (BFEs) and modified BFEs are made final for the communities listed below. The BFEs and modified BFEs are the basis for the floodplain management measures that each community is required either to adopt or to show evidence of being already in effect in order to qualify or remain qualified for participation in the National Flood Insurance Program (NFIP).

**DATES:** The date of issuance of the Flood Insurance Rate Map (FIRM) showing

BFEs and modified BFEs for each community. This date may be obtained by contacting the office where the maps are available for inspection as indicated on the table below.

**ADDRESSES:** The final BFEs for each community are available for inspection at the office of the Chief Executive Officer of each community. The respective addresses are listed in the table below.

**FOR FURTHER INFORMATION CONTACT:** William R. Blanton, Jr., Engineering Management Branch, Mitigation Directorate, Federal Emergency Management Agency, 500 C Street, SW., Washington, DC 20472, (202) 646-3151.

**SUPPLEMENTARY INFORMATION:** The Federal Emergency Management Agency (FEMA) makes the final determinations listed below for the modified BFEs for each community listed. These modified elevations have been published in newspapers of local circulation and ninety (90) days have elapsed since that publication. The Assistant Administrator of the Mitigation Directorate has resolved any appeals resulting from this notification.

This final rule is issued in accordance with section 110 of the Flood Disaster Protection Act of 1973, 42 U.S.C. 4104, and 44 CFR part 67. FEMA has developed criteria for floodplain management in floodprone areas in accordance with 44 CFR part 60.

Interested lessees and owners of real property are encouraged to review the proof Flood Insurance Study and FIRM available at the address cited below for each community. The BFEs and modified BFEs are made final in the communities listed below. Elevations at selected locations in each community are shown.

**National Environmental Policy Act.** This final rule is categorically excluded from the requirements of 44 CFR part 10, Environmental Consideration. An environmental impact assessment has not been prepared.

**Regulatory Flexibility Act.** As flood elevation determinations are not within the scope of the Regulatory Flexibility Act, 5 U.S.C. 601-612, a regulatory flexibility analysis is not required.

**Regulatory Classification.** This final rule is not a significant regulatory action under the criteria of section 3(f) of Executive Order 12866 of September 30, 1993, Regulatory Planning and Review, 58 FR 51735.

**Executive Order 13132, Federalism.** This final rule involves no policies that have federalism implications under Executive Order 13132.

**Executive Order 12988, Civil Justice Reform.** This final rule meets the applicable standards of Executive Order 12988.

**List of Subjects in 44 CFR Part 67**

Administrative practice and procedure, Flood insurance, Reporting and recordkeeping requirements.

■ Accordingly, 44 CFR part 67 is amended as follows:

**PART 67—[AMENDED]**

■ 1. The authority citation for part 67 continues to read as follows:

**Authority:** 42 U.S.C. 4001 *et seq.*; Reorganization Plan No. 3 of 1978, 3 CFR, 1978 Comp., p. 329; E.O. 12127, 44 FR 19367, 3 CFR, 1979 Comp., p. 376.

**§ 67.11 [Amended]**

■ 2. The tables published under the authority of § 67.11 are amended as follows:

Flooding source(s)	Location of referenced elevation	* Elevation in feet (NGVD) + Elevation in feet (NAVD) # Depth in feet above ground Modified	Communities affected
<b>Randolph County, Illinois, and Incorporated Areas</b> <b>Docket No.: FEMA-B-7740</b>			
Kaskaskia River .....	At confluence with Mississippi River .....	+392	Village of Evansville, Unincorporated Areas of Randolph County.
	Randolph/Monroe County boundary (approximately 700 feet upstream Anna Lane extended).	+392	
Mississippi River .....	Jackson/Randolph County boundary (approximately Cora Road extended).	+382	City of Chester, Unincorporated Areas of Randolph County, Village of Kaskaskia, Village of Prairie Du Rocher, Village of Rockwood.

Page 234 of 2671

Many different substances can be components of PM-10, including dust, dirt, soot, smoke, and "secondary particulates." The latter are formed by the transformation of pollutant gases such as sulfur dioxide, nitrogen oxides, or volatile organic compounds into airborne particulates.

#### HEALTH EFFECTS OF PM-10

High levels of PM-10 can produce an array of adverse health effects, ranging from temporary reductions in lung capacity, to aggravation of pre-existing respiratory diseases, to cancer and premature death.

Children are especially vulnerable to PM-10 due to their high respiratory rates and small lungs. A recent study in Utah found that hospital admissions for children with respiratory disease (pneumonia, pleurisy, and bronchitis) were three times higher than normal during months in which the federal PM-10 standards were exceeded. Other vulnerable populations include the elderly, asthmatics, and victims of respiratory disease.

Certain types of PM-10 pose special health risks. On especially dangerous component of PM-10 is the carbon-based particles that result from incomplete combustion in diesel engines. EPA has concluded that these particulates—which are emitted in the exhaust of diesel trucks, buses, and other vehicles—may cause as many as 860 cancer cases annually. Particulates from wood stoves have similar hazardous characteristics.

Sulfates and nitrates, also called acid aerosols, are another dangerous type of particulate. These are secondary particulates that form from emissions of sulfur dioxide and nitrogen oxides. Acid aerosols can sear sensitive lung tissues when inhaled. According to the Office of Technology Assessment, they could cause thousands of excess deaths each year.

Even small dust particles can be hazardous, because they build up in the lungs over time and impair breathing capacity.

#### ENVIRONMENTAL AND WELFARE EFFECTS

PM-10 pollution—especially PM-10 pollution less than 2.5 microns in diameter—impairs visibility. Along the East Coast, summer used to be the season of best visibility, but over the past 30 years it has become the season of worst visibility. EPA has linked this decline in visibility to PM-10 pollution. The National Park Service has reported that particulate pollution, especially fine sulfate particles, impairs scenic vistas within the national park system 90% of the time.

PM-10 also soils materials and building surfaces. According to an EPA estimate, the damage is about \$1 to \$2 billion annually.

#### SOURCES OF PM-10 POLLUTION

There are two basic sources of particulate pollution: natural sources and man-made sources. In turn, within the broad category of man-made sources, there are three major subsets of sources: fugitive emissions (e.g., dust and dirt), direct emissions (e.g., diesel particulates and wood smoke), and secondary particulates (e.g., sulfates and nitrates). The

### PM-10 PROVISIONS

H.R. 3030 substantially revises the regulation of particulate matter. EPA has promulgated a change from implementing standards for total suspended particulates (TSP) to standards for the fraction of particulates below a certain particle size, called PM-10. The steel industry has been contesting the basis for these new standards. If not implemented in a reasonable and cost effective manner, attainment with PM-10 standards could be very costly to the industry, with very little associated improvement in public health protection.

The title I PM-10 provisions of H.R. 3030 somewhat reschedule the attainment dates that would otherwise apply under the PM-10 standards as promulgated by EPA. The fundamental control strategy appears to be RACT requirements. As long as the Agency and the States implement RACT in a truly reasonable manner, the consequences of PM-10 control for the steel industry may be manageable. If overly stringent controls result from the new title I PM-10 subpart added to the Clean Air Act by H.R. 3030, however, it could impose a very costly burden on the steel industry. As I noted earlier, the steel industry has already achieved reductions in particulate matter greater than 90 percent from uncontrolled levels.

This is not intended to be an exhaustive list of the steel industry's concern with clean air legislation. I did want, Mr. Speaker, to provide my colleagues with a idea of the areas of greatest concern to the steel industry. Again, I thank the members of the Energy and Commerce Committee for the many improvements they made in this legislation. I hope they will continue to follow this approach in the upcoming conference with the Senate.

Mr. WOLPE. Mr. Chairman, I rise in strong support of H.R. 3030, the Clean Air Act Amendments of 1990, and I commend Mr. Dingell and Mr. Waxman and the other members of the Energy and Commerce Committee for all their diligent effort over many months which produced this extraordinary piece of environmental legislation.

The Clean Air Act, first enacted in 1970, is the cornerstone of our public health and environmental protection efforts. For more than a decade, Congress has been sharply divided over the issue of clean air. Today, however, the House is on the verge of passing landmark legislation. The House clean air bill far surpasses both the version of the legislation initially crafted by the administration, and the bill passed by the Senate. The bill before us today would not have been possible to achieve had it not been for the incredible grassroots effort by citizens all across the country. The House bill is both stronger from an environmental standpoint and more flexible and cheaper for industry to implement.

This legislation reflects a new public--and congressional--awareness that clean air is not simply a matter of aesthetics; it is also a matter of economics and survival. Indeed, we are today paying dearly for our earlier inability to recognize the economic and human consequences of our failure to provide adequate protection for our environment. The truth is that our future economic growth is directly dependent on the health and stability of our environment and resource base.

The clean air bill we are debating today represents a light-year's advance in our thinking in yet another respect: We are beginning to understand that pollution prevention must be given much higher priority in the management of our hazardous wastes. My hope is that we will not only insist on the toughest possible enforcement but that we will move

### TOMORROW: Teleconference with Health, Environment and Legal Experts

Regarding Friday's Oral Arguments in Lawsuits over EPA's Cross-State Air Pollution Rule

This Friday, U.S. Court of Appeals for the District of Columbia Circuit will hear oral arguments in lawsuits over the Environmental Protection Agency's (EPA) Cross-State Air Pollution Rule.

The Cross-State Air Pollution Rule reduces the sulfur dioxide and oxides of nitrogen pollution (key contributors to harmful particulate pollution and smog) emitted from coal-fired power plants across 28 eastern states. That pollution drifts across the borders of those states, contributing to dangerous -- and sometimes lethal -- levels of particulate and smog pollution in downwind states.

EPA estimates that the Cross-State Air Pollution Rule, when fully implemented, will:

\*Save up to 34,000 lives each year

\*Prevent 15,000 heart attacks each year

\*Prevent 400,000 asthma attacks each year

\*Provide \$120 billion to \$280 billion in health benefits for the nation each year

Nine states (Connecticut, Delaware, Illinois, Massachusetts, Maryland, New York, North Carolina, Rhode Island, Vermont), five major cities (District of Columbia, Baltimore, Bridgeport, Chicago, New York and Philadelphia), health and environmental organizations (the American Lung Association, the Clean Air Council, Environmental Defense Fund, NRDC, Sierra Club) and major power companies (Calpine, Exelon and Public Service Enterprise Group) have all intervened in support of these vital clean air protections. (Click here to see the briefs that have been filed in the case)

Tomorrow, lawyers and experts for some of those health and environmental groups will hold a teleconference with members of the media. The panelists will be happy to answer questions from all participating journalists.

WHAT: Teleconference with Health and Environment and Legal Experts about Lawsuits over EPA's Cross-State Air Pollution Rule

WHEN: Thursday, April 12 at 11:00 a.m. Eastern time

WHO: Sean Donahue, counsel for EDF, and presenting arguments for environmental intervenors

Janice Nolen, Assistant Vice President of the American Lung Association

Zachary Fabish, Associate Attorney for Sierra Club

WHERE: Call – 800-743-4304 (no passcode required)

###

#### About the American Lung Association

Now in its second century, the American Lung Association is the leading organization working to save lives by improving lung health and preventing lung disease. With your generous support, the American Lung Association is "Fighting for Air" through research, education and advocacy. For more information about the American Lung Association, a Charity Navigator Four Star Charity and holder of the Better Business Bureau Wise Giving Guide Seal, or to support the work it does, call 1-800-LUNG-USA (1-800-586-4872) or visit [www.lung.org](http://www.lung.org)

Environmental Defense Fund ([edf.org](http://edf.org)), a leading national nonprofit organization, creates transformational solutions to the most serious environmental problems. EDF links science, economics,

law and innovative private-sector partnerships. See [twitter.com/EnvDefenseFund](https://twitter.com/EnvDefenseFund); [facebook.com/EnvDefenseFund](https://facebook.com/EnvDefenseFund)

Sierra Club is the nation's largest grassroots environmental organization with more than 1.4 million members and supporters nationwide. Since 2002, Sierra Club's Beyond Coal campaign has successfully stopped 161 new coal plant proposals from moving forward, and is working to move our nation beyond coal to a clean, safe energy economy.

Lead poisoning from gold mining. In the Nigerian state of Zamfara, a gold boom has led to a medical disaster with more than 400 children dead from lead poisoning and thousands sickened. It is believed to be the worst lead poisoning epidemic in modern history. Living On Earth  
<http://www.loe.org/shows/segments.html?programID=12-P13-00015&segmentID=1>

Can science be bought? Opponents in fracking debate discredit each other's research. In several cases, those on both sides of the argument over hydraulic fracturing have moved quickly to downplay or discredit scientific studies based on the source of their funding. Ithaca Journal, New York.  
<http://www.theithacajournal.com/article/20120413/NEWS01/204130366/Can-science-bought-Opponents-fracking-debate-discredit-each-other-s-research?odyssey=mod%7Cnewswell%7Ctext%7CFRONTPAGE%7Cp>

Power brokers: How the Ithaca-based Park Foundation is fueling the fight against fracking. The Park Foundation hasn't been on the front lines trying to beat back attempts to tap into the state's portion of the gas-rich Marcellus Shale. But the decades-old, Ithaca-based philanthropic foundation has quickly become one of the natural-gas industry's top targets. Ithaca Journal, New York.  
<http://www.theithacajournal.com/article/20120413/NEWS01/204130367/Power-brokers-How-the-Ithaca-based-Park-Foundation-is-fueling-the-fight-against-fracking>

Hydraulic fracturing: Obama sets up unconventional gas working group. The White House is setting up a new interagency working group to promote the safe development of domestic natural gas, President Obama announced today. Greenwire  
<http://www.eenews.net/public/Greenwire/2012/04/13/1>

Fracking water linked to earthquakes. The use of underground wells to dispose of waste water produced by fracking – the process used to unlock oil and gas deposits hidden deep in rock formations – is “almost certainly” behind the surge in earthquakes in the central US in recent years, a government study has found. Financial Times, United Kingdom.

Dental X-rays: Little and not often, please. These days, the main source of ionising radiation for most people is neither fallout from bombs nor radiotherapy; it is dental X-rays. Despite that, surprisingly little

research has been done on those X-rays' effects. Economist  
<http://www.economist.com/node/21552538>

Japan seeks to restart some nuclear power plants. Hoping to avert potentially devastating summer power shortages, Prime Minister Yoshihiko Noda said Friday that his government would seek to restart two nuclear reactors, in what would be a first step toward ending an almost complete shutdown of the nation's nuclear power industry. New York Times [Registration Required]  
<http://www.nytimes.com/2012/04/14/world/asia/japan-seeks-to-restart-some-nuclear-reactors.html>

Italy's 'triangle of death' linked to premature ageing. An area of Italy's Campania region - between Acerra, Nola and Marigliano - has been dubbed the "triangle of death" for the high number of fatalities from cancer found there. Birth defects are also common. Now, studies show that residents are aging more quickly there. New Scientist  
<http://www.newscientist.com/article/mg21428604.100-italys-triangle-of-death-linked-to-premature-ageing.html>

Judges sharply question EPA, petitioners during cross-state rule arguments. In a vigorously contested oral argument, a federal appeals court today considered the legality of a key Obama administration regulation aimed at limiting air pollution that crosses state lines. Greenwire  
<http://www.eenews.net/public/Greenwire/2012/04/13/2>

Temperature variations lower life expectancies in the chronically ill. Researchers have found that it isn't just temperature extremes that pose risks to human health; sudden temperature changes can also increase mortality. ClimateWire  
<http://www.eenews.net/public/climatewire/2012/04/13/1>

Water shortages: Ms Fang's parched patch. Like many in south-west China over the past three years, Fang Haixin, a subsistence farmer near the village of Huopu in western Guizhou province, has learnt to grapple with the sort of drought conditions that, until now, were more commonly a feature of China's dry northern plains. Economist  
<http://www.economist.com/node/21552583>

Obama's green jobs have been slow to sprout. The millions of "green jobs" Obama promised have been slow to sprout, disappointing many. Supporters say the administration over-promised on the jobs front and worry that a backlash could undermine support for clean-energy policies in general. Reuters  
<http://www.reuters.com/article/2012/04/13/us-usa-campaign-green-idUSBRE83C08D20120413>

Northwest coal export projects could have 'significant' public health impacts, EPA says. The Environmental Protection Agency wants a thorough review of the consequences of coal export through Northwest ports, saying the first project in the pipeline -- at Oregon's Port of Morrow -- "has the potential to significantly impact human health and the environment." Portland Oregonian, Oregon.  
[http://www.oregonlive.com/environment/index.ssf/2012/04/northwest\\_coal\\_export\\_projects.html](http://www.oregonlive.com/environment/index.ssf/2012/04/northwest_coal_export_projects.html)

Zimbabwe ill-prepared for climate change challenges – experts. Zimbabwe's lack of preparedness for the impact of climate change is coming under increasing scrutiny, as the nation faces another year of drought and the government admits it has done little to mitigate the crisis. Reuters  
<http://www.trust.org/alertnet/news/zimbabwe-ill-prepared-for-climate-change-challenges>

Homegrown power for auto plants. Acknowledging that it makes little sense to spend billions to develop electric cars if charging their batteries produces roughly the same amount of carbon dioxide as the most efficient gasoline models, some European automakers are investing directly in renewable energy. New York Times [Registration Required]  
<http://www.nytimes.com/2012/04/15/automobiles/in-europe-homegrown-power-for-auto-plants.html>

'Water schools' foster more sustainable habits in Mexico. So-called water schools, which educate communities on the resource and its links with the environment, gender and climate change, are

helping to raise awareness on proper water management in Mexico, at a time of severe drought. Inter Press Service  
<http://www.ipsnews.net/news.asp?idnews=107430>

US House to try again to advance Keystone pipeline. US House Speaker John Boehner will make a new attempt to force approval of the stalled Keystone XL oil pipeline as part of legislation for another 90-day extension of federal road, bridge and transit construction funding, Republican aides said on Friday. Reuters  
<http://news.yahoo.com/house-try-again-advance-keystone-pipeline-165349502.html>

The long fight. A prominent activist in the fight to expose toxic emissions in the Town of Tonawanda's industrial section said on Friday that the battle to reign in polluters like Tonawanda Coke is far from over. North Tonawanda News, New York.  
[http://tonawanda-news.com/top\\_stories/x1789088130/The-long-fight](http://tonawanda-news.com/top_stories/x1789088130/The-long-fight)

Unexpected ally helps Wal-mart cut waste. Michelle Harvey, an employee of the Environmental Defense Fund, has a security badge to a site that used to be considered enemy territory: the headquarters of Wal-Mart Stores in Bentonville, Ark. New York Times [Registration Required]  
<http://www.nytimes.com/2012/04/14/business/wal-mart-and-environmental-fund-team-up-to-cut-waste.html>

EPA's 'no plans' stance on existing power plants doesn't jibe with text of GHG rule

Jean Chemnick, E&E reporter

Published: Tuesday, April 17, 2012

Environmentalists and industry advocates who battle constantly on climate change issues have found common ground.

Both sides agree that U.S. EPA intends to promulgate a rule limiting emissions of heat-trapping greenhouse gases from existing power plants.

As evidence, both point to the proposed emissions rule released last month for new power plants that refers in several places to a future standard for existing emission sources.

The proposed new-source standard -- 1,000 pounds of carbon dioxide per megawatt-hour -- doesn't apply to existing power plants that are modified to comply with other air pollution rules and increase CO2 emissions, EPA explains on page 52 of the proposed rule, because "those projects would involve equipment changes to improve efficiency to meet the requirements of a future [Clean Air Act, Section] 111(d) rulemaking for existing sources."

And EPA says on page 268 that in addition to limiting greenhouse gas emissions from future power plants, the proposed new source rule "serves as a necessary predicate for the regulation of existing sources within this source category under section 111(d)."

The Office of Management and Budget appears to have trimmed other, more explicit references to EPA's future plans that were part of the rule when it arrived for review at the White House.

Left on OMB's cutting-room floor: "At a future date, EPA intends to promulgate emission guidelines for states to develop plans reducing CO2 emissions from existing fossil-fuel-fired" power plants.

EPA officials have been as vague in recent months, with Administrator Lisa Jackson and air chief Gina McCarthy insisting on Capitol Hill, in blog posts and elsewhere that the agency has "no plans" to regulate greenhouse gas emissions from existing power plants.

But EPA is required to do just that under Section 111 of the Clean Air Act. And environmentalists -- including groups that have sued EPA to regulate CO2 -- have expressed no concern that that agency might renege on its court-ordered agreement to introduce new source performance standards for new and existing power plants and petroleum refineries.

Environmentalists are generally reluctant to discuss EPA not having plans for existing sources. David Doniger of the Natural Resources Defense Council, a plaintiff, responded to EPA's stance in an interview last month by saying he had "no plans" to return to court. He declined to comment for this story.

Megan Ceronsky, an attorney with the Environmental Defense Fund, said changes made at OMB "appear to be focusing on the new source proposal on new sources, and clarifying that the administration is not currently proposing standards for existing sources."

"EDF firmly believes that common sense standards can be designed for existing sources that will mobilize solutions such as demand-side energy efficiency to reduce heat-trapping emissions and other harmful air pollutants while saving families and businesses money and strengthening the economy," she added.

Jeff Holmstead, who was EPA air chief under President George W. Bush and is now a partner at Bracewell & Giuliani, said it is interesting to see EPA taking such a careful stance on its future

greenhouse gas rules, which are certain to come. He attributed that caution to election-year strategy by the Obama White House.

"My impression is that there was a lot of discussion back and forth between the White House and EPA, and EPA was really pushing to get this out and the White House was really concerned about the politics of this," he said.

The final compromise between the agency and White House appears to be that EPA could release its new power plants standard but must stay mum about existing source standards, he said.

"That's just a way to get past the election without going another ox that could come back to hurt them," he said.

If EPA never promulgates existing-source rules, it will be sued, he said. But he said he expects the agency to roll them out after the November election.

Michael Livermore, who directs the Institute for Policy Integrity at New York University's School of Law, said EPA has a statutory obligation to write existing-source rules for greenhouse gases. He suggested the agency might want to avoid heightened speculation about what form those rules will take so early in the rulemaking process.

"They're trying to keep the focus on this rule, rather than on the rules that are on the horizon," he said. Existing-source rules, he said, could take months or years to write.

## FEATURED DECISION

*Rocky Mountain Farmers Union v. Goldstene* (9th Cir. April 23, 2012): added to the “challenges to state action” slide. The 9th Circuit held that California could continue to enforce its low-carbon fuel standard pending the state’s appeal of a December 2011 district court decision holding that the standard was unconstitutional. The decision in effect lifted an injunction issued by the district court pending appeal. In the December 2011 decision, the district court held that because the standard assigns more favorable carbon intensity values to corn-derived ethanol in California than to ethanol derived outside California, it impermissibly discriminates against out-of-state entities. In addition, the district court held that the standard impermissibly regulates channels of interstate commerce. The district court further held that although the standard serves a legitimate local purpose, that purpose could be accomplished through other nondiscriminatory means. The standard aims to reduce the carbon intensity of transportation fuels in California by at least 10 percent by 2020.

## DECISIONS AND SETTLEMENTS

*AES Corp. v. Steadfast Insurance Co.* (Vir. Sup. Ct. April 20, 2012): added to the “common law claims” slide under “money damages.” The Virginia Supreme Court reaffirmed its previous holding that an insurance company has no obligation to defend or indemnify an energy company against a lawsuit alleging that its greenhouse gas emissions were contributing to the destruction of an Alaskan village. AES was sued by the Alaskan coastal village of Kivalina, a case that is now before the 9th Circuit. The insurance company refused to defend or indemnify AES in the litigation, declaring that the damage allegedly caused by AES’s emissions was not the result of an accident or occurrence covered by its policy. AES sued the insurance company in Virginia state court, contending that the damages alleged by its emissions were the result of a covered occurrence. The trial court dismissed the case. AES appealed the case to the Virginia Supreme Court, which affirmed. AES requested a rehearing, which

the court granted. Upon rehearing, the court reaffirmed its prior holding, stating that the allegations by the village were that its damages were the result of AES's intentional actions and not an accident or other occurrence covered by the policy.

*Conservancy of Southwest Florida v. U.S. Fish and Wildlife Service* (11th Cir. April 18, 2012): added to the "Endangered Species Act" slide. The 11th Circuit affirmed a district court decision dismissing a lawsuit challenging the U.S. Fish and Wildlife Service's denial of petitions to designate critical habitat for the Florida panther. In 2009, several environmental advocacy groups petitioned the FWS to initiate such rulemaking, contending that the species was suffering a decline in population due to fragmentation and degradation of its habitat caused, in part, by climate change. The FWS denied the petitions on the grounds that the measures it was already taking were sufficient. The groups subsequently filed suit in federal court alleging that the denial violated the Administrative Procedure Act and the Endangered Species Act. The district court granted the FWS' motion to dismiss, holding that the FWS' decision was committed to agency discretion by law and thus it could not be reviewed. On appeal, the 11th Circuit affirmed on identical grounds.

*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (Cal. Ct. App. April 17, 2012): added to the "state NEPAs" slide. A California appellate court affirmed a ruling that held that a public authority responsible for constructing a light rail line connecting downtown Los Angeles with Santa Monica did not violate the California Environmental Quality Act (CEQA) when it analyzed the impact of the project on, among other things, greenhouse gas emissions using as baseline conditions projected for 2030. The court rejected the notion that CEQA forbids, as a matter of law, the use of projected conditions as a baseline. The petitioners had argued that CEQA required the authority to use baseline conditions that existed sometime between when the notice of preparation of the construction phase was filed in 2007 and when the authority certified the final environmental impact report (EIR) in 2010. The appellate court disagreed, holding that the project would not begin operating until 2015 at the earliest and thus its impact would yield no practical information to decision makers or the public until that time.

*Loorz v. Jackson* (D.D.C. April 2, 2012): added to the "common law claims" slide under "Public Trust Doctrine." A federal district court in Washington D.C. issued a decision allowing business groups to intervene in a lawsuit that seeks to require the federal government to establish a plan for an immediate cap on greenhouse gas emissions and start lowering these emissions by 6 percent a year beginning in 2013. Several advocacy groups, including Our Children's Trust, filed the federal lawsuit in May 2011 along with similar actions in many states. The lawsuit alleges that the federal government has a duty under the Public Trust Doctrine to reduce greenhouse gas emissions in the atmosphere. Thus far, none of the state actions have been successful.

*Sierra Club v. Mississippi Public Service Commission* (Miss. Sup. Ct. March 15, 2012): added to the "coal-fired power plant challenges" slide. In a unanimous decision, the Mississippi Supreme Court reversed a 2010 decision by the Mississippi Public Service Commission that permitted a company to construct a \$2.4 billion coal-fired power plant in Kemper County. The plant was to burn locally mined lignite coal and employ a novel type of Integrated Gasification Combined Cycle Gasification technology called "TRIG," which has never before been used on a commercial scale. The company proposed to capture the carbon dioxide associated with burning the gasified lignite and sell it to oil companies who would then sequester it in unidentified geologic formations. The Sierra Club challenged the approval on a number of grounds, including that the carbon sequestration plan had no buyer for the carbon dioxide and that the electricity that would be produced was not in fact needed. The Supreme Court, in a short opinion, held that the Commission's approval was not supported by substantial evidence and thus

remanded the case for further proceedings. A CCCL blog post examining this ruling is available [here](#).

*California Building Industry Association v. Bay Area Air Quality Management District* (Cal. Super. Ct. March 5, 2012): added to the “state NEPAs” slide. A California state court issued a decision ordering the Bay Area Air Quality Management District to set aside, depublish, and stop the circulation of thresholds of significance for greenhouse gas emissions when conducting CEQA analyses. The thresholds were intended to be used by the District and other local agencies in the San Francisco Bay Area to determine whether a local land use project would have significant air quality impacts under CEQA. In 2010, the District adopted a resolution which included numeric air quality thresholds, including greenhouse gas emissions, for analyses by lead agencies under CEQA. If a project’s emissions exceeded the thresholds, it would result in a finding of significant impact necessitating preparation of an EIR and adoption of mitigation measures. A building industry association filed suit, alleging that the District did not analyze the thresholds as a project under CEQA and failed to study their impact on future development patterns. The court agreed, holding that the thresholds should be set aside pending full CEQA compliance.

*New Energy Economy v. Vanzi* (N.M. Sup. Ct. Feb. 16, 2012): added to the “challenges to state action” slide. In a procedurally complex action, several nonprofit groups sought to participate in a proceeding challenging rules adopted by the New Mexico Environmental Improvement Board (EIB). Previously, New Energy Economy (NEE) petitioned the EIB to adopt a new rule, known as Rule 100, which cap greenhouse gas emissions from large power producers in the state. After the EIB adopted Rule 100 in December 2010, seven groups, including the New Mexico Public Service Commission (PSC) appealed EIB’s adoption of the rule. None of the parties who appealed the rule named NEE or any of the nonprofit groups as a party. In April 2011, NEE and the other nonprofits sought to intervene as a party in the appeal. The appellate court ordered mediation between EIB and PSC but denied the motions to intervene. Thus, the mediation included the seven groups opposing Rule 100 and the newly appointed members of EIB, now composed of members appointed by New Mexico Governor Susana Martinez, who publically opposed the rule. After the mediation began, PSC and EIB requested that the proceeding be remanded to EIB for further proceedings. On remand, the seven groups opposing the rule filed a new petition with EIB, essentially taking the role of petitioners to rescind or amend Rule 100. The nonprofit groups filed an appeal with the New Mexico Supreme Court seeking a writ of superintending control to overturn the appellate court’s decision denying their motions to intervene. The court granted the motions, holding that the appellate court did not have discretion to deny the motions given that the groups were proper parties to the proceeding and participated in a legally sufficient manner.

*Consolidated Irrigation District v. City of Selma* (Cal. Ct. App. Feb. 8, 2012): added to the “state NEPAs” slide. An irrigation district in California petitioned for a writ of mandate challenging the City of Selma’s use of a negative declaration under CEQA in approving a 160-unit, 44-acre residential development. The trial court granted the petition, holding among other things that the evidence presented supported a fair argument that the proposed development may have a significant effect on the environment. In particular, the court held that the negative declaration did not adequately address greenhouse gas emissions from the project. On appeal, the appellate court affirmed, holding that the irrigation district had standing to maintain the action and that the evidence in the record should not have been discounted by the city absent a credibility determination.

Sincerely,

Did N.J. make the right call in leaving RGGI?

Colin Sullivan, E&E reporter

Published: Friday, May 4, 2012

New Jersey officials this week dismissed claims that the state lost net value when it left the nine-state trading scheme known as the Regional Greenhouse Gas Initiative (RGGI), saying the fledgling market neither improved its economy nor reduced its contribution to climate change.

Led by Gov. Chris Christie (R), the Garden State pulled out of RGGI at the end of 2011 amid little fanfare. Christie called the system a backdoor carbon tax on electricity consumers in the Northeast that he could not support as a conservative with free-market roots.

New Jersey Gov. Chris Christie (R). Photo courtesy of Wikipedia.

Along the way, Christie vetoed legislation that would have put New Jersey back into the cap-and-trade system, which requires the region's power sector to cut its greenhouse gas emissions to 1990 levels by 2020. He also made light of the first-ever U.S. carbon market, calling it a "gimmicky" program that failed to achieve its intended aim since carbon permits were first auctioned in September 2008.

Christie, who says he believes in man-made global warming but does not support cap and trade, won praise from tea party activists and others on the right for his stand. Now that fervor is being matched by a backlash from the left. Sierra Club New Jersey just yesterday gave the governor an F on its environmental scorecard for, among other decisions, opting out of RGGI.

Also this week, a group called Environment Northeast issued a report that says New Jersey has missed out since ditching RGGI. The group hired a consulting firm to conduct an analysis of RGGI and found it had generated \$159 million in "net economic value" for New Jersey through 2011.

The report went on to suggest that a revamped RGGI that lowers carbon caps to current emissions levels -- which have been held down by low natural gas prices, warm weather and the recession -- would add \$11.6 billion in value and thousands of jobs in the entire Northeast region by 2020.

Losing out on a 'net positive'?

"Participation in RGGI has been a net positive for New Jersey residents and the environment, and the state could gain much more by getting back in the program," said Daniel Sosland, executive director of Environment Northeast.

How so? The group says the revenue generated from auctions will continue to beef up renewable energy in the state and add jobs. During its time in RGGI, the report says, \$75 million of the \$159 million was diverted to help with New Jersey budget shortfalls, while the rest went to support innovative energy projects starting from the ground up.

Larry Hajna, of the New Jersey Department of Environmental Protection, responded that even if the report from Environment Northeast is correct, that contribution to the state economy would be fairly negligible.

"When New Jersey pulled out of RGGI, we did so because we didn't feel it was the right approach, as has been evidenced by recent auctions that have been coming out at the minimal or minimal allowed,"

he said. "RGGI is not working as designed."

Hajna credited the state's steady increase in solar, wind and biopower to separate state incentives provided under state law. He said the state is right on track to cut its emission by 22.5 percent by 2021, starting in 2010.

Hanja added that Christie has committed to building no more coal-fired power plants in the state. He argued that the administration is doing all it can to reduce greenhouse gas emissions ahead of the deadlines established under state law.

"All of these factors give us a lot of confidence that we're doing the right thing without a complicated emissions trading scheme that wasn't working," he said.

When asked to weigh in, Robert Stavins, director of Harvard University's Environmental Economics Program, surprisingly sided with New Jersey officials, saying the state's exit is "not of major consequence" because RGGI is nonbinding in the first place.

"Their withdrawal is not of great significance," he said.

Stavins explained that low natural gas prices, the recent recession and one of the mildest winters in recent memory have helped to do the work that was envisioned by RGGI back when it was conceived. Or leaving a 'not very ambitious' program?

"It was originally not very ambitious," Stavins said of RGGI, "in order to keep prices down and avoid leakage to neighboring states."

As for the revenue claim, Stavins said it is likely New Jersey lost some revenue from auction proceeds, but he doubts that number is significant. He added that any analysis made by the state itself or environmental groups would likely be skewed and influenced by politics.

"They're probably making claims one way or the other because they're strong advocates," he said.

Hanja was asked to assess whether his state's position is fundamentally political. He admitted Christie has "a philosophical difference" with RGGI advocates but insisted most of his thinking on the topic is substantive.

"You have to take into account that RGGI does come at a cost to ratepayers. This is very important in New Jersey, which has some of the highest electricity rates in the nation," he said. "At the same time, allowances have been auctioned off at the minimum price.

"Again, this administration is more focused on practical solutions. We did not feel that RGGI was practical," he said.

When asked the same question, Jamie Howland, director of the Climate and Energy Analysis Center at Environment Northeast, responded that it was "kind of insulting" to be asked whether the group's position on cap and trade had influenced its work.

"We're a research-and-analysis-based advocacy group," he said. "We do not start with predetermined conclusions."

Sullivan is based in New York.

## Major Court Ruling Forces Nuclear Waste Disposal Review

FRIDAY, 08 JUNE 2012 13:42 PRESS RELEASE SCIENCE AND ENVIRONMENTAL

( 0 Votes )

NRDC: 'This Is A Game Changer'

WASHINGTON--(ENEWSPF)--June 8, 2012 -- A federal appeals court's unanimous decision today forces the country to re-evaluate the environmental impacts of the storage and disposal of its nuclear waste in a way that has never been done before.

Earn your B.S. in Environmental Science

Learn More

The decision will send the Nuclear Regulatory Commission back to square one to determine the safety and consequences of allowing nuclear reactors to produce and accumulate radioactive nuclear waste, including the potential environmental effects of the failure to develop a geologic repository.

"This is a game changer," said Geoff Fettus, senior project attorney in the nuclear program at the Natural Resources Defense Council. "This forces the Nuclear Regulatory Commission to take a hard look at the environmental consequences of producing highly radioactive nuclear waste without a long-term disposal solution. The court found: 'The Commission apparently has no long-term plan other than hoping for a geologic repository.'"

The court granted petitions for review by the environmental community and the states by vacating the NRC's recent Waste Confidence Decision and the associated Temporary Storage Rule.

Geoff Fettus of NRDC argued the case in March before the U.S. Court of Appeals for the D.C. Circuit, with co-counsel Diane Curran who represented the other environmental petitioners, Southern Alliance for Clean Energy, Riverkeeper, Inc., and Blue Ridge Environmental Defense League.

A copy of the U.S. Court of Appeals for the D.C. Circuit decision can be found here:

[http://www.cadc.uscourts.gov/internet/opinions.nsf/57ACA94A8FFAD8AF85257A1700502AA4/\\$file/11-1045-1377720.pdf](http://www.cadc.uscourts.gov/internet/opinions.nsf/57ACA94A8FFAD8AF85257A1700502AA4/$file/11-1045-1377720.pdf)

Key excerpts:

**Page 3:** We further hold that the Commission's evaluation of the risks of spent nuclear fuel is deficient in two ways: First, in concluding that permanent storage will be available "when necessary," the Commission did not calculate the environmental effects of failing to secure permanent storage—a possibility that cannot be ignored.

Second, in determining that spent fuel can safely be stored on site at nuclear plants for sixty years after the expiration of a plant's license, the Commission failed to properly examine future dangers and key consequences.

**Page 4:** Twenty years of work on establishing such a repository at Yucca Mountain was recently abandoned when the Department of Energy decided to withdraw its license application for the facility. Id. at 3. At this time, there is not even a prospective site for a repository, let alone progress toward the actual construction of one.

**Page 9:** Though we give considerable deference to an agency's decision regarding whether to prepare an EIS, the agency must 1) "accurately identifi[y] the relevant environmental concern," 2) take a "hard look at the problem in preparing its EA," 3) make a "convincing case for its finding of no significant impact," and 4) show that even if a significant impact will occur, "changes or safeguards in the project sufficiently reduce the impact to a minimum."

**Page 13:** The Commission apparently has no long term plan other than hoping for a geologic repository. If the government continues to fail in its quest to establish one, then [spent nuclear fuel] will seemingly be stored on site at nuclear plants on a permanent basis. The Commission can and must assess the potential environmental effects of such a failure.

The **Natural Resources Defense Council (NRDC)** is an international nonprofit environmental organization with more than 1.3 million members and online activists. Since 1970, our lawyers, scientists, and other environmental specialists have worked to protect the world's natural resources, public health, and the environment. NRDC has offices in New York City, Washington, D.C., Los Angeles, San Francisco, Chicago, Livingston, Montana, and Beijing. Visit us at

Just to let you know that we have published the July 2012 (34th) issue of irish environment, which includes: .

News: updated each Monday, Wednesday, and Friday

Commentary: Christopher Dobson, Dispelling the myths – let's tell the truth about wind farms

Report: International Energy Agency's Golden Age of Gas and Golden Rules on Fracking

Podcast: Interview with Jim Dillon, Leitrim Farmer, Speaking about Fracking

iePEDIA: Unconventional Gas

YouTube: Veganism. Saving the planet one plant at a time

Please pass along this Notice about the magazine to colleagues, friends and others interested in protecting the environment.

**UNITED STATES DISTRICT COURT  
FOR THE DISTRICT OF COLUMBIA**

**AMERICAN ROAD &  
TRANSPORTATION BUILDERS  
ASSOCIATION,**

**Plaintiff,**

**v.**

**ENVIRONMENTAL PROTECTION  
AGENCY et al.,**

**Defendants.**

**Civil Action 11-1713 (RC)**

**MEMORANDUM OPINION**

For the last ten years, the American Road and Transportation Builders Association (“ARTBA”) has sought to alter the regulations implementing section 209(e) of the Clean Air Act. The Environmental Protection Agency (“EPA”) has consistently denied its petitions. In 2009, the D.C. Circuit dismissed a challenge to one such denial; two other challenges are currently pending in the courts of appeals. ARTBA now asks this court to review the EPA’s denial of its petitions. But only the courts of appeals may review final action taken under the Clean Air Act, *see* 42 U.S.C. § 7607(b)(1), and so this court dismisses the case for lack of subject matter jurisdiction.

**I. BACKGROUND**

In 1990, Congress amended the Clean Air Act to authorize the federal regulation of emissions from nonroad engines,<sup>1</sup> which power vehicles and mobile equipment from

---

<sup>1</sup> The statute defines “nonroad engine” as “an internal combustion engine (including the fuel system) that is not used in a motor vehicle or a vehicle used solely for competition, or that is

lawnmowers to locomotives. Pub. L. No. 101-549, § 213, 104 Stat. 2399, 2500 (*codified at* 42 U.S.C. § 7547). At the same time, in section 209(e) of the amended Act, Congress preempted state regulation of such emissions. 42 U.S.C. § 7543(e). Section 209(e)(1) prohibits states from adopting or enforcing “any standard or other requirement relating to the control of emissions” from “new” locomotives or their engines or “new” engines below a certain horsepower that are used in farm or construction vehicles or equipment. *Id.* § 7543(e)(1). That bar is absolute, but section 209(e)(2) requires the EPA under certain conditions to “authorize California to adopt and enforce standards and other requirements relating to the control of emissions” from nonroad engines and vehicles not named in section 209(e)(1). *Id.* § 7543(e)(2)(A). Other states can then opt in to the California standards. *Id.* § 7543(e)(2)(B).

In 1994, the EPA published two regulations interpreting the preemptive scope of section 209(e). One regulation—the “preemption rule”—defined statutory terms and clarified the class of preempted state law, *see* Preemption of State Regulation for Nonroad Engine and Vehicle Standards, 59 Fed. Reg. 36,969, 36,986–87 (July 20, 1994) (“1994 Preemption Rule”) (codified at 40 C.F.R. § 85.1602–03 (1995)), while the other—the “interpretive rule”—emphasized the types of state regulation that were permitted without federal authorization, *see* Emission Standards for New Nonroad Compression-Ignition Engines At or Above 37 Kilowatts, 59 Fed. Reg. 31,306, 31,339–40 (June 17, 1994) (“1994 Interpretive Rule”) (codified at 40 C.F.R. § 89 subpt. A, App’x A (1995)). The agency’s rationales for the two regulations were nearly

---

not subject to standards promulgated under section 7411 of this title or section 7521 of this title,” that is, Clean Air Act sections 111 and 202. 42 U.S.C. § 7550(10). Most of the provisions concerning nonroad engines also apply to nonroad vehicles, defined as “a vehicle that is powered by a nonroad engine and that is not a motor vehicle or a vehicle used solely for competition,” *id.* § 7550(11).

identical. *Compare id.* at 31,328–31 with 1994 Preemption Rule, 59 Fed. Reg. at 36,971–74. In justifying both the preemption rule and the interpretive rule, the EPA acknowledged the “clear preemption of state regulation of nonroad engines . . . in section 209(e)(1)” and determined that, although “[t]he language of section 209(e)(2) does not state any clear preemption,” some preemption was nonetheless implied.<sup>2</sup> The agency further “noted that section 209(e)(2) of the Act does not prevent California or other states from regulating nonroad engines and vehicles *in use*,” and stated its belief that “the requirements of section 209(e)(2) apply only to *new* nonroad engines and vehicles.” 1994 Interpretive Rule, 59 Fed. Reg. at 31,330 (emphases added); 1994 Preemption Rule, 59 Fed. Reg. at 36,973 (same). The preemption rule therefore provided that no state could “enforce any standards or other requirements relating to the control of emission[s] from *new* nonroad engines or vehicles” unless California was first authorized to enforce them. 1994 Preemption Rule, 59 Fed. Reg. at 36,987 (codified at 40 C.F.R. § 85.1603(d) (1995)) (emphasis added). It defined a “new” engine or vehicle as one which has neither been “placed

---

<sup>2</sup> 1994 Interpretive Rule, 59 Fed. Reg. at 31,330; 1994 Preemption Rule, 59 Fed. Reg. at 36,973. As the D.C. Circuit explained when the regulation was challenged:

. . . if no state regulation were preempted, California would have no need to seek authorization for its regulations, and other states would not need to opt in to the California rules. Thus, the California authorization provision assumes the existence of a category of sources that are subject to preemption. In other words, states must be preempted from adopting any regulation for which California could seek authorization.

*Engine Mfrs. Ass’n v. EPA*, 88 F.3d 1075, 1087–88 (D.C. Cir. 1996) (citations omitted).

into service” nor had its “equitable or legal title . . . transferred to an ultimate purchaser.”<sup>3</sup> The interpretive rule described the EPA’s understanding of “in-use” regulations:

EPA believes that states are not precluded under section 209 from regulating the use and operation of nonroad engines, such as regulations on hours of usage, daily mass emission limits, or sulfur limits on fuel; nor are permits regulating such operations precluded once the engine is placed into service or once the equitable or legal title to the engine or vehicle is transferred to an ultimate purchaser, as long as no certification, inspection, or other approval related to the control on emissions is required as a condition precedent to the initial retail sale, titling, or registration of the engine or equipment.

1994 Interpretive Rule, 59 Fed. Reg. at 31,339 (codified at 40 C.F.R. § 89 subpt. A, App’x A (1995)).

An industry group challenged the preemption rule’s definition of “new” and its limitation of section 209(e)(2)’s preemptive effect to new nonroad engines, as well as the interpretive rule’s assertion that section 209(e)(2) did not preempt state regulation of the use of nonroad engines. *Engine Mfrs. Ass’n v. EPA*, 88 F.3d 1075 (D.C. Cir. 1996) (“*EMA*”). This suit was brought in the D.C. Circuit under Clean Air Act § 307(b)(1), which provides that review of “nationally applicable regulations promulgated” under the Act “may be filed *only* in the United States Court of Appeals for the District of Columbia.” 42 U.S.C. § 7607(b)(1) (emphasis added). The D.C. Circuit upheld the definition of “new,” ruling that the statutory term was ambiguous and the agency’s interpretation permissible. *EMA*, 88 F.3d at 1087. Turning to the question

---

<sup>3</sup> 1994 Preemption Rule, 59 Fed. Reg. at 36,986 (codified at 40 C.F.R. § 85.1602 (1995)). This definition of “new” did not apply to locomotives and their engines. *Id.* (codified at 40 C.F.R. § 85.1602 (1995)) (“This definition of *new* shall not apply to locomotives or engines used in locomotives.”). “New” was defined for that purpose in 1998. *See* Emission Standards for Locomotives and Locomotive Engines, 63 Fed. Reg. 18,978, 18,998 (Apr. 16, 1998) (codified at 40 C.F.R. §§ 85.1602, 85.1603(c) (1998)).

“whether, as the EPA decided, only new nonroad sources are covered by § 209(e)(2), or, as [the industry group] argue[d], both new and non-new sources are covered,” *id.* at 1088, the court concluded that Congress had spoken to the issue by omitting the word “new” from § 209(e)(2), *see id.* at 1087–93. The agency’s attempt to limit the scope of the provision was therefore barred by the statutory text. *Id.* at 1093. Having established “which nonroad sources the states are preempted from regulating,” the Circuit addressed the question of “what sorts of regulations the states are preempted from adopting,” *id.*, upholding the EPA’s determination that section 209(e)(2) did not preempt state regulation of the use of nonroad engines. *Id.* at 1094.

The EPA revised its regulations to conform to the Circuit’s decision in *EMA*. *See* Preemption of State Regulation for Nonroad Engine and Vehicle Standards; Amendments to Rules, 62 Fed. Reg. 67,733, 67,735 (Dec. 30, 1997) (“Amendments to Rules”) (“Today’s direct final rule implements the opinion of the Court regarding the scope of preemption of section 209(e)(2) by amending the language of the implementing regulations to reflect that California must request authorization for its emissions standards and other related requirements for *all* nonroad vehicles and engines.”) (emphasis added). The agency removed the word “new” from the preemption rule’s description of the engines whose emissions could not be regulated without federal approval, *see id.* at 67,736 (amending 40 C.F.R. § 85.1603(d)), and revised the language of the interpretive rule’s “determination that states are not precluded from regulating the use of nonroad engines,” *id.* at 67,734.

In 2002, ARTBA petitioned the EPA to amend its regulations. Petition to Amend Rules Implementing Clean Air Act § 209(e), EPA Docket HQ-OAR-2004-0008, Doc. 531 (July 12, 2002) (“Petition to Amend Rules”). The association asked the agency to declare that certain

types of state regulation which the revised interpretive rule<sup>4</sup> listed as permissible were in fact preempted by section 209(e), along with other types of regulation not discussed in the extant rules. Petition to Amend Rules at 1. ARTBA criticized the research and reasoning of the *EMA* decision at some length and identified allegedly untenable distinctions introduced by an amendment to the preemption rule dealing with locomotives. *Id.* at 3 (discussing Emissions Standards for Locomotives and Locomotive Engines, 63 Fed. Reg. 18,978, 18,998 (Apr. 16, 1998) (amending 40 C.F.R. § 85.1602–03)). ARTBA also noted that it had successfully challenged a Texas regulation as preempted by section 209(e). *Id.* at 1 (describing the holding of *Engine Mfrs. Ass’n v. Huston*, 190 F. Supp. 2d 922 (W.D. Tex. 2001), *vacated* (5th Cir. Mar. 5, 2002) and *dismissed as moot* (5th Cir. May 14, 2002)). After the Supreme Court’s decision in *Engine Manufacturers Association v. South Coast Air Quality Management District*, 541 U.S. 246 (2004), ARTBA argued in an email to the EPA that the new precedent compelled the agency to grant the regulatory revisions that the association was seeking. ARTBA Petition, EPA Docket HQ-OAR-2004-0008, Doc. 532 (Apr. 30, 2004).

The EPA put ARTBA’s petition out for comment in 2007, *see* Control of Emissions from Nonroad Spark-Ignition Engines and Equipment, 72 Fed. Reg. 28,098, 28,209–10 (May 18,

---

<sup>4</sup> The revised description of “the authority of states to regulate the use and operation of nonroad engines” read:

EPA believes that states are not precluded under section 209 from regulating the use and operation of nonroad engines, such as limitations on hours of usage, daily mass emission limits, or sulfur limits on fuel; nor are permits regulating such operations precluded, once the engine is no longer new.

Amendments to Rules, 62 Fed. Reg. at 67,736 (codified at 40 C.F.R. § 89 Subpt. A, Appx. A (1998)).

2007), and rejected it the following year, *see* Control of Emissions From Nonroad Spark-Ignition Engines and Equipment, 73 Fed. Reg. 59,034, 59,130 (Oct. 8, 2008) (“After reviewing ARTBA’s petition and the comments received regarding the petition, EPA is not adopting the changes requested by ARTBA in its petition.”).<sup>5</sup> The agency explained that “although EPA does agree in part with ARTBA’s interpretation, EPA does not believe it is necessary or appropriate to revise its regulations based on ARTBA’s petition.” Response to the Petition of ARTBA to Amend Regulations Regarding the Preemption of State Standards Regulating Emissions from Nonroad Engines, EPA Docket HQ-OAR-2004-0008, Doc. 921, at 11 (Aug. 21, 2008). Where the EPA agreed that certain forms of state regulation unmentioned in its regulations were in fact preempted by section 209(e), it nonetheless concluded that “the regulations as written are sufficient and need not be revised” to make that preemption explicit. *Id.* at 1. And the EPA maintained its position that, contrary to ARTBA’s reading of the statute, “Congress did not intend to preempt state and local regulation of the use and operation of nonroad engines under section 209(e) of the Clean Air Act.” *Id.* at 27 (abbreviation expanded).

ARTBA challenged the denial of its petition before the D.C. Circuit. *ARTBA v. EPA*, 588 F.3d 1109 (D.C. Cir. 2009). This challenge was also brought directly to that court under Clean Air Act § 307(b)(1), which provides that petitions for review of regulations promulgated under the Act “shall be filed within sixty days from the date notice of such promulgation . . . appears in the Federal Register,” unless the “petition is based solely on grounds arising after such sixtieth

---

<sup>5</sup> At the same time, the EPA recodified the preemption rule at 40 C.F.R. part 1074. *See* Control of Emissions From Nonroad Spark-Ignition Engines and Equipment, 73 Fed. Reg. at 59,130 (noting that, with two exceptions not relevant here, the EPA was “not changing the meaning of these regulations”); *id.* at 59,379–80 (codified at 40 C.F.R. § 1074.1 *et seq.* (2009)).

day.” 42 U.S.C. § 7607(b)(1). The Circuit held that ARTBA’s suit was an untimely attack on the 1997 re-promulgation of the preemption and interpretive rules rather than a timely challenge to the EPA’s denial of its 2008 petition because Clean Air Act § 307(b)(1) enacted an exception to “[t]he general rule . . . that it is a perfectly valid ‘method of obtaining judicial review of agency regulations once the limitations period has run . . . to petition the agency for amendment or rescission of the regulations and then to appeal the agency’s decision.’” *ARTBA*, 588 F.3d at 1112 (quoting *NLRB Union v. FLRA*, 834 F.2d 191, 196 (D.C. Cir. 1987)) (second ellipsis in original). Because ARTBA had not filed suit within sixty days of either the 1997 re-promulgation or a later event that ripened its claim, the Circuit dismissed the case for lack of subject matter jurisdiction. *Id.* at 1113–16.

In 2010, ARTBA submitted comments on California’s proposed revisions to a portion of its state implementation plan (“SIP”),<sup>6</sup> and “renew[ed] [ARTBA’s] petition with respect to the nonroad preemption rules.” ARTBA Comments and Rulemaking Petition Regarding Revision to California State Implementation Plan, EPA Docket R09-OAR-2010-0430, Doc. 14, at 1 (July 6, 2010). The association sought “EPA’s denial of California’s SIP revision for the same reasons that ARTBA ha[d] long sought amendment of EPA’s rules implementing Section 209(e).” *Id.* at 2. Rejecting the petition, the EPA explained that “ARTBA’s petition seems to be little more than a renewal of its earlier request for an amendment to EPA’s rule implementing Clean Air Act section 209(e).” Revisions to the California State Implementation Plan, 76 Fed. Reg. 26,609,

---

<sup>6</sup> Under the Clean Air Act, “states must adopt, and submit to the EPA for approval, SIPs that provide for the implementation, maintenance, and enforcement” of the national air quality standards. *County of Delaware, Pennsylvania v. Dep’t of Transp.*, 554 F.3d 143, 145 (D.C. Cir. 2009).

26,611–12 (May 9, 2011). The agency noted that it had “already reviewed these issues several times and [was] not revisiting these broader issues in this limited proceeding.” *Id.* at 26,612.

On July 8, 2011, ARTBA filed suit in the Ninth and D.C. Circuits. ARTBA petitioned the D.C. Circuit to review (1) the EPA’s approval of the SIP revisions, (2) the agency’s refusal to designate its action as having “nationwide scope or effect” under section 307(b)(1) and therefore subject to challenge in the D.C. Circuit instead of the Ninth Circuit, and (3) its denial of ARTBA’s petition to amend or repeal the rules concerning the preemptive scope of section 209(e). *See* Petition for Review, *ARTBA v. EPA*, No. 11-1256 (D.C. Cir. July 8, 2011). ARTBA petitioned the Ninth Circuit to review only the approval of the SIP revisions. *See* Petition for Review, *ARTBA v. EPA*, No. 11-71897 (9th Cir. July 8, 2011). The Ninth Circuit case is currently stayed pending the resolution of the D.C. Circuit case.

On September 22, 2011, ARTBA brought this case “to challenge EPA’s final agency action with respect to” the 2008 rulemaking at issue in *ARTBA v. EPA*, 588 F.3d 1109 (D.C. Cir. 2009), as well as the 2011 rulemaking regarding the California SIP revisions, both of which “relate to the preemptive scope of Clean Air Act § 209(e), 42 U.S.C. § 7543(e).” Compl. ¶ 1. ARTBA seeks, in essence, a declaratory judgment approving its interpretation of that provision and requiring the EPA to amend its regulations accordingly. ARTBA also asks this court to void decisions of the United States Supreme Court and the D.C. Circuit. The association has named as defendants the United States, the EPA, and its Administrator, Lisa P. Jackson, acting in her

official capacity (collectively, “the government”). The government has moved to dismiss the case for lack of jurisdiction.<sup>7</sup>

## II. LEGAL STANDARD

Sovereign immunity, which shields from suit the federal government, its agencies, and federal officials acting in their official capacities, is “jurisdictional in nature.” *FDIC v. Meyer*, 510 U.S. 471, 475 (1994) (the federal government and its agencies); *Jackson v. Donovan*, 2012 WL 574075, at \*1 (D.D.C. Feb. 23, 2012) (citing *Kentucky v. Graham*, 473 U.S. 159, 165–66 (1985)) (federal officials in their official capacities); *see also United States v. Mitchell*, 463 U.S. 206, 212 (1983) (“It is axiomatic that the United States may not be sued without its consent and that the existence of consent is a prerequisite for jurisdiction”). “A waiver of the Federal Government’s sovereign immunity must be unequivocally expressed in statutory text, and will not be implied.” *Lane v. Pena*, 518 U.S. 187, 192 (1996) (citations omitted). “Indeed, the ‘[statutory] terms of [the United States’] consent to be sued in any court define that court’s jurisdiction to entertain the suit.’” *Meyer*, 510 U.S. at 475 (quoting *United States v. Sherwood*, 312 U.S. 584, 586 (1941)). By the same token, because “the inferior courts of the United States . . . are creatures of statute,” *Owens v. Republic of Sudan*, 531 F.3d 884, 887 (D.C. Cir. 2008), which “may not exercise jurisdiction absent a statutory basis,” *Exxon Mobil Corp. v. Allapattah Servs., Inc.*, 545 U.S. 546, 552 (2005), the terms of jurisdiction-conferring statutes both define and limit a federal court’s authority to hear a given case. The plaintiff bears the burden of establishing both the court’s statutory jurisdiction and the government’s waiver of its sovereign

---

<sup>7</sup> The government argues in the alternative that ARTBA cannot state a claim on which relief can be granted and that the case is barred by *res judicata*, but the court need not reach those arguments to resolve the motion.

immunity. See *Kokkonen v. Guardian Life Ins. Co.*, 511 U.S. 375, 377 (1994); *Tri-State Hosp. Supply Corp. v. United States*, 341 F.3d 571, 575 (D.C. Cir. 2003) (“A party bringing suit against the United States bears the burden of proving that the government has unequivocally waived its immunity.”); *Jackson v. Bush*, 448 F. Supp. 2d 198, 200 (D.D.C. 2006) (noting that “a plaintiff must overcome the defense of sovereign immunity in order to establish the jurisdiction necessary to survive a Rule 12(b)(1) motion to dismiss”).

### III. ANALYSIS

Section 307(b)(1) of the Clean Air Act “channels review of final EPA action exclusively to the courts of appeals, regardless of how the grounds for review are framed.” *Virginia v. United States*, 74 F.3d 517, 523 (4th Cir. 1996); *Missouri v. United States*, 109 F.3d 440, 441 (8th Cir. 1997) (“The Clean Air Act . . . channels all petitions for review of EPA actions into the courts of appeals.”) (abbreviation expanded); see also *Massachusetts v. EPA*, 415 F.3d 50, 54 (D.C. Cir. 2005), *overruled on other grounds*, 549 U.S. 497 (2007) (“Section 307(b)(1), 42 U.S.C. § 7607(b)(1), gives this court *exclusive* jurisdiction over ‘nationally applicable regulations promulgated, or final action taken, by the Administrator’ under chapter 85 of the Act.”) (emphasis added); *Envtl. Def. Fund v. Thomas*, 870 F.2d 892, 896 (2d Cir. 1989) (“Because Section 307 embodies a grant of *exclusive* jurisdiction, it appears that if the District of Columbia [Circuit] has jurisdiction over the present action, the district court does not.”) (emphasis added); *Royster-Clark Agribusiness, Inc. v. Johnson*, 391 F. Supp. 2d 21, 25–26 (D.D.C. 2005) (“It is well-settled that subsection 307(b)(1) of the Clean Air Act provides the *exclusive* means of obtaining review of final actions by EPA under the Clean Air Act.”) (emphasis added) (abbreviation expanded). This case seeks review of final agency action by the

EPA under the Clean Air Act. Compl. ¶ 1. It must therefore be brought in the appropriate court of appeals—where, indeed, ARTBA has already sought identical relief.

In an attempt to avoid that conclusion, ARTBA principally invokes the citizen-suit provision of the Clean Air Act, §304(a)(2), 42 U.S.C. § 7604(a)(2), and the Administrative Procedure Act, 5 U.S.C. §§ 701–706. The government responds that neither waives the sovereign immunity of the United States nor gives the plaintiff a cause of action. It might have added—and this court is obliged to note—that ARTBA must also identify a source of statutory jurisdiction. When a party challenges administrative action, the three inquiries are closely related. For instance, if the Administrative Procedure Act provides a cause of action, then it also provides a waiver of sovereign immunity, and the federal question statute grants jurisdiction to the district courts. *See Trudeau v. FTC*, 456 F.3d 178, 185 (D.C. Cir. 2006) (“[T]he APA . . . provide[s] . . . a limited cause of action for parties adversely affected by agency action.”); *id.* at 187 (“[W]e hold that APA § 702’s waiver of sovereign immunity permits [the plaintiff’s] APA cause of action . . . .”); *Road Sprinkler Fitters Local Union 669 v. Herman*, 234 F.3d 1316, 1319 (D.C. Cir. 2000) (“28 U.S.C. § 1331 . . . gives federal courts . . . ‘jurisdiction of all civil actions arising under the . . . laws . . . of the United States,’ including those brought under the APA.”) (quoting 28 U.S.C. § 1331). If, however, another statute provides an “adequate remedy in a court,” 5 U.S.C. § 704, then the APA neither provides a cause of action nor waives sovereign immunity. *Washington Legal Found. v. Alexander*, 984 F.2d 483, 486 (D.C. Cir. 1993) (“[A]n adequate remedy is available to appellants, and we therefore conclude that appellants have no cause of action under the APA . . . .”); *Fornaro v. James*, 416 F.3d 63, 66 (D.C. Cir. 2005) (“The APA excludes from its waiver of sovereign immunity . . . claims for which an adequate remedy

is available elsewhere.”) (quoting *Transohio Sav. Bank v. Dir., Office of Thrift Supervision*, 967 F.2d 598, 607 (D.C. Cir. 1992)) (alterations in original); *Nat’l Wrestling Coaches Ass’n v. Dep’t of Educ.*, 366 F.3d 930, 947 (D.C. Cir. 2004) (“[T]he waiver of sovereign immunity under § 702 is limited by the ‘adequate remedy’ bar of § 704.”). And if the statute providing the adequate remedy channels review to the courts of appeals, it eliminates the federal question jurisdiction that the district courts would otherwise enjoy. See *Harrison v. PPG Indus., Inc.*, 446 U.S. 578, 584 (1980). Because statutory jurisdiction, sovereign immunity, and the ability to state a claim are interrelated in this way, the court will analyze them together as it considers each asserted basis for its jurisdiction and ARTBA’s claims.

The citizen suit provision of the Clean Air Act authorizes “any person” to sue the EPA in district court “where there is alleged a failure of the Administrator to perform any act or duty under this chapter which is not discretionary with the Administrator . . . .” 42 U.S.C. § 7604(a)(2). In doing so, it provides jurisdiction to the district courts, waives the sovereign immunity of the United States, and establishes a cause of action. See *Royster-Clark*, 391 F. Supp. 2d at 25–26 (“The Clean Air Act provides its own waiver of sovereign immunity and procedures for review . . . .”) (abbreviation expanded). To invoke this court’s jurisdiction under the citizen suit provision, a plaintiff must point to an “act or duty under [the Clean Air Act] which is not discretionary with the Administrator.” The provision “has been construed narrowly,” *Monongahela Power Co. v. Reilly*, 980 F.2d 272, 276 n.3 (4th Cir. 1992), because “Congress provided for district court enforcement under section 304 in order to permit citizen enforcement of clear-cut violations by polluters or defaults by the Administrator where the only required judicial role would be to make a clear-cut factual determination of whether a violation

did or did not occur,” *Sierra Club v. Thomas*, 828 F.2d 783, 791 (D.C. Cir. 1987) (quotation marks omitted); *see also Env'tl. Def. Fund v. Thomas*, 870 F.2d 892, 899 (2d Cir. 1989) (“[T]he district court has jurisdiction, under Section 304, to compel the Administrator to perform purely ministerial acts, not to order the Administrator to make particular judgmental decisions.”); *Mountain States Legal Found. v. Costle*, 630 F.2d 754, 766 (10th Cir. 1980) (“Congress . . . restricted citizens’ suits to actions seeking to enforce specific non-discretionary clear-cut requirements of the Clean Air Act.”); *Kennecott Copper Corp. v. Costle*, 572 F.2d 1349, 1355 (9th Cir. 1978) (describing the citizen suit provision as “intended to provide relief only in a narrowly-defined class of situations in which the Administrator failed to perform a mandatory function” and “not designed to permit review of the performance of those functions”) (quoting *Wis. Env'tl. Decade, Inc. v. Wis. Power & Light Co.*, 395 F. Supp. 313, 321 (W.D. Wis. 1975)).

ARTBA suggests that agencies’ “everpresent duty to insure that their actions are lawful,” *Pub. Citizen v. Nuclear Regulatory Comm’n*, 901 F.2d 147, 152 (D.C. Cir. 1990), gives the Administrator a nondiscretionary duty to grant the petitions that she denied. ARTBA’s theory is evidently that those petitions merely asked the EPA to bring its regulations into conformity with statutory law—and, of course, the duty to conform with the law is not discretionary. If an allegation of such an abstract duty were enough to satisfy the citizen suit provision, then section 307(b)(1) would mean nothing: any party could challenge regulations promulgated under the Clean Air Act in district court at any time by arguing that those regulations were contrary to the statute. The Clean Air Act clearly forecloses that interpretation. Because ARTBA seeks substantive review of EPA regulations rather than an order that the Administrator perform a purely ministerial act, its case is well outside the scope of the citizen suit provision.

ARTBA next argues that it can bring this suit under the APA. As discussed above, “[u]nder APA § 704, only ‘final agency action for which there is no other adequate remedy in a court [is] subject to judicial review,’” *Transohio Sav. Bank v. Dir., Office of Thrift Supervision*, 967 F.2d 598, 608 (D.C. Cir. 1992) (quoting 5 U.S.C. § 704) (second alteration in original), and “[t]he APA excludes from its waiver of sovereign immunity . . . claims for which an adequate remedy is available elsewhere.” *Fornaro v. James*, 416 F.3d 63, 66 (D.C. Cir. 2005) (quoting *Transohio*, 967 F.2d at 607) (alterations in original). The D.C. Circuit, “in determining whether an adequate remedy exists, has focused on whether a statute provides an independent cause of action or an alternative review procedure.” *El Rio Santa Cruz Neighborhood Health Ctr., Inc. v. HHS*, 396 F.3d 1265, 1270 (D.C. Cir. 2005). Section 307(b)(1) of the Clean Air Act provides just such a procedure. The fact that, as the Circuit ruled when ARTBA first sought relief there, a particular petition is filed after the statutory period for review does not make the statutory review procedure inadequate. *Martinez v. United States*, 333 F.3d 1295, 1319–20 (Fed. Cir. 2003) (“The fact that the complaint was untimely filed . . . does not mean that that court could not offer a full and adequate remedy; it merely means that [the plaintiff] did not file his complaint in time to take advantage of that remedy.”); *Town of Sanford v. United States*, 140 F.3d 20, 23 (1st Cir. 1998) (“A legal remedy is not inadequate for purposes of the APA because it is procedurally inconvenient for a given plaintiff, or because plaintiffs have inadvertently deprived themselves of an opportunity to pursue that remedy.”); *Sable Commc’ns, Inc. v. FCC*, 827 F.2d 640, 642 (9th Cir. 1987) (holding that the remedy provided by 28 U.S.C. § 2342 was adequate within the meaning of 5 U.S.C. § 704 when it was the plaintiff’s “own inaction which foreclosed review under section 2342”). ARTBA argues that the review procedures of the Clean Air Act are

inadequate because another provision of the Act limits judicial review to “objection[s] . . . raised with reasonable specificity during the period for public comment.” 42 U.S.C. § 7607(d)(7)(B). The association argues that many of its objections to the preemption rule and the interpretive rule arose more than sixty days after those rules were re-promulgated in 1997. (ARTBA does not explain why its challenges to the California SIP revisions now pending in the courts of appeals will not provide an adequate remedy as to those objections.) But the Clean Air Act accounts for just such an eventuality, providing that:

If the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule, the Administrator shall convene a proceeding for reconsideration of the rule and provide the same procedural rights as would have been afforded had the information been available at the time the rule was proposed.

*Id.* The judicial review provision, in turn, allows for the review of petitions based on grounds arising after the statutory period for review has expired. *Id.* § 7607(b)(1). Such grounds include “the occurrence of an event that ripens a claim,” although “a petition predicated on any such new event [must] be filed within 60 days of the event.” *ARTBA*, 588 F.3d at 1113–14. The D.C. Circuit held that “none of the[] events” that ARTBA cited there and now cites here occurred within sixty days of its petition either to the EPA or to the court of appeals. *Id.* at 1114. Had ARTBA filed its claim no more than sixty days after an event that ripened its claims, those claims would have been heard as timely brought.<sup>8</sup> ARTBA did not do so, and its claims were therefore dismissed. That the association failed to comply with the review procedures of the

---

<sup>8</sup> The D.C. Circuit acknowledged that there is some ambiguity as to whether such claims should first be presented to the Administrator or brought directly to the Circuit, *see ARTBA*, 588 F.3d at 1114, but that ambiguity is not enough to render the review procedure inadequate.

Clean Air Act does not render those procedures inadequate, nor permit ARTBA to bring its claim under the APA. ARTBA therefore has no cause of action under the APA, and cannot depend upon that statute's waiver of sovereign immunity.

ARTBA raises other arguments, which the court addresses briefly. There is a narrow exception to sovereign immunity for suits alleging that a federal officer has acted outside of his delegated power, *see Larson v. Domestic & Foreign Commerce Corp.*, 337 U.S. 682, 689–90 (1949); *Chamber of Commerce v. Reich*, 74 F.3d 1322, 1329 (D.C. Cir. 1996), but “[a] claim of error in the exercise of that power is . . . not sufficient.” *Larson*, 337 U.S. at 690; *see also Royster-Clark*, 391 F. Supp. 2d at 24–25. There is no doubt that the Administrator had the power to promulgate regulations implementing Clean Air Act section 209(e). 42 U.S.C. § 7543(e) (“The Administrator shall issue regulations to implement this subsection.”). To claim that she erred in doing so is not to state a claim that she acted *ultra vires*. ARTBA also invokes *Ex parte Young*, 209 U.S. 123 (1908), which is simply the first instance of the theory at work in *Larson*. *See Vann v. Kempthorne*, 534 F.3d 741, 751 (D.C. Cir. 2008) (discussing the “rationale set forth in *Ex parte Young* and described in *Larson*”). Moreover, “since 1976 federal courts have looked to § 702 of the Administrative Procedure Act to serve the purposes of the *Ex parte Young* fiction in suits against federal officers.” *EEOC v. Peabody W. Coal Co.*, 610 F.3d 1070, 1085 (9th Cir. 2010) (citation omitted). In *Leedom v. Kyne*, 358 U.S. 184 (1958), “the Supreme Court held that, even though there is a statutory prohibition against review of representation orders of the National Labor Relations Board, a District Court has jurisdiction under section [28 U.S.C. §] 1331 in the *very limited circumstance* where the Board has clearly violated an express mandate of the statute and the plaintiff has no alternative means of review.” *Telecomm.*

*Research & Action Ctr. v. FCC*, 750 F.2d 70, 78 (D.C. Cir. 1984). ARTBA has pointed to no “express mandate of the statute” and, as discussed above, it has an alternate means of review. ARTBA next invokes the Declaratory Judgment Act, 28 U.S.C. §§ 2201–02, which is not a basis for federal jurisdiction. *See Skelly Oil Co. v. Phillips Petroleum Co.*, 339 U.S. 667, 671–72; *see also Motor Vehicle Mfrs. Ass’n v. Costle*, 647 F.2d 675, 677 n.3 (6th Cir. 1981) (per curiam) (“Neither the Mandamus Act, the Declaratory Judgment Act, nor a district court’s federal question jurisdiction authorizes review . . . in the district court in light of the exclusive grant of jurisdiction to the United States Court of Appeals for the District of Columbia by Section 307(b)(1) of the Clean Air Act.”). Finally, ARTBA urges the court to exercise its general equity jurisdiction. But “[i]t is a basic doctrine of equity jurisprudence that courts of equity should not act when the moving party has an adequate remedy at law . . . .” *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 381 (1992) (ellipsis and internal quotation marks omitted). The court emphasizes once more that the Clean Air Act gave ARTBA an adequate means of judicial review.

#### IV. CONCLUSION

The Clean Air Act gives the courts of appeals exclusive jurisdiction over the claims that ARTBA would raise here. In doing so, it provides an adequate remedy at law. There is no basis for jurisdiction over ARTBA’s claims in this court, and no applicable waiver of the federal government’s sovereign immunity. The court will therefore grant the government’s motion to dismiss the case for lack of jurisdiction.

Rudolph Contreras  
United States District Judge

\*\*\*NOTE TO PUBLIC ACCESS USERS\*\*\* Judicial Conference of the United States policy permits attorneys of record and parties in a case (including pro se litigants) to receive one free electronic copy of all documents filed electronically, if receipt is required by law or directed by the filer. PACER access fees apply to all other users. To avoid later charges, download a copy of each document during this first viewing.

United States Court of Appeals for District of Columbia Circuit

Notice of Docket Activity

The following transaction was entered on 09/06/2012 at 9:54:45 AM EDT and filed on 09/06/2012

Case Name:

Coalition for Responsible Reg v. EPA

Case Number:

09-1322

Document(s):

Document(s)

Docket Text:

CLERK'S ORDER filed [1393022] Upon consideration of the petition of the Chamber of Commerce for rehearing en banc and the petition of the Non-State Petitioners for rehearing en banc, it is ORDERED that, within 15 days from the date of this order, respondent EPA file a combined response to the above-referenced en banc petitions, and intervenors for respondent file a combined response to the above-referenced en banc petitions. Each response may not exceed 20 pages. Absent further order of the court, no replies to the responses will be accepted. [09-1322, 10-1024, 10-1025, 10-1026, 10-1030, 10-1035, 10-1036, 10-1037, 10-1038, 10-1039, 10-1040, 10-1041, 10-1042, 10-1044, 10-1045, 10-1046, 10-1073, 10-1083, 10-1099, 10-1109, 10-1110, 10-1114, 10-1118, 10-1119, 10-1120, 10-1122, 10-1123, 10-1124, 10-1125, 10-1126, 10-1127, 10-1128, 10-1129, 10-1131, 10-1132, 10-1145, 10-1147, 10-1148, 10-1199, 10-1200, 10-1201, 10-1202, 10-1203, 10-1206, 10-1207, 10-1208, 10-1210, 10-1211, 10-1212, 10-1213, 10-1216, 10-1218, 10-1219, 10-1220, 10-1221, 10-1222, 10-1092, 10-1094, 10-1134, 10-1143, 10-1144, 10-1152, 10-1156, 10-1158, 10-1159, 10-1160, 10-1161, 10-1162, 10-1163, 10-1164, 10-1166, 10-1182, 10-1167, 10-1168, 10-1169, 10-1170, 10-1173, 10-1174, 10-1175, 10-1176, 10-1177, 10-1178, 10-1179, 10-1180, 10-1234, 10-1235, 10-1239, 10-1245, 10-1281, 10-1310, 10-1318, 10-1319, 10-1320, 10-1321]

Subject: Call in Information for 2:00 pm Telephone Conference Call in Case No. C2-99-1182  
Date: Fri Sep 07 2012 11:08:40 EDT  
Attachments:

---

Dear Counsel:

Below are the instructions for the telephone conference call at 2:00 p.m. today with Judge Sargus. Please e-mail me back and let me know if you are planning to participate so I can advise the Judge of the names of the participants.

The call in number is 888-684-8852., please call about 5 minutes prior to the scheduled time of call.

You will be asked for an access code, which is: 9586353#

Then you will be asked for a Conference Security Code, which is 1182

If you have any questions, please feel free to contact me.

Debra Hepler  
Secretary to Judge Edmund A. Sargus, Jr.  
(614) 719-3240

Subject: Re: Friday Call with AEP

Counsel - I have contacted the Judge's office and he is available to talk with us at 2:00 p.m. this afternoon. Penny Barrick in the Judge's office will send around call-in information to all of the parties copied on this e-mail. I have used the same e-mail list used for the call this morning, which I believe includes representatives for all parties.

I have also advised Penny that we would like to discuss the possibility of scheduling a meeting with Judge Sargus early the week of September 17, and she has told me that the judge has some availability on Tuesday, September 17 and is available all day Wednesday, September 18. The AEP representatives are available on either or both of those dates.

Thank you for your cooperation.

Debra, I plan to represent New York at the conference with Judge Sargus on September 19. I wanted to reach out in advance of that conference with a question. My former colleague, Scott Bassinson (and subsequently Robert Rosenthal) represented NY in the case and in negotiations over the consent decree. I represented NY in the related but separate AEP case that was assigned to Judge Frost, and was admitted pro hac vice in that matter. The consent decree resolved NY's claims in both of those cases. My question is whether, for purposes of participating in the Sept. 19 conference concerning the consent decree, Judge Sargus would consider my pro hac vice admission in the related AEP case sufficient, or whether he would prefer that I file a separate pro hac motion in this case in advance. Thank you.--Mike

Ceres Conference 2013, May 1-2, San Francisco CA

Save the Date for the Ceres Conference 2013!

Join us in San Francisco May 1-2, 2013

Featured Speaker Dan Hesse

Dan Hesse  
CEO Sprint Nextel Corporation

Record heat. Extreme storms. Devastating droughts. The climate is changing - but you don't go to a conference just to talk about the weather.

The climate and the economy are inextricably linked, and each year the Ceres Conference connect the dots.

More than ever, issues like water and resource scarcity, fragile supply chains and physical risks of climate change are increasingly intertwined. By bringing together business, investor and NGO leaders working to address the world's most pressing sustainability challenges, the Conference explores strategies for managing these escalating risks.

The scale of these challenges is immense, but there are signs of progress in every sector. From electric power to auto manufacturing to insurance, companies and investors are adapting business models to increase efficiency, reduce impacts and boost the bottom line.

Join us at the Ceres Conference 2013 to connect with fellow leaders creating the innovative solutions that will build a more sustainable global economy.

Registration for the Ceres Conference will open in December. In the meantime we have an opportunity for you to engage in the conference now!

Sign up for Conference Updates

Don't miss out on any Ceres Conference announcements. We'll be emailing updates as we add new speakers, networking events and registration details. Stay up to date with all the Ceres Conference happenings by signing up for our email list.

The Joan Bavaria Award: Nominate an individual who has inspired you

Do you know an investor, business or NGO leader who is working to create a sustainable global economy? Nominate your sustainability hero for the 2013 Joan Bavaria Award . The Joan Bavaria Award is presented annually by Ceres and Trillium Asset Management LLC to a unique investor, business or NGO leader who is working to transform the capital markets into a system that balances economic prosperity with social and environmental concerns. The winner will be announced at the 2013 Ceres Conference.

Nominations for the 2013 Joan Bavaria Award are now open! Nominate your sustainability hero online today.

To learn more about Joan Bavaria and the award, [click here](#) or email Brian Sant.

Michael,

You do not need to file for pro hac vice admission in the case before Judge Sargus. Judge Sargus asked if you would be able to pass a "hello" along to Robert Rosenthal from him?

Thanks,

Penny

All--Just wanted to pass along the good news that we received a favorable decision today granting our motion to dismiss the Thrun case. The judge found for us on standing and laches grounds. A copy of the decision is attached. Thanks for your help in making the laches case, which the judge obviously found convincing. I expect the plaintiffs will appeal, so will keep you posted.--Mike

4. COURT, JUDGE AND COUNTY FROM WHICH APPEAL IS TAKEN:

Hon. Thomas J. McNamara  
Supreme Court of the State of New York  
County of Albany

5. NATURE AND OBJECT OF ACTION OR PROCEEDING:

This action challenges New York’s participation in the Regional Greenhouse Gas Initiative (“RGGI”) on the grounds that RGGI is unconstitutional and unlawful. RGGI is an unprecedented taxation and revenue distribution program that has neither been voted on nor approved by the New York State Legislature. Defendants’ regulatory scheme to reduce greenhouse gas emissions through a “cap and trade” program imposes an unlawful substantial and hidden tax on all electricity purchasers in New York. This case presents the simple question of who should decide upon and approve (or reject) the creation of a massive, complex, expensive, and radical environmental regime of taxation and regulation – New York’s legislature, which is specifically tasked by the New York State Constitution with the job of weighing competing policy interests, lawmaking and taxation in New York, or a group of unelected bureaucrats, who answer to only the Governor. The conduct of each Defendant constitutes a violation of the separation of powers doctrine and a usurpation of the constitutionally-mandated exclusive role of the Legislature to impose taxes and make law.

Plaintiffs’ complaint asserts four causes of action against each Defendant: (1) that the entry into RGGI was *ultra vires*; (2) that RGGI is an unlawful tax not authorized by the Legislature; (3) that the implementation of RGGI was arbitrary and capricious; and (4) that RGGI violates the Compact Clause of the United States Constitution.

6. APPELLATE ISSUES:

Plaintiffs seek the reversal of the Supreme Court’s June 12, 2012 Decision and Order (a copy of which is attached hereto), which dismissed Plaintiffs’ complaint in its entirety on the

grounds that Plaintiffs lack standing to raise their claims and their claims are barred by the doctrine of laches. The grounds for reversal are as follows:

- (a) The Supreme Court improperly determined that Plaintiffs lack standing either as ratepayers of electricity or as taxpayers under New York State Finance Law § 123-b;
- (b) The Supreme Court improperly determined that even if Plaintiffs had standing, their claims are barred by the doctrine of laches;
- (c) The Supreme Court improperly determined that Defendants moved to dismiss the claims against the Governor and the Compact Clause claim;
- (d) The Supreme Court failed to consider and/or made erroneous legal or factual determinations concerning, among other things:
  - Whether New York’s participation in RGGI is unconstitutional;
  - Whether RGGI imposes an unlawful substantial and hidden tax on all electricity purchasers in New York;
  - Whether Defendants’ creation of a massive, complex, expensive, and radical environmental regime of taxation and regulation is a violation of the separation of powers doctrine;
  - Whether the Governor and the Executive Branch unlawfully usurped the lawmaking and taxation powers of the Legislature by the creation and implementation of RGGI; and
  - Whether New York’s agreement to enter into the RGGI Memorandum of Understanding (“MOU”) is an unlawful interstate agreement that was entered into by the then-Governor without legislative approval;

- (e) All other grounds permitted under New York substantive and procedural law, including any grounds advanced by Plaintiffs in opposition to Defendants' Motion to Dismiss.

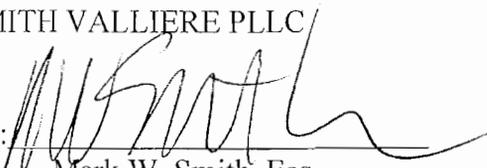

7. OTHER RELATED MATTERS:

None.

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

McNamara, J.

In December 2005 then-Governor George Pataki signed a Memorandum of Understanding (Memorandum) with the governors of six other States. In the Memorandum the seven signatory States each committed:

“to propose for legislative and/or regulatory approval a CO<sub>2</sub> Budget Trading Program (the “Program”) aimed at stabilizing and then reducing CO<sub>2</sub> emissions within the Signatory States, and implementing a regional CO<sub>2</sub> emissions budget and allowance trading program that will regulate CO<sub>2</sub> emissions from fossil fuel-fired electricity generating units having a rated capacity equal to or greater than 25 megawatts.”

The Memorandum allows for other States to sign on and also provides that any Signatory State may withdraw its participation in the program, known as the Regional Greenhouse Gas Initiative (RGGI), upon 30 days written notice. Three additional States later signed the Memorandum and in January 2012 New Jersey, one of the original Signatory States, ended its participation.

New York affirmed its participation in RGGI by promulgating regulations that implement the “CO<sub>2</sub> Budget Trading Program” (6 NYCRR Part 242, eff. September 24, 2008) and the “CO<sub>2</sub> Allowance Auction Program” (21 NYCRR Part 507, eff. October 8, 2008). The Budget Trading Program regulations were promulgated by the Department of Environmental Conservation (DEC) and the Auction Program regulations by the New York State Energy Research and Development Authority (NYSERDA). No specific legislative action was taken to authorize New York’s participation in RGGI though in 2011 the Legislature passed the Power NY Act of 2011 (Environmental Conservation Law § 19-0312). The act requires major electric generating facilities, those generating 25,000 kilowatts or more of electricity, to comply with applicable DEC air quality requirements relating to offsetting of emissions and directed the Commissioner to promulgate regulations targeting reductions in emissions of carbon dioxide that would apply to major

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

electric generating facilities that commenced construction after the effective date of the regulations. At the time RGGI was the only state carbon dioxide emission requirement applicable to power plants in New York.

In June 2011 plaintiffs commenced this action in which they assert four causes of action: each addressed in some manner to the legality of New York's participation in RGGI. In the first cause of action plaintiffs argue that the New York RGGI program is *ultra vires* because the Memorandum was executed, and the regulations were promulgated by DEC and NYSERDA, without the consent or authorization of the Legislature. The second cause of action presents an attack on the RGGI regulations as imposing an impermissible tax not authorized by the Legislature. In the third cause of action plaintiffs contend that the RGGI program, as implemented, is arbitrary and capricious. The fourth cause of action raises the question of whether the Memorandum violates the United States Constitution, Art I, § 10, cl 3: the Compact Clause. Plaintiffs seek declaratory judgments announcing that the entry of New York State into the RGGI was *ultra vires*; that in promulgating the RGGI regulations the actions of DEC and NYSERDA were *ultra vires*; created an unlawful tax and were arbitrary and capricious; and that the RGGI Memorandum is a multistate compact which has not been authorized by the United States Congress and therefore, is void under the Compact Clause.

Defendants have moved to dismiss the complaint on the grounds that plaintiffs lack standing, that the applicable Statute of Limitations has expired, that certain claims are barred by the doctrine of laches and that certain other claims are moot. Although plaintiffs maintain that defendants have not moved to dismiss claims against the Governor and the Compact Clause claim, the notice of motion does not so limit the relief sought and the arguments made in defendants' memorandum of law do not exclude any claim from the defenses of standing and laches. At a minimum defendants specifically assert in the memorandum that all

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

claims should be dismissed on laches grounds.

Standing is a threshold requirement for a party seeking to challenge governmental action and requires a showing that the party has suffered an injury-in-fact meaning that the party will actually be harmed by the challenged action (*New York State Assn. of Nurse Anesthetists v Novello*, 2 NY3d 207 [2004]). The injury must be particularized and the party asserting standing must show "special damage, different in kind and degree from the community generally" (*Matter of Sun-Brite Car Wash v Board of Zoning & Appeals*, 69 NY2d 406, 413 [1987]). Moreover, the harm must be shown to fall within the zone of interests, or concerns, sought to be promoted or protected by the authority under which the agency has acted (*Society of Plastics Indus. v County of Suffolk*, 77 NY2d 761, 773 [1991], citation and internal quotations omitted).

Plaintiffs contend that as electric utility rate-payers they have been harmed by having to pay increased costs passed along by electricity producers that must purchase CO<sub>2</sub> allowances under RGGI. Even assuming that plaintiffs could show that the cost they pay for electricity has increased because of RGGI, they have failed to show an injury distinct from the community generally. While acknowledging that RGGI impacts a large percentage of New York residents, plaintiffs maintain that as ratepayers they are distinguishable from the general public because there are members of the general public who do not pay electricity bills. The question, however, is whether the impact is felt by some, but not the community in general, and not whether, as plaintiffs' argue, that some segment of the community is not affected (see *Matter of Diederich v Lawrence*, 78 AD3d 1290 [2010], distinction between local taxpayers subjected to a tax and individuals not subjected to the tax fails). Such a strained interpretation would essentially eliminate the requirement of a distinct injury (*Id.* at 1292). Inasmuch as plaintiffs have failed to establish that as ratepayers they have suffered an injury distinct from that of the general public, they cannot assert

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

standing on the basis of that alleged harm.

The argument that DEC and NYSERDA usurped legislative authority in promulgating the RGGI regulations raises another concern recognized by the courts in addressing standing issues. Claims of institutional harm raised to ensure the continued vitality of the constraints on power that lie at the heart of our constitutional scheme require additional analysis when determining standing (see *Saratoga County Chamber of Commerce v Pataki*, 100 NY2d 801, 814 [2003]). In instances where denial of standing would, in effect, pose an impenetrable barrier to judicial scrutiny of an action of constitutional dimensions, standing may be found (*Id.* at 814). Here, however, as defendants note, the utility companies subject to the RGGI regulations are potentially interested parties who would have standing to bring a challenge to implementation of the program. Thus, denial of standing to these plaintiffs does not shield the challenged actions from judicial review.

Though not pled in the complaint, plaintiffs assert that they have standing under State Finance Law § 123-b which provides:

“... any person, who is a citizen taxpayer, whether or not such person is or may be affected or specially aggrieved by the activity herein referred to, may maintain an action for equitable or declaratory relief, or both, against an officer or employee of the state who in the course of his or her duties has caused, is now causing, or is about to cause a wrongful expenditure, misappropriation, misapplication, or any other illegal or unconstitutional disbursement of state funds or state property...”

Citizen-taxpayers need not demonstrate an injury-in-fact to acquire standing to question the unlawful expenditure of state funds (*Saratoga County Chamber of Commerce, Inc. v Pataki*, 100 NY2d 801, 814 [2004]). The important distinction in such matters is between “cases that present a challenge to the expenditure of money and those that use the expenditure of money as a pretense to challenge a governmental

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

decision (*Id.* at 814). The complaint here presents, generally, a challenge to New York's participation in RGGI and specifically challenges the authority of the Governor to sign the Memorandum and DEC and NYSERDA to promulgate the RGGI regulations. Both are essentially non-fiscal activities and consequently, section 123-b standing is not available.

Even if plaintiffs had standing, the doctrine of laches serves to bar the claims asserted. "Laches is defined as such neglect or omission to assert a right as, taken in conjunction with the lapse of time, more or less great, and other circumstances causing prejudice to an adverse party, operates as a bar in a court of equity" (*Matter of Schulz v State of New York*, 81 NY2d 336, 348 [1993] [internal quotation marks and citation omitted]). An action for a declaratory judgment, such as is present here, is subject to equitable principles (*Krieger v Krieger*, 25 NY2d 364 [1969]). The Memorandum was signed in December 2005 and the New York RGGI regulations became effective in September and October 2008. Plaintiffs did not commence this action until June 2011. Defendants argue that plaintiffs' delay in bringing this action would cause multifaceted prejudice to multiple parties if New York's participation in RGGI is invalidated as a consequence of this action. Defendants maintain that numerous projects that depend on proceeds from RGGI would be lost including the Green Jobs/Green New York Program that the Legislature has directed be funded with proceeds from the sale of CO<sub>2</sub> allowances. In addition, the State could face numerous lawsuits from purchasers of allowances. Defendants also contend that invalidation of New York's participation in RGGI would cause significant market uncertainty regarding the validity and value of New York issued CO<sub>2</sub> allowances held by out-of-state power generators and third-party investors. Defendants also point out the in-state power companies have made operational decisions and capital improvement planning decisions in reliance on having to meet a continuing compliance obligation. Power companies

*Thrun, et al v. Cuomo, et al*

*Index No.: 4358-11; RJI No.: 01-11-104776*

have made investments in their physical plants designed to reduce CO<sub>2</sub> emissions and in that way avoid the cost of having to purchase CO<sub>2</sub> allowances. Defendants contend that invalidation of New York's participation in RGGI would be prejudicial to these companies whose business models and strategic plans would be disrupted.

Plaintiffs' have not offered any reason for the delay in bringing the action. They argue, however, that any claim of prejudice is either curable by an award of prospective relief only or is undermined by the fact that the Memorandum provides that any Signatory State could withdraw from the agreement by providing 30 days notice. An award of prospective relief would not address all of the claimed prejudice such as disruption to the strategic plans of in-state power generators. And, while the possibility that New York could voluntarily withdraw from participation in RGGI has always existed, the risk of withdrawal based on a political decision is different in kind and degree from the risk posed by an end to participation based on legal reasons. The two risks present different considerations to those making decisions based on New York's participation in RGGI. The potential for harm to economic interest caused by the delay in bringing this action is sufficiently prejudicial to the interest of adverse parties to bar the action (see *Matter of Schulz v State of New York*, 81 N.Y.2d 336 [1993]).

Accordingly, it is

ORDERED, that the motion to dismiss each cause of action in the complaint is granted on the grounds that plaintiffs lack standing to raise the claims and the claims are barred by the doctrine of laches.

This constitutes the decision and order of the Court. The original decision and order are returned to the attorney for defendants. A copy of the decision and order and the supporting papers have been

Albany County Clerk  
Document Number 11172626  
Rcvd 06/13/2012 2:52:38 PM

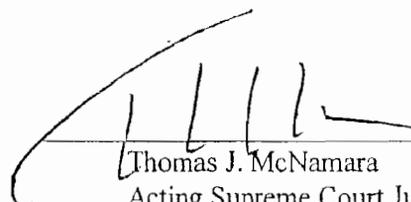

*Thrun, et al v. Cuomo, et al*

Subject: Win in RGGI case

All--Just wanted to pass along the good news that we received a favorable decision today granting our motion to dismiss the Thrun case. The judge found for us on standing and laches grounds. A copy of the decision is attached. Thanks for your help in making the laches case, which the judge obviously found convincing. I expect the plaintiffs will appeal, so will keep you posted.--Mike

To: Michael J. Myers  
Subject: INVITE: SEC Commissioner Meetings [Tuesday, October 23rd]

Dear Mr. Myers,

I'm writing to invite you to join Ceres staff on Tuesday, October 23rd at two INCR meetings with SEC Commissioners Aguilar and Walter at the U.S. Securities and Exchange Commission in Washington, D. C. At these meetings we'll be focused on SEC comment letters, plus climate risks related to oil and gas and water. In addition to these two meetings, we are hoping to confirm times with Chair Mary Schapiro and Corporation Finance Staff. The confirmed meeting times are as follows:

\*1:00 - 2:00pm ET: Commissioner Aguilar

\*4:00 - 5:00pm ET: Commissioner Walter

The purpose of these meetings is to discuss the state of climate change-related disclosure in SEC filings. As a reminder, INCR members were the key driver in encouraging the SEC to issue its groundbreaking interpretive guidance on climate change disclosure in 2010, and it's important for the SEC to hear from investors--in person--about the need for the Commission to better implement its guidance.

The SEC mentioned climate change disclosure in only 17 out of over 20,000 SEC comment letters sent to companies in the year and a-half after the guidance was issued. This level of implementation of the guidance indicates that SEC staff is missing opportunities to improve disclosure from corporations facing material climate risks and opportunities. At a time when the SEC is facing many constraints, it's especially important for us to position ourselves as a resource for the Commission and help them improve implementation of the guidance.

Please RSVP to these meetings by COB next Wednesday, September 26th. Due to limited space, we have capacity for one person from each organization at the meetings. If you should have any questions, please feel free to either e-mail me or call at (617) 247-0700 ex. 162.

Best Regards,

Siobhan

Vickie--Several of us in the bureau enjoyed Fred's recent Wall Street Journal piece on trying to forge a coalition to move climate change efforts forward. Is there a possibility that he could come down to our NYC office (125 Broadway) for lunch and talk about it (and any other topics of interest) as part of our brown bag series? It's very informal. We would also plan to plug in our Albany and Buffalo offices by phone so our attorneys and scientists in those offices could listen in. If that would work, we'd be happy to reach out to Fred's scheduler to find a date that would work for him. Thanks!--Mike

p.s. Are you are someone else from EDF planning on participating in the meetings on Oct. 23 with SEC Commissioners' on disclosure of climate change risks? Either Morgan or I will be attending, pending travel approval.

Good Morning,

Ceres looks forward to your participation in the upcoming SEC Commissioners Meetings in Washington, D.C. on Tuesday, October 23rd. We will circulate the draft agenda and prep materials by October 15th and welcome any questions from you prior to that date.

In preparation for meetings with Commissioner Elisse B. Walter, Commissioner Luis A. Aguilar and Corporate Finance staff, please let me know your availability for an hour-long prep call on the dates below by filling out this online poll: <http://doodle.com/uzuib9u6if98tmmt>.

Tuesday, 10/16: 3:00 - 4:00pm ET

Wednesday, 10/17: 1:00 - 2:00pm ET

Thursday, 10/18: 2:00 - 3:00pm ET

Please feel free to reach out to me via. email or phone (617) 247-0700 ex. 162 with any questions or concerns.

Best Regards,

Siobhan

Subject: Environmental Law Section Executive Committee Meeting  
Date: Wed Oct 10 2012 15:56:06 EDT  
Attachments:

As a reminder, the Environmental Law Section's Executive Committee will meet on Sunday, October 14, from 9:15-11:30 in the Skyroom of the Crowne Plaza Resort and Golf Club in Lake Placid in conjunction with the Section's Fall Meeting.

If you have not yet indicated your attendance at the meeting, please send an email to Kathy Plog at [Kplog@nysba.org](mailto:Kplog@nysba.org) to let her know, as I will be out of the office tomorrow at another meeting.

Please click this link for an agenda and meeting materials. [www.nysba.org/ENVECAgendaOct2012](http://www.nysba.org/ENVECAgendaOct2012)

A limited number of hard copies will be available at the meeting.

If you have any questions, just let me know.

Hi Laurel and Deb: As Mike and Vickie discussed, I would like to see if we can find a time to have Fred here to join us for one of our brown bag lunches which take place in the Environmental Protection Bureau conference room, here at 120 Broadway. Our lunches are typically every other Thursday from 12:30-1:30. Currently, the following dates are open:

Thursday November 29

Thursday December 6th

Thursday December 12th

Of course, if these dates do not work, we will certainly work with you and Fred to find a date/time that works. I look forward to hearing from you. Thanks!

Subject: Fred's 8/6/12 WSJ piece on climate change

Vickie--Several of us in the bureau enjoyed Fred's recent Wall Street Journal piece on trying to forge a coalition to move climate change efforts forward. Is there a possibility that he could come down to our NYC office (125 Broadway) for lunch and talk about it (and any other topics of interest) as part of our brown bag series? It's very informal. We would also plan to plug in our Albany and Buffalo offices by phone so our attorneys and scientists in those offices could listen in. If that would work, we'd be happy to reach out to Fred's scheduler to find a date that would work for him. Thanks!--Mike

p.s. Are you are someone else from EDF planning on participating in the meetings on Oct. 23 with SEC Commissioners' on disclosure of climate change risks? Either Morgan or I will be attending, pending travel approval.

Subject: Fred's 8/6/12 WSJ piece on climate change

Vickie--Several of us in the bureau enjoyed Fred's recent Wall Street Journal piece on trying to forge a coalition to move climate change efforts forward. Is there a possibility that he could come down to our NYC office (125 Broadway) for lunch and talk about it (and any other topics of interest) as part of our brown bag series? It's very informal. We would also plan to plug in our Albany and Buffalo offices by phone so our attorneys and scientists in those offices could listen in. If that would work, we'd be happy to reach out to Fred's scheduler to find a date that would work for him. Thanks!--Mike

p.s. Are you are someone else from EDF planning on participating in the meetings on Oct. 23 with SEC Commissioners' on disclosure of climate change risks? Either Morgan or I will be attending, pending travel approval.

Hi Jodi,

Happy to confirm Fred for Thurs, Dec 6th from 12:30-1:30pm. Any particular logistics for getting to your office at 120 Broadway?

Laurel

Hi Jodi,

Thanks for the date options. Fred is available on Thurs, Dec 6th if that still works on your end (the 12:30-1:30 window is fine).

Regards,

Laurel

Subject: RE: Fred's 8/6/12 WSJ piece on climate change

Hi Laurel and Deb: As Mike and Vickie discussed, I would like to see if we can find a time to have Fred here to join us for one of our brown bag lunches which take place in the Environmental Protection Bureau conference room, here at 120 Broadway. Our lunches are typically every other Thursday from 12:30-1:30. Currently, the following dates are open:

Thursday November 29

Thursday December 6th

Thursday December 12th

Of course, if these dates do not work, we will certainly work with you and Fred to find a date/time that works. I look forward to hearing from you. Thanks!

## **IDENTITY AND INTERESTS OF THE *AMICI***

The Commonwealth of Massachusetts and the State of New York (the “Amici States”) are national leaders on energy efficiency and environmental protection. As sovereign states, they are entitled to “special solicitude” because of their roles “as *parens patriae* to protect . . . public or governmental interests that concern the state as a whole.” *See Massachusetts v. EPA*, 549 U.S. 497, 520, and n. 17 (other citations omitted) (2007). The Amici States may file an *amicus curiae* brief with this Court pursuant to Rule 29(a) of the Federal Rules of Appellate Procedure and Circuit Rule 29(a).

The State Energy Resources Conservation and Development Commission of the State of California, more commonly known as the California Energy Commission (“CEC”), is California’s primary energy policy and planning agency. The CEC was created by the California Legislature in 1974 by the Warren-Alquist State Energy Resources Conservation and Development Act (“Warren-Alquist Act”) (Stats. 1974, ch. 276), codified at Cal. Pub. Res. Code § 25000, *et seq.* The CEC has obtained the consent of all parties to join the *amicus curiae* brief of the Amici States pursuant to Rule 29(a) of the Federal Rules of Appellate Procedure and Circuit Rule 29(b).

The Amici States and the CEC share common interests in supporting the furnace, central air conditioner, and heat pump efficiency standards set by the

Department of Energy's ("DOE") "direct final rule" being challenged by petitioner American Public Gas Association ("APGA"), and each also has its own special interests in seeing the standards upheld. Massachusetts and New York support the standards because, by reducing demand for natural gas, the 90 percent efficiency gas-furnace standard for northern tier states (including Massachusetts and New York) should result in significant cost savings for residents on their heating bills and improvements in the reliability of our energy systems, which depend on natural gas. The CEC supports the standards because the more stringent central air conditioner and heat pump efficiency standards for southwestern states (including California) should similarly result in significant cost savings for residents on their electric bills and improvements in system reliability. Thus, the standards will assist the Amici States and the CEC in advancing their energy and environmental laws and policies. *See, e.g.*, Massachusetts State Energy Plan<sup>1</sup> (reflecting Massachusetts' view that increased energy efficiency is "the best cost-containment tool we have to reduce energy use and greenhouse gas emissions that are causing global warming"); Massachusetts Green Communities Act ("GCA"), 2008 Mass. Acts, Ch. 169<sup>2</sup> (requiring utilities to meet electric or natural gas resource needs

---

first through “all available energy efficiency and demand reduction resources that are cost-effective or less expensive than supply”); N.Y. Energy Law § 3-101 (stating the policy of the State “to obtain and maintain an adequate and continuous supply of safe, dependable and economical energy for the people of the state,” and to “encourage conservation of energy . . . in heating”); N.Y. State Energy Plan<sup>3</sup> (setting forth goal to reduce demand for natural gas through energy efficiency improvements); Cal. Pub. Res. Code § 25402(c) (mandating that the CEC reduce energy consumption in California); *Id.* at § 25006, 25007 (expressing state policy to employ a range of measures to reduce wasteful, uneconomical, and unnecessary uses of energy and promotion of all feasible means of energy conservation); 2011 Integrated Energy Policy Report<sup>4</sup> (stating California’s commitment to meet new electricity demand first with energy efficiency).

In addition, both the Amici States and the CEC view the new furnace standard as an important tool in addressing the harms from climate change and other air pollution resulting from the combustion of fossil fuels during electricity generation. The Amici States and the State of California have participated in several cases in this Circuit, including *Massachusetts v. EPA*, *supra*, and, most recently, the *Coalition for Responsible Regulation v. EPA* cases, 684 F.3d 102

---

<sup>3</sup> Available at: <http://www.nysenergyplan.com/2009stateenergyplan.html>.

(D.C. Cir. 2012), in an effort to either compel or support efforts of the federal government to address greenhouse gas pollution that is causing, and will continue to cause, harm to our residents and natural resources due to climate change. In the absence of federal standards, the Amici States and the State of California enacted statutes and promulgated regulations to reduce emissions of greenhouse gas pollution. *See, e.g.*, Massachusetts Global Warming Solutions Act (“GWSA”), 2008 Mass. Acts. Ch. 298<sup>5</sup> (setting strict greenhouse gas reduction goals, including reducing those emissions 80 percent below 1990 levels by 2050); N.Y. CO<sub>2</sub> Budget Trading Program, N.Y. Comp. Codes R. & Regs., tit. 6, ch. 242<sup>6</sup> (establishing a cap-and-trade air pollution reduction program to reduce emissions of carbon dioxide from power plants in New York); California Global Warming Solutions Act of 2006 (AB 32), Cal. Health & Saf. Code § 38550, *et seq.*<sup>7</sup> (requiring the state to reduce greenhouse gas emissions to 1990 levels by 2020); Cal. Code Regs. tit. 17, § 95801, *et seq.*<sup>8</sup> (establishing a cap-and-trade program to implement AB 32). Because DOE projects that the furnace efficiency standards will reduce greenhouse gas pollution by approximately 82 million metric tons per year, and because the standards would eliminate the need for many power plants, the Amici States and

<sup>8</sup> Available at: <http://www.arb.ca.gov/regact/2010/capandtrade10/finalrevfro.pdf>.

the CEC support the standards as an important measure to address climate change and other forms of air pollution.

The CEC also has a unique interest as a signatory to the consensus agreement that underlies the direct final rule at issue in this case. The preamble of the consensus agreement requires the Joint Stakeholders to pursue a multipronged approach to achieve implementation of the standards contained in that agreement.<sup>9</sup> It is therefore in the CEC's interest, in furtherance of that obligation and in light of the energy and environmental benefits of the direct final rule, to see that the standards contained in the consensus agreement, and the regulatory process used to adopt those standards, are upheld by this Court.

<sup>9</sup> Available at:  
[http://www1.eere.energy.gov/buildings/appliance\\_standards/residential/pdfs/hvac\\_consensus\\_agreement.pdf](http://www1.eere.energy.gov/buildings/appliance_standards/residential/pdfs/hvac_consensus_agreement.pdf).

## STATEMENT OF FACTS<sup>10</sup>

### A. The Federal Efficiency Standards.

#### 1. The States' Lawsuit to Compel DOE to Issue Revised Furnace Efficiency Standards.

As of 2005, the federal annual fuel utilization efficiency standard set by DOE for gas-furnaces was only 78 percent. It had remained at this low level for many years because DOE had failed to engage in rulemaking required under the Energy Policy and Conservation Act (“EPCA”)<sup>11</sup> to promulgate a more stringent, technologically feasible and cost effective standard. Because DOE had also missed deadlines to upgrade efficiency standards for 21 other consumer and commercial products (*e.g.*, air conditioners, clothes dryers and some lamps) covered by EPCA, a coalition of stakeholders and fifteen states, including the

---

<sup>10</sup> While some materials submitted with and in this brief are not part of the record on appeal, this Court may still take notice of them because they are offered to show the Amici States’ and the CEC’s interest in the direct final rule and that DOE had full knowledge of those interests when it adopted the rule, thus informing the agency’s discretion to conclude that the sample of signatories to the JSC and the consensus agreement was “representative” under EPCA § 325(p)(4)(A). *Marshall County Health Care Auth. v. Shalala*, 988 F.2d 1221, 1226, n.6 (D.C. Cir. 1993) (as matters of public record, statements in the Federal Register can be examined); *Interstate Nat. Gas Co. v. S. California Gas Co.*, 209 F.2d 380, 385 (9th Cir. 1953) (“We may take judicial notice of records and reports of administrative bodies.”); *Native Village of Point Hope v. Salazar*, 680 F.3d 1123, 1129, n.6 (9th Cir. 2012) (notice taken of agency plan approval); *United States v. 14.02 Acres of Land More or Less in Fresno County*, 547 F.3d 943, 955 (9th Cir. 2008) (DOE study noticed).

<sup>11</sup> EPCA Subchapter III, Parts A & A-1, 42 U.S.C. §§ 6291-6317.

Amici States and the CEC,<sup>12</sup> brought suit against DOE in 2005 to force the issuance of new standards. *New York v. Bodman*; *NRDC v. Bodman*, Consolidated C.A. Nos. 05 Civ. 7807 (JES) and 05 Civ. 7808 (JES) (U.S.D.C., S.D.N.Y).

In November 2006, the parties to the consolidated cases against DOE, including the Amici States and the CEC, entered into a consent decree approved by the District Court that established deadlines for issuance of new DOE rules for all products at issue. The Consent Decree set September 30, 2007, as the deadline for issuance of an amended furnace and boiler standard (including for mobile home and small furnaces).

## **2. The Lawsuit Challenging DOE's Failure to Adopt a Ninety-Percent Efficiency Standard.**

After a short stay, DOE published a new final rule on November 19, 2007,<sup>13</sup> raising the gas-furnace standard to only 80 percent efficiency, still a very lenient standard. Government agencies in several states, including Michigan, New Hampshire, New York and Ohio, had submitted comments during the rulemaking

---

<sup>12</sup> Joined by: Connecticut, Illinois, Iowa, Maine, New Hampshire, New Jersey, New Mexico, North Carolina, Rhode Island, Vermont and Wisconsin, the Pennsylvania Department of Environmental Protection, the City of New York, Natural Resources Defense Council ("NRDC"), the Massachusetts Union of Public Housing Tenants, and the Texas Ratepayers' Organization to Save Energy.

<sup>13</sup> 72 Fed. Reg. 65,136 (Nov. 19, 2007).

proceeding urging DOE to adopt a 90 percent or higher efficiency standard for furnaces.<sup>14</sup>

On January 17, 2008, New York, Massachusetts, New York City, Connecticut and NRDC, filed petitions for review of this rule in the Court of Appeals for the Second Circuit, *New York v. DOE*, Nos. 08-311-ag(L), 08-312-ag(con). California, the California Energy Commission, and New Jersey subsequently intervened as petitioners. In briefs submitted in that case, the State petitioners expressly argued that DOE improperly rejected a more stringent 90 percent furnace efficiency standard.<sup>15</sup> By Court Order dated April 21, 2009, the 80 percent efficiency rule was voluntarily remanded to DOE for further notice and comment rulemaking.

DOE was further made aware of Massachusetts' interest in implementing a more stringent 90 percent gas-furnace efficiency standard when, on October 6, 2009, DOE received the "Waiver Petition of the Commonwealth of Massachusetts to Exempt from Federal Preemption Massachusetts' 90% Annual Fuel Utilization

<sup>15</sup> See, e.g., Final Opening Brief for Government Petitioners States of New York, Connecticut, New Jersey, and California, Commonwealth of Massachusetts, City of New York, and California Energy Comm'n, *New York v. DOE*, No. 08-0311ag(L) (2d Cir., May 7, 2008).

Efficiency Standard for Non-Weatherized Gas Furnaces” (“Waiver Petition”).<sup>16</sup>

(This is described more fully in Statement of Facts subsection B, below.)

### **3. The “Joint Stakeholder Comment” Process.**

The CEC, as California’s energy policy and planning agency, regularly participates in coalition efforts and federal efficiency rulemakings to seek more stringent energy conservation regulations from DOE under Part B of Title III of EPCA that will apply to California’s regulated appliances, especially where, as here, DOE’s authority to adopt new efficiency standards preempts states from issuing their own without prior DOE approval or waiver.

During 2009, the CEC participated extensively in the negotiations that led to a consensus agreement and the submission of a Joint Stakeholder Comment (“JSC”) to DOE, including face-to-face discussions with AHRI and other stakeholders on July 9, 2009.

On October 13, 2009, fifteen interested stakeholders (including seven furnace manufacturers, energy efficiency advocates, and the CEC) reached a consensus agreement that, among other things, supported a regional 90 percent

---

<sup>16</sup> The Waiver Petition and all Attachments thereto are available at: [http://www1.eere.energy.gov/buildings/appliance\\_standards/pdfs/ma\\_state\\_petition.pdf](http://www1.eere.energy.gov/buildings/appliance_standards/pdfs/ma_state_petition.pdf).

efficiency gas-furnace rule for thirty “northern tier” states.<sup>17</sup> 76 Fed. Reg., at 37,422. On January 26, 2010, various stakeholders (AHRI, ACEEE, ASE, ASAP, NRDC and NEEP) submitted the JSC to DOE that referenced the consensus agreement and advocated for such a rule. *Id.*

**4. DOE’s Adoption of the Direct Final Rule Establishing a Ninety-Percent Standard.**

On June 27, 2011, DOE issued a direct final rule establishing energy conservation standards for residential furnaces, central air conditioners, and heat pumps, including the regional standards for non-weatherized gas furnaces advocated in the consensus agreement. Energy Conservation Program: Energy Conservation Standards for Residential Furnaces and Residential Central Air Conditioners and Heat Pumps, Direct Final Rule, 76 Fed. Reg. 37,408. In adopting the direct final rule, DOE concluded that similarly-situated states in the northern tier would all benefit from a 90 percent furnace efficiency standard. *Id.* at 37,410 (citing EPCA § 325(o)(3)(B)’s requirement that a new or amended standard must

---

<sup>17</sup> Available at: [https://www1.eere.energy.gov/buildings/appliance\\_standards/residential/pdfs/furnaces\\_framework\\_jointstakeholdercomments.pdf](https://www1.eere.energy.gov/buildings/appliance_standards/residential/pdfs/furnaces_framework_jointstakeholdercomments.pdf)

“result in significant conservation of energy.”)<sup>18</sup>

Comments for and against retaining the direct final rule were submitted to DOE, and the agency, pursuant to the discretion afforded by EPCA § 325(p)(4)(C), declined to withdraw it. Energy Conservation Program: Energy Conservation Standards for Residential Furnaces and Residential Central Air Conditioners and Heat Pumps, 76 Fed. Reg. 67,037 (Oct. 31, 2011).

### **B. The Massachusetts Efficiency Standards.**

In 2005, because of its concerns about high energy costs, the availability of natural gas for home heating, and market barriers that exist for conservation programs, and to advance other overarching state energy and environmental policy goals, including addressing climate change, the Massachusetts Legislature amended its energy efficiency standards statute, M.G.L. c. 25B, §5,<sup>19</sup> to require that non-weatherized gas- and propane-fired residential furnaces” (“NWGF”)<sup>20</sup>

---

<sup>18</sup> Although California is not in the northern tier of states, the direct final rule also sets regional efficiency standards for central air conditioners and heat pumps in the southwest, of which California is a part. *See* 76 Fed. Reg. 37,408, 37,430-31 (June 27, 2011). The CEC supports the rule for this reason (as it appears APGA seeks to vacate the entire rule and not just the furnace standards) and because the gas-furnace standards will help address climate change concerns in the Nation and globally.

<sup>19</sup> *See* §11 of Chapter 139 of the Acts of 2005.

<sup>20</sup> A weatherized furnace is designed for installation outdoors and resistance to weather, and has its own venting system.” 10 C.F.R. §430.2. NWGFs are far more typical, are located indoors, and need no weatherization.

sold in-state meet a 90 percent annual fuel utilization efficiency standard.<sup>21</sup> The Massachusetts standard, much stricter than the then-existing 78 percent federal efficiency standard, was tightened to reduce the significant contribution furnaces make to overall Massachusetts energy consumption, to reduce high consumer energy costs, and to prevent unnecessary air pollution that results from excess fossil-fuel energy generation. Projections at that time were that the new standard would allow Massachusetts to avoid consuming one billion cubic feet of natural gas annually by the year 2020, and that the net present value (“NPV”) of the economic savings to consumers could be as high as \$100 million.<sup>22</sup>

Because furnaces are “covered products” for which DOE is authorized to set efficiency standards under 42 U.S.C. §§ 6291(2) and 6292(a)(5), Massachusetts could not implement its 90 percent standard without obtaining from DOE a waiver of federal preemption under EPCA § 327(d). In early October 2009,

---

<sup>21</sup> Following M.G.L. c. 25B, §5, the Massachusetts DOER revised its regulations to add the 90 percent AFUE standard. *See* 225 C.M.R. 9.03(10).

<sup>22</sup> An analysis prepared by the Appliance Standards Awareness Project (“ASAP”), a commenter on the JSC and signatory to the consensus agreement, estimated \$144 million in net present value savings from the adoption of 90 percent AFUE in Massachusetts. Formerly found at:

[http://www.standardsasap.org/state/2009%20federal%20analysis/states/fedappl\\_m\\_a.pdf](http://www.standardsasap.org/state/2009%20federal%20analysis/states/fedappl_m_a.pdf) Now replaced by [http://www.appliance-standards.org/sites/default/files/2009\\_Mass\\_fed\\_svngs.pdf](http://www.appliance-standards.org/sites/default/files/2009_Mass_fed_svngs.pdf)

Massachusetts filed the Waiver Petition” and supporting reports and exhibits.<sup>23</sup>

While Massachusetts knew about and supported the consensus agreement and JSC, it did not sign on because of its assessment that doing so might have undercut its request to DOE for a waiver of preemption.

Massachusetts identified in the Waiver Petition certain “unusual and compelling state . . . interests” that it believed justified a waiver under EPCA § 327(d)(1)(B). First, Massachusetts’ residential heating consumers have long been burdened by some of the nation’s highest energy costs,<sup>24</sup> which are well above the national average.<sup>25</sup>

Second, those customers need to consume far more natural gas to operate their furnaces than customers in many other states because heating degree days in Massachusetts generally exceed 6,000 and are higher than the national average.<sup>26</sup>

---

<sup>23</sup> Available at:

[http://www1.eere.energy.gov/buildings/appliance\\_standards/pdfs/ma\\_state\\_petition.pdf](http://www1.eere.energy.gov/buildings/appliance_standards/pdfs/ma_state_petition.pdf).

<sup>24</sup> For example, in 2008, Massachusetts residential natural gas prices averaged \$17.18 per thousand cubic feet (“mcf”) - 8th highest in the country - according to the Energy Information Administration’s listing of “Natural Gas Prices” by area (available at:

[http://tonto.eia.doe.gov/dnav/ng/ng\\_pri\\_sum\\_a\\_EPG0\\_PRS\\_DMcf\\_a.htm](http://tonto.eia.doe.gov/dnav/ng/ng_pri_sum_a_EPG0_PRS_DMcf_a.htm)). In 2011, Massachusetts rose to the 6th highest-cost state in the country. *Id.*

<sup>25</sup> The Optimal Report, Fig. 2, submitted as Attachment D to the Waiver Petition (*see* URL in footnotes 1, 16 & 23, above, showed Massachusetts residential gas prices to be 20% to 30% above national average since 2000.

<sup>26</sup> Optimal Report, at Fig. 1. Regardless of the year chosen, the U.S. average is generally between 4,000 and 4,500 heating degree days, compared to Massachusetts’ more than 6,000.

Third, residences and gas-fired power plants compete for regional gas supplies in Massachusetts,<sup>27</sup> which could cause winter gas interruptions and reliability problems.

Fourth, Massachusetts' high rate of rental housing (8th highest nationally)<sup>28</sup> creates unusual barriers to increasing the percentage of households that install high-efficiency furnaces because owners and renters have divergent interests. Owners have an "interest in reducing first cost, that is, putting in the least expensive equipment," while tenants who pay for fuel are "focused on reducing operation cost." These "split incentives" make it "significantly more challenging . . . to influence purchasing decisions through means other than standards."<sup>29</sup> *Id.*

Fifth, Massachusetts continues to seek lower gas consumption to help meet state policies and laws whose purposes are to save energy costs and address climate change, including the Massachusetts State Energy Plan ("Energy Plan")

---

<sup>27</sup> Optimal Report, Sec. II.D., at 7. *See also* ISO-New England, "CIGRE 2008 Case Study: Electric and Natural Gas Market Interdependencies Within New England" (Sept. 1, 2008), available at [http://www.iso-ne.com/pubs/spcl\\_rpts/2008/final\\_isonone\\_cigre\\_case\\_study\\_090108.pdf](http://www.iso-ne.com/pubs/spcl_rpts/2008/final_isonone_cigre_case_study_090108.pdf). This study noted, *id.* at 8: "There is no natural gas production or underground storage in New England," unlike much of the rest of the country, thus creating a relative scarcity of supply. Moreover, "gas-fired peaking generation" in New England "can also experience fuel related problems, exacerbated during winter conditions" because gas-fired generation is sometimes "treated as secondary on the priority list with respect to fuel delivery needs." *Id.* at 21.

<sup>28</sup> Optimal Report, at 8 & Fig. 8.

<sup>29</sup> Optimal Report, at 8.

and Gas Forecast (“Forecast”),<sup>30</sup> the GWSA<sup>31</sup> and the GCA.<sup>32</sup>

As required by EPCA § 327(d)(1)(C), Massachusetts evaluated its 90 percent rule “within the context of the State’s energy plan and forecast,” which reflects Massachusetts’ view that increased energy efficiency is “the best cost-containment tool we have to reduce energy use and greenhouse gas emissions that are causing global warming.”<sup>33</sup> During 2008, Massachusetts adopted the GWSA, which sets strict greenhouse gas reduction goals, including reducing those emissions 80 percent below 1990 levels by 2050.<sup>34</sup> Massachusetts also adopted the GCA to require in-state utilities to meet their electric and natural gas resource needs first by achieving all cost-effective energy efficiency.<sup>35</sup> The Waiver Petition explained that Massachusetts had already adopted a very broad range of programs to reduce energy consumption in light of the aggregated Forecast for regulated gas companies projecting yearly increases in gas consumption through 2015.

In its Waiver Petition, Massachusetts demonstrated that cost and energy savings from its 90 percent rule would be substantial. Estimates of the NPV savings (in 2009 dollars) to Massachusetts’ consumers ranged as high as \$144

---

<sup>30</sup> Waiver Petition, Attachments B & C.

<sup>31</sup> 2008 Mass. Acts, Ch. 298.

<sup>32</sup> 2008 Mass. Acts, Ch. 169.

<sup>33</sup> Energy Plan, at 2.

<sup>34</sup> *Id.*

<sup>35</sup> *Id.*, at 3.

million,<sup>36</sup> with avoided consumption of approximately 19 million therms of natural gas by 2030.<sup>37</sup>

Under EPCA § 327(d)(1)(C), Massachusetts needed to demonstrate to DOE that the “costs, benefits, burdens and reliability of energy . . . savings resulting from the State regulation make such regulation preferable or necessary when measured against the costs, benefits, burdens and reliability of alternative approaches to energy . . . savings . . .” Massachusetts prepared an Alternatives Analysis<sup>38</sup> that evaluated five alternative programs - consumer rebates, low-income grants, tax incentives, consumer financing, and a public information/education campaign. It concluded that high-efficiency furnaces had already reached high market penetration in Massachusetts through aggressive non-regulatory efficiency programs; that those approaches had largely reached maximum benefit; and that improving penetration would be difficult and costly without new regulations.<sup>39</sup> Implementing the 90 percent efficiency standard would have cost only \$24,000, compared to a range of \$3 million for tax incentives to

---

<sup>36</sup> Massachusetts offered an ASAP Project analysis found at [http://www.standardsasap.org/state/2009%20federal%20analysis/states/fedappl\\_m\\_a.pdf](http://www.standardsasap.org/state/2009%20federal%20analysis/states/fedappl_m_a.pdf), that has now been replaced at: [http://www.appliance-standards.org/sites/default/files/2009\\_Mass\\_fed\\_svngs.pdf](http://www.appliance-standards.org/sites/default/files/2009_Mass_fed_svngs.pdf)

<sup>37</sup> *Id.* (revising estimate to 18 million therms).

<sup>38</sup> Waiver Petition, Attachment E.

<sup>39</sup> Alternatives Analysis, at 2.

almost \$58 million for grant programs.<sup>40</sup> Thus, it would cost 125 to about 2,400 times more for Massachusetts to try to achieve 95 percent penetration of the high-efficiency furnaces using the studied alternatives, compared to adopting a 90 percent efficiency standard.<sup>41</sup>

Despite agreeing with much of Massachusetts' data and analysis, on October 7, 2010, DOE denied the Waiver Petition, but described in the decision that it was simultaneously conducting a rulemaking on whether to adopt a regional 90 percent gas-furnace efficiency standard based on the consensus agreement. *See* Notice of Denial of a Petition for Waiver from Federal Preemption, 75 Fed. Reg. 62,115, 62,119 (Oct. 7, 2010).<sup>42</sup>

The interests set forth by Massachusetts in its Waiver Petition remain today, and are shared by all northern-tier states, which is precisely why affirmation of the direct final rule is so important to the Amici States.

---

<sup>40</sup> *Id.*, at 3, 21-23.

## ARGUMENT

Although the Amici States and the CEC support the DOE's issuance of the direct final rule in all respects, we focus specifically here on APGA's erroneous contention<sup>43</sup> that DOE acted contrary to the statute by issuing, and then deciding not to withdraw, the direct final rule promulgating the 90 percent furnace efficiency standard. Contrary to APGA's arguments, DOE did not abuse its discretion by concluding that the JSC (and underlying consensus agreement) supporting issuance of the direct final rule was "fairly representative of relevant points of view . . . of interested parties," and by deciding that there was no reasonable basis offered by the Petitioner for withdrawing the direct final rule. EPCA § 325(p)(4).

Although APGA correctly notes<sup>44</sup> that the familiar test of *Chevron U.S.A. v. NRDC*, 467 U.S. 837, 842-43 (1984), governs, APGA fundamentally misapplies it here. APGA reads out of EPCA § 325(p)(4) the scope of the discretion Congress explicitly granted the Secretary to decide whether the JSC, supported by the consensus agreement, was made by parties who were "fairly representative of relevant points of view," and whether the adverse comments received about the direct final rule provided a "reasonable basis" for withdrawing it. Of course, that discretion is not unlimited; it is black-letter law that the Secretary must not act

---

<sup>43</sup> APGA Br. 53-60.

<sup>44</sup> APGA Br. 38, n. 48.

unreasonably, arbitrarily, capriciously, or in violation law, and he must make his decisions based on substantial record evidence. 5 U.S.C. § 706. These requirements were met in this case.

**I. DOE Properly Exercised Its Discretion Under 42 U.S.C. § 6295(p)(4)(A) (EPCA § 325(p)(4)(A)) When Issuing the Direct Final Rule.**

**A. The Secretary Properly Applied EPCA § 325(p)(4)(A) in Determining That the Consensus Agreement’s Signatories Were “Representative of Relevant Points of View,” and in Issuing the Direct Final Rule.**

EPCA § 325(p)(4)(A) provides in relevant part that, upon “receipt of a statement that is submitted jointly by interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates), *as determined by the Secretary*, and contains recommendations with respect to an energy or water conservation standard,” the Secretary “may issue” a direct final rule establishing the standard at the same time that the Secretary issues a proposed rule regarding the standard (emphasis added). Because the highlighted clause in the statute, “*as determined by the Secretary*,” is clear and not subject to any other reasonable interpretation, this Court should simply give effect to it as written, as required under the first step of the *Chevron* test. Under the facts and circumstances of this case, the Court should uphold DOE’s determinations because each had a rational basis and each was amply supported by the administrative record.

*Coalition for Responsible Regulation v. EPA*, 2012 WL 2381955, \*3, \*22 (2012);  
*Virginia Dep't of Med. Assistance Servs. v. U.S. Dep't of Health & Human  
Services*, 678 F.3d 918, 921-22, 926 (D.C. Cir. 2012); *AKM LLC dba Volks  
Constructors v. Sec'y of Labor*, 675 F.3d 752, 755 (D.C. Cir. 2012).

Subject to the general requirements of administrative law, EPCA  
§ 325(p)(4)(A) unambiguously delegates discretionary authority to the Secretary to  
do two things: first, to decide whether a statement of joint interest is “fairly  
representative” of “relevant points of view” on a proposed new energy standard,  
and then, if so, to decide whether to issue a direct final rule on the proposal.  
Congress required the Secretary to give due consideration to whether the group  
expressing views deemed “relevant” by DOE is representative of the entities listed  
in the parenthetical of the statute. The Amici States and the CEC agree with DOE  
that it did so, and that it properly found that the consensus agreement in this case,  
joined by seven product manufacturers, multiple efficiency advocates, and the  
CEC on behalf of California, and informed by the views of Massachusetts, New  
York and other interested states, and receiving no opposition from any State, was  
“fairly representative” of “relevant points of view.” 76 Fed. Reg., at 67,038.

**B. The Secretary Properly Determined That the Consensus Agreement Was Fairly Representative of Relevant States' Views.**

The claim of Intervenors ACCA and HARDI<sup>45</sup> that the consensus agreement submitted with the JSC was not representative because only a single “State entity” and no “State” signed on is plainly wrong. The CEC<sup>46</sup> signed on and has been authorized by California’s Legislative and Executive Branches to speak for California on matters involving appliance efficiency standards. The California Legislature established and consolidated the state’s responsibility for energy resources in the CEC when it passed the Warren-Alquist Act. Cal. Pub. Res. Code § 25006. The Warren-Alquist Act establishes as state policy the employment of a range of measures to reduce wasteful, uneconomical, and unnecessary uses of energy, and the promotion of all feasible means of energy conservation. *Id.*, at §§ 25007 and 25008. The CEC is required to carry out, directly or indirectly, various energy conservation measures, including prescribing efficiency standards for appliances. *Id.*, at §§ 25216(a) & 25402(c)(1). The CEC is also authorized to request and utilize the services of all federal, state, local, and regional agencies and to take any action it deems reasonable and necessary to carry out its duties to

---

<sup>45</sup> ACCA/HARDI Br. 29 & 28, n. 58.

<sup>46</sup> The CEC is comprised of five Commissioners appointed by the Governor and confirmed by the California Senate, who may be removed from office only by a majority vote of each house of the state Legislature. *Id.*, at §§ 25200, 25204, & 25216. Each Commissioner serves the state at large on a full-time basis for a five-year term. *Id.*, at §§ 25203 & 25206.

represent California's efficiency interests. *Id.*, at §§ 25218(d) & (e); § 25219.

Taken together, the provisions of the Warren-Alquist Act designate the CEC as a California agency that must be considered the "State" for the purposes of the involvement that led to the consensus agreement and the JSC. DOE acted appropriately in according the CEC this status here, as it has done in prior proceedings.

This treatment of the CEC by DOE is historically supported. Over the years, the CEC has submitted numerous letters and written comments to DOE in various rulemaking proceedings involving appliance efficiency. Particularly noteworthy is the CEC's 2005 petition to DOE for a waiver of federal preemption under EPCA § 327(d) to permit California to implement new water conservation standards for residential clothes washers.<sup>47</sup> DOE accepted and considered the CEC's petition and in doing so properly recognized the CEC's ability to act as the "State" of California in the context of an EPCA proceeding.<sup>48</sup>

Moreover, when considering the direct final rule, the Secretary was well aware of the strong, publicly expressed interest of numerous other states in a 90 percent efficiency gas-furnace standard from comments they submitted to DOE in

---

<sup>47</sup> The facts and issues involved in the petition are discussed in *California Energy Commission v. Department of Energy*, 585 F.3d 1143 (9th Cir. 2009).

<sup>48</sup> More recently, CEC staff recently attended DOE's May 2, 2012, public meeting regarding energy conservation standards for battery chargers and external power supplies and subsequently submitted written comments to the proceeding on May 29, 2012.

its prior rulemaking adopting an 80 percent efficiency standard,<sup>49</sup> the Second Circuit litigation filed by several states, including the Amici States and the CEC, challenging this standard as inadequate,<sup>50</sup> and Massachusetts' Waiver Petition.<sup>51</sup> Although these states did not join the JSC because they were already advocating for the higher furnace standard through the related Second Circuit litigation and the waiver process, their position undoubtedly informed the agency's determination that the sample of signatories to the JSC and the consensus agreement was indeed "representative" of relevant points of view and not underinclusive under EPCA § 325(p)(4)(A), as APGA erroneously claims.

**C. There is No *Per Se* Rule That Multiple State Signatures Are Required to Make a Joint Statement Fairly Representative of Relevant Points of View.**

Intervenors ACCA's and HARDI's claim<sup>52</sup> that "multiple States . . . must sign a joint statement before DOE may issue a DFR" is similarly unfounded. The touchstone under EPCA § 325(p)(4)(A) is a determination by the Secretary that the joint statement is fairly representative of relevant points of view. As the statutory text makes clear, in this analysis, the Secretary must consider whether the views of the States are represented in the joint statement.

---

<sup>49</sup> See 72 Fed. Reg. at 65,136.

<sup>50</sup> See *New York v. DOE*, No. 08-0311ag(L).

<sup>51</sup> See Notice of Denial, 75 Fed. Reg. at 62,115-20.

<sup>52</sup> ACCA/HARDI Br. 28, n. 58.

But contrary to intervenors' claims, the statute sets forth no *per se* rule that multiple States must sign a joint statement before it ever may be considered fairly representative of state views. As discussed above, the particular facts here provided ample basis for the Secretary to conclude that the States' views were fairly represented in the JSC. The CEC signed the consensus agreement, and through a variety of public proceedings - including DOE's own prior rulemaking proceedings, related litigation brought by the States, and DOE's handling of Massachusetts' waiver petition - DOE had been fully apprised of many States' interest in the passage of a 90 percent gas-furnace efficiency rule. Moreover, no State opposed the direct final rule, nor has any state challenged it or DOE's process as non-representative of the States' interests. Consequently, DOE had a sound basis here to conclude that the JSC was fairly representative of many States' views, and the direct final rule should not be annulled merely because the numerous States that publicly supported a 90 percent rule did not themselves sign the JSC. DOE thus satisfied the procedural threshold set forth in the statute to permit the Secretary to utilize the more streamlined mechanism available under EPCA to issue a direct final rule based on what he considered to be a representative group of entities with relevant opinions.

ACCA's and HARDI's restrictive viewpoint makes little logical sense under the facts of this case. The signatory to the consensus agreement was the CEC,

representing the country's largest state with a population (according to 2009 U.S. census data)<sup>53</sup> of approximately 37 million people. If, for example, Wyoming and Vermont, with populations totaling just under 1.2 million, had signed the consensus agreement and the CEC had not, this would presumably comply with ACCA's and HARDI's proposed *per se* rule, even though those two States together have only about 3% of California's population and only about 0.4% of the country's population. Congress could not have meant for DOE to rigidly apply EPCA § 325(p)(4)(A) to produce such anomalous results when its goal was to ensure "representativeness" for the greater good, and the Secretary had a sound basis to conclude that the States' views were well represented here.

**D. The Secretary Properly Determined That Entities Not Mentioned in the Statute Are Not Necessary to Make a Joint Statement Fairly Representative of Relevant Points of View.**

Curiously, and without adequate legal support, APGA argues<sup>54</sup> that DOE cannot "predicate" a direct final rule on the views of the kinds of entities specifically mentioned in the statute (*i.e.*, manufacturers, States, and efficiency advocates), without considering the views of certain other entities that the statute does not mention - namely "energy suppliers, contractors, distributors, and

---

<sup>53</sup> Available at: <http://www.census.gov/compendia/statab/2012/ranks/rank01.html>

<sup>54</sup> APGA Br. 54-55.

consumers.”<sup>55</sup> But, the “other” categories APGA lists were neither enumerated by Congress in the statute as entities whose opinions DOE had to consider in determining whether the consensus agreement was “representative,” nor as entities with “relevant points of view” in this area.

Moreover, DOE’s issuance of the direct final rule without any signatories from the specific entities that APGA represents is logical. Those entities are peripheral to the focus of the direct final rule’s 90 percent efficiency gas-furnace standard, which is directed only at furnace manufacturers, not energy suppliers, distributors or installers. As discussed above, the consensus agreement provided a representative sample of those parties specifically enumerated in the statute, and no such parties voiced any objection to it or the JSC. Furthermore, several groups advocating on behalf of energy consumers besides the consensus agreement signatories also supported the standards.<sup>56</sup> Thus, DOE acted well within the discretion and authority Congress delegated to it when determining that the viewpoints represented in support of the standards were sufficient under the statute

---

<sup>55</sup> In point of fact, many of the signatories to the consensus agreement and the JSC represent consumer groups.

<sup>56</sup> In addition to the energy efficiency advocates who signed the JSC (ACEEE, ASE, ASAP, NRDC and NEEP), Northwest Energy Efficiency, Environment America, and the Northwest Power and Conservation Council submitted comments in support of the direct final rule. (R.60 [EERE-2011-BT-STD-0011], submitted Nov. 17, 2011.)

to issue a direct final rule.<sup>57</sup>

Adopting Petitioner's view of the statute would frustrate EPCA's grant of expedited rulemaking authority to DOE to issue long-overdue energy efficiency standards. That authority gives DOE the discretion to utilize a streamlined rulemaking process where, as here, a representative set of stakeholders has negotiated a proposal for energy conservation standards that are technologically feasible and economically justified, and several other interested parties made their support for such standards clear in prior rulemaking proceedings, litigation, and legislation. APGA's reading of the statute is rigid, overly technical and without textual support. Adopting such an interpretation would undermine DOE's ability to use the Congress's valuable direct final rule procedure to expeditiously adopt efficiency standards that benefit consumers and the environment in the Amici States and in California and to avoid further unnecessary delay.

**II. EPCA § 325(p)(4)(C) Provides DOE with Authority to Refuse to Withdraw a Direct Final Rule Even When It Receives Substantive Opposition to the Rule.**

APGA's arguments<sup>58</sup> that DOE was required to withdraw the direct final rule once it received any substantive opposition to the rule ignores the plain

---

<sup>57</sup> It is also noteworthy that APGA and its supporting intervenors submitted comments on the consensus agreement that was the basis of the JSC, and therefore the direct final rule. 76 Fed. Reg. at 37,423-25. Thus, APGA and its supporting intervenors cannot plausibly say that they had no meaningful input in the rulemaking process.

language in the second part of subsection (C) of the statute, which expressly delegates authority to the Secretary to determine whether any adverse comments it has received provide a “reasonable basis” for withdrawing the rule. Section 325(p)(4)(C) of EPCA provides in relevant part that “the Secretary shall withdraw” the direct final rule “*if* . . . the Secretary receives 1 or more adverse public comments relating to” the rule *and* “based on the . . . record . . . the Secretary determines that such adverse public comments . . . *may* provide a reasonable basis for withdrawing” it. (Emphasis added.)

If, as the statute says, the Secretary is empowered to decide that adverse comments *may* provide a reasonable basis for withdrawing a direct final rule, he also possesses the corollary authority to decide that adverse comments *may not* or *do not* provide a reasonable basis for withdrawal. Of course, the Secretary’s power is not unlimited under the statute, and he still must act reasonably based on sufficient record evidence. That is precisely what the Secretary did here when, based on a thorough review of the record before him, including the submitted comments of APGA, HARDI and ACCA, he determined that the comments failed to raise concerns that would compel DOE to adopt a different standard upon further review. 76 Fed. Reg., at 67,037, 67,040, 67,051. Under the facts of this case, and given the long history of DOE’s consideration of new furnace standards,

---

<sup>58</sup> APGA Br. 56-58.

the Secretary permissibly exercised the discretion Congress granted him when he refused to withdraw the direct final rule.<sup>59</sup>

APGA fails to cite any authority in support of its argument that only “noncontroversial” consensus standards may be implemented through direct final rules.<sup>60</sup> There is no such limitation in the language of EPCA § 325(p)(4)(C), which is unambiguous with respect to the Secretary’s discretion. As such, under the first step of the *Chevron* test, it would not be appropriate for the Court to construe the statute in the manner the Petitioner argues.

Even if the Court were to conclude that the statute was not clear on its face, DOE’s interpretation of the statute as allowing it discretion not to withdraw the direct final rule in light of adverse comments received is reasonable and entitled to deference under the second step of the *Chevron* test. Given DOE’s long-term study and review of furnace standards, the agency properly concluded that it was well within its discretion to retain the rule.

---

<sup>59</sup> Here, DOE pointed out in its decision to retain the direct final rule that it “weighed the significance of each comment individually and all comments cumulatively” to evaluate whether they provided a reasonable basis for withdrawing the direct final rule,” and it considered “each adverse comment based on its merits and the background data and information that supported that comment.” 76 Fed. Reg., at 67,050.

<sup>60</sup> APGA Br. 57 (citing only to a quote from a comment on the direct final rule submitted by AHRI (R. 52 [EERE-2011-BT-STD-0011], at 2), in which the commenter ultimately supported the consensus agreement).

## CONCLUSION

For the foregoing reasons, and for the reasons cited by DOE in its brief, the petition for review should be denied and the direct final rule should be upheld.

Respectfully submitted,

**ADDENDUM:**  
**STATUTES AND REGULATIONS**

## **FEDERAL STATUTES AND REGULATIONS**

### **42 U.S.C. § 6291(2)**

For purposes of this part:

(2) The term “covered product” means a consumer product of a type specified in section 6292 of this title.

### **42 U.S.C. § 6292(a)(5)**

(a) In general.

The following consumer products, excluding those consumer products designed solely for use in recreational vehicles and other mobile equipment, are covered products:

(5) Furnaces.

### **42 U.S.C. § 6295(p)(4)**

(p) Procedure for prescribing new or amended standards

Any new or amended energy conservation standard shall be prescribed in accordance with the following procedure:

(4) Direct final rules.

(A) In general. On receipt of a statement that is submitted jointly by interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates), as determined by the Secretary, and contains recommendations with respect to an energy or water conservation standard—

(i) if the Secretary determines that the recommended standard contained in the statement is in accordance with subsection (o) or section 6313(a)(6)(B) of this title, as applicable, the Secretary may issue a final rule that establishes an energy or water conservation standard and is published simultaneously with a notice of proposed rulemaking that proposes a new or amended energy or water conservation standard that is identical to the standard established in the final rule to establish the recommended standard (referred to in this paragraph as a “direct final rule”); or

(ii) if the Secretary determines that a direct final rule cannot be issued based on the statement, the Secretary shall publish a notice of the determination, together with an explanation of the reasons for the determination.

(B) Public comment. The Secretary shall solicit public comment for a period of at least 110 days with respect to each direct final rule issued by the Secretary under subparagraph (A)(i).

(C) Withdrawal of direct final rules.

(i) In general. Not later than 120 days after the date on which a direct final rule issued under subparagraph (A)(i) is published in the Federal Register, the Secretary shall withdraw the direct final rule if

(I) the Secretary receives 1 or more adverse public comments relating to the direct final rule under subparagraph (B)(i) or any alternative joint recommendation; and

(II) based on the rulemaking record relating to the direct final rule, the Secretary determines that such adverse public comments or alternative joint recommendation may

provide a reasonable basis for withdrawing the direct final rule under subsection (o), section 6313(a)(6)(B) of this title, or any other applicable law.

(ii) Action on withdrawal. On withdrawal of a direct final rule under clause (i), the Secretary shall

(I) proceed with the notice of proposed rulemaking published simultaneously with the direct final rule as described in subparagraph (A)(i); and

(II) publish in the Federal Register the reasons why the direct final rule was withdrawn.

(iii) Treatment of withdrawn direct final rules.—A direct final rule that is withdrawn under clause (i) shall not be considered to be a final rule for purposes of subsection (o).

#### **42 U.S.C. § 6297(d)**

(d) Waiver of Federal preemption

(1)(A) Any State or river basin commission with a State regulation which provides for any energy conservation standard or other requirement with respect to energy use, energy efficiency, or water use for any type (or class) of covered product for which there is a Federal energy conservation standard under section 6295 of this title may file a petition with the Secretary requesting a rule that such State regulation become effective with respect to such covered product.

(B) Subject to paragraphs (2) through (5), the Secretary shall, within the period described in paragraph (2) and after consideration of the petition and the comments of interested persons, prescribe such rule if the Secretary finds (and publishes such finding) that the State or river basin commission has established by a preponderance of the evidence that such State regulation is needed to meet unusual and compelling State or local energy or water interests.

(C) For purposes of this subsection, the term "unusual and compelling State or local energy or water interests" means interests which

(i) are substantially different in nature or magnitude than those prevailing in the United States generally; and

(ii) are such that the costs, benefits, burdens, and reliability of energy or water savings resulting from the State regulation make such regulation preferable or necessary when measured against the costs, benefits, burdens, and reliability of alternative approaches to energy or water savings or production, including reliance on reasonably predictable market-induced improvements in efficiency of all products subject to the State regulation. The factors described in clause (ii) shall be evaluated within the context of the State's energy plan and forecast, and, with respect to a State regulation for which a petition has been submitted to the Secretary which provides for any energy conservation standard or requirement with respect to water use of a covered product, within the context of the water supply and groundwater management plan, water quality program, and comprehensive plan (if any) of the State or river basin commission for improving, developing, or conserving a waterway affected by water supply development.

(2) The Secretary shall give notice of any petition filed under paragraph (1)(A) and afford interested persons a reasonable opportunity to make written comments, including rebuttal comments, thereon. The Secretary shall, within the 6-month period beginning on the date on which any such petition is filed, deny such petition or prescribe the requested rule, except that the Secretary may publish a notice in the Federal Register extending such period to a date certain but no longer than one year after the date on which the petition was filed. Such notice shall

include the reasons for delay. In the case of any denial of a petition under this subsection, the Secretary shall publish in the Federal Register notice of, and the reasons for, such denial.

(3) The Secretary may not prescribe a rule under this subsection if the Secretary finds (and publishes such finding) that interested persons have established, by a preponderance of the evidence, that such State regulation will significantly burden manufacturing, marketing, distribution, sale, or servicing of the covered product on a national basis. In determining whether to make such finding, the Secretary shall evaluate all relevant factors, including -

(A) the extent to which the State regulation will increase manufacturing or distribution costs of manufacturers, distributors, and others;

(B) the extent to which the State regulation will disadvantage smaller manufacturers, distributors, or dealers or lessen competition in the sale of the covered product in the State;

(C) the extent to which the State regulation would cause a burden to manufacturers to redesign and produce the covered product type (or class), taking into consideration the extent to which the regulation would result in a reduction -

(i) in the current models, or in the projected availability of models, that could be shipped on the effective date of the regulation to the State and within the United States; or

(ii) in the current or projected sales volume of the covered product type (or class) in the State and the United States; and

(D) the extent to which the State regulation is likely to contribute significantly to a proliferation of State appliance efficiency requirements and the cumulative impact such requirements would have.

(4) The Secretary may not prescribe a rule under this subsection if the Secretary finds (and publishes such finding) that interested persons have established, by a preponderance of the evidence, that the State regulation is likely to result in the unavailability in the State of any covered product type (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the State at the time of the Secretary's finding, except that the failure of some classes (or types) to meet this criterion shall not affect the Secretary's determination of whether to prescribe a rule for other classes (or types).

(5) No final rule prescribed by the Secretary under this subsection may -

(A) permit any State regulation to become effective with respect to any covered product manufactured within three years after such rule is published in the Federal Register or within five years if the Secretary finds that such additional time is necessary due to the substantial burdens of retooling, redesign, or distribution needed to comply with the State regulation; or

(B) become effective with respect to a covered product manufactured before the earliest possible effective date specified in section 6295 of this title for the initial amendment of the energy conservation standard established in such section for the covered product; except that such rule may become effective before such date if the Secretary finds (and publishes such finding) that, in addition to the other requirements of this subsection the State has established, by a preponderance of the evidence, that -

(i) there exists within the State an energy emergency condition or, if the State regulation provides for an energy conservation standard or other requirement with respect to the water use of a covered product for which there is a Federal energy conservation standard under subsection (j) or (k) of section 6295 of this title, a water emergency condition, which -

(I) imperils the health, safety, and welfare of its residents because of the inability of the State or utilities within the State to provide adequate quantities of gas or electric energy or, in the case of a water emergency condition, water or wastewater treatment, to its residents at less than prohibitive costs; and

(II) cannot be substantially alleviated by the importation of energy or, in the case of a water emergency condition, by the importation of water, or by the use of interconnection agreements; and

(ii) the State regulation is necessary to alleviate substantially such condition.

(6) In any case in which a State is issued a rule under paragraph (1) with respect to a covered product and subsequently a Federal energy conservation standard concerning such product is amended pursuant to section 6295 of this title, any person subject to such State regulation may file a petition with the Secretary requesting the Secretary to withdraw the rule issued under paragraph (1) with respect to such product in such State. The Secretary shall consider such petition in accordance with the requirements of paragraphs (1), (3), and (4), except that the burden shall be on the petitioner to show by a preponderance of the evidence that the rule received by the State under paragraph (1) should be withdrawn as a result of the amendment to the Federal standard. If the Secretary determines that the petitioner has shown that the rule issued by the State should be so withdrawn, the Secretary shall withdraw it.

#### **10 C.F.R. § 430.2**

*Weatherized warm air furnace or boiler* means a furnace or boiler designed for installation outdoors, approved for resistance to wind, rain, and snow, and supplied with its own venting system.

### **MASSACHUSETTS STATUTES AND REGULATIONS**

#### **M.G.L. 25B § 5.**

Establishment of energy efficiency standards; revision

The commissioner shall by regulation establish the level of energy efficiency standards for lamps, so that each lamp covered by said standard shall consume less power in watts per unit of light output in lumens than a maximum reference level to be established by the commissioner; provided, however, that said standards shall not become effective until January first, nineteen hundred and ninety. The commissioner may by regulation increase the level of the energy efficiency standards for lamps, fluorescent ballasts, luminaires and showerheads. Said commissioner may also by regulation increase the level of the energy efficiency standards for refrigerators, refrigerator-freezers, freezers and water heaters, provided that said standards shall not become effective until January first, nineteen hundred and ninety. Any revision of such standards shall be based upon the determination by the commissioner that such efficiency levels are cost-effective to the users, as a group, of the covered appliance or lamp. Any standard revised pursuant to this section which conflicts with a corresponding standard in the state plumbing code shall take precedence over the standard in said code. Any standard revised pursuant to this section shall not take effect for at least one year after its adoption.

The commissioner, in consultation with the heads of other appropriate agencies, shall adopt regulations, in accordance with this chapter, establishing minimum energy efficiency standards for the types of new products set forth in clauses (f) to (s), inclusive, of section 3.

The regulations shall provide for the following minimum efficiency standards:

(1) New medium voltage dry-type distribution transformers, single voltage external AC to DC power supplies, and state-regulated incandescent reflector lamps manufactured on or after January 1, 2008, shall not be sold or offered for sale in the commonwealth unless the efficiency of the new product meets or exceeds the efficiency standards set forth in 225 CMR 9.03.

(2) Metal halide lamp fixtures designed to be operated with lamps rated greater than or equal to 150 watts but less than or equal to 500 watts shall not contain a probe-start metal halide ballast.

(3) Residential furnaces or boilers shall meet or exceed the following Annual Fuel Utilization Efficiency (AFUE):

Product Type	Minimum Efficiency Level
Gas and propane furnaces	90% AFUE
Oil furnaces	83% AFUE
Gas and propane hot water boilers	84% AFUE
Oil-fired hot water boilers	84% AFUE
Gas and propane steam boilers	82% AFUE
Oil-fired steam boilers	82% AFUE

The commissioner may adopt rules to exempt compliance with these furnace or boiler standards at any building, site or location where complying with said standards would be in conflict with any local zoning ordinance, building or plumbing code or other rule regarding installation and venting of boilers or furnaces.

Residential furnace air handlers shall have an ER of 2 per cent or less, except residential oil furnaces with a capacity of less than 94,000 Btu per hour shall have an ER of 2.3 per cent or less.

(4) Single-voltage external AC to DC power supplies shall meet the tier 1 energy efficiency requirements of California Code of Regulations, Title 20, Section 1605.3, as published in April 2005. This standard applies to single-voltage AC to DC power supplies that are sold individually and to those that are sold as a component of or in conjunction with another product.

(5) State-regulated incandescent reflector lamps shall meet the minimum average lamp efficiency requirements for federally-regulated incandescent reflector lamps contained in 42 U.S.C. section 6295 (i)(1)(A). The following lamps are exempt from these requirements: ER30, BR30, BR40 and ER40 of 50 watts or less; BR30, BR40 and ER40 of 65 watts; and R20 of 45 watts or less.

On or after January 1, 2008, no new medium voltage dry-type distribution transformer, single-voltage external AC to DC power supply or state-regulated incandescent reflector lamp may be

sold or offered for sale in the state unless the efficiency of the new product meets or exceeds the efficiency standards set forth in the regulations adopted pursuant to this section. On or after January 1, 2009, no new metal halide lamp fixture may be sold or offered for sale in the commonwealth unless the efficiency of the product meets or exceeds the efficiency standards set forth in the regulations adopted pursuant to this section. In accordance with section 9, the commissioner, in consultation with the attorney general, shall determine if implementation of state standards for residential furnaces or boilers requires a waiver from federal preemption, and shall apply for such waivers if necessary. If the commissioner determines that a waiver from federal preemption is necessary for residential furnaces or boiler standards established by this section, the state standard shall go into effect at the earliest date permitted by federal law. If the commissioner determines that a waiver from federal preemption is not needed for residential furnaces or boilers, then such state standards shall go into effect on June 1, 2008.

One year after the date upon which sale or offering for sale of certain products is limited pursuant to the preceding paragraph of this section, no new products may be installed for compensation in the state unless the efficiency of the new product meets or exceeds the efficiency standards set forth in the regulations adopted pursuant to this section.

## **225 C.M.R. 9.03(10)**

### Product Standards and Test Methods

#### (10) Residential Furnaces or Boilers.

(a) Residential furnaces or boilers shall meet or exceed the following Annual Fuel Utilization Efficiency (AFUE):

<u>Product Type</u>	<u>Minimum Efficiency Level</u>
Gas and propane furnaces	*90% AFUE
Oil furnaces	*83% AFUE
Gas and propane hot water boilers	*84% AFUE
Oil-fired hot water boilers	*84% AFUE
Gas and propane steam boilers	*82% AFUE
Oil-fired steam boilers	Oil-fired steam boilers

(b) The commissioner may adopt rules to exempt compliance with these furnace or boiler standards at any building, site or location where complying with said standards would be in conflict with any local zoning ordinance, building or plumbing code or other rule regarding installation and venting of boilers or furnaces.

(c) Residential furnace air handlers shall have an ER of 2% or less, except residential oil furnaces with a capacity of less than 94,000 Btu per hour shall have an ER of 2.3% or less.

(d) The manufacturer shall cause the testing of samples of each model of residential furnaces and boilers to be sold for final retail sale in Massachusetts in accordance with the federal test method contained in 10 CFR § 430, Subpart B, Appendix N. The test method includes the testing methods required for both elements of Massachusetts standards (*i.e.* minimum AFUE standards and maximum electricity ratio standard.)

## **CALIFORNIA STATUTES**

### **CAL. PRC. CODE § 25006**

It is the policy of the state and the intent of the Legislature to establish and consolidate the state's responsibility for energy resources, for encouraging, developing, and coordinating research and development into energy supply and demand problems, and for regulating electrical generating and related transmission facilities.

### **CAL. PRC. CODE § 25007**

It is further the policy of the state and the intent of the Legislature to employ a range of measures to reduce wasteful, uneconomical, and unnecessary uses of energy, thereby reducing the rate of growth of energy consumption, prudently conserve energy resources, and assure statewide environmental, public safety, and land use goals.

### **CAL. PRC. CODE § 25008**

It is further the policy of the state and the intent of the Legislature to promote all feasible means of energy and water conservation and all feasible uses of alternative energy and water supply sources.

The Legislature finds and declares that the State of California has extensive physical and natural resources available to it at state-owned sites and facilities which can be substituted for traditional energy supplies or which lend themselves readily to the production of electricity or water. Due to increases in energy and water costs, the state's expenditures for energy and water have also increased, adding to the burden on California taxpayers and reducing the amount of funds available for other public purposes.

It is in the best interest of the state to use these resources when it can be demonstrated that long-term cost, water, and energy use reduction will result, and where increased independence from other fuel and water sources and development of additional revenues for the state may be obtained.

Therefore, in recognition of recent and projected increases in the cost of energy and water from traditional sources, it is the policy of the state to use available resources at state facilities which can substitute for traditional energy and water supplies or produce electricity or water at its facilities when use or production will reduce long-term energy or water expenditures. Criteria used in analysis of proposed actions shall include lifecycle cost evaluation, benefit to taxpayers, reduced fossil fuel or reduced water consumption depending on the application, and improved efficiency. Energy or water facilities at state-owned sites shall be scaled to produce optimal system efficiency and best economic advantage to the state. Energy or water produced may be reserved by the state to meet state facility needs or may be sold to state or nonstate purchasers. Resources and processes which may be used to substitute for traditional energy and water supplies and for the purpose of electrical generation at state facilities include, but are not limited

to, cogeneration, biomass, wind, geothermal, vapor compression, water reclamation, and solar technologies.

It is the intent of the Legislature that no policy in this section, expressed or implied, be in conflict with existing state or federal regulations regarding the production or sale of electricity or water, and that this policy be just and reasonable to utility ratepayers.

**CAL. PRC. CODE § 25200**

There is in the Resources Agency the State Energy Resources Conservation and Development Commission, consisting of five members appointed by the Governor subject to Section 25204.

**CAL. PRC. CODE § 25203**

Each member of the commission shall represent the state at large and not any particular area thereof, and shall serve on a full-time basis.

**CAL. PRC. CODE § 25204**

The Governor shall appoint the members of the commission within 30 days after the effective date of this division. Every appointment made by the Governor to the commission shall be subject to the advice and consent of a majority of the members elected to the Senate.

**CAL. PRC. CODE § 25218**

In addition to other powers specified in this division, the commission may do any of the following:

- (a)Apply for and accept grants, contributions, and appropriations.
- (b)Contract for professional services if such work or services cannot be satisfactorily performed by its employees or by any other state agency.
- (c)Be sued and sue.
- (d)Request and utilize the advice and services of all federal, state, local, and regional agencies.
- (e)Adopt any rule or regulation, or take any action, it deems reasonable and necessary to carry out the provisions of this division.
- (f)Adopt rules and regulations, or take any action, it deems reasonable and necessary to ensure the free and open participation of any member of the staff in proceedings before the commission.

**CAL. PRC. CODE § 25219**

As to any matter involving the federal government, its departments or agencies, which is within the scope of the power and duties of the commission, the commission may represent its interest or the interest of any county, city, state agency, or public district upon its request, and to that end may correspond, confer, and cooperate with the federal government, its departments or agencies.

## **CAL. PRC. CODE § 25402**

The commission shall, after one or more public hearings, do all of the following, in order to reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy, including the energy associated with the use of water:

(a)(1)Prescribe, by regulation, lighting, insulation climate control system, and other building design and construction standards that increase the efficiency in the use of energy and water for new residential and new nonresidential buildings. The commission shall periodically update the standards and adopt any revision that, in its judgment, it deems necessary. Six months after the commission certifies an energy conservation manual pursuant to subdivision (c) of Section 25402.1, no city, county, city and county, or state agency shall issue a permit for any building unless the building satisfies the standards prescribed by the commission pursuant to this subdivision or subdivision (b) that are in effect on the date an application for a building permit is filed. Water efficiency standards adopted pursuant to this subdivision shall be demonstrated by the commission to be necessary to save energy.

(2)Prior to adopting a water efficiency standard for residential buildings, the Department of Housing and Community Development and the commission shall issue a joint finding whether the standard (A) is equivalent or superior in performance, safety, and for the protection of life, health, and general welfare to standards in Title 24 of the California Code of Regulations and (B) does not unreasonably or unnecessarily impact the ability of Californians to purchase or rent affordable housing, as determined by taking account of the overall benefit derived from water efficiency standards. Nothing in this subdivision in any way reduces the authority of the Department of Housing and Community Development to adopt standards and regulations pursuant to Part 1.5 (commencing with Section 17910) of Division 13 of the Health and Safety Code.

(3)Water efficiency standards and water conservation design standards adopted pursuant to this subdivision and subdivision (b) shall be consistent with the legislative findings of this division to ensure and maintain a reliable supply of electrical energy and be equivalent to or superior to the performance, safety, and protection of life, health, and general welfare standards contained in Title 24 of the California Code of Regulations. The commission shall consult with the members of the coordinating council as established in Section 18926 of the Health and Safety Code in the development of these standards.

(b)(1)Prescribe, by regulation, energy and water conservation design standards for new residential and new nonresidential buildings. The standards shall be performance standards and shall be promulgated in terms of energy consumption per gross square foot of floorspace, but may also include devices, systems, and techniques required to conserve energy and water. The commission shall periodically review the standards and adopt any revision that, in its judgment, it deems necessary. A building that satisfies the standards prescribed pursuant to this subdivision need not comply with the standards prescribed pursuant to subdivision (a). Water conservation design standards adopted pursuant to this subdivision shall be demonstrated by the commission to be necessary to save energy. Prior to adopting a water conservation design standard for residential buildings, the Department of Housing and Community Development and the

commission shall issue a joint finding whether the standard (A) is equivalent or superior in performance, safety, and for the protection of life, health, and general welfare to standards in the California Building Standards Code and (B) does not unreasonably or unnecessarily impact the ability of Californians to purchase or rent affordable housing, as determined by taking account of the overall benefit derived from the water conservation design standards. Nothing in this subdivision in any way reduces the authority of the Department of Housing and Community Development to adopt standards and regulations pursuant to Part 1.5 (commencing with Section 17910) of Division 13 of the Health and Safety Code.

(2)In order to increase public participation and improve the efficacy of the standards adopted pursuant to subdivisions (a) and (b), the commission shall, prior to publication of the notice of proposed action required by Section 18935 of the Health and Safety Code, involve parties who would be subject to the proposed regulations in public meetings regarding the proposed regulations. All potential affected parties shall be provided advance notice of these meetings and given an opportunity to provide written or oral comments. During these public meetings, the commission shall receive and take into consideration input from all parties concerning the parties' design recommendations, cost considerations, and other factors that would affect consumers and California businesses of the proposed standard. The commission shall take into consideration prior to the start of the notice of proposed action any input provided during these public meetings.

(3)The standards adopted or revised pursuant to subdivisions (a) and (b) shall be cost-effective when taken in their entirety and when amortized over the economic life of the structure compared with historic practice. When determining cost-effectiveness, the commission shall consider the value of the water or energy saved, impact on product efficacy for the consumer, and the life cycle cost of complying with the standard. The commission shall consider other relevant factors, as required by Sections 18930 and 18935 of the Health and Safety Code, including, but not limited to, the impact on housing costs, the total statewide costs and benefits of the standard over its lifetime, economic impact on California businesses, and alternative approaches and their associated costs.

(c)(1)Prescribe, by regulation, standards for minimum levels of operating efficiency, based on a reasonable use pattern, and may prescribe other cost-effective measures, including incentive programs, fleet averaging, energy and water consumption labeling not preempted by federal labeling law, and consumer education programs, to promote the use of energy and water efficient appliances whose use, as determined by the commission, requires a significant amount of energy or water on a statewide basis. The minimum levels of operating efficiency shall be based on feasible and attainable efficiencies or feasible improved efficiencies that will reduce the energy or water consumption growth rates. The standards shall become effective no sooner than one year after the date of adoption or revision. No new appliance manufactured on or after the effective date of the standards may be sold or offered for sale in the state, unless it is certified by the manufacturer thereof to be in compliance with the standards. The standards shall be drawn so that they do not result in any added total costs for consumers over the designed life of the appliances concerned.

In order to increase public participation and improve the efficacy of the standards adopted pursuant to this subdivision, the commission shall, prior to publication of the notice of proposed action required by Section 18935 of the Health and Safety Code, involve parties who would be subject to the proposed regulations in public meetings regarding the proposed regulations. All potential affected parties shall be provided advance notice of these meetings and given an opportunity to provide written or oral comments. During these public meetings, the commission shall receive and take into consideration input from all parties concerning the parties' design recommendations, cost considerations, and other factors that would affect consumers and California businesses of the proposed standard. The commission shall take into consideration prior to the start of the notice of proposed action any input provided during these public meetings.

The standards adopted or revised pursuant to this subdivision shall not result in any added total costs for consumers over the designed life of the appliances concerned. When determining cost-effectiveness, the commission shall consider the value of the water or energy saved, impact on product efficacy for the consumer, and the life cycle cost to the consumer of complying with the standard. The commission shall consider other relevant factors, as required by Sections 11346.5 and 11357 of the Government Code, including, but not limited to, the impact on housing costs, the total statewide costs and benefits of the standard over its lifetime, economic impact on California businesses, and alternative approaches and their associated costs.

(2)No new appliance, except for any plumbing fitting, regulated under paragraph (1), that is manufactured on or after July 1, 1984, may be sold, or offered for sale, in the state, unless the date of the manufacture is permanently displayed in an accessible place on that appliance.

(3)During the period of five years after the commission has adopted a standard for a particular appliance under paragraph (1), no increase or decrease in the minimum level of operating efficiency required by the standard for that appliance shall become effective, unless the commission adopts other cost-effective measures for that appliance.

(4)Neither the commission nor any other state agency shall take any action to decrease any standard adopted under this subdivision on or before June 30, 1985, prescribing minimum levels of operating efficiency or other energy conservation measures for any appliance, unless the commission finds by a four-fifths vote that a decrease is of benefit to ratepayers, and that there is significant evidence of changed circumstances. Before January 1, 1986, the commission shall not take any action to increase a standard prescribing minimum levels of operating efficiency for any appliance or adopt a new standard under paragraph (1). Before January 1, 1986, any appliance manufacturer doing business in this state shall provide directly, or through an appropriate trade or industry association, information, as specified by the commission after consultation with manufacturers doing business in the state and appropriate trade or industry associations on sales of appliances so that the commission may study the effects of regulations on those sales. These informational requirements shall remain in effect until the information is received. The trade or industry association may submit sales information in an aggregated form in a manner that allows the commission to carry out the purposes of the study. The commission shall treat any sales information of an individual manufacturer as confidential and that information shall not be a public record. The commission shall not request any information that cannot be reasonably

produced in the exercise of due diligence by the manufacturer. At least one year prior to the adoption or amendment of a standard for an appliance, the commission shall notify the Legislature of its intent, and the justification to adopt or amend a standard for the appliance. Notwithstanding paragraph (3) and this paragraph, the commission may do any of the following:

(A) Increase the minimum level of operating efficiency in an existing standard up to the level of the National Voluntary Consensus Standards 90, adopted by the American Society of Heating, Refrigeration, and Air Conditioning Engineers or, for appliances not covered by that standard, up to the level established in a similar nationwide consensus standard.

(B) Change the measure or rating of efficiency of any standard, if the minimum level of operating efficiency remains substantially the same.

(C) Adjust the minimum level of operating efficiency in an existing standard in order to reflect changes in test procedures that the standards require manufacturers to use in certifying compliance, if the minimum level of operating efficiency remains substantially the same.

(D) Readopt a standard preempted, enjoined, or otherwise found legally defective by an administrative agency or a lower court, if final legal action determines that the standard is valid and if the standard that is readopted is not more stringent than the standard that was found to be defective or preempted.

(E) Adopt or amend any existing or new standard at any level of operating efficiency, if the Governor has declared an energy emergency as described in Section 8558 of the Government Code.

(5) Notwithstanding paragraph (4), the commission may adopt standards pursuant to Commission Order No. 84-0111-1, on or before June 30, 1985.

(d) Recommend minimum standards of efficiency for the operation of any new facility at a particular site that are technically and economically feasible. No site and related facility shall be certified pursuant to Chapter 6 (commencing with Section 25500), unless the applicant certifies that standards recommended by the commission have been considered, which certification shall include a statement specifying the extent to which conformance with the recommended standards will be achieved.

Whenever this section and Chapter 11.5 (commencing with Section 19878) of Part 3 of Division 13 of the Health and Safety Code are in conflict, the commission shall be governed by that chapter of the Health and Safety Code to the extent of the conflict.

(e) The commission shall do all of the following:

(1) Not later than January 1, 2004, amend any regulations in effect on January 1, 2003, pertaining to the energy efficiency standards for residential clothes washers to require that residential clothes washers manufactured on or after January 1, 2007, be at least as water efficient as commercial clothes washers.

(2) Not later than April 1, 2004, petition the federal Department of Energy for an exemption from any relevant federal regulations governing energy efficiency standards that are applicable to residential clothes washers.

(3) Not later than January 1, 2005, report to the Legislature on its progress with respect to the requirements of paragraphs (1) and (2).

## **NEW YORK STATUTES**

### **N.Y. Energy Law § 3-101**

It shall be the energy policy of the state:

1. to obtain and maintain an adequate and continuous supply of safe, dependable and economical energy for the people of the state and to accelerate development and use within the state of renewable energy sources, all in order to promote the state's economic growth, to create employment within the state, to protect its environmental values, to husband its resources for future generations, and to promote the health and welfare of its people;

2. to encourage conservation of energy in the construction and operation of new commercial, industrial, and residential buildings, and in the rehabilitation of existing structures, through heating, cooling, ventilation, lighting, insulation and design techniques and the use of energy audits and life-cycle costing analysis;

3. to encourage the use of performance standards in all energy-using appliances, and in industrial and commercial applications of energy-using apparatus and processes;

4. to encourage transportation modes and equipment which conserve the use of energy;

5. to foster, encourage and promote the prudent development and wise use of all indigenous state energy resources including, but not limited to, on-shore oil and natural gas, off-shore oil and natural gas, natural gas from Devonian shale formations, small head hydro, wood, solar, wind, solid waste, energy from biomass, fuel cells and cogeneration; and

6. to encourage a new ethic among its citizens to conserve rather than waste precious fuels; and to foster public and private initiative to achieve these ends at the state and local levels.

\* 7. to conduct energy planning in an integrated and comprehensive manner through development of a long-range energy master plan which shall provide the framework for energy related decisions made throughout the state.

\* NB Expired January 1, 1984

Hi all,

Thanks for your responses! I'm fine with 3pm EST on Monday, if Vignesh and Hayley can make it as well. I'll be out of pocket Tues.

Vignesh, thanks for circulating the appt. We also have a call-in number here-- if it's more convenient, just let us know.

Works for me as well. Any time on Monday afternoon is fine for me. Otherwise a call later that week will work, although obviously we have Thanksgiving on Thursday! Which in NY, we should definitely celebrate with our families.

Hi Isaac,

Unfortunately, I cannot do 3pm. How about 5pm EST Monday?

Thanks,

Vignesh

Hi all,

Thanks for your responses! I'm fine with 3pm EST on Monday, if Vignesh and Hayley can make it as well. I'll be out of pocket Tues.

Vignesh, thanks for circulating the appt. We also have a call-in number here-- if it's more convenient, just let us know.

Hi Jodi and Mike,

I'm very sorry to give you this news so close to Dec 6, but a conflict has come up on Fred's calendar for the day and I'm afraid we need to reschedule his lunch session with you. Hopefully there are other dates we can consider as Fred was looking forward to the discussion. Please let me know. I apologize for any inconvenience.

Have a nice Thanksgiving holiday.

Regards,

Laurel

Hi Laurel and Deb: As Mike and Vickie discussed, I would like to see if we can find a time to have Fred here to join us for one of our brown bag lunches which take place in the Environmental Protection Bureau conference room, here at 120 Broadway. Our lunches are typically every other Thursday from 12:30-1:30. Currently, the following dates are open:

Thursday November 29

Thursday December 6th

Thursday December 12th

Of course, if these dates do not work, we will certainly work with you and Fred to find a date/time that works. I look forward to hearing from you. Thanks!

Subject: RE: Fred's 8/6/12 WSJ piece on climate change

Hi Mike, Fred would welcome this discussion. Laurel and Deb can help with scheduling. I'll follow up separately re the 126 petition. Best wishes, Vickie

From: Michael J. Myers [mailto:Michael.Myers@ag.ny.gov]  
Sent: Monday, October 01, 2012 3:18 PM  
To: Vickie Patton  
Cc: Morgan Costello; Lemuel Srolovic; Jodi Feld  
Subject: Fred's 8/6/12 WSJ piece on climate change

Vickie--Several of us in the bureau enjoyed Fred's recent Wall Street Journal piece on trying to forge a coalition to move climate change efforts forward. Is there a possibility that he could come down to our NYC office (125 Broadway) for lunch and talk about it (and any other topics of interest) as part of our brown bag series? It's very informal. We would also plan to plug in our Albany and Buffalo offices by phone so our attorneys and scientists in those offices could listen in. If that would work, we'd be happy to reach out to Fred's scheduler to find a date that would work for him. Thanks!--Mike

p.s. Are you are someone else from EDF planning on participating in the meetings on Oct. 23 with SEC Commissioners' on disclosure of climate change risks? Either Morgan or I will be attending, pending travel approval.

Hi Jodi and Mike,

I'm very sorry to give you this news so close to Dec 6, but a conflict has come up on Fred's calendar for the day and I'm afraid we need to reschedule his lunch session with you. Hopefully there are other dates we can consider as Fred was looking forward to the discussion. Please let me know. I apologize for any inconvenience.

Have a nice Thanksgiving holiday.

Regards,

Laurel

Hi Jodi,

Happy to confirm Fred for Thurs, Dec 6th from 12:30-1:30pm. Any particular logistics for getting to your office at 120 Broadway?

Laurel

Hi Jodi,

Thanks for the date options. Fred is available on Thurs, Dec 6th if that still works on your end (the 12:30-1:30 window is fine).

Regards,

Laurel

Hi Laurel and Deb: As Mike and Vickie discussed, I would like to see if we can find a time to have Fred here to join us for one of our brown bag lunches which take place in the Environmental Protection Bureau conference room, here at 120 Broadway. Our lunches are typically every other Thursday from 12:30-1:30. Currently, the following dates are open:

Thursday November 29

Thursday December 6th

Thursday December 12th

Of course, if these dates do not work, we will certainly work with you and Fred to find a date/time that works. I look forward to hearing from you. Thanks!

Great, thanks Vickie. I'm cc'ing Jodi Feld, our chief scientist in NYC who is coordinating scheduling of these lunches. Jodi, please contact Laurel and Deb to schedule a time when Fred's available to join us. Vickie, I'll look forward to your call on the section 126 petition.--Mike

Subject: Fred's 8/6/12 WSJ piece on climate change

Vickie--Several of us in the bureau enjoyed Fred's recent Wall Street Journal piece on trying to forge a coalition to move climate change efforts forward. Is there a possibility that he could come down to our NYC office (125 Broadway) for lunch and talk about it (and any other topics of interest) as part of our brown bag series? It's very informal. We would also plan to plug in our Albany and Buffalo offices by phone so our attorneys and scientists in those offices could listen in. If that would work, we'd be happy to reach out to Fred's scheduler to find a date that would work for him. Thanks!--Mike

p.s. Are you are someone else from EDF planning on participating in the meetings on Oct. 23 with SEC

Commissioners' on disclosure of climate change risks? Either Morgan or I will be attending, pending travel approval.

## PRELIMINARY STATEMENT

The Comprehensive Environmental Remediation, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. § 9601 et seq., promotes the cleanup of hazardous waste spills that occurred long ago by empowering the federal government and States to commence a cleanup using public funds *before* suing to recover cleanup costs from the parties responsible for a spill. Congress crafted CERCLA's statute of limitations to serve these goals by enabling the federal and state government to focus on environmental cleanup and the elimination of immediate health risks rather than diverting scarce resources to commencing and pursuing cost-recovery litigation.

Thus CERCLA's limitations periods are not triggered by a spill itself or notice to the government of a spill. Instead, they commence at different times in the cleanup process depending on whether response costs are sought for actions designed to address immediate threats to public health ("removal" actions) or to permanently remediate hazardous wastes ("remedial" actions). Costs for a removal action must be sought within three years of *completing* that action, while costs for permanent

remediation must be sought within six years of *commencing physical construction* of that action.

This appeal concerns the timeliness of the State's suit to recover response costs for the New Cassel Industrial Area (NCIA), a 170-acre site located in Nassau County. In 1990, the Town of Hempstead discovered that two of its water-supply wells were contaminated with hazardous chemicals—later determined to result from chemical plumes that had migrated from the NCIA, contaminating the aquifer that fed the Town's wells. The Town installed a granulated activated carbon (GAC) system in 1990 and later added an air stripper in 1995 to treat its well water; both of these remain in operation today.

Independently, in 1995, the New York State Department of Environmental Conservation (DEC) began a comprehensive remedial investigation to identify the nature and extent of groundwater contamination at the nearby NCIA. When DEC confirmed that the NCIA was the source of the contamination in the Town's wells, it agreed to reimburse the Town for the air stripper; a reimbursement agreement was executed in 2000. DEC noted during its investigation that the Town's GAC system and air stripper could only address the water

quality of the water withdrawn from two individual wells, doing nothing to remediate the contaminant plumes emanating from the NCIA.

After DEC completed a full investigation and remedial assessment, the State commenced in 2006 this cost-recovery suit against the private parties potentially responsible for the contamination of the NCIA site, seeking costs for its remedial investigation as well as the funds spent on construction of the air stripper. The United States District Court for the Eastern District of New York (Feuerstein, J.) granted defendants' motion for summary judgment on statute of limitations grounds—concluding that the Town's GAC system and air stripper were part of the State's "permanent containment effort" and remedial action for the NCIA, and therefore that effort commenced in 1990, or no later than June 1995—in either event, more than six years before the filing of the complaint in this action or the execution of any tolling agreements.

This Court should vacate the judgment of the district court. The Town's actions in this case were designed to remove contaminants from the water withdrawn from the Town's water wells, not to remediate the

chemical plumes that were the source of chemicals in the wells. The State had not even begun its remedial investigation when the Town decided to build the GAC system and air stripper, and did not select a permanent remedy until 2003. CERCLA does not require a State to immediately file suit for response costs long before remediation has been planned, much less commenced, merely because the State reimburses the Town for taking prompt action to ensure safe drinking water to residents.

The district court's decision, if affirmed, will jeopardize the ability of local governments and States to proceed in an orderly fashion in addressing contamination: focusing first on swiftly addressing immediate threats posed by contamination, next on carefully developing and implementing complementary remedial plans to address the underlying causes of such contaminations, and finally on recovering the costs of these actions from responsible parties under CERCLA. This result is inconsistent with both statutory language and the purposes of CERCLA.

## JURISDICTIONAL STATEMENT

The district court had original jurisdiction over this action pursuant to 42 U.S.C. § 9613(b) and supplemental jurisdiction over related state-law claims pursuant to 28 U.S.C. § 1367(a). On August 20, 2012, a final judgment was entered: (1) in favor of all non-defaulting defendants; and (2) in favor of the State with respect to all claims against the defaulting defendants, who are not parties to this appeal. The State filed a timely notice of appeal on September 4, 2012. This Court has appellate jurisdiction pursuant to 28 U.S.C. § 1291 over the district court's final order granting summary judgment in favor of all non-defaulting defendants with respect to all federal claims and dismissing all supplemental state-law claims.

## ISSUES PRESENTED

1. Whether the GAC system and air stripper—planned, built, and operated by the Town of Hempstead to address an immediate threat to the users of its drinking water—were removal measures subject to a separate limitations period under CERCLA, and not remedial actions that started the CERCLA limitations period for recovery of all response costs, including investigation costs, because (a)

they were not designed to and could not remediate the underlying source of the contaminants in the drinking water withdrawn from the wells, and (b) they were constructed more than eight years before the State adopted a final remedial plan?

2. Assuming that the GAC system and air stripper were both remedial actions rather than removal actions, whether the statute of limitations on the *State's* remediation efforts began to run only when physical construction of the air stripper began—no sooner than July 27, 1995—because (a) the State had no involvement with the GAC system at all and (b) test borings for the air stripper preceded and were not part of its physical construction?

## STATEMENT OF THE CASE

### A. Statutory and Regulatory Background

#### 1. CERCLA's cost-recovery scheme

Congress enacted CERCLA with dual goals: (1) to ensure the prompt and effective cleanup of hazardous waste sites and also (2) to assure that those responsible for the contaminated sites—rather than taxpayers—bear the costs of remediation. *Niagara Mohawk Power*

*Corp. v. Chevron U.S.A., Inc.*, 596 F.3d 112, 120 (2d Cir. 2010). In balancing these interests, Congress enacted a unique scheme that gives priority to environmental remediation rather than cost collection. Rejecting a sue-first, litigation-driven model, “CERCLA empowers the federal government and the states to initiate comprehensive cleanups,” *id.*, using public funds, *before* identifying potentially responsible parties or suing to recover costs and determine liability.

Congress specifically drafted CERCLA’s limitations period to ensure the responding agencies would not be compelled to commence cost-recovery litigation while cleanup efforts remain underway. For cost-recovery purposes, CERCLA recognizes two types of authorized government responses: removal actions, which are typically “short-term cleanup arrangements” designed to address immediate risks, and remedial actions, providing for “permanent containment or disposal programs” for a hazardous waste site. *New York v. Shore Realty Corp.*, 759 F.2d 1032, 1040 (2d Cir. 1985).<sup>1</sup>

---

<sup>1</sup> CERCLA § 101 defines removal actions as, *inter alia*, actions that “may be necessary to prevent, minimize, or mitigate damage to the public health or welfare or to the environment, which may otherwise  
(continued on the next page)

Rather than forcing litigation to commence as soon as an agency undertakes a removal action—which frequently happens in the earliest stage of a cleanup action, before the cause, nature and extent of the contamination has been fully investigated, Congress permitted cost-recovery suits to be brought, “for a removal action, within 3 years after completion of the removal action.” 42 U.S.C. § 9613(g)(2)(A). CERCLA also provides that an investigation is to be treated for this purpose as a removal action, *id.* § 9601(23), allowing an agency to complete its investigation before seeking to recover the costs of the investigation.

Once an agency has fully investigated the contamination and selected appropriate remedial action, CERCLA provides that a suit to recover the costs of that action must be brought “within 6 years after initiation of physical on-site construction of the remedial action.”

---

result from a release or threat of release.” 42 U.S.C. § 9601(23). Remedial actions include “those actions consistent with permanent remedy taken instead of or in addition to removal actions . . . to prevent or minimize the release of hazardous substances so that they do not migrate to cause substantial danger.” *Id.* § 9601(24). The term “response” refers generically to all removal and remedial actions and related enforcement activities. *Id.* § 9601(25).

*Id.* § 9613(g)(2)(B).<sup>2</sup> These limitations periods do not mandate litigation at the earliest dates. Instead, Congress allowed responding agencies to devote their attention to remediation, delaying suit until: (1) immediate removal actions are completed and imminent risks eliminated, and (2) physical construction has started on permanent remedial solutions.

## 2. State law: The role of DEC

In New York, DEC is responsible for and has primary authority over cleanup of hazardous sites within the State. *See* Environmental Conservation Law (ECL) § 27-1313(1)(a). Federal regulations, which govern response actions by the United States Environmental Protection Agency (EPA), classify EPA-initiated cleanup measures as either removal or remedial actions, adopting the terms of art employed by CERCLA. *See* 40 C.F.R. § 300.1 et seq.

State law does not use the same technical language. However, DEC is empowered to take both: (1) “interim remedial measures” similar to

---

<sup>2</sup> If a responding agency undertakes both removal and remedial actions at a single site, it may wait to seek removal costs within the longer six-year limitations period applicable to remedial actions if it initiates a remedial action “within 3 years after the completion of [its] removal action.” 42 U.S.C. § 9613(g)(2)(B).

“removal actions” as defined by CERCLA, 6 N.Y.C.R.R. § 375-1.2(ab), and (2) final remedial actions comparable to the full-scale “remedial actions” contemplated by CERCLA. State and federal law are also parallel in another respect. Because of the complexity and public importance of effective cleanup of hazardous waste sites, DEC—like EPA—is authorized to undertake full-scale remedial action only after a detailed field investigation, an assessment and study of remedial options, and completion of a public notice-and-comment process, procedural steps designed to ensure the selection of the most optimal and effective cleanup plan. *See* 6 N.Y.C.R.R. § 375-2.8(c), (e) (listing state requirements); 40 C.F.R. § 300.430(d)-(e) (listing federal requirements).

## **B. Factual Background**

This case stems from hazardous waste contamination at the 170-acre New Cassel Industrial Area (NCIA) site located in Nassau County (Joint Appendix [JA] 507). The NCIA was first developed in the early 1950s, and today is a highly developed commercial and industrial area (JA 506). In 1986, an investigation by the Nassau County Department of Health first revealed that the groundwater below the NCIA was extensively contaminated with volatile organic compounds (VOCs) (JA

506-507). The presence of elevated VOC levels in drinking water is a health risk because some VOCs are carcinogens and others may harm certain human organs. See Barbara L. Rowe, et al., Occurrence And Potential Human Health Relevance of Volatile Organic Contaminants in Drinking Water from Domestic Wells in the United States, 115 *Envtl. Health Perspectives* 1539 (2007).

Based upon the Nassau County Department of Health investigation, in 1988, DEC listed the NCIA on the State Registry of hazardous waste sites and began to conduct preliminary site assessments (JA 507, 990-991). No one knew at the time that VOC contamination from the NCIA was migrating offsite through three separate VOC plumes, contaminating groundwater in adjacent communities (JA 914, 987). A plume is a contaminated area of groundwater that migrates away from the original source of the contaminants.

## **1. Contamination of Town of Hempstead water-supply wells outside the NCIA**

In 1989, the Town of Hempstead, which is located outside the NCIA, identified VOC contamination in two of its water-supply wells. The Town's Water Commissioner determined that immediate action was necessary to ensure safe drinking water, and the Town subsequently hired an engineering firm, Dvirka and Bartilucci Consulting Engineers (D&B), to evaluate options to treat the water withdrawn from the wells. D&B initially recommended the installation of a granulated activated carbon (GAC) adsorption system<sup>3</sup> to treat the well water (JA 670-687, 914). The State Department of Health was copied on correspondence that the Town sent to the Nassau County Department of Health to secure the county agency's approval of the GAC (JA 692-697, 974). Construction of the GAC system, which was paid for entirely by the Town, was completed in 1990 (JA 917). In 1995, after the GAC failed to remove sufficient levels of VOC's from the Town's drinking water, the Town's Water Commissioner asked D&B to

---

<sup>3</sup> A GAC system functions like a giant filter—passing water through a carbon filter bed, which absorbs VOCs. The filter bed must be continually replaced as it absorbs the toxic chemicals (JA 679-680).

design a packed tower aeration system (an “air stripper”) to supplement the GAC system (JA 918).<sup>4</sup>

The Nassau County Department of Health also approved construction of the air stripper; the State Department of Health was again copied on correspondence between the Town and the County Health Department (JA 931). In June 1995 a subcontractor took exploratory soil borings to determine if the soil could bear the weight of an air-stripper, which requires a large above-ground tank to hold the well-water (JA 726-728, 918-919). On July 11, 1995, the Town of Hempstead awarded Region Associates, Inc., the contract to build the air-stripper; physical construction of the air stripper began some time there after (JA 660, 920, 975).

## **2. DEC’s investigation of the NCIA site and assessment of remedial options**

While Town officials were responding to the immediate health risks posed by contamination of the Town’s drinking water, DEC was

---

<sup>4</sup> An air stripper works by aerating the well water, thus removing some of the VOCs through evaporation, before the water enters the GAC system for additional removal of VOCs (JA 975).

conducting a parallel investigation into the NCIA site. After DEC listed the NCIA as a “Class 2” site<sup>5</sup> in the State registry of hazardous waste sites in 1988, it retained an engineering firm to conduct preliminary site assessments within the NCIA to determine the source and extent of groundwater contamination and to identify parties potentially responsible for the contamination (JA 507, 990-991).

In early 1995, DEC held a meeting to inform the public about its NCIA site investigation and possible next steps (JA 712), and Town officials realized, based on preliminary investigation results discussed at that meeting, that the NCIA site was the apparent source of the VOCs in the Town’s drinking water (JA 711, 713-715). The Town subsequently requested that the State reimburse the Town for the cost of installing the supplemental air stripper. In June 1995, DEC informed the Town by letter that it expected to do so (JA 729-730).

By 1998, DEC had identified seventeen specific parcels within the NCIA as sources of the VOC contamination (JA 507). By 1999,

---

<sup>5</sup> A Class 2 site is a site that contains hazardous wastes that pose a significant threat to public health or the environment. <sup>6</sup> N.Y.C.R.R. § 375-2.7(b)(3)(ii).

engineers had confirmed the existence of three migrating VOC plumes from the NCIA site (the eastern, western, and central plumes)—extending beyond the boundaries of the NCIA into adjacent areas, including the Town of Hempstead (JA 518-521, 987).

In 2000, after DEC had confirmed that NCIA VOC plumes had contaminated the Town's drinking water, DEC and Town entered into an assistance agreement. DEC agreed to reimburse the Town only for the cost of constructing and installing the supplemental air stripper (an expense of approximately \$1.2 million) (JA 741-750). Under the agreement, the Town retained ownership of the air stripper and remained responsible for its continued operation and maintenance (JA 742).

In compliance with state law, DEC conducted a full remedial investigation and feasibility study (RI/FS) to determine the best remedial option for the NCIA sites. Because of the extent and degree of contamination, DEC divided its remedial strategy into three phases.<sup>6</sup>

---

<sup>6</sup> The phases were described as "operable units," a term used under both CERCLA and state law to describe a discrete phase of a remedial plan. 6 N.Y.C.R.R. § 375-1-2(af).

Phase one identified and selected remedial options for the ground-level areas of contamination within the NCIA. Phase two investigated and selected remedial options for the contaminated groundwater directly underneath the NCIA. Finally, phase three investigated the migration of VOC plumes out of the NCIA and remedial options for dealing with resulting offsite contamination (JA 991).

In 2000, the engineering firm retained by DEC to assist with the NCIA investigation issued a final RI/FS report (JA 991). Based on the report, DEC prepared a proposed remedial action plan for dealing with the VOC plumes migrating out of the NCIA sites (JA 992). The proposed action plan was released for public comment and review in 2003—giving members of the community as well as parties potentially liable for cleanup costs an opportunity to weigh in on proposed remedial options (JA 992).

During the comment stage, DEC made clear that complete remediation would require more than treating contaminated water withdrawn from the Town's *currently* contaminated water-supply wells. The threat of groundwater contamination would have to be entirely eliminated, including from the sole-source aquifer underneath the Town

of Hempstead, which was a primary source of drinking water for the Town. Thus, when asked during the comment stage why the agency would propose and consider more expensive options for remediating the NCIA plumes—rather than simply relying on the Town of Hempstead’s existing GAC and air stripper to treat the Town’s water supply—DEC replied that it was “opposed” to simply relying on “perpetual operation” of the GAC and air stripper as an effective remedial option for two reasons. (JA 585-586, 984-995)

First, that approach “would not address the groundwater contamination outside the radii” of the Water District wells and would inappropriately leave “a significant contaminant plume in [the] sole source aquifer [beneath the Town of Hempstead] untreated.” Second, DEC noted, there was “a shortage of suitable locations for water supply wells” in the affected area and that local officials were trying to increase water-supply capacity. Because the GAC and air stripper only treated water withdrawn from the two specific wells, they would not provide safe drinking water if additional wells were needed. (JA 585-586, 994-995)

In the fall of 2003, DEC issued a final Record of Decision (ROD) for its phase 3 investigation into the migrating NCIA plumes (JA 499-603). In the ROD, DEC considered twelve alternative remedies, ranging from no further action to full remediation of the contaminant plumes by physical extraction of the VOCs from the groundwater (JA 524-544). After considering the feasibility of each option, DEC selected alternative 8—“Full Plume Remediation of Upper and Deep Portions of the Aquifer (to 225 ft [below ground surface]) with In-Well Vapor Stripping/Localized Vapor Treatment” as the best remedial option (JA 544-546, 992). The selected remedy called for deep, in-ground vapor stripping wells that circulate groundwater and lift contaminants out of the water using a vacuum blower (JA 540). In contrast to the well water treatment provided by the Town’s GAC and air stripper, DEC’s selected remedy includes full capture and treatment of the groundwater, including the groundwater supplying the Town’s affected wells, to a depth of 225 feet below ground (JA 540, 544).

DEC estimated that the cost of full remediation would be approximately \$5 million and that the process would take about seven years (JA 540). Engineering design work on the planned vapor stripping

wells continued over the next several years (JA 997-998). Pursuant to a 2007 contract, pilot tests were conducted and the results evaluated to determine the effectiveness of stripping. (JA 997-998). As the ROD had warned might occur, the plan had to be modified for economic and engineering reasons, and in 2009, engineers recommended that the original system be modified to provide for above-ground extraction and treatment of the contaminated groundwater (JA 546, 998).

DEC and its contractors worked on the design of the extraction and treatment system until 2011. At that time, the EPA took over responsibility for the NCIA after the federal government determined that the NCIA site and its off-site plumes qualified for the National Priorities List of hazardous waste sites in need of comprehensive remediation. *See* National Priorities List, Final Rule No. 52, 76 Fed. Reg. 57662, 57671 (table 1) (Sept. 16, 2011).

## **C. Procedural History**

### **1. Tolling agreements and complaint**

As CERCLA contemplates, the State's efforts and DEC's attention were initially focused on effective remediation of the NCIA rather than immediate cost-recovery litigation. In June 2001, while DEC was still

crafting a remedial action plan for the NCIA VOC plumes through the RI/FS process, the State entered into tolling agreements with several owners or operators of sources of contamination in the NCIA site. The agreements tolled the CERCLA statutes of limitations from the dates of the agreements' execution until the State later filed cost-recovery claims.<sup>7</sup>

The State filed the present cost-recovery action on March 13, 2006, in the United States District Court for the Eastern District of New York (JA 207). The complaint asserts claims under CERCLA and state law seeking to recover past and future recovery costs expended by the State for investigating and remediating the off-site groundwater contamination in the area south of the NCIA (JA 242). Those costs include—but are not limited to—the expenses of the State's

---

<sup>7</sup> Specifically, agreements were executed with: (1) defendant Arkwin Industries, Inc. to toll the statute of limitations from June 27, 2001 (JA 1153); (2) defendants Grand Machinery and Tishcon Corporation to toll the statute of limitations from June 28, 2001 (JA 1149-1150); (3) defendants Next Millennium Realty LLC and 101 Frost Street Associates LP to toll the statute of limitations from July 9, 2001 (SPA 26); and (4) defendants Utility Manufacturing Corporation, and Nest Equities, Inc., to toll the statute of limitations from August 23, 2001 (JA 1129, 1132).

investigation and the State's costs for reimbursing the Town for the air stripper installed by the Town in 1995, but no costs for the GAC system, which were covered entirely by the Town. The named defendants are the current owners and operators of contamination sources at the NCIA site and successors to entities that were owners or operators at the time of hazardous releases (JA 242). In 2009, most of the defendants moved for summary judgment—claiming that the Town of Hempstead's GAC system and air stripper were remedial actions as defined by CERCLA, and that the State's CERCLA claims for cost recovery were therefore time-barred because the State did not file the present actions (or enter into tolling agreements) within six years of the initiation of physical on-site construction of the GAC system in 1990 and the air stripper in 1995 (JA 322-328).<sup>8</sup>

## 2. Report and recommendation

In 2010, Magistrate Judge Orenstein issued a report and recommendation (R&R) recommending that defendants' motions for

---

<sup>8</sup> Several defendants defaulted, and the State obtained default judgments against them (JA 181-182). The defaulting defendants are not parties to this appeal.

summary judgment be granted (Special Appendix [SPA] 1-29). The R&R concluded that the Town's GAC system and air stripper—constructed before the location and existence of the NCIA plumes had been determined or DEC's remedial investigation completed—were long-term remedial actions by the State (SPA 13-20). The R&R attributed the GAC system and air stripper to the State because the State Department of Health had been copied on correspondence sent to the Nassau County Department of Health to secure the county agency's approval of the Town's GAC and air stripper construction plans (SPA 17-18).

The R&R further concluded that the Town's GAC system and air stripper were part of the State's long-term remedial strategy for cleaning up the NCIA VOC plumes because: (1) the GAC and air stripper had been operating for “nearly nineteen years;” (2) DEC used the word “remedial” in some engineering documents to refer to the purpose of the GAC system and air stripper; and (3) the \$1.25 million cost of the GAC system and \$1.22 million cost of the air stripper were not consistent with a “short-term clean-up arrangement” (SPA 20-23).

Because it deemed the Town's GAC system and air stripper to be the initiation of full remedial action by the State, the R&R found that CERCLA's six-year limitations period for remediation costs applied and that the deadline for seeking cost recovery began to run: (1) either in 1990, when the Town's GAC system was built, or (2) on June 12, 1995, when the Town's subcontractor took exploratory soil borings prior to physical construction of the air stripper—dates the State neither controlled nor even knew about at the time they occurred, as they pertained only to the Town's construction schedules (SPA 23-25). Under the R&R's reasoning, when calculated from the date of the air-stripper soil borings, the State missed the deadline for filing a cost-recovery action by less than a month with respect to the parties who signed tolling agreements.

### **3. District court decision**

The State filed detailed objections to the R&R explaining that: (1) the R&R erred in deeming the GAC system and air stripper remedial actions, given that the State did not even begin a remedial investigation until 1995 and that the GAC system and air stripper were simply interim measures by the Town to clean its drinking water;

(2) DEC's remedial investigation was a removal action for which it was entitled to recover costs regardless of whether the GAC system and air stripper were remedial actions; (3) the R&R improperly resolved a disputed question of fact in determining, on summary judgment, that the State was "involved with" the Town's decisions to select and build the GAC system and supplemental air stripper; and (4) the on-site physical construction of the air stripper did not begin until after the exploratory soil bearings in June 1995 and construction commenced at the earliest on July 27, 1995, when the concrete mix for the air stripper's foundation was approved, or September 6, 1995, when construction plans for the air stripper as a whole were approved (JA 234).

The district court adopted the R&R in full as the opinion of the court, granting summary judgment to defendants, and dismissing the state-law claims without prejudice (SPA 30-36). The State filed a timely notice of appeal (JA 239-240, 1158-1159).<sup>9</sup>

---

<sup>9</sup> For reasons unrelated to the appeal, the State has agreed not to pursue its claim against individual defendant Paul Merandi.  
*(continued on the next page)*

## STANDARD OF REVIEW

Classification of a response activity as a remedial action or removal action is a question of law. *United States v. W.R. Grace & Co.*, 429 F.3d 1224, 1234-35 (9th Cir. 2005); *Geraghty & Miller, Inc. v. Conoco Inc.*, 234 F.3d 917, 295-26 (5th Cir. 2000), *abrogated on other grounds, Burlington N. & Santa Fe Ry. Co. v. United States*, 556 U.S. 599 (2009). This Court reviews *de novo* a district court's grant of summary judgment, *Niagara Mohawk Power Corp.*, 596 F.3d at 129 n.22, "construing all evidence and drawing all reasonable inferences in favor of the State, the non-moving party," *New York v. Nat'l Serv. Indus., Inc.*, 460 F.3d 201, 206 (2d Cir. 2006).

## SUMMARY OF ARGUMENT

The district court's decision undermines CERCLA's goals by requiring that a State bring a cost-recovery action before it has had adequate time to prepare a remedial plan. The district court erred both in deeming the construction of the GAC system and air stripper to be

---

Accordingly, the State does not ask this Court to reverse or vacate the grant of summary judgment in Merandi's favor.

part of a response planned by the State and in characterizing them as a remedial action. The Town devised the GAC system and air stripper as interim responses to the immediate threat of contamination in its drinking water, while the State, in a separate, legally required remedial investigation, developed a plan to remediate the underlying cause of that contamination. The GAC system and air stripper could not have been remedial actions, because they left the VOC plumes migrating from the NCIA entirely intact. Furthermore, they were planned and approved entirely at the town and county level, with no State involvement.

But even if the GAC system and air stripper had been remedial actions, the State still would have had no cause of action before the initiation of construction on a project for which it is seeking to recover costs. The State spent no money on the GAC system built by the Town in 1990, and cannot be expected to have filed suit based on the construction date of that project—yet that is exactly what the district court demanded. The earliest date on which the statute of limitations could have begun to run was when physical construction began on the air stripper—and contrary to the holding of the district court,

exploratory soil borings designed to test the firmness of the ground are not physical construction. Accordingly, regardless of whether the GAC system and air stripper were remedial actions, the district court's decision must be vacated and remanded with respect to the defendants who signed tolling agreements with the State.

## ARGUMENT

### POINT I

#### **THE STATE'S SUIT IS TIMELY BECAUSE IT SEEKS RECOVERY OF COSTS UNDERTAKEN BEFORE LONG-TERM REMEDIAL PLANS FOR THE NCIA VOC PLUMES HAD BEEN FINALIZED OR IMPLEMENTED**

The primary issue on appeal is whether the Town's GAC system and air stripper are properly deemed part of a comprehensive remedial action by the State under CERCLA. Defendants moved for summary judgment on the ground that the State's cost-recovery action was untimely because the GAC and air stripper installed to protect Town residents by removing contaminants from their drinking water marked the commencement of long-term remedial action by the State. They do not contest that the State's cost-recovery suit would otherwise be timely because the State filed suit: (1) *before* commencement of physical

construction on full-plume remediation, the comprehensive remedy for the NCIA plumes DEC selected, and (2) *while* the GAC and air stripper remained in operation as removal actions—addressing immediate health risks to the Town’s residents—and DEC completed a more comprehensive investigation into the NCIA sites themselves.

The district court’s holding that the limitations period began to run as early as 1990—based on local officials’ attempts to provide clean drinking water before the existence or scope of the NCIA plumes had even been determined or DEC’s remedial investigation even commenced—fundamentally misapprehends the underlying remedial goals of CERCLA and the function of its limitations period. CERCLA was designed to authorize precisely what occurred here: a rapid local response to an immediate public health threat as well as a planned State response to investigate and fully remediate the underlying source of contamination. Congress did not compel suit—as the district court found—before the State could coherently devise an appropriate remedy for cleaning up the underlying contamination.

**A. The Town's GAC System and Air Stripper Were Installed to Respond to an Immediate Threat and Did Not Initiate the State's Remedial Response.**

In interpreting and applying CERCLA, courts must heed “the drafters’ overarching concern that aggressive action be taken to protect the public health.” *W.R. Grace & Co.*, 429 F.3d at 1240; *see also Sierra Club v. Seaboard Farms Inc.*, 387 F.3d 1167, 1172 (10th Cir. 2004) (“CERCLA . . . must be interpreted liberally so as to accomplish its remedial goals.”). CERCLA was enacted to address a problem of vast proportions. Before enactment of comprehensive federal and state laws regulating the disposal of hazardous waste materials, many commonly-used industrial materials were stored and disposed of improperly, contaminating the environment and creating long-term environmental and public health risks.

Since CERCLA was enacted, federal and state officials have engaged in long-term cleanup at thousands of contaminated sites. Today, there remain more than 1,300 sites on the federal National Priorities List,<sup>10</sup> and nearly 500 Class 2 sites on the State Registry of

---

<sup>10</sup>See <http://www.epa.gov/superfund/sites/npl/>.

hazardous waste sites in New York designated for DEC investigation and cleanup.<sup>11</sup> Because of the complexity in identifying the sources of contamination and the challenges in designing an effective remediation plan, the cleanup process at even a single site is lengthy and demanding. It may take several years just to study the problem and even more time to develop an effective remedy and actually clean up the site. The challenges are especially great at large hazardous waste sites like the 170-acre NCI and with contaminants like VOCs, which are mobile and can migrate into off-site areas—making the full zone and impact of contamination unpredictable and unknown.

Recognizing the unique challenges involved in cleaning up hazardous waste sites, Congress authorized recovery for both the costs of immediate removal actions, necessary to address imminent health and environmental risks, and longer-term remedial actions to permanently clean up hazardous waste sites. Moreover, Congress drafted CERCLA's limitations period to ensure a wide window for government response-cost suits. CERCLA's cost-recovery scheme is not designed to

---

<sup>11</sup>See <http://www.dec.ny.gov/cfmx/extapps/derexternal/index.cfm?pageid=3> (search method #2: "Site Class 02").

compel a suit for response costs before interim removal actions are complete. Its limitations periods recognize the exigencies present in a cleanup action by allowing a suit to recover the costs of a removal action to await the completion of that action while requiring a suit to recover the costs of a remedial action to be brought after physical construction is commenced.

Here, the State agreed to reimburse the Town of Hempstead for construction of a supplemental air stripper to secure safe drinking water for Town residents. The contaminated water withdrawn from the Town's two water-supply wells, however, was merely a symptom of the larger underlying contamination problem: VOC plumes are migrating from the NCIA site and contaminating a large portion of the aquifer adjacent to the site. Both the record and common sense preclude any finding that the GAC and air stripper were remedial actions: they removed the VOCs from the water pumped from the Town's wells but were not intended to and could not remedy the contamination in the underlying aquifer.

At the time the GAC and air stripper were planned by the Town, the existence and full scope of the NCIA VOC plumes had not been

determined or verified. Town officials were not acting to address VOC plumes; they were not even aware of the source of the VOCs in their well-water (JA 914, 987). The State agreed in 2000—after DEC confirmed that a VOC plume from the NCIA extended southwards into the Town of Hempstead (JA 987)—to reimburse the Town for the construction of the supplemental air stripper. But that one-time reimbursement does not retroactively transform the Town’s GAC and air stripper into long-term remedial actions by the State for the NCIA sites, or NCIA plumes, as a whole. CERCLA defines “remedial action” as including response actions designed “to prevent or minimize the release of hazardous substances so that they *do not migrate*.” 42 U.S.C. § 9601(24) (emphasis added). The GAC and air stripper did nothing, however, to prevent continued migration of hazardous VOCs from the NCIA site to off-site locations via contaminant plumes. The Town’s water wells are merely two points within the plumes.

And the record, which must be interpreted in the State’s favor for purposes of defendants’ motion for summary judgment, *see Nat’l Serv. Indus., Inc.*, 460 F.3d at 206, refutes defendants’ claim that the GAC

and air stripper were part of *the State's* comprehensive remedial plan for the NCIA plumes:

- The State did not pay for construction of the GAC system in 1990, or later. It did not own or operate the GAC system, or select the GAC system as the best treatment option.
- By later agreement in 2000, the State reimbursed the Town for one-time costs of constructing a supplemental air stripper, but the agreement expressly recognized the air-stripper as an “interim remedial measure,” a term which state law reserves for interim measures short of “remedial action” as that term is defined by CERCLA. See *supra* at 9-10.
- Town construction of the GAC system and air-stripper started in 1990 and 1995 respectively, more than eight years before DEC adopted a full remedial plan for the NCIA VOC plumes.
- In its remedial planning process, DEC expressly found that the Town’s GAC system and air stripper *were not* an acceptable remedial solution because the GAC system and air stripper were treatment solutions only for drinking water withdrawn from two individual wells. They would not eliminate VOC contamination in

the larger aquifer nor make the groundwater safe at other locations.

The R&R, which the district court adopted, emphasized that DEC's final remedial plan incorporated the Town's GAC and air stripper. However, DEC's plan simply recognizes a practical reality of environmental cleanup: if full remediation of a hazardous waste site will take many years, interim measures designed to eliminate immediate health risks will need to remain in place and continue to be operated. The continuation of interim removal measures, however, does not transform those measures from their inception into full-scale remedial actions. If the R&R were correct, many removal actions would later become remedial actions, belatedly changing the deadline to seek costs for those actions from three years after an action is completed to six years after construction was commenced. Indeed, under the district court's reasoning, if a ROD were to incorporate aspects of a prior removal action into a final remedial plan more than six years after the removal action began, any § 107 suit for costs relating to the remedial plan would be immediately out of time, without regard to the limited purpose of the prior removal action.

CERCLA was designed to prompt cost-recovery suits when removal actions are complete—and health and environmental risks eliminated—or construction of permanent remedial actions well under way. See *supra* at 7. None of that was true in 1990 or 1995 when, according to the district court, the State’s time to sue was triggered. There is no evidence that *any* entity, let alone the State, understood the full risks at that time or had sufficient information to assess the full scope of contamination at the NCIA sites. Addressing a local problem related to two water-supply wells located outside the NCIA—while critical—is not remedial action under CERCLA.

Moreover, the State can recover its investigation costs independently of the costs it seeks for construction of the air stripper. CERCLA makes clear that an investigation is a removal action. 42 U.S.C. § 9601(23). Indeed, the entire RI/FS process falls within the broad definition of “removal,” even though the result of that process is selection of a remedial action. See *Kelley v. E.I. DuPont Nemours & Co.*, 17 F.3d 836, 843 (6th Cir. 1994). Because the State’s investigation of the NCIA site had not been completed at the time it brought this action, the State is entitled to recover the costs of the investigation.

**B. The District Court Relied on Erroneous Noncontrolling Factors in Classifying the Town's GAC System and Air Stripper as Remedial Actions.**

In deeming the Town's GAC and air stripper to be remedial actions despite the fact the DEC's remedial investigation was completed only years later, the district court relied upon several factors identified in the R&R: (1) the State's alleged involvement in the Town's construction of the GAC and air stripper; (2) the existence of DEC documents referring to the Town's GAC and air stripper as "remedial" measures; (3) the cost of constructing the GAC and air stripper; and (4) the lengthy period of time the GAC and air stripper had remained in place. None of those factors, however, is sufficient to transform the local water-well chemical removal options selected by the Town into a full-scale remedial action by the State, triggering the State's obligation to commence CERCLA cost-recovery litigation within six years of the commencement of construction.

**1. The Town's decisions to install the GAC system and air stripper are not attributable to the State.**

First, the district court improperly conflated the actions of the Town and the State, as well as the actions of different state agencies, in characterizing the construction of the GAC and air stripper as part of the State's long-term remedial strategy for the NCIA sites. State officials were *aware* of the Town's decision to install a GAC system and air stripper to treat the Town's well water. But CERCLA is not a notice-based statute, and its limitations periods are not written in terms of *notice*.

Moreover, at the time the GAC and air stripper were proposed, neither Town nor State officials knew the source of the VOCs in the drinking water pumped from the town wells. They were responding to a water-supply problem—not an environmental cleanup concern—and accordingly proposed construction of the GAC and air stripper under water-safety regulations promulgated by the State Department of Health, which regulations are implemented by county health departments. *See* 10 N.Y.C.R.R. § 5-1.22(a), (d). The regulations are focused on local provision of safe water—not development of

comprehensive remedial plans for hazardous waste sites. Thus, even if the R&R were correct that the “State” approved the GAC system and air stripper, merely because state officials were copied on correspondence to the Nassau County Department of Health, at most it was the State Department of Health responding to a public health issue, not DEC implementing a long-term remedial strategy.

DEC, not the State Department of Health, has legal authority to select or implement remedial actions for hazardous waste sites under state law. *See* ECL § 27-1313(1)(a). Thus, whatever “involvement” the State had with the Town’s decisions to construct a GAC and air-stripper, the question is at least disputed, and the record did not support the district court’s finding that in either 1990 or 1995 the State approved the Town’s decision as a final remedial action designed to permanently restore the NCIA site.

**2. DEC documents do not use of the term “remedial” as a CERCLA term of art.**

The R&R adopted by the district court also relied on the fact that various DEC documents referred to the Town’s GAC and air stripper as “remedial” (R&R 21). But under CERCLA, “remedial action” has a

specific technical meaning, see *supra* at 7 & n.1. New York law does not use the same terminology, referring to many response actions as “remedial,” including “interim remedial measures,” which more closely approximate removal actions under CERCLA, see *supra* at 9-10.

Furthermore, especially in the language of engineers, every response activity to a hazardous waste site is “remedial” in the colloquial sense of remedying some risk of harm (JA 993). As a result, use of the term “remedial” in official documents or records does not establish the appropriate classification of particular response actions for CERCLA purpose. See, e.g., *City of Moses Lake v. United States*, 416 F. Supp. 2d 1015, 1024 (E.D. Wash. 2005) (use of the word “remedial” in a “generic sense” in several documents over a thirteen-year period “do[es] not constitute an admission” that a response activity is a remedial action as meant by CERCLA). Here, for example, engineers who worked on DEC’s Record of Decision explained that engineers commonly use the generic term “remediate” in situations when that term would not be accurate in the technical sense to a CERCLA lawyer generating documents for litigation (JA 993).

Moreover, several uses of the word “remedial” cited by the magistrate’s report demonstrate why the Town’s GAC system and air stripper *are not* properly characterized as state remedial actions for CERCLA purposes. For example, the R&R notes that section 5.2 of DEC’s Record of Decision refer to the Town’s “GAC system and air strip[per] as an interim remedial measure.” But as noted above, New York law defines “interim remedial measure” in a manner similar to “removal action” under CERCLA—as precisely the opposite, for present purposes, of a permanent remedial plan. Such activities are interim actions that can be undertaken “without [the] extensive investigation and evaluation” necessary for development of a full remedial plan. 6 N.Y.C.R.R. § 375-1.2(ab).

**3. Neither the cost of the GAC system and air stripper nor the duration of their use disqualifies them as removal actions.**

Finally, neither the length of time the GAC and air stripper will need to remain in place, nor their cost, is sufficient to transform either measure into final remedial actions by the State. Congress could have defined remedial actions in terms of cost and duration, but declined to do so and with good reason. Cost and duration of interim response

measures will vary from site to site depending on the characteristics of particular hazardous waste sites and the specific health and environmental risks presented by each site.

As a result, interim removal actions, as the EPA has confirmed, may be “expensive and complex” without qualifying as full remedial action for a site. EPA, *Use of Non-Time-Critical Removal Authority in Superfund Response Actions*, at 4 (Feb. 14, 2000), available at <http://nepis.epa.gov/Exe/ZyPURL.cgi?Dockkey=9100L9F9.txt>. Moreover, here the costs of \$1.22 million for the air-stripper were not large in comparison to the amounts Congress envisioned for removal measures, see 42 U.S.C. § 9604(c)(1) (setting cap on EPA-funded removal actions at \$2 million), and in fact, were much less than the \$5 million cost of the final remedial plan chosen by DEC.

Similarly, as courts have recognized, the “sheer magnitude” of the cleanup process at a particular site may require interim removal measures that last for many years until full remediation is accomplished—precisely what occurred here. *W.R. Grace & Co*, 429 F.3d at 1244; see also *United States v. Vertac Chem. Corp.*, 33 F. Supp. 2d 769, 783 (E.D. Ark. 1998) (“Removal actions, although of shorter

duration, do not have to be.”), *vacated on other grounds, United States v. Hercules, Inc.*, 247 F.3d 706 (8th Cir. 2001); *EPA v. TMG Enters., Inc.*, 979 F. Supp. 1110, 1130 (W.D. Ky. 1997) (neither “length of time” nor “permanency of the remedy” disqualifies a response activity from being a removal action).

#### **4. The district court’s holding undermines the remedial purposes of CERCLA.**

Ultimately, the district court’s ruling deserves the fundamental goals of CERCLA. Here, the State was facing a complex cleanup at a large hazardous waste site. The NCIA presented levels of contamination and environmental risks so grave that the federal government eventually placed the NCIA on the National Priorities List for sites in need of remediation and took over cleanup responsibilities.

CERCLA’s limitations period is specifically crafted to give responding agencies ample room to prioritize investigation and assessment and to ensure that meaningful remedial efforts are well under way before the government has to divert resources to pursuing cost recovery litigation. The limitations period also frees responding agencies to fund more immediate removal actions—responding to

imminent risks or emergent problems as they arise—without commencing comprehensive remedial action and triggering the clock on the time to seek recovery of full remedial costs.

Here, the district court held that the State's time to file suit began as early as 1990, with the Town's construction of the GAC. Under that reasoning, the State's time to seek cost recovery for remedial actions expired in 1996—before the State provided any reimbursement to the Town and before all but the earliest stages of the State's remedial investigation into the NCIA sites had taken place. That is not the result Congress intended. Indeed, the district court's rule will cause the most harm in complex cases that require lengthy remedial studies and a combination of removal and remedial actions—for it is in just those cases that a court may unexpectedly judge a removal action as a remedial action, cutting off compensation not only for that action but all genuinely remedial work that follows.

Imposing such a far-reaching, backwards-looking test would undermine CERCLA by discouraging urgently needed removal actions for fear that they will later be regarded as remedial actions, cutting off all further cost-recovery actions. It would also chill States from taking

those measures directly, and it would compel responding agencies to pursue litigation at ever earlier dates—diverting scarce resources from pursuing the difficult, challenging and time-consuming task for developing and implementing remedial plans for hazardous waste sites, CERCLA's primary goal.

## POINT II

### **EVEN IF THE AIR STRIPPER WERE A STATE REMEDIAL ACTION, THIS ACTION WOULD STILL BE TIMELY WITH RESPECT TO ANY DEFENDANT WHO SIGNED A TOLLING AGREEMENT**

If the district court were correct in characterizing the air stripper as part of the State's remedial effort, the State's cost-recovery action would still be timely as to the tolling defendants if properly calculated from the date physical construction on the air stripper began. (We exclude from this discussion the GAC system, because the State did not reimburse the Town for it, and does not seek compensation for it here.) In fact the State entered into tolling agreements with a number of defendants which tolled the statute of limitations with respect to any claims that arose starting between June 28, 1995, and August 23, 1995, depending on the defendant. Because *physical construction* of the air

stripper began within six years of the date that many of those agreements tolled the limitations period, this cost-recovery suit would have been timely against those defendants even if the district court had been correct to deem the air stripper a remedial action.

The plan to install an air stripper was initially devised by the Town, in order to remove VOCs immediately from the drinking water pumped from the Town's wells. When a drilling company visited the proposed site of the air stripper to test the ground via soil borings, it did so at the sole direction of the Town and its contractor. And if the soil borings had revealed that the ground could not support the air stripping tower, the Town would have had to devise an alternative means to remove the chemicals from its drinking water.

Physical construction of the air stripper did not begin with those borings, as the district court held, but rather no earlier than July 27, 1995 (JA 968), when the Town's general contractor approved the concrete mix, and possibly as late as September 1995, when the county health department approved the final plan for the air stripper (JA 967-968). As the designer of the air stripper explained, he hired a subcontractor to take soil borings in order to "determine whether the

soil could sustain the weight of the air stripping tower” and to provide guidance in locating the tower’s clearwell and foundation slab (JA 966-967).

Congress chose its words carefully, starting the clock based not on any “physical” act associated with a possible remedial action but on “construction,” a word that should be given its “ordinary meaning.” *United States v. Findett Corp.*, 220 F.3d 842, 848 (8th Cir. 2000). In order to qualify as “initiation of physical on-site construction” for purposes of the remedial action statute of limitations, an activity must be: (1) physical; (2) performed on-site; (3) construction; and (4) part of a permanent remedy. *Schaefer v. Town of Victor*, 457 F.3d 188, 203-04 (2d Cir. 2006) (citing 42 U.S.C. § 9613(g)(2)(B)).

When an on-site activity is merely exploratory, and does not involve the placement of any object, the spreading of any surface, or the pouring of any foundation, it is not “construction.” This distinction simply makes sense—for example, had the soil borings in this case revealed that the chosen location could not support an air stripper tower, the Town would have been forced to reevaluate its plans, requiring a delay of construction. A party cannot be expected to seek

costs under CERCLA before it has even determined that a given site can accommodate its intended response action. The soil borings taken in this case, which were necessary to determine *how* and *where* the air stripper could be built, are far more comparable to the sampling, surveying and design activities that were held not to be construction activity in *Findett Corp.* than to the spreading of cover—a physical substance that would remain in place permanently on a landfill—that was held to be construction activity in *Schaefer*.

“Actions such as visiting the Site, taking soil and water samples, and making engineering surveys are preliminary steps” do not trigger the statute of limitations. *Reichhold, Inc. v. U.S. Metals Refining Co.*, 655 F. Supp. 2d 400, 447 (D.N.J. 2009). Other exploratory measures are likewise not construction. *See, e.g., Louisiana v. Braselman Corp.*, 78 F. Supp. 2d 543, 549 (E.D. La. 1999) (installation of monitoring wells is not initiation of construction); *Illinois v. Grigoleit Co.*, 104 F. Supp. 2d 967, 976 (C.D. Ill. 2000) (inspection and soil sampling did not initiate construction).

As a matter of law, on-site physical construction of the air stripper could not have begun before July 27, 1995, and possibly later. Thus, at a

minimum, there is a material fact question regarding the date that on-site physical construction began. Accordingly, even if this Court were to conclude that construction and operation of the air stripper constituted a remedial action of the State, it should vacate the district court's judgment with respect to the defendants who signed tolling agreements.

### CONCLUSION

This Court should vacate the judgment of the district court and remand for further proceedings.

Dated: December 5, 2012  
New York, New York

**ORENSTEIN, Magistrate Judge:**

Plaintiffs State of New York and Alexander B. Grannis, as Commissioner of the New York State Department of Environmental Conservation (collectively “Plaintiffs”) brought this action under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, 42 U.S.C. §§ 9601 *et seq.*, (“CERCLA”) and New York’s common law of public nuisance, indemnification and restitution seeking to recover past and future response costs incurred by the State in responding to the

alleged release and threatened release of hazardous substances at or from thirteen facilities that form the New Cassel Industrial Area Superfund Site, located in North Hempstead, New York (the “NCIA Site”) and to redress harm to the public health and environment of the State resulting from defendants’ alleged acts and omissions at the NCIA Site. (Second Amended Compl. ¶¶ 1, 139-168.)

Pursuant to the Orders of District Judge Sandra J. Feuerstein dated October 5, 2009, December 15, 2009, June 17, 2010 and July 2, 2010, defendants’ (1) Next Millennium Realty, LLC (“Next Millennium”), 101 Frost Street Associates, L.P., 101 Frost Street Corporation, Alan Eidler, as Co-Executor of the Estate of Emily Spiegel, Pamela Spiegel Sanders, as Co-Executor of the Estate of Emily Spiegel, Lise Spiegel Wilks, as Co-Executor of the Estate of Emily Spiegel, and Jerry Spiegel (collectively the “Frost Street Defendants”); (2) Grand Machinery Exchange, Inc., Paul Merandi<sup>1</sup> and 2632 Realty Development Corporation (collectively the “Grand Machinery Defendants”)<sup>2</sup>; (3) Barouh Eaton Allen Corporation (“BEAC”)<sup>3</sup>; (4) Sulzer

---

<sup>1</sup>In their Memorandum of Law in Opposition to the Grand Machinery Defendants’ Motion for Summary Judgment, Plaintiffs state that they submitted their opposition only as to defendants Grand Machinery Exchange Inc. and 2632 Realty Development Corporation, and that they intend to withdraw the claims against defendant Paul Merandi. (Pls.’ Mem. of Law in Opp. to Grand Machinery’s Motion for Summary Judgment, dated Jan. 15, 2010, at 2 n.1.) Accordingly, the Court respectfully reports and recommends that defendant Paul Merandi’s motion for summary judgment be granted.

<sup>2</sup>By Notice of Motion dated December 14, 2009, the Grand Machinery Defendants joined in the Frost Street Defendants’ motion for summary judgment. *Notice of Motion*, dated December 14, 2009.

<sup>3</sup>By letter dated June 11, 2010, defendant BEAC joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Smith Letter*, dated June 11, 2010.

Metco (“Sulzer”)<sup>4</sup>; (5) Utility Manufacturing Corporation, Nest Equities, Inc., Audie Kranz and Wilbur Kranz (collectively the “Utility Manufacturing Defendants”)<sup>5</sup>; and Tishcon Corporation, Kamal Chopra and Joe Elbaz (collectively the “Tishcon Defendants”)<sup>6</sup> motions for summary judgment pursuant to Fed. R. Civ. P. 56 have been referred to the undersigned. In addition, defendants NMB (USA) Inc. and IMC Eastern Corporation (collectively the “IMC Defendants”)<sup>7</sup>; Island Transportation Inc.<sup>8</sup>; William Gross and C&O Realty (collectively the “C&O Defendants”)<sup>9</sup>; and Atlas Graphics, Inc., Richard Degenhart and H.D.P. Printing Industries, Inc. (collectively the “Atlas Graphics Defendants”)<sup>10</sup> (hereinafter all moving parties

---

<sup>4</sup>By letter dated June 10, 2010 (and filed June 14, 2010), defendant Sulzer joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *O’leary Letter*, dated June 10, 2010.

<sup>5</sup>By Notice of Motion dated June 15, 2010, the Utility Manufacturing Defendants joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Notice of Motion*, dated June 15, 2010.

<sup>6</sup>By letter dated June 29, 2010, the Tishcon Defendants joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Landrigan Letter*, dated June 29, 2010.

<sup>7</sup>By letter dated June 9, 2010, the IMC Defendants joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Lucic Letter*, dated July 9, 2010.

<sup>8</sup>By letter dated June 10, 2010, defendant Island Transportation, Inc. joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Woolson Letter*, dated June 10, 2010.

<sup>9</sup>By letter dated June 15, 2010, the C&O Defendants joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Schulz Letter*, dated June 15, 2010.

<sup>10</sup>By letter dated June 28, 2010, the Atlas Graphics Defendants joined in the Frost Street Defendants’ and Grand Machinery Defendants’ motions for summary judgment. *Robinson Letter*, dated June 28, 2010 (filed June 29, 2010).

referred to collectively as “Defendants”).<sup>11</sup>

For the reasons that follow, this Court respectfully reports and recommends that Defendants’ motions for summary judgment be granted.

### **BACKGROUND**

The factual background underlying this action is set forth in this Court’s prior Reports and Recommendations, dated February 17, 2007 and May 2, 2008, familiarity with which is presumed. *See Report and Recommendations*, dated February 17, 2007 and May 2, 2008, Orenstein, M., M.J.<sup>12</sup> The Court provides only those facts deemed pertinent to this motion.

The following facts are undisputed unless otherwise noted:

The NCIA is comprised of approximately 170 acres of industrial and commercial property, which is bounded by the Long Island Railroad, Frost Street, Old Country Road and Grand Boulevard in North Hempstead, Nassau County, New York. (Second Am. Compl. ¶¶ 2, 52-53, 140-42; Pl. 56.1 Statement at ¶¶ 2, 79.) The thirteen manufacturing and commercial facilities that are the subject of this action are a portion of the NCIA complex. (*Id.*) The NCIA is located over a sole-source aquifer identified by the United States Environmental Protection

---

<sup>11</sup>The Court notes that defendants Arkwin Industries, Inc., Thomas Molloy, William Maglio, as co-executor of the Estate of Daniel Berlin, and Frank Jacobson, as co-executor of the Estate of Daniel Berlin (collectively the “Arkwin Defendants”) have filed a motion for summary judgment and have agreed to a separate briefing schedule with Plaintiffs. *See Ommen Letter*, dated September 9, 2010 (informing the Court that the Arkwin Defendants agreed to the following briefing schedule: State’s opposition papers shall be served by October 8, 2010 and the Arkwin Defendants’ reply papers shall be served by October 25, 2010). Accordingly, the Arkwin Defendants’ motion for summary judgment will not be considered.

<sup>12</sup>By Orders, dated August 14, 2007 and May 2, 2008, respectively, the district court adopted the Reports and Recommendations in their entirety as Orders of the Court. *State of New York v. Next Millennium Realty, LLC*, 2007 WL 23621444 (E.D.N.Y. Aug. 14, 2007); *State of New York v. Next Millennium Realty, LLC*, 2008 WL 1958002 (E.D.N.Y. May 2, 2008).

Agency (the “EPA”). (*Id.*) Groundwater underlies the Sites at a depth of approximately 60 feet, and two public water supply wells are located approximately 1,500 feet downgradient of the NCIA. (*Id.*)

According to the Second Amended Complaint, the disposal of hazardous substances at each of the thirteen facilities have contaminated the soil and groundwater at and in the vicinity of each facility, including in and around the Bowling Green Water District (“Bowling Green”) public water supply wells. (*Id.*) As the contaminants from each of the facilities commingled, Plaintiffs allege that they formed a plume<sup>13</sup> of pollutants that has migrated from the NCIA sites and has contaminated the nearby Bowling Green public water supply wells, thus threatening the environment and public health. (*Id.*) Defendants are alleged to be the current owners and/or operators of the facilities and/or the successors to the entities that owned or operated the thirteen NCIA Sites at the time of the disposal of hazardous substances. (*Id.*)

Development of the NCIA dates back to early 1950, and past industrial activities conducted within the NCIA have resulted in extensive contamination of groundwater at the NCIA by volatile organic compounds (“VOC”s). (Second Am. Compl. ¶¶ 54-56; Pl. 56.1 Statement at ¶¶ 79-81.) Based upon an investigation by the Nassau County Health Department in connection with the NCIA site which revealed the presence of VOCs in the groundwater, the New York State Department of Environmental Conservation (the “NYSDEC”) placed the entire NCIA properties on the New York State Registry of Inactive Hazardous Waste Disposal Sites (the “Registry”) in August 1988. (*Id.*) The NYSDEC retained Lawler, Matusky & Skelly

---

<sup>13</sup>A plume is a volume of contaminated groundwater in an aquifer that extends downward and outward from a specific source of contamination. (Pls.’ Mem. of Law in Opp. to Defs. Grand Machinery’s Mot. for Summary Judgement, dated Jan. 15., 2010 at 3.)

("LMS") to conduct Preliminary Site Assessments ("PSA"s) to locate sources of groundwater contamination and to identify potentially responsible parties. (*Id.*) In March 1995, the NYSDEC delisted the NCIA Site as a whole and listed seven properties within the NCIA as Class 2 sites.<sup>14</sup> In 1996, 1997 and 1998 additional PSAs resulted in the NYSDEC listing additional properties within the NCIA as Class 2 sites. (*Id.*)

In remediating Class 2 sites in the NCIA, the NYSDEC employed a three-prong strategy. (Second Am. Compl. ¶¶ 57; Pl. 56.1 Statement at ¶¶ 82, 137-38.) First, the NYSDEC identified on-site source areas of contamination and chose appropriate remedial actions to address these areas. (*Id.*) Second, the NYSDEC investigated the on-site groundwater contamination at each site and chose appropriate remedial actions to address these areas. (*Id.*) Finally, the NYSDEC investigated off-site groundwater contamination migrating from Class 2 sites in the NCIA toward the Bowling Green public water supply. (*Id.*)

The NYSDEC conducted an area wide Remedial Investigation/Feasibility Study ("RI/FS") relating to off-site groundwater contamination that was migrating from the Class 2 sites in the NCIA. (*Id.*) The NYSDEC in 2003 issued its Record of Decision ("ROD") for the NCIA Site's off-site groundwater remediating south of the NCIA Site, called Operable Unit No. 3 ("OU-3"). (*Id.*) In its decision, the NYSDEC required the full plume remediating of the Western, Central and Eastern plumes, in the upper and lower portions of the aquifer with in-well stripping treatment systems. (*Id.*) In November 2005, the NYSDEC issued an Explanation of Significant Differences that separated the sites involved into two distinct groups: those located in the areas of the origin of the Eastern and Central plumes, and those located in the area of the

---

<sup>14</sup>Class 2 sites listed on the Registry are those properties that contain hazardous wastes and pose a significant threat to the environment. (*Id.*); see NYCRR § 375-1.8(a)(2)(ii).

origin of the Western plum. (*Id.*)

On March 13, 2006, Plaintiffs commenced the instant action<sup>15</sup> in the United States District Court for the Eastern District of New York (Feuerstein, *D.J.*) against Defendants (1) seeking recovery costs under § 107 of CERCLA for the completion of the remediating of the off-site groundwater plumes including the costs of investigating and remediating the off-site groundwater contamination in and around the Bowling Green public water supply wells and of responding to releases of hazardous substances at the respective facilities; (2) injunctive relief to abate the contamination in the NCIA and for reimbursement of the State's costs in abating a public nuisance under New York common law; (3) restitution; and (4) indemnification. (Compl., dated Mar. 13, 2006.) Plaintiffs amended the Complaint to add certain NCIA parties to this action on May 12, 2006. (Am. Compl., dated May 20, 2006.) On May 20, 2008, Plaintiffs filed a Second Amended Complaint to add certain NCIA parties to this action. (Second Am. Compl., dated May 20, 2008.)

Defendants now move for summary judgment pursuant to Fed. R. Civ. P. 56 on the grounds that Plaintiffs' claims are time-barred.

The underlying facts and applicable law surrounding Defendants' motion will be

---

<sup>15</sup> *State of New York et al. v. Next Millenium Realty, LLC et al.*, CV 06-1133 (SJF)(MLO) was consolidated into lead case, *Next Millenium Realty, LLC et al. v. Adchem Corp. et al.*, CV 03-5985 on May 4, 2006 as related actions. *See Order*, dated May 4, 2006 (Feuerstein, *D.J.*). Case number CV 06-1133 was administratively closed by *Order*, dated May 4, 2006. *Id.* Thereafter, in an *Order* dated September 8, 2010, the two actions were severed for all purposes, and the Clerk of the Court was directed to reopen the case entitled *State of New York et al. v. Next Millenium Realty, LLC et al.*, under docket number CV 06-1133. *See Order*, dated September 8, 2010 (Feuerstein, *D.J.*). By notice of motion dated September 17, 2010, defendants Adchem Corp., Northern State Realty Co., Pufahl Realty Corp. and Lincoln Processing moved for reconsideration of the *Order*, dated September 8, 2010 which severed the two actions for all purposes. (Notice of Motion, dated September 17, 2010.)

presented in the relevant discussion section below.

## DISCUSSION

### *I. Summary Judgment Standard*

Summary judgment is appropriate “if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law.” Fed. R. Civ. P. 56( c); *see also Celotex Corp. v. Catrett*, 477 U.S. 317, 322-23 (1986); *Major League Baseball Props., Inc. v. Salvino, Inc.*, 542 F.3d 290, 309 (2d Cir. 2008); *Globecom Group, LLC v. Hartford Fire Ins. Co.*, 434 F.3d 165, 170 (2d Cir. 2006). A dispute regarding a material fact is genuine “if the evidence is such that a reasonable jury could return a verdict for the nonmoving party.” *Anderson v. Liberty Lobby, Inc.*, 477 U.S. 242, 247-48 (1986); *see also SCR Joint Venture L.P. v. Warshawsky*, 559 F.3d 133, 137 (2d Cir. 2009); *Coppola v. Bear Stearns & Co.*, 499 F.3d 144, 148 (2d Cir. 2007). The nonmoving party “must do more than simply show that there is some metaphysical doubt as to the material facts.” *Matsushita Elec. Indus. Co., Ltd. v. Zenith Radio Corp.*, 475 U.S. 574, 586 (1986); *Murphy*, 2008 WL 2433615, at \*6. Rule 56(e) “requires the nonmoving party to go beyond the pleadings and by [its] own affidavits, or by the ‘depositions, answers to interrogatories, and admissions on file,’ designate specific facts showing there is a genuine issue for trial.” *Celotex Corp.*, 477 U.S. at 324, 106 S. Ct. 2548 (citing Fed. R. Civ. P. 56); *see Gilles v. Repicky*, 511 F.3d 239, 242 (2d Cir. 2007). In doing so, “[e]vidence submitted in support of a summary judgment motion must be admissible [at trial], and the proponent of the evidence bears the burden of showing that the evidence is admissible.” *Vahos v. General Motors Corp.*, 2008 WL 2439643, at \*4 (E.D.N.Y. June 16, 2008); *see Patterson v. County of Oneida*, 375 F.3d 206, 219-20, 222 (2d Cir. 2004).

In considering a motion for summary judgment, “the judge’s function is not himself to weigh the evidence and determine the truth of the matter but to determine whether there is a genuine issue for trial.” *Celotex*, 477 U.S. at 249, 106 S. Ct. at 2511; *see Caldarola v. Calabrese*, 298 F.3d 156, 160 (2d Cir. 2006). In doing so, “[t]he district court must draw all reasonable inferences and resolve all ambiguities in favor of the nonmoving party and grant summary judgment only if no reasonable trier of fact could find in favor of the nonmoving party.” *Sutera v. Schering Corp.*, 73 F.3d 13, 15 (2d Cir. 1995) (citation omitted); *see Augustin v. Yale Club of New York City*, 2008 WL 1813229, at \*1 (2d Cir. 2008).

## II. CERCLA Claims

CERCLA is a broad remedial statute that Congress enacted to encourage the timely cleanup of sites contaminated with hazardous wastes and other pollutants. *W.R. Grace & Co. v. Zotos Int’l, Inc.*, 559 F.3d 85 (2d Cir. 2009); *see Niagara Mohawk Power Corp. v. Chevron U.S.A., Inc.*, 596 F.3d 112,120 (2d Cir. 2010) (“CERCLA, remedial in nature, is designed to encourage prompt and effective cleanup of hazardous waste sites”). CERCLA “grants the President . . . power to command government agencies and private parties to clean up hazardous waste sites,” *Key Tronic Corp. v. Untied States*, 511 U.S. 809, 814 (1994), and provides that “everyone who is responsible for hazardous-waste contamination may be forced to contribute to the costs of cleanup,” *United States v. Bestfoods*, 524 U.S. 51, 56 & n.1 (1998) (internal quotation marks and citations omitted). *See Niagara Mohawk Power Corp.*, 596 F.3d at 120 (“CERCLA empowers the federal government and the states to initiate comprehensive cleanups, and to seek recovery of expenses associated with those cleanups”); *Commander Oil Corp. v. Barlo Equip. Corp.*, 215 F.3d 321, 326 (2d Cir. 2000) (CERCLA sets forth “a regime of broad-ranging liability, permitting the government to recover its remediating expenses directly from parties responsible

for pollution and authorizing private parties to pursue contribution or indemnification from potentially responsible parties for expenses incurred responding to environmental threats”) (citations omitted); *see also* S. Rep. No. 848, 96<sup>th</sup> Cong., 2d Sess. 13 (1980) (CERCLA’s expansive liability scheme is intended “to assure that the costs of injuries resulting from defective or hazardous substances are borne by the persons who create such risks rather than by the injured parties who are powerless to protect themselves”).

CERCLA’s goals include “encouraging the timely cleanup on those responsible for creating or maintaining the hazardous conditions.” *Consol. Edison Co. of N.Y. v. UGI Utilities, Inc.*, 423 F.3d 90, 94 (2d Cir. 2005) (internal quotation marks and citation omitted); *accord Burlington N. & Santa Fe Ry. Co. v. United States*, 129 S. Ct. 1870, 1874 (2009). In support of these goals, CERCLA provides two distinct legal remedies for the recoupment or reimbursement for hazardous waste cleanup and prevention costs at contaminated sites: (1) cost recovery actions by the government and private parties against potentially responsible parties under § 107(a) and (2) contribution actions under § 113(f). 42 U.S.C. §§ 9607(a) and 9613(f); *see Cooper Indus. Inc. v. Aviall Servs., Inc.*, 543 U.S. 157, 163 & n. 3 (2004); *Schaefer v. Town of Victor*, 457 F.3d 188, 194 (2d Cir. 2006). Only § 107(a) is at issue in the instant matter.

**(a) Statute of Limitations Under CERCLA § 107**

“Section 107 authorizes the United States, a state, or any other person to seek reimbursement for all removal or remedial costs associated with the hazardous materials on the property, provided that those actions are consistent with the National Contingency Plan – the federal government’s roadmap for responding to the release of hazardous substances.” *Niagara Mohawk Power Corp.*, 596 F.3d at 120-21 (internal quotation marks and citation omitted). Under §107 of CERCLA, there are two applicable limitations periods governing cost recovery actions

depending on whether the response costs were incurred in connection with a removal action or a remedial action. 42 U.S.C. § 9613(g)(2); *see Schaefer*, 457 F.3d at 195 (“For cost recovery actions under § 107, CERCLA distinguishes between two kinds of response: remedial actions – generally long-term or permanent containment or disposal programs – and removal efforts – typically short-term cleanup arrangements”) (internal quotation marks and citation omitted); *see also State of New York v. Shore Realty Corp.*, 759 F.2d 1032,1040 (2d Cir. 1985). Section 113(g)(2) of CERCLA provides in pertinent part:

An initial action for recovery of the costs referred to in [§ 107] of this title must be commenced;

(A) for a removal action, within 3 years after completion of the removal action, except that such cost recovery action must be brought within 6 years after a determination to grant a waiver under [§ 104(c)(1)(C)] of this title for continued response action; and

(B) for a remedial action, within 6 years after initiation of physical on-site construction of the remedial action, except that, if the remedial action is initiated within 3 years after the completion of the removal action, costs incurred in the removal action may be recovered in the cost recovery action brought under this subparagraph.

42 U.S.C. § 9613(G)(2). “Because of this difference in limitations periods, whether an activity is a “removal action” or a “remedial action” under § 107(a) can be determinative of the timeliness of a claim.” *Schaefer*, 457 F.3d at 195-96.

The statute defines removal actions as those responses that include

the cleanup or removal of released hazardous substances from the environment, such actions as may be necessary taken in the event of the threat of release of hazardous substances into the environment, such actions as may be necessary to monitor, assess, and evaluate the release or threat of release of hazardous substances, the disposal of removed material, or the taking of such other actions as may be necessary to prevent, minimize, or mitigate damage to the public

health or welfare or to the environment, which may otherwise result from a release or threat of release.

42 U.S.C. § 9601(23). Remedial actions are defined as those

actions consistent with permanent remedy taken instead of or in addition to removal actions in the event of a release or threatened release of a hazardous substance into the environment, to prevent or minimize the release of hazardous substances so that they do not migrate to cause substantial danger to present or future public health or welfare or the environment. The term includes, but is not limited to, such actions at the location of the release as storage, confinement, perimeter protection using dikes, trenches, or ditches, clay cover, neutralization, cleanup of released hazardous substances and associated contaminated materials, recycling or reuse, diversion, destruction, segregation of reactive wastes, dredging or excavations, repair or replacement of leaking containers, collection of leachate and runoff, onsite treatment or incineration, provision of alternative water supplies, and any monitoring reasonably required to assure that such actions protect the public health and welfare and the environment.

42 U.S.C. § 9601(24). “Distilled to its core, the key distinction between a remedial and a removal action is the purpose for which the action is undertaken. As a rule of thumb, though not an invariable guide, remedial actions are long-term or permanent containment or disposal programs, while removal actions are typically short-term cleanup arrangements.” *Yankee Gas Servs. Co. v. UGI Utilities, Inc.*, 616 F. Supp. 2d 228, 270 (D. Conn. 2009) (internal quotation marks and citations omitted).

**(b) Response Activities at the NCIA Site**

Defendants contend that (i) the physical on-site construction of the granulated activated carbon treatment system (the “GAC System”) to address contamination found in the Bowling Green aquifer which commenced on or before December 10, 1990; and/or alternatively (ii) the supplemental construction of a Packed Tower Aeration System (the “supplemental air stripping tower”) which was connected to the GAC System which commenced on June 12-13, 1995,

triggered the running of the time in which the State must have commenced its initial action for the recovery of costs associated with a remedial action under CERCLA. According to Defendants because Plaintiffs failed to commence the within action within six years of construction of (i) the GAC System in December 1990 and/or (ii) the supplemental air stripping tower on June 12-13, 1995, Plaintiffs' cost recovery claims under § 107 of CERCLA are barred by the applicable statute of limitations.

Plaintiffs disagree and argue that the instant action was timely commenced because the construction of the GAC System and the supplemental air stripping tower constituted removal actions, not remedial actions. In the alternative, Plaintiffs argue that the applicable statute of limitations was tolled by the execution of tolling agreements by Defendants.

**(i) Construction of GAC System**

A review of the record reveals the following. The "NCIA was first recognized as an area with widespread groundwater contamination during a county-wide groundwater investigation conducted by the NCDH in 1986." (ROD, dated October 2003, at 4.) The primary concern to human health and/or the environment was the threat of contamination to the sole source aquifer that is the source of the water supply at the Bowling Green water supply wells. (*Id.* at 1) As a result of the investigation, the NYSDEC listed the NCIA as a Class 2 site in the Registry in 1988. (*Id.*) In 1989, Bowling Green hired Dvirka & Bartilucci Consulting Engineers ("D&B") to recommend a "long-term treatment option" for remediating the VOC groundwater contamination migrating from the NCIA Site into the Bowling Green water supply wells. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 2-4; Ex. 1.) Following its evaluation, D&B recommended the GAC System at an estimated project cost of \$1.25 million. (*Id.* at ¶ 6.) On July 28, 1990, the NCDH approved the GAC System and the construction of the treatment system was put out to bid. (*Id.* at ¶¶ 7-10.)

Although Plaintiffs argue that the State had no involvement with the design, construction or approval of the plans for the GAC System (or the supplemental air stripping tower), and therefore the recovery activity cannot be imputed to the State for purposes of calculating the CERCLA statute of limitations, Plaintiffs' argument is belied by the record and applicable law.

Section 5-1.22 of Part 5, Chapter 1 of the New York State Sanitary Code ("SSC"), provides that no supplier of water may construct or install an addition to or modification of an existing public water system until the plans and specifications have been submitted to and approved by the State. 10 N.Y.C.R.R. § 5-1.22; *see Dunn Decl.*, dated Nov. 18, 2009, ¶ 2. Plans for the modification of an existing public water system may be approved by the State when the modification is deemed necessary to protect public health or safety. (*Id.*) A supplier of water must receive approval of the State<sup>16</sup> before placing into service any public system constructed under the requirements of the SSC. The New York State Department of Health ("NYSDOH") delegates to local health departments the responsibility for reviewing, commenting, and ultimately approving plans by the local water supplier for modifying the existing water supply system. (*Dunn Decl.*, dated Nov. 18, 2009, ¶¶ 3-4.)

Here, NYSDOH delegated direct supervision of the review, approval and construction of the GAC System (and supplemental air stripping tower) at Bowling Green to its designated representative NCDH. (*Id.*) Notwithstanding, in March 1990, D&B advised both NYSDOH and NCDH that the Bowling Green water supply wells had detected levels of contamination. (*Alarcon Decl.*, dated Mar. 17, 2009, ¶ 5.) NYSDOH received the initial application for the approval of the plans and was copied on all necessary correspondence concerning the GAC System and

---

<sup>16</sup>"State" is defined to mean the State Commissioner of Health or his designated representative. SSC § 5-1.1(bk).

supplemental air stripping tower. (*Id.*; see *Doyle Letter*, dated March 12, 1990 (attached as Ex. A to Frost Street Defs. Reply Mem., dated April 5, 2010)); *Davis Aff.*, dated Mar. 27, 2009, ¶ 6; Exs. 2-5; *Alarcon Decl.*, dated Mar. 17, 2009, ¶ 5; Exs. A-C, D-E ) Indeed, by letter dated March 12, 1990, D&B's plans for the construction of the GAC System were sent directly to Gilbert Faustel of the NYSDOH and sought the NYSDOH's assistance to expedite approval of the plans and specifications for the construction project. (*Doyle Letter*, dated March 12, 1990.) In pertinent part, the letter set forth the following:

Transmitted herewith are three (3) copies of Contract Nos. 1, 2, 3, and 4 for the Construction of Bowling Green Estates Water Treatment Facility and Application for Approval of Plans for Public Water Supply Improvement Gen. Form 296. The project involves the construction of a 4.0 MGD Granular Activated Carbon (GAC) Adsorption System to serve Well No. 1 and Well No. 2 in the Bowling Green Estates Water District, including the replacement of deep well turbine pumps and mortars. The project was broken down into several contracts to expedite fabrication and delivery of treatment equipment.

At present, the Town of Hempstead Department of Water is installing a Granular Activated Carbon (GAC) Adsorption System at the site of Wells No. 1 and 2 in order to maintain water of acceptable quality. The quality of water discharged from each of the wells has shown an increase in the levels of organic compounds; however, the concentration of organic compounds is below the maximum allowable limit as set forth in the New York State Sanitary Code Part 5, the Town of Hempstead Department of Water has initiated the installation of a GAC Adsorption System to ensure and maintain water of acceptable quantity and quality.

The treatment system is designed to remove, at a minimum, three times the actual influent concentration produced from any one well.

The combined discharge from the two public water supply wells is approximately 2,800 gallons per minute (gpm). The granular activated carbon adsorption system consisting of three (3) carbon adsorption units will treat the entire influent flow of 2,800 gallons per minute produced from the wells to reduce the levels of volatile organic compounds in the effluent . . . .

The Town of Hempstead is proceeding with the construction phase of the project with the intent of the system being completed and approved for use prior to the onset of summer, in order to meet area peak day demands. . . . We would appreciate any assistance your office can provide to expedite approval of plans and specification.

(*Id.*)

On June 28, 1990, NCDH approved the plans for the installation of the GAC System, notably giving its approval on NYSDOH Form DOH 101 which stated that the approval was “issued for the State Commissioner of Health.” (*Alarcon Decl.*, dated Mar. 17, 2009, ¶ 12, Ex. E.) Thereafter, the Town was permitted to operate the system when the NCDH issued an Approval of Completed Works certificate based upon the satisfactory water analysis results from the GAC System, and notably NCDH gave its approval on NYSDOH Form GEN219 which stated that the approval was “issued for the State Commissioner of Health.” (*Id.*, Ex. F.)

The fact that the NYSDOH delegated direct supervision of the installation of the GAC System to the NCDH does not relieve the State of its statutory responsibility for the approval of the treatment system. *See, e.g., Long Island Head Start Child Dev. Servs. v. Economic Opp. Comm’n of Nassau Cty.*, 558 F. Supp. 2d 378, 396 (E.D.N.Y. 2008) (holding “in general, under the law of agency, an agent’s knowledge is imputed to the principal, when the knowledge is material to the subject matter of his agency”). Moreover, there is sufficient evidence in the record that the State had involvement with the approval of the GAC System, including the facts that the NYSDOH received the initial application for the approval of the plans, was copied on all correspondence concerning the GAC System, and that the approval of the plans for the GAC System as well as the approval of a completed works certificate were officially noticed on NYSDOH letterhead and official forms under the authority of the State Commissioner of Health. (*Alarcon Decl.*, dated Mar. 17, 2009, ¶ 12, Ex. E.) Based on this evidence, the Court finds that

Plaintiffs had involvement with and approval of the construction of the GAC System at the NCIA Site.

On December 10, 1990, the construction of the GAC System was completed and D&B sought permission from NCDH to operate the GAC System at Bowling Green. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 11-12; Ex. 1, 4, 8.) Between 1990 and the spring of 1995, the GAC System was the exclusive remedy in place to treat the groundwater contamination adversely affecting the Bowling Green public waters supply.

Notably, in March 1995, the NYSDEC delisted the NCIA Site as a whole and listed seven properties within the NCIA as Class 2 sites. Additional PSAs thereafter resulted in the NYSDEC listing additional properties within the NCIA as Class 2 sites. The GAC System remains in use to this date, nearly nineteen years after its construction.<sup>17</sup> (*Davis Aff.*, dated Mar. 27, 2009, ¶ 14; *see Merklin Aff.*, dated Mar. 9, 2009, ¶¶ 10-11.)

**(ii) Construction of the Supplemental Air Stripping Tower**

A review of the record indicates the following. In the spring of 1995, the NCDH issued a report indicating that higher concentrations of contamination originating from the NCIA were migrating toward Bowling Green. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 15-18; Exs. 9-10.) On May 16, 1995, the NYSDEC and NYSDOH conducted a public meeting concerning the groundwater contamination, which was attended by Commissioner of the Town of Hempstead Water District Daniel Davis and the Town of Hempstead Town Attorney. (*Id.*) At the meeting, Commissioner Davis requested that the State reimburse Bowling Green for all costs associated

---

<sup>17</sup>The GAC System is presently utilized in conjunction with the supplemental air stripping tower which was constructed in 1995, and is to be incorporated into any future remedial systems at OF-3. (*Davis Aff.*, dated Mar. 27, 2009, ¶ 14; *Merklin Aff.*, dated Mar. 9, 2009, ¶¶ 4-6, 10-11; and ROD at 1, 19-22.)

with the construction and operation of the GAC System, and he received assurance that (i) “recovery of the cost of the construction and operation of the GAC treatment system would be pursued against the parties responsible for the contamination at [the] NCIA,” and (ii) “that the NYSDEC would assist in the funding of necessary supplemental remedial systems to protect the quality of the Bowling Green water.” (*Id.* at ¶¶ 16-20.) Following the meeting, Commissioner Davis again hired D&B to identify further remedial options, and on May 23, 1995, D&B recommended an approximately 34' air stripping tower to supplement the GAC System. (*Id.* at ¶¶ 21-27.)

On June 12 and 13, 1995, construction of the air stripping tower commenced. (*Id.* at ¶¶ 28-32; Ex. 17; *Merklin Aff.*, dated Mar. 9, 2009, at ¶¶ 6-9.) D&B hired Warren George, Inc. (“WGI”) to drill three foundation borings<sup>18</sup> at Bowling Green that measured four inches in diameter and went down 32 feet below the ground surface. (*Id.*) These soil borings were drilled with a large drilling truck (similar to the type of equipment used to drill a household well) and were drilled below the area onto which the concrete slab for the air stripping tower was to be poured. (*Id.*) Construction of the supplemental air stripping tower continued into July 1995, with the construction of the concrete pad on the which the air stripping tower would be erected as well as mechanical, electric and site work on the air stripping tower. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 33-34, 42-44, Ex. 22.) The supplemental air stripping tower continues to be utilized to this day in conjunction with the GAC System. (*Merklin Aff.*, dated Mar. 9, 2009, ¶ 11.)

### **(iii) Costs of Construction**

The November 1989 process evaluation by D&B estimated that the project cost for the

---

<sup>18</sup>The foundation borings were necessary and required physical on-site construction in order to support the air stripping tower (which weighed several tons). (*Id.*)

GAC System was \$1.25 million. (*Davis Aff.*, dated Mar. 27, 2009, Ex. 1.)

By letter dated June 21, 1995, NYSDEC Director Michael J. O'Toole informed NCDH that the capital costs of the proposed supplemental water treatment system would be paid out of the State Superfund Program. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 34-36, Ex. 18.) The following week, the NYSDEC Project Engineer for the Remediating of the NCIA, Jeff Trad, telephoned NCDH requesting certain information regarding the NCDH's activities for site remediating at the NCIA, directed that NCDH keep track of all expenses associated with the installation of the air stripping tower, informed him that the expenses would be refundable by the State (not the federal government), and stated "that their approach to a payout for this expense is that this is part of the remediating to clean up the groundwater which is basically the use of treatment at the well head." (*Id.* at ¶¶ 35-36, Ex. 19.)

By letter dated March 23, 1998, NCDH requested from the NYSDEC reimbursement for the cost of construction of the supplemental air stripping tower from the New York State Superfund, for an estimate cost of \$1.22 million, which included costs relating to integrating plant piping, instrumentation and safety controls with the existing granular activated carbon filters at the site.. (*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 42-44, Ex. 22.) NCDH was subsequently reimbursed for all its costs, including the cost of the WGI foundation borings from the New York State Superfund as part of the capital cost of installing the air stripping tower. (*Id.*)

Significantly, in the instant CERCLA action, Plaintiffs are seeking to recover past and future response costs incurred in responding to the off-site groundwater contamination in the area bordering the NCIA south of Old Country Road and Grand Boulevard, including in and around the Bowling Green public water supply wells. (Second Amended Complaint, dated May 20,

2008.) In particular, the record indicates that Plaintiffs are seeking the recovery of NYSDOH oversight costs incurred in 1990 and in 1995-96 in connection with activities at NCIA, including oversight of the approval of the GAC System and air stripping tower, and all construction costs of the supplemental air stripping tower system. (*Maldonado Aff.* dated Aug. 21, 2009, Ex. 7, Attachment B, Exs.4, 23.)

**(iv) Classification of the Response Activities at the NCIA Site**

Given the facts surrounding the history of the construction, use and projected use of the response activities at the NCIA site set forth in the record evidence and the applicable legal principles, this Court concludes that the GAC System utilized in conjunction with the supplemental air stripping tower were part of a permanent containment effort that was intended “to prevent and minimize the release of hazardous substances so that they do not migrate to cause substantial danger to present or future public health or welfare or the environment,” CERCLA § 101 (24), particularly with respect to groundwater contamination adversely affecting the Bowling Green public waters supply, *see Second Amended Compl.*, dated May 20, 2008.

First, the manner in which the project was planned, designed and implemented suggests that the response was intended to be a remedial action. Based on a groundwater investigation conducted by NCDH in 1986 that revealed a significant threat to public health and the environment posed by contamination found at and being released from the NCIA, the NYSDEC listed the entire NCIA as a Class 2 site in the Registry in 1988. Bowling Green thereafter hired D&B to recommend a long-term treatment option for remediating groundwater contamination migrating from the NCIA into the Bowling Green public drinking water supply well, and in 1989 D&B recommended the GAC System. The GAC System was completed in December 1990. Since the discovery of groundwater contamination in 1986, the only remedial response at OU-3

has been the installation of the GAC System as supplemented by the air stripping tower, and notably the GAC System in conjunction with the air stripping tower has been utilized at Bowling Green for nearly nineteen years.

Moreover, the response action was undertaken as part of a long-term strategy for the remediating of the groundwater contamination. The construction of the GAC System in 1990 at the Bowling Green water supply well was approved by both the NCDH and the NYSDEC and was constructed to permanently address, prevent and/or minimize the release of hazardous substances and remains in use to date as part of the remedial system for the NCIA. The construction of the supplemental air stripping tower which commenced on June 12-13, 1995 was added to the GAC System to address the higher concentrations of groundwater contamination originating from NCIA that were migrating toward Bowling Green and continues in conjunction with the GAC System to be in use to date.

Further, in its documents, the State's reference to the GAC System in combination with the supplemental air stripping tower as "remedial," while not dispositive, is significant. The ROD for OU-3, identifies the primary threat at the NCIA as the site's contravention of groundwater standards in the sole source aquifer that is the source of water supply at Bowling Green. (*Maldonado Decl.*, dated Aug. 21, 2009, Ex. 8, at 1.) Section 5.2 of the ROD refers to the GAC System and air stripping tower as an interim remedial measure and notes that the "supplemental water treatment system uses an air stripper to remove the contaminants, followed by carbon polishing" and was constructed using State Superfund money to ensure the protection of the public water supply. (*Id.* at 19.) In addition, Section 7.1 specifically lists the "supplemental treatment system consisting of air stripping followed by carbon polishing" as a

required “element of remediating” for “all remedial alternatives” considered in the ROD for OU-3 and notes that the air stripper followed by carbon polishing “was constructed to mitigate the impact of the groundwater contamination leaving the NCIA sites on the Bowling Green Water District supply wells.” (*Id.* at 21-22.) Thus, pursuant to the ROD, the GAC System in combination with the air stripping tower is expected to be part of the long term remedial response into the future and will be incorporated into any final remedial system. Moreover, in response to an interrogatory, the State stated in pertinent part “. . . it is necessary to supplement the existing air stripper system currently in use at the Town of Hempstead Bowling Green with additional remedial measures in order to complete the remediating of Hazardous Substances present or expected to be present in the groundwater at the Bowling Green well field.” (*Id.*, Ex. 7, at 22.) Finally, in a memorandum memorializing a conversation between the Commissioner of NCDH and the NYSDEC project engineer for the remediating of the New Cassel Industrial Waste Site on June 28, 1995, the Commissioner recorded as follows:

J. Trad indicated that the [Bowling Green Water] Department should keep track of all of the expenses associated with the installation of the air stripping tower at the Iris Place Pump Station [Bowling Green] and at the completion of the project the Department could then advise his office as to the total cost of the stripper.

This expense he indicated would be a refundable expense by the State (not the Federal Government) and that their approach to payout for this expense is that it is part of the remediating to clean up the groundwater which is basically the use of treatment at the well head.

(*Davis Aff.*, dated Mar. 27, 2009, ¶¶ 35-36, Ex. 19.)

Finally, the estimate costs expended for the GAC System (\$1.25 million) and for the supplemental air stripping tower (\$1.22 million) suggests that the response activities were

undertaken as the initial phases of remediation at the NCIA as opposed to a short-term clean-up arrangement.

(v) ***Timeliness of this Cost Recovery Action if Dated from the Construction of the GAC System***

Having concluded that the response activities (the GAC System utilized in conjunction with the supplemental air stripping tower) were remedial because they were part of long-term permanent containment effort and were intended to “prevent or minimize the release of hazardous substances,” CERCLA § 101(24), the applicable statute of limitations for this cost recovery action is “6 years after initiation of physical on-site construction of the remedial action,” CERCLA § 113(g)(2)(B). Thus, the determinative issue concerning the timeliness of Plaintiffs’ action is whether any of the response activities were initiated prior to (i) Mar. 13, 2000 (six years before Plaintiffs initiated the recovery action against the Frost Street Defendants when Plaintiffs filed their Complaint, dated Mar. 13, 2006); (ii) May 12, 2000 (six years before Plaintiffs initiated the recovery action against defendants Grand Machinery and Paul Merandi, the Utility Manufacturing Defendants, the Tishcon Defendants, and the C&O Defendants when Plaintiffs filed their Amended Complaint, dated May 12, 2006); or (iii) May 20, 2002 (six years before Plaintiffs initiated the recovery against defendants 2632 Realty Development Corporation, BEAC, Island Transportation Inc., and the Atlas Graphics Defendants when Plaintiffs filed their Second Amended Complaint, dated May 20, 2006), constitute the “initiation of physical on-site construction of the remedial action.” 42 U.S.C. § 113(g)(2)(B); *see Schaefer*, 457 F.3d at 203-04 (examining, for purposes of determining when the statute of limitations begins to run on remedial actions, whether the activity was a [1] “physical activity,” [2] that “occurred on site,” [3] which “qualifies as construction,” and thus [4] “qualifies as the initiation of remedial action”).

Here, the initiation of the remedial action began with the physical on-site construction of the GAC System. The GAC System project involved the construction of a 4.0 MGD Granular Activated Carbon (GAC) Adsorption System to serve Well No. 1 and Well No. 2 in the Bowling Green Estates Water District, including the replacement of deep well turbine pumps and mortors, and the project was broken down into several contracts, including general construction, electrical, plumbing and ventilation, to facilitate the fabrication and delivery of treatment equipment. The physical on-site construction of the GAC System at the Bowling Green water supply well commenced in 1990 and was completed by December 10, 1990.<sup>19</sup> Given the initiation of the physical, on-site construction of the GAC System occurred prior to Mar. 13, 2000, May 12, 2000, and/or May 20, 2002, Plaintiffs' recovery action is untimely. Accordingly, this Court respectfully reports and recommends that Defendants motion for summary judgment be granted on this basis.

**(vi) *Timeliness of this Cost Recovery Action if Dated from the Addition of the Air Stripping Tower***

In the alternative, should the District Court determine that the physical, on-site construction of the GAC System did not trigger the statute of limitations under CERCLA, then the Court respectfully reports and recommends that the supplementation of the GAC System, which began with the commencement of the construction of the air stripping tower that was connected to the GAC tower on June 12-13, 1995, started the clock for statute of limitations purposes. In such an instance, this Court finds that the physical on-site activity of a large drilling rig, drilling 32 foot deep foundation borings into the ground below the site of the proposed concrete slab for the air

---

<sup>19</sup>Although the parties have not specified the date upon which the on-site construction of the GAC System at Bowling Green commenced, it is undisputed that it commenced sometime in 1990 and was completed on or before December 10, 1990. In any event, even using use the completion date, December 10, 1990, for statute of limitations purposes, as discussed *infra* Plaintiffs' CERCLA claims are time-barred.

stripping tower at the Bowling Green water supply well constitutes the initiation of the physical on-site activity related to the construction of the supplemental air stripping tower. *See, e.g., Schaefer*, 457 F.3d at 203 (“While the mere purchase of a crane does not constitute the initiation of physical on-site construction, Schaefer’s subsequent use of the crane to spread cover (a mixture of topsoil, sand, and gravel) over his landfill satisfies each of the four statutory prerequisites”). In any event, given the initiation of the physical, on-site construction of the supplemental air stripping tower that was connected to the GAC System occurred prior to Mar 13, 2000, May 12, 2000 and/or May 20, 2002, Plaintiffs’ recovery action would be untimely. Accordingly, on this alternative basis, this Court respectfully reports and recommends that Defendants motion for summary judgment be granted.

**(vii) *The Tolling Agreements***

Although Plaintiffs argue that tolling agreements entered into by certain of the Defendants tolled the applicable statute of limitations period, as set forth below, Plaintiffs’ CERCLA claims were already time-barred by the effective date of the each of the respective tolling agreements.<sup>20</sup>

The record indicates the following. Prior to commencing the instant action, Plaintiffs and certain of the Defendants entered into tolling agreements. Significantly, the tolling agreements preserved these defendants’ rights to raise the statute of limitations defense to claims that were time-barred prior to the effective dates of the agreements and provided that they shall only apply prospectively and do not operate to revive any limitations periods. The tolling agreements entered

---

<sup>20</sup> As discussed *infra*, none of the tolling agreements entered between Plaintiffs and the respective above-listed defendants became effective prior to the expiration of the applicable statute of limitations, *i.e.*, either December 1996 (six years after on-site construction of the GAC System commenced), or in the alternative, June 12-13, 2001 (six years after on-site construction of the supplemental air stripping tower which connected to the GAC System).

into by these parties are as follows:

Plaintiffs and defendants Next Millennium and 101 Frost Street Associates entered into tolling agreements that were fully executed on July 9, 2001. As discussed above, the statute of limitations began to run (i) when on-site construction of the GAC System commenced (prior to December 10, 1990), or in the alternative, (ii) from the commencement of the construction of the supplemental air stripping tower which connected to the GAC System which commenced on June 12-13, 1995. Under either case, the tolling agreements did not become effective prior to the expiration of the applicable statute of limitations.

Defendant Grand Machinery and Paul Merandi (in his capacity as Treasurer of Grand Machinery) entered into tolling agreements with Plaintiffs in July 2001 with an effective date of June 28, 2001. (*Biblow Letter*, dated June 22, 2010.) As discussed above, the statute of limitations began to run (i) when on-site construction of the GAC System commenced (prior to December 10, 1990), or in the alternative, (ii) from the commencement of the construction of the supplemental air stripping tower which connected to the GAC System which commenced on June 12-13, 1995. Under either case, the tolling agreements did not become effective prior to the expiration of the applicable statute of limitations.

Defendants Utility Manufacturing Corporation, Nest Equities, Inc., Audie Kranz (in his capacity as President of Utility Manufacturing Corporation) and Wilbur Kranz (in his capacity as President of Nest Equities, Inc.) entered into tolling agreements with Plaintiffs on August 23, 2001. As discussed above, the statute of limitations began to run (i) when on-site construction of the GAC System commenced (prior to December 10, 1990), or in the alternative, (ii) from the commencement of the construction of the supplemental air stripping tower which connected to the

GAC System which commenced on June 12-13, 1995. Under either case, the tolling agreements did not become effective prior to the expiration of the applicable statute of limitations.

Defendants Tishcon Corporation entered into a tolling agreement with Plaintiffs on June 28, 2001. (*Landrigan Letter*, dated June 29, 2010.) As discussed above, the statute of limitations began to run (i) when on-site construction of the GAC System commenced (prior to December 10, 1990), or in the alternative, (ii) from the commencement of the construction of the supplemental air stripping tower which connected to the GAC System which commenced on June 12-13, 1995. Under either case, the tolling agreements did not become effective prior to the expiration of the applicable statute of limitations.

Accordingly, this Court respectfully reports and recommends that the Court find that the tolling agreements did not toll the relevant statute of limitations period.

### **III. New York State Law Claims**

Plaintiffs' Second Amended Complaint also asserts claims under New York State law for public nuisance, restitution and indemnification. (Second Amended Compl., ¶¶ 149-68.) Having found that Plaintiffs' federal CERCLA claims do not survive Defendants' summary judgment motion, this Court concludes that subject to the District Court's reconsideration of the motion to sever case Nos. CV-03-5985 and CV-06-1122 (*Order*, dated September 8, 2010 (Feuerstein, *D.J.*; *see supra* fn. 15), it is unwarranted to exercise supplemental jurisdiction over Plaintiffs' remaining state-law claims. *See* 28 U.S.C. § 1367(c)(3); *United Mine Workers of Am. v. Gibbs*, 383 U.S. 715, 726 (1966). "In the interest of comity, the Second Circuit instructs that absent exceptional circumstances, where federal claims can be disposed of pursuant to Rule 12(b)(6) or summary judgment grounds, courts should abstain from exercising pendent jurisdiction." *Maura v. Countrywide Home Loans, Inc.*, 2010 WL 2976506, at \*10-11 (E.D.N.Y. July 22, 2010) (quoting

*Walker v. Time Life Films, Inc.*, 784 F.2d 44, 53 (2d Cir. 1986) (internal quotation marks omitted)); *see Brzak v. United Nations*, 597 F.3d 107, 113-14 (2d Cir. 2010) (holding that “if a plaintiff’s federal claims are dismissed before trial, the state claims should be dismissed as well) (internal quotation marks and citations omitted); *Cave v. E. Meadow Union Free Sch. Dist.*, 514 F.3d 240, 250 (2d Cir. 2008) (“We have already found that the district court lacks subject matter jurisdiction over appellants’ federal claims. It would thus be clearly inappropriate for the district court to retain jurisdiction over the state law claims when there is no basis for supplemental jurisdiction”); *see also Seabrook v. Jacobson*, 153 F.3d 70, 72 (2d Cir. 1998) (observing that principles of federalism and comity may counsel in favor of the dismissal of state law claims where “the federal claim on which the state claim hangs has been dismissed”); *see also Karmel v. Claiborne, Inc.*, 2002 WL 1561126, at \*4 (S.D.N.Y. July 15, 2002) (“Where a court is reluctant to exercise supplemental jurisdiction because of one of the reasons put forth by § 1367(c), or when the interests of judicial economy, convenience, comity and fairness to litigants are not violated by refusing to entertain matters of state law, it should decline supplemental jurisdiction and allow the plaintiff to decide whether or not to pursue the matter in state court.”).

Accordingly, pursuant to 28 U.S.C. § 1367(c)(3), given the absence of any federal claims that survive the motion for summary judgment and in the interest of judicial economy, convenience and comity, this Court respectfully reports and recommends (subject to the District Court’s reconsideration of the motion to sever) that the District Court decline to exercise supplemental jurisdiction over Plaintiffs’ state law claims and dismiss these claims without prejudice.

## CONCLUSION

For the foregoing reasons, the Court respectfully reports and recommends that Defendants' motion for summary judgment be granted in its entirety on the federal claims. In addition, the Court respectfully reports and recommends that the Court decline to retain jurisdiction over Plaintiffs' remaining state law claims and dismiss such claims without prejudice.

## OBJECTIONS

Any objections to this Report and Recommendation must be filed with the Clerk of the Court with a copy to the undersigned within fourteen (14) days of receipt of this Report. Failure to file objections within this period waives the right to appeal the District Court's Order. *See* 28 U.S.C. 636 (b)(1); Fed. R. Civ. P. 72, 6(a), 6(e); *Beverly v. Walker*, 118 F.3d 900, 902 (2d Cir. 1997); *Savoie v. Merchants Bank*, 84 F.3d 52, 60 (2d Cir. 1996); *IUE AFL-CIO Pension Fund v. Herrmann*, 9 F.3d 1049, 1054 (2d Cir. 1993); *Roldan v. Racette*, 984 F.2d 85, 89 (2d Cir. 1993); *Frank v. Johnson*, 968 F.2d 298, 299 (2d Cir. 1992).

Pending before the Court are the objections of plaintiffs State of New York and Alexander B. Grannis, as Commissioner of the New York State Department of Environmental Conservation (collectively, “the State plaintiffs”), to the Report and Recommendation of former United States Magistrate Judge Michael L. Orenstein dated September 24, 2010 (“the Report”), recommending, *inter alia*, that the motions of (1) defendants Next Millennium Realty, LLC, 101 Frost Street Associates, L.P., 101 Frost Street Corporation, Alan Eidler, Pamela Spiegel Sanders and Lise Spiegel Wilks, as co-executors of the Last Wills and Testaments of, and as duly authorized administrators of the Estates of, defendants Emily Spiegel and Jerry Spiegel, deceased, (collectively, “the Next Millennium defendants”), and (2) defendants Grand Machinery Exchange, Inc., i/s/h as Grand Machinery Inc., Paul Merandi (“Merandi”) and 2632 Realty Development Corporation (collectively, “the Grand Machinery defendants”), seeking summary judgment dismissing the State plaintiffs’ federal claims against them<sup>1</sup> be granted, that the State

---

<sup>1</sup> Defendants Barouh Eaton Allen Corp. (“BEAC”); Sulzer Metco (US) Inc. (“SMI”); Utility Manufacturing Co., Inc., Nest Equities, Inc., Audie Kranz and Wilbur Kranz (collectively, “the Utility defendants”); Tishcon Corp., a/k/a Tishcon Corporation, Kamal Chopra and Joe Elbaz (collectively, “the Tishcon defendants”); IMC Eastern Corporation, f/k/a IMC Magnetics Corp. and NMB (USA) Inc. (collectively, “the IMC defendants”); Island Transportation Corporation (“ITC”); C&O Realty Co. and William Gross (collectively, “the C&O defendants”); and Atlas Graphics Inc., H.D.P. Printing Industries Corp. and Richard Degenhart (collectively, “the Atlas defendants”) joined in the Next Millennium defendants’ and Grand Machinery defendants’ motions for summary judgment. Moreover, defendants Arkwin Industries, Inc., William Maglio and Frank Jacobson, as co-executors of the Last Will and Testament of, and as duly authorized administrators of, the Estate of Daniel Berlin, deceased, and Thomas Molloy, i/s/h Thomas Malloy (collectively, “the Arkwin defendants”), advised the Court that they intended to file motions for summary judgment dismissing the State plaintiffs’ claims against them, but have deferred doing so as a result of procedural issues that have arisen in this case. Accordingly, the Court deems the Arkwin defendants to have also joined in the Next Millennium defendants’ and Grand Machinery defendants’ motions for summary judgment. The only remaining defendant that has appeared in this action, Equity Share I Associates, has not joined in the motions for summary judgment. The Clerk of the Court has entered the defaults of the remaining three (3) defendants in the action commenced by the State plaintiffs, i.e., Scibelli Brothers Auto Collision Inc., f/k/a Scibelli Brothers, Inc., a/k/a Scibelli Automotive, Inc., Joseph

plaintiffs' federal claims against all answering defendants in the action entitled State of New York, et ano. v. Next Millennium Realty, LLC, et al., No. 06-cv-1133 ("the State action"), be dismissed in their entirety with prejudice and that I decline to exercise supplemental jurisdiction over any remaining state law claims in the State action. For the reasons stated herein, the State plaintiffs' objections are overruled and the Report is accepted in its entirety.

#### I. Standard of Review

Rule 72 of the Federal Rules of Civil Procedure permits magistrate judges to conduct proceedings on dispositive pretrial matters without the consent of the parties. Fed. R. Civ. P. 72(b). Any portion of a report and recommendation on dispositive matters, to which a timely objection has been made, is reviewed *de novo*. 28 U.S.C. § 636(b)(1); Fed.R.Civ.P. 72(b). The court, however, is not required to review the factual findings or legal conclusions of the magistrate judge as to which no proper objections are interposed. See, Thomas v. Arn, 474 U.S. 140, 150, 106 S.Ct. 466, 88 L.Ed.2d 435 (1985). To accept the report and recommendation of a magistrate judge on a dispositive matter, to which no timely objection has been made, the district judge need only be satisfied that there is no clear error on the face of the record. See, Fed. R. Civ. P. 72(b); Johnson v. Goord, 487 F.Supp.2d 377, 379 (S.D.N.Y. 2007), aff'd, 305 Fed. Appx. 815 (2d Cir. Jan. 1, 2009); Baptichon v. Nevada State Bank, 304 F.Supp.2d 451, 453 (E.D.N.Y. 2004), aff'd, 125 Fed.Appx. 374 (2d Cir. 2005). Whether or not proper objections have been filed, the district judge may, after review, accept, reject, or modify any of the magistrate judge's findings or recommendations. 28 U.S.C. § 636(b)(1); Fed.R.Civ.P. 72(b).

---

Scibelli and Sam-Ton Salvage and Towing Inc. However, the State plaintiffs have not yet moved for default judgments to be entered against those defendants.

## II. State Plaintiffs' Objections

The State plaintiffs contend that Magistrate Judge Orenstein erred, *inter alia*, in finding that the construction of the granulated activated carbon (“GAC”) treatment system and the Packed Tower Aeration System (“the air stripping tower”) on the contaminated site triggered the statute of limitations applicable to remedial actions commenced under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, 42 U.S.C. §§ 9601, *et seq.*, (“CERCLA”), because that conclusion (a) is based on the determination that both systems were remedial, rather than removal, in nature, (b) erroneously imputes the construction of the GAC treatment system and air stripping tower to the State and (3) improperly resolves a question of fact regarding the commencement date of the physical on-site construction of the air stripping tower.

Upon *de novo* review of the Report and motion papers, and consideration of the State plaintiffs' objections, the Report is accepted in its entirety. Contrary to the State plaintiffs' contention, Magistrate Judge Orenstein, *inter alia*, properly characterized the on-site construction of the GAC treatment system and air stripping tower as remedial, rather than removal, measures. See, e.g. United States v. Washington State Department of Transportation, No. C05-5447, 2007 WL 445972, at \* 19-20 (W.D. Wash. Feb. 7, 2007) (finding that the on-site installation of two (2) air strippers was improperly characterized as a removal, rather than remedial, action). The State plaintiffs' remaining contentions are likewise rejected as without merit.

## III. State Law Claims

Since all federal claims against the answering defendants in the State action are dismissed

in accordance with the Report and this Order, the branch of the Report recommending that I decline to exercise supplemental jurisdiction over the State plaintiffs' state law claims is accepted and the State plaintiffs' state law claims against the answering defendants are dismissed without prejudice pursuant to 28 U.S.C. § 1367.<sup>2</sup>

#### IV. CONCLUSION

Upon *de novo* review of the Report and all motion papers, and consideration of the State plaintiffs' objections, the Report is accepted in its entirety. The Next Millennium defendants' and Grand Machinery defendants' motions for summary judgment are granted<sup>3</sup>, the State plaintiffs' federal claims against the answering defendants are dismissed in their entirety with prejudice as time-barred, and the State plaintiffs' state law claims against the answering

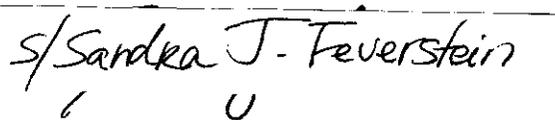

---

<sup>2</sup> In light of the dismissal of all of the State plaintiffs' claims against the answering defendants in the State action, the defendants' and third-party plaintiffs' respective counterclaims, cross-claims and third-party claims seeking contribution and indemnification against the answering defendants are likewise dismissed without prejudice to recommencement in any subsequently commenced state law action. Moreover, since the State action is dismissed in its entirety, with the exception of the parties' claims against the defaulting defendants, the pending motion of defendants Adchem Corp., Northern State Realty Corp., Lincoln Processing Corp., Northern State Realty Co. and Pufahl Realty Corp. (collectively, "the Adchem defendants") seeking reconsideration of this Court's September 8, 2010 order severing the two (2) above-captioned actions is denied as moot, without prejudice to renewal in the event that the Adchem defendants object to the parties in the State action seeking a default judgment, if any, against the defaulting defendants in the severed State action. **The parties are directed to move for a default judgment against the three (3) defaulting defendants in the State action on or before December 22, 2011, or their claims against the defaulting defendants will be deemed dismissed with prejudice for failure to prosecute.** In the event any party in the State action moves for a default judgment against the defaulting defendants, the hearing in aid of such default judgment will be held at the same time as the status conference previously scheduled before the Court on **February 2, 2012 at 11:15 a.m.**

<sup>3</sup> This order resolves the following: docket entries 452, 499, 551, 552, 553, 563, 591 and 592.

defendants are dismissed in their entirety without prejudice pursuant to 28 U.S.C. § 1367. **The parties in the State action are directed to move for a default judgment against the three (3) defaulting defendants on or before December 22, 2011, or their claims against the defaulting defendants will be deemed dismissed with prejudice for failure to prosecute.** In the event any party so moves for a default judgment in accordance with this Order, the hearing in aid of judgment will be held on **February 2, 2012 at 11:15 a.m.**

SO ORDERED.

---

SANDRA J. FEUERSTEIN  
United States District Judge

Dated: November 22, 2011  
Central Islip, New York

## 42 U.S.C. § 9601. Definitions

For purpose of this subchapter—

\* \* \*

(23) The terms “remove” or “removal” means [*sic*] the cleanup or removal of released hazardous substances from the environment, such actions as may be necessary taken in the event of the threat of release of hazardous substances into the environment, such actions as may be necessary to monitor, assess, and evaluate the release or threat of release of hazardous substances, the disposal of removed material, or the taking of such other actions as may be necessary to prevent, minimize, or mitigate damage to the public health or welfare or to the environment, which may otherwise result from a release or threat of release. The term includes, in addition, without being limited to, security fencing or other measures to limit access, provision of alternative water supplies, temporary evacuation and housing of threatened individuals not otherwise provided for, action taken under section 9604(b) of this title, and any emergency assistance which may be provided under the Disaster Relief and Emergency Assistance Act [42 U.S.C. 5121 et seq.].

(24) The terms “remedy” or “remedial action” means 3 those actions consistent with permanent remedy taken instead of or in addition to removal actions in the event of a release or threatened release of a hazardous substance into the environment, to prevent or minimize the release of hazardous substances so that they do not migrate to cause substantial danger to present or future public health or welfare or the environment. The term includes, but is not limited to, such actions at the location of the release as storage, confinement, perimeter protection using dikes, trenches, or ditches, clay cover, neutralization, cleanup of released hazardous substances and associated contaminated materials, recycling or reuse, diversion, destruction, segregation of reactive wastes, dredging or excavations, repair or replacement of leaking containers, collection of leachate and runoff, onsite treatment or incineration, provision of alternative water supplies, and any monitoring reasonably required to assure that such actions protect the public health and welfare and the environment. The term includes the costs of permanent relocation of residents and businesses and community facilities where the President determines that, alone or in combination with other measures, such relocation is more cost-effective than and environmentally preferable to the transportation, storage, treatment, destruction, or secure disposition offsite of hazardous substances, or may otherwise be necessary to protect the public health or welfare; the term includes offsite transport and offsite storage, treatment, destruction, or secure disposition of hazardous substances and associated contaminated materials.

## **42 U.S.C. § 9607(a). Liability**

### **(a) Covered persons; scope; recoverable costs and damages; interest rate; “comparable maturity” date**

Notwithstanding any other provision or rule of law, and subject only to the defenses set forth in subsection (b) of this section—

- (1) the owner and operator of a vessel or a facility,
- (2) any person who at the time of disposal of any hazardous substance owned or operated any facility at which such hazardous substances were disposed of,
- (3) any person who by contract, agreement, or otherwise arranged for disposal or treatment, or arranged with a transporter for transport for disposal or treatment, of hazardous substances owned or possessed by such person, by any other party or entity, at any facility or incineration vessel owned or operated by another party or entity and containing such hazardous substances, and
- (4) any person who accepts or accepted any hazardous substances for transport to disposal or treatment facilities, incineration vessels or sites selected by such person, from which there is a release, or a threatened release which causes the incurrence of response costs, of a hazardous substance, shall be liable for—
  - (A) all costs of removal or remedial action incurred by the United States Government or a State or an Indian tribe not inconsistent with the national contingency plan;
  - (B) any other necessary costs of response incurred by any other person consistent with the national contingency plan;
  - (C) damages for injury to, destruction of, or loss of natural resources, including the reasonable costs of assessing such injury, destruction, or loss resulting from such a release; and
  - (D) the costs of any health assessment or health effects study carried out under section 9604(i) of this title.

The amounts recoverable in an action under this section shall include interest on the amounts recoverable under subparagraphs (A) through (D). Such interest shall

accrue from the later of (i) the date payment of a specified amount is demanded in writing, or (ii) the date of the expenditure concerned. The rate of interest on the outstanding unpaid balance of the amounts recoverable under this section shall be the same rate as is specified for interest on investments of the Hazardous Substance Superfund established under subchapter A of chapter 98 of title 26. For purposes of applying such amendments to interest under this subsection, the term “comparable maturity” shall be determined with reference to the date on which interest accruing under this subsection commences.

## **42 U.S.C. § 9613. Civil Proceedings**

\* \* \*

### **(g) Period in which action may be brought**

\* \* \*

### **(2) Actions for recovery of costs**

An initial action for recovery of the costs referred to in section 9607 of this title must be commenced—

(A) for a removal action, within 3 years after completion of the removal action, except that such cost recovery action must be brought within 6 years after a determination to grant a waiver under section 9604(c)(1)(C) of this title for continued response action; and

(B) for a remedial action, within 6 years after initiation of physical on-site construction of the remedial action, except that, if the remedial action is initiated within 3 years after the completion of the removal action, costs incurred in the removal action may be recovered in the cost recovery action brought under this subparagraph. In any such action described in this subsection, the court shall enter a declaratory judgment on liability for response costs or damages that will be binding on any subsequent action or actions to recover further response costs or damages. A subsequent action or actions under section 9607 of this title for further response costs at the vessel or facility may be maintained at any time during the response action, but must be commenced no later than 3 years after the date of completion of all response action. Except as otherwise provided in this paragraph, an action may be commenced under section 9607 of this title for recovery of costs at any time after such costs have been incurred.

**N.Y. Environmental Conservation Law § 27-1313. Remedial programs.**

(1)(a) The department shall be responsible, as provided in this section, for inactive hazardous waste disposal site remedial programs except as provided in section one thousand three hundred eighty-nine-b of the public health law.

**6 N.Y.C.R.R. § 375-1.2. Definitions.**

The definitions set forth in ECL 27-1301; ECL 27-1405; and ECL 56-0502, some of which are clarified in this section, and the additional definitions set forth in this section, shall apply to these regulations. Certain definitions which apply only to the individual programs are set forth in Subparts 375-2, 375-3, 375-4 and 375-6 of this Part respectively.

\* \* \*

(ab) Interim remedial measure means activities to address both emergency and non-emergency site conditions, which can be undertaken without extensive investigation and evaluation, to prevent, mitigate or remedy environmental damage or the consequences of environmental damage attributable to a site, including, but not limited to, the following activities: construction of diversion ditches; collection systems; drum removal; leachate collection systems; construction of fences or other barriers; installation of water filters; provision of alternative water systems; the removal of source areas; or plume control.

**6 N.Y.C.R.R. § 375-2.8. Remedial program.**

(a) The goal of the remedial program for a specific site is to restore that site to pre-disposal conditions, to the extent feasible. At a minimum, the remedy selected shall eliminate or mitigate all significant threats to the public health and to the environment presented by contaminants disposed at the site through the proper application of scientific and engineering principles and in a manner not inconsistent with the national oil and hazardous substances pollution contingency plan as set forth in section 105 of CERCLA, as amended as by SARA.

(b) Application of the soil cleanup objectives.

(1) The remedial party must utilize soil cleanup objectives that eliminate or mitigate the significant threat and are protective of public health and the environment. The remedial party, subject to department approval, may:

(i) utilize the soil cleanup objectives, as set forth in section 375- 6.8 of this Part;

(ii) develop or modify site specific soil cleanup objectives, as set forth at section 375-6.9 of this Part; or

(iii) propose site-specific soil cleanup objectives which are protective of public health and the environment based upon other information.

(2) The soil component of the remedial program will consider the soil cleanup objectives for unrestricted use, as set forth in Table 375- 6.8(a) of this Part, as representative of pre-disposal conditions for remedial programs proceeding as set forth in subparagraph (1)(i) or (ii) of this subdivision, unless an impact to ecological resources has been identified.

(3) Cleanup objectives for other media. The threat to public health and the environment resulting from contamination in all other environmental media shall be evaluated in the development of remedial alternatives in the feasibility study to ensure that the remedial program meets the requirements of this subdivision and section 375-1.8 of this Part.

(c) Feasibility study.

(1) A feasibility study shall be conducted by the remedial party that develops and evaluates, using the factors in section 375-1.8(f) of this Part, alternatives for all contaminated media identified by the remedial investigation of the site.

(2) Where soil contamination above the unrestricted use soil cleanup objectives is identified by the remedial investigation, the feasibility study:

(i) shall develop and evaluate one or more alternatives that achieve the unrestricted use soil cleanup objectives for soil; and

(ii) may evaluate one or more alternatives that achieve a restricted use of the site which may be proposed by the remedial party. Where a restricted use is proposed, the feasibility study shall:

(a) develop and evaluate alternatives to achieve the restricted use proposed by the remedial party; and

(b) develop and evaluate other alternatives, if directed by the department, which will achieve the same use or a less restricted use of the site than that proposed by the remedial party.

(3) The department may approve a remedial program for soil that:

(i) utilizes different soil cleanup objectives between different areas of a site, provided such areas can be defined and described in the environmental easement and the necessary institutional and engineering controls can be effectively implemented, maintained, monitored and enforced through the site management plan;

(ii) considers site specific background concentrations, including the location of a site in areas of historic fill, in the development of the remedy; and/or

(iii) achieves a cleanup which is more stringent than the current, intended and reasonably anticipated future land uses of the site and its surroundings.

(4) The department shall select the remedy for the site from among the feasible alternatives:

(i) developed and evaluated by the feasibility study; or

(ii) developed by the department in addition to those presented by the feasibility study.

(d) Interim remedial measures. In the case of a site at which an interim remedial measure has been implemented, the department may determine, based on site-specific circumstances including post-implementation investigation and/or monitoring, that the interim remedial measure satisfies the goal of the remedial program for the site, where only continued implementation of the site management plan associated with the interim remedial measure or other engineering or institutional controls is required. In which event the department will propose the no

further action alternative. Provided no other operable units remain for the site requiring action, the department may reclassify or delist the site according to section 375-2.7(d) or (e) of this Subpart.

(e) Remedy selection. The process of selecting a remedy shall be documented in a record of decision, which includes the information identified below.

- (1) the location and a description of the site;
- (2) a history of the operation of the site;
- (3) the current environmental and public health status of the site;
- (4) an enforcement history and current status of the site;
- (5) The specific goals and objectives of the remedy selected for the site.
- (6) a description and evaluation of the remedial alternatives considered, except in the case of no further action remedies;
- (7) a summary of the basis for the department's decision;
- (8) a list of the documents the department used in its decisionmaking; and
- (9) a responsiveness summary.

Re: Defending the Department's Energy Efficiency Standards for Natural Gas  
Furnaces

Dear Secretary Chu:

The Attorneys General of the Commonwealth of Massachusetts and the States of New York, Oregon, Vermont and Illinois, and the California Energy Commission ("CEC"), acting for the State of California with respect to appliance efficiency standards, write to urge the United States Department of Energy ("Department") to proceed with its implementation of the regional 90% Annual Fuel Utilization Efficiency standard for gas-fired condensing furnaces for the thirty northern tier states ("90% Furnace Rule"). From our review of the now-granted abeyance motion filed in the D.C. Circuit appeal challenging the 90% Furnace Rule, we have become concerned that the Department is reconsidering its commitment to this critically important standard. We strongly encourage the Department to remain steadfast on the 90% Furnace Rule and to move forward with its defense in the D.C. Circuit.

As discussed in detail in the amicus brief Massachusetts, New York and the CEC filed in support of the Department in the litigation over the 90% Furnace Rule, the rule would deliver critical energy and environmental benefits to the northern tier states and to the Nation as a whole. These benefits would include substantial consumer energy savings and increased reliability in our energy systems, which depend on natural gas. In addition, the Department estimates that the furnace efficiency standards will reduce greenhouse gas emissions by 82 million metric tons annually. As evidenced from the recent damage caused by Hurricane Sandy, which may well have been made more severe by climate change, the federal government and the states must move forward expeditiously with measures to combat global warming, including efficiency standards.

The 90% Furnace Rule was the product of a consensus rulemaking by seven national furnace manufacturers and their principal trade association, the Air-Conditioning, Heating and Refrigeration Institute, numerous energy efficiency advocates, and the CEC, which had been authorized by the California Legislature to act on behalf of California on energy efficiency issues. Taking advantage of the then-new direct final rule process (under the Energy Policy and Conservation Act (“EPCA”), 42 U.S.C. § 6295(p)(4)(A)), to adopt the 90% Furnace Rule, the Department concluded that similarly situated northern tier states would all benefit from the new standard. In doing so, the Department clearly and carefully followed the requirements of the direct final rule process and recognized that the 90% Furnace Rule would “result in significant conservation of energy,” as EPCA requires.

The issuance of the 90% Furnace Rule was a proper exercise of the Department’s discretion under § 325(p)(4)(A) of the statute, because the joint statement submitted to the Department was, in fact, signed by “interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates), as determined by the Secretary.” The consensus standards are the result of negotiations among efficiency and consumer advocates, the CEC, and the Air Conditioning, Heating, and Refrigeration Institute, representing furnace manufacturers. Hence, the appeal taken by the American Public Gas Association (“Association”) and its supporting intervenors, who are not furnace manufacturers, is unlikely to succeed. The 90% Furnace Rule was directed instead at manufacturers to provide significant energy savings to consumers.

As explained in the Department’s merits brief and the amici briefs of the states and others in support, the Department’s refusal to withdraw the direct final rule was also a proper exercise of the agency’s discretionary authority under EPCA. The Department’s review of the record, including the comments of the Association and those intervening on its behalf, was thorough, and the Department correctly determined that the comments failed to raise concerns that would compel the Department to adopt a different standard upon further review. If a direct final rule were to be withdrawn every time an interested party voiced objection, it would render the entire direct final rule process meaningless.

In short, the process leading to the direct final rule, including the 90% Furnace Rule, worked exactly as Congress envisioned it would under the statute, and the

Department's actions are completely defensible. The Department should firmly stand behind its decisions and actions.

The consequences of withdrawing the 90% Furnace Rule at this time would be severe. Even if a rulemaking on a new furnace standard were to be convened expeditiously, there likely would be a delay in implementation of a new rule until 2019 or later, more than six years after the May 2013 effective date of the 90% Furnace Rule. This would be even more prejudicial in light of the fact that the rule was in development for about a decade, and was prompted by a lawsuit filed in 2005 against the Department by a coalition of stakeholders and fifteen states to force the issuance of new standards, including furnace standards. *New York v. Bodman*; *NRDC v. Bodman*, Consolidated C.A. Nos. 05 Civ. 7807 (JES) and 05 Civ. 7808 (JES) (U.S.D.C., S.D.N.Y).

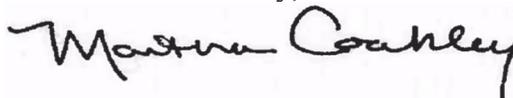

We offer Massachusetts' experience as an example of the unfairness of withdrawing the 90% Furnace Rule under the circumstances. Massachusetts has had its own 90% furnace efficiency rule on its books since 2005 but has been unable to implement it because of the Department's 2010 denial of the state's petition for waiver of federal preemption. The denial came at the time when the Department was about to issue the direct final rule. On the basis that the 90% Furnace Rule was likely to be issued, Massachusetts voluntarily relinquished its appeal rights on the Department's denial. Even if a prompt new rulemaking were to go forward, Massachusetts faces at a minimum a 14-year period between the passage of its own 90% furnace standard and the time a new federal standard would be implemented. EPCA requires a much more expeditious updating of federal furnace standards.

Because the 90% Furnace Rule would result in significant energy savings and would reduce greenhouse gas emissions and other air pollutants, any delay in implementing it would be an enormous energy efficiency set-back for all thirty northern tier states that are covered by the 90% Furnace Rule. The delay would cause the use of approximately 2 quads of energy that could otherwise have been saved, and would result in significantly more air pollution – including greenhouse gas emissions –because of a lost energy conservation opportunity. On these fronts, withdrawing the 90% Furnace Rule would represent a dramatic step backward.

We urge the Department to choose the path forward that would implement the 90% Furnace Rule, and to continue its defense of this standard in the D.C. Circuit.

Thank you for your consideration of this important matter.

Re: Defending the Department's Energy Efficiency Standards for Natural Gas  
Furnaces

Dear Secretary Chu:

The Attorneys General of the Commonwealth of Massachusetts and the States of New York, Oregon, Vermont and Illinois, and the California Energy Commission ("CEC"), acting for the State of California with respect to appliance efficiency standards, write to urge the United States Department of Energy ("Department") to proceed with its implementation of the regional 90% Annual Fuel Utilization Efficiency standard for gas-fired condensing furnaces for the thirty northern tier states ("90% Furnace Rule"). From our review of the now-granted abeyance motion filed in the D.C. Circuit appeal challenging the 90% Furnace Rule, we have become concerned that the Department is reconsidering its commitment to this critically important standard. We strongly encourage the Department to remain steadfast on the 90% Furnace Rule and to move forward with its defense in the D.C. Circuit.

As discussed in detail in the amicus brief Massachusetts, New York and the CEC filed in support of the Department in the litigation over the 90% Furnace Rule, the rule would deliver critical energy and environmental benefits to the northern tier states and to the Nation as a whole. These benefits would include substantial consumer energy savings and increased reliability in our energy systems, which depend on natural gas. In addition, the Department estimates that the furnace efficiency standards will reduce greenhouse gas emissions by 82 million metric tons annually. As evidenced from the recent damage caused by Hurricane Sandy, which may well have been made more severe by climate change, the federal government and the states must move forward expeditiously with measures to combat global warming, including efficiency standards.

The 90% Furnace Rule was the product of a consensus rulemaking by seven national furnace manufacturers and their principal trade association, the Air-Conditioning, Heating and Refrigeration Institute, numerous energy efficiency advocates, and the CEC, which had been authorized by the California Legislature to act on behalf of California on energy efficiency issues. Taking advantage of the then-new direct final rule process (under the Energy Policy and Conservation Act (“EPCA”), 42 U.S.C. § 6295(p)(4)(A)), to adopt the 90% Furnace Rule, the Department concluded that similarly situated northern tier states would all benefit from the new standard. In doing so, the Department clearly and carefully followed the requirements of the direct final rule process and recognized that the 90% Furnace Rule would “result in significant conservation of energy,” as EPCA requires.

The issuance of the 90% Furnace Rule was a proper exercise of the Department’s discretion under § 325(p)(4)(A) of the statute, because the joint statement submitted to the Department was, in fact, signed by “interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates), as determined by the Secretary.” The consensus standards are the result of negotiations among efficiency and consumer advocates, the CEC, and the Air Conditioning, Heating, and Refrigeration Institute, representing furnace manufacturers. Hence, the appeal taken by the American Public Gas Association (“Association”) and its supporting intervenors, who are not furnace manufacturers, is unlikely to succeed. The 90% Furnace Rule was directed instead at manufacturers to provide significant energy savings to consumers.

As explained in the Department’s merits brief and the amici briefs of the states and others in support, the Department’s refusal to withdraw the direct final rule was also a proper exercise of the agency’s discretionary authority under EPCA. The Department’s review of the record, including the comments of the Association and those intervening on its behalf, was thorough, and the Department correctly determined that the comments failed to raise concerns that would compel the Department to adopt a different standard upon further review. If a direct final rule were to be withdrawn every time an interested party voiced objection, it would render the entire direct final rule process meaningless.

In short, the process leading to the direct final rule, including the 90% Furnace Rule, worked exactly as Congress envisioned it would under the statute, and the

Department's actions are completely defensible. The Department should firmly stand behind its decisions and actions.

The consequences of withdrawing the 90% Furnace Rule at this time would be severe. Even if a rulemaking on a new furnace standard were to be convened expeditiously, there likely would be a delay in implementation of a new rule until 2019 or later, more than six years after the May 2013 effective date of the 90% Furnace Rule. This would be even more prejudicial in light of the fact that the rule was in development for about a decade, and was prompted by a lawsuit filed in 2005 against the Department by a coalition of stakeholders and fifteen states to force the issuance of new standards, including furnace standards. *New York v. Bodman*; *NRDC v. Bodman*, Consolidated C.A. Nos. 05 Civ. 7807 (JES) and 05 Civ. 7808 (JES) (U.S.D.C., S.D.N.Y).

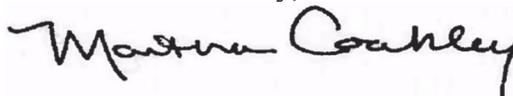

We offer Massachusetts' experience as an example of the unfairness of withdrawing the 90% Furnace Rule under the circumstances. Massachusetts has had its own 90% furnace efficiency rule on its books since 2005 but has been unable to implement it because of the Department's 2010 denial of the state's petition for waiver of federal preemption. The denial came at the time when the Department was about to issue the direct final rule. On the basis that the 90% Furnace Rule was likely to be issued, Massachusetts voluntarily relinquished its appeal rights on the Department's denial. Even if a prompt new rulemaking were to go forward, Massachusetts faces at a minimum a 14-year period between the passage of its own 90% furnace standard and the time a new federal standard would be implemented. EPCA requires a much more expeditious updating of federal furnace standards.

Because the 90% Furnace Rule would result in significant energy savings and would reduce greenhouse gas emissions and other air pollutants, any delay in implementing it would be an enormous energy efficiency set-back for all thirty northern tier states that are covered by the 90% Furnace Rule. The delay would cause the use of approximately 2 quads of energy that could otherwise have been saved, and would result in significantly more air pollution – including greenhouse gas emissions –because of a lost energy conservation opportunity. On these fronts, withdrawing the 90% Furnace Rule would represent a dramatic step backward.

We urge the Department to choose the path forward that would implement the 90% Furnace Rule, and to continue its defense of this standard in the D.C. Circuit.

Thank you for your consideration of this important matter.

Sincerely,

MARTHA COAKLEY

Friday, November 30, 2012

Lenape Resources' lawsuit seeking to overturn New York State's ban on hydraulic fracturing is likely to be a precedent setting case, said Michael Joy, a partner with the law firm Reed Smith Energy and Natural Resources.

However, Lenape has filed the case not to make a point, "but to save another small business in New York from being forced to close down because of oppressive government regulation," Joy said in a statement.

Lenape filed suit against the town of Avon, N.Y., and the New York State Department of Environmental Conservation Nov. 14 seeking to overturn the moratorium on hydraulic fracturing. The rule, which was enacted by the town's board in late June and finalized in July, placed a moratorium on oil and natural gas exploration, drilling and development, penalizing violators with criminal fines and jail time.

However, Lenape's oil and gas well operations were grandfathered into the law; Lenape argued that the clause does not allow Lenape to conduct essential field operations.

"Lenape is not proposing any new or unusual activity inconsistent with existing activities in the Town of Avon that is creating a dire necessity, the Prohibition on Natural Gas is not reasonably calculated to alleviate or prevent a crisis condition in the Town of Avon, and the Town of Avon is not taking action to rectify any real or perceived threat to the health, safety and welfare of any Town of Avon resident," Lenape said in the filing.

If Avon is allowed to enact the ban, Lenape said it would seek actual and compensatory damages of no less than \$50 million, the company said in the filing.

"Lenape Resources is absolutely concerned about the rampant spread of local laws attempting to ban natural gas in New York, but the action against the Town of Avon is to reverse an unlawful and improper local law that will force another small business in New York to close," Joy said in a statement.

"The issue is before the courts and we will let that process progress," said Emily DeSantis, director of public information for New York's Department of Environmental Conservation, in a statement.

Oil and gas exploration and production is nothing new to York, and has taken place in the state for 150 years. Low-volume hydraulic fracturing has taken place in New York state since the 1950s, while horizontal drilling has been used in New York since the 1980s.

In 1981, New York's Department of Conservation implemented a law which gave the state the right to regulate oil and gas operations, overriding the ability of local towns to regulate hydraulic fracturing. The law was implemented as the nation faced an energy crisis, and states were seeking to exploit their hydrocarbon resources, Joy said.

In the mid-1980s, the town of Kiantone, N.Y., adopted a local law trying to regulated oil and gas development, just like Avon is trying to do now. However, the court ruled in the case, EnviroGas vs Kiantone, against Kiantone, and held that the legislature had preempted all local regulation of oil and gas. This case made clear that the state has the exclusive right to regulate all oil and gas operations, preempting all local regulations of these activities, Joy noted.

The Fourth Appellate Court also upheld the lower court decision, setting a precedent in New York that the Department of Environmental Conservation, not the local government, had exclusive authority to regulate all aspects of oil and natural gas.

However, some towns in recent years have sought to indirectly ban or regulate hydraulic fracturing by implementing zoning laws or other regulations ahead of when the state does start issues permits for hydraulic fracturing, Joy told Rigzone.

While the 1980s case involving Kiantone followed the state law, court rulings involving the towns of Middlefield and Dryden upheld efforts by these towns to ban local drilling. These decisions go ahead the fact that only the state can regulate oil and gas operations.

"The Kiantone case was not even referenced in these legal opinions, which is highly improper," Joy commented.

However, a court ruling earlier this year involving the city of Binghamton went against the town's efforts to establish a moratorium.

In the case of Lenape, the town of Avon put a grandfathering clause in the law that would allow some

oil and gas activity but not all, meaning that Lenape can't drill additional wells or bring on new production as existing production declines. The real reason for the grandfathering clause is that Lenape provides free natural gas for the town's garage and a backup energy resource; some local residents also receive royalties from the production.

"The moratorium issue is very complex in that the moratorium in the towns also impacts pipeline operations; you can't just shut down one part of a system and continue to operate another part," said Joy, noting that the law was poorly written and does not reflect an understanding of the industry. The industry "cannot operate in such a patchwork" of conflicting rules in a densely populated region.

The Lenape story is unique and frustrating in that the company is a good operator with no incident on their record and Lenape President John Holko a guy "who makes Mitt Romney look like a wild child," Joy commented.

Lenape's operations in Avon are small, with between 16 to 20 wells and between 5,000 acres and 6,000 acres. The company has 56 wells on acreage near the town of Caledonia, which enacted the same type of law as Avon, and 50 wells in York, another nearby town that did not enact a moratorium. The debate over whether to allow hydraulic fracturing in New York has become a divisive issue for the state; in some cases, it's literally dividing communities.

"New York state is ground zero in this battle," said Joy. "I live in Pennsylvania and understand [the opposition oil and gas operators have faced] in Pennsylvania, Ohio, Colorado and Texas. If they think it's bad there, they need to come to New York, because it's the frontline in this war."

"I firmly believe that the Court that will hear the Lenape Resources case against the Town of Avon will follow the precedent established by the Kiantone case, the Court will strike down the local law enacted by the Town of Avon and in doing so will establish clear direction to the many other towns in New York that these ill-conceived local laws are not legal and are not enforceable," Joy said.

The laws are not locally generated laws designed to mitigate or prevent a local problem or concern, but are laws being shopped around the state by "radical anti-natural gas promoters" who are telling community leaders that they can do this, that nothing bad will happen, and that they will save their communities.

The opposition to hydraulic fracturing in the state is mostly based downstate in the New York City. While Sierra Club, EarthJustice and the other usual suspects among environmental groups oppose hydraulic fracturing, the predominant group behind the opposition in New York is the Community Environmental Defense Coalition (CEDC), which consists of two activist lawyers. CEDC receives funding from the Park Foundation.

On the other side, state level industry associations, chambers of commerce and unions favor development of New York's Marcellus and Utica development due to the jobs and economic activity that will be created.

Large landowner coalitions who originally banded together to aggregate their land in anticipation of oil and gas leasing also are speaking out, seeing the moratorium on fracking as a violation of their landowner rights.

"Since no one was doing any drilling or development, these groups have morphed into a community education and activist outlets," Joy noted.

Landowners who live in New York's southern tier can literally see across the border into Pennsylvania and the impact that Marcellus shale activity has had on landowners there.

"They look out the window and see this farmer is buying new equipment or trucks, while I'm struggling to work as hard as I can," Joy commented.

The advent of new technology that has enabled high-volume hydraulic fracturing and horizontal drilling prompted former New York Gov. David A. Paterson to require the New York Department of Environmental Conservation in 2008 to update the generic environmental impact state used to govern low-volume hydraulic fracturing to analyze and regulate new technology and ensure all environmental and public health impacts are mitigated or avoided.

Joy pointed out communities will not be adversely impacted by natural gas development, and that New York State will continue to have to most stringent drilling regulations in the nation, if not the world. If the local bans are upheld, the landowners and companies like Lenape who have invested in developing infrastructure will be liable for the value of the property they have taken.

"In Avon that amount will be at least and probably greater than \$50 million; in other towns across the state it could be considerably more,"

Joy commented. "There will be severe consequences to these ill-conceived local laws and the

promoters of these laws seem to be keeping that information from the communities – and that is wrong."

Subject: Copenhagen Accord/UNFCCC Assignment

Dear Lem and Monica,

Attached is the assignment on the Copenhagen Accord/the UNFCCC in the form of a factual background for a complaint. I also included the more recent information about reports on the "emissions gap" leading into the Doha Conference. The sources I used are attached, unless the source has a URL listed in a footnote. I have hard copies of several of the reports that I can bring by one of your offices as well. These sources are saved in my network folder under Monica Wagner --> International Climate Agreements.

I really enjoyed working on this assignment. I did my best to communicate the more technical info, but I tried to cite as closely as possible to the IPCC reports for reference purposes.

Best,

Katelyn Ciolino

## Factual Background

1. On October 15, 1992, the United States ratified the United Nations Framework Convention on Climate Change ("UNFCCC").<sup>1</sup>
2. Article 2 of the UNFCCC states, "The ultimate objective of this Convention and any related legal instruments that the Conference of the Parties may adopt is to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system."<sup>2</sup>
3. The UNFCCC outlined several principles to guide the achievement of this objective. First, it recognized that the parties to the Convention have "common but differentiated responsibilities" to reach these goals, and that developed country parties should take the lead in these efforts.<sup>3</sup> Second, that precautionary measures should be taken to "anticipate, prevent or minimize the causes of climate change and its adverse effects."<sup>4</sup> And third, that scientific uncertainty should not be a basis for postponing measures to address climate change.<sup>5</sup>
4. By ratifying the UNFCCC, the U.S. committed to working with the international community to reach the Convention's ultimate objective of preventing dangerous anthropogenic interference with the climate system, to submitting an annual inventory of greenhouse gas emissions and sinks to the UNFCCC, and to directing funds to climate change activities in developing countries.<sup>6</sup>

---

<sup>1</sup> *Status of Ratification of the Convention*, United Nations Framework Convention on Climate Change, [http://unfccc.int/essential\\_background/convention/status\\_of\\_ratification/items/2631.php](http://unfccc.int/essential_background/convention/status_of_ratification/items/2631.php) (last visited Dec. 6, 2012).

<sup>2</sup> United Nations Framework Convention on Climate Change, May 9, 1992, S. Treaty Doc No. 102-38, 1771 U.N.T.S. 107, Article 2. [hereinafter *UNFCCC*]. The UNFCCC defines greenhouse gases as "those gaseous constituents of the atmosphere, both natural and anthropogenic, that absorb and re-emit radiation." *Id.* at Article 1.

<sup>3</sup> *Id.* at art. 3, ¶ 1.

<sup>4</sup> *Id.* at art. 3, ¶ 3.

<sup>5</sup> *Id.*

<sup>6</sup> *International Climate Partnerships*, U.S. Environmental Protection Agency, <http://epa.gov/climatechange/EPAactivities/internationalpartnerships.html> (last visited Nov. 23, 2012).

5. The 195 parties to the UNFCCC make up the Conference of the Parties, the supreme decision making authority of the Convention. The Conference of the Parties is responsible for the review and implementation of the UNFCCC and any related legal instruments, and monitors the progress of the Parties towards the Convention's objectives.<sup>7</sup> The Conference of the Parties meets on an annual basis.<sup>8</sup>
6. Since the UNFCCC entered into force in 1994, the Conference of the Parties has held 17 sessions. The Conference of the Parties has the ability to adopt amendments or annexes to the UNFCCC by a consensus.<sup>9</sup> The Conference of the Parties may also adopt protocols, such as the Kyoto Protocol adopted in 1997.<sup>10</sup>
7. The 15<sup>th</sup> Conference of the Parties, that took place in Copenhagen, Denmark in December 2009, produced the Copenhagen Accord.<sup>11</sup> The Copenhagen Accord represents a statement of political intent to reduce global greenhouse gas emissions and address climate change in the short term and long term. "Since December 2009, 140 countries have associated themselves with the Copenhagen Accord," and 85 of these countries have "pledged to reduce their emissions or constrain their growth up to 2020."<sup>12</sup>
8. The United States is formally associated with the Copenhagen Accord. The United States additionally submitted economy-wide emission reduction targets of 17% of 2005 emissions by 2020, and approximately 83% of 2005 emissions by 2050. The United States submitted

these targets on the understanding that other developed and developing countries would associate with the Copenhagen Accord and submit mitigation actions.<sup>13</sup>

9. The Copenhagen Accord creates a consensus that in order to prevent dangerous anthropogenic interference with the climate system, as stated in the UNFCCC's objective, global temperature increase must be stabilized at, or below, 2° Celsius.<sup>14</sup> This long-term goal is subject to an assessment in 2015, when the request of developing countries to limit global temperature increase at 1.5 ° Celsius will also be considered.<sup>15</sup>
10. In adopting the scientific view that the increase in global temperature should not exceed 2° Celsius, the Copenhagen Accord explicitly references the Intergovernmental Panel on Climate Change's ("IPCC") Fourth Assessment Report.<sup>16</sup>
11. The IPCC Fourth Assessment Report expresses high confidence that an increase in global mean temperature of more than 2° Celsius above 1990 levels would exacerbate increases in human mortality, loss of glaciers, the endangered status of threatened species, and increases in the frequency and or intensity of extreme events including floods, droughts, heat waves and fires.<sup>17</sup> There is high confidence that developing countries will experience greater vulnerability to climate change than developed countries.<sup>18</sup>

<sup>18</sup> *Id.*

12. The IPCC Fourth Assessment Report found that if CO<sub>2</sub> equivalent concentrations are stabilized at 450 parts per million (ppm), there is likely to be a mean equilibrium surface temperature increase ranging from 1.4° – 3.1° Celsius, with the best guess as a 2.1 ° Celsius increase.<sup>19</sup> There is a medium probability of remaining below this temperature threshold at the CO<sub>2</sub> equivalent stabilization threshold of 450 ppm, which also means there is a 50% probability of exceeding the temperature threshold.<sup>20</sup>
13. At the 17<sup>th</sup> Conference of the Parties in Durban, South Africa in 2011, both developed and developing countries recognized that cuts in global greenhouse gas emissions are required to stabilize global average temperature increase at, or below 2 ° Celsius above pre-industrial levels, and recognized the need to consider strengthening this long-term goal to a global average temperature rise of 1.5 ° Celsius.
14. The 17<sup>th</sup> Conference of the Parties further acknowledged, with grave concern, that a significant gap remains between the aggregate effect of the Parties' mitigation pledges and the “aggregate emission pathways consistent with having a likely chance of holding the increase in global average temperature below 2 ° Celsius or 1.5 ° Celsius above pre-industrial levels.”<sup>21</sup>

<sup>19</sup> Meehl, G.A., et al., 2007: Global Climate Projections. In: *Climate Change 2007: The Physical Science Basis. Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change* Solomon, S., et al., eds., Cambridge University Press, Cambridge, UK, 747-846, at 826 (Table 10.8). “CO<sub>2</sub> equivalent concentration” is the “concentration of CO<sub>2</sub> that would cause the same amount of radiative forcing as a given mixture of CO<sub>2</sub> and other forcing components.” Bernstein, *supra* note 17, at 36. The IPCC's usage of the term “climate change” differs from that of the UNFCCC, in that it refers to any change in climate over time due to natural variability or human activity. *Id.* at 30. The UNFCCC's usage of term “climate change” refers to “change in climate that is attributed directly or indirectly to human activities ... that is in addition to natural climate variability observed over comparable time periods.” *Id.*

## Executive Summary

The future climate change results assessed in this chapter are based on a hierarchy of models, ranging from Atmosphere-Ocean General Circulation Models (AOGCMs) and Earth System Models of Intermediate Complexity (EMICs) to Simple Climate Models (SCMs). These models are forced with concentrations of greenhouse gases and other constituents derived from various emissions scenarios ranging from non-mitigation scenarios to idealised long-term scenarios. In general, we assess non-mitigated projections of future climate change at scales from global to hundreds of kilometres. Further assessments of regional and local climate changes are provided in Chapter 11. Due to an unprecedented, joint effort by many modelling groups worldwide, climate change projections are now based on multi-model means, differences between models can be assessed quantitatively and in some instances, estimates of the probability of change of important climate system parameters complement expert judgement. New results corroborate those given in the Third Assessment Report (TAR). Continued greenhouse gas emissions at or above current rates will cause further warming and induce many changes in the global climate system during the 21st century that would *very likely* be larger than those observed during the 20th century.

### Mean Temperature

All models assessed here, for all the non-mitigation scenarios considered, project increases in global mean surface air temperature (SAT) continuing over the 21st century, driven mainly by increases in anthropogenic greenhouse gas concentrations, with the warming proportional to the associated radiative forcing. There is close agreement of globally averaged SAT multi-model mean warming for the early 21st century for concentrations derived from the three non-mitigated IPCC Special Report on Emission Scenarios (SRES: B1, A1B and A2) scenarios (including only anthropogenic forcing) run by the AOGCMs (warming averaged for 2011 to 2030 compared to 1980 to 1999 is between +0.64°C and +0.69°C, with a range of only 0.05°C). Thus, this warming rate is affected little by different scenario assumptions or different model sensitivities, and is consistent with that observed for the past few decades (see Chapter 3). Possible future variations in natural forcings (e.g., a large volcanic eruption) could change those values somewhat, but about half of the early 21st-century warming is committed in the sense that it would occur even if atmospheric concentrations were held fixed at year 2000 values. By mid-century (2046–2065), the choice of scenario becomes more important for the magnitude of multi-model globally averaged SAT warming, with values of +1.3°C, +1.8°C and +1.7°C from the AOGCMs for B1, A1B and A2, respectively. About a third of that warming is projected to be due to climate change that is already committed. By late century (2090–2099), differences between scenarios are large, and only about 20% of that warming arises from climate change that is already committed.

An assessment based on AOGCM projections, probabilistic methods, EMICs, a simple model tuned to the AOGCM responses, as well as coupled climate carbon cycle models, suggests that for non-mitigation scenarios, the future increase in global mean SAT is *likely* to fall within –40 to +60% of the multi-model AOGCM mean warming simulated for a given scenario. The greater uncertainty at higher values results in part from uncertainties in the carbon cycle feedbacks. The multi-model mean SAT warming and associated uncertainty ranges for 2090 to 2099 relative to 1980 to 1999 are B1: +1.8°C (1.1°C to 2.9°C), B2: +2.4°C (1.4°C to 3.8°C), A1B: +2.8°C (1.7°C to 4.4°C), A1T: 2.4°C (1.4°C to 3.8°C), A2: +3.4°C (2.0°C to 5.4°C) and A1FI: +4.0°C (2.4°C to 6.4°C). It is not appropriate to compare the lowest and highest values across these ranges against the single range given in the TAR, because the TAR range resulted only from projections using an SCM and covered all SRES scenarios, whereas here a number of different and independent modelling approaches are combined to estimate ranges for the six illustrative scenarios separately. Additionally, in contrast to the TAR, carbon cycle uncertainties are now included in these ranges. These uncertainty ranges include only anthropogenically forced changes.

Geographical patterns of projected SAT warming show greatest temperature increases over land (roughly twice the global average temperature increase) and at high northern latitudes, and less warming over the southern oceans and North Atlantic, consistent with observations during the latter part of the 20th century (see Chapter 3). The pattern of zonal mean warming in the atmosphere, with a maximum in the upper tropical troposphere and cooling throughout the stratosphere, is notable already early in the 21st century, while zonal mean warming in the ocean progresses from near the surface and in the northern mid-latitudes early in the 21st century, to gradual penetration downward during the course of the 21st century.

An expert assessment based on the combination of available constraints from observations (assessed in Chapter 9) and the strength of known feedbacks simulated in the models used to produce the climate change projections in this chapter indicates that the equilibrium global mean SAT warming for a doubling of atmospheric carbon dioxide (CO<sub>2</sub>), or ‘equilibrium climate sensitivity’, is *likely* to lie in the range 2°C to 4.5°C, with a most likely value of about 3°C. Equilibrium climate sensitivity is *very likely* larger than 1.5°C. For fundamental physical reasons, as well as data limitations, values substantially higher than 4.5°C still cannot be excluded, but agreement with observations and proxy data is generally worse for those high values than for values in the 2°C to 4.5°C range. The ‘transient climate response’ (TCR, defined as the globally averaged SAT change at the time of CO<sub>2</sub> doubling in the 1% yr<sup>-1</sup> transient CO<sub>2</sub> increase experiment) is better constrained than equilibrium climate sensitivity. The TCR is *very likely* larger than 1°C and *very unlikely* greater than 3°C based on climate models, in agreement with constraints from the observed surface warming.

## Temperature Extremes

It is *very likely* that heat waves will be more intense, more frequent and longer lasting in a future warmer climate. Cold episodes are projected to decrease significantly in a future warmer climate. Almost everywhere, daily minimum temperatures are projected to increase faster than daily maximum temperatures, leading to a decrease in diurnal temperature range. Decreases in frost days are projected to occur almost everywhere in the middle and high latitudes, with a comparable increase in growing season length.

## Mean Precipitation

For a future warmer climate, the current generation of models indicates that precipitation generally increases in the areas of regional tropical precipitation maxima (such as the monsoon regimes) and over the tropical Pacific in particular, with general decreases in the subtropics, and increases at high latitudes as a consequence of a general intensification of the global hydrological cycle. Globally averaged mean water vapour, evaporation and precipitation are projected to increase.

## Precipitation Extremes and Droughts

Intensity of precipitation events is projected to increase, particularly in tropical and high latitude areas that experience increases in mean precipitation. Even in areas where mean precipitation decreases (most subtropical and mid-latitude regions), precipitation intensity is projected to increase but there would be longer periods between rainfall events. There is a tendency for drying of the mid-continental areas during summer, indicating a greater risk of droughts in those regions. Precipitation extremes increase more than does the mean in most tropical and mid- and high-latitude areas.

## Snow and Ice

As the climate warms, snow cover and sea ice extent decrease; glaciers and ice caps lose mass owing to a dominance of summer melting over winter precipitation increases. This contributes to sea level rise as documented for the previous generation of models in the TAR. There is a projected reduction of sea ice in the 21st century in both the Arctic and Antarctic with a rather large range of model responses. The projected reduction is accelerated in the Arctic, where some models project summer sea ice cover to disappear entirely in the high-emission A2 scenario in the latter part of the 21st century. Widespread increases in thaw depth over much of the permafrost regions are projected to occur in response to warming over the next century.

## Carbon Cycle

There is unanimous agreement among the coupled climate-carbon cycle models driven by emission scenarios run so far that future climate change would reduce the efficiency of the Earth system (land and ocean) to absorb anthropogenic CO<sub>2</sub>. As a result, an increasingly large fraction of anthropogenic CO<sub>2</sub> would stay airborne in the atmosphere under a warmer climate. For the A2 emission scenario, this positive feedback leads to additional atmospheric CO<sub>2</sub> concentration varying between 20 and 220 ppm among the models by 2100. Atmospheric CO<sub>2</sub> concentrations simulated by these coupled climate-carbon cycle models range between 730 and 1,020 ppm by 2100. Comparing these values with the standard value of 836 ppm (calculated beforehand by the Bern carbon cycle-climate model without an interactive carbon cycle) provides an indication of the uncertainty in global warming due to future changes in the carbon cycle. In the context of atmospheric CO<sub>2</sub> concentration stabilisation scenarios, the positive climate-carbon cycle feedback reduces the land and ocean uptake of CO<sub>2</sub>, implying that it leads to a reduction of the compatible emissions required to achieve a given atmospheric CO<sub>2</sub> stabilisation. The higher the stabilisation scenario, the larger the climate change, the larger the impact on the carbon cycle, and hence the larger the required emission reduction.

## Ocean Acidification

Increasing atmospheric CO<sub>2</sub> concentrations lead directly to increasing acidification of the surface ocean. Multi-model projections based on SRES scenarios give reductions in pH of between 0.14 and 0.35 units in the 21st century, adding to the present decrease of 0.1 units from pre-industrial times. Southern Ocean surface waters are projected to exhibit undersaturation with regard to calcium carbonate for CO<sub>2</sub> concentrations higher than 600 ppm, a level exceeded during the second half of the century in most of the SRES scenarios. Low-latitude regions and the deep ocean will be affected as well. Ocean acidification would lead to dissolution of shallow-water carbonate sediments and could affect marine calcifying organisms. However, the net effect on the biological cycling of carbon in the oceans is not well understood.

## Sea Level

Sea level is projected to rise between the present (1980–1999) and the end of this century (2090–2099) under the SRES B1 scenario by 0.18 to 0.38 m, B2 by 0.20 to 0.43 m, A1B by 0.21 to 0.48 m, A1T by 0.20 to 0.45 m, A2 by 0.23 to 0.51 m, and A1FI by 0.26 to 0.59 m. These are 5 to 95% ranges based on the spread of AOGCM results, not including uncertainty in carbon cycle feedbacks. For each scenario, the midpoint of the range is within 10% of the TAR model average for 2090–2099. The ranges are narrower than in the TAR mainly because of improved information about some uncertainties in the projected contributions. In all scenarios, the average rate of rise during

the 21st century *very likely* exceeds the 1961 to 2003 average rate ( $1.8 \pm 0.5 \text{ mm yr}^{-1}$ ). During 2090 to 2099 under A1B, the central estimate of the rate of rise is  $3.8 \text{ mm yr}^{-1}$ . For an average model, the scenario spread in sea level rise is only 0.02 m by the middle of the century, and by the end of the century it is 0.15 m.

Thermal expansion is the largest component, contributing 70 to 75% of the central estimate in these projections for all scenarios. Glaciers, ice caps and the Greenland Ice Sheet are also projected to contribute positively to sea level. General Circulation Models indicate that the Antarctic Ice Sheet will receive increased snowfall without experiencing substantial surface melting, thus gaining mass and contributing negatively to sea level. Further accelerations in ice flow of the kind recently observed in some Greenland outlet glaciers and West Antarctic ice streams could substantially increase the contribution from the ice sheets. For example, if ice discharge from these processes were to scale up in future in proportion to global average surface temperature change (taken as a measure of global climate change), it would add 0.1 to 0.2 m to the upper bound of sea level rise by 2090 to 2099. In this example, during 2090 to 2099 the rate of scaled-up Antarctic discharge would roughly balance the expected increased rate of Antarctic accumulation, being under A1B a factor of 5 to 10 greater than in recent years. Understanding of these effects is too limited to assess their likelihood or to give a best estimate.

Sea level rise during the 21st century is projected to have substantial geographical variability. The model median spatial standard deviation is 0.08 m under A1B. The patterns from different models are not generally similar in detail, but have some common features, including smaller than average sea level rise in the Southern Ocean, larger than average in the Arctic, and a narrow band of pronounced sea level rise stretching across the southern Atlantic and Indian Oceans.

### Mean Tropical Pacific Climate Change

Multi-model averages show a weak shift towards average background conditions which may be described as ‘El Niño-like’, with sea surface temperatures in the central and east equatorial Pacific warming more than those in the west, weakened tropical circulations and an eastward shift in mean precipitation.

### El Niño

All models show continued El Niño-Southern Oscillation (ENSO) interannual variability in the future no matter what the change in average background conditions, but changes in ENSO interannual variability differ from model to model. Based on various assessments of the current multi-model data set, in which present-day El Niño events are now much better simulated than in the TAR, there is no consistent indication at this time of discernible changes in projected ENSO amplitude or frequency in the 21st century.

### Monsoons

An increase in precipitation is projected in the Asian monsoon (along with an increase in interannual season-averaged precipitation variability) and the southern part of the west African monsoon with some decrease in the Sahel in northern summer, as well as an increase in the Australian monsoon in southern summer in a warmer climate. The monsoonal precipitation in Mexico and Central America is projected to decrease in association with increasing precipitation over the eastern equatorial Pacific through Walker Circulation and local Hadley Circulation changes. However, the uncertain role of aerosols in general, and carbon aerosols in particular, complicates the nature of future projections of monsoon precipitation, particularly in the Asian monsoon.

### Sea Level Pressure

Sea level pressure is projected to increase over the subtropics and mid-latitudes, and decrease over high latitudes (order several millibars by the end of the 21st century) associated with a poleward expansion and weakening of the Hadley Circulation and a poleward shift of the storm tracks of several degrees latitude with a consequent increase in cyclonic circulation patterns over the high-latitude arctic and antarctic regions. Thus, there is a projected positive trend of the Northern Annular Mode (NAM) and the closely related North Atlantic Oscillation (NAO) as well as the Southern Annular Mode (SAM). There is considerable spread among the models for the NAO, but the magnitude of the increase for the SAM is generally more consistent across models.

### Tropical Cyclones (Hurricanes and Typhoons)

Results from embedded high-resolution models and global models, ranging in grid spacing from 100 km to 9 km, project a *likely* increase of peak wind intensities and notably, where analysed, increased near-storm precipitation in future tropical cyclones. Most recent published modelling studies investigating tropical storm frequency simulate a decrease in the overall number of storms, though there is less confidence in these projections and in the projected decrease of relatively weak storms in most basins, with an increase in the numbers of the most intense tropical cyclones.

### Mid-latitude Storms

Model projections show fewer mid-latitude storms averaged over each hemisphere, associated with the poleward shift of the storm tracks that is particularly notable in the Southern Hemisphere, with lower central pressures for these poleward-shifted storms. The increased wind speeds result in more extreme wave heights in those regions.

## Atlantic Ocean Meridional Overturning Circulation

Based on current simulations, it is *very likely* that the Atlantic Ocean Meridional Overturning Circulation (MOC) will slow down during the course of the 21st century. A multi-model ensemble shows an average reduction of 25% with a broad range from virtually no change to a reduction of over 50% averaged over 2080 to 2099. In spite of a slowdown of the MOC in most models, there is still warming of surface temperatures around the North Atlantic Ocean and Europe due to the much larger radiative effects of the increase in greenhouse gases. Although the MOC weakens in most model runs for the three SRES scenarios, none shows a collapse of the MOC by the year 2100 for the scenarios considered. No coupled model simulation of the Atlantic MOC shows a mean increase in the MOC in response to global warming by 2100. It is *very unlikely* that the MOC will undergo a large abrupt transition during the course of the 21st century. At this stage, it is too early to assess the likelihood of a large abrupt change of the MOC beyond the end of the 21st century. In experiments with the low (B1) and medium (A1B) scenarios, and for which the atmospheric greenhouse gas concentrations are stabilised beyond 2100, the MOC recovers from initial weakening within one to several centuries after 2100 in some of the models. In other models the reduction persists.

## Radiative Forcing

The radiative forcings by long-lived greenhouse gases computed with the radiative transfer codes in twenty of the AOGCMs used in the Fourth Assessment Report have been compared against results from benchmark line-by-line (LBL) models. The mean AOGCM forcing over the period 1860 to 2000 agrees with the mean LBL value to within  $0.1 \text{ W m}^{-2}$  at the tropopause. However, there is a range of 25% in longwave forcing due to doubling atmospheric  $\text{CO}_2$  from its concentration in 1860 across the ensemble of AOGCM codes. There is a 47% relative range in longwave forcing in 2100 contributed by all greenhouse gases in the A1B scenario across the ensemble of AOGCM simulations. These results imply that the ranges in climate sensitivity and climate response from models discussed in this chapter may be due in part to differences in the formulation and treatment of radiative processes among the AOGCMs.

## Climate Change Commitment (Temperature and Sea Level)

Results from the AOGCM multi-model climate change commitment experiments (concentrations stabilised for 100 years at year 2000 for 20th-century commitment, and at 2100 values for B1 and A1B commitment) indicate that if greenhouse gases were stabilised, then a further warming of  $0.5^\circ\text{C}$  would occur. This should not be confused with ‘unavoidable climate change’ over the next half century, which would be greater because forcing cannot be instantly stabilised. In the very long term, it is plausible that climate change could be less than in a

commitment run since forcing could be reduced below current levels. Most of this warming occurs in the first several decades after stabilisation; afterwards the rate of increase steadily declines. The globally averaged precipitation commitment 100 years after stabilising greenhouse gas concentrations amounts to roughly an additional increase of 1 to 2% compared to the precipitation values at the time of stabilisation.

If concentrations were stabilised at A1B levels in 2100, sea level rise due to thermal expansion in the 22nd century would be similar to that in the 21st, and would amount to 0.3 to 0.8 m (relative to 1980 to 1999) above present by 2300. The ranges of thermal expansion overlap substantially for stabilisation at different levels, since model uncertainty is dominant; A1B is given here because most model results are available for that scenario. Thermal expansion would continue over many centuries at a gradually decreasing rate, reaching an eventual level of 0.2 to 0.6 m per  $^\circ\text{C}$  of global warming relative to present. Under sustained elevated temperatures, some glacier volume may persist at high altitudes, but most could disappear over centuries.

If greenhouse gas concentrations could be reduced, global temperatures would begin to decrease within a decade, although sea level would continue to rise due to thermal expansion for at least another century. Earth System Models of Intermediate Complexity with coupled carbon cycle model components show that for a reduction to zero emissions at year 2100 the climate would take of the order of 1 kyr to stabilise. At year 3000, the model range for temperature increase is  $1.1^\circ\text{C}$  to  $3.7^\circ\text{C}$  and for sea level rise due to thermal expansion is 0.23 to 1.05 m. Hence, they are projected to remain well above their pre-industrial values.

The Greenland Ice Sheet is projected to contribute to sea level after 2100, initially at a rate of 0.03 to 0.21 m per century for stabilisation in 2100 at A1B concentrations. The contribution would be greater if dynamical processes omitted from current models increased the rate of ice flow, as has been observed in recent years. Except for remnant glaciers in the mountains, the Greenland Ice Sheet would largely be eliminated, raising sea level by about 7 m, if a sufficiently warm climate were maintained for millennia; it would happen more rapidly if ice flow accelerated. Models suggest that the global warming required lies in the range  $1.9^\circ\text{C}$  to  $4.6^\circ\text{C}$  relative to the pre-industrial temperature. Even if temperatures were to decrease later, it is possible that the reduction of the ice sheet to a much smaller extent would be irreversible.

The Antarctic Ice Sheet is projected to remain too cold for widespread surface melting, and to receive increased snowfall, leading to a gain of ice. Loss of ice from the ice sheet could occur through increased ice discharge into the ocean following weakening of ice shelves by melting at the base or on the surface. In current models, the net projected contribution to sea level rise is negative for coming centuries, but it is possible that acceleration of ice discharge could become dominant, causing a net positive contribution. Owing to limited understanding of the relevant ice flow processes, there is presently no consensus on the long-term future of the ice sheet or its contribution to sea level rise.

## 10.1 Introduction

Since the Third Assessment Report (TAR), the scientific community has undertaken the largest coordinated global coupled climate model experiment ever attempted in order to provide the most comprehensive multi-model perspective on climate change of any IPCC assessment, the World Climate Research Programme (WCRP) Coupled Model Intercomparison Project phase three (CMIP3), also referred to generically throughout this report as the ‘multi-model data set’ (MMD) archived at the Program for Climate Model Diagnosis and Intercomparison (PCMDI). This open process involves experiments with idealised climate change scenarios (i.e.,  $1\% \text{ yr}^{-1}$  carbon dioxide ( $\text{CO}_2$ ) increase, also included in the earlier WCRP model intercomparison projects CMIP2 and CMIP2+ (e.g., Covey et al., 2003; Meehl et al., 2005b), equilibrium  $2 \times \text{CO}_2$  experiments with atmospheric models coupled to non-dynamic slab oceans, and idealised stabilised climate change experiments at  $2 \times \text{CO}_2$  and  $4 \times$  atmospheric  $\text{CO}_2$  levels in the  $1\% \text{ yr}^{-1}$   $\text{CO}_2$  increase simulations).

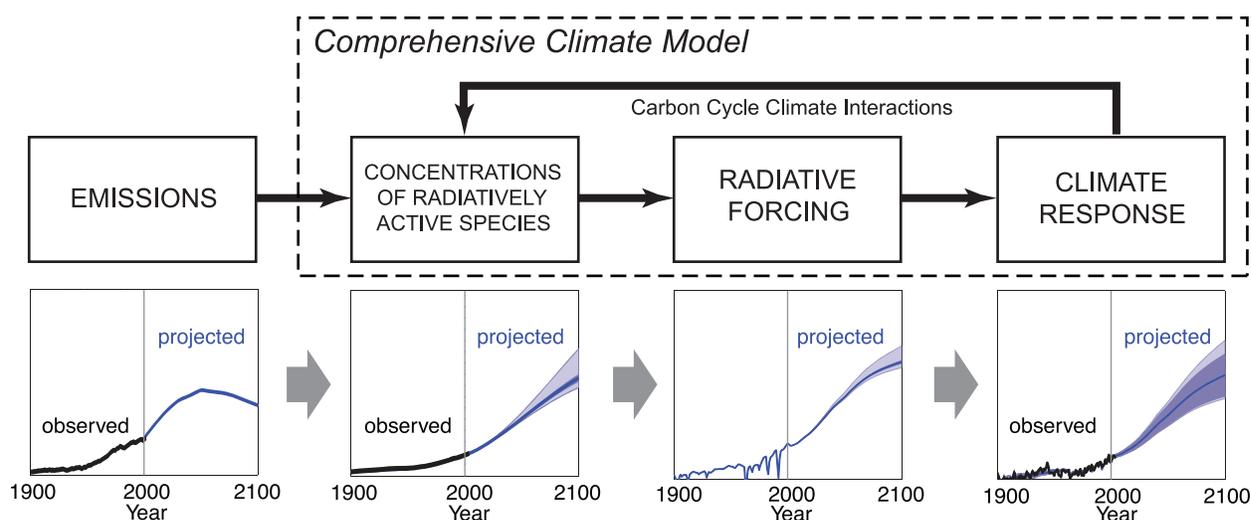

In the idealised  $1\% \text{ yr}^{-1}$   $\text{CO}_2$  increase experiments, there is no actual real year time line. Thus, the rate of climate change is not the issue in these experiments, but what is studied are the types of climate changes that occur at the time of doubling or quadrupling of atmospheric  $\text{CO}_2$  and the range of, and difference in, model responses. Simulations of 20th-century climate have been completed that include temporally evolving natural and anthropogenic forcings. For projected climate change in the 21st century, a subset of three IPCC Special Report on Emission Scenarios (SRES; Nakićenović and Swart, 2000) scenario simulations have been selected from the six commonly used marker scenarios. With respect to emissions, this subset (B1, A1B and A2) consists of a ‘low’, ‘medium’ and ‘high’ scenario

among the marker scenarios, and this choice is solely made by the constraints of available computer resources that did not allow for the calculation of all six scenarios. This choice, therefore, does not imply a qualification of, or preference over, the six marker scenarios. In addition, it is not within the scope of the Working Group I contribution to the Fourth Assessment Report (AR4) to assess the plausibility or likelihood of emission scenarios.

In addition to these non-mitigation scenarios, a series of idealised model projections is presented, each of which implies some form and level of intervention: (i) stabilisation scenarios in which greenhouse gas concentrations are stabilised at various levels, (ii) constant composition commitment scenarios in which greenhouse gas concentrations are fixed at year 2000 levels, (iii) zero emission commitment scenarios in which emissions are set to zero in the year 2100 and (iv) overshoot scenarios in which greenhouse gas concentrations are reduced after year 2150.

The simulations with the subset A1B, B1 and A2 were performed to the year 2100. Three different stabilisation scenarios were run, the first with all atmospheric constituents fixed at year 2000 values and the models run for an additional 100 years, and the second and third with constituents fixed at year 2100 values for A1B and B1, respectively, for another 100 to 200 years. Consequently, the concept of climate change commitment (for details and definitions see Section 10.7) is addressed in much wider scope and greater detail than in any previous IPCC assessment. Results based on this Atmosphere-Ocean General Circulation Model (AOGCM) multi-model data set are featured in Section 10.3.

Uncertainty in climate change projections has always been a subject of previous IPCC assessments, and a substantial amount of new work is assessed in this chapter. Uncertainty arises in various steps towards a climate projection (Figure 10.1). For

**Figure 10.1.** Several steps from emissions to climate response contribute to the overall uncertainty of a climate model projection. These uncertainties can be quantified through a combined effort of observation, process understanding, a hierarchy of climate models, and ensemble simulations. In a comprehensive climate model, physical and chemical representations of processes permit a consistent quantification of uncertainty. Note that the uncertainty associated with the future emission path is of an entirely different nature and not addressed in Chapter 10. Bottom row adapted from Figure 10.26, A1B scenario, for illustration only.

a given emissions scenario, various biogeochemical models are used to calculate concentrations of constituents in the atmosphere. Various radiation schemes and parametrizations are required to convert these concentrations to radiative forcing. Finally, the response of the different climate system components (atmosphere, ocean, sea ice, land surface, chemical status of atmosphere and ocean, etc.) is calculated in a comprehensive climate model. In addition, the formulation of, and interaction with, the carbon cycle in climate models introduces important feedbacks which produce additional uncertainties. In a comprehensive climate model, physical and chemical representations of processes permit a consistent quantification of uncertainty. Note that the uncertainties associated with the future emission path are of an entirely different nature and not considered in this chapter.

Many of the figures in Chapter 10 are based on the mean and spread of the multi-model ensemble of comprehensive AOGCMs. The reason to focus on the multi-model mean is that averages across structurally different models empirically show better large-scale agreement with observations, because individual model biases tend to cancel (see Chapter 8). The expanded use of multi-model ensembles of projections of future climate change therefore provides higher quality and more quantitative climate change information compared to the TAR. Even though the ability to simulate present-day mean climate and variability, as well as observed trends, differs across models, no weighting of individual models is applied in calculating the mean. Since the ensemble is strictly an ‘ensemble of opportunity’, without sampling protocol, the spread of models does not necessarily span the full possible range of uncertainty, and a statistical interpretation of the model spread is therefore problematic. However, attempts are made to quantify uncertainty throughout the chapter based on various other lines of evidence, including perturbed physics ensembles specifically designed to study uncertainty within one model framework, and Bayesian methods using observational constraints.

In addition to this coordinated international multi-model experiment, a number of entirely new types of experiments have been performed since the TAR to quantify uncertainty regarding climate model response to external forcings. The extent to which uncertainties in parametrizations translate into the uncertainty in climate change projections is addressed in much greater detail. New calculations of future climate change from the larger suite of SRES scenarios with simple models and Earth System Models of Intermediate Complexity (EMICs) provide additional information regarding uncertainty related to the choice of scenario. Such models also provide estimates of long-term evolution of global mean temperature, ocean heat uptake and sea level rise due to thermal expansion beyond the 21st century, and thus allow climate change commitments to be better constrained.

Climate sensitivity has always been a focus in the IPCC assessments, and this chapter assesses more quantitative estimates of equilibrium climate sensitivity and transient

climate response (TCR) in terms of not only ranges but also probabilities within these ranges. Some of these probabilities are now derived from ensemble simulations subject to various observational constraints, and no longer rely solely on expert judgement. This permits a much more complete assessment of model response uncertainties from these sources than ever before. These are now standard benchmark calculations with the global coupled climate models, and are useful to assess model response in the subsequent time-evolving climate change scenario experiments.

With regard to these time-evolving experiments simulating 21st-century climate, since the TAR increased computing capabilities now allow routine performance of multi-member ensembles in climate change scenario experiments with global coupled climate models. This provides the capability to analyse more multi-model results and multi-member ensembles, and yields more probabilistic estimates of time-evolving climate change in the 21st century.

Finally, while future changes in some weather and climate extremes (e.g., heat waves) were addressed in the TAR, there were relatively few studies on this topic available for assessment at that time. Since then, more analyses have been performed regarding possible future changes in a variety of extremes. It is now possible to assess, for the first time, multi-model ensemble results for certain types of extreme events (e.g., heat waves, frost days, etc.). These new studies provide a more complete range of results for assessment regarding possible future changes in these important phenomena with their notable impacts on human societies and ecosystems. A synthesis of results from studies of extremes from observations and model is provided in Chapter 11.

The use of multi-model ensembles has been shown in other modelling applications to produce simulated climate features that are improved over single models alone (see discussion in Chapters 8 and 9). In addition, a hierarchy of models ranging from simple to intermediate to complex allows better quantification of the consequences of various parametrizations and formulations. Very large ensembles (order hundreds) with single models provide the means to quantify parametrization uncertainty. Finally, observed climate characteristics are now being used to better constrain future climate model projections.

## 10.2 Projected Changes in Emissions, Concentrations and Radiative Forcing

The global projections discussed in this chapter are extensions of the simulations of the observational record discussed in Chapter 9. The simulations of the 19th and 20th centuries are based upon changes in long-lived greenhouse gases (LLGHGs) that are reasonably constrained by the observational record. Therefore, the models have qualitatively similar temporal evolutions of their radiative forcing time histories for LLGHGs (e.g., see Figure 2.23). However, estimates of future concentrations of LLGHGs and other radiatively active species are clearly subject to significant uncertainties. The evolution of these species is governed by a variety of factors that are difficult to predict, including changes in population, energy use, energy sources and emissions. For these reasons, a range of projections of future climate change has been conducted using coupled AOGCMs. The future concentrations of LLGHGs and the anthropogenic emissions of sulphur dioxide (SO<sub>2</sub>), a chemical precursor of sulphate aerosol, are obtained from several scenarios considered representative of low, medium and high emission trajectories. These basic scenarios and other forcing agents incorporated in the AOGCM projections, including several types of natural and anthropogenic aerosols, are discussed in Section 10.2.1. Developments in projecting radiatively active species and radiative forcing for the early 21st century are considered in Section 10.2.2.

### 10.2.1 Emissions Scenarios and Radiative Forcing in the Multi-Model Climate Projections

The temporal evolution of the LLGHGs, aerosols and other forcing agents are described in Sections 10.2.1.1 and 10.2.1.2. Typically, the future projections are based upon initial conditions extracted from the end of the simulations of the 20th century. Therefore, the radiative forcing at the beginning of the model projections should be approximately equal to the radiative forcing for present-day concentrations relative to pre-industrial conditions. The relationship between the modelled radiative forcing for the year 2000 and the estimates derived in Chapter 2 is evaluated in Section 10.2.1.3. Estimates of the radiative forcing in the multi-model integrations for one of the standard scenarios are also presented in this section. Possible explanations for the range of radiative forcings projected for 2100 are discussed in Section 10.2.1.4, including evidence for systematic errors in the formulations of radiative transfer used in AOGCMs. Possible implications of these findings for the range of global temperature change and other climate responses are summarised in Section 10.2.1.5.

#### 10.2.1.1 *The Special Report on Emission Scenarios and Constant-Concentration Commitment Scenarios*

The future projections discussed in this chapter are based upon the standard A2, A1B and B2 SRES scenarios (Nakićenović and Swart, 2000). The emissions of CO<sub>2</sub>, methane (CH<sub>4</sub>) and SO<sub>2</sub>, the concentrations of CO<sub>2</sub>, CH<sub>4</sub> and nitrous oxide (N<sub>2</sub>O) and the total radiative forcing for the SRES scenarios are illustrated in Figure 10.26 and summarised for the A1B scenario in Figure 10.1. The models have been integrated to year 2100 using the projected concentrations of LLGHGs and emissions of SO<sub>2</sub> specified by the A1B, B1 and A2 emissions scenarios. Some of the AOGCMs do not include sulphur chemistry, and the simulations from these models are based upon concentrations of sulphate aerosols from Boucher and Pham (2002; see Section 10.2.1.2). The simulations for the three scenarios were continued for another 100 to 200 years with all anthropogenic forcing agents held fixed at values applicable to the year 2100. There is also a new constant-concentration commitment scenario that assumes concentrations are held fixed at year 2000 levels (Section 10.7.1). In this idealised scenario, models are initialised from the end of the simulations for the 20th century, the concentrations of radiatively active species are held constant at year 2000 values from these simulations, and the models are integrated to 2100.

For comparison with this constant composition case, it is useful to note that constant emissions would lead to much larger radiative forcing. For example, constant CO<sub>2</sub> emissions at year 2000 values would lead to concentrations reaching about 520 ppm by 2100, close to the B1 case (Friedlingstein and Solomon, 2005; Hare and Munschhausen, 2006; see also FAQ 10.3).

#### 10.2.1.2 *Forcing by Additional Species and Mechanisms*

The forcing agents applied to each AOGCM used to make climate projections are summarised in Table 10.1. The radiatively active species specified by the SRES scenarios are CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, chlorofluorocarbons (CFCs) and SO<sub>2</sub>, which is listed in its aerosol form as sulphate (SO<sub>4</sub>) in the table. The inclusion, magnitude and temporal evolution of the remaining forcing agents listed in Table 10.1 were left to the discretion of the individual modelling groups. These agents include tropospheric and stratospheric ozone, all of the non-sulphate aerosols, the indirect effects of aerosols on cloud albedo and lifetime, the effects of land use and solar variability.

The scope of the treatments of aerosol effects in AOGCMs has increased markedly since the TAR. Seven of the AOGCMs include the first indirect effects and five include the second indirect effects of aerosols on cloud properties (Section 2.4.5). Under the more emissions-intensive scenarios considered in this chapter, the magnitude of the first indirect (Twomey) effect can saturate. Johns et al. (2003) parametrize the first indirect effect of anthropogenic sulphur (S) emissions as perturbations to the effective radii of cloud drops in simulations of the B1, B2, A2 and A1FI scenarios using UKMO-HadCM3. At 2100, the first indirect forcing ranges from -0.50 to

**Table 10.1.** Radiative forcing agents in the multi-model global climate projections. See Table 8.1 for descriptions of the models. Entries mean Y: forcing agent is included; C: forcing agent varies with time during the 20th Century Climate in Coupled Models (20C3M) simulations and is set to constant or annually cyclic distribution for scenario integrations; E: forcing agent represented using equivalent CO<sub>2</sub>; and n.a.: forcing agent is not specified in either the 20th-century or scenario integrations. Numeric codes indicate that the forcing agent is included using data described at 1: <http://www.cnrn.meteo.fr/ensembles/public/results/results.html>; 2: Boucher and Pham (2002); 3: Yukimoto et al. (2006); 4: Meehl, et al., 2006b; 5: <http://aom.giss.nasa.gov/IN/GHGA1B.LP>; and 6: [http://sres.ciesin.org/final\\_data.html](http://sres.ciesin.org/final_data.html).

$-0.79 \text{ W m}^{-2}$ . The normalised indirect forcing (the ratio of the forcing ( $\text{W m}^{-2}$ ) to the mass burden of a species ( $\text{mg m}^{-2}$ ), leaving units of  $\text{W mg}^{-1}$ ) decreases by a factor of four, from approximately  $-7 \text{ W mg}^{-1}$  in 1860 to between  $-1$  and  $-2 \text{ W mg}^{-1}$  by the year 2100. Boucher and Pham (2002) and Pham et al. (2005) find a comparable projected decrease in forcing efficiency of the indirect effect, from  $-9.6 \text{ W mg}^{-1}$  in 1860 to between  $-2.1$  and  $-4.4 \text{ W mg}^{-1}$  in 2100. Johns et al. (2003) and Pham et al. (2005) attribute the projected decline to the decreased sensitivity of clouds to greater sulphate concentrations at sufficiently large aerosol burdens.

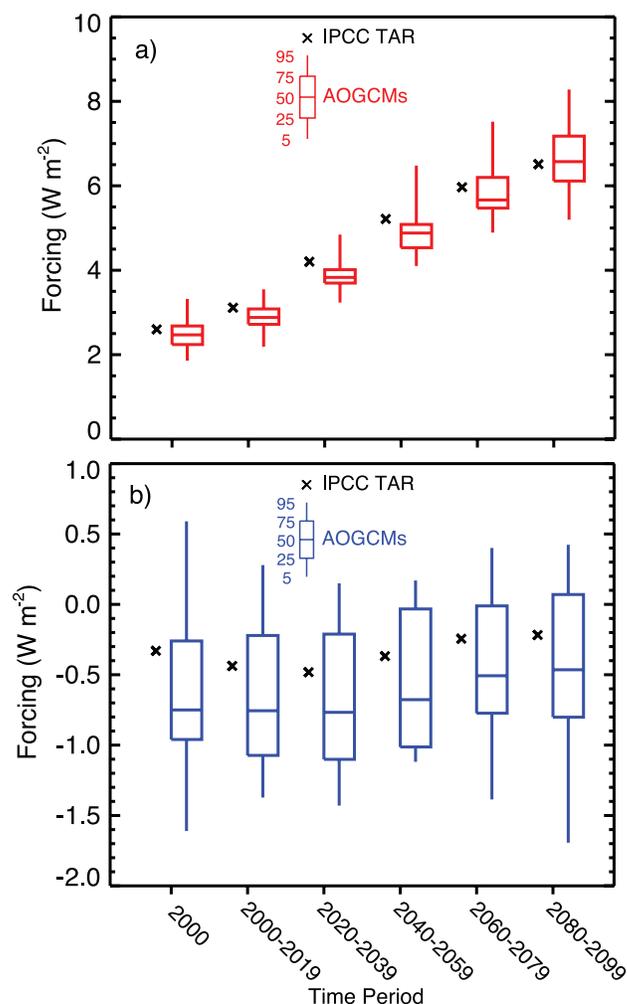

### 10.2.1.3 Comparison of Modelled Forcings to Estimates in Chapter 2

The forcings used to generate climate projections for the standard SRES scenarios are not necessarily uniform across the multi-model ensemble. Differences among models may be caused by different projections for radiatively active species (see Section 10.2.1.2) and by differences in the formulation of radiative transfer (see Section 10.2.1.4). The AOGCMs in the ensemble include many species that are not specified or constrained by the SRES scenarios, including ozone, tropospheric non-sulphate aerosols, and stratospheric volcanic aerosols. Other types of forcing that vary across the ensemble include solar variability, the indirect effects of aerosols on clouds and the effects of land use change on land surface albedo and other land surface properties (Table 10.1). While the time series of LLGHGs for the future scenarios are mostly identical across the ensemble, the concentrations of these gases in the 19th and early 20th centuries were left to the discretion of individual modelling groups. The differences in radiatively active species and the formulation of radiative transfer affect both the 19th- and 20th-century simulations and the scenario integrations initiated from these historical simulations. The resulting differences in the forcing complicate the separation of forcing and response across the multi-model ensemble. These differences can be quantified by comparing the range of shortwave and longwave forcings across the multi-model ensemble against standard estimates of radiative forcing over the historical record. Shortwave and longwave forcing refer to modifications of the solar and infrared atmospheric radiation fluxes, respectively, that are caused by external changes to the climate system (Section 2.2).

The longwave radiative forcings for the SRES A1B scenario from climate model simulations are compared against estimates using the TAR formulae (see Chapter 2) in Figure 10.2a. The graph shows the longwave forcings from the TAR and 20 AOGCMs in the multi-model ensemble from 2000 to 2100. The forcings from the models are diagnosed from changes in top-of-atmosphere fluxes and the forcing for doubled atmospheric  $\text{CO}_2$  (Forster and Taylor, 2006). The TAR and median model estimates of the longwave forcing are in very good agreement over the 21st century, with differences ranging from  $-0.37$  to  $+0.06 \text{ W m}^{-2}$ . For the year 2000, the global mean values from the TAR and median model differ by only  $-0.13 \text{ W m}^{-2}$ . However,

the 5th to 95th percentile range of the models for the period 2080 to 2099 is approximately  $3.1 \text{ W m}^{-2}$ , or approximately 47% of the median longwave forcing for that time period.

The corresponding time series of shortwave forcings for the SRES A1B scenario are plotted in Figure 10.2b. It is evident that the relative differences among the models and between the models and the TAR estimates are larger for the shortwave band. The TAR value is larger than the median model forcing by 0.2 to 0.3  $\text{W m}^{-2}$  for individual 20-year segments of the integrations. For the year 2000, the TAR estimate is larger by  $0.42 \text{ W m}^{-2}$ . In addition, the range of modelled forcings is sufficiently large that it includes positive and negative values

**Figure 10.2.** Radiative forcings for the period 2000 to 2100 for the SRES A1B scenario diagnosed from AOGCMs and from the TAR (IPCC, 2001) forcing formulas (Forster and Taylor, 2006). (a) Longwave forcing; (b) shortwave forcing. The AOGCM results are plotted with box-and-whisker diagrams representing percentiles of forcings computed from 20 models in the AR4 multi-model ensemble. The central line within each box represents the median value of the model ensemble. The top and bottom of each box shows the 75th and 25th percentiles, and the top and bottom of each whisker displays the 95th and 5th percentile values in the ensemble, respectively. The models included are CCSM3, CGCM3.1 (T47 and T63), CNRM-CM3, CSIRO-MK3, ECHAM5/MPI-OM, ECHO-G, FGOALS-g1.0, GFDL-CM2.0, GFDL-CM2.1, GISS-EH, GISS-ER, INM-CM3.0, IPSL-CM4, MIROC3.2 (medium and high resolution), MRI-CGCM2.3.2, PCM1, UKMO-HadCM3 and UKMO-HadGEM1 (see Table 8.1 for model details).

**Table 10.2.** All-sky radiative forcing for doubled atmospheric CO<sub>2</sub>. See Table 8.1 for model details.

Model <sup>Source</sup>	Longwave (W m <sup>-2</sup> )	Shortwave (W m <sup>-2</sup> )
CGCM 3.1 (T47/T63) <sup>a</sup>	3.39	-0.07
CSIRO-MK3.0 <sup>b</sup>	3.42	0.05
GISS-EH/ER <sup>a</sup>	4.21	-0.15
GFDL-CM2.0/2.1 <sup>b</sup>	3.62	-0.12

Mean ± standard deviation <sup>e</sup>	3.80 ± 0.33	-0.13 ± 0.11

## Notes:

<sup>a</sup> Forster and Taylor (2006) based upon forcing data from PCMDI for 200 hPa. Longwave forcing accounts for stratospheric adjustment; shortwave forcing does not.

<sup>b</sup> Forcings derived by individual modelling groups using the method of Gregory et al. (2004b).

<sup>c</sup> Based upon forcing data from PCMDI for 200 hPa. Longwave and shortwave forcing account for stratospheric adjustment.

<sup>d</sup> Forcings at diagnosed tropopause.

<sup>e</sup> Mean and standard deviation are calculated just using forcings at 200 hPa, with each model and model version counted once.

for every 20-year period. For the year 2100, the shortwave forcing from individual AOGCMs ranges from approximately -1.7 W m<sup>-2</sup> to +0.4 W m<sup>-2</sup> (5th to 95th percentile). The reasons for this large range include the variety of the aerosol treatments and parametrizations for the indirect effects of aerosols in the multi-model ensemble.

Since the large range in both longwave and shortwave forcings may be caused by a variety of factors, it is useful to determine the range caused just by differences in model formulation for a given (identical) change in radiatively active species. A standard metric is the global mean, annually averaged all-sky forcing at the tropopause for doubled atmospheric CO<sub>2</sub>. Estimates of

this forcing for 15 of the models in the ensemble are given in Table 10.2. The shortwave forcing is caused by absorption in the near-infrared bands of CO<sub>2</sub>. The range in the longwave forcing at 200 mb is 0.84 W m<sup>-2</sup>, and the coefficient of variation, or ratio of the standard deviation to mean forcing, is 0.09. These results suggest that up to 35% of the range in longwave forcing in the ensemble for the period 2080 to 2099 is due to the spread in forcing estimates for the specified increase in CO<sub>2</sub>. The findings also imply that it is not appropriate to use a single best value of the forcing from doubled atmospheric CO<sub>2</sub> to relate forcing and response (e.g., climate sensitivity) across a multi-model ensemble. The relationships for a given model should be derived using the radiative forcing produced by the radiative parametrizations in that model. Although the shortwave forcing has a coefficient of variation close to one, the range across the ensemble explains less than 17% of the range in shortwave forcing at the end of the 21st-century simulations. This suggests that species and forcing agents other than CO<sub>2</sub> cause the large variation among modelled shortwave forcings.

#### 10.2.1.4 Results from the Radiative-Transfer Model Intercomparison Project: Implications for Fidelity of Forcing Projections

Differences in radiative forcing across the multi-model ensemble illustrated in Table 10.2 have been quantified in the Radiative-Transfer Model Intercomparison Project (RTMIP, W.D. Collins et al., 2006). The basis of RTMIP is an evaluation of the forcings computed by 20 AOGCMs using five benchmark line-by-line (LBL) radiative transfer codes. The comparison is focused on the instantaneous clear-sky radiative forcing by the LLGHGs CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, CFC-11, CFC-12 and the increased water vapour expected in warmer climates. The results of this intercomparison are not directly comparable to the estimates of forcing at the tropopause (Chapter 2), since the latter include the effects of stratospheric adjustment. The effects of adjustment on forcing are approximately -2% for CH<sub>4</sub>, -4% for N<sub>2</sub>O, +5% for CFC-11, +8% for CFC-12 and -13% for CO<sub>2</sub> (IPCC, 1995; Hansen et al., 1997). The total (longwave plus shortwave) radiative forcings at 200 mb, a surrogate for the tropopause, are shown in Table 10.3 for climatological mid-latitude summer conditions.

**Table 10.3.** Total instantaneous forcing at 200 hPa (W m<sup>-2</sup>) from AOGCMs and LBL codes in RTMIP (W.D. Collins et al., 2006). Calculations are for cloud-free climatological mid-latitude summer conditions.

Radiative Species	CO <sub>2</sub>	CO <sub>2</sub>	N <sub>2</sub> O + CFCs	CH <sub>4</sub> + CFCs	All LLGHGs	Water Vapour
Forcing <sup>a</sup>	2000–1860	2x–1x	2000–1860	2000–1860	2000–1860	1.2x–1x
AOGCM mean	1.56	4.28	0.47	0.95	2.68	4.82
AOGCM std. dev.	0.23	0.66	0.15	0.30	0.30	0.34
LBL mean	1.69	4.75	0.38	0.73	2.58	5.08
LBL std. dev.	0.02	0.04	0.12	0.12	0.11	0.16

## Notes:

<sup>a</sup> 2000–1860 is the forcing due to an increase in the concentrations of radiative species between 1860 and 2000. 2x–1x and 1.2x–1x are forcings from increases in radiative species by 100% and 20% relative to 1860 concentrations.

Total forcings calculated from the AOGCM and LBL codes due to the increase in LLGHGs from 1860 to 2000 differ by less than 0.04, 0.49 and 0.10  $\text{W m}^{-2}$  at the top of model, surface and pseudo-tropopause at 200mb, respectively (Table 10.3). Based upon the Student t-test, none of the differences in mean forcings shown in Table 10.3 is statistically significant at the 0.01 level. This indicates that the ensemble mean forcings are in reasonable agreement with the LBL codes. However, the forcings from individual models, for example from doubled atmospheric  $\text{CO}_2$ , span a range at least 10 times larger than that exhibited by the LBL models.

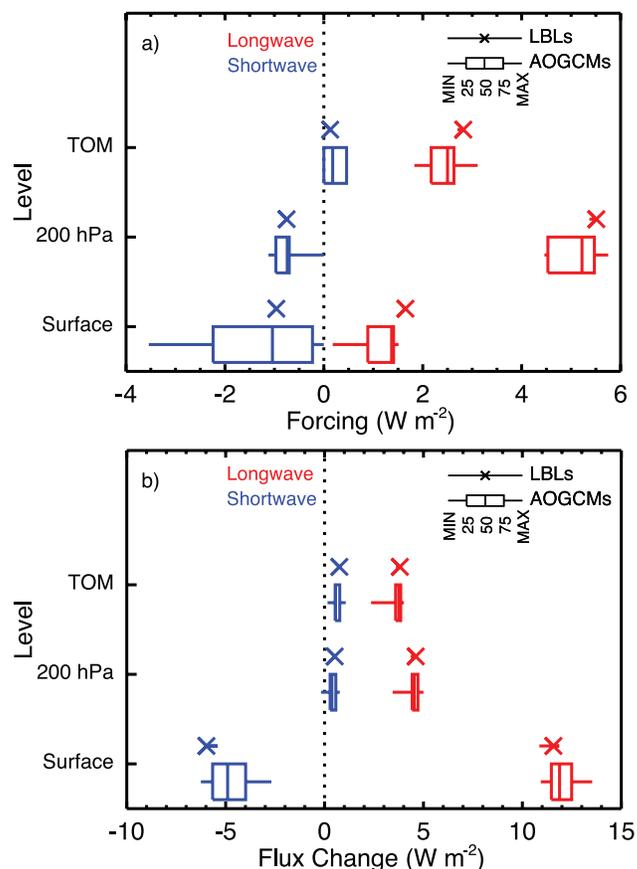

The forcings from doubling atmospheric  $\text{CO}_2$  from its concentration at 1860 AD are shown in Figure 10.3a at the top of the model (TOM), 200 hPa (Table 10.3), and the surface. The AOGCMs tend to underestimate the longwave forcing at these three levels. The relative differences in the mean forcings are less than 8% for the pseudo-tropopause at 200 hPa but increase to approximately 13% at the TOM and to 33% at the surface. In general, the mean shortwave forcings from the LBL and AOGCM codes are in good agreement at all three surfaces. However, the range in shortwave forcing at the surface from individual AOGCMs is quite large. The coefficient of variation (the ratio of the standard deviation to the mean) for the surface shortwave forcing from AOGCMs is 0.95. In response to a doubling in atmospheric  $\text{CO}_2$ , the specific humidity increases by approximately 20% through much of the troposphere. The changes in shortwave and longwave fluxes due to a 20% increase in water vapour are illustrated in Figure 10.3b. The mean longwave forcing from increasing water vapour is quite well simulated with the AOGCM codes. In the shortwave, the only significant difference between the AOGCM and LBL calculations occurs at the surface, where the AOGCMs tend to underestimate the magnitude of the reduction in insolation. In general, the biases in the AOGCM forcings are largest at the surface level.

### 10.2.1.5 Implications for Range in Climate Response

The results from RTMIP imply that the spread in climate response discussed in this chapter is due in part to the diverse representations of radiative transfer among the members of the multi-model ensemble. Even if the concentrations of LLGHGs were identical across the ensemble, differences in radiative transfer parametrizations among the ensemble members would lead to different estimates of radiative forcing by these species. Many of the climate responses (e.g., global mean temperature) scale linearly with the radiative forcing to first approximation. Therefore, systematic errors in the calculations of radiative forcing should produce a corresponding range in climate responses. Assuming that the RTMIP results (Table 10.3) are globally applicable, the range of forcings for 1860 to 2000 in the AOGCMs should introduce a  $\pm 18\%$  relative range (the 5 to 95% confidence interval) for 2000 in the responses that scale with forcing. The corresponding relative range for doubled atmospheric  $\text{CO}_2$ , which is comparable to the change in  $\text{CO}_2$  in the B1 scenario by 2100, is  $\pm 25\%$ .

## 10.2.2 Recent Developments in Projections of Radiative Species and Forcing for the 21st Century

Estimation of ozone forcing for the 21st century is complicated by the short chemical lifetime of ozone compared to atmospheric transport time scales and by the sensitivity of the radiative forcing to the vertical distribution of ozone. Gauss et al. (2003) calculate the forcing by anthropogenic increases

**Figure 10.3.** Comparison of shortwave and longwave instantaneous radiative forcings and flux changes computed from AOGCMs and line-by-line (LBL) radiative transfer codes (W.D. Collins et al., 2006). (a) Instantaneous forcing from doubling atmospheric  $\text{CO}_2$  from its concentration in 1860; (b) changes in radiative fluxes caused by the 20% increase in water vapour expected in the climate produced from doubling atmospheric  $\text{CO}_2$ . The forcings and flux changes are computed for clear-sky conditions in mid-latitude summer and do not include effects of stratospheric adjustment. No other well-mixed greenhouse gases are included. The minimum-to-maximum range and median are plotted for five representative LBL codes. The AOGCM results are plotted with box-and-whisker diagrams (see caption for Figure 10.2) representing percentiles of forcings from 20 models in the AR4 multi-model ensemble. The AOGCMs included are BCCR-BCM2.0, CCSM3, CGCM3.1 (T47 and T63), CNRM-CM3, ECHAM5/MPI-OM, ECHO-G, FGOALS-g1.0, GFDL-CM2.0, GFDL-CM2.1, GISS-EH, GISS-ER, INM-CM3.0, IPSL-CM4, MIROC3.2 (medium and high resolution), MRI-CGCM2.3.2, PCM, UKMO-HadCM3, and UKMO-HadGEM1 (see Table 8.1 for model details). The LBL codes are the Geophysical Fluid Dynamics Laboratory (GFDL) LBL, the Goddard Institute for Space Studies (GISS) LBL3, the National Center for Atmospheric Research (NCAR)/Imperial College of Science, Technology and Medicine (ICSTM) general LBL GENLN2, the National Aeronautics and Space Administration (NASA) Langley Research Center MRTA and the University of Reading Reference Forward Model (RFM).

of tropospheric ozone through 2100 from 11 different chemical transport models integrated with the SRES A2p scenario. The A2p scenario is the preliminary version of the marker A2 scenario and has nearly identical time series of LLGHGs and forcing. Since the emissions of CH<sub>4</sub>, carbon monoxide (CO), reactive nitrogen oxides (NO<sub>x</sub>) and volatile organic compounds (VOCs), which strongly affect the formation of ozone, are maximised in the A2p scenario, the modelled forcings should represent an upper bound for the forcing produced under more constrained emissions scenarios. The 11 models simulate an increase in tropospheric ozone of 11.4 to 20.5 Dobson units (DU) by 2100, corresponding to a range of radiative forcing from 0.40 to 0.78 W m<sup>-2</sup>. Under this scenario, stratospheric ozone increases by between 7.5 and 9.3 DU, which raises the radiative forcing by an additional 0.15 to 0.17 W m<sup>-2</sup>.

One aspect of future direct aerosol radiative forcing omitted from all but 2 (the GISS-EH and GISS-ER models) of the 23 AOGCMS analysed in AR4 (see Table 8.1 for list) is the role of nitrate aerosols. Rapid increases in NO<sub>x</sub> emissions could produce enough nitrate aerosol to offset the expected decline in sulphate forcing by 2100. Adams et al. (2001) compute the radiative forcing by sulphate and nitrate accounting for the interactions among sulphate, nitrate and ammonia. For 2000, the sulphate and nitrate forcing are -0.95 and -0.19 W m<sup>-2</sup>, respectively. Under the SRES A2 scenario, by 2100 declining SO<sub>2</sub> emissions cause the sulphate forcing to drop to -0.85 W m<sup>-2</sup>, while the nitrate forcing rises to -1.28 W m<sup>-2</sup>. Hence, the total sulphate-nitrate forcing increases in magnitude from -1.14 W m<sup>-2</sup> to -2.13 W m<sup>-2</sup> rather than declining as models that omit nitrates would suggest. This projection is consistent with the large increase in coal burning forecast as part of the A2 scenario.

Recent field programs focused on Asian aerosols have demonstrated the importance of black carbon (BC) and organic carbon (OC) for regional climate, including potentially significant perturbations of the surface energy budget and hydrological cycle (Ramanathan et al., 2001). Modelling groups have developed a multiplicity of projections for the concentrations of these aerosol species. For example, Takemura et al. (2001) use data sets for BC released by fossil fuel and biomass burning (Cooke and Wilson, 1996) under current conditions and scale them by the ratio of future to present-day CO<sub>2</sub>. The emissions of OC are derived using OC:BC ratios estimated for each source and fuel type. Koch (2001) models the future radiative forcing of BC by scaling a different set of present-day emission inventories by the ratio of future to present-day CO<sub>2</sub> emissions. There are still large uncertainties associated with current inventories of BC and OC (Bond et al., 2004), the ad hoc scaling methods used to produce future emissions, and considerable variation among estimates of the optical properties of carbonaceous aerosols (Kinne et al., 2006). Given these uncertainties, future projections of forcing by BC and OC should be quite model dependent.

Recent evidence suggests that there are detectable anthropogenic increases in stratospheric sulphate (e.g., Myhre et al., 2004), water vapour (e.g., Forster and Shine, 2002), and

condensed water in the form of aircraft contrails. However, recent modelling studies suggest that these forcings are relatively minor compared to the major LLGHGs and aerosol species. Marquart et al. (2003) estimate that the radiative forcing by contrails will increase from 0.035 W m<sup>-2</sup> in 1992 to 0.094 W m<sup>-2</sup> in 2015 and to 0.148 W m<sup>-2</sup> in 2050. The rise in forcing is due to an increase in subsonic aircraft traffic following estimates of future fuel consumption (Penner et al., 1999). These estimates are still subject to considerable uncertainties related to poor constraints on the microphysical properties, optical depths and diurnal cycle of contrails (Myhre and Stordal, 2001, 2002; Marquart et al., 2003). Pitari et al. (2002) examine the effect of future emissions under the A2 scenario on stratospheric concentrations of sulphate aerosol and ozone. By 2030, the mass of stratospheric sulphate increases by approximately 33%, with the majority of the increase contributed by enhanced upward fluxes of anthropogenic SO<sub>2</sub> through the tropopause. The increase in direct shortwave forcing by stratospheric aerosols in the A2 scenario during 2000 to 2030 is -0.06 W m<sup>-2</sup>.

Some recent studies have suggested that the global atmospheric burden of soil dust aerosols could decrease by between 20 and 60% due to reductions in desert areas associated with climate change (Mahowald and Luo, 2003). Tegen et al. (2004a,b) compared simulations by the European Centre for Medium Range Weather Forecasts/Max Planck Institute for Meteorology Atmospheric GCM (ECHAM4) and UKMO-HadCM3 that included the effects of climate-induced changes in atmospheric conditions and vegetation cover and the effects of increased CO<sub>2</sub> concentrations on vegetation density. These simulations are forced with identical (IS92a) time series for LLGHGs. Their findings suggest that future projections of changes in dust loading are quite model dependent, since the net changes in global atmospheric dust loading produced by the two models have opposite signs. They also conclude that dust from agriculturally disturbed soils is less than 10% of the current burden, and that climate-induced changes in dust concentrations would dominate land use changes under both minimum and maximum estimates of increased agricultural area by 2050.

### 10.3 Projected Changes in the Physical Climate System

The context for the climate change results presented here is set in Chapter 8 (evaluation of simulation skill of the control runs and inherent natural variability of the global coupled climate models), and in Chapter 9 (evaluation of the simulations of 20th-century climate using the global coupled climate models). Table 8.1 describes the characteristics of the models, and Table 10.4 summarises the climate change experiments that have been performed with the AOGCMs and other models that are assessed in this chapter.

**Table 10.4.** Summary of climate change model experiments produced with AOGCMs. Numbers in each scenario column indicate how many ensemble members were produced for each model. Coloured fields indicate that some but not necessarily all variables of the specific data type (separated by climate system component and time interval) were available for download at the PCMDI to be used in this report; ISCCP is the International Satellite Cloud Climatology Project. Additional data has been submitted for some models and may subsequently become available. Where different colour shadings are given in the legend, the colour indicates whether data from a single or from multiple ensemble members is available. Details on the scenarios, variables and models can be found at the PCMDI webpage ([http://www-pcmdi.llnl.gov/ipcc/about\\_ipcc.php](http://www-pcmdi.llnl.gov/ipcc/about_ipcc.php)). Model IDs are the same as in Table 8.1, which provides details of the models.

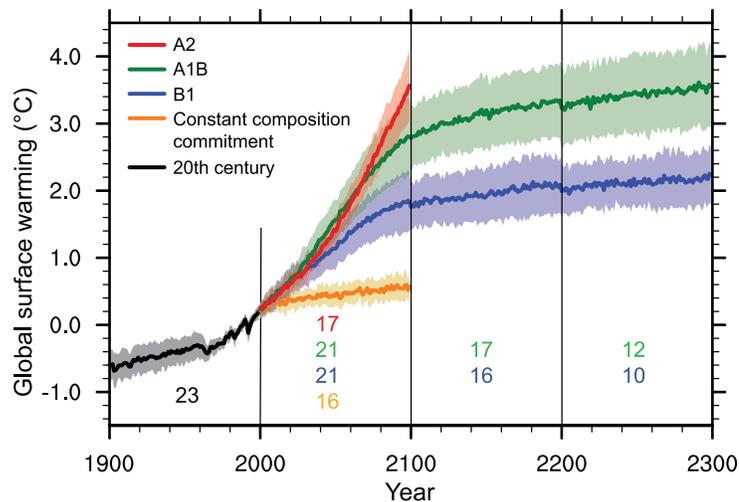

Model ID	Model, Country	Pre industr. control	Present day control	20th century	Commitment	SRES A2	SRES A1B	SRES B1	1% to 2xCO <sub>2</sub>	1% to 4xCO <sub>2</sub>	Slab ocean control	2XCO <sub>2</sub>	AMIP

\* Some of the ensemble members using the CCSM3 were run on the Earth Simulator in Japan in collaboration with the Central Research Institute of Electric Power Industry (CRIEPI).

The TAR showed multi-model results for future changes in climate from simple 1% yr<sup>-1</sup> CO<sub>2</sub> increase experiments, and from several scenarios including the older IS92a, and, new to the TAR, two SRES scenarios (A2 and B2). For the latter, results from nine models were shown for globally averaged temperature change and regional changes. As noted in Section 10.1, since the TAR, an unprecedented internationally coordinated climate change experiment has been performed by 23 models from around the world, listed in Table 10.4 along with the results submitted. This larger number of models running the same experiments allows better quantification of the multi-model signal as well as uncertainty regarding spread across the models (in this section), and also points the way to probabilistic estimates of future climate change (Section 10.5). The emission scenarios considered here include one of the SRES scenarios from the TAR, scenario A2, along with two additional scenarios, A1B and B1 (see Section 10.2 for details regarding the scenarios). This is a subset of the SRES marker scenarios used in the TAR, and they represent ‘low’ (B1), ‘medium’ (A1B) and ‘high’ (A2) scenarios with respect to the prescribed concentrations and the resulting radiative forcing, relative to the SRES range. This choice was made solely due to the limited computational resources for multi-model simulations using comprehensive AOGCMs and does not imply any preference or qualification of these three scenarios over the others. Qualitative conclusions derived from those three scenarios are in most cases also valid for other SRES scenarios.

Additionally, three climate change commitment experiments were performed, one where concentrations of greenhouse gases were held fixed at year 2000 values (constant composition commitment) and the models were run to 2100 (termed 20th-century stabilisation here), and two where concentrations were held fixed at year 2100 values for A1B and B1, and the models were run for an additional 100 to 200 years (see Section 10.7). The span of the experiments is shown in Figure 10.4.

This section considers the basic changes in climate over the next hundred years simulated by current climate models under non-mitigation anthropogenic forcing scenarios. While we assess all studies in this field, the focus is on results derived by the authors from the new data set for the three SRES scenarios. Following the TAR, means across the multi-model ensemble are used to illustrate representative changes. Means are able to simulate the contemporary climate more accurately than individual models, due to biases tending to compensate each other (Phillips and Gleckler, 2006). It is anticipated that this holds for changes in climate also (Chapter 9). The mean temperature trends from the 20th-century simulations are included in Figure 10.4. While the range of model results is indicated here, the consideration of uncertainty resulting from this range is addressed more completely in Section 10.5. The use of means has the additional advantage of reducing the ‘noise’ associated with internal or unforced variability in the simulations. Models are equally weighted here, but other options are noted in Section 10.5. Lists of the models used in the results are provided in the Supplementary Material for this Chapter.

**Figure 10.4.** Multi-model means of surface warming (relative to 1980–1999) for the scenarios A2, A1B and B1, shown as continuations of the 20th-century simulation. Values beyond 2100 are for the stabilisation scenarios (see Section 10.7). Linear trends from the corresponding control runs have been removed from these time series. Lines show the multi-model means, shading denotes the  $\pm 1$  standard deviation range of individual model annual means. Discontinuities between different periods have no physical meaning and are caused by the fact that the number of models that have run a given scenario is different for each period and scenario, as indicated by the coloured numbers given for each period and scenario at the bottom of the panel. For the same reason, uncertainty across scenarios should not be interpreted from this figure (see Section 10.5.4.6 for uncertainty estimates).

Standard metrics for response of global coupled models are the equilibrium climate sensitivity, defined as the equilibrium globally averaged surface air temperature change for a doubling of  $\text{CO}_2$  for the atmosphere coupled to a non-dynamic slab ocean, and the TCR, defined as the globally averaged surface air temperature change at the time of  $\text{CO}_2$  doubling in the  $1\% \text{ yr}^{-1}$  transient  $\text{CO}_2$  increase experiment. The TAR showed results for these  $1\%$  simulations, and Section 10.5.2 discusses equilibrium climate sensitivity, TCR and other aspects of response. Chapter 8 includes processes and feedbacks involved with these metrics.

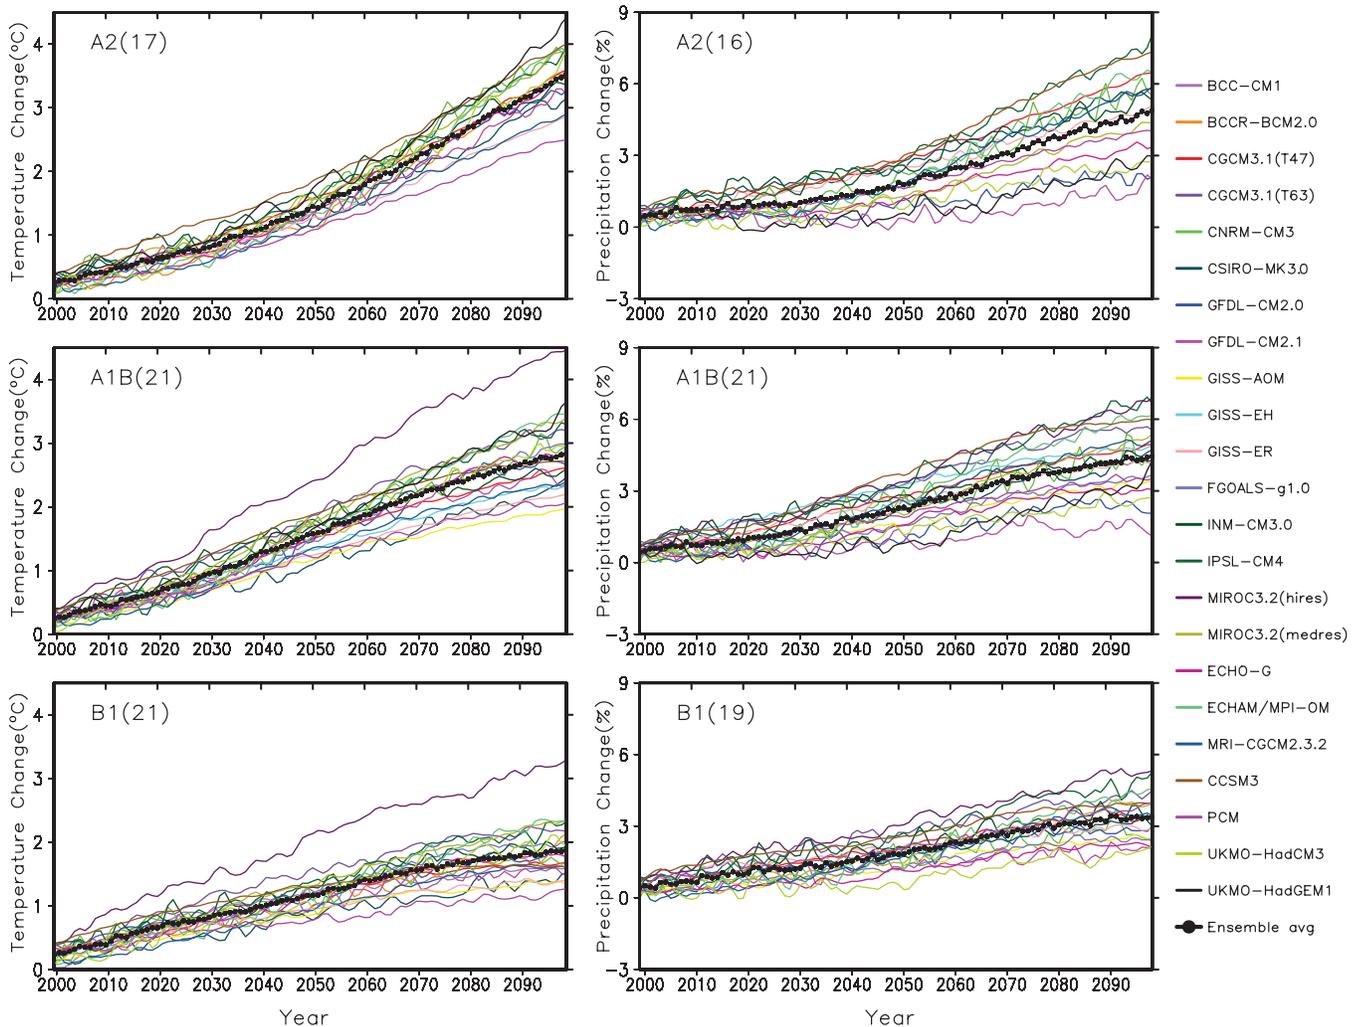

### 10.3.1 Time-Evolving Global Change

The globally averaged surface warming time series from each model in the MMD is shown in Figure 10.5, either as a single member (if that was all that was available) or a multi-member ensemble mean, for each scenario in turn. The multi-model ensemble mean warming is also plotted for each case. The surface air temperature is used, averaged over each year, shown as an anomaly relative to the 1980 to 1999 period and offset by any drift in the corresponding control runs in order to extract the forced response. The base period was chosen to match the contemporary climate simulation that is the focus of previous chapters. Similar results have been shown in studies of these models (e.g., Xu et al., 2005; Meehl et al., 2006b; Yukimoto et al., 2006). Interannual variability is evident in each single-model series, but little remains in the ensemble mean because most of this is unforced and is a result of internal variability, as was presented in detail in Section 9.2.2 of TAR. Clearly, there is a range of model results for each year, but over time this

range due to internal variability becomes smaller as a fraction of the mean warming. The range is somewhat smaller than the range of warming at the end of the 21st century for the A2 scenario in the comparable Figure 9.6 of the TAR, despite the larger number of models here (the ensemble mean warming is comparable,  $+3.0^\circ\text{C}$  in the TAR for 2071 to 2100 relative to 1961 to 1990, and  $+3.13^\circ\text{C}$  here for 2080 to 2099 relative to 1980 to 1999, Table 10.5). Consistent with the range of forcing presented in Section 10.2, the warming by 2100 is largest in the high greenhouse gas growth scenario A2, intermediate in the moderate growth A1B, and lowest in the low growth B1. Naturally, models with high sensitivity tend to simulate above-average warming in each scenario. The trends of the multi-model mean temperature vary somewhat over the century because of the varying forcings, including that of aerosols (see Section 10.2). This is illustrated in Figure 10.4, which shows the mean for A1B exceeding that for A2 around 2040. The time series beyond 2100 are derived from the extensions of the simulations (those available) under the idealised constant composition commitment experiments (Section 10.7.1).

Internal variability in the model response is reduced by averaging over 20-year time periods. This span is shorter than the traditional 30-year climatological period, in recognition of the transient nature of the simulations, and of the larger size of the ensemble. This analysis focuses on three periods over the coming century: an early-century period 2011 to 2030, a mid-century period 2046 to 2065 and the late-century period 2080 to 2099, all relative to the 1980 to 1999 means. The multi-model ensemble mean warmings for the three future periods in the different experiments are given in Table 10.5, among other results. The close agreement of warming for the early century, with a range of only  $0.05^\circ\text{C}$  among the SRES cases, shows that no matter which of these non-mitigation scenarios is followed, the warming is similar on the time scale of the next decade or two. Note that the precision given here is only relevant for comparison between these means. As evident in Figure 10.4 and discussed in Section 10.5, uncertainties in the projections are larger. It is also worth noting that half of the early-century climate change arises from warming that is already committed to under constant composition ( $0.37^\circ\text{C}$  for the early century). By mid-century, the choice of scenario becomes more important for the magnitude of warming, with a range of  $0.46^\circ\text{C}$ , and with about one-third of that warming due to climate change that is already committed to. By the late century, there are clear consequences for which scenario is followed, with a range of  $1.3^\circ\text{C}$  in these results, with as little as 18% of that warming coming from climate change that is already committed to.

Global mean precipitation increases in all scenarios (Figure 10.5, right column), indicating an intensification of the hydrological cycle. Douville et al. (2002) show that this is associated with increased water-holding capacity of the atmosphere in addition to other processes. The multi-model

**Figure 10.5.** Time series of globally averaged (left) surface warming (surface air temperature change, °C) and (right) precipitation change (%) from the various global coupled models for the scenarios A2 (top), A1B (middle) and B1 (bottom). Numbers in parentheses following the scenario name represent the number of simulations shown. Values are annual means, relative to the 1980 to 1999 average from the corresponding 20th-century simulations, with any linear trends in the corresponding control run simulations removed. A three-point smoothing was applied. Multi-model (ensemble) mean series are marked with black dots. See Table 8.1 for model details.

**Table 10.5.** Global mean warming (annual mean surface air temperature change) from the multi-model ensemble mean for four time periods relative to 1980 to 1999 for each of the available scenarios. (The mean for the base period is 13.6°C). Also given are two measures of agreement of the geographic scaled patterns of warming (the fields in Figure 10.8 normalised by the global mean), relative to the A1B 2080 to 2099 case. First the non-dimensional M value (see Section 10.3.2.1) and second (in italics) the global mean absolute error (mae, or difference, in °C/°C) between the fields, both multiplied by 100 for brevity. Here  $M = (2/\pi) \arcsin[1 - \text{mse} / (V_x + V_y + (G_x - G_y)^2)]$ , with mse the mean square error between the two fields X and Y, and V and G are variance and global mean of the fields (as subscripted). Values of 1 for M and 0 for mae indicate perfect agreement with the standard pattern. ‘Commit’ refers to the constant composition commitment experiment. Note that warming values for the end of the 21st century, given here as the average of years 2080 to 2099, are for a somewhat different averaging period than used in Figure 10.29 (2090–2099); the longer averaging period here is consistent with the comparable averaging period for the geographic plots in this section and is intended to smooth spatial noise.

	Global mean warming (°C)				Measures of agreement (M × 100, mae × 100)			
	2011–2030	2046–2065	2080–2099	2180–2199	2011–2030	2046–2065	2080–2099	2180–2199
A2	0.64	1.65	3.13		83, 8	91, 4	93, 3	
A1B	0.69	1.75	2.65	3.36	88, 5	94, 4	100, 0	90, 5
B1	0.66	1.29	1.79	2.10	86, 6	89, 4	92, 3	86, 6
Commit <sup>a</sup>	0.37	0.47	0.56		74, 11	66, 13	68, 13	

Notes:

<sup>a</sup> Committed warming values are given relative to the 1980 to 1999 base period, whereas the commitment experiments started with stabilisation at year 2000. The committed warming trend is about 0.1°C per decade over the next two decades with a reduced rate after that (see Figure 10.4).

mean varies approximately in proportion to the mean warming, though uncertainties in future hydrological cycle behaviour arise due in part to the different responses of tropical precipitation across models (Douville et al., 2005). Expressed as a percentage of the mean simulated change for 1980 to 1999 (2.83 mm day<sup>-1</sup>), the rate varies from about 1.4% °C<sup>-1</sup> in A2 to 2.3% °C<sup>-1</sup> in the constant composition commitment experiment (for a table corresponding to Table 10.5 but for precipitation, see the Supplementary Material, Table S10.1). These increases are less than increases in extreme precipitation events, consistent with energetic constraints (see Sections 9.5.4.2 and 10.3.6.1)

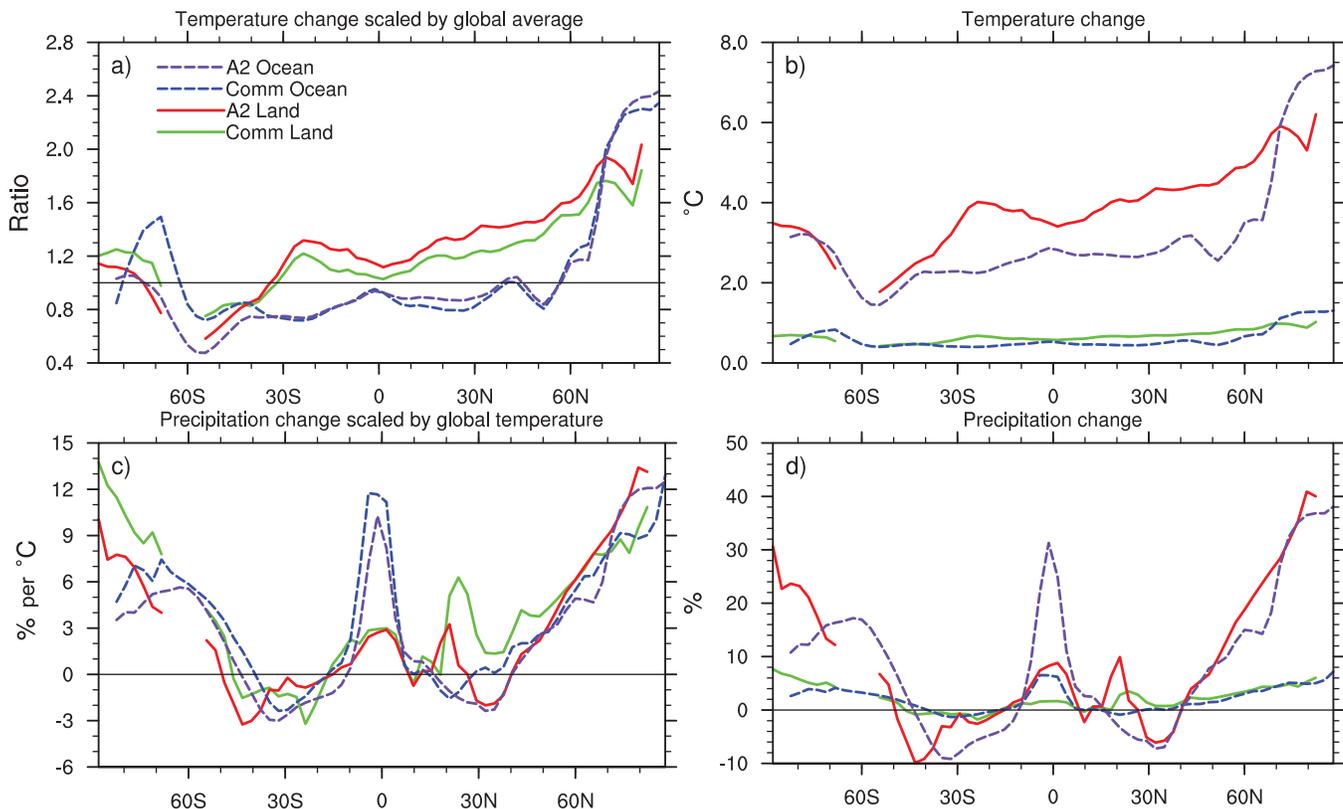

### 10.3.2 Patterns of Change in the 21st Century

#### 10.3.2.1 Warming

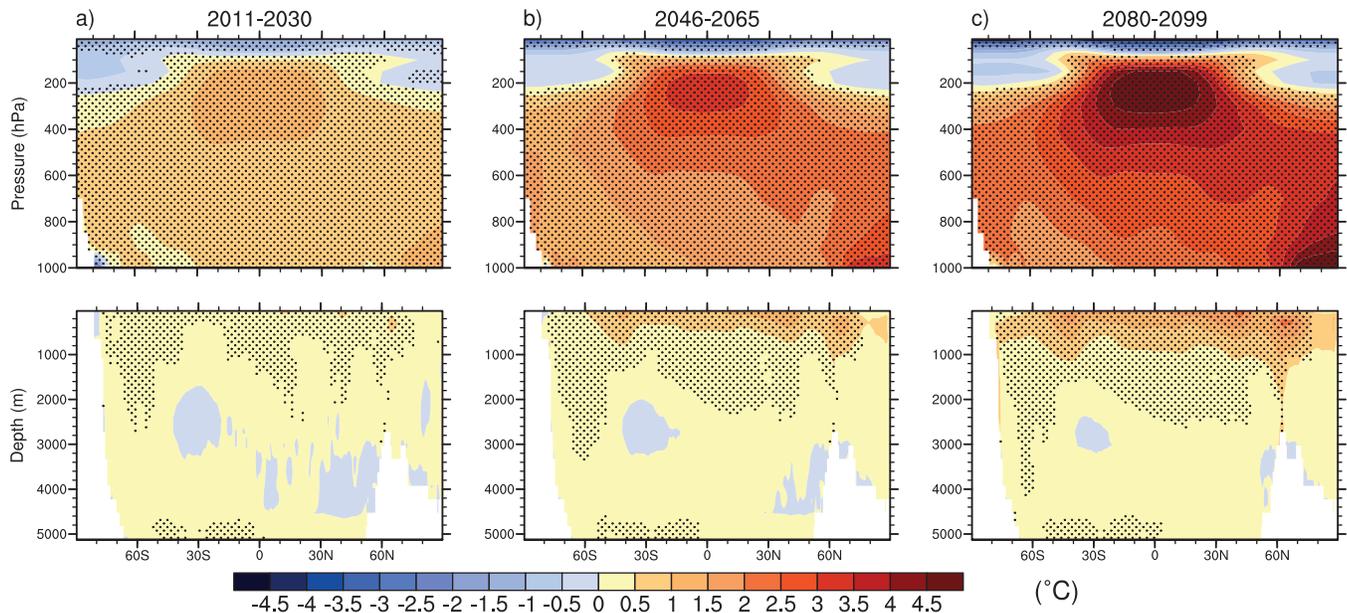

The TAR noted that much of the regional variation of the annual mean warming in the multi-model means is associated with high- to low-latitude contrast. This can be better quantified from the new multi-model mean in terms of zonal averages. A further contrast is provided by partitioning the land and ocean values based on model data interpolated to a standard grid. Figure 10.6 illustrates the late-century A2 case, with all values shown both in absolute terms and relative to the global mean warming. Warming over land is greater than the mean except in the southern mid-latitudes, where the warming over ocean is a

minimum. Warming over ocean is smaller than the mean except at high latitudes, where sea ice changes have an influence. This pattern of change illustrated by the ratios is quite similar across the scenarios. The commitment case (shown), discussed in Section 10.7.1, has relatively smaller warming of land, except in the far south, which warms closer to the global rate. At nearly all latitudes, the A1B and B1 warming ratios lie between A2 and commitment, with A1B particularly close to the A2 results. Aside from the commitment case, the ratios for the other time periods are also quite similar to those for A2. Regional patterns and precipitation contrasts are discussed in Section 10.3.2.3.

Figure 10.7 shows the zonal mean warming for the A1B scenario at each latitude from the bottom of the ocean to the top of the atmosphere for the three 21st-century periods used in Table 10.5. To produce this ensemble mean, the model data were first interpolated to standard ocean depths and atmospheric pressures. Consistent with the global transfer of excess heat from the atmosphere to the ocean, and the difference between warming over land and ocean, there is some discontinuity between the plotted means of the lower atmosphere and the upper ocean. The relatively uniform warming of the troposphere and cooling of the stratosphere in this multi-model mean are consistent with the changes shown in Figure 9.8 of the TAR, but now its evolution during the 21st century under this scenario can also be seen. Upper-tropospheric warming reaches a maximum in the tropics and is seen even in the early-century

**Figure 10.6.** Zonal means over land and ocean separately, for annual mean surface warming (a, b) and precipitation (c, d), shown as ratios scaled with the global mean warming (a, c) and not scaled (b, d). Multi-model mean results are shown for two scenarios, A2 and Commitment (see Section 10.7), for the period 2080 to 2099 relative to the zonal means for 1980 to 1999. Results for individual models can be seen in the Supplementary Material for this chapter.

**Figure 10.7.** Zonal means of change in atmospheric (top) and oceanic (bottom) temperatures ( $^{\circ}\text{C}$ ), shown as cross sections. Values are the multi-model means for the A1B scenario for three periods (a–c). Stippling denotes regions where the multi-model ensemble mean divided by the multi-model standard deviation exceeds 1.0 (in magnitude). Anomalies are relative to the average of the period 1980 to 1999. Results for individual models can be seen in the Supplementary Material for this chapter.

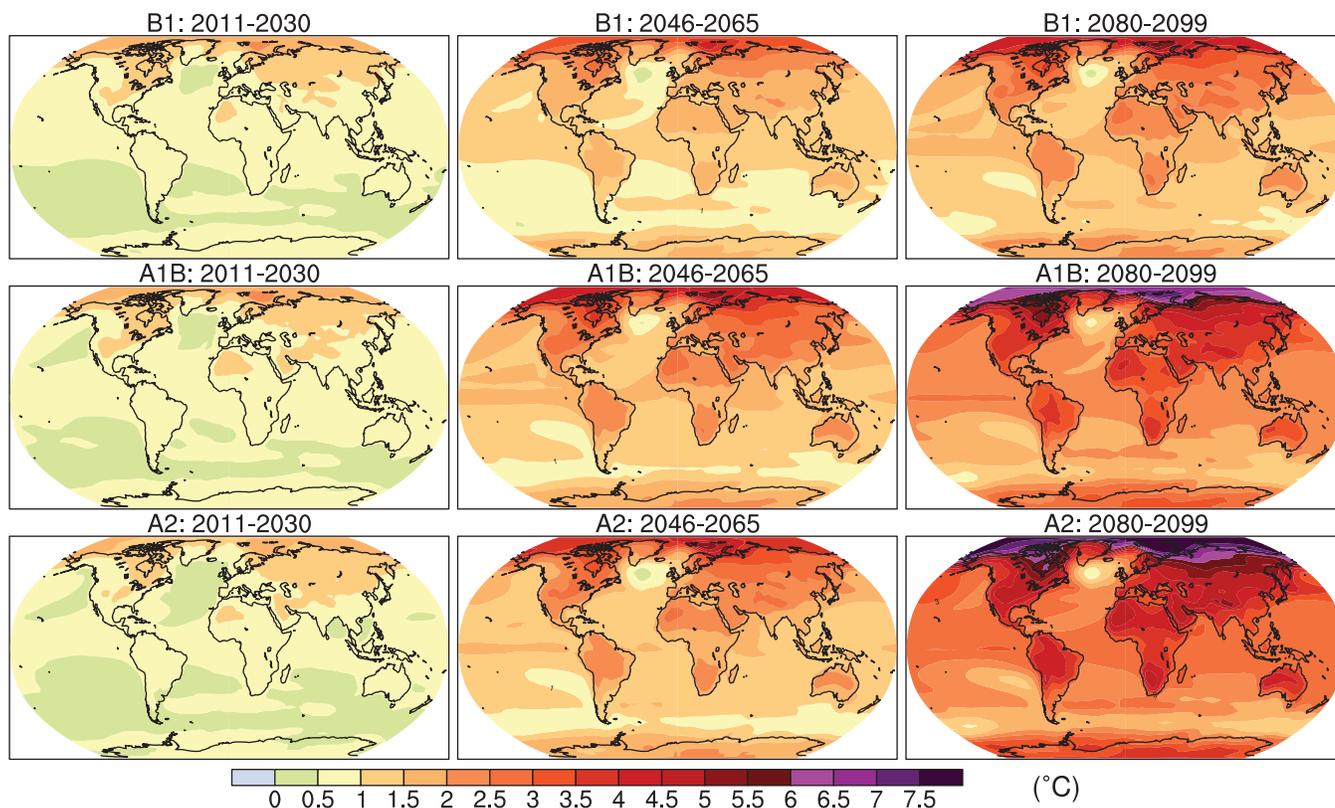

time period. The pattern is very similar over the three periods, consistent with the rapid adjustment of the atmosphere to the forcing. These changes are simulated with good consistency among the models. The larger values of both signs are stippled, indicating that the ensemble mean is larger in magnitude than the inter-model standard deviation. The ratio of mean to standard deviation can be related to formal tests of statistical significance and confidence intervals, if the individual model results were to be considered a sample.

The ocean warming evolves more slowly. There is initially little warming below the mixed layer, except at some high latitudes. Even as a ratio with mean surface warming, later in the century the temperature increases more rapidly in the deep ocean, consistent with results from individual models (e.g., Watterson, 2003; Stouffer, 2004). This rapid warming of the atmosphere and the slow penetration of the warming into the ocean has implications for the time scales of climate change commitment (Section 10.7). It has been noted in a five-member multi-model ensemble analysis that, associated with the changes in temperature of the upper ocean in Figure 10.7, the tropical Pacific Ocean heat transport remains nearly constant with increasing greenhouse gases due to the compensation of the subtropical cells and the horizontal gyre variations, even as the subtropical cells change in response to changes in the trade winds (Hazeleger, 2005). Additionally, a southward shift of the Antarctic Circumpolar Current is projected to occur in a 15-member multi-model ensemble, due to changes in surface winds in a future warmer climate (Fyfe and Saenko, 2005). This is associated with a poleward shift of the westerlies at the surface (see Section 10.3.6) and in the upper troposphere particularly notable in the Southern Hemisphere (SH) (Stone and Fyfe, 2005), and increased relative angular momentum from stronger

westerlies (Räisänen, 2003) and westerly momentum flux in the lower stratosphere particularly in the tropics and southern mid-latitudes (Watanabe et al., 2005). The surface wind changes are associated with corresponding changes in wind stress curl and horizontal mass transport in the ocean (Saenko et al., 2005).

Global-scale patterns for each of the three scenarios and time periods are given in Figure 10.8. In each case, greater warming over most land areas is evident (e.g., Kunkel and Liang, 2005). Over the ocean, warming is relatively large in the Arctic and along the equator in the eastern Pacific (see Sections 10.3.5.2 and 10.3.5.3), with less warming over the North Atlantic and the Southern Ocean (e.g., Xu et al., 2005). Enhanced oceanic warming along the equator is also evident in the zonal means of Figure 10.6, and can be associated with oceanic heat flux changes (Watterson, 2003) and forced by the atmosphere (Liu et al., 2005).

Fields of temperature change have a similar structure, with the linear correlation coefficient as high as 0.994 between the late-century A2 and A1B cases. As for the zonal means, the fields normalised by the mean warming are very similar. The strict agreement between the A1B field, as a standard, and the others is quantified in Table 10.5, by the absolute measure  $M$  (Watterson, 1996; a transformation of a measure of Mielke, 1991), with unity meaning identical fields and zero meaning no similarity (the expected value under random rearrangement of the data on the grid of the measure prior to the arcsin transformation). Values of  $M$  become progressively larger later in the 21st century, with values of 0.9 or larger for the late 21st century, thus confirming the closeness of the scaled patterns in the late-century cases. The deviation from unity is approximately proportional to the mean absolute difference. The earlier warming patterns are also similar to the standard case,

**Figure 10.8.** Multi-model mean of annual mean surface warming (surface air temperature change, °C) for the scenarios B1 (top), A1B (middle) and A2 (bottom), and three time periods, 2011 to 2030 (left), 2046 to 2065 (middle) and 2080 to 2099 (right). Stippling is omitted for clarity (see text). Anomalies are relative to the average of the period 1980 to 1999. Results for individual models can be seen in the Supplementary Material for this chapter.

particularly for the same scenario A1B. Furthermore, the zonal means over land and ocean considered above are representative of much of the small differences in warming ratio. While there is some influence of differences in forcing patterns among the scenarios, and of effects of oceanic uptake and heat transport in modifying the patterns over time, there is also support for the role of atmospheric heat transport in offsetting such influences (e.g., Boer and Yu, 2003b; Watterson and Dix, 2005). Dufresne et al. (2005) show that aerosol contributes a modest cooling of the Northern Hemisphere (NH) up to the mid-21st century in the A2 scenario.

Such similarities in patterns of change have been described by Mitchell (2003) and Harvey (2004). They aid the efficient presentation of the broad scale multi-model results, as patterns depicted for the standard A1B 2080 to 2099 case are usually typical of other cases. This largely applies to other seasons and also other variables under consideration here. Where there is similarity of normalised changes, values for other cases can be estimated by scaling by the appropriate ratio of global means from Table 10.5. Note that for some quantities like variability and extremes, such scaling is unlikely to work. The use of such scaled results in combination with global warmings from simple models is discussed in Section 11.10.1.

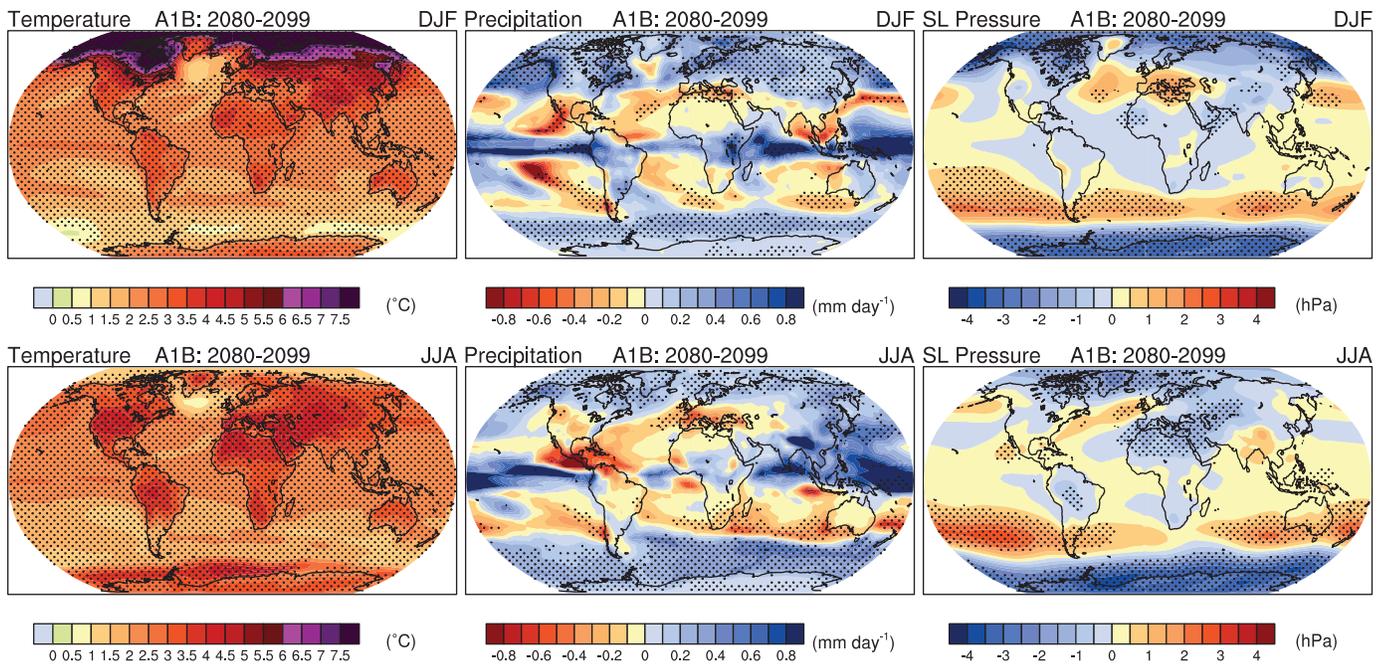

As for the zonal means (aside from the Arctic Ocean), consistency in local warmings among the models is high (stippling is omitted in Figure 10.8 for clarity). Only in the

central North Atlantic and the far south Pacific in 2011 to 2030 is the mean change less than the standard deviation, in part a result of ocean model limitations there (Section 8.3.2). Some regions of high-latitude surface cooling occur in individual models.

The surface warming fields for the extratropical winter and summer seasons, December to February (DJF) and June to August (JJA), are shown for scenario A1B in Figure 10.9. The high-latitude warming is rather seasonal, being larger in winter as a result of sea ice and snow, as noted in Chapter 9 of the TAR. However, the relatively small warming in southern South America is more extensive in southern winter. Similar patterns of change in earlier model simulations are described by Giorgi et al. (2001).

### 10.3.2.2 Cloud and Diurnal Cycle

In addition to being an important link to humidity and precipitation, cloud cover plays an important role for the sensitivity of the general circulation models (GCMs; e.g., Soden and Held, 2006) and for the diurnal temperature range (DTR) over land (e.g., Dai and Trenberth, 2004 and references therein) so this section considers the projection of these variables now made possible by multi-model ensembles. Cloud radiative feedbacks to greenhouse gas forcing are sensitive to the elevation, latitude and hence temperature of the clouds, in addition to their optical

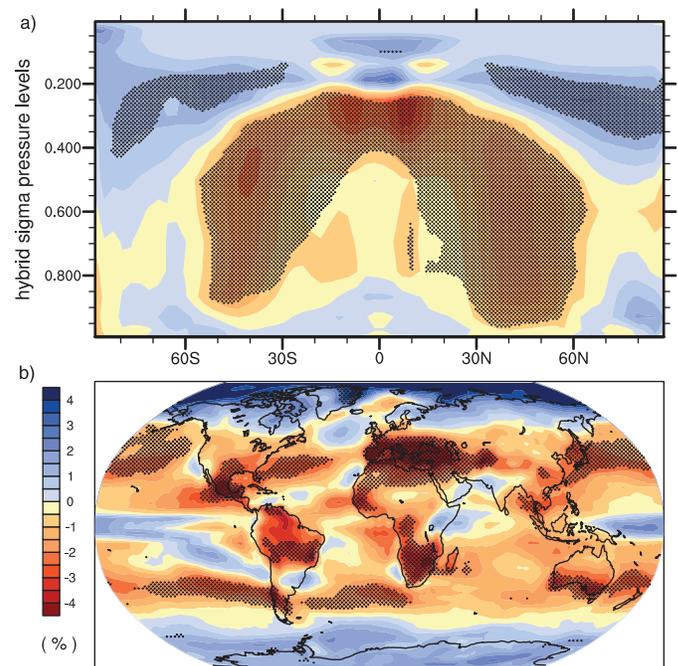

**Figure 10.9.** Multi-model mean changes in surface air temperature (°C, left), precipitation (mm day<sup>-1</sup>, middle) and sea level pressure (hPa, right) for boreal winter (DJF, top) and summer (JJA, bottom). Changes are given for the SRES A1B scenario, for the period 2080 to 2099 relative to 1980 to 1999. Stippling denotes areas where the magnitude of the multi-model ensemble mean exceeds the inter-model standard deviation. Results for individual models can be seen in the Supplementary Material for this chapter.

depth and their atmospheric environment (see Section 8.6.3.2). Current GCMs simulate clouds through various complex parametrizations (see Section 8.2.1.3) to produce cloud cover quantified by an area fraction within each grid square and each atmospheric layer. Taking multi-model ensemble zonal means of this quantity interpolated to standard pressure levels and latitudes shows increases in cloud cover at all latitudes in the vicinity of the tropopause, and mostly decreases below, indicating an increase in the altitude of clouds overall (Figure 10.10a). This shift occurs consistently across models. Outside the tropics the increases aloft are rather consistent, as indicated by the stippling in the figure. Near-surface amounts increase at some latitudes. The mid-level mid-latitude decreases are very consistent, amounting to as much as one-fifth of the average cloud fraction simulated for 1980 to 1999.

The total cloud area fraction from an individual model represents the net coverage over all the layers, after allowance for the overlap of clouds, and is an output included in the data set. The change in the ensemble mean of this field is shown in Figure 10.10b. Much of the low and middle latitudes experience a decrease in cloud cover, simulated with some consistency. There are a few low-latitude regions of increase, as well as substantial increases at high latitudes. The larger changes relate well to changes in precipitation discussed in Section 10.3.2.3. While clouds need not be precipitating, moderate spatial correlation between cloud cover and precipitation holds for seasonal means of both the present climate and future changes.

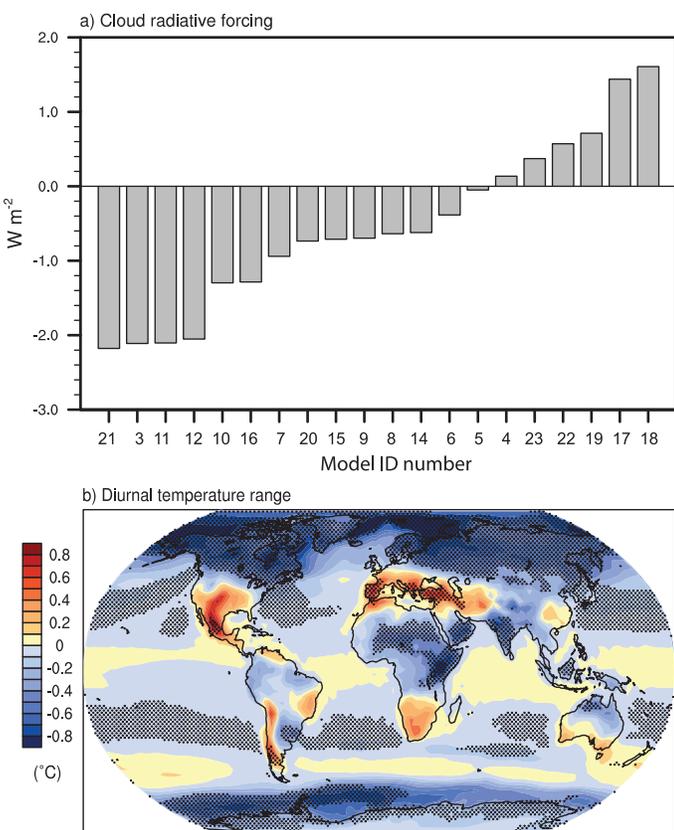

The radiative effect of clouds is represented by the cloud radiative forcing diagnostic (see Section 8.6.3.2). This can be

**Figure 10.10.** Multi-model mean changes in (a) zonal mean cloud fraction (%), shown as a cross section through the atmosphere, and (b) total cloud area fraction (percent cover from all models). Changes are given as annual means for the SRES A1B scenario for the period 2080 to 2099 relative to 1980 to 1999. Stippling denotes areas where the magnitude of the multi-model ensemble mean exceeds the inter-model standard deviation. Results for individual models can be seen in the Supplementary Material for this chapter.

evaluated from radiative fluxes at the top of the atmosphere calculated with or without the presence of clouds that are output by the GCMs. In the multi-model mean (not shown) values vary in sign over the globe. The global and annual mean averaged over the models, for 1980 to 1999, is  $-22.3 \text{ W m}^{-2}$ . The change in mean cloud radiative forcing has been shown to have different signs in a limited number of previous modelling studies (Meehl et al., 2004b; Tsushima et al., 2006). Figure 10.11a shows globally averaged cloud radiative forcing changes for 2080 to 2099 under the A1B scenario for individual models of the data set, which have a variety of different magnitudes and even signs. The ensemble mean change is  $-0.6 \text{ W m}^{-2}$ . This range indicates that cloud feedback is still an uncertain feature of the global coupled models (see Section 8.6.3.2.2).

The DTR has been shown to be decreasing in several land areas of the globe in 20th-century observations (see Section 3.2.2.7), together with increasing cloud cover (see also Section 9.4.2.3). In the multi-model mean of present climate, DTR over land is indeed closely spatially anti-correlated with the total cloud cover field. This is true also of the 21st-century changes in the fields under the A1B scenario, as can be seen by comparing

**Figure 10.11.** Changes in (a) global mean cloud radiative forcing ( $\text{W m}^{-2}$ ) from individual models (see Table 10.4 for the list of models) and (b) multi-model mean diurnal temperature range ( $^{\circ}\text{C}$ ). Changes are annual means for the SRES A1B scenario for the period 2080 to 2099 relative to 1980 to 1999. Stippling denotes areas where the magnitude of the multi-model ensemble mean exceeds the inter-model standard deviation. Results for individual models can be seen in the Supplementary Material for this chapter.

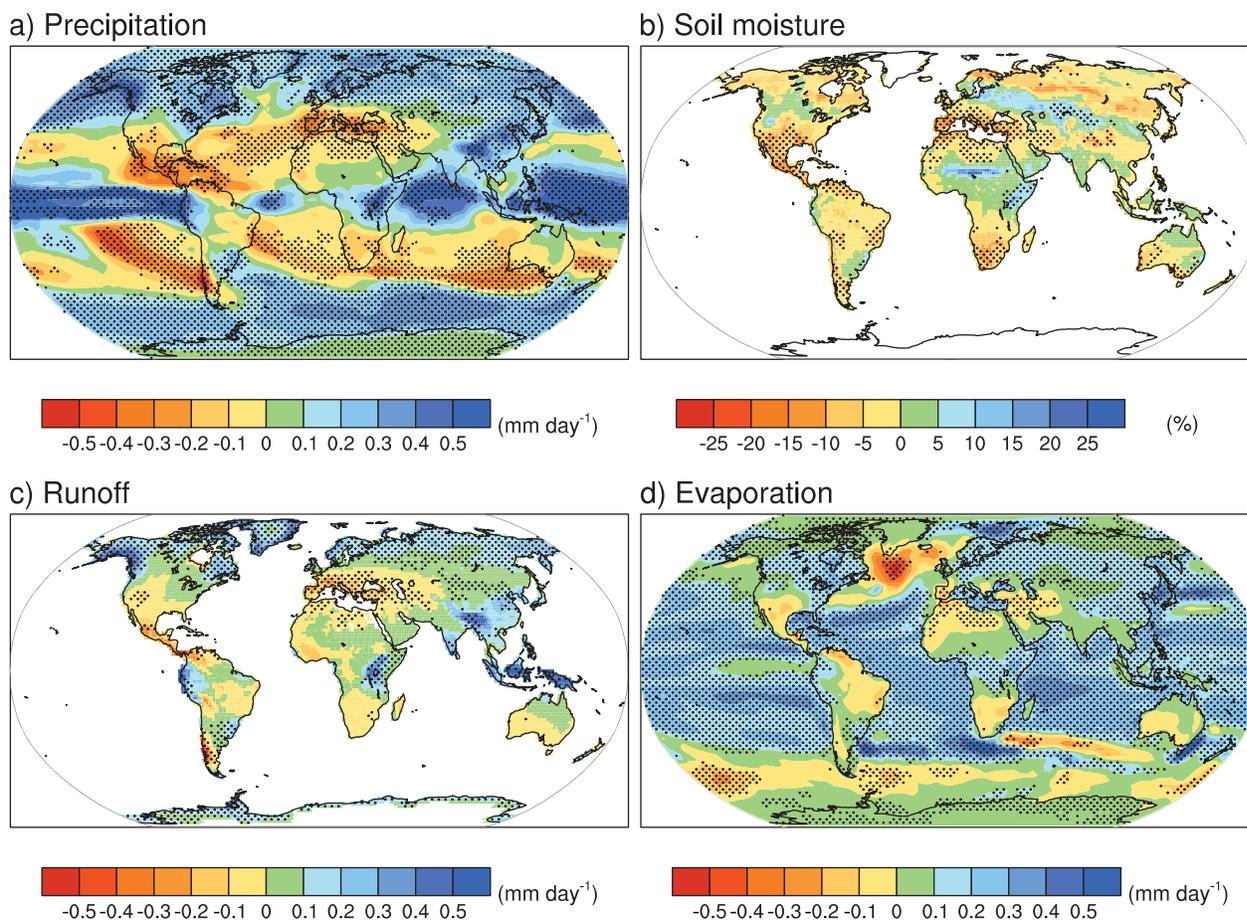

the change in DTR shown in Figure 10.11b with the cloud area fraction shown in Figure 10.10b. Changes in DTR reach a magnitude of  $0.5^{\circ}\text{C}$  in some regions, with some consistency among the models. Smaller widespread decreases are likely due to the radiative effect of the enhanced greenhouse gases including water vapour (see also Stone and Weaver, 2002). Further discussion of DTR is provided in Section 10.3.6.2.

In addition to the DTR, Kitoh and Arakawa (2005) document changes in the regional patterns of diurnal precipitation over the Indonesian region, and show that over ocean, nighttime precipitation decreases and daytime precipitation increases, while over land the opposite is the case, thus producing a decrease in the diurnal precipitation amplitude over land and ocean. They attribute these changes to a larger nighttime temperature increase over land due to increased greenhouse gases.

### 10.3.2.3 Precipitation and Surface Water

Models simulate that global mean precipitation increases with global warming. However, there are substantial spatial and seasonal variations in this field even in the multi-model means depicted in Figure 10.9. There are fewer areas stippled for precipitation than for the warming, indicating more variation in the magnitude of change among the ensemble of models. Increases in precipitation at high latitudes in both seasons are very consistent across models. The increases in precipitation over the tropical oceans and in some of the monsoon regimes (e.g., South Asian monsoon in JJA, Australian monsoon in DJF) are notable, and while not as consistent locally, considerable agreement is found at the broader scale in the tropics (Neelin et al., 2006). There are widespread decreases in mid-latitude summer precipitation, except for increases in eastern Asia. Decreases in precipitation over many subtropical areas are evident in the multi-model ensemble mean, and consistency in the sign of change among the models is often high (Wang, 2005), particularly in some regions like the tropical Central American-Caribbean (Neelin et al., 2006). Further discussion of regional changes is presented in Chapter 11.

The global map of the A1B 2080 to 2099 change in annual mean precipitation is shown in Figure 10.12, along with other hydrological quantities from the multi-model ensemble. Emori and Brown (2005) show percentage changes of annual precipitation from the ensemble. Increases of over 20% occur at most high latitudes, as well as in eastern Africa, central Asia and the equatorial Pacific Ocean. The change over the ocean between  $10^{\circ}\text{S}$  and  $10^{\circ}\text{N}$  accounts for about half the increase in the global mean (Figure 10.5). Substantial decreases, reaching 20%, occur in the Mediterranean region (Rowell and Jones, 2006), the Caribbean region (Neelin et al., 2006) and the subtropical western coasts of each continent. Overall, precipitation over land increases by about 5%, while precipitation over ocean increases 4%, but with regional changes of both signs. The net change over land accounts for 24% of the global mean increase in precipitation, a little less than the areal proportion of land (29%). In Figure 10.12, stippling indicates that the sign of the

**Figure 10.12.** Multi-model mean changes in (a) precipitation ( $\text{mm day}^{-1}$ ), (b) soil moisture content (%), (c) runoff ( $\text{mm day}^{-1}$ ) and (d) evaporation ( $\text{mm day}^{-1}$ ). To indicate consistency in the sign of change, regions are stippled where at least 80% of models agree on the sign of the mean change. Changes are annual means for the SRES A1B scenario for the period 2080 to 2099 relative to 1980 to 1999. Soil moisture and runoff changes are shown at land points with valid data from at least 10 models. Details of the method and results for individual models can be found in the Supplementary Material for this chapter.

local change is common to at least 80% of the models (with the alternative test shown in the Supplementary Material). This simpler test for consistency is of particular interest for quantities where the magnitudes for the base climate vary across models.

These patterns of change occur in the other scenarios, although with agreement (by the metric M) a little lower than for the warming. The predominance of increases near the equator and at high latitudes, for both land and ocean, is clear from the zonal mean changes of precipitation included in Figure 10.6. The results for change scaled by global mean warming are rather similar across the four scenarios, an exception being a relatively large increase over the equatorial ocean for the commitment case. As with surface temperature, the A1B and B1 scaled values are always close to the A2 results. The zonal means of the percentage change map (shown in Figure 10.6) feature substantial decreases in the subtropics and lower mid-latitudes of both hemispheres in the A2 case, even if increases occur over some regions.

Wetherald and Manabe (2002) provide a good description of the mechanism of hydrological change simulated by GCMs. In GCMs, the global mean evaporation changes closely

balance the precipitation change, but not locally because of changes in the atmospheric transport of water vapour. Annual average evaporation (Figure 10.12) increases over much of the ocean, with spatial variations tending to relate to those in the surface warming (Figure 10.8). As found by Kutzbach et al. (2005) and Bosilovich et al. (2005), atmospheric moisture convergence increases over the equatorial oceans and over high latitudes. Over land, rainfall changes tend to be balanced by both evaporation and runoff. Runoff (Figure 10.12) is notably reduced in southern Europe and increased in Southeast Asia and at high latitudes, where there is consistency among models in the sign of change (although less consistency in the magnitude of change). The larger changes reach 20% or more of the simulated 1980 to 1999 values, which range from 1 to 5  $\text{mm day}^{-1}$  in wetter regions to below 0.2  $\text{mm day}^{-1}$  in deserts. Runoff from the melting of ice sheets (Section 10.3.3) is not included here. Nohara et al. (2006) and Milly et al. (2005) assess the impacts of these changes in terms of river flow, and find that discharges from high-latitude rivers increase, while those from major rivers in the Middle East, Europe and Central America tend to decrease.

Models simulate the moisture in the upper few metres of the land surface in varying ways, and evaluation of the soil moisture content is still difficult (See Section 8.2.3.2; Wang, 2005; Gao and Dirmeyer, 2006 for multi-model analyses). The average of the total soil moisture content quantity submitted to the data set is presented here to indicate typical trends. In the annual mean (Figure 10.12), decreases are common in the subtropics and the Mediterranean region. There are increases in east Africa, central Asia, and some other regions with increased precipitation. Decreases also occur at high latitudes, where snow cover diminishes (Section 10.3.3). While the magnitudes of change are quite uncertain, there is good consistency in the signs of change in many of these regions. Similar patterns of change occur in seasonal results (Wang, 2005). Regional hydrological changes are considered in Chapter 11 and in the IPCC Working Group II report.

#### 10.3.2.4 Sea Level Pressure and Atmospheric Circulation

As a basic component of the mean atmospheric circulations and weather patterns, projections of the mean sea level pressure for the medium scenario A1B are considered. Seasonal mean changes for DJF and JJA are shown in Figure 10.9 (matching results in Wang and Swail, 2006b). Sea level pressure differences show decreases at high latitudes in both seasons in both hemispheres. The compensating increases are predominantly over the mid-latitude and subtropical ocean regions, extending across South America, Australia and southern Asia in JJA, and the Mediterranean in DJF. Many of these increases are consistent across the models. This pattern of change, discussed further in Section 10.3.5.3, has been linked to an expansion of the Hadley Circulation and a poleward shift of the mid-latitude storm tracks (Yin, 2005). This helps explain, in part, the increases in precipitation at high latitudes and decreases in the subtropics and parts of the mid-latitudes. Further analysis of the regional details of these changes is given in Chapter 11. The pattern of pressure change implies increased westerly flows across the western parts of the continents. These contribute to increases in mean precipitation (Figure 10.9) and increased precipitation intensity (Meehl et al., 2005a).

### 10.3.3 Changes in Ocean/Ice and High-Latitude Climate

#### 10.3.3.1 Changes in Sea Ice Cover

Models of the 21st century project that future warming is amplified at high latitudes resulting from positive feedbacks involving snow and sea ice, and other processes (Section 8.6.3.3). The warming is particularly large in autumn and early winter (Manabe and Stouffer, 1980; Holland and Bitz, 2003) when sea ice is thinnest and the snow depth is insufficient to blur the relationship between surface air temperature and sea ice thickness (Maykut and Untersteiner, 1971). As shown by Zhang and Walsh (2006), the coupled models show a range of responses in NH sea ice areal extent ranging from very little

change to a strong and accelerating reduction over the 21st century (Figure 10.13a,b).

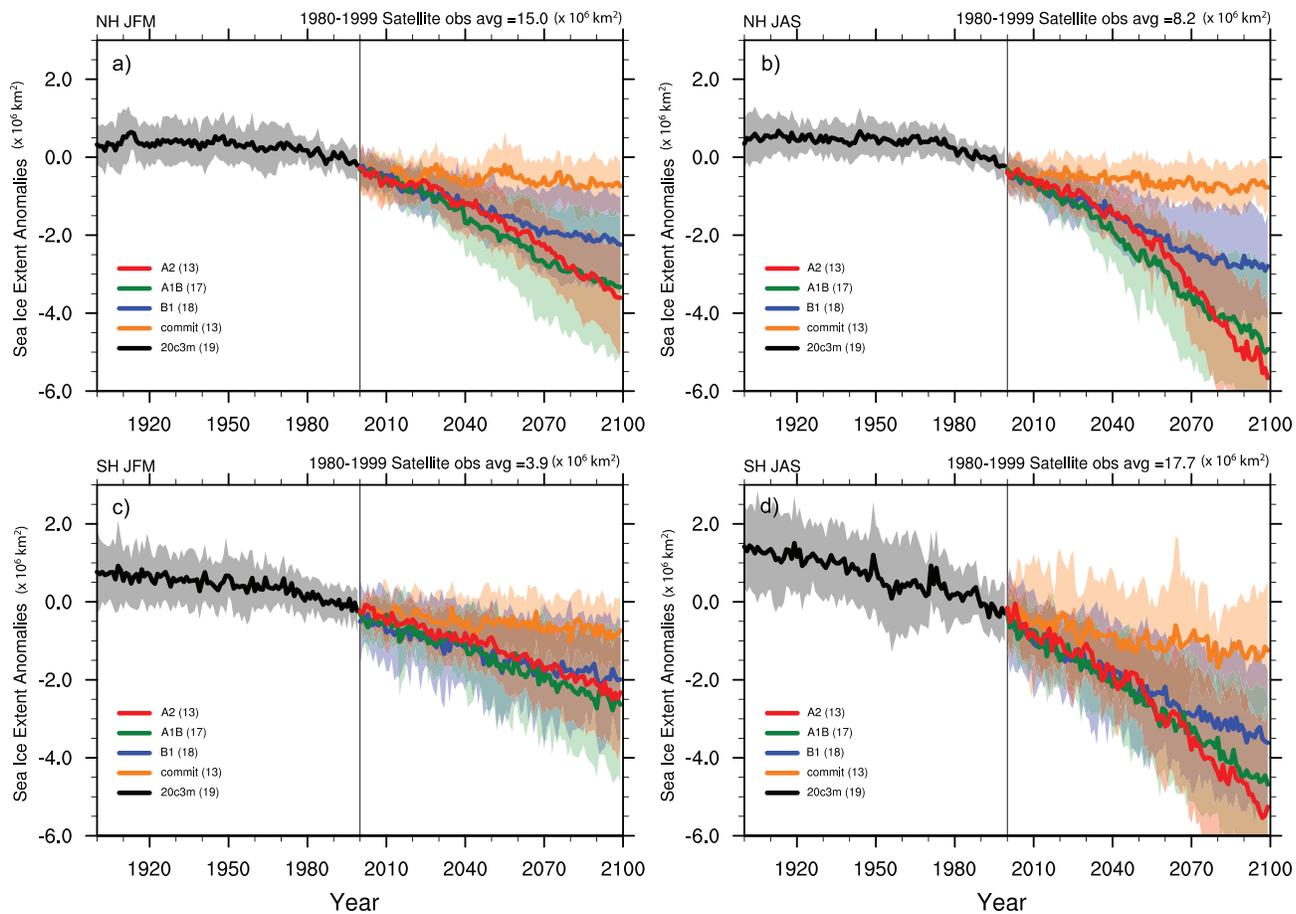

An important characteristic of the projected change is for summer ice area to decline far more rapidly than winter ice area (Gordon and O'Farrell, 1997), and hence sea ice rapidly approaches a seasonal ice cover in both hemispheres (Figures 10.13b and 10.14). Seasonal ice cover is, however, rather robust and persists to some extent throughout the 21st century in most (if not all) models. Bitz and Roe (2004) note that future projections show that arctic sea ice thins fastest where it is initially thickest, a characteristic that future climate projections share with sea ice thinning observed in the late 20th century (Rothrock et al., 1999). Consistent with these results, a projection by Gregory et al. (2002b) shows that arctic sea ice volume decreases more quickly than sea ice area (because trends in winter ice area are low) in the 21st century.

In 20th- and 21st-century simulations, antarctic sea ice cover is projected to decrease more slowly than in the Arctic (Figures 10.13c,d and 10.14), particularly in the vicinity of the Ross Sea where most models predict a local minimum in surface warming. This is commensurate with the region with the greatest reduction in ocean heat loss, which results from reduced vertical mixing in the ocean (Gregory, 2000). The ocean stores much of its increased heat below 1 km depth in the Southern Ocean. In contrast, horizontal heat transport poleward of about 60°N increases in many models (Holland and Bitz, 2003), but much of this heat remains in the upper 1 km of the northern subpolar seas and Arctic Ocean (Gregory, 2000; Bitz et al., 2006). Bitz et al. (2006) argue that these differences in the depth where heat is accumulating in the high-latitude oceans have consequences for the relative rates of sea ice decay in the Arctic and Antarctic.

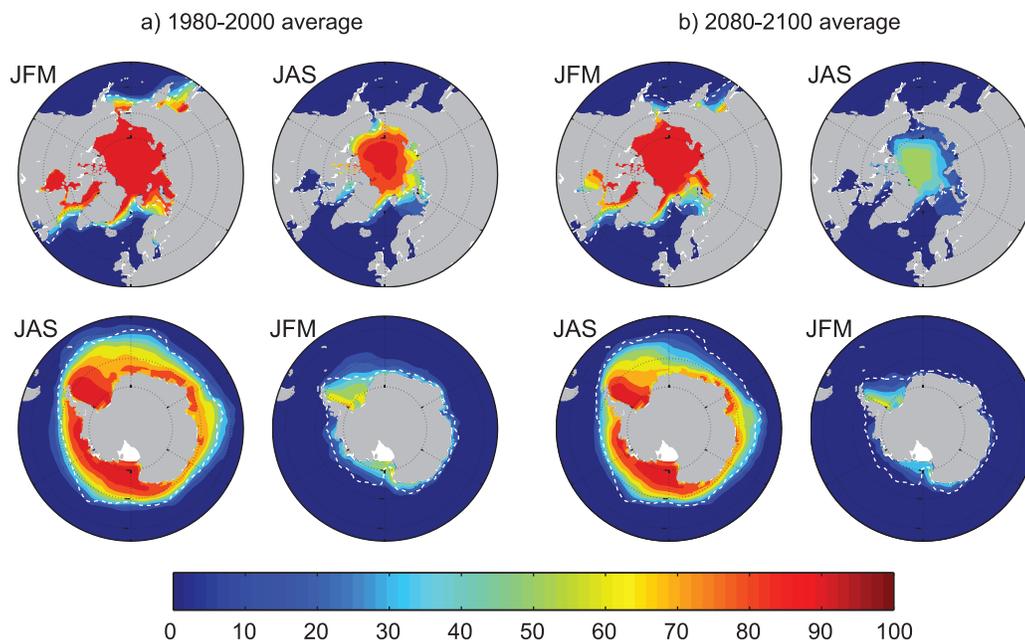

While most climate models share these common characteristics (peak surface warming in autumn and early winter, sea ice rapidly becomes seasonal, arctic ice decays faster than antarctic ice, and northward ocean heat transport increases into the northern high latitudes), models have poor agreement on the amount of thinning of sea ice (Flato and Participating CMIP Modeling Groups, 2004; Arzel et al., 2006) and the overall climate change in the polar regions (IPCC, 2001; Holland and Bitz, 2003). Flato (2004) shows that the basic state of the sea ice and the reduction in thickness and/or extent have little to do with sea ice model physics among CMIP2 models. Holland and Bitz (2003) and Arzel et al. (2006) find serious biases in the basic state of simulated sea ice thickness and extent. Further, Rind et al. (1995), Holland and Bitz (2003) and Flato (2004) show that the basic state of the sea ice thickness and extent have a significant influence on the projected change in sea ice thickness in the Arctic and extent in the Antarctic.

#### 10.3.3.2 Changes in Snow Cover and Frozen Ground

Snow cover is an integrated response to both temperature and precipitation and exhibits strong negative correlation with air temperature in most areas with a seasonal snow cover (see Section 8.6.3.3 for an evaluation of model-simulated

**Figure 10.13.** Multi-model simulated anomalies in sea ice extent for the 20th century (20c3m) and 21st century using the SRES A2, A1B and B1 as well as the commitment scenario for (a) Northern Hemisphere January to March (JFM), (b) Northern Hemisphere July to September (JAS). Panels (c) and (d) are as for (a) and (b) but for the Southern Hemisphere. The solid lines show the multi-model mean, shaded areas denote  $\pm 1$  standard deviation. Sea ice extent is defined as the total area where sea ice concentration exceeds 15%. Anomalies are relative to the period 1980 to 2000. The number of models is given in the legend and is different for each scenario.

**Figure 10.14.** Multi-model mean sea ice concentration (%) for January to March (JFM) and June to September (JAS), in the Arctic (top) and Antarctic (bottom) for the periods (a) 1980 to 2000 and (b) 2080 to 2100 for the SRES A1B scenario. The dashed white line indicates the present-day 15% average sea ice concentration limit. Modified from Flato et al. (2004).

present-day snow cover). Because of this temperature association, the simulations project widespread reductions in snow cover over the 21st century (Supplementary Material, Figure S10.1). For the Arctic Climate Impact Assessment (ACIA) model mean, at the end of the 21st century the projected reduction in the annual mean NH snow cover is 13% under the B2 scenario (ACIA, 2004). The individual model projections range from reductions of 9 to 17%. The actual reductions are greatest in spring and late autumn/early winter, indicating a shortened snow cover season (ACIA, 2004). The beginning of the snow accumulation season (the end of the snowmelt season) is projected to be later (earlier), and the fractional snow coverage is projected to decrease during the snow season (Hosaka et al., 2005).

Warming at high northern latitudes in climate model simulations is also associated with large increases in simulated thaw depth over much of the permafrost regions (Lawrence and Slater, 2005; Yamaguchi et al., 2005; Kitabata et al., 2006). Yamaguchi et al. (2005) show that initially soil moisture increases during the summer. In the late 21st century when the thaw depth has increased substantially, a reduction in summer soil moisture eventually occurs (Kitabata et al., 2006). Stendel and Christensen (2002) show poleward movement of permafrost extent, and a 30 to 40% increase in active layer thickness for most of the permafrost area in the NH, with the largest relative increases concentrated in the northernmost locations.

Regionally, the changes are a response to both increased temperature and increased precipitation (changes in circulation patterns) and are complicated by the competing effects of warming and increased snowfall in those regions that remain below freezing (see Section 4.2 for a further discussion of processes that affect snow cover). In general, snow amount and snow coverage decreases in the NH (Supplementary Material, Figure S10.1). However, in a few regions (e.g., Siberia), snow amount is projected to increase. This is attributed to the increase in precipitation (snowfall) from autumn to winter (Meleshko et al., 2004; Hosaka et al., 2005).

### 10.3.3.3 Changes in Greenland Ice Sheet Mass Balance

As noted in Section 10.6, modelling studies (e.g., Hanna et al., 2002; Kiilsholm et al., 2003; Wild et al., 2003) as well as satellite observations, airborne altimeter surveys and other studies (Abdalati et al., 2001; Thomas et al., 2001; Krabill et al., 2004; Johannessen et al., 2005; Zwally et al., 2005; Rignot and Kanagaratnam, 2006) suggest a slight inland thickening and strong marginal thinning resulting in an overall negative Greenland Ice Sheet mass balance which has accelerated recently (see Section 4.6.2.2.). A consistent feature of all climate models is that projected 21st-century warming is amplified in northern latitudes. This suggests continued melting of the Greenland Ice Sheet, since increased summer melting dominates over increased winter precipitation in model projections of future climate. Ridley et al. (2005) coupled UKMO-HadCM3 to an ice sheet model to explore the melting of the Greenland Ice Sheet under elevated (four times pre-industrial) levels of atmospheric CO<sub>2</sub> (see Section 10.7.4.3, Figure 10.38). While the entire Greenland

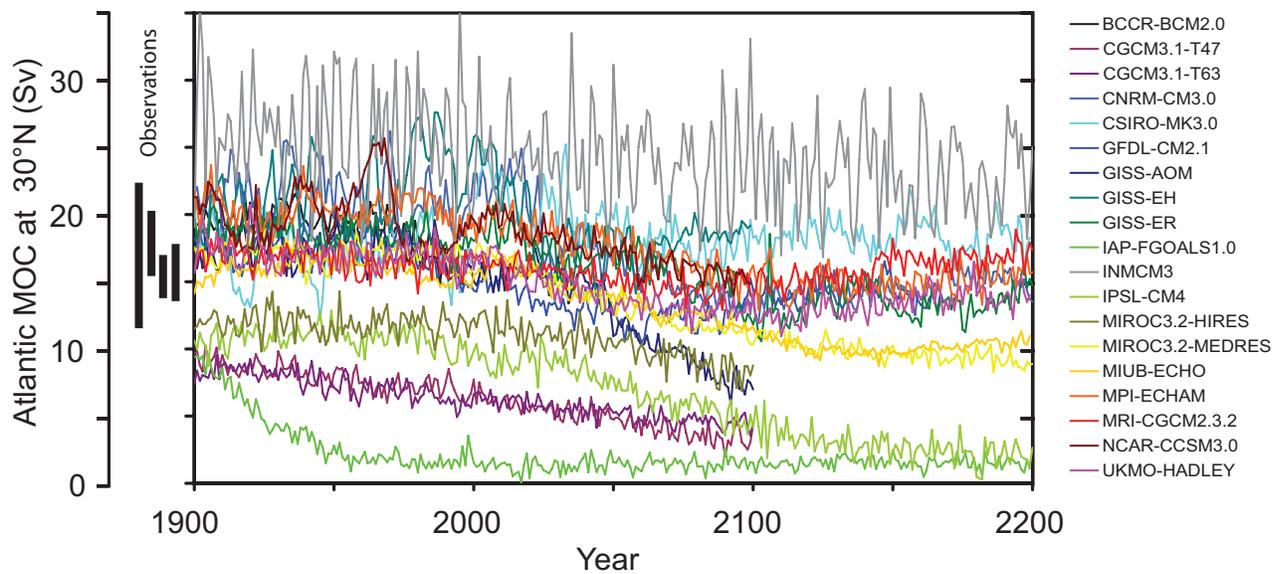

Ice Sheet eventually completely ablated (after 3 kyr), the peak rate of melting was 0.06 Sv (1 Sv = 10<sup>6</sup> m<sup>3</sup> s<sup>-1</sup>) corresponding to about 5.5 mm yr<sup>-1</sup> global sea level rise (see Sections 10.3.4 and 10.6.6). Toniazzi et al. (2004) further show that in UKMO-HadCM3, the complete melting of the Greenland Ice sheet is an irreversible process even if pre-industrial levels of atmospheric CO<sub>2</sub> are re-established after it melts.

### 10.3.4 Changes in the Atlantic Meridional Overturning Circulation

A feature common to all climate model projections is the increase in high-latitude temperature as well as an increase in high-latitude precipitation. This was reported in the TAR and is confirmed by the projections using the latest versions of comprehensive climate models (see Section 10.3.2). Both of these effects tend to make the high-latitude surface waters less dense and hence increase their stability, thereby inhibiting convective processes. As more coupled models have become available since the TAR, the evolution of the Atlantic Meridional Overturning Circulation (MOC) can be more thoroughly assessed. Figure 10.15 shows simulations from 19 coupled models integrated from 1850 to 2100 under SRES A1B atmospheric CO<sub>2</sub> and aerosol scenarios up to year 2100, and constant concentrations thereafter (see Figure 10.5). All of the models, except CGCM3.1, INM-CM3.0 and MRI-CGCM2.3.2, were run without flux adjustments (see Table 8.1). The MOC is influenced by the density structure of the Atlantic Ocean, small-scale mixing and the surface momentum and buoyancy fluxes. Some models simulate a MOC strength that is inconsistent with the range of present-day estimates (Smethie and Fine, 2001; Ganachaud, 2003; Lumpkin and Speer, 2003; Talley, 2003). The MOC for these models is shown for completeness but is not used in assessing potential future changes in the MOC in response to various emissions scenarios.

Fewer studies have focused on projected changes in the Southern Ocean resulting from future climate warming. A common feature of coupled model simulations is the projected poleward shift and strengthening of the SH westerlies (Yin, 2005; Fyfe and Saenko, 2006). This in turn leads to a strengthening, poleward shift and narrowing of the Antarctic Circumpolar Current. Fyfe and Saenko (2006) further note that the enhanced equatorward surface Ekman transport, associated with the intensified westerlies, is balanced by an enhanced deep geostrophic poleward return flow below 2,000 m.

Generally, the simulated late-20th century Atlantic MOC shows a spread ranging from a weak MOC of about 12 Sv to over 20 Sv (Figure 10.15; Schmittner et al., 2005). When forced with the SRES A1B scenario, the models show a reduction in the MOC of up to 50% or more, but in one model, the changes are not distinguishable from the simulated natural variability. The reduction in the MOC proceeds on the time scale of the simulated warming because it is a direct response to the increase in buoyancy at the ocean surface. A positive North Atlantic Oscillation (NAO) trend might delay this response by a few decades but not prevent it (Delworth and Dixon, 2000). Such

**Figure 10.15.** Evolution of the Atlantic meridional overturning circulation (MOC) at 30°N in simulations with the suite of comprehensive coupled climate models (see Table 8.1 for model details) from 1850 to 2100 using 20th Century Climate in Coupled Models (20C3M) simulations for 1850 to 1999 and the SRES A1B emissions scenario for 1999 to 2100. Some of the models continue the integration to year 2200 with the forcing held constant at the values of year 2100. Observationally based estimates of late-20th century MOC are shown as vertical bars on the left. Three simulations show a steady or rapid slow down of the MOC that is unrelated to the forcing; a few others have late-20th century simulated values that are inconsistent with observational estimates. Of the model simulations consistent with the late-20th century observational estimates, no simulation shows an increase in the MOC during the 21st century; reductions range from indistinguishable within the simulated natural variability to over 50% relative to the 1960 to 1990 mean; and none of the models projects an abrupt transition to an off state of the MOC. Adapted from Schmittner et al. (2005) with additions.

a weakening of the MOC in future climate causes reduced sea surface temperature (SST) and salinity in the region of the Gulf Stream and North Atlantic Current (Dai et al., 2005). This can produce a decrease in northward heat transport south of 60°N, but increased northward heat transport north of 60°N (A. Hu et al., 2004). No model shows an increase in the MOC in response to the increase in greenhouse gases, and no model simulates an abrupt shut-down of the MOC within the 21st century. One study suggests that inherent low-frequency variability in the Atlantic region, the Atlantic Multidecadal Oscillation, may produce a natural weakening of the MOC over the next few decades that could further accentuate the decrease due to anthropogenic climate change (Knight et al., 2005; see Section 8.4.6).

In some of the older models (e.g., Dixon et al., 1999), increased high-latitude precipitation dominates over increased high-latitude warming in causing the weakening, while in others (e.g., Mikolajewicz and Voss, 2000), the opposite is found. In a recent model intercomparison, Gregory et al. (2005) find that for all 11 models analysed, the MOC reduction is caused more by changes in surface heat flux than changes in surface freshwater flux. In addition, simulations using models of varying complexity (Stocker et al., 1992b; Saenko et al., 2003; Weaver et al., 2003) show that freshening or warming in the Southern Ocean acts to increase or stabilise the Atlantic MOC. This is likely a consequence of the complex coupling of Southern Ocean processes with North Atlantic Deep Water production.

A few simulations using coupled models are available that permit the assessment of the long-term stability of the MOC (Stouffer and Manabe, 1999; Voss and Mikolajewicz, 2001;

Stouffer and Manabe, 2003; Wood et al., 2003; Yoshida et al., 2005; Bryan et al., 2006). Most of these simulations assume an idealised increase in atmospheric CO<sub>2</sub> by 1% yr<sup>-1</sup> to various levels ranging from two to four times pre-industrial levels. One study also considers slower increases (Stouffer and Manabe, 1999), or a reduction in CO<sub>2</sub> (Stouffer and Manabe, 2003). The more recent models are not flux adjusted and have higher resolution (about 1.0°) (Yoshida et al., 2005; Bryan et al., 2006). A common feature of all simulations is a reduction in the MOC in response to the warming and a stabilisation or recovery of the MOC when the concentration is kept constant after achieving a level of two to four times the pre-industrial atmospheric CO<sub>2</sub> concentration. None of these models shows a shutdown of the MOC that continues after the forcing is kept constant. But such a long-term shutdown cannot be excluded if the amount of warming and its rate exceed certain thresholds as shown using an EMIC (Stocker and Schmittner, 1997). Complete shut-downs, although not permanent, were also simulated by a flux-adjusted coupled model (Manabe and Stouffer, 1994; Stouffer and Manabe, 2003; see also Chan and Motoi, 2005). In none of these AOGCM simulations were the thresholds, as determined by the EMIC, passed (Stocker and Schmittner, 1997). As such, the long-term stability of the MOC found in the present AOGCM simulations is consistent with the results from the simpler models.

The reduction in MOC strength associated with increasing greenhouse gases represents a negative feedback for the warming in and around the North Atlantic. That is, through reducing the transport of heat from low to high latitudes, SSTs are cooler than they would otherwise be if the MOC was unchanged. As

such, warming is reduced over and downstream of the North Atlantic. It is important to note that in models where the MOC weakens, warming still occurs downstream over Europe due to the overall dominant role of the radiative forcing associated with increasing greenhouse gases (Gregory et al., 2005). Many future projections show that once the radiative forcing is held fixed, re-establishment of the MOC occurs to a state similar to that of the present day. The partial or complete re-establishment of the MOC is slow and causes additional warming in and around the North Atlantic. While the oceanic meridional heat flux at low latitudes is reduced upon a slowdown of the MOC, many simulations show increasing meridional heat flux into the Arctic which contributes to accelerated warming and sea ice melting there. This is due to both the advection of warmer water and an intensification of the influx of North Atlantic water into the Arctic (A. Hu et al., 2004).

Climate models that simulated a complete shutdown of the MOC in response to sustained warming were flux-adjusted coupled GCMs or EMICs. A robust result from such simulations is that the shutdown of the MOC takes several centuries after the forcing is kept fixed (e.g., at  $4 \times$  atmospheric  $\text{CO}_2$  concentration). Besides the forcing amplitude and rate (Stocker and Schmitner, 1997), the amount of mixing in the ocean also appears to determine the stability of the MOC: increased vertical and horizontal mixing tends to stabilise the MOC and to eliminate the possibility of a second equilibrium state (Manabe and Stouffer, 1999; Knutti and Stocker, 2000; Longworth et al., 2005). Random internal variability or noise, often not present in simpler models, may also be important in determining the effective MOC stability (Knutti and Stocker, 2002; Monahan, 2002).

The MOC is not necessarily a comprehensive indicator of ocean circulation changes in response to global warming. In a transient  $2 \times$  atmospheric  $\text{CO}_2$  experiment using a coupled AOGCM, the MOC changes were small, but convection in the Labrador Sea stopped due to warmer and hence less dense waters that inflow from the Greenland-Iceland-Norwegian Sea (GIN Sea) (Wood et al., 1999; Stouffer et al., 2006a). Similar results were found by A. Hu et al. (2004), who also report an increase in convection in the GIN Sea due to the influx of more saline waters from the North Atlantic. Various simulations using coupled models of different complexity find significant reductions in convection in the GIN Sea in response to warming (Schaeffer et al., 2004; Bryan et al., 2006). Presumably, a delicate balance exists in the GIN Sea between the circum-arctic river runoff, sea ice production and advection of saline waters from the North Atlantic, and on a longer time scale, the inflow

of freshwater through Bering Strait. The projected increases in circum-arctic river runoff (Wu et al., 2005) may enhance the tendency towards a reduction in GIN Sea convection (Stocker and Raible, 2005; Wu et al., 2005). Cessation of convection in the Labrador Sea in the next few decades is also simulated in a high-resolution model of the Atlantic Ocean driven by surface fluxes from two AOGCMs (Schweckendiek and Willebrand, 2005). The large-scale responses of the high-resolution ocean model (e.g., MOC, Labrador Seas) agree with those from the AOGCMs. The grid resolution of the ocean components in the coupled AOGCMs has significantly increased since the TAR, and some consistent patterns of changes in convection and water mass properties in the Atlantic Ocean emerge in response to the warming, but models still show a variety of responses in the details.

The best estimate of sea level from 1993 to 2003 (see Section 5.5.5.2) associated with the slight net negative mass balance from Greenland is  $0.1$  to  $0.3 \text{ mm yr}^{-1}$  over the total ocean surface. This converts to only about  $0.002$  to  $0.003 \text{ Sv}$  of freshwater forcing. Such an amount, even when added directly and exclusively to the North Atlantic, has been suggested to be too small to affect the North Atlantic MOC (see Weaver and Hillaire-Marcel, 2004a). While one model exhibits a MOC weakening in the later part of the 21st century due to Greenland Ice Sheet melting (Fichefet et al., 2003), this same model had a very large downward drift of its overturning in the control climate, making it difficult to actually attribute the model MOC changes to the ice sheet melting. As noted in Section 10.3.3.3, Ridley et al. (2005) find the peak rate of Greenland Ice Sheet melting is about  $0.1 \text{ Sv}$  when they instantaneously elevate greenhouse gas levels in UKMO-HadCM3. They further note that this has little effect on the North Atlantic meridional overturning, although  $0.1 \text{ Sv}$  is sufficiently large to cause more dramatic transient changes in the strength of the MOC in other models (Stouffer et al., 2006b).

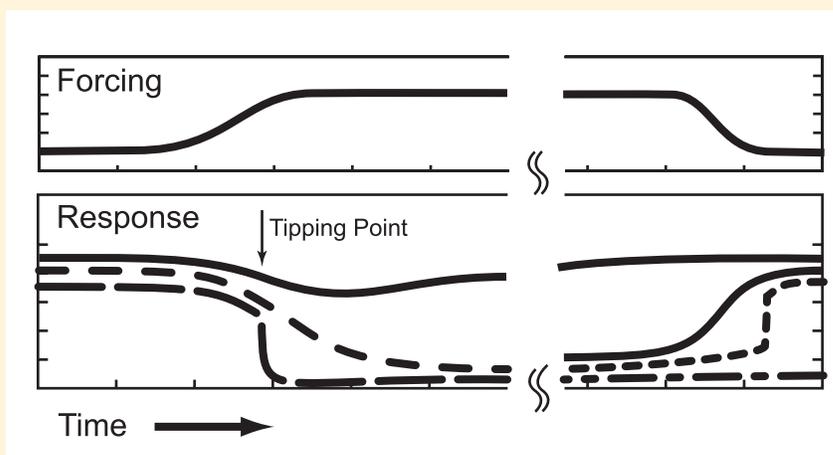

Taken together, it is very likely that the MOC, based on currently available simulations, will decrease, perhaps associated with a significant reduction in Labrador Sea Water formation, but very unlikely that the MOC will undergo an abrupt transition during the course of the 21st century. At this stage, it is too early to assess the likelihood of an abrupt change of the MOC beyond the end of the 21st century, but the possibility cannot be excluded (see Box 10.1). The few available simulations with models of different complexity instead suggest a centennial slowdown. Recovery of the MOC is simulated in some models if the radiative forcing is stabilised but would take several centuries; in other models, the reduction persists.

## Box 10.1: Future Abrupt Climate Change, 'Climate Surprises', and Irreversible Changes

Theory, models and palaeoclimatic reconstructions (see Chapter 6) have established the fact that changes in the climate system can be abrupt and widespread. A working definition of 'abrupt climate change' is given in Alley et al. (2002): 'Technically, an abrupt climate change occurs when the climate system is forced to cross some threshold, triggering a transition to a new state at a rate determined by the climate system itself and faster than the cause'. More generally, a gradual change in some determining quantity of the climate system (e.g., radiation balance, land surface properties, sea ice, etc.) can cause a variety of structurally different responses (Box 10.1, Figure 1). The response of a purely linear system scales with the forcing, and at stabilisation of the forcing, a new equilibrium is achieved which is structurally similar, but not necessarily close to the original state. However, if the system contains more than one equilibrium state, transitions to structurally different states are possible. Upon the crossing of a tipping point (bifurcation point), the evolution of the system is no longer controlled by the time scale of the forcing, but rather determined by its internal dynamics, which can either be much faster than the forcing, or significantly slower. Only the former case would be termed 'abrupt climate change', but the latter case is of equal importance. For the long-term evolution of a climate variable one must distinguish between reversible and irreversible changes. The notion of 'climate surprises' usually refers to abrupt transitions and temporary or permanent transitions to a different state in parts of the climate system such as, for example, the 8.2 kyr event (see Section 6.5.2.1).

### Atlantic Meridional Overturning Circulation and other ocean circulation changes:

The best-documented type of abrupt climate change in the palaeoclimatic archives is that associated with changes in the ocean circulation (Stocker, 2000). Since the TAR, many new results from climate models of different complexity have provided a more detailed view on the anticipated changes in the Atlantic MOC in response to global warming. Most models agree that the MOC weakens over the next 100 years and that this reduction ranges from indistinguishable from natural variability to over 50% by 2100 (Figure 10.15). None of the AOGCM simulations shows an abrupt change when forced with the SRES emissions scenarios until 2100, but some long-term model simulations suggest that a complete cessation can result for large forcings (Stouffer and Manabe, 2003). Models of intermediate complexity indicate that thresholds in the MOC may be present but that they depend on the amount and rate of warming for a given model (Stocker and Schmittner, 1997). The few long-term simulations from AOGCMs indicate that even complete shutdowns of the MOC may be reversible (Stouffer and Manabe, 2003; Yoshida et al., 2005; Stouffer et al., 2006b). However, until millennial simulations with AOGCMs are available, the important question of potential irreversibility of an MOC shutdown remains unanswered. Both simplified models and AOGCMs agree, however, that a potentially complete shut-down of the MOC, induced by global warming, would take many decades to more than a century. There is no direct model evidence that the MOC could collapse within a few decades in response to global warming. However, a few studies do show the potential for rapid changes in the MOC (Manabe and Stouffer, 1999), and the processes concerned are poorly understood (see Section 8.7). This is not inconsistent with the palaeoclimate records. The cooling events during the last ice ages registered in the Greenland ice cores developed over a couple of centuries to millennia. In contrast, there were also a number of very rapid warmings, the so-called Dansgaard-Oeschger events (NorthGRIP Members, 2004), or rapid cooling (LeGrande et al., 2006), which evolved over decades or less, most probably associated with rapid latitudinal shifts in ocean convection sites and changes in strength of the MOC (see Section 6.3.2).

**Box 10.1, Figure 1.** Schematic illustration of various responses of a climate variable to forcing. The forcing (top panels) reaches a new stable level (left part of figure), and later approaches the original level on very long time scales (right part of the figure). The response of the climate variable (bottom panels) can be smooth (solid line) or cross a tipping point inducing a transition to a structurally different state (dashed lines). That transition can be rapid (abrupt change, long-dashed), or gradual (short-dashed), but is usually dictated by the internal dynamics of the climate system rather than the forcing. The long-term behaviour (right part) also exhibits different possibilities. Changes can be irreversible (dash-dotted) with the system settling at a different stable state, or reversible (solid, dotted) when the forcing is set back to its original value. In the latter case, the transition again can be gradual or abrupt. An example for illustration, but not the only one, is the response of the Atlantic meridional overturning circulation to a gradual change in radiative forcing.

(continued)

Recent simulations with models with ocean components that resolve topography in sufficient detail obtain a consistent pattern of a strong to complete reduction of convection in the Labrador Sea (Wood et al., 1999; Schweckendiek and Willebrand, 2005). Such changes in the convection, with implications for the atmospheric circulation, can develop within a few years (Schaeffer et al., 2002). The long-term and regional-to-hemispheric scale effects of such changes in water mass properties have not yet been investigated.

With a reduction in the MOC, the meridional heat flux also decreases in the subtropical and mid-latitudes with large-scale effects on the atmospheric circulation. In consequence, the warming of the North Atlantic surface proceeds more slowly. Even for strong reductions in MOC towards the end of the 21st century, no cooling is observed in the regions around the North Atlantic because it is overcompensated by the radiative forcing that caused the ocean response in the first place.

At high latitudes, an increase in the oceanic meridional heat flux is simulated by these models. This increase is due to both an increase in the overturning circulation in the Arctic and the advection of warmer waters from lower latitudes and thus contributes significantly to continuing sea ice reduction in the Atlantic sector of the Arctic (A. Hu et al., 2004). Few simulations have also addressed the changes in overturning in the South Atlantic and Southern Ocean. In addition to water mass modifications, this also has an effect on the transport by the Antarctic Circumpolar Current, but results are not yet conclusive.

Current understanding of the processes responsible for the initiation of an ice age indicate that a reduction or collapse of the MOC in response to global warming could not start an ice age (Berger and Loutre, 2002; Crucifix and Loutre, 2002; Yoshimori et al., 2002; Weaver and Hillaire-Marcel, 2004b).

#### **Arctic sea ice:**

Arctic sea ice is responding sensitively to global warming. While changes in winter sea ice cover are moderate, late summer sea ice is projected to disappear almost completely towards the end of the 21st century. A number of positive feedbacks in the climate system accelerate the melt back of sea ice. The ice-albedo feedback allows open water to receive more heat from the Sun during summer, and the increase in ocean heat transport to the Arctic through the advection of warmer waters and stronger circulation further reduces ice cover. Minimum arctic sea ice cover is observed in September. Model simulations indicate that the September sea ice cover decreases substantially in response to global warming, generally evolving on the time scale of the warming. With sustained warming, the late summer disappearance of a major fraction of arctic sea ice is permanent.

#### **Glaciers and ice caps:**

Glaciers and ice caps are sensitive to changes in temperature and precipitation. Observations point to a reduction in volume over the last 20 years (see Section 4.5.2), with a rate during 1993 to 2003 corresponding to  $0.77 \pm 0.22$  mm yr<sup>-1</sup> sea level equivalent, with a larger mean central estimate than that for 1961 to 1998 (corresponding to  $0.50 \pm 0.18$  mm yr<sup>-1</sup> sea level equivalent). Rapid changes are therefore already underway and enhanced by positive feedbacks associated with the surface energy balance of shrinking glaciers and newly exposed land surface in periglacial areas. Acceleration of glacier loss over the next few decades is likely (see Section 10.6.3). Based on simulations of 11 glaciers in various regions, a volume loss of 60% of these glaciers is projected by the year 2050 (Schneeberger et al., 2003). Glaciated areas in the Americas are also affected. A comparative study including seven GCM simulations at  $2 \times$  atmospheric CO<sub>2</sub> conditions inferred that many glaciers may disappear completely due to an increase in the equilibrium line altitude (Bradley et al., 2004). The disappearance of these ice bodies is much faster than a potential re-glaciation several centuries hence, and may in some areas be irreversible.

#### **Greenland and West Antarctic Ice Sheets:**

Satellite and *in situ* measurement networks have demonstrated increasing melting and accelerated ice flow around the periphery of the Greenland Ice Sheet (GIS) over the past 25 years (see Section 4.6.2). The few simulations of long-term ice sheet simulations suggest that the GIS will significantly decrease in volume and area over the coming centuries if a warmer climate is maintained (Gregory et al., 2004a; Huybrechts et al., 2004; Ridley et al., 2005). A threshold of annual mean warming of 1.9°C to 4.6°C in Greenland has been estimated for elimination of the GIS (Gregory and Huybrechts, 2006; see section 10.7.3.3), a process which would take many centuries to complete. Even if temperatures were to decrease later, the reduction of the GIS to a much smaller extent might be irreversible, because the climate of an ice-free Greenland could be too warm for accumulation; however, this result is model dependent (see Section 10.7.3.3). The positive feedbacks involved here are that once the ice sheet gets thinner, temperatures in the accumulation region are higher, increasing the melting and causing more precipitation to fall as rain rather than snow; that the lower albedo of the exposed ice-free land causes a local climatic warming; and that surface melt water might accelerate ice flow (see Section 10.6.4.2).

A collapse of the West Antarctic Ice Sheet (WAIS) has been discussed as a potential response to global warming for many years (Bindschadler, 1998; Oppenheimer, 1998; Vaughan, 2007). A complete collapse would cause a global sea level rise of about 5 m. The observed acceleration of ice streams in the Amundsen Sea sector of the WAIS, the rapidity of propagation of this signal upstream and the acceleration of glaciers that fed the Larsen B Ice Shelf after its collapse have renewed these concerns (see Section 10.6.4.2).

(continued)

It is possible that the presence of ice shelves tends to stabilise the ice sheet, at least regionally. Therefore, a weakening or collapse of ice shelves, caused by melting on the surface or by melting at the bottom by a warmer ocean, might contribute to a potential destabilisation of the WAIS, which could proceed through the positive feedback of grounding-line retreat. Present understanding is insufficient for prediction of the possible speed or extent of such a collapse (see Box 4.1 and Section 10.7.3.4).

#### **Vegetation cover:**

Irreversible and relatively rapid changes in vegetation cover and composition have occurred frequently in the past. The most prominent example is the desertification of the Sahara region about 4 to 6 ka (Claussen et al., 1999). The reason for this behaviour is believed to lie in the limits of plant communities with respect to temperature and precipitation. Once critical levels are crossed, certain species can no longer compete within their ecosystem. Areas close to vegetation boundaries will experience particularly large and rapid changes due to the slow migration of these boundaries induced by global warming. A climate model simulation into the future shows that drying and warming in South America leads to a continuous reduction in the forest of Amazonia (Cox et al., 2000, 2004). While evolving continuously over the 21st century, such a change and ultimate disappearance could be irreversible, although this result could be model dependent since an analysis of 11 AOGCMs shows a wide range of future possible rainfall changes over the Amazon (Li et al., 2006).

One of the possible 'climate surprises' concerns the role of the soil in the global carbon cycle. As the concentration of CO<sub>2</sub> is increasing, the soil is acting, in the global mean, as a carbon sink by assimilating carbon due to accelerated growth of the terrestrial biosphere (see also Section 7.3.3.1.1). However, by about 2050, a model simulation suggests that the soil changes to a source of carbon by releasing previously accumulated carbon due to increased respiration (Cox et al., 2000) induced by increasing temperature and precipitation. This represents a positive feedback to the increase in atmospheric CO<sub>2</sub>. While different models agree regarding the sign of the feedback, large uncertainties exist regarding the strength (Cox et al., 2000; Dufresne et al., 2002; Friedlingstein et al., 2006). However, the respiration increase is caused by a warmer and wetter climate. The switch from moderate sink to strong source of atmospheric carbon is rather rapid and occurs within two decades (Cox et al., 2004), but the timing of the onset is uncertain (Huntingford et al., 2004). A model intercomparison reveals that once set in motion, the increase in respiration continues even after the CO<sub>2</sub> levels are held constant (Cramer et al., 2001). Although considerable uncertainties still exist, it is clear that feedback mechanisms between the terrestrial biosphere and the physical climate system exist which can qualitatively and quantitatively alter the response to an increase in radiative forcing.

#### **Atmospheric and ocean-atmosphere regimes:**

Changes in weather patterns and regimes can be abrupt processes that might occur spontaneously due to dynamical interactions in the atmosphere-ice-ocean system, or manifest as the crossing of a threshold in the system due to slow external forcing. Such shifts have been reported in SST in the tropical Pacific, leading to a more positive ENSO phase (Trenberth, 1990), in the stratospheric polar vortex (Christiansen, 2003), in a shut-down of deep convection in the Greenland Sea (Bönisch et al., 1997; Ronski and Budeus, 2005) and in an abrupt freshening of the Labrador Sea (Dickson et al., 2002). In the latter, the freshening evolved throughout the entire depth but the shift in salinity was particularly rapid: the 34.87 psu isohaline plunged from seasonally surface to 1,600 metres within 2 years with no return since 1973.

In a long, unforced model simulation, a period of a few decades with anomalously cold temperatures (up to 10 standard deviations below average) in the region south of Greenland was found (Hall and Stouffer, 2001). It was caused by persistent winds that changed the stratification of the ocean and inhibited convection, thereby reducing heat transfer from the ocean to the atmosphere. Similar results were found in a different model in which the major convection site in the North Atlantic spontaneously switched to a more southerly location for several decades to centuries (Goosse et al., 2002). Other simulations show that the slowly increasing radiative forcing is able to cause transitions in the convective activity in the Greenland-Iceland-Norwegian Sea that have an influence on the atmospheric circulation over Greenland and Western Europe (Schaeffer et al., 2002). The changes unfold within a few years and indicate that the system has crossed a threshold.

A multi-model analysis of regimes of polar variability (NAO, Arctic and Antarctic Oscillations) reveals that the simulated trends in the 21st century influence the Arctic and Antarctic Oscillations and point towards more zonal circulation (Rauthe et al., 2004). Temperature changes associated with changes in atmospheric circulation regimes such as the NAO can exceed in certain regions (e.g., Northern Europe) the long-term global warming that causes such inter-decadal regime shifts (Dorn et al., 2003).

### 10.3.5 Changes in Properties of Modes of Variability

#### 10.3.5.1 *Interannual Variability in Surface Air Temperature and Precipitation*

Future changes in anthropogenic forcing will result not only in changes in the mean climate state but also in the variability of climate. Addressing the interannual variability in monthly mean surface air temperature and precipitation of 19 AOGCMs in CMIP2, Räisänen (2002) finds a decrease in temperature variability during the cold season in the extratropical NH and a slight increase in temperature variability in low latitudes and in warm season northern mid-latitudes. The former is likely due to the decrease of sea ice and snow with increasing temperature. The summer decrease in soil moisture over the mid-latitude land surfaces contributes to the latter. Räisänen (2002) also finds an increase in monthly mean precipitation variability in most areas, both in absolute value (standard deviation) and in relative value (coefficient of variation). However, the significance level of these variability changes is markedly lower than that for time mean climate change. Similar results were obtained from 18 AOGCM simulations under the SRES A2 scenario (Giorgi and Bi, 2005).

#### 10.3.5.2 *Monsoons*

In the tropics, an increase in precipitation is projected by the end of the 21st century in the Asian monsoon and the southern part of the West African monsoon with some decreases in the Sahel in northern summer (Cook and Vizy, 2006), as well as increases in the Australian monsoon in southern summer in a warmer climate (Figure 10.9). The monsoonal precipitation in Mexico and Central America is projected to decrease in association with increasing precipitation over the eastern equatorial Pacific that affects Walker Circulation and local Hadley Circulation changes (Figure 10.9). A more detailed assessment of regional monsoon changes is provided in Chapter 11.

As a projected global warming will be more rapid over land than over the oceans, the continental-scale land-sea thermal contrast will become larger in summer and smaller in winter. Based on this, a simple idea is that the summer monsoon will be stronger and the winter monsoon will be weaker in the future than the present. However, model results are not as straightforward as this simple consideration. Tanaka et al. (2005) define the intensities of Hadley, Walker and monsoon circulations using the velocity potential fields at 200 hPa. Using 15 AOGCMs, they show a weakening of these tropical circulations by 9%, 8% and 14%, respectively, by the late 21st century compared to the late 20th century. Using eight AOGCMs, Ueda et al. (2006) demonstrate that pronounced warming over the tropics results in a weakening of the Asian summer monsoon circulations in relation to a reduction in the meridional thermal gradients between the Asian continent and adjacent oceans.

Despite weakening of the dynamical monsoon circulation, atmospheric moisture buildup due to increased greenhouse

gases and consequent temperature increase results in a larger moisture flux and more precipitation for the Indian monsoon (Douville et al., 2000; IPCC, 2001; Ashrit et al., 2003; Meehl and Arblaster, 2003; May, 2004; Ashrit et al., 2005). For the South Asian summer monsoon, models suggest a northward shift of lower-tropospheric monsoon wind systems with a weakening of the westerly flow over the northern Indian Ocean (Ashrit et al., 2003, 2005). Over Africa in northern summer, multi-model analysis projects an increase in rainfall in East and Central Africa, a decrease in the Sahel, and increases along the Gulf of Guinea coast (Figure 10.9). However, some individual models project an increase of rainfall in more extensive areas of West Africa related to a projected northward movement of the Sahara and the Sahel (Liu et al., 2002; Haarsma et al., 2005). Whether the Sahel will be more or less wet in the future is thus uncertain, although a multi-model assessment of the West African monsoon indicates that the Sahel could become marginally more dry (Cook and Vizy, 2006). This inconsistency of the rainfall projections may be related to AOGCM biases, or an unclear relationship between Gulf of Guinea and Indian Ocean warming, land use change and the West African monsoon. Nonlinear feedbacks that may exist within the West African climate system should also be considered (Jenkins et al., 2005).

Most model results project increased interannual variability in season-averaged Asian monsoon precipitation associated with an increase in its long-term mean value (e.g., Hu et al., 2000b; Räisänen, 2002; Meehl and Arblaster, 2003). Hu et al. (2000a) relate this to increased variability in the tropical Pacific SST (El Niño variability) in their model. Meehl and Arblaster (2003) relate the increased monsoon precipitation variability to increased variability in evaporation and precipitation in the Pacific due to increased SSTs. Thus, the South Asian monsoon variability is affected through the Walker Circulation such that the role of the Pacific Ocean dominates and that of the Indian Ocean is secondary.

Atmospheric aerosol loading affects regional climate and its future changes (see Chapter 7). If the direct effect of the aerosol increase is considered, surface temperatures will not get as warm because the aerosols reflect solar radiation. For this reason, land-sea temperature contrast becomes smaller than in the case without the direct aerosol effect, and the summer monsoon becomes weaker. Model simulations of the Asian monsoon project that the sulphate aerosols' direct effect reduces the magnitude of precipitation change compared with the case of only greenhouse gas increases (Emori et al., 1999; Roeckner et al., 1999; Lal and Singh, 2001). However, the relative cooling effect of sulphate aerosols is dominated by the effects of increasing greenhouse gases by the end of the 21st century in the SRES marker scenarios (Figure 10.26), leading to the increased monsoon precipitation at the end of the 21st century in these scenarios (see Section 10.3.2.3). Furthermore, it is suggested that aerosols with high absorptivity such as black carbon absorb solar radiation in the lower atmosphere, cool the surface, stabilise the atmosphere and reduce precipitation (Ramanathan et al., 2001). The solar

radiation reaching the surface decreases as much as 50% locally, which could reduce the surface warming by greenhouse gases (Ramanathan et al., 2005). These atmospheric brown clouds could cause precipitation to increase over the Indian Ocean in winter and decrease in the surrounding Indonesia region and the western Pacific Ocean (Chung et al., 2002), and could reduce the summer monsoon precipitation in South and East Asia (Menon et al., 2002; Ramanathan et al., 2005). However, the total influence on monsoon precipitation of temporally varying direct and indirect effects of various aerosol species is still not resolved and the subject of active research.

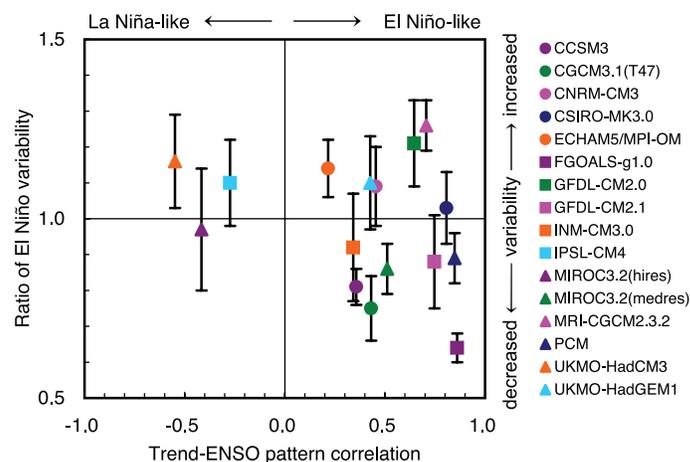

### 10.3.5.3 Mean Tropical Pacific Climate Change

This subsection assesses changes in mean tropical Pacific climate. Enhanced greenhouse gas concentrations result in a general increase in SST, which will not be spatially uniform in association with a general reduction in tropical circulations in a warmer climate (see Section 10.3.5.2). Figures 10.8 and 10.9 indicate that SST increases more over the eastern tropical Pacific than over the western tropical Pacific, together with a decrease in the sea level pressure (SLP) gradient along the equator and an eastward shift of the tropical Pacific rainfall distribution. These background tropical Pacific changes can be called an El Niño-like mean state change (upon which individual El Niño-Southern Oscillation (ENSO) events occur). Although individual models show a large scatter of ‘ENSO-ness’ (Collins and The CMIP Modelling Groups, 2005; Yamaguchi and Noda, 2006), an ENSO-like global warming pattern with positive polarity (i.e., El Niño-like mean state change) is simulated based on the spatial anomaly patterns of SST, SLP and precipitation (Figure 10.16; Yamaguchi and Noda, 2006). The El Niño-like change may be attributable to the general reduction in tropical circulations resulting from the increased dry static stability in the tropics in a warmer climate (Knutson and Manabe, 1995; Sugi et al., 2002; Figure 10.7). An eastward displacement of precipitation in the tropical Pacific accompanies an intensified and south-westward displaced subtropical anticyclone in the western Pacific, which can be effective in transporting moisture from the low latitudes to the Meiyu/Baiu region, thus generating more precipitation in the East Asian summer monsoon (Kitoh and Uchiyama, 2006).

In summary, the multi-model mean projects a weak shift towards conditions which may be described as ‘El Niño-like’, with SSTs in the central and eastern equatorial Pacific warming more than those in the west, and with an eastward shift in mean precipitation, associated with weaker tropical circulations.

### 10.3.5.4 El Niño

This subsection addresses the projected change in the amplitude, frequency and spatial pattern of El Niño. Guilyardi (2006) assessed mean state, coupling strength and modes (SST mode resulting from local SST-wind interaction or thermocline mode resulting from remote wind-thermocline feedbacks), using the pre-industrial control and stabilised  $2 \times$  and  $4 \times$  atmospheric

**Figure 10.16.** Base state change in average tropical Pacific SSTs and change in El Niño variability simulated by AOGCMs (see Table 8.1 for model details). The base state change (horizontal axis) is denoted by the spatial anomaly pattern correlation coefficient between the linear trend of SST in the  $1\% \text{ yr}^{-1} \text{ CO}_2$  increase climate change experiment and the first Empirical Orthogonal Function (EOF) of SST in the control experiment over the area  $10^\circ\text{S}$  to  $10^\circ\text{N}$ ,  $120^\circ\text{E}$  to  $80^\circ\text{W}$  (reproduced from Yamaguchi and Noda, 2006). Positive correlation values indicate that the mean climate change has an El Niño-like pattern, and negative values are La Niña-like. The change in El Niño variability (vertical axis) is denoted by the ratio of the standard deviation of the first EOF of sea level pressure (SLP) between the current climate and the last 50 years of the SRES A2 experiments (2051–2100), except for FGOALS-g1.0 and MIROC3.2(hires), for which the SRES A1B was used, and UKMO-HadGEM1 for which the  $1\% \text{ yr}^{-1} \text{ CO}_2$  increase climate change experiment was used, in the region  $30^\circ\text{S}$  to  $30^\circ\text{N}$ ,  $30^\circ\text{E}$  to  $60^\circ\text{W}$  with a five-month running mean (reproduced from van Oldenborgh et al., 2005). Error bars indicate the 95% confidence interval. Note that tropical Pacific base state climate changes with either El Niño-like or La Niña-like patterns are not permanent El Niño or La Niña events, and all still have ENSO inter-annual variability superimposed on that new average climate state in a future warmer climate.

$\text{CO}_2$  simulations in a multi-model ensemble. The models that exhibit the largest El Niño amplitude change in scenario experiments are those that shift towards a thermocline mode. The observed 1976 climate shift in the tropical Pacific actually involved such a mode shift (Fedorov and Philander, 2001). The mean state change, through change in the sensitivity of SST variability to surface wind stress, plays a key role in determining the ENSO variance characteristics (Z. Hu et al., 2004; Zelle et al., 2005). For example, a more stable ENSO system is less sensitive to changes in the background state than one that is closer to instability (Zelle et al., 2005). Thus, GCMs with an improper simulation of present-day climate mean state and air-sea coupling strength are not suitable for ENSO amplitude projections. Van Oldenborgh et al. (2005) calculate the change in ENSO variability by the ratio of the standard deviation of the first Empirical Orthogonal Function (EOF) of SLP between the current climate and in the future (Figure 10.16), which shows that changes in ENSO interannual variability differ from model to model. They categorised 19 models based on their skill in the present-day ENSO simulations. Using the most realistic 6 out of 19 models, they find no statistically significant changes in the amplitude of ENSO variability in the future. Large uncertainty in the skewness of the variability limits the assessment of the future relative strength of El Niño and La Niña events.

Merryfield (2006) also analysed a multi-model ensemble and finds a wide range of behaviour for future El Niño amplitude, ranging from little change to larger El Niño events to smaller El Niño events, although several models that simulated some observed aspects of present-day El Niño events showed future increases in El Niño amplitude. However, significant multi-decadal fluctuations in El Niño amplitude in observations and in long coupled model control runs add another complicating factor to attempting to discern whether any future changes in El Niño amplitude are due to external forcing or are simply a manifestation of internal multi-decadal variability (Meehl et al., 2006a). Even with the larger warming scenario under  $4 \times$  atmospheric CO<sub>2</sub> climate, Yeh and Kirtman (2005) find that despite the large changes in the tropical Pacific mean state, the changes in ENSO amplitude are highly model dependent. Therefore, there are no clear indications at this time regarding future changes in El Niño amplitude in a warmer climate. However, as first noted in the TAR, ENSO teleconnections over North America appear to weaken due at least in part to the mean change of base state mid-latitude atmospheric circulation (Meehl et al., 2006a).

In summary, all models show continued ENSO interannual variability in the future no matter what the change in average background conditions, but changes in ENSO interannual variability differ from model to model. Based on various assessments of the current multi-model archive, in which present-day El Niño events are now much better simulated than in the TAR, there is no consistent indication at this time of discernible future changes in ENSO amplitude or frequency.

### 10.3.5.5 ENSO-Monsoon Relationship

The El Niño-Southern Oscillation affects interannual variability throughout the tropics through changes in the Walker Circulation. Analysis of observational data finds a significant correlation between ENSO and tropical circulation and precipitation such that there is a tendency for less Indian summer monsoon rainfall in El Niño years and above normal rainfall in La Niña years. Recent analyses have revealed that the correlation between ENSO and the Indian summer monsoon has decreased recently, and many hypotheses have been put forward (see Chapter 3). With respect to global warming, one hypothesis is that the Walker Circulation (accompanying ENSO) shifted south-eastward, reducing downward motion in the Indian monsoon region, which originally suppressed precipitation in that region at the time of El Niño, but now produces normal precipitation as a result (Krishna Kumar et al., 1999). Another explanation is that as the ground temperature of the Eurasian continent has risen in the winter-spring season, the temperature difference between the continent and the ocean has increased, thereby causing more precipitation, and the Indian monsoon is normal in spite of the occurrence of El Niño (Ashrit et al., 2001).

An earlier version of an AOGCM developed at the Max Planck Institute (MPI) (Ashrit et al., 2001) and the Action de Recherche Petite Echelle Grande Echelle/Océan Parallélisé

(ARPEGE/OPA) model (Ashrit et al., 2003) simulated no global-warming related change in the ENSO-monsoon relationship, although a decadal-scale fluctuation is seen, suggesting that a weakening of the relationship might be part of the natural variability. However, Ashrit et al. (2001) show that while the impact of La Niña does not change, the influence of El Niño on the monsoon becomes small, suggesting the possibility of asymmetric behaviour of the changes in the ENSO-monsoon relationship. On the other hand, the MRI-CGCM2 (see Table 8.1 for model details) indicates a weakening of the correlation into the 21st century, particularly after 2050 (Ashrit et al., 2005). The MRI-CGCM2 model results support the above hypothesis that the Walker Circulation shifts eastward and no longer influences India at the time of El Niño in a warmer climate. Camberlin et al. (2004) and van Oldenborgh and Burgers (2005) find decadal fluctuations in the effect of ENSO on regional precipitation. In most cases, these fluctuations may reflect natural variability in the ENSO teleconnection, and long-term correlation trends may be comparatively weaker.

The Tropospheric Biennial Oscillation (TBO) has been suggested as a fundamental set of coupled interactions in the Indo-Pacific region that encompasses ENSO and the Asian-Australian monsoon, and the TBO has been shown to be simulated by current AOGCMs (see Chapter 8). Nanjundiah et al. (2005) analyse a multi-model data set to show that, for models that successfully simulate the TBO for present-day climate, the TBO becomes more prominent in a future warmer climate due to changes in the base state climate, although, as with ENSO, there is considerable inherent decadal variability in the relative dominance of TBO and ENSO.

In summary, the ENSO-monsoon relationship can vary due to natural variability. Model projections suggest that a future weakening of the ENSO-monsoon relationship could occur in a future warmer climate.

### 10.3.5.6 Annular Modes and Mid-Latitude Circulation Changes

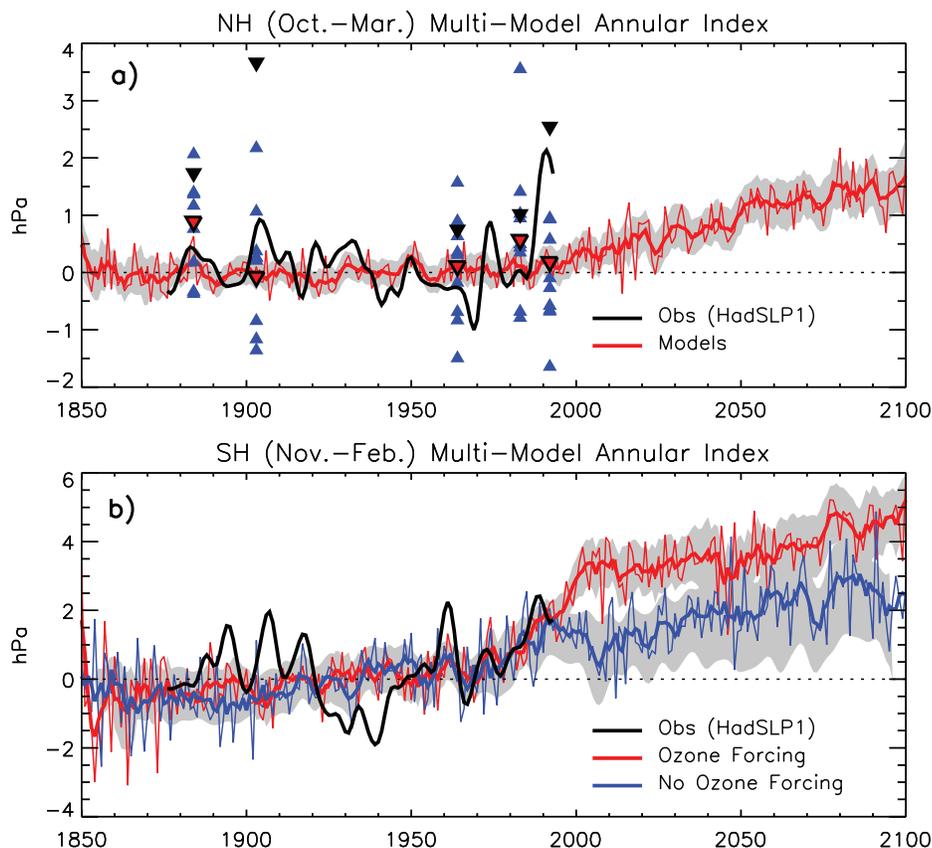

Many simulations project some decrease in the arctic surface pressure in the 21st century, as seen in the multi-model average (see Figure 10.9). This contributes to an increase in indices of the Northern Annular Mode (NAM) or the Arctic Oscillation (AO), as well as the NAO, which is closely related to the NAM in the Atlantic sector (see Chapter 8). In the recent multi-model analyses, more than half of the models exhibit a positive trend in the NAM (Rauthe et al., 2004; Miller et al., 2006) and/or NAO (Osborn, 2004; Kuzmina et al., 2005). Although the magnitude of the trends shows a large variation among different models, Miller et al. (2006) find that none of the 14 models exhibits a trend towards a lower NAM index and higher arctic SLP. In another multi-model analysis, Stephenson et al. (2006) show that of the 15 models able to simulate the NAO pressure dipole, 13 predict a positive increase in the NAO index with increasing CO<sub>2</sub> concentrations, although the magnitude of the response is generally small and model dependent. However, the multi-model average from the larger number (21) of models shown in

Figure 10.9 indicates that it is likely that the NAM index would not notably decrease in a future warmer climate. The average of IPCC-AR4 simulations from 13 models suggests the increase of the NAM index becomes statistically significant early in the 21st century (Figure 10.17a, Miller et al., 2006).

The spatial patterns of the simulated SLP trends vary among different models, in spite of close correlations of the models' leading patterns of interannual (or internal) variability with the observations (Osborn, 2004; Miller et al., 2006). However, at the hemispheric scale of SLP change, the reduction in the Arctic is seen in the multi-model mean (Figure 10.9), although the change is smaller than the inter-model standard deviation. Besides the decrease in the arctic region, increases over the North Pacific and the Mediterranean Sea exceed the inter-model standard deviation; the latter suggests an association with a north-eastward shift of the NAO's centre of action (Hu and Wu, 2004). The diversity of the patterns seems to reflect different responses in the Aleutian Low (Rauthe et al., 2004) in the North Pacific. Yamaguchi and Noda (2006) discuss the modelled response of ENSO versus AO, and find that many models project a positive AO-like change. In the North Pacific at high latitudes, however, the SLP anomalies are incompatible between the El Niño-like change and the positive AO-like

change, because models that project an El Niño-like change over the Pacific simulate a non-AO-like pattern in the polar region. As a result, the present models cannot fully determine the relative importance of the mechanisms inducing the positive AO-like change and those inducing the ENSO-like change, leading to scatter in global warming patterns at regional scales over the North Pacific. Rauthe et al. (2004) suggest that the effects of sulphate aerosols contribute to a deepening of the Aleutian Low resulting in a slower or smaller increase in the AO index.

Analyses of results from various models indicate that the NAM can respond to increasing greenhouse gas concentrations through tropospheric processes (Fyfe et al., 1999; Gillett et al., 2003; Miller et al., 2006). Greenhouse gases can also drive a positive NAM trend through changes in the stratospheric circulation, similar to the mechanism by which volcanic aerosols in the stratosphere force positive annular changes (Shindell et al., 2001). Models with their upper boundaries extending farther into the stratosphere exhibit, on average, a relatively larger increase in the NAM index and respond consistently to the observed volcanic forcing (Figure 10.17a, Miller et al., 2006), implying the importance of the connection between the troposphere and the stratosphere.

**Figure 10.17.** (a) Multi-model mean of the regression of the leading EOF of ensemble mean Northern Hemisphere sea level pressure (NH SLP, thin red line). The time series of regression coefficients has zero mean between year 1900 and 1970. The thick red line is a 10-year low-pass filtered version of the mean. The grey shading represents the inter-model spread at the 95% confidence level and is filtered. A filtered version of the observed SLP from the Hadley Centre (HadSLP1) is shown in black. The regression coefficient for the winter following a major tropical eruption is marked by red, blue and black triangles for the multi-model mean, the individual model mean and observations, respectively. (b) As in (a) for Southern Hemisphere SLP for models with (red) and without (blue) ozone forcing. Adapted from Miller et al. (2006).

A plausible explanation for the cause of the upward NAM trend simulated by the models is an intensification of the polar vortex resulting from both tropospheric warming and stratospheric cooling mainly due to the increase in greenhouse gases (Shindell et al., 2001; Sigmond et al., 2004; Rind et al., 2005a). The response may not be linear with the magnitude of radiative forcing (Gillett et al., 2002) since the polar vortex response is attributable to an equatorward refraction of planetary waves (Eichelberger and Holton, 2002) rather than radiative forcing itself. Since the long-term variation in the NAO is closely related to SST variations (Rodwell et al., 1999), it is considered essential that the projection of the changes in the tropical SST (Hoerling et al., 2004; Hurrell et al., 2004) and/or meridional gradient of the SST change (Rind et al., 2005b) is reliable.

The future trend in the Southern Annular Mode (SAM) or the Antarctic Oscillation (AAO) has been projected in a number of model simulations (Gillett and Thompson, 2003; Shindell and Schmidt, 2004; Arblaster and Meehl, 2006; Miller et al., 2006). According to the latest multi-model analysis (Miller et al., 2006), most models indicate a positive trend in the SAM index, and a declining trend in the antarctic SLP (as seen in Figure 10.9), with a higher likelihood than for the future NAM trend. On average, a larger positive trend is projected during the late 20th century by models that include stratospheric ozone changes than those that do not (Figure 10.17b), although during the 21st century, when ozone changes are smaller, the SAM trends of models with and without ozone are similar. The cause of the positive SAM trend in the second half of the 20th century is mainly attributed to stratospheric ozone depletion, evidenced by the fact that the signal is largest in the lower stratosphere in austral spring through summer (Thompson and Solomon, 2002; Arblaster and Meehl, 2006). However, increases in greenhouse gases are also important factors (Shindell and Schmidt, 2004; Arblaster and Meehl, 2006) for the year-round positive SAM trend induced by meridional temperature gradient changes (Brandefelt and Källén, 2004). During the 21st century, although the ozone amount is expected to stabilise or recover, the polar vortex intensification is likely to continue due to the increases in greenhouse gases (Arblaster and Meehl, 2006).

It is implied that the future change in the annular modes leads to modifications of the future change in various fields such as surface temperatures, precipitation and sea ice with regional features similar to those for the modes of natural variability (e.g., Hurrell et al., 2003). For instance, the surface warming in winter would be intensified in northern Eurasia and most of North America while weakened in the western North Atlantic, and winter precipitation would increase in northern Europe while decreasing in southern Europe. The atmospheric circulation change would also affect the ocean circulations. Sakamoto et al. (2005) simulate an intensification of the Kuroshio Current but no shift in the Kuroshio Extension in response to an AO-like circulation change for the 21st century. However, Sato et al. (2006) simulate a northward shift of the Kuroshio Extension, which leads to a strong warming off the eastern coast of Japan.

In summary, the future changes in the extratropical circulation variability are likely to be characterised by increases in positive phases of both the NAM and the SAM. The response in the NAM to anthropogenic forcing might not be distinct from the larger multi-decadal internal variability in the first half of the 21st century. The change in the SAM would appear earlier than in the NAM since stratospheric ozone depletion acts as an additional forcing. The positive trends in annular modes would influence the regional changes in temperature, precipitation and other fields, similar to those that accompany the NAM and the SAM in the present climate, but would be superimposed on the global-scale changes in a future warmer climate.

### 10.3.6 Future Changes in Weather and Climate Extremes

Projections of future changes in extremes rely on an increasingly sophisticated set of models and statistical techniques. Studies assessed in this section rely on multi-member ensembles (three to five members) from single models, analyses of multi-model ensembles ranging from 8 to 15 or more AOGCMs, and a perturbed physics ensemble with a single mixed-layer model with over 50 members. The discussion here is intended to identify general characteristics of changes in extremes in a global context. Chapter 3 provides a definition of weather and climate extremes, and Chapter 11 addresses changes in extremes for specific regions.

#### 10.3.6.1 Precipitation Extremes

A long-standing result from global coupled models noted in the TAR is a projected increase in the chance of summer drying in the mid-latitudes in a future warmer climate with associated increased risk of drought. This is shown in Figure 10.12, and has been documented in the more recent generation of models (Burke et al., 2006; Meehl et al., 2006b; Rowell and Jones, 2006). For example, Wang (2005) analyse 15 recent AOGCMs and show that in a future warmer climate, the models simulate summer dryness in most parts of the northern subtropics and mid-latitudes, but with a large range in the amplitude of summer dryness across models. Droughts associated with this summer drying could result in regional vegetation die-offs (Breshears et al., 2005) and contribute to an increase in the percentage of land area experiencing drought at any one time, for example, extreme drought increasing from 1% of present-day land area to 30% by the end of the century in the A2 scenario (Burke et al., 2006). Drier soil conditions can also contribute to more severe heat waves as discussed in Section 10.3.6.2 (Brabson et al., 2005).

Associated with the risk of drying is a projected increase in the chance of intense precipitation and flooding. Although somewhat counter-intuitive, this is because precipitation is projected to be concentrated into more intense events, with longer periods of little precipitation in between. Therefore, intense and heavy episodic rainfall events with high runoff amounts are interspersed with longer relatively dry periods with increased evapotranspiration, particularly in the subtropics

## Frequently Asked Question 10.1

# Are Extreme Events, Like Heat Waves, Droughts or Floods, Expected to Change as the Earth's Climate Changes?

*Yes; the type, frequency and intensity of extreme events are expected to change as Earth's climate changes, and these changes could occur even with relatively small mean climate changes. Changes in some types of extreme events have already been observed, for example, increases in the frequency and intensity of heat waves and heavy precipitation events (see FAQ 3.3).*

In a warmer future climate, there will be an increased risk of more intense, more frequent and longer-lasting heat waves. The European heat wave of 2003 is an example of the type of extreme heat event lasting from several days to over a week that is likely to become more common in a warmer future climate. A related aspect of temperature extremes is that there is likely to be a decrease in the daily (diurnal) temperature range in most regions. It is also likely that a warmer future climate would have fewer frost days (i.e., nights where the temperature dips below freezing). Growing season length is related to number of frost days, and has been projected to increase as climate warms. There is likely to be a decline in the frequency of cold air outbreaks (i.e., periods of extreme cold lasting from several days to over a week) in NH winter in most areas. Exceptions could occur in areas with the smallest reductions of extreme cold in western North America, the North Atlantic and southern Europe and Asia due to atmospheric circulation changes.

In a warmer future climate, most Atmosphere–Ocean General Circulation Models project increased summer dryness and winter wetness in most parts of the northern middle and high latitudes. Summer dryness indicates a greater risk of drought. Along with the risk of drying, there is an increased chance of intense precipitation and flooding due to the greater water-holding capacity of a warmer atmosphere. This has already been observed and is projected to continue because in a warmer world, precipitation tends to be concentrated into more intense events, with longer periods of little precipitation in between. Therefore, intense and heavy downpours would be interspersed with longer relatively dry periods. Another aspect of these projected changes is that wet extremes are projected to become more severe in many areas

where mean precipitation is expected to increase, and dry extremes are projected to become more severe in areas where mean precipitation is projected to decrease.

In concert with the results for increased extremes of intense precipitation, even if the wind strength of storms in a future climate did not change, there would be an increase in extreme rainfall intensity. In particular, over NH land, an increase in the likelihood of very wet winters is projected over much of central and northern Europe due to the increase in intense precipitation during storm events, suggesting an increased chance of flooding over Europe and other mid-latitude regions due to more intense rainfall and snowfall events producing more runoff. Similar results apply for summer precipitation, with implications for more flooding in the Asian monsoon region and other tropical areas. The increased risk of floods in a number of major river basins in a future warmer climate has been related to an increase in river discharge with an increased risk of future intense storm-related precipitation events and flooding. Some of these changes would be extensions of trends already underway.

There is evidence from modelling studies that future tropical cyclones could become more severe, with greater wind speeds and more intense precipitation. Studies suggest that such changes may already be underway; there are indications that the average number of Category 4 and 5 hurricanes per year has increased over the past 30 years. Some modelling studies have projected a decrease in the number of tropical cyclones globally due to the increased stability of the tropical troposphere in a warmer climate, characterised by fewer weak storms and greater numbers of intense storms. A number of modelling studies have also projected a general tendency for more intense but fewer storms outside the tropics, with a tendency towards more extreme wind events and higher ocean waves in several regions in association with those deepened cyclones. Models also project a poleward shift of storm tracks in both hemispheres by several degrees of latitude.

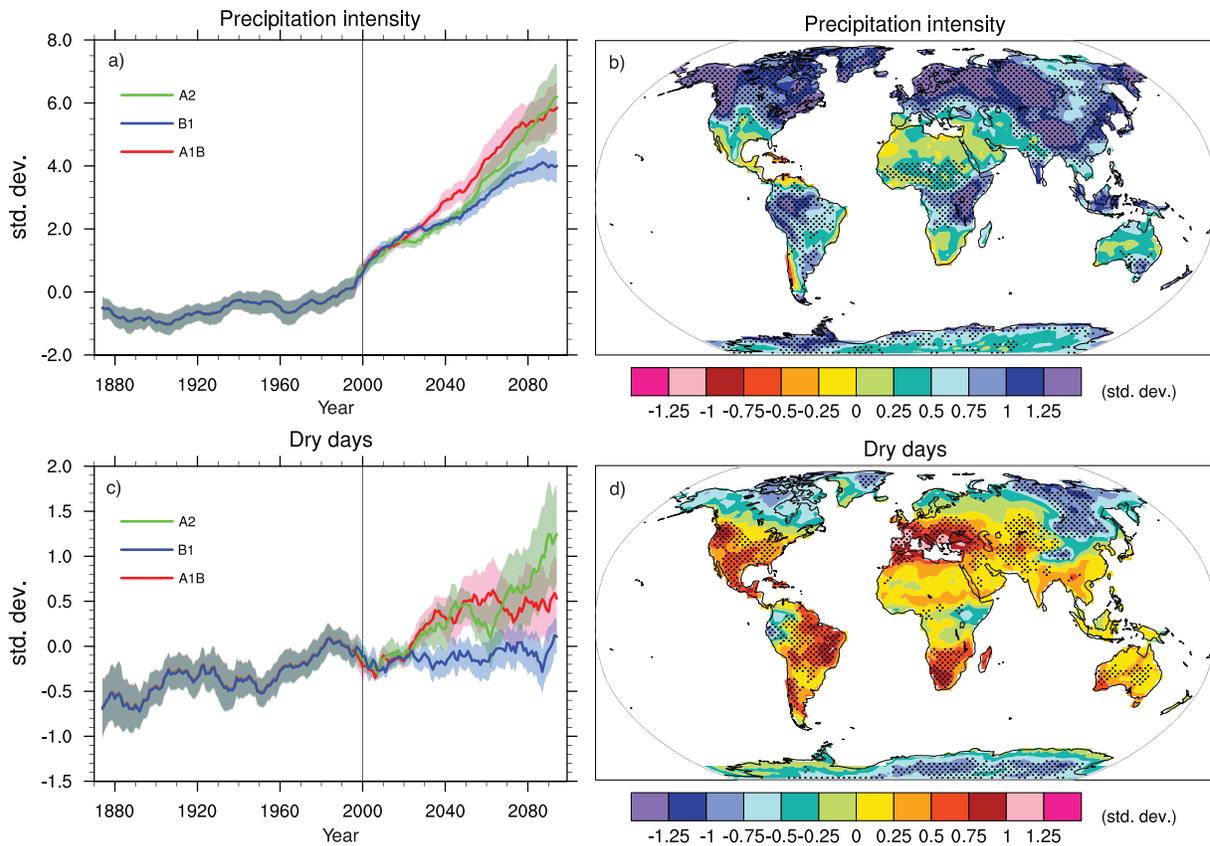

as discussed in Section 10.3.6.2 in relation to Figure 10.19 (Frei et al., 1998; Allen and Ingram, 2002; Palmer and Räisänen, 2002; Christensen and Christensen, 2003; Beniston, 2004; Christensen and Christensen, 2004; Pal et al., 2004; Meehl et al., 2005a). However, increases in the frequency of dry days do not necessarily mean a decrease in the frequency of extreme high rainfall events depending on the threshold used to define such events (Barnett et al., 2006). Another aspect of these changes has been related to the mean changes in precipitation, with wet extremes becoming more severe in many areas where mean precipitation increases, and dry extremes where the mean precipitation decreases (Kharin and Zwiers, 2005; Meehl et al., 2005a; Räisänen, 2005a; Barnett et al., 2006). However, analysis of the 53-member perturbed physics ensemble indicates that the change in the frequency of extreme precipitation at an individual location can be difficult to estimate definitively due to model parametrization uncertainty (Barnett et al., 2006). Some specific regional aspects of these changes in precipitation extremes are discussed further in Chapter 11.

Climate models continue to confirm the earlier results that in a future climate warmed by increasing greenhouse gases, precipitation intensity (e.g., proportionately more precipitation per precipitation event) is projected to increase over most regions (Wilby and Wigley, 2002; Kharin and Zwiers, 2005; Meehl et al., 2005a; Barnett et al., 2006), and the increase in precipitation extremes is greater than changes in mean precipitation (Kharin and Zwiers, 2005). As discussed in Chapter 9, this is related to the fact that the energy budget of the atmosphere constrains increases in large-scale mean precipitation, but extreme precipitation relates to increases in moisture content and thus the nonlinearities involved with the Clausius-Clapeyron relationship such that, for a given increase in temperature, increases in extreme precipitation can be more than the mean precipitation increase (e.g., Allen and Ingram, 2002). Additionally, time scale can play a role whereby increases in the frequency of seasonal mean rainfall extremes can be greater than the increases in the frequency of daily extremes (Barnett et al., 2006). The increase in mean and extreme precipitation in various regions has been attributed to contributions from both dynamic and thermodynamic processes associated with global warming (Emori and Brown, 2005). The greater increase in extreme precipitation compared to the mean is attributed to the greater thermodynamic effect on the extremes due to increases in water vapour, mainly over subtropical areas. The thermodynamic effect is important nearly everywhere, but changes in circulation also contribute to the pattern of precipitation intensity changes at middle and high latitudes (Meehl et al., 2005a). Kharin and Zwiers (2005) show that changes in both the location and scale of the extreme value distribution produce increases in precipitation extremes substantially greater than increases in annual mean precipitation. An increase in the scale parameter from the gamma distribution represents an increase in precipitation intensity, and various regions such as the NH land areas in winter showed particularly high values of increased scale parameter (Semenov and Bengtsson, 2002; Watterson and Dix, 2003). Time-slice

simulations with a higher-resolution model ( $\sim 1^\circ$ ) show similar results using changes in the gamma distribution, namely increased extremes in the hydrological cycle (Voss et al., 2002). However, some regional decreases are also projected such as over the subtropical oceans (Semenov and Bengtsson, 2002).

A number of studies have noted the connection between increased rainfall intensity and an implied increase in flooding. McCabe et al. (2001) and Watterson (2005) show a projected increase in extreme rainfall intensity with the extra-tropical surface lows, particularly over NH land, with an implied increase in flooding. In a multi-model analysis of the CMIP models, Palmer and Räisänen (2002) show an increased likelihood of very wet winters over much of central and northern Europe due to an increase in intense precipitation associated with mid-latitude storms, suggesting more floods across Europe (see also Chapter 11). They found similar results for summer precipitation with implications for greater flooding in the Asian monsoon region in a future warmer climate. Similarly, Milly et al. (2002), Arora and Boer (2001) and Voss et al. (2002) relate the increased risk of floods in a number of major river basins in a future warmer climate to an increase in spring river discharge related to increased winter snow depth in some regions. Christensen and Christensen (2003) conclude that there could be an increased risk of summer flooding in Europe.

Globally averaged time series of the Frich et al. (2002) indices in the multi-model analysis of Tebaldi et al. (2006) show simulated increases in precipitation intensity during the 20th century continuing through the 21st century (Figure 10.18a,b), along with a somewhat weaker and less consistent trend of increasing dry periods between rainfall events for all scenarios (Figure 10.18c,d). Part of the reason for these results is shown in the geographic maps for these quantities, where precipitation intensity increases almost everywhere, but particularly at middle and high latitudes where mean precipitation also increases (Meehl et al., 2005a; compare Figure 10.18b to Figure 10.9). However, in Figure 10.18d, there are regions of increased runs of dry days between precipitation events in the subtropics and lower mid-latitudes, but decreased runs of dry days at higher mid-latitudes and high latitudes where mean precipitation increases (compare Figure 10.9 with Figure 10.18d). Since there are areas of both increases and decreases in consecutive dry days between precipitation events in the multi-model average (Figure 10.9), the global mean trends are smaller and less consistent across models as shown in Figure 10.18. Consistency of response in a perturbed physics ensemble with one model shows only limited areas of increased frequency of wet days in July, and a larger range of changes in precipitation extremes relative to the control ensemble mean in contrast to the more consistent response of temperature extremes (Section 10.6.3.2), indicating a less consistent response for precipitation extremes in general compared to temperature extremes (Barnett et al., 2006). Analysis of the Frich et al. (2002) precipitation indices in a 20-km resolution global model shows similar results to those in Figure 10.18, with particularly large increases in precipitation intensity in South Asia and West Africa (Kamiguchi et al., 2005).

**Figure 10.18.** Changes in extremes based on multi-model simulations from nine global coupled climate models, adapted from Tebaldi et al. (2006). (a) Globally averaged changes in precipitation intensity (defined as the annual total precipitation divided by the number of wet days) for a low (SRES B1), middle (SRES A1B) and high (SRES A2) scenario. (b) Changes in spatial patterns of simulated precipitation intensity between two 20-year means (2080–2099 minus 1980–1999) for the A1B scenario. (c) Globally averaged changes in dry days (defined as the annual maximum number of consecutive dry days). (d) Changes in spatial patterns of simulated dry days between two 20-year means (2080–2099 minus 1980–1999) for the A1B scenario. Solid lines in (a) and (c) are the 10-year smoothed multi-model ensemble means; the envelope indicates the ensemble mean standard deviation. Stippling in (b) and (d) denotes areas where at least five of the nine models concur in determining that the change is statistically significant. Extreme indices are calculated only over land following Frich et al. (2002). Each model's time series was centred on its 1980 to 1999 average and normalised (rescaled) by its standard deviation computed (after de-trending) over the period 1960 to 2099. The models were then aggregated into an ensemble average, both at the global and at the grid-box level. Thus, changes are given in units of standard deviations.

### 10.3.6.2 Temperature Extremes

The TAR concluded that there was a very likely risk of increased high temperature extremes (and reduced risk of low temperature extremes) with more extreme heat episodes in a future climate. The latter result has been confirmed in subsequent studies (Yonetani and Gordon, 2001). Kharin and Zwiers (2005) show in a single model that future increases in temperature extremes follow increases in mean temperature over most of the world except where surface properties change (melting snow, drying soil). Furthermore, they show that in most instances warm extremes correspond to increases in daily maximum temperature, but cold extremes warm up faster than daily minimum temperatures, although this result is less consistent when model parameters are varied in a perturbed physics ensemble where there are increased daily temperature maxima for nearly the entire land surface. However, the range in magnitude of increases was substantial indicating a sensitivity to model formulations (Clark et al., 2006).

Weisheimer and Palmer (2005) examine changes in extreme seasonal (DJF and JJA) temperatures in 14 models for three scenarios. They show that by the end of 21st century, the probability of such extreme warm seasons is projected to rise in many areas. This result is consistent with the perturbed physics ensemble where, for nearly all land areas, extreme JJA temperatures were at least 20 times and in some areas 100 times more frequent compared to the control ensemble mean, making these changes greater than the ensemble spread.

Since the TAR, possible future cold air outbreaks have been studied. Vavrus et al. (2006) analyse seven AOGCMs run with the A1B scenario, and define a cold air outbreak as two or more consecutive days when the daily temperatures are at least two standard deviations below the present-day winter mean. For a future warmer climate, they document a 50 to 100% decline in the frequency of cold air outbreaks in NH winter in most areas compared to the present, with the smallest reductions occurring in western North America, the North Atlantic and southern Europe and Asia due to atmospheric circulation changes associated with the increase in greenhouse gases.

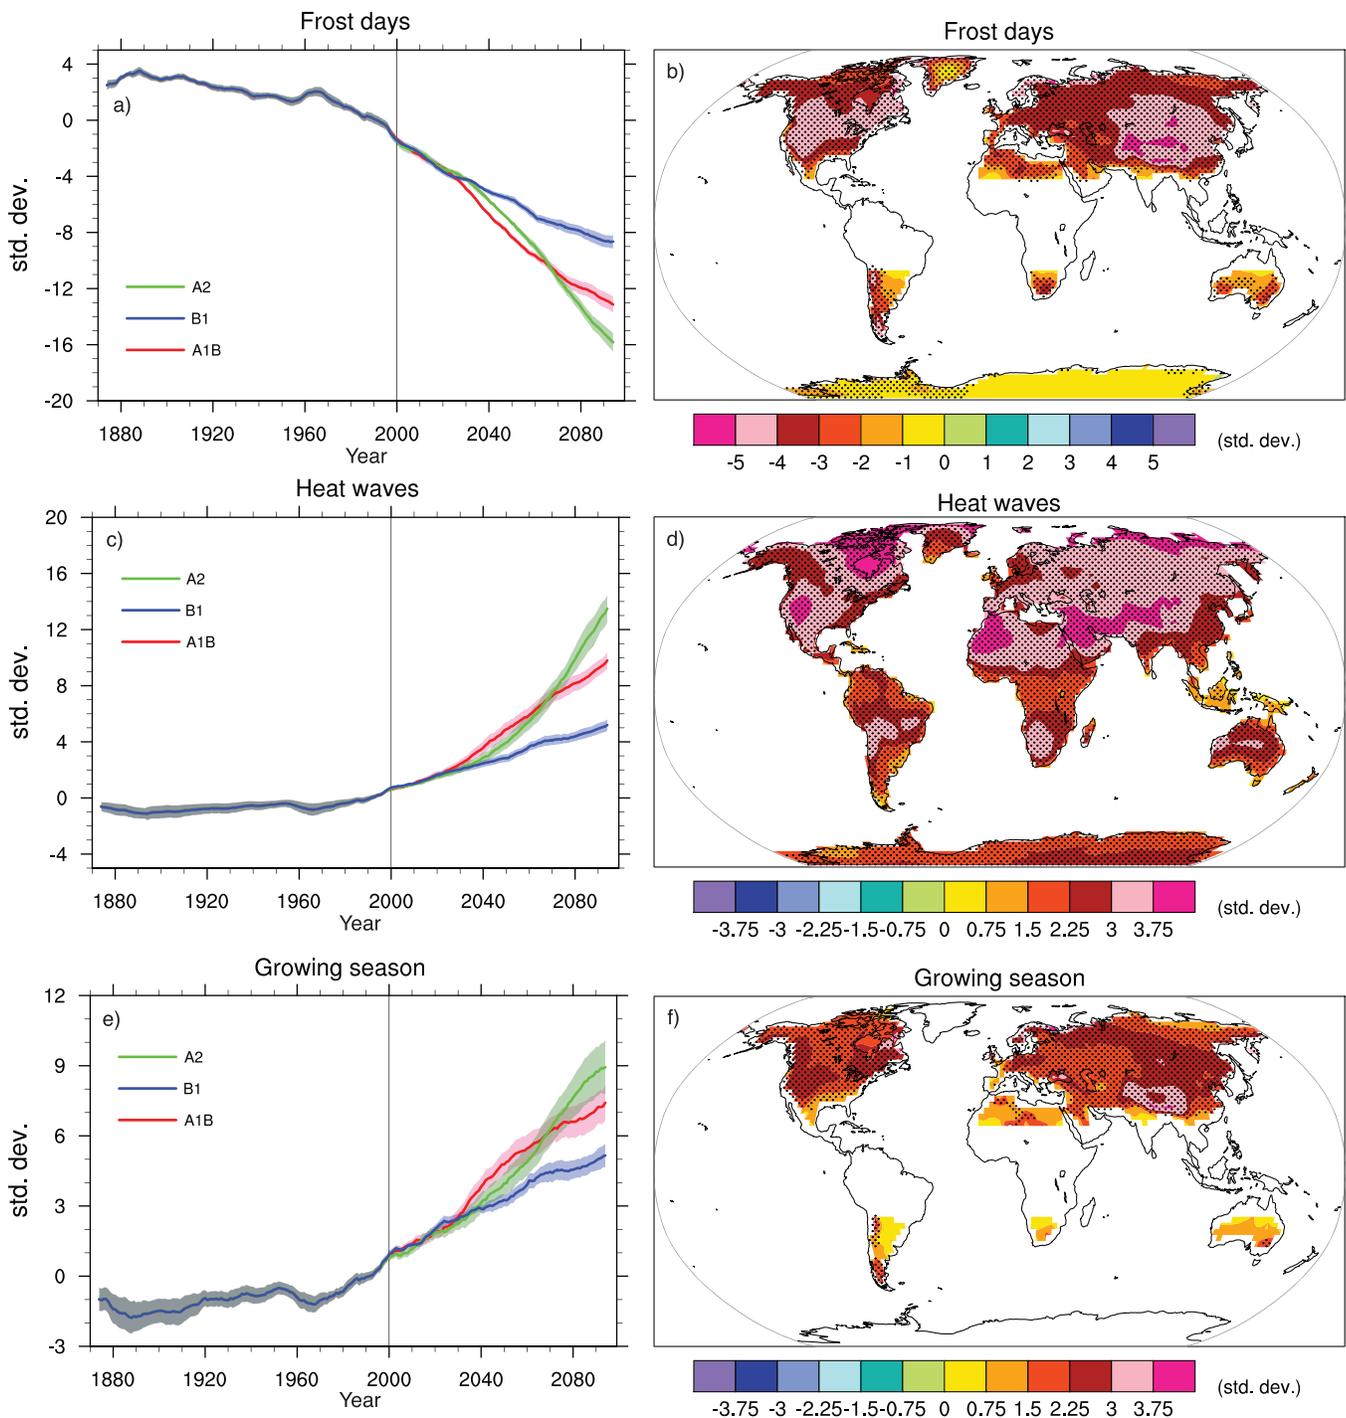

No studies at the time of the TAR specifically documented changes in heat waves (very high temperatures over a sustained period of days, see Chapter 3). Several recent studies address possible future changes in heat waves explicitly, and find an increased risk of more intense, longer-lasting and more frequent heat waves in a future climate (Meehl and Tebaldi, 2004; Schär et al., 2004; Clark et al., 2006). Meehl and Tebaldi (2004) show that the pattern of future changes in heat waves, with greatest intensity increases over western Europe, the Mediterranean and the southeast and western USA, is related in part to base state circulation changes due to the increase in greenhouse gases. An additional factor leading to extreme heat is drier soils in a future warmer climate (Brabson et al., 2005; Clark et al., 2006). Schär et al. (2004), Stott et al. (2004) and Beniston (2004) use the European 2003 heat wave as an example of the types of heat waves that are likely to become more common in a future warmer climate. Schär et al. (2004) note that the increase in the frequency of extreme warm conditions is also associated with a change in interannual variability, such that the statistical distribution of mean summer temperatures is not merely shifted towards warmer conditions but also becomes wider. A multi-model ensemble shows that heat waves are simulated to have been increasing over the latter part of the 20th century, and are projected to increase globally and over most regions (Figure 10.19; Tebaldi et al., 2006), although different model parameters can contribute to the range in the magnitude of this response (Clark et al., 2006).

A decrease in DTR in most regions in a future warmer climate was reported in the TAR, and is substantiated by more recent studies (e.g., Stone and Weaver, 2002; also discussed in relation to Figure 10.11b and in Chapter 11). For a quantity related to the DTR, the TAR concluded that it would be likely that a future warmer climate would also be characterised by a decrease in the number of frost days, although there were no studies at that time from global coupled climate models that addressed this issue explicitly. It has since been shown that there would indeed be decreases in frost days in a future warmer climate in the extratropics (Meehl et al., 2004a), with the pattern of the decreases dictated by the changes in atmospheric circulation due to the increase in greenhouse gases (Meehl et al., 2004a). Results from a nine-member multi-model ensemble show simulated decreases in frost days for the 20th century continuing into the 21st century globally and in most regions (Figure 10.19). A quantity related to frost days in many mid- and high-latitude areas, particularly in the NH, is growing season length as defined by Frich et al. (2002), and this has been projected to increase in future climate (Tebaldi et al., 2006). This result is also shown in a nine-member multi-model ensemble where the simulated increase in growing season length in the 20th century continues into the 21st century globally and in most regions (Figure 10.19). The globally averaged extremes indices in Figures 10.18 and 10.19 have non-uniform changes across the scenarios compared to the more consistent relative increases in Figure 10.5 for globally averaged temperature. This indicates that patterns that scale well by radiative forcing for temperature (e.g., Figure 10.8) would not scale for extremes.

### 10.3.6.3 Tropical Cyclones (Hurricanes)

Earlier studies assessed in the TAR showed that future tropical cyclones would likely become more severe with greater wind speeds and more intense precipitation. More recent modelling experiments have addressed possible changes in tropical cyclones in a warmer climate and generally confirmed those earlier results. These studies fall into two categories: those with model grid resolutions that only roughly represent some aspects of individual tropical cyclones, and those with model grids of sufficient resolution to reasonably simulate individual tropical cyclones.

In the first category, a number of climate change experiments with global models have started to simulate some characteristics of individual tropical cyclones, although classes of models with 50 to 100 km resolution or lower cannot accurately simulate observed tropical cyclone intensities due to the limitations of the relatively coarse grid spacing (e.g., Yoshimura et al., 2006). A study with roughly 100-km grid spacing shows a decrease in tropical cyclone frequency globally and in the North Pacific but a regional increase over the North Atlantic and no significant changes in maximum intensity (Sugi et al., 2002). Yoshimura et al. (2006) use the same model but different SST patterns and two different convection schemes, and show a decrease in the global frequency of relatively weak tropical cyclones but no significant change in the frequency of intense storms. They also show that the regional changes are dependent on the SST pattern, and precipitation near the storm centres could increase in the future. Another study using a 50 km resolution model confirms this dependence on SST pattern, and also shows a consistent increase in precipitation intensity in future tropical cyclones (Chauvin et al., 2006). Another global modelling study with roughly a 100-km grid spacing finds a 6% decrease in tropical storms globally and a slight increase in intensity, with both increases and decreases regionally related to the El Niño-like base state response in the tropical Pacific to increased greenhouse gases (McDonald et al., 2005). Another study with the same resolution model indicates decreases in tropical cyclone frequency and intensity but more mean and extreme precipitation from the tropical cyclones simulated in the future in the western north Pacific (Hasegawa and Emori, 2005). An AOGCM analysis with a coarser-resolution atmospheric model (T63, or about 200-km grid spacing) shows little change in overall numbers of tropical storms in that model, but a slight decrease in medium-intensity storms in a warmer climate (Bengtsson et al., 2006). In a global warming simulation with a coarse-resolution atmospheric model (T42, or about 300-km grid spacing), the frequency of global tropical cyclone occurrence did not change significantly, but the mean intensity of the global tropical cyclones increased significantly (Tsutsui, 2002). Thus, from this category of coarser-grid models that can only represent rudimentary aspects of tropical cyclones, there is no consistent evidence for large changes in either frequency or intensity of these models' representation of tropical cyclones, but there is a consistent response of more intense precipitation from future storms in a warmer climate. Also note that the

**Figure 10.19.** Changes in extremes based on multi-model simulations from nine global coupled climate models, adapted from Tebaldi et al. (2006). (a) Globally averaged changes in the frost day index (defined as the total number of days in a year with absolute minimum temperature below  $0^{\circ}\text{C}$ ) for a low (SRES B1), middle (SRES A1B) and high (SRES A2) scenario. (b) Changes in spatial patterns of simulated frost days between two 20-year means (2080–2099 minus 1980–1999) for the A1B scenario. (c) Globally averaged changes in heat waves (defined as the longest period in the year of at least five consecutive days with maximum temperature at least  $5^{\circ}\text{C}$  higher than the climatology of the same calendar day). (d) Changes in spatial patterns of simulated heat waves between two 20-year means (2080–2099 minus 1980–1999) for the A1B scenario. (e) Globally averaged changes in growing season length (defined as the length of the period between the first spell of five consecutive days with mean temperature above  $5^{\circ}\text{C}$  and the last such spell of the year). (f) Changes in spatial patterns of simulated growing season length between two 20-year means (2080–2099 minus 1980–1999) for the A1B scenario. Solid lines in (a), (c) and (e) show the 10-year smoothed multi-model ensemble means; the envelope indicates the ensemble mean standard deviation. Stippling in (b), (d) and (f) denotes areas where at least five of the nine models concur in determining that the change is statistically significant. Extreme indices are calculated only over land. Frost days and growing season are only calculated in the extratropics. Extremes indices are calculated following Frich et al. (2002). Each model's time series was centred around its 1980 to 1999 average and normalised (rescaled) by its standard deviation computed (after de-trending) over the period 1960 to 2099. The models were then aggregated into an ensemble average, both at the global and at the grid-box level. Thus, changes are given in units of standard deviations.

decreasing tropical precipitation in future climate in Yoshimura et al. (2006) is for SSTs held fixed as atmospheric CO<sub>2</sub> is increased, a situation that does not occur in any global coupled model.

In the second category, studies have been performed with models that have been able to credibly simulate many aspects of tropical cyclones. For example, Knutson and Tuleya (2004) use a high-resolution (down to 9 km) mesoscale hurricane model to simulate hurricanes with intensities reaching about 60 to 70 m s<sup>-1</sup>, depending on the treatment of moist convection in the model. They use mean tropical conditions from nine global climate models with increased CO<sub>2</sub> to simulate tropical cyclones with 14% more intense central pressure falls, 6% higher maximum surface wind speeds and about 20% greater near-storm rainfall after an idealised 80-year buildup of CO<sub>2</sub> at 1% yr<sup>-1</sup> compounded (warming given by TCR shown for models in Chapter 8). Using a multiple nesting technique, an AOGCM was used to force a regional model over Australasia and the western Pacific with 125-km grid resolution, with an embedded 30-km resolution model over the south-western Pacific (Walsh et al., 2004). At that 30-km resolution, the model is able to closely simulate the climatology of the observed tropical cyclone lower wind speed threshold of 17 m s<sup>-1</sup>. Tropical cyclone occurrence (in terms of days of tropical cyclone activity) is slightly greater than observed, and the somewhat weaker than observed pressure gradients near the storm centres are associated with lower than observed maximum wind speeds, likely due to the 30-km grid spacing that is too coarse to capture extreme pressure gradients and winds. For 3 × atmospheric CO<sub>2</sub> in that model configuration, the simulated tropical cyclones experienced a 56% increase in the number of storms with maximum wind speed greater than 30 m s<sup>-1</sup> and a 26% increase in the number of storms with central pressures less than 970 hPa, with no large changes in frequency and movement of tropical cyclones for that southwest Pacific region. It should also be noted that ENSO fluctuations have a strong impact on patterns of tropical cyclone occurrence in the southern Pacific (Nguyen and Walsh, 2001), and that uncertainty with respect future ENSO behaviour (Section 10.3.5.1) contributes to uncertainty with respect to tropical cyclones (Walsh, 2004).

In another experiment with a high resolution global model that is able to generate tropical cyclones that begin to approximate real storms, a global 20-km grid atmospheric model was run in time slice experiments for a present-day 10-year period and a 10-year period at the end of the 21st century for the A1B scenario to examine changes in tropical cyclones. Observed climatological SSTs were used to force the atmospheric model for the 10-year period at the end of the 20th century, time-mean SST anomalies from an AOGCM simulation for the future climate were added to the observed SSTs and atmospheric composition was changed in the model to be consistent with the A1B scenario. At that resolution, tropical cyclone characteristics, numbers and tracks were relatively well simulated for present-day climate, although simulated wind speed intensities were somewhat weaker than observed intensities (Oouchi et al., 2006). In that study, tropical

cyclone frequency decreased 30% globally (but increased about 34% in the North Atlantic). The strongest tropical cyclones with extreme surface winds increased in number while weaker storms decreased. The tracks were not appreciably altered, and maximum peak wind speeds in future simulated tropical cyclones increased by about 14% in that model, although statistically significant increases were not found in all basins. As noted above, the competing effects of greater stabilisation of the tropical troposphere (less storms) and greater SSTs (the storms that form are more intense) likely contribute to these changes except for the tropical North Atlantic where there are greater SST increases than in the other basins in that model. Therefore, the SST warming has a greater effect than the vertical stabilisation in the Atlantic and produces not only more storms but also more intense storms there. However, these regional changes are largely dependent on the spatial pattern of future simulated SST changes (Yoshimura et al., 2006).

Sugi et al. (2002) show that the global-scale reduction in tropical cyclone frequency is closely related to weakening of tropospheric circulation in the tropics in terms of vertical mass flux. They note that a significant increase in dry static stability in the tropical troposphere and little increase in tropical precipitation (or convective heating) are the main factors contributing to the weakening of the tropospheric circulation. Sugi and Yoshimura (2004) investigate a mechanism of this tropical precipitation change. They show that the effect of CO<sub>2</sub> enhancement (without changing SST conditions, which is not realistic as noted above) is a decrease in mean precipitation (Sugi and Yoshimura, 2004) and a decrease in the number of tropical cyclones as simulated in an atmospheric model with about 100 km resolution (Yoshimura and Sugi, 2005). Future changes in the large-scale steering flow as a mechanism to deduce possible changes in tropical cyclone tracks in the western North Pacific (Wu and Wang, 2004) were analysed to show different shifts at different times in future climate change experiments along with a dependence of such shifts on the degree of El Niño-like mean climate change in the Pacific (see Section 10.3.5).

A synthesis of the model results to date indicates that, for a future warmer climate, coarse-resolution models show few consistent changes in tropical cyclones, with results dependent on the model, although those models do show a consistent increase in precipitation intensity in future storms. Higher-resolution models that more credibly simulate tropical cyclones project some consistent increase in peak wind intensities, but a more consistent projected increase in mean and peak precipitation intensities in future tropical cyclones. There is also a less certain possibility of a decrease in the number of relatively weak tropical cyclones, increased numbers of intense tropical cyclones and a global decrease in total numbers of tropical cyclones.

#### 10.3.6.4 Extratropical Storms and Ocean Wave Height

The TAR noted that there could be a future tendency for more intense extratropical storms, although the number of storms could be less. A more consistent result that has emerged more

recently, in agreement with earlier results (e.g., Schubert et al., 1998), is a tendency for a poleward shift of several degrees latitude in mid-latitude storm tracks in both hemispheres (Geng and Sugi, 2003; Fischer-Bruns et al., 2005; Yin, 2005; Bengtsson et al., 2006). Consistent with these shifts in storm track activity, Cassano et al. (2006), using a 10-member multi-model ensemble, show a future change to a more cyclonically dominated circulation pattern in winter and summer over the Arctic, and increasing cyclonicity and stronger westerlies in the same multi-model ensemble for the Antarctic (Lynch et al., 2006).

Some studies have shown little change in extratropical cyclone characteristics (Kharin and Zwiers, 2005; Watterson, 2005). But a regional study showed a tendency towards more intense systems, particularly in the A2 scenario in another global coupled climate model analysis (Leckebusch and Ulbrich, 2004), with more extreme wind events in association with those deepened cyclones for several regions of Western Europe, with similar changes in the B2 simulation although less pronounced in amplitude. Geng and Sugi (2003) use a higher-resolution (about 100 km resolution) atmospheric GCM (AGCM) with time-slice experiments and find a decrease in cyclone density (number of cyclones in a 4.5° by 4.5° area per season) in the mid-latitudes of both hemispheres in a warmer climate in both the DJF and JJA seasons, associated with the changes in the baroclinicity in the lower troposphere, in general agreement with earlier results and coarser GCM results (e.g., Dai et al., 2001b). They also find that the density of strong cyclones increases while the density of weak and medium-strength cyclones decreases. Several studies have shown a possible reduction in mid-latitude storms in the NH but a decrease in central pressures in these storms (Lambert and Fyfe, 2006, for a 15-member multi-model ensemble) and in the SH (Fyfe, 2003, with a possible 30% reduction in sub-antarctic cyclones). The latter two studies did not definitively identify a poleward shift of storm tracks, but their methodologies used a relatively coarse grid that may not have been able to detect shifts of several degrees latitude and they used only identification of central pressures which could imply an identification of semi-permanent features like the sub-antarctic trough. More regional aspects of these changes were addressed for the NH in a single model study by Inatsu and Kimoto (2005), who show a more active storm track in the western Pacific in the future but weaker elsewhere. Fischer-Bruns et al. (2005) document storm activity increasing over the North Atlantic and Southern Ocean and decreasing over the Pacific Ocean.

By analysing stratosphere-troposphere exchanges using time-slice experiments with the middle atmosphere version of ECHAM4, Land and Feichter (2003) suggest that cyclonic and blocking activity becomes weaker poleward of 30°N in a warmer climate at least in part due to decreased baroclinicity below 400 hPa, while cyclonic activity becomes stronger in the SH associated with increased baroclinicity above 400 hPa. The atmospheric circulation variability on inter-decadal time scales may also change due to increasing greenhouse gases and aerosols. One model result (Hu et al., 2001) showed that

inter-decadal variability of the SLP and 500 hPa height fields increased over the tropics and decreased at high latitudes due to global warming.

In summary, the most consistent results from the majority of the current generation of models show, for a future warmer climate, a poleward shift of storm tracks in both hemispheres that is particularly evident in the SH, with greater storm activity at higher latitudes.

A new feature that has been studied related to extreme conditions over the oceans is wave height. Studies by Wang et al. (2004), Wang and Swail (2006a,b) and Caires et al. (2006) have shown that for many regions of the mid-latitude oceans, an increase in extreme wave height is likely to occur in a future warmer climate. This is related to increased wind speed associated with mid-latitude storms, resulting in higher waves produced by these storms, and is consistent with the studies noted above that showed decreased numbers of mid-latitude storms but more intense storms.

## 10.4 Changes Associated with Biogeochemical Feedbacks and Ocean Acidification

### 10.4.1 Carbon Cycle/Vegetation Feedbacks

As a parallel activity to the standard IPCC AR4 climate projection simulations described in this chapter, the Coupled Climate-Carbon Cycle Model Intercomparison Project (C<sup>4</sup>MIP) supported by WCRP and the International Geosphere-Biosphere Programme (IGBP) was initiated. Eleven climate models with a representation of the land and ocean carbon cycle (see Chapter 7) performed simulations where the model was driven by an anthropogenic CO<sub>2</sub> emissions scenario for the 1860 to 2100 time period (instead of an atmospheric CO<sub>2</sub> concentration scenario as in the standard IPCC AR4 simulations). Each C<sup>4</sup>MIP model performed two simulations, a ‘coupled’ simulation where the growth of atmospheric CO<sub>2</sub> induces a climate change which affects the carbon cycle, and an ‘uncoupled’ simulation, where atmospheric CO<sub>2</sub> radiative forcing is held fixed at pre-industrial levels, in order to estimate the atmospheric CO<sub>2</sub> growth rate that would occur if the carbon cycle was unperturbed by the climate. Emissions were taken from the observations for the historical period (Houghton and Hackler, 2000; Marland et al., 2005) and from the SRES A2 scenario for the future (Leemans et al., 1998).

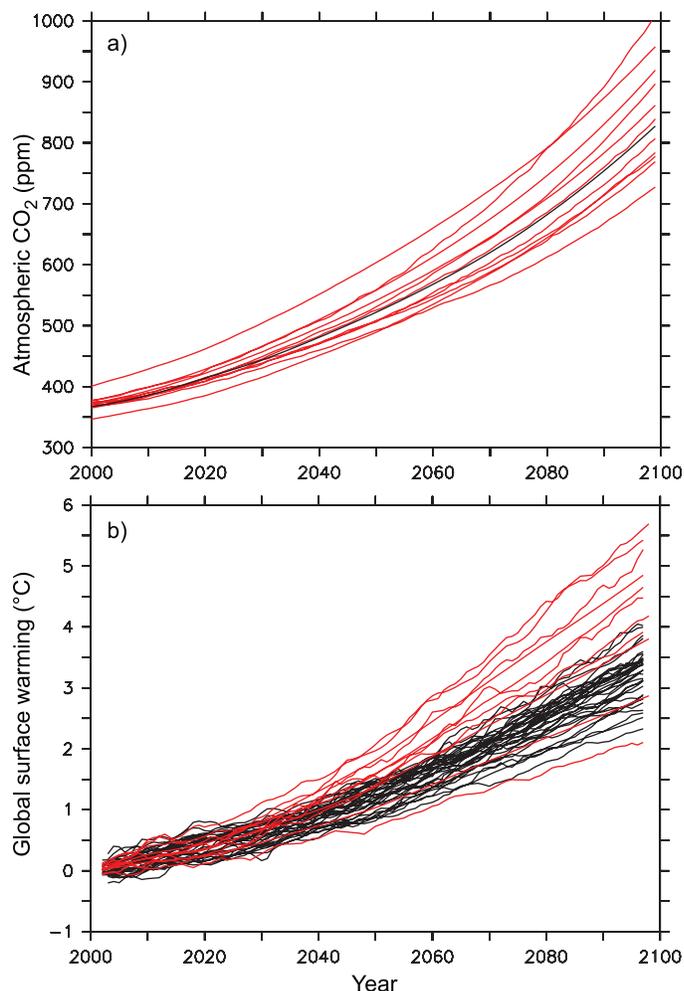

Chapter 7 describes the major results of the C<sup>4</sup>MIP models in terms of climate impact on the carbon cycle. This section starts from these impacts to infer the feedback effect on atmospheric CO<sub>2</sub> and therefore on the climate system. There is unanimous agreement among the models that future climate change will reduce the efficiency of the land and ocean carbon cycle to absorb anthropogenic CO<sub>2</sub>, essentially owing to a reduction in land carbon uptake. The latter is driven by a combination of

reduced net primary productivity and increased soil respiration of CO<sub>2</sub> under a warmer climate. As a result, a larger fraction of anthropogenic CO<sub>2</sub> will stay airborne if climate change controls the carbon cycle. By the end of the 21st century, this additional CO<sub>2</sub> varies between 20 and 220 ppm for the two extreme models, with most of the models lying between 50 and 100 ppm (Friedlingstein et al., 2006). This additional CO<sub>2</sub> leads to an additional radiative forcing of between 0.1 and 1.3 W m<sup>-2</sup> and hence an additional warming of between 0.1°C and 1.5°C.

All of the C<sup>4</sup>MIP models simulate a higher atmospheric CO<sub>2</sub> growth rate in the coupled runs than in the uncoupled runs. For the A2 emission scenario, this positive feedback leads to a greater atmospheric CO<sub>2</sub> concentration (Friedlingstein et al., 2006) as noted above, which is in addition to the concentrations in the standard coupled models assessed in the AR4 (e.g., Meehl et al., 2005b). By 2100, atmospheric CO<sub>2</sub> varies between 730 and 1,020 ppm for the C<sup>4</sup>MIP models, compared with 836 ppm for the standard SRES A2 concentration in the multi-model data set (e.g., Meehl et al., 2005b). This uncertainty due to future changes in the carbon cycle is illustrated in Figure 10.20a where the CO<sub>2</sub> concentration envelope of the C<sup>4</sup>MIP uncoupled simulations is centred on the standard SRES A2 concentration value. The range reflects the uncertainty in the carbon cycle. It should be noted that the standard SRES A2 concentration value of 836 ppm was calculated in the TAR with the Bern carbon cycle-climate model (BERN-CC; Joos et al., 2001) that accounted for the climate-carbon cycle feedback. Parameter sensitivity studies were performed with the BERN-CC model at that time and gave a range of 735 ppm to 1,080 ppm, comparable to the range of the C<sup>4</sup>MIP study. The effects of climate feedback uncertainties on the carbon cycle have also been considered probabilistically by Wigley and Raper (2001). A later paper (Wigley, 2004) considers individual emissions scenarios, accounting for carbon cycle feedbacks in the same way as Wigley and Raper (2001). The results of these studies are consistent with the more recent C<sup>4</sup>MIP results. For the A2 scenario considered in C<sup>4</sup>MIP, the CO<sub>2</sub> concentration range in 2100 using the Wigley and Raper model is 769 to 1,088 ppm, compared with 730 to 1,020 ppm in the C<sup>4</sup>MIP study (which ignored the additional warming effect due to non-CO<sub>2</sub> gases). Similarly, using neural networks, Knutti et al. (2003) show that the climate-carbon cycle feedback leads to an increase of about 0.6°C over the central estimate for the SRES A2 scenario and an increase of about 1.5°C for the upper bound of the uncertainty range.

Further uncertainties regarding carbon uptake were addressed with a 14-member multi-model ensemble using the CMIP2 models to quantify contributions to uncertainty from inter-model variability as opposed to internal variability (Berthelot et al., 2002). They found that the AOGCMs with the largest climate sensitivity also had the largest drying of soils in the tropics and thus the largest reduction in carbon uptake.

The C<sup>4</sup>MIP protocol did not account for the evolution of non-CO<sub>2</sub> greenhouse gases and aerosols. In order to compare the C<sup>4</sup>MIP simulated warming with the IPCC AR4 climate models, the SRES A2 radiative forcings of CO<sub>2</sub> alone and total forcing (CO<sub>2</sub> plus non-CO<sub>2</sub> greenhouse gases and aerosols) as given

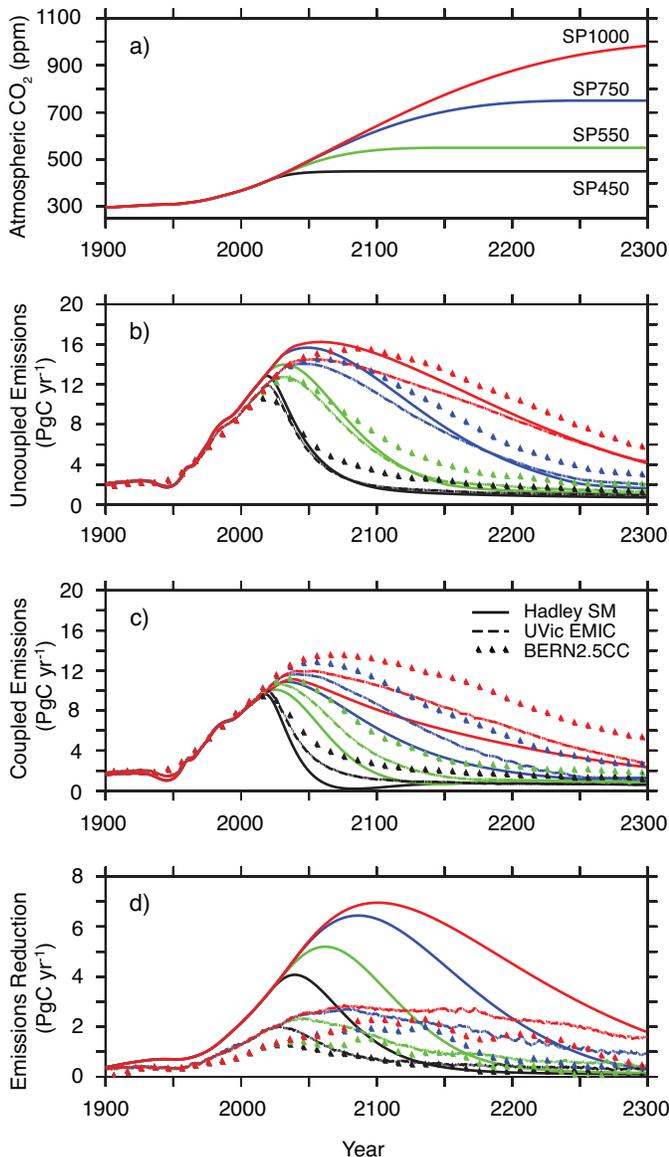

**Figure 10.20.** (a) 21st-century atmospheric CO<sub>2</sub> concentration as simulated by the 11 C<sup>4</sup>MIP models for the SRES A2 emission scenario (red) compared with the standard atmospheric CO<sub>2</sub> concentration used as a forcing for many IPCC AR4 climate models (black). The standard CO<sub>2</sub> concentration values were calculated by the BERN-CC model and are identical to those used in the TAR. For some IPCC-AR4 models, different carbon cycle models were used to convert carbon emissions to atmospheric concentrations. (b) Globally averaged surface temperature change (relative to 2000) simulated by the C<sup>4</sup>MIP models forced by CO<sub>2</sub> emissions (red) compared to global warming simulated by the IPCC AR4 models forced by CO<sub>2</sub> concentration (black). The C<sup>4</sup>MIP global temperature change has been corrected to account for the non-CO<sub>2</sub> radiative forcing used by the standard IPCC AR4 climate models.

in Appendix II of the TAR were used. Using these numbers and knowing the climate sensitivity of each C<sup>4</sup>MIP model, the warming that would have been simulated by the C<sup>4</sup>MIP models if they had included the non-CO<sub>2</sub> greenhouse gases and aerosols can be estimated. For the SRES A2 scenario, these estimates show that the C<sup>4</sup>MIP range of global temperature increase by the end of the 21st century would be 2.4°C to 5.6°C, compared with 2.6°C to 4.1°C for standard IPCC-AR4 climate models (Figure 10.20b). As a result of a much larger CO<sub>2</sub> concentration by 2100 in most of the C<sup>4</sup>MIP models, the upper estimate of the global warming by 2100 is up to 1.5°C higher than for the standard SRES A2 simulations.

The C<sup>4</sup>MIP results highlight the importance of coupling the climate system and the carbon cycle in order to simulate, for a

given scenario of CO<sub>2</sub> emissions, a climate change that takes into account the dynamic evolution of the Earth's capacity to absorb the CO<sub>2</sub> perturbation.

Conversely, the climate-carbon cycle feedback will have an impact on the estimate of the projected CO<sub>2</sub> emissions leading to stabilisation of atmospheric CO<sub>2</sub> at a given level. The TAR showed the range of future emissions for the Wigley, Richels and Edmonds (WRE; Wigley et al., 1996) stabilisation concentration scenarios, using different model parametrizations (including the climate-carbon feedback, Joos et al., 2001; Kheshgi and Jain,

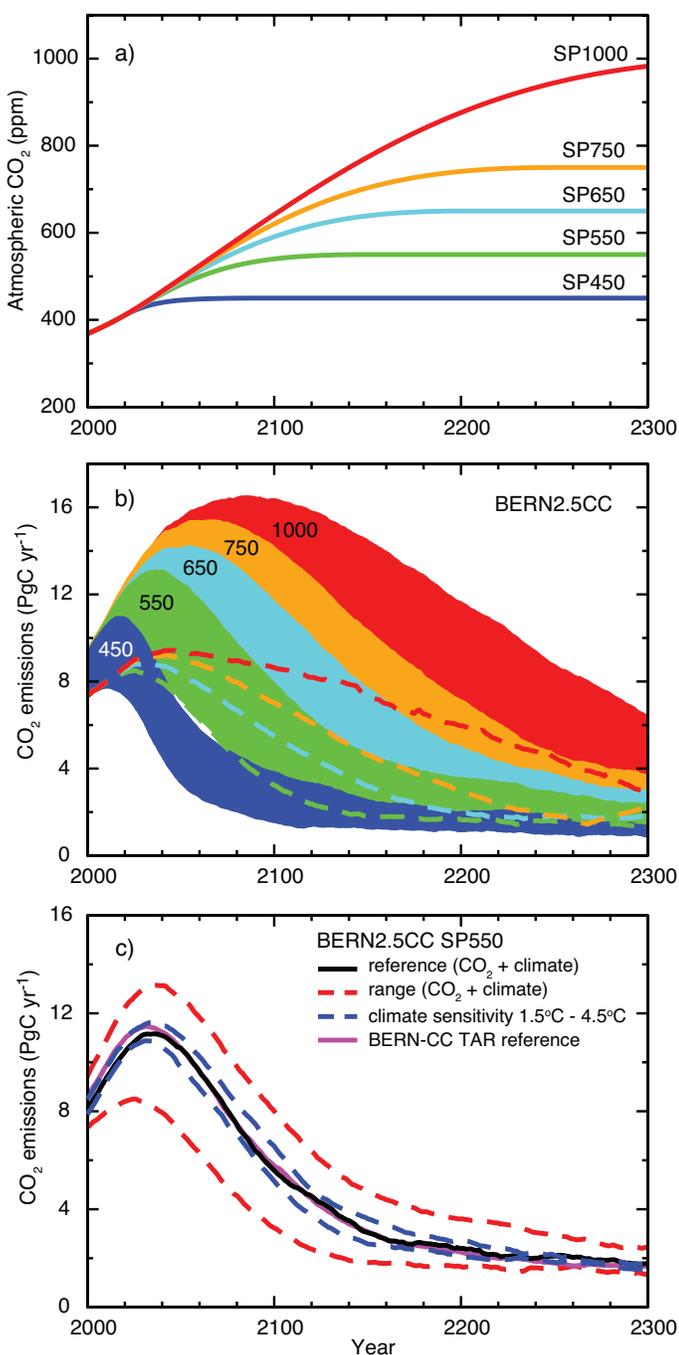

**Figure 10.21.** (a) Atmospheric CO<sub>2</sub> stabilisation scenarios SP1000 (red), SP750 (blue), SP550 (green) and SP450 (black). (b) Compatible annual emissions calculated by three models, the Hadley simple model (Jones et al., 2006; solid), the UVic EMIC (Matthews, 2005; dashed) and the BERN2.5CC EMIC (Joos et al., 2001; Plattner et al., 2001; triangles) for the three stabilisation scenarios without accounting for the impact of climate on the carbon cycle (see Table 8.3 for details of the latter two models). (c) As for (b) but with the climate impact on the carbon cycle accounted for. (d) The difference between (b) and (c) showing the impact of the climate-carbon cycle feedback on the calculation of compatible emissions.

2003). However, the emission reduction due to this feedback was not quantified. Similar to the C<sup>4</sup>MIP protocol, coupled and uncoupled simulations have been recently performed in order to specifically evaluate the impact of climate change on the future CO<sub>2</sub> emissions required to achieve stabilisation (Matthews, 2005; Jones et al., 2006). Figure 10.21 shows the emissions required to achieve CO<sub>2</sub> stabilisation for the stabilisation profiles SP450, SP550, SP750 and SP1000 (SP450 refers to stabilisation at a CO<sub>2</sub> concentration of 450 ppm, etc.) as simulated by three climate-carbon cycle models. As detailed above, the climate-carbon cycle feedback reduces the land and ocean uptake of CO<sub>2</sub>, leading to a reduction in the emissions compatible with a given atmospheric CO<sub>2</sub> stabilisation pathway. The higher the stabilisation scenario, the larger the climate change, the larger the impact on the carbon cycle, and hence the larger the emission reduction relative to the case without climate-carbon cycle feedback. For example, stabilising atmospheric CO<sub>2</sub> at 450 ppm, which will likely result in a global equilibrium warming of 1.4°C to 3.1°C, with a best guess of about 2.1°C, would require a reduction of current annual greenhouse gas emissions by 52 to 90% by 2100. Positive carbon cycle feedbacks (i.e., reduced ocean and terrestrial carbon uptake caused by the warming) reduce the total (cumulative) emissions over the 21st century compatible with a stabilisation of CO<sub>2</sub> concentration at 450 ppm by 105 to 300 GtC relative to a hypothetical case where the carbon cycle does not respond to temperature. The uncertainty regarding the strength of the climate-carbon cycle feedback highlighted in the C<sup>4</sup>MIP analysis is also evident in Figure 10.21. For higher stabilisation scenarios such as SP550, SP750 and SP1000, the larger warming (2.9°C, 4.3°C and 5.5°C, respectively) requires an increasingly larger reduction (130 to 425 GtC, 160 to 500 GtC and 165 to 510 GtC, respectively) in the cumulated compatible emissions.

The current uncertainty involving processes driving the land and ocean carbon uptake will translate into an uncertainty in the future emissions of CO<sub>2</sub> required to achieve stabilisation. In Figure 10.22, the carbon-cycle related uncertainty is addressed using the BERN2.5CC carbon cycle EMIC (Joos et al., 2001; Plattner et al., 2001; see Table 8.3 for model details) and the series of S450 to SP1000 CO<sub>2</sub> stabilisation scenarios. The range of emission uncertainty was derived using identical assumptions as made in the TAR, varying ocean transport parameters and parametrizations describing the cycling of carbon through the terrestrial biosphere. Results are thus very closely comparable, and the small differences can be largely explained by the different CO<sub>2</sub> trajectories and the use of a dynamic ocean model here compared to the TAR.

The model results confirm that for stabilisation of atmospheric CO<sub>2</sub>, emissions need to be reduced well below year 2000 values in all scenarios. This is true for the full range of simulations covering carbon cycle uncertainty, even including the upper bound, which is based on rather extreme assumptions of terrestrial carbon cycle processes.

Cumulative emissions for the period from 2000 to 2100 (to 2300) range between 596 GtC (933 GtC) for SP450, and 1,236 GtC (3,052 GtC) for SP1000. The emission uncertainty varies

**Figure 10.22.** Projected CO<sub>2</sub> emissions leading to stabilisation of atmospheric CO<sub>2</sub> concentrations at different levels and the effect of uncertainty in carbon cycle processes on calculated emissions. Panel (a) shows the assumed trajectories of CO<sub>2</sub> concentration (SP scenarios) (Knutti et al., 2005); (b) and (c) show the implied CO<sub>2</sub> emissions, as projected with the Bern2.5CC EMIC (Joos et al., 2001; Plattner et al., 2001). The ranges given in (b) for each of the SP scenarios represent effects of different model parametrizations and assumptions illustrated for scenario SP550 in panel (c) (range for 'CO<sub>2</sub> + climate'). The upper and lower bounds in (b) are indicated by the top and bottom of the shaded areas. Alternatively, the lower bound (where hidden) is indicated by a dashed line. Panel (c) illustrates emission ranges and sensitivities for scenario SP550.

between  $-26$  and  $+28\%$  about the reference cases in year 2100 and between  $-26$  and  $+34\%$  in year 2300, increasing with time. The range of uncertainty thus depends on the magnitude of the CO<sub>2</sub> stabilisation level and the induced climate change. The additional uncertainty in projected emissions due to uncertainty in climate sensitivity is illustrated by two additional simulations with  $1.5^{\circ}\text{C}$  and  $4.5^{\circ}\text{C}$  climate sensitivities (see Box 10.2). The resulting emissions for this range of climate sensitivities lie within the range covered by the uncertainty in processes driving the carbon cycle.

Both the standard IPCC-AR4 and the C<sup>4</sup>MIP models ignore the effect of land cover change in future projections. However, as described in Chapters 2 and 7, past and future changes in land cover may affect the climate through several processes. First, they may change surface characteristics such as albedo. Second, they may affect the ratio of latent to sensible heat and therefore affect surface temperature. Third, they may induce additional CO<sub>2</sub> emissions from the land. Fourth, they can affect the capacity of the land to take up atmospheric CO<sub>2</sub>. So far, no comprehensive coupled AOGCM has addressed these four components all together. Using AGCMs, DeFries et al. (2004) studied the impact of future land cover change on the climate, while Maynard and Royer (2004) performed a similar experiment on Africa only. DeFries et al. (2002) forced the Colorado State University GCM (Randall et al., 1996) with Atmospheric Model Intercomparison Project (AMIP) climatological sea surface temperatures and with either the present-day vegetation cover or a 2050 vegetation map adapted from a low-growth scenario of the Integrated Model to Assess the Global Environment (IMAGE-2; Leemans et al., 1998). The study finds that in the tropics and subtropics, replacement of forests by grassland or cropland leads to a reduction in carbon assimilation, and therefore in latent heat flux. The latter reduction leads to a surface warming of up to  $1.5^{\circ}\text{C}$  in deforested tropical regions. Using the ARPEGE-Climat AGCM (Déqué et al., 1994) with a higher resolution over Africa, Maynard et al. (2002) performed two experiments, one simulation with  $2 \times$  atmospheric CO<sub>2</sub> SSTs taken from a previous ARPEGE transient SRES B2 simulation and present-day vegetation, and one with the same SSTs but the vegetation taken from a SRES B2 simulation of the IMAGE-2 model (Leemans et al., 1998). Similar to DeFries et al. (2002), they find that future deforestation in tropical Africa leads to a redistribution of latent and sensible heat that leads to a warming of the surface. However, this warming is relatively small ( $0.4^{\circ}\text{C}$ ) and represents about 20% of the warming due to the atmospheric CO<sub>2</sub> doubling.

Two recent studies further investigated the relative roles of future changes in greenhouse gases compared with future changes in land cover. Using a similar model design as Maynard and Royer (2004), Voltaire (2006) compared the climate change simulated under a 2050 SRES B2 greenhouse gases scenario to the one under a 2050 SRES B2 land cover change scenario. They show that the relative impact of vegetation change compared to greenhouse gas concentration increase is of the order of 10%, and can reach 30% over localised tropical regions. In a more comprehensive study, Feddema et al. (2005) applied the same

methodology for the SRES A2 and B1 scenario over the 2000 to 2100 period. Similarly, they find no significant effect at the global scale, but a potentially large effect at the regional scale, such as a warming of 2°C by 2100 over the Amazon for the A2 land cover change scenario, associated with a reduction in the DTR. The general finding of these studies is that the climate change due to land cover changes may be important relative to greenhouse gases at the regional level, where intense land cover change occurs. Globally, the impact of greenhouse gas concentrations dominates over the impact of land cover change.

#### 10.4.2 Ocean Acidification Due to Increasing Atmospheric Carbon Dioxide

Increasing atmospheric CO<sub>2</sub> concentrations lower oceanic pH and carbonate ion concentrations, thereby decreasing the saturation state with respect to calcium carbonate (Feely et al., 2004). The main driver of these changes is the direct geochemical effect due to the addition of anthropogenic CO<sub>2</sub> to the surface ocean (see Box 7.3). Surface ocean pH today is already 0.1 unit lower than pre-industrial values (Section 5.4.2.3). In the multi-model median shown in Figure 10.23, pH is projected to decrease by another 0.3 to 0.4 units under the IS92a scenario by 2100. This translates into a 100 to 150% increase in the concentration of H<sup>+</sup> ions (Orr et al., 2005). Simultaneously, carbonate ion concentrations will decrease. When water is undersaturated with respect to calcium carbonate, marine organisms can no longer form calcium carbonate shells (Raven et al., 2005).

Under scenario IS92a, the multi-model projection shows large decreases in pH and carbonate ion concentrations throughout the world oceans (Orr et al., 2005; Figures 10.23 and 10.24). The decrease in surface carbonate ion concentrations is found to be largest at low and mid-latitudes, although undersaturation is projected to occur at high southern latitudes first (Figure 10.24). The present-day surface saturation state is strongly influenced by temperature and is lowest at high latitudes, with minima in the Southern Ocean. The model simulations project that undersaturation will be reached in a few decades. Therefore, conditions detrimental to high-latitude ecosystems could develop within decades, not centuries as suggested previously (Orr et al., 2005).

While the projected changes are largest at the ocean surface, the penetration of anthropogenic CO<sub>2</sub> into the ocean interior will alter the chemical composition over the 21st century down to several thousand metres, albeit with substantial regional differences (Figure 10.23). The total volume of water in the ocean that is undersaturated with regard to calcite (not shown) or aragonite, a meta-stable form of calcium carbonate, increases substantially as atmospheric CO<sub>2</sub> concentrations continue to rise (Figure 10.23). In the multi-model projections, the aragonite saturation horizon (i.e., the 100% line separating over- and undersaturated regions) reaches the surface in the Southern Ocean by about 2050 and substantially shoals by 2100 in the South Pacific (by >1,000 m) and throughout the Atlantic (between 800 m and 2,200 m).

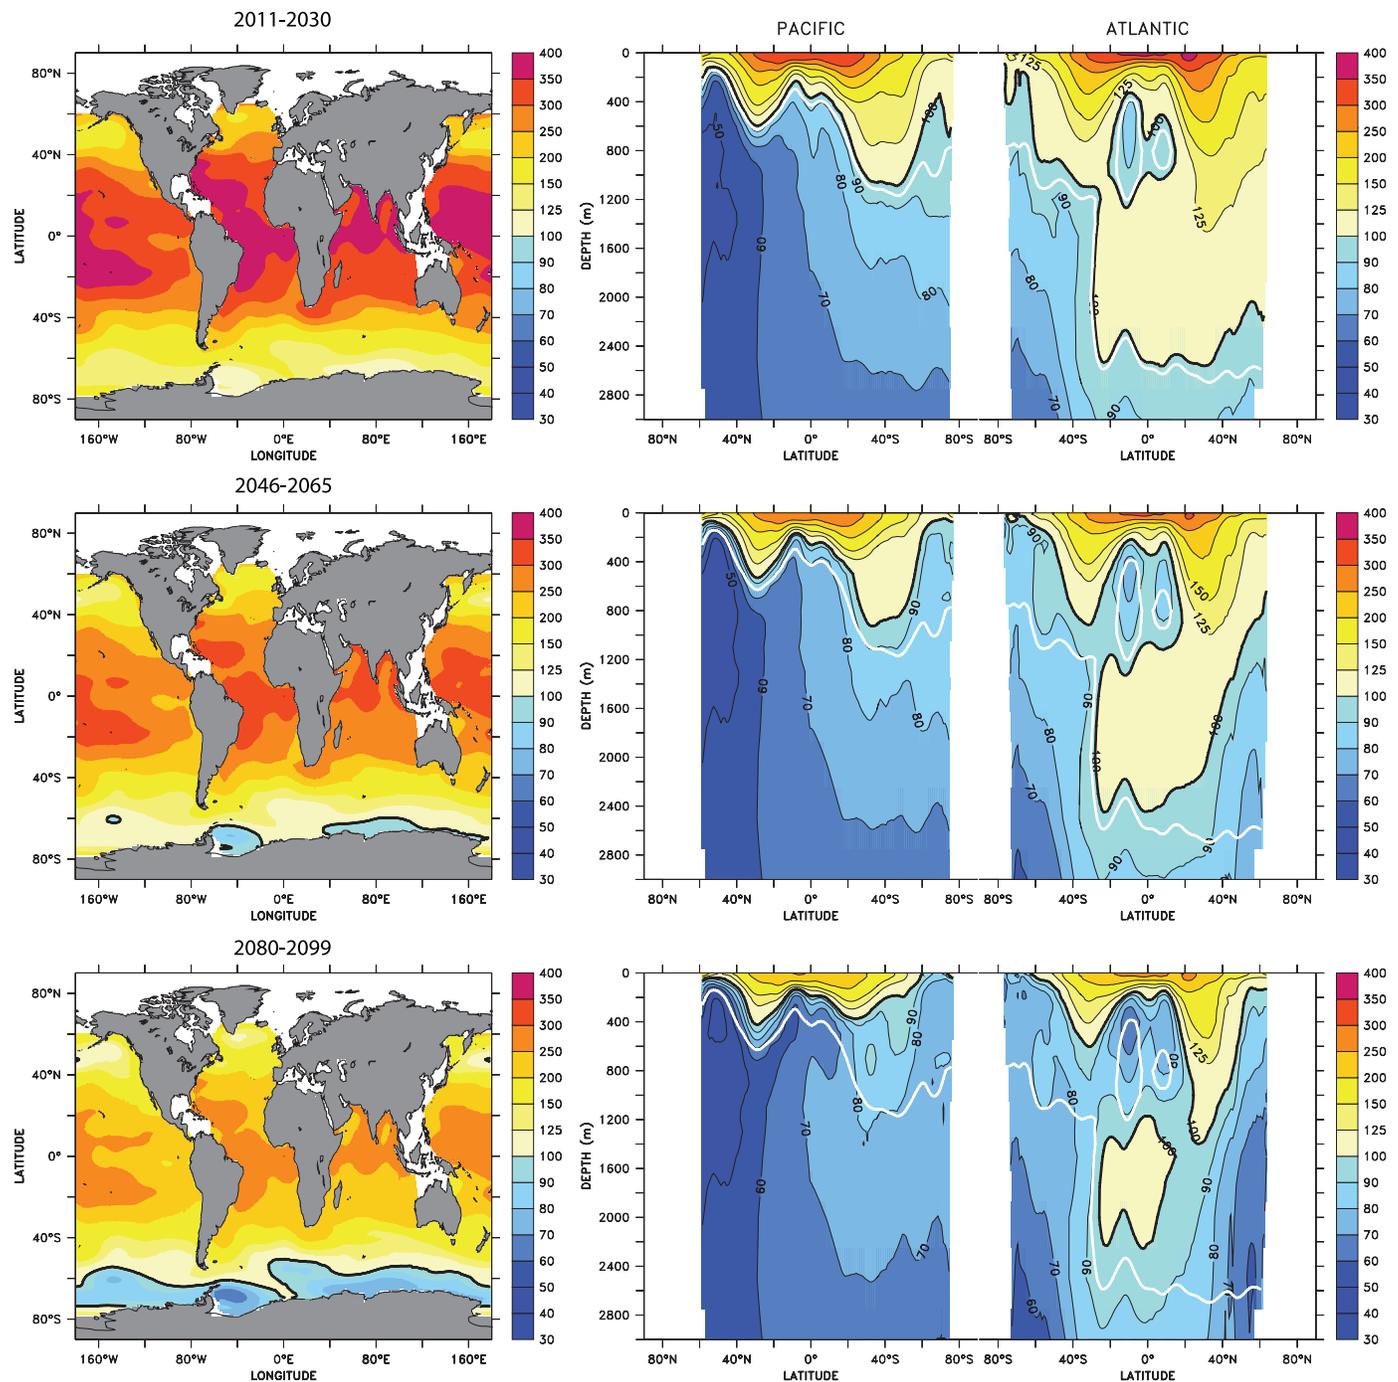

Ocean acidification could thus conceivably lead to undersaturation and dissolution of calcium carbonate in parts of the surface ocean during the 21st century, depending on the evolution of atmospheric CO<sub>2</sub> (Orr et al., 2005). Southern Ocean surface water is projected to become undersaturated with respect to aragonite at a CO<sub>2</sub> concentration of approximately 600 ppm. This concentration threshold is largely independent of emission scenarios.

Uncertainty in these projections due to potential future climate change effects on the ocean carbon cycle (mainly through changes in temperature, ocean stratification and marine biological production and re-mineralization; see Box 7.3) are small compared to the direct effect of rising atmospheric CO<sub>2</sub> from anthropogenic emissions. Orr et al. (2005) estimate that 21st century climate change could possibly counteract less than 10% of the projected direct geochemical changes. By far the largest uncertainty in the future evolution of these ocean interior changes is thus associated with the future pathway of atmospheric CO<sub>2</sub>.

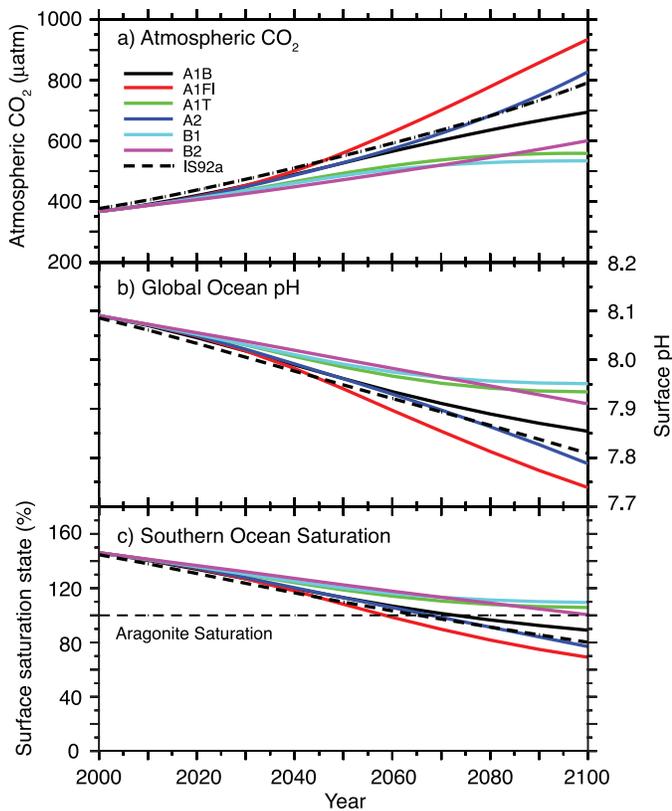

#### 10.4.3 Simulations of Future Evolution of Methane, Ozone and Oxidants

Simulations using coupled chemistry-climate models indicate that the trend in upper-stratospheric ozone changes sign sometime between 2000 and 2005 due to the gradual reduction in halocarbons. While ozone concentrations in the upper stratosphere decreased at a rate of 400 ppb (–6%) per decade during 1980 to 2000, they are projected to increase at a rate of 100 ppb (1 to 2%) per decade from 2000 to 2020 (Austin and Butchart, 2003). On longer time scales, simulations show significant changes in ozone and CH<sub>4</sub> relative to current concentrations. The changes are related to a variety of factors, including increased emissions of chemical precursors, changes in gas-phase and heterogeneous chemistry, altered climate conditions due to global warming and greater transport and mixing across the tropopause. The impacts on CH<sub>4</sub> and ozone from increased emissions are a direct effect of anthropogenic activity, while the impacts of different climate conditions and stratosphere-troposphere exchange represent indirect effects of these emissions (Grewe et al., 2001).

The projections for ozone based upon scenarios with high emissions (IS92a; Leggett et al., 1992) and SRES A2 (Nakićenović and Swart, 2000) indicate that concentrations of tropospheric ozone might increase throughout the 21st century, primarily as a result of these emissions. Simulations for the period 2015 through 2050 project increases in ozone of 20 to 25% (Grewe et al., 2001; Hauglustaine and Brasseur, 2001), and simulations through 2100 indicate that ozone below 250 mb may grow by 40 to 60% (Stevenson et al., 2000; Grenfell et al., 2003; Zeng and Pyle, 2003; Hauglustaine et al., 2005; Yoshimura et al., 2006). The primary species contributing to the increase in tropospheric ozone are anthropogenic emissions of NO<sub>x</sub>, CH<sub>4</sub>, CO and compounds from fossil fuel combustion. The photochemical reactions that produce smog are accelerated by increases of 2.6 times the present flux of NO<sub>x</sub>, 2.5 times the

**Figure 10.23.** Multi-model median for projected levels of saturation (%) with respect to aragonite, a meta-stable form of calcium carbonate, over the 21st century from the Ocean Carbon-Cycle Model Intercomparison Project (OCMIP-2) models (adapted from Orr et al., 2005). Calcium carbonate dissolves at levels below 100%. Surface maps (left) and combined Pacific/Atlantic zonal mean sections (right) are given for scenario IS92a as averages over three time periods: 2011 to 2030 (top), 2045 to 2065 (middle) and 2080 to 2099 (bottom). Atmospheric  $\text{CO}_2$  concentrations for these three periods average 440, 570 and 730 ppm, respectively. Latitude-depth sections start in the North Pacific (at the left border), extend to the Southern Ocean Pacific section and return through the Southern Ocean Atlantic section to the North Atlantic (right border). At 100%, waters are saturated (solid black line - the aragonite saturation horizon); values larger than 100% indicate super-saturation; values lower than 100% indicate undersaturation. The observation-based (Global Ocean Data Analysis Project; GLODAP) 1994 saturation horizon (solid white line) is also shown to illustrate the projected changes in the saturation horizon compared to the present.

**Figure 10.24.** Changes in global average surface pH and saturation state with respect to aragonite in the Southern Ocean under various SRES scenarios. Time series of (a) atmospheric CO<sub>2</sub> for the six illustrative SRES scenarios, (b) projected global average surface pH and (c) projected average saturation state in the Southern Ocean from the BERN2.5D EMIC (Plattner et al., 2001). The results for the SRES scenarios A1T and A2 are similar to those for the non-SRES scenarios S650 and IS92a, respectively. Modified from Orr et al. (2005).

present flux of CH<sub>4</sub> and 1.8 times the present flux of CO in the A2 scenario. Between 91 and 92% of the higher concentrations in ozone are related to direct effects of these emissions, with the remainder of the increase attributable to secondary effects of climate change (Zeng and Pyle, 2003) combined with biogenic precursor emissions (Hauglustaine et al., 2005). These emissions may also lead to higher concentrations of oxidants including the hydroxyl radical (OH), possibly leading to an 8% reduction in the lifetime of tropospheric CH<sub>4</sub> (Grewe et al., 2001).

Since the projected growth in emissions occurs primarily in low latitudes, the ozone increases are largest in the tropics and subtropics (Grenfell et al., 2003). In particular, the concentrations in Southeast Asia, India and Central America increase by 60 to 80% by 2050 under the A2 scenario. However, the effects of tropical emissions are not highly localised, since the ozone spreads throughout the lower atmosphere in plumes emanating from these regions. As a result, the ozone in remote marine regions in the SH may grow by 10 to 20% over present-day levels by 2050. The ozone may also be distributed through vertical transport in tropical convection followed by lateral transport on isentropic surfaces. Ozone concentrations can also be increased by emissions of biogenic hydrocarbons (e.g., Hauglustaine et

al., 2005), in particular isoprene emitted by broadleaf forests. Under the A2 scenario, biogenic hydrocarbons are projected to increase by between 27% (Sanderson et al., 2003) and 59% (Hauglustaine et al., 2005) contributing to a 30 to 50% increase in ozone formation over northern continental regions.

Developing countries have begun reducing emissions from mobile sources through stricter standards. New projections of the evolution of ozone precursors that account for these reductions have been developed with the Regional Air Pollution Information and Simulation (RAINS) model (Amann et al., 2004). One set of projections is consistent with source strengths permitted under the Current Legislation (CLE) scenario. A second set of projections is consistent with lower emissions under a Maximum Feasible Reduction (MFR) scenario. The concentrations of ozone and CH<sub>4</sub> have been simulated for the MFR, CLE and A2 scenarios for the period 2000 through 2030 using an ensemble of 26 chemical transport models (Dentener et al., 2006; Stevenson et al., 2006). The changes in NO<sub>x</sub> emissions for these three scenarios are -27%, +12% and +55%, respectively, relative to year 2000. The corresponding changes in ensemble-mean burdens in tropospheric ozone are -5%, +6% and +18% for the MFR, CLE and A2 scenarios, respectively. There are substantial inter-model differences of order ±25% in these results. The ozone decreases throughout the troposphere in the MFR scenario, but the zonal annual mean concentrations increase by up to 6 ppb in the CLE scenario and by typically 6 to 10 ppb in the A2 scenario (Supplementary Material, Figure S10.2).

The radiative forcing by the combination of ozone and CH<sub>4</sub> changes by -0.05, 0.18, and 0.30 W m<sup>-2</sup> for the MFR, CLE and A2 scenarios, respectively. These projections indicate that the growth in tropospheric ozone between 2000 and 2030 could be reduced or reversed depending on emission controls.

The major issues in the fidelity of these simulations for future tropospheric ozone are the sensitivities to the representation of the stratospheric production, destruction and transport of ozone and the exchange of species between the stratosphere and troposphere. Few of the models include the effects of non-methane hydrocarbons (NMHCs), and the sign of the effects of NMHCs on ozone are not consistent among the models that do (Hauglustaine and Brasseur, 2001; Grenfell et al., 2003).

The effect of more stratosphere-troposphere exchange (STE) in response to climate change is projected to increase the concentrations of ozone in the upper troposphere due to the much greater concentrations of ozone in the lower stratosphere than in the upper troposphere. While the sign of the effect is consistent in recent simulations, the magnitude of the change in STE and its effects on ozone are very model dependent. In a simulation forced by the SRES A1FI scenario, Collins et al. (2003) project that the downward flux of ozone increases by 37% from the 1990s to the 2090s. As a result, the concentration of ozone in the upper troposphere at mid-latitudes increases by 5 to 15%. For the A2 scenarios, projections of the increase in ozone by 2100 due to STE range from 35% (Hauglustaine et al., 2005) to 80% (Sudo et al., 2003; Zeng and Pyle, 2003). The increase in STE is driven by increases in the descending

branches of the Brewer-Dobson Circulation at mid-latitudes and is caused by changes in meridional temperature gradients in the upper troposphere and lower stratosphere (Rind et al., 2001). The effects of the enhanced STE are sensitive to the simulation of processes in the stratosphere, including the effects of lower temperatures and the evolution of chlorine, bromine and  $\text{NO}_x$  concentrations. Since the greenhouse effect of ozone is largest in the upper troposphere, the treatment of STE remains a significant source of uncertainty in the calculation of the total greenhouse effect of tropospheric ozone.

The effects of climate change, in particular increased tropospheric temperatures and water vapour, tend to offset some of the increase in ozone driven by emissions. The higher water vapour is projected to offset the increase in ozone by between 10% (Hauglustaine et al., 2005) and 17% (Stevenson et al., 2000). The water vapour both decelerates the chemical production and accelerates the chemical destruction of ozone. The photochemical production depends on the concentrations of  $\text{NO}_y$  (reactive odd nitrogen), and the additional water vapour causes a larger fraction of  $\text{NO}_y$  to be converted to nitric acid, which can be efficiently removed from the atmosphere in precipitation (Grewe et al., 2001). The water vapour also increases the concentrations of OH through reaction with the oxygen radical in the 1D excited state ( $\text{O}(^1\text{D})$ ), and the removal of  $\text{O}(^1\text{D})$  from the atmosphere slows the formation of ozone. The increased concentrations of OH and the increased rates of  $\text{CH}_4$  oxidation with higher temperature further reduce the lifetime of tropospheric  $\text{CH}_4$  by 12% by 2100 (Stevenson et al., 2000; Johnson et al., 2001). Decreases in  $\text{CH}_4$  concentrations also tend to reduce tropospheric ozone (Stevenson et al., 2000).

Recent measurements show that  $\text{CH}_4$  growth rates have declined and were negative for several years in the early 21st century (see Section 2.3.2). The observed rate of increase of  $0.8 \text{ ppb yr}^{-1}$  for the period 1999 to 2004 is considerably less than the rate of  $6 \text{ ppb yr}^{-1}$  assumed in all the SRES scenarios for the period 1990 to 2000 (Nakićenović and Swart, 2000; TAR Appendix II). Recent studies (Dentener et al., 2005) have considered lower emission scenarios (see above) that take account of new pollution control techniques adopted in major developing countries. In the CLE scenario, emissions of  $\text{CH}_4$  are comparable to the B2 scenario and increase from  $340 \text{ Tg yr}^{-1}$  in 2000 to  $450 \text{ Tg yr}^{-1}$  in 2030. The  $\text{CH}_4$  concentrations increase from 1,750 ppb in 2000 to between 2,090 and 2,200 ppb in 2030 under this scenario. In the MFR scenario, the emissions are sufficiently low that the concentrations in 2030 are unchanged at 1,750 ppb. Under these conditions, the changes in radiative forcing due to  $\text{CH}_4$  between the 1990s and 2020s are less than  $0.01 \text{ W m}^{-2}$ .

Current understanding of the magnitude and variation of  $\text{CH}_4$  sources and sinks is covered in Section 7.4, where it is noted that there are substantial uncertainties although the modelling has progressed. There is some evidence for a coupling between climate and wetland emissions. For example, calculations using atmospheric concentrations and small-scale emission measurements as input differ by 60% (Shindell and Schmidt, 2004). Concurrent changes in natural sources of  $\text{CH}_4$  are

now being estimated to first order using simple models of the biosphere coupled to AOGCMs. Simulations of the response of wetlands to climate change from doubling atmospheric  $\text{CO}_2$  show that wetland emissions increase by 78% (Shindell and Schmidt, 2004). Most of this effect is caused by growth in the flux of  $\text{CH}_4$  from existing tropical wetlands. The increase would be equivalent to approximately 20% of current inventories and would contribute an additional 430 ppb to atmospheric concentrations. Global radiative forcing would increase by approximately 4 to 5% from the effects of wetland emissions by 2100 (Gedney et al., 2004).

#### 10.4.4 Simulations of Future Evolution of Major Aerosol Species

The time-dependent evolution of major aerosol species and the interaction of these species with climate represent some of the major sources of uncertainty in projections of climate change. An increasing number of AOGCMs have included multiple types of tropospheric aerosols including sulphates, nitrates, black and organic carbon, sea salt and soil dust. Of the 23 models represented in the multi-model ensemble of climate-change simulations for IPCC AR4, 13 include other tropospheric species besides sulphates. Of these, seven have the non-sulphate species represented with parametrizations that interact with the remainder of the model physics. Nitrates are treated in just two of the models in the ensemble. Recent projections of nitrate and sulphate loading under the SRES A2 scenario suggest that forcing by nitrates may exceed forcing by sulphates by the end of the 21st century (Adams et al., 2001). This result is of course strongly dependent upon the evolution of precursor emissions for these aerosol species.

The black and organic carbon aerosols in the atmosphere include a very complex system of primary organic aerosols (POA) and secondary organic aerosols (SOA), which are formed by oxidation of biogenic VOCs. The models used for climate projections typically use highly simplified bulk parametrizations for POA and SOA. More detailed parametrizations for the formation of SOA that trace oxidation pathways have only recently been developed and used to estimate the direct radiative forcing by SOA for present-day conditions (Chung and Seinfeld, 2002). The forcing by SOA is an emerging issue for simulations of present-day and future climate since the rate of chemical formation of SOA may be 60% or more of the emissions rate for primary carbonaceous aerosols (Kanakidou et al., 2005). In addition, two-way coupling between reactive chemistry and tropospheric aerosols has not been explored comprehensively in climate change simulations. Unified models that treat tropospheric ozone- $\text{NO}_x$ -hydrocarbon chemistry, aerosol formation, heterogeneous processes in clouds and on aerosols, and gas-phase photolysis have been developed and applied to the current climate (Liao et al., 2003). However, these unified models have not yet been used extensively to study the evolution of the chemical state of the atmosphere under future scenarios.

The interaction of soil dust with climate is under active investigation. Whether emissions of soil dust aerosols increase or decrease in response to changes in atmospheric state and circulation is still unresolved (Tegen et al., 2004a). Several recent studies have suggested that the total surface area where dust can be mobilised will decrease in a warmer climate with higher concentrations of CO<sub>2</sub> (e.g., Harrison et al., 2001). The net effects of reductions in dust emissions from natural sources combined with land use change could potentially be significant but have not been systematically modelled as part of climate change assessment.

Uncertainty regarding the scenario simulations is compounded by inherently unpredictable natural forcings from future volcanic eruptions and solar variability. The eruptions that produce climatologically significant forcing represent just the extremes of global volcanic activity (Naveau and Ammann, 2005). Global simulations can account for the effects of future natural forcings using stochastic representations based upon prior eruptions and variations in solar luminosity. The relative contribution of these forcings to the projections of global mean temperature anomalies are largest in the period up to 2030 (Stott and Kettleborough, 2002).

## 10.5 Quantifying the Range of Climate Change Projections

### 10.5.1 Sources of Uncertainty and Hierarchy of Models

Uncertainty in predictions of anthropogenic climate change arises at all stages of the modelling process described in Section 10.1. The specification of future emissions of greenhouse gases, aerosols and their precursors is uncertain (e.g., Nakićenović and Swart, 2000). It is then necessary to convert these emissions into concentrations of radiatively active species, calculate the associated forcing and predict the response of climate system variables such as surface temperature and precipitation (Figure 10.1). At each step, uncertainty in the true signal of climate change is introduced both by errors in the representation of Earth system processes in models (e.g., Palmer et al., 2005) and by internal climate variability (e.g., Selten et al., 2004). The effects of internal variability can be quantified by running models many times from different initial conditions, provided that simulated variability is consistent with observations. The effects of uncertainty in the knowledge of Earth system processes can be partially quantified by constructing ensembles of models that sample different parametrizations of these processes. However, some processes may be missing from the set of available models, and alternative parametrizations of other processes may share common systematic biases. Such limitations imply that distributions of future climate responses from ensemble simulations are themselves subject to uncertainty (Smith, 2002), and would be wider were uncertainty

due to structural model errors accounted for. These distributions may be modified to reflect observational constraints expressed through metrics of the agreement between the observed historical climate and the simulations of individual ensemble members, for example through Bayesian methods (see Chapter 9 Supplementary Material, Appendix 9.B). In this case, the choice of observations and their associated errors introduce further sources of uncertainty. In addition, some sources of future radiative forcing are yet to be accounted for in the ensemble projections, including those from land use change, variations in solar and volcanic activity (Kettleborough et al., 2007), and CH<sub>4</sub> release from permafrost or ocean hydrates (see Section 8.7).

A spectrum or hierarchy of models of varying complexity has been developed (Claussen et al., 2002; Stocker and Knutti, 2003) to assess the range of future changes consistent with the understanding of known uncertainties. Simple climate models (SCMs) typically represent the ocean-atmosphere system as a set of global or hemispheric boxes, predicting global surface temperature using an energy balance equation, a prescribed value of climate sensitivity and a basic representation of ocean heat uptake (see Section 8.8.2). Their role is to perform comprehensive analyses of the interactions between global variables, based on prior estimates of uncertainty in their controlling parameters obtained from observations, expert judgement and from tuning to complex models. By coupling SCMs to simple models of biogeochemical cycles they can be used to extrapolate the results of AOGCM simulations to a wide range of alternative forcing scenarios (e.g., Wigley and Raper, 2001; see Section 10.5.3).

Compared to SCMs, EMICs include more of the processes simulated in AOGCMs, but in a less detailed, more highly parametrized form (see Section 8.8.3), and at coarser resolution. Consequently, EMICs are not suitable for quantifying uncertainties in regional climate change or extreme events, however they can be used to investigate the large-scale effects of coupling between multiple Earth system components in large ensembles or long simulations (e.g., Forest et al., 2002; Knutti et al., 2002), which is not yet possible with AOGCMs due to their greater computational expense. Some EMICs therefore include modules such as vegetation dynamics, the terrestrial and ocean carbon cycles and atmospheric chemistry (Plattner et al., 2001; Claussen et al., 2002), filling a gap in the spectrum of models between AOGCMs and SCMs. Thorough sampling of parameter space is computationally feasible for some EMICs (e.g., Stocker and Schmittner, 1997; Forest et al., 2002; Knutti et al., 2002), as for SCMs (Wigley and Raper, 2001), and is used to obtain probabilistic projections (see Section 10.5.4.5). In some EMICs, climate sensitivity is an adjustable parameter, as in SCMs. In other EMICs, climate sensitivity is dependent on multiple model parameters, as in AOGCMs. Probabilistic estimates of climate sensitivity and TCR from SCMs and EMICs are assessed in Section 9.6 and compared with estimates from AOGCMs in Box 10.2.

The high resolution and detailed parametrizations in AOGCMs enable them to simulate more comprehensively the

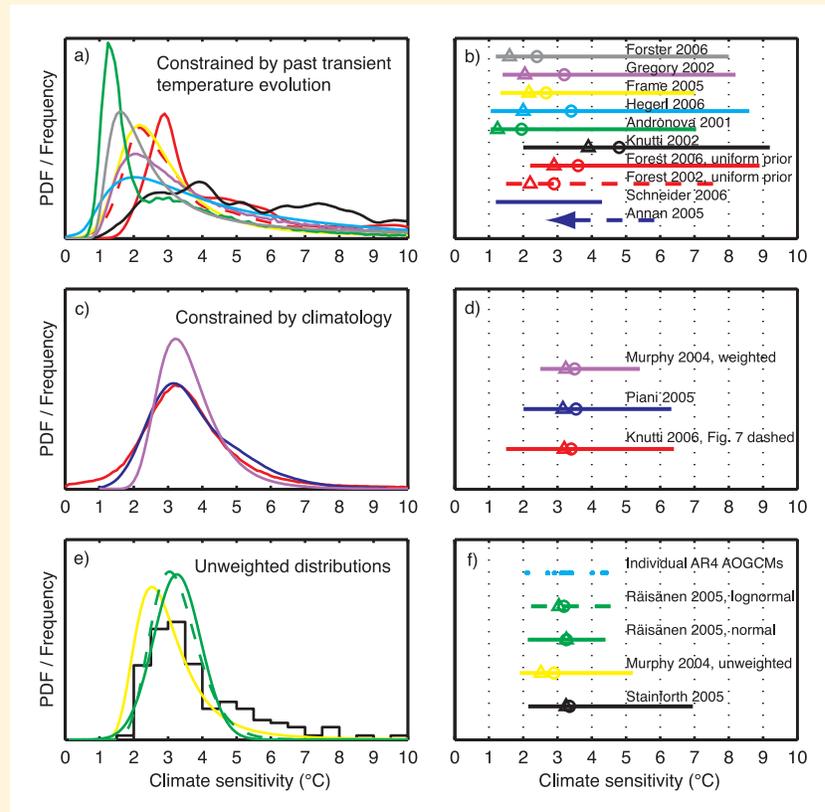

## Box 10.2: Equilibrium Climate Sensitivity

The likely range<sup>1</sup> for equilibrium climate sensitivity was estimated in the TAR (Technical Summary, Section F.3; Cubasch et al., 2001) to be 1.5°C to 4.5°C. The range was the same as in an early report of the National Research Council (Charney, 1979), and the two previous IPCC assessment reports (Mitchell et al., 1990; Kattenberg et al., 1996). These estimates were expert assessments largely based on equilibrium climate sensitivities simulated by atmospheric GCMs coupled to non-dynamic slab oceans. The mean  $\pm 1$  standard deviation values from these models were 3.8°C  $\pm$  0.78°C in the SAR (17 models), 3.5°C  $\pm$  0.92°C in the TAR (15 models) and in this assessment 3.26°C  $\pm$  0.69°C (18 models).

Considerable work has been done since the TAR (IPCC, 2001) to estimate climate sensitivity and to provide a better quantification of relative probabilities, including a most likely value, rather than just a subjective range of uncertainty. Since climate sensitivity of the real climate system cannot be measured directly, new methods have been used since the TAR to establish a relationship between sensitivity and some observable quantity (either directly or through a model), and to estimate a range or probability density function (PDF) of climate sensitivity consistent with observations. These methods are summarised separately in Chapters 9 and 10, and here we synthesize that information into an assessment. The information comes from two main categories: constraints from past climate change on various time scales, and the spread of results for climate sensitivity from ensembles of models.

The first category of methods (see Section 9.6) uses the historical transient evolution of surface temperature, upper air temperature, ocean temperature, estimates of the radiative forcing, satellite data, proxy data over the last millennium, or a subset thereof to calculate ranges or PDFs for sensitivity (e.g., Wigley et al., 1997b; Tol and De Vos, 1998; Andronova and Schlesinger, 2001; Forest et al., 2002; Gregory et al., 2002a; Harvey and Kaufmann, 2002; Knutti et al., 2002, 2003; Frame et al., 2005; Forster et al., 2006; Forster and Gregory, 2006; Hegerl et al., 2006). A summary of all PDFs of climate sensitivity from those methods is shown in Figure 9.20 and in Box 10.2, Figure 1a. Median values, most likely values (modes) and 5 to 95% uncertainty ranges are shown in Box 10.2, Figure 1b for each PDF. Most of the results confirm that climate sensitivity is very unlikely below 1.5°C. The upper bound is more difficult to constrain because of a nonlinear relationship between climate sensitivity and the observed transient response, and is further hampered by the limited length of the observational record and uncertainties in the observations, which are particularly large for ocean heat uptake and for the magnitude of the aerosol radiative forcing. Studies that take all the important known uncertainties in observed historical trends into account cannot rule out the possibility that the climate sensitivity exceeds 4.5°C, although such high values are consistently found to be less likely than values of around 2.0°C to 3.5°C. Observations of transient climate change provide better constraints for the TCR (see Section 9.6.1.3).

Two recent studies use a modelled relation between climate sensitivity and tropical SSTs in the Last Glacial Maximum (LGM) and proxy records of the latter to estimate ranges of climate sensitivity (Annan et al., 2005b; Schneider von Deimling et al., 2006; see (continued)

**Box 10.2, Figure 1.** (a) PDFs or frequency distributions constrained by the transient evolution of the atmospheric temperature, radiative forcing and ocean heat uptake, (b) as in (a) and (b) but 5 to 95% ranges, medians (circles) and maximum probabilities (triangles), (c) and (d) as in (a) but using constraints from present-day climatology, and (e) and (f) unweighted or fitted distributions from different models or from perturbing parameters in a single model. Distributions in (e) and (f) should not be strictly interpreted as PDFs. See Chapter 9 text, Figure 9.20 and Table 9.3 for details. Note that Annan et al. (2005b) only provide an upper but no lower bound. All PDFs are truncated at 10°C for consistency, some are shown for different prior distributions than in the original studies, and ranges may differ from numbers reported in individual studies.

<sup>1</sup> Though the TAR Technical Summary attached 'likely' to the 1.5°C - 4.5°C range, the word 'likely' was used there in a general sense rather than in a specific calibrated sense. No calibrated confidence assessment was given in either the Summary for Policymakers or in Chapter 9 of the TAR, and no probabilistic studies on climate sensitivity were cited in Chapter 9 where the range was assessed.

Section 9.6). While both of these estimates overlap with results from the instrumental period and results from other AOGCMS, the results differ substantially due to different forcings and the different relationships between LGM SSTs and sensitivity in the models used. Therefore, LGM proxy data provide support for the range of climate sensitivity based on other lines of evidence.

Studies comparing the observed transient response of surface temperature after large volcanic eruptions with results obtained from models with different climate sensitivities (see Section. 9.6) do not provide PDFs, but find best agreement with sensitivities around 3°C, and reasonable agreement within the 1.5°C to 4.5°C range (Wigley et al., 2005). They are not able to exclude sensitivities above 4.5°C.

The second category of methods examines climate sensitivity in GCMs. Climate sensitivity is not a single tuneable parameter in these models, but depends on many processes and feedbacks. Three PDFs of climate sensitivity were obtained by comparing different variables of the simulated present-day climatology and variability against observations in a perturbed physics ensemble (Murphy et al., 2004; Piani et al., 2005; Knutti et al., 2006, Box 10.2, Figure 1c,d; see Section 10.5.4.2). Equilibrium climate sensitivity is found to be most likely around 3.2°C, and very unlikely to be below about 2°C. The upper bound is sensitive to how model parameters are sampled and to the method used to compare with observations.

Box 10.2, Figure 1e,f show the frequency distributions obtained by different methods when perturbing parameters in the Hadley Centre Atmospheric Model (HadAM3) but before weighting with observations (Section 10.5.4). Murphy et al. (2004; unweighted) sampled 29 parameters and assumed individual effects to combine linearly.

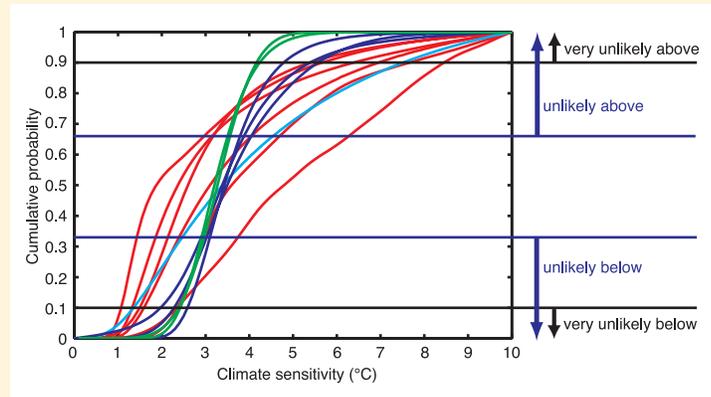

Stainforth et al. (2005) found nonlinearities when simulating multiple combinations of a subset of key parameters. The most frequently occurring climate sensitivity values are grouped around 3°C, but this could reflect the sensitivity of the unperturbed model. Some, but not all, of the simulations by high-sensitivity models have been found to agree poorly with observations and are therefore unlikely, hence even very high values are not excluded. This inability to rule out very high values is common to many methods, since for well-understood physical reasons, the rate of change (against sensitivity) of most quantities that can be observed tends to zero as the sensitivity increases (Hansen et al., 1985; Knutti et al., 2005; Allen et al., 2006b).

There is no well-established formal way of estimating a single PDF from the individual results, taking account of the different assumptions in each study. Most studies do not account for structural uncertainty, and thus probably tend to underestimate the uncertainty. On the other hand, since several largely independent lines of evidence indicate similar most likely values and ranges, climate sensitivity values are likely to be better constrained than those found by methods based on single data sets (Annan and Hargreaves, 2006; Hegerl et al., 2006).

The equilibrium climate sensitivity values for the AR4 AOGCMS coupled to non-dynamic slab ocean models are given for comparison (Box 10.2, Figure 1e,f; see also Table 8.2). These estimates come from models that represent the current best efforts from the international global climate modelling community at simulating climate. A normal fit yields a 5 to 95% range of about 2.1°C to 4.4°C with a mean value of equilibrium climate sensitivity of about 3.3°C (2.2°C to 4.6°C for a lognormal distribution, median 3.2°C) (Räisänen, 2005b). A probabilistic interpretation of the results is problematic, because each model is assumed to be equally credible and the results depend upon the assumed shape of the fitted distribution. Although the AOGCMS used in IPCC reports are an 'ensemble of opportunity' not designed to sample modelling uncertainties systematically or randomly, the range of sensitivities covered has been rather stable over many years. This occurs in spite of substantial model developments, considerable progress in simulating many aspects of the large-scale climate, and evaluation of those models against observations. Progress has been made since the TAR in diagnosing and understanding inter-model differences in climate feedbacks and equilibrium climate sensitivity. Confidence has increased in the strength of water vapour-lapse rate feedbacks, whereas cloud feedbacks (particularly from low-level clouds) have been confirmed as the primary source of climate sensitivity differences (see Section 8.6).

Since the TAR, the levels of scientific understanding and confidence in quantitative estimates of equilibrium climate sensitivity have increased substantially. Basing our assessment on a combination of several independent lines of evidence, as summarised in Box 10.2 Figures 1 and 2, including observed climate change and the strength of known feedbacks simulated in GCMs, we conclude that the global mean equilibrium warming for doubling CO<sub>2</sub>, or 'equilibrium climate sensitivity', is likely to lie in the range 2°C to 4.5°C, with a most likely value of about 3°C. Equilibrium climate sensitivity is very likely larger than 1.5°C.

For fundamental physical reasons as well as data limitations, values substantially higher than 4.5°C still cannot be excluded, but agreement with observations and proxy data is generally worse for those high values than for values in the 2°C to 4.5°C range.

**Box 10.2, Figure 2.** Individual cumulative distributions of climate sensitivity from the observed 20th-century warming (red), model climatology (blue) and proxy evidence (cyan), taken from Box 10.2, Figure 1a, c (except LGM studies and Forest et al. (2002), which is superseded by Forest et al. (2006)) and cumulative distributions fitted to the AOGCMS' climate sensitivities (green) from Box 10.2, Figure 1e. Horizontal lines and arrows mark the edges of the likelihood estimates according to IPCC guidelines.

processes giving rise to internal variability (see Section 8.4), extreme events (see Section 8.5) and climate change feedbacks, particularly at the regional scale (Boer and Yu, 2003a; Bony and Dufresne, 2005; Bony et al., 2006; Soden and Held, 2006). Given that ocean dynamics influence regional feedbacks (Boer and Yu, 2003b), quantification of regional uncertainties in time-dependent climate change requires multi-model ensemble simulations with AOGCMs containing a full, three-dimensional dynamic ocean component. However, downscaling methods (see Chapter 11) are required to obtain credible information at spatial scales near or below the AOGCM grid scale (125 to 400 km in the AR4 AOGCMs, see Table 8.1).

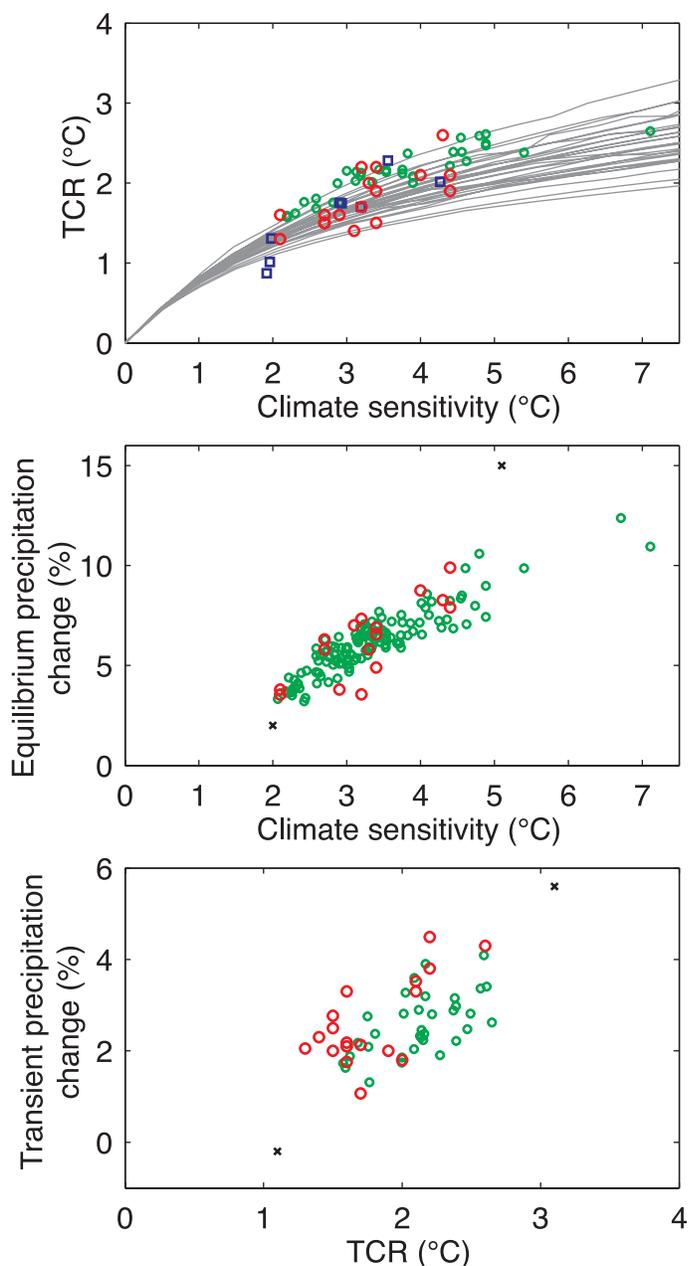

## 10.5.2 Range of Responses from Different Models

### 10.5.2.1 Comprehensive AOGCMs

The way a climate model responds to changes in external forcing, such as an increase in anthropogenic greenhouse gases, is characterised by two standard measures: (1) ‘equilibrium climate sensitivity’ (the equilibrium change in global surface temperature following a doubling of the atmospheric equivalent  $\text{CO}_2$  concentration; see Glossary), and (2) ‘transient climate response’ (the change in global surface temperature in a global coupled climate model in a  $1\% \text{ yr}^{-1}$   $\text{CO}_2$  increase experiment at the time of atmospheric  $\text{CO}_2$  doubling; see Glossary). The first measure provides an indication of feedbacks mainly residing in the atmospheric model but also in the land surface and sea ice components, and the latter quantifies the response of the fully coupled climate system including aspects of transient ocean heat uptake (e.g., Sokolov et al., 2003). These two measures have become standard for quantifying how an AOGCM will react to more complicated forcings in scenario simulations.

Historically, the equilibrium climate sensitivity has been given in the range from  $1.5^\circ\text{C}$  to  $4.5^\circ\text{C}$ . This range was reported in the TAR with no indication of a probability distribution within this range. However, considerable recent work has addressed the range of equilibrium climate sensitivity, and attempted to assign probabilities to climate sensitivity.

Equilibrium climate sensitivity and TCR are not independent (Figure 10.25a). For a given AOGCM, the TCR is smaller than the equilibrium climate sensitivity because ocean heat uptake delays the atmospheric warming. A large ensemble of the BERN2.5D EMIC has been used to explore the relationship of TCR and equilibrium sensitivity over a wide range of ocean heat uptake parametrizations (Knutti et al., 2005). Good agreement with the available results from AOGCMs is found, and the BERN2.5D EMIC covers almost the entire range of structurally different models. The percent change in precipitation is closely related to the equilibrium climate sensitivity for the current generation of AOGCMs (Figure 10.25b), with values from the current models falling within the range of the models from the TAR. Figure 10.25c shows the percent change in globally averaged precipitation as a function of TCR at the time of atmospheric  $\text{CO}_2$  doubling, as simulated by  $1\% \text{ yr}^{-1}$  transient  $\text{CO}_2$  increase experiments with AOGCMs. The figure suggests

**Figure 10.25.** (a) TCR versus equilibrium climate sensitivity for all AOGCMs (red), EMICs (blue), a perturbed physics ensemble of the UKMO-HadCM3 AOGCM (green; an updated ensemble based on M. Collins et al., 2006) and from a large ensemble of the Bern2.5D EMIC (Knutti et al., 2005) using different ocean vertical diffusivities and mixing parametrizations (grey lines). (b) Global mean precipitation change (%) as a function of global mean temperature change at equilibrium for doubled  $\text{CO}_2$  in atmospheric GCMs coupled to a non-dynamic slab ocean (red all AOGCMs, green from a perturbed physics ensemble of the atmosphere-slab ocean version of UKMO-HadCM3 (Webb et al., 2006)). (c) Global mean precipitation change (%) as a function of global mean temperature change (TCR) at the time of  $\text{CO}_2$  doubling in a transient  $1\% \text{ yr}^{-1}$   $\text{CO}_2$  increase scenario, simulated by coupled AOGCMs (red) and the UKMO-HadCM3 perturbed physics ensemble (green). Black crosses in (b) and (c) mark ranges covered by the TAR AOGCMs (IPCC, 2001) for each quantity.

a broadly positive correlation between these two quantities similar to that for equilibrium climate sensitivity, with these values from the new models also falling within the range of the previous generation of AOGCMs assessed in the TAR. Note that the apparent relationships may not hold for other forcings or at smaller scales. Values for an ensemble with perturbations made to parameters in the atmospheric component of UKMO-HadCM3 (M. Collins et al., 2006) cover similar ranges and are shown in Figure 10.25 for comparison.

Fitting normal distributions to the results, the 5 to 95% uncertainty range for equilibrium climate sensitivity from the AOGCMs is approximately 2.1°C to 4.4°C and that for TCR is 1.2°C to 2.4°C (using the method of Räisänen, 2005b). The mean for climate sensitivity is 3.26°C and that for TCR is 1.76°C. These numbers are practically the same for both the normal and the lognormal distribution (see Box 10.2). The assumption of a (log) normal fit is not well supported by the limited sample of AOGCM data. In addition, the AOGCMs represent an ‘ensemble of opportunity’ and are by design not sampled in a random way. However, most studies aiming to constrain climate sensitivity with observations do indeed indicate a similar to lognormal probability distribution of climate sensitivity and an approximately normal distribution of the uncertainty in future warming and thus TCR (see Box 10.2). Those studies also suggest that the current AOGCMs may not cover the full range of uncertainty for climate sensitivity. An assessment of all the evidence on equilibrium climate sensitivity is provided in Box 10.2. The spread of the AOGCM climate sensitivities is discussed in Section 8.6 and the AOGCM values for climate sensitivity and TCR are listed in Table 8.2.

The nonlinear relationship between TCR and equilibrium climate sensitivity shown in Figure 10.25a also indicates that on time scales well short of equilibrium, the model’s TCR is not particularly sensitive to the model’s climate sensitivity. The implication is that transient climate change is better constrained than the equilibrium climate sensitivity, that is, models with different sensitivity might still show good agreement for projections on decadal time scales. Therefore, in the absence of unusual solar or volcanic activity, climate change is well constrained for the coming few decades, because differences in some feedbacks will only become important on long time scales (see also Section 10.5.4.5) and because over the next few decades, about half of the projected warming would occur as a result of radiative forcing being held constant at year 2000 levels (constant composition commitment, see Section 10.7).

Comparing observed thermal expansion with those AR4 20th-century simulations that have natural forcings indicates that ocean heat uptake in the models may be 25% larger than observed, although both could be consistent within their uncertainties. This difference is possibly due to a combination of overestimated ocean heat uptake in the models, observational uncertainties and limited data coverage in the deep ocean (see Sections 9.5.1.1, 9.5.2, and 9.6.2.1). Assigning this difference solely to overestimated ocean heat uptake, the TCR estimates could increase by 0.6°C at most. This is in line with evidence for a relatively weak dependence of TCR on ocean mixing based

on SCMs and EMICS (Allen et al., 2000; Knutti et al., 2005). The range of TCR covered by an ensemble with perturbations made to parameters in the atmospheric component of UKMO-HadCM3 is 1.5 to 2.6°C (M. Collins et al., 2006), similar to the AR4 AOGCM range. Therefore, based on the range covered by AOGCMs, and taking into account structural uncertainties and possible biases in transient heat uptake, TCR is assessed as very likely larger than 1°C and very unlikely greater than 3°C (i.e., 1.0°C to 3.0°C is a 10 to 90% range). Because the dependence of TCR on sensitivity becomes small as sensitivity increases, uncertainties in the upper bound on sensitivity only weakly affect the range of TCR (see Figure 10.25; Chapter 9; Knutti et al., 2005; Allen et al., 2006b). Observational constraints based on detection and attribution studies provide further support for this TCR range (see Section 9.6.2.3).

### 10.5.2.2 Earth System Models of Intermediate Complexity

Over the last few years, a range of climate models has been developed that are dynamically simpler and of lower resolution than comprehensive AOGCMs, although they might well be more ‘complete’ in terms of climate system components that are included. The class of such models, usually referred to as EMICs (Claussen et al., 2002), is very heterogeneous, ranging from zonally averaged ocean models coupled to energy balance models (Stocker et al., 1992a) or to statistical-dynamical models of the atmosphere (Petoukhov et al., 2000), to low resolution three-dimensional ocean models, coupled to energy balance or simple dynamical models of the atmosphere (Opsteegh et al., 1998; Edwards and Marsh, 2005; Müller et al., 2006). Some EMICs have a radiation code and prescribe greenhouse gases, while others use simplified equations to project radiative forcing from projected concentrations and abundances (Joos et al., 2001; see Chapter 2 and the TAR, Appendix II, Table II.3.11). Compared to comprehensive models, EMICs have hardly any computational constraints, and therefore many simulations can be performed. This allows for the creation of large ensembles, or the systematic exploration of long-term changes many centuries hence. However, because of the reduced resolution, only results at the largest scales (continental to global) are to be interpreted (Stocker and Knutti, 2003). Table 8.3 lists all EMICs used in this section, including their components and resolution.

A set of simulations is used to compare EMICs with AOGCMs for the SRES A1B scenario with stable atmospheric concentrations after year 2100 (see Section 10.7.2). For global mean temperature and sea level, the EMICs generally reproduce the AOGCM behaviour quite well. Two of the EMICs have values for climate sensitivity and transient response below the AOGCM range. However, climate sensitivity is a tuneable parameter in some EMICs, and no attempt was made here to match the range of response of the AOGCMs. The transient reduction of the MOC in most EMICs is also similar to the AOGCMs (see also Sections 10.3.4 and 10.7.2 and Figure 10.34), providing support that this class of models can be used for both long-term commitment projections (see Section 10.7) and probabilistic projections involving hundreds to thousands

of simulations (see Section 10.5.4.5). If the forcing is strong enough, and lasts long enough (e.g.,  $4 \times \text{CO}_2$ ), a complete and irreversible collapse of the MOC can be induced in a few models. This is in line with earlier results using EMICs (Stocker and Schmittner, 1997; Rahmstorf and Ganopolski, 1999) or a coupled model (Stouffer and Manabe, 1999).

### 10.5.3 Global Mean Responses from Different Scenarios

The TAR projections with an SCM presented a range of warming over the 21st century for 35 SRES scenarios. The SRES emission scenarios assume that no climate policies are implemented (Nakićenović and Swart, 2000). The construction of Figure 9.14 of the TAR was pragmatic. It used a simple model tuned to AOGCMs that had a climate sensitivity within the long-standing range of  $1.5^\circ\text{C}$  to  $4.5^\circ\text{C}$  (e.g., Charney, 1979; and stated in earlier IPCC Assessment Reports). Models with climate sensitivity outside that range were discussed in the text and allowed the statement that the presented range was not the extreme range indicated by AOGCMs. The figure was based on a single anthropogenic-forcing estimate for 1750 to 2000, which is well within the range of values recommended by TAR Chapter 6, and is also consistent with that deduced from model simulations and the observed temperature record (TAR Chapter 12.). To be consistent with TAR Chapter 3, climate feedbacks on the carbon cycle were included. The resulting range of global mean temperature change from 1990 to 2100 given by the full set of SRES scenarios was  $1.4^\circ\text{C}$  to  $5.8^\circ\text{C}$ .

Since the TAR, several studies have examined the TAR projections and attempted probabilistic assessments. Allen et al. (2000) show that the forcing and simple climate model tunings used in the TAR give projections that are in agreement with the observationally constrained probabilistic forecast, reported in TAR Chapter 12.

As noted by Moss and Schneider (2000), giving only a range of warming results is potentially misleading unless some guidance is given as to what the range means in probabilistic terms. Wigley and Raper (2001) interpret the warming range in probabilistic terms, accounting for uncertainties in emissions, the climate sensitivity, the carbon cycle, ocean mixing and aerosol forcing. They give a 90% probability interval for 1990 to 2100 warming of  $1.7^\circ\text{C}$  to  $4^\circ\text{C}$ . As pointed out by Wigley and Raper (2001), such results are only as realistic as the assumptions upon which they are based. Key assumptions in this study were that each SRES scenario was equally likely, that  $1.5^\circ\text{C}$  to  $4.5^\circ\text{C}$  corresponds to the 90% confidence interval for the climate sensitivity, and that carbon cycle feedback uncertainties can be characterised by the full uncertainty range of abundance in 2100 of 490 to 1,260 ppm given in the TAR. The aerosol probability density function (PDF) was based on the uncertainty estimates given in the TAR together with constraints based on fitting the SCM to observed global and hemispheric mean temperatures.

The most controversial assumption in the Wigley and Raper (2001) probabilistic assessment was the assumption that each SRES scenario was equally likely. The *Special Report on*

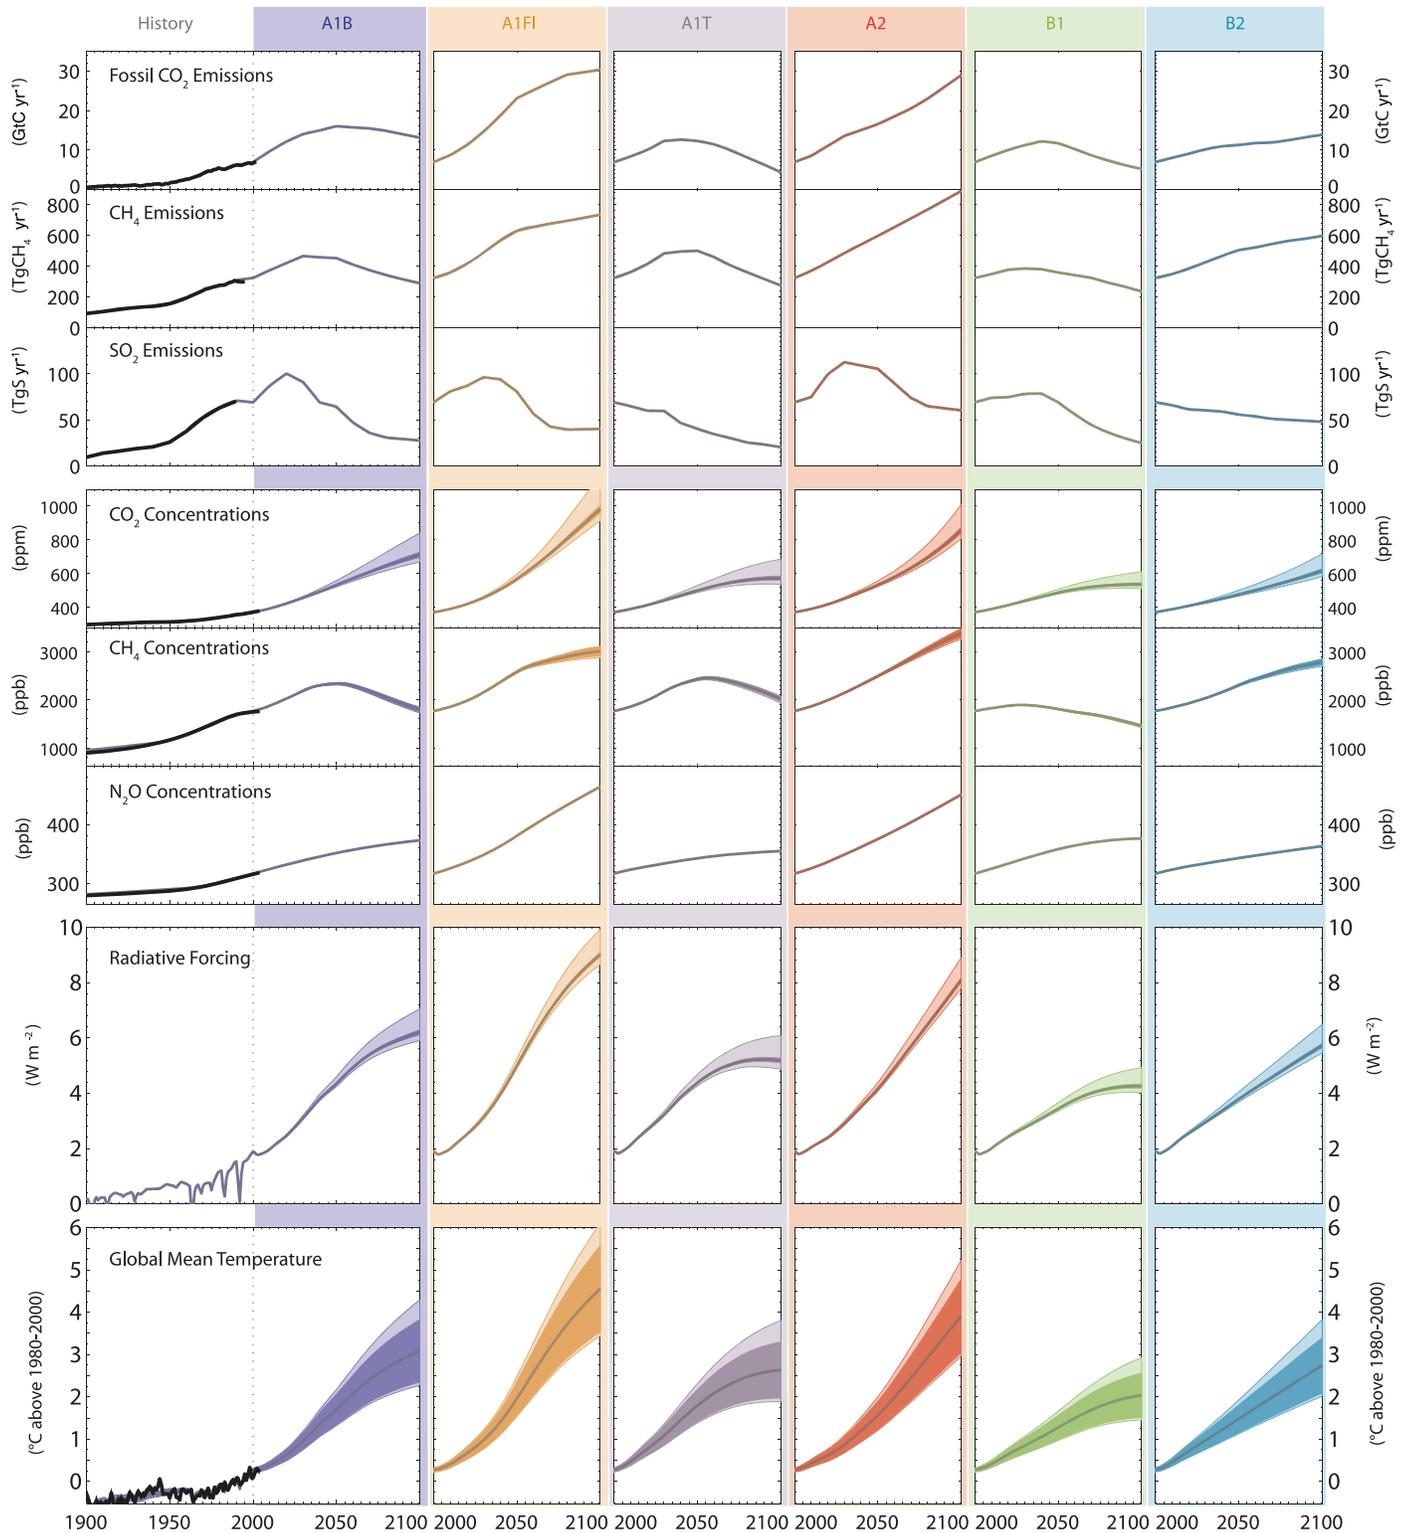

*Emissions Scenarios* (Nakićenović and Swart, 2000) states that ‘No judgment is offered in this report as to the preference for any of the scenarios and they are not assigned probabilities of occurrence, neither must they be interpreted as policy recommendations.’

Webster et al. (2003) use the probabilistic emissions projections of Webster et al. (2002), which consider present uncertainty in  $\text{SO}_2$  emissions, and allow the possibility of continuing increases in  $\text{SO}_2$  emissions over the 21st century, as well as the declining emissions consistent with SRES scenarios. Since their climate model parameter PDFs were constrained by observations and are mutually dependent, the effect of the lower present-day aerosol forcing on the projections is not easy to separate, but there is no doubt that their projections tend to be lower where they admit higher and increasing  $\text{SO}_2$  emissions.

Irrespective of the question of whether it is possible to assign probabilities to specific emissions scenarios, it is important to distinguish different sources of uncertainties in temperature projections up to 2100. Different emission scenarios arise because future greenhouse gas emissions are largely dependent on key socioeconomic drivers, technological development and political decisions. Clearly, one factor leading to different temperature projections is the choice of scenario. On the other hand, the ‘response uncertainty’ is defined as the range in projections for a particular emission scenario and arises from the limited knowledge of how the climate system will react to the anthropogenic perturbations. In the following, all given uncertainty ranges reflect the response uncertainty of the climate system and should therefore be seen as conditional on a specific emission scenario.

The following paragraphs describe the construction of the AR4 temperature projections for the six illustrative SRES scenarios, using the SCM tuned to 19 models from the MMD (see Section 8.8). These 19 tuned simple model versions have effective climate sensitivities in the range  $1.9^\circ\text{C}$  to  $5.9^\circ\text{C}$ . The simple model sensitivities are derived from the fully coupled  $2 \times$  and  $4 \times \text{CO}_2$   $1\% \text{ yr}^{-1} \text{ CO}_2$  increase AOGCM simulations and in some cases differ from the equilibrium slab ocean model sensitivities given in Table 8.2.

The SRES emission scenarios used here were designed to represent plausible futures assuming that no climate policies will be implemented. This chapter does not analyse any scenarios with explicit climate change mitigation policies. Still, there is a wide variation across these SRES scenarios in terms of anthropogenic emissions, such as those of fossil  $\text{CO}_2$ ,  $\text{CH}_4$  and  $\text{SO}_2$  (Nakićenović and Swart, 2000) as shown in the top three panels of Figure 10.26. As a direct consequence of the different emissions, the projected concentrations vary widely for the six illustrative SRES scenarios (see panel rows four to six in Figure 10.26 for the concentrations of the main greenhouse gases,  $\text{CO}_2$ ,  $\text{CH}_4$  and  $\text{N}_2\text{O}$ ). These results incorporate the effect of carbon cycle uncertainties (see Section 10.4.1), which were not explored with the SCM in the TAR. Projected  $\text{CH}_4$  concentrations are influenced by the temperature-dependent water vapour feedback on the lifetime of  $\text{CH}_4$ .

**Figure 10.26.** Fossil  $\text{CO}_2$ ,  $\text{CH}_4$  and  $\text{SO}_2$  emissions for six illustrative SRES non-mitigation emission scenarios, their corresponding  $\text{CO}_2$ ,  $\text{CH}_4$  and  $\text{N}_2\text{O}$  concentrations, radiative forcing and global mean temperature projections based on an SCM tuned to 19 AOGCMs. The dark shaded areas in the bottom temperature panel represent the mean  $\pm 1$  standard deviation for the 19 model tunings. The lighter shaded areas depict the change in this uncertainty range, if carbon cycle feedbacks are assumed to be lower or higher than in the medium setting. Mean projections for mid-range carbon cycle assumptions for the six illustrative SRES scenarios are shown as thick coloured lines. Historical emissions (black lines) are shown for fossil and industrial  $\text{CO}_2$  (Marland et al., 2005), for  $\text{SO}_2$  (van Aardenne et al., 2001) and for  $\text{CH}_4$  (van Aardenne et al., 2001, adjusted to Olivier and Berdowski, 2001). Observed  $\text{CO}_2$ ,  $\text{CH}_4$  and  $\text{N}_2\text{O}$  concentrations (black lines) are as presented in Chapter 6. Global mean temperature results from the SCM for anthropogenic and natural forcing compare favourably with 20th-century observations (black line) as shown in the lower left panel (Folland et al., 2001; Jones et al., 2001; Jones and Moberg, 2003).

In Figure 10.26, the plumes of CO<sub>2</sub> concentration reflect high and low carbon cycle feedback settings of the applied SCM. Their derivation is described as follows. The carbon cycle model in the SCM used here (Model for the Assessment of Greenhouse-gas Induced Climate Change: MAGICC) includes a number of climate-related carbon cycle feedbacks driven by global mean temperature. The parametrization of the overall effect of carbon cycle feedbacks is tuned to the more complex and physically realistic carbon cycle models of the C<sup>4</sup>MIP (Friedlingstein et al., 2006; see also Section 10.4) and the results are comparable to the BERN-CC model results across the six illustrative scenarios. This allows the SCM to produce projections of future CO<sub>2</sub> concentration change that are consistent with state-of-the-art carbon cycle model results. Specifically, the C<sup>4</sup>MIP range of CO<sub>2</sub> concentrations for the A2 emission scenario in 2100 is 730 to 1,020 ppm, while the SCM results presented here show an uncertainty range of 806 ppm to 1,008 ppm. The lower bound of this SCM uncertainty range is the mean minus one standard deviation for low carbon cycle feedback settings and the 19 AOGCM tunings, while the upper bound represents the mean plus one standard deviation for high carbon cycle settings. For comparison, the 90% confidence interval from Wigley and Raper (2001) is 770 to 1,090 ppm. The simple model CO<sub>2</sub> concentration projections can be slightly higher than under the C<sup>4</sup>MIP because the SCM's carbon cycle is driven by the full temperature changes in the A2 scenario, while the C<sup>4</sup>MIP values are driven by the component of A2 climate change due to CO<sub>2</sub> alone.

The radiative forcing projections in Figure 10.26 combine anthropogenic and natural (solar and volcanic) forcing. The forcing plumes reflect primarily the sensitivity of the forcing to carbon cycle uncertainties. Results are based on a forcing of 3.71 W m<sup>-2</sup> for a doubling of the atmospheric CO<sub>2</sub> concentration. The anthropogenic forcing is based on Table 2.12 but uses a value of -0.8 W m<sup>-2</sup> for the present-day indirect aerosol forcing. Solar forcing for the historical period is prescribed according to Lean et al. (1995) and volcanic forcing according to Ammann et al. (2003). The historical solar forcing series is extended into the future using its average over the most recent 22 years. The volcanic forcing is adjusted to have a zero mean over the past 100 years and the anomaly is assumed to be zero for the future. In the TAR, the anthropogenic forcing was used alone even though the projections started in 1765. There are several advantages of using both natural and anthropogenic forcing for the past. First, this was done by most of the AOGCMs the simple models are emulating. Second, it allows the simulations to be compared with observations. Third, the warming commitments accrued over the instrumental period are reflected in the projections. The disadvantage of including natural forcing is that the warming projections in 2100 are dependent to a few tenths of a degree on the necessary assumptions made about the natural forcing (Bertrand et al., 2002). These assumptions include how the natural forcing is projected into the future and whether to reference the volcanic forcing to a past reference

period mean value. In addition, the choice of data set for both solar and volcanic forcing affects the results (see Section 2.7 for discussion about uncertainty in natural forcings).

The temperature projections for the six illustrative scenarios are shown in the bottom panel of Figure 10.26. Model results are shown as anomalies from the mean of observations (Folland et al., 2001; Jones et al., 2001; Jones and Moberg, 2003) over the 1980 to 2000 period and the corresponding observed temperature anomalies are shown for comparison. The inner (darker) plumes show the ±1 standard deviation uncertainty due to the 19 model tunings and the outer (lighter) plumes show results for the corresponding high and low carbon cycle settings. Note that the asymmetry in the carbon cycle uncertainty causes global mean temperature projections to be skewed towards higher warming.

Considering only the mean of the SCM results with mid-range carbon cycle settings, the projected global mean temperature rise above 1980 to 2000 levels for the lower-emission SRES scenario B1 is 2.0°C in 2100. For a higher-emission scenario, for example, the SRES A2 scenario, the global mean temperature is projected to rise by 3.9°C above 1980 to 2000 levels in 2100. This clear difference in projected mean warming highlights the importance of assessing different emission scenarios separately. As mentioned above, the 'response uncertainty' is defined as the range in projections for a particular emission scenario. For the A2 emission scenario, the temperature change projections with the SCM span a ±1 standard deviation range of about 1.8°C, from 3.0°C to 4.8°C above 1980 to 2000 levels in 2100. If carbon cycle feedbacks are considered to be low, the lower end of this range decreases only slightly and is unchanged to one decimal place. For the higher carbon cycle feedback settings, the upper bound of the ±1 standard deviation range increases to 5.2°C. For lower-emission scenarios, this uncertainty range is smaller. For example, the B1 scenario projections span a range of about 1.4°C, from 1.5°C to 2.9°C, including carbon cycle uncertainties. The corresponding results for the medium-emission scenario A1B are 2.3°C to 4.3°C, and for the higher-emission scenario A1FI, they are 3.4°C to 6.1°C. Note that these uncertainty ranges are not the minimum to maximum bounds of the projected warming across all SCM runs, which are higher, namely 2.7°C to 7.1°C for the A2 scenario and 1.3°C to 4.2°C for the B1 scenario (not shown).

The SCM results presented here are a sensitivity study with different model tunings and carbon cycle feedback parameters. Note that forcing uncertainties have not been assessed and that the AOGCM model results available for SCM tuning may not span the full range of possible climate response. For example, studies that constrain forecasts based on model fits to historic or present-day observations generally allow for a somewhat wider 'response uncertainty' (see Section 10.5.4). The concatenation of all such uncertainties would require a probabilistic approach because the extreme ranges have low probability. A synthesis of the uncertainty in global temperature increase by the year 2100 is provided in Section 10.5.4.6.

### 10.5.4 Sampling Uncertainty and Estimating Probabilities

Uncertainty in the response of an AOGCM arises from the effects of internal variability, which can be sampled in isolation by creating ensembles of simulations of a single model using alternative initial conditions, and from modelling uncertainties, which arise from errors introduced by the discretization of the equations of motion on a finite resolution grid, and the parametrization of sub-grid scale processes (radiative transfer, cloud formation, convection, etc). Modelling uncertainties are manifested in alternative structural choices (for example, choices of resolution and the basic physical assumptions on which parametrizations are based), and in the values of poorly constrained parameters within parametrization schemes. Ensemble approaches are used to quantify the effects of uncertainties arising from variations in model structure and parameter settings. These are assessed in Sections 10.5.4.1 to 10.5.4.3, followed by a discussion of observational constraints in Section 10.5.4.4 and methods used to obtain probabilistic predictions in Sections 10.5.4.5 to 10.5.4.7.

While ensemble projections carried out to date give a wide range of responses, they do not sample all possible sources of modelling uncertainty. For example, the AR4 multi-model ensemble relies on specified concentrations of CO<sub>2</sub>, thus neglecting uncertainties in carbon cycle feedbacks (see Section 10.4.1), although this can be partially addressed by using less detailed models to extrapolate the AOGCM results (see Section 10.5.3). More generally, the set of available models may share fundamental inadequacies, the effects of which cannot be quantified (Kennedy and O'Hagan, 2001). For example, climate models currently implement a restricted approach to the parametrization of sub-grid scale processes, using deterministic bulk formulae coupled to the resolved flow exclusively at the grid scale. Palmer et al. (2005) argue that the outputs of parametrization schemes should be sampled from statistical distributions consistent with a range of possible sub-grid scale states, following a stochastic approach that has been tried in numerical weather forecasting (e.g., Buizza et al., 1999; Palmer, 2001). The potential for missing or inadequately parametrized processes to broaden the simulated range of future changes is not clear, however, this is an important caveat for the results discussed below.

#### 10.5.4.1 The Multi-Model Ensemble Approach

The use of ensembles of AOGCMs developed at different modelling centres has become established in climate prediction/projection on both seasonal-to-interannual and centennial time scales. To the extent that simulation errors in different AOGCMs are independent, the mean of the ensemble can be expected to outperform individual ensemble members, thus providing an improved 'best estimate' forecast. Results show this to be the case, both in verification of seasonal forecasts (Palmer et al., 2004; Hagedorn et al., 2005) and of the present-day climate from long term simulations (Lambert and Boer, 2001). By

sampling modelling uncertainties, ensembles of AOGCMs should provide an improved basis for probabilistic projections compared with ensembles of a single model sampling only uncertainty in the initial state (Palmer et al., 2005). However, members of a multi-model ensemble share common systematic errors (Lambert and Boer, 2001), and cannot span the full range of possible model configurations due to resource constraints. Verification of future climate change projections is not possible, however, Räisänen and Palmer (2001) used a 'perfect model approach' (treating one member of an ensemble as truth and predicting its response using the other members) to show that the hypothetical economic costs associated with climate events can be reduced by calculating the probability of the event across the ensemble, rather than using a deterministic prediction from an individual ensemble member.

An additional strength of multi-model ensembles is that each member is subjected to careful testing in order to obtain a plausible and stable control simulation, although the process of tuning model parameters to achieve this (Section 8.1.3.1) involves subjective judgement, and is not guaranteed to identify the optimum location in the model parameter space.

#### 10.5.4.2 Perturbed Physics Ensembles

The AOGCMs featured in Section 10.5.2 are built by selecting components from a pool of alternative parametrizations, each based on a given set of physical assumptions and including a number of uncertain parameters. In principle, the range of predictions consistent with these components could be quantified by constructing very large ensembles with systematic sampling of multiple options for parametrization schemes and parameter values, while avoiding combinations likely to double-count the effect of perturbing a given physical process. Such an approach has been taken using simple climate models and EMICs (Wigley and Raper, 2001; Knutti et al., 2002), and Murphy et al. (2004) and Stainforth et al. (2005) describe the first steps in this direction using AOGCMs, constructing large ensembles by perturbing poorly constrained parameters in the atmospheric component of UKMO-HadCM3 coupled to a mixed layer ocean. These experiments quantify the range of equilibrium responses to doubled atmospheric CO<sub>2</sub> consistent with uncertain parameters in a single GCM. Murphy et al. (2004) perturbed 29 parameters one at a time, assuming that effects of individual parameters were additive but making a simple allowance for additional uncertainty introduced by nonlinear interactions. They find a probability distribution for climate sensitivity with a 5 to 95% range of 2.4°C to 5.4°C when weighting the models with a broadly based metric of the agreement between simulated and observed climatology, compared to 1.9°C to 5.3°C when all model versions are assumed equally reliable (Box 10.2, Figure 1c).

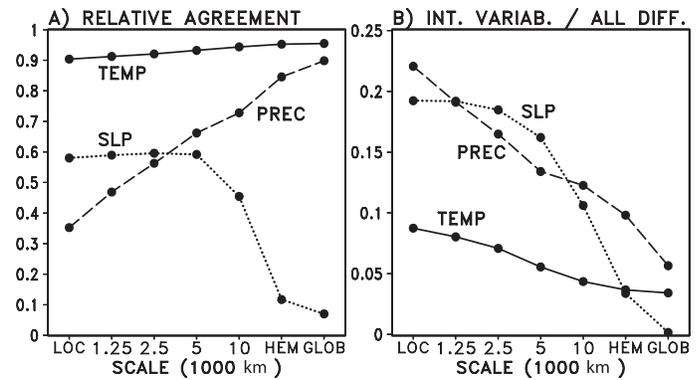

Stainforth et al. (2005) deployed a distributed computing approach (Allen, 1999) to run a very large ensemble of 2,578 simulations sampling combinations of high, intermediate and low values of six parameters known to affect climate sensitivity. They find climate sensitivities ranging from 2°C to

11°C, with 4.2% of model versions exceeding 8°C, and show that the high-sensitivity models cannot be ruled out, based on a comparison with surface annual mean climatology. By utilising multivariate linear relationships between climate sensitivity and spatial fields of several present-day observables, the 5 to 95% range of climate sensitivity is estimated at 2.2°C to 6.8°C from the same data set (Piani et al., 2005; Box 10.2 Figure 1c). In this ensemble, Knutti et al. (2006) find a strong relationship between climate sensitivity and the amplitude of the seasonal cycle in surface temperature in the present-day simulations. Most of the simulations with high sensitivities overestimate the observed amplitude. Based on this relationship, the 5 to 95% range of climate sensitivity is estimated at 1.5°C to 6.4°C (Box 10.2, Figure 1c). The differences between the PDFs in Box 10.2, Figure 1c, which are all based on the same climate model, reflect uncertainties in methodology arising from choices of uncertain parameters, their expert-specified prior distributions and alternative applications of observational constraints. They do not account for uncertainties associated with changes in ocean circulation, and do not account for structural model errors (Smith, 2002; Goldstein and Rougier, 2004)

Annan et al. (2005a) use an ensemble Kalman Filter technique to obtain uncertainty ranges for model parameters in an EMIC subject to the constraint of minimising simulation errors with respect to a set of climatological observations. Using this method, Hargreaves and Annan (2006) find that the risk of a collapse in the Atlantic MOC (in response to increasing CO<sub>2</sub>) depends on the set of observations to which the EMIC parameters are tuned. Section 9.6.3 assesses perturbed physics studies of the link between climate sensitivity and cooling during the Last Glacial Maximum (Annan et al., 2005b; Schneider von Deimling et al., 2006).

#### 10.5.4.3 Diagnosing Drivers of Uncertainty from Ensemble Results

Figure 10.27a shows the agreement between annual changes simulated by members of the AR4 multi-model ensemble for 2080 to 2099 relative to 1980 to 1999 for the A1B scenario, calculated as in Räisänen (2001). For precipitation, the agreement increases with spatial scale. For surface temperature, the agreement is high even at local scales, indicating the robustness of the simulated warming (see also Figure 10.8, discussed in Section 10.3.2.1). Differences in model formulation are the dominant contributor to ensemble spread, though the role of internal variability increases at smaller scales (Figure 10.27b). The agreement between AR4 ensemble members is slightly higher compared with the earlier CMIP2 ensemble of Räisänen (2001) (also reported in the TAR), and internal variability explains a smaller fraction of the ensemble spread. This is expected, given the larger forcing and responses in the A1B scenario for 2080 to 2099 compared to the transient response to doubled CO<sub>2</sub> considered by Räisänen (2001), although the use of an updated set of models may also contribute. For seasonal changes, internal variability is found to be comparable with model differences as a source of

**Figure 10.27.** Statistics of annual mean responses to the SRES A1B scenario, for 2080 to 2099 relative to 1980 to 1999, calculated from the 21-member AR4 multi-model ensemble using the methodology of Räisänen (2001). Results are expressed as a function of horizontal scale on the x axis ('Loc': grid box scale; 'Hem': hemispheric scale; 'Glob': global mean) plotted against the y axis showing (a) the relative agreement between ensemble members, a dimensionless quantity defined as the square of the ensemble-mean response (corrected to avoid sampling bias) divided by the mean squared response of individual ensemble members, and (b) the dimensionless fraction of internal variability relative to the ensemble variance of responses. Values are shown for surface air temperature, precipitation and sea level pressure. The low agreement of SLP changes at hemispheric and global scales reflects problems with the conservation of total atmospheric mass in some of the models, however, this has no practical significance because SLP changes at these scales are extremely small.

uncertainty in local precipitation and SLP changes (although not for surface temperature) in both multi-model and perturbed physics ensembles (Räisänen, 2001; Murphy et al., 2004). Consequently the local seasonal changes for precipitation and SLP are not consistent in the AR4 ensemble over large areas of the globe (i.e., the multi-model mean change does not exceed the ensemble standard deviation; see Figure 10.9), whereas the surface temperature changes are consistent almost everywhere, as discussed in Section 10.3.2.1.

Wang and Swail (2006b) examine the relative importance of internal variability, differences in radiative forcing and model differences in explaining the transient response of ocean wave height using three AOGCMs each run for three plausible forcing scenarios, and find model differences to be the largest source of uncertainty in the simulated changes.

Selten et al. (2004) report a 62-member initial condition ensemble of simulations of 1940 to 2080 including natural and anthropogenic forcings. They find an individual member that reproduces the observed trend in the NAO over the past few decades, but no trend in the ensemble mean, and suggest that the observed change can be explained through internal variability associated with a mode driven by increases in precipitation over the tropical Indian Ocean. Terray et al. (2004) find that the ARPEGE coupled ocean-atmosphere model shows small increases in the residence frequency of the positive phase of the NAO in response to SRES A2 and B2 forcing, whereas larger increases are found when SST changes prescribed from the coupled experiments are used to drive a version of the atmosphere model with enhanced resolution over the North Atlantic and Europe (Gibelin and Déqué, 2003).

Figure 10.25 compares global mean transient and equilibrium changes simulated by the AR4 multi-model ensembles against perturbed physics ensembles (M. Collins et al., 2006; Webb et al., 2006) designed to produce credible present-day simulations while sampling a wide range of multiple parameter perturbations and climate sensitivities. The AR4 ensembles partially sample structural variations in model components, whereas the perturbed physics ensembles sample atmospheric parameter uncertainties for a fixed choice of model structure. The results show similar relationships between TCR, climate sensitivity and precipitation change in both types of ensemble. The perturbed physics ensembles contain several members with sensitivities higher than the multi-model range, while some of the multi-model transient simulations give TCR values slightly below the range found in the perturbed physics ensemble (Figure 10.25a,b).

Soden and Held (2006) find that differences in cloud feedback are the dominant source of uncertainty in the transient response of surface temperature in the AR4 ensemble (see also Section 8.6.3.2), as in previous IPCC assessments. Webb et al. (2006) compare equilibrium radiative feedbacks in a 9-member multi-model ensemble against those simulated in a 128-member perturbed physics ensemble with multiple parameter perturbations. They find that the ranges of climate sensitivity in both ensembles are explained mainly by differences in the response of shortwave cloud forcing in areas where changes in low-level clouds predominate. Bony and Dufresne (2005) find that marine boundary layer clouds in areas of large-scale subsidence provide the largest source of spread in tropical cloud feedbacks in the AR4 ensemble. Narrowing the uncertainty in cloud feedback may require both improved parametrizations of cloud microphysical properties (e.g., Tsushima et al., 2006) and improved representations of cloud macrophysical properties, through improved parametrizations of other physical processes (e.g., Williams et al., 2001) and/or increases in resolution (Palmer, 2005).

#### 10.5.4.4 Observational Constraints

A range of observables has been used since the TAR to explore methods for constraining uncertainties in future climate change in studies using simple climate models, EMICs and AOGCMs. Probabilistic estimates of global climate sensitivity have been obtained from the historical transient evolution of surface temperature, upper-air temperature, ocean temperature, estimates of the radiative forcing, satellite data, proxy data over the last millennium, or a subset thereof (Wigley et al., 1997a; Tol and De Vos, 1998; Andronova and Schlesinger, 2001; Forest et al., 2002; Gregory et al., 2002a; Knutti et al., 2002, 2003; Frame et al., 2005; Forest et al., 2006; Forster and Gregory, 2006; Hegerl et al., 2006; see Section 9.6). Some of these studies also constrain the transient response to projected future emissions (see section 10.5.4.5). For climate sensitivity, further probabilistic estimates have been obtained using statistical measures of the correspondence between simulated and observed fields of present-day climate (Murphy et al.,

2004; Piani et al., 2005), the climatological seasonal cycle of surface temperature (Knutti et al., 2006) and the response to palaeoclimatic forcings (Annan et al., 2005b; Schneider von Deimling et al., 2006). For the purpose of constraining regional climate projections, spatial averages or fields of time-averaged regional climate have been used (Giorgi and Mearns, 2003; Tebaldi et al., 2004, 2005; Laurent and Cai, 2007), as have past regional- or continental-scale trends in surface temperature (Greene et al., 2006; Stott et al., 2006a).

Further observables have been suggested as potential constraints on future changes, but are not yet used in formal probabilistic estimates. These include measures of climate variability related to cloud feedbacks (Bony et al., 2004; Bony and Dufresne, 2005; Williams et al., 2005), radiative damping of the seasonal cycle (Tsushima et al., 2005), the relative entropy of simulated and observed surface temperature variations (Shukla et al., 2006), major volcanic eruptions (Wigley et al., 2005; Yokohata et al., 2005; see Section 9.6) and trends in multiple variables derived from reanalysis data sets (Lucarini and Russell, 2002).

Additional constraints could also be found, for example, from evaluation of ensemble climate prediction systems on shorter time scales for which verification data exist. These could include assessment of the reliability of seasonal to interannual probabilistic forecasts (Palmer et al., 2004; Hagedorn et al., 2005) and the evaluation of model parametrizations in short-range weather predictions (Phillips et al., 2004; Palmer, 2005). Annan and Hargreaves (2006) point out the potential for narrowing uncertainty by combining multiple lines of evidence. This will require objective quantification of the impact of different constraints and their degree of independence, estimation of the effects of structural modelling errors and the development of comprehensive probabilistic frameworks in which to combine these elements (e.g., Rougier, 2007).

#### 10.5.4.5 Probabilistic Projections - Global Mean

A number of methods for providing probabilistic climate change projections, both for global means (discussed in this section) and geographical depictions (discussed in the following section) have emerged since the TAR.

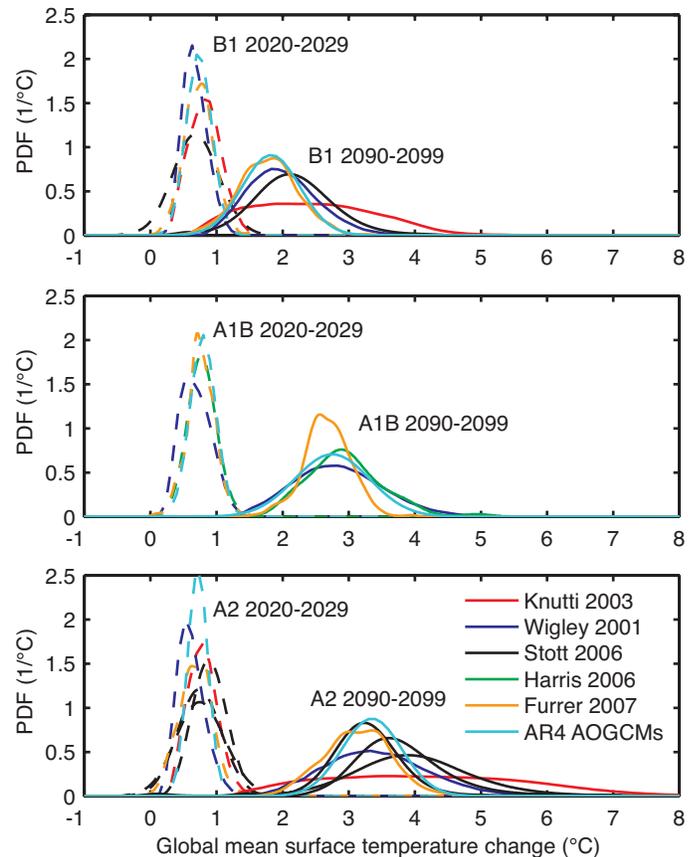

Methods of constraining climate sensitivity using observations of present-day climate are discussed in Section 10.5.4.2. Results from both the AR4 multi-model ensemble and from perturbed physics ensembles suggest a very low probability for a climate sensitivity below 2°C, despite exploring the effects of a wide range of alternative modelling assumptions on the global radiative feedbacks arising from lapse rate, water vapour, surface albedo and cloud (Bony et al., 2006; Soden and Held, 2006; Webb et al., 2006; Box 10.2). However, exclusive reliance on AOGCM ensembles can be questioned on the basis that models share components, and therefore errors, and may not sample the full range of possible outcomes (e.g., Allen and Ingram, 2002).

Observationally constrained probability distributions for climate sensitivity have also been derived from physical

relationships based on energy balance considerations, and from instrumental observations of historical changes during the past 50 to 150 years or proxy reconstructions of surface temperature during the past millennium (Section 9.6). The results vary according to the choice of verifying observations, the forcings considered and their specified uncertainties, however, all these studies report a high upper limit for climate sensitivity, with the 95th percentile of the distributions invariably exceeding 6°C (Box 10.2). Frame et al. (2005) demonstrate that uncertainty ranges for sensitivity are dependent on the choices made about prior distributions of uncertain quantities before the observations are applied. Frame et al. (2005) and Piani et al. (2005) show that many observable variables are likely to scale inversely with climate sensitivity, implying that projections of quantities that are inversely related to sensitivity will be more strongly constrained by observations than climate sensitivity itself, particularly with respect to the estimated upper limit (Allen et al., 2006b).

In the case of transient climate change, optimal detection techniques have been used to determine factors by which hindcasts of global surface temperature from AOGCMs can be scaled up or down while remaining consistent with past changes, accounting for uncertainty due to internal variability (Section 9.4.1.6). Uncertainty is propagated forward in time by assuming that the fractional error found in model hindcasts of global mean temperature change will remain constant in projections of future changes. Using this approach, Stott and Kettleborough (2002) find that probabilistic projections of global mean temperature derived from UKMO-HadCM3 simulations were insensitive to differences between four representative SRES emissions scenarios over the first few decades of the 21st century, but that much larger differences emerged between the response to different SRES scenarios by the end of the 21st century (see also Section 10.5.3 and Figure 10.28). Stott et al. (2006b) show that scaling the responses of three models with different sensitivities brings their projections into better agreement. Stott et al. (2006a) extend their approach to obtain probabilistic projections of future warming averaged over continental-scale regions under the SRES A2 scenario. Fractional errors in the past continental warming simulated by UKMO-HadCM3 are used to scale future changes, yielding wide uncertainty ranges, notably for North America and Europe where the 5 to 95% ranges for warming during the 21st century are 2°C to 12°C and 2°C to 11°C respectively. These estimates do not account for potential constraints arising from regionally differentiated warming rates. Tighter ranges of 4°C to 8°C for North America and 4°C to 7°C for Europe are obtained if fractional errors in past global mean temperature are used to scale the future continental changes, although this neglects uncertainty in the relationship between global and regional temperature changes.

Allen and Ingram (2002) suggest that probabilistic projections for some variables may be made by searching for ‘emergent constraints’. These are relationships between variables that can be directly constrained by observations, such as global surface temperature, and variables that may be indirectly constrained by establishing a consistent, physically

**Figure 10.28.** Probability density functions from different studies for global mean temperature change for the SRES scenarios B1, A1B and A2 and for the decades 2020 to 2029 and 2090 to 2099 relative to the 1980 to 1999 average (Wigley and Raper, 2001; Knutti et al., 2002; Furrer et al., 2007; Harris et al., 2006; Stott et al., 2006b). A normal distribution fitted to the multi-model ensemble is shown for comparison.

based relationship which holds across a wide range of models. They present an example in which future changes in global mean precipitation are constrained using a probability distribution for global temperature obtained from a large EMIC ensemble (Forest et al., 2002) and a relationship between precipitation and temperature obtained from multi-model ensembles of the response to doubled atmospheric CO<sub>2</sub>. These methods are designed to produce distributions constrained by observations, and are relatively model independent (Allen and Stainforth, 2002; Allen et al., 2006a). This can be achieved provided the inter-variable relationships are robust to alternative modelling assumptions Piani et al. (2005) and Knutti et al. (2006) (described in Section 10.5.4.2) follow this approach, noting that in these cases the inter-variable relationships are derived from perturbed versions of a single model, and need to be confirmed using other models.

A synthesis of published probabilistic global mean projections for the SRES scenarios B1, A1B and A2 is given in Figure 10.28. Probability density functions are given for short-term projections (2020–2030) and the end of the century (2090–2100). For comparison, normal distributions fitted to results from AOGCMs in the multi-model archive (see Section

10.3.1) are also given, although these curve fits should not be regarded as PDFs. The five methods of producing PDFs are all based on different models and/or techniques, described in Section 10.5. In short, Wigley and Raper (2001) use a large ensemble of a simple model with expert prior distributions for climate sensitivity, ocean heat uptake, sulphate forcing and the carbon cycle, without applying constraints. Knutti et al. (2002, 2003) use a large ensemble of EMIC simulations with non-informative prior distributions, consider uncertainties in climate sensitivity, ocean heat uptake, radiative forcing and the carbon cycle, and apply observational constraints. Neither method considers natural variability explicitly. Stott et al. (2006b) apply the fingerprint scaling method to AOGCM simulations to obtain PDFs which implicitly account for uncertainties in forcing, climate sensitivity and internal unforced as well as forced natural variability. For the A2 scenario, results obtained from three different AOGCMs are shown, illustrating the extent to which the Stott et al. PDFs depend on the model used. Harris et al. (2006) obtain PDFs by boosting a 17-member perturbed physics ensemble of the UKMO-HadCM3 model using scaled equilibrium responses from a larger ensemble of simulations. Furrer et al. (2007) use a Bayesian method described in Section 10.5.4.7 to calculate PDFs from the AR4 multi-model ensemble. The Stott et al. (2006b), Harris et al. (2006) and Furrer et al. (2007) methods neglect carbon cycle uncertainties.

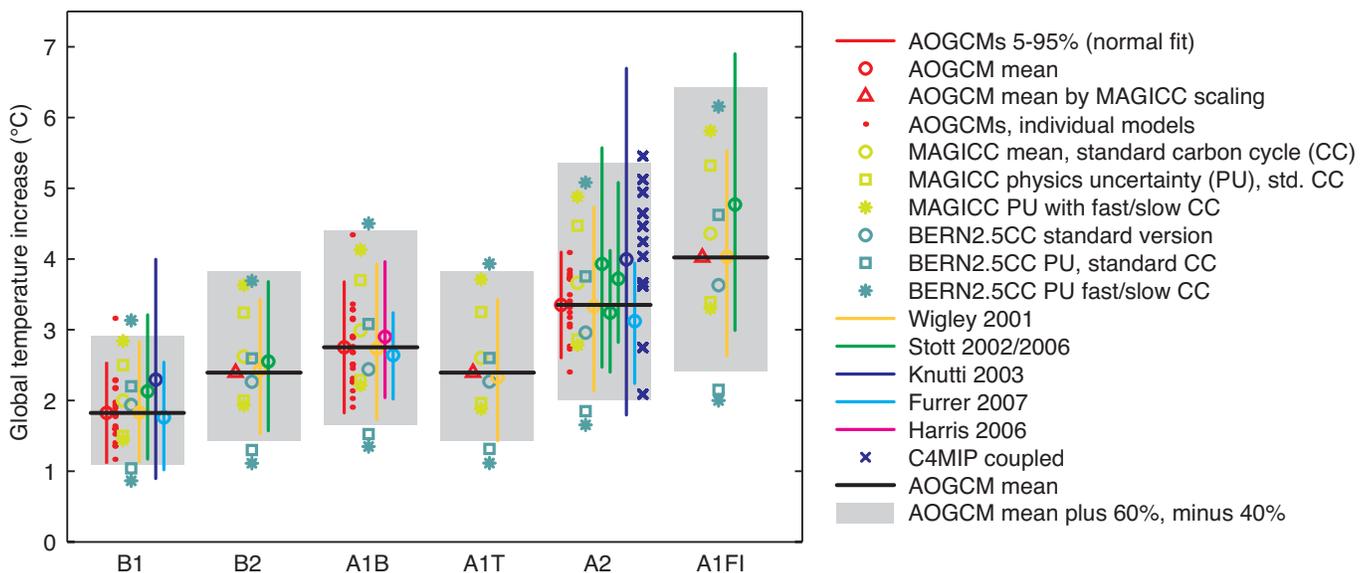

Two key points emerge from Figure 10.28. For the projected short-term warming (i) there is more agreement among models and methods (narrow width of the PDFs) compared to later in

the century (wider PDFs), and (ii) the warming is similar across different scenarios, compared to later in the century where the choice of scenario significantly affects the projections. These conclusions are consistent with the results obtained with SCMs (Section 10.5.3).

Additionally, projection uncertainties increase close to linearly with temperature in most studies. The different methods show relatively good agreement in the shape and width of the PDFs, but with some offsets due to different methodological choices. Only Stott et al. (2006b) account for variations in future natural forcing, and hence project a small probability of cooling over the next few decades not seen in the other PDFs. The results of Knutti et al. (2003) show wider PDFs for the end of the century because they sample uniformly in climate sensitivity (see Section 9.6.2 and Box 10.2). Resampling uniformly in observables (Frame et al., 2005) would bring their PDFs closer to the others. In sum, probabilistic estimates of uncertainties for the next few decades seem robust across a variety of models and methods, while results for the end of the century depend on the assumptions made.

#### 10.5.4.6 Synthesis of Projected Global Temperature at Year 2100

All available estimates for projected warming by the end of the 21st century are summarised in Figure 10.29 for the six SRES non-intervention marker scenarios. Among the various techniques, the AR4 AOGCM ensemble provides the most

**Figure 10.29.** Projections and uncertainties for global mean temperature increase in 2090 to 2099 (relative to the 1980 to 1999 average) for the six SRES marker scenarios. The AOGCM means and the uncertainty ranges of the mean  $-40\%$  to  $+60\%$  are shown as black horizontal solid lines and grey bars, respectively. For comparison, results are shown for the individual models (red dots) of the multi-model AOGCM ensemble for B1, A1B and A2, with a mean and 5 to 95% range (red line and circle) from a fitted normal distribution. The AOGCM mean estimates for B2, A1T and A1FI (red triangles) are obtained by scaling the A1B AOGCM mean with ratios obtained from the SCM (see text). The mean (light green circle) and one standard deviation (light green square) of the MAGICC SCM tuned to all AOGCMs (representing the physics uncertainty) are shown for standard carbon cycle settings, as well as for a slow and fast carbon cycle assumption (light green stars). Similarly, results from the BERN2.5CC EMIC are shown for standard carbon cycle settings and for climate sensitivities of  $3.2^{\circ}\text{C}$  (AOGCM average, dark green circle),  $1.5^{\circ}\text{C}$  and  $4.5^{\circ}\text{C}$  (dark green squares). High climate sensitivity/low carbon cycle and low climate sensitivity/high carbon cycle combinations are shown as dark green stars. The 5 to 95% ranges (vertical lines) and medians (circles) are shown from probabilistic methods (Wigley and Raper, 2001; Stott and Kettleborough, 2002; Knutti et al., 2003; Furrer et al., 2007; Harris et al., 2006; Stott et al., 2006b). Individual model results are shown for the C4MIP models (blue crosses, see Figure 10.20).

sophisticated set of models in terms of the range of processes included and consequent realism of the simulations compared to observations (see Chapters 8 and 9). On average, this ensemble projects an increase in global mean surface air temperature of 1.8°C, 2.8°C and 3.4°C in the B1, A1B and A2 scenarios, respectively, by 2090 to 2099 relative to 1980 to 1999 (note that in Table 10.5, the years 2080 to 2099 were used for those globally averaged values to be consistent with the comparable averaging period for the geographic plots in Section 10.3; this longer averaging period smoothes spatial noise in the geographic plots). A scaling method is used to estimate AOGCM mean results for the three missing scenarios B2, A1T and A1FI. The ratio of the AOGCM mean values for B1 relative to A1B and A2 relative to A1B are almost identical to the ratios obtained with the MAGICC SCM, although the absolute values for the SCM are higher. Thus, the AOGCM mean response for the scenarios B2, A1T and A1FI can be estimated as 2.4°C, 2.4°C and 4.0°C by multiplying the AOGCM A1B mean by the SCM-derived ratios B2/A1B, A1T/A1B and A1FI/A1B, respectively (for details see Appendix 10.A.1).

The AOGCMs cannot sample the full range of possible warming, in particular because they do not include uncertainties in the carbon cycle. In addition to the range derived directly from the AR4 multi-model ensemble, Figure 10.29 depicts additional uncertainty estimates obtained from published probabilistic methods using different types of models and observational constraints: the MAGICC SCM and the BERN2.5CC coupled climate-carbon cycle EMIC tuned to different climate sensitivities and carbon cycle settings, and the C4MIP coupled climate-carbon cycle models. Based on these results, the future increase in global mean temperature is likely to fall within -40 to +60% of the multi-model AOGCM mean warming simulated for each scenario. This range results from an expert judgement of the multiple lines of evidence presented in Figure 10.29, and assumes that the models approximately capture the range of uncertainties in the carbon cycle. The range is well constrained at the lower bound since climate sensitivity is better constrained at the low end (see Box 10.2), and carbon cycle uncertainty only weakly affects the lower bound. The upper bound is less certain as there is more variation across the different models and methods, partly because carbon cycle feedback uncertainties are greater with larger warming. The uncertainty ranges derived from the above percentages for the warming by 2090 to 2099 relative to 1980 to 1999 are 1.1°C to 2.9°C, 1.4°C to 3.8°C, 1.7°C to 4.4°C, 1.4°C to 3.8°C, 2.0°C to 5.4°C and 2.4°C to 6.4°C for the scenarios B1, B2, A1B, A1T, A2 and A1FI, respectively. It is not appropriate to compare the lowest and highest values across these ranges against the single range given in the TAR, because the TAR range resulted only from projections using an SCM and covered all SRES scenarios, whereas here a number of different and independent modelling approaches are combined to estimate ranges for the six illustrative scenarios separately. Additionally, in contrast to the TAR, carbon cycle uncertainties are now included in these ranges. These uncertainty ranges include only anthropogenically forced changes.

#### 10.5.4.7 Probabilistic Projections - Geographical Depictions

Tebaldi et al. (2005) present a Bayesian approach to regional climate prediction, developed from the ideas of Giorgi and Mearns (2002, 2003). Non-informative prior distributions for regional temperature and precipitation are updated using observations and results from AOGCM ensembles to produce probability distributions of future changes. Key assumptions are that each model and the observations differ randomly and independently from the true climate, and that the weight given to a model prediction should depend on the bias in its present-day simulation and its degree of convergence with the weighted ensemble mean of the predicted future change. Lopez et al. (2006) apply the Tebaldi et al. (2005) method to a 15-member multi-model ensemble to predict future changes in global surface temperature under a 1% yr<sup>-1</sup> increase in atmospheric CO<sub>2</sub>. They compare it with the method developed by Allen et al. (2000) and Stott and Kettleborough (2002) (ASK), which aims to provide relatively model independent probabilities consistent with observed changes (see Section 10.5.4.5). The Bayesian method predicts a much narrower uncertainty range than ASK. However its results depend on choices made in its design, particularly the convergence criterion for up-weighting models close to the ensemble mean, relaxation of which substantially reduces the discrepancy with ASK.

Another method by Furrer et al. (2007) employs a hierarchical Bayesian model to construct PDFs of temperature change at each grid point from a multi-model ensemble. The main assumptions are that the true climate change signal is a common large-scale structure represented to some degree in each of the model simulations, and that the signal unexplained by climate change is AOGCM-specific in terms of small-scale structure, but can be regarded as noise when averaged over all AOGCMs. In this method, spatial fields of future minus present temperature difference from each ensemble member are regressed upon basis functions. One of the basis functions is a map of differences of observed temperatures from late-minus mid-20th century, and others are spherical harmonics. The statistical model then estimates the regression coefficients and their associated errors, which account for the deviation in each AOGCM from the (assumed) true pattern of change. By recombining the coefficients with the basis functions, an estimate is derived of the true climate change field and its associated uncertainty, thus providing joint probabilities for climate change at all grid points around the globe.

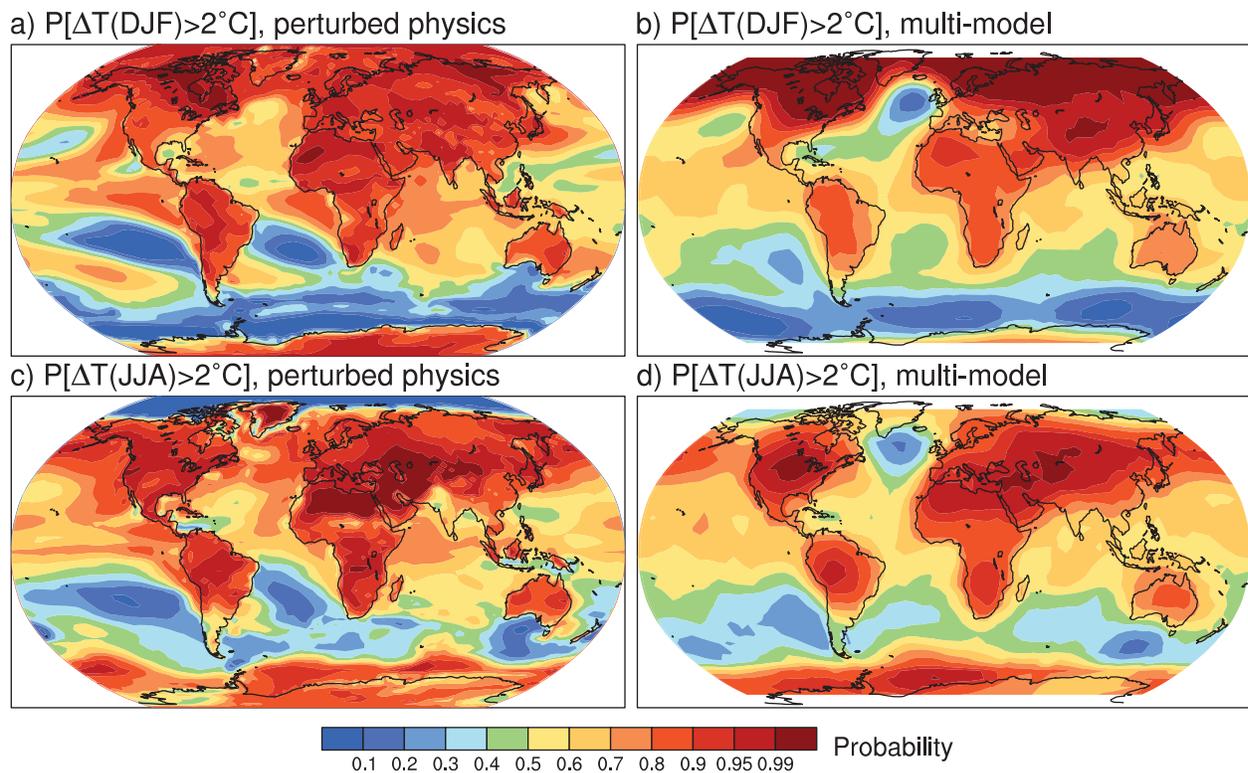

Estimates of uncertainty derived from multi-model ensembles of 10 to 20 members are potentially sensitive to outliers (Räisänen, 2001). Harris et al. (2006) therefore augment a 17-member ensemble of AOGCM transient simulations by scaling the equilibrium response patterns of a large perturbed physics ensemble. Transient responses are emulated by scaling equilibrium response patterns according to global temperature (predicted from an energy balance model tuned to the relevant climate sensitivities). For surface temperature, the scaled equilibrium patterns correspond well to the transient response patterns, while scaling errors for precipitation vary more

widely with location. A correction field is added to account for ensemble-mean differences between the equilibrium and transient patterns, and uncertainty is allowed for in the emulated result. The correction field and emulation errors are determined by comparing the responses of model versions for which both transient and equilibrium simulations exist. Results are used to obtain frequency distributions of transient regional changes in surface temperature and precipitation in response to increasing atmospheric CO<sub>2</sub>, arising from the combined effects of atmospheric parameter perturbations and internal variability in UKMO-HadCM3.

Figure 10.30 shows probabilities of a temperature change larger than 2°C by the end of the 21st century under the A1B scenario, comparing values estimated from the 21-member AR4 multi-model ensemble (Furrer et al., 2007) against values estimated by combining transient and equilibrium perturbed physics ensembles of 17 and 128 members, respectively (Harris et al., 2006). Although the methods use different ensembles and different statistical approaches, the large-scale patterns are similar in many respects. Both methods show larger probabilities (typically 80% or more) over land, and at high latitudes in the winter hemisphere, with relatively low values (typically less than 50%) over the southern oceans. However, the plots also reveal some substantial differences at a regional level, notably over the North Atlantic Ocean, the sub-tropical Atlantic and Pacific Oceans in the SH, and at high northern latitudes during June to August.

#### 10.5.4.8 Summary

Significant progress has been made since the TAR in exploring ensemble approaches to provide uncertainty ranges and probabilities for global and regional climate change. Different methods show consistency in some aspects of their results, but differ significantly in others (see Box 10.2; Figures 10.28 and 10.30), because they depend to varying degrees on the nature and use of observational constraints, the nature and design of model ensembles and the specification of prior distributions for uncertain inputs (see, e.g., Table 11.3). A preferred method cannot yet be recommended, but the assumptions and limitations underlying the various approaches, and the sensitivity of the results to them, should be communicated to users. A good example concerns the treatment of model error in Bayesian methods, the uncertainty in which affects the calculation of the likelihood of different model versions, but is difficult to specify (Rougier, 2007). Awareness of this issue is growing in the field of climate prediction (Annan et al., 2005b; Knutti et al., 2006), however, it is yet to be thoroughly addressed. Probabilistic depictions, particularly at the regional level, are new to climate change science and are being facilitated by the recently available multi-model ensembles. These are discussed further in Section 11.10.2.

**Figure 10.30.** Estimated probabilities for a mean surface temperature change exceeding 2°C in 2080 to 2099 relative to 1980 to 1999 under the SRES A1B scenario. Results obtained from a perturbed physics ensemble of a single model (a, c), based on Harris et al. (2006), are compared with results from the AR4 multi-model ensemble (b, d), based on Furrer et al. (2007), for December to February (DJF, a, b) and June to August (JJA, c, d).

## 10.6 Sea Level Change in the 21st Century

### 10.6.1 Global Average Sea Level Rise Due to Thermal Expansion

As seawater warms up, it expands, increasing the volume of the global ocean and producing thermosteric sea level rise (see Section 5.5.3). Global average thermal expansion can be calculated directly from simulated changes in ocean temperature. Results are available from 17 AOGCMs for the 21st century for SRES scenarios A1B, A2 and B1 (Figure 10.31), continuing from simulations of the 20th century. One ensemble member was used for each model and scenario. The time series are rather smooth compared with global average temperature time series, because thermal expansion reflects heat storage in the entire ocean, being approximately proportional to the time integral of temperature change (Gregory et al., 2001).

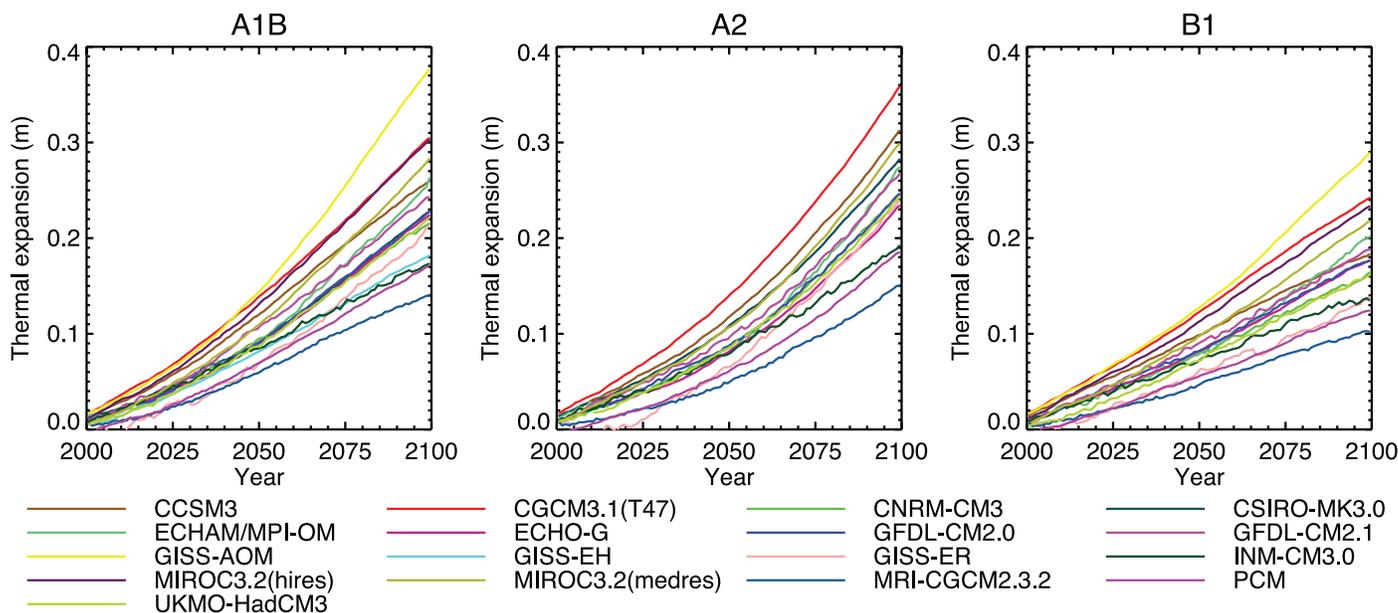

During 2000 to 2020 under scenario SRES A1B in the ensemble of AOGCMs, the rate of thermal expansion is  $1.3 \pm 0.7$  mm yr<sup>-1</sup>, and is not significantly different under A2 or B1. This rate is more than twice the observationally derived rate of  $0.42 \pm 0.12$  mm yr<sup>-1</sup> during 1961 to 2003. It is similar to the rate of  $1.6 \pm 0.5$  mm yr<sup>-1</sup> during 1993 to 2003 (see Section 5.5.3), which may be larger than that of previous decades partly because of natural forcing and internal variability (see Sections 5.5.2.4, 5.5.3 and 9.5.2). In particular, many of the AOGCM experiments do not include the influence of Mt. Pinatubo, the omission of which may reduce the projected rate of thermal expansion during the early 21st century.

During 2080 to 2100, the rate of thermal expansion is projected to be  $1.9 \pm 1.0$ ,  $2.9 \pm 1.4$  and  $3.8 \pm 1.3$  mm yr<sup>-1</sup> under

scenarios SRES B1, A1B and A2 respectively in the AOGCM ensemble (the width of the range is affected by the different numbers of models under each scenario). The acceleration is caused by the increased climatic warming. Results are shown for all SRES marker scenarios in Table 10.7 (see Appendix 10.A for methods). In the AOGCM ensemble, under any given SRES scenario, there is some correlation of the global average temperature change across models with thermal expansion and its rate of change, suggesting that the spread in thermal expansion for that scenario is caused both by the spread in surface warming and by model-dependent ocean heat uptake efficiency (Raper et al., 2002; Table 8.2) and the distribution of added heat within the ocean (Russell et al., 2000).

### 10.6.2 Local Sea Level Change Due to Change in Ocean Density and Dynamics

The geographical pattern of mean sea level relative to the geoid (the dynamic topography) is an aspect of the dynamical balance relating the ocean's density structure and its circulation, which are maintained by air-sea fluxes of heat, freshwater and momentum. Over much of the ocean on multi-annual time scales, a good approximation to the pattern of dynamic topography change is given by the steric sea level change, which can be calculated straightforwardly from local temperature and salinity change (Gregory et al., 2001; Lowe and Gregory, 2006). In much of the world, salinity changes are as important as temperature changes in determining the pattern of dynamic topography change in the future, and their contributions can be opposed (Landerer et al., 2007; and as in the past, Section 5.5.4.1). Lowe and Gregory (2006) show that in the UKMO-HadCM3 AOGCM, changes in heat fluxes are the cause of many of the large-scale features of sea level change, but freshwater

**Figure 10.31.** Projected global average sea level rise (m) due to thermal expansion during the 21st century relative to 1980 to 1999 under SRES scenarios A1B, A2 and B1. See Table 8.1 for model descriptions.

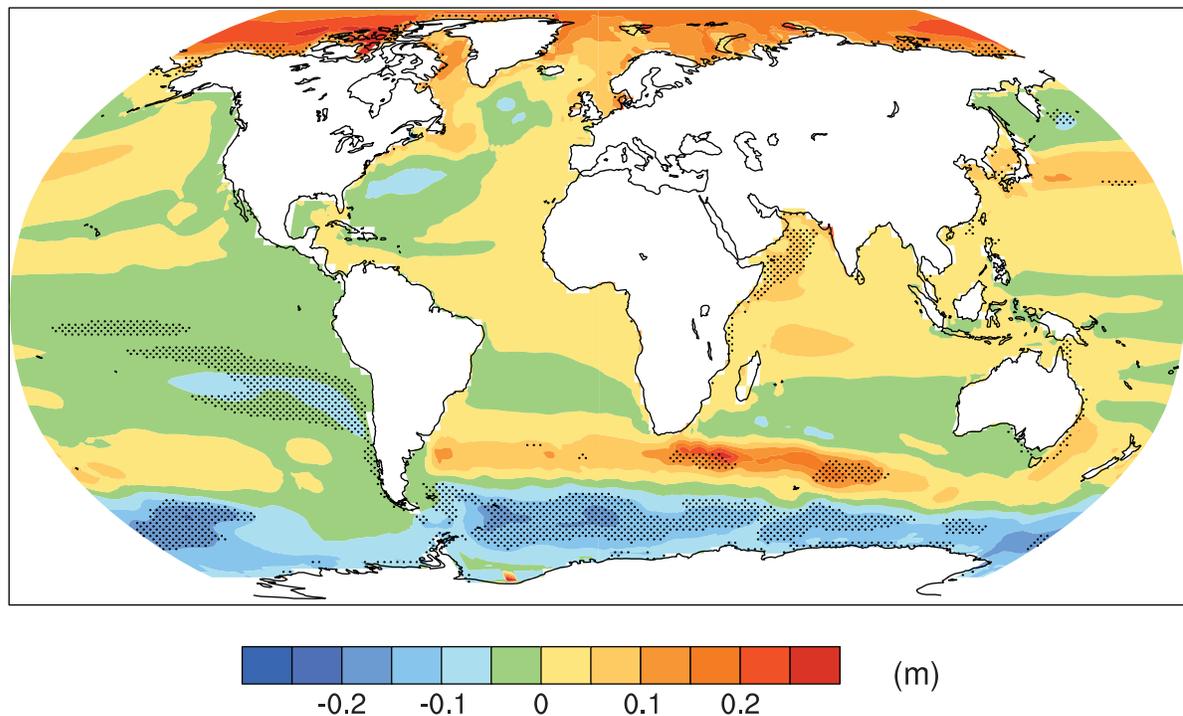

flux change dominates the North Atlantic and momentum flux change has a signature in the north and low-latitude Pacific and the Southern Ocean.

Results are available for local sea level change due to ocean density and circulation change from AOGCMs in the multi-model ensemble for the 20th century and the 21st century. There is substantial spatial variability in all models (i.e., sea level change is not uniform), and as the geographical pattern of climate change intensifies, the spatial standard deviation of local sea level change increases (Church et al., 2001; Gregory et al., 2001). Suzuki et al. (2005) show that, in their high-resolution model, enhanced eddy activity contributes to this increase, but across models there is no significant correlation of the spatial standard deviation with model spatial resolution. This section evaluates sea level change between 1980 to 1999 and 2080 to 2099 projected by 16 models forced with SRES scenario A1B. (Other scenarios are qualitatively similar, but fewer models are available.) The ratio of spatial standard deviation to global average thermal expansion varies among models, but is mostly within the range 0.3 to 0.4. The model median spatial standard deviation of thermal expansion is 0.08 m, which is about 25% of the central estimate of global average sea level rise during the 21st century under A1B (Table 10.7).

The geographical patterns of sea level change from different models are not generally similar in detail, although they have more similarity than those analysed in the TAR by Church et al.

(2001). The largest spatial correlation coefficient between any pair is 0.75, but only 25% of correlation coefficients exceed 0.5. To identify common features, an ensemble mean (Figure 10.32) is examined. There are only limited areas where the model ensemble mean change exceeds the inter-model standard deviation, unlike for surface air temperature change (Section 10.3.2.1).

Like Church et al. (2001) and Gregory et al. (2001), Figure 10.32 shows smaller than average sea level rise in the Southern Ocean and larger than average in the Arctic, the former possibly due to wind stress change (Landerer et al., 2007) or low thermal expansivity (Lowe and Gregory, 2006) and the latter due to freshening. Another obvious feature is a narrow band of pronounced sea level rise stretching across the southern Atlantic and Indian Oceans and discernible in the southern Pacific. This could be associated with a southward shift in the circumpolar front (Suzuki et al., 2005) or subduction of warm anomalies in the region of formation of sub antarctic mode water (Banks et al., 2002). In the zonal mean, there are maxima of sea level rise in 30°S to 45°S and 30°N to 45°N. Similar indications are present in the altimetric and thermosteric patterns of sea level change for 1993 to 2003 (Figure 5.15). The model projections do not share other aspects of the observed pattern of sea level rise, such as in the western Pacific, which could be related to interannual variability.

**Figure 10.32.** Local sea level change (m) due to ocean density and circulation change relative to the global average (i.e., positive values indicate greater local sea level change than global) during the 21st century, calculated as the difference between averages for 2080 to 2099 and 1980 to 1999, as an ensemble mean over 16 AOGCMs forced with the SRES A1B scenario. Stippling denotes regions where the magnitude of the multi-model ensemble mean divided by the multi-model standard deviation exceeds 1.0.

The North Atlantic dipole pattern noted by Church et al. (2001), that is, reduced rise to the south of the Gulf Stream extension, enhanced to the north, consistent with a weakening of the circulation, is present in some models; a more complex feature is described by Landerer et al. (2007). The reverse is apparent in the north Pacific, which Suzuki et al. (2005) associate with a wind-driven intensification of the Kuroshio Current. Using simplified models, Hsieh and Bryan (1996) and Johnson and Marshall (2002) show how upper-ocean velocities and sea level would be affected in North Atlantic coastal regions within months of a cessation of sinking in the North Atlantic as a result of propagation by coastal and equatorial Kelvin waves, but would take decades to adjust in the central regions and the south Atlantic. Levermann et al. (2005) show that a sea level rise of several tenths of a metre could be realised in coastal regions of the North Atlantic within a few decades (i.e., tens of millimetres per year) of a collapse of the MOC. Such changes to dynamic topography would be much more rapid than global average sea level change. However, it should be emphasized that these studies are sensitivity tests, not projections; the Atlantic MOC does not collapse in the SRES scenario runs evaluated here (see Section 10.3.4).

The geographical pattern of sea level change is affected also by changes in atmospheric surface pressure, but this is a relatively small effect given the projected pressure changes (Figure 10.9; a pressure increase of 1 hPa causes a drop in local sea level of 0.01 m; see Section 5.5.4.3). Land movements and changes in the gravitational field resulting from the changing loading of the crust by water and ice also have effects which are small over most of the ocean (see Section 5.5.4.4).

### 10.6.3 Glaciers and Ice Caps

Glaciers and ice caps (G&IC, see also Section 4.5.1) comprise all land ice except for the ice sheets of Greenland and Antarctica (see Sections 4.6.1 and 10.6.4). The mass of G&IC can change because of changes in surface mass balance (Section 10.6.3.1). Changes in mass balance cause changes in area and thickness (Section 10.6.3.2), with feedbacks on surface mass balance.

#### 10.6.3.1 Mass Balance Sensitivity to Temperature and Precipitation

Since G&IC mass balance depends strongly on their altitude and aspect, use of data from climate models to make projections requires a method of downscaling, because individual G&IC are much smaller than typical AOGCM grid boxes. Statistical relations for meteorological quantities can be developed between the GCM and local scales (Reichert et al., 2002), but they may not continue to hold in future climates. Hence, for projections the approach usually adopted is to use GCM simulations of changes in climate parameters to perturb the observed climatology or mass balance (Gregory and Oerlemans, 1998; Schneeberger et al., 2003).

Change in ablation (mostly melting) of a glacier or ice cap is modelled using  $b_T$  (in  $\text{m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$ ), the sensitivity of the mean

specific surface mass balance to temperature (refer to Section 4.5 for a discussion of the relation of mass balance to climate). One approach determines  $b_T$  by energy balance modelling, including evolution of albedo and refreezing of melt water within the firm (Zuo and Oerlemans, 1997). Oerlemans and Reichert (2000), Oerlemans (2001) and Oerlemans et al. (2006) refine this approach to include dependence on monthly temperature and precipitation changes. Another approach uses a degree-day method, in which ablation is proportional to the integral of mean daily temperature above the freezing point (Braithwaite et al., 2003). Braithwaite and Raper (2002) show that there is excellent consistency between the two approaches, which indicates a similar relationship between  $b_T$  and climatological precipitation. Schneeberger et al. (2000, 2003) use a degree-day method for ablation modified to include incident solar radiation, again obtaining similar results. De Woul and Hock (2006) find somewhat larger sensitivities for arctic G&IC from the degree-day method than the energy balance method. Calculations of  $b_T$  are estimated to have an uncertainty of  $\pm 15\%$  (standard deviation) (Gregory and Oerlemans, 1998; Raper and Braithwaite, 2006).

The global average sensitivity of G&IC surface mass balance to temperature is estimated by weighting the local sensitivities by land ice area in various regions. For a geographically and seasonally uniform rise in global temperature, Oerlemans and Fortuin (1992) derive a global average G&IC surface mass balance sensitivity of  $-0.40 \text{ m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$ , Dyurgerov and Meier (2000)  $-0.37 \text{ m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  (from observations), Braithwaite and Raper (2002)  $-0.41 \text{ m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  and Raper and Braithwaite (2005)  $-0.35 \text{ m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$ . Applying the scheme of Oerlemans (2001) and Oerlemans et al. (2006) worldwide gives a smaller value of  $-0.32 \text{ m yr}^{-1} \text{ } ^\circ\text{C}^{-1}$ , the reduction being due to the modified treatment of albedo by Oerlemans (2001).

These global average sensitivities for uniform temperature change are given only for scenario-independent comparison of the various methods; they cannot be used for projections, which require regional and seasonal temperature changes (Gregory and Oerlemans, 1998; van de Wal and Wild, 2001). Using monthly temperature changes simulated in G&IC regions by 17 AR4 AOGCMs for scenarios A1B, A2 and B1, the global total surface mass balance sensitivity to global average temperature change for all G&IC outside Greenland and Antarctica is  $0.61 \pm 0.12 \text{ mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  (sea level equivalent) with the  $b_T$  of Zuo and Oerlemans (1997) or  $0.49 \pm 0.13 \text{ mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  with those of Oerlemans (2001) and Oerlemans et al. (2006), subject to uncertainty in G&IC area (see Section 4.5.2 and Table 4.4).

Hansen and Nazarenko (2004) collate measurements of soot (fossil fuel black carbon) in snow and estimate consequent reductions in snow and ice albedo of between 0.001 for the pristine conditions of Antarctica and over 0.10 for polluted NH land areas. They argue that glacial ablation would be increased by this effect. While it is true that soot has not been explicitly considered in existing sensitivity estimates, it may already be included because the albedo and degree-day parametrizations have been empirically derived from data collected in affected regions.

For seasonally uniform temperature rise, Oerlemans et al. (1998) find that an increase in precipitation of 20 to 50% °C<sup>-1</sup> is required to balance increased ablation, while Braithwaite et al. (2003) report a required precipitation increase of 29 to 41% °C<sup>-1</sup>, in both cases for a sample of G&IC representing a variety of climatic regimes. Oerlemans et al. (2006) require a precipitation increase of 20 to 43% °C<sup>-1</sup> to balance ablation increase, and de Woul and Hock (2006) approximately 20% °C<sup>-1</sup> for Arctic G&IC. Although AOGCMs generally project larger than average precipitation change in northern mid- and high-latitude regions, the global average is 1 to 2% °C<sup>-1</sup> (Section 10.3.1), so ablation increases would be expected to dominate worldwide. However, precipitation changes may sometimes dominate locally (see Section 4.5.3).

Regressing observed global total mass balance changes of all G&IC outside Greenland and Antarctica against global average surface temperature change gives a global total mass balance sensitivity which is greater than model results (see Appendix 10.A). The current state of knowledge does not permit a satisfactory explanation of the difference. Giving more weight to the observational record but enlarging the uncertainty to allow for systematic error, a value of  $0.80 \pm 0.33$  mm yr<sup>-1</sup> °C<sup>-1</sup> (5 to 95% range) is adopted for projections. The regression indicates that the climate of 1865 to 1895 was 0.13°C warmer globally than the climate that gives a steady state for G&IC (cf., Zuo and Oerlemans, 1997; Gregory et al., 2006). Model results for the 20th century are sensitive to this value, but the projected temperature change in the 21st century is large by comparison, making the effect relatively less important for projections (see Appendix 10.A).

### 10.6.3.2 Dynamic Response and Feedback on Mass Balance

As glacier volume is lost, glacier area declines so the ablation decreases. Oerlemans et al. (1998) calculate that omitting this effect leads to overestimates of ablation of about 25% by 2100. Church et al. (2001), following Bahr et al. (1997) and Van de Wal and Wild (2001), make some allowance for it by diminishing the area  $A$  of a glacier of volume  $V$  according to  $V \propto A^{1.375}$ . This is a scaling relation derived for glaciers in a steady state, which may hold only approximately during retreat. For example, thinning in the ablation zone will steepen the surface slope and tend to increase the flow. Comparison with a simple flow model suggests the deviations do not exceed 20% (van de Wal and Wild, 2001). Schneeberger et al. (2003) find that the scaling relation produced a mixture of over- and underestimates of volume loss for their sample of glaciers compared with more detailed dynamic modelling. In some regions where G&IC flow into the sea or lakes there is accelerated dynamic discharge (Rignot et al., 2003) that is not included in currently available glacier models, leading to an underestimate of G&IC mass loss.

The mean specific surface mass balance of the glacier or ice cap will change as volume is lost: lowering the ice surface as the ice thins will tend to make it more negative, but the predominant loss of area at lower altitude in the ablation zone

will tend to make it less negative (Braithwaite and Raper, 2002). For rapid thinning rates in the ablation zone, of several metres per year, lowering the surface will give enhanced local warmings comparable to the rate of projected climatic warming. However, those areas of the ablation zone of valley glaciers that thin most rapidly will soon be removed altogether, resulting in retreat of the glacier. The enhancement of ablation by surface lowering can only be sustained in glaciers with a relatively large, thick and flat ablation area. On multi-decadal time scales, for the majority of G&IC, the loss of area is more important than lowering of the surface (Schneeberger et al., 2003).

The dynamical approach (Oerlemans et al., 1998; Schneeberger et al., 2003) cannot be applied to all the world's glaciers individually as the required data are unknown for the vast majority of them. Instead, it might be applied to a representative ensemble derived from statistics of size distributions of G&IC. Raper et al. (2000) developed a geometrical approach, in which the width, thickness and length of a glacier are reduced as its volume and area declines. When applied statistically to the world population of glaciers and individually to ice caps, this approach shows that the reduction of area of glaciers strongly reduces the ablation during the 21st century (Raper and Braithwaite, 2006), by about 45% under scenario SRES A1B for the GFDL-CM2.0 and PCM AOGCMs (see Table 8.1 for model details). For the same cases, using the mass-balance sensitivities to temperature of Oerlemans (2001) and Oerlemans et al. (2006), G&IC mass loss is reduced by about 35% following the area scaling of Van de Wal and Wild (2001), suggesting that the area scaling and the geometrical model have a similar effect in reducing estimated ablation for the 21st century. The effect is greater when using the observationally derived mass balance sensitivity (Section 10.6.3.1), which is larger, implying faster mass loss for fixed area. The uncertainty in present-day glacier volume (Table 4.4) introduces a 5 to 10% uncertainty into the results of area scaling. For projections, the area scaling of Van de Wal and Wild (2001) is applied, using three estimates of world glacier volume (see Table 4.4 and Appendix 10.A). The scaling reduces the projections of the G&IC contribution up to the mid-21st century by 25% and over the whole century by 40 to 50% with respect to fixed G&IC area.

### 10.6.3.3 Glaciers and Ice Caps on Greenland and Antarctica

The G&IC on Greenland and Antarctica (apart from the ice sheets) have been less studied and projections for them are consequently more uncertain. A model estimate for the G&IC on Greenland indicates an addition of about 6% to the G&IC sea level contribution in the 21st century (van de Wal and Wild, 2001). Using a degree-day scheme, Vaughan (2006) estimates that ablation of glaciers in the Antarctic Peninsula presently amounts to 0.008 to 0.055 mm yr<sup>-1</sup> of sea level, 1 to 9% of the contribution from G&IC outside Greenland and Antarctica (Table 4.4). Morris and Mulvaney (2004) find that accumulation increases on the Antarctic Peninsula were larger than ablation increases during 1972 to 1998, giving a small net *negative* sea

level contribution from the region. However, because ablation increases nonlinearly with temperature, they estimate that for future warming the contribution would become positive, with a sensitivity of  $0.07 \pm 0.03 \text{ mm yr}^{-1} \text{ }^{\circ}\text{C}^{-1}$  to uniform temperature change in Antarctica, that is, about 10% of the global sensitivity of G&IC outside Greenland and Antarctica (Section 10.6.3.1).

These results suggest that the Antarctic and Greenland G&IC will together give 10 to 20% of the sea level contribution of other G&IC in future decades. In recent decades, the G&IC on Greenland and Antarctica have together made a contribution of about 20% of the total of other G&IC (see Section 4.5.2). On these grounds, the global G&IC sea level contribution is increased by a factor of 1.2 to include those in Greenland and Antarctica in projections for the 21st century (see Section 10.6.5 and Table 10.7). Dynamical acceleration of glaciers in Greenland and Antarctica following removal of ice shelves, as has recently happened on the Antarctic Peninsula (Sections 4.6.2.2 and 10.6.4.2), would add further to this, and is included in projections of that effect (Section 10.6.4.3).

### 10.6.4 Ice Sheets

The mass of ice grounded on land in the Greenland and Antarctic Ice Sheets (see also Section 4.6.1) can change as a result of changes in surface mass balance (the sum of accumulation and ablation; Section 10.6.4.1) or in the flux of ice crossing the grounding line, which is determined by the dynamics of the ice sheet (Section 10.6.4.2). Surface mass balance and dynamics together both determine and are affected by the change in surface topography.

#### 10.6.4.1 Surface Mass Balance

Surface mass balance (SMB) is immediately influenced by climate change. A good simulation of the ice sheet SMB requires a resolution exceeding that of AGCMs used for long climate experiments, because of the steep slopes at the margins of the ice sheet, where the majority of the precipitation and all of the ablation occur. Precipitation over ice sheets is typically overestimated by AGCMs, because their smooth topography does not present a sufficient barrier to inland penetration (Ohmura et al., 1996; Glover, 1999; Murphy et al., 2002). Ablation also tends to be overestimated because the area at low altitude around the margins of the ice sheet, where melting preferentially occurs, is exaggerated (Glover, 1999; Wild et al., 2003). In addition, AGCMs do not generally have a representation of the refreezing of surface melt water within the snowpack and may not include albedo variations dependent on snow ageing and its conversion to ice.

To address these issues, several groups have computed SMB at resolutions of tens of kilometres or less, with results that compare acceptably well with observations (e.g., van Lipzig et al., 2002; Wild et al., 2003). Ablation is calculated either by schemes based on temperature (degree-day or other temperature index methods) or by energy balance modelling. In the studies listed in Table 10.6, changes in SMB have been calculated

from climate change simulations with high-resolution AGCMs or by perturbing a high-resolution observational climatology with climate model output, rather than by direct use of low-resolution GCM results. The models used for projected SMB changes are similar in kind to those used to study recent SMB changes (Section 4.6.3.1).

All the models show an increase in accumulation, but there is considerable uncertainty in its size (Table 10.6; van de Wal et al., 2001; Huybrechts et al., 2004). Precipitation increase could be determined by atmospheric radiative balance, increase in saturation specific humidity with temperature, circulation changes, retreat of sea ice permitting greater evaporation or a combination of these (van Lipzig et al., 2002). Accumulation also depends on change in local temperature, which strongly affects whether precipitation is solid or liquid (Janssens and Huybrechts, 2000), tending to make the accumulation increase smaller than the precipitation increase for a given temperature rise. For Antarctica, accumulation increases by 6 to 9%  $^{\circ}\text{C}^{-1}$  in the high-resolution AGCMs. Precipitation increases somewhat less in AR4 AOGCMs (typically of lower resolution), by 3 to 8%  $^{\circ}\text{C}^{-1}$ . For Greenland, accumulation derived from the high-resolution AGCMs increases by 5 to 9%  $^{\circ}\text{C}^{-1}$ . Precipitation increases by 4 to 7%  $^{\circ}\text{C}^{-1}$  in the AR4 AOGCMs.

Kapsner et al. (1995) do not find a relationship between precipitation and temperature variability inferred from Greenland ice cores for the Holocene, although both show large changes from the Last Glacial Maximum (LGM) to the Holocene. In the UKMO-HadCM3 AOGCM, the relationship is strong for climate change forced by greenhouse gases and the glacial-interglacial transition, but weaker for naturally forced variability (Gregory et al., 2006). Increasing precipitation in conjunction with warming has been observed in recent years in Greenland (Section 4.6.3.1).

All studies for the 21st century project that antarctic SMB changes will contribute negatively to sea level, owing to increasing accumulation exceeding any ablation increase (see Table 10.6). This tendency has not been observed in the average over Antarctica in reanalysis products for the last two decades (see Section 4.6.3.1), but during this period Antarctica as a whole has not warmed; on the other hand, precipitation has increased on the Antarctic Peninsula, where there has been strong warming.

In projections for Greenland, ablation increase is important but uncertain, being particularly sensitive to temperature change around the margins. Climate models project less warming in these low-altitude regions than the Greenland average, and less warming in summer (when ablation occurs) than the annual average, but greater warming in Greenland than the global average (Church et al., 2001; Huybrechts et al., 2004; Chylek and Lohmann, 2005; Gregory and Huybrechts, 2006). In most studies, Greenland SMB changes represent a net positive contribution to sea level in the 21st century (Table 10.6; Kiilsholm et al., 2003) because the ablation increase is larger than the precipitation increase. Only Wild et al. (2003) find the opposite, so that the net SMB change contributes negatively to sea level in the 21st century. Wild et al. (2003) attribute this

**Table 10.6.** Comparison of ice sheet (grounded ice area) SMB changes calculated from high-resolution climate models.  $\Delta P/\Delta T$  is the change in accumulation divided by change in temperature over the ice sheet, expressed as sea level equivalent (positive for falling sea level), and  $\Delta R/\Delta T$  the corresponding quantity for ablation (positive for rising sea level). Note that ablation increases more rapidly than linearly with  $\Delta T$  (van de Wal et al., 2001; Gregory and Huybrechts, 2006). To convert from  $\text{mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  to  $\text{kg yr}^{-1} \text{ } ^\circ\text{C}^{-1}$ , multiply by  $3.6 \times 10^{14} \text{ m}^2$ . To convert  $\text{mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  of sea level equivalent to  $\text{mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  averaged over the ice sheet, multiply by  $-206$  for Greenland and  $-26$  for Antarctica.  $\Delta P/(P\Delta T)$  is the fractional change in accumulation divided by the change in temperature.

<sup>c</sup> In these cases  $P$  is precipitation rather than accumulation.

difference to the reduced ablation area in their higher-resolution grid. A positive SMB change is not consistent with analyses of recent changes in Greenland SMB (see Section 4.6.3.1).

For an average temperature change of 3°C over each ice sheet, a combination of four high-resolution AGCM simulations and 18 AR4 AOGCMs (Huybrechts et al., 2004; Gregory and Huybrechts, 2006) gives SMB changes of  $0.3 \pm 0.3 \text{ mm yr}^{-1}$  for Greenland and  $-0.9 \pm 0.5 \text{ mm yr}^{-1}$  for Antarctica (sea level equivalent), that is, sensitivities of  $0.11 \pm 0.09 \text{ mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  for Greenland and  $-0.29 \pm 0.18 \text{ mm yr}^{-1} \text{ } ^\circ\text{C}^{-1}$  for Antarctica. These results generally cover the range shown in Table 10.6, but tend to give more positive (Greenland) or less negative (Antarctica) sea level rise because of the smaller precipitation increases projected by the AOGCMs than by the high-resolution AGCMs. The uncertainties are from the spatial and seasonal patterns of precipitation and temperature change over the ice sheets, and from the ablation calculation. Projections under SRES scenarios for the 21st century are shown in Table 10.7.

#### 10.6.4.2 Dynamics

Ice sheet flow reacts to changes in topography produced by SMB change. Projections for the 21st century are given in Section 10.6.5 and Table 10.7, based on the discussion in this

section. In Antarctica, topographic change tends to increase ice flow and discharge. In Greenland, lowering of the surface tends to increase the ablation, while a steepening slope in the ablation zone opposes the lowering, and thinning of outlet glaciers reduces discharge. Topographic and dynamic changes simulated by ice flow models (Huybrechts and De Wolde, 1999; van de Wal et al., 2001; Huybrechts et al., 2002, 2004; Gregory and Huybrechts, 2006) can be roughly represented as modifying the sea level changes due to SMB change with fixed topography by  $-5\% \pm 5\%$  from Antarctica, and  $0\% \pm 10\%$  from Greenland ( $\pm$  one standard deviation) during the 21st century.

The TAR concluded that accelerated sea level rise caused by rapid dynamic response of the ice sheets to climate change is very unlikely during the 21st century (Church et al., 2001). However, new evidence of recent rapid changes in the Antarctic Peninsula, West Antarctica and Greenland (see Section 4.6.3.3) has again raised the possibility of larger dynamical changes in the future than are projected by state-of-the-art continental models, such as cited above, because these models do not incorporate all the processes responsible for the rapid marginal thinning currently taking place (Box 4.1; Alley et al., 2005a; Vaughan, 2007).

The main uncertainty is the degree to which the presence of ice shelves affects the flow of inland ice across the grounding

## Frequently Asked Question 10.2

# How Likely are Major or Abrupt Climate Changes, such as Loss of Ice Sheets or Changes in Global Ocean Circulation?

*Abrupt climate changes, such as the collapse of the West Antarctic Ice Sheet, the rapid loss of the Greenland Ice Sheet or large-scale changes of ocean circulation systems, are not considered likely to occur in the 21st century, based on currently available model results. However, the occurrence of such changes becomes increasingly more likely as the perturbation of the climate system progresses.*

Physical, chemical and biological analyses from Greenland ice cores, marine sediments from the North Atlantic and elsewhere and many other archives of past climate have demonstrated that local temperatures, wind regimes and water cycles can change rapidly within just a few years. The comparison of results from records in different locations of the world shows that in the past major changes of hemispheric to global extent occurred. This has led to the notion of an unstable past climate that underwent phases of abrupt change. Therefore, an important concern is that the continued growth of greenhouse gas concentrations in the atmosphere may constitute a perturbation sufficiently strong to trigger abrupt changes in the climate system. Such interference with the climate system could be considered dangerous, because it would have major global consequences.

Before discussing a few examples of such changes, it is useful to define the terms 'abrupt' and 'major'. 'Abrupt' conveys the meaning that the changes occur much faster than the perturbation inducing the change; in other words, the response is nonlinear. A 'major' climate change is one that involves changes that exceed the range of current natural variability and have a spatial extent ranging from several thousand kilometres to global. At local to regional scales, abrupt changes are a common characteristic of natural climate variability. Here, isolated, short-lived events that are more appropriately referred to as 'extreme events' are not considered, but rather large-scale changes that evolve rapidly and persist for several years to decades. For instance, the mid-1970s shift in sea surface temperatures in the Eastern Pacific, or the salinity reduction in the upper 1,000 m of the Labrador Sea since the mid-1980s, are examples of abrupt events with local to regional consequences, as opposed to the larger-scale, longer-term events that are the focus here.

One example is the potential collapse, or shut-down of the Gulf Stream, which has received broad public attention. The Gulf Stream is a primarily horizontal current in the north-western Atlantic Ocean driven by winds. Although a stable feature of the general circulation of the ocean, its northern extension, which feeds deep-water formation in the Greenland-Norwegian-Iceland Seas and thereby delivers substantial amounts of heat to these seas and nearby land areas, is influenced strongly by changes in the density of the surface waters in these areas. This current

constitutes the northern end of a basin-scale meridional overturning circulation (MOC) that is established along the western boundary of the Atlantic basin. A consistent result from climate model simulations is that if the density of the surface waters in the North Atlantic decreases due to warming or a reduction in salinity, the strength of the MOC is decreased, and with it, the delivery of heat into these areas. Strong sustained reductions in salinity could induce even more substantial reduction, or complete shut-down of the MOC in all climate model projections. Such changes have indeed happened in the distant past.

The issue now is whether the increasing human influence on the atmosphere constitutes a strong enough perturbation to the MOC that such a change might be induced. The increase in greenhouse gases in the atmosphere leads to warming and an intensification of the hydrological cycle, with the latter making the surface waters in the North Atlantic less salty as increased rain leads to more freshwater runoff to the ocean from the region's rivers. Warming also causes land ice to melt, adding more freshwater and further reducing the salinity of ocean surface waters. Both effects would reduce the density of the surface waters (which must be dense and heavy enough to sink in order to drive the MOC), leading to a reduction in the MOC in the 21st century. This reduction is predicted to proceed in lockstep with the warming: none of the current models simulates an abrupt (nonlinear) reduction or a complete shut-down in this century. There is still a large spread among the models' simulated reduction in the MOC, ranging from virtually no response to a reduction of over 50% by the end of the 21st century. This cross-model variation is due to differences in the strengths of atmosphere and ocean feedbacks simulated in these models.

Uncertainty also exists about the long-term fate of the MOC. Many models show a recovery of the MOC once climate is stabilised. But some models have thresholds for the MOC, and they are passed when the forcing is strong enough and lasts long enough. Such simulations then show a gradual reduction of the MOC that continues even after climate is stabilised. A quantification of the likelihood of this occurring is not possible at this stage. Nevertheless, even if this were to occur, Europe would still experience warming, since the radiative forcing caused by increasing greenhouse gases would overwhelm the cooling associated with the MOC reduction. Catastrophic scenarios suggesting the beginning of an ice age triggered by a shutdown of the MOC are thus mere speculations, and no climate model has produced such an outcome. In fact, the processes leading to an ice age are sufficiently well understood and so completely different from those discussed here, that we can confidently exclude this scenario.

*(continued)*

Irrespective of the long-term evolution of the MOC, model simulations agree that the warming and resulting decline in salinity will significantly reduce deep and intermediate water formation in the Labrador Sea during the next few decades. This will alter the characteristics of the intermediate water masses in the North Atlantic and eventually affect the deep ocean. The long-term effects of such a change are unknown.

Other widely discussed examples of abrupt climate changes are the rapid disintegration of the Greenland Ice Sheet, or the sudden collapse of the West Antarctic Ice Sheet. Model simulations and observations indicate that warming in the high latitudes of the Northern Hemisphere is accelerating the melting of the Greenland Ice Sheet, and that increased snowfall due to the intensified hydrological cycle is unable to compensate for this melting. As a consequence, the Greenland Ice Sheet may shrink substantially in the coming centuries. Moreover, results suggest that there is a critical temperature threshold beyond which the Greenland Ice Sheet would be committed to disappearing completely, and that threshold could be crossed in this century. However, the total melting of the Greenland Ice Sheet, which

would raise global sea level by about seven metres, is a slow process that would take many hundreds of years to complete.

Recent satellite and *in situ* observations of ice streams behind disintegrating ice shelves highlight some rapid reactions of ice sheet systems. This raises new concern about the overall stability of the West Antarctic Ice Sheet, the collapse of which would trigger another five to six metres of sea level rise. While these streams appear buttressed by the shelves in front of them, it is currently unknown whether a reduction or failure of this buttressing of relatively limited areas of the ice sheet could actually trigger a widespread discharge of many ice streams and hence a destabilisation of the entire West Antarctic Ice Sheet. Ice sheet models are only beginning to capture such small-scale dynamical processes that involve complicated interactions with the glacier bed and the ocean at the perimeter of the ice sheet. Therefore, no quantitative information is available from the current generation of ice sheet models as to the likelihood or timing of such an event.

line. A strong argument for enhanced flow when the ice shelf is removed is yielded by the acceleration of Jakobshavn Glacier (Greenland) following the loss of its floating tongue, and of the glaciers supplying the Larsen B Ice Shelf (Antarctic Peninsula) after it collapsed (see Section 4.6.3.3). The onset of disintegration of the Larsen B Ice Shelf has been attributed to enhanced fracturing by crevasses promoted by surface melt water (Scambos et al., 2000). Large portions of the Ross and Filchner-Ronne Ice Shelves (West Antarctica) currently have mean summer surface temperatures of around  $-5^{\circ}\text{C}$  (Comiso, 2000, updated). Four high-resolution GCMs (Gregory and Huybrechts, 2006) project summer surface warming in these major ice shelf regions of between 0.2 and 1.3 times the antarctic annual average warming, which in turn will be a factor  $1.1 \pm 0.3$  greater than global average warming according to AOGCM simulations using SRES scenarios. These figures indicate that a local mean summer warming of  $5^{\circ}\text{C}$  is unlikely for a global warming of less than  $5^{\circ}\text{C}$  (see Appendix 10.A). This suggests that ice shelf collapse due to surface melting is unlikely under most SRES scenarios during the 21st century, but we have low confidence in the inference because there is evidently large systematic uncertainty in the regional climate projections, and it is not known whether episodic surface melting might initiate disintegration in a warmer climate while mean summer temperatures remain below freezing.

In the Amundsen Sea sector of West Antarctica, ice shelves are not so extensive and the cause of ice shelf thinning is not surface melting, but bottom melting at the grounding line (Rignot and Jacobs, 2002). Shepherd et al. (2004) find an average ice-

shelf thinning rate of  $1.5 \pm 0.5 \text{ m yr}^{-1}$ . At the same time as the basal melting, accelerated inland flow has been observed for Pine Island, Thwaites and other glaciers in the sector (Rignot, 1998, 2001; Thomas et al., 2004). The synchronicity of these changes strongly implies that their cause lies in oceanographic change in the Amundsen Sea, but this has not been attributed to anthropogenic climate change and could be connected with variability in the SAM.

Because the acceleration took place in only a few years (Rignot et al., 2002; Joughin et al., 2003) but appears up to about 150 km inland, it implies that the dynamical response to changes in the ice shelf can propagate rapidly up the ice stream. This conclusion is supported by modelling studies of Pine Island Glacier by Payne et al. (2004) and Dupont and Alley (2005), in which a single and instantaneous reduction of the basal or lateral drag at the ice front is imposed in idealised ways, such as a step retreat of the grounding line. The simulated acceleration and inland thinning are rapid but transient; the rate of contribution to sea level declines as a new steady state is reached over a few decades. In the study of Payne et al. (2004) the imposed perturbations were designed to resemble loss of drag in the 'ice plain', a partially grounded region near the ice front, and produced a velocity increase of about  $1 \text{ km yr}^{-1}$  there. Thomas et al. (2005) suggest the ice plain will become ungrounded during the next decade and obtain a similar velocity increase using a simplified approach.

Most of inland ice of West Antarctica is grounded below sea level and so it could float if it thinned sufficiently; discharge therefore promotes inland retreat of the grounding line, which

represents a positive feedback by further reducing basal traction. Unlike the one-time change in the idealised studies, this would represent a sustained dynamical forcing that would prolong the contribution to sea level rise. Grounding line retreat of the ice streams has been observed recently at rates of up to about 1 km yr<sup>-1</sup> (Rignot, 1998, 2001; Shepherd et al., 2002), but a numerical model formulation is difficult to construct (Vieli and Payne, 2005).

The majority of West Antarctic ice discharge is through the ice streams that feed the Ross and Ronne-Filchner ice shelves, but in these regions no accelerated flow causing thinning is currently observed; on the contrary, they are thickening or near balance (Zwally et al., 2005). Excluding these regions, and likewise those parts of the East Antarctic Ice Sheet that drain into the large Amery ice shelf, the total area of ice streams (areas flowing faster than 100 m yr<sup>-1</sup>) discharging directly into the sea or via a small ice shelf is 270,000 km<sup>2</sup>. If all these areas thinned at 2 m yr<sup>-1</sup>, the order of magnitude of the larger rates observed in fast-flowing areas of the Amundsen Sea sector (Shepherd et al., 2001, 2002), the contribution to sea level rise would be about 1.5 mm yr<sup>-1</sup>. This would require sustained retreat simultaneously on many fronts, and should be taken as an indicative upper limit for the 21st century (see also Section 10.6.5).

The observation in west-central Greenland of seasonal variation in ice flow rate and of a correlation with summer temperature variation (Zwally et al., 2002) suggest that surface melt water may join a sub-glacially routed drainage system lubricating the ice flow (although this implies that it penetrates more than 1,200 m of subfreezing ice). By this mechanism, increased surface melting during the 21st century could cause

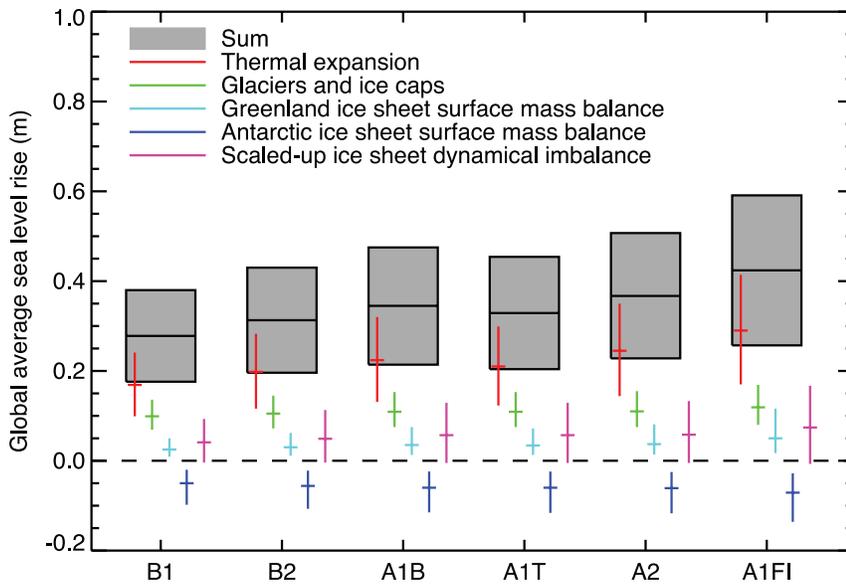

acceleration of ice flow and discharge; a sensitivity study (Parizek and Alley, 2004) indicated that this might increase the sea level contribution from the Greenland Ice Sheet during the 21st century by up to 0.2 m, depending on the warming and other assumptions. However, other studies (Echelmeyer and Harrison, 1990; Joughin et al., 2004) found no evidence of seasonal fluctuations in the flow rate of nearby Jakobshavn Glacier despite a substantial supply of surface melt water.

### 10.6.5 Projections of Global Average Sea Level Change for the 21st Century

Table 10.7 and Figure 10.33 show projected changes in global average sea level under the SRES marker scenarios for the 21st century due to thermal expansion and land ice changes based on AR4 AOGCM results (see Sections 10.6.1, 10.6.3 and 10.6.4 for discussion). The ranges given are 5 to 95% intervals characterising the spread of model results, but we are not able to assess their likelihood in the way we have done for temperature change (Section 10.5.4.6), for two main reasons. First, the observational constraint on sea level rise projections is weaker, because records are shorter and subject to more uncertainty. Second, current scientific understanding leaves poorly known uncertainties in the methods used to make projections for land ice (Sections 10.6.3 and 10.6.4). Since the AOGCMs are integrated with scenarios of CO<sub>2</sub> concentration, uncertainties in carbon cycle feedbacks are not included in the results. The carbon cycle uncertainty in projections of temperature change cannot be translated into sea level rise because thermal expansion is a major contributor and its relation to temperature change is uncertain (Section 10.6.1).

**Table 10.7.** Projected global average sea level rise during the 21st century and its components under SRES marker scenarios. The upper row in each pair gives the 5 to 95% range (m) of the rise in sea level between 1980 to 1999 and 2090 to 2099. The lower row in each pair gives the range of the rate of sea level rise (mm yr<sup>-1</sup>) during 2090 to 2099. The land ice sum comprises G&I and ice sheets, including dynamics, but excludes the scaled-up ice sheet discharge (see text). The sea level rise comprises thermal expansion and the land ice sum. Note that for each scenario the lower/upper bound for sea level rise is larger/smaller than the total of the lower/upper bounds of the contributions, since the uncertainties of the contributions are largely independent. See Appendix 10.A for methods.

**Figure 10.33.** Projections and uncertainties (5 to 95% ranges) of global average sea level rise and its components in 2090 to 2099 (relative to 1980 to 1999) for the six SRES marker scenarios. The projected sea level rise assumes that the part of the present-day ice sheet mass imbalance that is due to recent ice flow acceleration will persist unchanged. It does not include the contribution shown from scaled-up ice sheet discharge, which is an alternative possibility. It is also possible that the present imbalance might be transient, in which case the projected sea level rise is reduced by 0.02 m. It must be emphasized that we cannot assess the likelihood of any of these three alternatives, which are presented as illustrative. The state of understanding prevents a best estimate from being made.

In all scenarios, the average rate of rise during the 21st century is very likely to exceed the 1961 to 2003 average rate of  $1.8 \pm 0.5$  mm yr<sup>-1</sup> (see Section 5.5.2.1). The central estimate of the rate of sea level rise during 2090 to 2099 is 3.8 mm yr<sup>-1</sup> under A1B, which exceeds the central estimate of 3.1 mm yr<sup>-1</sup> for 1993 to 2003 (see Section 5.5.2.2). The 1993 to 2003 rate may have a contribution of about 1 mm yr<sup>-1</sup> from internally generated or naturally forced decadal variability (see Sections 5.5.2.4 and 9.5.2). These sources of variability are not predictable and not included in the projections; the actual rate during any future decade might therefore be more or less than the projected rate by a similar amount. Although simulated and observed sea level rise agree reasonably well for 1993 to 2003, the observed rise for 1961 to 2003 is not satisfactorily explained (Section 9.5.2), as the sum of observationally estimated components is  $0.7 \pm 0.7$  mm yr<sup>-1</sup> less than the observed rate of rise (Section 5.5.6). This indicates a deficiency in current scientific understanding of sea level change and may imply an underestimate in projections.

For an average model (the central estimate for each scenario), the scenario spread (from B1 to A1FI) in sea level rise is only 0.02 m by the middle of the century. This is small because of the time-integrating effect of sea level rise, on which the divergence among the scenarios has had little effect by then. By 2090 to 2099 it is 0.15 m.

In all scenarios, the central estimate for thermal expansion by the end of the century is 70 to 75% of the central estimate for the sea level rise. In all scenarios, the average rate of expansion

during the 21st century is larger than central estimate of 1.6 mm yr<sup>-1</sup> for 1993 to 2003 (Section 5.5.3). Likewise, in all scenarios the average rate of mass loss by G&IC during the 21st century is greater than the central estimate of 0.77 mm yr<sup>-1</sup> for 1993 to 2003 (Section 4.5.2). By the end of the century, a large fraction of the present global G&IC mass is projected to have been lost (see, e.g., Table 4.3). The G&IC projections are rather insensitive to the scenario because the main uncertainties come from the G&IC model.

Further accelerations in ice flow of the kind recently observed in some Greenland outlet glaciers and West Antarctic ice streams could increase the ice sheet contributions substantially, but quantitative projections cannot be made with confidence (see Section 10.6.4.2). The land ice sum in Table 10.7 includes the effect of dynamical changes in the ice sheets that can be simulated with a continental ice sheet model (Section 10.6.4.2). It also includes a scenario-independent term of  $0.32 \pm 0.35$  mm yr<sup>-1</sup> ( $0.035 \pm 0.039$  m in 110 years). This is the central estimate for 1993 to 2003 of the sea level contribution from the Antarctic Ice Sheet, plus half of that from Greenland (Sections 4.6.2.2 and 5.5.5.2). We take this as an estimate of the part of the present ice sheet mass imbalance that is due to recent ice flow acceleration (Section 4.6.3.2), and assume that this contribution will persist unchanged.

We also evaluate the contribution of rapid dynamical changes under two alternative assumptions (see, e.g., Alley et al., 2005b). First, the present imbalance might be a rapid short-term adjustment, which will diminish during coming decades. We take an e-folding time of 100 years, on the basis of an idealised model study (Payne et al., 2004). This assumption reduces the sea level rise in Table 10.7 by 0.02 m. Second, the present imbalance might be a response to recent climate change, perhaps through oceanic or surface warming (Section 10.6.4.2). No models are available for such a link, so we assume that the imbalance might scale up with global average surface temperature change, which we take as a measure of the magnitude of climate change (see Appendix 10.A). This assumption adds 0.1 to 0.2 m to the estimated upper bound for sea level rise depending on the scenario (Table 10.7). During 2090 to 2099, the rate of scaled-up antarctic discharge roughly balances the increased rate of antarctic accumulation (SMB). The central estimate for the increased antarctic discharge under the SRES scenario A1FI is about 1.3 mm yr<sup>-1</sup>, a factor of 5 to 10 greater than in recent years, and similar to the order-of-magnitude upper limit of Section 10.6.4.2. It must be emphasized that we cannot assess the likelihood of any of these three alternatives, which are presented as illustrative. The state of understanding prevents a best estimate from being made.

The central estimates for sea level rise in Table 10.7 are smaller than the TAR model means (Church et al., 2001) by 0.03 to 0.07 m, depending on scenario, for two reasons. First, these projections are for 2090-2099, whereas the TAR projections were for 2100. Second, the TAR included some small constant additional contributions to sea level rise which are omitted here (see below regarding permafrost). If the TAR model means are adjusted for this, they are within 10% of the central estimates from Table 10.7. (See Appendix 10.A for further information.) For each scenario, the upper bound of sea level rise in Table 10.7 is smaller than in the TAR, and the lower bound is larger than in the TAR. This is because the uncertainty on the sea level projection has been reduced, for a combination of reasons (see Appendix 10.A for details). The TAR would have had similar ranges to those shown here if it had treated the uncertainties in the same way.

Thawing of permafrost is projected to contribute about 5 mm during the 21st century under the SRES scenario A2 (calculated from Lawrence and Slater, 2005). The mass of the ocean will also be changed by climatically driven alteration in other water storage, in the forms of atmospheric water vapour, seasonal snow cover, soil moisture, groundwater, lakes and rivers. All of these are expected to be relatively small terms, but there may be substantial contributions from anthropogenic change in terrestrial water storage, through extraction from aquifers and impounding in reservoirs (see Sections 5.5.5.3 and 5.5.5.4).

## 10.7 Long Term Climate Change and Commitment

### 10.7.1 Climate Change Commitment to Year 2300 Based on AOGCMs

Building on Wigley (2005), we use three specific definitions of climate change commitment: (i) the ‘constant composition commitment’, which denotes the further change of temperature (‘constant composition temperature commitment’ or ‘committed warming’), sea level (‘constant composition sea level commitment’) or any other quantity in the climate system, since the time the composition of the atmosphere, and hence the radiative forcing, has been held at a constant value; (ii) the ‘constant emission commitment’, which denotes the further change of, for example, temperature (‘constant emission temperature commitment’) since the time the greenhouse gas emissions have been held at a constant value; and (iii) the ‘zero emission commitment’, which denotes the further change of, for example, temperature (‘zero emission temperature commitment’) since the time the greenhouse gas emissions have been set to zero.

The concept that the climate system exhibits commitment when radiative forcing has changed is mainly due to the thermal inertia of the oceans, and was discussed independently by Wigley (1984), Hansen et al. (1984) and Siegenthaler and Oeschger

(1984). The term ‘commitment’ in this regard was introduced by Ramanathan (1988). In the TAR, this was illustrated in idealised scenarios of doubling and quadrupling atmospheric CO<sub>2</sub>, and stabilisation at 2050 and 2100 after an IS92a forcing scenario. Various temperature commitment values were reported (about 0.3°C per century with much model dependency), and EMIC simulations were used to illustrate the long-term influence of the ocean owing to long mixing times and the MOC. Subsequent studies have confirmed this behaviour of the climate system and ascribed it to the inherent property of the climate system that the thermal inertia of the ocean introduces a lag to the warming of the climate system after concentrations of greenhouse gases are stabilised (Mitchell et al., 2000; Wetherald et al., 2001; Wigley and Raper, 2003; Hansen et al., 2005b; Meehl et al., 2005c; Wigley, 2005). Climate change commitment as discussed here should not be confused with ‘unavoidable climate change’ over the next half century, which would surely be greater because forcing cannot be instantly stabilised. Furthermore, in the very long term it is plausible that climate change could be less than in a commitment run since forcing could plausibly be reduced below current levels as illustrated in the overshoot simulations and zero emission commitment simulations discussed below.

Three constant composition commitment experiments have recently been performed by the global coupled climate modelling community: (1) stabilising concentrations of greenhouse gases at year 2000 values after a 20th-century climate simulation, and running the model for an additional 100 years; (2) stabilising concentrations of greenhouse gases at year 2100 values after a 21st-century B1 experiment (e.g., CO<sub>2</sub> near 550 ppm) and running the model for an additional 100 years (with some models run to 200 years); and (3) stabilising concentrations of greenhouse gases at year 2100 values after a 21st-century A1B experiment (e.g., CO<sub>2</sub> near 700 ppm), and running the model for an additional 100 years (and some models to 200 years). Multi-model mean warming in these experiments is depicted in Figure 10.4. Time series of the globally averaged surface temperature and percent precipitation change after stabilisation are shown for all the models in the Supplementary Material, Figure S10.3.

The multi-model average warming for all radiative forcing agents held constant at year 2000 (reported earlier for several of the models by Meehl et al., 2005c), is about 0.6°C for the period 2090 to 2099 relative to the 1980 to 1999 reference period. This is roughly the magnitude of warming simulated in the 20th century. Applying the same uncertainty assessment as for the SRES scenarios in Fig. 10.29 (–40 to +60%), the likely uncertainty range is 0.3°C to 0.9°C. Hansen et al. (2005a) calculate the current energy imbalance of the Earth to be 0.85 W m<sup>-2</sup>, implying that the unrealised global warming is about 0.6°C without any further increase in radiative forcing. The committed warming trend values show a rate of warming averaged over the first two decades of the 21st century of about 0.1°C per decade, due mainly to the slow response of the oceans. About twice as much warming (0.2°C per decade) would be expected if emissions are within the range of the SRES scenarios.

For the B1 constant composition commitment run, the additional warming after 100 years is also about  $0.5^{\circ}\text{C}$ , and roughly the same for the A1B constant composition commitment (Supplementary Material, Figure S10.3). These new results quantify what was postulated in the TAR in that the warming commitment after stabilising concentrations is about  $0.5^{\circ}\text{C}$  for the first century, and considerably smaller after that, with most of the warming commitment occurring in the first several decades of the 22nd century.

Constant composition precipitation commitment for the multi-model ensemble average is about 1.1% by 2100 for the 20th-century constant composition commitment experiment, and for the B1 constant composition commitment experiment it is 0.8% by 2200 and 1.5% by 2300, while for the A1B constant composition commitment experiment it is 1.5% by 2200 and 2% by 2300.

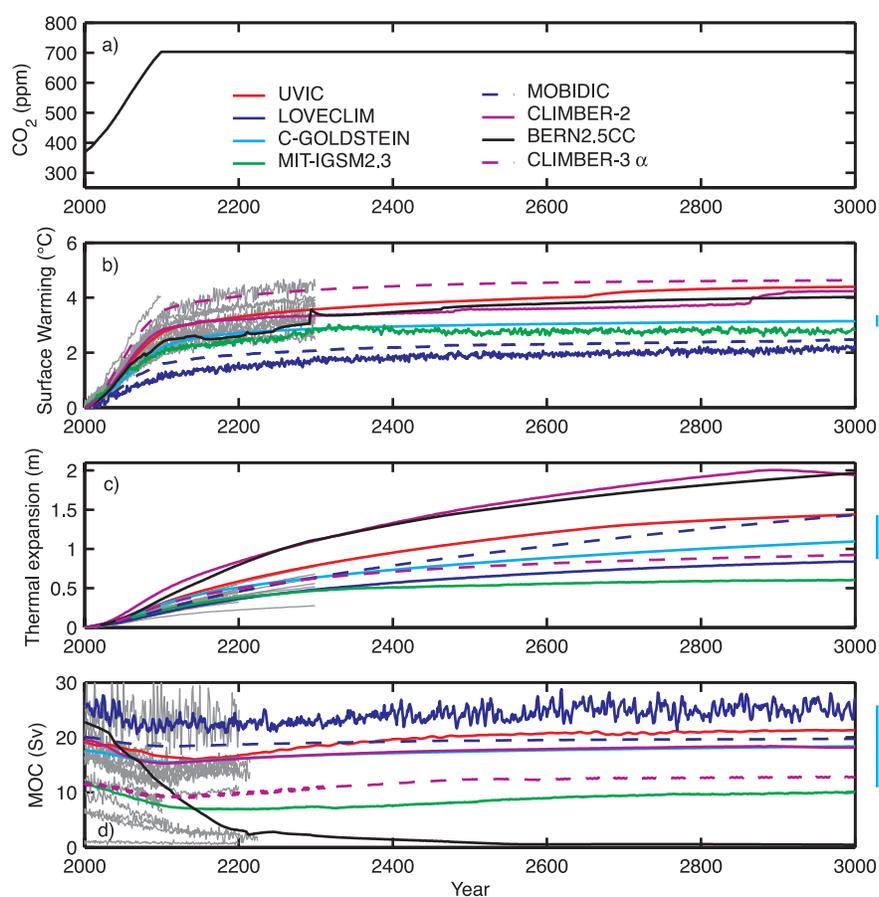

The patterns of change in temperature in the B1 and A1B experiments, relative to the pre-industrial period, do not change greatly after stabilisation (Table 10.5). Even the 20th-century stabilisation case warms with some similarity to the A1B pattern (Table 10.5). However, there is some contrast in the land and

ocean warming rates, as seen from Figure 10.6. Mid- and low-latitude land warms at rates closer to the global mean of that of A1B, while high-latitude ocean warming is larger.

### 10.7.2 Climate Change Commitment to Year 3000 and Beyond to Equilibrium

Earth System Models of Intermediate Complexity are used to extend the projections for a scenario that follows A1B to 2100 and then keeps atmospheric composition, and hence radiative forcing, constant to the year 3000 (see Figure 10.34). By 2100, the projected warming is between  $1.2^{\circ}\text{C}$  and  $4.1^{\circ}\text{C}$ , similar to the range projected by AOGCMs. A large constant composition temperature and sea level commitment is evident in the simulations and is slowly realised over coming centuries. By the year 3000, the warming range is  $1.9^{\circ}\text{C}$  to  $5.6^{\circ}\text{C}$ . While surface temperatures approach equilibrium relatively quickly, sea level continues to rise for many centuries.

Five of these EMICs include interactive representations of the marine and terrestrial carbon cycle and, therefore, can be used to assess carbon cycle-climate feedbacks and effects of

**Figure 10.34.** (a) Atmospheric  $\text{CO}_2$ , (b) global mean surface warming, (c) sea level rise from thermal expansion and (d) Atlantic meridional overturning circulation (MOC) calculated by eight EMICs for the SRES A1B scenario and stable radiative forcing after 2100, showing long-term commitment after stabilisation. Coloured lines are results from EMICs, grey lines indicate AOGCM results where available for comparison. Anomalies in (b) and (c) are given relative to the year 2000. Vertical bars indicate  $\pm 2$  standard deviation uncertainties due to ocean parameter perturbations in the C-GOLDSTEIN model. The MOC shuts down in the BERN2.5CC model, leading to an additional contribution to sea level rise. Individual EMICs (see Table 8.3 for model details) treat the effect from non- $\text{CO}_2$  greenhouse gases and the direct and indirect aerosol effects on radiative forcing differently. Despite similar atmospheric  $\text{CO}_2$  concentrations, radiative forcing among EMICs can thus differ within the uncertainty ranges currently available for present-day radiative forcing (see Chapter 2).

### Frequently Asked Question 10.3

## If Emissions of Greenhouse Gases are Reduced, How Quickly do Their Concentrations in the Atmosphere Decrease?

The adjustment of greenhouse gas concentrations in the atmosphere to reductions in emissions depends on the chemical and physical processes that remove each gas from the atmosphere. Concentrations of some greenhouse gases decrease almost immediately in response to emission reduction, while others can actually continue to increase for centuries even with reduced emissions.

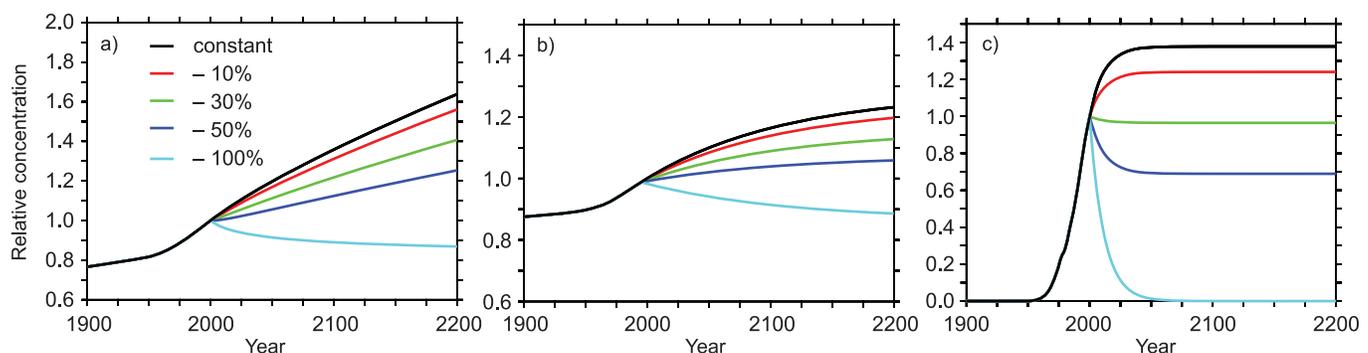

The concentration of a greenhouse gas in the atmosphere depends on the competition between the rates of emission of the gas into the atmosphere and the rates of processes that remove it from the atmosphere. For example, carbon dioxide (CO<sub>2</sub>) is exchanged between the atmosphere, the ocean and the land through processes such as atmosphere-ocean gas transfer and chemical (e.g., weathering) and biological (e.g., photosynthesis) processes. While more than half of the CO<sub>2</sub> emitted is currently removed from the atmosphere within a century, some fraction (about 20%) of emitted CO<sub>2</sub> remains in the atmosphere for many millennia. Because of slow removal processes, atmospheric CO<sub>2</sub> will continue to increase in the long term even if its emission is substantially reduced from present levels. Methane (CH<sub>4</sub>) is removed by chemical processes in the atmosphere, while nitrous oxide (N<sub>2</sub>O) and some halocarbons are destroyed in the upper atmosphere by solar radiation. These processes each operate at different time scales ranging from years to millennia. A measure for this is the lifetime of a gas in the atmosphere, defined as the time it takes for a perturbation to be reduced to 37% of its initial amount. While for CH<sub>4</sub>, N<sub>2</sub>O, and other trace gases such as hydrochlorofluorocarbon-22 (HCFC-22), a refrigerant fluid, such lifetimes can be reasonably determined (for CH<sub>4</sub> it is about 12 yr, for N<sub>2</sub>O about 110 yr and for HCFC-22 about 12 yr), a lifetime for CO<sub>2</sub> cannot be defined.

The change in concentration of any trace gas depends in part on how its emissions evolve over time. If emissions increase with time, the atmospheric concentration will also increase with time, regardless of the atmospheric lifetime of the gas. However, if actions are taken to reduce the emissions, the fate of the trace gas concentration will depend on the relative changes not only of emissions but also of its removal processes. Here we show how the lifetimes and removal processes of different gases dictate the evolution of concentrations when emissions are reduced.

As examples, FAQ 10.3, Figure 1 shows test cases illustrating how the future concentration of three trace gases would respond to illustrative changes in emissions (represented here as a response to an imposed pulse change in emission). We consider CO<sub>2</sub>, which has no specific lifetime, as well as a trace gas with a well-defined long lifetime on the order of a century (e.g., N<sub>2</sub>O), and a trace gas with a well-defined short lifetime on the order of decade (such as CH<sub>4</sub>, HCFC-22 or other halocarbons). For each gas, five illustrative cases of future emissions are presented: stabilisation of emissions at present-day levels, and immediate emission reduction by 10%, 30%, 50% and 100%.

The behaviour of CO<sub>2</sub> (Figure 1a) is completely different from the trace gases with well-defined lifetimes. Stabilisation of CO<sub>2</sub> emissions at current levels would result in a continuous increase of atmospheric CO<sub>2</sub> over the 21st century and beyond, whereas for a gas with a lifetime on the order of a century (Figure 1b) or a decade (Figure 1c), stabilisation of emissions at current levels would lead to a stabilisation of its concentration at a level higher than today within a couple of centuries, or decades, respectively. In fact, only in the case of essentially complete elimination of

(continued)

**FAQ 10.3, Figure 1.** (a) Simulated changes in atmospheric CO<sub>2</sub> concentration relative to the present-day for emissions stabilised at the current level (black), or at 10% (red), 30% (green), 50% (dark blue) and 100% (light blue) lower than the current level; (b) as in (a) for a trace gas with a lifetime of 120 years, driven by natural and anthropogenic fluxes; and (c) as in (a) for a trace gas with a lifetime of 12 years, driven by only anthropogenic fluxes.

emissions can the atmospheric concentration of CO<sub>2</sub> ultimately be stabilised at a constant level. All other cases of moderate CO<sub>2</sub> emission reductions show increasing concentrations because of the characteristic exchange processes associated with the cycling of carbon in the climate system.

More specifically, the rate of emission of CO<sub>2</sub> currently greatly exceeds its rate of removal, and the slow and incomplete removal implies that small to moderate reductions in its emissions would not result in stabilisation of CO<sub>2</sub> concentrations, but rather would only reduce the rate of its growth in coming decades. A 10% reduction in CO<sub>2</sub> emissions would be expected to reduce the growth rate by 10%, while a 30% reduction in emissions would similarly reduce the growth rate of atmospheric CO<sub>2</sub> concentrations by 30%. A 50% reduction would stabilise atmospheric CO<sub>2</sub>, but only for less than a decade. After that, atmospheric CO<sub>2</sub> would be expected to rise again as the land and ocean sinks decline owing to well-known chemical and biological adjustments. Complete elimination of CO<sub>2</sub> emissions is estimated to lead to a slow decrease in atmospheric CO<sub>2</sub> of about 40 ppm over the 21st century.

carbon emission reductions on atmospheric CO<sub>2</sub> and climate. Although carbon cycle processes in these models are simplified, global-scale quantities are in good agreement with more complex models (Doney et al., 2004).

Results for one carbon emission scenario are shown in Figure 10.35, where anthropogenic emissions follow a path towards stabilisation of atmospheric CO<sub>2</sub> at 750 ppm but at year 2100 are reduced to zero. This permits the determination of the zero emission climate change commitment. The prescribed emissions were calculated from the SP750 profile (Knutti et al., 2005) using the BERN-CC model (Joos et al., 2001). Although unrealistic, such a scenario permits the calculation of zero emission commitment, i.e., climate change due to 21st-century emissions. Even though emissions are instantly reduced to zero at year 2100, it takes about 100 to 400 years in the different models for the atmospheric CO<sub>2</sub> concentration to drop from the maximum (ranges between 650 to 700 ppm) to below the level of doubled pre-industrial CO<sub>2</sub> (~560 ppm) owing to a continuous transfer of carbon from the atmosphere into the terrestrial and oceanic reservoirs. Emissions during the 21st century continue to have an impact even at year 3000 when both surface temperature and sea level rise due to thermal expansion are still substantially higher than pre-industrial. Also shown are atmospheric CO<sub>2</sub> concentrations and ocean/terrestrial carbon inventories at year 3000 versus total emitted carbon for similar emission pathways targeting (but not actually reaching) 450, 550, 750 and 1,000 ppm atmospheric CO<sub>2</sub> and with carbon emissions reduced to zero at year 2100. Atmospheric CO<sub>2</sub> at year 3000 is approximately linearly related to the total amount of carbon emitted in each model, but with a substantial spread among the models in both slope and absolute values, because the redistribution of carbon between the different reservoirs is

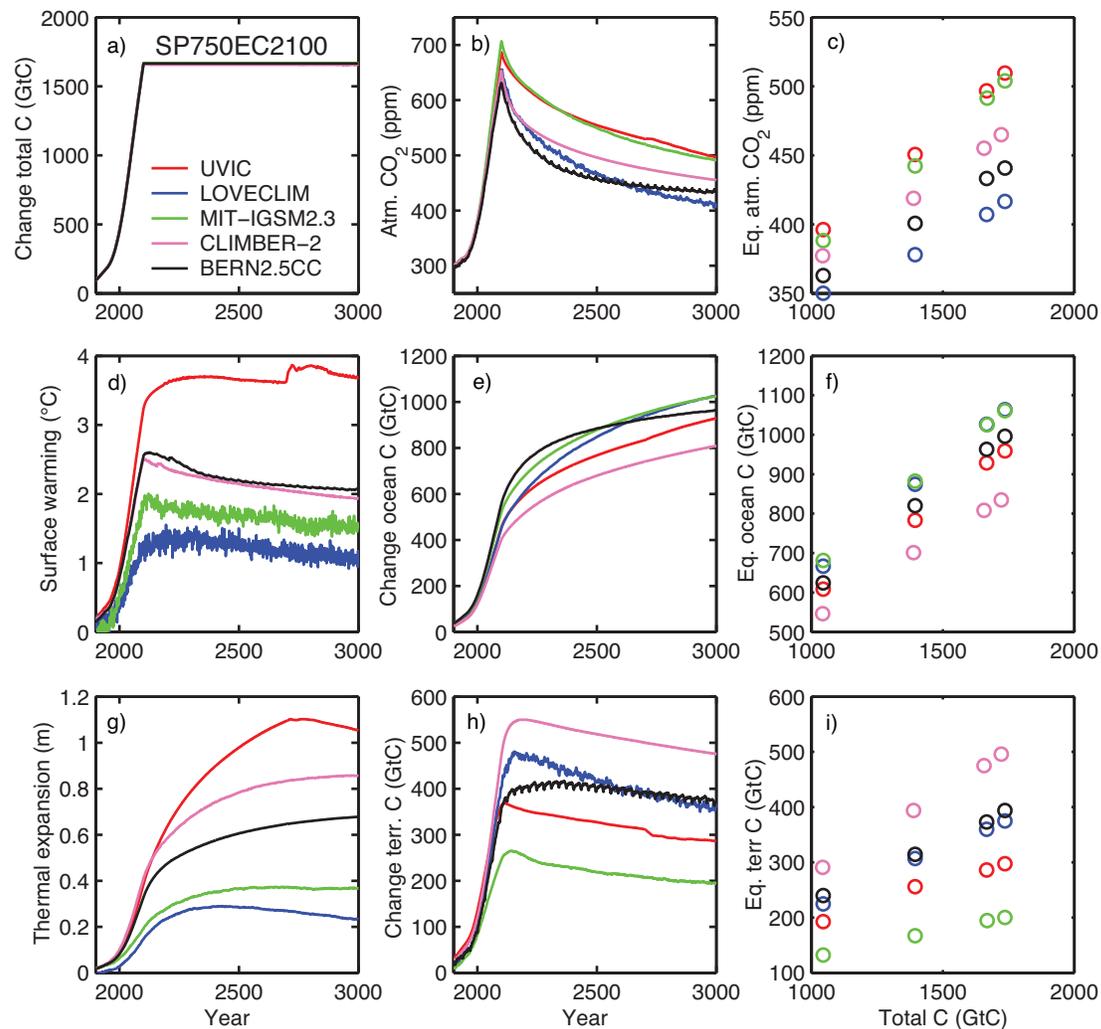

The situation is completely different for the trace gases with a well-defined lifetime. For the illustrative trace gas with a lifetime of the order of a century (e.g., N<sub>2</sub>O), emission reduction of more than 50% is required to stabilise the concentrations close to present-day values (Figure 1b). Constant emission leads to a stabilisation of the concentration within a few centuries.

In the case of the illustrative gas with the short lifetime, the present-day loss is around 70% of the emissions. A reduction in emissions of less than 30% would still produce a short-term increase in concentration in this case, but, in contrast to CO<sub>2</sub>, would lead to stabilisation of its concentration within a couple of decades (Figure 1c). The decrease in the level at which the concentration of such a gas would stabilise is directly proportional to the emission reduction. Thus, in this illustrative example, a reduction in emissions of this trace gas larger than 30% would be required to stabilise concentrations at levels significantly below those at present. A complete cut-off of the emissions would lead to a return to pre-industrial concentrations within less than a century for a trace gas with a lifetime of the order of a decade.

model dependent. In summary, the model results show that 21st-century emissions represent a minimum commitment of climate change for several centuries, irrespective of later emissions. A reduction of this ‘minimum’ commitment is possible only if, in addition to avoiding CO<sub>2</sub> emissions after 2100, CO<sub>2</sub> were actively removed from the atmosphere.

Using a similar approach, Friedlingstein and Solomon (2005) show that even if emissions were immediately cut to zero, the system would continue to warm for several more decades before starting to cool. It is important also to note that ocean heat content and changes in the cryosphere evolve on time scales extending over centuries.

On very long time scales (order several thousand years as estimated by AOGCM experiments, Bi et al., 2001; Stouffer, 2004), equilibrium climate sensitivity is a useful concept to characterise the ultimate response of climate models to different future levels of greenhouse gas radiative forcing. This concept can be applied to climate models irrespective of their complexity. Based on a global energy balance argument, equilibrium climate sensitivity  $S$  and global mean surface temperature increase  $\Delta T$  at equilibrium relative to pre-industrial for an equivalent stable CO<sub>2</sub> concentration are linearly related according to  $\Delta T = S \times \log(\text{CO}_2 / 280 \text{ ppm}) / \log(2)$ , which follows from the definition of climate sensitivity and simplified expressions for the radiative forcing of CO<sub>2</sub> (Section 6.3.5 of the TAR). Because the combination of various lines of modelling results and expert judgement yields a quantified range of climate sensitivity  $S$  (see Box 10.2), this can be carried over to equilibrium temperature increase. Most likely values, and the likely range, as well as a very likely lower bound for the warming, all consistent with the quantified range of  $S$ , are given in Table 10.8.

**Figure 10.35.** Changes in carbon inventories and climate response relative to the pre-industrial period simulated by five different intermediate complexity models (see Table 8.3 for model descriptions) for a scenario where emissions follow a pathway leading to stabilisation of atmospheric CO<sub>2</sub> at 750 ppm, but before reaching this target, emissions are reduced to zero instantly at year 2100. (a) Change in total carbon, (b) atmospheric CO<sub>2</sub>, (d) change in surface temperature, (e) change in ocean carbon, (g) sea level rise from thermal expansion and (h) change in terrestrial carbon. Right column: (c) atmospheric CO<sub>2</sub> and the change in (f) oceanic and (i) terrestrial carbon inventories at year 3000 relative to the pre-industrial period for several emission scenarios of similar shape but with different total carbon emissions.

**Table 10.8.** Best guess (i.e. most likely), likely and very likely bounds/ranges of global mean equilibrium surface temperature increase  $\Delta T(^{\circ}\text{C})$  above pre-industrial temperatures for different levels of CO<sub>2</sub> equivalent concentrations (ppm), based on the assessment of climate sensitivity given in Box 10.2.

Equivalent CO <sub>2</sub>	Best Guess	Very Likely Above	Likely in the Range
350	1.0	0.5	0.6–1.4
450	2.1	1.0	1.4–3.1
550	2.9	1.5	1.9–4.4
650	3.6	1.8	2.4–5.5
750	4.3	2.1	2.8–6.4
1,000	5.5	2.8	3.7–8.3
1,200	6.3	3.1	4.2–9.4

It is emphasized that this table does not contain more information than the best knowledge of  $S$  and that the numbers are not the result of any climate model simulation. Rather it is assumed that the above relationship between temperature increase and CO<sub>2</sub> holds true for the entire range of equivalent CO<sub>2</sub> concentrations. There are limitations to the concept of radiative forcing and climate sensitivity (Senior and Mitchell, 2000; Joshi et al., 2003; Shine et al., 2003; Hansen et al., 2005b). Only a few AOGCMs have been run to equilibrium under elevated CO<sub>2</sub> concentrations, and some results show that nonlinearities in the feedbacks (e.g., clouds, sea ice and snow cover) may cause a time dependence of the effective climate sensitivity and substantial deviations from the linear relation assumed above (Manabe and Stouffer, 1994; Senior and Mitchell, 2000; Voss and Mikolajewicz, 2001; Gregory et al., 2004b), with effective climate sensitivity tending to grow with time in some of the AR4 AOGCMs. Some studies suggest

that climate sensitivities larger than the likely estimate given below (which would suggest greater warming) cannot be ruled out (see Box 10.2 on climate sensitivity).

Another way to address eventual equilibrium temperature for different CO<sub>2</sub> concentrations is to use the projections from the AOGCMs in Figure 10.4, and an idealised 1% yr<sup>-1</sup> CO<sub>2</sub> increase to 4 × CO<sub>2</sub>. The equivalent CO<sub>2</sub> concentrations in the AOGCMs can be estimated from the forcings given in Table 6.14 in the TAR. The actual CO<sub>2</sub> concentrations for A1B and B1 are roughly 715 ppm and 550 ppm (depending on which model is used to convert emissions to concentrations), and equivalent CO<sub>2</sub> concentrations are estimated to be about 835 ppm and 590 ppm, respectively. Using the equation above for an equilibrium climate sensitivity of 3.0°C, eventual equilibrium warming in these experiments would be 4.8°C and 3.3°C, respectively. The multi-model average warming in the AOGCMs at the end of the 21st century (relative to pre-industrial temperature) is 3.1°C and 2.3°C, or about 65 to 70% of the eventual estimated equilibrium warming. Given rates of CO<sub>2</sub> increase of between 0.5 and 1.0% yr<sup>-1</sup> in these two scenarios, this can be compared to the calculated fraction of eventual warming of around 50% in AOGCM experiments with those CO<sub>2</sub> increase rates (Stouffer and Manabe, 1999). The Stouffer and Manabe (1999) model has somewhat higher equilibrium climate sensitivity, and was actually run to equilibrium in a 4-kyr integration to enable comparison of transient and equilibrium warming. Therefore, the AOGCM results combined with the estimated equilibrium warming seem roughly consistent with earlier AOGCM experiments of transient warming rates. Additionally, similar numbers for the 4 × CO<sub>2</sub> stabilisation experiments performed with the AOGCMs can be computed. In that case, the actual and equivalent CO<sub>2</sub> concentrations are the same, since there are no other radiatively active species changing in the models, and the multi-model CO<sub>2</sub> concentration at quadrupling would produce an eventual equilibrium warming of 6°C, where the multi-model average warming at the time of quadrupling is about 4.0°C or 66% of eventual equilibrium. This is consistent with the numbers for the A1B and B1 scenario integrations with the AOGCMs.

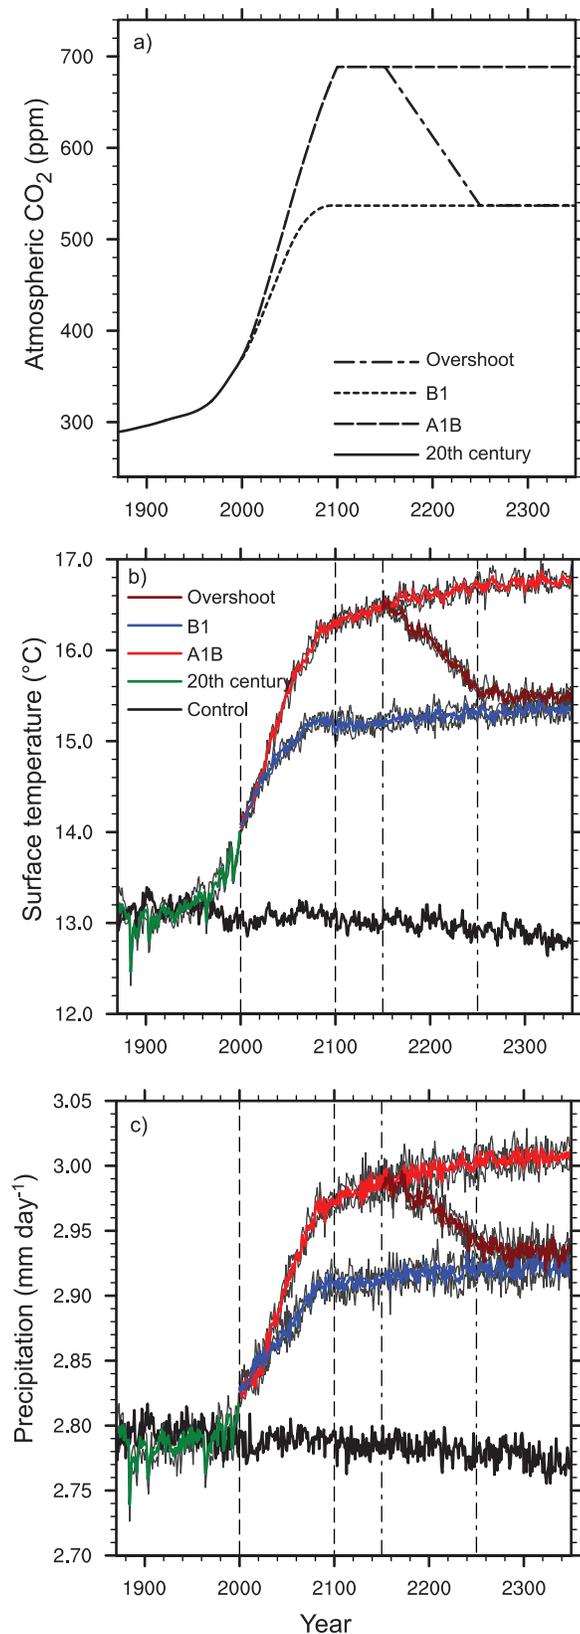

It can be estimated how much closer to equilibrium the climate system is 100 years after stabilisation in these AOGCM experiments. After 100 years of stabilised concentrations, the warming relative to pre-industrial temperature is 3.8°C in A1B and 2.6°C in B1, or about 80% of the estimated equilibrium warming. For the stabilised 4 × CO<sub>2</sub> experiment, after 100 years of stabilised CO<sub>2</sub> concentrations the warming is 4.7°C, or 78% of the estimated equilibrium warming. Therefore, about an additional 10 to 15% of the eventual equilibrium warming is achieved after 100 years of stabilised concentrations (Stouffer, 2004). This emphasizes that the approach to equilibrium takes a long time, and even after 100 years of stabilised atmospheric concentrations, only about 80% of the eventual equilibrium warming is realised.

### 10.7.3 Long-Term Integrations: Idealised Overshoot Experiments

The concept of mitigation related to overshoot scenarios has implications for IPCC Working Groups II and III and was addressed in the Second Assessment Report. A new suite of mitigation scenarios is currently being assessed for the AR4. Working Group I does not have the expertise to assess such scenarios, so this section assesses the processes and response of the physical climate system in a very idealised overshoot experiment. Plausible new mitigation and overshoot scenarios will be run subsequently by modelling groups and assessed in the next IPCC report.

An idealised overshoot scenario has been run in an AOGCM where the CO<sub>2</sub> concentration decreases from the A1B stabilised level to the B1 stabilised level between 2150 and 2250, followed by 200 years of integration with that constant B1 level (Figure 10.36a). This reduction in CO<sub>2</sub> concentration would require large reductions in emissions, but such an idealised experiment illustrates the processes involved in how the climate system would respond to such a large change in emissions and concentrations. Yoshida et al. (2005) and Tsutsui et al. (2007) show that there is a relatively fast response in the surface and upper ocean, which start to recover to temperatures at the B1 level after several decades, but a much more sluggish response with more commitment in the deep ocean. As shown in Figure 10.36b and c, the overshoot scenario temperatures only slowly decrease to approach the lower temperatures of the B1 experiment, and continue a slow convergence that has still not cooled to the B1 level at the year 2350, or 100 years after the CO<sub>2</sub> concentration in the overshoot experiment was reduced to equal the concentration in the B1 experiment. However, Dai et al. (2001a) show that reducing emissions to achieve a stabilised CO<sub>2</sub> concentration in the 21st century reduces warming moderately (less than 0.5°C) by the end of the 21st century in comparison to a business-as-usual scenario, but the warming reduction is about 1.5°C by the end of the 22nd century in that experiment. Other climate system responses include the North Atlantic MOC and sea ice volume that almost recover to the B1 level in the overshoot scenario experiment, except for a significant hysteresis effect that is shown in the sea level change due to thermal expansion (Yoshida et al., 2005; Nakashiki et al., 2006).

Such stabilisation and overshoot scenarios have implications for risk assessment as suggested by Yoshida et al. (2005) and others. For example, in a probabilistic study using an SCM and multi-gas scenarios, Meinshausen (2006) estimated that the probability of exceeding a 2°C warming is between 68 and 99% for a stabilisation of equivalent CO<sub>2</sub> at 550 ppm. They also considered scenarios with peaking CO<sub>2</sub> and subsequent stabilisation at lower levels as an alternative pathway and found that if the risk of exceeding a warming of 2°C is not to be greater than 30%, it is necessary to peak equivalent CO<sub>2</sub> concentrations around 475 ppm before returning to lower concentrations of about 400 ppm. These overshoot and targeted climate change estimations take into account the climate change commitment

**Figure 10.36.** (a) Atmospheric CO<sub>2</sub> concentrations for several experiments simulated with an AOGCM; (b) globally averaged surface air temperatures for the overshoot scenario and the A1B and B1 experiments; (c) same as in (b) but for globally averaged precipitation rate. Modified from Yoshida et al. (2005).

in the system that must be overcome on the time scale of any overshoot or emissions target calculation. The probabilistic studies also show that when certain thresholds of climate change are to be avoided, emission pathways depend on the certainty requested of not exceeding the threshold.

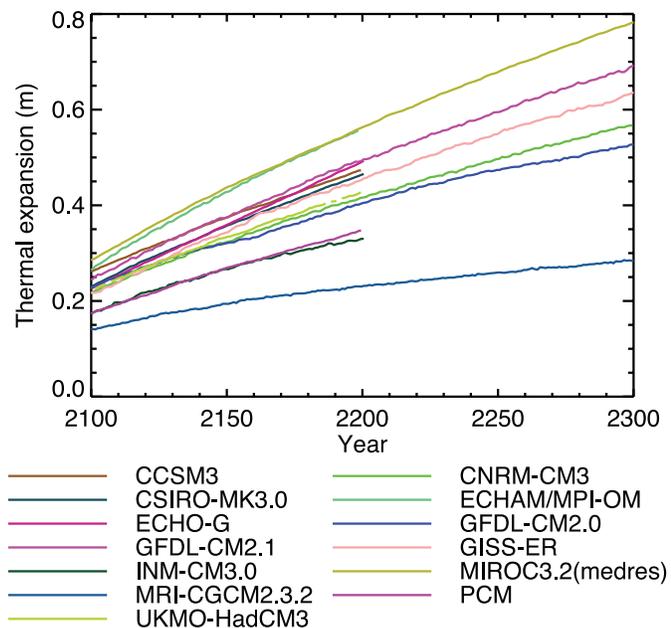

Earth System Models of Intermediate Complexity have been used to calculate the long-term climate response to stabilisation of atmospheric CO<sub>2</sub>, although EMICs have not been adjusted to take into account the full range of AOGCM sensitivities. The newly developed stabilisation profiles were constructed following Enting et al. (1994) and Wigley et al. (1996) using the most recent atmospheric CO<sub>2</sub> observations, CO<sub>2</sub> projections with the BERN-CC model (Joos et al., 2001) for the A1T scenario over the next few decades, and a ratio of two polynomials (Enting et al., 1994) leading to stabilisation at levels of 450, 550, 650, 750 and 1,000 ppm atmospheric CO<sub>2</sub> equivalent. Other forcings are not considered. Supplementary Material, Figure S10.4a shows the equilibrium surface warming for seven different EMICs and six stabilisation levels. Model differences arise mainly from the models having different climate sensitivities.

Knutti et al. (2005) explore this further with an EMIC using several published PDFs of climate sensitivity and different ocean heat uptake parametrizations and calculate probabilities of not overshooting a certain temperature threshold given an equivalent CO<sub>2</sub> stabilisation level (Supplementary Material, Figure S10.4b). This plot illustrates, for example, that for low values of stabilised CO<sub>2</sub>, the range of response of possible warming is smaller than for high values of stabilised CO<sub>2</sub>. This is because with greater CO<sub>2</sub> forcing, there is a greater spread of outcomes as illustrated in Figure 10.26. Figure S10.4b also shows that for any given temperature threshold, the smaller the desired probability of exceeding the target is, the lower the stabilisation level that must be chosen. Stabilisation of atmospheric greenhouse gases below about 400 ppm CO<sub>2</sub> equivalent is required to keep the global temperature increase likely less than 2°C above pre-industrial temperature (Knutti et al., 2005).

## 10.7.4 Commitment to Sea Level Rise

### 10.7.4.1 Thermal Expansion

The sea level rise commitment due to thermal expansion has much longer time scales than the surface warming commitment, owing to the slow processes that mix heat into the deep ocean (Church et al., 2001). If atmospheric composition were stabilised at A1B levels in 2100, thermal expansion in the 22nd century would be similar to in the 21st (see, e.g., Section 10.6.1; Meehl et al., 2005c), reaching 0.3 to 0.8 m by 2300 (Figure 10.37). The ranges of thermal expansion overlap substantially for stabilisation at different levels, since model uncertainty is dominant; A1B is given here because results are available from more models for this scenario than for other scenarios. Thermal expansion would continue over many centuries at a gradually decreasing rate (Figure 10.34). There is a wide spread among

**Figure 10.37.** Globally averaged sea level rise from thermal expansion relative to the period 1980 to 1999 for the A1B commitment experiment calculated from AOGCMs. See Table 8.1 for model details.

the models for the thermal expansion commitment at constant composition due partly to climate sensitivity, and partly to differences in the parametrization of vertical mixing affecting ocean heat uptake (e.g., Weaver and Wiebe, 1999). If there is deep-water formation in the final steady state as in the present day, the ocean will eventually warm up fairly uniformly by the amount of the global average surface temperature change (Stouffer and Manabe, 2003), which would result in about 0.5 m of thermal expansion per degree celsius of warming, calculated from observed climatology; the EMICs in Figure 10.34 indicate 0.2 to 0.6 m °C<sup>-1</sup> for their final steady state (year 3000) relative to 2000. If deep-water formation is weakened or suppressed, the deep ocean will warm up more (Knutti and Stocker, 2000). For instance, in the 3 × CO<sub>2</sub> experiment of Bi et al. (2001) with the CSIRO AOGCM, both North Atlantic Deep Water and Antarctic Bottom Water formation cease, and the steady-state thermal expansion is 4.5 m. Although these commitments to sea level rise are large compared with 21st-century changes, the eventual contributions from the ice sheets could be larger still.

#### 10.7.4.2 Glaciers and Ice Caps

Steady-state projections for G&IC require a model that evolves their area-altitude distribution (see, e.g., Section 10.6.3.3). Little information is available on this. A comparative study including seven GCM simulations at 2 × CO<sub>2</sub> conditions inferred that many glaciers may disappear completely due to an increase of the equilibrium line altitude (Bradley et al., 2004), but even in a warmer climate, some glacier volume may persist at high altitude. With a geographically uniform warming relative to 1900 of 4°C maintained after 2100, about 60% of G&IC volume would vanish by 2200 and practically all by 3000

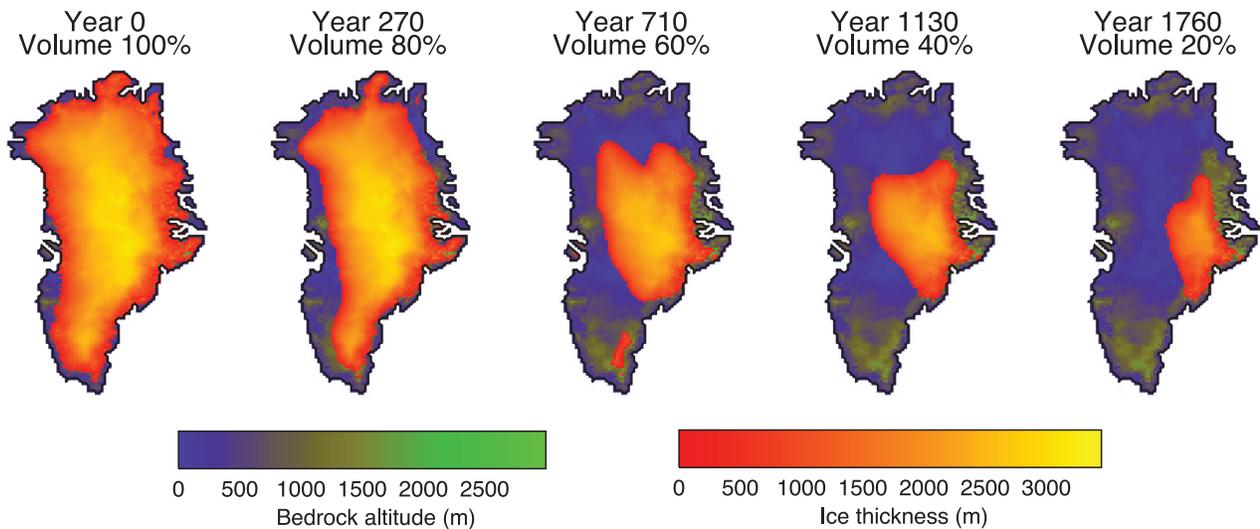

(Raper and Braithwaite, 2006). Nonetheless, this commitment to sea level rise is relatively small (<1 m; Table 4.4) compared with those from thermal expansion and ice sheets.

#### 10.7.4.3 Greenland Ice Sheet

The present SMB of Greenland is a net accumulation estimated as 0.6 mm yr<sup>-1</sup> of sea level equivalent from a compilation of studies (Church et al., 2001) and 0.47 mm yr<sup>-1</sup> for 1988 to 2004 (Box et al., 2006). In a steady state, the net accumulation would be balanced by calving of icebergs. General Circulation Models suggest that ablation increases more rapidly than accumulation with temperature (van de Wal et al., 2001; Gregory and Huybrechts, 2006), so warming will tend to reduce the SMB, as has been observed in recent years (see Section 4.6.3), and is projected for the 21st century (Section 10.6.4.1). Sufficient warming will reduce the SMB to zero. This gives a threshold for the long-term viability of the ice sheet because negative SMB means that the ice sheet must contract even if ice discharge has ceased owing to retreat from the coast. If a warmer climate is maintained, the ice sheet will eventually be eliminated, except perhaps for remnant glaciers in the mountains, raising sea level by about 7 m (see Table 4.1). Huybrechts et al. (1991) evaluated the threshold as 2.7°C of seasonally and geographically uniform warming over Greenland relative to a steady state (i.e. pre-industrial temperature). Gregory et al. (2004a) examine the probability of this threshold being reached under various CO<sub>2</sub> stabilisation scenarios for 450 to 1000 ppm using TAR projections, and find that it was exceeded in 34 out of 35 combinations of AOGCM and CO<sub>2</sub> concentration considering seasonally uniform warming, and 24 out of 35 considering summer warming and using an upper bound on the threshold.

Assuming the warming to be uniform underestimates the threshold, because warming is projected by GCMs to be weaker in the ablation area and in summer, when ablation occurs. Using geographical and seasonal patterns of simulated temperature change derived from a combination of four high-resolution AGCM simulations and 18 AR4 AOGCMs raises the threshold to 3.2°C to 6.2°C in annual- and area-average warming in Greenland, and 1.9°C to 4.6°C in the global average (Gregory and Huybrechts, 2006), relative to pre-industrial temperatures. This is likely to be reached by 2100 under the SRES A1B scenario, for instance (Figure 10.29). These results are supported by evidence from the last interglacial, when the temperature in Greenland was 3°C to 5°C warmer than today and the ice sheet survived, but may have been smaller by 2 to 4 m in sea level equivalent (including contributions from arctic ice caps, see Section 6.4.3). However, a lower threshold of 1°C (Hansen, 2005) in global warming above present-day temperatures has also been suggested, on the basis that global mean (rather than Greenland) temperatures during previous interglacials exceeded today's temperatures by no more than that.

For stabilisation in 2100 with SRES A1B atmospheric composition, Greenland would initially contribute 0.3 to

**Figure 10.38.** Evolution of Greenland surface elevation and ice sheet volume versus time in the experiment of Ridley et al. (2005) with the UKMO-HadCM3 AOGCM coupled to the Greenland Ice Sheet model of Huybrechts and De Wolde (1999) under a climate of constant quadrupled pre-industrial atmospheric  $\text{CO}_2$ .

$2.1 \text{ mm yr}^{-1}$  to sea level (Table 10.7). The greater the warming, the faster the loss of mass. Ablation would be further enhanced by the lowering of the surface, which is not included in the calculations in Table 10.7. To include this and other climate feedbacks in calculating long-term rates of sea level rise requires coupling an ice sheet model to a climate model. Ridley et al. (2005) couple the Greenland Ice Sheet model of Huybrechts and De Wolde (1999) to the UKMO-HadCM3 AOGCM. Under constant  $4 \times \text{CO}_2$ , the sea level contribution is  $5.5 \text{ mm yr}^{-1}$  over the first 300 years and declines as the ice sheet contracts; after 1 kyr only about 40% of the original volume remains and after 3 kyr only 4% (Figure 10.38). The rate of deglaciation would increase if ice flow accelerated, as in recent years (Section 4.6.3.3). Basal lubrication due to surface melt water might cause such an effect (see Section 10.6.4.2). The best estimate of Parizek and Alley (2004) is that this could add an extra 0.15 to 0.40 m to sea level by 2500, compared with 0.4 to 3.2 m calculated by Huybrechts and De Wolde (1999) without this effect. The processes whereby melt water might penetrate through subfreezing ice to the bed are unclear and only conceptual models exist at present (Alley et al., 2005b).

Under pre-industrial or present-day atmospheric  $\text{CO}_2$  concentrations, the climate of Greenland would be much warmer without the ice sheet, because of lower surface altitude and albedo, so it is possible that Greenland deglaciation and the resulting sea level rise would be irreversible. Toniazzo et al. (2004) find that snow does not accumulate anywhere on an ice-free Greenland with pre-industrial atmospheric  $\text{CO}_2$ , whereas Lunt et al. (2004) obtain a substantial regenerated ice sheet in east and central Greenland using a higher-resolution model.

#### 10.7.4.4 Antarctic Ice Sheet

With rising global temperature, GCMs indicate increasingly positive SMB for the Antarctic Ice Sheet as a whole because

of greater accumulation (Section 10.6.4.1). For stabilisation in 2100 with SRES A1B atmospheric composition, antarctic SMB would contribute 0.4 to  $2.0 \text{ mm yr}^{-1}$  of sea level fall (Table 10.7). Continental ice sheet models indicate that this would be offset by tens of percent by increased ice discharge (Section 10.6.4.2), but still give a negative contribution to sea level, of  $-0.8 \text{ m}$  by 3000 in one simulation with antarctic warming of about  $4.5^\circ\text{C}$  (Huybrechts and De Wolde, 1999).

However, discharge could increase substantially if buttressing due to the major West Antarctic ice shelves were reduced (see Sections 4.6.3.3 and 10.6.4.2), and could outweigh the accumulation increase, leading to a net positive antarctic sea level contribution in the long term. If the Amundsen Sea sector were eventually deglaciated, it would add about 1.5 m to sea level, while the entire West Antarctic Ice Sheet (WAIS) would account for about 5 m (Vaughan, 2007). Contributions could also come in this manner from the limited marine-based portions of East Antarctica that discharge into large ice shelves.

Weakening or collapse of the ice shelves could be caused either by surface melting or by thinning due to basal melting. In equilibrium experiments with mixed-layer ocean models, the ratio of antarctic to global annual warming is  $1.4 \pm 0.3$ . Following reasoning in Section 10.6.4.2 and Appendix 10.A, it appears that mean summer temperatures over the major West Antarctic ice shelves are about as likely as not to pass the melting point if global warming exceeds  $5^\circ\text{C}$ , and disintegration might be initiated earlier by surface melting. Observational and modelling studies indicate that basal melt rates depend on water temperature near to the base, with a constant of proportionality of about  $10 \text{ m yr}^{-1} \text{ }^\circ\text{C}^{-1}$  indicated for the Amundsen Sea ice shelves (Rignot and Jacobs, 2002; Shepherd et al., 2004) and 0.5 to  $10 \text{ m yr}^{-1} \text{ }^\circ\text{C}^{-1}$  for the Amery ice shelf (Williams et al., 2002). If this order of magnitude applies to future changes, a warming of about  $1^\circ\text{C}$  under the major ice shelves would eliminate them within centuries. We are not able to relate this

quantitatively to global warming with any confidence, because the issue has so far received little attention, and current models may be inadequate to treat it because of limited resolution and poorly understood processes. Nonetheless, it is reasonable to suppose that sustained global warming would eventually lead to warming in the seawater circulating beneath the ice shelves.

Because the available models do not include all relevant processes, there is much uncertainty and no consensus about what dynamical changes could occur in the Antarctic Ice Sheet (see, e.g., Vaughan and Spouge, 2002; Alley et al., 2005a). One line of argument is to consider an analogy with palaeoclimate (see Box 4.1). Palaeoclimatic evidence that sea level was 4 to 6 m above present during the last interglacial may not all be explained by reduction in the Greenland Ice Sheet, implying a contribution from the Antarctic Ice Sheet (see Section 6.4.3). On this basis, using the limited available evidence, sustained global warming of 2°C (Oppenheimer and Alley, 2005) above present-day temperatures has been suggested as a threshold beyond which there will be a commitment to a large sea level contribution from the WAIS. The maximum rates of sea level rise during previous glacial terminations were of the order of 10 mm yr<sup>-1</sup> (Church et al., 2001). We can be confident that future accelerated discharge from WAIS will not exceed this size, which is roughly an order of magnitude increase in present-day WAIS discharge, since no observed recent acceleration has exceeded a factor of ten.

Another line of argument is that there is insufficient evidence that rates of dynamical discharge of this magnitude could be sustained over long periods. The WAIS is 20 times smaller than the LGM NH ice sheets that contributed most of the melt water during the last deglaciation at rates that can be explained by surface melting alone (Zweck and Huybrechts, 2005). In the study of Huybrechts and De Wolde (1999), the largest simulated rate of sea level rise from the Antarctic Ice Sheet over the next 1 kyr is 2.5 mm yr<sup>-1</sup>. This is dominated by dynamical discharge associated with grounding line retreat. The model did not simulate ice streams, for which widespread acceleration would give larger rates. However, the maximum loss of ice possible from rapid discharge of existing ice streams is the volume in excess of flotation in the regions occupied by these ice streams (defined as regions of flow exceeding 100 m yr<sup>-1</sup>; see Section 10.6.4.2). This volume (in both West and East Antarctica) is 230,000 km<sup>3</sup>, equivalent to about 0.6 m of sea level, or about 1% of the mass of the Antarctic Ice Sheet, most of which does not flow in ice streams. Loss of ice affecting larger portions of the ice sheet could be sustained at rapid rates only if new ice streams developed in currently slow-moving ice. The possible extent and rate of such changes cannot presently be estimated, since there is only very limited understanding of controls on the development and variability of ice streams. In this argument, rapid discharge may be transient and the long-term sign of the antarctic contribution to sea level depends on whether increased accumulation is more important than large-scale retreat of the grounding line.

## Appendix 10.A: Methods for Sea Level Projections for the 21st Century

### 10.A.1 Scaling MAGICC Results

The MAGICC SCM was tuned to emulate global average surface air temperature change and radiative flux at the top of the atmosphere (assumed equal to ocean heat uptake on decadal time scales; Section 5.2.2.3 and Figure 5.4) simulated by each of 19 AOGCMs in scenarios with CO<sub>2</sub> increasing at 1% yr<sup>-1</sup> (Section 10.5.3). Under SRES scenarios for which AOGCMs have been run (B1, A1B and A2), the ensemble average of the tuned versions of MAGICC gives about 10% greater temperature rise and 25% more thermal expansion over the 21st century (2090 to 2099 minus 1980 to 1999) than the average of the corresponding AOGCMs. The MAGICC radiative forcing is close to that of the AOGCMs (as estimated for A1B by Forster and Taylor, 2006), so the mismatch suggests there may be structural limitations on the accurate emulation of AOGCMs by the SCM. We therefore do not use the tuned SCM results directly to make projections, unlike in the TAR. The TAR model means for thermal expansion were 0.06–0.10 m larger than the central estimates in Table 10.7, probably because the simple climate model used in the TAR overestimated the TAR AOGCM results.

The SCM may nonetheless be used to estimate results for scenarios that have not been run in AOGCMs, by calculating time-dependent ratios between pairs of scenarios (Section 10.5.4.6). This procedure is supported by the close match between the ratios derived from the AOGCM and MAGICC ensemble averages under the scenarios for which AOGCMs are available. Applying the MAGICC ratios to the A1B AOGCM results yields estimates of temperature rise and thermal expansion for B1 and A2 differing by less than 5% from the AOGCM ensemble averages. We have high confidence that the procedure will yield similarly accurate estimates for the results that the AOGCMs would give under scenarios B2, A1T and A1FI.

The spread of MAGICC models is much narrower than the AOGCM ensemble because the AOGCMs have internally generated climate variability and a wider range of forcings. We assume inter-model standard deviations of 20% of the model average for temperature rise and 25% for thermal expansion, since these proportions are found to be fairly time and scenario independent in the AOGCM ensemble.

### 10.A.2 Mass Balance Sensitivity of Glaciers and Ice Caps

A linear relationship  $r_g = b_g \times (T - T_0)$  is found for the period 1961 to 2003 between the observational time series of the contribution  $r_g$  to the rate of sea level rise from the world's glaciers and ice caps (G&IC, excluding those on Antarctica and Greenland; Section 4.5.2, Figure 4.14) and global average

surface air temperature  $T$  (Hadley Centre/Climatic Research Unit gridded surface temperature dataset HadCRUT3; Section 3.2.2.4, Figure 3.6), where  $b_g$  is the global total G&IC mass balance sensitivity and  $T_0$  is the global average temperature of the climate in which G&IC are in a steady state,  $T$  and  $T_0$  being expressed relative to the average of 1865 to 1894. The correlation coefficient is 0.88. Weighted least-squares regression gives a slope  $b_g = 0.84 \pm 0.15$  (one standard deviation) mm yr<sup>-1</sup> °C<sup>-1</sup>, with  $T_0 = -0.13$ °C. Surface mass balance models driven with climate change scenarios from AOGCMs (Section 10.6.3.1) also indicate such a linear relationship, but the model results give a somewhat lower  $b_g$  of around 0.5 to 0.6 mm yr<sup>-1</sup> °C<sup>-1</sup> (Section 10.6.3.1). To cover both observations and models, we adopt a value of  $b_g = 0.8 \pm 0.2$  (one standard deviation) mm yr<sup>-1</sup> °C<sup>-1</sup>. This uncertainty of  $\pm 25\%$  is smaller than that of  $\pm 40\%$  used in the TAR because of the improved observational constraint now available. To make projections, we choose a set of values of  $b_g$  randomly from a normal distribution. We use  $T_0 = T - r_g/b_g$ , where  $T = 0.40$  °C and  $r_g = 0.45$  mm yr<sup>-1</sup>, are the averages over the period 1961 to 2003. This choice of  $T_0$  minimises the root mean square difference of the predicted  $r_g$  from the observed, and gives  $T_0$  in the range  $-0.5$ °C to  $0.0$ °C (5 to 95%). Note that a constant  $b_g$  is not expected to be a good approximation if glacier area changes substantially (see Section 10.A.3).

### 10.A.3 Area Scaling of Glaciers and Ice Caps

Model results using area-volume scaling of G&IC (Section 10.6.3.2) are approximately described by the relations  $b_g / b_1 = (A_g / A_1)^{1.96}$  and  $A_g / A_1 = (V_g / V_1)^{0.84}$ , where  $A_g$  and  $V_g$  are the global G&IC area and volume (excluding those on Greenland and Antarctica) and variable  $X_i$  is the initial value of  $X_g$ . The first relation describes how total SMB sensitivity declines as the most sensitive areas are ablated most rapidly. The second relation follows Wigley and Raper (2005) in its form, and describes how area declines as volume is lost, with  $dV_g / dt = -r_g$  (expressing  $V$  as sea level equivalent, i.e., the liquid-water-equivalent volume of ice divided by the surface area of the world ocean). Projections are made starting from 1990 using  $T$  from Section 10.A.1 with initial values of the present-day  $b_g$  from Section 10.A.2 and the three recent estimates  $V_g = 0.15, 0.24$  and  $0.37$  m from Table 4.4, which are assumed equally likely. We use  $T = 0.48$ °C at 1990 relative to 1865 to 1894, and choose  $T_0$  as in Section 10.A.2. An uncertainty of 10% (one standard deviation) is assumed because of the scaling relations. The results are multiplied by 1.2 (Section 10.6.3.3) to include contributions from G&IC on Greenland and Antarctica (apart from the ice sheets). These scaling relations are expected to give a decreasingly adequate approximation as greater area and volume is lost, because they do not model hypsometry explicitly; they predict that  $V$  will tend eventually to zero in any steady-state warmer climate, for instance, although this is not necessarily the case. A similar scaling procedure was used in the TAR. Current estimates of present-day G&IC mass are smaller than those used in the TAR, leading to more rapid wastage of

area. Hence, the central estimates for the G&IC contribution to sea level rise in Table 10.7 are similar to those in the TAR, despite our use of a larger mass balance sensitivity (Section 10.A.2).

#### 10.A.4 Changes in Ice Sheet Surface Mass Balance

Quadratic fits are made to the results of Gregory and Huybrechts (2006) (Section 10.6.4.1) for the SMB change of each ice sheet as a function of global average temperature change relative to a steady state, which is taken to be the late 19th century (1865–1894). The spread of results for the various models used by Gregory and Huybrechts represents uncertainty in the patterns of temperature and precipitation change. The Greenland contribution has a further uncertainty of 20% (one standard deviation) from the ablation calculation. The Antarctic SMB projections are similar to those of the TAR, while the Greenland SMB projections are larger by 0.01–0.04 m because of the use of a quadratic fit to temperature change rather than the constant sensitivity of the TAR, which gave an underestimate for larger warming.

#### 10.A.5 Changes in Ice Sheet Dynamics

Topographic and dynamic changes that can be simulated by currently available ice flow models are roughly represented as modifying the sea level changes due to SMB change by  $-5\% \pm 5\%$  from Antarctica, and  $0\% \pm 10\%$  from Greenland ( $\pm$  one standard deviation) (Section 10.6.4.2).

The contribution from scaled-up ice sheet discharge, given as an illustration of the effect of accelerated ice flow (Section 10.6.5), is calculated as  $r_1 \times T / T_1$ , with  $T$  and  $T_1$  expressed relative to the 1865 to 1894 average, where  $r_1 = 0.32 \text{ mm yr}^{-1}$  is an estimate of the contribution during 1993 to 2003 due to recent acceleration and  $T_1 = 0.63^\circ\text{C}$  is the global average temperature during that period.

#### 10.A.6 Combination of Uncertainties

For each scenario, time series of temperature rise and the consequent land ice contributions to sea level are generated using a Monte Carlo simulation (van der Veen, 2002). Temperature rise and thermal expansion have some correlation for a given scenario in AOGCM results (Section 10.6.1). In the Monte Carlo simulation, we assume them to be perfectly correlated; by correlating the uncertainties in the thermal expansion and land ice contributions, this increases the resulting uncertainty in the sea level rise projections. However, the uncertainty in the projections of the land ice contributions is dominated by the various uncertainties in the land ice models themselves (Sections 10.A.2–4) rather than in the temperature projections. We assume the uncertainties in land ice models and temperature projections to be uncorrelated. The procedure used in the TAR, however, effectively assumed the land ice model uncertainty

to be correlated with the temperature and expansion projection uncertainty. This is the main reason why the TAR ranges for sea level rise under each of the scenarios are wider than those of Table 10.7. Also, the TAR gave uncertainty ranges of  $\pm 2$  standard deviations, whereas the present report gives  $\pm 1.65$  standard deviations (5 to 95%).

#### 10.A.7 Change in Surface Air Temperature Over the Major West Antarctic Ice Shelves

The mean surface air temperature change over the area of the Ross and Filchner-Ronne ice shelves in December and January, divided by the mean annual antarctic surface air temperature change, is  $F_1 = 0.62 \pm 0.48$  (one standard deviation) on the basis of the climate change simulations from the four high-resolution GCMs used by Gregory and Huybrechts (2006). From AR4 AOGCMs, the ratio of mean annual antarctic temperature change to global mean temperature change is  $F_2 = 1.1 \pm 0.2$  (one standard deviation) under SRES scenarios with stabilisation beyond 2100 (Gregory and Huybrechts, 2006), while from AR4 AGCMs coupled to mixed-layer ocean models it is  $F_2 = 1.4 \pm 0.2$  (one standard deviation) at equilibrium under doubled  $\text{CO}_2$ . To evaluate the probability of ice shelf mean summer temperature increase exceeding a particular value, given the global temperature rise, a Monte Carlo distribution of  $F_1 \times F_2$  is used, generated by assuming the two factors to be normal and independent random variables. Since this procedure is based on a small number of models, and given other caveats noted in Sections 10.6.4.2 and 10.7.4.4, we have low confidence in these probabilities.

### *Details of data preparation for runoff and soil moisture plots (Fig. 10.12)*

For both these land quantities a technique was used to allow improved presentation of the simulated data, particularly at coasts. The basic method was previously used for the soil moisture plot of the Working Group I contribution to the IPCC Second Assessment Report (Figure 6.12). Firstly, for each model, each climatological field was tested for data that were clearly invalid, including missing values over ocean and ice sheets. Data outside the range  $10^{-12}$  and  $0.001 \text{ kg m}^{-2} \text{ s}^{-1}$  for runoff, and  $10^{-4}$  and  $3000 \text{ kg m}^{-2}$  for soil moisture, were set to a missing value. The field was then interpolated to a finer grid with halved spacing, letting valid data extend to the original coastlines. The resulting field from each model was then interpolated to a common fine grid. At each point, a simple average was then used, provided there were valid data from at least 10 models. This produced a field with data for most of the true land, and excluding permanent ice sheets in the case of soil moisture. Land with seasonal cover may still be poorly represented by this process. For soil moisture the field plotted was the change as a percentage of the multi-model mean for 1980-1999. In effect, the changes were biased towards those in models with a greater depth of soil, but this is not unreasonable given that these are likely more sophisticated schemes. Averaging the individual percentage changes produced a noisier field. The use of normalised soil moisture changes by Wang (2005) is a worthy alternative.

**Table S10.1.** Models used in constructing multi-model means shown in figures in Section 10.3. Letters below figure numbers refer either to the SRES scenario considered or to the panel within the figure.

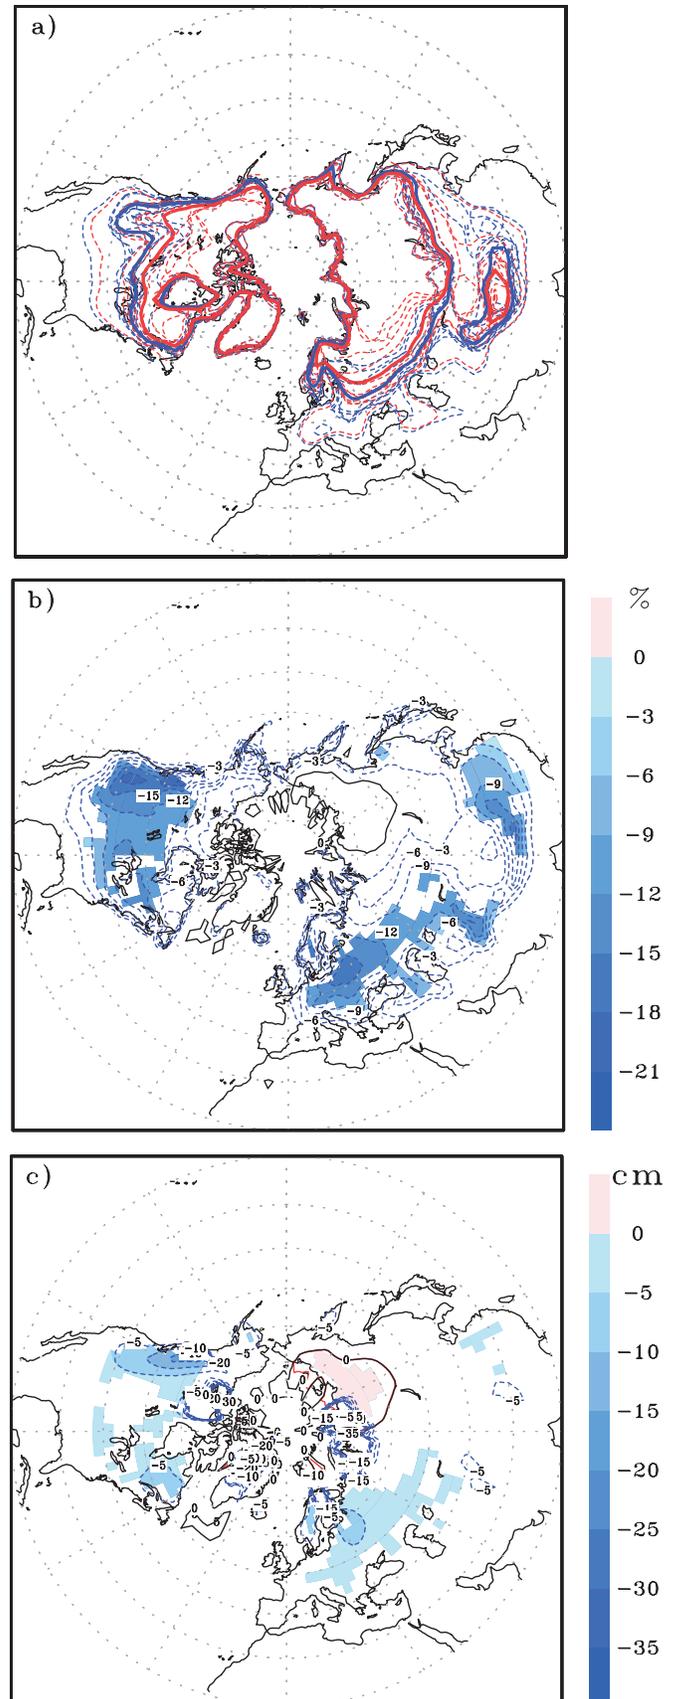

Figure 10.11b: diurnal temperature range

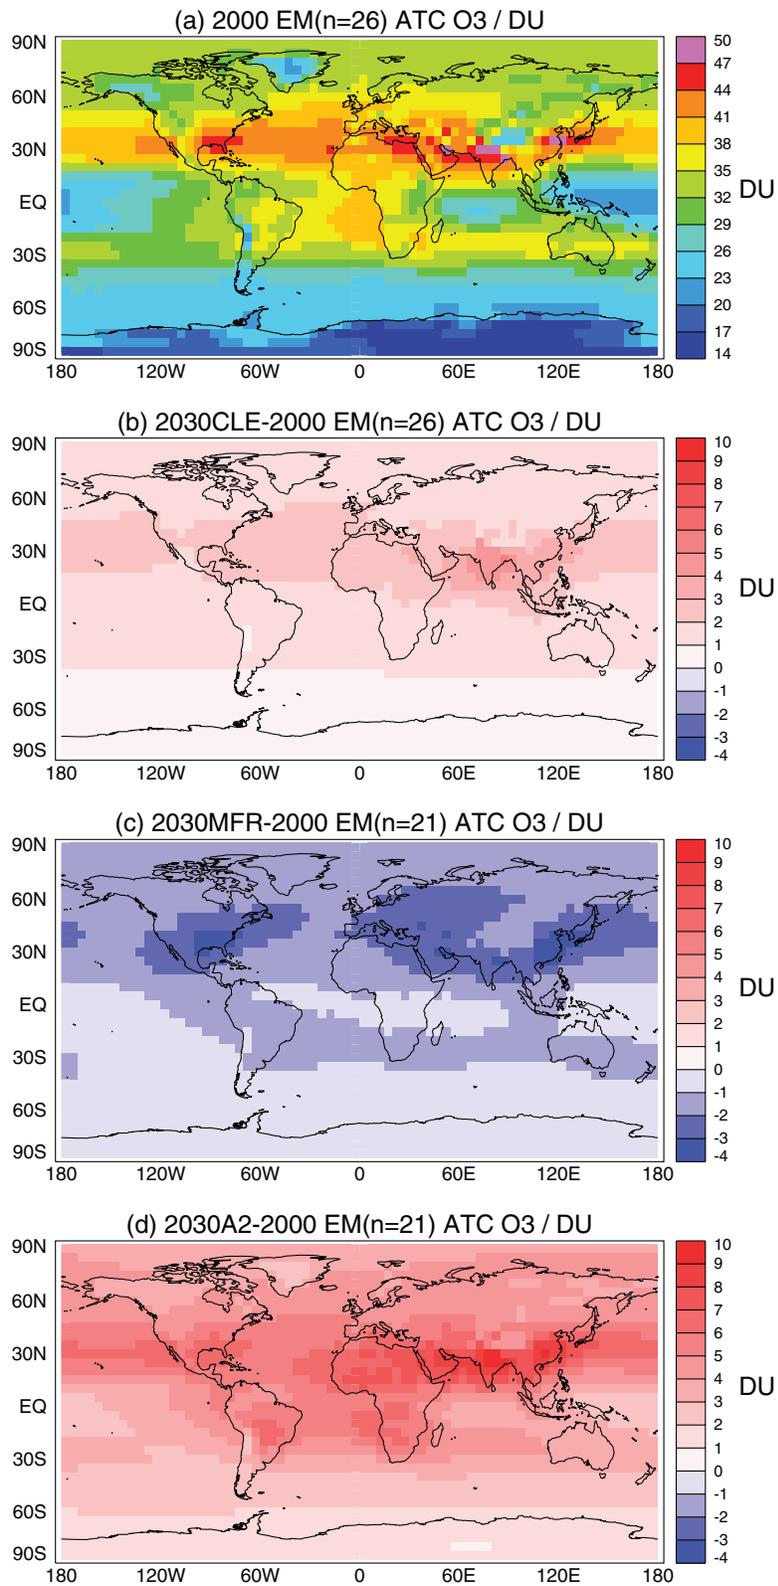

Figure 10.12: precipitation, soil moisture, runoff, evaporation

**Table S10.2.** Global mean change in annual mean precipitation from the multi-model ensemble mean for four time periods relative to 1980–1999, for each of the available scenarios. Values are given as a percentage of the global mean for 1980–1999 (2.83 mm d<sup>-1</sup>), divided by the global mean warming for each case (Table 10.5). (The data are averages of the series depicted in Fig. 10.5.) Also given are two measures of agreement of the geographic scaled patterns of change (the precipitation fields normalised by the global mean warming), relative to the A1B 2080–2099 case. First the non-dimensional *M* value (see text, and caption to Table 10.5), and second (in italics) the mae (global mean absolute ‘error’ or difference, in mm d<sup>-1</sup> K<sup>-1</sup>) between the fields, both multiplied by 100 for brevity. ‘Commit’ refers to the constant-composition commitment experiment.

	Global mean rainfall change (scaled, % K <sup>-1</sup> )				Measures of agreement of scaled field ( <i>M</i> × 100 n.d., mae × 100 mm d <sup>-1</sup> K <sup>-1</sup> )			
	2011– 2030	2046– 2065	2080– 2099	2180– 2199	2011– 2030	2046– 2065	2080– 2099	2180– 2199

## Executive summary

Climate change will lead to changes in geophysical, biological and socio-economic systems. An impact describes a specific change in a system caused by its exposure to climate change. Impacts may be judged to be harmful or beneficial. Vulnerability to climate change is the degree to which these systems are susceptible to, and unable to cope with, adverse impacts. The concept of risk, which combines the magnitude of the impact with the probability of its occurrence, captures uncertainty in the underlying processes of climate change, exposure, impacts and adaptation. [19.1.1]

Many of these impacts, vulnerabilities and risks merit particular attention by policy-makers due to characteristics that might make them 'key'. The identification of potential key vulnerabilities is intended to provide guidance to decision-makers for identifying levels and rates of climate change that may be associated with 'dangerous anthropogenic interference' (DAI) with the climate system, in the terminology of United Nations Framework Convention on Climate Change (UNFCCC) Article 2 (see Box 19.1). Ultimately, the definition of DAI cannot be based on scientific arguments alone, but involves other judgements informed by the state of scientific knowledge. No single metric can adequately describe the diversity of key vulnerabilities, nor determine their ranking. [19.1.1]

This chapter identifies seven criteria from the literature that may be used to identify key vulnerabilities, and then describes some potential key vulnerabilities identified using these criteria. The criteria are [19.2]:

- magnitude of impacts,
- timing of impacts,
- persistence and reversibility of impacts,
- likelihood (estimates of uncertainty) of impacts and vulnerabilities and confidence in those estimates
- potential for adaptation
- distributional aspects of impacts and vulnerabilities
- importance of the system(s) at risk.

Key vulnerabilities are associated with many climate-sensitive systems, including food supply, infrastructure, health, water resources, coastal systems, ecosystems, global biogeochemical cycles, ice sheets and modes of oceanic and atmospheric circulation. [19.3]

General conclusions include the following [19.3].

- Some observed key impacts have been at least partly attributed to anthropogenic climate change. Among these are increases in human mortality, loss of glaciers, and increases in the frequency and/or intensity of extreme events.
- Global mean temperature changes of up to 2°C above 1990-2000 levels (see Box 19.2) would exacerbate current key impacts, such as those listed above (high confidence), and trigger others, such as reduced food security in many low-latitude nations (medium confidence). At the same time, some systems, such as global agricultural productivity, could benefit (low/medium confidence).

- Global mean temperature changes of 2 to 4°C above 1990-2000 levels would result in an increasing number of key impacts at all scales (high confidence), such as widespread loss of biodiversity, decreasing global agricultural productivity and commitment to widespread deglaciation of Greenland (high confidence) and West Antarctic (medium confidence) ice sheets.
- Global mean temperature changes greater than 4°C above 1990-2000 levels would lead to major increases in vulnerability (very high confidence), exceeding the adaptive capacity of many systems (very high confidence).
- Regions that are already at high risk from observed climate variability and climate change are more likely to be adversely affected in the near future by projected changes in climate and increases in the magnitude and/or frequency of already damaging extreme events.

The 'reasons for concern' identified in the Third Assessment Report (TAR) remain a viable framework in which to consider key vulnerabilities. Recent research has updated some of the findings from the TAR [19.3.7].

- There is new and stronger evidence of observed impacts of climate change on unique and vulnerable systems (such as polar and high-mountain communities and ecosystems), with increasing levels of adverse impacts as temperatures increase (very high confidence).
- There is new evidence that observed climate change is likely to have already increased the risk of certain extreme events such as heatwaves, and it is more likely than not that warming has contributed to the intensification of some tropical cyclones, with increasing levels of adverse impacts as temperatures increase (very high confidence).
- The distribution of impacts and vulnerabilities is still considered to be uneven, and low-latitude, less-developed areas are generally at greatest risk due to both higher sensitivity and lower adaptive capacity; but there is new evidence that vulnerability to climate change is also highly variable within countries, including developed countries.
- There is some evidence that initial net market benefits from climate change will peak at a lower magnitude and sooner than was assumed for the TAR, and it is likely that there will be higher damages for larger magnitudes of global mean temperature increases than was estimated in the TAR.
- The literature offers more specific guidance on possible thresholds for initiating partial or near-complete deglaciation of the Greenland and West Antarctic ice sheets.

Adaptation can significantly reduce many potentially dangerous impacts of climate change and reduce the risk of many key vulnerabilities. However, the technical, financial and institutional capacity, and the actual planning and implementation of effective adaptation, is currently quite limited in many regions. In addition, the risk-reducing potential of planned adaptation is either very limited or very costly for some key vulnerabilities, such as loss of biodiversity, melting of mountain glaciers and disintegration of major ice sheets. [19.4.1]

A general conclusion on the basis of present understanding is that for market and social systems there is considerable adaptation potential, but the economic costs are potentially large, largely unknown and unequally distributed, as is the adaptation potential itself. For biological and geophysical systems, the adaptation potential is much less than in social and market systems. There is wide agreement that it will be much more difficult for both human and natural systems to adapt to larger magnitudes of global mean temperature change than to smaller ones, and that adaptation will be more difficult and/or costly for faster warming rates than for slower rates. [19.4.1]

Several conclusions appear robust across a diverse set of studies in the integrated assessment and mitigation literature [19.4.2, 19.4.3].

- Given the uncertainties in factors such as climate sensitivity, regional climate change, vulnerability to climate change, adaptive capacity and the likelihood of bringing such capacity to bear, a risk-management framework emerges as a useful framework to address key vulnerabilities. However, the assignment of probabilities to specific key impacts is often very difficult, due to the large uncertainties involved.
- Actions to mitigate climate change and reduce greenhouse gas emissions will reduce the risk associated with most key vulnerabilities. Postponement of such actions, in contrast, generally increases risks.
- Given current atmospheric greenhouse gas concentrations (IPCC, 2007a) and the range of projections for future climate change, some key impacts (e.g., loss of species, partial deglaciation of major ice sheets) cannot be avoided with high confidence. The probability of initiating some large-scale events is very likely to continue to increase as long as greenhouse gas concentrations and temperature continue to increase.

## 19.1 Introduction

### 19.1.1 Purpose, scope and structure of the chapter

Many social, biological and geophysical systems are at risk from climate change. Since the Third Assessment Report (TAR; IPCC, 2001a), policy-makers and the scientific community have increasingly turned their attention to climate change impacts, vulnerabilities and associated risks that may be considered ‘key’ because of their magnitude, persistence and other characteristics. An impact describes a specific change in a system caused by its exposure to climate change. Impacts may be judged to be either harmful or beneficial. Vulnerability to climate change is the degree to which these systems are susceptible to, and unable to cope with, the adverse impacts. The concept of risk, which combines the magnitude of the impact with the probability of its occurrence, captures uncertainty in the underlying processes of climate change, exposure, sensitivity and adaptation.

The identification of potential key vulnerabilities is intended to provide guidance to decision-makers for identifying levels and

rates of climate change that may be associated with ‘dangerous anthropogenic interference’ (DAI) with the climate system, in the terminology of the United Nations Framework Convention on Climate Change (UNFCCC) Article 2 (see Box 19.1). Ultimately, the determination of DAI cannot be based on scientific arguments alone, but involves other judgements informed by the state of scientific knowledge.

The purpose of this chapter is two-fold. First, it synthesises information from Working Group I (WGI) and Chapters 3-16 of Working Group II (WGII) of the IPCC Fourth Assessment Report (AR4) within the uncertainty framework established by IPCC (Moss and Schneider, 2000; IPCC, 2007b) and the risk management approach discussed in Chapter 2, and identifies key vulnerabilities based on seven criteria (see Section 19.2). A focus on key vulnerabilities is meant to help policy-makers and stakeholders assess the level of risk and design pertinent response strategies. Given this focus, the analytic emphasis of this chapter is on people and systems that may be *adversely* affected by climate change, particularly where impacts could have serious and/or irreversible consequences. Positive impacts on a system are addressed when reported in the literature and where relevant to the assessment of key vulnerabilities. A comprehensive assessment of positive and negative climate impacts in all sectors and regions is beyond the scope of this chapter, and readers are encouraged to turn to the sectoral and regional chapters of this volume (Chapters 3-16) for this information.

Furthermore, it is acknowledged that the impacts of future climate change will occur in the context of an evolving socio-economic baseline. This chapter attempts to reflect the limited literature examining the possible positive and negative relationships between baseline scenarios and future impacts. However, the purpose of this chapter is not to compare the effects of climate change with the effects of socio-economic development, but rather to assess the additional effects of climate change on top of whatever baseline development scenario is assumed. Whether a climate change impact would be greater or smaller than welfare gains or losses associated with particular development scenarios is beyond the scope of this chapter but is dealt with in Chapter 20 and by Working Group III (WGIII).

Second, this chapter provides an assessment of literature focusing on the contributions that various mitigation and adaptation response strategies, such as stabilisation of greenhouse gas concentrations in the atmosphere, could make in avoiding or reducing the probability of occurrence of key impacts. Weighing the benefits of avoiding such climate-induced risks versus the costs of mitigation or adaptation, as well as the distribution of such costs and benefits (i.e., equity implications of such trade-offs) is also beyond the scope of this chapter, as is attempting a normative trade-off analysis among and between various groups and between human and natural systems. (The term ‘normative’ is used in this chapter to refer to a process or statement that inherently involves value judgements or beliefs.) Many more examples of such literature can be obtained in Chapters 18 and 20 of this volume and in the Working Group III (WGIII) AR4.

The remainder of Section 19.1 presents the conceptual framework, and Section 19.2 presents the specific criteria used in this chapter for the assessment of key vulnerabilities. Section 19.3 presents selected key vulnerabilities based on these criteria. Key

vulnerabilities are linked to specific levels of global mean temperature increase (above 1990-2000 levels; see Box 19.2) using available estimates from the literature wherever possible. Section 19.3 provides an indicative, rather than an exhaustive, list of key vulnerabilities, representing the authors' collective judgements based on the criteria presented in Section 19.2, selected from a vast array of possible candidates suggested in the literature. Section 19.4 draws on the literature addressing the linkages between key vulnerabilities and strategies to avoid them by adaptation (Section 19.4.1) and mitigation (Section 19.4.2). Section 19.4.4 concludes this chapter by suggesting research priorities for the natural and social sciences that may provide relevant knowledge for assessing key vulnerabilities of climate change. The assessment of key vulnerabilities and review of the particular assemblage of literature needed to do so is unique to the mission of Chapter 19. Accordingly, in Sections 19.3 and 19.4, we have made judgments with regard to likelihood and confidence whereas, in some cases, other chapters in this volume and in the WGI AR4 have not.

Another important area of concern, also marked by large uncertainties, is the assessment of impacts resulting from multiple factors. In some cases, key vulnerabilities emerging from such interactions are assessed, such as the fragmentation of habitats that constrains some species, which – when combined with climate change – forces species movements across disturbed habitats. This is a multi-stressor example that is likely to multiply the impacts relative to either stressor acting alone. Other examples from the literature are also given in the text; though any attempt

to be comprehensive or quantitative in such multi-stress situations is beyond the scope of the chapter.

## 19.1.2 Conceptual framework for the identification and assessment of key vulnerabilities

### 19.1.2.1 Meaning of 'key vulnerability'

Vulnerability to climate change is the degree to which geophysical, biological and socio-economic systems are susceptible to, and unable to cope with, adverse impacts of climate change (see Chapter 17; Füssel and Klein, 2006). The term 'vulnerability' may therefore refer to the vulnerable system itself, e.g., low-lying islands or coastal cities; the impact to this system, e.g., flooding of coastal cities and agricultural lands or forced migration; or the mechanism causing these impacts, e.g., disintegration of the West Antarctic ice sheet.

Many impacts, vulnerabilities and risks merit particular attention by policy-makers due to characteristics that might make them *key*. Key impacts that may be associated with key vulnerabilities are found in many social, economic, biological and geophysical systems, and various tabulations of risks, impacts and vulnerabilities have been provided in the literature (e.g., Smith et al., 2001; Corfee-Morlot and Höhne, 2003; Hare, 2003; Oppenheimer and Petsonk, 2003, 2005; ECF, 2004; Hitz and Smith, 2004; Leemans and Eickhout, 2004; Schellnhuber et al., 2006). Key vulnerabilities are associated with many climate-sensitive systems, including, for example, food supply, infrastructure, health, water resources, coastal systems,

### Box 19.1. UNFCCC Article 2

The text of the UNFCCC Article 2 reads:

"The ultimate objective of this Convention and any related legal instruments that the Conference of the Parties may adopt is to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. Such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner."

### Box 19.2. Reference for temperature levels

Levels of global mean temperature change are variously presented in the literature with respect to: pre-industrial temperatures in a specified year e.g., 1750 or 1850; the average temperature of the 1961-1990 period; or the average temperature within the 1990-2000 period. The best estimate for the increase above pre-industrial levels in the 1990-2000 period is 0.6°C, reflecting the best estimate for warming over the 20th century (Folland et al., 2001; Trenberth et al., 2007). Therefore, to illustrate this by way of a specific example, a 2°C increase above pre-industrial levels corresponds to a 1.4°C increase above 1990-2000 levels. Climate impact studies often assess changes in response to regional temperature change, which can differ significantly from changes in global mean temperature. In most land areas, regional warming is larger than global warming (see Christensen et al., 2007). Unless otherwise specified, this chapter refers to global mean temperature change above 1990-2000 levels, which reflects the most common metric used in the literature on key vulnerabilities. However, given the many conventions in the literature for baseline periods, the reader is advised to check carefully and to adjust baseline levels for consistency every time a number is given for impacts at some specified level of global mean temperature change.

ecosystems, global biogeochemical cycles, ice sheets, and modes of oceanic and atmospheric circulation (see Section 19.3).

### 19.1.2.2 Scientific assessment and value judgements

The assessment of key vulnerabilities involves substantial scientific uncertainties as well as value judgements. It requires consideration of the response of biophysical and socio-economic systems to changes in climatic and non-climatic conditions over time (e.g., changes in population, economy or technology), important non-climatic developments that affect adaptive capacity, the potential for effective adaptation across regions, sectors and social groupings, value judgements about the acceptability of potential risks, and potential adaptation and mitigation measures. To achieve transparency in such complex assessments, scientists and analysts need to provide a ‘traceable account’ of all relevant assumptions (Moss and Schneider, 2000).

Scientific analysis can inform policy processes but choices about which vulnerabilities are ‘key’, and preferences for policies appropriate for addressing them, necessarily involve value judgements. “Natural, technical and social sciences can provide essential information and evidence needed for decision-making on what constitutes ‘dangerous anthropogenic interference with the climate system’. At the same time, such decisions are value judgments determined through socio-political processes, taking into account considerations such as development, equity and sustainability, as well as uncertainties and risk” (IPCC, 2001b).

### 19.1.2.3 UNFCCC Article 2

The question of which impacts might constitute DAI in terms of Article 2 has only recently attracted a high level of attention, and the literature still remains relatively sparse (see Oppenheimer and Petsonk 2005; Schellnhuber et al., 2006 for reviews). Interpreting Article 2 (ultimately the obligation of the Conference of the Parties to the UNFCCC) involves a scientific assessment of what impacts might be associated with different levels of greenhouse gas concentrations or climate change; and a normative evaluation by policy-makers of which potential impacts and associated likelihoods are significant enough to constitute, individually or in combination, DAI. This assessment is informed by the magnitude and timing of climate impacts as well as by their distribution across regions, sectors and population groups (e.g., Corfee-Morlot and Agrawala, 2004; Schneider and Mastrandrea, 2005; Yamin et al., 2005). The social, cultural and ethical dimensions of DAI have drawn increasing attention recently (Jamieson 1992, 1996; Rayner and Malone, 1998; Adger, 2001; Gupta et al., 2003; Gardiner, 2006). The references to adverse effects as significant deleterious effects in Article 1 of the UNFCCC<sup>1</sup> and to natural ecosystems, food production, and sustainable development in Article 2 provide guidance as to which impacts may be considered relevant to the definition of DAI (Schneider et al., 2001).

Interpreting Article 2 is necessarily a dynamic process because the assessment of what levels of greenhouse gas

concentrations may be considered ‘dangerous’ would be modified based on changes in scientific knowledge, social values and political priorities.

### 19.1.2.4 Distribution and aggregation of impacts

Vulnerability to climate change differs considerably across socio-economic groups, thus raising important questions about equity. Most studies of impacts in the context of key vulnerabilities and Article 2 have focused on aggregate impacts, grouping developing countries or populations with special needs or situations. Examples include island nations faced with sea-level rise (Barnett and Adger, 2003), countries in semi-arid regions with a marginal agricultural base, indigenous populations facing regionalised threats, or least-developed countries (LDCs; Huq et al., 2003). Within developed countries, research on vulnerability has often focused on groups of people, for example those living in coastal or flood-prone regions, or socially vulnerable groups such as the elderly.

No single metric for climate impacts can provide a commonly accepted basis for climate policy decision-making (Jacoby, 2004; Schneider, 2004). Aggregation, whether by region, sector, or population group, implies value judgements about the selection, comparability and significance of vulnerabilities and cohorts (e.g., Azar and Sterner, 1996; Fankhauser et al., 1997; Azar, 1998, on regional aggregation). The choice of scale at which impacts are examined is also crucial, as considerations of fairness, justice or equity require examination of the distribution of impacts, vulnerability and adaptation potential, not only between, but also within, groupings (Jamieson, 1992; Gardiner, 2004; Yamin et al., 2005).

### 19.1.2.5 Critical levels and thresholds

Article 2 of the UNFCCC defines international policy efforts in terms of avoidance of a level of greenhouse gas concentrations beyond which the effects of climate change would be considered to be ‘dangerous’. Discussions about ‘dangerous interference with the climate system’ and ‘key vulnerabilities’ are also often framed around thresholds or critical limits (Patwardhan et al., 2003; Izrael, 2004). Key vulnerabilities may be linked to systemic thresholds where non-linear processes cause a system to shift from one major state to another (such as a hypothetical sudden change in the Asian monsoon or disintegration of the West Antarctic ice sheet). Systemic thresholds may lead to large and widespread consequences that may be considered as ‘dangerous’. Examples include climate impacts such as those arising from ice sheet disintegration leading to large sea-level rises or changes to the carbon cycle, or those affecting natural and managed ecosystems, infrastructure and tourism in the Arctic.

Smooth and gradual climate change may also lead to damages that are considered unacceptable beyond a certain point. For instance, even a gradual and smooth increase of sea-level rise would eventually reach a level that certain stakeholders would consider unacceptable. Such normative impact thresholds could

<sup>1</sup> Article 1 reads, “For the purposes of this Convention: 1. ‘Adverse effects of climate change’ means changes in the physical environment or biota resulting from climate change which have significant deleterious effects on the composition, resilience or productivity of natural and managed ecosystems or on the operation of socio-economic systems or on human health and welfare.”

be defined at the global level (e.g., Toth et al., 2002, for natural ecosystems) and some have already been identified at the regional level (e.g., Jones, 2001, for irrigation in Australia).

## 19.2 Criteria for selecting 'key' vulnerabilities

As previously discussed, determining which impacts of climate change are potentially 'key' and what is 'dangerous' is a dynamic process involving, inter alia, combining scientific knowledge with factual and normative elements (Patwardhan et al., 2003; Dessai et al., 2004; Pittini and Rahman, 2004). Largely factual or objective criteria include the scale, magnitude, timing and persistence of the harmful impact (Parry et al., 1996; Kenny et al., 2000; Moss and Schneider, 2000; Goklany, 2002; Corfee-Morlot and Höhne, 2003; Schneider, 2004; Oppenheimer, 2005). Normative and subjective elements are embedded in assessing the uniqueness and importance of the threatened system, equity considerations regarding the distribution of impacts, the degree of risk aversion, and assumptions regarding the feasibility and effectiveness of potential adaptations (IPCC, 2001a; OECD, 2003; Pearce, 2003; Tol et al., 2004). Normative criteria are influenced by the perception of risk, which depends on the cultural and social context (e.g., Slovic, 2000; Oppenheimer and Todorov, 2006). Some aspects of confidence in the climate change–impact relationship are factual, while others are subjective (Berger and Berry, 1988). In addition, the choice of which factual criteria to employ in assessing impacts has a normative component.

This chapter identifies seven criteria from the literature that may be used to identify key vulnerabilities, and then describes some potential key vulnerabilities identified using these criteria. The criteria are listed and explained in detail below:

- magnitude of impacts,
- timing of impacts,
- persistence and reversibility of impacts,
- likelihood (estimates of uncertainty) of impacts and vulnerabilities, and confidence in those estimates,
- potential for adaptation,
- distributional aspects of impacts and vulnerabilities,
- importance of the system(s) at risk.

### *Magnitude*

Impacts of large magnitude are more likely to be evaluated as 'key' than impacts with more limited effects. The magnitude of an impact is determined by its scale (e.g., the area or number of people affected) and its intensity (e.g., the degree of damage caused). Therefore, many studies have associated key vulnerabilities or dangerous anthropogenic interference primarily with large-scale geophysical changes in the climate system.

Various aggregate metrics are used to describe the magnitude of climate impacts. The most widely used quantitative measures for climate impacts (see Chapter 20 and WGIII AR4 Chapter 3 (Fisher et al., 2007)) are monetary units such as welfare, income or revenue losses (e.g., Nordhaus and Boyer, 2000), costs of

anticipating and adapting to certain biophysical impacts such as a large sea-level rise (e.g., Nicholls et al., 2005), and estimates of people's willingness to pay to avoid (or accept as compensation for) certain climate impacts (see, e.g., Li et al., 2004). Another aggregate, non-monetary indicator is the number of people affected by certain impacts such as food and water shortages, morbidity and mortality from diseases, and forced migration (Barnett, 2003; Arnell, 2004; Parry et al., 2004; van Lieshout et al., 2004; Schär and Jendritzky, 2004; Stott et al., 2004). Climate impacts are also quantified in terms of the biophysical end-points, such as agricultural yield changes (see Chapter 5; Füssel et al., 2003; Parry et al., 2004) and species extinction numbers or rates (see Chapter 4; Thomas et al., 2004). For some impacts, qualitative rankings of magnitude are more appropriate than quantitative ones. Qualitative methods have been applied to reflect social preferences related to the potential loss of cultural or national identity, loss of cultural heritage sites, and loss of biodiversity (Schneider et al., 2000).

### *Timing*

A harmful impact is more likely to be considered 'key' if it is expected to happen soon rather than in the distant future (Bazermann, 2005; Weber, 2005). Climate change in the 20th century has already led to numerous impacts on natural and social systems (see Chapter 1), some of which may be considered 'key'. Impacts occurring in the distant future which are caused by nearer-term events or forcings (i.e., 'commitment'), may also be considered 'key'. An often-cited example of such 'delayed irreversibility' is the disintegration of the West Antarctic ice sheet: it has been proposed that melting of ice shelves in the next 100 to 200 years may lead to gradual but irreversible deglaciation and a large sea-level rise over a much longer time-scale (see Section 19.3.5.2; Meehl et al., 2007). Debates over an 'appropriate' rate of time preference for such events (i.e., discounting) are widespread in the integrated assessment literature (WGIII AR4 Chapter 2: Halsnaes et al., 2007), and can influence the extent to which a decision-maker might label such possibilities as 'key'.

Another important aspect of timing is the rate at which impacts occur. In general, adverse impacts occurring suddenly (and surprisingly) would be perceived as more significant than the same impacts occurring gradually, as the potential for adaptation for both human and natural systems would be much more limited in the former case. Finally, very rapid change in a non-linear system can exacerbate other vulnerabilities (e.g., impacts on agriculture and nutrition can aggravate human vulnerability to disease), particularly where such rapid change curtails the ability of systems to prevent and prepare for particular kinds of impacts (Niemeyer et al., 2005).

### *Persistence and reversibility*

A harmful impact is more likely to be considered 'key' if it is persistent or irreversible. Examples of impacts that could become key due to persistence include the emergence of near-permanent drought conditions (e.g., in semi-arid and arid regions in Africa – Nyong, 2005; see Chapter 9) and intensified cycles of extreme flooding that were previously regarded as 'one-off' events (e.g., in parts of the Indian subcontinent; see Chapter 10).

Examples of climate impacts that are irreversible, at least on time-scales of many generations, include changes in regional or global biogeochemical cycles and land cover (Denman et al., 2007; see Section 19.3.5.1), the loss of major ice sheets (Meehl et al., 2007; see Section 19.3.5.2); the shutdown of the meridional overturning circulation (Randall et al., 2007; Meehl et al., 2007; see Section 19.3.5.3), the extinction of species (Thomas et al., 2004; Lovejoy and Hannah, 2005), and the loss of unique cultures (Barnett and Adger, 2003). The latter is illustrated by Small Island Nations at risk of submergence through sea-level rise (see Chapter 16) and the necessity for the Inuit of the North American Arctic (see Chapter 15) to cope with recession of the sea ice that is central to their socio-cultural environment.

#### *Likelihood and confidence*

Likelihood of impacts and our confidence in their assessment are two properties often used to characterise uncertainty of climate change and its impacts (Moss and Schneider, 2000; IPCC, 2007b). Likelihood is the probability of an outcome having occurred or occurring in the future; confidence is the subjective assessment that any statement about an outcome will prove correct. Uncertainty may be characterised by these properties individually or in combination. For example, in expert elicitations of subjective probabilities (Nordhaus, 1994; Morgan and Keith, 1995; Arnell et al., 2005; Morgan et al., 2006), likelihood of an outcome has been framed as the central value of a probability distribution, whereas confidence is reflected primarily by its spread (the lesser the spread, the higher the confidence). An impact characterised by high likelihood is more apt to be seen as ‘key’ than the same impact with a lower likelihood of occurrence. Since risk is defined as consequence (impact) multiplied by its likelihood (probability), the higher the probability of occurrence of an impact the higher its risk, and the more likely it would be considered ‘key’.

#### *Potential for adaptation*

To assess the potential harm caused by climate change, the ability of individuals, groups, societies and nature to adapt to or ameliorate adverse impacts must be considered (see Section 19.3.1; Chapter 17). The lower the availability and feasibility of effective adaptations, the more likely such impacts would be characterised as ‘key vulnerabilities’. The potential for adaptation to ameliorate the impacts of climate change differs between and within regions and sectors (e.g., O’Brien et al., 2004). There is often considerable scope for adaptation in agriculture and in some other highly managed sectors. There is much less scope for adaptation to some impacts of sea-level rise such as land loss in low-lying river deltas, and there are no realistic options for preserving many endemic species in areas that become climatically unsuitable (see Chapter 17). Adaptation assessments need to consider not only the technical feasibility of certain adaptations but also the availability of required resources (which is often reduced in circumstances of poverty), the costs and side-effects of adaptation, the knowledge about those adaptations, their timeliness, the (dis-)incentives for adaptation actors to actually implement them, and their compatibility with individual or cultural preferences.

The adaptation literature (see Chapter 17) can be largely separated into two groups: one with a more favourable view of the potential for adaptation of social systems to climate change, and an opposite group that expresses less favourable views, stressing the limits to adaptation in dealing with large climate changes and the social, financial and technical obstacles that might inhibit the actual implementation of many adaptation options (see, e.g., the debate about the Ricardian climate change impacts methods – Mendelsohn et al., 1994; Cline, 1996; Mendelsohn and Nordhaus, 1996; Kaufmann, 1998; Hanemann, 2000; Polsky and Easterling, 2001; Polsky, 2004; Schlenker et al., 2005). This chapter reports the range of views in the literature on adaptive capacity relevant for the assessment of key vulnerabilities, and notes that these very different views contribute to the large uncertainty that accompanies assessments of many key vulnerabilities.

#### *Distribution*

The distribution of climate impacts across regions and population groups raises important equity issues (see Section 19.1.2.4 for a detailed discussion). The literature concerning distributional impacts of climate change covers an increasingly broad range of categories, and includes, among others, income (Tol et al., 2004), gender (Denton, 2002; Lambrou and Laub, 2004) and age (Bunyavanich et al., 2003), in addition to regional, national and sectoral groupings. Impacts and vulnerabilities that are highly heterogeneous or which have significant distributional consequences are likely to have higher salience, and therefore a greater chance of being considered as ‘key’.

#### *Importance of the vulnerable system*

A salient, though subjective, criterion for the identification of ‘key vulnerabilities’ is the importance of the vulnerable system or system property. Various societies and peoples may value the significance of impacts and vulnerabilities on human and natural systems differently. For example, the transformation of an existing natural ecosystem may be regarded as important if that ecosystem is the unique habitat of many endemic species or contains endangered charismatic species. On the other hand, if the livelihoods of many people depend crucially on the functioning of a system, this system may be regarded as more important than a similar system in an isolated area (e.g., a mountain snowpack system with large downstream use of the melt water versus an equally large snowpack system with only a small population downstream using the melt water).

## 19.3 Identification and assessment of key vulnerabilities

This section discusses what the authors have identified as possible key vulnerabilities based on the criteria specified in the Introduction and Section 19.2, and on the literature on impacts that may be considered potentially ‘dangerous’ in the sense of Article 2. The key vulnerabilities identified in this section are, as noted earlier, not a comprehensive list but illustrate a range of

impacts relevant for policy-makers. Section 19.3.1 introduces, in condensed tabular form, key vulnerabilities, organising them by type of system, i.e., market, social, ecological or geophysical. The following sections discuss some of the key vulnerabilities by type of system, and add discussions of extreme events and an update on the 'reasons for concern' framework from the TAR. Each sub-section is cross-referenced to the relevant sections of the Fourth Assessment Report as well as primary publications from which more detail can be obtained. As noted in Section 19.1.1, the likelihood and confidence judgements in this section reflect the assessments of the authors of this chapter.

### 19.3.1 Introduction to Table 19.1

Table 19.1 provides short summaries of some vulnerabilities which, in the judgment of the authors of this chapter and in the

light of the WGI AR4 and chapters of the WGII AR4, may be considered 'key' according to the criteria set out above in Section 19.2. The table presents vulnerabilities grouped by the following categories, described in the following text:

- Global social systems
- Regional systems
- Global biological systems
- Geophysical systems
- Extreme events

The table attempts to describe, as quantitatively as the literature allows, how impacts vary with global mean temperature increase above 1990-2000 levels. In addition, the authors of this chapter have assigned confidence estimates to this information. Where known, the table presents information regarding the dependence of effects on rates of warming, duration of the changes, exposure to the stresses, and adaptation taking into account uncertainties

**Table 19.1.** Examples of potential key vulnerabilities. This list is not ordered by priority or severity but by category of system, process or group, which is either affected by or which causes vulnerability. Information is presented where available on how impacts may change at larger increases in global mean temperature (GMT). All increases in GMT are relative to circa 1990. Entries are necessarily brief to limit the size of the table, so further details, caveats and supporting evidence should be sought in the accompanying text, cross-references, and in the primary scientific studies referenced in this and other chapters of the AR4. In many cases, climate change impacts are marginal or synergistic on top of other existing and changing stresses. Confidence symbol legend: \*\*\* very high confidence, \*\* high confidence, \* medium confidence, • low confidence. Sources in [square brackets] are from chapters in the WGII AR4 unless otherwise indicated. Where no source is given, the entries are based on the conclusions of the Chapter 19 authors.

Systems, processes or groups at risk [cross-references]	Prime criteria for 'key vulnerability' (based on the seven criteria listed in Section 19.2)	Relationship between temperature and risk. Temperature change by 2100 (relative to 1990-2000)

<b>Global social systems</b>							
Food supply [19.3.2.2]	Distribution, Magnitude			Productivity decreases for some cereals in low latitudes */• [5.4]			
				Productivity increases for some cereals in mid/high latitudes */• [5.4]			Cereal productivity decreases in some mid/high-latitude regions */• [5.4]
				Global production potential increases to around 3°C * [5.4, 5.6]			Global production potential very likely to decrease above about 3°C * [5.4, 5.6]
Infrastructure [19.3.2]	Distribution, Magnitude, Timing	Damages likely to increase exponentially, sensitive to rate of climate change, change in extreme events and adaptive capacity ** [3.5, 6.5.3, 7.5].					
Health [19.3.2]	Distribution, Magnitude, Timing, Irreversibility	Current effects are small but discernible * [1.3.7, 8.2].	Although some risks would be reduced, aggregate health impacts would increase, particularly from malnutrition, diarrhoeal diseases, infectious diseases, floods and droughts, extreme heat, and other sources of risk */**. Sensitive to status of public health system *** [8.ES, 8.3, 8.4, 8.6].				
Water resources [19.3.2]	Distribution, Magnitude, Timing	Decreased water availability and increased drought in some mid latitudes and semi-arid low latitudes ** [3.2, 3.4, 3.7].	Severity of floods, droughts, erosion, water-quality deterioration will increase with increasing climate change ***. Sea-level rise will extend areas of salinisation of groundwater, decreasing freshwater availability in coastal areas *** [3.ES]. Hundreds of millions people would face reduced water supplies ** [3.5].				
Migration and conflict	Distribution, Magnitude	Stresses such as increased drought, water shortages, and riverine and coastal flooding will affect many local and regional populations **. This will lead in some cases to relocation within or between countries, exacerbating conflicts and imposing migration pressures * [19.2].					
Aggregate market impacts and distribution	Magnitude, Distribution	Uncertain net benefits and greater likelihood of lower benefits or higher damages than in TAR •. Net market benefits in many high-latitude areas; net market losses in many low-latitude areas. * [20.6, 20.7]. Most people negatively affected •/*.		Net global negative market impacts increasing with higher temperatures * [20.6]. Most people negatively affected *.			

Systems, processes or groups at risk [cross-references]	Prime criteria for 'key vulnerability' (based on the seven criteria listed in Section 19.2)	Relationship between temperature and risk.					
		Temperature change by 2100 (relative to 1990-2000)					
Regional systems		0°C	1°C	2°C	3°C	4°C	5°C
Africa [19.3.3]	Distribution, Magnitude, Timing, Low Adaptive Capacity	Tens of millions of people at risk of increased water stress; increased spread of malaria • [9.2, 9.4.1, 9.4.3].					Hundreds of millions of additional people at risk of increased water stress; increased risk of malaria in highlands; reductions in crop yields in many countries, harm to many ecosystems such as Succulent Karoo • [9.4.1, 9.4.3, 9.4.4, 9.4.5].
Asia [19.3.3]	Distribution, Magnitude, Timing, Low Adaptive Capacity	About 1 billion people would face risks from reduced agricultural production potential, reduced water supplies or increases in extremes events • [10.4].					
Latin America [19.3.3]	Magnitude, Irreversibility, Distribution, and Timing, Low Adaptive Capacity	Tens of millions of people at risk of water shortages • [13.ES, 13.4.3]; many endemic species at risk from land-use and climate change • (~1°C) [13.4.1, 13.4.2].					More than a hundred million people at risk of water shortages • [13.ES, 13.4.3]; low-lying coastal areas, many of which are heavily populated, at risk from sea-level rise and more intense coastal storms • (about 2-3°C) [13.4.4]. Widespread loss of biodiversity, particularly in the Amazon • [13.4.1, 13.4.2].
Polar regions [19.3.3]	Timing, Magnitude, Irreversibility, Distribution, Low Adaptive Capacity	Climate change is already having substantial impacts on societal and ecological systems ** [15.ES].					Continued warming likely to lead to further loss of ice cover and permafrost ** [15.3]. Arctic ecosystems further threatened **, although net ecosystem productivity estimated to increase ** [15.2.2, 15.4.2]. While some economic opportunities will open up (e.g., shipping), traditional ways of life will be disrupted ** [15.4, 15.7].
Small islands [19.3.3]	Irreversibility, Magnitude, Distribution, Low Adaptive Capacity	Many islands already experiencing some negative effects ** [16.2]. Increasing coastal inundation and damage to infrastructure due to sea-level rise ** [16.4].					
Indigenous, poor or isolated communities [19.3.3]	Irreversibility, Distribution, Timing, Low Adaptive Capacity	Some communities already affected ** [11.4, 14.2.3, 15.4.5].					Climate change and sea-level rise add to other stresses **. Communities in low-lying coastal and arid areas are especially threatened ** [3.4, 6.4].
Drying in Mediterranean, western North America, southern Africa, southern Australia, and north-eastern Brazil [19.3.3]	Distribution, Magnitude, Timing	Climate models generally project decreased precipitation in these regions [3.4.1, 3.5.1, 11.3.1]. Reduced runoff will exacerbate limited water supplies, decrease water quality, harm ecosystems and result in decreased crop yields ** [3.4.1, 11.4].					
Inter-tropical mountain glaciers and impacts on high-mountain communities [19.3.3]	Magnitude, Timing, Persistence, Low Adaptive Capacity, Distribution	Inter-tropical glaciers are melting and causing flooding in some areas; shifts in ecosystems are likely to cause water security problems due to decreased storage ** [Box 1.1, 10.ES, 10.2, 10.4.4, 13.ES, 13.2.4, 19.3].					Accelerated reduction of inter-tropical mountain glaciers. Some of these systems will disappear in the next few decades * [Box 1.1, 9.2.1, Box 9.1, 10.ES, 10.2.4, 10.4.2, 13.ES, 13.2.4.1].
<b>Global biological systems</b>							
Terrestrial ecosystems and biodiversity [19.3.4]	Irreversibility, Magnitude, Low Adaptive Capacity, Persistence, Rate of Change, Confidence	Many ecosystems already affected *** [1.3].			circa 20-30% species at increasingly high risk of extinction * [4.4].		Major extinctions around the globe ** [4.4]  Terrestrial biosphere tends toward a net carbon source ** [4.4]
Marine ecosystems and biodiversity [19.3.4]	Irreversibility, Magnitude, Low Adaptive Capacity, Persistence, Rate of Change, Confidence	Increased coral bleaching ** [4.4]			Most corals bleached ** [4.4]		Widespread coral mortality *** [4.4]

		Temperature change by 2100 (relative to 1990-2000)					
		0°C	1°C	2°C	3°C	4°C	5°C
<b>Global biological systems</b>							
Freshwater ecosystems [19.3.4]	Irreversibility, Magnitude, Persistence Low Adaptive Capacity	Some lakes already showing decreased fisheries output; poleward migration of aquatic species ** [1.3.4, 4.4.9].	Intensified hydrological cycles, more severe droughts and floods *** [3.4.3].	Extinction of many freshwater species **, major changes in limnology of lakes **, increased salinity of inland lakes **.			
<b>Geophysical systems</b>							
Biogeochemical cycles [WGII 4.4.9, 19.3.5.1; WGI 7.3.3, 7.3.4, 7.3.5, 7.4.1.2, 10.4.1, 10.4.2]	Magnitude, Persistence, Confidence, Low Adaptive Capacity, Rate of Change	Ocean acidification already occurring, increasing further as atmospheric CO <sub>2</sub> concentration increases ***; ecological changes are potentially severe * [1.3.4, 4.4.9]. Carbon cycle feedback increases projected CO <sub>2</sub> concentrations by 2100 by 20-220 ppm for SRES <sup>2</sup> A2, with associated additional warming of 0.1 to 1.5°C **. AR4 temperature range (1.1-6.4°C) accounts for this feedback from all scenarios and models but additional CO <sub>2</sub> and CH <sub>4</sub> releases are possible from permafrost, peat lands, wetlands, and large stores of marine hydrates at high latitudes * [4.4.6, 15.4.2]. Permafrost already melting, and above feedbacks generally increase with climate change, but eustatic sea-level rise likely to increase stability of hydrates *** [1.3.1].					
Greenland ice sheet [WGII 6.3, 19.3.5.2; WGI 6.4.3.3, 10.7.4.3]	Magnitude, Irreversibility, Low Adaptive Capacity, Confidence	Localised deglaciation (already observed, due to local warming); extent would increase with temperature increase *** [19.3.5].	Commitment to widespread ** to near-total * deglaciation, 2-7 m sea-level rise <sup>3</sup> over centuries to millennia * [19.3.5].	Near-total deglaciation ** [19.3.5]			
West Antarctic ice sheet [WGII 6.3, 19.3.5.2; WGI 6.4.3.3, 10.7.4.4]	Magnitude, Irreversibility, Low Adaptive Capacity	Localised ice shelf loss and grounding line retreat * (already observed, due to local warming) [1.3.1, 19.3.5]	Commitment to partial deglaciation, 1.5-5 m sea-level rise over centuries to millennia •* [19.3.5]	Likelihood of near-total deglaciation increases with increases in temperature ** [19.3.5]			
Meridional overturning circulation [WGII 19.3.5.3; WGI 8.7.2.1, 10.3.4]	Magnitude, Persistence, Distribution, Timing, Low Adaptive Capacity, Confidence	Variations including regional weakening (already observed but no trend identified)	Considerable weakening **. Commitment to large-scale and persistent change including possible cooling in northern high-latitude areas near Greenland and north-west Europe • highly dependent on rate of climate change [12.6, 19.3.5].				
<b>Extreme events</b>							
Tropical cyclone intensity [WGII 7.5, 8.2, 11.4.5, 16.2.2, 16.4, 19.3.6; WGI Table TS-4, 3.8.3, Q3.3, 9.5.3.6, Q10.1]	Magnitude, Timing, Distribution	Increase in Category 4-5 storms*/**, with impacts exacerbated by sea-level rise	Further increase in tropical cyclone intensity */** exceeding infrastructure design criteria with large economic costs ** and many lives threatened **.				
Flooding, both large-scale and flash floods [WGII 14.4.1; WGI Table TS-4, 10.3.6.1, Q10.1]	Timing, Magnitude	Increases in flash flooding in many regions due to increased rainfall intensity** and in floods in large basins in mid and high latitudes **.	Increased flooding in many regions (e.g., North America and Europe) due to greater increase in winter rainfall exacerbated by loss of winter snow storage **. Greater risk of dam burst in glacial mountain lakes ** [10.2.4.2].				
Extreme heat [WGII 14.4.5; WGI Table TS-4, 10.3.6.2, Q10.1]	Timing, Magnitude	Increased heat stress and heat-waves, especially in continental areas ***.	Frequency of heatwaves (according to current classification) will increase rapidly, causing increased mortality, crop failure, forest die-back and fire, and damage to ecosystems ***.				
Drought [WGI Table TS-4, 10.3.6.1]	Magnitude, Timing	Drought already increasing * [1.3.2.1]. Increasing frequency and intensity of drought in mid-latitude continental areas projected ** [WGI 10.3.6.1].	Extreme drought increasing from 1% land area to 30% (SRES A2 scenario) [WGI 10.3.6.1]. Mid-latitude regions seriously affected by poleward migration of Annular Modes ** [WGI 10.3.5.5].				
Fire [WGII 1.3.6; WGI 7.3]	Timing, Magnitude	Increased fire frequency and intensity in many areas, particularly where drought increases ** [4.4, 14.2.2].	Frequency and intensity likely to be greater, especially in boreal forests and dry peat lands after melting of permafrost ** [4.4.5, 11.3, 13.4.1, 14.4.2, 14.4.4].				

<sup>2</sup> SRES: Special Report on Emissions Scenarios, see Nakićenović et al., 2000.

<sup>3</sup> Range is based on a variety of methods including models and analysis of palaeo data [19.3.5.2]

regarding socio-economic development. However, only in a few cases does the literature address rate or duration of warming and its consequences. As entries in the table are necessarily short, reference should be made to the relevant chapters and to the accompanying text in this chapter for more detailed information and cross-referencing, including additional caveats where applicable.

### 19.3.2 Global social systems

The term ‘social systems’ is used here in a broad sense to describe human systems, and includes both market systems and social systems. Market systems typically involve the provision and sale of goods and services in formal or informal markets. Valuation of non-market impacts (e.g., losses of human life, species lost, distributional inequity, etc.) involves a series of normative judgements that limit the degree of consensus and confidence commanded by different studies (see Section 19.1.2). The importance of non-market impacts and equity weighting is suggested by Stern (2007) but, in the absence of likelihood and confidence assessments, it is difficult to apply to any risk-management framework calculations.

We first discuss impacts on major market systems, followed by a discussion of impacts on major aspects of social systems. Such impacts are often considered to be important in the context of sustainable development.

#### 19.3.2.1 Agriculture

Ensuring that food production is not threatened is an explicit criterion of UNFCCC Article 2. In general, low-latitude areas are most at risk of having decreased crop yields. In contrast, mid- and high-latitude areas could generally, although not in all locations, see increases in crop yields for temperature increases of up to 1-3°C (see Chapter 5 Section 5.4.2). Taken together, there is low to medium confidence that global agricultural production could increase up to approximately 3°C of warming. For temperature increases beyond 1-3°C, yields of many crops in temperate regions are projected to decline (•/\*<sup>4</sup>). As a result, beyond 3°C warming, global production would decline because of climate change (•/\*) and the decline would continue as GMT increases (•/\*). Most studies on global agriculture have not yet incorporated a number of critical factors, including changes in extreme events or the spread of pests and diseases. In addition, they have not considered the development of specific practices or technologies to aid adaptation.

#### 19.3.2.2 Other market sectors

Other market systems will also be affected by climate change. These include the livestock, forestry and fisheries industries, which are very likely to be directly affected as climate affects the quality and extent of rangeland for animals, soils and other growing conditions for trees, and freshwater and marine ecosystems for fish. Other sectors are also sensitive to climate change. These include energy, construction, insurance, tourism and recreation. The aggregate effects of climate change on many of these sectors has received little attention in the literature and remains highly uncertain. Some sectors are likely to see shifts in

expenditure; with some contracting and some expanding. Yet, for some sectors, such as insurance, the impacts of climate change are likely to result in increased damage payments and premiums (see Chapter 7).

Other sectors, such as tourism and recreation, are likely to see some substantial shifts (e.g., reduction in ski season, loss of some ski areas, shifts in location of tourist destinations because of changes in climate and extreme events; e.g., Hamilton et al., 2005; see also Chapter 7 Section 7.4.2 and Chapter 14 Section 14.4.7). Global net energy demand is very likely to change (Tol, 2002b). Demand for air-conditioning is highly likely to increase, whereas demand for heating is highly likely to decrease. The literature is not clear on what temperature is associated with minimum global energy demand, so it is uncertain whether warming will initially increase or decrease net global demand for energy relative to some projected baseline. However, as temperatures rise, net global demand for energy will eventually rise as well (Hitz and Smith, 2004).

#### 19.3.2.3 Aggregate market impacts

The total economic impacts from climate change are highly uncertain. Depending upon the assumptions used (e.g., climate sensitivity, discount rate and regional aggregation) total economic impacts are typically estimated to be in the range of a few percent of gross world product for a few degrees of warming (see Chapter 20). Some estimates suggest that gross world product could increase up to about 1-3°C warming, largely because of estimated direct CO<sub>2</sub> effects on agriculture, but such estimates carry only low confidence. Even the direction of gross world product change with this level of warming is highly uncertain. Above the 1-3°C level of warming, available studies indicate that gross world product could decrease (•). For example, Tol (2002a) estimates net positive global market impacts at 1°C when weighting by economic output, but finds much smaller positive impacts when equity-weighted. Nordhaus (2006) uses a geographically based method and finds more negative economic impacts than previous studies, although still in the range of a few percent of gross world product.

Studies of aggregate market impacts tend to rely on scenarios of average changes in climate and focus on direct economic effects alone. Potential damages from increased severity of extreme climate events are often not included. The damages from an increase in extreme events could substantially increase market damages, especially at larger magnitudes of climate change (\*). Also, recent studies draw attention to indirect effects of climate change on the economy (e.g., on capital accumulation and investment, on savings rate); although there is debate about methods, the studies agree that such effects could be significant and warrant further attention (see Section 19.3.7; Fankhauser and Tol, 2005; Kempfert, 2006; Roson and Tol, 2006; Fisher et al., 2007).

#### 19.3.2.4 Distribution of market impacts

Global market impacts mask substantial variation in market impacts at the continental, regional, national and local scales. Even if gross world product were to change just a few percent, national economies could be altered by relatively large amounts.

<sup>4</sup> The following confidence symbols are used: \*\*\* very high confidence, \*\* high confidence, \* medium confidence, • low confidence.

For example, Maddison (2003) reports increases in cost of living in low-latitude areas and decreases in high-latitude areas from a 2.5°C warming. All studies with regional detail show Africa, for example, with climate damages of the order of several percent of gross domestic product (GDP) at 2°C increase in GMT or even lower levels of warming (\*). As noted below, very small economies such as Kiribati face damages from climate change in the range of 20% of their GDP (•) (see Chapter 16 Section 16.4.3). The distributional heterogeneity in market system impacts reflects the equity criterion described in Section 19.2 when considering which impacts may be considered ‘key’.

### 19.3.2.5 Societal systems

With regard to vulnerability of societal systems, there are myriad thresholds specific to particular groups and systems at specific time-frames beyond which they can be vulnerable to variability and to climate change (Yamin et al., 2005). These differences in vulnerability are a function of a number of factors. Exposure is one key factor. For example, crops at low latitudes will have greater exposure to higher temperatures than crops at mid- and high latitudes. Thus, yields for grain crops, which are sensitive to heat, are more likely to decline at lower latitudes than at higher latitudes. Social systems in low-lying coastal areas will vary in their exposure and adaptive capacities, yet most will have increased vulnerability with greater warming and associated sea-level rises or storm surges.

A second key factor affecting vulnerability is the capacity of social systems to adapt to their environment, including coping with the threats it may pose, and taking advantage of beneficial changes. Smit et al. (2001) identified a number of determinants of adaptive capacity, including such factors as wealth, societal organisation and access to technology (see also Yohe and Tol, 2002). These attributes differentiate vulnerability to climate change across societies facing similar exposure. For example, Nicholls (2004) and Nicholls and Tol (2006) found that level of development and population growth are very important factors affecting vulnerability to sea-level rise. The specific vulnerabilities of communities with climate-related risks, such as the elderly and the poor or indigenous communities, are typically much higher than for the population as a whole (see Section 14.2.6)

Even though some cold-related deaths and infectious disease exposure are likely to be reduced, on balance there is medium confidence that global mortality will increase as a result of climate change. It is estimated that an additional 5-170 million people will be at risk of hunger by the 2080s as a consequence of climate change (Chapter 5 Section 5.6.5). There is medium to high confidence that some other climate-sensitive health outcomes, including heatwave impacts, diarrhoeal diseases, flood-related risks, and diseases associated with exposure to elevated concentrations of ozone and aeroallergens, will increase with GMT (Chapter 8 Section 8.4.1). Development and adaptation are key factors influencing human health risk (Chapter 8 Section 8.6).

Vulnerability associated with water resources is complex because vulnerability is quite region-specific. In addition, the level of development and adaptation and social factors determining access to water are very important in determining vulnerability in the water sector. Studies differ as to whether

climate change will increase or decrease the number of people living in water-stressed areas (e.g., Parry et al., 1999; Arnell, 2004; Hitz and Smith, 2004; Alcamo et al., 2007). Hundreds of millions of people are estimated to be affected by changes in water quantity and quality (Chapter 3 Section 3.4.3; Arnell, 2004) but uncertainties limit confidence and thus the degree to which these risks might be labelled as ‘key’. Floods and droughts appear to have increased in some regions and are likely to become more severe in the future (Chapter 3 Section 3.4.3).

### 19.3.3 Regional vulnerabilities

Many of the societal impacts discussed above will be felt within the regions assessed as part of the AR4. At a regional and sub-regional scale, vulnerabilities can vary quite considerably. For example, while mid- and high-latitude areas would have increased crop yields up to about 3°C of warming, low-latitude areas would face decreased yields and increased risks of malnutrition at lower levels of warming (•/\*) (Chapter 5 Section 5.4.2; Parry et al., 2004).

Africa is likely to be the continent most vulnerable to climate change. Among the risks the continent faces are reductions in food security and agricultural productivity, particularly regarding subsistence agriculture (Chapter 9 Sections 9.4.4 and 9.6.1; Parry et al., 2004; Elasha et al., 2006), increased water stress (Chapter 9 Section 9.4.1) and, as a result of these and the potential for increased exposure to disease and other health risks, increased risks to human health (Chapter 9 Section 9.4.3). Other regions also face substantial risks from climate change. Approximately 1 billion people in South, South-East, and East Asia would face increased risks from reduced water supplies (•) (Chapter 10 Section 10.4.2), decreased agricultural productivity (•) (Chapter 10 Section 10.4.1.1), and increased risks of floods, droughts and cholera (\*) (Chapter 10 Section 10.4.5). Tens of millions to over a hundred million people in Latin America would face increased risk of water stress (•) (Chapter 13 Section 13.4.3). Low-lying, densely populated coastal areas are very likely to face risks from sea-level rise and more intense extreme events (Chapter 13 Section 13.4.4). The combination of land-use changes and climate change is very likely to reduce biodiversity substantially (Chapter 13 Section 13.2.5.1).

There is very high confidence that human settlements in polar regions are already being adversely affected by reduction in ice cover and coastal erosion (Chapter 15 Section 15.2.2). Future climate change is very likely to result in additional disruption of traditional cultures and loss of communities. For example, warming of freshwater sources poses risks to human health because of transmission of disease (\*) (Martin et al., 2005). Shifts in ecosystems are very likely to alter traditional use of natural resources, and hence lifestyles.

Small islands, particularly several small island states, are likely to experience large impacts due to the combination of higher exposure, for example to sea-level rise and storm surge, and limited ability to adapt (Chapter 16 Sections 16.ES, 16.2.1 and 16.4). There is very high confidence that many islands are already experiencing some negative effects of climate change (Chapter 1 Section 1.3.3; Chapter 16 Section 16.4). The long-term sustainability of small-island societies is at great risk from

climate change, with sea-level rise and extreme events posing particular challenges on account of their limited size, proneness to natural hazards and external shocks combined with limited adaptive capacity and high costs relative to GDP. Subsistence and commercial agriculture on small islands is likely to be adversely affected by climate change and sea-level rise, as a result of inundation, seawater intrusion into freshwater lenses, soil salinisation, decline in water supply and deterioration of water quality (Chapter 16 Executive Summary and Section 16.4). A group of low-lying islands, such as Tarawa and Kiribati, would face average annual damages of 17 to 18% of its economy by 2050 under the SRES A2 and B2 scenarios (•) (Chapter 16 Section 16.4.3).

Even in developed countries, there are many vulnerabilities. Arnell (2004) estimated a 40 to 50% reduction in runoff in southern Europe by the 2080s (associated with a 2 to 3°C increase in global mean temperature). Fires will very likely continue to increase in arid and semi-arid areas such as Australia and the western USA, threatening development in wildland areas (Chapter 4 Section 4.4.4; Chapter 11 Section 11.3.1; Chapter 14 Box 14.1 and Section 14.4.4; Westerling et al., 2006). Climate change is likely to increase the frequency and intensity of extreme heat events, as well as concentrations of air pollutants, such as ozone, which increase mortality and morbidity in urban areas (see Chapters 8, 11, 12 and 14).

### 19.3.4 Ecosystems and biodiversity

There is high confidence that climate change will result in extinction of many species and reduction in the diversity of ecosystems (see Section 4.4) Vulnerability of ecosystems and species is partly a function of the expected rapid rate of climate change relative to the resilience of many such systems. However, multiple stressors are significant in this system, as vulnerability is also a function of human development, which has already substantially reduced the resilience of ecosystems and makes many ecosystems and species more vulnerable to climate change through blocked migration routes, fragmented habitats, reduced populations, introduction of alien species and stresses related to pollution.

There is very high confidence that regional temperature trends are already affecting species and ecosystems around the world (Chapter 1 Sections 1.3.4 and 1.3.5; Parmesan and Yohe, 2003; Root et al., 2003; Menzel et al., 2006) and it is likely that at least part of the shifts in species observed to be exhibiting changes in the past several decades can be attributed to human-induced warming (see Chapter 1; Root et al., 2005). Thus, additional climate changes are likely to adversely affect many more species and ecosystems as global mean temperatures continue to increase (see Section 4.4). For example, there is high confidence that the extent and diversity of polar and tundra ecosystems is in decline and that pests and diseases have spread to higher latitudes and altitudes (Chapter 1 Sections 1.3.5 and 1.5).

Each additional degree of warming increases disruption of ecosystems and loss of species. Individual ecosystems and species often have different specific thresholds of change in temperature, precipitation or other variables, beyond which they

are at risk of disruption or extinction. Looking across the many ecosystems and thousands of species at risk of climate change, a continuum of increasing risk of loss of ecosystems and species emerges in the literature as the magnitude of climate change increases, although individual confidence levels will vary and are difficult to assess. Nevertheless, further warming is likely to cause additional adverse impacts to many ecosystems and contribute to biodiversity losses. Some examples follow.

- About half a degree of additional warming can cause harm to vulnerable ecosystems such as coral reefs and Arctic ecosystems \* (Table 4.1).
- A warming of 1°C above 1990 levels would result in all coral reefs being bleached and 10% of global ecosystems being transformed (Chapter 4 Section 4.4.11).
- A warming of 2°C above 1990 levels will result in mass mortality of coral reefs globally \*\*\* (Chapter 4 Section 4.4; Chapter 6 Box 6.1), with one-sixth of the Earth's ecosystems being transformed (Leemans and Eickhout, 2004) \*\*, and about one-quarter of known species being committed to extinction \*. For example, if Arctic sea-ice cover recedes markedly, many ice-dependent Arctic species, such as polar bears and walrus, will be increasingly likely to be at risk of extinction; other estimates suggest that the African Succulent Karoo is likely to lose four-fifths of its area (Chapter 4 Section 4.4.11 and Table 4.1). There is low confidence that the terrestrial biosphere will become a net source of carbon (Chapter 4 Section 4.4.1).
- An additional degree of warming, to 3°C, is likely to result in global terrestrial vegetation becoming a net source of carbon (Chapter 4 Section 4.4.1), over one-fifth of ecosystems being transformed \* (Chapter 4 Section 4.4.11; Leemans and Eickhout, 2003), up to 30% of known species being committed to extinction \* (Chapter 4 Section 4.4.11 and Table 4.1; Thomas et al., 2004; Malcolm et al., 2006, estimate that 1 to 43% of species in 25 biodiversity hotspots are at risk from an approximate 3 to 4°C warming) and half of all nature reserves being unable to meet conservation objectives \* (Chapter 4 Table 4.1). Disturbances such as fire and pests are very likely to increase substantially (Chapter 4 Section 4.4).
- There is very high confidence that warming above 3°C will cause further disruption of ecosystems and extinction of species.

### 19.3.5 Geophysical systems

A number of Earth-system changes may be classified as key impacts resulting in key vulnerabilities.

#### 19.3.5.1. Global biogeochemical cycles

The sensitivity of the carbon cycle to increased CO<sub>2</sub> concentrations and climate change is a key vulnerability due to its magnitude, persistence, rate of change, low adaptive capacity and the level of confidence in resulting impacts. Models suggest that the overall effect of carbon–climate interactions is a positive feedback (Denman et al., 2007 Section 7.1.5). As CO<sub>2</sub> concentrations increase and climate changes, feedbacks from terrestrial stores of carbon in forests and grasslands, soils, wetlands, peatlands and permafrost, as well as from the ocean,

would reduce net uptake of CO<sub>2</sub> (Denman et al., 2007 Sections 7.3.3 and 7.3.4). Hence the predicted atmospheric CO<sub>2</sub> concentration in 2100 is higher (and consequently the climate is warmer) than in models that do not include these couplings (Denman et al., 2007 Section 7.1.5). An intercomparison of ten climate models with a representation of the land and ocean carbon cycle forced by the SRES A2 emissions scenario (Denman et al., 2007 Section 7.3.5; Meehl et al., 2007 Section 10.4.1) shows that, by the end of the 21st century, additional CO<sub>2</sub> varies between 20 and 200 ppm for the two extreme models, with most of the models projecting additional CO<sub>2</sub> between 50 and 100 ppm (Friedlingstein et al., 2003), leading to an additional warming ranging between 0.1 and 1.5°C. A similar range results from estimating the effect including forcing from aerosols and non-CO<sub>2</sub> greenhouse gases (GHGs). Such additional warming would increase the number and severity of impacts associated with many key vulnerabilities identified in this chapter. In addition, these feedbacks reduce the emissions (Meehl et al., 2007 Section 10.4.1) compatible with a given atmospheric CO<sub>2</sub> stabilisation pathway (\*\*)

At the regional level (see Chapters 4, 10, 11, 12 and 14), important aspects of the carbon–climate interaction include the role of fire (Denman et al., 2007 Section 7.3.3.1.4) in transient response and possible abrupt land-cover transitions from forest to grassland or grassland to semi-arid conditions (Claussen et al., 1999; Eastman et al., 2001; Cowling et al., 2004; Rial et al., 2004).

Warming destabilises permafrost and marine sediments of methane gas hydrates in some regions according to some model simulations (Denman et al., 2007 Section 7.4.1.2), as has been proposed as an explanation for the rapid warming that occurred during the Palaeocene/Eocene thermal maximum (Dickens, 2001; Archer and Buffett, 2005). A rising eustatic (global) contribution to sea level is estimated to stabilise hydrates to some degree. One study (Harvey and Huang, 1995) reports that methane releases may increase very long-term future temperature by 10-25% over a range of scenarios. Most studies also point to increased methane emissions from wetlands in a warmer, wetter climate (Denman et al., 2007 Section 7.4.1.2).

Increasing ocean acidity due to increasing atmospheric concentrations of CO<sub>2</sub> (Denman et al., 2007 Section 7.3.4.1; Sabine et al., 2004; Royal Society, 2005) is very likely to reduce biocalcification of marine organisms such as corals (Hughes et al., 2003; Feely et al., 2004). Though the limited number of studies available makes it difficult to assess confidence levels, potentially severe ecological changes would result from ocean acidification, especially for corals in tropical stably stratified waters, but also for cold water corals, and may influence the marine food chain from carbonate-based phytoplankton up to higher trophic levels (Denman et al., 2007 Section 7.3.4.1; Turley et al., 2006).

### 19.3.5.2 Deglaciation of West Antarctic and Greenland ice sheets

The potential for partial or near-total deglaciation of the Greenland and the West Antarctic ice sheets (WAIS) and associated sea-level rise (Jansen et al., 2007 Sections 6.4.3.2 and 6.4.3.3; Meehl et al., 2007 Sections 10.6.4, 10.7.4.3 and

10.7.4.4; Alley et al., 2005; Vaughan, 2007), is a key impact that creates a key vulnerability due to its magnitude and irreversibility, in combination with limited adaptive capacity and, if substantial deglaciation occurred, high levels of confidence in associated impacts. Ice sheets have been discussed specifically in the context of Article 2 (O'Neill and Oppenheimer 2002; Hansen, 2005; Keller et al., 2005; Oppenheimer and Alley, 2005). Near-total deglaciation would eventually lead to a sea-level rise of around 7 m and 5 m (\*\*\*) from Greenland and the WAIS, respectively, with wide-ranging consequences including a reconfiguration of coastlines worldwide and inundation of low-lying areas, particularly river deltas (Schneider and Chen, 1980; Revelle, 1983; Tol et al., 2006; Vaughan, 2007). Widespread deglaciation would not be reversible except on very long time-scales, if at all (Meehl et al., 2007 Sections 10.7.4.3 and 10.7.4.4). The Amundsen Sea sector of the WAIS, already experiencing ice acceleration and rapid ground-line retreat (Lemke et al., 2007 Section 4.6.2.2), on its own includes ice equivalent to about 1.5 m sea-level rise (Meehl et al., 2007 Section 10.7.4.4; Vaughan, 2007). The ability to adapt would depend crucially on the rate of deglaciation (\*\*). Estimates of this rate and the corresponding time-scale for either ice sheet range from more rapid (several centuries for several metres of sea-level rise, up to 1 m/century) to slower (i.e., a few millennia; Meehl et al., 2007 Section 10.7.4.4; Vaughan and Spouge, 2002), so that deglaciation is very likely to be completed long after it is first triggered.

For Greenland, the threshold for near-total deglaciation is estimated at 3.2-6.2°C local warming (1.9-4.6°C global warming) relative to pre-industrial temperatures using current models (Meehl et al., 2007 Section 10.7.4.3). Such models also indicate that warming would initially cause the Antarctic ice sheet as a whole to gain mass owing to an increased accumulation of snowfall (\*; some recent studies find no significant continent-wide trends in accumulation over the past several decades; Lemke et al., 2007 Section 4.6.3.1). Scenarios of deglaciation (Meehl et al., 2007 Section 10.7.4.4) assume that any such increase would be outweighed by accelerated discharge of ice following weakening or collapse of an ice shelf due to melting at its surface or its base (\*). Mean summer temperatures over the major West Antarctic ice shelves are about as likely as not to pass the melting point if global warming exceeds 5°C (Meehl et al., 2007 Section 10.7.4.4). Some studies suggest that disintegration of ice shelves would occur at lower temperatures due to basal or episodic surface melting (Meehl et al., 2007 Sections 10.6.4.2 and 10.7.4.4; Wild et al., 2003). Recent observations of unpredicted, local acceleration and consequent loss of mass from both ice sheets (Alley et al., 2005) underscores the inadequacy of existing ice-sheet models, leaving no generally agreed basis for projection, particularly for WAIS (Lemke et al., 2007 Section 4.6.3.3; Meehl et al., 2007 Sections 10.6.4.2 and 10.7.4.4; Vieli and Payne, 2005). However, palaeoclimatic evidence (Denman et al., 2007 Sections 6.4.3.2 and 6.4.3.3; Overpeck et al., 2006; Otto-Bliesner et al., 2006) suggests that Greenland and possibly the WAIS contributed to a sea-level rise of 4-6 m during the last interglacial, when polar temperatures were 3-5°C warmer, and the global mean was not notably warmer, than at present (Meehl et al., 2007 Sections

10.7.4.3 and 10.7.4.4). Accordingly, there is medium confidence that at least partial deglaciation of the Greenland ice sheet, and possibly the WAIS, would occur over a period of time ranging from centuries to millennia for a global average temperature increase of 1-4°C (relative to 1990-2000), causing a contribution to sea-level rise of 4-6 m or more (Meehl et al., 2007 Sections 10.7.4.3 and 10.7.4.4; Oppenheimer and Alley, 2004, 2005; Hansen, 2005).

Current limitations of ice-sheet modelling also increase uncertainty in the projections of 21st-century sea-level rise (Meehl et al., 2007 Section 10.6.4.2) used to assess coastal impacts in this report. An illustrative estimate by WGI of the contribution of processes not represented by models yielded an increase of 0.1-0.2 m in the upper ranges of projected sea-level rise for 2100 (Meehl et al., 2007 Section 10.6.4.2). Other approximation methods would yield larger or smaller adjustments, including zero.

### 19.3.5.3 Possible changes in the North Atlantic meridional overturning circulation (MOC)

The sensitivity of the North Atlantic meridional overturning circulation (MOC) (cf., WGI AR4 Glossary; Bindoff et al., 2007 Box 5.1) to anthropogenic forcing is regarded as a key vulnerability due to the potential for sizeable and abrupt impacts (Tol, 1998; Keller et al., 2000; Mastrandrea and Schneider, 2001; Alley et al., 2003; Rahmstorf et al., 2003; Link and Tol, 2004, 2006; Higgins and Schneider, 2005; Sathaye et al., 2007).

Palaeo-analogues and model simulations show that the MOC can react abruptly and with a hysteresis response, once a certain forcing threshold is crossed (Randall et al., 2007; Meehl et al., 2007). Estimates of the forcing threshold that would trigger large-scale and persistent MOC changes rely on three main lines of evidence. The first, based on the analysis of coupled Atmosphere-Ocean General Circulation Models (AOGCMs), do not show MOC collapse in the 21st century (Meehl et al., 2007 Box 10.1). Assessing the confidence in this is, however, difficult, as these model runs sample only a subset of potentially relevant uncertainties (e.g., Challenor et al., 2006) and do not cross the forcing thresholds suggested by the second line of evidence: simulations using Earth system models of intermediate complexity (EMICs) (Randall et al., 2007 Section 8.8.3; Meehl et al., 2007 10.3.4). EMIC simulations, which use simplified representations of processes to explore a wider range of uncertainties, suggest that the probability that forcing would trigger an MOC threshold response during the 21st century could exceed estimates derived from AOGCM runs alone (e.g., Challenor et al., 2006). The third line of evidence, not assessed by Working Group I, relies on expert elicitations (sometimes combined with the analysis of simple climate models). These MOC projections show a large spread, with some suggesting a substantial likelihood of triggering a MOC threshold response within this century (Arnell et al., 2005; Rahmstorf and Zickfeld, 2005; McInerney and Keller, 2006; Schlesinger et al., 2006; Yohe et al., 2006).

Potential impacts associated with MOC changes include reduced warming or (in the case of abrupt change) absolute cooling of northern high-latitude areas near Greenland and

north-western Europe, an increased warming of Southern Hemisphere high latitudes, tropical drying (Vellinga and Wood, 2002, 2006; Wood et al., 2003, 2006), as well as changes in marine ecosystem productivity (Schmittner, 2005), terrestrial vegetation (Higgins and Vellinga, 2004), oceanic CO<sub>2</sub> uptake (Sarmiento and Le Quéré, 1996), oceanic oxygen concentrations (Matear and Hirst, 2003) and shifts in fisheries (Keller et al., 2000; Link and Tol, 2004). Adaptation to MOC-related impacts is very likely to be difficult if the impacts occur abruptly (e.g., on a decadal time-scale). Overall, there is high confidence in predictions of a MOC slowdown during the 21st century, but low confidence in the scale of climate change that would cause an abrupt transition or the associated impacts (Meehl et al., 2007 Section 10.3.4). However, there is high confidence that the likelihood of large-scale and persistent MOC responses increases with the extent and rate of anthropogenic forcing (e.g., Stocker and Schmittner, 1997; Stouffer and Manabe, 2003).

### 19.3.5.4 Changes in the modes of climate variability

Change in the modes of climate variability in response to anthropogenic forcing can lead to key impacts because these modes dominate annual-to-decadal variability, and adaptation to variability remains challenging in many regions. For example, some studies suggest that anthropogenic forcings would affect El Niño-Southern Oscillation (ENSO) variability (Timmermann et al., 1999; Fedorov and Philander, 2000; Fedorov et al., 2006; Hegerl et al., 2007 Section 9.5.3.1; Meehl et al., 2007 Section 10.3.5.3-5). Current ENSO projections are marked by many uncertainties, including

- the potential for an abrupt and/or hysteresis response,
- the direction of the shift,
- the level of warming when triggered.

ENSO shifts would affect agriculture (Cane et al., 1994; Legler et al., 1999), infectious diseases (Rodo et al., 2002), water supply, flooding, droughts (Kuhnel and Coates, 2000; Cole et al., 2002), wildfires (Swetnam and Betancourt, 1990), tropical cyclones (Pielke and Landsea, 1999; Emanuel, 2005), fisheries (Lehodey et al., 1997), carbon sinks (Bacastow et al., 1980) and the North Atlantic MOC (Latif et al., 2000).

The North Atlantic Oscillation (NAO) and the Annular Mode in both the Northern and Southern Hemispheres (also known as the Arctic Oscillation, AO, and the Antarctic Oscillation, AAO; Meehl et al., 2007 Section 10.3.5.6; Hartmann et al., 2000; Thompson and Wallace, 2000; Fyfe et al., 1999; Kushner et al., 2001; Cai et al., 2003; Gillett et al., 2003; Kuzmina et al., 2005) are likely to be affected by greenhouse forcing and ozone depletion. For example, the average of the IPCC WGI AR4 simulations from thirteen models shows a positive trend for the Northern Annular Mode that becomes statistically significant early in the 21st century (Meehl et al., 2007 Section 10.3.5.6). Such changes would affect surface pressure patterns, storm tracks and rainfall distributions in the mid and high latitudes of both hemispheres, with potentially serious impacts on regional water supplies, agriculture, wind speeds and extreme events. Implications are potentially severe for water resources and storminess in Australia, New Zealand, southern Africa, Argentina and Chile, southern Europe, and possibly parts of the USA where Mediterranean-type climates prevail.

Current forcing may have caused changes in these modes but observed changes are also similar to those simulated in AOGCMs in the absence of forcing (Cai et al., 2003). There is some evidence for a weakening of major tropical monsoon circulations (AR4 WGI 3.7.1, 9.5.3.5). Projections of monsoon precipitation show a complex pattern of increases (e.g., Australia in the southern summer and Asia), and decreases (e.g., the Sahel in the northern summer) (Meehl et al., 2007 Section 10.3.5.2). Confidence in projections of specific monsoonal changes is low to medium.

### 19.3.6 Extreme events

As discussed in WGI AR4 Technical Summary (Solomon et al., 2007) Box TS.5 and Table TS.4, various extreme events are very likely to change in magnitude and/or frequency and location with global warming. In some cases, significant trends have been observed in recent decades (Trenberth et al., 2007 Table 3.8).

The most likely changes are an increase in the number of hot days and nights (with some minor regional exceptions), or in days exceeding various threshold temperatures, and decreases in the number of cold days, particularly including frosts. These are virtually certain to affect human comfort and health, natural ecosystems and crops. Extended warmer periods are also very likely to increase water demand and evaporative losses, increasing the intensity and duration of droughts, assuming no increases in precipitation.

Precipitation is generally predicted in climate models to increase in high latitudes and to decrease in some mid-latitude regions, especially in regions where the mid-latitude westerlies migrate polewards in the summer season, thus steering fewer storms into such 'Mediterranean climates' (Meehl et al., 2007 Section 10.3.2.3). These changes, together with a general intensification of rainfall events (Meehl et al., 2007 Section 10.3.6.1), are very likely to increase the frequency of flash floods and large-area floods in many regions, especially at high latitudes. This will be exacerbated, or at least seasonally modified in some locations, by earlier melting of snowpacks and melting of glaciers. Regions of constant or reduced precipitation are very likely to experience more frequent and intense droughts, notably in Mediterranean-type climates and in mid-latitude continental interiors.

Extended warm periods and increased drought will increase water stress in forests and grasslands and increase the frequency and intensity of wildfires (Cary, 2002; Westerling et al., 2006), especially in forests and peatland, including thawed permafrost. These effects may lead to large losses of accumulated carbon from the soil and biosphere to the atmosphere, thereby amplifying global warming (\*\*) (see Sections 4.4.1, 19.3.5.1; Langmann and Heil, 2004; Angert et al., 2005; Bellamy et al., 2005).

Tropical cyclones (including hurricanes and typhoons), are likely to become more intense with sea surface temperature increases, with model simulations projecting increases by mid-century (Meehl et al., 2007 Section 10.3.6.3). However, despite an ongoing debate, some data reanalyses suggest that, since the 1970s, tropical cyclone intensities have increased far more

rapidly in all major ocean basins where tropical cyclones occur (Trenberth et al., 2007 Section 3.8.3), and that this is consistently related to increasing sea surface temperatures. Some authors have questioned the reliability of these data, in part because climate models do not predict such large increases; however, the climate models could be underestimating the changes due to inadequate spatial resolution. This issue currently remains unresolved. Some modelling experiments suggest that the total number of tropical cyclones is expected to decrease slightly (Meehl et al., 2007 Section 10.3.6.3), but it is the more intense storms that have by far the greatest impacts and constitute a key vulnerability.

The combination of rising sea level and more intense coastal storms, especially tropical cyclones, would cause more frequent and intense storm surges, with damages exacerbated by more intense inland rainfall and stronger winds (see Section 6.3.2). Increasing exposure occurs as coastal populations increase (see Section 6.3.1).

Many adaptation measures exist that could reduce vulnerability to extreme events. Among them are dams to provide flood protection and water supply, dykes and coastal restoration for protection against coastal surges, improved construction standards, land-use planning to reduce exposure, disaster preparedness, improved warning systems and evacuation procedures, and broader availability of insurance and emergency relief (see Chapter 18). However, despite considerable advances in knowledge regarding weather extremes, the relevant adaptation measures are underused, partly for reasons of cost, especially in developing countries (White et al., 2001; Sections 7.4.3, 7.5 and 7.6). Despite progress in reducing the mortality associated with many classes of extremes, human societies, particularly in the developing world, are not well adapted to the current baseline of climate variability and extreme events, such as tropical cyclones, floods and droughts, and thus these impacts are often assessed as key vulnerabilities.

### 19.3.7 Update on 'Reasons for Concern'

The TAR (Smith et al., 2001; IPCC, 2001b) identified five 'reasons for concern' about climate change and showed schematically how their seriousness would increase with global mean temperature change. In this section, the 'reasons for concern' are updated.

#### *Unique and threatened systems*

The TAR concluded that there is medium confidence that an increase in global mean temperature of 2°C above 1990 levels or less would harm several such systems, in particular coral reefs and coastal regions.

Since the TAR, there is new and much stronger evidence of observed impacts of climate change on unique and vulnerable systems (see Sections 1.3.4 and 1.3.5; Parmesan and Yohe, 2003; Root et al., 2003, 2005; Menzel et al., 2006), many of which are described as already being adversely affected by climate change. This is particularly evident in polar ecosystems (e.g., ACIA, 2005). Furthermore, confidence has increased that an increase in global mean temperature of up to 2°C relative to 1990 temperatures will pose significant risks to many unique and

vulnerable systems, including many biodiversity hotspots (e.g., Hare, 2003; Leemans and Eickhout, 2004; Malcolm et al., 2006). In summary, there is now high confidence that a warming of up to 2°C above 1990–2000 levels would have significant impacts on many unique and vulnerable systems, and is likely to increase the endangered status of many threatened species, with increasing adverse impacts and confidence in this conclusion at higher levels of temperature increase.

#### *Extreme events*

The TAR concluded that there is high confidence that the frequency and magnitude of many extreme climate-related events (e.g., heatwaves, tropical cyclone intensities) will increase with a temperature increase of less than 2°C above 1990 levels; and that this increase and consequent damages will become greater at higher temperatures.

Recent extreme climate events have demonstrated that such events can cause significant loss of life and property damage in both developing and developed countries (e.g., Schär et al., 2004). While individual events cannot be attributed solely to anthropogenic climate change, recent research indicates that human influence has already increased the risk of certain extreme events such as heatwaves (\*\*) and intense tropical cyclones (\*) (Stott et al., 2004; Emanuel, 2005; Webster et al., 2005; Trenberth et al., 2007; Bindoff et al., 2007). There is high confidence that a warming of up to 2°C above 1990–2000 levels would increase the risk of many extreme events, including floods, droughts, heatwaves and fires, with increasing levels of adverse impacts and confidence in this conclusion at higher levels of temperature increase.

#### *Distribution of impacts*

Chapter 19 of the WGII TAR (Smith et al., 2001) concluded that there is high confidence that developing countries will be more vulnerable to climate change than developed countries; medium confidence that a warming of less than 2°C above 1990 levels would have net negative impacts on market sectors in many developing countries and net positive impacts on market sectors in many developed countries; and high confidence that above 2 to 3°C, there would be net negative impacts in many developed countries and additional negative impacts in many developing countries.

There is still high confidence that the distribution of impacts will be uneven and that low-latitude, less-developed areas are generally at greatest risk due to both higher sensitivity and lower adaptive capacity. However, recent work has shown that vulnerability to climate change is also highly variable within individual countries. As a consequence, some population groups in developed countries are also highly vulnerable even to a warming of less than 2°C (see, e.g., Section 12.4.). For instance, indigenous populations in high-latitude areas are already faced with significant adverse impacts from climate change to date (see Section 14.4; ACIA, 2005), and the increasing number of coastal dwellers, particularly in areas subject to tropical cyclones, are facing increasing risks (Christensen et al., 2007 Box 11.5; Section 11.9.5). There is high confidence that warming of 1 to 2°C above 1990–2000 levels would include key negative impacts in some regions of the world (e.g., Arctic nations, small islands), and pose

new and significant threats to certain highly vulnerable population groups in other regions (e.g., high-altitude communities, coastal-zone communities with significant poverty levels), with increasing levels of adverse impacts and confidence in this conclusion at higher levels of temperature increase.

#### *Aggregate impacts*

Chapter 19 of the WGII TAR (Smith et al., 2001) concluded that there is medium confidence that with an increase in global mean temperature of up to 2°C above 1990 levels, aggregate market sector impacts would be plus or minus a few percent of gross world product, but most people in the world would be negatively affected. Studies of aggregate economic impacts found net damages beyond temperature increases of 2 to 3°C above 1990 levels, with increasing damages at higher magnitudes of climate change.

The findings of the TAR are consistent with more recent studies, as reviewed in Hitz and Smith (2004). Many limitations of aggregated climate impact estimates have already been noted in the TAR, such as difficulties in the valuation of non-market impacts, the scarcity of studies outside a few developed countries, the focus of most studies on selected effects of a smooth mean temperature increase, and a preliminary representation of adaptation and development. Recent studies have included some of these previously unaccounted for aspects, such as flood damage to agriculture (Rosenzweig et al., 2002) and damages from increased cyclone intensity (Climate Risk Management Limited, 2005). These studies imply that the physical impacts and costs associated with these neglected aspects of climate change may be very significant. Different analytic techniques (e.g., Nordhaus, 2006) can result in estimates of higher net damages; inclusion of indirect effects can increase the magnitude of impacts (e.g., Fankhauser and Tol, 2005; Stern, 2007). Other studies reinforce the finding of potential benefits at a few degrees of warming, followed by damages with more warming (Maddison, 2003; Tol, 2005). However, long-term costs from even a few degrees of warming, such as eventual rise in sea level (e.g., Overpeck et al., 2006), are not included in aggregate damage estimates. In addition, the current literature is limited in accounting for the economic opportunities that can be created by climate change.

On balance, the current generation of aggregate estimates in the literature is more likely than not to understate the actual costs of climate change. Consequently, it is possible that initial net market benefits from climate change will peak at a lower magnitude and sooner than was assumed for the TAR, and it is likely that there will be higher damages for larger magnitudes of global mean temperature increases than estimated in the TAR.

The literature also includes analysis of aggregate impacts of climate change other than monetary effects. Parry et al. (1999) found that climate change could adversely affect hundreds of millions of people through increased risk of coastal flooding, reduction in water supplies, increased risk of malnutrition and increased risk of exposure to disease. All of these impacts would directly affect human health. The 'Global Burden of Disease' study estimated that the climate change that has occurred since 1990 has increased mortality, and that projected climate change will increase future disease burdens even with adaptation

(McMichael et al., 2004). There is low to medium confidence that most people in the world will be negatively affected at global mean temperature increases of 1-2°C above 1990-2000 levels, with increasing levels of adverse impacts and confidence in this conclusion at higher levels of temperature increase.

#### *Large-scale singularities*

The TAR concluded that there is low to medium confidence that a rapid warming of over 3°C would trigger large-scale singularities in the climate system, such as changes in climate variability (e.g., ENSO changes), breakdown of the thermohaline circulation (THC – or equivalently, meridional overturning circulation, MOC), deglaciation of the WAIS, and climate–biosphere–carbon cycle feedbacks. However, determining the trigger points and timing of large-scale singularities was seen as difficult because of the many complex interactions of the climate system.

Since the TAR, the literature offers more specific guidance on possible thresholds for partial or near-complete deglaciation of the Greenland and West Antarctic ice sheets. There is medium confidence that at least partial deglaciation of the Greenland ice sheet, and possibly the WAIS, would occur over a period of time ranging from centuries to millennia for a global average temperature increase of 1-4°C (relative to 1990-2000), causing a contribution to sea-level rise of 4-6 m or more (Section 19.3.5.2; Jansen et al., 2007 Section 6.4; Meehl et al., 2007 Sections 10.7.4.3 and 10.7.4.4; Oppenheimer and Alley, 2004, 2005; Hansen, 2005; Otto-Bliesner et al., 2006; Overpeck et al., 2006). Since the TAR, there is more confidence in projections of the climate consequences of feedbacks in the carbon cycle (see Section 19.3.5.1).

## 19.4 Assessment of response strategies to avoid key vulnerabilities

This section reviews the literature addressing the linkages between key vulnerabilities and response strategies in order to avoid or reduce them. This section is structured as follows. Section 19.4.1 reviews the literature on the role of adaptation to avoid key vulnerabilities. As discussed in Section 19.2, the lack of adaptive capacity, or the inability to adapt, is one of the criteria relevant for the selection of key vulnerabilities. Section 19.4.2 reviews the literature that specifically addresses the avoidance of key vulnerabilities through mitigation of climate change. Section 19.4.3 synthesises the knowledge about avoiding key vulnerabilities of climate change.

The principal response strategies – mitigation of climate change and adaptation – are often portrayed as having largely different foci in terms of their characteristic spatial and temporal scales. Other important strategies include investing in gaining knowledge (e.g., improving predictions and the understanding of options) and investing in capacity-building (improving ability and tools to make good decisions under uncertainty). Finally, some have suggested geo-engineering as a backstop policy option (see, e.g., Izrael, 2005; Cicerone, 2006; Crutzen, 2006; Kiehl, 2006; Wigley, 2006, for an update on this debate).

Given the integrating nature of this section at the interface between climate change impacts and vulnerabilities, mitigation, and adaptation, there are important links with other chapters of the IPCC AR4. Most importantly, WGII Chapter 17 discusses the role of adaptation to climate change; WGII Chapter 18, WGIII Chapter 2 Section 2.5 and Chapter 3 Section 3.5 discuss the links between mitigation and adaptation; WGIII Chapter 1 Section 1.2 and Chapter 2 Section 2.2 discuss the characteristics of the challenge and some decision-making problems in responding to global climate change, respectively; WGII Chapter 2 Section 2.2.7 and WGIII Chapter 2 Section 2.3 discuss methods to address uncertainties in this context; WGIII Chapter 3 Section 3.3 and Chapter 3 Section 3.6 discuss climate change mitigation from a long-term and a short-term perspective, respectively; and WGII Chapter 2 Section 2.4.6 discusses methods of evaluating impacts associated with mitigation scenarios.

### 19.4.1 Adaptation as a response strategy

How much can anticipatory and autonomous adaptation achieve? What is the potential for, and limitations of, adaptation to reduce impacts and to reduce or avoid key vulnerabilities?

The scientific literature on these questions is less well developed than for mitigation, and the conclusions are more speculative in many cases. It is clear, however, that there is no simple comprehensive response to the adaptation question, and that the answers are often place-specific and very nuanced, and are likely to become more so as research advances.

In agriculture, for example, previous IPCC assessments have generally concluded that, in the near to medium term, aggregate world food production is not threatened (IPCC, 1996, 2001a). However, considerable regional variation in impacts and adaptive capacity suggests that severe impacts and food scarcity could occur in some regions, especially at low latitudes, where large numbers of poorer people are already engaged in agriculture that is not currently viable (see Section 5.4.2). In global terms, agriculture has been extremely resilient and world food production has expanded rapidly to keep pace with world population growth. Of course, there is debate on the sustainability of these trends, as they depend in part on the growing demand for meat and meat products as well as potential competition between agricultural resources for producing food versus those used for producing energy. Nevertheless, even where shortages have occurred, the reasons are rarely to be found in an absolute lack of food but are more due to lack of purchasing power and failures of the distribution system.

Attention to adaptation in agriculture has tended to focus on specific measures at the farm level, and some progress is being made in the incorporation of climate risks into agricultural practices. On the other hand, the processes of globalisation and technological change are placing adaptation more in the hands of agri-business, national policy-makers, and the international political economy, including such factors as prices, tariffs and subsidies, and the terms of international trade (Apuuli et al., 2000; Burton and Lim, 2005).

The record of past success in agriculture is often seen in other sectors, particularly in developed countries and, in many regions it is evident that current climate variability falls largely within

the coping range (Burton and Lim, 2005). One possible exception is in the case of extreme events where monetary losses (both insured and uninsured – Munich Re, 2005) have been rising sharply, although mortality has been falling. In such cases, adaptation has not been so successful, despite major improvements in understanding the risks and in forecasts and warnings (White et al., 2001). One reason is the decline in local concern and thus a reduced propensity to adopt proactive adaptation measures, as the memory of specific disaster events fades. Related to this lack of appreciation of possible risks is that governments and communities can still be taken by surprise when extreme events occur, even though scientific evidence of their potential occurrence is widely available (Bazermann, 2005). Economic damage and loss of life from Hurricane Katrina in 2005, the European heatwave of 2003, and many other similar events are due in large measure to a lack of sufficient anticipatory adaptation, or even maladaptation in some cases. So while the overall record of adaptation to climate change and variability in the past 200 or so years has been successful overall, there is evidence of insufficient investments in adaptation opportunities, especially in relation to extreme events (Burton, 2004, Burton and May, 2004; Hallegatte et al., 2007). While economic losses have increased, there has been considerable success in reducing loss of life; and despite the recent spate of deadly extreme weather events, the general trend in mortality and morbidity remains downwards.

It is clear that in the future there is considerable scope for adaptation, provided that existing and developing scientific understanding, technology and know-how can be effectively applied. It might be expected that the slower the rate of climate change, the more likely it is that adaptation will be successful. For example, even a major rise in sea level might be accommodated and adjusted to by human societies if it happens very slowly over many centuries (Nicholls and Tol, 2006). On the other hand, slow incremental change can still involve considerable costs and people might not be sufficiently motivated to take precautionary action and bear the associated costs without some more dramatic stimulus. Paradoxically, therefore, the full array of human adaptation potential is not likely to be brought to bear when all the market, social, psychological and institutional barriers to adaptation are taken into account.

In terms of the key vulnerabilities identified in Table 19.1, it is clear that adaptation potential is greater the more the system is under human management and control. Major geophysical changes leave little room for human-managed adaptation. Fortunately these changes are likely to unfold relatively slowly, thus allowing more time for adaptation to their eventual impacts. There is somewhat greater adaptive capacity in biological systems, but it is still very limited. Biodiversity and ecosystems are likely to be impacted at a much faster rate than geophysical systems without a commensurately larger adaptive capacity for such impacts. It seems likely, therefore, that the greatest impacts in the near to medium term, where adaptation capacity is very limited, will occur in biological systems (Leemans and Eickhout, 2004; Smith, 2004; see Chapter 4). As we move into human social systems and market systems, adaptive capacity at the technical level increases dramatically. However, the understanding of impacts, adaptive capacity, and the costs of

adaptation is weaker in social systems than in biological systems, and the uncertainties are high. This is especially the case for synergistic or cross-cutting impacts. Considered in isolation, the potential for agricultural adaptation may appear to be good. When related impacts in water regimes, droughts and floods, pest infestations and plant diseases, human health, the reliability of infrastructure, poor governance, as well as other non-climate-related stresses are taken into account, the picture is less clear.

A general conclusion on the basis of the present understanding is that for market and social systems there is considerable adaptation potential, but the economic costs are potentially large, largely unknown and unequally distributed, as is the adaptation potential itself. For biological and geophysical systems, the adaptation potential is much less than in social and market systems, because impacts are more direct and therefore appear more rapidly. A large proportion of the future increase in key vulnerabilities is likely to be recorded first in biological systems (see Chapter 1). This does not mean that key vulnerabilities will not occur in social and market systems. They depend on biological systems, and as ecosystems are affected by mounting stresses from climate change and concomitant factors such as habitat fractionation, and the spread of plant diseases and pest infestations, then the follow-on, second-order effects on human health and safety, livelihoods and prosperity, will be considerable (\*/\*\*).

## 19.4.2 Mitigation

This subsection reviews the growing literature (see, e.g., Schellnhuber et al., 2006) on mitigation of climate change as a means to avoid key vulnerabilities or dangerous anthropogenic interference (DAI) with the climate system. A more general review of the literature on climate change mitigation is found in the WGIII AR4 Chapter 3 (Fisher et al., 2007) Sections 3.3.5 (on long-term stabilisation scenarios), 3.5.2 and 3.5.3 (on integrated assessment and risk management) and 3.6 (on linkages between short-term and long-term targets).

### 19.4.2.1 Methodological approaches to the assessment of mitigation strategies

A variety of methods is used in the literature to identify response strategies that may avoid potential key vulnerabilities or DAI (see also Fisher et al., 2007, Section 3.5.2). These methods can be characterised according to the following dimensions.

- *Targeted versus non-targeted*

In this section, targeted approaches refer to the determination of policy strategies that attempt to avoid exceeding pre-defined targets for key vulnerabilities or DAI thresholds, whereas non-targeted approaches determine the implications for key vulnerabilities or DAI of emissions or concentration pathways selected without initial consideration of such targets or thresholds. Targeted approaches are sometimes referred to as ‘inverse’ approaches, as they are working backwards from a specified outcome (e.g., an impact threshold not to be exceeded) towards the origin of the cause–effect chain that links GHG emissions with climate impacts.

- *Deterministic versus set-based versus probabilistic*  
Deterministic analyses are based on best-guess estimates for uncertain parameters, whereas probabilistic analyses explicitly consider key uncertainties of the coupled socio-natural system by describing one or more parameters in terms of probability distributions. Uncertainty can also be treated discretely by set-based methods that select different possible values without specifying any probability distribution across the members of that set. For a more detailed discussion of the role of uncertainty in the assessment of response strategies, see Box 19.3.
- *Optimising versus adaptive versus non-optimising*  
Optimising analyses determine recommended policy strategies based on a pre-defined objective, such as cost minimisation; whereas non-optimising analyses do not require the specification of such an objective function.

Adaptive analyses optimise near-term decisions under the assumption that future decisions will consider new information as and when it materialises.

Table 19.2 characterises the main methods applied in the relevant literature based on two of the three dimensions defined above, because deterministic, set-based and probabilistic approaches can be applied to each of these methods. The remainder of Section 19.4 reviews literature pertaining to these methods that examines mitigation strategies to avoid key vulnerabilities or DAI.

#### 19.4.2.2 Scenario analysis and analysis of stabilisation targets

Scenario analysis examines the implications of specified emissions pathways or concentration profiles for future climate change, e.g., magnitude and rate of temperature increase. Some studies focus on the key radiative forcing agent CO<sub>2</sub>, while

### Box 19.3. Uncertainties in the assessment of response strategies

Climate change assessments and the development of response strategies face multiple uncertainties and unknowns (see Fourth Assessment Working Group II Chapter 2 and Working Group III Chapter 2). The most relevant sources of uncertainty in this context are:

- (i) Natural randomness,
- (ii) Lack of scientific knowledge,
- (iii) Social choice (reflexive uncertainty),
- (iv) Value diversity.

Some sources of uncertainty can be reasonably represented by probabilities, whereas others are more difficult to characterise probabilistically. The natural randomness in the climate system can be characterised by frequentist (or objective) probabilities, which describe the *relative frequency* (sometimes referred to as ‘likelihood’) of a repeatable event under known circumstances. There are, however, limitations to the frequentist description, given that the climate system is non-stationary at a range of scales and that past forcing factors cannot be perfectly known. The reliability of *knowledge* about uncertain aspects of the world (such as the ‘true’ value of climate sensitivity) cannot be empirically represented by frequentist probabilities alone. It is possible to construct probability distributions of climate sensitivity that look like frequency representations, but they will always have substantial elements of subjectivity embedded (Morgan and Keith, 1995; Allen et al., 2001). The inherent need for probabilistic analyses in a risk-management framework becomes problematic when some analysts object in principle to even assessing probabilities in situations of considerable lack of data or other key ingredients for probabilistic assessment. To help bridge this philosophical conflict, it has been suggested that making subjective elements transparent is an essential obligation of assessments using such an approach (e.g., Moss and Schneider, 2000). One method of characterising uncertainty due to a lack of scientific knowledge is by Bayesian (or subjective) probabilities, which refer to the *degree of belief* of experts in a particular statement, considering the available data. Another approach involves non-probabilistic representations such as imprecise probabilities (e.g., Hall et al., 2006). Whether probabilities can be applied to describe future social choice, in particular uncertainties in future greenhouse gas emissions, has also been the subject of considerable scientific debate (e.g., Allen et al., 2001; Grubler and Nakićenović, 2001; Lempert and Schlesinger, 2001; Pittock et al., 2001; Reilly et al., 2001; Schneider, 2001, 2002). Value diversity (such as different attitudes towards risk or equity) cannot be meaningfully addressed through an objective probabilistic description. It is often assessed through sensitivity analysis or scenario analysis, in which different value systems are explicitly represented and their associated impacts contrasted.

The probabilistic analyses of DAI reported in this section draw substantially on (subjective) Bayesian probabilities to describe key uncertainties in the climate system, such as climate sensitivity, the rate of oceanic heat uptake, current radiative forcing, and indirect aerosol forcing. See WGI Chapter 9 (Hegerl et al., 2007) and Chapter 10 (Meehl et al., 2007) for a more detailed discussion. While these uncertainties prevent the establishment of a high-confidence, one-to-one linkage between atmospheric greenhouse gas concentrations and global mean temperature increase, probabilistic analyses can assign a subjective probability of exceeding certain temperature thresholds for given emissions scenarios or concentration targets (e.g., Meinshausen, 2005; Harvey, 2007).

**Table 19.2.** Methods to identify climate policies to avoid key vulnerabilities or DAI.

Method	Description	Optimising approach?	Targeted approach?
Scenario analysis, analysis of stabilisation targets	Analyse the implications for temperature increase of specific concentration stabilisation levels, concentration pathways, emissions scenarios, or other policy scenarios.	No	No
Guardrail analysis	Derive ranges of emissions that are compatible with predefined constraints on temperature increase, intolerable climate impacts, and/or unacceptable mitigation costs.	No	Yes
Cost-benefit analysis including key vulnerabilities and DAI	Include representations of key vulnerabilities or DAI in a cost-optimising integrated assessment framework.	Yes	No
Cost-effectiveness analysis	Identify cost-minimising emissions pathways that are consistent with predefined constraints for GHG concentrations, climate change or climate impacts.	Yes	Yes

others include additional gases and aerosols in their analysis, often representing concentrations in terms of CO<sub>2</sub>-equivalent ppm or radiative forcing in W/m<sup>2</sup> (see Forster et al., 2007 Section 2.3). Dynamic analyses include information about the trajectories of GHG emissions and development pathways, GHG concentrations, climate change and associated impacts. Related static analyses examine the relationship between stabilisation targets for GHG concentrations and equilibrium values for climate parameters (typically the increase in global mean temperature). Note that the term ‘GHG stabilisation’ is used here with a time horizon of up to several centuries. Over a longer time period without anthropogenic GHG emissions, CO<sub>2</sub> concentrations may return to values close to pre-industrial levels through natural processes (Brovkin et al., 2002; Putilov, 2003; Semenov, 2004a,b; Izrael and Semenov, 2005, 2006).

The shape over time of the specified emissions pathway or concentration profile is of particular relevance when considering key vulnerabilities, as it influences transient climate change and associated climate impacts (see, e.g., O’Neill and Oppenheimer, 2004; Meinshausen, 2005; Schneider and Mastrandrea, 2005; Mastrandrea and Schneider, 2006). Two general categories can be distinguished in studies that specifically consider CO<sub>2</sub> concentrations or temperature thresholds associated with key vulnerabilities or DAI: stabilisation scenarios, which imply concentrations increasing smoothly from current levels to a final stabilisation concentration (e.g., Enting et al., 1994; Schimel et al., 1996; Wigley et al., 1996; Morita et al., 2000; Swart et al., 2002; O’Neill and Oppenheimer, 2004) and peaking or overshoot scenarios, where a final concentration stabilisation level is temporarily exceeded (Harvey, 2004; Kheshgi, 2004;

O’Neill and Oppenheimer, 2004; Wigley, 2004; Izrael and Semenov, 2005; Kheshgi et al., 2005; Meinshausen et al., 2005; Frame et al., 2006). Overshoot scenarios are necessary for the exploration of stabilisation levels close to or below current concentration levels.

Some studies treat the uncertainty in future GHG emissions and climate change by analysing a discrete range of scenarios. O’Neill and Oppenheimer (2002) examined ranges of global mean temperature increase in 2100 associated with 450, 550 and 650 ppm CO<sub>2</sub> concentration stabilisation profiles, as reported in the TAR (Cubasch et al., 2001). They concluded that none of these scenarios would prevent widespread coral-reef bleaching in 2100 (assumed to have a threshold 1°C increase above current levels), and that only the 450 ppm CO<sub>2</sub> stabilisation profile is likely to be associated with avoiding both deglaciation of West Antarctica (assumed to have a threshold of 2°C above current levels) and collapse of the MOC (assumed to have a threshold of 3°C increase within 100 years). Lowe et al. (2006) consider a suite of climate scenarios based on a ‘perturbed parameter ensemble’ of Hadley Centre climate models, finding that, for stabilisation close to 450 ppm, 5% of their scenarios exceed a threshold for deglaciation of West Antarctica (assumed to be 2.1°C local warming above 1990-2000 levels). Corfee-Morlot and Höhne (2003) review the current knowledge about climate impacts for each ‘reason for concern’ at different levels of global mean temperature change and CO<sub>2</sub> stabilisation, based on published probability density functions (PDFs) of climate sensitivity, finding that any CO<sub>2</sub> stabilisation target above 450 ppm is associated with a significant probability of triggering a large-scale climatic event. An inverse analysis of the implications of reaching CO<sub>2</sub> stabilisation at 450 ppm concludes that more than half of the SRES emissions scenarios leave this stabilisation target virtually out of reach as of 2020. A robust finding across such studies is that the probability of exceeding thresholds for specific key vulnerabilities or DAI increases with higher stabilisation levels for GHG concentrations.

Other studies quantify uncertainty using probability distributions for one or more parameters of the coupled social-natural system. Figure 19.1, for instance, depicts the likelihood of exceeding an equilibrium temperature threshold of 2°C above pre-industrial levels based on a range of published probability distributions for climate sensitivity. To render eventual exceedence of this exemplary threshold ‘unlikely’ (<33% chance), the CO<sub>2</sub>-equivalent stabilisation level must be below 410 ppm for the majority of considered climate sensitivity uncertainty distributions (range between 350 and 470 ppm).

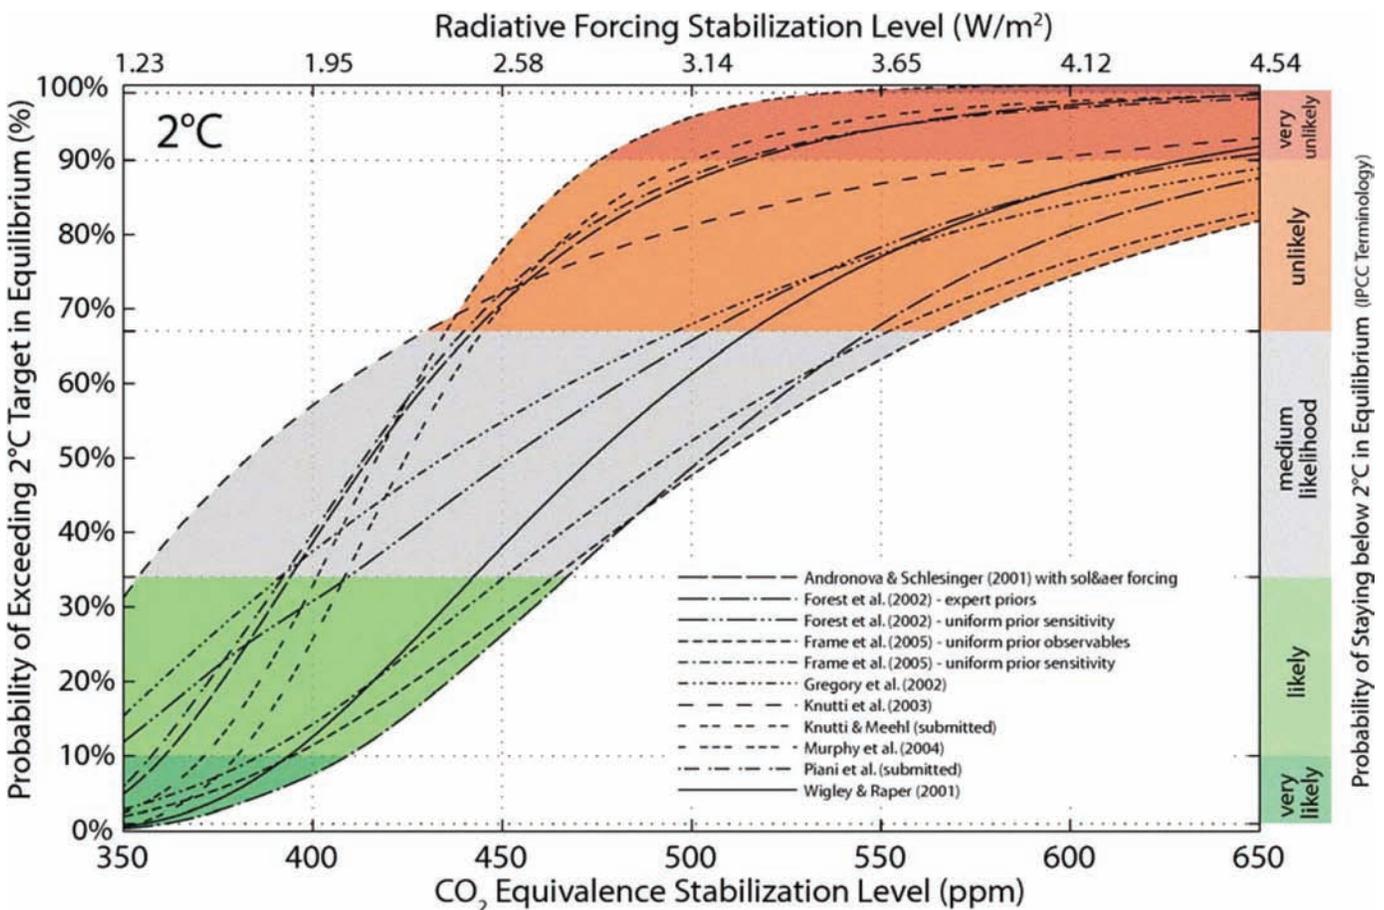

*Key caveat:* The analysis in Figure 19.1 employs a number of probability distributions taken from the literature. The WGIAR4 has assessed the body of literature pertaining to climate sensitivity, and concludes that the climate sensitivity is ‘likely’ to lie in the range 2-4.5°C, and is ‘very likely’ to be above 1.5°C (Meehl et al., 2007 Executive Summary). For fundamental physical reasons, as well as data limitations, values substantially higher than 4.5°C still cannot be excluded, although agreement with observations and proxy data is generally worse for those high values than for values in the 2-4.5°C range (Meehl et al., 2007 Executive Summary). ‘Likely’ in IPCC usage has been defined as a 66 to 90% chance, and ‘very likely’ has been

defined as a 90 to 99% chance. Therefore, implicit in the information given by WGI is a 10 to 34% chance that climate sensitivity is outside the 'likely' range, with equal probability (5 to 17%) that it is below 2°C or above 4.5°C. Furthermore, the WGI assessment assigns a 90 to 99% chance that the climate sensitivity is above 1.5°C. However, the shape of the distribution to the right of 4.5°C – crucial for risk-management analyses – is, as noted by WGI, so uncertain given the lack of scientific knowledge, that any quantitative conclusion reached based on probability functions beyond 4.5°C climate sensitivity would be very low confidence. For these reasons, we assign no more than low confidence to any of the distributions or results presented in this section, particularly if the result depends on the tails of the probability distribution for climate sensitivity. Nevertheless, as noted here, a risk-management framework requires input of (even if low-probability, low-confidence) outlier information. Therefore, we present the literature based on probabilistic analyses to demonstrate the framework inherent in the risk management approach to assessing key vulnerabilities.

The temperature threshold for DAI can itself be represented by a subjective probability distribution. Wigley (2004) combined probability distributions for climate sensitivity and the temperature threshold for DAI in order to construct a distribution for the CO<sub>2</sub> stabilisation level required to avoid DAI. Under this assumption set, the median stabilisation level for atmospheric

CO<sub>2</sub> concentrations is 536 ppm, and there is a 17% chance that the stabilisation level necessary to avoid DAI is below current atmospheric CO<sub>2</sub> levels. A similar analysis by Harvey (2006, 2007) added the explicit normative choice of an 'acceptable' probability (10%) for exceeding the probabilistic temperature threshold for DAI. With similar assumptions about the probability distributions for climate sensitivity and the DAI temperature threshold, he finds that the allowable CO<sub>2</sub> stabilisation concentration is between 390 and 435 ppm, depending on assumptions about aerosol forcing. Of course, these results are quite sensitive to all the assumptions made, as both authors explicitly acknowledge.

Finally, significant differences in environmental impacts are anticipated between GHG concentration stabilisation trajectories that allow overshoot of the stabilisation concentration versus those that do not, even when they lead to the same final concentration. For example, Schneider and Mastrandrea (2005) calculate the probability of at least temporarily exceeding a target of 2°C above pre-industrial (1.4°C above 'current') by 2200 to be 70% higher (77% instead of 45%) for an overshoot scenario rising to 600 ppm CO<sub>2</sub>-equivalent and then stabilising in several centuries at 500 ppm CO<sub>2</sub>-equivalent, compared with a non-overshoot scenario stabilising at the same level (Figure 19.2, top panel). Overshoot scenarios induce higher transient temperature increases, increasing the probability of temporary or

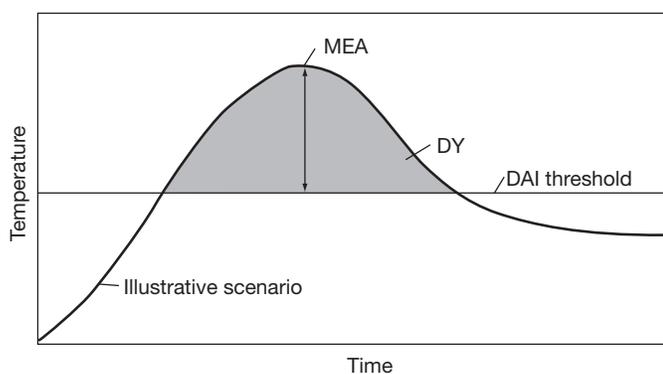

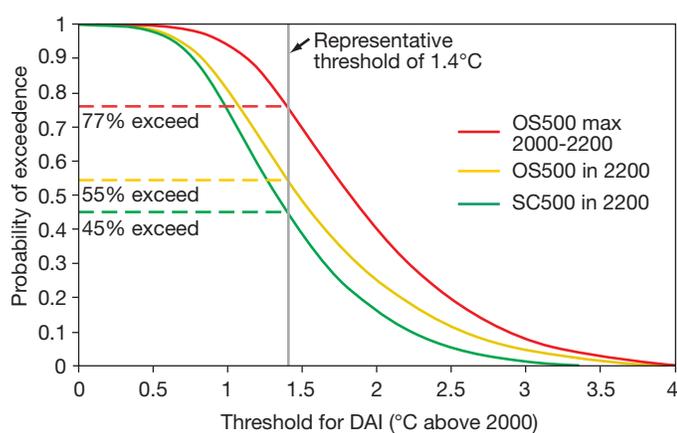

**Figure 19.1.** Probability (see 'Key caveat' above on low confidence for specific quantitative results) of exceeding an equilibrium global warming of 2°C above pre-industrial (1.4°C above 1990 levels), for a range of CO<sub>2</sub>-equivalent stabilisation levels. Source: Hare and Meinshausen (2005).

permanent exceedence of thresholds for key vulnerabilities or DAI (e.g., Hammitt and Shlyakhter, 1999; Harvey, 2004; O'Neill and Oppenheimer, 2004; Hare and Meinshausen, 2005; Knutti et al., 2005). With this in mind, Schneider and Mastrandrea (2005) suggested two metrics – maximum exceedence amplitude and degree years – for characterising the maximum and cumulative magnitude of overshoot of a temperature threshold for DAI, as shown for an illustrative scenario in Figure 19.2 (bottom panel). Since the rate of temperature rise is important to adaptive capacity (see Section 19.4.1) and thus impacts, the time delay between now and the date of occurrence of the maximum temperature (year of MEA on Figure 19.2b) is also relevant to the likelihood of creating key vulnerabilities or exceeding specified DAI thresholds.

### 19.4.2.3 Guardrail analysis

Guardrail analysis comprises two types of inverse analysis that first define targets for climate change or climate impacts to

**Figure 19.2.** Top panel: Probability of exceedence of a range of temperature thresholds for overshoot (OS500) and non-overshoot (SC500) scenarios, derived from probability distributions for climate sensitivity (see ‘Key caveat’ above on low confidence for specific quantitative results). OS500 Max is derived from the maximum overshoot temperature that occurs during the transient response before 2200, whereas OS500 in 2200 and SC500 in 2200 are derived from temperatures in 2200. While model-dependent, these results demonstrate the importance of considering transient temperature change when evaluating mitigation strategies to avoid key vulnerabilities. Bottom panel: Visualisation of maximum exceedence amplitude (MEA) and degree years (DY) for an illustrative overshoot temperature profile. Source: Schneider and Mastrandrea (2005).

be avoided and then determine the range of emissions that are compatible with these targets: tolerable windows analysis (Toth, 2003) and safe landing analysis (Swart et al., 1998). The tolerable windows approach allows the assessment of the implications of multiple competing climate policy goals on the mid-term and long-term ranges of permissible greenhouse gas emissions. It has initially been applied to several normative thresholds for climate impacts, which are analysed together with socio-economic constraints that aim at excluding unacceptable mitigation policies. Toth et al. (2003) analyse the interplay between thresholds for the global transformation of ecosystems, regional mitigation costs and the timing of mitigation. They show that following a business-as-usual scenario of GHG emissions (which resembles the SRES A2 scenario) until 2040 precludes the possibility of limiting the worldwide transformation of ecosystems to 30%, even under optimistic assumptions regarding willingness to pay for the mitigation of GHG emissions afterwards. Toth et al. (2003) show that mitigation of GHG emissions has to start no later than 2015 if a reduction in agricultural yield potential in South Asia of more than 10% is to be avoided. This result, however, is contingent on the regional climate change projection of the specific GCM applied in this analysis (HadCM2) and the accuracy of the impact models. The consideration of regional and local climate impacts in inverse analyses raises challenges as to the treatment of the significant uncertainties associated with them.

The tolerable windows approach has also been applied in connection with systematic climate thresholds, predominantly for probabilistic analyses of the stability of the thermohaline ocean circulation (Zickfeld and Bruckner, 2003; Bruckner and Zickfeld, 2004; Rahmstorf and Zickfeld, 2005). Rahmstorf and Zickfeld (2005) conclude that the SRES A2 emissions scenario exceeds the range of emissions corresponding to a 5% and 10% likelihood of inducing a commitment to a circulation shutdown around 2035 and 2065, respectively. A 2% risk of shutdown can no longer be avoided, even with very stringent emission reductions, given the assumptions in their models.

### 19.4.2.4 Cost–benefit analysis

Cost–benefit analyses (CBAs) of climate change in general are reviewed in Fisher et al., 2007 Section 3.5.3.3. The discussion here focuses on the suitability of CBA for avoiding key vulnerabilities and DAI. Most early cost–benefit analyses of climate change have assumed that climate change will be a gradual and smooth process. This assumption has prevented these analyses from determining a robust optimal policy solution (Hall and Behl, 2006), as it neglects important key vulnerabilities. Recognising the restrictions of this assumption, an extensive literature has developed extending cost–benefit analyses and related decision-making (e.g., Jones, 2003) in the context of Article 2, with a particular emphasis on abrupt change at global and regional scales (Schneider and Azar, 2001; Higgins et al., 2002; Azar and Lindgren, 2003; Baranzini et al., 2003; Wright and Erickson, 2003).

Several papers have focused on incorporating damages from large-scale climate instabilities identified as key vulnerabilities, such as climate-change-induced slowing or shutdown of the MOC (Keller et al., 2000, 2004; Mastrandrea and Schneider,

2001; Link and Tol, 2004). For example, quantifying market-based damages associated with MOC changes is a difficult task, and current analyses should be interpreted as order-of-magnitude estimates, with none carrying high confidence. These preliminary analyses suggest that significant reductions in anthropogenic greenhouse gas emissions are economically efficient even if the damages associated with a MOC slowing or collapse are less than 1% of gross world product. However, model results are very dependent on assumptions about climate sensitivity, the damage functions for smooth and abrupt climate change and time discounting, and are thus designed primarily to demonstrate frameworks for analysis and order-of-magnitude outcomes rather than high-confidence quantitative projections.

Several researchers have implemented probabilistic treatments of uncertainty in cost–benefit analyses; recent examples include Mastrandrea and Schneider (2004) and Hope (2006). These probabilistic analyses consistently suggest more aggressive mitigation policies compared with deterministic analyses, since probabilistic analyses allow the co-occurrence of high climate sensitivities (see *Key caveat* in Section 19.4.2.2 on low confidence for specific quantitative results) with high climate-damage functions.

#### 19.4.2.5 Cost-effectiveness analysis

Cost-effectiveness analysis involves determining cost-minimising policy strategies that are compatible with pre-defined probabilistic or deterministic constraints on future climate change or its impacts. Comparison of cost-minimal strategies for alternative climate constraints has been applied to explore the trade-offs between climate change impacts and the associated cost of emissions mitigation (e.g., Keller et al., 2004; McInerney and Keller, 2006). The reductions in greenhouse-gas emissions determined by cost-effectiveness analyses incorporating such constraints are typically much larger than those suggested by most earlier cost–benefit analyses, which often do not consider the key vulnerabilities underlying such constraints in their damage functions. In addition, cost–benefit analysis assumes perfect substitutability between all costs and benefits of a policy strategy, whereas the hard constraints in a cost-effectiveness analysis do not allow for such substitution.

Some cost-effectiveness (as well as cost–benefit) analyses have explored sequential decision strategies in combination with the avoidance of key vulnerabilities or thresholds for global temperature change. These strategies allow for the resolution of key uncertainties in the future through additional observations and/or improved modelling. The quantitative results of these analyses cannot carry high confidence, as most studies represent uncertain parameters by two to three discrete values only and/or employ rather arbitrary assumptions about learning (e.g., Hammitt et al., 1992; Keller et al., 2004; Yohe et al., 2004). In a systematic analysis, Webster et al. (2003) finds that the ability to learn about damages from climate change and costs of reducing greenhouse gas emissions in the future can lead to either less restrictive or more restrictive policies today. All studies report the opinions of their authors to be that the scientific uncertainty by itself does not provide justification for doing nothing today to mitigate potential climate damages.

### 19.4.3 Synthesis

The studies reviewed in this section diverge widely in their methodological approach, in the sophistication with which uncertainties are considered in geophysical, biological and social systems, and in how closely they approach an explicit examination of key vulnerabilities or DAI. The models involved range from stand-alone carbon cycle and climate models to comprehensive integrated assessment frameworks describing emissions, technologies, mitigation, climate change and impacts. Some frameworks incorporate approximations of vulnerability but none contains a well-established representation of adaptation processes in the global context.

It is not possible to draw a simple summary from the diverse set of studies reviewed in this section. The following conclusions from literature since the TAR, however, are more robust.

- A growing literature considers response strategies that aim at preventing damage to particular key elements and processes in geophysical, biological and socio-economic systems that are sensitive to climate change and have limited adaptation potential; policy-makers may want to consider insights from the literature reviewed here in helping them to design policies to prevent DAI.
- In a majority of the literature, key impacts are associated with long-term increases in equilibrium global mean surface temperature above the pre-industrial equilibrium or an increase above 1990-2000 levels. Transient temperature changes are more instructive for the analyses of key vulnerabilities, but the literature is sparse on transient assessments relative to equilibrium analyses. Many studies provide global mean temperature thresholds that would lead sooner or later to a specific key impact, i.e., to disruption/shutdown of a vulnerable process. Such thresholds are not known precisely, and are characterised in the literature by a range of values (or occasionally by probability functions). Assessments of whether emissions pathways/GHG concentration profiles exceed given temperature thresholds are characterised by significant uncertainty. Therefore, deterministic studies alone cannot provide sufficient information for a full analysis of response strategies, and probabilistic approaches should be considered. Risk analyses given in some recent studies suggest that there is no longer high confidence that certain large-scale events (e.g., deglaciation of major ice sheets) can be avoided, given historical climate change and the inertia of the climate system (Wigley, 2004, 2006; Rahmstorf and Zickfeld, 2005). Similar conclusions could also be applied to risks for social systems, though the literature often suggests that any thresholds for these are at least as uncertain.
- Meehl et al., 2007 Table 10.8 provide likely ranges of equilibrium global mean surface temperature increase for different CO<sub>2</sub>-equivalent stabilisation levels, based on their expert assessment that equilibrium climate sensitivity is likely to lie in the range 2-4.5°C (Meehl et al., 2007 Executive Summary). They present the following likely

ranges (which have been converted from temperature increase above pre-industrial to equilibrium temperature increase above 1990-2000 levels – see Box 19.2); 350 ppm CO<sub>2</sub>-equivalent: 0-0.8°C above 1990-2000 levels; 450 ppm CO<sub>2</sub>-equivalent: 0.8-2.5°C above 1990-2000 levels; 550 ppm CO<sub>2</sub>-equivalent: 1.3-3.8°C above 1990-2000 levels; 650 ppm CO<sub>2</sub>-equivalent: 1.8-4.9°C above 1990-2000 levels; 750 ppm CO<sub>2</sub>-equivalent: 2.2-5.8°C above 1990-2000 levels. Some studies suggest that climate sensitivities larger than this likely range (which would suggest greater warming) cannot be ruled out (Meehl et al., 2007 Section 10.7.2), and the WGI range implies a 5-17% chance that climate sensitivity falls above 4.5°C (see *Key caveat* in Section 19.4.2.2 for further information).

- While future global mean temperature trajectories associated with different emissions pathways are not projected to diverge considerably in the next two to four decades, the literature shows that mitigation activities involving near-term emissions reductions will have a significant effect on concentration and temperature profiles over the next century. Later initiation of stabilisation efforts has been shown to require higher rates of reduction if they are to reduce the likelihood of crossings levels of DAI (Semenov, 2004a,b; Izrael and Semenov, 2005, 2006). Substantial delay (several decades or more) in mitigation activities makes achievement of the lower range of stabilisation targets (e.g., 500 ppm CO<sub>2</sub>-equivalent and lower) infeasible, except via overshoot scenarios (see Figure 19.2, bottom panel). Overshoot scenarios induce higher transient temperature increases, increasing the probability of temporary or permanent exceedence of thresholds for key vulnerabilities (Hammit, 1999; Harvey, 2004; O'Neill and Oppenheimer, 2004; Hare and Meinshausen, 2005; Knutti et al., 2005; Schneider and Mastrandrea, 2005).
- There is considerable potential for adaptation to climate change for market and social systems, but the costs and institutional capacities to adapt are insufficiently known and appear to be unequally distributed across world regions. For biological and geophysical systems, the adaptation potential is much lower. Therefore, some key impacts will be unavoidable without mitigation.

#### 19.4.4 Research needs

The knowledge-base for the assessment of key vulnerabilities and risks from climate change is evolving rapidly. At the same time, there are significant gaps in our knowledge with regard to impacts, the potential and nature of adaptation, and vulnerabilities of human and natural systems. However, as this chapter has tried to bring out, a growing base of information that is likely to be of significance and value to the ongoing policy dialogue does exist.

In this concluding section of the chapter, some of the research priorities from the different domains are highlighted. Clearly, this can only be an indicative list, suggesting areas where new knowledge may have immediate utility and relevance as far as the objective of this chapter is concerned.

This chapter has suggested that key vulnerabilities may be a useful concept for informing the dialogue on dangerous anthropogenic interference. Further elucidation of this concept requires highly interdisciplinary, integrative approaches that are able to capture bio-geophysical and socio-economic processes. In particular, it is worth noting that the socio-economic conditions which determine vulnerability (e.g., number of people at risk, wealth, technology, institutions) change rapidly. Better understanding of the underlying dynamics of these changes at varying scales is essential to improve understanding of key vulnerabilities to climate change. The relevant research questions in this context are not so much how welfare is affected by changing socio-economic conditions, but rather how much change in socio-economic conditions affects vulnerability to climate change. In other words, a key question is how future development paths could increase or decrease vulnerability to climate change.

As this chapter has brought out through the criteria for identifying key vulnerabilities, the responses of human and natural systems, both autonomous and anticipatory, are quite important. Consequently, it is important that the extant literature on this issue is enriched with contributions from disciplines as diverse as political economy and decision theory. In particular, one of the central problems is a better understanding of adaptation and adaptive capacity, and of the practical, institutional, and technical obstacles to the implementation of adaptation strategies. This improvement in understanding will require a richer characterisation of the perception–evaluation–response process at various levels and scales of decision-making, from individuals to households, communities and nations. In this context, it is worth noting that new research approaches may be required. For example, with regard to adaptation, a learning-by-doing approach may be required so that the development of theory occurs in parallel with, and supported by, experience from practice.

A significant category of key vulnerabilities is associated with large-scale, irreversible and systemic changes in geophysical systems. Large-scale changes such as changes in the West Antarctic and Greenland ice sheets, could lead to significant impacts, particularly due to long-term large sea-level rise. Therefore, to obtain improved estimates of impacts from both 21st-century and long-term sea-level rise, new modelling approaches incorporating a better understanding of dynamic processes in ice sheets are urgently needed, as already noted by WGI. Furthermore, central to nearly all the assessments of key vulnerabilities is the need to improve knowledge of climate sensitivity – particularly in the context of risk management – the right-hand tail of the climate sensitivity probability distribution, where the greatest potential for key impacts lies.

Finally, the elucidation and determination of dangerous anthropogenic interference is a complex socio-political process, involving normative judgments. While information on key vulnerabilities will inform and enrich this process, there may be useful insights from the social sciences that might support this process, such as better knowledge of institutional and organisational dynamics, and diverse stakeholder inputs. Also needed are assessments of vulnerability and adaptation that combine top-down climate models with bottom-up social vulnerability assessments.

## Decision 1/CP.15

### Outcome of the work of the Ad Hoc Working Group on Long-term Cooperative Action under the Convention

*The Conference of the Parties,*

*Recalling* its decision 1/CP.13,

*Committed* to enable the full, effective and sustained implementation of the Convention through long-term cooperative action, now, up to and beyond 2012,

*Having considered* the outcome of the work of the Ad Hoc Working Group on Long-Term Cooperative Action under the Convention pursuant to paragraph 2 of decision 1/CP.13,

1. *Decides* to extend the mandate of the Ad Hoc Working Group on Long-term Cooperative Action under the Convention to enable it to continue its work with a view to presenting the outcome of its work to the Conference of the Parties for adoption at its sixteenth session;
2. *Requests* the Ad Hoc Working Group on Long-Term Cooperative Action under the Convention to continue its work drawing on the report of the Ad Hoc Working Group on Long-term Cooperative Action under the Convention presented to the Conference of the Parties at its fifteenth session,<sup>1</sup> as well as work undertaken by the Conference of the Parties on the basis of that report;
3. *Mandates* the host country of the next session of the Conference of the Parties to make the necessary arrangements in order to facilitate the work towards the success of that session.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

---

<sup>1</sup> FCCC/AWGLCA/2009/17, annex I.

FCCC/CP/2009/11/Add.1

Page 4

**Decision 2/CP.15**  
**Copenhagen Accord**

*The Conference of the Parties,*

*Takes note of the Copenhagen Accord of 18 December 2009.*

## Copenhagen Accord

**The Heads of State, Heads of Government, Ministers, and other heads of the following delegations present at the United Nations Climate Change Conference 2009 in Copenhagen:<sup>1</sup>**

Albania, Algeria, Armenia, Australia, Austria, Bahamas, Bangladesh, Belarus, Belgium, Benin, Bhutan, Bosnia and Herzegovina, Botswana, Brazil, Bulgaria, Burkina Faso, Cambodia, Canada, Central African Republic, Chile, China, Colombia, Congo, Costa Rica, Côte d'Ivoire, Croatia, Cyprus, Czech Republic, Democratic Republic of the Congo, Denmark, Djibouti, Eritrea, Estonia, Ethiopia, European Union, Fiji, Finland, France, Gabon, Georgia, Germany, Ghana, Greece, Guatemala, Guinea, Guyana, Hungary, Iceland, India, Indonesia, Ireland, Israel, Italy, Japan, Jordan, Kazakhstan, Kiribati, Lao People's Democratic Republic, Latvia, Lesotho, Liechtenstein, Lithuania, Luxembourg, Madagascar, Malawi, Maldives, Mali, Malta, Marshall Islands, Mauritania, Mexico, Monaco, Mongolia, Montenegro, Morocco, Namibia, Nepal, Netherlands, New Zealand, Norway, Palau, Panama, Papua New Guinea, Peru, Poland, Portugal, Republic of Korea, Republic of Moldova, Romania, Russian Federation, Rwanda, Samoa, San Marino, Senegal, Serbia, Sierra Leone, Singapore, Slovakia, Slovenia, South Africa, Spain, Swaziland, Sweden, Switzerland, the former Yugoslav Republic of Macedonia, Tonga, Trinidad and Tobago, Tunisia, United Arab Emirates, United Kingdom of Great Britain and Northern Ireland, United Republic of Tanzania, **United States of America**, Uruguay and Zambia,

*In pursuit* of the ultimate objective of the Convention as stated in its Article 2,

*Being guided* by the principles and provisions of the Convention,

*Noting* the results of work done by the two Ad hoc Working Groups,

*Endorsing* decision 1/CP.15 on the Ad hoc Working Group on Long-term Cooperative Action and decision 1/CMP.5 that requests the Ad hoc Working Group on Further Commitments of Annex I Parties under the Kyoto Protocol to continue its work,

*Have agreed* on this Copenhagen Accord which is operational immediately.

1. We underline that climate change is one of the greatest challenges of our time. We emphasise our strong political will to urgently combat climate change in accordance with the principle of common but differentiated responsibilities and respective capabilities. **To achieve the ultimate objective of the Convention to stabilize greenhouse gas concentration in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system, we shall, recognizing the scientific view that the increase in global temperature should be below 2 degrees Celsius, on the basis of equity and in the context of sustainable development, enhance our long-term cooperative action to combat climate change.** We recognize the critical impacts of climate change and the potential impacts of response measures on countries particularly vulnerable to its adverse effects and stress the need to establish a comprehensive adaptation programme including international support.

2. **We agree that deep cuts in global emissions are required according to science, and as documented by the IPCC Fourth Assessment Report with a view to reduce global emissions so as to hold the increase in global temperature below 2 degrees Celsius, and take action to meet this objective consistent with science and on the basis of equity. We should cooperate in achieving the peaking of global and national emissions as soon as possible,** recognizing that the time frame for peaking will be longer in developing countries and bearing in mind that social and economic development and poverty

<sup>1</sup> Some Parties listed above stated in their communications to the secretariat specific understandings on the nature of the Accord and related matters, based on which they have agreed to be listed here. The full text of the letters received from Parties in relation to the Copenhagen Accord, including the specific understandings, can be found at <http://unfccc.int/meetings/items/5276.php>.

eradication are the first and overriding priorities of developing countries and that a low-emission development strategy is indispensable to sustainable development.

3. Adaptation to the adverse effects of climate change and the potential impacts of response measures is a challenge faced by all countries. Enhanced action and international cooperation on adaptation is urgently required to ensure the implementation of the Convention by enabling and supporting the implementation of adaptation actions aimed at reducing vulnerability and building resilience in developing countries, especially in those that are particularly vulnerable, especially least developed countries, small island developing States and Africa. We agree that developed countries shall provide adequate, predictable and sustainable financial resources, technology and capacity-building to support the implementation of adaptation action in developing countries.

4. Annex I Parties commit to implement individually or jointly the quantified economy-wide emissions targets for 2020, to be submitted in the format given in Appendix I by Annex I Parties to the secretariat by 31 January 2010 for compilation in an INF document. Annex I Parties that are Party to the Kyoto Protocol will thereby further strengthen the emissions reductions initiated by the Kyoto Protocol. Delivery of reductions and financing by developed countries will be measured, reported and verified in accordance with existing and any further guidelines adopted by the Conference of the Parties, and will ensure that accounting of such targets and finance is rigorous, robust and transparent.

5. Non-Annex I Parties to the Convention will implement mitigation actions, including those to be submitted to the secretariat by non-Annex I Parties in the format given in Appendix II by 31 January 2010, for compilation in an INF document, consistent with Article 4.1 and Article 4.7 and in the context of sustainable development. Least developed countries and small island developing States may undertake actions voluntarily and on the basis of support. Mitigation actions subsequently taken and envisaged by Non-Annex I Parties, including national inventory reports, shall be communicated through national communications consistent with Article 12.1(b) every two years on the basis of guidelines to be adopted by the Conference of the Parties. Those mitigation actions in national communications or otherwise communicated to the Secretariat will be added to the list in appendix II. Mitigation actions taken by Non-Annex I Parties will be subject to their domestic measurement, reporting and verification the result of which will be reported through their national communications every two years. Non-Annex I Parties will communicate information on the implementation of their actions through National Communications, with provisions for international consultations and analysis under clearly defined guidelines that will ensure that national sovereignty is respected. Nationally appropriate mitigation actions seeking international support will be recorded in a registry along with relevant technology, finance and capacity building support. Those actions supported will be added to the list in appendix II. These supported nationally appropriate mitigation actions will be subject to international measurement, reporting and verification in accordance with guidelines adopted by the Conference of the Parties.

6. We recognize the crucial role of reducing emission from deforestation and forest degradation and the need to enhance removals of greenhouse gas emission by forests and agree on the need to provide positive incentives to such actions through the immediate establishment of a mechanism including REDD-plus, to enable the mobilization of financial resources from developed countries.

7. We decide to pursue various approaches, including opportunities to use markets, to enhance the cost-effectiveness of, and to promote mitigation actions. Developing countries, especially those with low emitting economies should be provided incentives to continue to develop on a low emission pathway.

8. Scaled up, new and additional, predictable and adequate funding as well as improved access shall be provided to developing countries, in accordance with the relevant provisions of the Convention, to enable and support enhanced action on mitigation, including substantial finance to reduce emissions from deforestation and forest degradation (REDD-plus), adaptation, technology development

and transfer and capacity-building, for enhanced implementation of the Convention. The collective commitment by developed countries is to provide new and additional resources, including forestry and investments through international institutions, approaching USD 30 billion for the period 2010–2012 with balanced allocation between adaptation and mitigation. Funding for adaptation will be prioritized for the most vulnerable developing countries, such as the least developed countries, small island developing States and Africa. In the context of meaningful mitigation actions and transparency on implementation, developed countries commit to a goal of mobilizing jointly USD 100 billion dollars a year by 2020 to address the needs of developing countries. This funding will come from a wide variety of sources, public and private, bilateral and multilateral, including alternative sources of finance. New multilateral funding for adaptation will be delivered through effective and efficient fund arrangements, with a governance structure providing for equal representation of developed and developing countries. A significant portion of such funding should flow through the Copenhagen Green Climate Fund.

9. To this end, a High Level Panel will be established under the guidance of and accountable to the Conference of the Parties to study the contribution of the potential sources of revenue, including alternative sources of finance, towards meeting this goal.

10. We decide that the Copenhagen Green Climate Fund shall be established as an operating entity of the financial mechanism of the Convention to support projects, programme, policies and other activities in developing countries related to mitigation including REDD-plus, adaptation, capacity-building, technology development and transfer.

11. In order to enhance action on development and transfer of technology we decide to establish a Technology Mechanism to accelerate technology development and transfer in support of action on adaptation and mitigation that will be guided by a country-driven approach and be based on national circumstances and priorities.

12. We call for an assessment of the implementation of this Accord to be completed by 2015, including in light of the Convention's ultimate objective. This would include consideration of strengthening the long-term goal referencing various matters presented by the science, including in relation to temperature rises of 1.5 degrees Celsius.

## **Decision 3/CP.15**

### **Amendment to Annex I to the Convention**

*The Conference of the Parties,*

*Recalling* Articles 15 and 16 of the Convention,

*Taking note* of the proposal by Malta to amend Annex I to the Convention by adding the name of Malta,<sup>1</sup>

1. *Decides* to amend Annex I to the Convention by including the name of Malta;
2. *Notes* that in accordance with Article 16, paragraph 4, the entry into force of this amendment to Annex I to the Convention shall be subject to the same procedure as that for the entry into force of annexes to the Convention provided for in Article 16, paragraph 3, of the Convention.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

---

<sup>1</sup> FCCC/CP/2009/2.

## Decision 4/CP.15

### **Methodological guidance for activities relating to reducing emissions from deforestation and forest degradation and the role of conservation, sustainable management of forests and enhancement of forest carbon stocks in developing countries**

*The Conference of the Parties,*

*Recalling* decisions 1/CP.13 and 2/CP.13,

*Acknowledging* the importance of reducing emissions from deforestation and forest degradation, and the role of conservation, sustainable management of forests and enhancement of forest carbon stocks in developing countries,

*Noting* the progress made by the Subsidiary Body for Scientific and Technological Advice in its programme of work on methodological issues related to a range of policy approaches and positive incentives,

*Also noting* the range of ongoing activities and cooperative efforts being undertaken by Parties and international organizations, in accordance with decision 2/CP.13, paragraphs 1, 2, 3 and 5,

*Recognizing* the need for full and effective engagement of indigenous peoples and local communities in, and the potential contribution of their knowledge to, monitoring and reporting of activities relating to decision 1/CP.13, paragraph 1 (b) (iii),

*Recognizing* the importance of promoting sustainable management of forests and co-benefits, including biodiversity, that may complement the aims and objectives of national forest programmes and relevant international conventions and agreements,

*Noting* experiences and lessons learned from ongoing activities and efforts in capacity-building, testing methodologies and monitoring approaches, and a range of policy approaches and positive incentives, including those guided by the indicative guidance contained in the annex to decision 2/CP.13,

1. *Requests* developing country Parties, on the basis of work conducted on the methodological issues set out in decision 2/CP.13, paragraphs 7 and 11, to take the following guidance into account for activities relating to decision 2/CP.13, and without prejudging any further relevant decisions of the Conference of the Parties, in particular those relating to measurement and reporting:

- (a) To identify drivers of deforestation and forest degradation resulting in emissions and also the means to address these;
- (b) To identify activities within the country that result in reduced emissions and increased removals, and stabilization of forest carbon stocks;
- (c) To use the most recent Intergovernmental Panel on Climate Change guidance and guidelines, as adopted or encouraged by the Conference of the Parties, as appropriate, as a basis for estimating anthropogenic forest-related greenhouse gas emissions by sources and removals by sinks, forest carbon stocks and forest area changes;

- (d) To establish, according to national circumstances and capabilities, robust and transparent national forest<sup>1</sup> monitoring systems and, if appropriate, sub-national systems as part of national monitoring systems that:
- (i) Use a combination of remote sensing and ground-based forest carbon inventory approaches for estimating, as appropriate, anthropogenic forest-related greenhouse gas emissions by sources and removals by sinks, forest carbon stocks and forest area changes;
  - (ii) Provide estimates that are transparent, consistent, as far as possible accurate, and that reduce uncertainties, taking into account national capabilities and capacities;
  - (iii) Are transparent and their results are available and suitable for review as agreed by the Conference of the Parties;

2. *Recognizes* that further work may need to be undertaken by the Intergovernmental Panel on Climate Change, in accordance with any relevant decisions by the Conference of the Parties;

3. *Encourages*, as appropriate, the development of guidance for effective engagement of indigenous peoples and local communities in monitoring and reporting;

4. *Encourages* all Parties in a position to do so to support and strengthen the capacities of developing countries to collect and access, analyse and interpret data, in order to develop estimates;

5. *Invites* Parties in a position to do so and relevant international organizations to enhance capacity-building in relation to using the guidance and guidelines referred in to paragraph 1 (c) above, taking into account the work of the Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention;

6. *Requests* the secretariat, subject to availability of supplementary funding, to enhance coordination of the activities referred to in paragraph 5 above, in the context of existing initiatives;

7. *Recognizes* that developing country Parties in establishing forest reference emission levels and forest reference levels should do so transparently taking into account historic data, and adjust for national circumstances, in accordance with relevant decisions of the Conference of the Parties;

8. *Invites* Parties to share lessons learned and experiences gained in the application of the guidance referred to in paragraph 1 above and the annex to decision 2/CP.13 through the web platform on the UNFCCC website;

9. *Urges* relevant international organizations, non-governmental organizations and stakeholders to integrate and coordinate their efforts in order to avoid duplication and enhance synergy with regard to activities relating to decision 2/CP.13.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

---

<sup>1</sup> Taking note of, if appropriate, the guidance on consistent representation of land in the Intergovernmental Panel on Climate Change *Good Practice Guidance for Land Use, Land-Use Change and Forestry*.

## Decision 5/CP.15

### Work of the Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention

*The Conference of the Parties,*

*Recalling* the relevant provisions of the Convention, in particular Article 4, paragraphs 1, 3 and 7, and Article 12, paragraphs 1, 4, 5 and 7,

*Recalling also* decisions 8/CP.5, 3/CP.8, 17/CP.8 and 8/CP.11,

*Acknowledging* that the Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention has made a substantial contribution to improving the process of preparation of national communications from Parties not included in Annex I to the Convention (non-Annex I Parties) by providing technical advice and support and therefore enhancing the capacity of such Parties to prepare their national communications,

*Emphasizing* the importance of providing relevant technical advice and support for the process of preparation of national communications, as well as the importance of providing a forum for non-Annex I Parties to share experiences of this process,

*Recognizing* that the preparation of national communications is a continuing process,

1. *Decides* to reconstitute the Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention for a period of three years from 2010 to 2012;
2. *Also decides* that membership of the Consultative Group of Experts shall be the same as in decision 3/CP.8, annex, paragraphs 3–8;
3. *Further decides* that the Consultative Group of Experts shall be composed of experts drawn from the UNFCCC roster of experts with expertise in greenhouse gas inventories, vulnerability and adaptation assessment, mitigation and other matters related to the process of preparation of national communications;
4. *Encourages* regional groups, in nominating their experts to the Consultative Group of Experts, to make all efforts to ensure balanced representation in the areas of expertise indicated in paragraph 3 above;
5. *Decides* that the Consultative Group of Experts, in fulfilling its mandate, shall function in accordance with the terms of reference contained in the annex to this decision;
6. *Also decides* that the term and the mandate of the Consultative Group of Experts and the need for continuation of the group shall be reviewed by the Conference of the Parties at its seventeenth session;
7. *Requests* the secretariat to facilitate the work of the Consultative Group of Experts, in accordance with Article 8, paragraph 2(c), of the Convention and decision 17/CP.8, by:
  - (a) Organizing meetings and workshops of the Consultative Group of Experts and compiling reports of its meetings and workshops for consideration by the Subsidiary Body for Implementation;

- (b) Providing technical support to the Consultative Group of Experts as required, particularly in the areas of national greenhouse gas inventories, vulnerability and adaptation assessment, mitigation assessment, research and systematic observation, education, training and public awareness, technology transfer and capacity-building, as they relate to the process of and the preparation of national communications, in accordance with the provisions in the budget;
- (c) Disseminating the information materials and technical reports prepared by the Consultative Group of Experts to Parties, relevant experts and organizations;

8. *Invites* Parties included in Annex II to the Convention to contribute financial resources to support the work of the Consultative Group of Experts.

## ANNEX

**Terms of reference of the Consultative Group of Experts  
on National Communications from Parties not included  
in Annex I to the Convention**

1. The Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention shall have the objective of improving the process of and preparation of national communications from Parties not included in Annex I to the Convention (non-Annex I Parties), by providing technical advice and support to non-Annex I Parties, including those Parties that have not yet completed their initial national communications.
2. The Consultative Group of Experts, in fulfilling its mandate, shall:
  - (a) Provide technical assistance to non-Annex I Parties for the regular development of national greenhouse gas (GHG) inventories, vulnerability and adaptation assessment, mitigation assessment, research and systematic observation, education, training and public awareness, technology transfer and capacity-building, with a view to improving the accuracy, consistency and transparency of information in their national communications;
  - (b) Provide recommendations, as appropriate, on elements to be considered in a future revision of the guidelines for the preparation of national communications from Parties not included in Annex I to the Convention, taking into account the difficulties encountered by non-Annex I Parties in the preparation of their most recent national communications;
  - (c) Provide technical advice to non-Annex I Parties to facilitate the development and long-term sustainability of processes, and the establishment and maintenance of national technical teams, for the preparation of national communications, including GHG inventories, on a continuous basis;
  - (d) Provide technical advice and support to Parties, upon request, on the provision of information on steps to integrate climate change considerations into relevant social, economic and environmental policies and actions, in accordance with Article 4, paragraph 1(f), of the Convention;
  - (e) Provide non-Annex I Parties, upon request, with information on existing activities and programmes, including bilateral, regional and multilateral sources of financial and technical assistance, to facilitate and support the preparation of national communications by non-Annex I Parties;
  - (f) Provide technical support on issues mentioned above in paragraph 2 (c) above, and to the extent possible paragraph 2 (a) above, including through workshops, hands-on training and training of trainers, building on experiences of Parties and/or lessons learned, in the preparation of national communications, subject to the availability of resources.
3. The Consultative Group of Experts shall, in defining and implementing its work programme, take into account other relevant work by expert groups under the Convention in order to avoid duplication of work.
4. The Consultative Group of Experts shall forward recommendations on matters indicated in paragraph 2 above for consideration by the Subsidiary Body for Implementation.

FCCC/CP/2009/11/Add.1

Page 16

5. The reconstituted Consultative Group of Experts shall develop, at its first meeting, a work programme for 2010–2012.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## **Decision 6/CP.15**

### **Fourth review of the financial mechanism**

*The Conference of the Parties,*

1. *Requests* the Subsidiary Body for Implementation to continue its consideration of the fourth review of the financial mechanism at its thirty-second session on the basis of the draft text contained in the annex to this decision, with a view to recommending a draft decision for adoption by the Conference of the Parties at its sixteenth session;
2. *Decides* to complete the consideration of the fourth review of the financial mechanism at its sixteenth session.

## ANNEX

[ENGLISH ONLY]

**Draft decision -/CP.15****Fourth review of the financial mechanism**

*[The Conference of the Parties,*

*Recalling* Article 4, paragraphs 3, 4, 5, 8, and 9, of the Convention,

*Taking fully into account* Article 11 of the Convention, in particular its paragraph 1,

*Also recalling* decisions 11/CP.1, 12/CP.2, 3/CP.4, 6/CP.13 and 3/CP.14,

*Pursuant to* Article 7, paragraph 2(h), of the Convention,

*Noting* that multilateral and bilateral agencies have scaled up financial resources related to the implementation of the Convention,

*Also noting* the annual report of the Global Environment Facility to the Conference of the Parties,

*Further noting* the report<sup>1</sup> on the Fourth Overall Performance Study of the Global Environment Facility,

1. *Takes note* of the findings of the Fourth Overall Performance Study that:

- (a) The Global Environment Facility support continues to be in line with guidance from the Convention;
- (b) [Although developed country donors have provided new and additional funding for global environmental benefits to developing countries, this has been insufficient to cover the increasing agenda of the Global Environment Facility as agreed upon in the conventions];
- (c) The Global Environment Facility support has been crucial in enabling countries to integrate climate change into their national development agendas;
- (d) The Global Environment Facility support has assisted developing countries in introducing policies to address climate change and reduce and avoid greenhouse gas emissions;
- (e) The Resource Allocation Framework has hindered the access of group countries to the Global Environment Facility, particularly in climate change, which may explain some of the discontent of the climate change community with the Global Environment Facility;
- (f) The Global Environment Facility reporting requirements to the Conventions have generally been met, yet certain aspects require improvement;

---

<sup>1</sup> Global Environment Facility Evaluation office. Fourth Overall Performance Study of the GEF Progress Toward Impact. Full report, 9 November 2009.

- (g) The move of the Global Environment Facility towards country-level programming has increased country ownership to some extent, but that the current modalities for resource allocation require improvement;
  - (h) There is scope to further simplify and streamline the Global Environment Facility procedures, particularly the project identification phase, and improve timeliness throughout the project cycle;
  - (i) The Global Environment Facility needs a knowledge management strategy to improve learning and the sharing of best practices;
  - (j) The Global Environment Facility has played an important role in scaling up resources to address climate change;
2. *Calls upon* developed country Parties and invites other Parties that make financial contributions to the Global Environment Facility to ensure a successful fifth replenishment in order to assist in providing adequate and predictable funding;
3. *Invites* the Global Environment Facility, as an operating entity of the financial mechanism, to continue to ensure active participation of recipient partners in the replenishment process;
4. *Also invites* developed country Parties to provide, through bilateral and regional and other multilateral channels, financial resources related to the implementation of the Convention;
5. *Decides* that the Global Environment Facility has provided and should continue to enhance its support to developing countries in:
- (a) Meeting their commitments under the Convention;
  - (b) Strengthening national capacity-building;
  - (c) Applying and diffusing technologies, practices and processes for mitigation;
  - (d) [Taking into account low-carbon development and adaptation needs across all GEF focal areas, as appropriate;] [All focal areas, taking into account low-carbon development and adaptation needs;]
  - (e) [Developing synergies between the Multilateral Environmental Agreements;] [addressing the interaction between the components of the climate system;]
6. *Requests* the GEF to continue improving its modalities to increase the responsiveness, effectiveness and efficiency of its support, including:
- (a) Being responsive to new guidance from the Conference of the Parties;
  - (b) Reporting from the Global Environment Facility to the convention should include a critical assessment of its experience with implementation of projects, as well as its experience with incorporating guidance from the Conference of the Parties into its strategies and programme priorities;
  - (c) Enhancing modalities which reinforce country ownership and improve the allocation of resources;
  - (d) The future resource allocation system in the Global Environment Facility should [exclude] [prioritize] funding for [the agreed full cost of national communications] [communications to the convention, since they are mandatory and are supposed to be paid in full by the Global Environment Facility];

- (e) Further simplifying and improving its procedures, particularly those for the identification, preparation and approval of activities;
- (f) Ensuring that access to resources is expeditious and timely;
- (g) Enabling country-level programming, where appropriate;
- (h) Ensuring consistency and complementarity with other financing activities;
- (i) Promoting private-sector financing and investment to address climate change activities;
- (j) Strengthening its knowledge management approach to share best practice;

7. *Decides* that the Global Environment Facility should continue to provide and enhance support for the implementation of adaptation activities, including the implementation of national adaptation plans of action, through the Least Developed Country Fund and Special Climate Change Fund;

8. [*Decides*] [that the Global Environment Facility] [*Urges* all Parties [in a position to do so] [to] examine all options available, to scale up the funding available for the implementation of obligations under Articles 4, paragraphs 3, 4 and 5, of the Convention;

9. [*Further reiterates* decision 7/CP.7 to the Convention that predictable and adequate levels of funding shall be made available to Parties not included in Annex I [to meet the agreed full incremental cost of complying with their obligations under the convention]];

10. *Requests* the Global Environment Facility, in its regular report to the Conference of the Parties, to include information on the steps it has taken to implement the guidance provided in paragraphs 3, 5, 6 [and 7] above;

11. *Also requests* the Subsidiary Body for Implementation to initiate the fifth review of the financial mechanism at its thirty-seventh session in accordance with the criteria contained in the guidelines annexed to decisions 3/CP.4 and 6/CP.13, or as these guidelines may be subsequently amended, and to report on the outcome to the Conference of the Parties at its nineteenth session.]

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## **Decision 7/CP.15**

### **Additional guidance to the Global Environment Facility**

*The Conference of the Parties,*

*Noting* the report of the Global Environment Facility to the Conference of the Parties,<sup>1</sup>

*Recalling* its decision to provide annual guidance to the Global Environment Facility in accordance with the annex to decision 12/CP.2,

*Requests* the Subsidiary Body for Implementation to continue its consideration of additional guidance to the Global Environment Facility at its thirty-second session, with a view to recommending a draft decision for adoption by the Conference of the Parties at its sixteenth session.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

---

<sup>1</sup> FCCC/CP/2009/9.

## **Decision 8/CP.15**

### **Capacity-building under the Convention**

*The Conference of the Parties,*

*Recalling* decision 6/CP.14,

1. *Requests* the Subsidiary Body for Implementation to continue its consideration of the second comprehensive review of the implementation of the framework for capacity-building in developing countries at its thirty-second session, with a view to preparing a draft decision on the outcome of this review for adoption by the Conference of Parties at its sixteenth session;

2. *Decides* to complete the consideration of the second comprehensive review at its sixteenth session.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## Decision 9/CP.15

### Systematic climate observations

*The Conference of the Parties,*

*Recalling* Article 4, paragraph 1(g–h), and Article 5 of the Convention,

*Further recalling* decisions 8/CP.3, 14/CP.4, 5/CP.5, 11/CP.9, 5/CP.10 and 11/CP.13,

*Having considered* the conclusions of the Subsidiary Body for Scientific and Technological Advice at its thirtieth session,

*Noting* the important role of the Global Climate Observing System in meeting the need for climate observation under the Convention,

1. *Expresses its appreciation:*
  - (a) To the secretariat and sponsoring agencies of the Global Climate Observing System for preparing the report on progress with the *Implementation Plan for the Global Observing System for Climate in Support of the UNFCCC* (hereinafter referred to as the Global Climate Observing System implementation plan);
  - (b) To the secretariat and sponsoring agencies of the Global Terrestrial Observing System for developing a framework for the preparation of guidance materials, standards and reporting guidelines for terrestrial observing systems for climate;
  - (c) To the Committee on Earth Observation Satellites for its coordinated response, on behalf of Parties that support space agencies involved in global observations, to the needs expressed in the Global Climate Observing System implementation plan;
2. *Recognizes* the significant progress made during 2004–2008 in improving the observing systems for climate relevant to the Convention;
3. *Notes* that, despite the progress made, only limited advances have been made in achieving long-term continuity for several in situ observing systems and that there are still large areas, in Africa for example, for which in situ observations and measurements are not available;
4. *Also notes* that not all climate information needs under the Convention are being met;
5. *Urges* Parties to work towards addressing the priorities and gaps identified in the report on progress with the Global Climate Observing System implementation plan, in particular the implementation of the regional action plans that were developed during 2001–2006, and ensuring sustained long-term operation of essential in situ networks, especially for the oceanic and terrestrial domains, including through provision of the necessary resources;
6. *Invites* relevant United Nations agencies and international organizations to do the same;
7. *Encourages* Parties in a position to do so to support activities aimed at sustaining climate observations over the long term in developing countries, especially the least developed countries and small island developing States;
8. *Invites* the Global Climate Observing System secretariat, under the guidance of the Global Climate Observing System Steering Committee, to update, by the thirty-third session of the Subsidiary Body for Scientific and Technological Advice, the Global Climate Observing System

implementation plan, taking into account emerging needs in climate observation, in particular those relating to adaptation activities;

9. *Encourages* the secretariat and the sponsoring agencies of the Global Terrestrial Observing System to implement the framework for the preparation of guidance materials, standards and reporting guidelines for terrestrial observing systems for climate, as a joint terrestrial framework mechanism between relevant agencies of the United Nations and the International Organization for Standardization;

10. *Encourages* the Committee on Earth Observation Satellites to continue coordinating and supporting the implementation of the satellite component of the Global Climate Observing System;

11. *Urges* Parties that support space agencies involved in global observations to enable these agencies to continue to implement, in a coordinated manner through the Committee on Earth Observation Satellites, the actions identified in the updated report of the Committee on Earth Observation Satellites,<sup>1</sup> in order to meet the relevant needs of the Convention, in particular by ensuring long-term continuity of observations and data availability.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

---

<sup>1</sup> FCCC/SBSTA/2008/MISC.11.

## Decision 10/CP.15

### **Updated training programme for greenhouse gas inventory review experts for the technical review of greenhouse gas inventories from Parties included in Annex I to the Convention**

*The Conference of the Parties,*

*Recalling* Articles 4, 7 and 12 of the Convention,

*Further recalling* decisions 19/CP.8 and 12/CP.9,

*Having considered* the relevant recommendations of the Subsidiary Body for Scientific and Technological Advice,

*Recognizing* the importance of the training programme for greenhouse gas inventory review experts for the technical review of greenhouse gas inventories from Parties included in Annex I to the Convention,

1. *Requests* the secretariat to develop and implement the updated training programme for greenhouse gas inventory review experts for the technical review of greenhouse gas inventories from Parties included in Annex I to the Convention, as outlined in the annex, including the examination of experts, and to give priority to organizing an annual seminar for the basic course;
2. *Encourages* Parties included in Annex I to the Convention in a position to do so to provide financial support for enhancing the training programme;
3. *Requests* the secretariat to include, in its annual report on inventory review activities to the Subsidiary Body for Scientific and Technological Advice, information on the training programme, in particular information on examination procedures and the selection of trainees and instructors, in order for Parties to assess the effectiveness of the programme.

## ANNEX

**Updated training programme for greenhouse gas inventory review experts for the technical review of greenhouse gas inventories of Parties included in Annex I to the Convention****A. Details of the training programme**

1. The courses are intended to train greenhouse gas (GHG) inventory review experts for the technical review of GHG inventories of Parties included in Annex I to the Convention. All training courses will be available online. For trainees without easy access to the Internet, courses will be distributed through electronic means; for courses facilitated by an instructor, trainees will communicate with the instructor by electronic means. At the request of a Party, the courses will also be made available to others interested in the review process, provided that this does not require additional resources. All courses, without instructor, will be available to trainees all year round.
2. A closing seminar for the basic course of the training programme will be offered annually for around 30 participants (new GHG inventory review experts).
3. Additional regional training seminars for new GHG inventory review experts and a refresher seminar for experienced GHG inventory review experts may be offered annually, depending on the availability of resources. The refresher seminars may be offered in conjunction with meetings of lead reviewers to complete the training for lead reviewers and other experienced GHG inventory review experts.
4. All training courses will include an examination. Examination procedures will be standardized, objective and transparent.
5. For courses which have a closing seminar, the examination will generally take place during the seminar. In exceptional circumstances, other arrangements for examinations will be made, provided that the examinations take place under the supervision of the secretariat and that this does not require additional resources. For other courses, the examination will take place online.
6. New GHG inventory review experts who successfully complete the relevant requirements of the training programme will be invited to participate in a centralized or in-country review, working alongside experienced GHG inventory review experts.
7. Experts who do not pass an examination for a course at the first attempt may retake the examination once only, provided that the expert has fulfilled all of the tasks assigned during the course in a timely manner and that the retake does not require the secretariat to incur additional costs.
8. Experts with relevant inventory expertise will be invited to act as instructors for courses of the training programme, ensuring that their collective skills cover the subjects addressed in each course. They will provide advice and support by e-mail or other electronic means. The secretariat will seek to achieve a geographical balance among the instructors participating in the training programme.
9. When selecting new GHG inventory review experts for courses facilitated by instructors, the secretariat will give priority to national GHG inventory review experts, nominated to the UNFCCC roster of experts, from Parties that have not participated in review activities before.

## B. Courses of the training programme

### 1. Basic course for the review of greenhouse gas inventories of Annex I Parties

**Description:** This course covers UNFCCC review guidelines and procedures and general Intergovernmental Panel on Climate Change (IPCC) inventory guidance (the Revised 1996 IPCC Guidelines, the IPCC good practice guidance and the IPCC good practice guidance for LULUCF)<sup>1</sup> as well as specific aspects of the review of the IPCC sectors energy, fugitive emissions, industrial processes, agriculture, land use, land-use change and forestry, and waste. This course also provides guidance on making review reports substantive, consistent among review teams and reader-friendly

**Preparation:** 2009

**Implementation:** 2009–2014

**Target audience:** New GHG inventory review experts

**Type of course:** E-learning, facilitated by an instructor, with a closing seminar

**Examination requirements and format:** New GHG inventory review experts must pass the examination before participating in expert review teams. In-person examination.

### 2. Review of complex models and higher tier methods

**Description:** This course provides general guidance and procedures, as well as specific aspects for the review of emission estimates performed using complex models and higher tier methods (tier 3 methods)

**Preparation:** 2010

**Implementation:** 2011–2014

**Target audience:** Lead reviewers and GHG inventory review experts who participate in reviews, including new GHG inventory review experts

**Type of course:** E-learning, without instructor

**Examination requirements and format:** Optional. Self-check electronic examination.

### 3. Improving communication and facilitating consensus in expert review teams

**Description:** This course provides tools to improve the work of expert review teams and facilitate teamwork

**Preparation:** 2003

**Implementation:** 2009–2014

**Target audience:** New GHG inventory review experts and experienced GHG inventory review experts as a refresher course

**Type of course:** E-learning, without instructor

**Examination requirements and format:** Optional. Self-check electronic examination.

## C. Refresher seminar for experienced greenhouse gas inventory review experts

**Description:** This annual seminar provides general guidance on specific and complex aspects of the review of emission estimates. It enables experienced GHG inventory review experts to strengthen and refresh their knowledge, both for cross-cutting aspects and for sector-specific issues

**Implementation:** 2011–2014, subject to the availability of resources

<sup>1</sup> In full: *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories, Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories and Good Practice Guidance for Land Use, Land-Use Change and Forestry.*

FCCC/CP/2009/11/Add.1

Page 28

**Target audience:** Lead reviewers and experienced GHG inventory review experts who participate in reviews.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## Decision 11/CP.15

### Administrative, financial and institutional matters

*The Conference of the Parties,*

*Having considered* the information in documents prepared by the secretariat on administrative, financial and institutional matters,<sup>1</sup>

*Recalling* paragraphs 11 and 19 of the financial procedures for the Conference of the Parties adopted by decision 15/CP.1,

#### I. Budget performance for the biennium 2008–2009

1. *Takes note* of the interim financial statements for the biennium 2008–2009 as at 31 December 2008, the report on budget performance for the period 1 January 2008 to 30 June 2009 and the status of contributions as at 15 May 2009 and 15 November 2009 to the Trust Fund for the Core Budget of the UNFCCC, the Trust Fund for Supplementary Activities and the Trust Fund for Participation in the UNFCCC Process;

2. *Expresses appreciation* to Parties that have paid their contributions to the core budget in a timely manner;

3. *Calls upon* Parties that have not paid their contributions to the core budget to do so without delay, bearing in mind that contributions are due on 1 January of each year in accordance with the financial procedures;

4. *Expresses appreciation* for the contributions received from Parties to the Trust Fund for Participation in the UNFCCC Process and to the Trust Fund for Supplementary Activities, especially for the generous contributions for the work of the Ad Hoc Working Group on Further Commitments for Annex I Parties under the Kyoto Protocol and the Ad Hoc Working Group on Long-term Cooperative Action under the Convention;

5. *Reiterates* its appreciation to the Government of Germany for its annual voluntary contribution to the core budget of EUR 766,938 and its special contribution of EUR 1,789,522 as host Government to the secretariat;

#### II. Continuing review of the functions and operations of the secretariat

6. *Notes* the information relating to the functions and operations of the secretariat as contained in relevant documents, particularly in document FCCC/SBI/2009/11;

7. *Agrees* that the Subsidiary Body for Implementation should consider this matter at its thirty-third session, in keeping with its decision taken at its twenty-first session to continue to consider this matter annually.<sup>2</sup>

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

<sup>1</sup> FCCC/SBI/2009/11, FCCC/SBI/2009/INF.3, FCCC/SBI/2009/INF.7 and FCCC/SBI/2009/INF.10 and Corr.1.

<sup>2</sup> FCCC/SBI/2004/19, paragraph 105.

## Decision 12/CP.15

### Programme budget for the biennium 2010–2011

*The Conference of the Parties,*

*Recalling* paragraph 4 of the financial procedures for the Conference of the Parties to the United Nations Framework Convention on Climate Change,<sup>1</sup>

*Having considered* the proposed programme budget for the biennium 2010–2011 submitted by the Executive Secretary,<sup>2</sup>

1. *Decides* that the programme budget shall be calculated in euros;
2. *Approves* the programme budget for the biennium 2010–2011, amounting to EUR 44,200,099 for the purposes specified in table 1;
3. *Notes with appreciation* the annual contribution of the Host Government, EUR 766,938, which offsets planned expenditures;
4. *Approves* a drawing of EUR 1,400,000 from the unspent balances or contributions (carry-over) from previous financial periods to cover part of the 2010–2011 budget;
5. *Approves* the staffing table (table 2) for the programme budget;
6. *Notes* that the programme budget contains elements relating to the Convention, as well as to the Kyoto Protocol;
7. *Adopts* the indicative scale of contributions for 2010 and 2011 contained in the annex to this decision, covering 63.2 per cent of the indicative contributions specified in table 1;
8. *Invites* the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol, at its fifth session, to endorse the elements of the recommended budget as it applies to the Kyoto Protocol;
9. *Approves* a contingency budget for conference services, amounting to EUR 8,138,700, to be added to the programme budget for the biennium 2010–2011 in the event that the United Nations General Assembly decides not to provide resources for these activities in the United Nations regular budget (table 3);
10. *Invites* the United Nations General Assembly to decide at its sixty-fourth session on the issue of meeting the conference services expenses from its regular budget;
11. *Requests* the Executive Secretary to report to the Subsidiary Body for Implementation on the implementation of paragraph 9 above, as necessary;
12. *Authorizes* the Executive Secretary to make transfers between each of the main appropriation lines set out in table 1, up to an aggregate limit of 15 per cent of total estimated expenditure for those appropriation lines, provided that a further limitation of up to minus 25 per cent of each such appropriation line shall apply;
13. *Decides* to maintain the level of the working capital reserve at 8.3 per cent of the estimated expenditure;

---

<sup>1</sup> Decision 15/CP.1, annex I.

<sup>2</sup> FCCC/SBI/2009/2 and Add.1–3.

14. *Invites* all Parties to the Convention to note that contributions to the core budget are due on 1 January of each year in accordance with paragraph 8 (b) of the financial procedures and to pay promptly and in full, for each of the years 2010 and 2011, the contributions required to finance expenditures approved under paragraph 2 above and any contributions required to finance the expenditures arising from the decisions referred to in paragraph 9 above;

15. *Authorizes* the Executive Secretary to implement decisions taken by the Conference of the Parties at its fifteenth session for which provisions are not made under the approved budget, using voluntary contributions and resources available under the core budget;

16. *Urges* Parties to make voluntary contributions as necessary for the timely implementation of the decisions referred to in paragraph 15 above;

17. *Takes note* of the proposed contingency budget for resource requirements for work related to agreed outcomes under the Bali Road Map contained in document FCCC/SBI/2009/2;

18. *Requests* the Executive Secretary to propose, for consideration by the Subsidiary Body for Implementation at its first session following the fifteenth session of the Conference of the Parties, an additional budget to cover potential activities related to decisions taken by the Conference of the Parties at its fifteenth session for which financial provisions are not made;

19. *Requests* the Subsidiary Body for Implementation to recommend at its first session following the fifteenth session of the Conference of the Parties, an additional budget as referred to in paragraph 17 above for adoption by the Conference of the Parties at its sixteenth session and/or the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol at its sixth session, as appropriate;

20. *Also requests* the Subsidiary Body for Implementation to authorize the Executive Secretary to notify Parties of their possible contributions based on the recommended additional budget;

21. *Takes note* of the accrued liability, related to staff entitlements, of USD 21.5 million as at 31 December 2008, of which approximately USD 10.4 million relates to the Trust Fund for the Core Budget of the UNFCCC;

22. *Agrees* to continue making provisions in the core budget to cover current funding commitments relating to after-service health insurance and repatriation grants on a 'pay-as-you-go' basis;

23. *Requests* the Executive Secretary to continue exploring ways to make a provision for this liability in the future, based on best practices and in line with recent developments on this matter within the United Nations system;

24. *Authorizes* the Executive Secretary to use, to the extent possible and in consultation with Parties and the Office of Human Resources Management of the United Nations, available balances from the existing reserves and surplus balances in the event that the secretariat needs to address its liability, as estimated in the actuarial study and the financial statements for the biennium 2008–2009;<sup>3</sup>

25. *Encourages* the Executive Secretary to continue to implement initiatives to reduce the level of greenhouse gas emissions of the secretariat's operations and activities;

26. *Authorizes* the Executive Secretary to make provisions under the relevant source of funding, within available resources, for efforts to offset the greenhouse gas emissions of the secretariat's operations and activities;

---

<sup>3</sup> A breakdown of the liability by fund is provided in the interim financial statements for the biennium 2008–2009 contained in document FCCC/SBI/2009/INF.3.

FCCC/CP/2009/11/Add.1

Page 32

27. *Takes note* of the funding estimates for the Trust Fund for Participation in the UNFCCC Process specified by the Executive Secretary (table 4), and invites Parties to make contributions to this fund;

28. *Takes note* of the funding estimates for the Trust Fund for Supplementary Activities specified by the Executive Secretary (EUR 24,154,170 for the biennium 2010–2011) (table 5), and invites Parties to make contributions to this fund;

29. *Requests* the Executive Secretary to report to the Conference of the Parties at its sixteenth session on income and budget performance, and to propose any adjustments that might be needed in the programme budget for the biennium 2010–2011.

<sup>a</sup> Assistant Secretary-General (ASG); Director (D) and Professional (P).

<sup>b</sup> This position may be upgraded to Under-Secretary-General following the independent review of the secretariat by the Secretary-General of the United Nations (see document FCCC/SBI/2009/2, para. 36).

<sup>c</sup> One position may be upgraded to ASG following the independent review noted above in footnote b.

**Table 3. Resource requirements for the conference services contingency in the biennium 2010–2011**  
(thousands of euros)

Object of expenditure	2010	2011	Total 2010–2011	
	(EUR)	(EUR)	(EUR)	(USD)
Interpretation <sup>a</sup>	672.4	672.4	1 344.8	1 923.0
Documentation <sup>b</sup>				
Translation	1 307.3	1 307.3	2 614.6	3 738.8
Reproduction and distribution	1 344.5	1 344.5	2 689.0	3 845.3
Meetings services support <sup>c</sup>	133.5	133.5	267.0	381.7
<b>Subtotal</b>	<b>3 457.7</b>	<b>3 457.7</b>	<b>6 915.4</b>	<b>9 888.8</b>
Programme support costs	449.5	449.5	899.0	1 285.5
Working capital reserve	324.3	--	324.3	463.7
<b>TOTAL</b>	<b>4 231.5</b>	<b>3 907.2</b>	<b>8 138.7</b>	<b>11 638.1</b>

Note: Assumptions used for calculating the conference services contingency budget include the following:

- The expected number of meetings with interpretation does not exceed 40 per session;
- The expected documentation volume is based on the calculations provided by the United Nations Office at Geneva;
- Meetings services support includes staff normally provided by United Nations Office at Geneva conference services for the in-session coordination and support of interpretation, translation and reproduction services;
- Overall, the figures used are conservative and have been applied on the assumption that there will be no major increase in requirements during the biennium.

<sup>a</sup> Includes salaries, travel and daily subsistence allowance for interpreters.

<sup>b</sup> Includes all costs relating to the processing of pre-, in- and post-session documentation; translation costs include revision and typing of documents.

<sup>c</sup> Includes salaries, travel and daily subsistence allowance for meetings services support staff, and costs for shipment and telecommunications.

<sup>a</sup> Scale may be adjusted following a review by the United Nations General Assembly in December 2009.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## Decision 13/CP.15

### Dates and venues of future sessions

*The Conference of the Parties,*

*Recalling* Article 7, paragraph 4, of the Convention,

*Also recalling* United Nations General Assembly resolution 40/243 of 18 December 1985 on the pattern of conferences,

*Further recalling* rule 22, paragraph 1, of the draft rules of procedure being applied<sup>1</sup> regarding the rotation of the office of President among the five regional groups,

*Noting* that in keeping with the principle of rotation among regional groups, and in the light of recent consultations among the groups, the President of the sixteenth session of the Conference of the Parties would come from the Group of Latin America and the Caribbean, the President of the seventeenth session would come from the African Group<sup>2</sup> and the President of the eighteenth session would come from the Asian Group,

#### **A. Date and venue of the sixteenth session of the Conference of the Parties and the sixth session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol**

1. *Decides* to accept with appreciation the offer by the Government of Mexico to host the sixteenth session of the Conference of the Parties and the sixth session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol from 29 November 2010 to 10 December 2010, subject to confirmation by the Bureau that all logistical, technical and financial elements for hosting the sessions are available, in conformity with General Assembly resolution 40/243, and subject to the successful conclusion of a Host Country Agreement;

2. *Requests* the Executive Secretary to continue consultations with the Government of Mexico and to negotiate a Host Country Agreement for convening the sessions, with a view to concluding and signing the Host Country Agreement not later than the thirty-second sessions of the Subsidiary Body for Scientific and Technological Advice and the Subsidiary Body for Implementation;

#### **B. Date and venue of the seventeenth session of the Conference of the Parties and the seventh session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol**

3. *Recalls* that the seventeenth session of the Conference of the Parties and the seventh session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol shall be held in South Africa<sup>3</sup> from 28 November to 9 December 2011;<sup>4</sup>

4. *Requests* the Executive Secretary to continue consultations with the Government of South Africa and to negotiate a Host Country Agreement for convening the sessions, with a view to concluding and signing the Host Country Agreement not later than the thirty-fourth sessions of the Subsidiary Body for Scientific and Technological Advice and the Subsidiary Body for Implementation;

<sup>1</sup> FCCC/CP/1996/2.

<sup>2</sup> FCCC/SBI/2008/8, paragraph 141.

<sup>3</sup> Decision 9/CP.14, paragraph 4.

<sup>4</sup> Decision 9/CP.12, paragraph 14.

FCCC/CP/2009/11/Add.1

Page 42

**C. Date and venue of the eighteenth session of the Conference of the Parties and the eighth session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol**

5. *Invites* Parties to come forward with offers to host the eighteenth session of the Conference of the Parties and the eighth session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## **Resolution 1/CP.15**

### **Expression of gratitude to the Government of the Kingdom of Denmark and the people of the city of Copenhagen**

*The Conference of the Parties and the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol,*

*Having met* in Copenhagen from 7 to 18 December 2009 at the invitation of the Government of the Kingdom of Denmark,

1. *Express their profound gratitude* to the Government of the Kingdom of Denmark for having made it possible for the fifteenth session of the Conference of the Parties and the fifth session of the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol to be held in Copenhagen;

2. *Request* the Government of the Kingdom of Denmark to convey to the people of Copenhagen the gratitude of the Conference of the Parties and the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol for the hospitality and warmth extended to the participants.

*9<sup>th</sup> plenary meeting  
18–19 December 2009*

## Decision 1/CP.17

### Establishment of an Ad Hoc Working Group on the Durban Platform for Enhanced Action

*The Conference of the Parties,*

*Recognizing* that climate change represents an urgent and potentially irreversible threat to human societies and the planet and thus requires to be urgently addressed by all Parties, and acknowledging that the global nature of climate change calls for the widest possible cooperation by all countries and their participation in an effective and appropriate international response, with a view to accelerating the reduction of global greenhouse gas emissions,

*Noting with grave concern* the significant gap between the aggregate effect of Parties' mitigation pledges in terms of global annual emissions of greenhouse gases by 2020 and aggregate emission pathways consistent with having a likely chance of holding the increase in global average temperature below 2 °C or 1.5 °C above pre-industrial levels,

*Recognizing* that fulfilling the ultimate objective of the Convention will require strengthening of the multilateral, rules-based regime under the Convention,

*Noting* decision 1/CMP.7,

*Also noting* decision 2/CP.17,

1. *Decides* to extend the Ad Hoc Working Group on Long-term Cooperative Action under the Convention for one year in order for it to continue its work and reach the agreed outcome pursuant to decision 1/CP.13 (Bali Action Plan) through decisions adopted by the sixteenth, seventeenth and eighteenth sessions of the Conference of the Parties, at which time the Ad Hoc Working Group on Long-term Cooperative Action under the Convention shall be terminated;
2. *Also decides* to launch a process to develop a protocol, another legal instrument or an agreed outcome with legal force under the Convention applicable to all Parties, through a subsidiary body under the Convention hereby established and to be known as the Ad Hoc Working Group on the Durban Platform for Enhanced Action;
3. *Further decides* that the Ad Hoc Working Group on the Durban Platform for Enhanced Action shall start its work as a matter of urgency in the first half of 2012 and shall report to future sessions of the Conference of the Parties on the progress of its work;
4. *Decides* that the Ad Hoc Working Group on the Durban Platform for Enhanced Action shall complete its work as early as possible but no later than 2015 in order to adopt this protocol, another legal instrument or an agreed outcome with legal force at the twenty-first session of the Conference of the Parties and for it to come into effect and be implemented from 2020;
5. *Also decides* that the Ad Hoc Working Group on the Durban Platform for Enhanced Action shall plan its work in the first half of 2012, including, inter alia, on mitigation, adaptation, finance, technology development and transfer, transparency of action and support, and capacity-building, drawing upon submissions from Parties and relevant technical, social and economic information and expertise;

6. *Further decides* that the process shall raise the level of ambition and shall be informed, inter alia, by the Fifth Assessment Report of the Intergovernmental Panel on Climate Change, the outcomes of the 2013–2015 review and the work of the subsidiary bodies;
7. *Decides* to launch a workplan on enhancing mitigation ambition to identify and to explore options for a range of actions that can close the ambition gap with a view to ensuring the highest possible mitigation efforts by all Parties;
8. *Requests* Parties and observer organizations to submit by 28 February 2012 their views on options and ways for further increasing the level of ambition and decides to hold an in-session workshop at the first negotiating session in 2012 to consider options and ways for increasing ambition and possible further actions.

*10<sup>th</sup> plenary meeting  
11 December 2011*

## Decision 2/CP.17

### Outcome of the work of the Ad Hoc Working Group on Long-term Cooperative Action under the Convention

*The Conference of the Parties,*

#### I. A shared vision for long-term cooperative action

*Recalling* decision 1/CP.13 (the Bali Action Plan) and decision 1/CP.16, elaborating on a shared vision for long-term cooperative action, in particular the mandate contained in decision 1/CP.16, paragraphs 5 and 6, with regard to working towards identifying a global goal for substantially reducing global emissions by 2050 and a time frame for a global peaking of greenhouse gas emissions,

1. *Agrees*, in the context of the long-term goal and the ultimate objective of the Convention and the Bali Action Plan, to continue to work towards identifying a global goal for substantially reducing global emissions by 2050, and to consider it at its eighteenth session;
2. *Also agrees* to continue to work, in the context of the provisions of decision 1/CP.16, paragraph 6, towards identifying a time frame for the global peaking of greenhouse gas emissions based on the best available scientific knowledge and equitable access to sustainable development, and to consider it at its eighteenth session;
3. *Further agrees* that consideration of a global goal for substantially reducing global emissions by 2050 and the time frame for global peaking of greenhouse gas emissions cannot be undertaken in the abstract and will necessarily involve matters related to the context for such considerations;
4. *Requests* the Ad Hoc Working Group on Long-term Cooperative Action under the Convention to consider the issue of equitable access to sustainable development, as contained in decision 1/CP.16, through a workshop at its next session; the Ad Hoc Working Group on Long-term Cooperative Action under the Convention shall report on the workshop to the Conference of the Parties as part of its work;

#### II. Enhanced action on mitigation

##### A. Nationally appropriate mitigation commitments or actions by developed country Parties

###### Matters relating to decision 1/CP.16, paragraphs 36–38

*Recalling* decision 1/CP.16, which recognizes that climate change represents an urgent and potentially irreversible threat to human societies and the planet, and thus requires to be urgently addressed by all Parties,

*Also recalling* decision 1/CP.13 in relation to ensuring the comparability of mitigation efforts among all developed country Parties in a measurable, reportable and verifiable manner,

*Recognizing* that deep cuts in global greenhouse gas emissions are required according to science, as documented in the Fourth Assessment Report of the

Intergovernmental Panel on Climate Change, with a view to reducing global greenhouse gas emissions so as to hold the increase in global average temperature below 2 °C above pre-industrial levels, and that Parties should take urgent action to meet this long-term goal, consistent with science and on the basis of equity; also recognizing the need to consider, in the context of the first review of the long-term global goal, as referred to in decision 1/CP.16, paragraph 138, strengthening the long-term global goal on the basis of the best available scientific knowledge, including in relation to a global average temperature rise of 1.5 °C,

*Acknowledging* that there is a gap between the aggregate level of reduction in emissions of greenhouse gases to be achieved through global mitigation efforts and the reduction needed as part of the global effort to achieve the range indicated in the Fourth Assessment Report of the Intergovernmental Panel on Climate Change,

*Recognizing* that the clarification of developed country Parties' quantified economy-wide emission reduction targets builds confidence and trust among Parties,

*Urging* developed country Parties to increase the ambition of their economy-wide emission reduction targets, with a view to reducing their aggregate anthropogenic emissions of carbon dioxide and other greenhouse gases not controlled by the Montreal Protocol to a level consistent with the ranges documented in the Fourth Assessment Report of the Intergovernmental Panel on Climate Change and subsequent assessment reports of the Intergovernmental Panel on Climate Change,

*Noting* the quantified economy-wide emission reduction targets to be implemented by Parties included in Annex I to the Convention (Annex I Parties) as communicated by them and contained in document FCCC/SB/2011/INF.1/Rev.1,

5. *Decides* to continue in 2012 the process of clarifying the developed country Parties' quantified economy-wide emission reduction targets contained in document FCCC/SB/2011/INF.1/Rev.1, with the objective of understanding the assumptions and conditions related to the individual targets, in particular in relation to the base year, global warming potential values, coverage of gases, coverage of sectors, expected emission reductions, and the role of land use, land-use change and forestry, and carbon credits from market-based mechanisms, and associated assumptions and conditions related to the ambition of the pledges; this process shall include the following:

(a) Submission of relevant information by developed country Parties, using a common template, to the secretariat by 5 March 2012 to be compiled into a miscellaneous document;

(b) In-session workshops;

(c) An update of document FCCC/TP/2011/1;

6. *Requests* the secretariat to compile additional information relating to the quantified economy-wide emission reduction targets submitted by developed country Parties in a miscellaneous document;

7. *Also requests* the secretariat to organize the workshops referred to in paragraph 5(b) above in conjunction with the thirty-sixth sessions of the subsidiary bodies and to prepare a written workshop report in a structured manner;

8. *Further requests* the secretariat to prepare the technical paper referred to in paragraph 5(c) above, compiling all the information contained in Parties' submissions in a structured manner, and to further update that paper as new information is provided by Parties;

9. *Acknowledges* the value of ex ante information, and the need to elaborate rigorous, robust and transparent approaches in a systematic manner to measure progress towards the

achievement of economy-wide emission reduction targets, building on existing processes, practices and experiences;

10. *Decides* to hold workshops to explore the assumptions and conditions related to targets, including the elements listed in paragraph 5 above, and requests the secretariat to produce a technical paper exploring the commonalities and differences of approaches;

11. *Requests* developed country Parties to share experiences with the development of low-emission development strategies during the in-session workshops referred to in paragraph 5(b) above, and invites developed country Parties to submit information related to progress towards the formulation of their low-emission development strategies;

#### **UNFCCC biennial reporting guidelines for developed country Parties**

*Recalling* the relevant provisions of the Convention, in particular Articles 4, 5, 7, 10 and 12, and decisions 9/CP.2, 11/CP.4 and 4/CP.5 on national communications from Annex I Parties,

*Also recalling* that by decision 1/CP.16 it decided to enhance reporting in national communications of Annex I Parties, and on progress in achieving emission reductions and on the provision of financial, technology and capacity-building support to Parties not included in Annex I to the Convention (non-Annex I Parties), building on existing reporting and review guidelines, processes and experiences,

12. *Adopts* the guidelines contained in annex I on the preparation of biennial reports by developed country Parties (the “UNFCCC biennial reporting guidelines for developed country Parties”);

13. *Decides* that developed country Parties shall use the “UNFCCC biennial reporting guidelines for developed country Parties” for the preparation of their first biennial reports, taking into account their national circumstances, and shall submit their first biennial reports to the secretariat by 1 January 2014, and their second and subsequent biennial reports two years after the due date of a full national communication (i.e. in 2016, 2020);

14. *Also decides* that Annex I Parties shall submit a full national communication every four years, noting that the next due date after adoption of this decision is 1 January 2014 according to decision 9/CP.16;

15. *Further decides* that in the years when the full national communications are submitted, developed country Parties should present the biennial reports as an annex to the national communications or as a separate report;

16. *Decides* to establish a work programme under the Subsidiary Body for Scientific and Technological Advice on the development of a common tabular format for the electronic reporting of information according to the reporting guidelines referred to in paragraph 12 above, with a view to adopting the format by the Conference of the Parties at its eighteenth session;

17. *Invites* Annex I Parties to make submissions of views by 1 March 2014 on their experience with reporting the first biennial reports;

18. *Requests* the Subsidiary Body for Implementation to begin, at its fortieth session, the revision of the “Guidelines for the preparation of national communications by Parties included in Annex I to the Convention, Part II: UNFCCC reporting guidelines on national communications”, based on the experiences gained in preparing the first biennial reports and other information, with a view to adopting the revised guidelines by the Conference of the Parties at its twentieth session;

19. *Also requests* the Subsidiary Body for Scientific and Technological Advice to develop, taking into account existing international methodologies, and based on the

experiences gained in preparing the first biennial reports, methodologies for reporting financial information with a view to recommending a decision on this matter to the Conference of the Parties at its twentieth session;

20. *Requests* the secretariat to prepare a technical paper based on the submissions of views by Parties referred to in paragraph 17 above, with the aim of facilitating consideration by the Subsidiary Body for Implementation, at its forty-first session, of the matters referred to in paragraph 18 above;

21. *Also requests* the secretariat to prepare a compilation and synthesis report on the information reported by developed country Parties in the biennial reports referred to in paragraph 13 above, for consideration by the Conference of the Parties at its twentieth session and subsequent sessions, according to Article 7, paragraph 2(g), of the Convention;

22. *Encourages* Parties included in Annex II to the Convention (Annex II Parties) to assist Annex I Parties with economies in transition and those Annex I Parties whose special circumstances are recognized under the Convention, as necessary, through appropriate bilateral or multilateral channels, with technical aspects of the preparation of their biennial reports;

#### **Modalities and procedures for international assessment and review**

*Recalling* decisions 2/CP.1, 9/CP.2, 6/CP.3, 6/CP.5, 33/CP.7, 19/CP.8, 12/CP.9, 18/CP.10 and 1/CP.13,

*Also recalling* decision 1/CP.16, establishing a process for the international assessment and review of emissions and removals related to developed country Parties' quantified economy-wide emission reduction targets under the Subsidiary Body for Implementation, taking into account national circumstances, in a rigorous, robust and transparent manner, with a view to promoting comparability and building confidence,

*Responding* to the work programme launched by decision 1/CP.16 to develop modalities and procedures for international assessment and review, and building on existing review guidelines, processes and experiences,

*Recognizing* that the international assessment and review process should promote the comparability of efforts among all developed country Parties, including in relation to their quantified economy-wide emission limitation and reduction targets,

*Also recognizing* the need to have an efficient, cost-effective and practical international assessment and review process which does not impose an excessive burden on Parties and on the secretariat,

23. *Decides* that the international assessment and review process will be conducted through a technical review of information and a multilateral assessment of the implementation of quantified economy-wide emission reduction targets;

24. *Adopts* the modalities and procedures for international assessment and review as contained in annex II, and decides to use them until any revisions are decided upon by the Conference of the Parties;

25. *Agrees* that the first round of international assessment and review should commence two months after the submission of the first round of biennial reports by developed country Parties, and should be conducted in accordance with the modalities and procedures referred to in paragraph 24 above;

26. *Decides* to revise the modalities and procedures prescribed herein on the basis of the experience gained in the first round of international assessment and review, no later than 2016;

27. *Also decides* that the review of annual national greenhouse gas inventories will continue on an annual basis, and that international assessment and review will be conducted every two years for the biennial reports, whether independently or in conjunction with a national communication;
28. *Further decides* to establish a work programme under the Subsidiary Body for Scientific and Technological Advice, with a view to concluding the revision of the guidelines for the review of biennial reports and national communications, including national inventory reviews to be concluded no later than the nineteenth session of the Conference of the Parties;
29. *Requests* the secretariat to enhance coordination between different review processes in such a way as to ensure effective and efficient processes and procedures;
30. *Agrees* that the outputs of the multilateral assessment will comprise, for each Party, a record prepared by the secretariat, which will include in-depth review reports, the summary report of the Subsidiary Body for Implementation, questions submitted by Parties and responses provided, and any other observations of the Party under review that are submitted within two months of the working group session of the Subsidiary Body for Implementation;
31. *Also agrees* that any revision of the modalities and procedures for international assessment and review should take into account any future agreement on a compliance regime for mitigation targets under the Convention;

## **B. Nationally appropriate mitigation actions by developing country Parties**

### **Matters relating to decision 1/CP.16, paragraphs 48–51**

*Recalling* decision 1/CP.16, which recognizes that climate change represents an urgent and potentially irreversible threat to human societies and the planet, and thus requires to be urgently addressed by all Parties,

*Recognizing* that deep cuts in global greenhouse gas emissions are required according to science, and as documented in the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, with a view to reducing global greenhouse gas emissions so as to hold the increase in global average temperature below 2 °C above pre-industrial levels, and that Parties should take urgent action to meet this long-term goal, consistent with science and on the basis of equity; also recognizing the need to consider, in the context of the first review, as referred to in decision 1/CP.16, paragraph 138, strengthening the long-term global goal on the basis of the best available scientific knowledge, including in relation to a global average temperature rise of 1.5 °C,

*Acknowledging* that there is a gap between the aggregate level of reduction in emissions of greenhouse gases to be achieved through global mitigation efforts and the reduction needed as part of the global effort to achieve the range indicated in the Fourth Assessment Report of the Intergovernmental Panel on Climate Change,

*Recognizing* that understanding the diversity of mitigation actions submitted by developing country Parties, their underlying assumptions and methodologies, builds confidence and trust among Parties,

*Also recognizing* that developing country Parties are already contributing and will continue to contribute to a global mitigation effort in accordance with the principles and provisions of the Convention, and could enhance their mitigation actions, depending on provision of finance, technology and capacity-building support by developed country Parties,

*Reaffirming* that social and economic development and poverty eradication are the first and overriding priorities of developing country Parties, and that a low-emission development strategy is central to sustainable development, and that the share of global emissions originating in developing countries will grow to meet their social and development needs,

*Also reaffirming* that, in accordance with Article 4, paragraph 3, of the Convention, developed country Parties shall provide enhanced financial, technology and capacity-building support for the preparation and implementation of nationally appropriate mitigation actions of developing country Parties,

*Noting* the nationally appropriate mitigation actions to be implemented by non-Annex I Parties, as communicated by them and contained in the document FCCC/AWGLCA/2011/INF.1,

32. *Encourages* developing country Parties that are yet to submit information on nationally appropriate mitigation actions pursuant to decision 1/CP.16, paragraph 50, to do so, noting the need to extend flexibility to small island developing States and the least developed country Parties;

33. *Decides* to continue, in 2012, workshops, in a structured manner, to further the understanding of the diversity of mitigation actions as communicated and contained in document FCCC/AWGLCA/2011/INF.1, underlying assumptions and any support needed for the implementation of these actions, noting different national circumstances and the respective capabilities of developing country Parties;

34. *Invites* developing country Parties, with a view to providing input to the process referred to in paragraph 33 above, to submit, subject to availability, more information relating to nationally appropriate mitigation actions, including underlying assumptions and methodologies, sectors and gases covered, global warming potential values used, support needs for the implementation of nationally appropriate mitigation actions and estimated mitigation outcomes;

35. *Also invites* developing country Parties to submit this information to the secretariat, by 5 March 2012, to be compiled into a miscellaneous document;

36. *Requests* the secretariat to organize the in-session workshops referred to in paragraph 33 above in conjunction with the thirty-sixth session of the subsidiary bodies and to prepare written workshop summary reports;

37. *Also requests* the Subsidiary Body for Scientific and Technological Advice to develop general guidelines for domestic measurement, reporting and verification of domestically-supported nationally appropriate mitigation actions;

38. *Encourages* developing country Parties to develop low-emission development strategies, recognizing the need for financial and technical support by developed country Parties for the formulation of these strategies, and invites interested developing country Parties to share their experience with the formulation of low-emission development strategies during the in-session workshops referred to in paragraph 36 above;

#### **UNFCCC biennial update reporting guidelines for Parties not included in Annex I to the Convention**

*Recalling* the relevant provisions of the Convention, in particular Article 4, paragraphs 1, 3 and 7, Article 5, Article 7, paragraph 2(a), (b), (d) and (e), Article 9, paragraph 2(b), Article 10, paragraph 2(a) and (c), and Article 12, paragraphs 1, 5, 6 and 7,

*Also recalling* decisions on national communications from non-Annex I Parties in particular decisions 10/CP.2, 2/CP.4, 12/CP.4, 8/CP.5, 31/CP.7, 32/CP.7, 17/CP.8 and 8/CP.11,

*Further recalling* that, by decision 1/CP.16, paragraph 60, the Conference of the Parties decided to enhance the reporting in national communications, including inventories from non-Annex I Parties, on mitigation actions and their effects, and support received, with additional flexibility to be given to the least developed country Parties and small island developing States,

*Recalling* that the Conference of the Parties, through decision 1/CP.16, paragraph 60(c), decided that developing country Parties, consistent with their capabilities and the level of support provided for reporting, should submit biennial update reports containing updates of national greenhouse gas inventories, including a national inventory report and information on mitigation actions, needs and support received,

*Recognizing* the difficulties faced by non-Annex I Parties in reporting under the Convention and the need to take into account national capabilities and circumstances, and to build capacity, and the need for the provision of financial support in a timely manner to non-Annex I Parties to facilitate the timely preparation of biennial update reports,

*Urging* Annex II Parties and other developed country Parties in a position to do so to provide support for the preparation of biennial update reports,

*Recognizing* that the Consultative Group of Experts on National Communications from Parties not included in Annex I to the Convention could also play an important role in facilitating technical advice and support for the preparation and submission of the first biennial update report,

*Also recognizing* that, by decision 1/CP.16, the Conference of the Parties agreed on a work programme for developing the guidelines for the preparation of biennial update reports from non-Annex I Parties, as a part of their national communications,

39. *Adopts* the guidelines, contained in annex III, for the preparation of biennial update reports by non-Annex I Parties (hereinafter referred to as the Guidelines);

40. *Affirms* that the Guidelines shall respect the diversity of mitigation actions and provide flexibility for non-Annex I Parties to report information, while providing an understanding of actions taken;

41. *Decides*:

(a) That non-Annex I Parties, consistent with their capabilities and the level of support provided for reporting, should submit their first biennial update report by December 2014; the least developed country Parties and small island developing States may submit biennial update reports at their discretion;

(b) That in using the Guidelines, non-Annex I Parties should take into account their development priorities, objectives, capacities and national circumstances;

(c) That the Guidelines should be used as a basis to provide guidance to an operating entity of the financial mechanism for funding the preparation of biennial update reports from non-Annex I Parties and, in the case of the first biennial update report, to the Global Environment Facility;

(d) To urge non-Annex I Parties to submit their requests to the Global Environment Facility for support, in a timely manner;

(e) That enhanced support for the preparation of biennial update reports should be ensured by developed country Parties and other developed Parties included in Annex II

to the Convention by means of resources, in accordance with Article 4, paragraph 3, of the Convention, on the basis of agreed full-cost funding;

(f) That non-Annex I Parties shall submit a biennial update report every two years, either as a summary of parts of their national communication in the year in which the national communication is submitted or as a stand-alone update report; the least developed country Parties and small island developing States may submit biennial update reports at their discretion;

(g) That the first biennial update report submitted by non-Annex I Parties shall cover, at a minimum, the inventory for the calendar year no more than four years prior to the date of the submission, or more recent years if information is available, and that subsequent biennial update reports shall cover a calendar year that does not precede the submission date by more than four years;

42. *Also decides* that these guidelines should be reviewed and revised as appropriate, in accordance with decisions of the Conference of the Parties;

43. *Requests* the secretariat to facilitate assistance to non-Annex I Parties, on request, in the preparation of their biennial update reports, in accordance with Article 8, paragraph 2(c), of the Convention;

44. *Urges* and requests the Global Environment Facility to make available support to non-Annex I Parties preparing their first biennial update reports as early as possible in 2012 and on the basis of agreed full-cost funding;

### **Registry**

*Recalling* decision 1/CP.13,

*Also recalling* decision 1/CP.16, paragraphs 53–59, by which the Conference of the Parties decided to set up a registry to record the nationally appropriate mitigation actions seeking international support, to facilitate the matching of financial, technology and capacity-building support for these actions, and to recognize nationally appropriate mitigation actions of developing country Parties in a separate section of the registry,

*Further recalling* the same decision, by which the Conference of the Parties agreed to develop modalities for the facilitation of support through the registry, including any functional relationship with the financial mechanism,

*Recognizing* the need for support for enabling activities to assist developing country Parties in the identification and preparation of nationally appropriate mitigation actions for submission to the registry, and support for their implementation,

45. *Decides* that:

(a) The registry should be developed as a dynamic, web-based platform managed by a dedicated team in the secretariat;

(b) Participation in the registry shall be voluntary and only information submitted expressly for inclusion in the registry should be recorded;

(c) The registry should be structured in a flexible manner that clearly reflects the full range of the diversity of nationally appropriate mitigation actions, and a range of types of support;

46. *Invites* developing country Parties to submit, as appropriate, to the secretariat the following information on individual nationally appropriate mitigation actions seeking international support:

- (a) A description of the mitigation action and the national implementing entity, including contact information;
- (b) The expected time frame for the implementation of the mitigation action;
- (c) The estimated full cost of the preparation;
- (d) The estimated full cost and/or incremental cost of the implementation of the mitigation action;
- (e) The amount and type of support (financial, technology and capacity-building) required to prepare and/or implement the mitigation action;
- (f) The estimated emission reductions;
- (g) Other indicators of implementation;
- (h) Other relevant information, including the co-benefits for local sustainable development, if information thereon exists;

47. *Also invites* developing country Parties to submit to the secretariat information on other individual nationally appropriate mitigation actions, to be recorded in a separate section of the registry, for their recognition;
