**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	DOCKET 17-4802
TFN 6 2-025)	
)	

**OBJECTOR FISHERS' BRIEF ON THE APPLICATION OF
WYOMING STATUTE §35-11-406(n)**

Objectors Mary Brezik-Fisher and David Fisher, through their undersigned attorney Jay A. Gilbertz, of Yonkee & Toner, LLP, hereby file this brief addressing the application of Wyoming Statute §35-11-406(n) to these proceedings.

- I. Brook Mine's Application for a surface coal mine *must* contain the information which demonstrates that the requirements of §35-11-406(n) have been met. If the Application lacks this proof, it is not a complete application.**

Wyoming Statute §35-11-406 provides that when an Applicant for surface coal mining permit and the Department of Environmental Quality (DEQ) believe an application is complete, the application moves to a public participation phase during which interested members of the public can raise questions about, comment on, and object to the application. At this juncture, the back-and-forth between the Applicant and the DEQ about the contents and technical aspects of the application has concluded and the Applicant (Brook Mine) necessarily takes the position that the assessment of

its application is ready to move to a final determination.

In several locations, §35-11-406 requires that the application be “complete” by this stage. In other words, at this point, the Applicant is claiming that it has provided everything which is necessary for the issuance of the mining permit and the application is ready, *as submitted*, to be reviewed for compliance with Wyoming law and ultimately for issuance of a coal mining permit. In order for the application to be “complete” it must demonstrate compliance with all Wyoming statutes, rules and regulations that govern surface coal mines *and* it must contain all the information necessary for the issuance of the permit. Section 35-11-406(n) provides:

(n) The applicant for a surface coal mining permit **has the burden of establishing that his application is in compliance with this act and all applicable state laws.** No surface coal mining permit shall be approved unless the **applicant affirmatively demonstrates** and the administrator finds in writing:

Wyo. Stat. §35-11-406 (LexisNexis 2015) (emphasis added). Subsection (n) goes on to list the required showings which include affirmative proof that application is accurate and complete, that the proposed mining operation has “been designed to prevent material damage to the hydrologic balance outside the permit area” and that the mining activity will not “materially damage the quantity or quality of water in surface or underground water systems” that supply alluvial valley floors. Wyo. Stat. §35-11-406(n)(i), (n)(iii), & (n)(v)(B).

The above quoted portion of the statute clearly and unambiguously requires the applicant to prove that its “application in compliance with this act” – meaning the Environmental Quality Act. Subsection (n) cited above is part of that Act and for this reason the *application* must demonstrate compliance with all the requirements of the Environmental Quality Act – including subsection (n). By very definition then, an application cannot be complete unless it contains all the information necessary to prove that the applicant is in compliance with subsection (n) and its sub-parts. If the application and its contents do not contain this information, then it is incomplete.

While it is true that there can be a later assessment by the Director to determine if the Director believes Brook has proven the subsection (n) factors, this later process does not relieve Brook from the current obligation to set forth the necessary facts and proof within the content of the very application that Brook contends is complete and ready for such an assessment. Without detailed and meaningful evidence and analysis proving that the requirements of §35-11-406(n) have been met, the application does not have the information upon which any later finding could be based. Moreover, without this proof being set forth and sufficiently detailed, there is no opportunity for members of the public to gauge or challenge the adequacy or reliability of the claimed proof. Sweeping and conclusory generalities such as "No harm is expected" do not constitute affirmative proof.

In short, an application lacking in this proof is incomplete. This is actually a quite simple and very straightforward matter which warrants no further discussion or analysis. Whether or not the application contains proof of compliance with the §35-11-406(n) requirements must be addressed.

II. Failure to assess whether the permit application contains the necessary information to prove compliance with subsection (n) would constitute a grave error of law and constitute an arbitrary and capricious act.

The "technically adequate" and "technically complete" distraction:

Throughout the proceedings, Brook Mine contended that all it needed to show for these proceedings was that its mining application was "technically adequate" or "technically complete". Surprisingly, the DEQ itself participated in this dissimulation of the applicable standard and adopted this same inaccurate terminology.

Nowhere in the Wyoming Statutes are the terms "technically adequate" or "technically complete" used as a descriptive term for the adequacy of an application for a coal mining permit.

Rather, Wyoming Statute §35-11-406 simply states in several locations that the application must be “complete”. Complete means “having all necessary parts, elements, or steps.” *Merriam Webster’s Collegiate Dictionary*, 10th Ed. (1995). To be complete, the application must contain the elements or parts which reveals information satisfying the essential requirements of §35-11-406(n).

By purposeful addition of the qualifier “technical” and through avoidance of the actual language of the statute, Brook attempts to reduce its obligated showing to something less than a “complete” application. The EQC must reject Brook’s efforts to diminish its required showing through clever semantics and hold Brook to the statutory standard of having a complete application. A complete application must contain the information necessary to demonstrate that the requirements of §35-11-406(n) have been *meaningfully* satisfied in the contents and attachments to the application in its current form.

Rather than addressing the extent to which the application and its attachments satisfied this burden, Brook (and to a large degree DEQ) aggressively fought addressing the topic throughout the proceedings objecting any time the topic was raised. This resistance to squarely addressing the issue is a clear indication the permit is lacking the required proof.

Interpreting §35-11-406 to allow Brook to proceed to the issuance of a mining permit without demonstrating that its application contains the information proving compliance with the standards of §35-11-406(n) is an absurd reading of the Statute and violates the policy of the Act.

Statutes must be interpreted and construed in a way that does not render any portion of the statute meaningless. *Reliance Ins. Co. v. Chevron U.S.A. Inc.*, 713 P.2d 766 (Wyo. 1986). Statutes cannot be construed or interpreted in a “manner producing absurd results.” *State v. Sodergren*, 686 P.2d 521, 527 (Wyo. 1984), See also *In re Romer*, 436 P.2d 956 (Wyo. 1968); *Woolley v. State Highway Commission*, 387 P.2d 667 (Wyo. 1963); *Huber v. Thomas*, 19 P.2d 1042 (Wyo. 1933); and *Jones v. State*, 2006 WY 40, ¶ 12, 132 P.3d 162, 166 (Wyo. 2006).

Brook contends that whether it has proven that the requirements of §35-11-406(n) have been met is a determination to later be made by the Director of the DEQ and thus it need not demonstrate that its application contains the information from which that conclusion can be drawn. This contention ignores the fact that at this stage of the process Brook has supplied everything it believes is necessary to support issuance of the permit. If the contents of Brook's application is not capable of meaningfully proving the requirements of §35-11-406(n), then the application is by definition incomplete. It would constitute an absurd reading of the statute to declare that the application can be considered complete without the information necessary to make these required determinations.

Moreover, construing the statute in this way implicates due process concerns and contradicts the underlying goals of environmental protection laws. Like the federal law upon which it was modeled, Wyoming environmental protection laws impose a duty of taking a "hard look" at the environmental consequences of a project and require the meaningful participation of the public in that decision making process. As stated by the U.S. Supreme Court, the goal of environmental protection laws is to ensure that "the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts; **it also guarantees that the relevant information will be made available to the larger audience that may also play a role in both the decision making process and the implementation of that decision.**" *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349, 109 S. Ct. 1835, 1845, (1989) (emphasis added). Wyoming's statutes provide for and echo this notion of the public having detailed and relevant information about the proposed activities, the environmental risks and having the right to a meaningful role in the decision making process.

Under Brook's proffered construction of the statute, it need not demonstrate that its application clearly contains the detailed information necessary to prove that it has satisfied the

requirements of §35-11-406(n) (which are prerequisites to obtaining the permit). According to Brook, this is because the Director of the DEQ can later make his own determination of whether these requirements have been satisfied. This reading effectively freezes-out public participation in the decision making process.

In other words, Brook's position is that it does not need to show that it has provided the detailed and "relevant information" in its application because there is a later decision to be made. The grave upshot of that argument is that this relevant information will only be made known to the public after the permit is issued – if ever. This would put Brook in the position of getting its mining permit with the only recourse or role for the public and "larger audience" to play being an appeal of the permit's issuance. Under this scenario, it would then be the obligation of the objectors to show the permit was improperly granted.

In effect, Brook seeks to cleverly flip the burden of proof from itself to the public and in the bargain gain the right to begin its mining operations and environmental disturbance before any challenges can be addressed. No doubt, Brook would prize such a discrepant outcome, but the EQC cannot allow the operator to shirk its burden of proof. Accepting Brook's construction of the statute would result in an absurdity and undermine the very goals of public review and participation in the process.

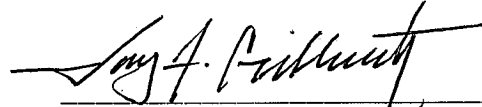

III. Conclusion

The requirements of §35-11-406(n) are substantive requirements of the Wyoming Environmental Quality Act and a coal mining applicant must prove its mining activities will be in compliance with these provisions as a prerequisite to any mining permit being issued. Consequently, in order to demonstrate that an application is complete, the relevant information must be contained and set forth in the application documents demonstrating and proving that the proposed mining

operation has met these requirements. The EQC must consider §35-11-406(n) in determining whether Brook's application is complete.

DATED this 26th day of June, 2017.

ATTORNEY FOR OBJECTORS
BIG HORN COAL COMPANY

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **Docket Nos. 17-4802, 17-**
) **4803, and 17-4804**
TFN 6 2-025) **(Consolidated)**

**BIG HORN COAL COMPANY'S BRIEF REGARDING THE SCOPE OF
THE ENVIRONMENTAL QUALITY COUNCIL'S REVIEW**

Pursuant to the Environmental Quality Council's ("EQC") Briefing Order, dated June 13, 2017, Big Horn Coal Company ("Big Horn"), by and through its undersigned counsel of record, hereby submits this brief addressing the legal parameters governing the EQC's review in this matter, as well as the appropriate burden of proof standard.

INTRODUCTION

This matter involves the surface coal mining permit application of Brook Mining Company, LLC ("Brook Mine") and the numerous objections thereto. After

the permit application was deemed complete and suitable for publication by the Wyoming Department of Environmental Quality (“DEQ”),¹ notice of the application was published pursuant to Wyo. Stat. Ann. § 35-11-406(j). In response, and pursuant to Wyo. Stat. Ann. § 35-11-406(k), numerous parties submitted written objections to the permit application citing various deficiencies and requesting an informal conference to attempt to resolve the disputes without the need for a contested case hearing. DEQ denied the requests for an informal conference and the matter was referred to the EQC for a contested case hearing. Additional proceedings before the EQC eventually led to this contested case hearing.

The EQC’s June 13th Order directs the parties to submit briefs as to the appropriate legal framework and burden of proof standard to be applied by the EQC, and to particularly address the applicability of Wyo. Stat. Ann. § 35-11-406(n).

In short, pursuant to Wyo. Stat. Ann. § 35-11-406, the EQC must consider all statutes and regulations regarding permit application requirements and required findings relating to permit issuance. This certainly includes Wyo. Stat. Ann. § 35-11-406(n), as this subsection specifically provides criteria that must be met prior to

¹ Various decisions, statements or legal requirements referenced herein pertain to specific personnel, divisions or locations within DEQ. Because these specifics generally do not affect the subject matter briefed herein, for the sake of simplicity, in this Brief, Big Horn simply refers to “DEQ” generally.

any permit approval. As to the appropriate burden of proof standard, Wyo. Stat. Ann. § 35-11-406(n) clearly provides that Brook Mine, as the permit applicant, bears the burden to affirmatively establish and demonstrate that its application is “in compliance with the [Environmental Quality Act] and all applicable state laws” and meets each and every requirement under Wyo. Stat. Ann. § 35-11-406(n).

ANALYSIS

Wyoming Statute Annotated § 35-11-406 (sometimes referred to herein as “Section 406”), as the statute governing Brook Mine’s permit application and its eventual issuance or denial, makes clear that the matter at hand is whether Brook Mine’s permit application is suitable for approval and issuance. Under the course of these proceedings, the EQC must render a decision on the permit application following a contested case hearing, which it is empowered to hear pursuant to Section 406 and Wyo. Stat. Ann. § 35-11-112(a)(iv). From this, two conclusions can be drawn: (1) to properly discharge its duties, the EQC must consider all legal requirements pertaining to surface coal mine permit applications, specifically including Wyo. Stat. Ann. § 35-11-406(n); and (2) by clear and unequivocal statutory directive, the burden falls squarely on Brook Mine to affirmatively establish that its application is in compliance with all relevant laws and meets the specific requirements of Section 406(n). Wyo. Stat. Ann. § 35-11-406(n).

In analyzing the EQC’s role, it is helpful to review the applicable statutory procedure governing the processing of Brook Mine’s permit application, the course

of proceedings in this matter, and the powers and duties of the EQC. Additionally, in light of its future decisions, it is important for the EQC to evaluate whether it is required to give deference to DEQ in interpreting statutory provisions, including those related to the permit application's accuracy and completeness.

I. Procedure Provided for in Wyo. Stat. Ann. § 35-11-406

Section 406 provides, in a very linear and step-by-step fashion, both the procedure and legal requirements for surface coal mining permit applications and the eventual issuance or denial thereof.

Section 406 begins with subparts (a), (b) and (c) which set forth and provide specific requirements that the permit application must contain. Wyo. Stat. Ann. § 35-11-406(a) – (c). These subsections are then supplemented by the various permit requirements provided for in DEQ's Land Quality-Coal Rules and Regulations, found within WY Rules and Regulations ENV LQC Ch. 1 through Ch. 20. Section 406(d) next requires the permit application to be made publicly available in the county in which the proposed permit area resides. Wyo. Stat. Ann. § 35-11-406(d). Subpart (e) pertains to DEQ finding of whether the application is "complete," and subparts (f) and (g) pertain to additional steps to be taken to obtain this "completeness" finding and require publication of the fact that the application has been filed. *Id.* at -406(e) – (g). Subpart (h) then calls for DEQ to again review the filed application for completeness and find either that: (1) the application is complete and suitable for publication; (2) the application is deficient; or (3) the

application is denied. *Id.* at -406(h). As set forth in Wyo. Stat. Ann. 35-11-103(e)(xxii), the designation of completeness as contemplated by Section 406(e) does not mean that an application is substantively adequate for permit issuance or accurate and complete. Instead, by definition, it merely means that “the application contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter[.]”

If DEQ determines the application to be complete and suitable for publication, subparts (j) and (k) call for notice of the application to be published, in part to allow for objections to the application. Wyo. Stat. Ann. § 35-11-406(j) – (k).²

Subpart (k) also provides for review of the application in the event of objections. If the application is for surface coal mining operations, and if requested, DEQ may hold an informal conference to informally resolve the disputes and subsequently take action on the permit application. *Id.* at -406(k). This decision is then appealable to the EQC for a *de novo* review. *Id.* Additionally, subpart (k) provides for an alternative method of review, in which objections are heard by the EQC in the form of a contested case hearing. *Id.*

Subparts (m) and (n) set forth the requirements for permit approval, with subpart (n) pertaining to surface coal mining permit applications. *Id.* at -406(m) –

² To avoid confusion, Big Horn notes that there is no subpart (i) or (l) to Section 406.

(n). Subpart (n) specifically states that the permit applicant “has the burden of establishing that his application is in compliance with [the Wyoming Environmental Quality Act] and all applicable state laws” and that “[n]o surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing” several requirements, including that:

- (i) The application is accurate and complete;
- (ii) The reclamation plan can accomplish reclamation as required by this act;
- (iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area; . . .

Id. at -406(n).

Subpart (o) pertains to the applicant’s past conduct related to environmental harm. *Id.* at -406(o).

Finally, subpart (p) states when a decision on the permit shall be made. Included in this subsection is the requirement that if a contested case hearing is held regarding the application, the EQC “shall issue findings of fact and a decision on the [permit] application within sixty (60) days after the final hearing.” *Id.* at -406(p). DEQ then “shall issue or deny the permit no later than fifteen (15) days from receipt of any findings of fact and decision from the [EQC].” *Id.*

II. Procedure in this matter

In this case, DEQ found Brook Mine’s permit application suitable for publication, public notice was given, and interested parties were required to submit objections to DEQ by January 27, 2017. *See Big Horn’s Response to Brook Mine’s*

Motion to Dismiss Big Horn Coal Company's Petition for a Contested Case Hearing, at Exh. D. Big Horn, along with other interested parties filed objections citing various problems and deficiencies with Brook Mine's permit application. Within these objections were several requests for an informal conference as contemplated by Section 406(k). DEQ, however, denied the requests for an informal conference and referred this matter to the EQC for a contested case hearing.

As DEQ has made clear in both its Prehearing Memorandum and at the hearing for this matter, it has not completed several prerequisite requirements necessary for any permit issuance and has not made the findings necessary to issue or deny the permit. *See Department of Environmental Quality's Prehearing Memorandum*, p. 2.³

III. Role and Powers of the EQC

Wyoming Statute Annotated § 35-11-112 sets forth the role and powers of the EQC. Included in these powers are the specific provisions that the EQC:

- Shall conduct hearings in any case contesting the grant, denial, suspension, revocation or renewal of any permit, license, certification or variance authorized or required by this act; and

³ While the complete transcript from the contested case hearing is not yet available to the parties, at the hearing DEQ acknowledged that certain requirements, such as the Cumulative Hydrologic Impact Assessment (CHIA), are required before any permit may be issued and have not yet been completed.

- May order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified.

Wyo. Stat. Ann. § 35-11-112(a)(iv), (c)(ii).

IV. Requirements the EQC Must Consider in its Review

Pursuant to Section 406, the EQC must consider whether Brook Mine has affirmatively established that its permit application meets all legal prerequisites for permit approval. The burden of proof falls upon Brook Mine to affirmatively prove that its permit application is in compliance with all applicable state laws and meets all requirements of Section 406(n).

DEQ found Brook Mine's permit application sufficiently complete to be suitable for publication. As demonstrated by Wyo. Stat. Ann. 35-11-103(e)(xxii), this determination is not a substantive determination on the permit application. Instead, as defined by law, such determination indicated that DEQ found that the application "contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter[.]" Wyo. Stat. Ann. § 35-11-103(e)(xxii). Hence, this determination of completeness and suitability for publication merely means the permit application contains the requisite pieces, but does not pass judgment as to the substance of the application's contents and its overall compliance with the substantive or legal requirements and

prerequisites to permit issuance. This review comes later, as further outlined in Section 406 and discussed below.⁴

Because objections were filed, Section 406(k) allowed for either an informal conference or a contested case hearing before the EQC regarding the permit application. Wyo. Stat. Ann. § 35-11-406(k). In either event, the result will be a decision regarding the permit and its suitability for issuance. *See id.* at -406(k) (stating that DEQ will “take action on the application” after the informal conference, with the right of review to the EQC); -406(p) (stating that “[i]f a hearing is held, the [EQC] shall issue findings of fact and a decision on the application”) (emphasis added). Section 406(n) then sets forth the criteria reviewed in taking action on the permit application, and provides the specific statutory criteria under which the substance of the permit application for a surface coal mining permit is evaluated. *Id.* at -406(n).

In this case, DEQ elected not to hold an informal conference, and instead referred this matter to the EQC. It is therefore the task of the EQC to conduct the contested case hearing, review the evidence presented along with the permit application and, pursuant to Section 406(p), render a decision on the application pursuant to criteria set forth in Section 406(n). Under Section 406(n), the EQC must

⁴ DEQ admits as much in its Prehearing Memorandum, indicating that it has not completed the final steps to determine whether to issue or deny the permit. *See Department of Environmental Quality’s Prehearing Memorandum*, p. 5.

determine whether Brook Mine has “establish[ed] that [its] application is in compliance with this act and all applicable state laws,”⁵ and whether Brook Mine has affirmatively demonstrated that it has met the specific requirements from Section 406(n) including, but not limited to, that:

- The application is accurate and complete;
- The reclamation plan can accomplish reclamation as required by this act;
- The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area ...

Wyo. Stat. Ann. § 35-11-406(n)(i)-(vii).

Section 406(n) makes it abundantly clear that the burden in these proceedings is on Brook Mine, as the applicant, to establish all requirements in Section 406(n). In fact, Section 406(n) provides the only applicable burden in reviewing Brook Mine’s permit application.

This interpretation of Section 406(n) is in complete accord with not only Section 406 and Wyo. Stat. Ann. § 35-11-103(e)(xxii)’s reference to the “further

⁵ The additional state laws that Brook Mine must establish its application is in compliance with come from the various rules and regulations of the Wyoming DEQ. Many of these rules and regulations have been set forth and described in the parties’ various Prehearing Memoranda and will be further set forth by the parties in their respective Proposed Findings of Fact and Conclusions of Law.

review for substance and compliance” with law, it is also in complete conformity with case law and the statutory powers and duties of the EQC.

The case of *Grams v. Environmental Quality Council*, 730 P.2d 784 (Wyo. 1986), demonstrates the correct procedure and scope of review for the EQC in this matter. In *Grams*, an applicant coal mining entity submitted an application to DEQ for a permit to mine coal. *Id.* at 786. As in this case and pursuant to Section 406, after DEQ determined the application was complete and suitable for publication, objections were filed and a hearing was held before the EQC. *Id.* At the conclusion of the hearing, the EQC did not issue a statement as to whether the application was complete or “technically adequate,” rather the EQC issued a decision on the permit directing DEQ as to whether to issue the permit. *Id.* *Grams* outlines the procedure regarding objections to a surface coal mining permit application, but more importantly, for purposes of this analysis, it demonstrates that, in these proceedings the EQC properly considers the requirements of Section 406(n) and that “the burden of proof rests upon the applicant to show that the application is in compliance with applicable law.” *Id.* at 789 (citing Wyo. Stat. Ann. § 35-11-406(n)).

Here, the EQC conducted the proceedings contesting the issuance of Brook Mine’s requested permit and it is the duty of the EQC to render a decision on the permit application based on a consideration of Section 406(n), which incorporates all other applicable laws and regulations. Wyo. Stat. Ann. § 35-11-112(a)(iv) (stating the EQC shall “conduct hearings in any case contesting the grant, denial,

suspension, revocation or renewal of any permit”); Wyo. Stat. Ann. § 35-11-406(n),(p) (mandating the EQC issue a decision on the permit application and setting forth the criteria for that decision); *Grams*, 730 P.2d at 789. Moreover, because the EQC is vested with power to “order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified,” it is within the power of the EQC to direct that DEQ not issue any permit based on the application unless or until certain additional studies have occurred, or to direct that condition(s) be imposed on any issued permit to ensure compliance with all applicable laws and regulations. Wyo. Stat. Ann. § 35-11-112(c)(ii) (emphasis added). The EQC may also determine what it finds inaccurate or incomplete within the application so that Brook Mine and DEQ can addresses such deficiencies.

V. Deference Afforded to EQC Finding Regarding the Permit’s Technical Adequacy/Completeness

One final consideration for the EQC in this matter is regarding the deference or weight to be afforded to the statement or position from DEQ that the Brook Mine application is “technically adequate.” The term “technically adequate” is not found anywhere in Section 406, nor is it found in any of the relevant DEQ Rules and Regulations. To the extent that DEQ may consider the term “technically adequate” to be synonymous with the requirement in Section 406(n)(i) that the application be “accurate and complete,” such position is not based in statute or regulation, and is not entitled to any deference under case law or other legal precedent. It is within

the EQC's powers and duties to makes its own interpretation of whether Brook Mine's permit application is "accurate and complete" in light of all applicable requirements from Section 406 and DEQ's Rules and Regulations.

The case of *Platte Development Co. v. State, Environmental Quality Council*, 966 P.2d 972 (Wyo. 1998), demonstrates that the EQC properly considers the plain language of statutes rather than deferring to DEQ's interpretation of specific terms. In *Platte Development*, the issue presented to the Court involved the interpretation of the statutory term "overburden." 966 P.2d at 975. The Environmental Quality Act limited "small" mines, such as the mine at issue, to removing not more than 10,000 yards of overburden in any one year. *Id.* at 975-976. The Environmental Quality Act defined overburden as "all earth and other materials which lie above the mineral deposit," but DEQ followed an industry custom which considered topsoil distinct and not included in its overburden calculations. *Id.* The EQC, however, found that the statutory language was clear and topsoil was to be included in the overburden amount. *Id.* at 976. According to the Court, because the statutory language was clear, the EQC correctly applied the plain language of the statute as to the meaning of "overburden." *Id.*

Similarly, in this case, the EQC must consider the plain language of Section 406(n) and its requirement that Brook Mine affirmatively prove that its permit application is "accurate and complete" without deference to DEQ's position that the permit application is "technically adequate." The statutory mandate of Section

406(n) unambiguously states that the permit cannot be approved unless Brook Mine meets this burden. Wyo. Stat. Ann. § 35-11-406(n). It is therefore incumbent upon the EQC to determine if the permit application contains all necessary legal requirements, is free from errors and conforms exactly to the applicable standards. (Merriam-Webster Dictionary defining “accurate” as “free from error especially as the result of care” and “conforming exactly to truth or to a standard,” and “complete” as “having all necessary parts, elements, or steps”).⁶ The legally undefined classification of “technically adequate” has no bearing on the EQC’s determination of “accurate and complete.”

CONCLUSION

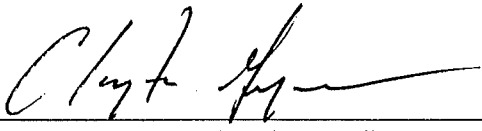

In sum, Section 406 and the relevant case law conclusively demonstrate that the EQC must render a decision on Brook Mine’s permit application in light of the relevant and applicable state laws, which undoubtedly include Section 406(n). Section 406(n) is the guiding principle for the EQC’s review in that matter, and unambiguously demonstrates that the burden of proof rests on Brook Mine to affirmatively establish that its permit application is in compliance with all applicable state laws, specifically including those from Section 406(n).

In making its determination and rendering a decision on the permit application, the EQC may direct that DEQ modify or impose conditions upon any

⁶ See <https://www.merriam-webster.com>.

permit as necessary to ensure compliance with the all applicable state laws and to ensure that any application is accurate and complete. Finally, the EQC owes no deference to any determination of the application being “technically adequate” in the context of evaluating whether the permit application is “accurate and complete” for purposes of Section 406(n).

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **DOCKET 17-4802**
TFN 6 2-025)

POWDER RIVER BASIN RESOURCE COUNCIL'S BRIEF
Oral Argument Requested

Pursuant to the June 13, 2017 Order, the Powder River Basin Resource Council (“Resource Council”) hereby files its brief in the above captioned proceedings. This brief summarizes the specific statutes and rules the Environmental Quality Council (“EQC” or “Council”) is required by law to consider in this matter. Specifically, this brief addresses the requirements of Section 406(n) of the Environmental Quality Act and the corresponding burden of proof an applicant for a surface coal mining permit has in these proceedings.

SCOPE OF THE EQC'S DECISION

Pursuant to Section 406(p), the Council “shall issue findings of fact and a decision on the application” after the hearing. Notably, Section 406(p) specifies that the “decision on the application” made by the Council after a hearing is the same “decision on the application” that the DEQ Director would make if no informal conference or hearing is requested. Therefore, in the case where a hearing on a permit application is held, the Council steps into the place of the DEQ Director to make the “decision on the application.” The permit must still be granted or

denied by the DEQ as the issuing agency; however, that DEQ decision is made pursuant to the “findings of fact and decision of the environmental quality council.”

This means that the scope of the Council’s decision here is to decide the issues of fact and determine whether the Brook Mine permit application meets the requirements of the law and therefore whether the permit should be issued or denied, and if issued, under what conditions. *See Grams v. Env’tl Quality Council*, 730 P.2d 784, 786 (Wyo. 1986) (“On November 19, 1985, the EQC entered its order directing the LQD to issue a mining permit to AMAX.”).¹ It is not to merely determine whether the application is “complete” or “suitable for publication” or make other findings that are applicable at earlier stages in the permitting process.² Here, the “decision on the application” is the final decision on the application. Additionally, Section 406(p) does not limit the scope of the Council’s decision to the objections raised by the parties. However, given the evidence and testimony presented, the findings of fact issued by the Council will likely be tailored to the factual issues presented through evidence and/or discussed at the hearing.

The scope of the Council’s decision is particularly applicable here, when DEQ denied any additional public participation opportunities, such as an informal conference. If the informal conference had been held, DEQ would have made the decision on the permit application and issued or denied the permit *before* any contested case proceeding, and in that case, the proceeding before the EQC would have been more similar to an administrative appeal of a DEQ

¹ The Council has the power to “Order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified.” W.S. § 35-11-112(c)(ii). While DEQ is the agency that implements the Council’s order, the Council has the power – and in this case, the obligation – to make an order directing the DEQ to grant or deny the coal mine permit.

² Although there was testimony as to the “technically adequate” or “technically accurate” determination by DEQ, these phrases do not appear in the Environmental Quality Act. The correct phrase is “suitable for publication.”

decision.³ That is not the case here. The only meaningful reading of Section 406(p) in this proceeding is for the Council to make the “decision on the application” – the *same* decision the DEQ Director would make if an informal conference was held or if no informal conference or hearing was requested.

APPLICABLE LAW⁴

In order to make “a decision on the application,” the Council must fully consider and apply Section 406 of the Environmental Quality Act, which governs the permitting process for new coal (and non-coal) mines. Portions of Section 406 relevant to the Brook Mine permit and the decision pending by the EQC are:

- Section 406(a) – detailing basic contents of the permit application;
- Section 406(b) – detailing substantive contents of the mining and reclamation plan required as part of the permit application;
- Section 406(e) – detailing the process for the initial completeness finding made by DEQ;
- Section 406(h) – detailing the process for DEQ staff review of the permit application and the process for DEQ staff to identify and resolve deficiencies;
- Section 406(j) – detailing the public notice process required;
- Section 406(k) – detailing the objection and hearing process;
- Section 406(n) – detailing the applicant’s burdens to demonstrate compliance with key parts of the state’s surface coal mining laws (further discussed below);
- Section 406(o) – preventing a permit to be issued to an applicant with outstanding violations; and

³ This procedural posture also dictates the burden of proof, discussed *infra*.

⁴ These statutory and regulatory provisions will be discussed in detail in the Resource Council’s forthcoming brief and proposed findings of fact and conclusions of law.

- Section 406(p) – detailing the decisions on the permit application made by the DEQ Director and the EQC (discussed above).

Other portions of the Environmental Quality Act applicable to the Brook Mine permit include Section 415(b), especially Section 415(b)(x) (alluvial valley floor protection), Section 415(b)(xi) (blasting requirements), and Section 415(b)(xii) (replacement of water supply), Section 416 (surface owner bond requirements),⁵ Sections 417(a)-(c) (reclamation bond requirements), and Sections 103(a) and 103(e) (definitions).

Portions of the DEQ Land Quality Rules and Regulations relevant to the Brook Mine permit and the pending decision by the EQC include:

- Chapter 1: Authority and Definitions;
- Chapter 2: Surface Coal Mining Permit Application Requirements, including Section 1 (General Requirements), Section 2 (Adjudication Requirements, including a description of other permits and steps taken to comply with the requirements for those permits, including MSHA permits and permits from other DEQ divisions), Section 3 (Vegetation Baseline Requirements), Section 4 (Other Baseline Requirements, including hydrology and geology baseline requirements that are of particular importance to this proceeding), Section 5 (Mine Plan, including identification and descriptions of mining activities, including processing facilities, blasting plan requirements, requirements for a “plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and adjacent to the permit area,” a probable hydrologic consequences determination, “[a]n evaluation of the impact of the proposed mining activities that may result in contamination, diminution, or interruption of the quality and

⁵ This section is applicable here because of the lack of surface use agreement with Big Horn Coal Co.

quantity of groundwater or surface water within the proposed mine permit area or adjacent areas that are used for domestic, agricultural, industrial, or other legitimate purposes,” and a road system plan – all of which are applicable to this proceeding), and Section 6 (Reclamation Plan);

- Chapter 3, Section 2 (Alluvial Valley Floor permit requirements);
- Chapter 3, Section 5 (Auger Mining permit requirements);
- Chapter 4: Environmental Performance Standards for Surface Coal Mining Operations – while these are operating standards, the permit application must contain conditions and information sufficient to demonstrate compliance with these standards;
- Chapter 5: Performance Standards for Special Categories of Coal Mining, including Section 3 (Alluvial Valley Floors) and Section 6 (Auger Mining);
- Chapter 6: Blasting – like Chapters 4 and 5, Chapter 6 contains operating standards, but the permit application must contain conditions and information sufficient to demonstrate compliance with these standards;
- Chapter 7: Underground Mining, including Section 1 (Permit Application Requirements), Section 2 (Performance Standards), Section 3 (Public Notice Requirements), and Section 4 (Surface Owner Protection);
- Chapter 12: Procedures Applicable to Surface Coal Mining Operations, including Section 1(a) (Permitting Procedures) and Section 2 (Bonding and Insurance Provisions); and
- Chapter 19: Required Studies for Surface Coal Mining Permit Applications, including Section 2 detailing requirements for the probable hydrologic consequences determination.

DEQ has also adopted a number of guidelines for coal mining. These guidelines are merely guidance documents that were not subject to notice and comment rulemaking, and as

such, they are not binding on the agency or the applicant and therefore are not requirements “the Council is required by law to consider.”

STANDARD OF REVIEW & BURDEN OF PROOF

The Council’s review of DEQ’s permitting decisions and of the permit application is *de novo*. See Order Denying Basin Electric Power Cooperative Inc.’s Motion to Dismiss Appeal at 7, Docket No. 07-2801; see also Appeal of 4W Ranch Objection to NPDES Permits, Docket No. 04-3801 (EQC Mar. 5, 2007) (“The EQC conducts *de novo* hearings pursuant to the DEQ Rules of Practice and Procedure, the Wyoming Rules of Evidence, and the Wyoming Rules of Civil Procedure.”). Under *de novo* review, the Council must look afresh or “from the new” at the permit application and should not afford deference to DEQ in issuing any findings of fact or in making the decision on the permit application.⁶

Under Section 406(n), “The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with [the Environmental Quality Act] and all applicable state laws.” The Wyoming Supreme Court has held that this burden extends to any hearing before the Council on a coal mine permit. *Grams*, 730 P.2d at 789 (citing Section 406(n) and holding “the burden of proof rests upon the applicant to show that the application is in compliance with applicable law.”). This burden of proof is especially relevant because, as discussed above, the Council must review the permit application *de novo*, as if reviewing the permit application for the first time. Similar to when DEQ reviews the permit application, the Council’s review must find that the permit applicant has met its burden of proof to demonstrate

⁶ While this standard of review also applies to administrative appeals of DEQ issued permits, it is especially applicable here where the scope of the Council’s decision is to make the decision on the permit application, a decision DEQ has not made.

compliance with the law and that no part of the permit application is deficient. *See* W.S. § 35-11-406(h).⁷

APPLICABILITY OF SECTION 406(n)⁸

As discussed above, the Wyoming Supreme Court has found Section 406(n) applicable to hearings on coal mine permit applications before the Council. Since the burden of proof is not separated from any other part of Section 406(n), a plain reading of the section dictates that the entirety of the section, including Sections 406(n)(i)-(vii), is relevant to the Council's review and "decision on the application."

In many ways, Section 406(n) is the heart of requirements for a surface coal mining permit as the requirements of the section were put in place to comply with the Surface Mining Control and Reclamation Act's ("SMCRA") main requirements for reclamation and protection of water resources.

Section 406(n)(i) dictates that the application must be "accurate and complete." This ensures compliance with Sections 406(a) and 406(b), as well as corresponding DEQ regulations, listed above, that spell out what must be included in a permit application.

However, 406(n) does not stop there. There is a not a period or an "or" after 406(n)(i). Instead, Sections 406(n)(ii)-(vii) must be considered as well. The only portion of Section 406(n) not relevant to this proceeding is Section 406(n)(vi) regarding requirements related to prime farmland, which is not present in the permit area.

⁷ "Deficiency" is defined in the Environmental Quality Act as "an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director." W.S. § 35-11-103(e)(xxiv).

⁸ Like the rest of Section 406, this brief merely discusses the applicability of Section 406(n). Discussion of the applicant's compliance with this section will be included in the Resource Council's forthcoming brief and proposed findings of fact and conclusions of law.

While Section 406(n) explains that the “administrator” must find in writing that the requirements of the section have been demonstrated, in this proceeding, the Council will need to make those findings as DEQ has admitted that the administrator has not yet made any findings pursuant to the section. Moreover, DEQ witnesses testified that the administrator has a conflict of interest for the permit application and is therefore unable to make the findings. *See* Tr. at 283-84. These findings need to be made *before* the Council can make a “decision on the application,” as without them, the Council’s job will be impossible. A “decision on the application” cannot be made without first determining whether the requirements of Section 406(n) have been met. Therefore, since DEQ has yet to make the findings, the Council will have to make the findings as part of its review of the permit application and as part of its “decision on the application.”

Furthermore, DEQ’s overtures that the agency’s yet-to-be-finalized cumulative hydrologic impact assessment (“CHIA”) somehow prevents the DEQ or the Council from making any determinations regarding material damage to the hydrologic balance outside the permit area (Section 406(n)(iii)) or in determining impacts to alluvial valley floor hydrologic systems (Section 406(n)(v)) at this time is a red herring argument. DEQ’s CHIA is just that – *a cumulative assessment* – and it is a document separate from the permit application. *See* Tr. at 413.^{9,10} As such, it does not abdicate the applicant’s requirements to provide a probable

⁹ Of course, a DEQ witness admitted that normally the CHIA is finalized by the time of a public comment to afford an opportunity to raise objections on the CHIA – a process that did not happen here. Tr. 423-25. Had DEQ finalized the CHIA at a time to afford the public an opportunity to submit objections to it as part of this process, the parties likely would not be briefing this issue at all.

¹⁰ At times, DEQ conducts a CHIA regionally, while taking into account each mine’s individual contributions to the cumulative impacts. *See* Ogle, K.M., and M. Calle, 2006, *Cumulative Hydrological Impact Assessment (CHIA) of Coal Mining in the Southern Powder River Basin, Wyoming*, WDEQ-CHIA-19 (cited in the Bureau of Land Management’s Final Environmental Impact Statement for the Wright Area Coal Lease Applications, available at

hydrologic consequences analysis and determination under Chapters 2 and 19 of the coal program rules, nor does it excuse the applicant from its burden under 406(n) to design a coal mining operation that will prevent material damage to the hydrologic balance. To think otherwise would turn the *permit* requirements of Section 406 on their head, would threaten the state's compliance with SMCRA, and would effectively render the rather lengthy and expensive hearing process held by the Council meaningless.

Section 406(p) dictates that once there is a hearing before the Council, it is the Council that makes the "decision on the application," not the DEQ. Thus, there is no later opportunity for the DEQ to review the permit's compliance with Section 406(n). Compliance with Section 406(n) must be done now, as part of the Council's "decision on the application."

CONCLUSION

For the foregoing reasons, the Council should find that the permit applicant, Brook Mining Co., LLC, has the burden of proof in these proceedings to demonstrate that the permit application is not deficient and that it meets all of the relevant requirements of the law, including compliance with Section 406(n).

Dated this 26th day of June, 2017.

1 BEFORE THE ENVIRONMENTAL QUALITY COUNCIL

2 STATE OF WYOMING

3 -----

4 IN RE BROOK MINE APPLICATION Docket No. 17-4802

5 -----

6

7 TRANSCRIPT OF HEARING PROCEEDINGS

8 VOLUME III

9

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter reconvened for hearing on the
12 24th day of May, 2017, at the approximate hour of
13 11:02 a.m., at the Sheridan College, Thorne-Rider Campus
14 Center, Room TRCC 008, 3059 Coffeen Avenue, Sheridan,
15 Wyoming, before the Wyoming Environmental Quality Council,
16 with Chairman David Bagley, presiding, and Council Member
17 Meghan Lally, Council Member Megan Degenfelder, Council
18 Member Tim Flitner, Council Member Nick Agopian and
19 Council Member Deb Baumer also in attendance.

20 Mr. Ryan Schelhaas, Wyoming Attorney General's
21 Office, Attorney for the Council; Mr. Jim Ruby, Executive
22 Director to the Council; Mr. Joe Girardin, Business Office
23 Coordinator, were also in attendance.

24

25

1 A P P E A R A N C E S

2 For Brook Mine: MR. ISAAC N. SUTPHIN
MR. JEFFREY S. POPE
3 MR. THOMAS SANSONETTI
Attorneys at Law
4 HOLLAND & HART, LLP
2515 Warren Avenue
5 Suite 450
Cheyenne, Wyoming 82001-3117

6 For Big Horn Coal MS. LYNNETTE J. BOOMGAARDEN
7 and Lighthouse Attorney at Law
Resources: CROWLEY FLECK PLLP
8 237 Storey Boulevard
Suite 110
9 Cheyenne, Wyoming 82009

10 MR. CLAYTON H. GREGERSEN
Attorney at Law
11 CROWLEY FLECK PLLP
Transwestern Plaza II
12 490 N. 31st Street, Suite 500
Billings, Montana 59101

13 For PRBRC: MS. SHANNON R. ANDERSON
14 Attorney
POWDER RIVER BASIN RESOURCE COUNCIL
15 934 North Main Street
Sheridan, Wyoming 82801

16 For the Fishers: MR. JAY A. GILBERTZ
17 Attorney at Law
YONKEE & TONER, LLP
18 319 West Dow Street
P. O. Box 6288
19 Sheridan, Wyoming 82801

20 For the DEQ: MR. ANDREW J. KUHLMANN
Senior Assistant Attorney General
21 MR. JAMES M. LAROCK
Assistant Wyoming Attorney General
22 WYOMING ATTORNEY GENERAL'S OFFICE
2424 Pioneer Avenue
23 Cheyenne, Wyoming 82002

1 P R O C E E D I N G S

2 (Hearing proceedings reconvened

3 11:02 a.m., May 24, 2017.)

4 CHAIRMAN BAGLEY: All right. Let's take
5 our seats. And we are back in session. Good morning. It
6 is 11:02 a.m., May 24, 2017.

7 I am Dr. David Bagley, the hearing officer in
8 Docket 17-4802 in regards to Brook Mine, LLC. Present
9 today from the council are Tim Flitner, Meghan Lally,
10 Megan Degenfelder, Nick Agopian and Deb Baumer. Councilman
11 Fairservis has recused himself due to conflict.

12 Parties present today are, on behalf of Brook
13 Mine -- I will let you introduce yourself.

14 MR. POPE: Jeff Pope, Isaac Sutphin and
15 Tom Sansonetti.

16 CHAIRMAN BAGLEY: Thank you.

17 On behalf of DEQ.

18 MR. KUHLMANN: Andrew Kuhlmann and
19 James LaRock.

20 CHAIRMAN BAGLEY: Thank you.

21 On behalf of Powder River Basin Resource Council.

22 MS. ANDERSON: Good morning. Shannon
23 Anderson.

24 CHAIRMAN BAGLEY: Thank you.

25 On behalf of the Fishers.

1 MR. GILBERTZ: Jay Gilbertz with Yonkee &
2 Toner.

3 CHAIRMAN BAGLEY: Thank you.

4 And on behalf of Big Horn Coal.

5 MS. BOOMGAARDEN: Good morning.
6 Lynn Boomgaarden and Clay Gregersen, Crowley Fleck.

7 CHAIRMAN BAGLEY: Thank you.

8 Also present for the council are Jim Ruby,
9 Executive Officer; and Joe Girardin, Council Business
10 Coordinator; and Ryan Schelhaas from the Attorney General's
11 Office.

12 This hearing is being held in Sheridan College,
13 Room TRCC 008, in the Thorne-Rider Campus Center,
14 3059 Coffeen Avenue, Sheridan, Wyoming. There is a court
15 reporter present.

16 So we ended yesterday with completing with a
17 witness from DEQ, and I believe it is now time for DEQ to
18 call its next witness.

19 So, please, Mr. Kuhlmann.

20 MR. KUHLMANN: Thank you, Mr. Hearing
21 Officer.

22 DEQ will now call Dr. Muthu Kuchanur.

23 (Witness sworn.)

24

25

1 MUTHU KUCHANUR, PhD, PE,
2 called for examination by DEQ, being first duly sworn,
3 testified as follows:

4 DIRECT EXAMINATION

5 Q. (BY MR. KUHLMANN) Good morning. Can you please
6 state your name for the record.

7 A. Muthu Kuchanur, M-U-T-H-U K-U-C-H-A-N-U-R.

8 Q. Can you tell us what your current job is.

9 A. I am a geologist for division services of Land
10 Quality Division in Cheyenne. I have been in this job for
11 the past five years.

12 Q. Can you explain briefly what your duties are in
13 your current job.

14 A. I provide hydrogeology technical support for all
15 three Land Quality Divisions for the state of Wyoming.

16 Q. Tell us a little bit about your educational
17 background.

18 A. I have my PhD in environmental engineering from
19 Texas A&M. My doctoral dissertation focused on developing
20 and applying groundwater monitors to optimize and balance
21 the water usage for both economic growth and environmental
22 protection.

23 I have my master's in industrial engineering
24 from Texas A&M, and my bachelor's in mechanical
25 engineering from India. I'm also a licensed professional

1 engineer within the state of Wyoming.

2 Q. Can you tell us a little bit about your work
3 history.

4 A. After graduation I worked as consultant in
5 Albuquerque, New Mexico for five years. In my everyday
6 role as a consultant, I designed, developed, applied and
7 evaluated groundwater models, including various
8 objectives, including water rights, evaluation and
9 contamination indication from groundwater.

10 Q. Do you have any teaching experience?

11 A. Yes, I do. The Office of Surface Mining, as a
12 national level training program, trains the state and
13 federal government employees. I am the lead instructor
14 for groundwater modeling with Groundwater Vistas. And
15 that's the software that Brook Mine has used in its permit
16 application. Also I teach coal mine permitting hydrology,
17 quantitative hydrogeology and applied engineering
18 principles for the Office of Surface Mining.

19 Q. You previously testified before the EQC?

20 A. Yes. Once before.

21 Q. In what capacity?

22 A. I was the expert witness on -- from DEQ on the
23 Linc Energy Underground Research and Development License
24 Application.

25 Q. Turning now to the Brook Mine permit

1 application. Did you review any portions of the Brook
2 Mine permit application?

3 A. Yes. I specifically reviewed the groundwater
4 model that's in MP.3. And also I reviewed the groundwater
5 related sections in Appendix D6, the mine plan and the
6 reclamation plan.

7 Q. Pull up Exhibit DEQ 12, page 12-183. Can you
8 tell us what this part of the mine plan is?

9 A. This is the addendum in the mine plan that
10 describes some documents for the groundwater model that
11 was submitted by Brook Mine during their permit
12 application, and this is the document I reviewed.

13 Q. Have you reviewed groundwater models and permit
14 applications before?

15 A. Yes.

16 Q. How many groundwater models have you reviewed?

17 A. In the past 5 years with LQD, I have reviewed
18 about 10 groundwater models.

19 Q. During review of Brook Mine's groundwater model,
20 about how many review comments did you have?

21 A. I had a total of 97 review comments. And all of
22 my comments were not resolved in one round. There were
23 several outstanding comments. There was some back and
24 forth between me and the Brook Mine. There was some
25 comment responses interaction, and all these are

1 documented in the technical review comments I provided.

2 And by the end of review round number 4, all of my

3 comments were resolved.

4 Q. Related to your review of the groundwater model,
5 can you tell us what the objective of this groundwater
6 model is in the permit application?

7 A. The goal of the -- the goal of the groundwater
8 model is to characterize the groundwater impacts that
9 might potentially be caused by this proposed mine. And
10 one specific objective is to evaluate and identify the
11 water -- the impacts to the water rights that's adjacent
12 to the proposed mine.

13 Q. Who created the groundwater model in this
14 application?

15 A. The groundwater model was created by WWC
16 Engineering, a consultant of the Brook Mine.

17 Q. What did you review -- or what did you do to
18 review the groundwater model?

19 A. As part of my review, I did three specific
20 items. Item Number 1, I reviewed the methodology that's
21 provided by Brook Mine in this specific addendum, and
22 ensured that this methodology's adhering to the general
23 industry standard principles on groundwater modeling.

24 Item number 2, I reviewed the input data that's
25 into the -- that went into the model for technical

1 adequacy, and also ensure that it's representative of the
2 site-specific conditions that we see at Brook Mine.

3 Item Number 3, I ran the model, evaluated
4 the essence of the model, and ensured that it's
5 technically a reasonable tool to predict the future
6 impacts, and also reasonably representative of the current
7 conditions that you see at the site.

8 And if I had any comments during -- or questions
9 or clarifications during these three steps, I contacted
10 the mine and asked for clarification as part of the
11 technical review process.

12 Q. Can you provide an overview of the groundwater
13 model and the modeling process?

14 A. This is the most exciting part for me.

15 THE REPORTER: Just slowly.

16 A. So -- so Appendix D6, the baseline that we
17 discussed yesterday, provides a good conceptual
18 understanding of where the recharge zones are, where the
19 discharge for the groundwater is, how deep the coal seams
20 are and things like that.

21 After you get the conceptual understanding there
22 are eight distinct steps that Brook Mine followed in this
23 permit application. Step number 1, selecting a computer
24 modeling code. Step number 2, they discretized the grids
25 for the model. And step number 3, they defined the

1 boundary conditions for the model. Step number 4, they
2 provided the hydrologic input data into the model. Step
3 number 5, did the calibration of the model. Step number
4 6, model sensitivity analysis. And step number 7, that's
5 when they did the predictive simulations. And step number
6 8, the final step, is this model --

7 THE REPORTER: Is what?

8 THE WITNESS: Model documentation.

9 Q. (BY MR. KUHLMANN) I guess starting with step 1.
10 And you state that was selecting a computer code for the
11 model. What is the computer code used in the groundwater
12 model submitted by the Brook Mine?

13 A. The computer code that Brook Mine used in this
14 application is called MODFLOW. It's a --

15 THE REPORTER: I'm sorry. There's a mower
16 out there. I'm just distracted.

17 THE WITNESS: It's called MODFLOW,
18 M-O-D-F-L-O-W.

19 A. It's a three-dimensional finite difference
20 modeling code that was developed by USGS, and it's
21 maintained by USGS. It's an industry standard for
22 modeling groundwater conditions. So MODFLOW is the code,
23 the back end, where all the calculations and final
24 equations are done. And the front end that they use and
25 tracks with MODFLOW, that's called Groundwater Vistas.

1 That's the software that makes it a little easier for the
2 user to input all the stuff, all the input data, and look
3 at the results out of the model. So Groundwater Vistas is
4 the front end software and MODFLOW is the back end tool.

5 Both of these tools are pretty robust and widely
6 accepted. So, in other words, if Brook Mine was not using
7 MODFLOW, I'd be asking them the justification why they did
8 not chose MODFLOW.

9 Q. (BY MR. KUHLMANN) Just for the clarity of the
10 record, can you explain what the -- what you mean by USGS?

11 A. United States Geologic Survey.

12 Q. You mentioned step 2 is constructing the
13 structure of the groundwater model. What is involved in
14 this step?

15 A. So you can think of the step like pulling any of
16 the plat maps that you have here in front of you and then
17 taking a ruler and drawing rows and columns. So this is
18 the step that you discretize the whole area into grids.
19 So the reason why we do this is we want to like give the
20 input data, the geology structure into these grids to give
21 us an adequate representation of the site conditions.

22 So since we are talking about a three-
23 dimensional model, there are two -- two types of -- two
24 categories of discretization. One is the horizontal
25 discretization. That's the one that I said you pull your

1 map -- you pull your map and draw your grids into it. And
2 that's the horizontal discretization.

3 So in this model, if you look at -- from the
4 top, so you are looking at about 164 rows and 325 columns.
5 So that's a grid structure here. And if you look at the
6 permit, Brook's proposed permit, it's about 4500 acres.
7 And if you look at the modeling domain, they extend that
8 grid stop, it's about 38,000 acres. So it's about eight
9 and a half times more than the permit area of the Brook.

10 And the model was constructed this way because
11 they wanted to account for all the externalities and the
12 effect of the boundary conditions that you define outside
13 of the pages of the grids does not influence numerically
14 what you see within the permit boundary. So that's
15 Category 1.

16 And the second category is the vertical
17 discretization. Now you're going to take a slice of the
18 cross-section and then you are like trying to get the
19 vertical grids. So these vertical grids are going to
20 represent the aquifers of the geology units that might
21 potentially be impacted by proposed -- by the proposed
22 Brook Mine. So I think Dr. Bagley was getting to this
23 point yesterday.

24 So in this instance, we have introduced six
25 model layers or six units. Model layer number 1, that's

1 overburden of the alluvium. Model layer number 2, that's
2 the interburden unit that's going to separate this
3 overburden and alluvium to the coal seams.

4 The next coal seam that you're looking at is the
5 Carney coal seam. And in this area the coal seam is put
6 into two coal seams, depending on value of the area. So
7 the upper Carney coal seam is represented by layer number
8 3, and 4 would be the interburden of the noncoal unit, low
9 permeable that's going to separate the upper and the lower
10 Carney coal seams.

11 And there is also similar interburden that
12 separates the lower Carney and the Masters coal seam that
13 you're interested in. So to summarize, there are three
14 coal seams of interest: the lower, the upper Carney coal
15 seams, the Masters coal seam. So model layers number 2, 4
16 and 6 represent these coal seams. And the in between
17 layers, 1, 3 and 5, they are in general lower permeable.
18 They are noncoal seams.

19 So I said initially we discretized on the top
20 164 rows by 325 columns. So you're reading the same
21 structures for all six layers. So the total grids that
22 you're looking at in this model is about 325,800 grid
23 notes.

24 Q. And so just for clarify of the record, there are
25 a total of six model layers?

1 A. Yes.

2 Q. And I think you said the first model layer was
3 the alluvium and overburden?

4 A. Yes.

5 Q. And the second model layer I think you said was
6 the interburden?

7 A. Yes.

8 Q. And which was the Carney coal -- the upper
9 Carney coal seam?

10 A. That would be model layer number 3. I think
11 it's -- I think I got it incorrect identified. It's 2, 4
12 and 6 on the layers we're interested in. So 2 would be
13 the upper Carney.

14 Q. Thank you.

15 You mentioned step 3 in the modeling process was
16 model bound -- modeling the boundary -- sorry.
17 Establishing the model boundary conditions. What are the
18 different boundaries in this model?

19 A. So one of the critical decisions that the
20 modeler needs to make is where you stop modeling. Where
21 do you cut the model off and say this is --

22 THE REPORTER: Say this is what?

23 THE WITNESS: This is representative of the
24 site conditions.

25 A. So in this instance, if you look at the

1 bottommost layer, the Masters coal seam, the layer that's
2 below the shale. And that's pretty well documented, the
3 shale is the lower permeable unit throughout the Powder
4 River Basin. So there is very minimal interaction, if
5 any, between the lower coal seam in the Masters and the
6 shale. So the model stops at model layer number 6 because
7 there is not much interaction after that below.

8 And on the extents -- on the horizontal extents,
9 towards the northwestern portions of the permit boundary,
10 that's where the coal seams outcrop. So after that,
11 there's no coal seam. So they took it all the way to the
12 outcrops where the coal seams come to the surface. And on
13 the southern and the eastern edges of the boundaries,
14 that's where the coal seams dip and go deeper. So they
15 used the general head boundary condition in the MODFLOW
16 model to represent how water comes in and gets out in the
17 southern and eastern portion of the Brook boundary.

18 Q. (BY MR. KUHLMANN) Can you explain what a head
19 boundary is?

20 A. It's -- so based on the observe -- or the source
21 information, you can prescribe these are the water levels
22 at the boundaries. So that's one of the reasons we wanted
23 the boundaries to be like away from the domain of the
24 permit boundary of interest, because we know that there
25 are going to be uncertainties in these locations. We

1 don't want this to be impacting in any way the domain of
2 interest. So that's the reason we are further away from
3 these boundaries.

4 Q. You mentioned step 4 on providing the
5 hydrogeologic input data. Can you summarize the primary
6 input data used in this groundwater model?

7 A. So on to step, we have defined the grids, we
8 have prorated the top and the bottom elevation, geology
9 structure to the model. So if you can image, these grids
10 are flexible. It's going to like follow the -- the coal
11 depth, the thickness of the coal, and how it's getting
12 deeper once you get to the Tongue River. It's going to
13 tell you like how far it's from the top, the lands that
14 face all the way to the coal seam and how deep these units
15 are. So you've got the geology to the model. So in this
16 step is where you get the hydrology to the model. This is
17 where we are going to say like these are the hydraulic
18 parameters into the model. So like we can think of this
19 step as the marriage between geology and hydrology.

20 So in this step you tell the model what's the
21 hydraulic conductivity of the units, what's the storage
22 parameters, what's the recharge that's coming in from
23 precipitation. You represent the Tongue River in the
24 model, denote the geology fonts into the model. So this
25 is the place where you give all the parameters that

1 represent the hydrogeology.

2 Q. Is input data you just mentioned described in
3 the permit application?

4 A. Yes, it does. It's defined in the baseline
5 sections, Appendix D6. And also in the MP.3 and in the
6 mine plan.

7 Q. Moving on to step number 5. Calibration. Did
8 Brook Mine do a model calibration?

9 A. Yes, they did.

10 Q. What is model calibration?

11 A. So model calibration in oil and gas field, they
12 call it a history matching. So this is the step that we
13 ensure that the model has the ability to represent reality
14 of what you see in the ground. I just want to emphasize
15 the model is just a representation of reality. We do the
16 best we can to get to reality, but it's not -- it's not
17 what you see in the ground. So it's our best effort.

18 So this is step that we want to make sure that
19 the model represents reality. So we -- we take the
20 approach of like -- we also acknowledge the heterogeneity
21 in the aquifer. We acknowledge the variability in the
22 parameters. So, for example, we know from the free data
23 that's collected by the Brook Mine in the published
24 literature sources of hydraulic conductivity varies
25 between .1 and 1 feet --

1 THE REPORTER: .1 and what?

2 THE WITNESS: .1 and 1 feet per day, for
3 example.

4 A. So in this stage, you are trying to characterize
5 what's the effective parameter within this range -- within
6 this framework that's going to give the best match for
7 what you see on the water levels in the ground. So you
8 acknowledge this variable. Again, you're trying to get to
9 an effective parameter set, what's the best recharge,
10 what's the best fit for the hydraulic conductivity that's
11 going to be representative of the field conditions at this
12 stage in the model. Yes.

13 Q. (BY MR. KUHLMANN) What is step number 6, model
14 sensitivity analysis?

15 A. So I mentioned that during model calibration,
16 you're varied within this published framework that we
17 think is reasonable. But in model sensitivity analysis we
18 take step further because we want to understand -- we
19 don't want to just match stuff to what you see on the
20 ground, but we also want to understand how the system
21 behaves. So you try to take this up a notch, and you say
22 I'm going to weigh this hydraulic conductivity not just
23 between .1 feet -- .1 and 1 feet per day. I'm going to
24 vary this by an order of magnitude on either side, and I'm
25 going to see -- I want to see what's this impact on the

1 water levels. So you want to -- this is a step that helps
2 us to understand what's the effect of this parameters and
3 how sensitive are these parameters to the model that's of
4 interest to us.

5 Q. On step number 7, predictive simulations, can
6 you explain that step?

7 A. This is the step that we are reasonably assured
8 that we have a good handle on like what's representative
9 of the site conditions. You are going to jump from the
10 realm to present to future. So you are pretty reasonably
11 sure the model person -- what's -- what's at the site
12 right now. But we don't know what's the future's going to
13 be. So but what we know is the proposed mine sequence by
14 Brook Mine.

15 So at this stage we incorporate the mine
16 sequence into the model and say this is Trench Number 1.
17 This is how they're going to do over the years. And we
18 incorporate this into the model, into the predictive
19 simulations, and run the model into the future to look at
20 what's going to be the impacts.

21 Q. Getting to step number 8, model documentation,
22 where are the model -- modeling methodology input data and
23 results documented in the permit application?

24 A. Yes. In the MP.3 that you're looking at here,
25 that's the document that -- that summarizes all the seven

1 steps that the mine went through to get to this point.
2 And they reviewed this document just to ensure that if
3 someone wants to reproduce the results, we want to
4 document this as accurately as we can. So reproducibility
5 is a critical item, and all the steps are documented in
6 this step.

7 Q. Do the modeling approach followed by the mine
8 adhere to industry standards?

9 A. Yes. Specifically I used ASTM standards.
10 D5447, D54 -- okay. 5491 I want to say, but I think the
11 next one is 5609, 5611 and 5981. These are the standards
12 that I have applied for reviewing Brook Mine's
13 application.

14 Q. Go ahead and pull up DEQ Exhibit 36.
15 Dr. Kuchanur, I'll have you go ahead and take up the white
16 binder on the far corner of the table and turn to
17 Exhibit 36. I'll give you a moment to take a look at that
18 exhibit.

19 A. Yes.

20 Q. Do you know what this document is?

21 A. These are the ASTM Standards that I used in
22 reviewing the model.

23 Q. So those are the ASTM Standards you just named
24 in previous testimony?

25 A. Yes.

1 Q. What are the significant input data to the
2 groundwater model?

3 A. I'd like to highlight three pieces of
4 information. So the one -- item number 1 is the input
5 data that went into the -- into building the geology
6 structure of the model, to tell how deep the coal seams
7 are, like how -- what's the dipping rate and things like
8 that. So that's a key parameter.

9 Input parameter -- input on data set number 2,
10 that's the hydrologic input data that's going into the
11 model, the hydraulic conductivity, the recharge, the fault
12 locations, storage parameters. So that's data set number
13 2.

14 And data set number 3, the number of wells, the
15 wells that Brook Mine used to calibrate the model, that's
16 data set number 3.

17 So these are the three key input parameters I
18 would think for that particular model.

19 Q. For that third key piece of input data, you said
20 that number of groundwater -- groundwater wells had been
21 drilled by Brook. Does that provide groundwater level
22 data?

23 A. Yes, they do.

24 Q. Can you summarize the data used for building the
25 3D structure of the model?

1 A. So this is the -- this is the step where you
2 tell the top and the bottom elevations of all the six
3 layers of interest. So Brook Mine used about 300 -- or
4 evaluated 300 drill holes within the permit boundary. And
5 they used that information in building this geology
6 structure. So the 300 drill holes provide point location.
7 So we are looking at 4500 acres and 300 drill holes in
8 this acreage provides you an understanding of what's the
9 geology at this point location and this point location for
10 300 point locations.

11 But it doesn't tell you how to connect the dots.
12 So how do you connect one well to another? That why you
13 need the judgment from a professional geologist to connect
14 the dots and say this is how the geology moves along the
15 site. So the Brook Mine had like 14 different
16 cross-sections that dispersed throughout the site
17 connecting all the dots, telling us how the geology flows
18 in the site.

19 And also they have created thickness maps, what
20 we call isopach maps to tell us what's the thickness of
21 these coal seams. These are different ways of looking at
22 the same information, but it also gives a sense of
23 reliability and confidence into the input data that you're
24 putting into the model.

25 Q. You mentioned connecting the dots. Did Brook

1 Mine have a professional geologist connect the dots
2 between the holes?

3 A. Yes, on the cross-sections and documents that I
4 mentioned were stamped --

5 THE REPORTER: They were what?

6 THE WITNESS: They were stamped by a
7 professional geologist.

8 Q. (BY MR. KUHLMANN) And for the benefit of the
9 court reporter, can you please spell isopach maps?

10 A. I-S-O-P-A-C-H. Did I win the spelling bee?

11 Q. Absolutely.

12 After building the 3D structure, you mentioned
13 applying the hydrogeologic input data into the model.
14 What are the hydrologic -- hydrogeologic input data that
15 were used for this model?

16 A. There are three things that I would like to
17 opine here. Number one, the hydraulic conductivity and
18 the storage input data that went into the model. Brook
19 Mine did an aquifer test that gave us this information for
20 the Carney and the Masters coal seam. For Carney they
21 used .3 feet per day, and for Masters, they used .5 feet
22 per day. So this is the hydraulic conductivity data. And
23 they also calculated the storage parameters that went into
24 the model using this field -- field test data.

25 And the other -- the second piece of information

1 is the geology faults. These faults were mapped by
2 B. Barnum in this USGS study. So this is a published
3 information and they incorporated this information into
4 the model.

5 And the recharge -- the starting point for
6 recharge values that they used in calibration was from
7 Driscoll and Carter. That's also a published USGS study.

8 So to summarize, Brook Mine used literature
9 sources and the data that they collected in the field into
10 the model.

11 Q. You mentioned aerial recharge data. Were the
12 recharge rates applied to the project area adjusted during
13 the calibration?

14 A. Yes. They were within the range of values
15 that's available in the --

16 THE REPORTER: That's available in the?

17 THE WITNESS: In the literature. In the
18 literature.

19 Q. (BY MR. KUHLMANN) Regarding the third type of
20 input data that you noted, you said that was field
21 observed groundwater level data; is that correct?

22 A. That's correct.

23 Q. Can you summarize and explain how this data was
24 applied in the model?

25 A. Yes. So if you have in the medical profession,

1 X rays are the thing that gives you insight on what's
2 happening in the human body. And for me, as a groundwater
3 person, the groundwater wells tells me the information on
4 what's happening in the ground.

5 So Brook Mine has like 15 different groundwater
6 wells in the Masters and Carney coal seam. So they used
7 these 15 groundwater wells, the data from the wells -- the
8 water and the data from the wells to calibrate. So if you
9 look at the well that had highest water elevation and if
10 you look at the well that had lowest water level
11 elevation, the range that we are looking at is about
12 384 feet. So the difference between the highest and the
13 lowest point, in terms of water levels, is 384 points --
14 384 feet.

15 And if you look at the calibration statistics,
16 the mean error that's -- that's -- that's noted in the
17 model, to match these 15 different wells is about
18 3.8 feet. So I considered this a robust calibration
19 because they were able to represent the range that you see
20 in the field within an accuracy of 3 feet.

21 Q. And let me try to make sure I'm clear on what
22 you're representing there, is they looked at the actual
23 measured groundwater levels.

24 A. Yes.

25 Q. And then they ran the groundwater model.

1 A. Yes.

2 Q. And the -- the error of 3.63 feet that you
3 referred to, that's the error between what the groundwater
4 model predicted the level would be and what the actual
5 level was measured to be.

6 A. That's correct.

7 Q. And that's a relatively small amount of error?

8 A. Yes.

9 Q. Is there an area of the mine plan, that MP.3,
10 that summarizes the calibration targets and the residuals
11 and statistics?

12 A. Yes. There are figures and tables that show
13 this.

14 Q. How did you evaluate -- now that you talked
15 about what input data there was, how did you evaluate the
16 input data provided to groundwater model and to determine
17 if it was scientifically credible?

18 A. Typically, when I review models -- and in this
19 case, Brook Mine's model -- I ask myself five questions to
20 begin with. One is is the model adequately -- are the
21 parameters used in the model, are they consistent with
22 what they're telling me from the field.

23 Question number 2, are these parameters both in
24 the field and the model, are they consistent with the
25 published literature. And in this case, in Wyoming we are

1 fortunate with lots of coal mines, so I also asked of this
2 data that's collected by Brook Mine, is this consistent
3 with the information that's collected by other coal mines.

4 And, also, I mean, we need to acknowledge that
5 the hydrology has variability in all these input data that
6 goes into the model. So if that's the choice between like
7 .1 and 1 feet per day, for example -- the previous example
8 that I used in hydraulic conductivity, my preference is to
9 use the parameter that's going to give a conservative
10 estimate.

11 In our case, we are interested in drawdown. So
12 I'll be looking at a parameter that's going to give us
13 more drawdown than a parameter that's going to give us a
14 lesser drawdown. So I want to make sure all the
15 parameters are reasonably conservative within the range
16 that's acceptable.

17 And the last principle is the principle of --

18 THE REPORTER: Principle of what?

19 THE WITNESS: Parsimony, P-A-R-S-I-M-O-N-Y.

20 Q. (BY MR. KUHLMANN) Can you explain the principle
21 of parsimony?

22 A. Yes. The cornerstone of the principle of
23 parsimony from a groundwater modeling perspective is
24 pretty much don't make the model any more complex than
25 what's needed to represent what you see in the field and

1 it's monitored by the complexity of the site.

2 Sometimes, I mean, it's easy to make these
3 things pretty complex. So you can make it so complex that
4 you can't understand what the model's doing. So the
5 principle of parsimony essentially states don't make it
6 any more complex than what's needed.

7 So, for example, in this case, we have 15
8 different groundwater wells that Brook Mine used in
9 the application. So, for example, there is a model that
10 shows -- that has like 15 different groundwater wells, and
11 it has 15 different zones of hydraulic conductivity, with
12 the expectation that's it's going to help them to match
13 each of those values better to what you see at those wells
14 in terms of water levels versus another model that has
15 like one effective hydraulic conductivity parameter that's
16 going to provide an estimation on a -- the water levels
17 that's of similar match.

18 I put more weight on the model that has an
19 effective parameter that represents all the 15 wells
20 rather than the distinct individual zones that have
21 15 different hydraulic conductivity. The reason being
22 that we need to remember that the model is not just a tool
23 to represent what you see right now in the field. That
24 the primary goal is to represent -- or to get an
25 understanding and evaluate and characterize what's going

1 to happen in the future.

2 So to summarize, I think I'm -- some of you --
3 the principle of parsimony reminds me of don't lose the
4 forest for the trees. And I'd also like touch back little
5 bit on -- I said one of the things I ask myself is the
6 data that's used by Brook Mine consistent with the other
7 information that's collected by the coal mines. So one of
8 the things we have in the Division is a database that's a
9 collection of all the aquifer tests that's conducted
10 within the state of Wyoming by all the coal mines. So we
11 have about 500 aquifer tests that's conducted by different
12 coal mines throughout the state. I understand all the
13 coal seams are like different, they're conducted by
14 different companies, and there are like lots of
15 variabilities in the data set over time. We have
16 information all the way from 1970s to now.

17 I looked into this data set, and I have like a
18 readily available statistics all of this data set. And
19 the median for the coal aquifer of this data set is
20 .67 feet per day. So -- and then the value that's used by
21 .3 and .5. So that reasonably assures me, given all the
22 variability that I'm seeing, this is like one of the line
23 of evidence that tells me that the values that get used in
24 this -- used in this model are within the range.

25 Q. Just to clarify you mentioned the data was

1 available in the Division's database. Can you just
2 clarify which division?

3 A. Land Quality Division.

4 Q. I'll turn now -- I'll have us turn now to DEQ
5 page 12-248. And just have my colleague, Mr. LaRock, also
6 take a quick look at page 249 and 250.

7 Does the groundwater model state the predictions
8 that came out of it?

9 A. Yes. One of the key points of interest to us is
10 the drawdown that's going to be at the wells. And these
11 figures illustrate the drawdowns at the different coal
12 seams. The blue line -- the blue contours that you see
13 are the predicted drawdown and the -- the numerical value
14 that lies on top of these blue contour lines, they show
15 the magnitude of the drawdown. So, for example, if you
16 see a 10, so like at this location, it's about --

17 THE REPORTER: It's what?

18 THE WITNESS: It's about 10 feet.

19 THE REPORTER: Are you saying drawdown?

20 THE WITNESS: At this location, drawdown is
21 about 10 feet.

22 Q. (BY MR. KUHLMANN) I'll have you turn now to the
23 very next page, page 12-251. Can you tell us what this
24 document is?

25 A. Yes, this is the table that lists all the

1 identified water rights that's adjacent to the proposed
2 Brook Mine. And it lists what's the estimated predicted
3 drawdown at these well locations that have a water right.

4 So the last column that you see here that's
5 labeled Max Drawdown Feet, that tells you what's the
6 drawdown that's -- that will be caused by mining at these
7 well locations. So there is one value that indicates
8 25.8 feet, but everything else, all that you look at here,
9 they're like pretty much less than 2 feet or so of
10 drawdown.

11 Q. Are these drawdown impacts mentioned on the
12 table permit?

13 A. They are not permit.

14 Q. Does the mine plan or the groundwater model
15 discuss why they aren't permit?

16 A. Yes. The -- the groundwater model doesn't just
17 stop at the same stage in mining stage. It runs -- it
18 goes into the recovery stage. So after the mining is
19 done, the model also predicts what's the time it's going
20 to take for these wells to recover to premining water
21 levels.

22 Q. I'll have you turn to page 12-258. Can you tell
23 us what this section of the groundwater model is?

24 A. This is the section that talks about the
25 recovery that's estimated by the model.

1 Q. What does the -- what is the groundwater model's
2 estimate on the recovery period for the groundwater
3 levels?

4 A. So if you look at these drawdowns, the maximum
5 impact of the maximum drawdown's going to be at the
6 locations where you mine. So that's going to be the
7 location where maximum drawdown. Once you go out from
8 this location, the drawdown's going to decrease with the
9 distance. So the model estimates that the locations you
10 mine within the permit boundary, it's going to take 10 to
11 20 years for the Masters coal and Carney coal seams to
12 recover to within 10 feet of premining water levels.

13 Q. Does that rate of recovery -- is that like -- is
14 that different between the Masters and Carney coal seams?

15 A. Yes, they are. The Masters -- the Carney coal
16 seams, it's about 10 years, and the Masters, it's been
17 20 years.

18 Q. Does the -- does the groundwater model predict
19 estimated groundwater flow that will be intercepted during
20 the mining operations?

21 A. Yes.

22 Q. I'll have us turn to page 12-254. Can you tell
23 us what the table on this page is?

24 A. So this table predicts what's going to be the
25 pit inflow into the Brook Mine. So this tells what's the

1 potential -- what's the possible amount of groundwater
2 that Brook Mine will be intercepting during their mining
3 operations. So you have a year -- so Brook is proposing
4 to mine for 12 and a half years. So this table tells us
5 by year what's the amount of groundwater that -- that will
6 be intercepted by Brook Mine during their mining.

7 So if you'll look at this -- the maximum draw --
8 the maximum amount of pit inflow that you see here, it's
9 about year 7. It's about 98.9 gallons per minute. That's
10 the potential maximum groundwater that may be intercepted
11 by Brook Mine during mining.

12 Q. Is that number applied to a particular pit or
13 can you describe what that -- that number represents?

14 A. So as we know Brook -- Brook Mine is going to
15 follow a mine sequence. They're going to mine a certain
16 area in the year number 1, they're going to move on to the
17 second trench in year number 2, and they're going to
18 progress and follow the sequence. So, for example, if
19 you're looking at year number 7, this tells us the
20 cumulative impact of all the previous trenches that was --
21 that before year 7. It's a total of all the groundwater
22 that may potentially be impacted by Brook in year 7 based
23 on like the number of --

24 THE REPORTER: Based on the number of?

25 THE WITNESS: Based on the number of pits

1 that's open at the time.

2 Q. (BY MR. KUHLMANN) So that inflow represents the
3 total of all of the inflow that might be in the pits at
4 that time in the mine?

5 A. Yes.

6 Q. Does the groundwater model take into account
7 streamflow data?

8 A. The groundwater has a representation of Tongue
9 River into it, yes.

10 Q. Do you know where this -- that data was
11 obtained?

12 A. That data's also represented in Appendix D6, but
13 mine has used some of the information from the USGS
14 gauging stations that's available.

15 Q. Do you know what -- based upon the data, do you
16 know what the average annual flow was in that data for the
17 Tongue River?

18 A. So I think I'm going to like to provide the
19 council the context of the numbers that we are talking
20 about. And we're talking about 98.9, hundred and
21 thousand. And what does it mean in the practical context?
22 So if you look at the Tongue River. It's right next to
23 the proposed mine area. We have a -- we have a gauging
24 station from USGS that tells us what's the flow in this
25 river. We have -- we have a data set that gives us the

1 information for a ten-year period, from 2005 to 2015. So
2 we have a ten-year period of this information. So it's --
3 it's a decent data set for us to get a handle on what's
4 flows in the Tongue River.

5 So I looked into this data set and the minimum-
6 most flow that's in the Tongue River during this ten-year
7 period is 100 CFS. The maximum that I see is like 400
8 CFS. And the average is 200 CFS. And if I look into this
9 table, it says like 98.9 GPM. And this translate to .22
10 CFS. So Tongue River, even if you take the most
11 conservative case, the lower -- the -- the lowest flow
12 that's in the past 10 years is 100 CFS. And worst-case
13 that you look at the highest possible amount of
14 groundwater that Brook Mine would be intercepting, that's
15 .22 CFS. So 100 CFS in Tongue River, .22 CFS from Brook
16 Mine. So there is a magnitude two orders -- three orders
17 of magnitude of difference in flows here.

18 So it's important to keep in mind Brook Mine did
19 all this modeling work to characterize the .22 CFS that
20 they are intercepting. And I reviewed this model for its
21 accuracy of intercepting .22 CFS.

22 Q. You mentioned the heterogeneous nature of the
23 aquifer and the uncertainties in the groundwater model
24 input parameters. Based on your review of the model, how
25 would these uncertainties affect the model results?

1 A. The two parameters of interest for us in the
2 model is the drawdown that's going to be caused by the
3 proposed mine in what is the current water right and
4 what's the amount of groundwater that Brook Mine will be
5 intercepting. These are the two parameters of interest to
6 us. And both these parameters concern the heterogeneity
7 of uncertainty. Both these parameters will be impacted to
8 some extent. That is, we have -- we have acknowledged
9 there is variability and uncertainty from the model in
10 predicting these parameters of interest to us.

11 Q. Considering those uncertainties, are there any
12 additional mechanisms to protect nearby well owners in the
13 permit application?

14 A. In the LQD, Land Quality Division, over the
15 years we have always acknowledged when you're dealing with
16 Mother Nature, there is always going to be heterogeneity
17 and variability and it's going to be certain level of
18 uncertainty to the outputs that you're looking at from a
19 model. So, I mean, we did the best that we could in
20 reviewing the model, making sure it's technically
21 adequate, it's reasonable. But there's always the
22 potential that the model predictions may be off track,
23 even if the chance is slim or whatever, our confidence on
24 each -- on the predictions, we need to acknowledge this
25 uncertainty and we need to have --

1 THE REPORTER: We need to have?

2 THE WITNESS: We need to have backstop
3 mechanisms.

4 A. So the -- so the two back -- we have several
5 regulatory mechanisms that we can address these
6 uncertainties. And first parameter of interest, the
7 drawdown and its impact of that of just water rights. We
8 have a commitment that --

9 THE REPORTER: I'm sorry. Sorry.

10 A. So we have a -- we have required Brook to have a
11 commitment in the permit that says if the water rights --
12 if the groundwater rights are impacted by the proposed
13 mining, they need to provide a replacement source. So
14 that's a commitment that's struck by statute and it's in
15 the permit.

16 Item number 2, the amount of water that's --
17 that Brook's going to intercept, that is a variability and
18 we need to acknowledge that. So how we deal with that is
19 we have a set of three mechanisms I can think of. One is
20 the groundwater model in itself is not a once done sealed
21 document. We rely quite a bit on the annual -- the annual
22 reports that the mine needs to submit to us, the site
23 inspections, and we also require the mine to collect
24 monitoring information from these water -- from these
25 wells during mining.

1 So there is the during mining monitoring,
2 there's the LQD oversight in terms of inspections and
3 annual reports from the Brook Mine and reviewing and
4 commenting on those things. And item number 3, the
5 monitoring doesn't stop on the model -- the model
6 predictions doesn't stop the annual -- this stage we take
7 it all the way to post-mine monitoring. So even after the
8 mining is complete, Brook is required to monitor
9 post-mining after reclamation.

10 Q. (BY MR. KUHLMANN) Is that data that you just
11 identified incorporated into the groundwater model?

12 A. The -- can you rephrase the question?

13 Q. Yes. Is the groundwater model updated?

14 A. Yes. I would consider the groundwater model as
15 a living, updateable tool. So based on the information
16 that we -- that the Brook Mine submits to us during mining
17 and the information that we've been collecting in annual
18 reports, inspections, all this data will go into the
19 model, and if we see any deviation what the model was
20 designed for versus what you see in the field, we will
21 require Brook to update the mine application.

22 Q. I'll have us turn to page DEQ 12-064. You had
23 mentioned a monitoring plan. Can you tell us if this
24 document relates to that?

25 A. Yes. This is the section in the mine plan that

1 talks about the committed monitoring --

2 THE REPORTER: The what?

3 THE WITNESS: The committed monitoring by
4 Brook Mine.

5 Q. (BY MR. KUHLMANN) What is the frequency of the
6 collection?

7 A. We require Brook to collect quarterly.

8 Q. Talking about the second regulatory control you
9 mentioned, annual reports and site inspections. When does
10 the Land Quality Division require the mine to submit
11 annual reports?

12 A. It's a statutory requirement that Brook needs to
13 submit the annual report prior to within 30 days of the
14 anniversary of the permit. So every year, prior to within
15 30 days of the permit approval date, that they need to
16 submit the annual reports for our review.

17 Q. Does DEQ identify what information needs to be
18 provided in the annual reports?

19 A. There is a document. This is called the coal
20 annual report format that we use to guide coal mines to
21 provide the information that we would like to see in their
22 annual reports.

23 Q. I'll have us turn to DEQ Exhibit 29. And taking
24 a look at this page, as well as following few pages. Is
25 this the document that you were just mentioning?

1 A. Yes.

2 Q. This is the coal annual report format?

3 A. Yes.

4 Q. Could you -- I guess we'll turn to page
5 DEQ 29-014. Does this page identify groundwater data
6 that needs to be provided in an annual report?

7 A. Yes. I'd like to highlight the statement right
8 here. The bottom of this page that states "The operator
9 will provide a brief discussion of the data and state
10 whether data are trending toward or away from permit
11 projections in the Probable Hydrologic Consequences
12 section of the permit." So the modeling is a part of the
13 Probable Hydrologic Consequences section of the permit.
14 So the data that's provided by Brook Mine during the
15 annual reports are deviating from what's in the modeling
16 of the -- modeling section of the permit, then we'll be
17 asking Brook to provide an explanation why it's deviating
18 and what needs to be done to --

19 THE REPORTER: Done to --

20 THE WITNESS: Update the model.

21 Q. (BY MR. KUHLMANN) To clarify just for the
22 transcript where that statement that you just read was
23 located, was that statement in paragraph with the lower
24 case B in front of it on this page?

25 A. That's correct.

1 Q. You mentioned a third regulatory control, that
2 is post-mine monitoring. Is there a commitment from Brook
3 Mine for post-mine monitoring?

4 A. Yes.

5 Q. Can you tell us where in the permit application
6 that's located?

7 A. It's in the reclamation plan from the permit
8 application.

9 Q. We'll open up DEQ Exhibit 13 and turn to page
10 13-052. Can you tell us what this part of the reclamation
11 plan is?

12 A. This is the part where Brook commits to monitor
13 groundwater levels and water quality post-mining.

14 Q. What is the intent for post-mining groundwater
15 monitoring?

16 A. The intent for post-mining -- most mine
17 groundwater monitoring is to ensure that the groundwater
18 levels and groundwater quantity meets the approved
19 post-mining land use.

20 Q. How long does the Brook Mine -- how long is
21 Brook Mine required to collect this data?

22 A. We require Brook Mine to collect this
23 information until final --

24 THE REPORTER: Until final?

25 THE WITNESS: Bond release.

1 Q. (BY MR. KUHLMANN) Based on your review, during
2 the technical review of the groundwater model and those
3 areas of the permit application that you mention you
4 reviewed, did you determine that those portions of the
5 application were technically adequate, in your opinion?

6 A. Yes.

7 Q. Have you reviewed the objections filed relating
8 to groundwater -- or to the groundwater model and the
9 areas of the permit application that you reviewed?

10 A. Yes.

11 Q. Did you look at objections related to the trench
12 TR-1 -- TR-1 area?

13 A. Yes.

14 Q. What is your understanding and analysis of the
15 TR-1 area?

16 A. The TR-1 area, there is a specific cross-section
17 in the permit application that describes or helps me
18 inform what's happening in the TR-1 area. So that's the
19 document that I'd like to point the council to show my
20 understanding on what's happening in the TR-1 area.

21 Q. I'd like to open up Big Horn's Exhibit Number
22 14. Can you tell me if -- is this the document you were
23 referring to?

24 A. Yes. This is the document that I was referring
25 to. So even though it's a Big Horn Coal exhibit, I'd like

1 to point out the map that's used here is developed by
2 Brook Mine. It's part of the permit application.

3 Q. Okay. And you reviewed that figure during your
4 review of the permit as well as reviewing after the
5 objections?

6 A. Yes.

7 Q. Is there anything different on this exhibit than
8 is on the figure inside the permit application?

9 A. There is a red line here that's marked as
10 3600 feet elevation. You can see the red text here that
11 shows the exhibit number.

12 Q. Can you explain how this figure informs your
13 understanding of the TR-1 area?

14 A. So I guess I would like to point the scale that
15 we are looking at here, each of these intervals here
16 that's about 25 feet. So the darker shade that you see
17 here, that's the saturated backfill of the TR-1 area. And
18 this is a drill hole, a groundwater monitoring well that
19 was drilled by Brook Mine during their pre-investigation.

20 So this is the coal seam of interest to Brook.
21 This is the backfill. And then you see the Tongue River
22 here. And the red line here that shows -- that's put in
23 by Big Horn in their exhibit, 3600 feet, that shows the
24 water level in the saturated backfill and what's in the
25 Tongue River.

1 I also would like to point out the lighter blue
2 lines that you see here, those are the water levels, the
3 groundwater levels that, that are observed at these
4 monitoring wells by Brook. And the white space that you
5 see here, we can zoom in and take a look at it, but the
6 drill hole here shows what's in this --

7 Q. We'll just take a moment to zoom in. Please
8 continue?

9 A. These are lower permeable units, the clay,
10 claystone, siltstone, and there's some sandstone in here.

11 So one of the things that it informs me when I
12 was reviewing is -- I'm looking at these two water levels.
13 What's in the saturated backfill, what's in the Tongue
14 River, and also looking at like what's in the -- what's in
15 the -- what's in the coal seam. So I see a difference of
16 about 100 feet between the blue line that I see in the
17 well versus what I see in the Tongue River and saturated
18 backfill.

19 So I'd like to maybe simplify things. So, for
20 example, if you think like two tanks just laying on top of
21 each other. The top tank represents the Tongue River and
22 the saturated backfill, and the bottom tank represents the
23 coal seam that's of interest to Brook Mine. So if you
24 think there's a partition in between these two tanks that
25 separate these two tanks. If this partition is permeable

1 or porous, you would think at some point in time this --
2 the water levels in between break and you will see one
3 water level. One distinct water level that's
4 representative of the entire tank.

5 But in this instance, the fact is we are seeing
6 two distinct water levels. One is representative of the
7 coal, one is representative of the Tongue River and the
8 saturated backfill. So that tells me these two tanks are
9 not talking to each other. They are -- there is a
10 partition in there that separates these two systems.

11 There might be some minimal connection here. In
12 hydrology we -- hydrogeology we never want to say there's
13 no connection and rule it out there is some connection
14 there, but the water levels indicate they are hundred feet
15 apart. There is the other evidence that I see in the
16 materials that tells us that is clay -- claystone,
17 siltstone and low permeable materials. So this tells me
18 the story that these two things are not hydrologically
19 related.

20 Q. After reviewing the objections related to the
21 Tongue River TR-1 area and the other objections you may
22 have reviewed, and then looking back in the permit
23 application, in your opinion, are the groundwater model
24 and portions of application you reviewed still technically
25 adequate?

1 A. Yes.

2 Q. Did the objections reveal any minor technical
3 issues that could be corrected through a permit revision
4 after the permit is issued?

5 A. Yes. There was one issue that was point --
6 pointed our attention from the objectors. On -- on the
7 comment from the Brook Mine to replace groundwater rights.
8 That's one issue I think we need to correct.

9 Q. I'll have us open back up DEQ Exhibit 12 and
10 turn to page 12-062. Can you tell us if the area you were
11 mentioning needs to be corrected is on this page?

12 A. Yes. It's on the first paragraph. And I think
13 it -- here it says it's -- there is the Tongue adjudicated
14 water rights. We would like to remove "the Tongue
15 adjudicated" from this statement.

16 Q. What would that correction -- what would the
17 effect of that correction be?

18 A. So this correction will ensure that on valid
19 water rights that have a permit with the State Engineer's
20 Office would be replaced if they were impaired by Brook
21 Mine.

22 Q. Are adjudicated water rights just one type of
23 water rights?

24 A. I will not get into the SEO technology.

25 Q. But based upon your review, this correction

1 should be made?

2 A. Yes.

3 Q. Just to over -- to summarize overall, do you
4 believe, in your opinion, that the permit application is
5 technically adequate?

6 A. Yes, it is.

7 MR. KUHLMANN: Okay. Thank you. That's my
8 last question.

9 CHAIRMAN BAGLEY: Thank you.

10 Well, I don't know about you, but that works up
11 an appetite for me just listening to that.

12 So it is 12:10. Let us take an hour and
13 20 minutes and be back here at 1:30 to start
14 cross-examination. So we are recessed until 1:30.

15 (Hearing proceedings recessed
16 12:10 p.m. to 1:30 p.m.)

17 CHAIRMAN BAGLEY: All right. We are back
18 in session. I understand there's a question.

19 Ms. Anderson.

20 MS. ANDERSON: Thank you, Dr. Bagley. I
21 just wanted to ask the council if, given where we are in
22 the hearing process -- I'm sure aware we haven't even
23 completed DEQ witnesses -- if there's an ability of the
24 council to continue the hearing beyond I think it was
25 Friday at noon that we originally anticipated wrapping up,

1 just so all the parties are aware that we will have
2 adequate time to ask questions and call the witnesses we
3 need to call through the rest of the hearing.

4 CHAIRMAN BAGLEY: Yeah, we've been thinking
5 about that. We don't have a complete decision yet, but
6 my -- we weren't going to close the hearing on Friday at
7 noon anyway. And I think it's really important for
8 everyone to have a chance to comment and while we've been
9 going slow, I think it's actually been really useful to
10 hear all this information, have everybody have a chance to
11 ask questions. So we will -- we're not going to force an
12 ending arbitrarily Friday at noon, and if we need to
13 continue on, we will figure out a way to do that.

14 MS. ANDERSON: Okay. Thank you. I
15 appreciate that.

16 CHAIRMAN BAGLEY: Now, that said, people
17 can speed it up.

18 CHAIRMAN FLITNER: Mr. Chairman.

19 CHAIRMAN BAGLEY: Yes.

20 COUNCIL MEMBER FLITNER: Since a lot of
21 us -- I don't know about a lot of us -- I think a couple of
22 us -- three of us are going to be gone on Friday. If it
23 looks like on Thursday night we will not finish, would it
24 be a consideration, maybe, to not meet at all on Friday and
25 at least then more of us -- if you're not going to finish,

1 then postpone a larger share of the hearing so that maybe
2 more of us can get back for that extra testimony? At least
3 those of us that are going to be gone day and a half or day
4 of testimony at least can listen to it in person.

5 CHAIRMAN BAGLEY: That's a good suggestion.
6 We can make that decision probably about midday tomorrow.
7 We'll see how we're going. But thanks. That's a good
8 suggestion.

9 MR. POPE: Dr. Bagley, one quick
10 clarification on that issue. Will we have the opportunity
11 to comment if the council decides not to hold a hearing on
12 Friday? The concern -- the concern for Brook Mine is, as
13 the council's well aware, we feel this should have been a
14 20-day hearing.

15 CHAIRMAN BAGLEY: Uh-huh.

16 MR. POPE: It's gotten bumped and bumped
17 and bumped. And this seems like another occasion to bump
18 it further down the road. And if we had an original 20-day
19 hearing, we would have had a decision from the director in
20 just a matter of days. This would have already taken
21 place. The council would have issued findings of fact, and
22 somewhere, whether it's yes, no or yes with conditions. So
23 our concern is pushing this further down the line and
24 delaying the process even further. So we recommend the
25 council hold a hearing on Friday. And, frankly, we think

1 people are talking about relevant information and
2 proceeding in efficient manner, we can get it done by
3 Friday. And understanding that members of the council
4 won't be here. And I understand that concern as well, but
5 we -- we have an issue with getting permit and moving
6 forward.

7 CHAIRMAN BAGLEY: Sure. Thank you for that
8 feedback. So tomorrow -- tomorrow afternoon we will -- we
9 will revisit where we are and see what we need to do, but
10 we weren't going to close the hearing on Friday at noon
11 anyway. I was going to request closing statements to be
12 not presented on Friday, first -- so we -- we'll get it
13 sorted out.

14 But I do want to make sure, and I certainly
15 appreciate the urgency of Brook Mine, but I do want to make
16 sure that the public does have a chance to bring its
17 feedback in, and those who had objections get a chance to
18 do that, understanding your objection.

19 MR. POPE: Thank you, Dr. Bagley.

20 CHAIRMAN BAGLEY: All right. So let us now
21 continue with the cross-examination.

22 So, Ms. Boomgaarden, or your colleague.

23 MS. BOOMGAARDEN: Mr. Gregersen will
24 proceed with cross. Thank you.

25 CHAIRMAN BAGLEY: Thank you.

1 MR. GREGERSEN: Thank you, Mr. Chairman.

2 I notice the projector is not showing my screen.

3 MR. GIRARDIN: Just a second. Should be
4 turning on now.

5 MR. GREGERSEN: There we are.

6 CROSS-EXAMINATION

7 Q. (BY MR. GREGERSEN) All right. Hello,
8 Dr. Kuchanur. My name is Clayton Gregersen. I am here
9 with Crowley Fleck on behalf of my client Big Horn Coal
10 Company. You'll probably be happy to hear that I don't
11 think I have all that many questions for you. Most of the
12 issues that I have with the permit application and
13 groundwater were addressed by Mr. Kristiansen, and his
14 responses to those questions I believe are in the
15 transcript already. So for you I think we can keep this
16 pretty brief.

17 Okay. So I'm going to start out again on the
18 screen with Big Horn Exhibit 10 for your reference and for
19 the council's reference. Do you see this map?

20 A. I see it on the screen, yes.

21 Q. And do you recognize this map as being from the
22 Brook Mine permit application?

23 A. I cannot read the label here, the bigger name,
24 but I can see it from the application.

25 Q. Thank you. I think that's good enough.

1 MR. GREGERSEN: And for the record, it is
2 Exhibit MP.4 -- MP.4 from the permit application. It is
3 the Skittles map that's been referred to throughout this
4 hearing.

5 Q. (BY MR. GREGERSEN) And, Dr. Kuchanur, as you
6 may have gathered from being present at the prior
7 testimony, that one of my client's chief concerns is
8 that -- presenting here at the hearing today is the TR-1
9 area and the implications of the proposed mining
10 operations in that area. Are you familiar with the TR-1
11 area?

12 A. Yes, I am.

13 Q. And got the laser pointer. So you understand
14 the TR-1 area being this area, right here in Sections 15
15 and 22?

16 A. Yes.

17 Q. And so as I believe you discussed a little bit
18 in your direct examination, you understand the TR-1 area
19 as being an area where there will be a highwall trench cut
20 through that horizontal east-to-west oval, and then from
21 the bottom of that trench, they will go and mine panels
22 both north and south underground, correct?

23 A. That's correct.

24 Q. Okay. So now I want to turn to an exhibit you
25 referenced in your testimony. Big Horn -- BHC Exhibit 14.

1 Do you remember that?

2 A. Yes, I do.

3 Q. All right. And as you discussed, there is what
4 you refer to as saturated backfill material right here,
5 correct?

6 A. That is correct.

7 Q. And when you talk about saturated backfill, you
8 mean saturated with groundwater, correct?

9 A. That's correct.

10 Q. And now you also talked about this test well
11 that was drilled by Brook Mine and how it indicates on
12 light blue markings where there is groundwater in the coal
13 seams. Do you remember that?

14 A. Yes.

15 Q. Now, that well, although it goes through what
16 you've described as saturated backfill, it doesn't
17 acknowledge any groundwater in the saturated backfill,
18 does it?

19 A. This specific well that we are looking at,
20 screened in the coal seams.

21 Q. So it didn't acknowledge any of the groundwater
22 in the backfill, right?

23 A. So when I mentioned screened in the coal seams,
24 it's specifically designed to look at what's happening in
25 the coal seams, not in the saturated backfill.

1 Q. Thank you.

2 And so what you described as one of your reasons
3 for not being worried about the saturated backfill
4 material and the groundwater implications is that you
5 described a barrier and a lack of connect -- connection
6 between saturated backfill and that groundwater and the
7 groundwater in the coal seams, right?

8 A. Yes.

9 Q. So that barrier is basically the strata that's
10 in between the two areas, correct?

11 A. Yes.

12 Q. Now, as we just discussed, when looking at the
13 TR-1 area, Brook Mine's proposal is to actually cut a
14 trench cut through this backfill material, right?

15 A. That's correct.

16 Q. And so their trench will cut through that
17 separating strata between the groundwater and the
18 saturating backfill and the groundwater in the coal seams,
19 won't it?

20 A. That's correct.

21 Q. So then, in effect, that barrier you described
22 that gave you the comfort of knowing those water barriers
23 were separate and distinct, that will actually be cut
24 through and be done in a portion of this material, right?

25 A. Where the proposed mine trench is going to be at

1 that specific location, yes.

2 Q. Thank you.

3 Okay. So Dr. Kuchanur, as you testified, your
4 role in review of the Brook Mine permit application was to
5 review groundwater issues and particularly the groundwater
6 modeling; is that correct?

7 A. Yes.

8 Q. And it is your understanding that as part of the
9 mine permit application, Brook Mine was required to submit
10 data and analysis regarding groundwater, and this needed
11 to include the groundwater modeling, which would address
12 impacts that the mine operations might have on that
13 groundwater, right?

14 A. Yes.

15 Q. And I believe you also talked about how the
16 hydrological input and data from the modeling and the
17 information that it provided would be the foundation --
18 excuse me, the hydrological data and input from the
19 various wells drilled by Brook Mine would provide the
20 input and data for that modeling and also for your review,
21 right?

22 A. Yes.

23 Q. Okay. So over the last couple of days we've
24 heard a lot of testimony about whether DEQ personnel such
25 as yourself think the permit application is technically

1 adequate and complete, and a lot about how much time
2 people have spent looking at the application. But what I
3 want to do with you is actually go through with you
4 portions of the permit application and specifically some
5 portions that you referenced in your testimony. Does that
6 sound all right?

7 A. Sounds good.

8 Q. All right. So I believe you referenced Addendum
9 D6 at various points, and you reference that it outlines a
10 lot of the information in the model that you considered,
11 right?

12 A. Can you restate what's the reference that you're
13 mentioning?

14 Q. Yeah. So during your direct examination,
15 frequently -- or at least several times, I believe, you
16 referenced Addendum D6 of the permit application, correct?

17 A. Addendum D6.

18 Q. Yes. Or Appendix D6?

19 A. Appendix D6, yes.

20 Q. Okay. Thank you.

21 Now, I'd like to pull up a portion of that. And
22 I'll put it up on the screen here. And so you see the
23 D6.2 up at the top?

24 A. Yes, I do.

25 Q. And so this is part of the Appendix D6?

1 A. That's correct.

2 Q. And Section D6.2 is actually the groundwater
3 portion of Appendix D6, right?

4 A. Correct.

5 Q. So this section, as it goes through, discusses
6 the various aspects of the groundwater in the permit
7 application, right?

8 A. Correct.

9 Q. All right. So I'm going to go to the next page,
10 DEQ 6-024. And at the bottom of this page, I have a
11 sentence highlighted. I want you to follow along as I
12 read and tell me if I read this correctly. "No monitoring
13 wells were completed in the overburden or interburden as
14 no water was found in these units during drilling
15 operations."

16 And then ending on this page and going on to the
17 next page it says, "Addendum D5.2 contains drilling logs
18 and resistivity logs that demonstrate the overburden and
19 interburden are dry." Did I read that correctly?

20 A. Correct.

21 Q. Okay. And I've already talked to
22 Mr. Kristiansen about the reference material and whether
23 that material is actually accurate. But as you read this,
24 this pretty clearly states there are actually no
25 monitoring wells in any of the overburden and interburden,

1 correct?

2 A. Yes.

3 COUNCIL MEMBER FLITNER: Are we talking
4 about the overburden in whole mine or just TR-1 or -- I
5 mean --

6 Q. (BY MR. GREGERSEN) We're talking --
7 Dr. Kuchanur, we're talking about the overburden in the
8 entire permit area, correct?

9 A. That's correct.

10 COUNCIL MEMBER FLITNER: Because I think a
11 point of clarification needs to be made. I don't think
12 there's any debate that everything but TR-1 is dry. Is
13 that -- am I right there?

14 MR. GREGERSEN: Yes. I believe --

15 COUNCIL MEMBER FLITNER: So would it
16 clarify things if we kind of kept it to TR-1 on these water
17 issues so people kind of --

18 MS. ANDERSON: I'm sorry. Dr. Bagley,
19 objection to the interjection of Mr. Flitner. This doesn't
20 seem to be the right process for his questions.

21 COUNCIL MEMBER FLITNER: I don't care where
22 we keep it, but it's hard to keep track of which areas
23 we're talking about. So I'm just trying to get it clear in
24 my mind. I'm not trying to --

25 CHAIRMAN BAGLEY: Yeah. So let's make sure

1 it's clear that when we're asking the questions whether
2 you're referring to the whole permitted area or
3 specifically focusing on TR-1 so that we -- we can --

4 COUNCIL MEMBER FLITNER: Because they're
5 completely different.

6 CHAIRMAN BAGLEY: There's different
7 hydrogeologies throughout this system.

8 MR. GREGERSEN: Yes, Mr. Chairman, I will.

9 For clarification, right now I am talking about
10 the entire overburden anywhere.

11 Q. (BY MR. GREGERSEN) My next question actually
12 was, and so in that there is no modeling or monitoring
13 wells in the TR -- in the entire overburden area that
14 necessarily means there's no monitoring wells in the TR-1
15 area, correct?

16 A. There are no --

17 THE REPORTER: I'm sorry?

18 THE WITNESS: There are no monitoring
19 wells.

20 Q. (BY MR. GREGERSEN) All right. Now the next
21 section I want to take you to is DEQ Exhibit 12, which is
22 the mine plan, correct?

23 A. That's correct.

24 Q. So I put this on the projector. And MP.6, the
25 title of this is Probable Hydrologic Impacts, correct?

1 A. Yes.

2 Q. And so this -- this is a section that's going to
3 discuss those impacts and is actually something that's
4 specifically required by the DEQ rules and regulations;
5 isn't that right?

6 A. Yes.

7 Q. Okay. So Section MP.6.1 starts with surface
8 water. And if we go down a couple pages, we get to MP.6.2
9 which is groundwater, correct?

10 A. Yes.

11 Q. All right. Now, we're going to go one more page
12 down to MP.6.2.3, which is entitled Drawdown in the
13 Overburden. Do you see that?

14 A. Yes.

15 Q. And, again, this says "The overburden
16 encountered when installing the monitoring network was
17 primarily dry and is indicative of the Tongue River Member
18 of the Fort Union Formation in this area?"

19 The next sentence, "Drawdowns of the overburden
20 were not modeled and only isolated sands where encountered
21 are expected to be affected." Did I read that correctly?

22 A. You read that correctly.

23 Q. And so based on this, we can see that there were
24 no model -- there's no modeling done in any of the
25 overburden, correct?

1 A. This statement that you read could have been
2 phrased better. As in discussed in my testimony, the
3 overburden is represented in model layer number 1. This
4 statement, my interpretation is the drawdowns that you
5 assign the figures were not specifically shown as a
6 figure. So the model accounts for overburden.

7 Q. The model -- so this statement in the permit
8 application and mine plan is incorrect?

9 A. It could have been phrased better.

10 Q. But -- okay. So I just want to be absolutely
11 clear on this. This says the drawdowns of the overburden
12 were not modeled, but you say that they were modeled?

13 A. They are accounted --

14 THE REPORTER: They are what?

15 THE WITNESS: They are accounted in the
16 model. Accounted.

17 Q. (BY MR. GREGERSEN) Okay. And this also says
18 that the drawdowns in the overburden were not modeled
19 because they were isolated sands and effectively because
20 they were dry, correct?

21 MR. KUHLMANN: Asked and answered.

22 Objection.

23 CHAIRMAN BAGLEY: Yeah, I agree. Let's go
24 ahead and move on.

25 Q. (BY MR. GREGERSEN) So basically what I'm

1 getting at here is these portions that we've reviewed
2 suggest that the overburden is absolutely dry, right?

3 A. I think we want to be specific about the area
4 that we are looking at. In general, it was not listed
5 portions of the permit that's dry. When you get to the
6 Tongue River, it's not.

7 Q. Okay. And that's contrary to what's written
8 here in the mine plan?

9 A. That's not my understanding.

10 Q. Okay. Well, I guess to sum this up, you've
11 acknowledged to me that the overburden in the TR-1 area is
12 actually saturated and wet, right?

13 A. The overburden in the TR-1 area is saturated,
14 yes.

15 Q. And what I'm getting at here is the mine permit
16 application doesn't ever address that, does it?

17 A. The model that's in the mine permit considers
18 the TR-1 area and it's in the model.

19 Q. The TR-1 area is in the model?

20 A. Yes.

21 Q. And the overburden and the -- the saturation of
22 that overburden is in the model?

23 A. Spatially TR-1 area and everything with the --
24 acres --

25 THE REPORTER: I'm sorry. The what acres?

1 THE WITNESS: The 4500 acres of the
2 proposed Brook Mine permit and 38,000 areas that's outside
3 the permit, it's not listed in the model, so we did not --
4 the model did not exclude the TR-1 area.

5 Q. (BY MR. GREGERSEN) But does the model
6 contemplate the saturation of the overburden in the TR-1
7 area?

8 MR. KUHLMANN: Objection. Asked and
9 answered.

10 CHAIRMAN BAGLEY: Yeah, I agree. The
11 answer is it does. That's what I've heard several times.

12 Q. (BY MR. GREGERSEN) Okay. So I'll ask the next
13 question. Can you tell me where in the permit application
14 that information is present?

15 A. It's back -- the modeling layers of this -- the
16 overburden's in there. And then there are figures showing
17 the cross-section within the modeling section, and it
18 shows the overburden that's in the model.

19 Q. Do you have any specific portion of the mine
20 plan or the permit application you can point me to?

21 A. I can't think of --

22 THE REPORTER: You can't?

23 THE WITNESS: I cannot think of it right
24 now.

25 Q. (BY MR. GREGERSEN) Okay. But we can agree that

1 the permit application stated there was no monitoring
2 wells in the overburden in the TR-1 area, correct?

3 A. That's correct.

4 Q. Okay. So what I want to show you now is a
5 portion of DEQ rules and regulations. And this is, as you
6 can see from Chapter 2, Permit Application Requirements
7 for Surface Coal Mining Operations. Do you see that?
8 It's up here in the top. In the top box.

9 A. Yes.

10 Q. Okay. And so this is Section 4 of that chapter,
11 Other Baseline Requirements. Do you see that?

12 A. Yes, I do.

13 Q. All right. So we're looking at subsection (a),
14 which is right below that, which, to summarize, says that
15 the lands within the permit area need to be described.
16 And then it goes on in various subsections to say what
17 that description needs to consist of. Is that your
18 understanding?

19 A. Yes.

20 Q. So we're going to go down to subsection (xii),
21 which is highlighted on the screen. Do you see that?

22 Excuse me.

23 A. Yes.

24 Q. And so this says that it needs complete
25 information on the groundwater which may be affected in

1 the permit area and adjacent areas, correct?

2 A. Correct.

3 Q. Okay. And as we just discussed, there was no
4 mod -- there may be modeling contemplated in the TR-1
5 areas based on its coverage, but there's actually no
6 monitoring wells in the TR-1 area, correct?

7 A. Correct.

8 Q. And you acknowledge that area actually has
9 groundwater in it?

10 A. Correct.

11 MR. GREGERSEN: Thank you.

12 I'll confer with my co-counsel here and see if I
13 have any follow-up questions.

14 Dr. Kuchanur, I don't think I have any more
15 questions.

16 THE WITNESS: Thank you.

17 MR. GREGERSEN: Thank you.

18 CHAIRMAN BAGLEY: All right. Thank you.

19 Ms. Anderson.

20 MS. ANDERSON: Thank you, Dr. Bagley.

21 CROSS-EXAMINATION

22 Q. (BY MS. ANDERSON) Good afternoon. You have
23 said that the permit is technically adequate, correct?

24 A. Correct.

25 Q. Okay. But yet you testified a little earlier

1 about the adjudicated versus permitted wells issue for
2 water wells, correct?

3 A. Correct.

4 Q. And that you -- it's your opinion that the
5 permit needs to be changed to remove the word
6 "adjudicated," correct?

7 A. Correct.

8 Q. How did you determine that was -- I think your
9 phrase was "a minor technical issue."

10 MS. ANDERSON: We can just wait? I'm not
11 ready for technology at this point.

12 Q. (BY MS. ANDERSON) So to repeat the question.
13 How did you determine that to remove the word adjudicated
14 would be a minor technical issue?

15 A. So not sure, but if we have a specific page that
16 cites that definition that I testified to. The specific
17 sentence also was the statute. So the sentence -- the
18 statute is clear. We need to replace --

19 THE REPORTER: I'm sorry?

20 THE WITNESS: We need to replace all
21 impaired water rights by any monitoring.

22 Q. (BY MS. ANDERSON) Would you agree that's an
23 important part of the statute?

24 A. It is.

25 Q. And particularly important for nearby landowners

1 whose water wells may be impacted by the mining, correct?

2 A. Correct.

3 Q. So is it minor regarding the replacement of
4 those water wells?

5 A. It's minor in the sense we, as a division, rely
6 on the statutes. And the permit comes next. So if the
7 permit contradicts the statutes, the statute wins. We can
8 leave it up to the council to discuss that, but my
9 understanding statute is over rights and everything else.

10 Q. Okay. That makes sense.

11 So I guess how will this change -- that's an
12 important point then. How will that change be made in the
13 permit application?

14 A. I have recommended the change after I reviewed
15 the objections. I leave the process to the permit
16 coordinator and the supervisors to decide what the process
17 is.

18 Q. Okay. So you said you made a recommendation.
19 Where is that recommendation recorded?

20 A. We have discussed this change internally. And
21 the council is the place that I'm making this
22 recommendation to.

23 Q. Okay. So you're making the recommendation to
24 the council, and you're asking the council to do something
25 with that in their decision?

1 A. We are acknowledging that this is a
2 recommendation we make.

3 Q. Okay. Have you contemplated making it a
4 condition of approval of the permit application?

5 A. I would not give the details of the process.

6 Q. Okay. That's fine.

7 All right. So have you ever heard the phrase
8 "garbage in, garbage out" in relation to a model? For
9 instance, a scientific model.

10 A. Yes.

11 Q. Okay. Would you agree generally that that
12 phrase is used to mean that a model is only good -- as
13 good as the data you put into it?

14 A. Correct.

15 Q. Okay. So you talked a lot in your testimony
16 about, you know, some holes in the ground -- I'm going to
17 use a very unscientific phrase for that -- that provided
18 some data. Hundreds of wells, right?

19 A. That's correct.

20 Q. Okay. But would you agree that those holes in
21 the ground were actually just bore holes drilled for the
22 exploration of the coal resource?

23 A. That table that I referenced in my testimony
24 lists a lot of bore holes, and they were drilled for lots
25 of purposes, that includes historical holes too. So...

1 Q. But generally they were drilled only into the
2 coal seam, correct?

3 A. They go --

4 Q. They do go deeper.

5 THE REPORTER: They go what?

6 THE WITNESS: They go deeper.

7 Q. (BY MS. ANDERSON) Deeper but not shallower.

8 A. There are like 300 drill holes in the table, and
9 covers a lot of ground in terms of depth.

10 Q. Okay. So how many monitoring wells drilled
11 specifically for the purposes of delineating baseline and
12 groundwater were drilled for this permit application?

13 A. So I'd like to clarify the process that we took.
14 I was involved in reviewing the permit after the permit
15 application was submitted in November of 2014. And before
16 that our District 3 staff -- Mr. Kristiansen was involved
17 in discussions with the mine on where do we set up the
18 baseline and this is the baseline, things like that.

19 So I'm not exactly sure about what the details
20 of those discussions, but for my review of the groundwater
21 model, I relied on 15 specific groundwater level
22 elevations.

23 Q. Okay. So 15. Not hundreds, necessarily?

24 A. For groundwater levels, yes.

25 Q. Okay. Kind of along those lines of questioning,

1 how many site-specific data values did you collect or did
2 the permit applicant collect for hydro -- hydraulic -- I'm
3 going to butcher this, sorry -- hydraulic conductivity?

4 A. There was one aquifer tested that was conducted
5 by Brook Mine, and that was done during the
6 pre-application phase of the --

7 Q. Okay. So one test?

8 A. That's correct.

9 Q. Okay. And where was that test done?

10 A. That was done within the permit boundary towards
11 the northeastern sections of the permit.

12 Q. Okay. And which geologic units?

13 A. The coal seams were the ones tested during these
14 aquifer tests.

15 Q. Okay. So the coal seams. Okay.

16 How many site-specific data for -- oh, man --
17 specific yield did you -- did the permit applicant
18 collect?

19 A. So --

20 Q. And storage coefficient.

21 A. Storage?

22 Q. Yes. That's --

23 A. Okay. I wanted to make sure that --

24 Q. That's the phrase that I'm supposed to be saying
25 here. Yes, storage.

1 A. The storage parameters that was used in the
2 model was also calibrated from this aquifer.

3 Q. Okay. So that same test?

4 A. Yes.

5 Q. Okay. So why did you feel confident of -- that
6 the permit application used a single value for hydrologic
7 connectivity [sic], storage coefficient and porosity to
8 characterize the entire coal seam?

9 A. I'd like to step back a little bit here and
10 explain the process. We need these parameters to
11 characterize the aquifer. One is just to have data
12 points, and the other one is the point -- the process of
13 applying the data points in the model. As I mentioned
14 before, I am looking for an effective parameter that
15 provides the best match to the -- to what you see in the
16 ground in terms of water levels. If this one aquifer
17 test -- I'm not going to speak for Mr. Kristiansen -- but
18 they went through this pre-application phase and they
19 decided that this is the most appropriate location to
20 conduct this test.

21 And if this test is going to provide effective
22 parameter that the model is able to match the field
23 conditions, initial data, as a scientist, it's good to me,
24 but as regulator I think it's technically --

25 THE REPORTER: It's technically?

1 THE WITNESS: It's technically adequate for
2 the modeling purposes.

3 Q. (BY MS. ANDERSON) Okay. Did I just hear you
4 that you draw a distinction between what's good for a
5 scientist versus what's good for a regulator?

6 A. So data is always good. I mean, we all know
7 that we have hypotheses, even if it's well accepted. We
8 like to increase our confidence over time with more and
9 more and more data. But -- but I think we also need to
10 realize, as a regulator, that rules and regulations set
11 requirements for us to evaluate and get a good starting
12 point for a mining application. That's where we are.

13 Q. Okay. So does it kind of go back to the minimum
14 standards that Brook was talking about in their opening
15 statement?

16 A. It does not. I mean, in this instance,
17 specifically the modeling, this provides the information
18 I'm looking for. The value that additional data points
19 are adding to the model at this point are diminution
20 value.

21 Q. And I'm sorry I don't have technology ready
22 for you. So could you turn to Exhibit 12 of DEQ's at
23 page 213. This is the mine plan at 213.

24 Sorry to make you do this. I just can't display
25 my screen right now.

1 A. Did you say 213?

2 Q. Yeah, 2 -- 2-1-3.

3 A. I'm on page 213.

4 Q. Okay. Great. Do you see the last sentence of
5 that first full paragraph on page 213?

6 A. Yes.

7 Q. Okay. Would you agree that it reads,
8 "Limitations and assumptions specific to this modeling
9 effort are primarily due to the complexity of the
10 hydrogeologic system and a lack of data on physical and
11 hydraulic characteristics of the aquifers and confining
12 units being modeled." Do you see that? Am I in the wrong
13 spot?

14 A. Seems -- the last sentence that I have in this
15 page?

16 Q. No, the last sentence of the first paragraph.
17 Sorry. Yeah, up at the top there. So limitations and
18 assumptions starting that sentence.

19 A. Yes.

20 Q. Okay. Great. So it reads "Limitations and
21 assumptions specific to this modeling effort are primarily
22 due to the complexity of the hydrogeologic system and a
23 lack of data on physical and hydraulic characteristics of
24 the aquifers and confining units being modeled, as
25 described in detail within this report." Would you agree

1 that's what that sentence says? Just yes or no whether
2 that's what it says.

3 A. Yes. That's what it says.

4 Q. Okay. Would you agree with that statement?

5 A. There are limitations in the model. There are
6 assumptions in the model. I agree with that, yes.

7 Q. In the course of your review of the permit
8 application, did you identify any other limitations of
9 this modeling effort that you believe is not captured
10 within the sentence?

11 A. I don't think so.

12 Q. You don't think so. Okay.

13 Did you identify any other assumptions that you
14 had to draw to complete this modeling effort?

15 A. Can you please restate the question?

16 Q. In the course of your review of the permit
17 application did you identify any other assumptions that
18 you had to draw to complete this modeling effort that's
19 not captured within this sentence here?

20 A. This sentence is just one of 60 pages of the
21 model, so I cannot state this sentence represents what you
22 see in the 60 pages and all the documents I reviewed.

23 Q. Okay. Would you agree there were a lot of
24 assumptions drawn for these of this model?

25 A. There are assumptions. I would not choose to

1 qualify a lot.

2 Q. A lot.

3 More or less than other permit applications
4 you've reviewed?

5 A. Nothing stands out to me.

6 Q. Okay. Could you turn to page 192 of that
7 exhibit. Are you there?

8 A. Yes.

9 Q. Okay. Do you see the last sentence of the last
10 full paragraph on that page starting with "Exploration
11 data"?

12 A. That's correct. Yes.

13 Q. Okay. And would you agree that it reads,
14 "Exploration data within the project area to date provides
15 a limited understanding of the coal location, continuity
16 and hydrology." And in the sentence after that reads,
17 "This model was therefore constructed to provide a general
18 understanding of regional groundwater impacts." Would you
19 agree that's what that says?

20 A. That's what it states here, but in my opinion
21 that could have been phrased better.

22 Q. It could be phrased better.

23 A. Yes.

24 Q. How would you phrase it?

25 A. This model provides adequate information to

1 understand what's happening at the field right now and act
2 as a good --

3 THE REPORTER: I'm sorry?

4 THE WITNESS: Act as a good predictive
5 tool.

6 A. So I would like to step back and just like
7 contemplate just a little bit here to provide contextual
8 understanding of these kinds of statements and modeling
9 reports. As I said, there are like 164 rows and 325
10 columns of grid and 319,800 grid notes. So for a modeler,
11 it's pretty hard to say when you don't have a distinct
12 data points for each of those grid notes. So it becomes
13 pretty subjective what you call a limited understanding
14 versus an adequate understanding of the --

15 THE REPORTER: Of the --

16 THE WITNESS: Geographic area of interest.

17 Q. (BY MS. ANDERSON) Okay. But this is the words
18 from the permit applicant themselves, right?

19 A. That's correct.

20 Q. On the purpose of their model, right?

21 A. That's correct.

22 Q. That it was for a general understanding of
23 regional groundwater impacts, right?

24 A. Correct.

25 Q. Okay. So given that, how can this model

1 accurately -- be accurately used to predict site-specific
2 conditions with a measure of certainty?

3 A. I would not like to repeat all the things that I
4 said in the direct, but a lot of information went into
5 building this model, testing the model, adhering to the
6 industry standards. Based on that reasoning, I believe
7 that this --

8 THE REPORTER: I'm sorry. You believe?

9 THE WITNESS: I believe that the model is
10 an adequate representation of the field conditions.

11 Q. (BY MS. ANDERSON) Okay. You talked a little
12 bit about, I guess, the uncertainty. And I think you used
13 a phrase of like 3 feet or something like that.

14 A. The error?

15 Q. Yeah, the error?

16 A. That was observed in the model values.

17 Q. Okay. What is the uncertainty or the error
18 associated with the model results?

19 A. So when you have a specific observation model
20 well -- for example, if it says the water level at this
21 well is a hundred feet, the model can predict plus or
22 minus 3 feet -- plus or minus.

23 THE REPORTER: 3 feet?

24 THE WITNESS: 3 feet to the hundred feet.

25 Q. (BY MS. ANDERSON) And is that true throughout

1 the permit area?

2 A. That's the -- that's what we call the mean
3 error. So that's the average error on an average that you
4 see within the permit boundary.

5 Q. Okay. So what's the high range of the error?

6 A. I have to go to the table and look at it. I
7 can't recollect the exact number.

8 Q. That's fine. I don't know where that page is
9 either, so we're fine with that.

10 Okay. Would you agree generally that the -- the
11 alluvial aquifer is an important aquifer in this area?

12 A. Yes.

13 Q. Because it serves for a water source and is
14 important to agriculture?

15 A. Yes.

16 Q. Okay. So why did you sign off on a permit as
17 being technically adequate, then, when there weren't any
18 monitoring wells constructed in that alluvium?

19 A. I cannot go into the details of the
20 pre-mining -- or the pre-application phase. And the
21 monitoring that was seen because I was not involved in
22 those discussions.

23 Q. Okay. So you just took the data that you got.
24 You didn't have the ability to ask for more?

25 A. From the modeling perspective, I did not need

1 that information.

2 Q. Okay. So you -- in all the rounds of comments
3 we talked about, you never said, Hey, let's get some more
4 data here. Let's characterize this the right way.

5 A. I definitely asked for justification for the
6 information that they provided in the permit.

7 Q. Okay. But you never asked for more data?

8 MR. KUHLMANN: Objection. Asked and
9 answered.

10 MS. ANDERSON: Okay.

11 Q. (BY MS. ANDERSON) Now that you've had a chance
12 to review the permit application and the objections, would
13 you, in your opinion, consider monitoring the alluvium
14 important?

15 A. Monitoring in the alluvium is important. And
16 the mine has committed --

17 THE REPORTER: I'm sorry.

18 A. The mine has committed to three monitoring wells
19 in the Tongue River alluvium.

20 Q. (BY MS. ANDERSON) Okay. And that's going to be
21 another one of these kind of minor technical fixes, I
22 think is how they've been phrased?

23 A. It is not. It's in the permit application.

24 Q. Okay. How does the model and your review of it
25 and use of it handle the saturated overburden in the TR-1

1 area?

2 A. It represents as a geologic unit --

3 THE REPORTER: I'm sorry.

4 THE WITNESS: It represents -- it's
5 represented in the model as model layer number 1.

6 Q. (BY MS. ANDERSON) Okay. So you seem to be a
7 pretty important part of the permit review process given
8 the importance of groundwater in the area, so I'm going to
9 ask you the same question I asked Mr. Kristiansen. Did
10 you feel at any time pressure related to review of the
11 permit application, given the statutory deadlines that
12 DEQ has to meet for its rounds of technical review?

13 A. No, I did not.

14 Q. You did not. So after that first round, it's a
15 30-day review period, right?

16 A. Yes.

17 Q. For all the other rounds?

18 A. Yes.

19 Q. And that's enough time to run the models, check
20 the data, do all the work that you have to do?

21 A. I did all the work in 30 days.

22 Q. All right. Must be some late nights that you
23 have going on there at DEQ.

24 MS. ANDERSON: All right. Thank you.

25 That's all the questions I have.

1 THE WITNESS: Thank you.

2 CHAIRMAN BAGLEY: Thank you.

3 Mr. Gilbertz.

4 MR. GILBERTZ: Thank you.

5 CROSS-EXAMINATION

6 Q. (BY MR. GILBERTZ) Good afternoon, Doctor.

7 A. Good afternoon.

8 Q. I have a few questions to cover with you. I --
9 so I do not forget to, I would like to follow up for a
10 moment on a couple of questions that Ms. Anderson had
11 asked. If I understand correctly, the hydraulic
12 conductivity and the storage coefficient for the entire
13 4,500 acres was developed from one well site, correct?

14 A. Correct.

15 Q. And if I have understood the testimony of the
16 DEQ correctly in these proceedings, this is an area that's
17 geologically fractured and highly variable.

18 A. Yes.

19 Q. If additional wells were drilled for purposes of
20 testing the hydraulic conductivity and storage
21 coefficient, those could give us different results as a --
22 because of this fractured and variable geology, correct?

23 A. Depends on how you define different.

24 Q. Okay. And if we had significantly different
25 findings in those wells and you plugged them into your

1 model, it would have the opportunity to confound and crash
2 the model, correct?

3 A. Can you please restate the question?

4 Q. Sure. If you have a model and you start showing
5 that the hydraulic conductivity and the storage
6 coefficient differ significantly in a short distance, that
7 is a confounding problem for the model, isn't it?

8 A. Not sure it's not.

9 Q. But it can, can't it?

10 A. Not sure why it would be.

11 Q. Okay. Yet what we don't have in this is
12 anything but one well in all of this fractured and
13 variable geology to apply that one hydraulic conductivity
14 and storage coefficient across the entire acreage,
15 correct?

16 MR. KUHLMANN: Objection. Didn't sound
17 like a question to me.

18 MR. GILBERTZ: It was a question. Question
19 mark.

20 CHAIRMAN BAGLEY: Could you repeat the
21 question, please.

22 Q. (BY MR. GILBERTZ) So what we have is this. One
23 well that establishes the hydraulic conductivity and
24 storage coefficient across the entire 4,500 acres, even
25 though you acknowledge that this is a fractured geology

1 and variable, correct?

2 A. Speaking from a modeling perspective, the test
3 was one aspect of the lines of evidence that I looked
4 into.

5 Q. But it is an important piece of data, is it not?

6 A. It is.

7 Q. In fact, you couldn't have the model without
8 that data?

9 A. No, you couldn't, you cannot have the model.

10 Q. And then one more follow-up. You have mentioned
11 that the DEQ is now willing to say that these registered
12 water wells be covered by the commitment for replacement,
13 correct?

14 A. Correct.

15 Q. Will the stipulation also state that DEQ has the
16 ability to enforce that stipulation and order the operator
17 to drill the wells or supply the replacement water?

18 A. We have a process in place that's called State
19 Engineer's -- State Engineer's Office's process. That's
20 the process that we need to go through.

21 Q. DEQ will not retain the right to tell the
22 operator that it has determined a water source has been
23 impaired by its operations and is obligated to supply
24 replacement water; is that right?

25 A. All water rights that are impacted will need to

1 be replaced.

2 Q. And will DEQ retain the authority to order the
3 operator to supply the replacement water? I'll tell you
4 why I'm struggling with this, Doctor. I have represented
5 landowners when the operators have commitments to supply
6 replacement water and we have spent years in litigation
7 fighting over whether or not it is their obligation to do
8 so. So I'm wondering whether DEQ will retain the
9 authority to direct the operator to supply replacement
10 water.

11 A. I'm not -- I'm not familiar with the process.
12 I'm not in a position to address the question.

13 Q. Thank you.

14 Now I do want to talk about your model for a few
15 minutes. We know now that you have no baseline data for
16 the alluvial valley floors, correct?

17 MR. KUHLMANN: Objection. I think it's a
18 mischaracterization.

19 Q. (BY MR. GILBERTZ) For the alluvium --

20 CHAIRMAN BAGLEY: Wait a minute.

21 MR. GILBERTZ: He's right. It's not --
22 it's not a mischaracterization. It's a poor question.

23 CHAIRMAN BAGLEY: Yeah. Rephrase your
24 question.

25 Q. (BY MR. GILBERTZ) We have no baseline data for

1 the water in the alluvium in the valleys, correct?

2 A. We don't have monitoring wells in the Tongue
3 River, yes.

4 Q. Okay. Very good.

5 And you have told us that the alluvium is an
6 important aquifer for the region, correct?

7 A. Yes.

8 Q. Okay. Now, a day or so ago I was visiting with
9 other folks from the DEQ about impacts on the alluvium and
10 there was a discussion of how the coal in certain areas is
11 exceedingly dry. So I want to visit about that for a
12 moment. Your testimony is that the water modeling that
13 has been done is something that we can scientifically rely
14 on, at least to some degree, right?

15 A. Correct.

16 Q. Okay. Good. So I'm going to go to DEQ 12. I
17 need to get to the particular maps so people don't get
18 dizzy. Here we go.

19 So I have a map here, which is DEQ 12-246. Do
20 you see this map?

21 A. Yes, I see it.

22 Q. This is part of the water modeling, correct?

23 A. That's correct. Yes.

24 Q. Okay. So I'm going to blow it up and make it
25 easier for us to look at. Oh, come on. There we go. Now

1 we got nice and clear.

2 So on this particular map, as you have told us,
3 these blue lines coming out represent the drawdown of the
4 coal seam aquifer, correct?

5 A. That's correct. Yes.

6 Q. And that's the -- this is what the model tells
7 us we can reasonably expect, correct?

8 A. Correct.

9 Q. And you told us earlier that, for example, here
10 where it says 10, that that represents a 10-foot drawdown,
11 correct?

12 A. Correct.

13 Q. And then here where we see 20, that is a 20-foot
14 drawdown?

15 A. That's correct.

16 Q. Okay. And we can see that our blue line
17 drops -- this red line -- do you recognize the red line
18 passing through the map and partially through the
19 concentric rings being representative of the interstate?

20 A. Can you please restate that question?

21 Q. Yeah. The red line that goes from the corner of
22 the map up, that's the interstate, right?

23 A. Yes.

24 Q. Okay. And so just to get a conceptual idea of
25 this, we can look and see that the line extends down here

1 even to the extent of touching the Tongue River itself,
2 correct? You see that as the Tongue River coming up,
3 looping through here?

4 A. Yes.

5 Q. Okay. And then back up across the interstate,
6 right?

7 A. Correct.

8 Q. Okay. So just for a second here, then, I want
9 to say this area that we've just been talking about,
10 roughly inside of this green highlighted portion, what you
11 have just been discussing, correct?

12 A. Correct.

13 Q. Okay. Good. Now I'd like to take that and
14 compare that to something else because we now have an
15 indication of 10 and in some instances 20 feet of drawdown
16 extending beyond the interstate.

17 Let's go back to a DEQ exhibit, and that will be
18 16. And do you recognize this area labeled as potential
19 AVF acreage to encompass that same area that I just
20 identified the model showing a 10-to-20-foot drawdown in?

21 A. Yes.

22 Q. And you were -- you've been here during the
23 course of these proceedings, right?

24 A. Yes.

25 Q. And so you've heard the discussion earlier that

1 there has been the general agreement that the Carney seam
2 subcrops into the Tongue River alluvium -- alluvium,
3 correct?

4 A. Correct.

5 Q. Let's talk then a bit more about the notion of
6 whether there's water in this upper portion of the Brook
7 permit acreage. And then I'm going to go back to DEQ 12.
8 All right. And this is Table 4.9-1. Do you see that?

9 A. Yes.

10 Q. You were visiting about this with us earlier
11 about this demonstrating the drawdown that might happen
12 for particular wells.

13 A. That's correct. Yes.

14 Q. Okay. So let's blow up our top portion just a
15 little bit here for us. And I will try to do this. I'm
16 positive I can. I'll highlight two wells up here at the
17 top. These are the two I'd like to visit with you about.
18 The first well on the list has a Wyoming well -- that's a
19 Wyoming State Engineer's designation of that well,
20 correct?

21 A. Correct.

22 Q. And we see down on the end that it is predicted
23 to have a 7.4-foot drawdown in that well?

24 A. Correct.

25 Q. That could be very significant for that well,

1 correct? Its productivity?

2 A. Depends on a lot of factors.

3 Q. Depends on where the wells sit?

4 A. How deep it is.

5 Q. How much aquifer is at that location?

6 A. Yes.

7 Q. Okay. The next one we have on the list, which
8 is P48251W, whiskey. And we see that one has a drawdown
9 of 25.8 feet, correct?

10 A. That's correct. Yes.

11 Q. Okay. Let's find out where those wells are.
12 Just a second. All right. I should start with this
13 shrunk and tell everyone that we are now talking about
14 DEQ 12-253. I've highlighted the identification of a well
15 on that map. You see that, Doctor?

16 A. Yes, I do.

17 Q. And that is the well number and location for the
18 well that's going to suffer 25-foot -- almost 26-foot
19 drawdown according to the model, correct?

20 A. Yes.

21 Q. And the one that is going to suffer the
22 7-or-so-foot drawdown is the one that I've highlighted
23 here, correct?

24 A. Yes.

25 Q. You would agree with me that both of those wells

1 are outside the permit boundary?

2 A. Yeah. They are outside --

3 THE REPORTER: I'm sorry?

4 THE WITNESS: They are outside the permit
5 boundary, yes.

6 Q. (BY MR. GILBERTZ) And so they will be
7 materially impacted by these drawdowns, correct?

8 MR. KUHLMANN: Objection. Speculative.

9 CHAIRMAN BAGLEY: Yeah. Rephrase.

10 Q. (BY MR. GILBERTZ) Do you know whether they'll
11 be materially impacted?

12 A. Can you define materially impacted, please?

13 Q. Well, will this harm the quantity or quality of
14 water that these wells are capable of producing?

15 A. So when you have a well that's 250 feet deep, if
16 this is going to cause 25-foot drawdown, depending on the
17 water column, still you can meet the livestock demands for
18 this well.

19 Q. You know, in fact, that this model has been
20 developed focused solely on the Carney itself, right?

21 MR. KUHLMANN: Objection. It's
22 argumentative.

23 MR. GILBERTZ: What's the objection?

24 CHAIRMAN BAGLEY: The model --

25 MR. GILBERTZ: I'll solve it. Let's do it

1 this way. We're going to stick right in that same exhibit.

2 I don't want anybody speculating.

3 Q. (BY MR. GILBERTZ) Right here on page 12-240,
4 the highlighted portion down here it says "Some of the
5 wells are believed to be completed over multiple water
6 bearing intervals, but model impacts are reported as if
7 they are only completed in the coal seams of interest."
8 Do you see that?

9 A. Yes.

10 Q. So, therefore, the drawdown for these two wells
11 I've just been talking about have been modeled as if the
12 only impact is the drawdown from the coal seam of
13 interest, right?

14 A. That's not correct.

15 Q. Okay. Why is that not correct?

16 A. So the statements here indicate that these wells
17 potentially might be completed in separate zones, not just
18 not coal seams. But the model assumed on the water that's
19 going to come out of this well is going to come from the
20 coal seam. So it's a conservative assumption. So it's
21 limiting the water production to the thin coal seams that
22 we are talking about, given that you have 200 feet of
23 other zones that the well might be getting its water from.
24 So it's a conservative assumption for modeling purposes.

25 Q. Right. So you and I said the same thing in

1 different words. So this model predicts that that -- that
2 well, if completed in the coal seam, is going to suffer
3 25-foot drawdown.

4 A. So when you drill a well, you look at the
5 water level -- you look at the water level pre-mining,
6 you look at the water level post-mining. The difference
7 is 25 feet.

8 Q. Okay.

9 A. If you look, that well is like 200 feet deep.
10 You still have the rest of the column to provide stuff
11 like that you need for the demands.

12 Q. So then on the wells that we've been --

13 A. And I'd like to highlight that the 25 feet is
14 the one-year value --

15 THE REPORTER: I'm sorry.

16 THE WITNESS: The one-year maximum value
17 that's about 10 feet.

18 Q. (BY MR. GILBERTZ) So --

19 A. So we are looking at an extreme case here.

20 Q. So in these two wells, the one thing you cannot
21 say because you don't -- let's go about it more precisely.

22 The first well on our list here, you do not know
23 how deep that well is, correct?

24 A. The table here shows the depth.

25 Q. You do not know which seam it is completed --

1 which aquifers it is completed into, correct?

2 A. This table does not have that information.

3 Q. Okay. And, therefore, you cannot tell us that
4 drawing down the water table at that well by 7.4 feet will
5 not have a material impact to that well, correct?

6 A. Can you please restate the question?

7 Q. Because you do not know these things, you cannot
8 tell us that drawing down this well by 7.4 feet will not
9 materially impact this well?

10 A. We know the well is 180 feet deep.

11 COUNCIL MEMBER FLITNER: How many?

12 THE WITNESS: 180 feet.

13 CHAIRMAN BAGLEY: Just a minute.

14 THE WITNESS: In the third column.

15 CHAIRMAN BAGLEY: Did you have a comment?

16 COUNCIL MEMBER FLITNER: I just didn't hear
17 how many feet it was.

18 CHAIRMAN BAGLEY: Okay. Sorry.

19 A. So that's 180 feet. That's the well depth.
20 This is the drawdown. And in general we know how -- how
21 deep our -- from the land surface where you see the
22 groundwater. So this will tell us the 7.4 feet is going
23 to affect us or not.

24 COUNCIL MEMBER FLITNER: Do we know the
25 level of water or the water table is? Is it 100 -- you

1 know, is it 160 feet? Is it a hundred feet? Do we know
2 what those values are?

3 THE WITNESS: This table does not provide
4 us that information, but we have that information.

5 COUNCIL MEMBER FLITNER: You do have it.

6 THE WITNESS: It's in maps that we can look
7 at.

8 COUNCIL MEMBER FLITNER: Okay.

9 Q. (BY MR. GILBERTZ) And on the next one, the
10 25.8 feet. That's almost the entire depth of the Carney
11 seam, right?

12 A. We are discussing about two different things.
13 One is thickness of the coal seam and the thickness of the
14 water column. Two different things.

15 Q. Right. The thickness of the coal seam, if it is
16 the aquifer, is only about 25 feet.

17 COUNCIL MEMBER FLITNER: Mr. Chairman.

18 CHAIRMAN BAGLEY: Yes.

19 COUNCIL MEMBER FLITNER: We're spending a
20 lot of time on this. And I think it's a good concept. I
21 mean -- but I think that it would shorten this discussion
22 if we knew -- I mean, because it could be a moot point.
23 With the discussion we're having now, we don't know whether
24 these wells are affected or not. And we can argue all day
25 about --

1 MR. GILBERTZ: That's fine.

2 COUNCIL MEMBER FLITNER: -- there will be
3 or whether be won't. If that information's out there,
4 let's get the information and then we know and the
5 discussion's over one way or the other. I'm not
6 interesting in going back and forth on things we can never
7 answer.

8 Q. (BY MR. GILBERTZ) I'll do it this way. As you
9 sit here today, you cannot tell us any more about these
10 wells other than these are the drawdowns anticipated by
11 the mine?

12 A. This table just shows that information.

13 Q. Okay. And then -- oh, and then we know that
14 these wells that are predicted by the model to suffer
15 these drawdowns if completed in only the Carney seam are
16 located up in -- up in this general area. Right up here,
17 just outside the permit boundary, right? We just
18 established that on our other map.

19 A. The locations of the wells, yes.

20 Q. Okay. And that's up in this area that we heard
21 yesterday the coal was completely dry, yet the model
22 predicts these drawdowns?

23 A. That's not the area that's dry.

24 MR. GILBERTZ: Okay. No further questions.

25 Thank you.

1 CHAIRMAN BAGLEY: All right. Thank you,
2 Mr. Gilbertz.

3 Mr. Pope.

4 MR. POPE: Thank you, Dr. Bagley.

5 CROSS-EXAMINATION

6 Q. (BY MR. POPE) Dr. Kuchanur, thank you very
7 much. I'm sure being subjected to cross-examination by a
8 bunch of lawyers is not the most fun thing in the world.
9 But I want to make sure that we're clear on a couple of
10 points, because I think we're losing the forest through
11 the trees, to borrow your phrase.

12 To pick up where you were discussing with
13 Mr. Gilbertz about drawdowns in the water table, does
14 Appendix D6 contain potentiometry maps that show water
15 surface elevation contours?

16 A. Yes, it does.

17 Q. And is that the type of information Council
18 Member Flitner was referring to in deciding where the
19 water level is in this area?

20 A. Exactly.

21 Q. And Appendix D6 is in the permit, correct?

22 A. Yes.

23 Q. Sticking with the theme of losing the forest for
24 the trees. You discussed in your direct testimony the
25 concept of parsimony, correct?

1 A. Correct.

2 Q. And as you explained it, it was we don't want to
3 make models too complex, otherwise we're not going to have
4 an accurate understanding; is that fair?

5 A. Just to rephrase, added complexity does not
6 translate directly into an increased accuracy.

7 Q. And, please, Dr. Kuchanur, if I mess up the
8 science, please correct me. I became a lawyer so I can
9 avoid science.

10 The -- the goal of the groundwater model within
11 Brook's permit application, was to figure out what is
12 going on with the groundwater across the entire mine
13 permit boundary, correct?

14 A. Correct.

15 Q. And in your opinion, the model in the permit
16 application was able to do that.

17 A. Yes.

18 Q. Correct?

19 And we've heard some discussion about number of
20 wells, number of bore holes, but I think you testified on
21 direct that you had access to other data sources. Is that
22 correct?

23 A. Yes.

24 Q. Did you use those data sources in analyzing and
25 filling in the alleged gaps the objectors have presented?

1 A. I have looked into other information that helped
2 my understanding and to inform myself, yes.

3 Q. Let's talk very briefly about trench TR-1. I
4 want to clear up a few issues there. The material that
5 Mr. Gregersen was discussing with you is saturated
6 backfill; is that correct?

7 A. Yes.

8 Q. Okay. Help me understand that. Is that
9 material native to that area?

10 A. It's not.

11 Q. What is it?

12 A. That's the mined-out area. It was backfilled by
13 Big Horn.

14 Q. Is saturated backfill considered an aquifer for
15 purposes of your review?

16 A. Can you restate the question, because the
17 definition of aquifer is very scientific, so --

18 Q. Sure. Actually, why don't I just go ahead and
19 tell you the definition and you can -- we can go from
20 there. So aquifer is defined in Chapter 1, Section 2, as
21 a zone stratum or group of strata that stores and
22 transmits water in sufficient quantities for specific use.

23 Using that definition, is saturated backfill
24 considered an aquifer?

25 A. The saturated backfill does not have any

1 production wells, so it's currently not acting as a source
2 of water.

3 Q. So is it fair to say, then, based on what you
4 just said, if Brook were to remove that material
5 temporarily, it would not be disturbing an aquifer?

6 A. It will not be disturbing an area that's
7 providing active source of water supply.

8 Q. Fair enough.

9 Very briefly I want to, again, ask you about
10 something you heard from Mr. Gregersen, he represented to
11 you that he had discussed some issues with
12 Mr. Kristiansen, and I believe what he was referring to
13 was a discussion about Round 1 Comment 11 from you to
14 Brook about data and justification. You remember hearing
15 that discussion with Mr. Kristiansen?

16 A. Yes, I do.

17 Q. And groundwater hydrology and hydrogeology is
18 your area of expertise, correct?

19 A. Correct.

20 Q. So you were the one who analyzed Brook's permit
21 application and provided that comment and analyzed the
22 response, correct?

23 A. That's correct.

24 Q. Okay. Were you satisfied with Brook's response
25 to that comment?

1 A. If I was not satisfied --

2 THE REPORTER: I'm sorry?

3 THE WITNESS: If I am not satisfied, I will
4 not accepting the response.

5 Q. (BY MR. POPE) Just a few more questions for
6 you, Dr. Kuchanur.

7 Mr. Gilbertz was showing you a map of potential
8 areas of drawdown near the Tongue River. Do you remember
9 that?

10 A. I do.

11 Q. Okay. To your knowledge, is there a hydrologic
12 connection between the surface water in the Tongue River
13 and the water in the Carney seams in the area you were
14 looking at?

15 A. Can you please restate the question?

16 Q. Absolutely. In the area we were looking at with
17 Mr. Gilbertz, there were those concentric rings with 10,
18 20 indicating a drawdown of water, correct?

19 A. Correct. Yes.

20 Q. And some of those rings got -- it got near the
21 Tongue River, right?

22 A. Correct. Yes.

23 Q. And what I'm curious about is the water, the
24 potential drawdown will occur in a coal seam, correct?

25 A. That's correct, yes.

1 Q. Is there a connection -- a hydrologic connection
2 between the coal seams in that area and the surface water
3 in that area?

4 A. I'd like to go back to my tanks analogy. Based
5 on my tanks analogy, water level stage elevation that you
6 see in the Tongue River district and what you see in the
7 coal aquifers. So based on my review of the information
8 that's in the permit application, I don't think there is
9 hydrological connection.

10 MR. POPE: Thank you, Dr. Kuchanur. I have
11 no further questions.

12 THE WITNESS: Thank you.

13 CHAIRMAN BAGLEY: It is 2:45. Let us take
14 a 10-minute recess and be back at 5 to 3:00.

15 (Hearing proceedings recessed

16 2:44 p.m. to 2:54 p.m.)

17 CHAIRMAN BAGLEY: All right, everyone.

18 Okay. We are back in session. It's that time
19 for council members to ask any questions.

20 We'll start with you, Tim.

21 COUNCIL MEMBER FLITNER: A couple. I don't
22 know if you can answer on the second.

23 EXAMINATION

24 Q. (BY COUNCIL MEMBER FLITNER) But the first one,
25 I think we're calling that trench a box cut. And there

1 was a question brought up earlier, and if I understand it
2 right, that's really the only place that the water in the
3 coal seam can communicate with the water in the backfill
4 area in a TR-1, because the trench is the only place.
5 Everywhere else you're talking about that horizontal
6 barrier, whatever, sediment you had in it that's pretty
7 solid. But the backfill, it's not anyway. But at the box
8 cut I think we're calling it, that water's going to come
9 in there, both from the backfill water and from the coal
10 seam, correct?

11 A. That's correct. Yes.

12 Q. So that water will be pumped out there for
13 pretty much the lifetime of the mine because they'll be
14 using that water for the other mines, correct?

15 A. That's correct. Yes.

16 Q. So are there any effects to that water?
17 Because, you know, we talked about the barrier, said one
18 doesn't have anything to do with the other, but in this
19 particular place they will mix and they will communicate.
20 So are there any, you know, effects of that that we need
21 to take a look at?

22 A. You stated there's going to be some limited
23 communication there, and the mine is going to have a mine
24 water management plan, but that's all I can think of is --
25 there's nothing else I can think of.

1 Q. Okay. The other part goes back to this well
2 that we were -- two wells we were talking about, which
3 opens up whole 'nother can of worms. We can't find these
4 wells. First of all, they're outside the permit area.
5 We're not really finding any information on them. But we
6 don't know the depths. We don't know -- is it possible
7 some of these wells are more shallow than the coal seam?
8 Do we know if some of these wells are in the coal seams
9 we're talking about? Do we have information on those
10 kinds of things so we know going forward what kind of
11 effects they might see from the drawdown?

12 A. The State Engineer's Office has a database on
13 the wells and the mine put all the information available
14 to the state engineer's database into the department. So
15 we know the information on the depth, where it's screened.
16 The only thing I was not able to look at is in that
17 specific table did not bring all the information in one
18 place.

19 Q. So if I'm a landowner and I have a well, and I
20 know it's -- what was that one -- 180 feet deep. I can go
21 to the State Engineer's Office or I can come to you and
22 find out basically what effects that's going to have on my
23 well with that drawdown. I can get to that information if
24 I need it?

25 A. Yes, you can.

1 Q. And then I guess I can -- I can be guaranteed
2 that -- I mean, through the process that may prove
3 difficult. I understand the legal process just enough to
4 know there's no place for justice sometimes.

5 But, anyway, you would have an idea of what --
6 what kind of impact it's going to have, so we would maybe
7 hear that from the landowner over the next day or two.
8 They should have that information available to them and be
9 able to present to us what's going to happen to them.

10 A. Yes.

11 COUNCIL MEMBER FLITNER: Okay. That's all
12 I've got.

13 CHAIRMAN BAGLEY: All right. Thank you.
14 Megan.

15 COUNCIL MEMBER DEGENFELDER: Just one.

16 EXAMINATION

17 Q. (BY COUNCIL MEMBER DEGENFELDER) So no
18 monitoring wells were completed in the over/interburden,
19 correct?

20 A. That's correct.

21 Q. Is that necessary for it to be technically
22 accurate, the permit?

23 A. So during the pre-application phase of the --

24 THE REPORTER: I'm sorry.

25 A. During the pre-application phase of the mine

1 permit, there was some discussions on things like that,
2 given the predominantly dry nature of the area and the
3 interburden and overburden being low permeable, they did
4 some drill holes and things like that, but they did not
5 find water. So that was one constraint that I'm aware of
6 and why they did not have a permanent monitoring well.

7 Q. (BY COUNCIL MEMBER DEGENFELDER) Okay. Because
8 I think what I'm still struggling with a bit is the TR-1,
9 whether or not, as you said, is that primarily dry or not.
10 That's what I can't seem to get an answer on.

11 A. The TR-1 area, specifically the backfill --

12 Q. Yes.

13 A. -- is --

14 THE REPORTER: It is?

15 THE WITNESS: It is saturated. Saturated.

16 Q. (BY COUNCIL MEMBER DEGENFELDER) But it's not a
17 source of water, correct?

18 A. It's not a source of water.

19 Q. Okay.

20 A. Or any wells --

21 Q. Okay. Thank you.

22 THE REPORTER: Can you say that again?

23 THE WITNESS: It's not a source of water
24 for any wells -- production wells that I'm aware of.

25 COUNCIL MEMBER DEGENFELDER: Okay.

1 CHAIRMAN BAGLEY: Meghan L.

2 EXAMINATION

3 Q. (BY COUNCIL MEMBER LALLY) I've asked this
4 question before, and you may not be able to answer it.
5 Was one reason that there were no monitoring wells or
6 wells to be accessed, drilled, in TR because of the lack
7 of access by Brook to that property?

8 A. I don't have the information to that question.

9 CHAIRMAN BAGLEY: Is that it?

10 COUNCIL MEMBER LALLY: Yeah.

11 CHAIRMAN BAGLEY: All right. Nick?

12 COUNCIL MEMBER AGOPIAN: I don't have any
13 questions at this time.

14 CHAIRMAN BAGLEY: Okay. Deb?

15 COUNCIL MEMBER BAUMER: My questions have
16 been answered. Thank you.

17 CHAIRMAN BAGLEY: Okay. I have a few
18 questions, Dr. Kuchanur. I actually really like this sort
19 of stuff, having taken some coursework in it years ago
20 myself, but not to the level you have.

21 EXAMINATION

22 Q. (BY CHAIRMAN BAGLEY) I'll ask a couple of
23 technical questions, then I want to get to the question I
24 think is on everybody's mind, but -- so, first, when we
25 put a box cut trench in and start pulling the coal out,

1 how is the model dealing with that as -- as it predicts
2 into the future?

3 A. So you're -- can you -- just trying to
4 understand the question. So you're thinking about the
5 mechanism the model uses to incorporate how it's being
6 mined into the model, Dr. Bagley?

7 Q. Yes. Yes. So, for example, the coal has a
8 certain hydraulic conductivity, and so in your baseline
9 modeling that you use to calibrate it, the coal's all
10 there and you're able to use the baseline hydraulic
11 conductivity of the coal. Now we go in and we drop the
12 box cut in, so we cut through all those layers, as
13 Mr. Flitner indicated, then we go in and start pulling
14 coal out. So that's, of course, is going to act -- it
15 could even act almost like a tunnel, I suppose, but -- so
16 I was wondering how did the model -- how does that handle
17 that as you predict into the future, knowing that there's
18 coal being pulled out of that seam?

19 A. It's a pretty good question. MODFLOW models has
20 a provision that's called drain cells. The drain cells
21 are specifically used in MODFLOW to -- in mining
22 applications. So what those drain cells do is they act as
23 the dewatering -- dewatering location for those trench
24 cuts. So once you know this is where the trench cut's
25 going to be, then you place a drain cell in the MODFLOW

1 model, and that's going to dewater, and it's going to
2 represent what's going to happen at the mine during
3 mining. So that's how the model deals with it. I hope
4 that answers your question.

5 Q. So MODFLOW does have an actual component that
6 allows you to account for that as start to pull coal out,
7 you put these drain cells in in those spots and it's an
8 accounting for now that you completely changed that
9 hydraulic conductivity?

10 A. Exactly, yes.

11 Q. Okay. Thank you.

12 How does the model -- and maybe -- well, it
13 would have had to, since you had the different layers.
14 How does the model handle the Tongue River and Goose
15 Creek, since you had the model going over a lot of large
16 area?

17 A. So the model -- MODFLOW has a specific component
18 to represent rivers, perennial rivers. It's called river
19 package. So the model used a specific package that's a
20 component of MODFLOW. It's called a river package to
21 represent --

22 THE REPORTER: What was the last part?

23 THE WITNESS: To represent the river.

24 Q. (BY CHAIRMAN BAGLEY) So in a way does that act
25 like a boundary condition?

1 A. It does.

2 Q. Okay. This question has come up a lot, so I
3 just want to follow up on it. And so this would be, in
4 your opinion, based on the information you have, is the
5 overburden -- the nondisturbed overburden -- so not the
6 TR-1 area, but the nondisturbed overburden, is it serving
7 as an aquifer in that area?

8 A. No, it does not.

9 Q. So it -- and you base that on when you were
10 doing the boreholes -- or you weren't doing them. But
11 when boreholes were done and you start digging down
12 through -- and, of course, you're taking samples and
13 checking all the way, just no water was found as they went
14 down. Is that your understanding?

15 A. That's my understanding, yes.

16 Q. So now back to TR-1 backfill. I think you may
17 have already answered this question, but I'll ask it again
18 just to be sure, because I want to make sure I hear it.
19 So the TR-1 area has backfill. It's been previously
20 mined. The backfill goes to a certain level. Doesn't go
21 all the way down to the seam that you're interested in.
22 But it had -- and it's being -- you've noted that you
23 believe it's saturated. Is it serving, to your knowledge,
24 as an aquifer?

25 A. It's not serving as a production source for any

1 supply wells.

2 Q. Okay. So it's not serving as a production
3 source, to your knowledge.

4 When you had mentioned 98.9 GPM inflow during
5 year seven, I pulled out my calculator but you beat me to
6 it. But I confirmed your answer that it was .22 cubic
7 feet per second. And I wanted to know how that compared
8 to the flow of the Tongue River. And you answered that
9 too by saying, well, the Tongue River is 100 to 400 cubic
10 feet per second, so this is truly a trivial amount
11 going -- that's flowing into the pits.

12 But my question, then, is, in your opinion, will
13 there be effects on the Tongue River/Goose Creek due to
14 groundwater changes that occur due to -- throughout the
15 mining process?

16 A. So that's -- I do pretty well restating the .22
17 CFS that the mine will be intercepting. If it hadn't been
18 intercepted, not all the water will be discharging to the
19 Tongue River. There will be some very minimum collection
20 out at the mine CFS, but not all the water is
21 hydrologically connected and discharging to the Tongue
22 River.

23 Q. So the Tongue River and Goose Creek are not
24 hydrologically connected to the lower coal seam,
25 although I am actually looking at a -- a DEQ 12-231 that

1 says the -- it is likely that the Carney coal would lose
2 water to the Tongue -- Tongue River alluvium. So
3 there's -- there may be some connection to some of these
4 seams with the rivers, right?

5 A. That's correct, yes.

6 Q. Okay. So I guess I have two concerns. One,
7 will we suck all the water out of these rivers to the
8 point where people downstream have a problem? Just in
9 your opinion, as would be -- the effect be that
10 significant?

11 A. Based on the site plans that I reviewed on the
12 modeling, it does not indicate that way.

13 Q. Okay. So my next question is, will we have
14 another problem? Will we contaminate these rivers with
15 flow from the groundwater due to the mining activities?

16 A. So I haven't discussed this before, but on the
17 issue of groundwater contamination, so we would like to
18 discuss about like what's the source of this
19 contamination? How does it -- where exactly this
20 contamination will be coming from.

21 So if you look at it when you do the box cuts,
22 dig the trench, you take the material out, you store it
23 and then put it back. So things change geochemically, and
24 that might be the source of contamination that might
25 pollute the water. So DEQ/LQD, Land Quality Division, we

1 have guidelines and rules and regulations in place to deal
2 with the spoils material. We make sure these things are
3 like placed in appropriate locations so that it doesn't
4 act as a source of contamination for the groundwater. So
5 that's what we try to address that approach of groundwater
6 quantity and pollution at sites.

7 Q. Okay. Thank you.

8 So now the question that I think some of council
9 were beating around the bush at, I'll just come out and
10 ask it. We've got folks out there around that area that
11 are depending on wells that are producing water for their
12 homes, their livelihoods. Are folks going to see wells
13 run dry or become contaminated because of this mine
14 operation?

15 A. Based on the information that I have reviewed,
16 it's present in the permit application, I don't think so.

17 Q. Okay. So based on the -- the modeling that was
18 done, that you reviewed, you double-checked, and even
19 though we see drawdowns of things, the location of where
20 some of those are, it's -- it's your -- it's your expert
21 opinion that we will not -- people who were not there will
22 not see their wells being significantly affected by
23 quantity or quality --

24 A. That's correct.

25 Q. -- because of this mine.

1 A. Yes.

2 Q. And what if they were?

3 A. That's where the backstop mechanisms that I
4 previously mentioned. Number one, the mines need to
5 provide a replacement for the groundwater right if --

6 THE REPORTER: I'm sorry.

7 THE WITNESS: If it's impaired by Brook
8 Mine, and the mine needs to replace those water rights.

9 A. Item number 2, we'll also be keeping a closer
10 eye during our operations monitoring and during our site
11 inspections and annual reports on what these impacts are.
12 So if this is going to deviate from what the site right
13 now says there's not going to be any impact, then I think
14 we need to be requiring Brook Mine to update the
15 predictions and we'll be basically reevaluating the --

16 Q. (BY CHAIRMAN BAGLEY) So a question I've -- I've
17 gotten. Will there be -- there are, I think you said, 15
18 monitoring wells or were they just water level wells?

19 A. There are 15 monitoring wells that provide water
20 level information.

21 Q. Okay. And then there's going to be did you say
22 three additional monitoring wells added as part of the
23 mine plan?

24 A. Yes.

25 Q. So how often will those wells have to be sampled

1 for both level and quality?

2 A. Quarterly.

3 Q. Quarterly.

4 So let's say we've got a monitoring well located
5 down-gradient from the mine, between say the mine activity
6 and a homeowner's well that's off site of the mine
7 property, but moving in that direction, if we see
8 something happen to that monitoring well that's between
9 the two -- and I don't know if that's the case, but I'm
10 just asking this more of a speculative-type question. But
11 we see the levels significantly drop. We see a
12 contamination problem. What happens to this whole -- the
13 whole system?

14 A. So the first step we'll do is we'll have a
15 meeting with the mine and make sure that we understand
16 that this drawdown, is this like really happening and make
17 sure like all the analysis information and double-check
18 it's all falling into place. After we do this and if we
19 see an impact -- for example, if it's a drawdown impact,
20 it's drawing down the alluvial aquifer to a significant
21 extent, then we'll ask -- we'll require the mine to
22 evaluate what's causing this drawdown and they either need
23 to minimize or mitigate the impacts soon.

24 Q. So is there -- I guess what I'm wondering -- and
25 you may not know the answer. Does DEQ have a legal remedy

1 if you see an impact one quarter, you come back the next
2 quarter, it's gotten worse and nothing seems to have
3 changed, is there any kind of legal remedy that DEQ might
4 take to help stop this? Because, you know, we assume if
5 it's moving down-gradient, it hits one of the monitoring
6 wells, it could continue to move down-gradient off the
7 permit site. Do you know of a legal remedy?

8 A. I cannot think of a legal remedy, but I think in
9 my view it would be in the interest of the mine to take a
10 closer look at this before it hits the well owners and
11 impact mostly their operations.

12 CHAIRMAN BAGLEY: Okay. I shouldn't have
13 asked you a legal question. I've got a bunch of lawyers I
14 could have asked that legal question. That's all my
15 questions. Thank you very much.

16 THE WITNESS: Thank you, Dr. Bagley.

17 CHAIRMAN BAGLEY: Any other questions from
18 council?

19 All right. Mr. Kuhlmann, chance for redirect.

20 MR. KUHLMANN: Thank you, Dr. Bagley.

21 I thank you for asking a few questions I was
22 going to, so I'll try to pare mine down.

23 REDIRECT EXAMINATION

24 Q. (BY MR. KUHLMANN) Dr. Kuchanur, you previously
25 testified about a minor technical issue identified after

1 reviewing the objections related to the commitment in the
2 permit application for Brook to replace adjudicated
3 groundwater wells that might be impacted.

4 A. Yes.

5 Q. Is that what you testified to?

6 And I believe your testimony was that the
7 recommendation was -- from DEQ was that the term
8 "adjudication" be removed so it would just be replacing
9 water rights.

10 A. Correct.

11 Q. Do you know what -- if there's a similar
12 commitment in the surface water quality sections in the
13 mine plan to replace impaired surface water rights?

14 A. There is no qualifying term to replace water
15 rights. That specifies only adjudicated water rights will
16 be replaced.

17 Q. So I'll rephrase this just to make sure I
18 understand it. The -- the commitment to replace surface
19 water rights. It does not say adjudicated surface water
20 rights?

21 A. Right.

22 Q. So removal of the term adjudicated groundwater
23 rights section make that commitment more closely match the
24 surface water rights section?

25 A. It will.

1 Q. Would you characterize deleting of a single word
2 as minor?

3 A. In this instance, yes.

4 Q. And does the fact that the application that was
5 determined to be technically adequate by DEQ prior to the
6 public notice, the fact that the term adjudicated water
7 rights is used instead of just water rights, in your
8 opinion does that make the application tech -- not
9 technically adequate?

10 A. It does not.

11 Q. Okay. You were asked a little bit about whether
12 wells would be materially impacted. Is that a term that
13 is defined in DEQ regulations?

14 A. I don't know off the top.

15 Q. Is that a -- a technical term you would --
16 you're familiar with the definition of?

17 A. I'm not.

18 Q. I think you may have got at this issue a little
19 bit with Dr. Bagley. When you mentioned that .22 CFS,
20 that would be the maximum amount of water intercepted
21 according to the groundwater model. Not all of that would
22 have gone into the Tongue River, correct?

23 A. That's correct. Yes.

24 Q. Where other -- if it hadn't been intercepted,
25 where are some other places that water might have gone to?

1 A. To be pretty much in the coal seams, traveling
2 in those coal seams.

3 Q. So the .22 CFS that would be intercepted would
4 be a total of any of the water that would have gone into
5 the Tongue River, any of the water that would have gone
6 into the coal seams as well?

7 A. Yes. It's the total of any water that's being
8 intercepted by the mine, irrespective of the geology units
9 recharging from or discharging to.

10 Q. So when you compared the .22 CFS to the flow of
11 the Tongue River, which I believe you said the -- the
12 minimum flow as 100 CFS in the last 10 years -- was that
13 correct, the flow?

14 A. That's correct. Yes.

15 Q. When you compare the .22 CFS to the flow of the
16 Tongue River, does the model -- does the model predict
17 that the intercepted .22 CFS -- let me rephrase that.
18 Does the model predict that the Tongue River's flow will
19 lose .22 CFS because of the intercepted groundwater?

20 A. It does not.

21 Q. So if there was water that was intercepted, the
22 Tongue River could be less than .22 CFS?

23 A. Potentially, yes.

24 Q. Do the -- to your knowledge, does the existence
25 of water drawdown from a well make a permit application

1 not technically adequate?

2 A. It does not.

3 Q. So there can be some drawdown and the
4 application is still technically adequate?

5 A. Yes.

6 MR. KUHLMANN: I don't have any other
7 questions. Thank you.

8 THE WITNESS: Thank you.

9 CHAIRMAN BAGLEY: Thank you, Mr. -- Dr. --
10 oh, did you have another question, Tim?

11 COUNCIL MEMBER FLITNER: Yeah.

12 EXAMINATION

13 Q. (BY COUNCIL MEMBER FLITNER) I mean, just
14 sitting here thinking, and probably my problem, so I
15 apologize for being a nag on this, but I don't think I
16 phrased it very well. But I've been trying to figure out
17 a way to explain it better.

18 But what I'm getting at is the water in the coal
19 seam is deeper than, say, your backfill water or any
20 groundwater that might be above that. So it's under more
21 pressure. So, basically, when we make that crosscut,
22 we're breaching that -- that system down there. It's like
23 letting water out -- or air out of a tire, correct? I
24 mean, we've got -- got the coal seam under so much
25 pressure here, and as you get up into the backfill, of

1 course the backfill water is under less pressure. But
2 this box cut is going to tie those two together for all
3 eternity, and so your pressure's going to want to
4 equalize. So what stops the water in the coal seam? It's
5 been there for millions of years under a certain amount of
6 pressure. Now, from leaking up through the box cut, even
7 years after the mine is backfilled. Because you can't
8 stop that now. I mean, you've basically breached that
9 lock between the coal seam and the backfill. And you're
10 basically backfilling it -- the breach now. It's not that
11 hard sediment that you talked to -- talked about, because
12 we cut through it, and you can't pack it tight enough to
13 seal it again.

14 So over -- over the years to come in the future,
15 what happens to that groundwater in the coal seam that
16 maybe there are other wells attached to, because that
17 pressure will -- then that water will eventually leak out
18 of that coal seam and up into the box cut. And so
19 those -- that pressure in there will eventually deplete,
20 correct? So if you have a well in that coal seam, that
21 pressure originally would have pushed water up into
22 your -- you know, into your system, but now maybe it
23 doesn't. What happens -- I mean, what is -- what is the
24 effects of that?

25 A. There are two parts that I'm going to use to

1 answer your question, Mr. Flitner. Number one, when you
2 put the backfill in -- into the coal, you have on either
3 side -- one side of coal being removed and wide and things
4 like that. On the other side there is still going to be
5 the native coal. And we know that the coal is more
6 permeable than the backfill aquifer. So the overburden,
7 the permeability, the rate at which it can conduct
8 water -- we know the coal conducts water better than the
9 backfill.

10 So groundwater always take the path of least
11 resistance, so it tries to like continue and follow the
12 coal seam. And the other one is a little -- the second
13 part of my response is going to be nuanced, but when you
14 talked about the pressure, the confined aquifer, the coal
15 aquifer in this zone, the pressure that you're looking at
16 is not like several tens of feet or something like that.
17 The pressure is pretty minimal. As.

18 You saw the blue line, it's like right above the
19 coal seam. It's just like a little bit above the
20 thickness of the coal. I mentioned the area is about like
21 10 feet, so maybe might be 5 feet above, maybe like 2 or 3
22 feet above the top of the coal seam. So the pressure to
23 begin with is not a lot, and the permeability difference
24 between the backfill and the coal is going to make sure
25 that the water follows the natural path of least

1 resistance.

2 Q. So you're saying the lack of real pressure that
3 exists, and the fact that the coal is permeable, the
4 water's more likely to travel horizontally than
5 vertically. So really the effects are nominal. Not much
6 will happen.

7 A. Exactly. Yes.

8 CHAIRMAN FLITNER: Okay.

9 COUNCIL MEMBER LALLY: I've got a question
10 on follow-up for that.

11 CHAIRMAN BAGLEY: Okay.

12 EXAMINATION

13 Q. (BY COUNCIL MEMBER LALLY) Will that -- because
14 coal's going to -- or coal -- I'm sorry, water's going to
15 want to follow the path of least resistance, like you were
16 saying. Are you going to lose water in that upper aquifer
17 because it's trying to go down into that coal and fill the
18 next aquifer down and losing water in the upper aquifer by
19 doing that?

20 A. Sounds like a little mechanical response I'm
21 going to give. We know the backfill is coming from the
22 Tongue River, and we know that the permeability of the
23 backfill aquifer --

24 THE REPORTER: I'm sorry.

25 THE WITNESS: The permeability of the

1 backfill aquifer is low. So it's connected to the Tongue
2 River, and it's based on my review of the backfill aquifer
3 saturation from Big Horn Mine. It took like 23 years for
4 the backfill to re-saturate. So we know that the water's
5 going to trickle down into the backfill, and we know that
6 the permeability is like low. So it's -- it's going to be
7 a very slow process, and it's going to be very, very
8 minimal.

9 And, typically, if you look at these units, the
10 horizontal permeability of that water, most naturally it's
11 going to be more than the vertical permeability. So those
12 are the two things I can think of.

13 COUNCIL MEMBER LALLY: Okay. Thank you.

14 CHAIRMAN BAGLEY: All right. Thank you,
15 Dr. Kuchanur.

16 THE DEPONENT: Thank you, Dr. Bagley.

17 CHAIRMAN BAGLEY: Do you have any other
18 witnesses, Mr. Kuhlmann?

19 MR. LAROCK: Yes. We're going to call
20 Doug Emme.

21 CHAIRMAN BAGLEY: All right.

22 (Witness sworn.)

23 DOUG EMME,
24 called as a witness on behalf of the DEQ, being first duly
25 sworn, testified as follows:

1 DIRECT EXAMINATION

2 Q. (BY MR. LAROCK) Hey, Doug.

3 A. James.

4 Q. Can you spell your name for the record, please.

5 A. D-O-U-G. Last name is Emme, E-M-M-E.

6 Q. Okay. Thanks. What's your job title at DEQ?

7 A. I'm a blasting program principal for Land
8 Quality.

9 Q. How long have you been the blasting program
10 principal?

11 A. Over 27 and a half years.

12 Q. What's your education background?

13 A. BS in geological engineering from South Dakota
14 School of Mines.

15 MR. LAROCK: Is this speed fine? Thank
16 you.

17 Q. (BY MR. LAROCK) Can you talk a little bit about
18 your work experience.

19 A. It's been about 15 years in the industry, grew
20 up in construction family. I've been running equipment
21 since I was probably 12, 13 years old. Done a little bit
22 of everything in mines. I've operated dragline shovels,
23 scrapers, dozers, drills, run drill blaster. I've run
24 dragline crews, done job estimating for mines and
25 construction companies, and then I've done this for the

1 State for the last 27 and a half years.

2 Q. Can you talk about your duties as the blasting
3 program principal?

4 A. I train blasters for the mining industry. I
5 license blasters for the mining industry. I investigate
6 blasting complaints citizens have. I do blasting
7 inspections. I do other inspections. I also helped
8 develop our bond guideline about 27 years ago. And I'm
9 tasked to update it on an annual or as-needed basis. I do
10 a lot of the coal mine bond estimates for our District 3,
11 which includes the northeast part of the state. I've also
12 helped our other two districts in Lander and Cheyenne with
13 bond reviews on not only coal mines, but larger small
14 mines, granite quarries, gravel pits, things like that.

15 Q. Have you ever consulted for coal companies on
16 blasting?

17 A. Yes.

18 Q. Can you talk a little bit about your teaching
19 and lecturing experience?

20 A. I spent a couple years as an adjunct professor
21 here at Sheridan College back in the mid-'70s, teaching
22 introductory mining courses. For about the last 20 years,
23 as well as my teaching duties, training blasters for the
24 State of Wyoming, I've taught blasting classes for OSM all
25 over the country. We have introductory blasting class as

1 well as advanced blasting class. The advanced blasting
2 class we actually go to the field, set up seismographs.
3 People get to be out on the bench, watch blaster load
4 holes, fire the shots.

5 Five years ago, the Department of Interior sent
6 me to Costa Rica to do some training for Costa Rican
7 government officials on the adverse effects of mine and
8 quarry blasting near people that live near those quarries
9 and mines.

10 Q. And you certify the blasting for the state of
11 Wyoming?

12 A. I certificate blasting for the state of Wyoming,
13 yes.

14 Q. Can someone become certified to blast in the
15 state of Wyoming without your signature?

16 A. No.

17 Q. Let's talk a little bit about Wyoming's blasting
18 rules and regulations. How were Wyoming's blasting
19 standards developed?

20 A. Wyoming is a state that has primacy under the
21 OSM, the Office of Service Mining, surface coal
22 regulations. And our regulations have to be as stringent
23 as OSM regulations. So ours almost mirror theirs.

24 Q. How do the regulations deal with damage to
25 structures from blasting?

1 A. Our regulations are set forth so any structure,
2 anybody that lives in a house, any public building off
3 mine permit is protected from damage from ground
4 vibration, air blast, fly rock, any adverse effects from
5 mine blasting.

6 Q. So in your view, if a mine doesn't exceed ground
7 vibration or air limits -- air blast limits, should there
8 be any damage to structure outside the permit area?

9 A. If they don't exceed limits set forth in our
10 regulations, there would be no structural damage to any
11 houses in the area.

12 Q. Okay. Let's talk a little bit about the Brook
13 Mine permit application. Did you review the Brook Mine
14 permit application?

15 A. Yes.

16 Q. What kinds of protections are in the permit
17 application as relates to blasting?

18 A. They are going to comply with all the state,
19 federal, local relations -- there are no local blasting
20 regulations, so they'll comply with the state and federal
21 regulations.

22 Q. Okay. Can -- when the mine is blasting, is the
23 mine going to shake the house -- a structure -- well,
24 hypothetically -- outside the permit boundary?

25 A. Yes. Our regulations allow mines to shake a

1 house, but not damage it.

2 Q. Okay. What kind of shaking would a person
3 expect when a mine's blasting?

4 A. They might hear the windows rattle. A picture
5 on the wall might move. Dishes in a china cabinet might
6 rattle. If a dish were broken or a picture fell off the
7 wall from mine-related blast, ground vibration or air
8 blast, the mine would have to replace, say, the glass in
9 the picture or the dishes in the china hutch.

10 Q. How's the mine going to know what the structures
11 look like inside and outside?

12 A. Anybody that lives within a half mile of the
13 permit area can request a pre-blast survey from the mine
14 at any time.

15 Q. And that pre-blast survey looks at what exactly?

16 A. Pre-blast survey will look at the condition of
17 the structure at the time a pre-blast survey was done.
18 Most of them consists of a series of pictures of videos
19 that document the outside, as well as the inside of the
20 structure. And they also look at the quantity and quality
21 of any water from wells on their property.

22 Q. Okay. So if the mine's following the rules,
23 there shouldn't be any damage, but if it breaks the rules,
24 then you have evidence of what changed, right?

25 A. That's correct.

1 Q. So relatively speaking, I think folks hear
2 blasting and think about the Powder River Basin. Can you
3 talk about how this mine's going to be different from
4 those mines?

5 A. Most of the mines on Powder River Basin shoot
6 multiple times daily. The bigger mines like Black Thunder
7 and NARM, they might have five, six, seven shots a day.
8 This mine is going to shoot when they open the initial box
9 cut, and they'll shoot the coal in that box cut, then
10 there's going to be no blasting for months, could be a
11 year or more, depending on what their production is. So
12 it's going to be sporadic.

13 Q. What are the size of the shots going to be like?

14 A. Shots are going to be relatively small. Will be
15 dependent on the type of drilling equipment they use and
16 type of excavating equipment.

17 Q. Is there going to be cast blasting?

18 A. No.

19 Q. And just for the benefit of the council, what's
20 cast blasting?

21 A. Cast blasting is a blasting technique where we
22 try to chemically move the dirt, so it never has to be
23 handled with a dragline or a shovel. It's all done
24 through the ground blast operation. And the mines in the
25 basin that do cast blasting probably get 30 to 40 percent

1 of the bench moved to where it never has to be touched by
2 equipment.

3 THE REPORTER: Mr. LaRock, can you slow
4 down, please.

5 MR. LAROCK: I'm so sorry. Of course I
6 can.

7 Q. (BY MR. LAROCK) So, again, to reiterate, people
8 living half mile away are going to feel vibrations, right?

9 A. Yes.

10 Q. But it's -- are those vibrations going to be
11 bigger or smaller than other kinds of vibrations they
12 might normally feel as part of day-to-day life?

13 A. They will more than likely be less than what
14 they feel from the everyday activities in the house.
15 People coming in, closing the door. A teenager flopping
16 down on the couch. The wind in Wyoming is going to put
17 more impact on the leading wall where that wind hits the
18 house than what they're going to experience from blasts
19 from neighboring mine.

20 Q. But the blasting might be more distressing, as
21 they may not know where it's coming from?

22 A. Perception to reality. And people aren't used
23 to the blast where they are used to the wind or normal
24 everyday activities in the house.

25 Q. What kind of steps is Brook going to take make

1 people aware of when blasting is going to happen?

2 A. They have to publish annually and also send this
3 publication to the people that live within half mile of
4 the permit a blasting public notice that specifies days
5 and times when blasting's going to occur. How the access
6 to the area's going to be controlled. It will also list
7 the name, address, phone number, contact information for
8 the operator, should they have any problems they could
9 contact the operator.

10 Q. Okay. But the mine's not going to submit some
11 kind of formal plan detailing exactly which explosives are
12 going to be used and when?

13 A. No.

14 Q. Okay. Would such a plan be required by the
15 rules and regulations?

16 A. No.

17 Q. Can you explain why that is?

18 A. We don't want that type of specificity in the
19 permit. Because if they say we're going to shoot with
20 ANFO, that's all they can shoot with. And we want them to
21 use the best technology available. The best initiation
22 system, the best explosives for the product that they're
23 trying to produce.

24 Q. Do you know if the mine is going to be able to
25 blast at night?

1 A. No. Our regulations only allow sunrise-sunset.
2 So the biggest window possible.

3 Q. Could they blast night for emergencies?

4 A. Emergency situations, they possibly could shoot
5 after sunset. There are very few emergency situations.

6 Q. If a mine's experiencing an emergency that would
7 require them to blast at night, how do they go about doing
8 that?

9 A. My recommendation there's nothing specific in
10 the regulations, but my recommendation is they try to
11 contact me before they do it. And if they can't contact
12 me, they have to let me know within 24 hours after the
13 fact.

14 Q. In your 27-plus years being program principal
15 for blasting, how often are you aware of that you
16 authorized night blasting?

17 A. Less than five times.

18 Q. All right. Thank you.

19 That's all the questions I have about blasting.
20 I'm going to move on to your life reviewing bonds.

21 So just as a preliminary matter, has a bond been
22 set for the Brook Mine yet?

23 A. No.

24 Q. Okay. When is it going to be set?

25 A. It won't be set until we're ready to issue the

1 permit and they give us specifics on what actually they
2 plan to do in the first 12 months of the mining operation.

3 Q. Okay. Is the Brook Mine required to submit an
4 estimate to you of what they think the bond should be?

5 A. Not at this point, they're not.

6 Q. Okay. Talking about bonding generally. In
7 Wyoming do we require bonds that are going to cover the
8 entire life of the mine?

9 A. No.

10 Q. How much time does a bond have to cover?

11 A. When an operator submits a bond, they're looking
12 at what the operation looks like the day the bond is
13 submitted and the projection 12 months in advance.

14 Q. How often are bonds being viewed and reset?

15 A. At least annually.

16 Q. But it could be more than annually?

17 A. Yes.

18 Q. You mentioned you developed Guideline 12.

19 A. Yes.

20 Q. Can you talk a little bit about how Guideline 12
21 works?

22 A. Guideline 12 specifies different equipment they
23 can use to backfill pits, spread topsoil, scarify, seed,
24 demolish structures, set bond, air quality monitors,
25 screen monitors. And we use hourly equipment costs that

1 we get from national recognized companies, and then we
2 adjust those for Wyoming conditions.

3 Q. How often is the dollar amount set in Guideline
4 12 updated?

5 A. We update it at least once a year. And I think
6 I've done it three times in the last 14 months.

7 Q. Okay. So what's the most recent version of
8 Guideline 12's prices?

9 A. February 2017.

10 Q. Okay. All right. Does an operator have to
11 suggest a bond amount in order for a permit application to
12 be deemed technically adequate?

13 A. No.

14 Q. Okay. Has Brook Mine submitted an estimated
15 bond amount?

16 A. Yes.

17 Q. When operators submit an estimated bond amount
18 to DEQ, do you just accept that amount or do you do your
19 own analysis what the bond amount should be?

20 A. We don't accept theirs. We do our own analysis.

21 MR. LAROCK: Okay. Can I get the
22 connection to throw something up? Never mind. My
23 co-counsel's going to do it.

24 So what we're going to throw up is DEQ
25 Exhibit 32. And just for the council's benefit, a paper

1 copy of DEQ 32 is over with all of our other exhibits now.

2 Q. (BY MR. LAROCK) Mr. Emme, do you recognize this
3 map?

4 A. Yes.

5 Q. Can you describe what this map is?

6 A. This is permit boundary in blue. These little
7 colored areas are their projected disturbance in the first
8 12 months of activity.

9 Q. So --

10 A. What we call year zero.

11 Q. Okay. So the bond amount that they've suggested
12 only needs to cover the activities that are outlined in
13 this map, correct?

14 A. That's right.

15 Q. Can you describe what the map says you're going
16 to do in year zero?

17 A. We have 20.7 acres here in this tan crosshatched
18 area, which is going to be the pit that we've been talking
19 about. They will strip topsoil in that pit, as well as a
20 laydown area. There are a couple of sediment ponds and
21 topsoil stockpile from the topsoil they strip off that
22 area and any access road into that area. The total
23 disturbance in that first 12 months is projected at
24 30.8 acres.

25 Q. Okay. So there's not going to be blasting or

1 big trenches or anything like that in year zero?

2 A. There will be no blasting. There will be no
3 overburden removal in year zero.

4 Q. So I'm going to ask you now what I was getting
5 close to asking a little bit earlier. The mine submitted
6 a proposed estimate to you, right?

7 A. Yes.

8 Q. What amount did they suggest?

9 A. It was 371,000 and change. And the
10 recommendation was to round that to 372,000.

11 Q. Is that more or less than you would have
12 requested had you gone through this yourself under
13 Guideline 12?

14 A. My review indicated that the bond was very
15 robust. Higher than I would have asked for.

16 Q. Okay. But, again, the bond isn't set yet?

17 A. No, it is not.

18 Q. Okay. If DEQ realizes that an annual bond
19 amount is too low, what can DEQ do?

20 A. We can increase the bond.

21 Q. Okay. I think that's all the questions I have
22 about bonds.

23 So just wrapping it up, have you reviewed the
24 objections that have been submitted in this case to the
25 permit application?

1 A. Yes.

2 Q. In light of those objections, do you still
3 believe that the permit application is technically
4 adequate with regards to blasting and bonding?

5 A. Yes, I do.

6 MR. LAROCK: I don't have any more
7 questions for this witness.

8 CHAIRMAN BAGLEY: Thank you.

9 Ms. Boomgaarden or Mr. Gregersen, please.

10 MR. GREGERSEN: Mr. Chairman, right now
11 with the focus of our case, I don't believe we have any
12 questions for Mr. Emme. However, we would like to defer to
13 Mr. Gilbertz and Ms. Anderson, and with opportunity to
14 maybe ask a couple follow-up questions if they arise
15 through the cross-examination.

16 CHAIRMAN BAGLEY: All right. Yeah, we'll
17 let -- we'll come back to you, then. Defer.

18 MR. GREGERSEN: Thank you.

19 CHAIRMAN BAGLEY: Ms. Anderson.

20 MS. ANDERSON: Sure. Can I have the little
21 doohickey thingy.

22 MR. LAROCK: Do you mean the connection?

23 MS. ANDERSON: That's the official name of
24 it?

25 MR. LAROCK: That's the official name of

1 it.

2 MS. ANDERSON: That's fine. I can do it.

3 CROSS-EXAMINATION

4 Q. (BY MS. ANDERSON) All right. Good afternoon,
5 Mr. Emme.

6 A. Good afternoon.

7 Q. All right. Would you agree that there is a lot
8 of residents in the area around the Brook Mine?

9 A. There are a fair amount.

10 Q. I think yesterday we heard testimony of
11 hundreds. Would you agree with that?

12 A. I -- you'd have a better idea than I would, so
13 that could be accurate.

14 Q. So more than maybe some of the other mines that
15 you deal with --

16 A. Probably, yes.

17 Q. -- in blasting.

18 And just for the benefit of the court reporter,
19 we're going to try not to talk over each other.

20 Okay. So with that, given your history -- and I
21 know you've received citizen complaints every now and then
22 from citizens on blasting, right?

23 A. Yes.

24 Q. And those are generally in areas where there's
25 more people close to a mine, right?

1 A. Yes.

2 Q. Okay. So given the -- kind of your knowledge of
3 those kind of concerns, is there anything special you did
4 with the review of this permit versus maybe other permits
5 that you've looked at for blasting requirements?

6 A. No.

7 Q. Are there any special conditions or restrictions
8 you were thinking of?

9 A. No.

10 Q. Okay. Let's see. You talked a little bit -- I
11 have on the screen DEQ Exhibit 12, page 338, which I think
12 you mentioned that blasting would be limited to daylight
13 hours, correct?

14 A. Yes.

15 Q. Okay. But they can occur any day of the week?

16 A. If that's what they put in their permit and
17 that's what we agreed to, yes, they could.

18 Q. But you don't know for sure one way or the
19 other?

20 A. They could specify in permit they're going to
21 shoot Monday through Friday from noon to 4:00, that would
22 be the only window they could shoot.

23 Q. Okay. But that's something the operator would
24 have to suggest to you --

25 A. Unless -- unless it were an area where we felt

1 that restricting the blasting times was advantageous.

2 Q. Did you think about that in the context of the
3 Brook Mine --

4 A. No.

5 Q. -- whether it be advantageous?

6 A. No, I don't believe it would be advantageous.

7 Q. Restricting -- given the presence of all the
8 residents in this area, you don't think it would be
9 advantageous to limit blasting to certain days of the week
10 or maybe different times to limit the impacts on those
11 neighbors?

12 A. No, because I don't feel the blasting is going
13 to be that impactful from this operation.

14 Q. Okay. Do you agree that in addition to the
15 vibrations you talk about in your testimony, that blasting
16 also causes visual and potentially noise impacts?

17 A. There could be some. They may see some in the
18 operation. They may see dust from the blast, that type of
19 thing. They're going to see those things from interstate
20 traffic on the interstate, traffic on gravel roads where
21 they live. So I doubt the blasting will be much more
22 visually disturbing to them than everyday traffic in areas
23 where they live.

24 Q. Okay. You didn't really talk about this in your
25 direct testimony, but what is -- you know, when you blast,

1 is there a certain amount of kind of pollution that comes
2 up at that time, generally? Like a cloud of dust, for
3 instance?

4 A. There will be dust from a lot of blasts, yes.

5 Q. Is that something that regularly happens on the
6 interstate?

7 A. I've seen a lot of dust on the interstate when
8 the wind blows, yes.

9 Q. Okay. Did DEQ consider any other limitations on
10 blasting, such as limiting blasting during inclement or
11 adverse weather conditions?

12 A. No.

13 Q. Or when soil conditions are not appropriate for
14 blasting, when that soil's saturated with water?

15 A. No, we did not.

16 Q. I think you have a history with a situation that
17 can result from blasting called orange cloud, correct?

18 A. Will you repeat that, please?

19 Q. Yeah. I know that you have some background in
20 situations where blasting causes what's called an orange
21 cloud.

22 A. Yes.

23 Q. Could you tell the council what an orange cloud
24 is?

25 A. Orange cloud is what we call NOx, N-O-X, oxide

1 and nitrogen. The orange cloud is actually NO2. The
2 initial gas produced from an incomplete combustion is NO,
3 and it mixes with oxygen in the atmosphere and produces
4 NO2. That's what gives it the yellowish-red color. We
5 have had a fair amount of problems with NOx fumes in the
6 Powder River Basin at mines with cast blasting.

7 Q. Okay. And I think your testimony is that Brook
8 won't cast blast.

9 A. That's correct.

10 Q. Is that in their permit application right now,
11 that they won't do that?

12 A. I don't believe so.

13 Q. So how do you know that that won't happen?

14 A. Because their mining technique does not lend
15 itself to cast blasting.

16 Q. Is that something DEQ has considered as maybe a
17 condition of approval for the permit?

18 A. No. If we were going to condition a permit,
19 they'd have to come in with a mine plan and specify they
20 were going to cast blast in their operation.

21 Q. Okay. So it's your assumption, based on the
22 type of mining, there won't be cast blasting. But it's
23 not spelled out anywhere in the permit application, right?

24 A. No, it's not.

25 Q. Okay. Are you aware of orange clouds developing

1 in any situation besides cast blasting?

2 A. It happens occasionally.

3 Q. Okay. In what situations?

4 A. Oftentimes when you get wet conditions and your
5 product gets wet, that's when operations use a mix of ANFO
6 and emulsion and go to a water-resistant product.

7 Q. Okay. So a moment ago I just asked you if DEQ
8 considered limitations on blasting to kind of, I guess, if
9 the soil's too wet or if it's rainy outside, did you --
10 would you agree that that would be -- those kind of
11 conditions might help to prevent orange clouds from
12 happening?

13 A. I don't feel we need to condition a permit
14 because their blasting plan specifies they're going to use
15 the best techniques available in their operations. So if
16 wet conditions -- no operator's going to use straight ANFO
17 if it's going to tend to break down in a wet borehole.
18 They're going to use a waterproof rocket.

19 Q. You would agree that in spite of the best
20 efforts of operators, orange clouds still happen, right?

21 A. Yes.

22 Q. Okay. In your review of the permit application,
23 are you aware of the likely blasting amounts and durations
24 necessary to achieve the operations plans of the company?

25 A. Do not know how often or how much they will

1 blast on an annual basis. Again, that's going to be
2 dependent upon traffic.

3 Q. Okay. So you would agree that a blasting plan
4 would be submitted at a later date?

5 A. They have a blasting plan in place in the permit
6 right now.

7 Q. But it doesn't discuss how often blasting would
8 happen or where?

9 A. No.

10 Q. So how is that a plan?

11 A. They're going to blast in active pits that they
12 mine in. We know according to their mine plan where
13 they're going to mine in year one, year two, year three,
14 throughout the mine, we know where they're going to blast.
15 So they have to follow mine plan if they're going to blast
16 in those areas in those specified years.

17 Q. And that's an assumption you're drawing. It's
18 not actually spelled out in the permit application,
19 correct?

20 A. Their mine plan spells out where they're going
21 to mine each year --

22 Q. And you're drawing --

23 A. -- during the term of the permits.

24 Q. And you're drawing assumption that based on
25 where they're going to mine, where they're going to blast,

1 right?

2 A. Why would they blast anywhere else?

3 Q. Okay. But they don't actually, in their
4 blasting plan, have any identification of where they're
5 going to blast?

6 MR. LAROCK: Mr. --

7 MR. SUTPHIN: Mr. Chair -- go ahead,
8 Counsel.

9 MR. LAROCK: Objection. Asked and answered
10 several times, I think.

11 MS. ANDERSON: Okay. That's fine.

12 Q. (BY MS. ANDERSON) Okay. Are you aware of the
13 part of the regulations that allows the administrator or
14 maybe in this case your supervisor, I guess, if
15 Mr. Wendtland wasn't involved, that would allow other
16 information necessary to ensure compliance with Chapter 6
17 of your regulations?

18 MR. LAROCK: I'm going to have to object to
19 the characterization of that question. The witness has
20 already testified that Mr. Wendtland was not involved.

21 Q. (BY MS. ANDERSON) Okay. But -- so the rest of
22 the question, let's get to that. And -- I mean, the
23 regulation says administrator, so that's why I'm having
24 the difficulty dealing with this because I don't know who
25 else to put in the regulation besides the administrator.

1 But are you aware of the ability for I guess
2 someone at DEQ to request additional information necessary
3 to ensure compliance with Chapter 6 of your regulations
4 within the mine permit application?

5 A. The rules and regs in Chapter 6 specify that the
6 administrator, my boss, can specify more stringent
7 regulations for ground vibration or air blast if he deems
8 that necessary to protect structures near mine or quarry.

9 Q. Well, if Mr. Wendtland wasn't involved, then who
10 at DEQ could have done that in the context of the Brook
11 Mine?

12 A. I believe, if we felt it was necessary, would
13 have been Mr. Alan Edwards.

14 Q. Okay. Did you talk to Mr. Edwards about this at
15 all in the scope of your review?

16 A. No.

17 Q. Do you know if Mr. Edwards is aware of this
18 regulation this is something he could do?

19 A. I'm sure he's aware of it.

20 Q. How -- okay. I won't ask you that.

21 Are you aware of recreation uses in the area?

22 A. Yes.

23 Q. Are you at all concerned about blasting impacts
24 to those recreation uses?

25 A. There will be no recreation uses on the permit

1 during mining, so I'm not too concerned about impacts to
2 recreation on a permit during mining.

3 Q. Okay. How about adjacent areas?

4 A. Adjacent areas, I'm not very concerned about any
5 impacts from this mine operation.

6 Q. Okay. Are you aware that the permit area
7 includes some county roads that are used by the public?

8 A. Yes.

9 Q. Are you at all concerned about blasting near
10 those county roads?

11 A. No. If they're blasting close to those county
12 roads, it would be the operator's responsibility to block
13 traffic on those roads and make sure that anybody
14 traveling on the road -- those roads didn't travel on them
15 during blasting operations.

16 Q. Is blocking a road an impact, in your opinion?

17 A. It would be a minor impact.

18 Q. Are you aware of the presence of Abandoned Mine
19 Lands mines in the area?

20 A. Yes.

21 Q. Did in the scope of your review of the blasting
22 impacts, did you consider those abandoned mine lands at
23 all?

24 A. I thought about them. I didn't really consider
25 them too much, no.

1 Q. So you didn't consider if you're blasting right
2 close to an abandoned mine, if that would have an impact
3 related to that abandoned mine?

4 A. I doubt that it would have much of an impact.
5 Most of the abandoned mines in the area, if there was
6 going to be subsidence, would have subsided by now. And
7 for that matter blasting vibrations probably wouldn't
8 cause subsidence in an old mine near the operation.

9 Q. Do you draw that opinion based on anything
10 discussed or any information provided by the permit
11 applicant?

12 A. No.

13 Q. So you're -- what's the basis of this opinion?

14 A. My experience and knowledge of ground vibrations
15 impact on adjacent structures of mines.

16 Q. Okay. Are you aware that there's still active
17 subsidence in the area?

18 A. Yes.

19 Q. So I think just a moment ago you testified that
20 if subsidence would happen, it would have happened by now,
21 right?

22 A. In most cases. Most of those mines are many
23 decades old.

24 Q. But you just told me that subsidence is still
25 happening, right?

1 A. Possibly.

2 Q. Are you aware of subsidence happening?

3 A. I haven't been out in that area in many years,
4 so I guess I'm not aware of it.

5 Q. You didn't visit the mine site in the course of
6 your review at all?

7 A. No.

8 Q. And when you mean you haven't been out there,
9 it's -- in many years, when was the last time you were out
10 there?

11 A. I really couldn't say.

12 Q. Okay. Are you aware that nitrogen is a common
13 constituent in blasting agents, right?

14 A. Would you repeat that, please.

15 Q. Is nitrogen a common constituent in a blasting
16 agent? It's a common chemical. Maybe you can explain
17 this better than I can, but --

18 A. Ammonium nitrate --

19 Q. Yes.

20 A. -- is a common chemical used in many blasting
21 agents, yes.

22 Q. Okay. We talked a lot about the water today.
23 In the scope of review of blasting, did you consult with
24 any of your colleagues that reviewed the hydrogeologic
25 consequences of the mine related to possible nitrogen

1 contamination?

2 A. No.

3 Q. Is that something you've ever done in the course
4 of a mine?

5 A. I have.

6 Q. Why didn't you do it here?

7 A. I didn't feel it was necessary. I don't think
8 that there will be nitrogen contamination on groundwater,
9 as much of the permit is dry, as you've already heard.

10 Q. So you don't think there's going to be nitrogen
11 contamination. What evidence do you draw that opinion?

12 A. I believe that the operator will use the best
13 techniques available, and they use waterproof products
14 when they shoot in wet areas.

15 Q. Okay. So you talked a little bit about -- a
16 little bit about possible -- or the unlikely nature of
17 structural damage in the homes in the adjacent areas from
18 blasting, right?

19 A. Yes.

20 Q. There may be some vibrations and some pictures
21 may fall off the wall, but structural damage likely
22 wouldn't happen, right?

23 A. Very unlikely.

24 Q. Are you aware of stone houses or stone buildings
25 in the area?

1 A. Yes.

2 Q. Do you think the presence of those kind of
3 buildings, would that change your opinion at all?

4 A. No.

5 Q. Why not?

6 A. If I remember -- and I actually looked at that
7 house years ago, when we were looking at houses to buy and
8 remodel, it's a sandstone foundation. It's a pretty
9 sturdy foundation. Probably a better foundation than many
10 other houses in the area that are on a poured concrete
11 foundation.

12 Q. Is that kind of information in the permit
13 application?

14 A. The quality of the structure?

15 Q. Yeah, or potential impacts to structures at all,
16 actually.

17 A. All they are going to do is comply with blasting
18 regulations, so there's no damage to houses near the
19 permit.

20 Q. And there's nothing in the permit application
21 about any kind of structures themselves right now?

22 A. I believe --

23 MR. SUTPHIN: Mr. Chairman, I'm going to
24 object. I know that this witness has already testified
25 that if damage is caused, pre-blast surveys will have been

1 done and operator will be responsible for any repairs -- or
2 damages they've caused.

3 MS. ANDERSON: And, Mr. Chairman, my line
4 of questioning, while that may be true to some degree,
5 there's also a duty to prevent harm in the Environmental
6 Quality Act in Chapter 6. And that's where these questions
7 are getting at.

8 CHAIRMAN BAGLEY: As I understand what I've
9 heard here, the blasting regulations have been designed to
10 do that. So if the blasting regulations are what's in the
11 mine plan, I guess I'm having some difficulty understanding
12 this too. So I'll give you one more crack at this and then
13 we'll need to move on.

14 MS. ANDERSON: Okay. Sure.

15 Q. (BY MS. ANDERSON) Let's talk a little bit about
16 water wells. Are you aware that there's probably a lot of
17 water wells in the area, given a lot of homes in the area?

18 A. Yes.

19 Q. Okay. Can blasting impact water wells?

20 MR. LAROCK: Mr. Chairman, I'm going to
21 have to object. I know it doesn't sound like the same line
22 of questioning, but again, the Land Quality rules and
23 regulations require protection to groundwater wells.

24 MS. ANDERSON: I guess, again, I'm getting
25 at what's in the permit application to make sure those

1 requirements are met.

2 COUNCIL MEMBER FLITNER: Is he really
3 qualified to answer a question about what's going to happen
4 to water wells?

5 MS. ANDERSON: He's the blasting guy.

6 CHAIRMAN BAGLEY: Yeah. It's -- it's not a
7 building, but it is something. I'll allow this question.
8 And I think -- I mean, I -- we have blasting regulations
9 that presumably have been set, as we've heard, to address
10 these issues. And so go ahead and ask that question.

11 Q. (BY MS. ANDERSON) Okay. Mr. Emme, are you
12 aware of times that blasting has impacted water wells?

13 A. No.

14 Q. No. So never in the history of the DEQ program
15 that you're aware of?

16 A. We have had complaints. We've investigated
17 complaints about a potential blasting impacting wells. We
18 have actually run a downhole camera down a well that
19 complainant thought blasting was affecting it. We had the
20 camera sitting right above the groundwater in the well
21 when the blast went off at the neighboring mine and there
22 was not even a ripple in the water. We have had mining
23 operators that have replaced wells because it was cheaper
24 to replace well from a complaint than it was to sit and go
25 through the informal conference with the director, sit in

1 front of the EQC, bring their lawyers in from their home
2 office, wherever that might be. But they've also had the
3 operators -- or the complainant sign a nondisclosure that
4 their blasting did not affect the well. So, no, we
5 have -- we have had no actual wells impacted by blasting.

6 Q. Okay. Just one last question on the orange
7 clouds. Can you explain to the council just the toxicity
8 of that and how that matters potentially for the public?

9 A. The orange cloud -- the NOx cloud that we get
10 from a lot of our casting operations is highly toxic.
11 Some regulatory agencies, like CAL/OSHA, they have short-
12 term disclosure limits as low as one part per million for
13 that orange cloud. And it's a tough thing to monitor
14 because you gets a little bit of shift in wind and you
15 don't get it coming over your monitors.

16 Initially, when the blast goes off, heat of the
17 reaction causes that NOx cloud to rise. It is much
18 heavier than the atmosphere. As it drifts off site, it
19 tends to settle back to the surface. It's highly toxic.
20 In the Powder River Basin, all the mines have either
21 permit conditions or have voluntarily put restrictions on
22 their operations. They don't shoot cast blast when the
23 wind's blowing towards neighbors because of toxicity of
24 the cloud.

25 Q. Okay. And you just reminded me I did have one

1 question on wind direction too. Just to clarify, there's
2 nothing in the permit application or you didn't consider
3 conditions would limit blasting during high wind days, for
4 instance?

5 A. No, I didn't, because I don't feel like we'll
6 have a NOx problem at this mine because shots are going to
7 be relatively small. They're not going to cast blast.
8 Cast blasts are the shots that usually produce the NOx
9 fumes. If we have a problem with NOx, then it's at that
10 point in time we would probably require the operator to
11 have wind restrictions and not shoot when the wind blows
12 towards neighbors.

13 Q. So, for instance, some of the mines in the
14 Powder River Basin, we do have those kinds of restrictions
15 in the permit application?

16 A. Many of them do, yes.

17 Q. Okay. All right. I might shift over to bond.

18 I think during your direct testimony you said
19 that Brook needs to give specifics about what they plan to
20 do in the first year prior to you calculating the bond,
21 right?

22 A. That's right.

23 Q. When are they going to give those specifics?

24 A. If we get approval to issue a permit, they will
25 have to give us more specifics. And it may be exactly

1 what we saw on the map, and then we'll have to review that
2 bond and set it.

3 Q. Okay. So, Mr. Emme, let's just walk through
4 this a little bit. So we're here at a contested case
5 hearing. We know some point there's going to be a
6 decision from the council. And then after that decision
7 from the council, would you agree that there's a 15-day
8 period where we either get the permit denied or granted --
9 granted, right?

10 A. Well, there is a 15-day period, but their permit
11 will not be issued until the bond is set and in place.

12 Q. So you can take longer than that 15 days in the
13 statute if you need it?

14 A. If -- if they don't have the bond in place, the
15 permit won't get issued until the bond's in place.

16 Q. Okay. So you're saying DEQ probably -- and
17 maybe this calls for a legal conclusion. I'm already
18 seeing the objection here, but to the extent that you need
19 to take more time, you feel you can take it?

20 A. I would get the review done in the regulatory
21 time frame, but then it's incumbent upon the operator to
22 get the bond in place and approved by our Cheyenne staff.

23 Q. Okay. I think you're aware of the general
24 purpose of the bond, right? That it's -- and the history
25 of the Environmental Quality Act and SMCRA and why the

1 bonding program's important, right?

2 A. Yes.

3 Q. Could you kind of tell us about that?

4 A. Well, we have a reclamation bond. So if an
5 operator walks away, the state has revenue money in place
6 to reclaim the mine site.

7 Q. Are you aware that there's public notice and
8 comment provisions generally for a bond amount? Do you
9 agree with that, that the public generally has the right
10 to comment on the bond amount?

11 MR. LAROCK: Objection calls for a legal
12 conclusion.

13 Q. (BY MS. ANDERSON) In your review of other
14 permit applications, is there generally a bond set in a
15 way that allows the public to review that bond amount?

16 A. The bond is set in the permit, and there is a
17 public comment period before the permit is approved.

18 Q. All right. So I guess I'm getting at here,
19 where's the public comment period for the bond amount?

20 A. We don't have a bond in place yet.

21 Q. Right. So how are we going to comment on it?

22 A. Once we go to issue the permit --

23 COUNCIL MEMBER FLITNER: Mr. Chairman.

24 CHAIRMAN BAGLEY: Yeah. Just a minute.

25 COUNCIL MEMBER FLITNER: Are we talking

1 with this particular permit or are we talking about DEQ
2 regulations in a broad sense here? Because I get the
3 feeling that he's doing what he's supposed to be doing by
4 state regulations and we're quizzing him on that versus
5 what -- I mean, if there's holes in this permit, point them
6 out to us. Tell us exactly what they are. But this
7 question and answer about in the broad sense doesn't help
8 us.

9 MS. ANDERSON: We're talking about this
10 permit.

11 COUNCIL MEMBER FLITNER: If you can target
12 this -- okay. But it sounds like he's been doing this like
13 this for years. And I can't distinguish between what's
14 different about the process of this permit and what might
15 be the process in the Powder River or anywhere else. I'm
16 looking for deficiency in this permit. If that's what
17 you're looking for --

18 MS. ANDERSON: Thank you, Mr. Flitner.

19 COUNCIL MEMBER FLITNER: -- I want you to
20 make it really clear for me because I'm kind of slow.

21 MS. ANDERSON: Okay. Thank you,
22 Mr. Flitner. I will get exactly right there.

23 Q. (BY MS. ANDERSON) So I just asked you generally
24 in the -- you know, when you review bonds and you set
25 bonds, and generally they're set at a time that allows

1 public comment, right?

2 A. For the initial permit.

3 Q. Right. So in this permit application, the bond
4 has yet to be set, right?

5 A. That's right.

6 Q. Where is the public comment period?

7 A. I guess I can't answer that for you.

8 Q. You can't answer it?

9 A. I guess I can't.

10 Q. Okay. Let's talk a little bit about the bond
11 estimate provided by Brook. Can you talk a little bit
12 about contingency factors in a bond estimate?

13 A. Yes. We include the contingency factors for
14 profit, project design, administration, accounting, site
15 security. We also have an unknown to take care of acts of
16 God. Maybe a large flood or something like that. I think
17 our contingencies cover about all the bases for any large
18 project.

19 Q. Okay. And would you agree with me that a
20 contingency factor is important, not just for the permit
21 applicant, but actually if DEQ would have to take over in
22 the case of a forfeiture?

23 A. The contingency is very important if the state
24 has to take over bond.

25 Q. Okay.

1 A. They have enough money to do the project, yes.

2 Q. Right. So -- and would you agree with me that
3 contingency factors are important regardless of the size
4 of the project?

5 A. Yes.

6 Q. So in the course of your review of the bond
7 estimate from Brook Mine, are you at all concerned about
8 some of those contingency factors are zeros?

9 A. In this particular operation I'm not, because I
10 think the overall bond, as I said, is very robust.
11 There's a line item in the contingencies \$125,000 for site
12 security, for a 30.8-acre site is exorbitant.

13 Q. But would you agree that there's some number for
14 that contingency factor and it could be maybe prorated or
15 adjusted for size?

16 A. There should be some number, but that particular
17 line is very high. And I think overall the contingencies
18 are adequate and the bond is more than adequate.

19 Q. So are you saying that even though there are
20 some zeros, maybe there's enough cushion and a couple of
21 the other lines that you could adjust it over to some
22 other line?

23 A. I believe so.

24 Q. Okay. Are you generally aware of the AML work
25 in the area?

1 A. Somewhat.

2 Q. Somewhat?

3 Are you aware at all about the costs of that AML
4 work in the area?

5 A. No.

6 Q. No. Okay. Then I won't ask you any questions
7 about that.

8 MS. ANDERSON: And that's all I have.
9 Thank you.

10 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
11 Let's take a 10-minute break -- 12-minute break. I have
12 4:13. Let's start at 4:25.

13 (Hearing proceedings recessed
14 4:13 p.m. to 4:25 p.m.)

15 CHAIRMAN BAGLEY: All right. It's 4:25.
16 Let us return.

17 (Council Member Flitner
18 is no longer present.)

19 CHAIRMAN BAGLEY: And we're up to
20 Mr. Gilbertz, please.

21 MR. GILBERTZ: Thank you.

22 CROSS-EXAMINATION

23 Q. (BY MR. GILBERTZ) Good afternoon, sir.

24 A. Good afternoon.

25 Q. Just a couple quick questions about these

1 issues.

2 We call these vibrations -- what have been
3 called vibrations, what we have happening when that
4 explosion happens is that's a shockwave transferred
5 through the strata, right?

6 A. That's right.

7 Q. Okay. And one thing we know is that when that
8 shockwave gets to these old abandoned mines, it is not
9 going to make them more stable, correct?

10 A. No. Probably not.

11 Q. Okay. And you said you didn't know much about
12 the work out at the abandoned mine stuff. So in thinking
13 about that and the abandoned mines in close proximity to
14 the Brook Mine, you were not aware that in 2014 the State
15 spent \$42,000 to mitigate just two sinkholes?

16 A. I was not.

17 Q. Okay. Not aware that added to another
18 mitigation project of \$33,000 that was ongoing?

19 A. I did not know that either.

20 Q. Or 2016 the State spent \$161,000 on subsidence
21 in that area?

22 A. I did not know that.

23 Q. Okay. And so the blasting plan does not take
24 into account additional subsidence that may be caused out
25 at the -- in these old abandoned mines, correct?

1 A. That's true.

2 Q. Okay. And neither does the bond?

3 A. No, it doesn't.

4 Q. Okay. Couple of questions about the blasting.

5 You -- if I gather rightly from your testimony, they can
6 once they submit their blast plan, they can blast any time
7 from sunrise to sunset, right?

8 A. If that's what's in their permit, yes.

9 Q. Okay. Then -- so then there wouldn't be
10 restrictions, anything -- any restrictions on that at all,
11 for example, blast sunrise to sunset on Christmas day?

12 A. That's true.

13 Q. Did the DEQ consider making some reasonable
14 limitations like that in this process with so many
15 homeowners in close proximity?

16 A. No, we did not.

17 Q. You mentioned that it was within the power of
18 the DEQ to put further restrictions on the blasting should
19 it deem that necessary; is that correct?

20 A. That's correct.

21 Q. So you did not, if I understand, investigate
22 historic buildings that might be more susceptible to these
23 shockwaves traveling through the ground to them?

24 A. No.

25 Q. Okay. And, therefore, not aware of a barn on

1 the Fisher property that's made out of rock and over a
2 hundred years old?

3 A. No.

4 Q. Would that be anything that DEQ would consider
5 is limiting the blasting to provide protection for any of
6 these types of old historic structures?

7 A. It could be considered. Again, it's going to
8 depend on how far the structure's away, the size of the
9 shots. If they stay within the standards set forth in the
10 rules and regs, I doubt it's going to have any impact on a
11 hundred-year-old barn.

12 Q. One of the things that the DEQ has done in other
13 circumstances is place a seismic monitor near the
14 habitable structure, say the Fisher house, to measure the
15 amount of shockwave that's making it through the substrate
16 to the Fisher home. DEQ's done that before, right?

17 A. I've done that, yes.

18 Q. You've done that.

19 And did you give any consideration to putting
20 any of those kinds of seismic monitors in for my
21 homeowner?

22 A. If we had complaints and felt it was necessary,
23 we could do that at any point in time.

24 Q. Okay. Only after complaints, then?

25 A. If we had a request -- it might not necessarily

1 have to be a complaint. If we had a request, we could do
2 it.

3 Q. And you mentioned that if they -- if damage is
4 caused, well, then the mine would have to pay for the
5 damage, right?

6 A. If you can prove that the damage was done by
7 blasting, yes.

8 Q. And that's the point. If the damage is done to
9 the Fisher home, they're left to the court system and
10 litigating with Brook's lawyers about whether or not the
11 damage was caused?

12 A. More than likely.

13 Q. On the weather restrictions, sounds like the --
14 the notion is if we have a problem, then we'll think about
15 the weather restrictions at a later date?

16 A. As far as NOx fumes are concerned, yes, I think
17 so. If we have a problem, but I do not foresee a problem
18 in this operation.

19 Q. Did you take -- you're from Sheridan, right,
20 sir?

21 A. I've been here for 42-plus years.

22 Q. Did you take into consideration in any way the
23 sort of local problem of having inversions in this valley,
24 which holds all the wood smoke and all the other kinds of
25 things in?

1 A. Yes. Inversions are very common. Not only in
2 Sheridan, but in the Gillette area. So I'm very aware of
3 aversion -- inversions and problems they cause, dust from
4 operations at mines, on county roads, as well as blasting.

5 Q. Okay. But as it stands today, no restrictions
6 on blasting during inversion events?

7 A. No.

8 Q. This last series of questions about this
9 conceptual understanding about how blasting was going to
10 occur. Pretty simple, aren't they?

11 A. Would you repeat that?

12 Q. Sure. The questions I just asked you about how
13 blasting was going to happen and whether there might be
14 restrictions, pretty simple questions, right?

15 A. Pretty simple, yes.

16 Q. Pretty easy for you to answer, right?

17 A. Yes.

18 Q. Do you find odd that the Fishers had to get all
19 the way into this room to have those questions asked?

20 A. I don't know if it's odd. Nobody has approached
21 me about any concerns except for the complaints that were
22 written and submitted to DEQ, and I've read those
23 complaints and I'm very aware of them.

24 MR. GILBERTZ: Thank you. No further
25 questions.

1 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

2 Mr. Gregersen, did you have any questions at this
3 point?

4 MR. GREGERSEN: Mr. Chairman, as I
5 expected, we have no questions.

6 CHAIRMAN BAGLEY: Thank you.

7 Mr. Sutphin.

8 MR. SUTPHIN: Yes, Mr. Chairman. Thank
9 you. I have a few questions.

10 CROSS-EXAMINATION

11 Q. (BY MR. SUTPHIN) Mr. Emme, good afternoon.

12 A. Good afternoon.

13 Q. Were you in the room when Mr. Kristiansen
14 referred to you as a world renowned blasting expert?

15 A. I was.

16 Q. How did that make you feel, Mr. Emme?

17 A. I thought that was very nice comment by my
18 coworker.

19 Q. I guess I want to follow up on a few of the
20 points that have been brought up and to stay consistent
21 with the pattern. Let's start with blasting, which is a
22 lot more fun anyway.

23 Would you agree that your approach to blasting
24 plans and permits is to allow sufficient flexibility so
25 that blasting can be done efficiently and safely?

1 A. Yes.

2 Q. You testified about a couple of the issues where
3 it sounded like you don't want to overly restrict an
4 operator to, for example, only using ANFO, right?

5 A. That's true.

6 Q. Do you recall that you submitted a comment to
7 Brook during the comment and response period regarding
8 this sort of concept of having more flexibility in the --
9 in the blasting plan?

10 A. I remember making comment like that.

11 Q. So -- and I'm -- I'm maybe trying to read your
12 mind too much, but I'd like to look at one of the comments
13 that you made in the comment response period. This is
14 found in DEQ Exhibit Number 34, page 129. And, Mr. Emme,
15 you don't need to bring it up. We'll give it a shot here
16 on the screen. See if this will work.

17 I'm particularly interested in your -- well, do
18 we have Comment 13 on that page? No. I apologize. Let's
19 try 128. It's a little blurry up there too. Well,
20 obviously my notes are wrong, Mr. Emme. Let's go back to
21 129.

22 CHAIRMAN BAGLEY: 34-128?

23 Q. (BY MR. SUTPHIN) That's funny. Well, let's
24 just look, Mr. Emme, at that -- the page that we do have
25 up. Maybe I was right after all. I'm interested, I

1 guess, in comment DE-16. And Carri will blow that up for
2 us. Just the comment.

3 So first, Mr. Emme, are you DE?

4 A. Yes.

5 Q. Okay. Can you just take a look at this, but
6 just summarize for me, if you will, the nature of your
7 comment.

8 A. Their initial blasting plan in the mine plan had
9 very specific pattern sizes, amounts of stemming that they
10 were going to use, type of explosive they were going to
11 use, and a lot of their specifics were not good design
12 parameters for a shot. For instance, a 15-foot coal seam
13 drilled on a 35-by-35 pattern with a 7 and seven-eighths
14 inch drill with 4 and a half foot of stemming is not going
15 to produce a good shot, and we'd have a lot of fly rock,
16 wouldn't get good fragmentation. So I try to note some of
17 these things and coach them to not be as specific, be more
18 general in what they were going to do for their blasting
19 and to use the best practices, best products available.

20 Q. And were you satisfied with Ramaco -- or rather
21 Brook's response?

22 A. Yes.

23 Q. Now I'd like to zoom in on -- actually, to be
24 fair, it looks like -- yeah, so let's look at the
25 response. So do you -- first I guess did you actually

1 look at the Section MP.14.8.2 to confirm it had been
2 changed as Brook indicated it had?

3 A. Yes.

4 Q. Okay. And the response here says, "The text now
5 provides more open design standards for Ramaco to function
6 as necessary for safe and efficient blasting during mining
7 operations." Did you feel that was an important change?

8 A. I did.

9 Q. And if you had not agreed with that change, what
10 would you have done?

11 A. I would have made another comment requesting
12 different language, and I probably would have recommended
13 some language that they put in the permit.

14 Q. Let's talk briefly about these abandoned mines
15 that have been referenced. Isn't it true that there is a
16 setback required of 500 feet from any known existing
17 underground mines and the blasting operations?

18 A. Any surface mine that is going to do blasting
19 within 500 foot of an active or abandoned underground mine
20 has to have the specific approval of the federal
21 regulatory agency, as well as state regulatory agency that
22 regulates underground mining. That would be MSHA, Mine
23 Safety and Health Administration, for the feds, and State
24 Mine Inspector for the state.

25 Q. And so that's a commitment and a requirement

1 that Brook will have to live up to in this operation,
2 right?

3 A. That's true.

4 Q. What happens if they violate that?

5 A. They would get a violation, probably a fine.

6 Q. What limitations are in place in the Brook Mine
7 permit file and in the rules and regulations to protect
8 structures from damage from blasting?

9 A. There are specifics to the rules and regulations
10 that the Brook Mine has said that they will comply with to
11 protect structures, and there are limits on how much
12 ground vibration we can -- the mine can produce at a
13 nearby structure, the maximum air blast allowed at a
14 nearby structure, the mine cannot throw fly rock off the
15 permit or more than half the distance of any occupied
16 structure. Could be their own structure. So the rules
17 and regulations protect the public pretty well.

18 Q. Speaking of protecting the public, you mentioned
19 earlier in your testimony that you don't believe that any
20 recreational users will be at risk of harm from blasting
21 operations, right?

22 A. That's true.

23 Q. And I think -- and you may not have said it this
24 way, but I certainly came away thinking you were talking
25 about steps that will be taken to make sure that no one

1 wanders around in an active blasting area. Fair?

2 A. That's fair. That's what any certified blaster
3 has to do before he initiates a shot.

4 Q. Do you know what the blasting plan says about
5 steps that will be taken to prevent unauthorized access
6 during blasting?

7 A. The blasting plan, again is pretty generic. But
8 all blasts will be under the supervision of a certified
9 blaster, and part of his designated responsibility is to
10 make sure that all access points to the blast area are
11 barricaded so no one gets into the blast area during the
12 shot or before the all clear is given.

13 Q. Let's take a quick look at what the mine plan in
14 this permit file says about unauthorized access control.
15 Okay? This is on DEQ Exhibit 12-081. And Carri has
16 already blown up a portion of the bottom of that page. Do
17 you see that there?

18 A. Yes.

19 Q. And -- and we don't need to spend a whole lot of
20 time on this piece, but it -- this is the beginning of a
21 list of steps that will be taken to control unauthorized
22 access; is that fair?

23 A. Yes.

24 Q. Okay. Let's look at the very next page, which,
25 of course, is 082, still in DEQ Exhibit 12. And let's

1 just blow up the top part of that list. So I know we left
2 one piece on the other page, but, Mr. Emme, in your
3 experience and in your opinion, do you believe that these
4 are sufficient steps to prevent unauthorized access during
5 blasting operation?

6 A. Yes.

7 Q. Thank you. Does DEQ monitor and force --
8 monitor and enforce the blasting program?

9 A. Yes.

10 Q. What happens if DEQ is made aware of some
11 violation of the blasting rules and regs or the permit
12 conditions?

13 A. We write a violation, oftentimes accompanied by
14 a fine.

15 Q. Did you say you can fine the company?

16 A. Yes.

17 Q. Can you also stop work?

18 A. Yes.

19 Q. Have you ever had to do that?

20 A. In certain parts of a mine we've shut down
21 operations at a portion of a pit, yes.

22 Q. Are you aware that Big Horn Coal blasted in the
23 area of the proposed Brook Mine for its historic surface
24 mining operations?

25 A. Yes.

1 Q. Do you have a personal knowledge about any of
2 the blasting procedures that they used?

3 A. I don't know how much personal knowledge I have,
4 but I knew a lot of the blasters at Big Horn worked for
5 the same company that owned Big Horn years ago.

6 Q. Do you know how the blasting that Big Horn Coal
7 conducted historically would compare in magnitude to the
8 blasting that Brook is proposing?

9 A. Size of shots may be similar. But probably
10 smaller, because I got that they're going to bring an
11 electric shovel in to remove overburden. And, again, it's
12 going to be sporadic blasting. They're going to open one
13 box cut, shoot that overburden, remove it, shoot the coal,
14 remove it, and move their auger in and start the auger
15 mine.

16 Q. Let me make sure we're clear, because you've --
17 we might have crossed our wires there. You expect that
18 the Brook Mine blasting will use smaller shots, true?

19 A. I do anticipate that.

20 Q. And you also would -- I think what you've said
21 is that the frequency of Brook's blasting will be less
22 frequent than -- than what Big Horn Coal did historically,
23 true?

24 A. Yes.

25 Q. Okay. Isn't it true that many, if not all, of

1 the same houses and structures and buildings that have
2 been here for a hundred years were also there when Big
3 Horn Coal was doing its blasting?

4 A. Many of them. There's probably a few new ones
5 since Big Horn shut down, but most of them.

6 Q. I'm sad to say I'm probably done asking you
7 about blasting, because I like that subject. But let's
8 briefly cover a few issues -- actually, we're not done on
9 blasting. I apologize.

10 You heard some questions from Mr. Gilbertz about
11 some expensive AML costs to repair some subsidence. Do
12 you remember those questions?

13 A. I do.

14 Q. And, in fact, I don't remember the number he
15 said, but it seemed like a pretty big number to repair
16 just two sinkholes. Do you remember that?

17 A. Yes.

18 Q. So those abandoned mine lands -- I mean, by
19 their very definition, those are old mines, right?

20 A. Very old.

21 Q. And do you know what I mean when I say "prelaw"?

22 A. Yes.

23 Q. What does that mean to you?

24 A. Pre-SMCRA.

25 Q. Okay. So the fact that AML is dealing with this

1 situation means that there's -- there just ain't nobody
2 around to pay to repair those old mines; is that fair?

3 A. That's fair.

4 Q. He also said something -- or you, in visiting
5 with him, said that the bond calculation doesn't consider
6 reclaiming old mine subsidence that would have been caused
7 by Brook's blasting, right?

8 A. That's true.

9 Q. But isn't it true that in year zero Brook Mine
10 will do zero blasting?

11 A. That's true.

12 Q. Okay. So would you expect the bond to include
13 an amount to possibly repair blast-caused subsidence when
14 there's no blasting taking place?

15 A. No.

16 Q. I think now we can talk more about the bonding.
17 Did you review the objections in -- to the Brook
18 Mine as they relate to the bonding amount?

19 A. Yes.

20 Q. And to be very specific, we're talking about
21 reclamation bonding, right?

22 A. Yes. That's right.

23 Q. Okay. You've already told us about what the --
24 the proposed bond calculation is, and can you remind me
25 roughly what that amount was?

1 A. \$372,000.

2 Q. Did you specifically review the objection letter
3 filed by Powder River Basin Resource Council with respect
4 to the reclamation bond amount?

5 A. Yes.

6 Q. So I want to take a look at that and ask you a
7 few questions. Okay?

8 A. Okay.

9 Q. So we're going to take a look at Powder River
10 Basin Resource Council Exhibit Number 1. Mr. Emme, we
11 just handed you a hard copy of that. Okay?

12 A. Yes.

13 Q. Will you please turn to page 8 of that objection
14 letter. The objection regarding the reclamation bond
15 begins at the bottom of page 8. Do you see that?

16 A. I do.

17 Q. Do you know who prepared these bond-related
18 objections for Powder River Basin Resource Council?

19 A. I do not.

20 Q. Have you ever heard of a guy named Stu Levit?

21 A. I actually read his deposition.

22 Q. Okay. Have you ever talked to Stu Levit?

23 A. No.

24 Q. Okay. So having read his deposition, do you
25 understand that Mr. Levit was, in fact, the one

1 responsible for drafting these objections -- or this
2 portion of the PRBRC objection letter?

3 A. I did not know that he drafted this objection
4 letter.

5 Q. Okay. I think -- you just said you never talked
6 to him; is that right?

7 A. Never talked to him.

8 Q. Okay. So you probably don't know why he's not
9 listed as a witness to testify here?

10 A. I don't, but I can speculate.

11 MS. ANDERSON: Objection.

12 We don't want you to speculate.

13 Q. (BY MR. SUTPHIN) I was just going to say that
14 too. We don't want you to speculate.

15 Let's take a look at the second -- or last
16 paragraph on page 8. Do you see where it says "Based on
17 our review of the reclamation bond estimate it is too low
18 to protect the public interest." Do you agree with that
19 opinion?

20 A. No.

21 Q. In fact, I think you said that the bond estimate
22 is robust, true?

23 A. True.

24 Q. How much would you have told Brook to bond if
25 they had not submitted their own proposal to you?

1 A. I'd probably have reviewed it and gone ahead and
2 just stuck with their number, like pretty much what we
3 did.

4 Q. But I think you said if you did the calculations
5 independently, you would have come in at later number,
6 right?

7 A. That's true.

8 Q. What was that number?

9 A. I don't have a specific number, but I can say
10 that topsoil costs were probably 40 percent higher than
11 what I would have used.

12 Q. I appreciate that.

13 Let's now turn to page 9 of the Powder River
14 Basin Exhibit 1. I'm very interested in the last
15 paragraph on page 9. Here it says Costs to Restore
16 Hydrologic Conditions. "The bond fails to include
17 sufficient funds to carry out all operations needed to
18 restore to pre-mine hydrologic conditions within the
19 permit area -- and in any offsite areas that are
20 impacted." Isn't it true that the only thing Brook is
21 proposing to do in year zero is scrape the topsoil off of
22 approximately 30.8 acres?

23 A. Strip topsoil and building a couple of
24 buildings.

25 Q. Would you expect, in your experience with

1 bonding, that it would require or need to include anything
2 about the hydrologic conditions given that amount of work?

3 A. Not for that minimal surface impact, no.

4 Q. Let's turn the page to page 10. The first
5 paragraph refers to independent reclamation design. Do
6 you see that?

7 A. Yes.

8 Q. Bear with us. We're going to bring it up on the
9 screen here. What -- what is generally meant by
10 independent reclamation design in your bond formula?

11 A. In a large surface mine, it would be for some
12 independent mining construction firm to design the
13 reclamation, backfill the pit, bring it to a state where
14 we had three grade nonerosive slopes and reclaim as close
15 as possible to approximately original contour.

16 Q. Would you expect an independent reclamation
17 design for year zero in a mine that is only proposing to
18 disturb 30.8 acres of surface?

19 A. There's no way that you would hire an
20 independent design firm to design any sort of reclamation
21 for a mine that's got 30.8 acres of surface disturbance.

22 Q. So given that answer, I think I know what you're
23 going to say about this, but what PRBRC claim would be an
24 appropriate amount for an independent reclamation design
25 for the year zero of the Brook Mine?

1 A. \$125,000.

2 Q. And what is your opinion of that number?

3 A. Well, I think I could do it in about an hour.

4 Q. So I -- I appreciate your answer, Mr. Emme, but
5 doesn't really translate super great on the record.

6 A. Okay. You can easily design this for a thousand
7 dollars.

8 Q. Okay. And I apologize, Mr. Emme, I'm asking you
9 these questions, but the fact of the matter is, based on
10 the testimony that we got from Mr. Levit at his
11 deposition, he was the one who did these numbers, and he
12 won't be here, so I don't get to ask him these questions.
13 So I appreciate your patience with me as I try to clarify
14 what I believe -- well, I won't say what I was about to
15 say.

16 So overall, of all the objections, are there any
17 objections regarding the proposed bond amount that you
18 feel deserve further discussion?

19 A. No.

20 Q. What happens -- assuming this permit is issued,
21 what happens when we get to what I'll call year one, the
22 second year of operations? Will Brook be required to
23 submit additional bonding?

24 A. They will submit an annual report. It will
25 document the disturbance on the ground at that time and

1 projected disturbance for the upcoming year, and they will
2 have to bond or the worst-case scenario, which, obviously,
3 would be the end of the next year, and then we'll have to
4 review that bond and make any adjustments we deem
5 necessary.

6 Q. Will the public have an opportunity to review
7 those -- those bond proposals for the next year of
8 operation?

9 A. No.

10 Q. Will there be any opportunity for someone to
11 question whether those bonds are high enough?

12 A. The public can come in and look at the permit at
13 any point in time.

14 Q. And is it fair to say that the reclamation bond
15 is cumulative? In other words, each year it will be
16 increased commensurate with the amount of disturbance
17 that's projected?

18 A. Generally, yes.

19 Q. How does one like Brook Mine go about getting
20 their bond money released?

21 A. They have to backfill the pit, topsoil, seed,
22 and then go through an extensive bond release process.

23 Q. Does the public get to weigh in on whether or
24 not the bond should be released?

25 A. There is a public comment period for that also.

1 MR. SUTPHIN: Okay. I don't have any other
2 questions, Mr. Emme. Thank you so much.

3 CHAIRMAN BAGLEY: Thank you, Mr. Sutphin.

4 Does the council have any questions? Tim's not
5 here. We'll start with Megan.

6 COUNCIL MEMBER DEGENFELDER: I don't have
7 any questions. Thank you.

8 CHAIRMAN BAGLEY: Meghan.

9 COUNCIL MEMBER LALLY: I have two
10 questions.

11 EXAMINATION

12 Q. (BY COUNCIL MEMBER LALLY) I read the
13 regulations that the notice has to be between 30 and
14 60 days for blasting. Does it have to list exactly what
15 hour and time, or is it more broad than that?

16 A. Most operations are going to pick the widest
17 window they can, Sunday through Saturday, sunrise to
18 sunset. We do have some operators that specify a window,
19 like I said, noon to maybe 4 p.m. Most operators want to
20 give themselves that widest window in case a piece of
21 equipment breaks down. They may typically shoot at
22 lunchtime. But then if a drill breaks down and they don't
23 get the shot off until 5:00 in the afternoon, they want to
24 give themselves that wide window.

25 Q. So mostly they'll say it's -- we're going to

1 blast on January 1 from sunrise to sunset? That would be
2 what the notice would say?

3 A. It would say in the period between January 1,
4 2017, December 31, 2017, we will shoot Sunday through
5 Saturday, sunrise to sunset.

6 Q. Okay. Then how does that work with the 30-day
7 notice --

8 A. They can't --

9 Q. -- to --

10 A. Excuse me.

11 Q. -- to landowners?

12 Say if they're only going to blast two days a
13 year, theoretically, and they have to give public notice,
14 but if they're saying we're going to do it within the next
15 year, that's not really noticing the public as to when
16 they're going to be blasting.

17 A. Because this operation's a little bit different
18 than a mine in, say, the Powder River Basin shoots every
19 day --

20 Q. Right.

21 A. -- you know, the operator may decide to call up
22 people and say our blasting is going to commence June 1st
23 and it should take us about six weeks of blasting to, you
24 know, effectively shoot and excavate the first box cut.

25 Q. Okay. And then second one -- and I think you've

1 already answered this, but is weekend blasting normal? It
2 sounds like they just sort of designate they're going to
3 blast all the time and --

4 A. At the coal mines -- bigger coal mines of the
5 state, you know, Kemmerer, Rock Springs, Powder River
6 Basin, up into the Montana in the Powder River Basin, they
7 shoot daily, and they shoot multiple times daily because
8 of their production needs. So, yes, they shoot every day
9 of the week, they shoot on holidays. That's why they want
10 to give themselves the widest window they can.

11 Q. And would it be reasonable -- and you may not
12 know the answer to this -- in a case like this, where it's
13 just such a short blasting period, to put some
14 restrictions in considering the number of houses that are
15 nearby?

16 A. It is possible, yes.

17 COUNCIL MEMBER LALLY: Thank you.

18 CHAIRMAN BAGLEY: Nick?

19 COUNCIL MEMBER AGOPIAN: Just a follow-up
20 on Meghan's question.

21 EXAMINATION

22 Q. (BY COUNCIL MEMBER AGOPIAN) If you were to
23 decide that restrictions were necessary based on the
24 objections or comments that have been received, would
25 you -- would that fall within -- is that something that

1 put in conditions --

2 THE REPORTER: I'm sorry. I can't hear.

3 Q. (BY COUNCIL MEMBER AGOPIAN) Would that fall
4 within the window of things that can -- that can be
5 covered in conditions of approval on the final permit?

6 A. Yes. We can condition the permit with
7 restricted, you know, whatever days, whatever times we
8 felt necessary.

9 COUNCIL MEMBER AGOPIAN: Thank you.

10 CHAIRMAN BAGLEY: Deb?

11 COUNCIL MEMBER BAUMER: No questions.

12 CHAIRMAN BAGLEY: I actually have a couple
13 of questions.

14 EXAMINATION

15 Q. (BY CHAIRMAN BAGLEY) So I'm not familiar with
16 what would need to be blasted for this mine. I mean, we
17 heard earlier about highwall mining and they -- the coal
18 itself is removed by like a some kind of drilling
19 operation that goes in and kind of -- it didn't seem like
20 there was any blasting involved with that. Could you
21 explain to me where the blasting comes in for this
22 particular mine.

23 A. Okay. When they excavate the first box cut, I
24 think it's been referred to as a trench at times in the
25 commentary. That native overburden would have to be

1 drilled and shot to be effectively, you know, removed,
2 scraper, front-end loader, whatever. Once they get that
3 first box cut opened up, that first chunk of coal that
4 they've exposed, they drill and shoot that. Once they get
5 that excavated, then they come in with the highwall miner,
6 which is essentially like an underground miner. You know,
7 most of them have a big auger head on them, and they just
8 start driving that into their drifts after they've got
9 that box cut open. And during that point in time there's
10 no blasting.

11 Q. So the blasting occurs, really, when they're
12 getting the box cut opened and prepared, and then there's
13 this time when they're doing the actual highwall mining,
14 whether -- there is no blasting on that particular
15 location?

16 A. That's right.

17 Q. About how long does -- would it take to open up
18 one of these box cuts?

19 A. You know, it's going to be dependent on what
20 type of equipment they use to open it. Some of their box
21 cuts are bigger than others. Again, I don't have a good
22 number on yardage. You know, it might just be a few weeks
23 to open that first box cut.

24 Q. Uh-huh.

25 A. Some of the longer cuts could be, you know, a

1 few months.

2 Q. So it's not like -- it's not going to be like
3 big open pit mines where daily blasting is how they get
4 coal out.

5 A. Right.

6 Q. It's just open up the box cut. Okay.

7 A. That's correct.

8 Q. So you said at one point that you did not
9 consider this orange cloud issue with the NOx to be a
10 problem for this site. Could you explain to me why?

11 A. Generally, the only shots that we see NOx
12 produced from in this part of the world are the cast
13 shots. Now, occasionally you'll see a shot that maybe
14 90 percent of the bench was dry and they used ANFO, and a
15 few holes might get wet, start to break down that ammonium
16 nitrate, and that portion of the shot might produce a
17 little bit of color. Coal is generally more competent
18 than the overburden we have, so when you shoot coal, in my
19 career, I have seen NOx produced from a coal shot one
20 time. It's almost unheard of. And in that case, it was
21 because they use ANFO and the product got wet.

22 These small shots they're usually loaded and
23 shot the same day, doesn't give the powder long to break
24 down. They're not as energetic as a cast shot. And the
25 energetic shots to form the overburden, and that's the big

1 reason we get NOx from cast blasting.

2 Q. So most of the times you see that is with this
3 cast blasting where you're trying to actually completely
4 move the -- the rock or the whatever it is you're
5 blasting, completely move it without having to get any
6 shovels in. We can just put enough energy into it that it
7 moves itself to where you want it.

8 A. The cast blasting, they've actually got a big
9 pit void that they're moving the dirt into. In this case,
10 open box, there's no pit void to move any dirt to. You
11 know, they take that out of the pit, put it in an
12 overburden stockpile, they mine the coal, do all their
13 auger mining, then they backfill the pit.

14 Q. So they're blasting really in a way to break
15 it up so that they can get in and, in essence, shovel it
16 out?

17 A. Yeah, because, you know, front-end loaders,
18 scrapers, small shovel, whatever your excavation
19 equipment, they don't -- they don't produce well in unshot
20 rock.

21 CHAIRMAN BAGLEY: Okay. Okay. Thank you.

22 THE WITNESS: Uh-huh.

23 CHAIRMAN BAGLEY: Mr. LaRock, redirect.

24 MR. LAROCK: Just three questions on
25 redirect.

1 REDIRECT EXAMINATION

2 Q. (BY MR. LAROCK) First, if the Fishers are
3 worried about the integrity of their structures, can they
4 ask for a pre-blast survey?

5 A. If they live within a half mile of the permit,
6 the operator has to do the pre-blast survey.

7 Q. Okay. Second, changing gears, talking about the
8 orange cloud. Besides good-heartedness and wanting to
9 make sure the air stays clean, is there any reason that a
10 mine would want to use waterproof shots in watery area?

11 A. James, would you repeat that, please?

12 Q. Sure. Besides its general good-heartedness and
13 its desire to keep pollution out of the air, is there a
14 practical reason the mine is going to use water-resistant
15 shots in wet dirt?

16 A. Yes. Ammonium nitrate-fuel oil is the primary
17 blasting agent used in North America. But ammonium
18 nitrate prills break down. They're hygroscopic, they
19 absorb moisture. They'll absorb moisture from a hole you
20 think is dry, from the borehole walls, because a lot of
21 our overburden has inherent moisture in it that the rock
22 doesn't give up. So if you load the ANFO in a dry hole,
23 sometimes it still gets NOx.

24 So, you know, operators often use a mixture of
25 ammonium nitrate and a water-resistant emulsion to get a

1 waterproof product that is not going to break down if it
2 gets wet.

3 Q. And final question, just to clarify. Does a
4 bond have to be in place in order for a permit application
5 to be technically adequate?

6 A. No.

7 MR. LAROCK: No further questions.

8 CHAIRMAN BAGLEY: All right. Thank you,
9 Mr. Emme.

10 THE WITNESS: Thank you.

11 CHAIRMAN BAGLEY: Do you have any more
12 witnesses, Mr. Kuhlmann?

13 MR. KUHLMANN: Mr. Hearing Officer, DEQ
14 does not have any additional witnesses to call in its case
15 in chief, so we rest our case in chief and reserve ability
16 to provide rebuttal, if necessary.

17 CHAIRMAN BAGLEY: All right. Thank you.
18 So I would like to get -- keep moving ahead here.

19 Mr. Pope or Mr. Sutphin, would you please call
20 your first witness.

21 MR. SUTPHIN: Thank you, Dr. Bagley. Brook
22 Mine will call Mr. Jeff Barron as its first witness.

23 (Witness sworn.)

24

25

1 JEFF BARRON,

2 called for examination by Brook Mine, being first duly

3 sworn, testified as follows:

4 DIRECT EXAMINATION

5 Q. (BY MR. SUTPHIN) Good afternoon, Mr. Barron.

6 How are you today?

7 A. I am doing grand. Thank you for asking.

8 Q. Mr. Barron, do you have your cell phone in your
9 pocket?

10 A. I do.

11 Q. Would you please put it on airplane mode?

12 A. I can do that. It's done.

13 Q. Thank you.

14 Mr. Barron, would you please introduce yourself
15 to the members of the Environmental Quality Council.

16 A. I would love to. I'm Jeff Barron. I work for
17 Western Water Consultants, professional engineer, and I'm
18 glad to be here.

19 Q. Where do you live, Mr. Barron?

20 A. I live in the town of Ranchester.

21 Q. How long have you lived in Sheridan County?

22 A. Moved here in 2005.

23 Q. How close do you live to the proposed Brook
24 Mine?

25 A. I'm well within six miles.

1 Q. Are you concerned about trying to keep Sheridan
2 County safe?

3 A. Absolutely.

4 Q. Are you involved in the community in any way?

5 A. Actually involved in the community in several
6 ways. I serve on the Ranchester town council as a
7 councilman. I have served several years on the Tongue
8 River Fire Department, which the residents and the mine
9 are in that district. And then I serve on the Marion
10 Daycare board.

11 Q. Would you do anything -- or at least do anything
12 in relation to the Brook Mine permit and knowingly destroy
13 any part of Sheridan County?

14 A. Absolutely not.

15 Q. You mentioned that you are a professional
16 engineer. And I know we heard some testimony about that
17 from other witnesses. Does the fact that you are a
18 professional engineer influence the way that you have
19 treated the Brook Mine permit in any way?

20 A. It does. My license comes from state statute
21 under the public health and safety clause. So my primary
22 duty outside of any other duties is beholden to the public
23 health and safety.

24 Q. Does that fact affect the decisions that you're
25 willing to make to try and to get the Brook Mine

1 permitted?

2 A. It does.

3 Q. How so?

4 A. Chief among my duties, outside of employment, is
5 the protection of the public and health and safety. And
6 so beyond above every single one of those, I hold that
7 paramount.

8 Q. What is your educational background?

9 A. I received my bachelor's of science degree from
10 Montana State University in civil engineering. There is a
11 facet of that called Bioresource Engineering, which
12 focuses on environmental issues.

13 Q. What do you mean by facet?

14 A. So inside the civil engineering program, the
15 Bioresource Engineering Program deals more with geology,
16 geotechnical issues, water, hydrology, hydrogeology, as
17 opposed to designing a high-rise building.

18 Q. How has that emphasis on bioresources -- well,
19 has that emphasis on bioresources helped you in
20 preparation of the Brook Mine permit?

21 A. It has. It's had a unique qualification for
22 preparing this type of permit application.

23 Q. How so?

24 A. Many of the things that I learned in my
25 undergrad are part of the permit application. We deal

1 with hydrogeology in a permit application, as you all
2 heard. We deal with precipitation. We deal with geology.
3 We deal with vegetation. All of those things that were
4 part of the focus of my undergrad are also the focus of
5 this permit application.

6 Q. What is your engineering background and
7 experience?

8 A. I have worked with Western Water since 2005. In
9 2009 I received my professional engineering license. And
10 I hold that license in two states, both in Wyoming and in
11 Montana.

12 Q. During the time that you've worked as an
13 engineer, have you worked on other mine permits?

14 A. Yes. When I began working with Western Water
15 Consultants, day one was working with Black Thunder permit
16 application.

17 Q. And how many mining permits would you say you've
18 worked on in your time as engineer?

19 A. I've worked on dozens.

20 Q. And of those mine permits -- I mean, just so
21 that we're clear, are we talking about new permits or
22 renewals? Can you please explain to the council what your
23 experience has been?

24 A. So Brook Mine is the first new permit
25 application in several decades, so I've not worked on any

1 new permit applications. However, I've been involved with
2 amendment applications, I've been involved with mergers of
3 applications from one mine to another, merging those
4 documents. I've also worked with minor modifications to
5 existing permit applications, major modifications to
6 permit applications, even something as simple as
7 permitting a single sediment pond within a permit
8 application.

9 Q. How long has Brook Mine been working on this
10 permit application?

11 A. We began our work in May of 2013.

12 Q. And let's be really clear. When you say "we,"
13 what do you mean?

14 A. Western Water Consultants began work on the
15 application 2013. However, Brook Mine was operating and
16 preparing for a permit application prior to our
17 involvement.

18 Q. You were here to listen to Mr. Kristiansen's
19 testimony, right?

20 A. I was, yes.

21 Q. And did you hear him talk about the permit
22 process overview just generally?

23 A. I did, yes.

24 Q. Well, did you agree with Mr. Kristiansen on how
25 the process works?

1 A. I do, yes.

2 Q. Would you add anything that you think might help
3 the council?

4 A. No, I think Bj did an excellent job in
5 describing the process.

6 Q. Would you describe the permitting process as
7 dynamic?

8 A. Absolutely dynamic.

9 Q. What does that meant to you, I guess, to be
10 clear?

11 A. So the permitting process, from inception and
12 really until final bond release is completed, changes,
13 additions and subtractions, both during the
14 pre-application of the phase, during the application
15 phase, even after approval and the amendment phase, the
16 document continues to change to adapt to conditions on the
17 ground or the economic conditions that might drive a
18 permit application. And we do our best to keep the permit
19 document current with DEQ, both to provide for the
20 operator and give DEQ an enforceable document to keep the
21 public safe.

22 Q. Has that dynamic nature been -- have you
23 observed that in all the permits you've worked on?

24 A. I have, yes.

25 Q. Would you say that the permit process involves

1 collaboration between the applicant and the Department of
2 Environmental Quality, Land Quality Division?

3 A. In my professional opinion it does not work
4 without that collaboration.

5 Q. Why do you think that is?

6 A. It's important along every step of the way to
7 engage the agency that's overseeing the application to
8 ensure that they get the document that they're looking for
9 and we prepare a document that protects the safety and
10 health of the residents of the state.

11 Q. Where does an engineer involved in permit
12 applications like these look for direction on what is
13 required for permit issuance?

14 A. Primarily the first step for engineers is the
15 DEQ guidance documents. Unlike other states, DEQ has done
16 an excellent job in the state of Wyoming preparing
17 documents that guide the operator in the preparation of a
18 permit application that is this big. It's not as simple
19 as filling out one-page form. And so to help operators
20 and add some uniformity to the process, they prepared
21 several guidance documents. Those guidance documents are
22 guidelines, they were not hard and fast rules. But
23 they're promulgated by the rules and regulations. So
24 what's in those documents takes away from the regulations
25 and adds some clarity for ease of preparation of the

1 document that you see before you today.

2 Q. Other than the guidance documents, where else
3 would an engineer like yourself look for direction on how
4 to get a permit?

5 A. We would also look at the state rules and
6 regulations.

7 Q. Anything else?

8 A. We look -- above that, would be the state
9 statute themselves, the law.

10 Q. Did you do all of those things as part of the
11 Brook Mine permit application?

12 A. I did, yes.

13 Q. How about the other permit applications you've
14 worked on?

15 A. Absolutely, yes.

16 Q. Okay. Let's move and talk a little bit about
17 highwall mining. It occurred to me from some of the
18 questions we heard over the few days that we didn't really
19 start with a good explanation of highwall mining. So I'd
20 like you to take a look at Powder River Basin Resource
21 Council Exhibit 84.

22 Now, do you recognize this document, Mr. Barron?
23 You know what, don't answer that. It doesn't really
24 matter. This is for demonstrative purposes. Let's look
25 at page 16. Okay?

1 A. Okay.

2 Q. Getting there. Okay. Let's blow that little
3 diagram up. That picture. Have you seen this figure
4 before?

5 A. I have seen that figure before.

6 Q. Okay. Now, first of all, what does this figure
7 represent?

8 A. This figure represents a cross-section of a
9 highwall miner that is mining a coal seam with overburden,
10 and you can see a launch vehicle on the left-hand side of
11 the picture.

12 Q. And to be clear, this is a figure in -- you
13 know, that's shown and is accredited to Caterpillar. Do
14 you see that?

15 A. I do see that, yes.

16 Q. Okay. Is this identical to the machine that
17 Brook will be using for the proposed Brook Mine?

18 A. It's similar, but it is not identical.

19 Q. Okay. So can you just briefly describe the
20 highwall mining process for the council. And if you need
21 to stand up, please go ahead.

22 A. So the highwall mining process starts with
23 you've heard it called a trench or a pit or a box cut
24 that exposes the coal seam. And then the highwall miner
25 pushes forward a machine with a rotating drum with teeth

1 on it. Think of a rolling pin with teeth that claw away
2 at the coal seam. And then in the ADDCAR system, it's a
3 set of conveyors. In this Caterpillar system there's a
4 tube with a screw in it that pulls the coal back to the
5 launch vehicle and then after it gets to its full extent,
6 it's retrieved. The machine moves down the pit and goes
7 back into the seam again.

8 Q. Just to be clear, Mr. Barron, I notice in this
9 figure -- I realize this is just demonstrative -- but we
10 can see trees and things behind the machine. You see
11 that?

12 A. Yes.

13 Q. Is that the situation you would expect during
14 operations at Brook Mine?

15 A. It is. The overburden above the highwall miner
16 is undisturbed. It stays the native ground, the native
17 topography with even the native vegetation.

18 Q. Okay. Now I'd like to look at a different
19 exhibit to help sort of flesh out the -- some of the
20 terminology we've heard throughout the hearing. Let's
21 look at DEQ Exhibit 12-121.

22 All right, Mr. Barron. Can you please explain
23 to the council what we're looking at here?

24 A. So this is a figure that's in the mine plan.
25 And as discussed before, the mine plan has some

1 generalities to describe to the reader just in general
2 what is going on and what something would look like. So
3 you saw a cross-section of the highwall miner, and then
4 this is looking at plan, you are facing right into the
5 open box cut. So we're in the box cut looking at the
6 highwall.

7 And this is describing just in general that the
8 drifts that have been -- they've been called that in this
9 hearing -- are spaced on somewhat regular intervals. And
10 between each drift is left a web, a supporting wall. Just
11 like in this room, we've got -- we're in the drift, and
12 we've got two walls that are the webs between them, and we
13 occupy this space.

14 And then it shows this larger web, which is
15 called a barrier pillar. And it describes that this
16 resides between a series of webs. Its purpose is not for
17 protection, but this figure is just showing the general
18 layout of what you would expect to see if you were looking
19 in the highwall.

20 Q. So, Mr. Barron, roughly how far below the
21 surface will these webs and pillars and drifts be for the
22 proposed Brook Mine?

23 A. They can be in tens of feet to hundreds of feet
24 below the ground. And you heard earlier how the coal is
25 tipped and it gets deeper as we move across the mine

1 permit area.

2 Q. By looking at this generalized schematic, can
3 you tell me how wide the barrier pillar will be in, say,
4 for example trench 1?

5 A. No.

6 Q. What about the coal web width? Can you tell me
7 that based on this schematic?

8 A. For trench 1, no, I can't tell you the exact
9 width of the pillar.

10 Q. So to put it another way, is this figure that we
11 see here an engineered drawing that the operator will use
12 to make its cuts into the coal seam exactly like this?

13 A. No, not at all.

14 Q. So why did you include this in the mine plan?

15 A. Well, it's important in a permit application,
16 when dealing with the regulatory body, and the public that
17 gets to view it, to give them a picture of what this does
18 kind of look like so they don't get lost in the words or
19 some other narrative. So we included this to add it to
20 the permit application.

21 Q. Let's talk a little bit about subsidence. Okay?

22 A. Okay.

23 Q. Have you read the objection letters in --
24 regarding the Brook Mine permit?

25 A. I have.

1 Q. Were there objections regarding subsidence?

2 A. Yes.

3 Q. What is your general understanding of the --
4 subsidence-related objections?

5 A. In general, that the mining operation would
6 cause subsidence in old mine works, and that the highwall
7 mining itself would generate subsidence on the land
8 surface, causing impacts to the surface and to the
9 underground area.

10 Q. Do you believe that the mine permit sufficiently
11 addresses these issues?

12 A. I do.

13 Q. Did DEQ accept your subsidence-related terms and
14 commitments entirely in the first round of comments and
15 responses?

16 A. In the first round, no, they did not.

17 Q. What about your baseline assessment of geology
18 in Appendix D5? Did they accept that entirely in Round 1?

19 A. No. They had comments on the Appendix D5.

20 Q. We heard Mr. Kristiansen go through one example
21 of a comment response. I'd like to show you another
22 example. Let's look at DEQ Exhibit Number 34-014. Do you
23 recognize this? I know I didn't show you the first page,
24 but do you know what we're looking at here, Mr. Barron?

25 A. We're looking at a compiled view of comments and

1 responses.

2 Q. Is this a document that you prepared?

3 A. Yes.

4 Q. And what was it based on?

5 A. It was based on several rounds of comments we
6 compiled into one document.

7 Q. Does it also include Brook's responses?

8 A. It -- I don't know if it includes responses,
9 though.

10 Q. Well, I'll show you in just a minute.

11 A. Okay.

12 Q. Let's look at Comment BJ Number 14. Okay?

13 A. Okay.

14 Q. It's a little tough because it spills over to
15 the next page, but do you see what Carri's just blown up?

16 A. I do sees that, yes.

17 Q. Just to set the stage, what is -- what part of
18 the permit file is Comment BJ 14 referring to?

19 A. It's a -- it's commented on Appendix D5. It's
20 in the geology section of the permit application.

21 Q. Okay. Now let's look at the very next page, DEQ
22 34-015. So first, Mr. Barron, how about now? Do you
23 understand -- do you know whether or not this exhibit
24 includes Brook's responses to the comments?

25 A. Appears to be, yes.

1 Q. Okay. So let's blow up the rest of Bj's Comment
2 14. We don't need to read this whole thing, but,
3 Mr. Barron, please take a look at that and can you just
4 summarize generally what -- what Comment 14 was about?

5 A. Comment 14 was about the level of sampling and
6 testing for strength parameters within the geologic area
7 of the permit application.

8 Q. Does that have anything to do with subsidence,
9 in your experience?

10 A. It does.

11 Q. And what did you think of this comment when you
12 received it?

13 A. After I received that comment, it was apparent
14 that we needed to address the comments and create a
15 mechanism to supply some additional data to DEQ.

16 Q. And what kind of additional data was -- or --
17 well, I guess, yeah, data -- was DEQ interested in based
18 on this comment?

19 A. They were interested in more specific strength
20 parameters tied to specific mine areas.

21 Q. Okay. Now let's take a quick look at Brook's
22 response. So what was your response to BJ 14 comment?

23 A. We updated the appropriate section in D5.

24 Q. Okay. What section is that exactly?

25 A. It is Section D5.3.3.2.

1 Q. Okay. Let's take a quick look at DEQ
2 Exhibit 5-017. So first, Mr. Barron, what is Appendix D5?

3 A. D5 deals with overburden and geology within the
4 permit area.

5 Q. Okay. We're just going to blow up the first
6 piece here just for a second. So is this the part of
7 Exhibit -- or rather Appendix D5 that you referred to in
8 your comment response?

9 A. It is.

10 Q. Okay. So let's turn to page DEQ 5-018.
11 Mr. Barron, would it help if we gave you -- that's just a
12 lot of exhibits to go back and forth. I think we'll --
13 are you okay with us still using the screen?

14 A. It works for me, yes.

15 Q. Okay. So let's blow up the first paragraph on
16 that page.

17 MR. SUTPHIN: And, actually -- Carri, I
18 apologize. Let's pull up the first two paragraphs on that
19 page.

20 Q. (BY MR. SUTPHIN) Mr. Barron, is this what
21 you would refer to as the narrative portion of the
22 Appendix D5?

23 A. Yes, it is.

24 Q. And can you just summarize -- I mean, you can
25 certainly take a look here, and so can the council -- but

1 can you just summarize this language in the narrative?

2 A. Yeah. This language discusses the sampling
3 efforts in the baseline, and also provides for a
4 commitment to supply the MSHA ground control plan to DEQ.

5 Q. And at the beginning of this it mentions -- and
6 I'm trying to find my place exactly. Maybe the third
7 sentence down. These samples will not represent all
8 conditions encountered by the continuous miner. Do you
9 see that?

10 A. Yes.

11 Q. Do you believe that statement is true?

12 A. Yes.

13 Q. So how do you know what you're going to do about
14 subsidence or whether subsidence is going to occur if you
15 don't know the conditions, interburden thickness,
16 overburden, et cetera, that you're going to encounter?

17 A. So we will study the exact areas. When we begin
18 mining in a specific highwall mining area and specifically
19 a panel that is shooting off of a highwall we will study
20 and get samples for that area and it will be designed
21 appropriately for the operation of the mine.

22 Q. This narrative mentions the MSHA ground control
23 plan. Do you see that?

24 A. I do see that, yes.

25 Q. What is the MSHA ground control plan?

1 A. The MSHA ground control plan is the document
2 that MSHA uses to verify the safety of the miners who are
3 operating in and around a highwall.

4 Q. Why did you mention it in this part of the
5 narrative?

6 A. For the underground component of the ground
7 control plan, we have to calculate to the satisfaction of
8 MSHA a factor of safety for the strength, the ability of
9 these pillars, the walls we will see in the room that hold
10 up the roof. And so the calculations necessary to provide
11 the information for MSHA are exactly the same data that
12 DEQ is looking for for each one of these panels.

13 Q. And to be clear, have you done those additional
14 sampling procedures yet?

15 A. We have not.

16 Q. Why not?

17 A. They're not necessary at this time.

18 Q. When will they be necessary?

19 A. At the time that we are going to bond and
20 receive hopefully a permit to mine application, we will
21 have addressed the area, TR-1, for instance, that we are
22 going to mine, and we will pull additional samples. That
23 will become part of the ground control plan. And we
24 cannot mine without that ground control plan in place,
25 submitting it both for MSHA review and to DEQ at that

1 time.

2 Q. To be fair, Brook -- has Brook Mine done any
3 strength testing within its mine permit boundaries?

4 A. We have.

5 Q. Okay. And did you test the strength of the coal
6 at all?

7 A. We did.

8 Q. How many samples of coal strength have been
9 done?

10 A. Two, I believe.

11 Q. Okay. And do you recall what the coal strength
12 findings were?

13 A. We had a strength, if I remember correctly,
14 about 1400 PSI.

15 Q. And I should probably be more precise,
16 especially since you are an engineer. What kind of
17 strength testing was done on the coal?

18 A. It's called an un -- unconfined compressive
19 strength test.

20 Q. Where would the members of the council look in
21 the permit file to see the results of those tests?

22 A. Those are found in Appendix D5. And I believe
23 it's Addendum D5.6.

24 Q. Did you do the unconfined strength testing thing
25 you just mentioned personally?

1 A. We did not do that at Western Water, no.

2 Q. Who did it?

3 A. We sent them to a lab to be tested.

4 Q. Does the MSHA ground control plan require an
5 accurate characterization of the roof materials?

6 A. It does.

7 Q. Does it require an accurate -- accurate
8 characterization of the floor materials?

9 A. It does.

10 Q. Does it require an accurate characterization of
11 the coal strength and characteristics?

12 A. It does as well.

13 Q. How do you know all that?

14 A. The program that MSHA -- we use is called ARMPS,
15 and the input parameters for that program are listed.

16 Q. Does MSHA require a compressive strength test
17 for -- or any of these other parameters -- for every panel
18 that will be mined with the highwall miner?

19 A. They do, yes.

20 Q. And I think we established this, but just to be
21 clear, when I say "a highwall mining panel," do you
22 know -- what does that mean to you?

23 A. So to me and to MSHA highwall mining panel is
24 when a box cut is open and then you can mine on either the
25 left or the right of the box cut, those are the panel.

1 Now sometimes it gets confused, but a panel is just the
2 area between the barrier pillars. But in this case, it's
3 the full length of a panel to be mined, some 1500, 2,000
4 feet in length.

5 Q. I want to turn now to the subsidence control
6 plan. Okay?

7 A. Okay.

8 Q. First of all, can you just explain to the
9 council what a subsidence control plan is?

10 A. That is the plan in the permit that addresses
11 subsidence. It talks about the parameters for subsidence
12 and it talks about how the mine will deal with subsidence.

13 Q. And who prepared the subsidence control plan
14 that's part of the permit file?

15 A. It was a company by the name of Cardno MMA.

16 Q. Why was Cardno MMA selected to prepare the
17 subsidence and control plan?

18 A. So Cardno and MMA were mergering. MMA is
19 Marshall Miller & Associates. They've since retracted and
20 that's who they are now. Marshall Miller, the founder of
21 the company, has done extensive work in this field, so I
22 chose that company to do this rather than our company.

23 Q. Where in the --

24 MR. SUTPHIN: You can zoom out, please,
25 Carri.

1 Q. (BY MR. SUTPHIN) Where in the permit file would
2 the council turn to find the subsidence control plan?

3 A. That's found within the Brook Mine mine plan.

4 Q. You might have said it, but does MMA have
5 experience with highwall mining subsidence control plans?

6 A. They've done the vast majority of highwall
7 mining in the East.

8 Q. I want to look at the next page of Addendum
9 MP-6. This is DEQ 12-322. And I'm interested, in
10 particular, in the last paragraph, before the review of
11 previous mining activity. And I realize that you did not
12 draft this, but have you reviewed this information,
13 Mr. Barron?

14 A. I have, yes.

15 Q. And what -- well, first of all, it's talking
16 about support pillars will be designed to have a width
17 equal to or exceeding the maximum extraction thickness
18 anticipated in the highwall mining hole based on the
19 mine's geologic model. Do you know what that means?

20 A. As a matter of fact, yes, I do.

21 Q. Can you explain it, please?

22 A. I can. So if the council will remember the
23 figure that we had up previously, that's talking about the
24 height of the coal seam, and it's talking about the
25 variable being equal to that height, the width between

1 them.

2 Q. So this goes on to talk about Occupational
3 Safety and Health's -- NIOSH ARMPS-HWM. What does that
4 mean?

5 A. That's the program that's used to calculate the
6 factors of safety. It's the one that Bj discussed and was
7 trained on in his class. And it's also the program that
8 Cardno MMA now is familiar with.

9 Q. So just to simplify, how does the pillar
10 width -- how do you figure out, going from that general
11 schematic, to an actual plan to create a mine panel, say,
12 in TR-1?

13 A. So in TR-1 after you have taken a new sample or
14 sample in that area and sent the materials off for
15 testing, both the floor, the roof and the coal, those
16 parameters are entered into this program. It's an
17 industry standard. And based off the width and depth that
18 you're going to go into a coal seam, part of what judges
19 that too is the overburden thickness amount of -- well,
20 Jay Gilbertz' computer as it sat on top of the roof and
21 then the paper as it fell, that goes into this model so
22 that the paper doesn't fall. And it's designed with a
23 factor of safety and the standard is 1.3 to assure to the
24 best of their ability that we have a stable, nonsubsiding
25 mine plan for a specific area with specific parameters at

1 that area.

2 Q. What are -- what's the status of Brook's efforts
3 to get an approved MSHA ground control plan?

4 A. That document is being prepared.

5 Q. Has it been submitted?

6 A. It has not.

7 Q. Do you know when it will be?

8 A. I don't know exactly the time it will be
9 submitted right now.

10 Q. Have you had any contact with anyone at MSHA
11 regarding what's required for the ground control plan?

12 A. Yes, I have.

13 Q. Who's that?

14 A. A gentleman by the name of Ron Gehrke. He is
15 their expert in that field and served in that capacity for
16 several years.

17 Q. And just to be clear, what -- like who was
18 Mr. Gehrke? Who does he work for? Where is he
19 responsible for, if you know?

20 A. He is in Denver. He works for MSHA in District
21 9, I believe it is.

22 Q. Is that the district that -- that the Brook Mine
23 will be located in?

24 A. Yes. That's the district that we're covering.

25 Q. Did Mr. Gehrke provide any guidance or

1 information to help with the preparation of the ground
2 control plan?

3 A. Absolutely he did. He provided several
4 documents.

5 Q. I want to show you Exhibit Brook 10d. Do you
6 recognize that document, Mr. Barron?

7 A. That was one supplied by Mr. Gehrke.

8 Q. How would you describe this document, just
9 generally?

10 A. It's the -- it's the District 9. It's titled on
11 the top District 9 Highwall Ground Control Plan Check
12 Sheet. It's what needs to be provided to MSHA for a
13 highwall miner.

14 Q. Would you -- or I suppose could you direct the
15 council to any relevant portions of this document as they
16 pertain to subsidence?

17 A. About -- I don't know.

18 Q. We'll give you a pointer here real quick.

19 MR. GILBERTZ: There's one right in front
20 of him. One on the table.

21 MR. SUTPHIN: Oh, there is one on the
22 table.

23 THE WITNESS: I got the red dot, though.
24 That's cooler. Higher tech. My kids would be -- will be
25 excited.

1 MR. GILBERTZ: Mine works without
2 batteries.

3 THE WITNESS: Can't have everything.

4 Q. (BY MR. SUTPHIN) Go ahead, Mr. Barron.

5 A. So in this document, this area right here has a
6 list of things that need to be supplied. I don't know if
7 you can bring that up easy for at least my eyeballs.

8 So we need to supply the slope of ground to be
9 mined, maximum highwall height, pit width, description of
10 methods and equipment, and it goes on to some other
11 caveats with the highwall must be --

12 THE REPORTER: I'm sorry.

13 A. -- width of the equipment to be used.

14 THE REPORTER: Can you say that over.

15 THE WITNESS: There are a few caveats on
16 the bottom. Width of highwall benches must be two and a
17 half times the width of the equipment to be used. So it
18 already sets out some of the design parameters for the
19 highwall miner.

20 Q. (BY MR. SUTPHIN) Let's take a quick look at the
21 bottom of this page and just zoom in on this last box.

22 What is your understanding of this portion of
23 the checklist, Mr. Barron?

24 A. This mentions that factor of safety that I
25 previously mentioned, using the program ARMPS. We have an

1 overall factor of safety of 1.3.

2 Q. Okay. Let's move to next page for just a
3 moment.

4 MR. SUTPHIN: Can you zoom in on the top
5 one, please, Carri.

6 Q. (BY MR. SUTPHIN) This appears to be a
7 continuation of that comment that we just mentioned. Can
8 you just summarize what this piece of the checklist
9 requires?

10 A. Yes. That piece is providing MSHA a map of the
11 design and the components we used in the calculation of
12 that factor of safety.

13 MS. ANDERSON: I think at this point I'm
14 going to raise the objection that several council members
15 have raised before. This isn't in the permit application.

16 THE WITNESS: The commitment for this is in
17 the --

18 CHAIRMAN BAGLEY: Wait. Wait.

19 MR. SUTPHIN: Mr. Barron, hold on just a
20 minute.

21 Mr. Chairman, may I respond?

22 CHAIRMAN BAGLEY: Yes.

23 MR. SUTPHIN: This witness has already
24 established that this is a checklist for the MSHA ground
25 control plan that is very explicitly a part of the mine

1 permit file and a commitment that Brook has made within
2 that mine permit file. This goes directly to the
3 objections about subsidence and is not only relevant but
4 already included in the permit file.

5 CHAIRMAN BAGLEY: So this is in the permit.

6 MR. SUTPHIN: To be clear, Mr. Chairman,
7 this document is not in the file -- in the permit file.
8 What is in the permit file are very explicit commitments
9 that an MSHA ground control plan will be provided before
10 any mining takes place, and these are the requirements of
11 an MSHA ground control plan.

12 CHAIRMAN BAGLEY: Yeah. You can go ahead
13 and continue.

14 MR. SUTPHIN: Thank you, Mr. Chairman.

15 Q. (BY MR. SUTPHIN) Let's -- and, frankly, we're
16 not going to spend much more time on this, because I think
17 we've established the point that needed to be done.

18 But let's look at the top of page 3, Mr. Barron.
19 Were you -- did you hear the testimony or have you heard
20 the objections regarding the potential impacts that the
21 Brook Mine operation may cause on existing underground
22 mines?

23 A. I have, yes.

24 Q. Okay.

25 MR. SUTPHIN: Zoom in, please, on the very

1 top.

2 Q. (BY MR. SUTPHIN) Can you please summarize for
3 the council what this portion of the MSHA ground control
4 plan checklist requires.

5 A. It requires a 50-foot barrier needs to be
6 maintained between the end of the hole and existing
7 previous works.

8 Q. Is that something that you will do as part of
9 your MSHA ground control plan?

10 A. It's something we have to do.

11 Q. Mr. Barron, have you reviewed the report by
12 Dr. Jerry Marino that was submitted by the Powder River
13 Basin Resource Council?

14 A. I have.

15 Q. Did you also sit in on Mr. -- no, not Mr.

16 MS. ANDERSON: Doctor.

17 MR. SUTPHIN: Doctor. My apologies.

18 Q. (BY MR. SUTPHIN) Dr. Marino's deposition?

19 A. I did, yes.

20 Q. Do you believe that Dr. Marino's suggestions for
21 additional geotechnical study and analysis are
22 appropriate?

23 A. Yes.

24 Q. Why do you think that is that his opinions or
25 suggestions are appropriate?

1 A. They are appropriate. And as Bj has mentioned
2 and was pointed out earlier, Dr. Marino's work was noted
3 in the class that Bj attended.

4 Q. So if you agree with his suggestions and with
5 his opinion, or at least of the type of geotechnical study
6 that needs to be done, why haven't you done it yet?

7 A. We haven't done it yet, but it is a commitment
8 as part of the permit application in the ground control
9 plan that those will be done.

10 Q. You heard some testimony, I think it was from
11 Mr. Kristiansen, about the technology involved in the
12 highwall mining machine. Do you remember that?

13 A. I do.

14 Q. And I think you used the term directionally
15 intelligent, if I remember correctly. Was your
16 understanding of the technology used with the highwall
17 mining machine?

18 A. The highwall mining machine, and it's being
19 improved even today, has a lot of capabilities. Bj
20 mentioned that it has a gamma probe to sense whether it's
21 in the coal or not by the way the probe reads. There's
22 also cameras at the front. And then there is a surveying
23 component. So the miner itself knows exactly how much
24 coal it has extracted, and then those come into the
25 reports that get filed with the agency. It also knows

1 where it is on its azimuth, either with GPS or some other
2 mechanism.

3 Q. What does the Brook Mine permit say about
4 subsidence monitoring?

5 A. We commit to monitoring firstly for the
6 immediate six months after we have mined an area. But
7 that monitoring actually continues until final bond
8 release.

9 Q. And what does the permit application say about
10 subsidence with remediation?

11 A. If we find subsidence, we fix it.

12 MS. ANDERSON: At this point, before more
13 questions are asked about the subsidence control plan, I'd
14 just like to lodge a general objection that Mr. Barron
15 didn't actually prepare this document, and I would
16 appreciate a little bit more foundation laid before he
17 answers his questions about his personal knowledge about
18 the document itself.

19 CHAIRMAN BAGLEY: Any comment?

20 MR. SUTPHIN: No comment, Mr. Chairman.

21 CHAIRMAN BAGLEY: What I'd like to have
22 you do, then, is -- we have the report. It was written by
23 a subcontractor, who has, I think, been demonstrated -- or
24 Mr. Barron said is capable of doing this. But we can focus
25 on the things that are in the permit, which -- I mean, the

1 monitoring of subsidence, I believe, is something that
2 would have been in the document Mr. Barron wrote or was
3 involved with, and that's the specific details of Carno --
4 or Cardno.

5 MR. SUTPHIN: Yes. Absolutely. And I
6 appreciate that, Mr. Chairman. I was done talking about
7 the subsidence control plan, so I think we'll move on.

8 CHAIRMAN BAGLEY: Thank you.

9 Q. (BY MR. SUTPHIN) What is Brook Mine's
10 expectation about the coal removal ratios?

11 A. That's listed in the permit. It's 45 percent to
12 60 percent, I believe.

13 Q. Why doesn't Brook Mine anticipate any greater
14 coal extraction?

15 A. That would be inherently dangerous and probably
16 cause subsidence.

17 Q. When you're mining into a coal seam -- you
18 know what, let's go back to that diagram that was Exhibit
19 DEQ 12-121. Might be easier to have you explain this with
20 a diagram instead of just trying to talk about it.

21 So I realize this is a general schematic and you
22 don't know how tall the coal seam is, but roughly just --
23 what would you expect the height of a coal seam to be in
24 the Brook Mine area?

25 A. Around 12 feet thick.

1 Q. Okay. So if we assume for a second that we're
2 looking at a 12-foot-tall seam of coal, how much of that
3 12 feet is the highwall miner going to remove in one of
4 those drifts or entry spans?

5 A. Usually in the 12 feet, we would remove
6 something like 10 feet of coal.

7 Q. Why wouldn't you remove the entire 12 feet of
8 coal?

9 A. The top portion of the coal and the bottom
10 portion of coal are not equivalent to the chemical makeup
11 of the central portion of the coal, so it's advantageous
12 to remove the better coal.

13 Q. Before we leave this diagram again, do you
14 recall that Dr. Marino made some -- rendered some opinions
15 about Brook Mine's projected extraction ratios?

16 A. He did. He projected that we were extracting
17 75 percent.

18 Q. And what is your reaction to that opinion?

19 A. We are not extracting that much coal.

20 Q. And why not?

21 A. First, we clearly state in the permit
22 application that it will be between 45 and 60 percent.
23 The other mechanism, it was evident in Marino's deposition
24 that he was using this figure to establish how much our
25 extraction was by using the worst-case scenario on this

1 figure, and this figure is not intended for that purpose.

2 Q. All right. Mr. Barron, let's move to a
3 discussion about everyone's favorite topic, alluvial
4 valley floors. Okay?

5 CHAIRMAN BAGLEY: Mr. Sutphin, before we do
6 that, I'd like to ask you just a couple questions. About
7 how much longer do you expect direct to occur for
8 Mr. Barron?

9 MR. SUTPHIN: I anticipate one more hour of
10 direct examination, Dr. Bagley.

11 CHAIRMAN BAGLEY: All right. Let us take a
12 10-minute break and then we'll come back and conclude
13 direct to finish off today.

14 MR. SUTPHIN: Very good. Thank you.

15 CHAIRMAN BAGLEY: So 10-minute recess.

16 (Hearing proceedings recessed

17 5:53 p.m. to 6:04 p.m.)

18 CHAIRMAN BAGLEY: All right. We're back in
19 session. Please, continue.

20 Q. (BY MR. SUTPHIN) Okay. Mr. Barron, can you
21 please summarize your understanding of the objections
22 relating to alluvial valley floors.

23 A. In general, the objections deal with either
24 harming or disrupting groundwater flows to alluvial valley
25 floors.

1 Q. And do you -- what is your opinion about how the
2 Brook permit file addresses alluvial valley floors?

3 A. We have an entire binder dedicated to all of the
4 components of an alluvial valley floor. Appendix D11.

5 Q. You heard Mr. Kristiansen explain generally the
6 process for alluvial valley floor determinations, right?

7 A. I did, yes.

8 Q. Did you have anything that you would add to his
9 testimony or explanation?

10 A. No. I think he did a complete job.

11 Q. What limitations or restrictions are placed on a
12 mine regarding AVF, just generally?

13 A. So one of the determinations on alluvial valley
14 floor is its significance to farming. And in general, you
15 cannot harm or mine through an alluvial valley floor that
16 has a significance to farming.

17 Q. To your knowledge, are there any AVF's in and
18 around the Brook permit area that are significant to
19 farming?

20 A. None within the permit boundary.

21 Q. If the AVF is not significant, are there still
22 limitations about what a mine can do?

23 A. So if you mine through an alluvial valley floor
24 that is not significant to farming, it has some function.
25 Say, for instance, to convey flows. You can mine through

1 that alluvial valley floor, but you would have to
2 reconstruct it so that it could perform its function.

3 Q. Does the Brook Mine propose mining through any
4 known designated AVFs?

5 A. It does not.

6 Q. Okay. How do you know that these are the
7 limitations on a mine with respect to AVF?

8 A. Guideline 9 sets out those parameters.

9 Q. Have you also reviewed the rules and regs?

10 A. I have, yes.

11 Q. But you're not a lawyer, are you, Mr. Barron?

12 A. I am not a lawyer.

13 Q. So why would you look at the rules and the regs
14 and the guidelines?

15 A. Because it's my job.

16 Q. What do you mean by that?

17 A. In order for me to protect the public health and
18 safety, I have to review the laws, the rules, the
19 regulations to make a call whether or not I'm building a
20 document that's compliant. I couldn't do my job without
21 them.

22 Q. Were there rounds of comments and responses
23 regarding AVF?

24 A. Yes.

25 Q. Do you know how many comments pertain to AVF?

1 A. You know, in general I would say somewhere
2 around 50, I suppose, if I was to guess.

3 Q. To your knowledge, were all of those comments
4 resolved to the satisfaction of DEQ?

5 A. They were.

6 Q. What does the permit say about the expected
7 impacts on AVF?

8 A. Permit outlays that we will have minimal impact
9 to AVFs.

10 Q. And other than Appendix D11, where I think you
11 said the baseline information is found, where would the
12 council look to identify what the mine or what the permit
13 says about AVF?

14 A. In the -- in the case of mining in and around an
15 AVF, there are sections in the mine plan that outline
16 that. And also the reclamation plan has sections on
17 dealing with reclaiming in and near AVF.

18 Q. So we just pulled up Exhibit DEQ 12-090. Is
19 this the part of the mine plan you were just referring to
20 regarding AVF?

21 A. Yes.

22 Q. Okay. Do you know how many pages this AVF
23 portion goes on for?

24 A. Several.

25 Q. Okay. We're not going to read them all. Is

1 there anywhere else that the council might look to see
2 what Brook is proposing regarding AVF?

3 A. Outside of the mine plan and the reclamation
4 plan, Appendix D11, there would also be references in
5 Appendix D6 dealing with hydrology.

6 Q. You referenced the reclamation plan and what
7 it might say about AVF. We're going to pull up Exhibit
8 DEQ 13-073. Mr. Barron, is this part of the reclamation
9 plan?

10 A. Yes.

11 Q. And is this the part you were -- you were
12 referring to about AVF?

13 A. Yes.

14 Q. Again, we don't want to read this in its
15 entirety but generally speaking, what does the reclamation
16 plan say about reclaiming or restoring AVF?

17 A. So in the reclamation plan we commit to -- and
18 if we -- we have the reclamation plan set up for all
19 occurrences that might happen within the mine site, but in
20 this case it would speak to restoring the hydrologic
21 function or restoring flows to any AVF that we have
22 separate flows that materially damage an AVF.

23 Q. Do you believe that Brook Mine will be capable
24 of restoring any AVF that it might impact?

25 A. Yes.

1 Q. How can you -- I mean, why? Based on what?

2 A. I've worked with other mines, and we have
3 restored AVFs in the practice of our business.

4 Q. And Mr. Kristiansen mentioned an example of
5 restoring AVF functionality at the Rawhide Mine. Do you
6 remember hearing that?

7 A. I do, yes.

8 Q. Do you know who designed the project to restore
9 the AVF at the Rawhide Mine?

10 A. Western Water Consultants.

11 Q. And that's your company?

12 A. It is.

13 Q. Were you personally involved in that?

14 A. I was not.

15 Q. How do you know about it, then?

16 A. I spoke to my supervisor. He told me about the
17 project. We've also referenced that project in with
18 others, and I've been involved in that.

19 Q. Does Western Water Consulting have any other
20 experience restoring AVF functionality after it's been
21 affected by mining?

22 A. We have. We've done work for Antelope Mine as
23 well.

24 Q. What did that -- first of all, did you do that
25 work or design personally?

1 A. I did not.

2 Q. But are you familiar with it?

3 A. I am, yes.

4 Q. So just generally what happened and what was
5 done?

6 A. It was a reconstructive effort to restore the
7 hydrologic function of the AVF, which was primarily to
8 convey underflow. So it meant replacing stream-laid
9 deposits in a fashion that the AVF could continue to
10 function in the way it had in the environment.

11 Q. To your knowledge, was that restoration work
12 approved by DEQ, Land Quality Division?

13 A. It was, yes.

14 Q. All right. Let's move on to blasting. What is
15 your general understanding of the blasting-related
16 objections?

17 A. Most of the blasting-related objections have to
18 do with vibrations and potential damage to structures,
19 interruption of recreational activities and potential harm
20 to wells.

21 Q. You heard Mr. Emme testify just a little while
22 ago about blasting, right?

23 A. I did, yes.

24 Q. And did you have anything you'd like to add to
25 Mr. Emme's testimony?

1 A. No. I think Mr. Emme did a fine job.

2 Q. Can you just briefly describe some of the
3 commitments that Brook Mine has in its blasting plan to
4 protect structures in and around the Brook Mine?

5 A. As Mr. Emme pointed out, there is a commitment
6 in the mine plan for a pre-blast survey. Any resident
7 within a half mile of the permit boundary can request a
8 pre-blast survey, and that includes examination of the
9 structures and wells to ascertain their pre-mining
10 condition. And then if some damage should occur in the
11 future, we would have a case for potential causation and
12 we could repair those damages.

13 Q. Where would the council turn to find the
14 commitments and the information regarding blasting in your
15 permit file?

16 A. That would be in the mine plan volume.

17 Q. Do you know off the top of your head where in
18 the mine plan volume?

19 A. Not off the top of my head, but I could point it
20 out in relatively short order. That would be in Section
21 MP.14.

22 Q. And where is that found in the mine plan? And
23 what I mean is what DEQ exhibit number is it?

24 A. It is DEQ Exhibit 12.

25 Q. And what page?

1 A. The document page --

2 Q. No. I'm going to interrupt you, Mr. Barron.

3 Does that one not say a DEQ- number on it?

4 A. It does. I'm in the table of contents.

5 Q. Oh.

6 A. That won't help you. But I am almost there.

7 MP.14 begins on DEQ 12-073.

8 Q. And where does the blasting related -- where
9 does MP.14 end?

10 A. It ends on DEQ 12-082.

11 Q. What is Brook Mine committed to do to make sure
12 that residents of the area are aware of your anticipated
13 blasting activities?

14 A. We need to publicize our blasting activities.

15 Q. What does that mean?

16 A. Brook Mine needs to put in a circulation, a
17 public record, our blasting schedule.

18 Q. Mr. Barron, I don't know. Maybe you're nervous
19 or stiff or something. I don't know. A circulation of
20 what?

21 A. A newspaper. A newspaper circulation in the
22 area.

23 Q. Okay. Thank you. And, yeah, I mean, let's keep
24 it simple, please.

25 Other than putting notice in the newspaper, what

1 would Brook do to make sure residents in the area are
2 aware of proposed blasting activities?

3 A. The mine area will have signage around the mine
4 site to indicate that blasting activities are happening.
5 We also put road guards or roadblocks in the area of
6 blasting. There's an audible tone, a siren, that will be
7 heard.

8 Q. Will you be sending any direct mail to any of
9 the residents around the mine permit area?

10 A. Mr. Emme pointed out we will be sending a direct
11 mailer to everyone within a half mile.

12 Q. Let's talk about bonding for a moment. Okay,
13 Mr. Barron?

14 A. Very good.

15 Q. Again, you heard Mr. Emme testify about bonding,
16 right?

17 A. I did.

18 Q. Did you have any disagreements with what
19 Mr. Emme said?

20 A. I did not.

21 Q. Did you prepare the Brook Mine reclamation bond
22 estimate?

23 A. I did.

24 Q. And why did you do that?

25 A. It was an effort to convey to DEQ what our plan

1 of disturbances were for the first year.

2 Q. Before you heard Mr. Emme testify today, did you
3 know that in his opinion your proposed estimate was high?

4 A. I did not until today.

5 Q. How did that make you feel to hear that?

6 A. Made me feel like I did a good job.

7 Q. Are you proud of the work you did on the Brook
8 Mine permit application?

9 A. Absolutely.

10 Q. Why?

11 A. This is a large volume of work. It took
12 uncountable man-hours to complete. And the council has
13 heard DEQ testify, it's a good body of work. It describes
14 a lot, and there's a lot of detail in it.

15 Q. How many man-hours has Western Water Consulting
16 put into preparing the Brook Mine application file?

17 A. Thousands.

18 Q. How do you know that? Sort of shut that off.
19 How do you know?

20 A. Well, for me personally I've been working on
21 this project since May of 2013 and it has consumed the
22 bulk of my time -- at least 80 percent -- and we continue
23 to work today. So four -- four years of my time and
24 80 percent, 2,000 hours a year, it's --

25 Q. Is your permit application file perfect, in your

1 mind?

2 A. No.

3 Q. Why not?

4 A. I don't know that anyone could say that any
5 permit application is perfect. However, being a dynamic
6 document, we have opportunities along several times during
7 the application process to improve it and make it better,
8 both either by our initiation or from comment from DEQ or
9 the public.

10 Q. Having committed all that time and investing
11 yourself into the permit file, are you afraid that you're
12 so invested that maybe you'd want this permit approved at
13 all costs?

14 A. No. Absolutely not.

15 Q. Do you have any concerns with some of the permit
16 conditions that have been discussed at this hearing?

17 A. No. If conditions need to be placed on the
18 permits to make it a better document, I would welcome
19 them.

20 Q. Before the bonding, you heard some testimony
21 that Brook Mine has not posted a bond for the first year
22 of projected disturbance, right?

23 A. That's correct.

24 Q. Is Brook Mine prepared to post that bond?

25 A. They are prepared to post the bond, yes.

1 Q. Do you know how that bond -- like what mechanism
2 will be employed to make sure that the reclamation bond
3 requirement is satisfied?

4 A. It will be a financial instrument of sorts.

5 Q. Okay. Do you know what self-bonding is?

6 A. I do.

7 Q. And will Brook Mine be self-bonding for its
8 reclamation bond?

9 A. Not to my knowledge.

10 Q. Okay. Let's talk about underground coal fires
11 now. Okay?

12 Did you see any objections pertaining to
13 underground coal fires?

14 A. I did see objections.

15 Q. And what was the nature of those objections,
16 generally?

17 A. In essence, the Brook Mine was either not aware
18 of underground coal fires or didn't know how to deal with
19 that.

20 Q. And was your opinion of the Brook Mine -- or
21 rather how the Brook Mine permit addresses potential
22 underground coal fires?

23 A. We have a fire control plan within the mine
24 plan.

25 Q. Do you think that underground coal fires will be

1 a problem in this operation?

2 A. In the permit area there are no known coal
3 fires, but they certainly could be encountered, and the
4 fire control plan can address those issues.

5 Q. So where in the permit would the council need to
6 look to examine your fire control plan?

7 A. They will look -- it's an addendum to the mine
8 plan, Addendum MP.5.

9 Q. Okay. And just so you don't have to turn to it,
10 take a look at the screen, Mr. Barron. Is this Addendum
11 MP.5?

12 A. Yes.

13 Q. Okay. And what does the fire control plan say
14 about what will happen if you encounter a coal fire?

15 A. I don't exactly remember the specifics of what
16 it says. But fires, in general, as they're discovered, we
17 will extinguish those fires with the best technology we
18 have available to us to address those fires.

19 Q. Do you believe it's possible to extinguish an
20 underground coal fire if you were to encounter one in the
21 Brook Mine operation?

22 A. Yes.

23 Q. What's that based on?

24 A. One, mines commonly encounter underground coal
25 fires and deal with them as part of their operational

1 plan. Those have commonly been extinguished. Abandoned
2 Mine Lands also deals with underground coal fires and part
3 of the practice they extinguish those underground coal
4 fires. So the techniques used in either of these
5 instances would be employed by Brook Mine.

6 Q. Did Department of Environmental Quality, Land
7 Quality Division express any concerns or comments
8 regarding underground coal fires?

9 A. No, they did not.

10 Q. Would you say that this is a common issue?

11 A. Not super common in a coal mine, but, I mean,
12 it's an occurrence that coal mines expect. One of the
13 mechanisms for coal to catch fire is the presence of
14 moisture and oxygen. So coal naturally has some moisture
15 in it, and can be exposed to oxygen. So certainly the
16 pieces to start a fire are there.

17 Q. Let's turn really quickly to DEQ 12-316. This
18 is still in your fire control plan, right?

19 A. It is.

20 Q. So I'm looking at Section MP-5.4.2. Okay?

21 A. Yes.

22 Q. So what does this say about coal fires?

23 A. It specifically says a coal fire in the pit will
24 be extinguished by excavating the burning or smoldering
25 coal and then spreading, contacting or burying it as

1 necessary.

2 Q. This doesn't say -- or let me -- I better not
3 ask too many leading questions.

4 Does this say exactly where you expect coal
5 fires will be encountered?

6 A. No, it does not.

7 Q. Does it say exactly how the operations crew will
8 react to the coal fire?

9 A. It does not.

10 Q. Does it say what kind of equipment will be used
11 to deal with the coal fire?

12 A. It does not.

13 Q. Okay. So why not?

14 A. Just like Doug Emme described, we want to allow
15 for the best practices to deal with the coal fire. We
16 have a section that says we will deal with those, and it
17 gives us the broadest latitude to employ the best
18 technologies that we have to deal with those fires.

19 Q. Mr. Barron, what is, in your mind, a
20 performance-based regulation?

21 A. A performance-based regulation is one that is
22 written to achieve an outcome, but does not dictate how
23 you get to that outcome.

24 Q. Does that performance-based regulation approach
25 apply, in your mind, to the Brook Mine permit?

1 A. Absolutely, it does.

2 Q. So why?

3 A. DEQ regulations are performance-based
4 regulations. For instance, this table. You could say as
5 a regulator that a table shall be this wide, this deep and
6 supported by two legs. But a performance-based regulation
7 will say this table needs to be supported and an operator
8 could choose how to support this table best to carry out
9 the function of holding these documents. DEQ writes its
10 regulations that way so that the operator has the broadest
11 latitude to achieve something, but still needs to be
12 restricted to a specific outcome.

13 Q. Let's talk about groundwater briefly. Again,
14 you were here to listen to the testimony of Dr. Kuchanur,
15 right?

16 A. I was.

17 Q. Did you disagree with anything Dr. Kuchanur had
18 to say about ground --

19 A. No, I did not.

20 Q. Ooh. Ooh.

21 A. Sorry.

22 Q. Did you disagree with anything Dr. Kuchanur had
23 to say relating to groundwater?

24 A. I did not.

25 Q. Would you add anything to Dr. Kuchanur's

1 testimony?

2 A. No, I would not.

3 Q. Why not?

4 A. I think it's evident Mr. Kuchanur's --
5 Dr. Kuchanur's expertise in the field. He gave great
6 comments to the permit application that I believe improved
7 the application and addressed several issues. In the end,
8 I think this -- the state and the public can feel
9 confident in both the state's ability, professional
10 engineers that worked on the groundwater control plan,
11 that it's a -- the document is sound.

12 Q. What are the commitments that Brook Mine has
13 made in the permit file regarding possible water well
14 impairment?

15 A. Chief among those is the replacement of both
16 quality and quantity of water if any well should be
17 materially damaged.

18 Q. And you heard the testimony about distinction
19 between an adjudicated well and a permitted well, right?

20 A. I did, yes.

21 Q. And you heard the testimony about the condition
22 that -- that Brook Mine can't restrict its protections to
23 only adjudicated wells?

24 A. I did.

25 Q. And what is Brook Mine's reaction to that

1 condition?

2 A. Well, it's accepted.

3 Q. Why wasn't it that way in the first place?

4 A. It was that way in the first place. We decided
5 both the statutes, and as a commitment in the mine plan,
6 and then added the term "adjudicated well," which
7 introduced a great deal of confusion, which is apparent by
8 the public comment. Dr. Muthu pointed that out earlier in
9 his testimony. And I think by adding that condition in
10 the state decision document clarifies that. So rest
11 assured, it's going to be permitted wells that are
12 replaced.

13 Q. So, again, let's assume hypothetically that a
14 well -- well, first of all, is there a limit to how far
15 away from the permit area you can be before these well
16 replacement or restoration terms are triggered?

17 A. It's generally the half-mile buffer within the
18 permit application. However, if someone outside of that
19 buffer senses that the mine has done something to one of
20 their water wells, they certainly can raise the concern
21 and be evaluated on its base. If causation is found, we
22 can deal with it.

23 Q. And I don't want to put words in your mouth,
24 but -- well, let me just ask it again. What happens if
25 there is water well impairment caused by the Brook Mine?

1 What does Brook Mine have to do, in your opinion?

2 A. Brook Mine needs to replace both quality and
3 quantity.

4 Q. And is that -- sorry. Is that part of the
5 permit commitments?

6 A. It is.

7 Q. Who determines if you've replaced the quality
8 and quantity of an impaired well sufficiently?

9 A. DEQ has oversight.

10 Q. How long does this replacement have to last?

11 A. The replacement would need to satisfy the
12 landowner for the duration of the well's life. So if it
13 meant drilling a new well, a new well would be drilled.

14 Q. What if a new well can't be drilled?

15 A. Then a new supply of water would need to be
16 granted to the owner. I mean, the commitment is in the
17 permit to do replacement of quality and quantity. We
18 can't shirk that responsibility.

19 Q. What are Brook Mine's predictions regarding the
20 potential effect on the hydrologic balance in and around
21 the area of the proposed Brook Mine?

22 A. You will have a minimal effect on hydrologic
23 balance within the Brook Mine.

24 Q. Let's talk a little bit about TR-1 area. Okay?
25 How would you describe the geology of the TR-1

1 area?

2 A. TR-1 area is comprised of mine backfill from
3 mining operations that occurred to extract the Monarch
4 coal seam. Below that you have the overburden layer
5 Dr. Kuchanur talked about. And then Carney coal seam and
6 Masters coal seam below that.

7 Q. You heard some discussion about on -- on various
8 parts of the testimony about some alleged uncertainties
9 about what the hydrogeology in that area might be like.
10 Can you recall those?

11 A. I do, yes.

12 Q. Okay. Would you characterize this area, the
13 geology and hydrogeology, as unknown?

14 A. No, I wouldn't characterize it as unknown.

15 Q. Why not?

16 A. It's in the area of historic Big Horn -- well,
17 the active Big Horn Coal mine. They've been mining there
18 since prelaw. So it is a known area.

19 Q. You heard the testimony that there are no
20 groundwater monitoring wells in the vicinity of the
21 proposed TR-1 pit, right?

22 A. Right. I did, yes.

23 Q. Okay. Is that true? Are there no groundwater
24 monitoring wells in that area?

25 A. There are no groundwater monitoring wells in the

1 saturated backfill.

2 Q. Are there wells that can give us information
3 about the area that aren't in the saturated backfill?

4 A. Yes.

5 Q. And just generally where are those?

6 A. They're both north and south of that pit.

7 Q. And is that the information that we saw in the
8 cross-section that Dr. Kuchanur was using?

9 A. Yes the cross-section found in Appendix D5
10 showed both of those.

11 Q. Did Brook Mine attempt to acquire data from
12 groundwater monitoring in the area of the TR-1 pit?

13 A. We did, yes.

14 Q. And why -- so if you tried, why didn't you get
15 any?

16 A. Big Horn Coal called the Sheridan County Sheriff
17 and had us escorted from the site.

18 Q. Now you say "us." Who do you mean?

19 A. I had a water well driller, subcontractor,
20 working on the site. He was escorted from the site. Then
21 I went down with Mr. Niles Veal, and spoke with the
22 Sheridan County Sheriff and he asked us to leave and we
23 obeyed him.

24 Q. Did you tell DEQ that you were trying to get
25 water monitoring information from that area and were

1 blocked?

2 A. Yes.

3 Q. And what was the response that DEQ provided?

4 A. They allowed that the monitoring that had
5 happened to date was sufficient, and we continued without
6 adding any additional wells in that area.

7 Q. Briefly on the subject of air quality. Are you
8 aware of objections pertaining to the air quality?

9 A. Yes.

10 Q. And who is responsible for issuance of an air
11 quality permit?

12 A. Wyoming Department of Environmental Quality,
13 their Air Quality Division.

14 Q. And is that different from the Land Quality
15 Division?

16 A. It is.

17 Q. Has an Air Quality permit been granted?

18 A. It has.

19 Q. And is there a copy of it in this mine permit
20 file?

21 A. No, there is not.

22 Q. Why not?

23 A. It's referenced in the permit documents, but
24 it's not a requirement that it be in this permit document.

25 Q. How will Brook Mine handle agreements with, for

1 example, Sheridan County regarding any impact that the
2 Brook Mine may have on county roads?

3 A. If we are going to have an impact to a county
4 road, we will -- and we started discussions with the
5 county already to make them aware we will have some
6 impacts at some time. We will enter into a Memorandum of
7 Understanding with them and those documents will become
8 part of the adjudication file in the permit application.

9 Q. But is there any information in the permit file
10 now about agreements you have with the county about county
11 roads?

12 A. No, there is not.

13 Q. Why not?

14 A. There is no impending need to engage the county
15 because we are not planning at any time right now to move
16 any of the roads.

17 Q. But I guess maybe I'm -- I was speaking more
18 broadly. I don't mean about just moving county roads. Do
19 you have to have discussions with Sheridan County about
20 using county roads?

21 A. No.

22 MR. SUTPHIN: Okay. Mr. Barron, we're
23 moving a little faster than I anticipated, which is always
24 good news, but it also makes me nervous that I may have
25 missed something. Although I suppose in fairness, the

1 council will get an opportunity to ask questions of you.

2 Mr. Chairman, if you'll indulge me for just a
3 moment, I'll consult with my colleagues and make sure that
4 I haven't missed anything obvious.

5 CHAIRMAN BAGLEY: That would be fine.
6 We're certainly happy you've been moving quickly. That's
7 great.

8 MR. SUTPHIN: Thanks.

9 (Cell phone rings.)

10 MS. ANDERSON: For the record, that was my
11 client.

12 MS. MORRISON: Sorry.

13 MS. ANDERSON: That's fine.

14 Q. (BY MR. SUTPHIN) Okay. Mr. Barron, to your
15 understanding, has DEQ, Land Quality Division, deemed the
16 Brook Mine permit application technically adequate?

17 A. They have.

18 Q. And to your knowledge, has that determination
19 changed in any way in response to the objections that have
20 been raised by objectioners?

21 A. It has not.

22 Q. I think I already asked you this, but just to
23 make sure. Are you proud of the work that you and your
24 team did on the Brook Mine permit application?

25 A. I am, yes.

1 Q. Is there anything that you would change in the
2 permit application as it exists today?

3 A. At this point, no.

4 Q. Are you confident in the quality of the work
5 that your subconsultants performed in assisting on the
6 Brook Mine permit application?

7 A. I am.

8 MR. SUTPHIN: Mr. Chairman, I have no
9 further questions of this witness at this time.

10 CHAIRMAN BAGLEY: Thank you very much.

11 So we will recess until 8:30 tomorrow morning,
12 when we will start cross-examination. We are recessed.

13 (Hearing proceedings recessed

14 6:40 p.m., May 24, 2017.)

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter reconvened for hearing on the
12 23rd day of May, 2017, at the approximate hour of
13 9:02 a.m., at the Sheridan College, Thorne-Rider Campus
14 Center, Room TRCC 008, 3059 Coffeen Avenue, Sheridan,
15 Wyoming, before the Wyoming Environmental Quality Council,
16 with Chairman David Bagley, presiding, and Council Member
17 Meghan Lally, Council Member Megan Degenfelder, Council
18 Member Tim Flitner, Council Member Nick Agopian and
19 Council Member Deb Baumer in attendance.

20 Mr. Ryan Schelhaas, Wyoming Attorney General's
21 Office, Attorney for the Council; Mr. Jim Ruby, Executive
22 Director to the Council; Mr. Joe Girardin, Business Office
23 Coordinator, were also in attendance.

2 (Hearing proceedings reconvened

3 9:02 a.m., May 23, 2017.)

4 CHAIRMAN BAGLEY: Good morning. It is
5 9 a.m. -- 9:02, May 23, 2017. I am Dr. David Bagley, the
6 hearing officer in Docket 17-4802 in regard to Brook Mine,
7 LLC.

8 Present today for the council are Tim Flitner,
9 Meghan Lally, Megan Degenfelder, Nick Agopian and
10 Deb Baumer. Councilman Fairservis has recused himself due
11 to a conflict.

12 The parties present today are -- you know what?
13 I'm going to let the folks introduce themselves. I'll name
14 who your party and you can let me know your names, since I
15 always miss somebody.

16 So on behalf of Brook Mine, LLC are?

17 MR. POPE: Jeff Pope, Isaac Sutphin and
18 Tom Sansonetti.

19 CHAIRMAN BAGLEY: Thank you.

20 On behalf of DEQ are?

21 MR. KUHLMANN: Andrew Kuhlmann and James
22 LaRock.

23 CHAIRMAN BAGLEY: Thank you.

24 On behalf of Powder River Basin Resource Council.

25 MS. ANDERSON: Hi. Shannon Anderson.

1 CHAIRMAN BAGLEY: On behalf Big Horn Coal.

2 MS. BOOMGAARDEN: Good morning. Lynn

3 Boomgaarden and Clay Gregersen.

4 CHAIRMAN BAGLEY: Thank you.

5 On behalf of the Fishers.

6 MR. GILBERTZ: Jay Gilbertz from Yonkee &

7 Toner.

8 CHAIRMAN BAGLEY: Thank you.

9 Also present for the council are Jim Ruby,
10 executive officer; and Joe Girardin, counsel business
11 coordinator; and Ryan Schelhaas from the Attorney General's
12 Office.

13 This hearing is being held at Sheridan College,
14 Room TRCC 008, in the Thorne-Rider Campus Center,
15 3059 Coffeen Avenue, Sheridan, Wyoming. There is a court
16 reporter present.

17 Before we continue with the witness from
18 yesterday, I would like to get the exhibits in this matter
19 introduced and any objections on the record, and then I'll
20 make a decision on those and then we can move forward.

21 So I would like to start with Brook Mine.
22 Mr. Pope, please identify the party and number of what
23 exhibits you object to and all your objections. The
24 grounds have been listed, and you can be very brief on that
25 so we can move forward.

1 MR. POPE: Thank you, Dr. Bagley.

2 In terms of the Department of Environmental
3 Quality's exhibits, we have no objection to any of those
4 exhibits. In terms of the Powder River Basin Resource
5 Council, to be efficient I'll try to group as I go along.
6 We've objected to Exhibit Number 1, which is their
7 objection letter, on the basis of hearsay. Understanding
8 that hearsay is a rarely used ground in administrative
9 hearings for excluding evidence, we think this one is
10 important because it speaks to the fundamental fairness of
11 this process.

12 We've learned through discovery that the people
13 who have prepared this objection letter are Shannon
14 Anderson and Jill Morrison, and as well as a gentleman by
15 the name of Stuart Levit. None of those people will
16 testify before the council. We will not have the
17 opportunity to cross-examine them and learn whether or not
18 the allegations in there are truthful, credible and
19 probative, which is the standard in administrative
20 proceedings for hearsay.

21 Likewise, discovery in this matter, we've had the
22 opportunity to depose Mr. Levit and discover that in many
23 instances he didn't look at the law. He didn't look at the
24 regulations and didn't read relevant portions of the permit
25 application. We should have the ability to explore the

1 veracity of those allegations, but he's not going to
2 testify. And, therefore, we don't think it's fair. We
3 think that the arbitrary and capricious standard would
4 suggest that our rights would be prejudiced if the
5 objection letter was allowed in.

6 For -- and I guess I should mention as well, it
7 begs the question why we're here. If we are simply going
8 to allow objections letters and not have anyone testify,
9 council doesn't need us here. The council could have
10 simply received the letters, could have received the permit
11 application and gone on its merry way to make a decision.
12 We're here so I can see the witnesses, see the truthfulness
13 or credibility of their statements and make a
14 determination. Allowing this letter in would not allow the
15 council to do that.

16 We also object to PRBRC Exhibits 2 through 10,
17 which are individual objection letters filed by various --
18 various folks here in the community. We object to them on
19 a similar basis, but there is an additional ground here
20 too. None of these individuals requested a contested case
21 before this council. And, therefore, they're not parties.
22 So we think based on how this council ruled several months
23 ago, they -- they have had the opportunity to make their
24 objections, but they should not be allowed under the
25 auspices of the PRBRC to shoehorn in their objections. And

1 again, many of these people are not going to testify, so we
2 don't have the opportunity to cross-examine them.

3 The analogy here I think for the council is that
4 if this were a criminal case and you were accused of a
5 crime and someone said we have a letter from victim who
6 said you did it, we're not going to allow you to talk to
7 that convict, call the police officer who investigated the
8 case, our system wouldn't deem that fair. It's because the
9 fundamental process right is our opportunity to look at
10 someone on the witness stand and ask them questions.

11 We also object to PRBRC Exhibits 12 through 14
12 and 17, which are expert reports. Similar basis. Those
13 experts are going to testify. That should be the basis on
14 which this council judges their testimony. So it should be
15 kept out.

16 We object to Exhibit -- PRBRC Exhibits 25 through
17 27 on relevance grounds. Those are slideshows and news
18 articles that have little, if anything, to do with this
19 case. They are concerning other topics, such as the iPark
20 or industrial manufacturing, which is not relevant to the
21 adequacy -- technical adequacy of Brook's permit
22 application.

23 We also object to Exhibits 38 through 45, all on
24 the same basis. These are documents about the Abandoned
25 Mine Lands Program in Wyoming. Again, not relevant to

1 Brook's permit application.

2 We object to Exhibit 47. Same reason. This is a
3 1980 USGS paper, has nothing to do with Brook's permit
4 application.

5 We object to PRBRC Exhibit 63. This is a letter
6 from Mr. Tony Wendtland to Ms. Joan Tellez concerning
7 statements made at a Sheridan County Commissioners hearing.
8 It has nothing to do with Brook's permit application and
9 the technical adequacy of that.

10 We object to Exhibit 64. This is a Frahm Office
11 of Surface Mining Bond Calculation Handbook. Has nothing
12 to do with this hearing. It has no relevance because the
13 bond calculations in Wyoming are governed by DEQ
14 regulations, not the Office of Surface Mining.

15 Similar objections to PRBRC Exhibits 68 and 69.
16 Those are Office of Surface Mining documents. Not relevant
17 to Brook's permit application.

18 We object to Exhibit 72. This is a presentation
19 on advanced carbon products. It's not relevant to the
20 technical adequacy of Brook's permit application. We also
21 object to Exhibits 86 through 88. Same reasons you've
22 heard before, these are Abandoned Mine Land documents.
23 They aren't relevant to the technical adequacy of Brook's
24 permit application.

25 Finally, we object to PRBRC Exhibit 90. This is

1 a letter from the Tongue River Water Users Association
2 objecting to Brook's permit. It is dated May 17, 2017. It
3 was an objection letter filed months after the objection
4 deadline passed. And it was created on the same day that
5 exhibits were due in this matter. We do not have the
6 opportunity to cross-examine anyone from the Tongue River
7 Water Users Association. We don't have -- did not have the
8 opportunity to do discovery and learn about the veracity of
9 these allegations. So for all of the reasons that I
10 discussed in the previous objection letters, we object on
11 that basis.

12 That is it for the PRBRC exhibits. In terms of
13 the Fishers' exhibits, this should go a little bit faster.
14 We object to Fisher Exhibit 8 through 11 on relevance
15 ground. These are news articles about blasting and
16 Abandoned Mine Land work in other areas in other mines.
17 They're not relevant to the technical adequacy of Brook's
18 permit application. We also think they are unduly
19 prejudicial. They invite this council to draw an inference
20 that bad stuff has happened somewhere else, therefore, it
21 will happen here. That is a logical fallacy and no
22 evidence supports that claim.

23 We object to Fisher Exhibits 13 and 14. Same
24 reason. They are judgments in two civil matters wholly
25 unrelated to this case. And they, again, invite the

1 council to draw a prejudicial inference that because bad
2 things happen somewhere else, bad things will happen here.

3 And, lastly, we -- for the Fishers' exhibits. We
4 object to Fisher Exhibit 26. This is the Fishers'
5 objection letter. Similar reason here. They should come
6 up to the stand, testify about that. There is no need to
7 include that in this case.

8 Big Horn Coal exhibits. We object to Exhibit
9 Number 3, which is their objection letter. Similar basis.
10 But, again, here we have another issue where someone who
11 will not testify at the hearing drafted portions of this
12 letter. Jason Todd, who was a disclosed expert in this
13 matter, we learned through depositions of Mr. Sweeney, he
14 prepared text that was lifted and put directly into the
15 objection letter. He's not going to be here to testify.
16 He was -- we were told that he was no longer going to be
17 used by Big Horn Coal, and, therefore, we don't have the
18 ability to explore the veracity of his allegations. And
19 Mr. Sweeney has testified under oath at his deposition that
20 he will not be providing any testimony to support
21 Mr. Todd's assertions. So, again, we do not have the
22 fundamental opportunity to talk about those issues.

23 We also object to Exhibit -- BHC Exhibit 6, which
24 is permit provisions for the Buckskin and Cordero Rojo
25 Mines on relevance grounds. It does not matter what those

1 particular mines did. I understand the inference they're
2 going to try and draw, but it is not a relevant inference
3 to the facts of this case.

4 Lastly, we object to BHC Exhibit 9. This is the
5 expert report of Mr. Gerlach. He is going to be here to
6 testify. That should be the statements. Otherwise, again,
7 it begs the question of why we're here. They can simply
8 submit those reports, no one testifies and council can go
9 on its way.

10 That concludes our exhibit objections. Thank
11 you, Mr. Hearing Officer.

12 CHAIRMAN BAGLEY: All right. Thank you.

13 Mr. Kuhlmann, any --

14 MR. KUHLMANN: Thank you, Mr. Chairman.

15 Mr. LaRock will address our positions.

16 CHAIRMAN BAGLEY: All right. Thank you.

17 MR. LAROCK: Mr. Hearing Officer, because
18 we view this hearing as opportunity for objectors to
19 provide DEQ with more information to help us, we don't plan
20 to object any of the exhibits identified by any of the
21 objectors or the witnesses' testimony. As long as that
22 information is at least baseline relevant to this process,
23 we don't plan to object.

24 CHAIRMAN BAGLEY: All right. Thank you.

25 Ms. Anderson.

1 MS. ANDERSON: Do you just want my
2 objections or do you want my response to objections?

3 MR. RUBY: Just objections.

4 CHAIRMAN BAGLEY: Just objections.

5 MS. ANDERSON: Okay.

6 CHAIRMAN BAGLEY: Yeah.

7 MS. ANDERSON: Thank you, Dr. Bagley.

8 At this point we would object to Brook 6, which
9 is a voluminous document, I don't even think provided to
10 you yet, as council members, not printed for this hearing,
11 nor -- you know, I think we've reviewed some of it during
12 discovery, but, you know, it's over 10,000 pages. So we
13 would object to that.

14 We do stipulate to anything that's part of the
15 official correspondence file for this hearing, which has
16 already provided an exhibit from DEQ, but beyond that, we
17 believe the parties, as we did, should go through and
18 identify the specific emails and documents that are
19 relevant to their cases.

20 We also object to the use of outdated law.
21 Critically there's an exhibit from Brook that's a 2010
22 version of the Environmental Quality Act. There is
23 obviously a 2017 version out there. And we do believe that
24 there's no need for an exhibit at all on the law itself,
25 similar to the regulations. We believe those regulations

1 are the regulations and you can pull them off of the
2 applicable websites and look at them, and they don't need
3 to be an exhibit for evidence at this hearing.

4 So those are the exhibit objections that we have
5 of Brook. And we have no objections to DEQ nor do we have
6 any objections to any of the other parties.

7 CHAIRMAN BAGLEY: All right. Thank you.

8 MR. RUBY: Mr. Chair, can you find out what
9 exhibit numbers those were?

10 CHAIRMAN BAGLEY: One of them was Brook 6.
11 What are the other two objections?

12 MS. ANDERSON: So the regulations,
13 Dr. Bagley, are Brook 5.

14 CHAIRMAN BAGLEY: Okay.

15 MS. ANDERSON: And it's sub (a) through
16 (i). And then the -- I'm trying to find the Environmental
17 Quality Act one. It might be --

18 MR. GILBERTZ: 3.

19 MS. ANDERSON: 3. Okay. Thank you.

20 MR. GILBERTZ: 4 is also law.

21 MS. ANDERSON: Thank you.

22 So Brook 3 and 4.

23 MR. POPE: Mr. Bagley, I think I can save
24 the council some time on this, not to get us bogged down.
25 We'll withdraw the law exhibits. We included those for the

1 council's convenience, but if it's going to cause an issue,
2 there's no need. We will withdraw those.

3 MR. GILBERTZ: So is that 3, 4 and 5,
4 Mr. Pope?

5 MR. POPE: Yes. We'll withdraw all the
6 statute -- the statute exhibit, as well as the regulation
7 exhibit. And those are broken down in (a) through (i).

8 CHAIRMAN BAGLEY: So we will withdraw --
9 Brook Exhibits 3, 4 and 5 have been withdrawn?

10 MR. POPE: Yes.

11 CHAIRMAN BAGLEY: Thank you.

12 All right. Mr. Gilbertz.

13 MR. GILBERTZ: Thank you. I can be pretty
14 brief. Understanding that this is administrative in
15 nature, and so a lot of the objections I'm used to dealing
16 with are sort of out the window.

17 In relation to DEQ, no objections to their
18 exhibits.

19 Based on the withdrawal in relation to Brook, I
20 would echo the objection to Brook 6, Sections A and B,
21 which I understand to be about 13,000 pages of
22 miscellaneous correspondence, emails, internal/external,
23 mainly for the purpose of saying that I cannot conceive
24 that all 13,000 pages are relevant to the issues we'll be
25 dealing with today.

1 In relation to Big Horn -- or to -- yeah, to Big
2 Horn Coal, no objections.

3 And to Powder River Resource Basin Council [sic],
4 no objections.

5 CHAIRMAN BAGLEY: Thank you.

6 Ms. Boomgaarden.

7 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

8 Big Horn Coal has no objections to DEQ exhibits,
9 no objections to PRBRC exhibits, no objections to Fisher
10 exhibits, and with the withdrawal of Brook Exhibits 3, 4
11 and 5, would just like to put on the record a similar
12 objection with regard to Brook 6.

13 We are happy to stipulate to anything that is a
14 portion of the official DEQ record that is available to the
15 public. Without the ability to review all 13,000 pages of
16 that, if they would -- if Brook would like to certify or
17 somehow otherwise demonstrate for the commission, if
18 they're going to put those on, that these are part of the
19 DEQ report and would be publicly available, we'd be happy
20 to stipulate at that time, but would like to reserve the
21 right at -- as to those exhibits or that exhibit to raise
22 objections at hearing.

23 CHAIRMAN BAGLEY: All right. Okay. Thank
24 you, everybody.

25 And I have -- I've looked at the list of the

1 exhibits. Obviously the exhibits don't become available to
2 us to see until people present them, but I have looked at
3 the list, and I must admit some of the lists are very long.
4 And, frankly, I don't want to see all those exhibits during
5 this hearing, but I am going to receive all of them, with
6 your objections noted. And if the -- the -- with the
7 exception being that if Brook 6 is brought forward, I will
8 entertain specific objections at that time, because I don't
9 want to do 13,000 pages either, so...

10 But at this point I'll entertain the specific
11 objections for that exhibit at this time -- at that time.

12 And so, Jim, anything else I need to do on that?

13 (DEQ Exhibit Nos. 17-33 and
14 35-36; Brook Mine Exhibit Nos. 1,
15 2, 7-13; Big Horn Coal Exhibit
16 Nos. 1-19; PRBRC Exhibit
17 Nos. 1-90; Fisher Exhibit
18 Nos. 1-26 received in evidence.)

19 MR. RUBY: No. But if you want, if you
20 just want to give me a couple minutes so I can enable them
21 all, or you can just go ahead and proceed.

22 CHAIRMAN BAGLEY: We can go ahead, because
23 the witness we're on is going to be --

24 MR. RUBY: Yeah.

25 CHAIRMAN BAGLEY: All right. Thank you.

1 So, you know, just as a reminder to everybody, we
2 are only here for relatively short time. I mean, it's just
3 this week. So as I looked at that list last night of
4 exhibits, I started to wonder if we'd be here until
5 midnight every night going through these, so I'd like to
6 encourage everybody to keep moving right along. Council
7 members will -- are able to examine, think about the
8 relevance of things as we go. So let's kind of try to keep
9 moving this along.

10 So yesterday we were in the middle of testimony
11 by Mr. Kristiansen. And if we are ready to resume.

12 Mr. Kuhlmann, please.

13 MR. KUHLMANN: Thank you, Mr. Chairman.
14 Andrew Kuhlmann, Wyoming Attorney General's Office. We'll
15 be continuing our testimony of Mr. Bj Kristiansen.

16 BJARNE KRISTIANSEN,
17 called as a witness on behalf of the DEQ, having been
18 previously sworn, testified further as follows:

19 DIRECT EXAMINATION (CONTINUED)

20 Q. (BY MR. KUHLMANN) Mr. Kristiansen, yesterday I
21 believe we stopped while we were talking about the mine
22 plan, which is Exhibit DEQ 12. Do you have that in front
23 of you?

24 A. I do.

25 Q. Can you turn to what is -- can you tell us what

1 the mine plan says regarding how coal will be transported
2 in and from the Brook Mine?

3 A. Yes, I can. Coal will be transported in and
4 from the Brook Mine in large semi trailer trucks with
5 tandem trailers in behind the semi truck, over-the-road
6 vehicles that will be loaded in the pit and then
7 transported up -- up the ramp to the haul road system and
8 then leave the mine property.

9 Q. Are those trucks the same kind of trucks that
10 are used in, say, the -- the North Antelope Rochelle Mine
11 to haul coal around that mine?

12 A. No. These are significantly different vehicles.

13 Q. Does the mine plan discuss what types of roads
14 will be used at the Brook Mine?

15 A. It does. There are several classifications of
16 roads to be used in the Brook Mine.

17 Q. Can you explain what those classifications are?

18 A. Certainly. Primarily haul roads, which are the
19 large-scale roads utilized for the haulage and general
20 mine utilization by pickups and service vehicles. There
21 are access roads that we get from point A to point B in
22 and around the mine for smaller vehicles, pickups and
23 service vehicles. And there are two-track roads that will
24 be around the perimeter of the mine to access things like
25 monitor wells and other monitoring sites out in the

1 periphery of the mine.

2 Q. Does the mine plan indicate where the different
3 types of roads will be located?

4 A. There are indications of where the haul road
5 system and access road system will be.

6 Q. Do you -- the roads that Brook Mine will use, do
7 they have to be designed to meet DEQ performance
8 standards?

9 A. They do.

10 Q. Can you explain some of the process for review
11 and what's required for those designs?

12 A. Primarily we examine the nature of the road and
13 the use of the road that will be used for both short term
14 and long term. And then we require certain specifications
15 be put into place in the mine plan to cover those roads.
16 The primary roads that are to be designed by engineers are
17 the haul roads. They must undergo a series of evaluations
18 by a professional engineer, designed by a professional
19 engineer and certified by a professional engineer before
20 they can be used. Any haul road that does not go through
21 that process cannot be used by the operator.

22 Q. Does DEQ -- oh. Excuse me.

23 After the roads are designed and constructed,
24 does Brook Mine need to maintain those roads to make sure
25 they're in condition to comply with conformance standards?

1 A. They do.

2 Q. Is Brook responsible for reclaiming the roads it
3 uses as haul roads?

4 A. They will be.

5 Q. And when will that reclamation occur?

6 A. Reclamation will occur over different periods of
7 time depending on how the mine sequence is occurring. And
8 reclamation may not necessarily be due to mining
9 conditions, but could be due to other kinds of conditions
10 we find in and around the mine. Topographic conditions,
11 water conditions if there are rains, other kinds of
12 conditions that come and go over time may need to be
13 accounted for.

14 Q. Will the coal -- under the -- the Brook Mine
15 permit currently, will the coal be transported by rail?

16 A. It will not.

17 Q. Was there any previous version of the permit
18 application that included a rail transportation?

19 A. There was.

20 Q. Can you describe what that -- what that plan was
21 at the time?

22 A. I can. In the original version of the permit
23 application, the railroad loop was built into the mine
24 plan system to utilize the train tracks and the trains
25 available on the BNSF to haul the coal to whatever --

1 wherever the -- the customers were and whoever wanted the
2 coal could get to it via rain -- or via train and vehicle
3 haul.

4 One of the things we found in that particular
5 instance was that there were considerations that
6 essentially disqualified that train track for various and
7 sundry reasons. There were difficulties involved in that
8 railroad loop, it was very confined area and very
9 difficult to work in. And so we gave Brook Mine the
10 option to reassess that particular railroad loop, which
11 they did in subsequent mine plans.

12 Q. Do you recall around what round of comments that
13 was changed?

14 A. Second round of comments. Or I shouldn't say
15 that. The first round that came out of us, responses that
16 came back were the ones that addressed that
17 satisfactorily.

18 Q. Okay. Does the permit application include any
19 agreements for road use with any governmental agencies
20 or -- or governmental entities?

21 A. There are no agreements that we know of at this
22 time. But that's not something we enforce. And it's
23 something they will have to address. We cannot enforce
24 it. So that's as far as we go in the permit -- in the
25 permit application.

1 Q. So does a permit application -- is it required
2 that a permit application include agreements with, say,
3 the County or Department of Transportation?

4 A. It does for various and sundry groups they'll be
5 dealing with, particularly the county and state, both
6 county roads and highways.

7 Q. Is that required to be in this permit
8 application?

9 A. The narrative in the mine plan essentially
10 determines who those individuals are, what those
11 corporations are that are going to be utilized. And the
12 generalities are in the mine plan. The specifics of the
13 agreements they have are not necessarily part of the mine
14 plan.

15 Q. Moving to a slightly different topic. Does the
16 permit -- or permit application describe how the mine will
17 control air pollution?

18 A. It does.

19 Q. Can you explain a little bit more about what the
20 mine -- what the permit application says about that issue?

21 A. Primarily what they will do is they'll control
22 the dust and all the access areas and in the pits by
23 applying water, utilizing water trucks, to haul roads in
24 those areas. There will also be water utilized in the
25 crushing devices in some cases, depending upon the

1 dustiness of the coal in those particular areas, because
2 dustiness can change over distance in coal beds. And
3 we'll monitor those circumstances and keep that dust down
4 to a minimum. They'll reduce all hauling and loading in
5 the pit to the bottom of the pit in the ramp, and utilize
6 the surface above the pit only for transportation of coal
7 product to the access area that leaves the mine site.

8 Q. Does the DEQ Land Quality Division enforce air
9 pollution -- air pollution procedures that you just
10 discussed?

11 A. They do not.

12 Q. Who does?

13 A. That would be the Air Quality Division of
14 Wyoming DEQ.

15 Q. Does the Brook Mine need to obtain an air
16 quality permit from the Air Quality Division of DEQ?

17 A. They will need to obtain that permit.

18 Q. Do you know if they have?

19 A. Best of my knowledge, they have obtained that
20 permit.

21 Q. Does DEQ have any -- does DEQ Land Quality
22 Division have the ability to enforce the air quality
23 permit?

24 A. No, we cannot.

25 Q. Moving to another topic. Still within the mine

1 plan.

2 Does the Brook Mine permit area overlap any
3 other mine active planning permit areas?

4 A. Yes, it does. It overlaps two other mining
5 areas currently permitted by LQD.

6 Q. Can you explain what those are?

7 A. One of those, the Big Horn Coal mine, as we
8 noted in the past. There are overlapping permit
9 boundaries in the southeast part of the permit application
10 area. There's also the Taylor Quarry that has a permit to
11 mine scoria just north of the interstate. And that permit
12 also overlaps the Brook permit application boundary.

13 Q. Is it common for coal mines to have overlapping
14 permit areas?

15 A. It isn't uncommon. It's something that does
16 occur within the Powder River Basin, in 14 cases that I
17 know of exactly where there is overlapping mine permits.
18 They both are responsible for specific areas.

19 Q. Are how does DEQ regulate the mines in the lands
20 in the overlapping permit areas?

21 A. We regulate those lands just as if the mine were
22 a stand-alone unit, as if those overlapped lands did not
23 have another mine permit on them. So we ascertain that
24 full responsibility for reclamation liability is -- is due
25 to both parties involved. So we treat those as individual

1 parties so there's always reclamation performance bond in
2 place on the overlap area.

3 Q. Does the permit application address what you've
4 just discussed about bonding in the overlap area?

5 A. It does.

6 Q. Where does it discuss it?

7 A. It discusses that in the part of the mine plan
8 that discusses the bond occurrences, it discusses the
9 nature of the bonds that occur in those overlapping areas,
10 as well as the nature of the overlapping resources that
11 also exist in those as far as buildings and haul roads and
12 other things.

13 Q. Does any other part of the permit application
14 address the bonding and the overlapping area?

15 A. Reclamation also addresses some of those topics.

16 Q. Just for clarity of the record, did you mean to
17 say the reclamation plan?

18 A. Yes. Excuse me. The reclamation plan.

19 Q. And we will talk about that here in a little
20 bit.

21 Before we move to some of the addendums of the
22 mine plan, were there any items that you testified about
23 yesterday that you might want to clarify today?

24 A. Could you be more specific?

25 Q. Were there any items that you testified about

1 yesterday that you might want to clarify a little bit
2 today?

3 A. One of those items was probably the AVF
4 determination that I made. It was a circumstance that it
5 took us quite a while to do some of the science that
6 needed to be done in that particular area. And during
7 that process, Brook Mine had submitted their AVF
8 discussion in the permit application. We found that their
9 discussion in that part of the permit application was
10 technically adequate. And so at that point in time
11 discussion -- that narrative in that area was essentially
12 put to bed. I subsequently found that there was a small
13 AVF in the northwest corner of the permit area that
14 included that in some of my memorandums we looked at
15 yesterday.

16 Q. And which -- so you were just discussing the AVF
17 determinations near Slater Creek; is that correct?

18 A. Exactly.

19 Q. I think you testified yesterday that those AVF
20 areas would not be affected by mining operations.

21 A. They will not.

22 Q. Is that correct?

23 Can you explain why they won't be affected?

24 A. Two different aspects of that. One is they do
25 not directly affect the surface of the area. They

1 maintain a certain distance -- specific distance away from
2 the active portions of Slater Creek that appear to be
3 sufficient to ensure that the creek itself will not be
4 impacted by surface activity.

5 There's also another boundary in there that
6 normally we don't see. And that's the boundary of the
7 extension of the mining panels possibly beneath Slater
8 Creek. What they've done is they've terminated those
9 panel underground approximately 100 feet away from where
10 Slater Creek is inscribed into the landscape. So the
11 final panel exists 100 feet away from wherever Slater
12 Creek is, though it is at depth below that, what is
13 determined was we wanted to ensure that if subsidence
14 occurs which is not planned, that Slater Creek will not be
15 impacted by that.

16 Q. When you mentioned a hundred feet away from
17 Slater Creek, does that imply in total over Slater Creek,
18 or does that apply on either side of Slater Creek?

19 A. That would be the center of Slater Creek. Right
20 down the middle of the stream.

21 Q. Okay. Yesterday you also testified about the
22 oversight in DEQ of the Brook Mine permit application's
23 processing, correct?

24 A. Correct.

25 Q. I think you mentioned Mr. Alan Edwards was

1 involved in that oversight?

2 A. Yes, he was.

3 Q. Was there anyone else that was involved in
4 overseeing the decisions made on the Brook Mine permit
5 application?

6 A. We utilized a chain of communication, a chain of
7 command in the process. If I at any point in time
8 encounter questionable information or materials that I
9 didn't understand the statutes or the rules and
10 regulations on, I went to my direct supervisor,
11 Mr. Mark Rogaczewski, who is the District 3 supervisor.
12 And I would go to Mark and try to determine what rules and
13 regulations are statutory and compliances had to be met.

14 If both of us came to a stopping point where we
15 could not answer the question, we then contacted our
16 superiors in Cheyenne and asked them their opinions of the
17 legalities of some of these narratives or inside the mine
18 plan, reclamation plan, and the rest of it.

19 We also worked with the Attorney General's
20 Office to help us with those, particularly with the legal
21 aspects in the adjudication files. So we had that process
22 in place, system of communication, so we could make
23 determinations on the Brook Mining permit application.

24 Q. Thank you.

25 Were those the items that you wanted to correct

1 from yesterday?

2 A. They were.

3 Q. Go ahead and let's take a look at a couple of
4 addendums to the mine plan. Could you please turn to
5 DEQ 12-314.

6 A. I'm there.

7 Q. Okay. Can you tell us what this part of the
8 mine plan is?

9 A. This is the fire control and prevention plan for
10 the mine plan operation.

11 Q. Is there an addendum number for that?

12 A. There is an addendum number for this. It is
13 called Addendum MP-5-3.

14 Q. Can you tell us what the purpose of the fire
15 control plan is?

16 A. This plan establishes a system and puts
17 mitigation system in place in case the mining operation or
18 the other operations of the mine encounter fires, both
19 either the surface or subsurface.

20 Q. Does the fire control plan include procedures
21 for how the mine might respond to fires that occur in
22 coal?

23 A. It does in a narrative degree.

24 Q. Can you explain what you mean by that?

25 A. There are what we consider to be general

1 mitigation aspects that are put into place, narrative
2 communication aspects that essentially wait for a
3 circumstance to occur, and then different specifics can be
4 put into place. Each of these areas are site specific,
5 and so some of the mitigating factors have to be decided
6 at that point in time.

7 So what they've done is they've given us a
8 general discussion of the process that they're going to
9 use with the caveat, the understanding, that there would
10 be specific instances and specific bits and pieces of
11 information that would be put together to properly treat
12 the mine fire.

13 Q. Is there a regulatory entity that would enforce
14 the actual response to a particular fire?

15 A. Yes. That would be the Mine Safety and Health
16 Administration, MSHA. They are the ones that oversee the
17 ground control program for fire, other safety related
18 items in the Brook Mine.

19 Q. So if a fire occurred, what would MSHA's role be
20 in -- in regulating the permit?

21 A. Their enforcement capacity would be to ensure
22 that the fire was put out and did not have a chance of
23 coming back again in that particular area.

24 Q. Does the DEQ Land Quality Division enforce
25 making sure that mine fires are put out?

1 A. We do not enforce mine fire extinction.

2 Q. Does a fire control plan have to include
3 specifics mirroring the MSHA regulations?

4 A. No, it does not. Since we do not enforce the
5 fire protection plan, we only need those general
6 narratives that are in the mine plan.

7 Q. Can you describe what maybe the purpose of --
8 DEQ Land Quality Division's not going to enforce the
9 ground control plan. Why is it -- is it important to make
10 sure there's a narrative discussing the fire control plan
11 in the mine permit application?

12 A. The fire control plan could affect other aspects
13 of mining. So they could affect other aspects of the mine
14 plan and reclamation plan over time. So that's primarily
15 one of the reasons we need to know there are circumstances
16 that have been put into place to address some of these
17 issues on other mining aspects. Not just the fire itself,
18 but possible ignition of vegetative material up on top.
19 Possibly slumping of highwalls by undercutting by mine
20 fires. These are kind of things we need to know about in
21 order to address the other aspects of the mine plan.

22 Q. Does the fire control plan inside the Brook Mine
23 permit application, does that address those issues you
24 just mentioned?

25 A. It does address those issues.

1 Q. Is it, in your opinion, technically adequate?

2 A. It is technically adequate, yes.

3 Q. I'll have you turn now to DEQ -- or page DEQ
4 12-319.

5 A. I am there.

6 Q. Can you tell us what this part of the mine plan
7 is?

8 A. This is Addendum MP-6, which is subsidence
9 control plan.

10 Q. Can you tell us what the purpose of the
11 subsidence control plan is?

12 A. The subsidence control plan has several aspects
13 to it. One is to analyze potential of subsidence within
14 the mine area. Obviously, we're going underground with a
15 piece of equipment in this mine, and so subsidence control
16 is of key importance to the mine plan. Had to establish
17 the possibility of subsidence and then establish possibly
18 the nature of subsidence. How large of area might it
19 occur?

20 After working through computer models and
21 utilizing formulas developed by the Office of Surface
22 Mining, it was determined this would be nonsubsiding mine.
23 And so that is the way it's permitted, as nonsubsiding
24 mine.

25 Q. Who created the subsidence control plan in this

1 permit application?

2 A. That would be Cardno Company.

3 Q. Are you familiar with that company?

4 A. Vaguely familiar with that company. I know of
5 them a little bit. I know they're a very, very large
6 company, with many offices and a lot of employees that
7 work in underground mining.

8 Q. Who reviewed the subsidence control plan in DEQ?

9 A. I reviewed the subsidence control plan.

10 Q. Do you have past experience reviewing subsidence
11 control plans in applications?

12 A. I do not have past experience in reviewing these
13 in applications, no.

14 Q. Have you had any training on reviewing
15 subsidence control plans?

16 A. I have.

17 Q. Can you explain -- or tell us a little bit about
18 that training?

19 A. The training was twofold. First of all, it was
20 experiential training in the field. In a coal mine that I
21 worked at, there were a lot of underground mines in coal
22 beds we were mining. And a lot of these underground mines
23 were not very well mapped. This is in the Hanna area. I
24 lived in Hanna, Wyoming. And a lot of those old
25 underground mines were not mapped. There were so many of

1 these ma and pa mines, a lot of these mines just went off
2 into the hill somewhere. Those were almost impossible to
3 find out where they were at.

4 So I had the task put before me to find the way
5 to walk the dragline across these voids. And so I
6 initiated a drilling program, again, using my analysis of
7 strength of those materials and ascertained we could walk
8 the dragline across the voids. We walked across the voids
9 successfully.

10 As far as the analysis for the permit itself,
11 for the permit application, I had to attend some training,
12 get more familiar with how to determine subsidence.
13 Rather than the field version of drilling until we find
14 voids and work with those, I had to understand some of the
15 theory behind subsidence so I can at least judge the
16 document for its worth.

17 Q. When you're referring to the purpose of the
18 application, are you referring to the Brook Mine permit
19 application?

20 A. I am.

21 Q. Can you tell us a little bit more about that
22 training?

23 A. I attended OSM training on a subsidence class in
24 southern Illinois. It was in the spring of 2015. And we
25 analyzed all kinds of subsidence from different kinds of

1 underground mines, as well as highwall mining. And came
2 to find out what some of the parameters are that I needed
3 to examine to determine whether or not the mine plan, as
4 it addressed subsidence, was adequate.

5 Q. I'm not sure if it's been fully spelled out yet
6 in the record, but can you explain what OSM means?

7 A. That was the Office of Surface Mining.

8 Q. And that's a federal regulator?

9 A. It is.

10 Q. Can you describe how you reviewed the subsidence
11 control plan in this permit application?

12 A. There was a primary component in review of the
13 subsidence control plan was to break it up into couple
14 different options. The first one was a historical record
15 in that particular area. The mines in the Sheridan area
16 all subsided at one point in the past, sooner or later.
17 The type of mining they utilized here, room and pillar
18 method, was a recovery method where they utilized both
19 room and pillar techniques until they were ready to mine
20 back out of the mine. When they backed out of the mine,
21 they began removing all the pillars they had left in place
22 before for the support of the roof. In doing that, the
23 mine subsided. All the old underground mines then
24 subsided primarily due to the mining technique. It's
25 called retreat mining, where you back out of a mine like

1 that, robbing the pillars. They get the maximum coal
2 recovery they can do by doing that.

3 There were other types of mines that occurred in
4 other parts of the country. Longwall mining, which is
5 totally different than this, it does plan for subsidence.
6 It's actually an aspect of longwall mining that is planned
7 for and allowed for. I have actually seen in southern
8 Illinois panels that subsided not just houses, but towns.
9 And so they know how to deal with subsidence. And when I
10 took my class, that is where I went to.

11 The area that we're dealing with here, north of
12 the interstate in the Brook Mine permit area, has also had
13 old subsidence from those room and pillar mines. This is
14 a totally different mining technique than what we're
15 discussing with highwall mining.

16 Q. Can you describe what you looked at when you
17 were reviewing the subsidence control plan.

18 A. I looked at, like I said, the history of the
19 mining area and what the occurrences were of the
20 subsidence. And I also examined some of the rock
21 mechanics that were characterized by a laboratory analysis
22 of the roof, the coal, the floor materials, that is, the
23 materials above the coal, the coal itself, to act as a
24 strengthening support, and then the materials below the
25 coal. There were some limited lab analysis performed on

1 those materials to try to determine some of the basic
2 characters of pressures that they could withstand, as well
3 as the discussion as to the nature of those kinds of
4 forces and how they would react to highwall mining. Very
5 specifically.

6 Q. I'll have you pick up a different binder. And
7 it's the one that includes multiple DEQ exhibits. And
8 have you turn to tabs for DEQ Exhibits 17, 18, 19 and 20.
9 I'll give you a minute to just take a look at those.

10 Do you know what those documents are?

11 A. I do. These are portions of textbook that I
12 used in my subsidence class.

13 Q. Can you explain a little bit where those come
14 from?

15 A. These are created by the Office of Surface
16 Mining, and related to underground mining in this class.
17 And the chapters that exist here are those I utilized to
18 help assess the Brook Mining application. And so these
19 are the ones I pored over many, many times when I was
20 trying to determine the subsidence mechanics of this
21 particular area.

22 (Council Member Degenfelder
23 is now present.)

24 Q. (BY MR. KUHLMANN) Okay. When you evaluated the
25 subsidence control plan, did you try to run the model that

1 was used to create the control plan?

2 A. I did not.

3 Q. And why didn't you?

4 A. We received the data that was utilized for
5 modeling. And the model itself was described as a very
6 specific model that the Office of Surface Mining uses all
7 over the country to try to predict subsidence in areas
8 where we have coal as primarily the supporting structure
9 for the overburden material. And the materials then were
10 utilized by Cardno to determine the mechanics of the
11 actual subsidence itself, if it were to occur. These are
12 levels of expertise that are significantly higher than I
13 have. So the only thing that I was comfortable in doing
14 was analyzing the results to make sure that they looked
15 like something that would be feasible in this particular
16 case.

17 Q. Did Cardno provide any certification of their
18 model work?

19 A. I don't remember.

20 Q. Okay. Does DEQ need to run a subsidence model
21 in order to review a subsidence control plan?

22 A. No, we don't. I can make a couple of
23 assumptions when we get the information. One, the data is
24 accurate and it is as represented, because it comes from a
25 consultant, generally. An independent lab that is running

1 these analyzes that has really no association with the
2 mining company or a consultant. These particular
3 laboratories are known for their accuracy and their
4 fairness in dealing with others and their -- their
5 standing in the community as being -- dealing with others
6 in a -- in a tried and true way without actually
7 embellishing anything coming out of their laboratory.

8 Q. I think you mentioned earlier that highwall
9 mining at Brook Mine's not predicted to cause subsidence.

10 A. Correct.

11 Q. Can you tell us why?

12 A. There are several reasons. The model they ran
13 indicated that it would not subside, utilizing all the
14 variables that were known about the area at that time.
15 There's also a rule of thumb the Office of Surface Mining
16 has established over the years, that if you mine an area
17 and only recover 50 percent or less of coal, the mine will
18 not subside. This is a statement they've made over and
19 over again in many legal cases, and so it's a fairly
20 accurate rule of thumb in most of these areas where
21 subsidence is being under question.

22 Q. Do you know if the historic underground mines in
23 the area were considered in the subsidence program?

24 A. They were.

25 Q. Can you explain how those were considered?

1 A. They were considered primarily by, first of all,
2 mapping the areas the underground mines occurred in. The
3 maps that were provided by Brook in their permit
4 application were the most complete maps I've ever seen of
5 these underground mines. Primarily we have old surveyor's
6 maps and old mine maps from those underground mines from
7 the 19-teens, the 1920s, all way up to 1950s, but there
8 have never been one document or one map where they're all
9 put together. And Cardno and Brook and Western Water
10 worked over these and brought them all into one map. So
11 they were well aware of what mines existed in the area
12 they were at. They didn't have to go from map to map to
13 map to map and risk missing things.

14 Q. Under the permit application is highwall mining
15 going to occur near any historic underground mines?

16 A. Yes, it is.

17 Q. Can you explain how near that might be?

18 A. At present the panels are determined to exist up
19 to approximately 500 feet away from the old underground
20 mines. This is in case that some of the old underground
21 mines have not been mapped accurately. I will assume the
22 underground mines in some cases have not been mapped
23 accurately. And we want to leave a buffer in place just
24 in case they began to encounter some of those underground
25 mines prematurely. So the 500-foot buffer was put into

1 place for panel lengths.

2 Q. Even though subsidence is not predicted to occur
3 for the Brook Mine, is there anything in the mine plan
4 that describes how the applicant would address subsidence
5 if it does occur?

6 A. There is.

7 Q. Can you explain a little bit what the mine says
8 on that?

9 A. Again, there's a subsidence control plan that's
10 been placed into the mine plan itself to determine whether
11 or not subsidence will occur. If it occurs, what the
12 mitigation effects will be. There is a series of
13 possibilities that they will explore if subsidence shows
14 up. Different kinds of areas will have different kinds of
15 subsidence. And different areas are more critical to
16 subsidence than others.

17 Obviously, if it's beneath a stream or a wetland
18 or some other area like that, extremely severe. Other
19 areas out on the prairie, there might be a small -- let's
20 say a small crater, 3 feet deep and 10 feet wide, not
21 quite as critical as some of those other ones. Even there
22 they've got to subsidence control plan even for the
23 smallest ones, where they will institute a monitoring
24 program, observe the subsidence as -- as it goes through
25 mining process, start building reclamation plan for the

1 reclamation phase of the mine, in case it needs to be
2 reclaimed. Have all that in place about the time the
3 reclamation occurs in that particular area.

4 And so their control plan, essentially, is to
5 look for subsidence, control the subsidence and reclaim
6 the subsidence if and when that occurs.

7 Q. Will DEQ be involved in the reclamation
8 decisions made if subsidence occurs?

9 A. We will be implicitly involved with all of that.
10 One of the commitments they have made is that we will very
11 much dictate a lot of the procedures that take place
12 within that mitigation.

13 Q. Have you turn now to page DEQ 12-239. I
14 apologize. We're moving back to the mine plan.

15 A. Okay. Thank you.

16 Q. Exhibit 12. Apologize.

17 So pages --

18 A. Please give me the page again.

19 Q. That's DEQ 12-239. Apologize. I may have the
20 wrong page number.

21 A. Okay.

22 Q. Okay. I will not ask you about that.

23 A. Okay.

24 Q. It was not very --

25 A. Okay.

1 Q. Okay. We found it. It's page 12-23 --

2 MR. LAROCK: It's 329.

3 Q. (BY MR. KUHLMANN) 329.

4 A. 329. Okay.

5 MR. KUHLMANN: Thank you, Mr. LaRock.

6 A. And I am at page 12-329.

7 Q. (BY MR. KUHLMANN) Do you recognize this
8 document?

9 A. I do.

10 Q. Can you tell us what this document is?

11 A. This is a large-scale broad-scale map, general
12 location map of some of the trenches, some of the panels
13 they'll be utilizing in their highwall mining technique,
14 and some old underground coal mines that exist within the
15 permit boundary of the Brook Mine permit application.

16 Q. Does this map show mine panels related to pit --
17 or trench TR-1?

18 A. It does.

19 Q. Can you remind the council where that's located?

20 A. TR-1 is in the southeast corner of both the
21 Brook permit application area and the Big Horn mine permit
22 area.

23 Q. Are the mine panels described on this map the
24 current designs for the mine panels in the mine -- in the
25 other parts of the permit application?

1 A. These are not as current as some of the -- the
2 other information that was put forward previously. The
3 information that we looked at with the dated panels that
4 will take place over month and year are much more current
5 than these are. These are primarily visual aids to help
6 the reader understand the general occurrences of the pits,
7 the panels and the mine plan itself to help them
8 understand in a broad general way where it's at, what is
9 entailed. The ones we really observed for exact mining
10 details of those maps that we looked at earlier and each
11 panel by month and by year for the first five years.

12 Q. Was that the map that I think we referred to, in
13 short, as the Skittles map --

14 A. Yes, it was.

15 Q. -- or the rainbow map?

16 Can you describe how the mine panel shape has
17 changed -- or I guess how it's different between the map
18 that I'm showing you now and the map that you discussed
19 yesterday?

20 A. The primary difference is in the TR-1 pit area
21 down in the southeast corner. The entire system there was
22 moved 1700 feet to the south to move away from some of the
23 Big Horn Coal Mine buildings and other appurtenances
24 there. They are trying to avoid all those areas so they
25 don't have needless problems with Big Horn Coal services

1 and their buildings.

2 Q. When that mine panel was -- or that trench was
3 moved south, the place of the mine panel was moved south,
4 as you just said --

5 A. Correct.

6 Q. -- does that make it closer or further away from
7 the Tongue River?

8 A. It's further away from the Tongue River.

9 Q. All right. Thank you.

10 Go ahead and have you close up DEQ Exhibit 12.

11 We'll pull out DEQ Exhibit 13.

12 A. Give me a moment to -- Exhibit 13.

13 Q. Do you know what this document is?

14 A. Yes, I do.

15 Q. Can you tell us a little bit about it?

16 A. This is the reclamation plan for the Brook
17 permit application.

18 Q. What's the purpose of the reclamation plan?

19 A. The purpose of the reclamation plan is to give
20 us a tool to enforce reclamation of the mine area so that
21 any damage that is done by the mine, any modifications to
22 the overburden material, the coal itself, vegetation,
23 wildlife, can all be mitigated at one -- one time or
24 another, so that when the coal mine is done and the
25 reclamation is finished, the land use can recur to at

1 least equal or better than the original land use. So it's
2 close to approximate original --

3 THE REPORTER: I'm sorry. It's close to?

4 THE WITNESS: Original contour.

5 Q. (BY MR. KUHLMANN) Can you describe what you
6 mean by original contour?

7 A. Original contour is the basic shape of the
8 landscape. In this area you have a system of ridges and
9 valleys, and the reclaimed area has to include the system
10 of ridges and valleys. Not the very specific area where
11 they occur, but they must occur side by side just as
12 natural topography does now. That needs to be resculpted
13 in that manner.

14 Q. Is there a post-mine land use for the Brook
15 Mine?

16 A. There is.

17 Q. Is that described in the permit application?

18 A. It is.

19 Q. Can you tell us what that is?

20 A. Right now the post-mining land use is
21 principally for agricultural purposes, primarily grazing
22 land. And there's also some other aspects involved there.
23 For example, with the hunting walk-in area, that will be
24 fully reestablished again. The other uses -- recreational
25 uses, to a large degree in this particular area, will also

1 come back into play to a large degree than during the mine
2 life.

3 Q. All right. Does DEQ Land Quality Division have
4 control over the Game & Fish walk-in area program?

5 A. No. We do not.

6 Q. Do we know -- do you know yet that Game & Fish
7 will, with certainty, reestablish a walk-in area over the
8 Brook Mine permit area after mining is completed?

9 A. The indications that we have is what their
10 initial influence will be. For example, in retaining part
11 of the walk-in areas, they requested that we retain part
12 of that. So part of that is going to be retained. As far
13 as what DEQ -- or what Game & Fish does after the mine
14 plan and the mine is over, we don't know.

15 Q. I think you had mentioned that reclamation
16 includes contouring. Does it include replacement of
17 soils?

18 A. It does.

19 Q. Can you tell us a little bit more about that?

20 A. When the soils are removed, they are mapped.
21 Each topsoil stockpile has a quantity of topsoil known to
22 occur within that stockpile. We always keep inventories
23 of the topsoil and all the different stockpiles so we know
24 exactly how much topsoils exists to place back on top of
25 the cuts as they are reclaimed. Once the cuts have been

1 utilized through the mining purposes and the material is
2 pushed back into the pit, the overburden material, then
3 those different pieces of topsoil will be put back in
4 place on top of those mined-out areas in thicknesses that
5 equivalent -- that are equivalent to premining conditions.

6 Q. You mentioned topsoils stockpiles. Are there
7 any other types of materials that need to be stockpiled?

8 A. Yes. There will also be overburden stockpiles.
9 Since this is a single trench operation rather than a
10 conventional surface mine, there's not a lot of area to
11 put top -- or spoil material at this point in time. So
12 material will be removed from the trench and laid next to
13 the trench. It's ready to be pushed into the hole with
14 dozers later during the reclamation phase.

15 Q. Where -- on what type of soil are overburden
16 stockpiles placed?

17 A. Stockpiles are generally placed on topsoil,
18 topsoil stockpiles. Overburden stockpiles are placed on
19 lands that have had the topsoil removed and the growth
20 mediums removed first.

21 Q. So just to clarify there, topsoil piles are
22 placed on top --

23 A. On topsoil. Overburden piles are placed on
24 overburden, for all intents and purposes.

25 Q. Thank you.

1 Does the -- does reclamation include
2 revegetation?

3 A. It does.

4 Q. Can you tell us a little bit more about what is
5 required there?

6 A. Vegetation studies are performed prior to mining
7 to establish a baseline. During the mining phase, the
8 vegetation is continued to be analyzed and monitored to
9 allowed for climatological changes over time. The
10 vegetation you see today may not be the vegetation that's
11 there tomorrow. Very contingent upon the nature of the
12 materials that are being examined as well as the climate.

13 In this particular area that we live in, this
14 has been a good year so far. Fully expect to see good
15 growth in the vegetation. A number of years ago there was
16 terrible growth in the vegetation. We were receiving 7 to
17 8 inches of rainfall in a year, during that drought in
18 late 1990s and early 2000s. And so the vegetation at that
19 point in time was almost a completely different suite than
20 exists now.

21 So the vegetation, after long study over periods
22 of time to allow for the variance -- natural variance in
23 vegetation has been replaced in a manner that will fit
24 that particular scheme of it.

25 Q. When does -- when does the responsibility for --

1 when does Brook's responsibility over revegetation efforts
2 end?

3 A. It ends after a period of time where final
4 reclamation is observed for -- for lengths of years. And
5 dependent upon the nature of the material, how long it's
6 been since mining has occurred, the length of time it
7 takes for that kind of material to reclaim and for
8 vegetation to sprout and become fully ensconced in the
9 area. After at least five years of observation. Then we
10 can begin thinking about removing some of the -- the
11 amounts we have in the reclamation bond to reestablish
12 vegetation.

13 Q. Can it take longer than five years?

14 A. It can. In some areas, low rainfall and high
15 winds.

16 Q. And what happens to the reclamation bond if it
17 takes longer than five years?

18 A. Reclamation bond remains in place until it has
19 been declared by DEQ to be satisfactory.

20 Q. Okay. Is that as long as it takes to get that
21 declaration --

22 A. This is as long as it takes, yes. The Rosebud
23 Coal Mine in Hanna, Wyoming, one of the ones I worked at
24 many years, was in that phase for quite a long time, until
25 they finally came out of reclamation. It's the first mine

1 in Wyoming -- surface mine in Wyoming that underneath the
2 more or less modern rules and regulations that was
3 reclaimed standards and have the -- the permit was finally
4 allowed to elapse. So that mine is fully reclaimed and
5 stands as probably a model for a lot of the other mines.

6 Q. Does reclamation address structures or roads in
7 the permit area?

8 A. It does.

9 Q. What does reclamation of the structures require?

10 A. Reclamation of the roads requires moving of
11 materials that are nonsupportable to vegetation, to other
12 areas. A lot of scoria roads and the other roads of that
13 nature are generally -- will be picked up and placed in a
14 pit area somewhere where there's room to place the
15 material and make that part of the overburden material
16 again. And so they remove that from areas that need full
17 vegetation.

18 There are areas that are allowed to have roads
19 left in there. Sometimes the ranchers want to keep the
20 roads in that area, in which case the liability falls on
21 the ranchers, if they request that road to remain on the
22 ranch.

23 By and large, the roads in the reclamation area
24 are two-tracks. We try to keep as many roads out of the
25 reclamation area as possible. Obviously, we've got to

1 have some for access, things like monitoring wells,
2 weather stations and that sort of things. But they are,
3 by and large, two-track roads that are fairly easy to
4 reclaim by simply running over them with a disc and
5 placing some seed in there. So, yes, the roads that are
6 involved in this are generally of less impactful nature.

7 Q. What occurs to structures that might be in the
8 permit area during reclamation?

9 A. All structures that are -- are not spoken for,
10 are removed and reclaimed in a suitable manner, whether
11 they are resold for recovery of the materials to someone
12 else that may want to use the materials for -- steel, for
13 example -- or actually use the buildings again and rebuild
14 them. They can utilize them that way. Other bits and
15 pieces will be taken to a landfill. There are parts of
16 buildings, for example, or parts of facilities that are
17 not recoverable and the landfill will be utilized for
18 those.

19 The landfill can be in the mine permit itself.
20 There are solid waste disposal areas in most of the mines,
21 in some of the old worked-out pits where they can place a
22 lot of these materials. They don't have to haul them all
23 they way to, say, the Sheridan dump or something like
24 that.

25 Q. Is there a solid waste facility plan for the

1 Brook Mine?

2 A. There is not yet.

3 Q. If there was, is there regulation over that?

4 A. We do observe the -- the structures themselves.

5 One primary reason is to ensure the solid waste does not
6 ever encounter the groundwater system. So the solid waste
7 put -- is put in the old pit remains above the groundwater
8 table. We don't want that material in the groundwater
9 table. Though they are supposed to be benign materials,
10 we still want to ensure the groundwater table does not
11 intersect those in case there's something we missed.

12 Q. Would the Brook Mine permit need to be changed
13 in order for Brook Mine to construct a solid waste
14 facility in the future?

15 A. There is some minor discussion on those -- on
16 those aspects, but right now the plans utilize a
17 consultant, I should say, or a supplier of solid waste
18 disposal.

19 Q. So would that description have to be changed if
20 Brook Mine instead wanted to build a solid waste facility?

21 A. It would have to be modified so we knew the
22 location and the extent of the -- of the facility. And
23 also we do not actually oversee the administration of that
24 facility or the enforcement of that facility. We just
25 observe those as related to groundwater. The Solid and

1 Hazardous Waste Department of DEQ handles the actual
2 materials themselves and the condition of the materials in
3 the hole.

4 Q. Does restoration address hydrology?

5 A. Yes.

6 Q. Or reclamation. I apologize. Does reclamation
7 address --

8 A. Reclamation does address hydrology.

9 Q. Can you tell us little bit how that is
10 addressed?

11 A. Most cases the hydrology is addressed
12 straightforwardly, as it is in Appendix D6 in the mine
13 plan. What they're looking for is longevity and use in
14 the future, with the understanding that the general
15 hydrology of the system has now been influenced by a
16 trench, a 150-foot-wide, multiple hundred foot deep trench
17 that has intersected the groundwater systems. In the TR-1
18 pit area that is not as critical because that's an old
19 mined-out pit. So the upper two-thirds or three-quarters
20 of that pit has already been mined and put back in the
21 hole. So that groundwater system has already
22 reestablished itself in unconsolidated materials, which is
23 what will go back into that hole again is unconsolidated
24 materials. But changing hydrology in that particular area
25 has already happened.

1 Some of these other areas can move up into the
2 hills. Those dryer areas will influence the recharge in
3 some of those areas because it will then have fill
4 material in areas that used to have solid sandstone,
5 shales and coals. So what happened is those refill areas
6 will begin to recharge quicker than the normal areas would
7 recharge. And so this actually puts possibility out there
8 that seams, coal seams, and the other semi aquifers above
9 those might be able to recharge faster down dip from this
10 because they are now in this faster recharge.

11 So ultimately what will happen is the hydrology
12 of the area will reestablish itself and end up with a
13 long-term hydrology that fits our rules and regulations
14 and statutes.

15 Q. Was the groundwater hydrology modelled for this
16 permit application?

17 A. It was.

18 Q. Who reviewed that model?

19 A. Mr. [sic] Muthu Kuchanur reviewed that model,
20 from the Cheyenne office.

21 Q. On the same subject. You had talked a little
22 bit about yesterday about sampling of overburden; is that
23 correct?

24 A. Correct.

25 Q. You mentioned that Brook Mine had gone through a

1 pattern of sampling, that they were not able to -- I guess
2 they had -- they had gone through a pattern of sampling,
3 correct?

4 A. Correct. Initially, they did.

5 Q. Can you describe what that pattern was?

6 A. The initial pattern was a lot broader-scale
7 pattern. When you go into an area for primary
8 exploration, has never had any exploration holes drilled
9 in it, or you don't have access to exploration holes that
10 were drilled in it, you've got to drill a series of holes
11 with a pretty wide, all-encompassing area within the
12 permit application.

13 As you begin to put the information together and
14 see what kind of units are out there, you then have to
15 start in-filling some of those areas with further
16 information from the drill holes. Also, at that point in
17 time you have to start taking cores of the overburden to
18 try to characterize the chemical nature of the overburden
19 itself. So you know not just what material you're dealing
20 with, what the quality of the material's like at the same
21 time. So you can allow for the mine plan, reclamation
22 plan, and all the pieces that are needing to come together
23 for this entire permit application.

24 Q. Was the overburden sampling that DEQ -- or that
25 Brook Mine conducted sufficient to make the application

1 technically adequate?

2 A. It was.

3 Q. I think you mentioned yesterday the idea of
4 Brook Mine conducting some additional overburden sampling.
5 Is that correct?

6 A. Yes. Yes, I did.

7 Q. What would be the purpose of requiring Brook
8 Mining to conduct that additional overburden sampling?

9 A. Brook Mine, when they performed their overburden
10 sampling, did this 80-acre centers on drill holes. This
11 is twice the density required by many of the other coal
12 mines. They were very concerned with the nature of the
13 materials in the trench areas and just outside of trench
14 areas because there were -- there were multifold reasons
15 for this. Primarily because the highwall miner and the
16 highwall safety. So they did a lot more testing of those
17 materials for not just mechanics but quality as well.

18 They did the 80-acre spacing, which normally
19 required 160, which helped us generate a model -- a
20 stratigraphic model in that particular area, with the
21 ability to extrapolate from what we had, because it was
22 pretty dense in most of -- I'd say 85 percent of the area.
23 We can then build extrapolations to go into those areas we
24 wanted to have overburden control because of the reasons I
25 just specified, but were not absolutely necessary for

1 technical adequacy.

2 Q. So what would DEQ's Land Quality Division use
3 additional data in say that extra 15 percent of the mine
4 permit area for?

5 A. This would give us a little bit better level of
6 comfort, I should say, for lack of a better word, with the
7 information as is presented. So we feel it's fully
8 represented to the degree we would like to see it. The
9 statutes, rules and regulations have a degree that things
10 are brought to, and then we also have degrees of
11 completeness that we also like to keep in-house that help
12 us become more comfortable with these particular
13 properties in lieu of information in some cases.

14 Q. In your opinion, has the sampling that's
15 occurred met the requirements of the statutes and
16 regulations?

17 A. It has.

18 Q. Taking a look at page DEQ 13-075.

19 A. Okay.

20 Q. Can you tell us what the section marked as RP.12
21 refers to?

22 A. This is the reclamation and bonding of these
23 dual permitted areas we discussed earlier.

24 Q. And if you could mention a little bit about
25 bonding required in the dual permitted areas. Can you

1 explain what Brook Mine would be responsible for in dual
2 permit area?

3 A. Certainly. Brook Mine's responsible for all of
4 the activities that they have taken within those dual
5 permitted areas that relate to the mine plan and
6 reclamation. They're responsible for essentially every
7 drop of dirt that they move, every bit of topsoil that
8 they replace. So we have bond for every single thing that
9 they do. If, for example, they have were to leave the
10 area for whatever reason, we would have a full bond amount
11 for that overlap area. This protects not just the
12 citizens of the state of Wyoming, but the other company as
13 well. They would not be left with this bond liability.

14 Q. I think you mentioned earlier that the Big Horn
15 Coal Company has -- part of its permit overlaps with part
16 of the Brook Mine's permit.

17 A. Yes, it does.

18 Q. What would the responsibilities for bonding be
19 for the Big Horn Coal Mine based upon Brook Mine's permit
20 application?

21 A. Certainly. Big Horn's responsibility is for the
22 amount that they still have left of their final
23 reclamation phase of their mine. So they still have their
24 shop area and a little bit of a boneyard in front of the
25 shop. They still have their primary access road, which is

1 actually a haul road, that goes between that area that Big
2 Horn has and the county roads in two different directions.
3 They're responsible for that piece of the overlapping area
4 and that's it.

5 All the pastureland has already been fully
6 released. All of the areas that can be reclaimed for
7 those pastures and agricultural land has been fully
8 released. And only areas of those roads and those
9 buildings. That's it. So that's all they're responsible
10 for.

11 Q. If the Brook Mine disturbed areas in the Big
12 Horn Coal permit area that Big Horn Coal had previously
13 reclaimed, who would need to bond to reclaim that -- that
14 disturbance?

15 A. That surface disturbance would need to be bonded
16 by Brook Mine.

17 Q. Okay. When does reclamation of the mine begin?

18 A. Reclamation can begin, depending upon the
19 requirements of each mine. It's different for each mine.
20 There are different rationale for the reclamation
21 schedule. They're not the same for all mines, very
22 obviously. There are mines that reclamation can occur in
23 almost immediately, depending on the nature of the pits
24 being put in place. There are other areas that cannot be
25 reclaimed for long, long periods of times because they're

1 being used by the mining process.

2 Once the pits are mined through, they're very
3 contained in areas or other accessibility. Like I said,
4 there could be solid materials placed in those as a solid
5 waste dump. They can also be utilized as sumps. In a lot
6 of mines, the water doesn't occur uniformly throughout the
7 mine, unfortunately. It generally occurs in one or two
8 parts of the mine specifically, where you have a lot of
9 water that's gathered. And so that pit has been left open
10 in most of the coal mines in the eastern part of the basin
11 to gather water out of that particular area to use on the
12 rest of the mine.

13 So when they get into those areas further away
14 from the water facilities and don't have water they can
15 get to, they can haul to that particular area and utilize
16 it to knock down road dust, other kinds of dust, and for
17 other applications that are needed for that water. So
18 these different kinds of facilities may still be in place
19 for long periods of time. What they do is make the pit
20 stable so no subsidence can occur or slumping can occur,
21 no coal mine fires may start, stabilize everything in that
22 area, put structures into place to gather the water, for
23 example, that's a sump, and utilize that area for maybe
24 mine life in some cases, because some of the mines only
25 have those one or two areas that have water in them. The

1 rest of them are dry. So they have to use from that
2 original pit.

3 Q. Does the fact that water can infiltrate into an
4 open pit indicate there's a problem?

5 A. Not necessarily. Most mines in the Powder River
6 Basin do encounter water in the coal beds. By and large,
7 the coal beds are the primary aquifers in the basin.
8 Other aquifers that we see are generally little in nature
9 and smaller extent, and generally not suitable for
10 utilization as an aquifer with -- aquifer has to be fairly
11 reliable, provide a certain amount of water over a long
12 period of time. There are virtually none of those in the
13 Powder River Basin but the coal beds.

14 Q. If there's a pit that's left -- or stabilized to
15 be a sump for a period of time, does that pit still need
16 to be reclaimed --

17 A. Yes.

18 Q. -- through the mine?

19 A. It does. Absolutely.

20 Q. Is that pit bonded for reclamation?

21 A. It is fully bonded the entire life of the sump.

22 Q. If it's open for 10 years, it would be bonded
23 for 10 years?

24 A. Yes.

25 Q. Does the Brook Mine permit application describe

1 the geographic sequence of reclamation?

2 A. Yes, it does. It depicts the -- the mining to
3 occur from east to west and TR-1 pit area we discussed
4 earlier and all the way through to the western side of the
5 permit boundary over time. So it moves east to west.
6 Reclamation is slightly different. The first pit, TR-1
7 pit is going to be kept as a sump. Since that's in the --
8 down in the bathtub of the area there where we've got a
9 lot of available water, you can utilize that water in that
10 pit throughout mine life for all the different purposes
11 they need that for. If they were to fill that in and
12 reclaim it, it would be pinching off a major source of
13 water for them. They do not have water in that upper part
14 of that area because the reasons I explained, too close to
15 the outcrop, the aquifers do not contain any water, even
16 the coal is very, very dry in that area. So that
17 particular area needs that pit to stay open for mine life
18 so they can knock dust down and everything else.

19 The TR-2 pit to the rest of the pits, then, will
20 have concurrent reclamation taking place at some point in
21 time. So TR-2 will be initialized, remove the overburden,
22 remove the coal, do the highwall mining technique, pull
23 out of that pit, push the overburden in, reclaim it with
24 the topsoil. There's a series of events taking place to
25 try to remain as concurrent as possible.

1 There's a waiting period for the TR-2
2 reclamation, obviously, because you've got to mine it.
3 Once it's been fully mined and the miner has been moving
4 over to TR-3, for example, from TR-2, TR-2 can be fully
5 reclaimed. And so as typical in a lot of our mines,
6 we'll have one pit being reclaimed while the other one's
7 being mined.

8 Q. Has the groundwater inflows into, say, pit TR-1
9 and other pits been modeled for this permit?

10 A. Yes, it was.

11 Q. Where are the results of that -- the predicted
12 inflows located?

13 A. There are two locations. One is Appendix D6,
14 and the other one is a narrative description or narrative
15 discussion in the mine plan, possible hydrological
16 consequences.

17 Q. Are those also addressed in a groundwater model?

18 A. The numbers themselves are addressed in
19 groundwater modeling, yes. And the future -- both the
20 past, present and future occurrences of water are
21 addressed in that model.

22 Q. Do you know if -- if there might be another
23 witness from DEQ who will be addressing the groundwater
24 modeling?

25 A. Dr. Kuchanur would be that witness.

1 Q. I'll have you turn to but not open up page
2 DEQ 13-114.

3 A. I am there.

4 Q. Do you know what this document is?

5 A. This is a topsoil replacement sequence map.

6 Q. Okay. And can you generally describe what this
7 map includes?

8 A. It generally defines the topsoil piles and
9 replacement of topsoil over time, where the topsoil will
10 be replaced on top of the overburden as it's pushed back
11 into the pit, what time, approximate date, over which area
12 during that time.

13 Q. Does this map generally describe the geographic
14 sequence of reclamation you testified about just a minute
15 ago?

16 A. It does. It does.

17 Q. Does the reclamation plan allow reclamation to
18 occur sooner than this map indicates?

19 A. It can, yes.

20 Q. Okay. You've mentioned that Brook Mining will
21 provide a reclamation bond for its permit, correct?

22 A. Yes. Indeed.

23 Q. Has Brook Mining submitted a proposed bond
24 calculation to DEQ?

25 A. They have.

1 Q. Is it required for Brook Mine to provide a -- is
2 it a permit application requirement for Brook Mine to
3 submit a bond calculation to DEQ?

4 A. It is.

5 Q. Did you review the most recently proposed bond
6 calculation?

7 A. I did.

8 Q. Was there anyone else who reviewed it?

9 A. Mr. Doug Emme assisted me in review of that bond
10 calculation.

11 Q. What is Mr. Emme's experience with bonding?

12 A. He is an expert bonding analyst based on
13 background and experience. He does most of our
14 reclamation bonds throughout the entire District 3 area.
15 He works on all kinds of bonds, all the way from smaller
16 mines to larger mines. He's been doing it for decades.
17 So we fall back on his expertise when we're looking at
18 bonds, if we ever have doubts or concerns, worries about
19 these. And so he is a very good resource for us to go to.

20 Q. I guess kind of in -- kind of wrapping up our
21 testimony today, have you reviewed the objections filed
22 against the Brook Mine permit application?

23 A. I have.

24 Q. And looking back at the -- after reviewing those
25 objections and looking back at the permit application

1 portions that you reviewed and testified about today and
2 yesterday, in your opinion is -- are those portions of the
3 application still technically adequate?

4 A. Yes.

5 MR. KUHLMANN: Thank you, Mr. Kristiansen.
6 That was my last question.

7 CHAIRMAN BAGLEY: All right. Let us take
8 five-minute break and then we will begin cross-examination.

9 (Hearing proceedings recessed

10 10:25 a.m. to 10:36 a.m.)

11 CHAIRMAN BAGLEY: All right. Now begin
12 cross-examination. We'll start with Ms. Boomgaarden.

13 MS. BOOMGAARDEN: Thank you, Mr. Chairman.
14 Mr. Gregersen is going to cross-examine.

15 CHAIRMAN BAGLEY: All right. Thank you.

16 CROSS-EXAMINATION

17 Q. (BY MR. GREGERSEN) Hi, Mr. Kristiansen. My
18 name is Clayton Gregersen. I'm here on behalf of Big Horn
19 Coal Company. I just have a few questions based on your
20 testimony from yesterday and today.

21 A. Okay.

22 Q. The first issue I want to address is you stated
23 at one point that the TR-1 area there would be a pump down
24 in there that would supply water to the mine I believe for
25 the life of the mine?

1 A. It's possible. It's just defined as a sump
2 area, so I don't know the mechanics.

3 Q. You don't know the mechanics.

4 A. No.

5 Q. Is that information in the permit application?

6 A. It is not.

7 Q. It is not.

8 So the source of the water to be used for the --
9 for the -- well, in your words, I believe, for a large
10 portion of the mine actually isn't in the permit
11 application?

12 A. The source of the water is identified, but the
13 mechanics of moving the water is not, that I can remember.

14 Q. So it is in the permit application that the
15 water from TR-1 area will be used and pumped out of there
16 for other mine purposes?

17 A. It's part of the narrative.

18 Q. Okay. Thank you.

19 And do you know where exactly that is in --

20 A. I don't know exactly, no.

21 Q. Do you know what a -- what section of the permit
22 application it would be in?

23 A. Primarily be in mine plan and probably Appendix
24 D6, hydrology appendix.

25 Q. Okay.

1 A. A lot of the specifics are discussed.

2 MS. BOOMGAARDEN: Mr. Ruby, Mr. Girardin,
3 we do need to connect the computer to the --

4 MR. RUBY: Projector.

5 MS. BOOMGAARDEN: -- projector.

6 Sorry. There's a --

7 MR. GIRARDIN: We need the same adapter.

8 MR. RUBY: See if I can do this without
9 tearing everything apart.

10 MR. GIRARDIN: Function -- there it is.

11 Q. (BY MR. GREGERSEN) I'm not -- we don't need to
12 look at that yet. I just wanted to have that ready.

13 A. Oh, okay.

14 Q. (BY MR. GREGERSEN) My apologies if I misled
15 you.

16 All right. So the -- one of the first areas I
17 wanted to ask you about is the -- well, you indicated in
18 what you pointed out yesterday as the Brook Mine surface
19 damage bond for Big Horn Coal surface ownership.

20 A. Uh-huh.

21 MR. GREGERSEN: This is found in DEQ
22 Exhibit 1, pages DEQ 1-066 through 073, if anyone wants to
23 turn to it.

24 Q. (BY MR. GREGERSEN) Could you get that in front
25 of you.

1 A. Which -- DEQ --

2 Q. DEQ Exhibit 1.

3 COUNCIL MEMBER LALLY: What were those page
4 numbers again?

5 MS. BOOMGAARDEN: 066 to 073.

6 A. There we go. What pages were those again?

7 Q. (BY MR. GREGERSEN) 066 through 073.

8 A. I'm there.

9 Q. All right. Now, isn't it true that under
10 Wyoming Statute 35-11-416(a), that in instances where the
11 surface owner is not the owner of the mineral estate
12 proposed to be mined by the mining operations a permit
13 shall not be issued without the execution of a bond or
14 undertaking to the state, whichever is applicable, for the
15 use and benefit of the surface owner. Is that correct?

16 A. That is correct.

17 Q. And this -- the amount of the surface owner bond
18 has to be set by DEQ, by statute, correct?

19 A. Yes, it does.

20 Q. Now, what you're looking at, DEQ 1066, this is a
21 document that is actually prepared by Brook Mine or at the
22 behest of Brook Mine, correct?

23 A. Yes, it was.

24 Q. Actually, it says on there it was prepared by
25 WWC; is that right?

1 A. Yes, it is.

2 Q. Okay. Now, isn't it true that in prior
3 testimony before this council you've testified the surface
4 owner protection bond is something that DEQ doesn't have a
5 set procedure for and is something that you yourself have
6 never been a part of before?

7 A. Correct.

8 Q. And didn't you also testify that while you
9 weren't sure exactly how the surface protection bond
10 amount would be set, what you did know was that all
11 parties including the mining company, the surface owner
12 and DEQ would participate together and arrive at the
13 process to gather that bond amount?

14 A. Yes.

15 Q. And so under your testimony, you said that the
16 surface owner protection bond will, in fact, be set by the
17 DEQ, and the landowner will have the opportunity to see
18 this number and then it will be published for any comments
19 and questions, correct?

20 A. I'm not sure about the published part, but it
21 will be seen by all the parties prior to.

22 Q. And they'll be able to participate?

23 A. Yes.

24 Q. And be part -- so is it still your position
25 specifically with the Big -- the surface ownership bond

1 for Big Horn Coal that Big Horn Coal will be able to
2 participate in this before any number is set and before
3 any permit is issued as required by the statute?

4 A. It will be, yes.

5 Q. Okay. Thank you.

6 Mr. Kristiansen, I'd like to move to a separate
7 area of your testimony from yesterday. Yesterday you
8 talked and Mr. Kuhlmann introduced various exhibits,
9 excuse me, from the permit application and several
10 portions of that application. Do you remember that?

11 A. I do.

12 Q. Okay. So specifically one of the documents that
13 Mr. Kuhlmann had you review was a map of the Brook Mine
14 mine plan found in DEQ Exhibit 12, page 12. -- -134.
15 Could you please pull up that map?

16 A. Please say that again.

17 Q. Exhibit 12 of DEQ, page 12-134. I believe this
18 is the rainbow or the Skittles map that you referred to?

19 A. Do you have the DEQ number on the lower
20 right-hand corner I can flip to quicker?

21 Q. The number that we have for the exhibit is
22 12-134.

23 A. All right. Here we go. I'll open this much of
24 it to show this is indeed the map you're talking about,
25 correct?

1 Q. Yep. I think you actually have the portion that
2 I was going to draw your attention to.

3 A. Okay.

4 Q. Do you see on that bottom corner -- I'm not sure
5 this is technically considered part of the key, but it has
6 the Ramaco logo, and it says Exhibit MP-4. -- or MP-4.1.

7 A. Yes.

8 Q. All right. And so that I don't have to go
9 through and try to pull up that page from the I don't know
10 how many hundreds of pages document that is Exhibit 12,
11 what I've put up on the screen there for you is what's
12 labeled as Big Horn -- BHC Exhibit 10. And if you look at
13 the bottom corner, it also says MP-4.1. Do you see that?

14 A. I do.

15 Q. And so this is the same map, correct?

16 A. It appears to be the same map, yes.

17 Q. Okay. Thank you.

18 So as you discussed yesterday the various
19 rainbow-colored polygons on this map indicate areas of the
20 proposed mine by Brook Mine, correct?

21 A. Correct.

22 Q. Now, this map also shows the location of these
23 proposed mining areas by using the backdrop of township,
24 range, section lines. Do you see those?

25 A. I do.

1 Q. Okay. Now I want you to look up at the map and
2 I want to direct your attention to what you described
3 yesterday as the TR-1 area.

4 A. Okay.

5 Q. It's right there, I believe.

6 A. That's it.

7 Q. And that is in Section -- the -- excuse me, that
8 is only in Sections 15 to 22, correct?

9 A. Correct.

10 Q. So it's not found -- and, specifically, it's
11 only in the southeast corner of 15 and the northeast
12 corner of 22, correct?

13 A. Correct.

14 Q. Now, as you discussed yesterday, that center
15 oval-shaped portion is where the highwall trench is going
16 to be cut and where Brook Mine proposes to cut down
17 through the overburden and where it will begin the mining
18 panels that will extend to both north and south as
19 indicated by the colored strips, correct?

20 A. Correct.

21 Q. Now, as -- I believe you testified just earlier
22 today, this is the map that you believe is the more
23 accurate map of the mining operation, right?

24 A. Yes, it is.

25 Q. Okay. And so as you can see, these mining

1 panels, particularly the ones that run to the north, run
2 right up pretty close to the Tongue River, right?

3 A. Yes, they do.

4 Q. And they -- and they're actually right in kind
5 of that -- that almost armpit area that's in the
6 confluence of the Tongue River and Goose Creek, right?

7 A. Pretty close, yes.

8 Q. Now, you also testified I think both today and
9 yesterday that the TR-1 area is a little bit unique
10 because it falls in area that is previously mined
11 material, right?

12 A. Yes.

13 Q. That overburden material on top of the coal
14 that's proposed to be mined is previous mined backfill
15 that's been dumped back in there.

16 A. Yes, it is.

17 Q. And so this is different than a lot of the
18 native strata and a lot of the other overburden that's
19 going to be encountered in the Brook Mine proposed mining
20 operations for that reason; isn't that right?

21 A. Yes, it is.

22 Q. All right. So I'm going to leave this map up
23 there just as sort of a reference as we start going
24 through some of the other portions of some of the exhibits
25 that you introduced yesterday. And I'm going to go ahead

1 and apologize to the council and to you, Mr. Kristiansen,
2 in advance, because as I'm sure you're aware -- as aware
3 as anyone, a lot of these aspects of the mine plan, the
4 permit application, they have cross-references that make
5 you have to jump back and forth between documents. So
6 we're going to have to do a little bit of jumping here.

7 A. Okay.

8 Q. So yesterday you testified about DEQ Exhibit 34,
9 which consists of comments to the permit application of
10 Brook Mine and the responses of DEQ personnel, right?

11 A. Yes.

12 Q. Could you pull out Exhibit 34.

13 THE REPORTER: I think it's the one that's
14 right in front that your map's on.

15 THE WITNESS: This one here?

16 THE REPORTER: Yes.

17 THE WITNESS: It is. Put that over here.

18 A. And I'm there.

19 Q. (BY MR. GREGERSEN) All right. And so
20 Exhibit 34, as you testified yesterday, is a series of
21 comments and responses -- comments from DEQ personnel
22 where they identify some problematic areas or areas where
23 they would like more information from the permit
24 application, and then Brook Mine's response to those,
25 correct?

1 A. Correct.

2 Q. So I'd like to first draw your attention and the
3 council's attention to DEQ 34, page 048.

4 A. I'm there.

5 Q. All right. And on the middle of that page, do
6 you see a comment Muk 11 - Round 1?

7 A. I do.

8 Q. And so just for our clarification, who is that
9 comment from?

10 A. That's from Dr. Kuchanur.

11 Q. Dr. Kuchanur. All right.

12 And as you testified yesterday, as the permit
13 director, you kind of oversee all these comments, and in
14 many instances you actually participate in the comment
15 process, correct?

16 A. Yes.

17 Q. So looking at the substance of this comment, it
18 states that Appendix D6, Section D6.2.1 of the permit
19 application states that "The overburden is comprised of
20 sand lenses, clinker and alluvial that have the potential
21 of water bearing bodies." But then he goes on to say
22 these areas are discontinuous and will not hold large
23 quantities of water. Do you see that?

24 A. I do.

25 Q. The comment then requests additional

1 justification for this statement, and specifically
2 requests this justification come from the hydrogeologic
3 data specifically collected by Brook Mine that shows the
4 dry zones based on the drill holes, monitor wells and
5 other applicable data, right?

6 A. Uh-huh.

7 Q. All right. So then the response states that
8 "Section D6.2.1.1 has been updated..." to which the
9 comment responds by saying that it is not accepted an
10 additional -- and in addition to the reference to Addendum
11 D5, please provide a description of this. Do you see
12 this?

13 A. I see it.

14 Q. Now, let's go ahead and take a look at
15 Section D6.2.1.1. This is in DEQ Exhibit 6, page 23.

16 A. What page was that again?

17 Q. DEQ Exhibit 6, page 23.

18 A. 23. I am there.

19 Q. All right. So this section is entitled Local
20 Hydrogeology. And it states there's three potential
21 hydrogeologic units in the Brook Mine. They include
22 Carney seam, Masters seam and the underburden. And then
23 the very last word on page 23 onto page 24, says,
24 "The overburden is comprised of sand lenses, clinker and
25 alluvial," same in the comments. And then it says that

1 these waters -- these bodies won't hold sufficient amounts
2 of water, large quantities of water. And then it cites
3 Addendum D5-2 as containing electric logs with resistivity
4 data that demonstrates that the overburden is dry. Do you
5 see that?

6 A. I do see that.

7 Q. So the comment which requested additional
8 justification that the overburden doesn't hold large
9 bodies of water, the answer to that is effectively
10 referring them to Addendum D5-2, correct?

11 A. Yes.

12 Q. Now, isn't it true that -- actually, let's go
13 ahead and take a look, then, at D5-2. This is on page --
14 DEQ Exhibit 5, page 53.

15 A. DEQ Exhibit 5, page 53.

16 Q. Yes, sir.

17 A. I am at page 53.

18 Q. Okay. And as I understand it, Addendum D5-2
19 goes until page 164. Is that your understanding?

20 A. Yes, it does.

21 Q. And so these roughly 110 pages contain data
22 referenced by Brook Mine, and I'm assuming reviewed by DEQ
23 in response to this comment, and it has a series of
24 drilling logs that discuss the materials found at various
25 depths --

1 A. Yes.

2 Q. -- many of which drilled through the overburden,
3 correct?

4 A. Yes.

5 Q. Now, Mr. Kristiansen, isn't it true that there's
6 absolutely no drilling logs of any kind from Section 22?

7 A. To the best of my recollection, you're correct.

8 Q. And as we discussed earlier, the TR-1 area is
9 only in the northeast of 22 and the southeast of 15?

10 A. Correct.

11 Q. And so there's no drilling logs from Section 22.
12 And, in fact, there's no drilling log from the southeast
13 section of Section 15, is there?

14 A. No, there aren't.

15 Q. Now, if you turn to page DEQ 5, 162, the last
16 three pages of Addendum D5-2, you'll see what is the only
17 drilling log from Section 15; isn't that correct?

18 A. Correct.

19 Q. And this drilling log from Section 15 is from
20 the -- not the southeast, but the actually northwest
21 portion of Section 15, correct?

22 A. Correct.

23 Q. And this is actually 40 years old, isn't it?

24 A. Yes. It is.

25 Q. It's from 1978?

1 A. It's almost 40 years old.

2 Q. And it's actually not in any data from Brook
3 Mine. It's actually data from Big Horn Coal; isn't that
4 right?

5 A. Yes, it is.

6 Q. So then the material responding to the comments
7 and to establish to the DEQ, the statement -- for the
8 statement the overburden is dry, there is actually no
9 information from the TR-1 area. And the only information
10 from anywhere near the TR-1 area is from 40 years ago and
11 about a half mile to the northwest?

12 A. Correct.

13 Q. So as a result, the materials provided to the
14 DEQ in response to the comment requesting the
15 justification that the overburden is dry, it actually
16 doesn't contain any information from the TR-1 area,
17 correct?

18 A. Right.

19 Q. So according to these logs, there's no knowledge
20 as to whether the TR-1 area might have a significant
21 amount of groundwater in the overburden and might not be
22 dry?

23 A. Correct.

24 Q. And maybe I misunderstood your testimony earlier
25 today, but you describe the TR-1 area as a bathtub, right?

1 A. Correct.

2 Q. And were you only talking about the coal seams
3 or were you also discussing the overburden as --

4 A. In that area general area I was discussing the
5 overburden because of its nature.

6 Q. Overburden there actually has a significant
7 amount of water?

8 A. It probably does.

9 Q. But that's not what the permit application says.
10 The permit application says the overburden is dry, doesn't
11 it?

12 A. That part of the description actually applies to
13 the rest of the mine. Other than that particular area,
14 it's not clear.

15 Q. But this says Local Hydrology, and I guess I'm
16 missing where the distinction is again the TR-1 area and
17 the rest of it in the permit application. Can you show
18 that to me?

19 A. It doesn't exist.

20 Q. Thank you.

21 Now, can you go back to DEQ Exhibit 34, the
22 comments and responses, and this time go to page 47. Oh,
23 excuse me. DEQ 49. 47 is the number at the bottom of the
24 page, but --

25 A. Oh, okay. DEQ --

1 Q. -- exhibit number --

2 A. DEQ number, the exhibit number.

3 Q. I apologize.

4 A. Thank you. I'm there.

5 Q. Okay. So do you see Comments Muk 13 - Round 1?

6 A. Uh-huh.

7 Q. So this, again, notes Section D6.2.2.1 and
8 state -- recognizes that no monitoring wells were
9 completed in the overburden or the interburden as no water
10 was found in these areas during drilling operations. The
11 comment goes on to say this information is critical in
12 demonstrating the overlying units are dry. Therefore,
13 please provide a map with all the drilling holes and their
14 depths that were used to make this determination. Do you
15 see that?

16 A. Yes, I do.

17 Q. And the response is that D6.2.2.1 has been
18 updated as requested and the eventual response then is
19 this response is assumed to be adequate, correct?

20 A. Yes.

21 Q. So when we go to look at actual Section
22 D6.2.2.1, which is in DEQ Exhibit 6 page 24.

23 A. Which pages was it again?

24 Q. Exhibit 6, page 24.

25 A. 24. Thank you.

1 And I'm there.

2 Q. All right. So do you see the heading D6.2.2.1?

3 A. Yes, I do.

4 Q. And this is about the monitor well construction,
5 completion and development?

6 A. Yes, it is.

7 Q. Okay. So the very last sentence at the very
8 bottom of this page, second line up, says no monitoring
9 wells were completed in the overburden or interburden as
10 no water was found in these units during drilling
11 operations.

12 Then goes on over the next sentence to say,
13 Addendum D5-2 contains the drilling logs and resistivity
14 logs that demonstrate that the overburden and interburden
15 are dry. But as we just looked, Exhibit D -- or Addendum
16 D5-2 doesn't have any information from the TR-1 area?

17 A. No, it doesn't.

18 Q. And this -- this statement would indicate that
19 the overburden is completely dry, wouldn't it?

20 A. For all intents and purposes, yes.

21 Q. And that's contrary to what you stated here
22 today, that the overburden in the TR-1 area actually does
23 have significant amount of groundwater?

24 A. Yes.

25 Q. So, Mr. Kristiansen, the last thing I want to

1 direct your attention to is on the screen here. And this
2 is from -- see, I'm going to see if I can go full screen
3 and still change pages. Yes, I can. All right.

4 So as you can see, this is the DEQ's rules and
5 regulations from the Land Quality coal [sic]. And this is
6 from Chapter 2, which is specifically entitled Permit
7 Application Requirements For Surface Coal Mining
8 Operations, and there's a Section 4, Other Baseline
9 Requirements. Do you see that?

10 A. I see it.

11 Q. And so in Subpart A of this document it states
12 that a permit application requires description of the
13 lands to be affected within the permit area, and then
14 states that this description must include, and then it
15 goes through a series of (i), (ii), (iii) -- Romanette 1,
16 2, 3 -- naming off the information that needs to be
17 included as to the lands, correct?

18 A. Would that be the next page where they name all
19 those?

20 Q. So you can see where the mouse is. I'll use the
21 laser pointer.

22 A. Okay.

23 Q. After Section A it says this information must
24 include --

25 THE REPORTER: You're going to have to slow

1 down.

2 MR. GREGERSEN: I apologize.

3 Q. (BY MR. GREGERSEN) So subsection A says the
4 information as to the affected lands, and it must include,
5 and then it starts going through a list where the first is
6 (i), the second is (ii) --

7 A. There we go. Yes.

8 Q. And so each one of those subsections is actually
9 information that's required to be in the permit
10 application, correct?

11 A. Yes.

12 Q. So if we go down to (viii), which is highlighted
13 on the screen there --

14 A. Uh-huh.

15 Q. -- and this is information must be included as
16 to the land, then it says for the proposed permit area and
17 by extrapolation adjacent areas, characterization of the
18 geologic strata down to and including the deeper of either
19 the strata immediately below the lowest coal seam to be
20 mined or any aquifer below the lowest coal seam to be
21 mined, which may be adversely impacted by mining.

22 And it says this information shall include a
23 statement of the results of test borings or core samples
24 which have been collected and analyzed to show, and it
25 says the location of any groundwater.

1 But as we just discussed, those logs that are in
2 Addendum D5-2 don't include any information from the TR-1
3 area, and so they can't show any groundwater in that area,
4 can they?

5 A. At this point, no.

6 Q. Okay. And so with that and with your testimony
7 that there actually is groundwater in the TR-1 area, this
8 requirement hasn't been met, has it?

9 A. Not yet it has not, no.

10 Q. Okay. And so without meeting this requirement,
11 the permit application cannot be accurate and it cannot be
12 complete, can it?

13 A. Can be complete based on the information that we
14 examined in and around this area.

15 Q. But it cannot be accurate if it doesn't include
16 this required finding?

17 A. It's not accurate yet in that area.

18 MR. GREGERSEN: Okay. Thank you. I don't
19 have any further questions.

20 CHAIRMAN BAGLEY: Thank you.

21 Ms. Anderson.

22 MS. ANDERSON: Yeah. Can I get the little
23 adapter for the projector?

24 MR. GREGERSEN: Yeah.

25 MR. RUBY: Next time you need that thing,

1 Shannon, give me a holler.

2 MS. ANDERSON: Oh, okay.

3 MR. RUBY: I'll save you from tripping over
4 stuff.

5 CROSS-EXAMINATION

6 Q. (BY MS. ANDERSON) Okay. Good morning,
7 Mr. Kristiansen.

8 A. Good morning.

9 Q. I'd like to start off with a clarifying question
10 from your testimony yesterday --

11 A. Okay.

12 Q. -- that you provided.

13 I think I heard you say that "currently" the
14 company plans to do highwall mining. Have you had any
15 conversations with the company indicating that they might
16 not start out with a highwall mine?

17 A. Not at this time.

18 Q. Not at this time.

19 Okay. In your testimony yesterday you stated
20 that you started working for DEQ in May 2013, correct?

21 A. Yes.

22 Q. And that you started reviewing pre-permit
23 submittals from the company around that time, right?

24 A. I did.

25 Q. So this permit application review is one of the

1 first jobs you had at DEQ, right?

2 A. I did.

3 Q. You also stated yesterday that you'd reviewed
4 10 to 12 other coal mine permits since you started DEQ in
5 2013. Were those amendments and renewals or new permits?

6 A. Those were all amendments and renewals and major
7 revisions.

8 Q. Okay. 10 to 12 seems like a lot of work to fit
9 in while you were doing review for this permit. Did you
10 ever have any trouble balancing the workload?

11 A. No. I generally don't because the -- this --
12 the distance in space of time we generally have is enough
13 to be able to get all the work done in that particular
14 time period.

15 Q. Okay. You also stated yesterday that the
16 technical review for the permit application by DEQ took a
17 year and a half, right?

18 A. Uh-huh.

19 Q. So it didn't take twice that long, three years,
20 as stated in the company's prehearing memo?

21 A. That's the entire permit application process.
22 Probably wasn't clear yesterday when all but one item had
23 been resolved, essentially, in the year and a half.

24 Q. Okay.

25 A. And there was one left.

1 Q. You've talked a lot about the review process in
2 the last couple of days, but you haven't talked about the
3 statutory deadlines for that review process. Can you
4 explain those to me?

5 A. Well, the first statutory deadline, once we
6 declare the permit complete, is to analyze the technical
7 adequately. That's 150 days. We get that 150 days to
8 complete analysis and generate comments and observations
9 and questions for the document itself, which we then send
10 to the operator. And it is then their responsibility to
11 answer those comments and give us the information we're
12 asking for. They have no deadline in doing that.

13 Q. Okay. Did you ever feel any time pressure
14 related to your review or the review of your colleagues
15 related to the permit application giving those statutory
16 deadlines --

17 A. At times --

18 Q. -- DEQ has to meet?

19 THE REPORTER: I'm sorry?

20 THE WITNESS: At times I did.

21 Q. (BY MS. ANDERSON) Mr. Kristiansen, I have up on
22 the screen our Exhibit 55, which is email from you to some
23 of your colleagues. Do you remember writing this email?

24 A. I do.

25 Q. Would you agree that this email is from you to

1 your other colleagues at DEQ about the Round 4 comment
2 period?

3 A. Yes.

4 Q. Okay. And would you agree that in this email
5 you say the comment period is 30 days, correct?

6 A. Correct.

7 Q. Okay. And that included the Christmas holiday
8 period, correct?

9 A. It did, yes.

10 Q. Okay. Did the company have any deadlines on
11 their end to reply back to DEQ?

12 A. No, they did not.

13 Q. Okay. And so all the deadlines fell on DEQ, not
14 the company?

15 A. Yes, they do.

16 Q. Okay. Did you ever pressure other DEQ staff to
17 make decisions or -- I shouldn't just say DEQ staff, but
18 other staff to make decisions regarding the permit
19 application?

20 A. No, I did not.

21 Q. Okay. I have up on the screen with me
22 Exhibit 59 from our exhibits. Are you familiar with this
23 email?

24 A. I am.

25 Q. Okay. And would you agree that this email is

1 from you to Andrew Kuhlmann about the permit review
2 process?

3 A. I do.

4 Q. Okay. And would you agree that you're
5 expressing concern about not having a decision from the
6 Attorney General's Office and concerns about your ability
7 to meet deadlines related to your review process?

8 A. This was not actually a concern.

9 Q. Okay. You state that WWC was calling hourly.
10 Is this typical of a permit applicant?

11 A. This was actually an overexaggeration of the
12 time frame involved, more humorous than anything else.

13 Q. Okay. Did you ever feel under pressure from the
14 company and its political connections?

15 A. I never have.

16 Q. Did you know the company was at times in
17 communication with the governor and his staff?

18 A. I do understand that.

19 Q. Okay. Would you say you were upset when the
20 objections to the permit were filed?

21 A. I wouldn't use the word "upset."

22 Q. All right. What was your reaction?

23 A. I guess one of questioning as to exactly what
24 had been undertaken and what some of the consequences
25 might be.

1 Q. Okay. I have up on the screen now our
2 Exhibit 89. Do you remember this email conversation
3 between you and some of your colleagues at DEQ? This is
4 the part you wrote down at the bottom?

5 A. I do basically remember, yes.

6 Q. Okay. Do you still think the objections are, in
7 your words at the time in this email, designed to slow the
8 permitting process significantly to dishearten Ramaco and
9 LQD and foster a sense of hopelessness?

10 A. I no longer --

11 THE REPORTER: I'm sorry?

12 THE DEPONENT: I no longer believe that.

13 Q. (BY MS. ANDERSON) You no longer believe that.
14 Why did you believe that at the time?

15 A. I felt at that point in time I was a little
16 irritated and wrote some things that were not appropriate.

17 Q. Okay. So after having a chance to review the
18 objection letters in greater detail perhaps than you did
19 when you wrote this email --

20 A. Correct.

21 Q. -- did you think of any -- any of the objections
22 raised were worth considering?

23 A. Yes, I did.

24 Q. Okay. I guess when you wrote this email, why
25 were you concerned about commenters disheartening Ramaco?

1 A. I honestly don't know what I meant at that time.

2 Q. Okay. Were you worried about how the comment
3 process would affect the company and their ability to get
4 a permit?

5 A. No, I wasn't.

6 Q. I guess, in part, Mr. Kristiansen, I'm just
7 wondering how we can take your testimony seriously today
8 if at the time, at least, you viewed our comments and the
9 comments of our members and others citizens in the process
10 with such distaste.

11 A. Well, I have since changed my attitude on that.

12 Q. Okay. How do you plan to address the comments
13 and objections raised through the permitting process?

14 A. Which comments are you referring to?

15 Q. The objections.

16 A. The objections?

17 Q. How is DEQ considering them? How have you
18 considered them over the last few months? Will you plan
19 to consider them?

20 A. We're still in the process of evaluating that.

21 Q. So you can't tell me what parts of what
22 objections are going to be reviewed by the agency
23 incorporated somehow into your decision-making process?

24 A. Not right now I can't, no.

25 Q. When are those decisions made?

1 A. It will be made sometime in the future. We get
2 a better sense of the direction of what we're going to be
3 doing after this hearing.

4 Q. So is it within that 15-day period in the
5 statute between when the council issues their decision and
6 DEQ then has to issue or deny the permit?

7 A. We will work within that time period to satisfy
8 all the conditions we can.

9 Q. In that 15 days?

10 A. Yes.

11 Q. Will the people and entities that submitted
12 comments get a response from the agency at any time?

13 A. I don't know.

14 Q. You don't know. But at this time DEQ isn't
15 planning to respond to any of the commenters or people
16 that submitted objection letters?

17 A. I don't know.

18 Q. Okay. Switching gears a little bit. Did DEQ
19 conduct any of its own studies or reviews to help review
20 the permit application?

21 A. Would you please rephrase that again?

22 Q. Yeah. Did DEQ, the agency, conduct any of its
23 own studies or reviews to help review the permit
24 application or did you just use the data from the company?

25 A. Well, primarily the -- for the application

1 itself, we used the data that was presented.

2 Q. Okay. So DEQ didn't independently conduct
3 baseline samples or something like that?

4 A. No, we did not.

5 Q. Okay. So you relied on what was submitted to
6 you and you just reviewed that, correct?

7 A. We did.

8 Q. Okay. Let's talk for a little bit about your
9 experience. Your resume says you mainly review noncoal
10 mines, right?

11 A. At this point, yes.

12 Q. Okay. Was this the first coal mine permit that
13 you coordinated for DEQ?

14 A. Yes. This will be the first coal mine permit.

15 Q. Okay. Was this the first coal mine permit with
16 underground components that you coordinated for DEQ?

17 A. Yes.

18 Q. Would you agree that the District 3 office of
19 the Land Quality Division doesn't have a lot of experience
20 in permitting coal mine permits with underground mining
21 aspects?

22 A. I would say that's probably an accurate
23 position.

24 Q. In fact, this is the first highwall mining
25 permit that District 3 has permitted, right?

1 A. Yes.

2 Q. Okay. Mr. Kristiansen, have you had a chance to
3 review Fisher Exhibits 21 through 23? Yeah, they won't be
4 in front of you.

5 A. Okay.

6 Q. And this is Exhibit 21 on the screen. Do you
7 remember this email that you wrote to some of your
8 colleagues?

9 A. I do.

10 Q. Okay. Would you agree that this email shows
11 that you personally did not have experience in permitting
12 a highwall mine?

13 A. Yes.

14 Q. Okay. And you were relying on some of your
15 colleagues and other district offices to help guide you?

16 A. I did.

17 Q. And we have to ask, why did you see your role as
18 needing to help Ramaco "craft" their permit application?

19 A. Rephrase that again.

20 Q. You have in your email here that you were
21 helping the company craft their permit application. Why
22 did you see that as their role -- as your role at DEQ?

23 A. One of our roles is to assist the company with
24 information as to legality of the -- of the plans that
25 they have, statutes, rules and regulations. We also guide

1 them towards our guidelines to help them with their
2 program. And so we -- a lot of cases is a -- as a source
3 of information for the mining company to form the permit
4 application appropriately.

5 Q. Okay. And did the company come to you and ask
6 you at DEQ to provide some information to them about what
7 should be in a subsidence control plan?

8 A. They did not.

9 Q. So you were just reaching out to your colleagues
10 on your own or --

11 A. I was.

12 Q. Okay. So at no time did the company ask you at
13 DEQ about the subsidence control plan and what should be
14 in it?

15 A. No, they did not.

16 Q. Okay. Given that you and the Land Quality
17 Division District 3 office don't have any highwall mines
18 yet, have you developed any new policies or procedures for
19 inspection and enforcement of this kind of mine?

20 A. We have not.

21 Q. In your testimony yesterday you mentioned the
22 amount of coal that is to be left underground to help
23 prevent subsidence. Do you remember that part of your
24 testimony?

25 A. I do.

1 Q. How will you and your DEQ colleagues inspect the
2 mine to make sure that is the case?

3 A. In our monthly inspections we do a mine-wide
4 inspection of facilities in cases. Sediment control
5 ponds, there are lots of ancillary pieces of information
6 that are within the mine permit area. We also, in this
7 particular mine, will get into those areas where the
8 panels are being developed and look for surface subsidence
9 physically.

10 Q. Okay. So you'll kind of walk along the
11 surface --

12 A. Correct.

13 Q. -- and look for subsidence?

14 A. Correct.

15 Q. But how you will independently verify the
16 amounts of coal that are being left in the ground?

17 A. I can't verify that.

18 Q. Okay.

19 A. I have to rely on production reports.

20 Q. You'll rely on the production reports.

21 A. Yes.

22 Q. How do you -- do you compare that to the amount
23 of reserves, or how do you know that that amount is being
24 left in the ground?

25 A. We could compare that to reserves, if necessary.

1 We have to accept the information that we get as being
2 valid and forthright.

3 Q. Okay. So there's no way, that you know of, for
4 DEQ to -- to make sure what you said yesterday, this
5 important part of the permit is being complied with?

6 A. Correct.

7 Q. Okay. On the topic -- topic of inspection
8 enforcement, you testified yesterday that DEQ utilizes the
9 mine plan to enforce the permit, correct?

10 A. Correct.

11 Q. So would you agree that you would have
12 difficulty in enforcing the mine plan if it was too vague
13 or left something too important out?

14 A. Yes, it would.

15 Q. At various times the company has said the rules
16 in the statutes are the only thing to focus on and
17 improve -- in approving permit application. But wouldn't
18 you agree that the rules in the statute need
19 interpretation and application based on professional
20 experience and background?

21 A. Yes.

22 Q. Don't you feel you use your professional
23 judgment at times to require this or that in the permit
24 application?

25 A. I do at times, yes.

1 Q. And to do that, you have to rely on scientific
2 principles or standards or best industry practices?

3 A. The best I can, yes.

4 Q. Okay. Let's switch a little bit to subsidence.
5 Yesterday you testified that you considered some of the
6 Chapter 7 rules in the scope of your review of the permit
7 application. That's correct?

8 A. Yes.

9 Q. Okay. I have on the screen our Exhibit 24,
10 which is the DEQ response to our first set of
11 interrogatories in the discovery for this proceeding.
12 Were you a part of -- in preparing the answers that DEQ
13 provided to us?

14 A. Would you scroll back up again, please?

15 Q. Yeah. Sure.

16 A. Now go ahead and scroll.

17 Q. Okay.

18 A. Thank you for that.

19 Q. Sure. Sorry. Just give me a moment while I
20 find the right part here.

21 A. That's okay. That's enough. I did assist in
22 the drafting of this particular document.

23 Q. Okay. Great.

24 All right. Do you see Interrogatory Number 11
25 on the screen now?

1 A. I do.

2 Q. Okay. And would you agree that this is a
3 question that we raised about the notice provisions
4 related to this permit?

5 A. Correct.

6 Q. Okay. And would you read the response provided
7 by DEQ to this question.

8 A. "The public notice requirements in Chapter 7,
9 Section 3 is only applicable when an underground coal mine
10 will be permitted. The Brook Mine is a surface coal mine,
11 therefore the public notice requirements in Chapter 7,
12 Section 3 are not appropriate."

13 Q. Okay. Would you -- would you still agree with
14 that statement?

15 A. I do.

16 Q. Okay. So Chapter 7 of the rules and regulations
17 aren't applicable here?

18 A. I can't fully answer that, because I don't have
19 Chapter 7 in front of me.

20 Q. Chapter 7 relates to underground mine permits
21 and their requirements thereof. Would you agree with
22 that?

23 A. Yes. We only use --

24 MR. KUHLMANN: Objection.

25 MS. ANDERSON: Okay.

1 MR. KUHLMANN: He just said he doesn't have
2 it in front of him.

3 MS. ANDERSON: Okay. That's fine.

4 Q. (BY MS. ANDERSON) All right. Let's see. Did
5 DEQ review or use any rules applicable to auger mining and
6 its review of the permit application?

7 A. We did.

8 Q. Okay. Are you aware that the permit application
9 refers to this type of mining as auger mining?

10 A. I am.

11 Q. Okay. So would you agree that the requirements
12 related to auger or underground mining are applicable
13 here?

14 A. They are.

15 Q. Okay. On this subsidence control plan
16 specifically, could you tell me what you believe the
17 purpose of a subsidence control plan to be?

18 A. Primarily determining areas that may have
19 concerns about subsidence in the future, during mining
20 process, and attempting to build potential mitigation
21 based on that.

22 Q. Okay. And what do you base that opinion on?

23 A. Primarily based on some of the past practices of
24 taking place in the highwall mining areas of eastern part
25 of the United States, some of the information I was able

1 to look up and based on some of the applications that have
2 taken place in other parts of the state.

3 Q. Okay. Anything specific in Wyoming rules or
4 regulations about this?

5 A. I can't remember right off the bat, no.

6 Q. All right. What technical and scientific
7 standards must a subsidence control plan meet in your
8 opinion?

9 A. I'm not expert enough to actually answer that
10 question.

11 Q. But you were the only one from DEQ that reviewed
12 the subsidence control plan, correct?

13 A. Correct. Correct.

14 Q. Okay. Did you seek out help from any of your
15 colleagues who might have more expertise than you did?

16 A. I did not.

17 Q. Why not?

18 A. At that point in time I didn't have any
19 colleagues that were more expert in our particular
20 district.

21 Q. Okay. How about other districts?

22 A. They were available, and I did not use them.

23 Q. You didn't use them?

24 A. I did not use them.

25 Q. Okay. Did you reach out to the office of

1 surface mine and reclamation enforcement or any other
2 agency in helping you review the subsidence control plan,
3 given your lack of expertise?

4 A. I did ask them one question.

5 Q. Okay. Do you remember when that question was?

6 A. I wanted to know what the compressive strength
7 for coal in the western United States would be classified
8 as.

9 Q. Okay. All righty. So if you're not sure what
10 technical and scientific standards must be met in the
11 subsidence control plan, how did you deem the subsidence
12 control plan technically adequate?

13 A. Based on the narrative, it matched --

14 THE REPORTER: I'm sorry. It matched --

15 THE WITNESS: It matched the learning that
16 I gained in my subsidence control class that I took from
17 OSM. And so I was able to at least judge the narrative
18 itself as being straightforward and accurate as I could
19 estimate.

20 Q. (BY MS. ANDERSON) Okay. Mr. Kristiansen, are
21 you familiar with the term "planned subsidence"?

22 A. I am.

23 Q. Okay. In going back to those regulations in
24 Chapter 7, are you familiar with notice provisions
25 required for subsidence?

1 A. Vaguely. I only read it once.

2 Q. Did you or, to your knowledge, any of your
3 colleagues at DEQ consider whether those notice provisions
4 were applicable to the mine here?

5 A. I can't remember.

6 Q. Okay. Do you know whether planned subsidence is
7 part of the permit application?

8 A. It is not.

9 Q. Okay. Would you agree that the permit
10 application says that subsidence, planned or unplanned, is
11 unlikely to occur?

12 A. Yes, it is.

13 Q. Okay. Anywhere in the permit boundary?

14 A. Yes.

15 Q. Okay. Does the plan say that there will be a
16 chance of pillar collapse?

17 A. I don't remember.

18 Q. You don't remember.

19 All right. How about roof collapse?

20 A. Again, I don't remember it specifically
21 mentioned.

22 Q. Don't remember.

23 Okay. How about mine floor failure?

24 A. Again, I don't remember.

25 Q. Okay. I guess I don't know if I should even ask

1 this, but did you do any analysis to confirm any of those
2 findings?

3 A. I examined the information that presided both --
4 presented in both D5 to geology and overburden, as well as
5 the mine plan --

6 Q. Okay.

7 A. -- subsidence plan.

8 Q. You didn't do any specific analysis of pillar
9 collapse, roof collapse, mine floor failure?

10 A. I did not do an analysis.

11 Q. How can you have any confidence that subsidence
12 isn't likely within this permit?

13 A. Based on the components that I learned from the
14 OSM class, given the conditions of the highwall mine and
15 the nature of the webs and pillars, the information that I
16 gained stated that it would not be a subsiding mine.

17 Q. Okay. Mr. Kristiansen, I have on the screen now
18 our Exhibit 54. Do you recall this email that you wrote
19 to your colleague Matt Kunze?

20 A. I do.

21 Q. Okay. Would you agree that this email -- that
22 this exhibit is a copy of the email between you and a
23 colleague about the permit area?

24 A. Yes.

25 Q. Would you agree that you have some professional

1 experience in the mining area?

2 A. I do.

3 Q. And based on that experience, would you agree
4 there has been a history of subsidence problems in the
5 area?

6 A. There has.

7 Q. And with that history in mind, why were you not
8 more concerned about the prospect for subsidence at this
9 mine?

10 A. They're completely different kinds of mining
11 processes, and the mines that subside in that area are
12 planned subsidence mines.

13 Q. Okay. The historic mining was planned
14 subsidence?

15 A. Yes, it was.

16 Q. Okay. All right. I'm going to have you pull
17 out Exhibit 12, page 145. I'll display it up here too,
18 but -- it's the mine plan. It's a relatively big map.
19 Let's see if I can get it --

20 A. Ah.

21 MS. ANDERSON: I know these things must be
22 really hard on your little iPads, so trying to get it a
23 little more --

24 A. Okay.

25 Q. (BY MS. ANDERSON) Okay. This is a busy map.

1 Would you --

2 A. Yeah.

3 Q. Yeah. Would you agree that it generally depicts
4 areas of proposed trench in a highwall mining?

5 A. It does.

6 Q. Okay. And that it shows areas of historic
7 mining in the area?

8 A. It does.

9 Q. Okay. And in some cases proposed mining will be
10 quite close to those areas of historic mining?

11 A. Yes, it is.

12 Q. Okay. Let's take the old Carney Mine Number 44.

13 A. Okay.

14 Q. Do you see that on the map?

15 A. I do.

16 Q. Okay. Was that an underground mine?

17 A. It was.

18 Q. Do you know the status of that mine and whether
19 it's fully reclaimed?

20 A. Mine is -- has not been operated for decades.

21 And there has been no reclamation other than surface
22 reclamation performed by Big Horn Coal in some of those
23 areas. And the mine was pre SMCRA, so it was never
24 reclaimed.

25 Q. Okay. Are you familiar with any Abandoned Mine

1 Lands program work at that mine site?

2 A. I am not familiar with the AML work, no.

3 Q. Okay. Do you see Acme Number 3 mine on that
4 map?

5 A. I can't actually read that well enough.

6 Q. Yeah. I'm sorry.

7 A. I'm sorry. Maybe I need to get the map.

8 Q. Yeah, you might want to look at the bigger
9 version, but --

10 A. It's actually in -- I don't remember where that
11 map is exactly. Do you remember? Can't read this.

12 Q. Yeah, it's DEQ Exhibit 12, which is the mine
13 plan.

14 A. Right.

15 Q. It's page 145.

16 A. Okay. There we go. Thank you.

17 Q. Okay.

18 THE WITNESS: Joe, I did it to you again.

19 I'm sorry.

20 A. Okay. Which mine did you want --

21 Q. (BY MS. ANDERSON) Okay. Acme Number 3.

22 A. Acme Number 3. Do you have a general location?

23 I'm not familiar with that one. Nope, there it is.

24 Q. Yeah, near Acme.

25 COUNCIL MEMBER BAUMER: Can you help us?

1 I'm -- can you --

2 Q. (BY MS. ANDERSON) Yeah, maybe --

3 Mr. Kristiansen, if you could just maybe hold it up and
4 point to the council where that is?

5 THE WITNESS: It's this area right here.

6 COUNCIL MEMBER BAUMER: Thank you.

7 Q. (BY MS. ANDERSON) And was that an underground
8 mine?

9 A. It was.

10 Q. Okay. Do you know the status of that mine and
11 whether it's fully reclaimed?

12 A. Again, this was a mine pre-SMCRA, so it was
13 never reclaimed.

14 Q. Are you familiar with any Abandoned Mine Lands
15 Program work at that mine site?

16 A. Yes. Abandoned Mine Lands have done work in
17 that particular area, as well as the -- some of the Carney
18 areas.

19 Q. Do you see Acme Number 2 on that map? And if
20 you can point out to the council that would be helpful
21 too.

22 A. Here it is. I do see that. That's this one
23 right here.

24 Q. Okay. Great. Was that an underground mine?

25 A. It was.

1 Q. Okay. And would you agree that this map shows
2 that Acme Number 2 mine and the proposed highwall mining
3 by Brook will overlap --

4 A. Yes, they do.

5 Q. -- to some degree.

6 And the same Acme Number 1 mine, also on this
7 map.

8 A. Yes, they will. Number 1 -- thank you. I
9 appreciate that.

10 Q. You can be a professor.

11 A. Number 1 mine is here.

12 Q. Okay. So Acme Number 1, so there is an overlap
13 between what the proposed mining and the old mine Acme
14 Number 1?

15 A. Yes.

16 Q. Okay. And do you know the status of Acme Number
17 1 and Acme Number 2 mines and whether they're fully
18 reclaimed?

19 A. Much of the areas have been reclaimed
20 sufficiently by AML programs.

21 Q. Okay. Are they active in all sites at this
22 time?

23 A. I don't know.

24 Q. You don't know. Okay. Given the presence of
25 these historic mines, did you consult with your colleagues

1 in the AML division about the permit application?

2 A. I did not.

3 Q. You did not. Okay.

4 So I take it you didn't ask them about the
5 status of reclamation and AML work in the area?

6 A. I did not.

7 Q. Okay. Do you know if Brook or any of its
8 consultants were in contact with the AML division staff?

9 A. I don't know.

10 Q. You don't know. Okay.

11 I have to admit I'm having a hard time with
12 this, Mr. Kristiansen. Given this area was mined out
13 through any number of mining operations over a period of
14 time, why didn't you reach out to the AML staff about this
15 proposed permit?

16 A. The coals being mined are two different coal
17 beds, separated by 70 feet of interburden, and so at that
18 time we didn't believe that was sufficiently serious to
19 warrant --

20 THE REPORTER: I'm sorry. I can't hear
21 you.

22 A. Okay. These are underground mines. They mined
23 different coal beds than the highwall mine will mine. So
24 there is a separation between those coals that were mined
25 historically underground and the highwall mine. And so we

1 did not believe at that time that most of that information
2 was germane to this particular permit application.

3 Q. (BY MS. ANDERSON) Okay. Did you do analysis of
4 whether blasting at the Brook Mine could have an impact on
5 any of these AML sites, for instance?

6 A. I did not. I am not the blasting expert.
7 Mr. Doug Emme, my associate, is.

8 Q. Okay. Did you have -- do any analysis of
9 whether subsidence caused by any of that historic mining
10 could have a relationship at all to the proposed mine?

11 A. I did not.

12 Q. No. Okay. One last question on these AML
13 sites. How did DEQ, in the scope of its review of the
14 permit application, work in conditions of approval or
15 other language into the permit to address how to determine
16 liability from subsidence or impacts to structures or the
17 land from this mine versus other mines in the area?

18 A. Would you break that down, please.

19 Q. Yeah. It's a little bit longer question. But
20 what I'm getting at here, Mr. Kristiansen, is so you've
21 admitted there's an overlap --

22 A. Yes.

23 Q. -- at least in some areas --

24 A. Yes, there is.

25 Q. -- between historic mines and current mines --

1 and the proposed mine.

2 So if you saw subsidence when you were out on
3 one of your inspections you were talking about on the
4 surface, how would you know what mine caused that
5 subsidence?

6 A. There will be a pre-mining survey of the surface
7 above all panel areas, which is committed to in the mining
8 plan.

9 Q. Okay.

10 A. These pre-surveys will locate any existing
11 subsidence that exists at that point in time.

12 Q. Okay. So even if there's -- maybe the
13 subsidence was caused by Acme Number 1, for instance, but
14 if it's post permit for Brook, Brook would still be liable
15 for that cleanup. Is that what you're saying?

16 A. No, they would not. If it's not Brook's
17 subsidence, they will not be responsible.

18 Q. But how do you know it's Brook's subsidence?

19 A. We will have to do our best to ascertain that.

20 Q. How will you do that?

21 A. At this point in time I can't answer that.

22 Q. Okay. All right. Are you aware of special
23 regulations that address when surface mining will be close
24 to underground mines?

25 A. Yes, I do.

1 Q. Okay.

2 A. I can't quote them verbatim, but I'm aware of
3 them.

4 Q. Okay. That's fine. That's all I need. Would
5 you agree those regulations exist because there can be
6 impacts that result when surface mining is close to
7 underground mining?

8 A. Yes.

9 Q. Okay. You mentioned in your testimony that you
10 took a course from the Office of Surface Mining, or OSM,
11 on subsidence, correct?

12 A. Uh-huh.

13 Q. Okay. And remind me what -- when you took that
14 course.

15 A. That was in the spring of 2015.

16 Q. Okay. So was it a little ways into the permit
17 application?

18 A. It was.

19 Q. At that point had you started already reviewing
20 the subsidence control plan or --

21 A. That's one of the reasons I took the class.

22 Q. Okay. Would you agree that the course materials
23 and the references they use provide technical and
24 scientific standards for the assessment and prevention of
25 subsidence?

1 A. They do have some, yes.

2 Q. Does the subsidence control plan meet those
3 standards?

4 A. To the best of my ability, yes, they do.

5 Q. In what way?

6 A. Narrative standard that is -- that is utilized
7 in the permit application, generally meets a lot of
8 requirements that are general in some of the subsidence
9 estimation of -- of the highwall mines.

10 Q. Okay. I have up on the screen our Exhibit 84,
11 which is the complete version of the course materials
12 provided back from OSM to you. Would you agree with that?
13 Or have you had a chance to look at our Exhibit 84?

14 A. I can't -- no.

15 Q. Okay. That's fine. Do you -- I don't think
16 Chapter 1 was part of the DEQ exhibits for this hearing;
17 is that correct?

18 A. I don't remember.

19 Q. You don't remember.

20 Do you remember Chapter 1 from the course that
21 you took at --

22 A. I do.

23 Q. -- OSM?

24 You do?

25 A. I do.

1 Q. Okay. I'm turning to page 15 of that chapter.
2 And would you agree that this page depicts some highwall
3 mine operations that OSM talked about in its course
4 materials?

5 A. It does.

6 Q. Okay. Would you read the last sentence on that
7 page, please?

8 A. "Surface subsidence potential does exist in
9 spite of low mining recovery because of faster
10 deterioration of narrow ribs left in-place between auger
11 holes."

12 Q. Do you agree with that statement?

13 A. I do.

14 Q. And did you evaluate that statement in the
15 context of the Brook Mine?

16 A. I did.

17 Q. You did. How did you do that?

18 A. I evaluated the mine plan methodology is not
19 auger mining; therefore, it doesn't apply.

20 Q. Okay. But isn't this page about highwall mining
21 specifically?

22 A. It is about practice of highwall mining and the
23 example of auger mining is utilized there is not what's
24 going to occur at the highwall mine Brook is going to
25 have.

1 Q. Okay. But doesn't the mine plan talk about
2 auger mining?

3 A. It does in a general sense.

4 Q. In a general sense.

5 It says it's similar to highwall, correct?

6 A. They establish the same basic extraction point.

7 Q. Okay. All right. I'm going to turn to another
8 page in this exhibit. It's page 120 of the PDF. It's
9 start of Chapter 9 of the OSM course materials. Do you
10 remember this chapter from your course at OSM?

11 A. I do.

12 Q. You do?

13 A. I do. Yes.

14 Q. Okay. Did you review this chapter in the
15 context of Brook Mine application?

16 A. I believe I did.

17 Q. You believe you did. All right. Did you notice
18 that Dr. Jerry Marino's research is referenced in this
19 chapter of materials from OSM?

20 A. Yes, I did.

21 MS. ANDERSON: Okay. And just for the
22 record, it's pages 123 to 134. There's some tables and
23 charts references there.

24 Q. (BY MS. ANDERSON) So a moment ago you mentioned
25 that these materials from OSM are helpful to provide some

1 standards for the assessment and prevention of subsidence.

2 Would you agree that Dr. Marino's research referenced in

3 the materials provides those standards too?

4 A. These particular materials? Yes.

5 Q. Yes. Okay.

6 Have you reviewed Dr. Marino's report and CV

7 related to this hearing?

8 A. I read over it briefly, yes.

9 Q. Okay. So you mentioned earlier today that you

10 relied largely on the company because Cardno has more

11 experience than you in subsidence, correct?

12 A. Yes.

13 Q. But you also agree that Dr. Marino has more

14 experience than you --

15 A. I don't know.

16 Q. -- in subsidence?

17 You don't know?

18 But you looked at his report --

19 A. I have.

20 Q. -- and CV?

21 A. I have.

22 Q. And you know that his materials are mentioned

23 here in the OSM course?

24 A. Yes, they are.

25 Q. Okay. So you can't tell me whether you think he

1 has more experience than you in subsidence?

2 A. I assume he does.

3 Q. You assume he does. Okay.

4 Okay. Back to Chapter 9. There's a lot of math
5 in here. Are you familiar with all these formulas? And
6 you don't have to go over them one by one, but I'll pull a
7 few up here.

8 A. Okay. I am familiar with looking at these
9 formulas.

10 Q. Okay. Do you have any professional background
11 or experience in using the formulas in Chapter 9?

12 A. I do not.

13 Q. Okay. Did you check to see whether any of these
14 formulas were in the subsidence control plan?

15 A. I looked at the subsidence control plan, and I
16 don't remember specifically if this formula was there.

17 Q. Okay. Or any of the other formulas in
18 Chapter 9?

19 A. I don't remember specifically if they're there
20 or not.

21 Q. Okay. Did you independently run through any of
22 the formulas to double-check the company's work?

23 A. I did not.

24 Q. Okay. Yesterday you mentioned that DEQ would do
25 their own modeling runs for hydrology to check the

1 company's work. Why didn't you feel the need to do the
2 same for subsidence?

3 A. We don't have the expertise in that area that we
4 do in hydrology.

5 Q. Okay. So to be honest here, you don't have the
6 technical background to do review of this kind of work?

7 A. Based on the requirements of mine plan, I had
8 enough information to be -- to assess the narrative of the
9 mine plan.

10 Q. Okay. But you wouldn't say you have
11 expertise --

12 A. I would not --

13 Q. -- in this area?

14 A. -- say I'm an expert, no.

15 Q. Okay. Besides the OSM materials, what other
16 sources did you use to determine the standards for the
17 subsidence control plan and assess subsidence risk of the
18 permit?

19 A. Primarily those are the basic tools that I
20 utilized to -- to analyze the narrative.

21 Q. Okay. So just the OSM materials?

22 A. Yes.

23 Q. Okay. Let's go back to the subsidence control
24 plan. It was prepared by a company called Cardno, right?

25 A. Yes. Yes, it was.

1 Q. Okay. And we haven't heard much about them.

2 And they don't appear on the witness list. Who are they?

3 A. As far as I know, they're an engineering
4 consulting firm spread around the world that does work in
5 underground coal mining.

6 Q. Okay. They're a big company. Who at Cardno
7 prepared the subsidence control plan?

8 A. I don't know.

9 Q. You don't know.

10 Did you review any of their CVs or professional
11 or educational backgrounds?

12 A. I did not.

13 Q. Okay. So how can you know for sure that they
14 have more experience and expertise than you do?

15 A. Primarily based on the work that they do is
16 significantly different than most of the work I do.

17 Q. Okay. So it was a judgment call?

18 A. Yes.

19 Q. Okay. And we've -- I think we've established
20 this, but just to confirm, you haven't independently
21 verified any of the results from Cardno?

22 A. I have not.

23 Q. Okay. So you didn't conduct any compression
24 strength tests?

25 A. I did not.

1 Q. Okay. Did DEQ conduct any other geotechnical
2 studies related to subsidence risk?

3 A. We did not.

4 Q. Did you even speak directly with anyone at
5 Cardno about their findings?

6 A. I did not.

7 Q. Have you done any long-term pillar design
8 analysis before?

9 A. I have not.

10 Q. Have you done any long-term mine roof design
11 analysis before?

12 A. I have not.

13 Q. Have you done any long-term mine floor design
14 analysis before?

15 A. I have not.

16 Q. Having not done any of these analyses, how can
17 you have confidence that unplanned subsidence is unlikely
18 and thus approve the submitted subsidence control plan?

19 A. Based on the information I did have, the
20 narrative I did see, that was a logical conclusion.

21 Q. Okay. So we heard a bit yesterday about a
22 driver's license creating minimum standards. Would you
23 give someone a driver's license without any test if they
24 just told you they could drive?

25 MR. KUHLMANN: Objection. Speculative.

1 MS. ANDERSON: Okay. That's fine. It's
2 withdrawn.

3 Q. (BY MS. ANDERSON) Would you agree that
4 additional geotechnical studies are necessary before the
5 company can start mining?

6 A. No, I don't.

7 Q. You don't.

8 So they're not planning to do any additional
9 geotechnical studies that you know of?

10 A. They are planning on beginning a geotechnical
11 exploration program when they begin to develop the --

12 Q. When they begin the develop the --

13 A. Prior to the -- right.

14 Q. And will those studies be available for public
15 notice and comment?

16 A. As far as I know, yes.

17 Q. As far as you know, yes.

18 How do you know that?

19 A. This is the kind of baseline information that we
20 utilize for validation during annual reports. And this
21 information may be made known in annual report, which is a
22 public document.

23 Q. Okay. And so DEQ will ask questions during the
24 annual report review process related to those technical
25 studies?

1 A. Yes, it will.

2 Q. And will you approve them prior to mining, or
3 how will you --

4 A. We will evaluate them prior to mining.

5 Q. Okay. Are these studies identified or outlined
6 in the permit application?

7 A. No, they're not.

8 Q. They're not.

9 A. They are -- I got to take a step back.

10 Q. Yeah.

11 A. In a narrative they are committing to taking
12 samples prior to mining each panel.

13 Q. Okay. Has DEQ thought about whether there
14 should be conditions of approval related to these studies?

15 A. I'm not sure what context you're putting that
16 in.

17 Q. Commitments made by the company to do these
18 studies.

19 A. Those commitments are -- once again, it's in the
20 narrative of the mine plan.

21 Q. Okay. Going back to the finding that the
22 company made, and DEQ, yourself, found to be technically
23 adequate that subsidence is not likely to occur at the
24 mine site. This finding is for the entire permit area,
25 correct?

1 A. Correct.

2 Q. Okay. So would you agree that the data and
3 studies have to be complete enough in this permit
4 application to make and support this finding for the
5 entire permit area?

6 A. Yes.

7 Q. Okay. But yet you just said additional
8 geotechnical studies are needed before the company can
9 start mining, right?

10 A. Correct.

11 Q. Okay. Thanks.

12 Would you agree that the subsidence control plan
13 calls for monitoring for a period of six months? Do you
14 remember that --

15 A. I do not --

16 Q. -- in the subsidence control plan?

17 A. -- remember that at this time, no.

18 Q. Okay. Do you know if DEQ considered any other
19 period of time as part of its review?

20 A. We have not set a time at this point, no.

21 Q. Okay. Would you agree that subsidence can occur
22 more than six months after mining?

23 A. It can.

24 Q. Okay. Let's go back to the OSM course
25 materials. And this is from Chapter 2, and it's page 24

1 of the combined PDF that we have in our exhibits.

2 Could you look at the last bullet point there on
3 this exhibit here being displayed. Do you see the heading
4 Elapsed Time?

5 A. I see that.

6 Q. Okay. Would you agree that the first sentence
7 says subsidence does not occur instantaneously but over a
8 period of time?

9 A. Yes.

10 Q. Okay. Do you agree with that statement?

11 A. Yes.

12 Q. And based on your knowledge about subsidence in
13 the area surrounding the Brook Mine, isn't subsidence
14 occurring years, if not decades in some cases, after
15 mining?

16 A. It has.

17 Q. And are you familiar with the requirements in
18 Chapter 7 of the regulations that require reclamation
19 caused by subsidence within five years of mining?

20 A. I don't remember that.

21 Q. Okay. You don't remember that.

22 A. I do not.

23 Q. That's fine.

24 Just, I guess, tell me how DEQ found a six-
25 month subsidence monitoring period to be sufficient for

1 the Brook Mine.

2 A. Monitoring period, specific period, is one that
3 we have to help us with some of our mine inspections. So
4 that gives us the definite standard to start from, and
5 give us -- some of the inspectors an idea of what to look
6 for at that point in time.

7 Q. Okay.

8 A. That's the -- that's where it's being utilized
9 is in that type of context.

10 Q. Okay.

11 A. We may decide that five years is too short.

12 Q. All right. Okay. Let's shift gears a little
13 bit. You provided some testimony about this yesterday
14 and today, so -- but to confirm, are you familiar with the
15 concept of adjacent lands when it comes to the mining
16 permit?

17 A. I am.

18 Q. And would you agree that generally adjacent
19 lands are lands within one-half mile of the permit
20 boundary?

21 A. Yes.

22 Q. Would you agree that adjacent lands are
23 important to know who should get notified for a public
24 comment period?

25 A. Yes.

1 Q. And to assess impacts to water resources.

2 Including alluvial valley floors?

3 A. Correct.

4 Q. And to monitor and inspect for offsite impacts
5 from the mining operation? Are you familiar with offsite
6 impacts and that term?

7 A. I am. I am. That depends upon the nature of
8 the material and how it's defined in the rules and
9 regulations. Some materials do have to be examined, other
10 materials do not have to be, unless impacts are defined.

11 Q. Okay. And would you agree adjacent lands are
12 important to know for -- to assess impacts to wildlife?

13 A. Yes.

14 Q. Okay. Can you think of any other reasons why
15 these adjacent or how you put it yesterday, these very
16 close lands are important to know in the scope of DEQ's
17 review in permitting of a coal mine?

18 A. Can you rephrase that, please?

19 Q. Anything else that you want to tell us about
20 adjacent lands and --

21 A. Other than wildlife, you mean?

22 Q. Other than notification and water resources and
23 offsite impacts and wildlife.

24 A. If -- you're saying offsite impacts to wildlife.

25 Q. Or offsite impacts or wildlife.

1 A. Or wildlife.

2 Q. Yes.

3 A. Okay. Thank you.

4 Q. Sorry.

5 A. I didn't hear the "or."

6 Q. Yeah.

7 A. It depends upon the nature of the mine plan and
8 the nature of the mining condition as to what is going to
9 be affected, what is not going to be affected. If the
10 disturbance is fully within the permit boundary and shows
11 nothing leaving the property, then there are no reasons to
12 analyze adjacent lands for some applications -- for some
13 scientific applications --

14 Q. Okay.

15 A. -- since they will not be influenced or
16 impacted.

17 Q. Okay. Thank you.

18 So let's go back to the alluvial valley floors
19 for a moment. You've testified that you were the lead DEQ
20 staff member assessing alluvial valley floors, correct?

21 A. Correct.

22 Q. Okay. And, in fact, yesterday you testified
23 that it was just you that reviewed the materials in DEQ
24 Exhibit 11, right?

25 A. It was.

1 Q. Okay. You didn't think to consult with your
2 hydrogeologist colleagues at DEQ about that?

3 A. I actually misspoke.

4 Q. Okay.

5 A. There were unitizations of the AVF from
6 Mr. Matt Kunze in his analysis of some other parts of the
7 mining permit.

8 Q. Okay. But did Mr. Kunze go out in the area at
9 all and look at the alluvial valley floors?

10 A. He did. He was with me when we examined the
11 alluvial valley floor in Slater Creek.

12 Q. Okay. So we talked a moment ago about these
13 adjacent lands, and how generally for a permit those lands
14 within one-half mile are assessed for impacts to water
15 resources, correct?

16 A. Uh-huh.

17 Q. Okay. So isn't it true that DEQ in this case
18 did not assess alluvial valley floors in all adjacent
19 lands to the permit application?

20 A. We did not.

21 Q. And would you agree that DEQ didn't do this
22 assessment because Brook didn't have surface access to all
23 these adjacent lands?

24 A. I would not.

25 Q. You would not. Okay.

1 I'm going to pull up our Exhibit 37 that's on
2 the screen. Are you familiar with this email --

3 A. I am.

4 Q. -- that you wrote me?

5 A. I am, yes.

6 Q. Okay. And in this email are we -- are you
7 talking to me about AVF mapping related to the permit
8 application?

9 A. Yes.

10 Q. Okay. And that you need to maybe do a little
11 bit more at some point?

12 A. That I would need to -- if the Brook Mine is
13 going to affect the AVF -- any AVF in the area outside the
14 permit boundary, then at that time we'd be mapping the
15 AVF.

16 Q. Okay. But in making a technical adequacy
17 determination for this permit application, how could you
18 do that without knowing whether there are AVFs in any of
19 those areas?

20 A. Statutes and rules and regulations, if there's
21 no outside impact from the mine, all permit -- impacts
22 within the mine permit boundary do not directly impact
23 AVFs, the analysis does not need to be done.

24 Q. Okay. But do you know where those AVFs are?

25 A. I know where the historical AVFs are, yes.

1 Q. Okay. But how about on all the lands within
2 one-half mile of the permit boundary?

3 A. There are areas that could be AVF, but we have
4 not designated them as such.

5 Q. Have you reviewed them at all whether they could
6 be designated?

7 A. I have looked at them and made an evaluation
8 that many of them might fit within that category, and that
9 field examination was necessary to determine that.

10 Q. Okay. A moment ago you just said that you
11 didn't do some of this mapping I guess not because of the
12 lack of surface access.

13 A. Yes. We did make a determination subsequent to
14 this surface access was not going to be a problem.

15 Q. It was not going to be a problem.

16 A. Right. I was overestimating the impact of the
17 surface owners with this particular evaluation, and then
18 we subsequently made a decision that some of these surface
19 owners could be brought in simultaneously so would not be
20 as difficult to map as we thought it was going to be.

21 Q. Okay. Well, this email's back in February of
22 this year. Have you since then reached out to, say,
23 Mr. Buyok and asked him if you could come out to his land?

24 MR. KUHLMANN: Objection. I think you're
25 mischaracterizing the date.

1 MS. ANDERSON: Okay. It says Monday,
2 February 8, 2016.

3 MR. KUHLMANN: You said February of this
4 year.

5 MS. ANDERSON: I'm sorry. February -- I'm
6 sorry. February of last year.

7 MR. KUHLMANN: Yes.

8 MS. ANDERSON: I can't remember what year
9 it is, apparently.

10 Q. (BY MS. ANDERSON) So February of last year.
11 Since that time, have you reached out to any of these
12 landowners, say, Mr. Buyok, and ask them if you could come
13 out and do some AVF mapping on their land?

14 A. I did not. There's only one landowner I
15 contacted in the upper Slater Creek area.

16 Q. Okay. So you just said that surface access
17 wouldn't be a problem. So why didn't you reach out to any
18 of these landowners try to do some of that work before you
19 determined the permit application technically adequate?

20 A. When we determined that we were not having to
21 map the AVF at that point in time, I put it on the back
22 burner as something to do in the future because the
23 mine --

24 Q. Something to do in the future.

25 A. -- would not be there for five years.

1 Q. When in the future will that be done?

2 A. At any point in time that the AVF potentially be
3 impacted by Brook Mine.

4 Q. And what -- wouldn't you agree that Brook's own
5 analysis shows that some wells on the property of some of
6 these landowners will be impacted for mining activities?

7 A. We don't know that.

8 Q. You don't know that?

9 A. No.

10 Q. So you don't remember a part of the permit
11 application that has a list of wells that are expected to
12 be impacted for mining?

13 A. From what I understand, it's just a list of
14 wells in the area.

15 Q. Okay. But you don't remember another -- okay.
16 This isn't going anywhere.

17 So what scientific basis did you use to
18 determine that additional AVS -- alluvial valley floor
19 mapping was not necessary for the Brook Mine permit?

20 A. The information that we had based on the permit
21 application, the lack of discharge of any kind, the lack
22 of affected area outside the permit boundary led us to
23 assume that there would be no impacts to any adjacent
24 lands to that permit boundary.

25 Q. Okay. All right. Let's turn to facilities at

1 the mine plan. Would you generally agree that a coal
2 mining permit should include all facilities incidental to
3 conducting coal mining activities, including loadout
4 facilities?

5 A. If they were -- if they were in the mine plan,
6 you bet.

7 Q. Okay. Are you familiar with the requirements in
8 Chapter 2 of the regulations that speak to a railroad spur
9 or spurs being included in the permit boundary?

10 A. I have read them. I'm not familiar with them at
11 the point where I can quote them.

12 Q. I think you testified to this earlier, but does
13 this permit contain a loadout facility or railroad spur at
14 this time?

15 A. It does not.

16 Q. Okay. It did at one point, though?

17 A. It did in the initial permit application, yes.

18 Q. Okay. Have you ever seen a coal mining permit
19 without a loadout facility?

20 A. I have.

21 Q. You have? What was that permit?

22 A. One of the permits that -- that was examined
23 in -- I'm going to have to step back a minute. Long time
24 ago. I was working on a potential mine in southern part
25 of the state of Wyoming, Roosevelt mine. We were

1 estimating how we could build a mine adjacent to the
2 Rosebud, utilize Rosebud's facilities, and, therefore, not
3 have facilities on the mine that we were looking into.

4 Q. Okay. But there was still an adjacent mine
5 where they were going to use --

6 A. There was an adjacent mine that could use those
7 facilities on, yes.

8 Q. Okay. Correct.

9 All right. Didn't you think it was unusual that
10 the company doesn't have any facilities to get its coal to
11 market?

12 A. Based on the mining techniques, the rate of
13 mining that's going to occur, the tonnage rates that are
14 going to occur, they can handle that with a fleet of
15 trucks that they've shown in the mine plan.

16 Q. Where do the trucks go?

17 A. Trucks will leave the property, and we don't
18 know where it goes from there.

19 Q. Okay. So do you remember a conversation you and
20 I had in your office at one point in time when I asked you
21 about the loadout facility?

22 A. Uh-huh.

23 Q. Okay. And would you agree that you told me that
24 once coal leaves the permit, DEQ authority is over?

25 A. Yes.

1 Q. Okay. But doesn't DEQ require all facilities
2 and roads that are incidental to coal mining to be part of
3 the permit?

4 A. Correct.

5 Q. How about processing facilities and processing
6 areas? Are there any of those discussed in the permit as
7 of now?

8 A. Yes, there are.

9 Q. There are.

10 Do you know if the company has proposed a
11 processing facility to be used for coal at this mine site?

12 A. Yes, there is.

13 Q. Okay. Have you heard about the industrial park
14 and manufacturing facilities to process coal from the
15 mine?

16 A. I --

17 MR. SUTPHIN: Now, Mr. Chairman, I'm going
18 have to object to these lines of questions. We are here to
19 talk about the permit to mine coal that is in all these
20 volumes. What happens to the coal after it leaves the area
21 is of no importance to this hearing.

22 CHAIRMAN BAGLEY: I actually agree. We
23 need to focus on the mining aspect. What happens with the
24 coal elsewhere, I would imagine is going to be picked up in
25 other applications and things, so we need to focus on the

1 mining aspects.

2 MS. ANDERSON: Mr. Hearing Officer, can I
3 respond briefly?

4 CHAIRMAN BAGLEY: Sure.

5 MS. ANDERSON: Noting that you just
6 probably made your ruling. But as you'll see in our
7 prehearing memo, we discussed the requirements for what is
8 considered to be coal mining activities under the
9 Environmental Quality Act. And coal mining activities also
10 include areas that are incidental to the actual mining,
11 including processing areas.

12 CHAIRMAN BAGLEY: So -- yeah, so --

13 MS. ANDERSON: We believe the permit
14 application is deficient at this time because it does not
15 include processing areas that have been proposed by the
16 company and will be used as part of the mining operation.

17 CHAIRMAN BAGLEY: The question is are we
18 putting these facilities on this site, and I see no
19 evidence. I mean, I have also read the newspaper, and I've
20 heard these things, but I've not seen any evidence that
21 it's going into the mine site. And so they're going to
22 load the mine -- the coal out and send it somewhere and
23 process it, that is a concern, but not of our hearing
24 today.

25 MS. ANDERSON: Okay. Thank you.

1 Q. (BY MS. ANDERSON) All right. Let's turn to
2 recreation activities.

3 CHAIRMAN BAGLEY: Actually, Ms. Anderson --

4 MS. ANDERSON: Oh, sure. Sorry. Lunch.

5 CHAIRMAN BAGLEY: -- how much longer do you
6 think? It's 12:00.

7 MS. ANDERSON: I've probably got a little
8 while longer, yeah.

9 CHAIRMAN BAGLEY: If you don't mind, I
10 think we'd like to take a break. Let's take one hour and
11 10 minutes. We'll start at 1:15.

12 MS. ANDERSON: Okay. Thank you.

13 (Hearing proceedings recessed
14 12:04 p.m. to 1:16 p.m.)

15 CHAIRMAN BAGLEY: We are back in session.
16 Please continue, Ms. Anderson.

17 MS. ANDERSON: Thank you, Dr. Bagley.

18 Q. (BY MS. ANDERSON) Mr. Kristiansen, let's turn
19 to Recreation Activities. Could you explain to us what
20 the scope of your review was related to recreational
21 activities?

22 A. Yes. What we did was examine the recreational
23 activities that occur within that area. There are
24 multiplicity of recreation activities that take place,
25 from hunting to hiking to four-wheeling in some places,

1 fishing, a lot of different recreational activities that
2 do happen in that general area. So we did examine the
3 impacts on recreational activities on the -- based on mine
4 plan and what we expected during that mining period.

5 Q. So you considered impacts like fencing off lands
6 currently used for hunting and recreation?

7 A. We did.

8 Q. Okay. And would you agree that some areas of
9 the permit will have to be fenced off?

10 A. Yes. They will, yes.

11 Q. Okay. Did you consider whether recreation
12 activities on any adjacent lands would be impacted by
13 mining activities?

14 A. We've looked at it cursorily because they're
15 outside that permit boundary. We can't enforce anything
16 outside the boundary, so we looked at in general terms.

17 Q. In general terms. Okay.

18 I mean, what did your review find?

19 A. That the impact to recreational activity in the
20 area should be minimal. Other than hunt areas that you
21 would walk in, access is pretty sufficient right now.
22 Some of that would have to be attenuated by the mine
23 working up there, so we'd have to shrink that space down a
24 little bit up here.

25 Q. Okay. And this may be a question for Mr. Emme

1 later today too about blasting and whether you looked at
2 whether blasting in the area would have any impacts on
3 recreation activities.

4 A. Mr. Emme is the correct person to talk to about
5 that.

6 Q. Okay. Is DEQ considering any conditions of
7 approval related to recreation uses or activities for the
8 mine?

9 A. No. That is actually outside of our capacity.
10 A lot of these lands are the surface owner has worked with
11 Brook Mine in building what is considered to be
12 appropriate limitations in some of those areas. And
13 that's about all we can enforce is some of the stuff
14 within that permit boundary is all.

15 Q. Okay. All right. Let's switch to production
16 limits. Based on what you know about the company, would
17 you agree the company's plans for the area and for the
18 coal to be mined have changed since 2014 when the permit
19 application was submitted, to your knowledge?

20 A. I never, for a long period of time, we didn't
21 discuss destination of the coal. Primary concern was the
22 mining of the coal, and once it left the property. We had
23 no real in-depth discussion of what some of the
24 destinations might be for that coal. All we knew was that
25 they were not thinking the terminal coal or thinking of a

1 different use for that coal. But at that point in time we
2 didn't know.

3 Q. Okay.

4 A. They developed more things over time, but I
5 haven't been privy to any of that stuff.

6 Q. Okay. So you never asked the company about
7 their production goals or --

8 A. You mean as far as tonnage?

9 Q. Yeah.

10 A. The tonnage is indicated in the mine plan and
11 what tonnage will occur during which years.

12 Q. Okay. And based on what you know about their
13 use of the coal now, did you ever ask them about whether
14 they need to update that tonnage amount?

15 A. At this point in time they've left it stand, so
16 I have to assume they're still going to mine that amount.

17 Q. Okay. Would you agree that the company already
18 has an Air Quality permit?

19 A. Yes, they do. They've expressed that.

20 Q. And why does the mine permit application say
21 that the Air Quality permit will be submitted then?

22 A. There's a timing period on some of that stuff
23 was -- decisions were made at specific times prior to
24 their acquiring the permit, and they have subsequently
25 acquired the permit after that point in the narrative.

1 Q. Okay. Will DEQ require an update in the permit
2 narrative to reflect that Air Quality permit that has been
3 received?

4 A. All we require is they state they have an Air
5 Quality permit.

6 Q. I think they state it will be submitted. Is
7 that sufficient?

8 A. I'm not sure. I can't remember that part of it.
9 But it is sufficient to state that -- if they state it
10 will be submitted prior to the mining commencing that we
11 would consider that adequate.

12 Q. Okay. Have you reviewed that Air Quality
13 permit?

14 A. I have not.

15 Q. Okay. So you don't know if there's any
16 production limits or anything like that in the Air Quality
17 permit?

18 A. No, I don't.

19 Q. Okay. Did you ever consult with anybody in the
20 Air Quality Division about the Air Quality permit?

21 A. For the Brook Mine?

22 Q. Yeah.

23 A. I haven't really in specific details, other than
24 they were -- they said, yeah, we'll have to provide a
25 permit for the mine. And that's been quite a while ago,

1 so we haven't really talked about that because it hasn't
2 become -- Brook is taking care of that themselves.

3 Q. Okay. Would you agree that in certain years,
4 for the permit it's projected that the company will mine
5 more than 2 million tons per year?

6 A. No, I don't.

7 Q. You don't. So you don't see a number that's
8 more than 2 million for any year in the permit?

9 COUNCIL MEMBER FLITNER: How would he have
10 any knowledge about this kind of stuff? Let's get back to
11 the permit. I mean, he doesn't know what their plans are.
12 It's not his privy. He doesn't work for the coal company.
13 Let's get back into the permitting end.

14 MS. ANDERSON: Okay. Thank you. I can
15 find the map...

16 Q. (BY MS. ANDERSON) Are you -- Mr. Kristiansen,
17 are you aware of a chart in the permit application that
18 lays out the production estimated for the life of the
19 mine?

20 A. There is a table in the mine plan that depicts
21 the annual average production --

22 Q. Okay.

23 A. -- for the life of the mine. It is upon seeing
24 that in some of the comments, I looked at it again and it
25 is improperly labeled. It is total production per year by

1 life of the mine. So the year 6 through 10, say 10
2 million tons are 2 million tons per year.

3 Q. Okay. And how about some of those other years
4 in that chart, as you called it?

5 A. They seem fairly applicable to what they plan on
6 doing.

7 Q. Okay.

8 A. So that's probably about a 2-million-ton-a-year
9 operation when they're in full swing.

10 Q. Okay. Let's turn to traffic and roads. Is it
11 accurate to say that Brook has represented that the
12 traffic control plan will be an operational requirement?

13 A. The traffic control can be part of their mine
14 plan as far as haul roads, access roads and all the other
15 roads put into place, and they'll have mine defined limits
16 in some of those roadways. We don't enforce roads or
17 speed limits or any of the rest of that sort of stuff, so
18 there's not much more we can do about it except for a
19 general narrative.

20 Q. But isn't there required section of the permit
21 that considers impacts to existing uses including public
22 roads?

23 A. There is some narrative description. Very minor
24 at this point in time. It's outside the permit boundary.
25 Again, the roads to be discussed in the permit application

1 are the roads inside the boundary. And roads outside of
2 that, then, in passing, there was some issue about
3 traffic.

4 Q. Okay. Let's turn to Exhibit 12 of yours,
5 page 131. And it's displayed on the projector, but you
6 might want to pull out the whole map just for ease of you
7 being able to read it.

8 A. Okay. And I have it.

9 Q. Okay. Great. Do you see Slater Creek Road on
10 this map?

11 A. I do.

12 Q. Could you point it out in the projection, just
13 for the benefit of the council.

14 A. Find my little --

15 Q. Yeah, your little projector [sic].

16 A. My little pointer there. Did you take the
17 pointer back or -- ah.

18 MR. RUBY: He did.

19 A. Okay.

20 Q. (BY MS. ANDERSON) So Slater Creek Road.

21 A. Slater Creek Road.

22 Q. Yeah.

23 A. Is -- let's see if I can see it on this picture
24 here. And it actually goes right up through here, but
25 it's really hard to see with the color and reproduction

1 there.

2 Q. Okay. That's fine.

3 Would you agree that mining will take place
4 under this county road?

5 A. Yes, mining will take place beneath the county
6 road.

7 Q. Okay. Will any trench or surface mining occur
8 on or around this county road?

9 A. No trenches or surface mining will occur on the
10 county road area.

11 Q. Do you see Hidden Water Road on this map?

12 A. I do see Hidden Water Road.

13 Q. Okay.

14 A. And that is coming up through -- this one right
15 here is Hidden Water Road that comes up through Section
16 17.

17 Q. Okay. And would you agree that mining will take
18 place under this county road?

19 A. Yes, it will.

20 Q. Okay. Do you see the frontage road or Wyoming
21 State Highway 345 on the map?

22 A. I do. And that is going down through here like
23 this.

24 Q. Did you ask the company if they would use State
25 Highway 345 for any mining activities?

1 A. I did not specifically ask them. It's outside
2 the permit boundary.

3 Q. Okay. Do you have any reason to believe that
4 coal will be hauled on this road?

5 A. I don't know for a fact what the plans are for
6 that.

7 Q. Okay. I'm going to have to do something else.
8 Do you see Interrogatory Number 15 -- I'm sorry.
9 So this is back to DEQ's responses to our interrogatories.
10 Do you see Interrogatory Number 15 on this display?

11 A. I do.

12 Q. Could you read the response for me.

13 A. "Public Roads:" is that the one you're looking
14 at?

15 Q. Yes. That's the one?

16 A. "County roads will be used for haulage where the
17 trucks leave the minesite. This occurs in year 1, with
18 the TR-1 Pit coal hauled south to highway 338. During
19 years 8 to 11, coal will be hauled using the Slater Creek
20 Road and the South Ash Creek Roads, it's the highway 345.
21 County roads will be redesigned to allow for industrial
22 traffic, working with Sheridan County on long term
23 planning prior to use. Buffering is not required where
24 the surface owner has worked out a Surface Use Agreement
25 to use the roads for mine transportation. Haulroads will

1 be designed and certified ahead of mining by a revision
2 submittal to the permit."

3 Q. Okay. So is it still your testimony that DEQ
4 has no knowledge about the use of Highway 345?

5 A. We don't see any specific mention of 335 -- or
6 345 in the -- some of the formal materials we've looked
7 at, we're making an assumption there that it will be used.

8 Q. Okay. So this particular paragraph isn't in the
9 mine plan?

10 A. Not that I can remember, no.

11 Q. Not that you can remember.

12 So this is DEQ's interpretation of what can
13 happen?

14 A. Based on what I see here, it is.

15 Q. Okay. Okay. Going back to the map. This is
16 similar kind of question. Do you see the Decker Highway
17 on this map?

18 A. I do see the Decker Highway.

19 Q. Okay.

20 A. It is right here.

21 Q. Excellent. Did you ask the company if they
22 would use that highway for any mining activities or
23 transportation of coal?

24 A. I did not. We assumed they would utilize it,
25 but I never specifically asked them because the assumption

1 was already there.

2 Q. Okay. Has DEQ been in communication with the
3 Wyoming Department of Transportation about the use of
4 these public highways?

5 A. We --

6 THE REPORTER: I'm sorry?

7 THE WITNESS: We have not.

8 Q. (BY MS. ANDERSON) Has DEQ been in communication
9 with the county commissioners of Sheridan County about the
10 use of mining impact on county roads?

11 A. We have not.

12 Q. Are you aware of the use of county roads by
13 anybody but the surface landowner for those county roads?
14 So, for instance, Slater Creek, are you aware of other
15 landowners maybe outside the permit area that --

16 A. Yeah, there are --

17 Q. -- use those roads.

18 A. -- some landowners that live up Slater Creek.

19 And from what I understand, they will be
20 utilizing the road as long as they can, and if there are
21 any diversions that need to be made to re-run the road so
22 they can continue to mine in around that area will be
23 performed, from what I understand. There are a number of
24 residents that do live up there and utilize that road on a
25 daily basis.

1 Q. Okay. Has DEQ been in communication with any of
2 those landowners?

3 A. We have not.

4 Q. Do you know if the company has?

5 A. I don't know.

6 Q. Okay. All right. So I'm going to switch topics
7 a little bit here.

8 So you talked a little bit in your testimony
9 about I think you used the phrase chain of command for the
10 permit review.

11 A. Uh-huh.

12 Q. Who is your supervisor for the purposes of your
13 district office's review of the permit application?

14 A. Mr. Mark Rogaczewski was my immediate
15 supervisor.

16 Q. And who is his supervisor in Cheyenne?

17 A. His supervisor in Cheyenne, for this particular
18 project, was Mr. Alan Edwards.

19 Q. Okay. There is a change in Land Quality
20 Division administrator during the review period for permit
21 application, right?

22 A. Yes.

23 Q. And what was that change?

24 A. Mr. Kyle Wendtland is the administrator for Land
25 Quality, but he recused himself from the entire mine

1 review process or any decision making.

2 Q. Any decision making?

3 A. Yes.

4 Q. Okay. So you would say that he hasn't been
5 involved in reviewing any aspect of the Brook Mine permit?

6 A. Not that I know of.

7 Q. Not that you know of. Okay.

8 Could you tell us why Mr. Wendtland was recused
9 from the proceedings?

10 A. I'll do it the best of my ability. His brother
11 is an attorney that works for I think one of the Brook's
12 clients, and so he recused himself on day one.

13 Q. Okay. I have on the display here our
14 Exhibit 70, which is a chain of emails which you're
15 included in.

16 A. Uh-huh.

17 Q. Do you remember this conversation?

18 A. I don't, but scroll down further, please.

19 Q. Yeah. Sure.

20 A. Okay. Yes, I do.

21 Q. Yes, you do. Okay.

22 MR. KUHLMANN: Mr. Chairman, the Department
23 did not try to exclude any exhibits based on relevance.
24 But if -- I guess I would ask that the -- I would ask that
25 PRBRC's counsel keep this line of questioning focused on

1 actually the contents of the permit, because I don't know
2 that that's where this question is going.

3 MS. ANDERSON: And Mr. Hearing Officer,
4 there were objections raised about the conflict of
5 interest. And as you heard just right now from
6 Mr. Kristiansen, the Department and the company have said
7 that Mr. Wendtland was totally recused. The reason we have
8 exhibits related to this is we will show that he wasn't
9 totally recused and he was actually involved in a limited
10 way, but in some important ways, according to our
11 organization and some of the objectors. So that's where
12 this line of questioning is going.

13 MR. KUHLMANN: Mr. Chairman, I guess I
14 question the relevance of whether or not Mr. Wendtland was
15 involved in any respect with the sufficiency of the
16 application actual contents.

17 CHAIRMAN BAGLEY: I guess I'm wondering the
18 same thing. I mean, we have a mine plan and obviously
19 we've been going through it in a lot of detail, asking a
20 lot of questions about that. If -- I guess my question is
21 if you had -- you have an indication that something in the
22 mine plan was specifically changed because of communication
23 with Mr. Wendtland, otherwise I don't see that it's
24 relevant.

25 MS. ANDERSON: Okay.

1 Q. (BY MS. ANDERSON) I'll pull up Exhibit 60 from
2 our exhibits. And, Mr. Kristiansen, do you remember this
3 chain of emails between you and Mr. Wendtland? I'll
4 scroll down.

5 A. Scroll down, yeah. Thanks.

6 Q. Yeah.

7 A. Okay. I remember it, yep.

8 Q. Okay. Can you tell us what this is about?

9 A. Boy.

10 Q. Was it about what period of review DEQ would be
11 using for --

12 A. That's what I'm trying to remember, is what
13 period of review that was in. 11/17 --

14 Q. It was something about the permit application,
15 right?

16 A. Yes, it was.

17 Q. And so -- and then Kyle Wendtland replied back
18 to you, right?

19 A. Correct.

20 Q. And it says that -- and then you reply back to
21 him, right?

22 A. I believe so.

23 Q. Okay. So would you agree that Mr. Wendtland was
24 involved in this decision?

25 A. He occasionally heard some of the aspects of the

1 operation, but had nothing to do with the mine permit or
2 the application of our critique of the permit.

3 Q. Okay. Let me turn to Exhibit 65 -- 66 -- I'm
4 going to turn to Fisher Exhibit 18. And this may be a
5 question for Mark.

6 A. Yeah. I didn't see this.

7 Q. Okay. That's fine. I'll leave that for Mark.

8 MS. ANDERSON: Okay. That is all I have.
9 Thank you, Mr. Kristiansen.

10 THE WITNESS: Thank you.

11 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
12 Mr. Gilbertz.

13 MR. GILBERTZ: Thank you. I need to
14 connect to my technology here.

15 CROSS-EXAMINATION

16 Q. (BY MR. GILBERTZ) Good afternoon,
17 Mr. Kristiansen.

18 A. Good afternoon.

19 Q. My name is Jay Gilbertz. I represent the
20 Fishers in this matter. I'll try not to spend time
21 plowing the same ground visited about already -- or others
22 have already visited with you about.

23 A. Okay.

24 Q. I wanted to go over a couple of things quickly.
25 One, there are -- we know we've got a few landowners in

1 these proceedings here today before us about what's going
2 on out there, but the Tongue River Valley down by the
3 river is an area with a great number of landowners and
4 farmers and ranchers living down through that area,
5 correct?

6 A. Correct.

7 Q. And from the mine documents it appears that more
8 than 350 domestic or stock water wells are within the zone
9 of potential influence considered by the DEQ, correct?

10 A. Correct.

11 Q. Okay. And as you told us a couple of times,
12 both yesterday and today, the coal seam itself out in this
13 portion of the country is the aquifer, right?

14 A. The coal seams are aquifers, yes.

15 Q. And you said that there are -- there are not a
16 lot of options in the shallow ranges or anything else that
17 will produce sufficient quantity or quality of water for
18 domestic well, right?

19 A. Generally not.

20 Q. Good. Also try to start with a couple of things
21 I bet we can agree on. You would agree with me that it is
22 a basic tenet of Wyoming's Environmental Protection Act to
23 enable the state to prevent, reduce, eliminate pollution
24 and to both preserve and reclaim the land of Wyoming?

25 A. Uh-huh.

1 Q. You also agree with me that part of the policy
2 is to carefully plan the development, reclamation and
3 preservation of the land and the water resources of the
4 state?

5 A. Yes.

6 Q. Indeed, you would recognize that as the -- very
7 similar to the precise language of the policy set forth in
8 the statute?

9 A. Yes.

10 Q. Good. With that goal in policy, you would agree
11 with me that it's important to review and address both the
12 risks and potential problems with reclamation and
13 hydrology carefully and thoughtfully before mining?

14 A. Can you say that again.

15 Q. You bet. With this goal and this policy in
16 mind, you would agree with me that it is important to
17 review and address both the risks and the potential
18 problems associated with reclamation and hydrology in a
19 careful and thoughtful manner?

20 A. Yes.

21 Q. And the same question a little differently. You
22 would agree with me that it is important to review and
23 assess the risks and potential problems with reclamation
24 and hydrology in a thoughtful and scientific fashion?

25 A. Yes.

1 Q. And we want to approach that process on a
2 case-by-case and site-specific approach, correct?

3 A. Generally speaking, yes.

4 Q. Good. Would you agree with me that at times
5 input from the public can add value to this process and
6 bring to light or raise attention to issues that might not
7 previously have been addressed in the mine plan?

8 A. It can.

9 Q. And, indeed, that after objections were filed in
10 this case and the contested case proceedings got started,
11 if I understand the answers to interrogatories right, the
12 DEQ has acknowledged that the comments from objectors
13 about placing additional monitoring on the Tongue River
14 itself are valid?

15 A. Yes, they are.

16 Q. Okay. And so that was something that was
17 helpful from the public?

18 A. Yes, it was.

19 Q. Okay. Also, it was brought to light that the
20 way the mine plan was configured was that it was only to
21 protect adjudicated wells and not adjudicated and
22 registered wells?

23 A. That was the way it was stated, yes.

24 Q. And if I understand correctly, the DEQ has
25 agreed that it would be appropriate to amend the mine plan

1 to include both the registered and the adjudicated wells?

2 A. Both sets of wells, yes, permitted and
3 adjudicated.

4 Q. Can you tell us how that change to the mine plan
5 will be accomplished now?

6 A. This will come in as a modification of a
7 document, and we would assess the modification to
8 determine whether it's significant or insignificant --
9 minimally significant, to see whether there is something
10 we need to push forward or if we can utilize some
11 narrative resources at this point in time to develop some
12 programs later.

13 Q. Would these acknowledgments be made part of the
14 mine plan?

15 A. Depending upon the nature of those, it may or
16 may not.

17 Q. Okay. I would take it that you also wouldn't
18 have any problem with conditions being placed on the
19 permit should this council find that some of the evidence
20 in the case lends to the conclusion that a condition is
21 appropriate?

22 A. There's appropriate place for this conditions,
23 and this may occur.

24 Q. Okay. Now -- we're not reading each other. No
25 matter how hard I try, technology always ends up being my

1 bane. There we go. Looks like it's going to succeed at
2 this point.

3 So to further the discussion we're about to have
4 I just want to take a look at a bit of law for us for a
5 moment. It comes off orange up there. Let me just start
6 off with -- this is part of Wyoming 35-11-406(n). We have
7 a discussion -- this is familiar to you, right, sir?

8 A. Yes, sir.

9 Q. And we see here that an applicant for a surface
10 coal mining permit has a burden of establishing the
11 application that's in compliance with the act. It goes on
12 to say that no surface coal mining permit shall be
13 permitted unless the applicant affirmatively demonstrates
14 and the administrator finds in writing one of these is
15 number 2 -- (ii), the reclamation plan can be -- or the
16 reclamation plan can accomplish reclamation as required by
17 the act.

18 A. Correct.

19 Q. And that reclamation required by the act is --
20 act is restoration, correct?

21 A. It is reclamation.

22 Q. Okay. And (iii) says the proposed operation has
23 been designed to prevent material damage to the hydrologic
24 balance outside of the permit area, correct?

25 A. Correct.

1 Q. Okay. So we're talking about waters that exist
2 outside of the permit area. And so that we don't need to
3 revisit this again as we go through our concepts. Down
4 below in section (v), the proposed operation would, under
5 subsection (B), not materially damage the quantity or the
6 quality of the water in surface or underground water
7 systems that supply these alluvial valley floors. That's
8 part of the statute, correct?

9 A. Correct.

10 Q. Okay. So with that in mind, let's talk about
11 some hydrology points for a moment. When Brook mines in
12 the coal seams, if there is water in them, it will dewater
13 the coal seams, correct?

14 A. Correct.

15 Q. And the coal seams, at least in some places,
16 contain quite a bit of water?

17 A. In a few places they do, yes.

18 Q. Okay. And, again, as you stated to us
19 yesterday, the coal seam can be the aquifer in these parts
20 of Wyoming.

21 A. They can.

22 Q. Okay. Indeed, are you aware that the Fishers'
23 domestic water supply comes from the coal seam?

24 A. I didn't know that.

25 Q. Okay. Now, a coal seam is an aquifer that can

1 be connected to other things in a river and alluvial
2 valley system, correct?

3 A. Possible, yes.

4 Q. Well, let's talk a little bit about the
5 connected nature of that plan. I'm going to direct you to
6 what is part of the mine plan. It's the reclamation plan.
7 You're familiar with that, right?

8 A. Okay. Yep.

9 Q. I want to visit with you for a few moments about
10 what is in this reclamation plan. By the way, this is
11 drafted by Western Water Consultants, to your
12 understanding, correct?

13 A. Yes. Uh-huh.

14 Q. And we are looking for my iPad again.

15 A. There you go.

16 Q. When in doubt, plug it back in.

17 So in the discussion under RP.8.3, we have a
18 discussion of some of the water issues here. And this
19 portion in -- highlighted in blue says the aquifers are
20 generally recharged in the northwest and the water flows
21 down the geologic dip to the southeast. Do you see that?

22 A. I do.

23 Q. Great. Do you have any reason to disagree that
24 the aquifers in this area are generally recharged in the
25 northwest and water flows down the geologic dip to the

1 southeast?

2 A. I have no reason to disagree with that.

3 Q. Good. The next section says sources of recharge
4 to the Carney seam -- that would be the Carney coal seam,
5 right?

6 A. Correct.

7 Q. Include the Carney burn scoria that is adjacent
8 to the coal seam, open Carney mine pits to the north of
9 the permit area, regions where the Carney seam subcrops
10 into Slater Creek or Tongue River alluvial material. Do
11 you see that?

12 A. I see that.

13 Q. No reason to disagree with the notion that these
14 coal seams subcrop into the alluvial material?

15 A. There's no reason to doubt that.

16 Q. And therefore we have a connection of some sort
17 between the coal seams and the alluvial material, correct?

18 A. It can be, yes.

19 Q. In fact, we have that as an -- as the statement
20 of the applicant themselves.

21 A. Yes.

22 Q. Good. We go on now in blue again to talk about
23 the Masters seam. I won't read that to everyone because
24 we can -- hopefully it's large enough we can all read it
25 for ourselves. But in here we, again, come to the

1 conclusion that the Masters seam is in communication with
2 the river alluvium, correct?

3 A. Yes.

4 Q. Okay. So we now have a situation where we have
5 an interconnection between these coal seams and the river
6 alluvium. Let's take a second here and go to DEQ Exhibit
7 Number 15. And I'm going to try to blow this up. This is
8 the end of DEQ Exhibit 15. We can see the Brook Mine
9 permit acreage here, and we can see some identification of
10 AVF acreage over here on the right, correct?

11 A. Correct.

12 Q. To go back to what we just learned, we have the
13 water flowing down the geological dip from the north --
14 oops, lost it -- from the northwest, right?

15 A. Uh-huh.

16 Q. Down to the southeast. Something like that.

17 A. A little bit less precipitous than that. A
18 little bit more west northwest -- more northwestern, it
19 seems.

20 Q. Okay.

21 A. But, generally speaking, in that general
22 direction.

23 Q. Something more like this?

24 A. Sure.

25 Q. What you described for me? And that's going to

1 happen throughout the permit area. For example, that same
2 thing's happening over here, where water --

3 A. No, it won't.

4 Q. -- comes down to dip and out, right?

5 A. There's places where that doesn't apply.

6 Q. Okay. That's the general statement we have for
7 how the hydrology works underground in this area, correct?

8 A. That is right. It's a general statement.

9 Q. Good. And one of the things that you were
10 saying in your testimony earlier about AVFs is that you
11 looked at Brook's statement that there were no AVFs to
12 be -- to be looked at within the Slater Creek drainage,
13 correct? And you looked at that and determined that to be
14 in error.

15 A. I did.

16 Q. Okay. And, in fact, you identified that there
17 are AVFs in the Slater Creek area, correct?

18 A. I did.

19 Q. Let's go ahead and jump to DEQ 16, which is the
20 findings in that regard, I believe. Oops. I'm on the
21 wrong spot. I am. There we are. No need to run away
22 from my exhibit. We're still on 15.

23 And what we have here, which is page 10 of your
24 memo on Slater Creek, is an area that you have designated
25 as alluvial valley floor in Slater Creek, correct?

1 A. It is.

2 Q. And that is -- we see it stopped suddenly there
3 at the permit boundary. I presume that was because you're
4 only identifying the AVF within the permit boundary?

5 A. Correct.

6 Q. Okay. So in this instance you found the
7 designation -- or the claim that there was no AVF within
8 this permit boundary to be in error, because, in fact,
9 there was AVF inside the permit boundary.

10 A. Oh, okay. Yes.

11 Q. Okay. And you also found some I think
12 identified just below the permit boundary as well; is that
13 right?

14 A. There was some potential areas down in there
15 that needed to be examined.

16 Q. But that examination has not happened yet?

17 A. No, it has not yet happened.

18 Q. Okay. So let's talk a bit more about the
19 portions that are already designated as alluvial valley
20 floors. We're still in 15, and I'm at page 13. I'm going
21 to try to make our map a little usable here. There we go.
22 At least from my angle that looks orangish. Is it from
23 your angle?

24 A. It is.

25 Q. On the actual map that is colored in yellow,

1 correct?

2 A. I believe it is.

3 Q. Okay. And we have a label here that says AVF
4 acreage pointing to these shaded areas we're looking at?

5 A. Yes, it does.

6 Q. Good. And you have told us that it has been
7 designated as AVF, alluvial valley floor, as -- a while
8 back as part of the Big Horn Coal permit, correct?

9 A. Yes. This was concluded a good number of years
10 ago.

11 Q. Good. And what we know is that -- I'll try to
12 make my laser work here -- this area that I'm pointing to
13 in here, is the TR-1, correct?

14 A. Correct.

15 Q. And that is the very first place that Brook
16 intends to mine. Is that --

17 A. It is.

18 Q. And we can see that the edge of the permit
19 boundary parallels and follows precisely, pretty darn
20 close anyway, the designation of the alluvial valley
21 floor.

22 A. Yes, it does.

23 Q. Okay. And what we have, then, as you have
24 noticed, is that this portion that will be mined,
25 potentially, in here, that this is heavily saturated

1 material, bathtub like, I think, correct?

2 A. Say that again.

3 Q. I think you described this as being like a
4 bathtub. There's a lot of water in that material.

5 A. There's -- that's an old Big Horn Coal pit.

6 Q. There's a lot of water within the earth material
7 inside of this boundary, correct?

8 A. At this point in time, there is.

9 Q. Which is directly and next door adjacent to this
10 designated alluvial valley floor.

11 A. Yes.

12 Q. Okay. What data or scientific study do we have
13 that tells us that interrupting water inside of the mine
14 area is not going to have a detrimental effect on the
15 water in the alluvial valley floor?

16 A. I don't have the answer for that.

17 Dr. Muthu Kuchanur does.

18 Q. Okay.

19 A. So when he gives his testimony, you'll be able
20 to get the answer.

21 Q. Well, let's then stick with something you do
22 know about. Go to 16. So I'm going to blow up the map
23 that's in exhibit -- DEQ Exhibit 16, which is the Brook
24 Mine boundary now with the addition of what you have
25 labeled as the potential AVF acreage, correct?

1 A. Correct.

2 Q. And, in fact, it was you who identified this as
3 potential AVF acreage?

4 A. Correct.

5 Q. Good. And while we're here, if we were to do
6 the same thing that we did before, we've established
7 already that the coal seams, Carney and Masters,
8 communicate with the river alluvium of the Tongue River.

9 A. Possibly.

10 Q. Okay. Possibly.

11 And we have established that the geological dip
12 goes from northwest to southeast through the permit
13 acreage where the coal will be mined, coal which is an
14 aquifer, and into the alluvial valley floor below,
15 correct?

16 A. The dip actually, more generally eastward and
17 northeastward.

18 Q. Okay.

19 A. The strike is northwest to southeast.

20 Q. Okay. So that's the interesting part of this,
21 is that everywhere within the mine plan that I can find,
22 it is designated that the slope is from northwest to
23 southeast flowing through the Brook permit acreage toward
24 the alluvial valley floors. However, when it came to this
25 alluvial valley floor designation, you then concluded, the

1 only place I can find in the mine plan, that the regional
2 dip runs about 90 degrees of what everything else says,
3 and that it goes a different direction.

4 A. Correct. That was my finding.

5 Q. And by that finding, you, therefore, found that
6 it was unnecessary for the DEQ to determine whether the
7 coal seams in this area that may, as you say, communicate
8 with the alluvium of the Tongue River Valley need not be
9 performed.

10 A. At this point in time -- would you please
11 rephrase that question?

12 Q. Sure.

13 A. I got lost.

14 Q. The decision that the water didn't flow as -- as
15 Brook Mine it itself says the water flows in its
16 reclamation plan, it was necessary to exclude the alluvial
17 valley floor of the Tongue River from consideration.

18 A. No, this was the determination I based on a lot
19 of the regional geology. And in some of these areas, the
20 geology turns and looks different directions. And based
21 upon the way it was deposited in there. So some of these
22 areas do, in fact, dip towards the southeast and others
23 dip toward the northeast.

24 Q. Okay.

25 A. Depends on what part of the mine you're in, what

1 parts of the geology you're looking at.

2 Q. So it's complex under there.

3 A. It is.

4 Q. We can't say for sure what happens.

5 A. In most cases, within a limited distance, beyond
6 that point we can't.

7 Q. Okay. So there is a complexity in how the water
8 flows and we know that it may connect with the alluvial
9 valley floor of the Tongue River in what you've labeled
10 potential AVF acreage.

11 A. There's a potential.

12 Q. Okay. Good. And, therefore, we cannot say that
13 mining through the coal seam, which is an aquifer flowing
14 to that alluvial valley floor, will not materially damage
15 the quantity or the quality of the water in the alluvial
16 valley floor, can we?

17 A. We can't say that.

18 THE REPORTER: You can or can't?

19 THE WITNESS: We cannot say that.

20 Q. (BY MR. GILBERTZ) Okay. All right. And then
21 as to this portion that you marked as potential AVF.
22 Here's the area of the photograph of that area. Is it
23 familiar to you, sir?

24 A. It is basically familiar to me.

25 Q. Okay. There is very little doubt -- I

1 understand that you have to do particular studies to make
2 the conclusion, but there's very little doubt in your mind
3 this is AVF, is there?

4 A. The Tongue River area done here is probably AVF.

5 Q. Very good. And then just going back to memo. I
6 think you may have started to answer this question
7 earlier, but I want to get to it. The reasons that you
8 give for not furthering the study of the AVF in the Tongue
9 River Valley marked as potential. One, the conclusion of
10 the dip goes in a different direction, as we discussed.

11 The other one was -- if I can make this work --
12 it was going to be hard to get access. And you say
13 several of the landowners have indicated that data
14 collection on -- it reads several of the landowners have
15 indicated that data collection on their property for
16 purposes of evaluating the Brook Mine permit application
17 will be fought with every means at their disposal.

18 A. Correct.

19 Q. Suggesting that the ability to do the work would
20 be compromised by the landowners themselves.

21 A. At that point in time, yes.

22 Q. Thank you. So this is my question to you. Name
23 one.

24 A. A landowner?

25 Q. Yes, who told you that they would fight data

1 collection on their property with every means at their
2 disposal.

3 A. I'm not comfortable naming any landowners at
4 this time.

5 Q. So you cannot name one for us?

6 A. Will not.

7 Q. Okay. It wasn't Mrs. Fisher?

8 A. No, it was not.

9 Q. Okay. She wasn't asked, right?

10 A. No, she was not.

11 Q. And wasn't Mr. Bocek, right?

12 A. No. It was not.

13 Q. He wasn't asked? It wasn't Mr. Buyok. Excuse
14 me?

15 A. Thank you. No, it was not.

16 Q. And Mr. Bocek's not with us, but he wasn't
17 asked?

18 A. Correct.

19 Q. All right. Okay. So at least mapping of those
20 individuals who would have no resistance could have been
21 accomplished?

22 A. It could have been, possibly.

23 Q. Forgive me for a moment. I'm trying not to
24 repeat ground other lawyers have spoken with you about.

25 We mentioned the Fishers' water well earlier.

1 You said you did not know that it derives its water from
2 the coal seam.

3 A. I did not know that, no.

4 Q. Okay. And I have seen some reports in relation
5 to expected drawdowns, I believe came from the permit,
6 from certain wells. Are you familiar with that?

7 A. This area of the permit application was handled
8 by Dr. Muthu Kuchanur, and I'm not familiar with the
9 details.

10 Q. Good. I will ask him about that, then.

11 You were asked a few questions earlier today
12 about permits and whether you'd been involved in a
13 highwall mining permit, those sorts of things. Just to be
14 clear -- and your answer will be, but I need to do it for
15 the record -- have you previously been involved in a
16 highwall mining permit application near a major alluvial
17 river such as the Tongue River?

18 A. I have not.

19 Q. And another question. Have you been involved in
20 all these coal mining permits that you talked to us about,
21 have you ever been involved in coal mining permit in which
22 the -- either at least a draft of the probable
23 hydrological consequences or a draft of the cumulative
24 hydrological impacts was not done by the time DEQ declared
25 the permit technically accurate?

1 A. I can't remember any right now.

2 Q. So the best of your memory, this is the only
3 time that a permit has been declared technically adequate
4 without these hydrological studies having been done at
5 least in the draft form and available for review?

6 A. I can't remember any -- not having it, so no.

7 Q. Okay. We heard a lot over the last couple of
8 days, and I'm going to try to get us moving on to
9 hopefully somebody other than you, which may make you
10 happy. But we've talked an awful lot about these volumes
11 of materials and rounds of production. Can you identify
12 for me any materials which undertook to assess the
13 objectors' objections from a scientific perspective and
14 see whether there was merit to that?

15 A. At this point in time we gathered the objectors'
16 objections and classified them and put them together. We
17 have not had much of an opportunity to actually study
18 different objections for scientific merit or lack of it.

19 Q. You haven't had a chance to study them, even
20 though they're approximately five months old?

21 A. Not at this time, no.

22 Q. Okay. And so what we know, then, is in this
23 volume of materials, none of it is dedicated to DEQ trying
24 to understand whether the objectors have valid points.

25 A. No. Not that I can remember.

1 Q. And then I don't think we need to revisit it,
2 but you did draw some initial conclusions about that were
3 really just designed to harass folks.

4 A. Not in my opinion, no. I know some of those
5 landowners, I know they're sincere.

6 Q. Good. So at this point you don't hold that that
7 opinion that these are --

8 A. No, I don't.

9 Q. -- for purposes of harassment.

10 And I'll do something because our court reporter
11 is going to scalp me if I don't. It is impossible for her
12 to take down both of us talking at the same time.

13 A. Correct.

14 Q. So I'll try to go slow and finish the question
15 and not interrupt you, if you can do the same for me.

16 A. I can do that.

17 Q. Thank you.

18 Let's talk for a couple minutes about the
19 subsidence issues. I think you told the council that you
20 had relied on these other folks who had developed a
21 rapport about the subsidence as the basis for determining
22 this would be a no subsidence mine; is that right?

23 A. Yes.

24 Q. Who was that group again?

25 A. Say that again.

1 Q. What was the name of the group that did the
2 subsidence report?

3 A. Cardno.

4 Q. Cardno.

5 And that was a provider hired by the mine,
6 correct?

7 A. Would be from Brook Mine, yes.

8 Q. Okay. One of the things you mentioned was that,
9 well, they'd done a lot of sampling out there on 80-acre
10 spacings instead of 160s, correct?

11 A. Correct.

12 Q. 160-acre spacings for sampling is a process
13 that's typically used in the mines down by Gillette,
14 correct?

15 A. Correct.

16 Q. And the one thing you don't have to worry about
17 in the mines down by Gillette on these larger spacings is
18 the bearing capacity of the floor or the roof, right?

19 A. Correct.

20 Q. Because there isn't going to be a roof.

21 A. Correct.

22 Q. It's a true strip mine.

23 A. Yes.

24 Q. Okay. So it might be possible, when we are
25 concerned with the bearing capacity of the roof and the

1 floor, that tighter spacings could be required?

2 A. It may be, yes.

3 Q. Indeed, tighter spacings perhaps than 80?

4 A. Yes.

5 Q. Good. Now, you were talking a little bit about
6 this, so I wanted to see if we can just get some of our
7 basic terminology down. When the coal seam is sitting in
8 the ground, if it were my laptop sitting there, it's
9 supported underneath by all of the underburden under it,
10 correct?

11 A. Correct.

12 Q. And so its weight is distributed relatively
13 evenly across that surface, right?

14 A. Correct.

15 Q. When we take the coal out and we create these
16 voids, and when they do the longwall mine, they call the
17 part taking the coal out, they call that the drift, right?

18 A. There are several names for it. The gob in some
19 other areas. But depending upon the company, it's an area
20 of active mining.

21 Q. Okay. And that -- there are spots in this type
22 of mining where the coal remains and spots where the coal
23 is removed.

24 A. Correct.

25 Q. Can I call the part that's being removed the

1 drift, for purpose of our communication today?

2 A. Okay.

3 Q. Okay. Good. And so one of the things you said
4 is that, well, there's this rule of thumb that if you
5 don't take more than 50 percent of the mine, you're going
6 to -- or 50 percent of the coal, you're going to be okay.
7 Right?

8 A. Correct.

9 Q. Okay. And so what that is a function of,
10 however, is the strength of the roof, right?

11 A. Correct.

12 Q. So if we have a situation where there are
13 coal -- coal has been removed and supports have been left,
14 my little example here we have a situation where my
15 computer now represents the roof material. Can you follow
16 with me?

17 A. Yes, I am.

18 Q. Okay. And now the roof and all -- and
19 everything above it is supported on these little water
20 bottles, which may be the coal that's left behind. Are
21 you following my analogy?

22 A. Yes, I am.

23 Q. Right. So then if we come along and we put
24 overburden on that, then that adds to the pressure on
25 these bits of coal left holding onto everything, right?

1 A. Yes, it does.

2 Q. This works out well if this material in the roof
3 has been determined to be rigid enough to deal with that,
4 right?

5 A. Yes.

6 Q. You told us out on -- in this area that the core
7 samples told us that the overburden was comprised of sand,
8 was one material, right?

9 A. Sandstone is one material.

10 Q. Sandstone. I think you also said sand, right?

11 A. Sands and silts, yes.

12 Q. Sands and silts. And also shales, right?

13 A. Yes.

14 Q. Okay. So sands and silts would not be a
15 particularly rigid roof structure, correct?

16 A. Those are materials that are near the surface,
17 so that would not be.

18 Q. And so what we need to know, in designing our
19 mine is whether the materials that are above it can
20 support the weight of the overburden, correct?

21 A. Correct.

22 Q. And if they can't, then we have subsidence, even
23 if the coal pillars themselves do not break.

24 A. At some kinds of mines, yes.

25 Q. Okay. So roof rigidity or its ability to

1 withstand the overburden once the coal's removed from
2 underneath it, it's important.

3 A. It is.

4 Q. As is the stability of the floor.

5 A. It is.

6 Q. Because what could happen if the floor isn't
7 well supported is when that extra weight is added, when
8 the -- the column of coal that's left behind begins to
9 carry all the load, as these did, instead of my computer's
10 weight being spread out, it could push the floor down.

11 A. Sure.

12 Q. If that happens, then we also have subsidence.

13 A. Yes.

14 Q. So we would have agreement, then, that it is
15 important to understand whether subsidence will occur to
16 have a thorough understanding of the capacity of the roof
17 bearing material and the floor bearing material.

18 A. Yes.

19 Q. Okay. It is also important to understand the
20 capacity of the pillars made out of coal to withstand the
21 additional pressure that is put on them by now needing to
22 carry the weight from coal that has been removed?

23 A. Correct.

24 Q. And I think you told us for purposes of
25 determining what the bearing capacity of that coal was,

1 you just used a general resource?

2 A. There is a general number the Office of Surface
3 Mining recommends to do the analysis.

4 Q. If we, in this circumstances, wanted to do a
5 site-specific analysis to this site, as you have agreed
6 with me previously we should do, would it not be important
7 to have an understanding of what the coal out there
8 actually has as far as a bearing capacity?

9 A. It would be.

10 Q. You may not know, sir, but do you know -- give
11 us a ballpark how many landowners are in a half-mile
12 radius of the Brook Mine?

13 A. I don't have any idea. There are larger number
14 than we normally see.

15 Q. Okay. Now, more than a hundred, fair to say?

16 A. I don't know.

17 Q. I have an email up that came from the emails
18 produced in this, which appears to be, in its beginning,
19 from a lady named Deanna Hill to you, sir.

20 A. Correct.

21 Q. Do you see that? Who was Deanna Hill?

22 A. Deanna Hill was our adjudication expert in
23 Cheyenne during the early phases of the permit application
24 process.

25 Q. Okay. And do you remember Ms. Hill writing to

1 you that "this is one dang ugly permit"?

2 A. I do.

3 MR. GILBERTZ: Thank you, sir. I have no
4 further questions.

5 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.
6 Mr. Sutphin, will you be --

7 MR. SUTPHIN: Yes, sir.

8 CHAIRMAN BAGLEY: Go ahead.

9 MR. SUTPHIN: Could we grab the --

10 MS. ANDERSON: Oh, yeah. Do you --

11 CROSS-EXAMINATION

12 Q. (BY MR. SUTPHIN) Good afternoon,
13 Mr. Kristiansen.

14 A. Good afternoon.

15 Q. First I want to thank you for your thorough
16 testimony. It's -- some people may not agree, but I've
17 really enjoyed listening to you explain this permit. So
18 thank you for that.

19 You heard in opening Mr. Gilbertz refer to the
20 unknowns in this permit. Do you remember him saying it's
21 like a black velvet bag?

22 A. I don't remember that.

23 Q. Well, I remember it. It was interesting.

24 Does an applicant ever know everything that it's
25 going to encounter in the process of mining for coal?

1 A. No, they don't.

2 Q. But isn't it true that the mine plan and the
3 reclamation plan and the narratives in the permit file are
4 designed to address those unknowns if they come up?

5 A. To the best of their ability, yes.

6 Q. Would you agree that the statutes and rules and
7 regs also establish performance standards so that any
8 issues not specifically identified in the mine and rec
9 plans can be handled?

10 A. Yes.

11 Q. I think you might have told us, but how long
12 have you lived in Sheridan County?

13 A. Thirty-five years.

14 Q. And I think you said you used to work out at Big
15 Horn Coal, right?

16 A. I did.

17 Q. Do you care about this area?

18 A. I do.

19 Q. I mean, do you -- do you take seriously your
20 mandate to protect the environment and the safety of the
21 people around this area?

22 A. Absolutely.

23 Q. Would you ever do anything to knowingly allow
24 the destruction of the resources in the Tongue River
25 Valley?

1 A. I would not.

2 Q. So do you feel like you did a good job in
3 evaluating Brook's permit application to make sure that
4 doesn't happen?

5 A. I do.

6 Q. How many permit -- well, you already told how
7 many permit applications you've been a part of. What's
8 the typical number of comments and objections that you see
9 in a coal permit or any permit you've been a part of?

10 A. The -- it's difficult to say. Each one's fairly
11 specific to the site, and so they vary. It can be as
12 little as 20 or 30 or as many as multiple hundreds, as in
13 this case.

14 Q. In your experience, have you seen permits that
15 have comments that have been offered in support of the
16 permit?

17 A. I have.

18 Q. Okay. Did you consider those supporting
19 comments in reviewing this permit?

20 A. We do.

21 Q. And what impact, if any, did that have on your
22 assessment of the technical adequacy?

23 A. It had no impact on the assessment.

24 Q. You told us about the permit process and what it
25 took to get us here. And I'm not going to rehash that.

1 But generally the completeness review and then the
2 technical adequacy review. But you haven't really talked
3 about all that much about what happens from this point on.
4 So if the EQC agrees with your conclusion that this permit
5 is technically adequate, you're going to recommend to the
6 director that this permit be granted, correct?

7 A. Yes.

8 Q. And there was a little bit of discussion about
9 this a moment ago, but the DEQ can still add conditions or
10 commitments to the state decision document, right?

11 A. Yes.

12 Q. So, for example, if it's concluded after this
13 hearing that there's still some uncertainty about the area
14 around TR-1 down on the Big Horn Coal property, you could
15 make a condition or commitment of the -- of the State
16 decision document that further study needs to be done,
17 correct?

18 A. I can.

19 Q. But in that case, you're still issuing a permit,
20 right?

21 A. Yes.

22 Q. You're just affixing conditions to it to make
23 sure that the concerns raised have been addressed.

24 A. Yes.

25 Q. Okay. Let's talk about subsidence. And I'm

1 going to try to let you know what -- where I'm going, so
2 that I don't -- I don't lose you. But if I get carried
3 away and you can't understand what subject I'm talking
4 about, let me know, okay?

5 A. I will.

6 Q. All right. So what are the general DEQ
7 standards regarding subsidence that must be met before a
8 coal permit can be issued?

9 A. The general standards, they vary depending on
10 the nature of the mine. By and large, the mines have the
11 permit -- underground mines permit have subsidence
12 positions built into the permit application. Many of the
13 mines that are utilized -- underground mines in
14 southwestern part of the state are larger-scale
15 underground mines that do subside. They're designed that
16 way. This one is not.

17 Q. So -- I mean, is there a performance standard
18 about how much subsidence is maybe okay with the Brook
19 Mine?

20 A. There is not.

21 Q. Okay. In fact, the -- the goal is thou shalt
22 not subside, right?

23 A. Exactly.

24 Q. Okay. What happens if there is subsidence out
25 at the Brook Mine?

1 A. Well, the mining operations have to cease
2 immediately. And we have to go in the field and make
3 evaluation with company representatives and everybody else
4 has interest in the area, determine the type of
5 subsidence, the nature of the subsidence, what may be
6 occurring under the ground if you see the subsidence
7 happen and try to put all the information together that we
8 have to try to figure out what's taking place at that
9 point.

10 Q. Okay. Let's take a quick look at Exhibit Brook
11 1, please. It's terribly small. We'll blow it up.
12 Maybe. Yeah, please.

13 We're going to give you a hard copy so you can
14 see that.

15 A. Thank you. I blame my glasses. These are new
16 glasses, but I have nothing to complain about because my
17 eyesight's actually better than it was.

18 Q. Well, your new glasses look pretty fly.

19 A. Oh, thank you.

20 Q. Okay. So you recognize this is an email from
21 you?

22 A. I do.

23 Q. And it's dated January 6, 2014, right?

24 A. It is.

25 Q. It looks like it's sent to someone named

1 paul.mccombs@cardno.com. Do you see that?

2 A. Yes, I see that.

3 Q. Do you remember sending this email?

4 A. I do.

5 Q. Do you remember why you sent this email?

6 A. I sent this email to forward information on to
7 Cardno for some requests that they had.

8 Q. And do you recall what Cardno was asking you
9 for?

10 A. Cardno wanted to know if there are any
11 underground mines in the state and where they were and
12 what some of the language might be in the permit
13 application.

14 Q. Okay. If you look at the second line of your
15 email, it says "You requested information on our DEQ
16 guidelines on subsidence control plans for permitting."
17 Do you see that?

18 A. Correct.

19 Q. Do you recall Mr. McCombs asking you for some
20 sort of guideline on subsidence control plans?

21 A. Correct.

22 Q. And what was your response?

23 A. We do not have specific guidelines to -- or
24 specific subsidence mitigation.

25 Q. But that doesn't change the fact that you have

1 an overall performance standard about thou shalt not
2 commit subsidence?

3 A. Exactly. No subsidence in this particular case
4 is allowed.

5 Q. So I want to dive into a couple of details about
6 the subsidence plan. And the reason I want to do this
7 is -- I mean, I don't know if you got the same feeling I
8 did, but on some of those questions about subsidence, I
9 was left with the impression that maybe you don't really
10 know what you're talking about. And I want to show,
11 through this process, based on what I've seen, I believe
12 you do.

13 So let's look at DEQ Exhibit 34. And if you
14 want, I know it's in the -- one of those binders in front
15 of you. I think it might -- oh, you have that already?

16 A. I think I actually have that one right here.

17 Q. And if it will help, DEQ Exhibit 34 includes the
18 Comment and Response Round 3.

19 A. Yes. It will be -- do you have a page for the
20 beginning of that?

21 Q. Well, I want you to look at DEQ Exhibit 34-102.
22 And we're going to pay particular attention to BJ Comment
23 52 for reference.

24 A. I have it.

25 Q. Okay. Are you Bj, Mr. Kristiansen?

1 A. I am.

2 Q. And was this Comment Number 52 your comment?

3 A. It was.

4 Q. All right. What was the nature of this comment
5 that you made?

6 A. These were some pieces of information I felt
7 were necessary to adequately create a mine plan in this
8 particular mine operation. And some of the requirements
9 that we would request in District 3 for the particular
10 operation.

11 Q. And, specifically, are you addressing questions
12 of subsidence here in Comment 52?

13 A. I am.

14 Q. Okay. You notice about halfway through the
15 first paragraph it says "A small sample of tests have been
16 run on roof and coal rock intervals and those tests have
17 been reported." Right?

18 A. Yes.

19 Q. Were those tests, in your mind, sufficient to
20 determine the strength of the roof, the coal and the floor
21 throughout the mine permit area?

22 A. It was not.

23 Q. Okay. So what did you ask Brook to do?

24 A. I asked Brook to place language in the mine plan
25 that would emphasize them taking samples of roof coal and

1 floor materials prior to mining each and every case.

2 Q. And what do you mean by each and every case?

3 A. Every single panel that was going to be
4 developed, consider a panel mining a certain direction of
5 a highwall miner, and then another panel might be going
6 the other direction, since they're down in the middle of
7 the coal. Each of those panels have to be defined by
8 roof, coal and floor samples and lab evaluation.

9 Q. Okay. So is it fair to say you were
10 specifically asking that for each of those panels, before
11 they can mine, they have to have strength tests on the
12 floor, the coal and the roof?

13 A. Yes.

14 Q. You go on to say "Our concern rests with the
15 competence of the overlying lithologies and their
16 possibility for subsidence." What do you mean by that?

17 A. We were concerned with the nature of the
18 materials in that area. And as I testified earlier, the
19 geology is fairly complex when you look at it on a
20 site-specific basis. And that means there's a lot of
21 different kinds of materials in the rock over that. So we
22 would need to do this to find what kind of rocks they are
23 and their relative strength before we can really sign off
24 on it.

25 Q. So do you recall when you made this comment?

1 A. That would have been early in the process. I
2 can't remember -- I can't remember the date. But it was
3 in the early 2015 time frame, I believe.

4 Q. So at least as early as 2015 you were smart
5 enough to identify we better get some specific floor coal
6 and -- and roof strength data before you can mine, right?

7 A. Yes. Yes.

8 Q. So what was Brook Mine's response?

9 A. They put a narrative in the mine plan that they
10 would perform those obligations prior to mining in area,
11 that they would gather that data, get the statistical
12 results put together and present those to us at that time.

13 Q. Was that satisfactory to you, Mr. Kristiansen?

14 A. It was.

15 Q. I think you said you looked at Dr. Marino's
16 report, right?

17 A. I did.

18 Q. Would you agree with me that the type of
19 site-specific information Dr. Marino is looking for is
20 exactly -- not exactly, but very similar to what you were
21 looking for?

22 A. It is.

23 Q. So when will this site-specific information be
24 provided?

25 A. Provided prior to mining in that particular

1 area.

2 Q. Okay. In the response to your Comment 52, Brook
3 refers to an MSHA ground control plan. Do you see that?
4 It's at the bottom of page Brook 34-102.

5 A. Okay. Yes, I see that.

6 Q. What is your understanding of what an MSHA
7 ground control plan is with respect to a highwall mining
8 operation?

9 A. The ground control program that MSHA would have
10 for a highwall mining operation would be significantly
11 similar to a conventional open-pit mine. And, in fact,
12 the most dangerous area of mining is at the highwall.
13 That, generally, is where most of the problems occur, as
14 it is in all other surface mines.

15 And so what MSHA does is they generate
16 requirements for the mine to have safety measures in place
17 during all aspects of mining, all the way from what's
18 called haul road speed limits to mine depths to bench --
19 safety benches placed in areas where there's softer
20 overburdens. MSHA essentially controls all the safety of
21 the mine particularly in those areas in the right of
22 mining phase.

23 Q. Do they also, if you know, have requirements
24 regarding safety factor for the coal pillars that are left
25 behind after mining?

1 A. They do.

2 Q. I'm going to get this wrong, but -- and I think
3 you alluded to some calculations that OSM or MSHA
4 requires. Do you know what those are called?

5 A. The calculations for the relative compressive
6 strength of materials?

7 Q. Well, essentially what I'm getting at is -- I'm
8 going to call it ARMPS. ARMPS?

9 A. Yes.

10 Q. Let's call that A-R-M --

11 A. P.

12 Q. -- P-S.

13 Do you know anything about that calculation or
14 that program?

15 A. That is the primary program that the OSM
16 utilizes to predict surface subsidence.

17 Q. And what's the result -- what number is
18 generated out of that ARMPS program?

19 A. Not to get into a very long discussion about the
20 science. They have been testing laboratory analyses to
21 infield practical applications of those numbers for
22 probably a hundred years. And what they found out over
23 all these years, OSM has with their resident mining
24 engineers, is that these can be predicted to a fairly good
25 extent, as long as utilized constant for the coal. Coal

1 is almost impossible to test. The nature of the coal
2 makes it that way. Coal has a lot of cleat and fracture
3 in it, so it breaks in a blocky occurrence. And when you
4 subject that to pressurization, this can fail in a lot of
5 different directions, depending upon the actual sample you
6 gather. So it can be totally off from what the
7 recommended amount is.

8 Q. That went way over my head.

9 A. I'm sorry.

10 Q. That's okay. I appreciate -- again, I
11 appreciate your thoroughness. Let me try to simplify it
12 for myself, and maybe you can help.

13 First I do want to point out, you are aware that
14 there was coal strength testing done on at least one
15 sample in this mine plan, right?

16 A. There was.

17 Q. Okay. So here's what I'm getting at with the
18 ARMPS. You have to input certain data points into the
19 program, right?

20 A. Correct.

21 Q. One of those data points is the strength of the
22 coal.

23 A. Yes.

24 Q. One of those data points is the strength of
25 the -- well, I guess the strength of the floor?

1 A. Yes.

2 Q. And one is going to be the strength of the roof,
3 right?

4 A. Yes.

5 Q. And isn't that why you have to have core samples
6 before you're going to mine through a particular panel?

7 A. Yes.

8 Q. Okay. So is it fair to say the only real
9 variable is the width of the coal that's left in place as
10 a support?

11 A. Yes.

12 Q. Okay. And then, as I understand it, when that
13 program is done, it spits out a safety factor number,
14 right?

15 A. Yes, it does.

16 Q. And there's a threshold that has to be met. Is
17 that your understanding?

18 A. Yes.

19 Q. Do you know what that threshold is?

20 A. Of competency, you mean, of the material? Or
21 I'm not sure what you're looking for.

22 Q. Do you know what the threshold number for the
23 safety factor is before MSHA will approve a subsidence --
24 a ground control plan?

25 A. Generally speaking, their number is a point

1 where you can receive 50 percent recovery of the coal and
2 utilize pillars in between those, that is nonsubsiding.
3 Once you cross that line taking 51 percent recovery, you
4 begin to see effects taking place.

5 Q. Let me ask the question this way. In -- in --
6 do you believe -- well, did you ask -- talk to anyone at
7 MSHA about what they require for their ground control
8 plan?

9 A. I did not.

10 Q. Okay. Do you understand that Brook will be
11 required to take samples for each panel as part of its
12 ground control plan?

13 A. It can be utilized in that way. There's
14 components there that MSHA regulates.

15 Q. So let's look really quickly at Exhibit Brook
16 12. The Powder River Basin Resource Council asked you a
17 question about where in the heck is the ground control
18 plan. Is that fair?

19 A. Yes.

20 Q. Do you remember them asking you this question in
21 this email?

22 A. I do.

23 Q. And what was your response?

24 A. The safety ground control plan is an enforcement
25 methodology that MSHA uses to perform their

1 responsibilities.

2 Q. So isn't it true that Brook can't begin mining
3 without an approved ground control plan?

4 A. Correct. They may not.

5 Q. Is that true even if DEQ grants this permit that
6 we're seeking today?

7 A. Absolutely.

8 Q. You talked about the training that you had --
9 the subsidence training you had with OSM. Was there
10 anything in particular about the training you think
11 council should know to give credence to your opinions in
12 this case?

13 A. The thing I did learn, I think above all things,
14 first of all, to identify the methodology of mining. It
15 has such a bearing on how the subsidence occurs in the
16 given areas of the mining over time. There are different
17 types of mining that are virtually no subsidence and other
18 kinds that plan on it. Longwall operation, for example,
19 plans on subsidence. It has to operate that way in order
20 to be economically feasible. And so highwall mining is
21 determined to be the least subsiding, the least impactful
22 type of mining that we have where you gather materials
23 underneath roof material.

24 Q. I don't necessarily want to take you through
25 other examples, just for the sake of time, but the example

1 that we just talked about in BJ Comment Number 52, did you
2 have other comments that you provided to Brook regarding
3 subsidence-related issues?

4 A. I had several more. I can't remember them right
5 off the bat.

6 Q. And whether you remember them or not, as you sit
7 here today, do you believe that all of your concerns were
8 addressed in subsequent responses from Brook?

9 A. I do.

10 Q. In fact, you -- you would never have agreed that
11 it was -- that the permit was technically adequate if they
12 hadn't properly satisfied your concerns. Fair?

13 A. Yes.

14 Q. Okay. So we won't bother going through all of
15 those. I do want to talk very quickly about monitoring,
16 subsidence monitoring and subsidence remediation. Okay?

17 A. Correct.

18 Q. You had many questions on cross-examination
19 about the commitment that Brook will monitor for
20 subsidence for a period of six months after mining. And I
21 think you said you didn't remember if that was the actual
22 number. Okay?

23 A. Right.

24 Q. What I'm more interested in is what happens if
25 subsidence does occur after six months?

1 A. They're still responsible for that subsidence.

2 Q. How long will Brook be responsible for repairing
3 the subsidence that they cause?

4 A. Throughout mine life and reclamation life.

5 Q. Is there a cutoff that we can say, "Brook,
6 you're done. You don't have to fix any more subsidence"?

7 A. Maybe that point in time when the mine is fully
8 reclaimed, has been released from its permit.

9 Q. And part of that, it's also true that release
10 from the permit means once the bond is completely -- the
11 reclamation bond is completely released, right?

12 A. Yes.

13 Q. Okay. We're moving right along here,
14 Mr. Kristiansen. Let's talk briefly about coal fires.

15 A. Okay.

16 Q. I get excited when I think about this subject
17 because of the amazing technology. Are you aware of any
18 known coal fires within the permit boundary as of today?

19 A. I do not.

20 Q. Okay. Does the possibility of underground coal
21 fires in the area change your opinion about the technical
22 adequacy of Brook's mine permit application?

23 A. No, it does not.

24 Q. There could be some underground coal fires out
25 there that we just don't know about, right?

1 A. It's possible.

2 Q. Okay. Have you seen coal fires that have been
3 encountered during active mining anywhere in the area
4 around where Brook's going to be?

5 A. I have.

6 Q. And are there steps that can be taken once you
7 discover those heretofore unknown coal fires so you can
8 keep mining?

9 A. Yes, there are.

10 Q. And have you seen that done?

11 A. I have.

12 Q. Do you have any reason to believe that that
13 couldn't be done in this case?

14 A. No reason to believe that, no.

15 Q. Would you agree with me that if you're going to
16 be a coal miner, you better be pretty flexible?

17 A. Yes.

18 Q. Got to adapt to changing situations, right?

19 A. Yes.

20 Q. But you're always under the -- the enforcement
21 and oversight of somebody like yourself at DEQ, right?

22 A. Correct.

23 Q. Are you satisfied with the Brook Mine
24 commitments as they relate to coal fires?

25 A. I am.

1 Q. Let's talk about groundwater. Okay?

2 A. Okay.

3 Q. You mentioned something you called the MODFLOW
4 model; is that correct?

5 A. Yes, it is.

6 Q. All right. Is DEQ aware of any other
7 groundwater modeling tools that operators have used other
8 than MODFLOW?

9 A. I can't answer that. That was all done by
10 Dr. Kuchanur.

11 Q. Yeah. Let me -- let me -- I'm asking the
12 question broadly. In this case, Brook used MODFLOW,
13 right?

14 A. Yes, they did.

15 Q. But are you aware of any other groundwater
16 modeling programs that have been used in the industry or
17 by other regulators?

18 A. There are other programs. I'm not familiar with
19 them at all.

20 Q. Okay. Does the word Line Sync mean anything to
21 you?

22 A. I've done those myself.

23 Q. What is Line Sync?

24 A. You establish a point of measurement, let's say,
25 for example, within coal trench, and you develop data

1 along that coal trench in the line. And there are
2 formulas to determine in different kind of conditions how
3 far out the mining will affect the coal-bed that you're
4 analyzing. And so what it will do is show you how far you
5 can go before you stop influencing that coal aquifer.

6 Q. So how does the MODFLOW model compare to Line
7 Sync?

8 A. MODFLOW is significantly more robust than Line
9 Sync is.

10 Q. I want to -- I wasn't going to ask these
11 questions because you did such a fantastic job yesterday,
12 but I think there's some confusion about cross-examination
13 now.

14 How would you characterize -- or rather would
15 you characterize the coal on the west end of the permit as
16 an aquifer?

17 A. No.

18 Q. Why not?

19 A. There's no water --

20 THE REPORTER: There's no water?

21 THE WITNESS: There's no water in it.

22 Q. (BY MR. SUTPHIN) So would you call the area of
23 the -- of the coal seams on the west end of the permit
24 area dry?

25 A. Yes.

1 Q. Okay. How would you characterize the overburden
2 in the west end of the mine permit area?

3 A. It too is dry.

4 Q. And, in fact -- I mean, I say west end, but
5 would you agree that it's the majority of the permit area
6 that would be considered dry?

7 A. I would classify 75 percent to 80 percent of the
8 area is dry.

9 Q. And this is based on sampling wells, in part,
10 right?

11 A. Yes.

12 Q. It's also based on your personal knowledge --
13 just your own personal knowledge of that area, right?

14 A. Yes. I've explored that area.

15 Q. So let's -- let's look at DEQ Exhibit 16. And
16 now we're going to transition into AVF.

17 A. Okay.

18 Q. If you want, Mr. Kristiansen, it might be easier
19 to look at the screen.

20 A. Yes.

21 Q. Let's just zoom in on the map.

22 Mr. Gilbertz was asking you questions about
23 this. Do you remember that?

24 A. I do.

25 Q. He was talking about the -- the drainage and

1 essentially how things are going to come down, and talk
2 about the interconnectedness of the coal seams with the
3 alluvial material. Do you remember all those questions?

4 A. I do.

5 Q. All right. So you've got this area identified
6 as potential AVF acreage, right?

7 A. Uh-huh.

8 Q. Okay. You just told me that 75 to 80 percent of
9 the mine permit area is dry, right?

10 A. Correct.

11 Q. So, in your opinion, is there a likelihood that
12 anything within the mine permit area is having an effect
13 on this potential AVF acreage?

14 MR. GILBERTZ: Objection. Calls for
15 speculation. He already said he doesn't know.

16 Q. (BY MR. SUTPHIN) You can go ahead and answer.

17 A. Please restate the question.

18 Q. Yeah, I'm -- what I'm getting at is -- I can't
19 restate it because I don't remember what it was.

20 A. Okay.

21 Q. But what I'm getting at is, if the area --
22 75 percent of the area, especially on the west side of the
23 permit, is dry, what -- what effect does that have on
24 recharging the AVF -- the potential AVF acreage?

25 A. It has no effect on AVF recharge.

1 Q. Let's look at this picture that we got to see
2 briefly.

3 MR. SUTPHIN: Except Carri has abandoned
4 me.

5 Can you pull up Fisher 1.001.

6 Q. (BY MR. SUTPHIN) Do you know the source of the
7 water that charges the potential AVF that we see in this
8 beautiful green photo?

9 A. That's the Tongue River.

10 Q. Okay. And how do you know that?

11 A. I've been in the area, so I recognize it.

12 Q. Okay. So is it more likely that that AVF is
13 charged by the Tongue River and not by the coal seams that
14 are in the dry portion of the mine permit boundary?

15 A. Yes.

16 MR. GILBERTZ: Objection. Beyond the scope
17 of this --

18 MR. SUTPHIN: All right.

19 MR. GILBERTZ: -- witness's expertise.

20 MR. SUTPHIN: Okay. So you can go ahead
21 and take that one down.

22 Q. (BY MR. SUTPHIN) Continuing on the subject of
23 AVF. Isn't it the applicant's job to provide the
24 information and the data so that the AVF determination can
25 be made by DEQ?

1 A. Yes.

2 Q. Okay. So just to be clear, Brook Mine doesn't
3 get to decide if something is AVF or not, right?

4 A. No, they do not.

5 Q. But they do provide you, DEQ, with the
6 information you need to make a determination?

7 A. Yes.

8 Q. Okay. Yesterday you talked about -- when you
9 were talking about AVF with Mr. Kuhlmann, you talked about
10 moving the Belle Fourche River. Do you remember that?

11 A. I do.

12 Q. You talked about returning it to original -- to
13 its original course and reestablishing the functionality
14 of the AVF. Remember that?

15 A. Correct.

16 Q. Do you know who designed that project to
17 reestablish the functionality of the AVF?

18 A. I do not.

19 Q. Do you know who designed restoring the river to
20 its original channel?

21 A. I do not.

22 Q. What about -- you mentioned the Rawhide Mine and
23 restoring the AVF functionality in that area. Do you know
24 who designed the project to restore AVF at the Rawhide
25 Mine?

1 A. I don't.

2 Q. Okay. Are you familiar with an example of
3 someone who actually mined through the Tongue River in the
4 area of the proposed Brook Mine?

5 A. I don't have direct experience with that.

6 Q. Do you -- have you heard any information about
7 Big Horn Coal mining through the Tongue River
8 historically?

9 MS. ANDERSON: Objection. Asked and
10 answered.

11 Q. (BY MR. SUTPHIN) Yeah. I was just giving you a
12 little more detail, so I'll ask it again.

13 A. Okay.

14 Q. Do you have any information or have you ever
15 heard of the Big Horn Coal Company mining through the
16 Big -- the Tongue River historically?

17 A. I did not work at Big Horn at that time. I
18 heard they did that, yes.

19 Q. We'll just leave it at that, then, if you don't
20 have any more details about it.

21 You mentioned the AVF determination you made up
22 on Slater Creek. Okay? Remember that?

23 A. Yes, I do.

24 Q. Okay. And I think you said something about how
25 it was in an area where there was an old pond --

1 A. Correct.

2 Q. -- historically?

3 A. Correct.

4 Q. Okay. I think you said something to the effect
5 that Brook Mine isn't proposing to mine through that newly
6 identified AVF. Fair?

7 A. Correct.

8 Q. Okay. What about any other AVF in the mine
9 permit area? Are you aware of designated AVF that Brook
10 Mine is proposing to mine through?

11 A. Not within the permit area, no.

12 Q. And I think you said that if they come across
13 some heretofore unknown AVF, that you're going to stop
14 them and evaluate it, right?

15 A. Correct.

16 Q. Okay. Let's talk about this continuous miner.
17 Okay, Mr. Kristiansen?

18 You used the word "directionally intelligent."
19 Do you remember that?

20 A. I did.

21 Q. Is that important to you in evaluating the Brook
22 Mine permit?

23 A. Absolutely.

24 Q. Why?

25 A. Because you can tell at any point in time where

1 the head of that continuous miner is at.

2 Q. And I think you talked about how it's important
3 to be able to shoot straight holes so that you don't cross
4 and cause subsidence. Is that a fair summary?

5 A. Correct.

6 Q. Okay. You mentioned gamma probe. What in the
7 world is a gamma probe?

8 A. It is a tool that counts the natural
9 radioactivity in the materials to try to determine what
10 they are. Coal has almost no radioactivity at all in it,
11 and so it shows up as almost a blank spot. And so as long
12 as it's reading low analyses, you're in the coal in that
13 particular area. When you start getting higher, you're
14 getting out of the coal.

15 Q. Okay. And why is that important -- or is that
16 important in your consideration of the Brook Mine permit?

17 A. That's critical, because then you don't wander
18 up into the roof or down into the floor.

19 Q. And just so I understand, and maybe for the sake
20 of the council, is that gamma probe the same sort of
21 technology that helps when you're doing core samples and
22 core logs so you can identify where the coal seam is?

23 A. Yes, it is.

24 Q. And I think there's even something called a
25 gamma log. Does that sound --

1 A. Gamma log, yes.

2 Q. Okay. Are you aware of a feature on the
3 continuous remote highwall miner that enables -- that
4 basically is a camera that allows the operator to see what
5 the miner head is doing underground?

6 A. They do exist. I didn't know whether they were
7 utilizing one of those or not.

8 Q. We won't go any further with that.
9 You have testified about production rates of
10 approximately 50 percent of the coal. Remember that?

11 A. I do.

12 Q. What is that based on?

13 A. That is based on the -- the production rates
14 that are shown in the mine plan and the recovery rates
15 that are exemplified in the mine plan.

16 Q. Would you agree that the current mine permit
17 file is sufficiently detailed to allow DEQ to make
18 adequate determination of technical compliance?

19 A. It is.

20 Q. Before we leave that subject. Do you have any
21 understanding about what MSHA will require in terms of an
22 engineered design for each mine panel?

23 A. I do not know.

24 Q. Okay. You talked about how after the permit was
25 deemed complete -- let me -- I'm going to get this wrong.

1 But what do you call that first step that DEQ performs
2 once they get the permit application?

3 A. Complete.

4 Q. Okay. Is there a public notice that goes out
5 after that?

6 A. There is. The first public notice on the permit
7 application goes out after that.

8 Q. So at the time of the completeness
9 determination, is the permit file open for public review?

10 A. It is.

11 Q. I'm going to look at Exhibit DEQ 12, Number 134.
12 This is the Skittles map.

13 A. Okay. We should have left it out.

14 Q. You know what? You don't even need to open it,
15 Carri's going to pull it up and just zoom into the
16 Skittles part.

17 What is your understanding about the maximum
18 capacity for reach of the highwall miner into the coal
19 seam?

20 A. Particular mining -- miners they're using has
21 capacity of approximately 2,000 feet of lateral movement.

22 Q. Okay. So is it your understanding that the
23 Skittles on this map are showing the maximum extent or
24 2,000 feet from the center of the pit?

25 A. They're either controlled by the permit boundary

1 or other constraints or 2,000 feet.

2 Q. So do you -- do you know, once the mining
3 actually begins, is every tunnel going to go out 2,000
4 feet?

5 A. No.

6 Q. Why not?

7 A. There are constraints in some cases. Like I
8 said, they may be close to permit boundary, which they
9 can't cross, whether on the surface or underground. And
10 there are other areas where there may be geologic
11 processes taking place, such as a fault zone. Where they
12 can mine to the fault zone but not pass because the coal
13 is no longer there. And there are other constraints that
14 may show up during mining that prevent an exact 2,000
15 feet.

16 Q. All right. Let's look quickly at Powder River
17 Basin Exhibit Number 24. Do you remember answering some
18 questions about these interrogatory answers?

19 A. I do.

20 Q. And I think you said that you helped draft these
21 answers, right?

22 A. I did. Along with our team.

23 Q. Okay. Did you feel intimidated by Powder River
24 Basin Resource Council when they submitted these questions
25 to you?

1 A. No.

2 Q. Why not?

3 A. We understood that they were being -- presenting
4 concerns of local landowners. They had legitimate
5 concerns, and they were trying to address those so we were
6 at least familiar with those.

7 Q. Let's look at Powder River Basin Resource
8 Council Exhibit Number 89.

9 If you want, Mr. Kristiansen, I'll hand you a
10 hard copy.

11 A. I appreciate that.

12 Q. It's kind of small up there.

13 This is the email where you made some comments
14 about maybe some of the landowner objectors' motives. Do
15 you remember your testimony about that?

16 A. Yes, I do.

17 Q. And if I understand it correctly, you've -- you
18 have said you don't feel that way any more, right?

19 A. No, I don't.

20 Q. Okay. Very end of the first page of Exhibit 89,
21 you say, "The way that I approach this is that LQD
22 followed 35-11-406 and other, pertinent rules and
23 regulations..." Do you see that?

24 A. I do.

25 Q. Do you still feel that that's true?

1 A. I do.

2 Q. And then you go on to say, "...to determine that
3 the permit application satisfied" -- turn the page -- oh,
4 I turned the page too soon -- "satisfied all aspects of
5 the law."

6 Mr. Kristiansen, do you still agree with that
7 statement?

8 A. I do.

9 Q. What about the next statement, "This took three
10 years, six rounds of input from examiners, the involvement
11 of a minimum of 20 experts in ten agencies, and an action
12 from the EQC to get us to this point." Do you still agree
13 with that statement?

14 A. I do.

15 Q. How long did you say you've been the permit
16 coordinator on the Brook Mine file?

17 A. Four years.

18 Q. Was there a permit coordinator on the file
19 before you?

20 A. There was and we're not quite sure. I believe
21 it was a gentleman that's now retired from DEQ.

22 Q. But, I mean, I just -- based on what you said
23 yesterday, I just wanted to make sure. As far as you
24 know, this wasn't just an uncoordinated permit on DEQ's
25 side of things before your involvement, was there?

1 A. No. There was no permit application at that
2 time.

3 Q. Well, my esteemed co-counsel has asked me to
4 follow up on one thing on Exhibit 89. If you look at the
5 second paragraph on page 2.

6 A. Okay.

7 Q. Second sentence, "Our role has always been as an
8 enforcement agency, tasked with stewardship of the land
9 being mined and ensuring prompt mitigation from the
10 impacts of the extraction of the resource." Did I read
11 that right?

12 A. Yes, you did.

13 Q. Do you still stand by that statement,
14 Mr. Kristiansen?

15 A. Absolutely.

16 Q. And that's kind of where we started, right?
17 You're not going to do anything to knowingly shirk that
18 responsibility, are you?

19 A. No.

20 Q. In fact, you're going to be checking up on Brook
21 Mine at least every month, right?

22 A. At least every month, yes.

23 Q. I'm almost done, Mr. Kristiansen.

24 How would you -- well, no. Let me ask it this
25 way. This is a tough question. How many man-hours has

1 DEQ committed to the Brook Mine permit file to date? And
2 I don't need a precise number.

3 A. That is a difficult number to judge. I know my
4 man-hours because I keep track of them. And I've done
5 over 2400 hours on this project.

6 Q. Hold on. Let me make sure I heard that right.
7 How many hours have you personally spent on this file?

8 A. 2400 hours.

9 Q. Do you have any idea how long any of your
10 colleagues at DEQ have spent on this file?

11 A. Some of them with as little as possibly 20,
12 25 hours. And others in the 100 to 110 hours range.

13 Q. How would you describe the level of expertise of
14 the DEQ staff and personnel involved in reviewing the
15 Brook Mine permit?

16 A. Based on the individuals I worked with and the
17 actions we performed, the expertise level is as high as --

18 THE REPORTER: As high as?

19 THE WITNESS: It's as high as anything in
20 the industry.

21 Q. (BY MR. SUTPHIN) How would you characterize the
22 quality of DEQ's work on this permit file?

23 A. I think it's excellent.

24 MR. SUTPHIN: I don't have any other
25 questions for you. Thank you, Mr. Kristiansen.

1 CHAIRMAN BAGLEY: Thank you, Mr. Sutphin.

2 We will take a 10-minute break, and then we'll
3 have any questions from council, and you'll have an
4 opportunity for redirect.

5 MR. KUHLMANN: Thank you, Mr. Chairman.

6 (Hearing proceedings recessed

7 2:59 p.m. to 3:14 p.m.)

8 CHAIRMAN BAGLEY: Let's begin. I just want
9 to mention if there's an objection, please wait until I
10 have the chance to say something about it. I'm actually
11 not asleep up here, but I'm slow. So let me get a chance
12 to do that. That way everyone's objections have a chance
13 to be heard.

14 All right. Any questions from council? We'll
15 start -- no, I don't want to start with you. You want
16 everyone else's questions.

17 COUNCIL MEMBER FLITNER: I can start. Mine
18 are easy.

19 CHAIRMAN BAGLEY: All right. Go ahead,
20 Tim.

21 COUNCIL MEMBER FLITNER: Pretty quick.

22 EXAMINATION

23 Q. (BY COUNCIL MEMBER FLITNER) You mentioned early
24 on, I think, if I heard it right, I think maybe you said
25 it changed. Did I hear that one of those panels the

1 boundary was 100 feet from the Tongue River? Is that
2 still the case?

3 A. It was a hundred feet from Slater Creek.

4 Q. Slater Creek.

5 A. Yes.

6 Q. Which is -- I mean, it's a -- it runs water
7 year-round still?

8 A. It runs water in the upper reaches and then goes
9 dry in the summer months, lower down where they're inside
10 the mine permit area. So it's ephemeral in that
11 particular area until it gets over by the interstate,
12 where it picks back up again. So it's dry for most of its
13 course except for that one corner.

14 Q. So -- and what's the distance between the end of
15 the panel and the Tongue River on those other ones?

16 A. Oh, the Tongue River? Thousands of feet.

17 Q. Because it looks closer than that.

18 A. Oh, excuse me. I misspoke. In that area of
19 TR-1, they are -- best of my knowledge, they are
20 approximately, oh, 300 feet in most places. They have
21 been pulled back from that particular area, so a little
22 bit shorter than when they started.

23 Q. So -- and how deep are those panels?

24 A. In that particular area, I think about 170,
25 200 feet deep. Don't quote me on that. I'm trying to

1 remember.

2 Q. So probably those voids are going to fill with
3 water.

4 A. Eventually, yeah, they sure will.

5 Q. And once they do, then the table comes back to a
6 normal standard, wherever it was. And since the water
7 table is -- is -- I think was stated it was probably
8 filled with the Tongue River anyway --

9 A. Sure.

10 Q. -- it doesn't have that much to do with the
11 coal, so that would bring the water table to a -- to a
12 normal level. If you had a well anywhere in that area,
13 once that's -- once those voids are backfilled with water,
14 then it's kind of going to be a normal water table again,
15 isn't it?

16 A. Yes, it is. Dr. Kuchanur will cover that in
17 detail.

18 Q. Okay. So we'll get into that.

19 A. Good chance.

20 Q. The other thing is, I'm a little uncomfortable
21 with, you know, when we start talking about zero
22 subsidence. I don't think you're ever going to get me
23 convinced there won't be subsidence. Unless you figure
24 out a way to defy gravity, I think that's a fact of life.
25 I think you're going to see it, might be measured in

1 inches, but it's -- you mix water and soil and voids,
2 there's to be going subsidence. So mostly what we're
3 going to come down to in the end is how do you mitigate
4 it?

5 A. Correct.

6 Q. And -- and are the -- is the mitigation then in
7 that process far less invasive than other coal mining
8 procedures? Because the hand we're dealt here is this is
9 a coal mine and has been designated coal mine since 1950s,
10 if I'm not mistaken.

11 A. Correct.

12 Q. And the easement's in place and the ruling
13 that's behind us already, et cetera, et cetera --

14 A. Right.

15 Q. -- I would think that -- to your knowledge, is
16 there a less invasive way to mine coal than this one?

17 A. No. This would be the least invasive way to
18 mine coal.

19 Q. So, I mean, there's a few things I think need
20 tweaked here, but if I'm the landowner here, I'm kind of
21 liking this method compared to tearing the top off this
22 ground, if I'm Padlock or another landowner. I mean, I
23 might want to change a few things, but there isn't a
24 better way, right, that we know of today?

25 A. As far as I know of right now, there is not.

1 Q. So worst-case scenario here is there is some
2 subsidence --

3 A. Correct.

4 Q. -- which can be dealt with?

5 A. Correct.

6 Q. Even in TR-1, you have ways to deal with that,
7 right? Which we'll go into a little bit later, probably?

8 A. We should. There's a way of designing the pit
9 that takes care of that.

10 COUNCIL MEMBER FLITNER: Okay. That's all
11 I've got.

12 CHAIRMAN BAGLEY: Thank you.

13 Meghan.

14 COUNCIL MEMBER DEGENFELDER: Just a couple
15 of quick questions.

16 EXAMINATION

17 Q. (BY COUNCIL MEMBER DEGENFELDER) Kind of on that
18 note, in reference to the MSHA ground control plan and so
19 it was referenced, in a question that was asked of you,
20 about strength testing at least one panel.

21 A. Correct.

22 Q. And then I think maybe confusion is that enough
23 or do you feel that as subsequently moving to those next
24 panels and continuing testing before mining, is that
25 enough, do you feel?

1 A. I do at this time. The one sample was enough to
2 indicate to me some real general terms as to the strength
3 of those materials. I wasn't looking at the coal, per se,
4 because OSM has essentially defined lab tests don't work
5 very good for coal. Because there's so many constituents
6 in that stuff. It will break at a look and sometimes it
7 will hold up all day.

8 And so what we're doing is looking at roof and
9 floor materials. And I saw enough in that to feel more
10 comfortable with the nature of those materials. Now,
11 they're going to have to go each panel at least one core
12 prior to developing the panel so that we have that comfort
13 factor on the roof and the floor.

14 Q. Okay. Thank you. And then in your expertise or
15 your knowledge, the Fisher property -- I'm still having
16 some confusion whether or not that water is derived coal
17 seam or Tongue River. Do you have --

18 A. If I were to estimate, the chances of that I'd
19 say probably 98 percent Tongue River, 2 percent the other.
20 And that's off the wall. It's just --

21 Q. Right. I understand.

22 A. -- an estimate.

23 COUNCIL MEMBER DEGENFELDER: That's all I
24 have at this time.

25 CHAIRMAN BAGLEY: Thank you.

1 Go down to the end. Deb.

2 COUNCIL MEMBER BAUMER: Thank you,
3 Mr. Chairman.

4 EXAMINATION

5 Q. (BY COUNCIL MEMBER BAUMER) I have a question
6 about just following up on Tim and Megan there with the
7 subsidence and the 50 percent extraction --

8 A. Sure.

9 Q. -- how that actually gets monitored. How do
10 they know when 50 percent is gone?

11 A. You can do a --

12 Q. How does DEQ know that?

13 A. We can do a purely arithmetic way of looking at
14 it. So if the drifts are 12 feet wide and the ribs are
15 12 feet wide, that's 50 percent. Now, they're a unit.
16 You have a drift area and you have a rib, and those
17 two units comprise what would be considered to be a mining
18 unit. And obviously offset again, do another 12-foot
19 drift with another 12-foot rib.

20 So what we do is look at the volume of coal in
21 that particular area. Say there was 10 million tons of
22 coal in this area. You mine 5 million tons. This --
23 these are numbers that are reproducible. We can actually
24 look at these numbers and gain these from other sources so
25 we know they're pretty close to spot on.

1 Q. So the information will come from Brook that you
2 then will analyze to see if rather than that 50 percent?

3 A. Their miner records its position at all times.

4 Q. Oh, yeah.

5 A. And so -- and it records width and depth because
6 it does change as it goes through that coal-bed. Because
7 the coals thin out too in places. So it will follow
8 those. It keeps track of all that stuff.

9 Q. And where does your you called it rule of thumb
10 on this 50 percent thing come from?

11 A. That is an Office of Surface Mining graph that
12 was built to utilize kind of a quick way of looking at
13 potential subsidence in areas, depending upon mining
14 technique. And the graph is in one of those pieces of
15 that textbook that they had gotten from OSM. And it's
16 just a plain old straight graph, and anything less than
17 50 percent, there's no subsidence, and when you get to a
18 hundred percent there's total subsidence. So there's a
19 curve that runs down through there that defines the
20 amounts of subsidence, given the recovery rate.

21 Q. There's been talk about conditions of approval.
22 Is there a document that you can point me to that has some
23 conditions of approval already or is that something that
24 happens -- I'm not sure when any conditions of the
25 approval take place --

1 A. There are other --

2 Q. -- or if that's in there someplace --

3 A. There are --

4 Q. -- because I don't have --

5 A. Yep. There's other mine permits that have
6 conditions on them.

7 Q. Uh-huh.

8 A. Whether they were original or came during one of
9 the 6 terminals. But there are quite a few of those in
10 our office that we have that can be examined, our Cheyenne
11 office.

12 Q. I mean on this permit?

13 A. On this particular permit?

14 Q. Yeah.

15 A. No, we haven't defined any of those yet.

16 Q. Okay. Then I won't worry about it.

17 COUNCIL MEMBER BAUMER: That's all I have,
18 Mr. Chairman.

19 CHAIRMAN BAGLEY: All right. Thank you.

20 Nick?

21 COUNCIL MEMBER AGOPIAN: No, I don't -- I
22 don't know that I have any questions at this point.

23 CHAIRMAN BAGLEY: That's good, because
24 Megan would like to ask another question.

25 COUNCIL MEMBER AGOPIAN: There ya go.

1 COUNCIL MEMBER DEGENFELDER: I'll just
2 steal it from ya.

3 EXAMINATION

4 Q. (BY COUNCIL MEMBER DEGENFELDER) Sorry. I just
5 realized I had one other question.

6 In relation to TR-1, can I just have
7 clarification on whether or not in reference to the
8 drilling logs and whether or not dry or not dry, that
9 discussion that we had, whether or not you feel that the
10 permit is technically accurate.

11 A. I do in that particular area, and the only
12 reason is because it's all backfill. And we have dealt
13 with backfill in the past. If we utilize constants that
14 we've seen in other areas that had backfill and utilized
15 for that area, then it all works fairly effectively. If
16 it was native rock, then I would have some concern. All
17 pretty much backfill material from the old Big Horn Mine.

18 COUNCIL MEMBER DEGENFELDER: Okay. Thank
19 you.

20 CHAIRMAN BAGLEY: All right. Meghan Lally.

21 COUNCIL MEMBER LALLY: Okay.

22 EXAMINATION

23 Q. (BY COUNCIL MEMBER LALLY) I have a couple of
24 questions. One is how do we determine if subsidence on
25 the upper lines that are above -- they're above the

1 proposed mine --

2 A. Correct.

3 Q. -- isn't caused by the new mine as opposed to --
4 because you were saying that Brook would only be
5 responsible for subsidence into its own mine shafts.

6 A. Correct.

7 Q. But if there's blasting underneath an old
8 mine --

9 A. Okay.

10 Q. -- would that -- and it causes subsidence in
11 that upper mine -- I guess that's my question. How -- how
12 is Brook not causing that particular subsidence?

13 A. Okay. Mr. Emme will cover the blasting aspect
14 of that to explain how it works in this particular
15 instance. In these places where you only have a single
16 box cut and that's the only place we blast, and so all of
17 those panels that go out are not blasting. Simply grind
18 their way down through there. So those aren't
19 consistently blasting.

20 Q. Not just blasting, but disturbance by big
21 machine underneath.

22 A. Sure. And that's almost impossible to tell in
23 some cases as to what subsided. I think the assumption we
24 might make is that perhaps it was instituted possibly by
25 some of Brook's operations. We'll have to look at it very

1 closely. And if we can't determine, then we'll have to
2 fall back to some principles that we established during
3 some of our examinations of those. We may have to work
4 out processes as we're going to see how it works.

5 Q. And how will that subsidence be mitigated if --
6 I mean, would Brook pay for it? Would the State have to
7 pay for it? Because obviously those mines are old -- old
8 mines.

9 A. Right. It depends on the nature of the
10 subsidence. In some cases it's an observation technique
11 that's taking place when you may have -- maybe there's a
12 pit that fill in that's 3 feet deep and 5 feet wide.
13 Something fairly minor like that, observation is the key
14 to a lot of those. And in some cases when subsidence --
15 if it happens where it's gross and overt, we'll have to
16 generate some fairly stringent control programs to get
17 mitigation on that.

18 Q. Okay.

19 A. Our primary concern is what is it doing to the
20 environment during the moment it's occurring so that
21 vegetation, wildlife and everything is protected. And in
22 some cases, mitigation may be worse than leaving
23 subsidence alone. I don't know. I've seen those where
24 they happen where you get some subsidence. It ceases.
25 You have a hole develop. You get some trees growing up

1 out of that because there's more water in there. So there
2 can be benefits as well. So we have to be careful what we
3 do in our program.

4 Q. Okay. And then my second question, kind of
5 going back to Big Horn's questions about Section 50 -- 15
6 and 22. Why do you -- you may not know. Why weren't
7 those checked in the same way? Was there lack of
8 permission? Was there the assumption that it was backfill
9 so they already knew it was there? Do you --

10 A. There were some landowner constraints in that
11 particular area at the time. And there were some
12 difficulty in determining access at that time. And so we
13 allowed them to not have to sample that area simply
14 because they could not get to it at that moment. And so
15 realizing that they were -- one of the conditions we're
16 probably going to be working on is where they have to put
17 those new samples prior to mining. That's probably going
18 to be one of the areas they'll have to sample.

19 COUNCIL MEMBER LALLY: Thank you.

20 CHAIRMAN BAGLEY: Well, thank you very
21 much.

22 Oh, another question. Okay. Go ahead.

23 COUNCIL MEMBER BAUMER: Sorry.

24 EXAMINATION

25 Q. (BY COUNCIL MEMBER BAUMER) I did have one other

1 thing, and it was a follow-up to Big Horn Coal's questions
2 on cross-examination. And I wrote down that you said that
3 this permit was not technically accurate or adequate in
4 the testing of the dry -- dry statements made where the --

5 THE REPORTER: I'm sorry. I can't hear.

6 Q. (BY COUNCIL MEMBER BAUMER) Oh, the dry -- the
7 statements made about the dry areas in the permit.

8 A. I don't remember saying that. It is adequate in
9 those areas, primarily because the lack of any information
10 sometimes is information itself. And those areas we
11 didn't get samples. We couldn't get results because they
12 were too darn dry. So if I -- if I in any way imparted
13 that it was not adequate, that is not correct.

14 Q. Okay.

15 A. I may have --

16 THE REPORTER: I'm sorry. That last --

17 THE WITNESS: I may have misspoken.

18 COUNCIL MEMBER BAUMER: I'm through.

19 CHAIRMAN BAGLEY: Okay. I want to thank
20 you, Mr. Kristiansen. You've been at this a while. I
21 still have some questions, though. Hopefully they won't be
22 too strenuous.

23 EXAMINATION

24 Q. (BY CHAIRMAN BAGLEY) I'm sitting here listening
25 and I can't remember -- maybe I should know, but I can't

1 remember how many coal beds are in there in this area?

2 A. There are a lot of coal beds in this area. I
3 can think of seven right off the bat that are minable.

4 Q. Okay. And I guess I mean just in the Brook Mine
5 permit area.

6 A. In the Brook Mine permit area?

7 Q. Yeah.

8 A. There are three primary coal beds in the Brook
9 Mine permit area.

10 Q. Okay. And could you just mention those again?

11 A. The topmost bed is call the Monarch coal.

12 Q. Monarch.

13 A. And it was the primary target of Big Horn Coal
14 Company when they were mining that area. It's a nice,
15 thick coal bed. It's fairly uniform in that area. It's
16 got high BTUs. It's a pretty nice target.

17 Q. Okay.

18 A. So the pits were set where the coal was the
19 thickest.

20 Q. So Big Horn Coal mined in the Monarch.

21 A. Generally they did. There were a couple other
22 pits that mined other small local seams.

23 Q. Okay.

24 A. That was the primary target.

25 Q. And then some of those historic mines that we

1 saw, like the Acme Mines and things, what -- do you know
2 what bed they were?

3 A. They were in the Monarch coal, by and large.

4 Q. Okay.

5 A. Primarily because it was the best coal in this
6 area. The Carney coal, which is below that, is the target
7 for Brook Mine.

8 Q. Okay.

9 A. It's thinner. It has a few more splits in it
10 because the intelligent head they got on that system, they
11 can mine and not worry too much about thickening and
12 thinning and those things.

13 Q. Okay.

14 A. And then the Masters bed below that, it's their
15 bottom target.

16 Q. So how deep was the Monarch bed?

17 A. In -- in places it's almost at the surface.

18 Q. Okay.

19 A. The burn in that area, red scoria that we have,
20 is all Monarch burn, by and large.

21 Q. Okay.

22 A. And so once you get in behind the burned area,
23 get back into the coals, as a lot of the mines have done
24 over in the eastern part of the basin.

25 Q. So it's up near the surface. How did deep is

1 the Carney bed?

2 A. Oh, it varies from outcrop, all the way to
3 multiple hundreds of feet.

4 Q. And in the Brook Mine plan, about -- is it -- we
5 have that variation of the depth throughout their mining?
6 Are they are picking up mining into the consistent depth
7 throughout that?

8 A. No. It does vary primarily because the beds
9 thicken and thin and move very gradually over distances.
10 As those depositional areas were moving back and forth
11 when the river was going down through there. So they're
12 not consistent in that manner, and so they're a little bit
13 tricky to mine those. Surface mine has a harder time with
14 it because they are tricky. You might run out of them
15 suddenly and if you move 20 million yards of dirt and you
16 got out of the coal mine, it's not good. So this is --

17 Q. So -- I'm sorry.

18 So let me ask question a little bit different.
19 What's the -- sort of distance -- vertical distance
20 between the Monarch and Carney beds?

21 A. Between 70 and a hundred feet.

22 Q. Okay. So 70 to a hundred feet, and it will
23 move -- where they are in relation to the surface depends
24 on how the -- the geology and what's happening on the
25 surface, but the beds stay pretty uniformly 70 to hundred

1 feet apart?

2 A. Fairly uniformly. They do vary a little bit
3 over distance. But any time you use one discrete area,
4 you're pretty consistent.

5 Q. Okay. Okay. Now, the type of mining that's
6 been done -- and people have talked about subsidence a
7 lot. Obviously an important question. I want to make
8 sure I understand this. So the -- the machine goes in and
9 it's going to take a 12-foot-wide, 11-feet-high, and it's
10 going to go down up to 2,000 feet into the -- into the
11 mine --

12 A. Correct.

13 Q. -- or into the bed.

14 A. Yep.

15 Q. And then we're going to take a 12-foot break; is
16 that correct?

17 A. Yes.

18 Q. And then we're going to take another -- bring
19 it. So a 12 foot of coal -- and you described it just
20 recently here as a rib. So that -- will that be a
21 continuous rib all the way to that same 12 feet --

22 A. Yes, it will.

23 Q. -- or they be punching holes through there?

24 A. No, it will be going all the way to the bottom
25 of the face where they stop in their drifts when they put

1 the -- the continuous miner down through there. So it
2 will be these series of ribs that run down through there
3 from the surface all the way to the end of the mine. And
4 that's why it's primarily nonsubsiding is because the
5 support that exists.

6 Q. So it's not a pillar --

7 A. No.

8 Q. -- but almost like a wall?

9 A. It is, for all intents and purposes.

10 Q. Okay. Seven pages of question. No, not that
11 many. Sorry.

12 COUNCIL MEMBER FLITNER: You're getting as
13 bad as they are.

14 CHAIRMAN BAGLEY: Yeah.

15 Q. (BY CHAIRMAN BAGLEY) So how deep is the trench,
16 then, that has to be put in?

17 A. It varies, of course, because of the topography.
18 But what they've attempted to do is in most of the areas
19 where there's maybe a swale, where you may lose a little
20 bit of overburden, you try to put that there's a minimal
21 amount of overburden to remove in the box cut.

22 Q. Okay.

23 A. And so can be almost any depth. There's
24 places where it's probably less than a hundred feet.

25 Q. Okay.

1 A. Part of the problem there for a surface mine is
2 the box cut is fine, going either direction, you get under
3 a ridge again. So that's essentially how it will work.
4 I'm trying to find the least amount of overburden in box
5 cut. Other places, there are design considerations to be
6 made.

7 Q. How wide is that cut, then?

8 A. 150 foot across the bottom.

9 Q. 150 foot across. And how long are they,
10 typically? I think some of them are different, but --

11 A. 2 to 3,000 feet.

12 Q. Okay.

13 A. Mining conditions will dictate that in some
14 places.

15 Q. Right.

16 Okay. So will there be an effect on the Tongue
17 River by any of the mining, as you see it?

18 A. Dr. Kuchanur has studied that, and I prefer him
19 to answer that question --

20 Q. Okay.

21 A. -- during his testimony.

22 Q. Okay.

23 A. So that would be --

24 Q. And then are there any structures in the permit
25 area that are above where the mine will be? Like will

1 the -- the mine panels go underneath structures on the
2 surface?

3 A. I don't remember any at this point. That area
4 has been -- it's a mining area and agricultural area.
5 There's a lot of ranching that takes place in there.
6 Grazing.

7 Q. Uh-huh.

8 A. And there are not any houses or sheds or barns
9 that we know of in that particular area.

10 CHAIRMAN BAGLEY: Okay. And that was all
11 the questions I had. Does the council have any more
12 questions?

13 COUNCIL MEMBER AGOPIAN: I'll ask --

14 CHAIRMAN BAGLEY: Yes, please.

15 EXAMINATION

16 Q. (BY COUNCIL MEMBER AGOPIAN) Just --
17 Mr. Kristiansen, in understanding the process of where
18 we're currently at. I just want to confirm I understand
19 correctly that while you received objections, you received
20 public input, you still have taken those into
21 consideration and revised in the mine plan that went out
22 for public hearing earlier this year; is that correct?

23 A. Correct.

24 Q. And that you still have the opportunity to make
25 changes to the mine plan, as originally proposed, either

1 in -- with that being significant changes themselves or
2 conditions of approval, you'd be able to address any of
3 those objections that you feel are valid, that need to be
4 addressed before the board?

5 A. We do. We have several methodologies we can use
6 depending upon the nature of the -- of the complaints or
7 the issues as they arise.

8 Q. And down the road, if the permit reaches the
9 director and if the director approves the permit, it's my
10 understanding that DEQ still retains significant amount of
11 regulatory discretion under its authority to address any
12 unforeseen issues that may not be specifically addressed
13 in the mine plan?

14 A. Absolutely.

15 Q. And there's nothing in that mine plan that
16 limits their discretion or limits their statutory
17 regulatory authority?

18 A. No, there is not.

19 COUNCIL MEMBER AGOPIAN: Thank you.

20 CHAIRMAN BAGLEY: Thank you.

21 Mr. Kuhlmann, a chance to do any redirect, if
22 you'd like.

23 MR. KUHLMANN: Thank you, Mr. Chairman. I
24 have some questions. I'll try to keep them short.

25 REDIRECT EXAMINATION

1 Q. (BY MR. KUHLMANN) First, Mr. Kristiansen, you
2 had been asked about a curve that OSM had prepared or
3 included in their training documents related to the
4 50 percent recovery rate?

5 A. Correct.

6 Q. Is that correct?

7 Could you please turn to Exhibit 17 -- DEQ
8 Exhibit 17. I believe it will be in one of the binders
9 that has multiple exhibits in it. Tabs.

10 A. It's -- let's see. Is it up here, you think?

11 Q. It might actually be on the corner closest to me
12 of the table.

13 A. This one? It is. I have it.

14 Q. Can you turn to page 17 -- DEQ 17-006.

15 A. 006?

16 Q. Correct.

17 A. Yes.

18 Q. Can you tell us, is this -- the graph on this
19 page, is that the graph you were referring to?

20 A. This is exactly the graph I was referring to.

21 Q. Thank you.

22 Earlier in your testimony you had been asked
23 about other districts in DEQ that may have dealt with
24 mines with underground mining relationships; is that
25 correct?

1 A. Correct.

2 Q. Did you contact any staff in the other districts
3 of the Land Quality Division to find out about their
4 experience with underground mining?

5 A. I actually did prior to the permit document
6 being submitted. It was significantly early in the -- in
7 the creation of some of the permitted language. They were
8 still working in the early parts of the CN. I knew it was
9 going to be a --

10 THE REPORTER: It was going to be a what?

11 THE WITNESS: It was going to be a highwall
12 mine.

13 A. And so what I did was I contacted our
14 individuals in District 2 just to see if they had any
15 highwall mines in the area. They said they had a couple
16 that had attempted to do some highwall mining. They went
17 straight to underground mining in the Bridger. So I had
18 him send me some of those pieces of information, and I
19 forwarded those on to a couple of individuals that had
20 questions about it.

21 Once the mining permit application was
22 submitted, I never received any more communications with
23 those individuals.

24 Q. (BY MR. KUHLMANN) Okay. Did you take a look at
25 the materials that were provided by those individuals?

1 A. I did.

2 Q. What -- what was your conclusion?

3 A. That they had no real bearing on the type of
4 mining we were trying to do. That some of the auger
5 mining that had been done earlier wasn't actual auger
6 mining, and the conditions were pretty extreme in those
7 particular mining areas. There were also some attempts at
8 other kinds of highwall mining, but the geology in that
9 area is completely different than it is here, and so the
10 roof materials, the floor materials, everything else
11 behave differently. Plus they had a significant number of
12 faults in a particular area down there that we don't have.
13 So the actual language they provided me with was not very
14 sufficient for the kind of highwall mining we would be
15 doing in this area. So it kind of relegated those to the
16 back of the door.

17 Q. But you did contact the other districts within
18 the Land Quality Division that might have experience with
19 this type of permit?

20 A. I did early on, before the permit application.

21 Q. You mentioned auger mining just now. And
22 yesterday I believe you testified about the differences
23 and similarities between auger mining and highwall mining,
24 correct?

25 A. Correct.

1 Q. Did DEQ treat -- in looking at the regulations
2 to apply to the Brook Mine permit application highwall
3 mining method, did it treat that highwall mining method as
4 falling under the auger mining regulations?

5 A. There was some applicabilities there that did
6 fall under the auger mining regulations, primarily because
7 in some cases that's all we have. And so we had to
8 utilize some of that, as well as some of the other
9 subsidence coming from some of our underground programs as
10 well.

11 Q. Are there specific auger mining regulations in
12 the DEQ coal regulations?

13 A. There are a few, yes.

14 Q. Okay. Talking about the materials you obtained
15 from OSM at your training. You were shown a PRB -- PRBRC
16 Exhibit 84. Do you remember that?

17 A. I do.

18 Q. Okay. And I guess my question for you is do you
19 know that Exhibit PRBRC 84 was a copy of the materials you
20 actually used to evaluate this permittee application?

21 A. I don't know if it was a copy of the materials I
22 used.

23 Q. So do you know if you had ever seen the
24 Chapter 1 that you were asked to read out of when it was
25 put in PRBRC 84? Had you seen that before you were asked

1 to read from it today?

2 A. I was working with a different edition of the
3 subsidence manual. That was a 2015 edition. And had
4 rewritten it since then. I attempted to get another copy
5 of the 2015, but they didn't have any more. And so they
6 sent me the newer one that was subsequent to that 2015
7 manual. So I didn't know what version was being shown
8 there. If it was the same version I had, then I could
9 attest to the fact I seen it. But I don't know what
10 version it was.

11 Q. Were the exhibits that -- were the exhibits
12 the -- there was four chapters of the OSM materials that I
13 discussed with you this morning, were those the OSM
14 materials that you used when evaluating the permit
15 application?

16 A. They were.

17 Q. There was some discussion about, I guess, why
18 DEQ would trust information provided in the subsidence
19 control plan if DEQ did not do the modeling itself. Do
20 you remember that question?

21 A. I do. I do.

22 Q. Are there reasons why DEQ can trust information
23 provided by consultants for the permit applicant?

24 A. The information we get by and large is coming
25 from laboratories, either nationally known laboratories or

1 smaller laboratories that are actually permitted in some
2 states, and other states they are certified to be
3 laboratory performing those kinds of analyses. We make
4 the assumption that they were honest and aboveboard when
5 they do their analysis and present their findings, to make
6 the assumption that the mine is aboveboard and honest when
7 they're dealing with those themselves, they present us
8 with those actual values that were presented from the
9 laboratory. We make the assumption laboratory's not
10 willing to subsume their reputation in the industry and
11 not take shortcuts with a lot of these, because, by and
12 large, they live on the results of their analyses, and we
13 trust the fact that they aren't going to shoot themselves
14 in the foot when it comes to reporting quantities and
15 qualities.

16 Q. Is trusting the subsidence -- the information
17 that you mentioned DEQ had trusted from the subsidence
18 control plan for the Brook Mine, is that unusual as far as
19 DEQ trusting information from a consultant in other areas
20 of a permit application?

21 A. Oh, no, it's not. We do that all the time in
22 some of the other permits, when these kinds of analyses
23 show up, whether it be coal quality analysis or overburden
24 analysis. We deal with a lot of analyses for soil,
25 overburden, at all the mines. And so we have to do that

1 same kind of trusting cooperation with the laboratory in
2 utilizing our abilities to look at the data.

3 Q. Does DEQ rely upon information stamped by
4 professional engineers?

5 A. We do.

6 Q. How about does DEQ rely on information provided
7 by and stamped by professional geologists?

8 A. We do.

9 Q. Are there reasons for doing that?

10 A. To ensure that we are getting a product that is
11 certifiably accurate as possible and as honest and
12 straightforward as it can possibly be, because there is
13 some -- some conflicts that could occur if they're not
14 certified, and maybe some discrepancies that could show
15 up. So we are relying on the board of certification for
16 both the geologists and engineers to give us individuals
17 that will be straightforward and competent and
18 professional as possible.

19 Q. You're a licensed professional geologist,
20 correct?

21 A. I am.

22 Q. Is there a code of ethics you have to abide by
23 as a professional geologist?

24 A. Yes, there is.

25 Q. Do you know if that's true for professional

1 engineers?

2 A. I assume it's the same.

3 Q. There were some discussions and I think some
4 questions from the council about additional geotechnical
5 studies and sampling that we need to occur from mining
6 panels prior to mining occurring.

7 A. Yes.

8 Q. Do you remember that?

9 A. I do.

10 Q. Why is it appropriate to do that testing prior
11 to the mining of particular panel?

12 A. So we can ensure that given those numbers for
13 the roofing and floor material, that the size of the
14 panels that are designed for that particular area are
15 adequate to prevent subsidence. There are different
16 constituents that get factored in when they do that, coal
17 thickness, coal distribution in an area. So each panel
18 will be little bit different than the last. So that's why
19 we like to have that information on every single panel.

20 Q. Does DEQ need to have that information in the
21 permit application at this time to make the permit
22 application technically adequate?

23 A. No, we do not.

24 Q. You had some questions -- or some questions were
25 brought to you regarding groundwater. Do you remember

1 some of those?

2 A. I do.

3 Q. I believe the term subcrop was referenced. Do
4 you remember that question?

5 A. I do.

6 Q. Does the presence of a subcrop mean that the
7 layers of -- where the subcrop occurs and further down in
8 coal seam, that those are hydrologically connected?

9 A. Not necessarily.

10 Q. And can you explain some reasons why that may
11 not be hydrologically connected?

12 A. Subcrops are notoriously poor in transferring
13 materials from the edge of the subcrop back into the
14 formation, primarily because a subcrop condition means
15 it's not exposed on the surface. It's been exposed at
16 some time in the past and then covered up. So it's been
17 covered up by some kind of material from some process,
18 whether it be slope wash or a river going by, the subcrop
19 itself gets covered up with more and more material.

20 River systems are very, very difficult because
21 there's a high clay content in a lot of river materials
22 sediments, and those sediments have a way of packing up
23 against the bank. And so they start forming these
24 impacted layers on the bank of the river or the bank of
25 the stream that prevent in a lot of cases recharge into

1 these subcrops because there's a clay layer in there. So
2 these make very, very difficult to ascertain where
3 infiltration will take place and where it won't take
4 place. You can't draw general conclusions, other than the
5 fact that some places it will and some it won't. It has
6 to be drilled out to find out why.

7 Q. Does the Brook mine application model potential
8 effects of mining operations on groundwater rights?

9 A. It does. But Dr. Kuchanur has addressed that in
10 his examination of the permit application.

11 Q. Okay. But those effects were modelled as part
12 of this permit application process?

13 A. They were.

14 Q. Does DEQ -- you were asked about questions on
15 sampling overburden and the coal and floor and roof areas.
16 Do DEQ statutes require overburden sampling on a spacing
17 of 80 acres?

18 A. No, they don't.

19 Q. Do they require sampling on a spacing more dense
20 than 80 acres?

21 A. We don't.

22 Q. Okay. What -- do you recall what they require
23 as far as the density of spacing?

24 A. The number we have determined after this
25 discussion, is prior to mining in the area, the core

1 samples need to be taken on every 160 acres to ensure that
2 we have some adequate sampling of the nature of the
3 overburden materials, the quality and quantity of the
4 material.

5 Q. And if -- if Brook Mine sampled at 180 -- or
6 160 acres, would that make the permit technically
7 adequate?

8 A. It would, given those conditions.

9 Q. You mentioned earlier that attempt was made to
10 sample at a spacing of 80 acres. Was that correct?

11 A. Yes.

12 Q. I think you mentioned that that was not able to
13 be completed in all areas.

14 A. Correct.

15 Q. Do you recall any particular area where that was
16 not able to be completed?

17 A. There were two primary areas. One was down in
18 the TR-1 Pit area, because of some access problems. And
19 there were some over what would be considered to be TR-9,
20 10 and 11 in the extreme northwestern part of the mine
21 because the areas they needed to sample were on top of
22 these scoria ridges and there was no way to get up there.
23 And they're fairly contiguous ridges up there, so you
24 can't get access anywhere up there. And there's 80,
25 100 acres of that material you can't get to. So what we

1 had to do is a narrative in the mine plan stated when they
2 get into those areas and get ready to mine in those areas,
3 they will take overburden samplings on 80-acre spaces.

4 Q. Regarding the sampling near the TR-1 Pit, did
5 Brook inform DEQ or inform you why they were unable to
6 take that sampling?

7 A. At some point in time they told us that they
8 were having trouble accessing the area, and that they were
9 unable to collect samples at that time.

10 Q. Is TR-1 the -- one of the pits that is partially
11 on the Big Horn Coal permit area?

12 A. Yes.

13 Q. Even though Brook was not able to complete the
14 testing at that area, did DEQ evaluate whether the testing
15 that was able to be completed was sufficient enough to
16 make the application technically adequate by itself?

17 A. We did, because of the nature of the material.

18 Q. Okay. You were asked a little earlier by one of
19 the council members about the -- I believe Mr. Chairman --
20 about the depths of the coal layers and the identification
21 of what the coal seams were in the permit area. Do you
22 remember that?

23 A. I do.

24 Q. Does the application include specific
25 information about the depth of those coal layers?

1 A. It does.

2 Q. Now I want to talk to you just briefly about
3 alluvial valley floors.

4 A. Okay.

5 Q. I believe you had said in previous testimony
6 that the alluvial valley floor area determined near Slater
7 Creek was not going to be affected by mining; is that
8 correct?

9 A. Correct.

10 Q. Does a permit application have to include a
11 determination about alluvial valley floor if it's not
12 going to be affected?

13 A. No, it does not.

14 Q. So the Brook Mine permit application, even
15 without mentioning an AVF around Slater Creek, is that
16 technically adequate application?

17 A. For that area it is.

18 Q. Would it also be tech -- or is it also
19 technically adequate if it does not include a
20 determination of AVFs in that area mentioned from your
21 memo that was identified as potential AVFs along the
22 Tongue River south of the permit area?

23 A. Could you please rephrase that.

24 Q. Yes.

25 Do you remember me showing your memo regarding

1 potential AVF lands near the Tongue River?

2 A. I do.

3 Q. And that memo was about parts of the Tongue
4 River that had not been determined to be AVF.

5 A. Correct.

6 Q. Those potential AVF lands are not included --
7 they're not discussed in the permit applications; is that
8 correct?

9 A. Correct.

10 Q. Why is that?

11 A. At this point in time, there was to be no
12 impacts on that particular stretch of the Tongue River
13 from the mine plan. There was no discharge taking place.
14 There was no panels going out into that area. There was
15 no mining activity that was going to be taking place. All
16 of it was north of the interstate, which can act as a
17 surface obstruction in some areas. And so our assumption
18 was that the -- the area would probably not be affected as
19 an AVF, and, therefore, do not need to study it at this
20 time.

21 Q. Did the groundwater model -- if you know, did
22 the groundwater model take into account that area that was
23 labeled on your map as potential AVF?

24 A. I can't state that categorically because --
25 Dr. Kuchanur knows that.

1 Q. Fair enough.

2 Even though the permit application does not
3 discuss the potential area -- AVF lands along the Tongue
4 River that we just talked about --

5 A. Uh-huh.

6 Q. -- is permit application still technically
7 adequate?

8 A. Yes.

9 Q. There's been some discussion about mechanisms
10 for revising the permit. Based upon the objections, do
11 you remember some of those discussions?

12 A. I do.

13 Q. Can you explain how a permit condition might be
14 placed on a -- on a mine permit so their revision would
15 occur after issuance of the permit?

16 A. Yes, we do that.

17 Q. Can you explain how that would work?

18 A. It becomes part of the permit application and
19 also becomes part of the Form 1, which are the must dos in
20 the mine permit. And there are time frames generally
21 attached to those so that -- say they have 90 days to make
22 determinations on overburden sampling or 150 days to make
23 determinations on overburden sampling or the permit would
24 be rescinded. So there are conditions built into the
25 permit that allow for that kind of subsequent activity to

1 take place to finally flesh the permit out to the
2 condition it needs to be for active mining. And so a lot
3 of the areas we're not quite as concerned about are those
4 areas out in the hinterlands where we do have some very
5 good information, very good data, but more may need to be
6 done, such as overburden sampling in areas you can't get
7 to. So those get into the permit application as must-do
8 conditions, and there's a time frame attached to them to
9 get them done in a certain period. Generally, it's
10 90 days, 150 days. It's not five years or anything like
11 that.

12 Q. Okay. And is the requirement to submit a
13 revision application to the Department addressing those
14 identified issues?

15 A. It was submit a permit revision to address those
16 as they occur.

17 Q. I'm going to jump to a completely different
18 topic now. Do you recall being shown an email from -- oh,
19 email string between you and Deanna Hill?

20 A. I do.

21 Q. And we can try to pull it up, if you need to see
22 it again.

23 A. No. I remember it. Thank you.

24 Q. Okay. Do you remember that it included a
25 statement I believe attributed to Ms. Hill that it was an

1 ugly permit?

2 A. Yes.

3 Q. Do you recall what she was referring to when she
4 described it as an ugly permit?

5 A. She was reviewing the adjudication part of the
6 permit, particularly the landowners. And I explained to
7 her that there were a lot of landowners in this particular
8 area, because it's part of Sheridan County that's heavily
9 populated. There were a lot of rural owners that live out
10 there and that the normal custom that we see in a lot of
11 these mines is two or three surface owners in lot of big
12 mines on the other side of the basin. In this particular
13 area there are probably hundreds within some of these
14 areas. And Deanna took a look at that and, oh, my gosh,
15 this is one dang ugly permit. She was kidding.

16 Q. Did Ms. Hill review any of the scientific or
17 technical portions of the permit?

18 A. She did not.

19 Q. So she wasn't referring to those, to your
20 understanding?

21 A. No. She was referring to the ownerships and how
22 interrelated they were.

23 Q. And just going back to one of the very first
24 questions, briefly, that you had been asked on
25 cross-examination. Talking about pit -- or trench TR-1.

1 You were asked about the permit application
2 identifying the water source for use from the TR-1 trench;
3 is that correct?

4 A. Yes.

5 Q. Okay. And you mentioned that the mechanics of
6 moving that water are not in the permit application?

7 A. Correct.

8 Q. Is a permit application required to include
9 details of the mechanics of moving water from the water
10 source to its present use?

11 A. No. That's daily engineering circumstance the
12 mine takes cares of on a daily basis.

13 MR. KUHLMANN: I believe that is my last
14 question. Thank you, Mr. Kristiansen.

15 THE WITNESS: Thank you.

16 CHAIRMAN BAGLEY: All right. Thank you.

17 Thank you, Mr. Kristiansen, for answering a lot
18 of questions.

19 We will take five minutes and then we will
20 proceed with your next witness.

21 (Hearing proceedings recessed

22 4:01 p.m. to 4:10 p.m.)

23 CHAIRMAN BAGLEY: All right. We are back.

24 We'll plan to go this evening until somewhere
25 between 6:30 and 7:00. So, folks, as you're -- just to let

1 folks know, tomorrow morning we will start at 8:30 to do
2 some council business. We've got some consent agenda items
3 and minutes. Then at 9:00 a.m. tomorrow we do a uranium
4 rulemaking. And when that is done, then we will come back
5 and continue with this hearing. So tomorrow morning we
6 will have a little bit of a break from this while the
7 council does some other things.

8 For right now -- yes. Question.

9 MR. GILBERTZ: Yes. So what time would you
10 like the parties and lawyers here ready to go tomorrow,
11 then?

12 CHAIRMAN BAGLEY: That's a good question.
13 We're expecting the rulemaking to take about two hours. So
14 I think if folks are ready at 11:00, that would be good.
15 And we will try to keep that moving along so we can get
16 back to it.

17 MR. GILBERTZ: Will we need to clear this
18 space off the lawyers are using tonight to be available for
19 you in the morning? Yes is the answer I'm hearing. So
20 thank you.

21 CHAIRMAN BAGLEY: Yeah. Let's go with yes.

22 Okay. We ready?

23 So, Mr. Kuhlmann, you've got -- forget your name.
24 Please go ahead, DEQ. Go ahead and pronounce your name and
25 bring your next witness.

1 MR. LAROCK: James LaRock on behalf of DEQ.

2 And we'd like to call Matt Kunze.

3 (Witness sworn.)

4 MATT KUNZE,

5 called for examination by DEQ, being first duly sworn,

6 testified as follows:

7 DIRECT EXAMINATION

8 Q. (BY MR. LAROCK) Hi, Matt. First I'll ask you
9 to spell your name for the record.

10 A. Matt, M-A-T-T, Kunze, K-U-N-Z-E.

11 Q. And do you currently work for the Department of
12 Environmental Quality?

13 A. Yes, I do. I've been there for 10 years.

14 Q. What's your job title there?

15 A. Natural resource program principal.

16 Q. Okay. What's your educational background?

17 A. I have a BA and BS in environmental studies and
18 MS in watershed studies.

19 Q. Prior to working for DEQ, where did you work?

20 A. I worked for four years at Colorado State
21 University working on natural resource projects on
22 military --

23 THE REPORTER: Natural resource project --

24 THE WITNESS: Projects military lands.

25 THE REPORTER: Thank you.

1 CHAIRMAN BAGLEY: Military lands.

2 Q. (BY MR. LAROCK) What have your duties been at
3 DEQ?

4 A. I work on surface water hydrology support for
5 the coal regulatory program. I primarily work on CHIAs,
6 cumulative hydrologic impact assessments. And I also
7 manage our hydrology database for the Division. This
8 includes surface groundwater data submitted to us by the
9 coal mines.

10 I also occasionally assist in technical reviews
11 of permit applications and also in reviews of coal mine
12 reports.

13 Q. Did you review sections of the Brook mine
14 application?

15 A. Yes, I did.

16 Q. Which sections of that permit application did
17 you review?

18 A. I reviewed the surface water elements of the
19 Appendix D6 with the baseline hydrology. I also reviewed
20 surface water items in the mine plan and reclamation plan.
21 I also provided some review of comments of the AVF section
22 for Appendix D11 of the alluvial valley floors.

23 Q. Do you remember how many comments you had during
24 the technical review process?

25 A. Yes.

1 Q. How many were there?

2 A. I had 127 comments. And my comments went
3 through four rounds of --

4 THE REPORTER: Four rounds?

5 THE WITNESS: Four rounds of review.

6 Q. (BY MR. LAROCK) So after four rounds of
7 comments and responses from Brook Mine, your comments were
8 fully addressed?

9 A. Yes. That's correct.

10 Q. Turning to the baseline hydrology in Appendix
11 D6. What baseline surface and water monitoring did the
12 Brook Mine conduct as part of the permit application
13 process?

14 A. The surface water monitoring plan was approved
15 during the pre-application process by the district staff
16 here in Sheridan back in 2013.

17 Q. Does the Land Quality Division have a guideline
18 on pre-application surface water monitoring?

19 A. Yes. That would be our Guideline Number 8, our
20 hydrology guideline for coal and noncoal operators.

21 Q. Do you know if the monitoring program was done
22 in accordance with Guideline 8?

23 A. To the best of my knowledge, it was.

24 Q. How many surface monitoring stations were
25 established?

1 A. There were four baseline stations established.

2 Q. Was that all within the permit boundary?

3 A. Yes. Those were all within the permit boundary.

4 Q. And where were those stations established?

5 A. There were two on Slater Creek at the upstream

6 and downstream extent of what the proposed disturbance

7 would be. And two on Hidden Water Creek, also at the

8 upstream and downstream extent of the disturbance.

9 Q. What kind of data was collected at those
10 stations?

11 A. Continuous streamflow data were collected for a
12 period of one year, with the exception of during the
13 winter months, which included, in this case, from November
14 through March. Also, the sites were visited monthly to
15 take water quality samples for a period of one year, with
16 the exception, again, of the winter months, from November
17 through March.

18 Q. Why wasn't data collected during the winter
19 months?

20 A. It's a common practice at other coal mining
21 permits to remove monitoring equipment in the winter,
22 especially on ephemeral and alluvium streams where water
23 is not present year-round. If there were water present in
24 some of these channels, they'd likely be frozen during the
25 winter and make sampling very difficult to impossible.

1 Q. And what were the overall results of that
2 sampling?

3 A. Slater Creek had very little streamflow that was
4 recorded during the period. And on Hidden Water Creek,
5 there was no flow recorded. There were two water quality
6 samples selected, one at each Slater Creek stations.
7 During the other times the sites on Slater Creek were
8 visited, the channel was dry. And no water quality
9 samples were collected at Hidden Water Creek because of a
10 lack of flow in that stream.

11 Q. Because of that lack of data, was additional
12 data brought into the permit application to help
13 characterize the baseline surface water at the site?

14 A. Yes, it was. During the first round of
15 technical review I requested the Brook Mine bring in some
16 additional data from both Slater Creek and Hidden Water
17 Creek. USGS operated a peak flow gauge on Slater Creek
18 just down the stream of the permit boundary for several
19 years. We believe it was late 1960s through 1981. And
20 they also collected a sediment sample at that gauge.

21 And then on Hidden Water Creek, the Big Horn
22 Mine operated a station there for numerous years, so they
23 brought in streamflow data from that site, about 16 or 17
24 years of flow data, and then about nine water quality
25 samples.

1 Q. Okay. Moving right along. We're going to turn
2 to the mine plan. My first question for you on that, is
3 the Brook Mine planning to directly disturb either the
4 Goose Creek or the Tongue River?

5 A. No, it's not.

6 Q. And just in plain English, what do we mean when
7 we say that a mine is not planning to directly disturb a
8 river?

9 A. It means that it will not be mining through
10 those streams, it will not be dumping any spoil into those
11 channels.

12 Q. Okay. Do you recall how much of the total
13 watershed for the Goose Creek and Tongue River is going to
14 be disturbed by this mine?

15 A. Well, the Brook Mine would disturb -- at least
16 directly disturb about 1200 acres. This represents about
17 0.2 percent of the Goose Creek and Tongue River watershed
18 area.

19 Q. And you say 1200 acres are going to be directly
20 disturbed. And is all that going to happen at once?

21 A. No, it's not. That will -- that will happen
22 over time due to the plan point sequence. So the trenches
23 will be open for approximately three years. And then
24 there will be reclamation taking place. And so really
25 this particular mine is pretty limited in surface

1 disturbance over space and time.

2 Q. Okay. Turning to specifically some water
3 quality issues. Can you tell us what a point source
4 discharge is?

5 A. A point source discharge is a direct discharge
6 to surface waters of the state.

7 Q. And is the mine currently planning to discharge
8 any water into the surface waters of the state? Do you
9 recall?

10 A. The ability to obtain discharge permits through
11 the Wyoming Pollution Discharge Emission System programs,
12 WYPDES. This is run by the DEQ Water Quality Division,
13 and so they need to obtain these discharge permits for any
14 discharge that they do to surface waters. By having these
15 discharge permits, this helps to protect water quality
16 both to receiving stream and also further downstream.

17 Q. Following up on that, can the Water Quality
18 Division require reporting and certain technologies to be
19 used for those discharges?

20 A. Yes.

21 Q. But the Land Quality Division doesn't regulate
22 that, right?

23 A. No. It's entirely by a different division of
24 DEQ.

25 Q. All right. What about nonpoint impacts to

1 surface water?

2 A. Nonpoint discharges will be controlled by
3 hydrologic and sediment control plan.

4 Q. I'm going to pull up what's been marked as DEQ
5 Exhibit 12, page 139, for the council. Let's see. Yes.
6 All right. Let's see if I can zoom in here.

7 Do you recognize this map as I'm zooming in
8 here?

9 A. Yes, I do. This is the hydrologic control plan
10 for the permit application.

11 Q. Okay. Does this map point out where the
12 trenches and piles of overburden and spoil's going to be?

13 A. Yes, it does. Shows the trenches, the small
14 area that we have a surface mine. It shows the stockpiles
15 for topsoil and overburden. It shows the names of the
16 stream channels in the area.

17 Q. Okay. So before we get too deep into the
18 different parts of this map, can you explain what that
19 blue dashed line is on the middle of the map?

20 A. Yes, I can. This -- this particular line here?

21 Q. Yes.

22 A. Yes. That is one-half mile to a Class II
23 stream. Class II streams are defined by the DEQ Water
24 Quality Division. And this particular area of Class II
25 streams include the Tongue River and Goose Creek.

1 Q. And I'll ask some questions about the
2 significance of that in a minute, but I just wanted to
3 point that out to the council.

4 A. Okay.

5 Q. So talking about hydrologic and sediment control
6 measures. What are sediment ponds?

7 A. Sediment ponds are ponds used to control water,
8 sediment from disturbed areas, in this case coal mine.

9 Q. Can you point to on the map where a few sediment
10 ponds are?

11 A. I could. Can I use the pointer.

12 Q. Can you use the pointer right there?

13 A. Yes. These are denoted by the SP connotation.
14 Here's one right here.

15 MR. LAROCK: Can the council see that that
16 says SP on their exhibit?

17 COUNCIL MEMBER LALLY: Yes.

18 Q. (BY MR. LAROCK) Okay. What's the function of
19 sediment ponds and how do they work? If you can explain.

20 A. The function of a sediment pond I just described
21 is to control runoff sediment from a disturbed area.

22 Q. Okay. Thank you.

23 Are the designs for sediment ponds in the permit
24 application?

25 A. Yes, they are. They are in mine plan

1 Addendum --

2 THE REPORTER: I'm sorry. Mine plan --

3 THE WITNESS: Mine Plan Addendum MP-2.

4 Q. (BY MR. LAROCK) Who designs sedimentation
5 ponds?

6 A. The ponds are designed by a licensed
7 professional engineer.

8 Q. Will the mine have to obtain the surface water
9 rights for those sedimentation ponds?

10 A. Yes, they will. They will have to obtain a
11 water right for each of the ponds from the Wyoming State
12 Engineer's Office.

13 Q. What kind of events are the sediment ponds
14 designed to control?

15 A. Ponds are designed to handle the runoff volume
16 from a 10-year, 24-hour storm event.

17 Q. Does the Land Quality Division have a guideline
18 on what kind of events sediment ponds need to be designed
19 and controlled?

20 A. Yes. That would be our Guideline Number 13.
21 That's the sedimentation guideline we have.

22 Q. Is the 10-year, 24-hour storm event kind of a
23 standard design event used in other Wyoming coal permits?

24 A. Yes, it is. It's used across nearly all --

25 THE REPORTER: I'm sorry. I didn't --

1 THE WITNESS: Yes, it is. It's a standard
2 design event across nearly all of the coal mines that the
3 LQD regulates.

4 Q. (BY MR. LAROCK) What prescription data does DEQ
5 use to determine what the 10-year, 24-hour event is?

6 A. That would be NOAA Atlas Number 2 that was used
7 on this particular permit application. NOAA is the
8 National Oceanic Atmospheric Administration.

9 Q. Is NOAA Atmos -- sorry. Excuse me. Is NOAA
10 Atlas 2 a commonly used data source?

11 A. Yes, it is. It's very commonly used across the
12 industry.

13 Q. And specifically in Wyoming?

14 A. Yes.

15 Q. All right. So you mentioned that sediment ponds
16 have to be designed by a licensed professional engineer.
17 Who supervises the construction of a sediment pond?

18 A. They would have to be supervised also by a
19 professional engineer, and they would have to essentially
20 sign off on the construction and their design.

21 Q. Okay. How often will sediment ponds be
22 inspected?

23 A. Sediment ponds will be inspected quarterly at
24 this mine. Also, the application commits to inspecting
25 them after a significant storm event, which is defined in

1 this case as 1.5 inches.

2 Q. Are there other features of the mine that are
3 used to control flooding?

4 A. Yes, there are. There's four flood control
5 reservoirs that would be used during the first five years
6 of the operation.

7 Q. And can you point on the map to where a flood
8 control reservoir is?

9 A. Yeah. Right here. FC-1.

10 Q. FC-1?

11 A. Uh-huh.

12 Q. What about the design of flood control
13 reservoirs? Who designs those?

14 A. Those are also designed by professional
15 engineers.

16 Q. And is the design for those in the mine plan?

17 A. Yes, they are. In Mine Plan Addendum MP-2.

18 Q. What other features do flood control reservoirs
19 have to help control flooding?

20 A. I'm sorry. Can you restate the question?

21 Q. Sure. Sorry about that.

22 Besides the 100 -- besides the 10-year, 24-hour
23 storm event, are flood control reservoirs designed to
24 safely handle other kinds of storm events?

25 A. Yes. The flood control reservoirs will also

1 have a spillway that is designed to handle a 25-year,
2 6-hour event.

3 Q. That's all the questions I have about flood
4 control reservoirs.

5 Let's talk about other hydrologic control
6 measures. Is the Brook Mine planning to use any
7 diversions to protect flows in the area?

8 A. Yes. There will be three planned stream
9 diversions on --

10 THE REPORTER: On what?

11 THE WITNESS: On Hidden Water Creek.

12 Q. (BY MR. LAROCK) Can you point on the map to
13 where those diversions are going to be?

14 A. Yes. Right in this area and down here.

15 Q. So it looks like it's been designed to go around
16 Trenches 2 and 3; is that correct?

17 A. Yes, I believe TR-2 and TR-3A.

18 Q. How long are those diversions in Hidden Water
19 Creek going to be in place?

20 A. They will be in place for approximately three
21 years, and they will be temporary.

22 Q. What are diversions designed to do besides
23 re-routing the water?

24 A. They essentially divert flows around
25 disturbance. So flows in the stream are still maintained

1 and water quality is protected.

2 Q. What kind of events are diversions designed to
3 control?

4 A. These diversions have designs for the 10-year,
5 24-hour event.

6 Q. Okay. So besides sediment ponds, flood control
7 reservoirs and diversions, what other methods is the Brook
8 Mine going to use to control sediment in mine permit area?

9 A. There's other important features, what we call
10 alternate sediment control measures or ASCMs. These are
11 smaller features that are used across kind of a wider
12 area, and they help essentially slow overland flow that
13 might happen after precipitation events and protect water
14 quality down the stream.

15 Q. Can you give examples of alternate sediment
16 controls measures?

17 A. Yes. There would be things like straw wattles,
18 check dams, silt fences, seeding.

19 Q. Can you point on the map to where a few examples
20 of the locations of those ASCMs will be?

21 A. Yes. They're denoted by the circles, with
22 various symbology inside the circle.

23 Q. So, for example, what's the circling with the
24 little dots inside of it?

25 A. I believe that is seeding. I would have to

1 double-check on that, the legend.

2 Q. Okay. And do these circles denote exactly where
3 the ASCMs are going to be or can they be in that general
4 area?

5 A. This would pretty much show the general area of
6 the ASCMs.

7 Q. Is there a D -- Land Quality Division guideline
8 on ASCMs and how they have to be constructed?

9 A. Yes, there is. That would be LQD Guideline
10 Number 15. Okay.

11 Q. So is there anywhere that ASCMs cannot be the
12 only form of sediment control?

13 A. Yes. That would be within one-half mile of the
14 Class II stream. That's something our LQD Guideline
15 Number 15 recommends. And so that, as you noted before,
16 is the dashed blue line. As I mentioned before, Tongue
17 River and Goose Creek are both Class II streams, as
18 defined by the Water Quality Division. So within this
19 boundary to those two streams, there's going to have to be
20 other forms of sediment control in addition to the ASCMs.
21 For example, sedimentation impoundments or even in mining
22 trenches.

23 Q. Are example designs of ASCMs in the mine plan?

24 A. Yes, I do have example designs. Those are in
25 Mine Plan Addendum MP-1.

1 Q. And will the ASCMs be designed in accordance
2 with any LQD guidelines?

3 A. Yes. They would be designed in accordance with
4 ASCM Guideline Number 15. In addition, if there's a
5 drainage area larger than 30 acres that drains to ASCM,
6 then there's going to have to be specific designs for that
7 ASCM that will have to be submitted to the Land Quality
8 Division for our review and approval.

9 Q. How are ASCMs going to be inspected?

10 A. The Brook Mine commits to an inspection plan in
11 Addendum MP-1. In addition, LQD staff will also be
12 inspecting the ASCMs during the monthly and quarterly mine
13 inspections.

14 Q. Okay. How will ASCMs or areas drained by ASCMs
15 going to be monitored?

16 A. Some of the ASCMs that drain to larger receiving
17 streams, for example, such as Slater Creek, the permit
18 application commits to a monitoring program for those as
19 recommended by our Guideline Number 15. So this would
20 include either stream channel cross-section monitoring or
21 an upstream-downstream sediment monitoring station.

22 Q. Okay. Are there any other special hydrologic
23 protections in the mine plan?

24 A. Yes, there are. Since Slater Creek is an
25 intermittent stream, the coal rules and regulations

1 required a 100-foot buffer be placed on either side of
2 that stream. So this buffer has been shown on the exhibit
3 here -- shown in this other dashed blue line. So it
4 extends from the upstream permit boundary all the way
5 downstream. So by having this buffer, this really helps
6 to maintain the streamflow in Slater Creek and would
7 protect the water quality within the channel. The only
8 disturbance to Slater Creek on the surface is going to be
9 near a proposed haul road, otherwise it wouldn't have this
10 buffer on the channel.

11 Q. How does the permit application propose to
12 monitor conditions on streams while it's in operation?

13 A. The application commits to continue to monitor
14 Slater Creek and Hidden Water Creek at the four stations
15 that I mentioned. So continuous streamflows and water
16 quality sampling will occur at those sites. In addition,
17 the application would sample the stock ponds on the permit
18 boundary.

19 In addition, the application commits to
20 monitoring the Tongue River at two existing USGS gauging
21 sites. One of those is located at Monarch. And this is
22 on the upstream end where the Tongue River goes into the
23 Goose River crossing. And then the second location is a
24 ways further downstream at a site --

25 THE REPORTER: I'm sorry. At the --

1 THE WITNESS: At a site at the Wyoming-
2 Montana state line.

3 Q. (BY MR. LAROCK) Do you recall what section of
4 the permit that monitoring plan is in?

5 A. Yes. That is in mine plan, Section MP-71.

6 Q. How often is the surface water monitoring going
7 to occur?

8 A. Quarterly.

9 Q. And how long is that going to be keep happening?

10 A. The monitoring will occur until final bond
11 release. The data that the mine collects will be
12 submitted to the LQD in the annual report. So as part of
13 that annual report, Brook Mine will have to analyze the
14 data and then the data will be reviewed by the LQD on an
15 annual basis in the annual report.

16 Q. Okay. Moving on to concerns about water
17 quantity. Does the Brook Mine permit application predict
18 there's going to be impacts to surface water rights?

19 A. The application predicts there will be no
20 impacts to surface water rights. However, in the event a
21 water right is impaired, the application does permit to
22 provide a source similar to water quantity and quality to
23 replace that water right that may be affected.

24 Q. Okay. And I think that's all the questions I
25 have about the mine plan.

1 When we're talking about the reclamation plan,
2 can you describe some of the things in the reclamation
3 plan that will protect post mine water quantity and
4 quality?

5 A. Yes. I can think of a couple of different
6 examples. First one would be that any material in the
7 mine uses for reclamation, for example, mine trenches or
8 other areas, it will have to be tested to determine
9 suitability of material. So by having a suitable
10 material, it would have to be at least 4 feet in depth
11 from the surface. Under any ephemeral stream channel, the
12 depth has to be increased to 6 feet. So by having
13 suitable materials near the reconstructed extreme
14 channels, for example, Hidden Water Creek, this helps to
15 protect the post mine water quality.

16 In terms of water quantity, one thing the permit
17 application did was provide a pre versus post mine
18 comparison. I did some runoff modeling and looked at
19 runoff volumes of peak flows in sub watersheds across the
20 river boundary. The analysis showed the post-mining
21 values for that comparison were within about 1 percent
22 different than pre-mining values. So, essentially, the
23 post-mining topography that permit application has
24 proposed demonstrates the geographic conditions will be
25 similar, so we would expect the post-mining water quality

1 should also be similar.

2 Q. Within, as you said, about 1 percent pre-mine
3 and post water -- water quantity?

4 A. Yes. Most of the drainages were about 1 percent
5 different.

6 Q. So in general, based on all the surface water
7 items that you reviewed, does the permit application meet
8 the Environmental Quality Act's standards or LQD rules and
9 regulations?

10 A. Yes, it does.

11 Q. Did you review the public comments and
12 objections submitted for this permit application?

13 A. I did.

14 Q. After reviewing the public comments and
15 objections, do you still believe the permit application is
16 technically adequate?

17 A. I do.

18 Q. Did the objections reveal any minor technical
19 issues that could be corrected through a permit revision?

20 A. I do believe that is the case.

21 Q. Can you describe what that is?

22 A. Sure. I would recommend that the Tongue River
23 monitoring sites be moved from the current location that
24 are proposed in the mine plan. I would recommend they
25 have the site further upstream in the Tongue River Valley.

1 This would be located somewhere near the upstream end of
2 where the permit is. And then I would also recommend a
3 site on the Tongue River that was as close as possible to
4 the mine permit boundary, just downstream of the
5 confluence with Goose Creek. I would also recommend that
6 they have a monitoring site on Goose Creek.

7 Goose Creek generally has poorer water quality
8 than the Tongue River, so it's important to note what's
9 coming in from Goose Creek. So we start looking at the
10 upstream-downstream comparison in the Tongue River so we
11 have some more data to be able to interpret any
12 differences you see between upstream and downstream.

13 Q. So that's to figure out if a change is caused by
14 a mine or just by Goose Creek, right?

15 A. That's correct.

16 Q. In your view, does not having those monitoring
17 stations make the permit application technically
18 deficient?

19 A. No, it does not. That was --

20 Q. I'm sorry. That was a double negative question.
21 But thank you. You can finish answering. I'm sorry.

22 A. Well, the application did have sites proposed
23 for the Tongue River. And based on review of the
24 objections, we feel they should be approved.

25 Q. And what section of the mine plan is that

1 language in that you would like to see adjusted?

2 A. That would be in the operational monitoring
3 section, Mine Plan MP-71.

4 Q. So that's all the questions I have for you about
5 the permit application, but there's been some questions
6 about the CHIA, or the cumulative hydrologic impact
7 assessment. Can you describe what a CHIA does?

8 A. Yes. A CHIA is a document that is produced by
9 the DEQ Land Quality Division for certain types of coal
10 permitting actions. The document takes a pretty intensive
11 look at surface and groundwater quality and quantity
12 within the area -- coal mine area, and it may include
13 looking at one or more different coal mines.

14 Q. Is the CHIA required as part of the permit
15 application?

16 A. No, it is not part of the permit application.
17 It is a separate document that supports findings that need
18 to be made before we can --

19 THE REPORTER: I'm sorry. Before we can --

20 THE WITNESS: Before we can approve a
21 permit, but it is not part of a permit application.

22 Q. (BY MR. LAROCK) So how is the CHIA used to make
23 findings of the permit application?

24 A. A CHIA is used to support the statutory finding
25 that a proposed operation has been designed to prevent

1 material damage to the hydrologic balance outside the mine
2 permit area.

3 Q. When you say "material damage," what do you mean
4 by that?

5 A. Material damage is defined in the coal rules and
6 regulations as a significant long-term permit adverse
7 change to the hydrological regime.

8 Q. So basically a coal mine can't significantly
9 adversely change water outside the permit boundary area,
10 right?

11 A. Yes. I can describe more fully what we do when
12 we look at material damage evaluation.

13 Q. Please.

14 A. Okay. So there's two primary things that we
15 look at. The first is the potential to impair water
16 rights outside the permit boundary. And the second is
17 potential to cause water quality exceedances outside the
18 mine permit boundary such that designated or beneficial
19 uses of that water is not being met or obtained.

20 Q. Who designates beneficial uses of water?

21 A. Those would be designated by the DEQ Water
22 Quality Division.

23 Q. What data sources do you use to build CHIA?

24 A. Mine permits themselves or a permit application
25 is the primary data source. So we would use things like

1 baseline hydrology, baseline data, things like a
2 groundwater model, and also a probable hydrologic
3 consequence section or PHC section.

4 Q. Can you use outside data sources also?

5 A. Yes. CHIA can also use outside data sources.

6 Q. Okay. So about that probable hydrologic
7 consequences section, is that required to be in the permit
8 application?

9 A. Yes, it is.

10 Q. Is there a probable hydrologic consequence
11 section at this data applicant -- mine permit application?

12 A. Yes.

13 Q. Did you review that section?

14 A. I did for surface water, yes.

15 Q. Thank you.

16 And did you find that it was technically
17 adequate?

18 A. I did.

19 Q. Besides the Land Quality Division, who else
20 reviews draft CHIAs?

21 A. As part of our process, we ask that the State
22 Engineer's Office review the CHIA because the State
23 Engineer's Office administers water rights of Wyoming.
24 And then we also ask the DEQ Water Quality Division to
25 review the CHIA because they administer water quality

1 standards.

2 Q. How does the CHIA become final?

3 A. To become final, a CHIA would need to be signed
4 by the DEQ director and the state engineer.

5 Q. Backing up just one second. What kinds of
6 cumulative impacts are valued in CHIAs?

7 A. A CHIA only looks at impacts from coal mining.
8 There's no requirement to look at other --

9 Q. Are there other coal mines in the area that
10 are -- that are conducting -- that are actively mining?

11 A. Depends what you mean by "area."

12 Q. Sorry. Let me -- let me rephrase.

13 So there's another mine right next to the Brook
14 Mine permit area, right?

15 A. There is. That's the Big Horn.

16 Q. Are they actively mining?

17 A. No, they are not.

18 Q. So just to put a bow on this. The CHIA is not
19 part of the permit application, and a permit application
20 can be deemed technically complete without the CHIA,
21 correct?

22 A. Yes, it can.

23 MR. LAROCK: I have no further questions
24 for this witness.

25 CHAIRMAN BAGLEY: All right. Thank you.

1 Ms. Boomgaarden.

2 MS. BOOMGAARDEN: Just a few questions, and
3 Mr. Gregersen will conduct cross. Thank you.

4 CHAIRMAN BAGLEY: Thanks.

5 MR. GREGERSEN: Thank you, Mr. Chairman.

6 CROSS-EXAMINATION

7 Q. (BY MR. GREGERSEN) Mr. Kunze, I just have a
8 couple questions, and based on your testimony, I really
9 don't think it's going to be anything that's too
10 controversial.

11 So isn't it true that for coal mining permit
12 applications like this one, the DEQ rules and regulations
13 require various testing, data, analysis and required
14 various forms on both surface and groundwater?

15 A. That's true.

16 Q. And isn't part of this reason because surface
17 and groundwater are connected, right?

18 A. Yes, they can be.

19 Q. And it's -- I mean, it's pretty common surface
20 and groundwater are connected, isn't it?

21 A. Ephemeral stream channel, I don't know that
22 that's not the case, the flow just in the surface.

23 Q. Okay. But it's not uncommon for say there was
24 shallow groundwater, meaning groundwater very near the
25 surface and very near to the surface groundwater, those

1 waters would be connected, right?

2 A. Sure.

3 Q. Okay. So based on that, I had two questions.
4 So you testified that there would be no direct impacts to
5 the Tongue River or Goose Creek from this mine permit
6 application, right?

7 A. That's correct. And what I meant was no direct
8 surface disturbance.

9 Q. Yeah. So no -- and the reason you said that was
10 because there was going to be no actual surface
11 disturbance within -- or on the Goose Creek and Tongue
12 River, right?

13 A. That's --

14 Q. They weren't going to be -- sorry. Go ahead.

15 A. Yes, that's correct.

16 Q. But because the groundwater and surface water
17 can be connected, there is a chance that there is impacts
18 to groundwater that there could be indirect impacts to the
19 Goose Creek and Tongue River from these mining operations,
20 right?

21 A. Would you mind restating the question?

22 Q. Yes. So given that we talked about the
23 groundwater and surface water can be connected, then if it
24 was the case that there was impacts to the groundwater
25 connected to the Goose Creek or Tongue River, then even

1 though there wouldn't be direct impacts to those two
2 streams, there could be indirect impacts; is that right?

3 A. I guess I would need to know what impacts to
4 groundwater you're referring to.

5 Q. And I just want to know whether or not you think
6 that's possible.

7 A. We need to know what the impacts are to
8 groundwater.

9 Q. Okay. And so my next question would be then if,
10 in fact, there was groundwater that was shown to be
11 connected to the Tongue River going into Goose Creek, and
12 that groundwater wasn't acknowledged or recognized in the
13 permit application and that groundwater was affected,
14 there is the possibility that then the surface water in
15 Goose Creek and Tongue River could be affected too, right?

16 A. I --

17 MR. LAROCK: I'm going to object that calls
18 for speculation.

19 MR. GREGERSEN: Well, this is an expert
20 witness, right?

21 I'm sorry.

22 CHAIRMAN BAGLEY: There was an objection.
23 So you believe it calls for speculation?

24 MR. LAROCK: Yeah.

25 CHAIRMAN BAGLEY: I think what we need to

1 know is -- I think I know where you're going with this.

2 Can you make it specific to the situation? I mean, you're
3 sort of picking random, and, you know, the answer -- let's
4 see if we can make it specific.

5 MR. GREGERSEN: Yes, sir, Mr. Chairman.

6 Thank you.

7 Q. (BY MR. GREGERSEN) Mr. Kunze, what I'm
8 wondering is if -- if it was established and if the
9 council found there was actually groundwater in the TR-1
10 area specifically that was connected to the Tongue River,
11 directly connected, then impacts to that groundwater could
12 manifest themselves in the impacts in the Tongue River,
13 correct?

14 A. It would depend on what scale we were talking
15 about.

16 Q. So it depends on the amount of connection, the
17 direct -- how direct the connection was between
18 groundwater and surface water?

19 A. Yes.

20 Q. And I have just one last line of questioning.
21 You said, I believe, that the CHIA, which is yet to be
22 done, but will be, is based on data from the mine permit,
23 right?

24 A. That is the primary data source, but it's not
25 the only data source.

1 Q. Where else does data come from?

2 A. There's data out there available from the
3 Big Horn Mine permits, as well as the USGS, at least for
4 surface water.

5 Q. And even if that data is not included in the
6 permit application, that would be considered by DEQ?

7 A. Yes. The CHIA would.

8 Q. And so the basic line of questioning I'm
9 wondering is if the mine permit provides a major source of
10 information for the CHIA, if the hydrogeological or
11 hydrological information in the mine permit is flawed or
12 missing, then that will result in flaws in the CHIA,
13 right?

14 A. That could potentially happen if it was
15 determined to be flawed.

16 MR. GREGERSEN: Thank you, Mr. Chairman. I
17 have no further questions.

18 CHAIRMAN BAGLEY: All right. Thank you.

19 Ms. Anderson.

20 MS. ANDERSON: Thank you, Mr. Chairman. I
21 do have a few questions.

22 CROSS-EXAMINATION

23 Q. (BY MS. ANDERSON) Mr. Kunze, are you aware of
24 portions of your regulations that require DEQ to request
25 supplemental information from the company, particularly

1 related to the water quality if certain permits are issued
2 by other agencies?

3 A. I am not aware of that specifically.

4 Q. Okay. You spoke a little bit to a WYPDES
5 permit, that's Wyoming pollution discharge permit. Has --
6 are you aware of the company receiving that permit at this
7 time?

8 A. They have not received any WYPDES.

9 Q. Are you aware of the company having received any
10 water quality permits related to this mine yet?

11 A. Not that I'm aware of.

12 Q. I'm going to pull up our Exhibit 53.

13 MS. ANDERSON: Oh, and I need the cord to
14 do that. Thank you.

15 MR. RUBY: Watch it. It's going around.

16 Q. (BY MS. ANDERSON) All right. Do you see this
17 exhibit displayed, Mr. Kunze?

18 A. I do.

19 Q. Am I pronouncing your name right?

20 A. No, you're not.

21 Q. Okay. Could you tell me how to pronounce it?

22 A. It's Kunze.

23 Q. Kunze. Okay. Thank you. We never met before,
24 so appreciate that.

25 All right. Are you familiar with this exhibit?

1 A. Yes. I remember this email.

2 Q. And would you agree that this is an email from
3 you to Mr. Kristiansen?

4 A. It is.

5 Q. Okay. And would you agree that in this email
6 you're relaying requirements about the CHIA to
7 Mr. Kristiansen?

8 A. Yes.

9 Q. Okay. Why did Mr. Kristiansen ask, do you know,
10 about the CHIA process?

11 A. He was trying to get a general background on how
12 the process works, what phase it comes into permit review,
13 that sort of thing.

14 Q. Okay.

15 A. Whatever it --

16 Q. Sorry. Go ahead and finish, please.

17 A. No. That's it.

18 Q. Okay. And this is fairly late in the permit
19 review process, right? It's July 5, 2016?

20 A. Yes.

21 Q. Okay. Would you agree that in this email you
22 talk about public comments on the CHIA and that in the
23 past you and DEQ have "made an attempt to finalize the
24 CHIA prior to the end of the comment period" so that the
25 public can comment on the CHIA if they want to?

1 A. That's essentially what this states here.

2 Q. Okay. Do you stand by that still? I mean, is
3 that common practice of DEQ to do that?

4 A. That has been a common practice in the past. It
5 is certainly not required.

6 Q. Okay. Why wasn't it done here?

7 A. This case --

8 MR. LAROCK: I'm really sorry. I'm going
9 to have to object a little bit on this line of question on
10 reference, because it's not part of the permit application,
11 which is what the council is here to review today.

12 MS. ANDERSON: Okay. I'll get -- sorry.

13 CHAIRMAN BAGLEY: I'll go ahead and allow
14 the question, but let's keep focused on the mine permit. I
15 think this does have -- the hydrologic issues are
16 important.

17 MS. ANDERSON: Okay. Thank you,
18 Mr. Chairman.

19 Q. (BY MS. ANDERSON) So I guess if this has been
20 DEQ practice before, why wasn't it done here?

21 A. Well, because this case was very different than
22 CHIA's we had in the past in that we've had objections and
23 public comments, and we want to make sure that a CHIA can
24 possibly incorporate those if it needs to be incorporated.

25 Q. Okay. But doesn't this email say that it's

1 common practice of DEQ to finalize the CHIA by the end of
2 the public comment process so people can participate at
3 that time?

4 A. That's essentially what it states. In this
5 case, it would not have been possible, even if we wanted
6 to do that. We did not receive agency comments back from
7 the reviewers up until about four days prior to the end of
8 the public comment period.

9 Q. Do you remember when you started the CHIA
10 process for this permit application?

11 A. Oh, it was back when it was originally
12 submitted. So November of 2014 is probably when we first
13 started working on it.

14 Q. Okay. It took that long to get agency comments
15 back?

16 A. No. We gave the agency reviewers -- typically
17 we give 30 days. In this particular case, we sent our
18 draft CHIA out to review December of 20- -- it would have
19 to be 2016. Yes.

20 Q. Sure.

21 A. Sorry. It's been a few years working on this.

22 Q. Yeah. No, definitely.

23 Do you remember when your last comments as part
24 of the DEQ technical review process were resolved? Do you
25 have any Round 5 or 6 comments, for instance?

1 A. The last one I had was Round 4.

2 Q. Round 4. Okay.

3 A. I do not remember exactly the date that it was
4 resolved.

5 Q. So I guess I'm wondering why you didn't start
6 the CHIA review process with the other agencies at that
7 time.

8 MR. LAROCK: Again, Mr. Chairman, I'm
9 sorry. The CHIA is not required to be in the permit
10 application. This line of questioning isn't about the
11 permit application.

12 CHAIRMAN BAGLEY: Yeah. I think we've
13 started November 2014. It's been -- was then sent out to
14 reviewers December '16. It wasn't complete by the time
15 that -- it was January, I believe, when comments were
16 requested. So I think we're -- kind of answered those
17 process questions on the CHIA.

18 MS. ANDERSON: Okay. Thank you,
19 Mr. Chairman. I'll ask a slightly different question,
20 then.

21 Q. (BY MS. ANDERSON) So when the CHIA is final,
22 will there be an opportunity for public review and
23 comment?

24 A. There would not, because the final CHIA will be
25 completed just before the permit is approved.

1 Q. Okay. So how would someone object to the
2 findings of the CHIA?

3 A. That would have to be done in -- through other
4 channels, I guess, outside of the -- the process with
5 council. I am not sure --

6 Q. Okay.

7 A. -- that it --

8 Q. Has DEQ had experience with objections to a CHIA
9 and that kind of situation before?

10 A. Not that I'm aware of.

11 Q. Okay. Is it possible that if we have
12 objections, we'd find ourselves right back here before the
13 EQC again?

14 A. I don't know the answer to that.

15 Q. Okay. All right. You talked in your testimony
16 a little bit about the purpose of the CHIA.

17 A. Uh-huh.

18 Q. And I think you said that it's to evaluate
19 impairment to water rights and to determine whether water
20 quality standards will be exceeded, correct?

21 A. That's correct.

22 Q. Are those the only two purposes of the CHIA?

23 A. Those are the things we look at for evaluating
24 material damage.

25 Q. Okay. And where do you, in your regulations and

1 your guidance, find that definition of material damage
2 that deals with those two particular parts?

3 A. That actually comes from a 1996 memo that was
4 done between at that time DEQ director and the state
5 engineer. That essentially laid out the elements that we
6 need to look at in the CHIA.

7 Q. And is that memo part of the state program for
8 DEQ ordered by OSM? Do you know?

9 A. It is part of the -- what we use to support our
10 CHIAs. We reference that particular document in every
11 CHIA we do. I do not know if it was ever looked at
12 before. I can't say that.

13 Q. Okay. That's fine.

14 And when you say water quality exceedances, just
15 to be clear, that means a violation of a water quality
16 standard?

17 A. Yes. That would be an exceedance of those
18 standards that are laid out in either Chapter 1 of the
19 water quality rules for surface water or Chapter 8 for
20 groundwater.

21 Q. All right. You were just asked some questions
22 about possible connections between ground and surface
23 water. In the scope of your review of this permit
24 application, do you have any personal knowledge of
25 connections between surface and groundwater?

1 A. With respect to which area?

2 Q. I think mainly the Tongue River-Goose Creek
3 area.

4 A. Personal knowledge, is that how you phrased it?

5 Q. Yeah, that's how I phrased it.

6 A. I can't cite to any knowledge right now that I
7 have about that.

8 Q. And the scope of your review, you were focused
9 on surface water, right?

10 A. Yes.

11 Q. But at the time surface and groundwater can be
12 connected, right?

13 A. Sure.

14 Q. So did you talk to the other people reviewing
15 the groundwater parts to make sure that those connections
16 were explored in the scope of your review?

17 A. Yes. I talked to the other reviewers about
18 groundwater.

19 Q. Okay. And did they raise any concerns about
20 those surface-groundwater connections with you?

21 A. Not that I can recall right now.

22 Q. Okay. You mentioned that -- you talked a little
23 bit about Slater Creek and the buffer that is required
24 as -- because of the nature of Slater Creek, but you
25 mentioned exception regarding a haul road; is that right?

1 A. Yes.

2 Q. Can you explain that a little bit more?

3 A. Well, that was shown on the exhibit that we had
4 up. So they would have a haul road that could have a
5 crossing of a stream. It was not described exactly what
6 that crossing would be, if it would be a culvert or
7 whatnot. But that would be the only disturbance in and
8 around the channel itself of Slater Creek.

9 Q. Okay. So there's a buffer, but then there's an
10 exception to the buffer. Is that what you're saying?

11 A. Yeah. You can look at it that way.

12 Q. Okay. And is that because, in your
13 determination, there won't be an impact to Slater Creek
14 from that exception to the buffer?

15 A. I don't know that we evaluated that in an
16 explicit way from that particular haul road. But we're
17 assuming if they're using culverts, which they have
18 explained in the mine plan they would use, they have
19 inspection of those culverts, that that crossing would be
20 installed appropriately and would protect water quality.

21 Q. Okay. You also talked a little bit about some
22 additional monitoring that you're going to require on the
23 Tongue River and Goose Creek as part of your review of the
24 objections, right?

25 A. Yes.

1 Q. Okay. Is that going to be a permit condition
2 that DEQ would then approve as -- as part of this permit?
3 Do you know?

4 A. Yes, I believe it would be a permit condition.

5 Q. Okay. You also talked a little bit about -- I
6 think your phrase was adjusting the mine plan to
7 incorporate those new conditions. How does that happen?

8 A. So there would be a permit condition. And so
9 after the approval of the permit, at some point in time
10 they would have to meet that condition and at that point
11 update portions of the mine and reclamation plan that
12 discuss that monitoring.

13 Q. Okay. So at some point prior to mining?

14 A. I'm assuming. I'm not sure the exact timeline
15 on that. That's --

16 Q. Okay.

17 A. -- not really up to me to decide.

18 Q. Would you feel it's important to get data from
19 those monitoring stations prior to mining?

20 A. Yes. That would be useful.

21 Q. That would be useful.

22 So I think you just talked a little bit about
23 maybe a year of monitoring data that is normally required
24 from baseline monitoring. Is that something that would be
25 useful from these monitoring stations?

1 A. Well, it's possible. There's also other data
2 sources out there that could be used to supplement that
3 baseline that are very close to where these sites would
4 be.

5 Q. And are those other sources in the mine plan?

6 A. Let me think about that. They are discussed in
7 Appendix D6. Some of them, not all of them.

8 Q. Some of them, not all of them.

9 Okay. Are you evaluating all of them in the
10 scope of the CHIA?

11 A. These outside sources?

12 Q. Yeah.

13 A. Yes.

14 Q. Yes. Okay.

15 You also talked a little bit -- or we heard
16 earlier a little bit about the adjudicated wells issue
17 versus permitted wells. Did you evaluate that at all in
18 the scope of review of the objections or is that more
19 groundwater?

20 A. That's more of a groundwater item, but, yes, it
21 was -- it was looked at --

22 Q. Okay.

23 A. -- by staff.

24 Q. Okay. Did you evaluate the water needs of the
25 mine in the scope of your review?

1 A. I did look at the water needs for the mine.

2 Q. Okay. I think I read somewhere that -- a number
3 of 328,200 gallons of water per day. Does that sound
4 right to you?

5 A. That sounds correct. I'm not positive, but I
6 think that's correct.

7 Q. Okay. And do you know where that water's going
8 to come from?

9 A. The -- the mine plan does identify the sources
10 for that water that is in Mine Plan Table -- Section MP-8
11 in the mine plan. I believe it's MP-8.1 is the table that
12 discusses that, demonstrates the different sources.

13 Q. Okay. We heard a little bit earlier about
14 the -- I guess the bathtub that is kind of right there
15 next to the Tongue. Would you agree that that's maybe a
16 source of water for the mine?

17 A. Potentially could be.

18 Q. Potentially. Okay.

19 Did DEQ independently analyze the amount of
20 water that would be needed or where that water would come
21 from?

22 A. With respect to the TR-1 area or --

23 Q. Just in general for the mine plan.

24 A. For the entire mine?

25 Q. Yeah.

1 A. I'm sorry. Could you restate the question?

2 Q. Yeah. Sure. Did DEQ independently analyze the
3 amount of water needed for the mine?

4 A. No, we did not independently analyze.

5 Q. Did you independently analyze where the water
6 would come from or where it could come from?

7 A. What do you mean by "independently analyze"?

8 Q. I guess did you -- in scope of your review of
9 what the permit applicant told you, did you raise any
10 questions about that or, you know, think of other sources
11 for sources of that water?

12 A. I did raise a few questions on that, yes.

13 MS. ANDERSON: Okay. I think that is all I
14 have. Thank you.

15 THE WITNESS: Okay.

16 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.

17 Mr. Gilbertz.

18 MR. GILBERTZ: Thank you.

19 CROSS-EXAMINATION

20 Q. (BY MR. GILBERTZ) Good afternoon.

21 A. Good afternoon.

22 Q. And my name is Jay Gilbertz. I'm an attorney
23 for Mary and David Fisher. I have only a couple of
24 questions for you, and they all relate to real world
25 practicality. We've had a lot of discussion about the

1 permit being technically per -- technically complete,
2 right? And that is another way of saying that it is ready
3 to be acted upon by the director; is that correct?

4 A. That sounds correct.

5 Q. Okay. And we are waiting for my signal.

6 So I have a copy of Wyoming Statute 35-11-406,
7 which tells us some of the things that need to happen as a
8 prerequisite to the issuance of a permit. One of those
9 things is that there's a demonstration and that the
10 administrator finds in writing that (iii), the proposed
11 operation has been designed to prevent material damage to
12 the hydrologic balance?

13 MR. LAROCK: I'm actually going to object
14 to this question. I'm sorry. This is asking about the
15 CHIA again. And what the council's looking at is technical
16 adequacy, not whether the permit should be issued or
17 denied.

18 MR. GILBERTZ: I haven't even asked the
19 question yet.

20 CHAIRMAN BAGLEY: I'm going to allow a
21 question, but I am going to ask, Mr. Gilbertz, this is the
22 second time we've seen this exact slide, so I think we're
23 familiar now with these requirements.

24 MR. GILBERTZ: Sure.

25 CHAIRMAN BAGLEY: If you can zoom in onto

1 what we want to ask this witness.

2 MR. GILBERTZ: Okay. That's what I'm
3 doing. I'm letting the witness see the statute because the
4 witness wasn't here before.

5 CHAIRMAN BAGLEY: Okay.

6 Q. (BY MR. GILBERTZ) So I'm talking to you about
7 this, where it says it has to be found and demonstrated
8 that the proposed operation has been designed to prevent
9 material damage to the hydrologic balance outside the
10 permit area. You see that, sir?

11 A. Yes.

12 Q. And also if there is alluvial valleys involved,
13 not materially damage the quantity or quality of water in
14 the surface or underground water that supplies the
15 alluvial valley floor. You see that, sir?

16 A. I do see that.

17 Q. Okay. So these are findings that need to be
18 made by the director in order for this to happen. My
19 practical real world question to you is the administrator
20 cannot make these finding without the CHIA, right?

21 A. That's correct.

22 Q. And so if in the 15 days -- it's within 15 days
23 after these proceedings are concluded, the CHIA's going to
24 be put together in those 15 days?

25 A. Well, we do have a draft CHIA. Final CHIA would

1 be put together in those 15 days.

2 Q. Okay. But no one -- that draft CHIA is not
3 shared with anyone until it's final?

4 A. That's correct. Until the permit has been
5 approved.

6 MR. GILBERTZ: Those are all the questions
7 I have.

8 CHAIRMAN BAGLEY: All right. Thank you.
9 Mr. Pope.

10 MR. POPE: Thank You, Mr. Hearing Officer.

11 CROSS-EXAMINATION

12 Q. (BY MR. POPE) Good afternoon, Mr. Kunze. My
13 name is Jeff Pope. I'm an attorney with Holland & Hart.
14 I'm here on behalf of Brook Mine. It's good to finally
15 meet you. You're named in a lot of places in the mine
16 plan. I'll be brief with you.

17 I'm curious about how much time did you spend in
18 analyzing the Brook permit application?

19 A. I do not have an estimate of time.

20 Q. Would you say it's over a hundred hours?

21 A. Oh, well over that.

22 Q. Do you think you did a good job in analyzing
23 Brook's permit application?

24 A. I did the best that I could.

25 Q. Fair enough. In analyzing the Brook permit

1 application, did you apply accepted scientific principles
2 and practices?

3 A. I did.

4 Q. Now we heard earlier you mention that you alone
5 had 127 comments that Brook, as part of the permit
6 application, had to respond to. Did you make these
7 comments to ensure that Brook's permit application would
8 adequately protect the surface water within the permit
9 boundary?

10 A. Yes.

11 Q. Were you satisfied by Brook's responses?

12 A. I was.

13 Q. We heard a little bit in some of the other
14 questions about other data sources. Is the availability
15 of other data for this area due in part to the fact that
16 other companies have had mines in this area?

17 A. Yes.

18 Q. And that those mines collected surface water
19 data?

20 A. Yes, they have.

21 Q. And is that data available to you either in your
22 review of Brook's permit application or the CHIA?

23 A. Yes, it is.

24 Q. We also heard you talk about some of the surface
25 water control and flood control measures that Brook has in

1 its mine permit application. To your knowledge, do those
2 flood and surface water control devices comply with
3 industry standards?

4 A. They do.

5 Q. I only have one question about the CHIA, we've
6 heard a lot about that. I want to put to rest something.
7 Before the Brook permit would issue, assuming this council
8 decides that should move forward, DEQ will finalize and
9 present the CHIA, correct?

10 A. I'm sorry. State the first part of the question
11 again.

12 Q. Absolutely. Assuming that this council decides
13 the permit application should move forward, DEQ will
14 finalize and include the CHIA with Brook's permit,
15 correct?

16 A. We will finalize the CHIA prior to the permit
17 application when moved.

18 Q. I want to talk briefly about the proposed
19 monitoring changes that you discussed. You discussed
20 moving the locations of several of these monitoring
21 stations. You said they were in response to the
22 objections, correct?

23 A. Correct.

24 Q. So that means you considered and analyzed those
25 objections in deciding how Brook's permit application may

1 move forward, correct?

2 A. That's correct.

3 Q. Is it fair to say that you fairly and honestly
4 evaluated those objections as they apply to surface water
5 issues within the Brook permit boundary?

6 A. Yes.

7 Q. Just a clarification question again on the
8 monitoring issue. I want to make sure we all understand
9 the purpose of this. Why is it that DEQ wants both an
10 upstream and a downstream set of monitoring stations?

11 A. That is typically what we see in coal mines. We
12 have upstream site so you know what's coming into the
13 system, and we have downstream site so you can evaluate
14 potential impacts to that water system from the operation.

15 Q. So I take from that that's pretty typical for a
16 coal mine to have both an upstream and a downstream
17 monitoring station in Wyoming?

18 A. It is. At least within permit boundary this
19 situation is a little different and these are --

20 THE REPORTER: I'm sorry. These are?

21 THE WITNESS: These would be located
22 outside the permit boundary.

23 Q. (BY MR. POPE) A few other loose ends I want to
24 tie up with you, Mr. Kunze. There was discussion of the
25 WYPDES permit. To my understanding, the Land Quality

1 Division does not administer or enforce WYPDES permits; is
2 that correct?

3 A. That's correct.

4 Q. Let's jump now to the issues of surface and
5 groundwater connections. You were asked some questions
6 about those. The potential connection between a surface
7 water source and a groundwater source depends, in part at
8 least, on the type of geology separating those two sources
9 of water; is that correct?

10 A. That can be one factor.

11 Q. So, for example, permeabilities of rock could
12 affect a connection between surface and groundwater?

13 A. That makes sense to me. I am not a professional
14 geologist, but that does make sense to me, what you
15 described.

16 Q. Let's move from -- from that connection to haul
17 roads. You discussed that culverts, particularly along
18 the haul road that's near to some of the surface water in
19 that area, would help alleviate concerns. Mr. Kristiansen
20 testified that a professional engineer must design and
21 certify those haul roads before they can be used. Would
22 those culverts be included in that professional design and
23 certification?

24 A. I do not know the answer to that.

25 Q. Fair enough. Another loose end I want to tie

1 up. You mentioned that -- in discussing the CHIA, that
2 there are other data sources available for surface water
3 in this area. What are those other data sources?

4 A. Those other data sources would include data that
5 have been collected in the Big Horn Mine and also
6 collected by the USGS.

7 Q. You talked a little bit with Ms. Anderson about
8 how much water that the Brook Mine intends to use in its
9 daily operations. It's true that Brook has to show how
10 much water it will use as part of the permit application
11 process, correct?

12 A. That's correct.

13 Q. And as you said, that is contained in the mine
14 plan in the application, correct?

15 A. Correct.

16 MR. POPE: After conferring with my
17 co-counsel, Mr. Kunze, I thank you for your time. I have
18 no further questions.

19 CHAIRMAN BAGLEY: All right. Thank you,
20 Mr. Pope.

21 I'd like to take a five-minute break for
22 biological activity, and we'll come back and have council
23 ask questions and finish with redirect.

24 MR. LAROCK: Thank you, Mr. Chairman.

25 (Hearing proceedings recessed)

1 5:20 p.m. to 5:30 p.m.)

2 CHAIRMAN BAGLEY: Okay. We're starting
3 again.

4 Now is the time for council members to ask
5 questions.

6 Start at the end there. Council Member Baumer.

7 COUNCIL MEMBER BAUMER: Thanks. I don't
8 have any questions at this time.

9 CHAIRMAN BAGLEY: No questions.

10 Nick?

11 COUNCIL MEMBER AGOPIAN: No, no questions.

12 CHAIRMAN BAGLEY: Meghan?

13 COUNCIL MEMBER LALLY: I don't have any
14 questions at this time.

15 CHAIRMAN BAGLEY: Tim?

16 COUNCIL MEMBER FLITNER: Just one.

17 EXAMINATION

18 Q. (BY COUNCIL MEMBER FLITNER) There's been a lot
19 of talk about this CHIA. I mean, it's not like it's once
20 the comment period has passed for the CHIA, it's not like
21 you can't change or regulate or mitigate anything that you
22 might find at that point, right? It's just another layer.
23 You still address any issues you might find that don't
24 satisfy the permit.

25 A. Yes. Those would be handled in a separate

1 process.

2 COUNCIL MEMBER FLITNER: Okay.

3 EXAMINATION

4 Q. (BY COUNCIL MEMBER DEGENFELDER) And just to
5 clarify one last time, that CHIA is in no way part of the
6 permit.

7 A. That's correct.

8 COUNCIL MEMBER DEGENFELDER: Okay. Thank
9 you.

10 COUNCIL MEMBER FLITNER: That's all I have.

11 CHAIRMAN BAGLEY: I have a couple of
12 questions, partly just for my -- just to clarify some of my
13 notes.

14 EXAMINATION

15 Q. (BY CHAIRMAN BAGLEY) Could you tell me what
16 CHIA means again? I didn't -- I don't think I got the
17 definition of it.

18 A. Cumulative hydrologic impact assessment.

19 Q. Okay. And if it's not part of the application,
20 what -- why is it done? I mean, what's the statutory
21 requirement?

22 A. It's one of the findings that supports one of
23 the findings that have to be made prior to approving a
24 permit.

25 Q. Okay. So you said earlier -- early in your

1 testimony that the mine plan, as it's laid out here, will
2 not directly disturb Tongue River and Goose Creek. Did I
3 hear that correctly?

4 A. That's correct.

5 Q. So when you mean directly disturb, you mean from
6 sort of like surface water runoff or something -- that
7 sort of thing?

8 A. I was meaning physically disturbed, so...

9 Q. Physical disturbed.

10 A. Yes.

11 Q. Okay. And then you mentioned something about
12 water rights need to come from the State Engineer's
13 Office. So were you referring, then, to if Brook Mine
14 needs water to use, they got to get those water rights
15 from the State Engineer's Office?

16 A. Yes.

17 Q. So those don't -- those aren't -- don't come
18 from the LQD?

19 A. Not at all. It's from a separate agency.

20 Q. So the use here that was mentioned, 328,200
21 gallons per day, would that be the sort of water right
22 they'd have to get from the State Engineer's --

23 A. Depending on the uses -- or, excuse me, the
24 sources for that water, they will have to obtain water
25 rights, both for surface water and groundwater.

1 Q. Okay. So both surface and groundwater rights
2 will be through the State Engineer's Office?

3 A. Yes.

4 Q. Okay. And then the water quality issues, are
5 they handled completely separately by the Water Quality
6 Division? I guess I'm having some trouble understanding
7 how the Land Quality Division is interacting with the
8 Water Quality Division in this matter.

9 A. Well, the discharge permits, those are handled
10 by Water Quality Division. So those would be the primary
11 Water Quality Division permit, in my estimation, would be
12 needed for this permit application. But as part of the
13 CHIA, we do look at Water Quality Standards in that
14 evaluation.

15 Q. Okay. So you and the Land Quality Division, as
16 part of the putting together the CHIA, do look at water
17 quality, but it's not -- it's for that specific item, not
18 for determining a permit -- a discharge permit?

19 A. Yes. Right.

20 Q. Okay. Now, in response to your looking at the
21 public comments objections that you've seen from earlier
22 this year and you recommended adding additional monitoring
23 stations, a question was raised about how much baseline
24 information do you think would be required from those
25 stations. Do you have an estimate of what -- the baseline

1 time you'd like to get from those monitoring stations?

2 A. Particular time, no. It would be nice to -- to
3 get a few samples at least or supplement the baseline with
4 the existing data that are out there --

5 Q. Okay.

6 A. -- that would be, I'm assuming, pretty close to
7 these sites.

8 The conservation district monitors the Tongue
9 River and Goose Creek in a lot of these areas, so they
10 have data readily available as well.

11 Q. Are these monitoring stations for flow or for
12 quality or both?

13 A. I'm sorry. The ones we'd be proposing or --

14 Q. Yes. Yes. The ones you're proposing.

15 A. Primarily from water quality. I would recommend
16 that a water quantity measurement be taken at the time of
17 sampling. That's used to help interpret the water quality
18 results.

19 CHAIRMAN BAGLEY: That's all the questions
20 I have. Any more questions from council members?

21 Yes. I'm sorry. Did I forget you?

22 COUNCIL MEMBER LALLY: You didn't forget
23 me. I came up with a question. Sorry.

24 EXAMINATION

25 Q. (BY COUNCIL MEMBER LALLY) You stated that

1 depending on the source of water they might have to get a
2 water permit from the State Engineer's Office. In what
3 case would you not need a water permit to use water from
4 the State Engineer's Office?

5 A. Can't think of any cases.

6 Q. So they would need to get a permit --

7 A. Yes.

8 THE REPORTER: I'm sorry. What was the
9 last part?

10 COUNCIL MEMBER LALLY: They would need to
11 get a permit no matter the source of the water.

12 A. Yes, that's correct.

13 COUNCIL MEMBER LALLY: Okay.

14 CHAIRMAN BAGLEY: Go ahead.

15 COUNCIL MEMBER DEGENFELDER: One other
16 question in relation to Big Horn Coal.

17 EXAMINATION

18 Q. (BY COUNCIL MEMBER DEGENFELDER) I gather that
19 they are concerned about T-1 and then the questions asked
20 particularly of you in relation to if the mine permit may
21 be flawed in that sense, that I'm just piecing together
22 speculatively. And so I'm wondering if you have any
23 comments on that. I gather that they're concerned about
24 the data collection, the drilling logs for that particular
25 area. So do you have any further comments on the accuracy

1 of that?

2 A. I guess I'd need to know exactly which objection
3 you're referring to because they had numerous items in
4 their objection letter that related to that area.

5 Q. Okay.

6 A. If it has to do with anything with groundwater,
7 Dr. Kuchanur would be the best person to address that.

8 Q. Okay. Thank you.

9 A. So...

10 CHAIRMAN BAGLEY: Any other questions from
11 council?

12 All right. So, Mr. LaRock, please, any redirect.

13 MR. LAROCK: Sure.

14 REDIRECT EXAMINATION

15 Q. (BY MR. LAROCK) I'm going to ask you two
16 questions you may not know the answer to. So, first, do
17 you know people can object to the permit after the
18 director issues it and appeal that decision?

19 A. I don't know that.

20 Q. Okay. That's fine.

21 And it's fine if you don't know this, because I
22 know who does. Do you know if the mine is planning on
23 beginning extracting any coal during that first year of
24 operation?

25 A. Not to my knowledge.

1 Q. Great. Then the final question. Does that
2 sampling that you want to have happen, does that need to
3 take place in proposed new sampling sites in order for the
4 mine's permit application to be technically adequate?

5 A. No, it does not.

6 MR. LAROCK: That's it.

7 CHAIRMAN BAGLEY: Okay.

8 MR. LAROCK: Oh, hang on. Wait. Wait.
9 Sorry. This is my first time doing this. I didn't tell
10 you that because you might get nervous.

11 Q. (BY MR. LAROCK) Just a couple questions about
12 the buffer around Slater Creek. Are buffers around
13 streams commonly used at other mines?

14 A. It depends on the type of stream it is. It's
15 not necessarily required if there's ways to handle flows
16 through diversion or something.

17 Q. Are crossings allowed across buffers at other
18 mines?

19 A. Yes, if they're designed appropriately.

20 Q. Can you describe generally if a road crossing a
21 buffer would lead to the same impacts of -- on a stream as
22 direct surface disturbance?

23 A. As long as it was -- the design was done
24 correctly, done by a PE, I would not think there would be
25 concerns.

1 Q. When you say PE, you mean a professional
2 engineer?

3 A. Yes.

4 Q. And then just a last question on this point. Is
5 allowing a haul road to cross Slater Creek -- do you think
6 it would have the same impacts as allowing a panel to go
7 underneath Slater Creek?

8 A. It's a difficult question to answer.

9 Q. Okay. Sure. I'm sorry. Let me see if I can
10 rephrase it.

11 Do you think if -- constructing a road would
12 have more or less severe impacts than undermining the
13 creek?

14 A. It's difficult for me to answer.

15 MR. LAROCK: All right. Yeah. That's
16 fine. I'll withdraw that question. Okay. Now there's no
17 further questions. Now we're done.

18 CHAIRMAN BAGLEY: Okay. Well, I know as
19 excited as everybody is -- thank you, Mr. Kunze, for your
20 testimony.

21 I know as excited as everybody is to move on,
22 you'll have to wait until tomorrow. I think this is a good
23 stopping point, and so we will recess.

24 For those who are really interested, at 8:30 the
25 council will be doing some other business. At 9:00 we have

1 rulemaking.

2 MR. RUBY: That's tomorrow.

3 CHAIRMAN BAGLEY: Tomorrow morning. Not
4 tonight. Tomorrow morning. And then we hope to start --
5 restart this about 11:00. So please be ready about 11:00.

6 We are recessed.

7 (Hearing proceedings recessed

Dear Counselors:

Attached is a letter from Councilwoman Degenfelder indicating her recusal from the Brook LLC 2 hearing in Docket 17-4802.

Jim Ruby

Jim Ruby
Wyoming Environmental Quality Council
122 West 25th
Herschler Building 1W, Room 1714
Cheyenne, WY 82002

Mr. Ruby:

Although I do not believe I am required to recuse myself from these proceedings, in light of my employment with Cloud Peak Energy, which is a thermal coal producer with operations in the Powder River Basin of Wyoming and Montana, I am hereby providing notice that I am voluntarily recusing myself from any decisions of the Environmental Quality Council with respect to this proceeding regarding Brook Mine.

Thank you,

Megan Degenfelder

4 IN RE BROOK MINE APPLICATION Docket No. 17-4802

5 -----

6

7 TRANSCRIPT OF HEARING PROCEEDINGS

8 VOLUME I

9

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter came on for hearing on the
12 22nd day of May, 2017, at the approximate hour of
13 3:00 p.m., at the Sheridan College, Thorne-Rider Campus
14 Center, Room TRCC 008, 3059 Coffeen Avenue, Sheridan,
15 Wyoming, before the Wyoming Environmental Quality Council,
16 with Chairman David Bagley, presiding, and Council Member
17 Meghan Lally, Council Member Megan Degenfelder, Council
18 Member Tim Flitner, Council Member Nick Agopian and
19 Council Member Deb Baumer also in attendance.

20 Mr. Ryan Schelhaas, Wyoming Attorney General's
21 Office, Attorney for the Council; Mr. Jim Ruby, Executive
22 Director to the Council; Mr. Joe Girardin, Business Office
23 Coordinator, were also in attendance.

1 P R O C E E D I N G S

2 (Hearing proceedings commenced

3 3:00 p.m., May 22, 2017.)

4 CHAIRMAN BAGLEY: All right. We'll start.

5 Good afternoon, everybody. It's 3 p.m., May 22,

6 2017. I am Dr. David Bagley, the hearing officer for

7 Docket 17-4802 in regards Brook Mine, LLC.

8 Present today from the Wyoming Environmental

9 Quality Council are Tim Flitner, Meghan Lally, Megan

10 Degenfelder, Nick Agopian and Deb Baumer. Council Member

11 Fairservis has recused himself due to a conflict.

12 Parties present today are Isaac Sutphin and

13 Jeff Pope on behalf of Brook Mine, LLC. Andrew Kuhlmann

14 and James LaRock on behalf of DEQ.

15 MR. POPE: Counselman Bagley, I apologize

16 for interrupting. We also have Tom Sansonetti here on

17 behalf of Brook Mine.

18 CHAIRMAN BAGLEY: Great. Thank you.

19 Shannon Anderson on behalf of Powder River Basin

20 Resource Council. And Jay Gilbertz on behalf of Mary

21 Brezik-Fisher and David Fisher.

22 And also present for the council are Jim Ruby,

23 executive officer and Joe Girardin, Council Business

24 Coordinator and Ryan Schelhaas from the Attorney General's

25 Office.

1 MR. RUBY: Mr. Chairman.

2 CHAIRMAN BAGLEY: Yes.

3 MR. RUBY: You forgot Lynn. I did not --
4 yeah.

5 CHAIRMAN BAGLEY: My apologies.

6 MS. BOOMGAARDEN: Lynn Boomgaarden and
7 Clayton Gregersen on behalf of Big Horn Coal Company.

8 CHAIRMAN BAGLEY: Thank you. This hearing
9 is being held at Sheridan College, Room TRCC 008 in the
10 Thorne-Rider Campus Center, 3059 Coffeen Avenue, Sheridan,
11 Wyoming. There is a court reporter present.

12 So this afternoon, what I'd like to do is have
13 opening statements, and then also we'll try to get the
14 evidence from the DEQ presented.

15 So for the opening statements, since everyone has
16 filed prehearing information, I'd like us to try to keep
17 the opening statements to 10 minutes, if possible, so we
18 can keep moving forward.

19 So -- is this the order I should go in, Jim?
20 Opening statements?

21 MR. RUBY: It's DEQ first, then Brook, then
22 PR -- or then Lynn, then PRBRC, then Jay.

23 CHAIRMAN BAGLEY: I'll get that there.

24 MS. ANDERSON: It's just the order of the
25 presentation of the hearing, Mr. [sic] Bagley.

1 MR. RUBY: I probably typed it in wrong.

2 CHAIRMAN BAGLEY: Yeah, I've got -- here,
3 Jim, come on over here so I can get this in the right
4 order. My apologies.

5 Great. Thanks. All right, then. Mr. Kuhlmann,
6 DEQ, would you please -- if you have an opening statement,
7 please proceed.

8 MR. KUHLMANN: Thank you, Mr. Chairman.

9 My name is Andrew Kuhlmann, and I am here on
10 behalf of the Department of Environmental Quality. I work
11 at the Wyoming Attorney General's Office. Also joining me
12 is James LaRock, also with the Wyoming Attorney General's
13 Office.

14 This case is about the public input provided
15 through the objections period on the proposed Brook
16 Mine. I will allow Brook Mine to go into greater detail
17 about the nature of their mine, but it's an application
18 for a new mining permit up near here, just north of
19 Sheridan.

20 Prior to this case, DEQ thoroughly reviewed the
21 Brook Mine permit application over a number of years. At
22 the conclusion of that, they determined that it was
23 technically adequate. The purpose of this hearing is to
24 determine that after the public has now filed objections
25 and provided new information, whether that permit is still

1 technically adequate. And by technically adequate, we're
2 referring to a permit whose contents meet the statutory,
3 regulatory requirements.

4 Now, the public has an opportunity to provide
5 information to DEQ on the permit application only at the
6 point of public comment and objections. Those objections
7 then can lead to a hearing in front of the council, and the
8 council now, over the next few days, will be able to make
9 findings about the objections, information -- both for them
10 as well as in response to them -- and conclusions about
11 whether or not the permit, in light of those objections, is
12 still technically adequate.

13 The other parties have characterized this case as
14 a matter of issuing or denying the permit. But the council
15 does not need to get that point. The statutes indicate the
16 director is to issue or deny the permit. There are a
17 number of findings that have to be made under Wyoming
18 Statute 35-11-406(n). And those findings must be made by
19 the director prior to permit issuance.

20 Those findings also depend, though, on the
21 content of the permit application, which objections and the
22 new information provided through them can affect and the
23 council will be able to affect through this hearing its
24 findings.

25 The findings that are necessary for the director

1 to make have not been made at this time. You will hear
2 evidence that the cumulative hydrologic impact assessment
3 has not been finalized or issued or signed at this point.
4 You will also hear that the bond, for reclamation purposes,
5 has not been set at this point. Nor do they need to be
6 because both of those items depend upon the content of the
7 permit application and the objections could potentially
8 allow for modifications of that substance.

9 Those issues, once those findings are made, can
10 be heard by council at that time, but it's not necessary
11 for the council to worry about those at this point or to
12 try to make those findings on their own.

13 The Department believes that -- has reviewed the
14 public objections and also believes that even after
15 reviewing those objections, the permit does remain
16 technically adequate. There are things objections have
17 identified that could be improvements upon the application,
18 but they are not deficiencies that would prevent the
19 issuance of the permit. And there's a common method used
20 by the Department to correct things such as this,
21 improvements that come up through the public objections
22 period, and that is to place a permit condition on an
23 issued permit requiring a permit revision to be filed by
24 the applicant within specified time after the permit is
25 issued and prior to mining. This allows the minor issues

1 to be corrected in a timely manner and allows the
2 permitting process to go forward.

3 DEQ planned -- intends to provide four witnesses
4 for the council. First, Mr. Bj Kristiansen, who is the
5 permit coordinator for Brook Mine, is going to help
6 introduce the volumes of the permit application. He will
7 also talk about several sections of the permit application
8 that he is familiar with. He will talk about the permit
9 review process, as well as preapplic -- preapplication
10 activities that Brook had with DEQ prior to issuing -- or
11 to filing their application. He'll talk about the geology
12 of the area. He'll talk about most of the contents of the
13 mine reclamation plans. He will talk about the subsidence
14 control plan and the fire control plan.

15 Mr. Matt Kunze, also with DEQ, will be providing
16 testimony about surface water, information and issues
17 raised in the objections and the parts of the application
18 that address surface water issues, both quantity and
19 quality.

20 Dr. Muthu Kuchanur will be testifying about the
21 water quantity and quality, as well as groundwater
22 monitoring.

23 And, finally, Mr. Doug Emme will be testifying
24 about the blasting program of the Department, as well as
25 bonding for reclamation.

1 The Department -- the council has likely
2 realized, from reviewing DEQ's prehearing memo, that there
3 are a number of statutes and regulations that apply to the
4 issues raised in the objections. I will not waste time by
5 trying to quote those here, but we refer to the council
6 DEQ's memorandum to identify where those are.

7 At the end of this hearing DEQ will request the
8 council to determine that the application is technically
9 adequate, and to make any recommendations of areas of
10 application that should be corrected through a permit
11 revision after the permit is issued. Thank you.

12 CHAIRMAN BAGLEY: Thank you, Mr. Kuhlmann.

13 Mr. Pope, would you please proceed.

14 MR. POPE: Certainly. If you'll give us
15 just one moment, Dr. Bagley. We have to move some
16 technology in place.

17 CHAIRMAN BAGLEY: Okay.

18 MR. POPE: If it's all right with council,
19 I prefer to stand. I'm short enough as it is, hiding
20 behind a desk.

21 CHAIRMAN BAGLEY: That's fine.

22 MR. POPE: All right. I think we're ready
23 to go. Ladies and gentlemen of the council, thank you for
24 taking time out of your schedule to join us for an
25 entertaining discussion on dirt.

1 Today we're going to be talking about the Brook
2 Mine permit application. But I first want to start with
3 something that's a little more understandable. Driver's
4 licenses. Many of us have them. Most of you have likely
5 seen one. They tell us that the person who has that
6 license has passed the minimum qualifications necessary to
7 drive a car in the state of Wyoming. Besides that they
8 don't really tell us a whole lot. They tell us height,
9 weight, date of birth, address. Maybe you look like what's
10 on the picture, maybe you don't, depending on when it was
11 taken. But at the end of the day, the license isn't an
12 expansive document and review of what a person's going to
13 do for their entire lives driving a car. There's many
14 unknowns that factor into when a person actually gets
15 behind the wheel of an automobile and begins to drive.

16 The type of car. The driver's license doesn't
17 tell you what kind of car that person is driving, but we
18 know that the make, model, age and technology of that car
19 can influence how you should approach driving; how fast you
20 should go, how slow you should go, how you deal with turns.

21 Likewise, that driver's license doesn't explain
22 10 or 15 years in the future how you're going to handle a
23 set of mountain curves or, if you've been driving for only
24 five years how, in the middle of May, when a foot and a
25 half of snow gets dumped on Cheyenne, how you're going to

1 deal with that. Likewise, it doesn't explain how someone
2 lives their entire lives in a rural Wyoming community is
3 going to deal with big city traffic.

4 But it doesn't have to, because that's not what a
5 driver's license is about. It's about setting a minimum
6 standard that you understand and commit to following the
7 rules of the road. You also don't go out there alone.
8 There's oversight. Highway patrol, sheriffs, city police.
9 And if you break the rules of the road, there are
10 consequences. You get pulled over. For example, if you're
11 trying to get back a little early from depositions in
12 Sundance, thinking you can go faster than the speed limit,
13 you may find out that the highway patrol says you're not
14 allowed to do that. A lesson Mr. Sutphin and I learned the
15 hard way.

16 But the point is there is somebody watching to
17 make sure everyone with that license follows the rules of
18 the road. I'm sure you're wondering at this point why on
19 earth I've been talking to you about a driver's license.
20 We're clearly not here to talk about how to drive a car.
21 The reason I mention it is because the principle behind a
22 driver's license really isn't different than the principle
23 that we're talking about over these next five days. The
24 permit application for a coal mine is designed to establish
25 a set of minimum standards that a company must meet to

1 operate safely and in an environmentally sound way in the
2 state of Wyoming.

3 But unlike the driver's license test, where you
4 go down to the DMV, you answer a few questions and show
5 them if you can make a left turn or not, the coal
6 permitting process in the state of Wyoming is far more
7 rigorous. As the council knows from the prehearing
8 memorandum, the Wyoming Environmental Quality Act provides
9 dozens of statutory sections that set out guidelines and
10 rules for what a permit applicant must do. DEQ has
11 promulgated hundreds of regulations that an applicant must
12 meet before we get to the point we're at today. And
13 there's over a dozen guidelines that DEQ has to guide
14 someone through the permitting process.

15 Now, what's on the screen is just a very, very
16 tiny snapshot of what an applicant must follow. And you're
17 going to see how detailed that application is. As
18 Mr. Kuhlmann mentioned, the witnesses from DEQ, the
19 experts, frankly, from DEQ are going to walk you through
20 the 13 volumes of Brook's permit application. There are
21 tens of thousands of pages within that permit document that
22 explain in great detail everything that Brook intends to do
23 to meet the -- meet the standards for a permit applicant --
24 application in the state of Wyoming.

25 Inside those 13 volumes, you're going to find

1 detailed studies, because after all, one of the chief
2 purposes of the permit application process is to make sure
3 that someone who wants to mine coal understands soil,
4 geology, hydrogeology, climatology in the area they're
5 going to mine so when they're done, they can put it back in
6 a way that they found it.

7 So you're going to hear from Jeff Barron, a
8 professional engineer and expert in the permitting process
9 on how Brook went about doing that.

10 You're also going to hear from Mr. Ken Woodring,
11 the company rep from Ramaco, about how it's going to do
12 those -- it's going to implement those studies moving
13 forward. And you're going to see things like Brook's
14 groundwater monitoring, its vegetation baseline, and its
15 assessment of alluvial valley floors.

16 In addition to that, you're also going to learn
17 about the lengthy review. Now, unlike the DMV, where you
18 can maybe in and out in a matter of hours, you're going to
19 hear from Mr. Kristiansen this process that will get us to
20 this point was years in the making.

21 Up on the screen now is snippet from PRBRC
22 Exhibit 89 where Mr. Kristiansen explains to Alan Edwards
23 and Todd Parfitt at DEQ that it took us three years, six
24 rounds of comments and responses. And that's the process,
25 as the council's aware of from the order in lieu of consent

1 hearing, where DEQ and Brook went back and forth to improve
2 upon the permit application. And it also involved minimum
3 of 20 experts across 10 different agencies just to get to
4 this point. And lest we not forget, this council was
5 actually involved earlier in the process to move the permit
6 application to where we are today.

7 But that's not the end of the process. There's
8 much more to do. And that's an important piece for the
9 council to consider as it hears the evidence. We're here
10 today talking about step one. You're going to hear
11 evidence from some of the objectors that's talking about
12 step 501.

13 For example, there's oversight, as I mentioned.
14 Just like the highway patrol is out there, DEQ continues
15 with Brook throughout the life of its mine. There will be
16 annual reports and annual recalculation of Brook's bond and
17 monthly inspections of the mine site to make sure Brook is
18 following the law. Just like the highway patrolman who
19 ticketed Mr. Sutphin, Brook can get notices of violations,
20 fines and changes to its operations if it doesn't abide by
21 its permit requirements.

22 And beyond that forward-looking oversight,
23 there's also more work for Brook to do. You see here,
24 Brook Exhibit 10-D, which is the part of the Mine Safety
25 Health Administration, MSHA -- I think I just butchered

1 that, apologize -- the assessment that Brook has to do in
2 order to meet the federal standards to safely operate a
3 mine. You're going to hear that Brook is going to be
4 undertaking those studies and those engineer -- and the
5 engineering necessary to comply with that law.

6 You're also going to hear that Brook is going to
7 do more work at the mine site that it did as part of its
8 permit application. It commits to monitoring water
9 quality, commits to monitoring the streams in the area.
10 And, again, all for the purposes of putting back the land
11 the way Brook found it when it's done mining.

12 And as Mr. Kuhlmann said, we think at the end of
13 the hearing this council should find and affirm DEQ's
14 decision that Brook's application is technically adequate
15 and it complies with all the relevant statutes and
16 regulations.

17 Now, even though there are objectors here, the
18 objectors in Brook can at least agree on one thing. This
19 screenshot at the bottom is from the deposition of Jill
20 Morrison, the executive director of the Powder River Basin
21 Resource Council. I asked her if Brook complies with all
22 of the statutes and regulations for a permit application in
23 Wyoming, should it get a permit? And she said, "I guess
24 so."

25 The objectors, however, despite agreeing with

1 Brook on that basic principle, are here today because they
2 conducted a very cursory review of Brook's permit
3 application. You're going to hear over the next five days
4 that many of the objectors spent little, if any time,
5 reviewing the tens of thousands of pages of Brook's permit
6 application. You're going to hear that in preparing their
7 objection letters, several of the objectors didn't look at
8 the statutes or regulations that govern a permit
9 application in the state of Wyoming. A few of those
10 examples are on the screen. As part of the deposition we
11 asked, Have you reviewed the statutes? No, Jordan Sweeney,
12 manager of Big Horn Coal says.

13 Are you familiar with the Environmental Quality
14 Act? I know of it, says Mikel Wireman, the expert for the
15 Powder River Basin Resource Council. But that's not
16 sufficient. The process is more rigorous. And we
17 ultimately think the final analysis for the council boils
18 down to this. Is the permit application technically
19 adequate and complete? Does it comply with Wyoming law?
20 And what that really is going to ask the council to do is
21 decide whether the experts who spent years going through
22 the permit, both at DEQ and Brook, did their job correctly.
23 Because at the end of the day, we don't think we're here to
24 talk about the substance of Brook's application. Instead,
25 this is an attack on the quality of work that DEQ did.

1 What we think when you hear from Mr. Kristiansen,
2 Mr. Kunze, Mr. Emme and others, you're going to realize
3 they did a great job. They put in a lot of effort. And at
4 the end of the day, it took all of that effort to get us
5 here today, where the council should find Brook's permit
6 action is technically adequate and complete. Thank you.

7 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

8 Ms. Boomgaarden.

9 MS. BOOMGAARDEN: Thank you, Mr. Chairman.
10 Members of the council. Good afternoon. With
11 Mr. Gregersen and I here today is Mr. Jordan Sweeney, mine
12 manager for Big Horn Coal. And then on the end of the row
13 there, local hydrologist, Mr. Joe Gerlach. Mr. Sweeney and
14 Mr. Gerlach will be our witnesses presenting evidence this
15 week.

16 Big Horn's primary concern with Brook's mine
17 permit application is simple and straightforward. The
18 permit application at step 1 fails to satisfy the
19 fundamental statutory and regulatory requirement referenced
20 multiple places in the rules and regulations, that Brook
21 must know and understand the actual on-the-ground
22 hydrologic conditions in the area in which they propose
23 highwall mining. And they have to know those actual
24 conditions so that Brook can ensure that those hydrologic
25 conditions will not be materially impaired.

1 Without knowing and understanding the site-
2 specific hydrologic conditions, it simply is impossible for
3 Brook to adequately consider the impacts of its proposed
4 highwall mining operations as the law requires at step 1.

5 Brook argues that DEQ's determination that the
6 mine permit was technically adequate and suitable for
7 publication satisfies Brook's statutory obligation to
8 demonstrate prior to permit approval that its permit
9 application does four things. First, that it's accurate
10 and complete. Second, that Brook can accomplish
11 recommendation as is required by the Environmental Quality
12 Act. Third, that mining Brook has proposed has been
13 designed, in the first instance, to prevent material damage
14 to the hydrologic balance outside the permit area. And,
15 fourth, that the permit application otherwise complies with
16 the Environmental Quality Act and all applicable state
17 laws.

18 DEQ disagrees with Brook on this point. So does
19 Big Horn Coal. Nothing in the statute at issue in this
20 case, Wyoming Statute 35-11-406(n) creates a presumption
21 that Brook's application was approvable upon
22 Mr. Kristiansen sending a letter to Brook Mine that its
23 permit application was technically adequate and suitable
24 for publication.

25 I know you're all familiar with the statute. For

1 your convenience we put the statutory language I just
2 referenced on the screen. As you can see, there's
3 absolutely nothing in that statute that permits Brook to
4 shift its burden of proof to the objectors. The statute
5 very specifically states that as the applicant, Brook has
6 the burden of establishing that its permit application is
7 in compliance with the law. The statute can't be any
8 clearer that no coal mining permit may be approved unless
9 the applicant affirmatively demonstrates that the
10 specific-listed requirements have been satisfied.

11 Contrary to Mr. Pope's assertion, Big Horn
12 carefully reviewed the portions of the materials that were
13 made available through publication for public review and
14 comment and noted the fundamental hydrologic deficiencies.
15 Brook must demonstrate with that Big Horn's wrong.

16 In response, Brook argues that state law requires
17 very little detail in permit application. We just heard
18 Mr. Pope make that argument. And in supporting the
19 argument, Brook illogically jumps to the characteristics of
20 an approved mine permit as a living dynamic document that
21 allows Brook to mine first and answer questions and address
22 problems later. According to Brook, DEQ's oversight and
23 enforcement authority over an approved permit is sufficient
24 to ensure that any further problems will be identified and
25 corrected.

1 The Environmental Quality Act in the Land Quality
2 Division Rules and Regulations require much more in mine
3 permit application than Brook is willing to acknowledge.
4 For example, the law requires that Brook determined
5 probable hydrologic consequences both within and outside
6 the permit area prior to permit approval. Brook can't make
7 that determination accurately or completely, as is required
8 by the statute if it hasn't obtained and analyzed critical
9 site-specific information.

10 Brook can't make that determination accurately or
11 completely and determine probable hydrologic consequences,
12 whereas here it has neglected to consider data establishing
13 that the overburden above the proposed highwall cuts is not
14 native overburden, as they presumed or assumed in their
15 permit application, but rather it's composed of previously
16 mined porous backfill that's saturated with groundwater
17 and that that's saturated with groundwater that's connected
18 to -- hydrologically connected to the Tongue River and
19 Goose Creek.

20 The evidence at hearing, including the evidence
21 of hydrologist Joe Gerlach, will demonstrate that given
22 Brook's total disregard of the known prior mining activity
23 and overburden and hydrologic conditions in Brook's
24 proposed mine trench 1 area, Brook has not credibly
25 demonstrated the probable hydrologic consequences of its

1 proposed mine operations or any such consequences that
2 would occur would be irreparable -- would not be
3 irreparable. Excuse me.

4 If Brook were being intellectually honest, it
5 would acknowledge that its permits application requirements
6 are separate and distinct from the operation performance
7 standards and the kind of flexibility that permittees have
8 under the law to amend a previously approved permit
9 application to address new or unforeseen circumstances, and
10 then the importance of DEQ's oversight and enforcement rule
11 during the operational period.

12 Notably, Big Horn doesn't seek to deny Brook an
13 opportunity to mine in Sheridan County. However, as the
14 owner of land, infrastructure and coal rights both within
15 Brook's proposed mine permit area and adjacent to Brook's
16 proposed operations, Big Horn is legally entitled to expect
17 that Brook's mine permit accurate -- mine permit
18 application is accurate, complete, complies with the law
19 and that prior to permit approval that application
20 demonstrates that the proposed operation is not expected to
21 irreparably harm the land and water, including Big Horn's
22 property.

23 The number of rounds of technical review, the
24 number of years that it took Brook to prepare a mine permit
25 application that was deemed by DEQ to be technically

1 adequate and suitable for publication, the number of
2 volumes and pages in that permit application, and the
3 number of emails exchanged between DEQ reviewers and Brook
4 over that time frame do not make Brook's permit application
5 any more or less provable.

6 The simple fact is Brook wouldn't rely so heavily
7 on the arguments that Mr. Pope just made if Brook could
8 point the council and the objectors to substantive
9 information that addresses the multiple asserted permit
10 application deficiencies.

11 For all these reasons, at the conclusion of this
12 hearing, Brook will request that the council -- excuse me,
13 Big Horn will request that the council will require Brook
14 to gather and to analyze the critical information missing
15 in its mine permit application and make the necessary
16 demonstrations. Brook must be required to submit this
17 critical baseline data and risk analysis to DEQ for review
18 prior to DEQ preparing its written findings and issuing a
19 state decision document on Brook's permit application.

20 Finally, consistent with DEQ's established
21 practice, as Mr. Kuhlmann just explained, of applying
22 permit conditions to ensure that all technical problems are
23 addressed prior to mining, Big Horn will request that the
24 council determine that specific permit conditions must be
25 included in any approved Brook Mine permit in order to

1 mitigate the risk that Brook's proposed operations will
2 cause irreparable environmental harm on Big Horn's lands
3 and elsewhere. Thank you.

4 CHAIRMAN BAGLEY: Thank you,
5 Ms. Boomgaarden.

6 Ms. Anderson.

7 MS. ANDERSON: Thank you. Mr. Chairman,
8 members of the council, good afternoon. My name is Shannon
9 Anderson, and I'm a staff attorney for Powder River Basin
10 Resource Council. Welcome to Sheridan. As a native, I
11 hope you enjoy your stay and explore the area a bit, which
12 will give you an appreciation of why our members who live
13 here care so much about our county.

14 I have with me today some of our members,
15 including Gillian Malone, a board member of ours who enjoys
16 recreating and spending time near the permit area. And
17 Anton Bocek and John Buyok, members of ours who live near
18 the proposed mine. All of them will be providing testimony
19 to you later this week.

20 Some of our other local members are in the
21 audience today to support our efforts. I also have with me
22 Jill Morrison, our organization's executive director and
23 longtime community organizer.

24 We will be joined later this week by Jerry
25 Marino, our geotechnical engineer expert, and Mike Wireman,

1 our hydrogeologist expert, both of whom will provide expert
2 testimony about concerns they have with the permit
3 application and opinions they have reached about why it is
4 not technically adequate.

5 We want to start off by addressing the argument
6 we know is coming. Ramaco and Brook Mine are going to try
7 to paint our organization as an activist group that is
8 opposed to coal no matter the merits. They want you to
9 believe that we don't have good cause for being here today.
10 We've seen that tactic before, and you should not fall for
11 it.

12 This is the first coal permit we have challenged
13 before the EQC at a hearing in quite some time. Some of
14 you may remember the last coal permit we challenged. It
15 was actually a research and development license for Linc
16 Energy. Linc is now in bankruptcy, and its projects in
17 Australia are the source of the largest contamination
18 cleanup ever in Queensland.

19 Now, before opposing jumps to the conclusions of
20 the relevance about that, we don't bring Linc up for its
21 relevance. We mention it to you to demonstrate that we are
22 selective about what projects our organization questions
23 and challenges. And as a nonprofit with limited resources,
24 we are especially selective about what projects we put
25 legal and financial resources into challenging before this

1 council.

2 As you will hear, we retain well-known and well-
3 respected experts with impeccable credentials. They are
4 scientists familiar with the standards of peer review and
5 what data is necessary to make good decisions. We asked
6 them to review the permit application and associated
7 materials without a predetermined outcome in mind.

8 We honestly wanted to know whether our
9 organization and our members should be concerned about this
10 large industrial project coming into our backyard. And the
11 answer we got back from both of them was a resounding yes.
12 Yes, we should be concerned, they told us. And that answer
13 led us to seek answers to our questions and concerns from
14 the regulators, including you, which brings me to
15 discussing what this proceeding is all about for our
16 organization.

17 Having been denied our request for an informal
18 conference, this hearing is now our only opportunity to
19 voice our concerns to you, the regulatory agency, in charge
20 of making a decision on whether the company has met its
21 burden to allow DEQ to grant or deny the permit
22 application.

23 Your role under Section 406(p) of the
24 Environmental Quality Act is to determine whether Ramaco
25 has met its burden to ensure this coal mine application has

1 met the standards of the law, is technically sound and
2 based upon the proper science-based conclusions, and that
3 it will not threaten the health, safety and welfare of
4 nearby landowners and nearby recreationists.

5 This week-long trial-like hearing is not the most
6 citizen-friendly venue to provide these comments and
7 concerns. And with that in mind, we ask you that -- to
8 give the citizens who are going to testify a little
9 latitude. This is now the only forum they have to raise
10 their concerns with you and with the company. Although it
11 may not look like it, and it certainly doesn't feel like it
12 to them, in essence, this is the only public comment
13 hearing they have had on this proposed coal mine.

14 Unfortunately, as opposed to informally meeting
15 with them to see if the company could address their
16 concerns, Ramaco has greeted these citizens with deposition
17 subpoenas and invasive discovery requests and subjected
18 them to hours of questioning about their motives and
19 technical knowledge. As of earlier today, they also tried
20 to kick out their voice at the proceeding altogether. So
21 they might be a bit nervous and shaken when they testify
22 before you later this week. This is an intimidating
23 process, but these citizens have checked that intimidation
24 at the door because they feel so strongly about the need to
25 raise their voice.

1 This project is expected to mine coal for at
2 least the next 12 years. With 10 years of statutorily
3 required reclamation monitoring, that means a presence from
4 the company for at least 22 years. You can raise a kid and
5 send her to college in that time frame. So for the next
6 generation, this company will be a neighbor to our members
7 who live just north of here in the scenic and historic
8 Tongue River Valley. And because of that, our members, and
9 in turn our organization, have a keen interest in ensuring
10 this company will be a good neighbor. We have an interest
11 in making sure that the permit application is complete,
12 updated, and accurate, as required by the law, as a good
13 permit application is necessary for good inspection and
14 enforcement oversight by DEQ, that Mr. Jeff Pope mentioned,
15 after the permit is approved. DEQ can't issue a notice of
16 violation if there isn't a permit condition or term to
17 violate. And we have a significant interest in making sure
18 the permit application and conditions of the permit
19 appropriately address all legal requirements related to
20 subsidence prevention and remediation, hydrologic
21 protection, blasting, water replacement and restoration and
22 bonding, among many other serious issues.

23 We ask you to consider the following question.
24 If this mine was proposed within half mile of your home,
25 wouldn't you want the permit to meet those requirements

1 too?

2 You've heard a lot already today about the scope
3 of DEQ's review -- and it will likely be a common refrain
4 the whole week from Ramaco and DEQ -- to look at all this
5 paper, think of all the time and on and on. But we ask you
6 to think of the substance. Details matter. Some really
7 complex, technical details, like how to use formulas to
8 calculate the likelihood of subsidence or how to adequately
9 characterize hydrologic systems. And some more general and
10 common details, like how many trucks will haul coal and
11 what roads will be impacted and how often will blasting
12 happen and how will the company ensure that blasting
13 doesn't impact neighbors? Or even the most basic of all,
14 how much coal are you going to mine? And where is it going
15 to go? And what facilities are necessary to make that
16 happen? All of those details are missing or technically
17 inadequate in the permit application.

18 Now, you're also going to hear a lot from DEQ and
19 Ramaco that DEQ normally does this or DEQ normally signs
20 off on that, so trust us and everything will be okay. But
21 the fact is District 3 of the Land Quality Division has
22 never done this before. That is, they have never permitted
23 a highwall mine before. And they certainly have never done
24 that in an area acknowledged to have active subsidence and
25 active coal fires and abandoned mine sites.

1 Consequences matter here. As discussed in the
2 objections and as you'll hear from the citizens testifying
3 later this week, this area has tremendous scenic value and
4 high recreational use. It has complex hydrological systems
5 that are critical to local agriculture, and it has homes in
6 close proximity to the mine.

7 We have to get this one right. We can't just
8 cross our fingers and hope everything will work out. The
9 words on all of that paper matter.

10 As we stated from the beginning, our presence
11 before you this week is not driven by some anti-coal agenda
12 or even anti-Ramaco vendetta. Our presence and actions are
13 exactly what yours would be if your home was near a new
14 proposed coal mine in a sensitive area with active
15 subsidence, coal fires and great concerns over water use
16 and impacts, and that is to demand that when this company
17 mines coal in the Tongue River Valley, that it does it
18 responsibly and in a manner that assure this mine will be
19 a good neighbor for the next generation to come. We
20 hope -- we know you will help us achieve that objective
21 through these proceedings, and we thank you for your time
22 and your efforts.

23 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.

24 Mr. Gilbertz.

25 MR. GILBERTZ: Thank you. My name is

1 Jay Gilbertz from Yonkee & Toner. It's my pleasure to
2 represent David and Mary Fisher.

3 Stand up, please.

4 Who are here today. The Fishers are homeowners
5 out in this area. In the map -- or the aerial that you see
6 right here, their house is just slightly off the photo to
7 the right, in that particular area.

8 I wanted to start by saying our proceedings this
9 week, I want to be clear, it's not about whether we're
10 going to reject a mine or not. It's going to be about
11 being careful, about being thoughtful. And it's most
12 importantly about being careful, thoughtful and scientific
13 about these hydrology and subsidence issues. That is the
14 important thing.

15 This spot, this photo you see, it lies right at
16 the base and adjacent to the Brook Mine application, and
17 where they propose to do their mine.

18 It's just a few short miles of Interstate 90.
19 You can see Interstate 90 up in the left-hand corner
20 cutting through the hill. And the interstate drops down
21 and it cuts right through where the mine is planned right
22 in this particular area you're looking at.

23 I grew up in Gillette on a cattle ranch, so I get
24 away with saying this. The coal mines in Gillette are one
25 thing. Coal mine dug in vast, endless expanses of

1 rangeland. This is not open rangeland like down in
2 Gillette. This is a very special and unique place. Just
3 up the river from this site is the site of the Connor
4 Battlefield where Connor engaged the Black Bear and the
5 Arapahoe in their village where they camped in this valley.
6 And the running battle that ensued as the Arapahoe attacked
7 and Connor attempted retreat ran right through the photo
8 that you're looking at.

9 Just up there also is a site of the Sawyer
10 expedition and where it camped and was attacked by the
11 natives.

12 Just below this photo is where General Crook
13 bivouacked and prepared his armies to march a short
14 distance up north and engage in the battle of the Rosebud.

15 You're probably all aware, just south of town,
16 but within a couple of miles, we have the historic Wagon
17 Box fight and place where Red Cloud engaged in his military
18 victory of the Fetterman massacre.

19 Why is it that the native peoples fought so hard
20 in this place? Why did they fight so hard in this place,
21 when so many vast tracts of land had been taken away from
22 them? And it is because it is a very special place. It's
23 not just a place.

24 This valley is home to turkeys. It is home to,
25 on the Fishers' property right now, a nesting crane. Just

1 up the creek from them, a bald eagle nesting in the same
2 tree with blue herons nesting. It is a trout fishery. It
3 has everything that the largest river in northeast Wyoming
4 could have associated with it.

5 And it is a place where the people are tied to
6 the land as well. Where the people in this valley measure
7 their water rights in terms longer than the state of
8 Wyoming. Territorial water rights run up and down that
9 entire valley, where water rights existed before the state
10 did. It's an important place.

11 The Fishers are just average landowners in this
12 group. And they've been thrust, because there hasn't been
13 an opportunity for public comment, into these contested,
14 expensive proceedings. And we're going to rely on some of
15 the well-qualified experts of other folks to talk to you
16 about these hydrology issues. And what you're going to
17 see -- what's going to be proven to you is that the Tongue
18 River, that you see in this photo, the Goose Creek that
19 comes in just below this, Slater Creek that comes in just
20 below this, these drainages, these rivers in this process,
21 in this landscape, are not half pipes of water flowing
22 through the land, but they are systems. They're systems.
23 They're tied to these alluvial valley floors that are
24 protected so prominently in surface mining.

25 Those alluvial valley floors are, in turn, tied

1 to the outlying aquifer systems, which include -- which
2 include the coal seams filled with water that will be
3 dewatered and mined through by Brook under its plan.

4 We'll show you there have been insufficient
5 studies done to understand how these complex hydrological
6 systems operate together. And we'll get through
7 Mr. Wireman, a highly qualified man who worked in hydrology
8 and mining for decades.

9 As a result, there is insufficient information
10 upon which to determine that this proposed mine will not
11 harm this complex water system and the alluvial valley
12 floors that are tied to it. Without understanding how
13 these systems work together, Brook cannot demonstrate that
14 it -- how -- it cannot demonstrate how it won't harm, and
15 most certainly can't demonstrate what it will do if it does
16 harm.

17 Mr. Wireman will explain to you that there are
18 certain types of damages that can be done to this water
19 system that cannot be undone no matter the price tag.

20 I'm going to prove to you the same is true about
21 the subsidence. Subsidence in this area is not a matter of
22 speculation. It's a matter of historical fact. There is
23 abandoned mine projects out here the DEQ has spent hundreds
24 and hundreds of thousands of dollars on just to address
25 some of the very worst of the situation.

1 The underground mines that were done in the early
2 part of the 1900s are subsiding terribly. Subsidence is a
3 known problem. And what you're going to hear is that the
4 necessary careful scientific work to understand what the
5 risk of subsidence will be when Brook tunnels its highwall
6 miner underground into the coal seam and pulls back out and
7 creates an underground cavity, with all the overburden over
8 it, has not been done. They have not been done with
9 sufficient degree for us to understand what the risk of
10 subsidence is, how much that will be, and, most
11 importantly, we can't understand how much work we would
12 have to do if it happens. So we haven't predicted
13 environmental outcomes, and we can. We can. It just
14 requires more work.

15 And he will also explain, based on the limited
16 information that we have, he has to conclude the risk of
17 subsidence in this area is high. That there will be
18 subsidence problems with the new Brook Mine, just as there
19 were with the old one.

20 And the other thing that has been left out of
21 this is as they blast to create their trench for these
22 purposes, what will those underground shock waves do to
23 those already and oftentimes nearby underground old
24 workings? Will they cause further subsidence and an
25 exacerbation of a problem that already exists in the old

1 workings?

2 So what we have for us -- before us in this
3 hearing are the issues of hydrology and the issues of
4 subsidence and geology are obscured from us. They're in a
5 black bag. Black velvet bag. Now, they're obscured from
6 us only because Brook has not tended to the necessary
7 studies. We can. Just additional studies need to be done,
8 and that is hydrology studies and geology studies to
9 quantify what is in the bag.

10 If we know what is in the bag, if we unveil it,
11 then we -- we can know what the risks are to the hydrology.
12 We can know what the risks are to the geology. And then we
13 can engage in a reasoned assessment of is it worth the
14 risk? Is the risk too high? Is the damage that may occur
15 so permanent that it cannot be fixed? Or is the answer
16 that the risks are acceptable and that the likely
17 ramifications can be remedied.

18 These are things that we need to find out. And
19 we can then make these reasoned decisions about fully and
20 scientifically assessing the risks and understanding them.
21 And like -- and scientifically predicting the likely
22 problems and consequences, deciding if it's worth the risk
23 and determining what the cost to fix anything that is
24 broken or harmed in the process might be, thereby setting
25 the bonds. Thereby setting the bonds.

1 But what Brook asks you to do is turn the
2 Environmental Quality Act on its head, to say trust us.
3 The stuff that's in the black box, this ancient artifact
4 that's in the black bag. Don't worry. It's not fragile.
5 We can drive our mining equipment through it. We can hit
6 it with our picks and hammers. And don't worry. If we
7 break it, we can fix it.

8 And as you're going to hear from folks, both the
9 subsidence and the water folks, some it can't be fixed.
10 There are consequences that cannot be fixed. To use
11 Mr. Pope's example. This is as if the person shows at the
12 driver's license bureau and says, "I don't need to take
13 that vision test. I see just fine. Look. Two fingers."
14 And we put them on the road. Don't worry. There's cops on
15 the road. Don't worry. I have insurance so all this can
16 be fixed later. There are some consequences of accidents
17 which cannot be fixed.

18 At the end of this, we will ask you to send this
19 back for more study to find that these things that were in
20 this bag, that they be studied and reviewed. It can be
21 done, and it needs to be done in relation to this very
22 special place. Thank you.

23 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

24 Do you need a break? Okay.

25 So now we'll begin with the evidence. We will

1 have the DEQ go first. A lot of the evidence that you
2 present, I imagine, will be of value to all parties, so
3 definitely I'd like to have you go first.

4 And so, Mr. Kuhlmann, would you please call your
5 first witness.

6 MR. KUHLMANN: Thank you, Mr. Chairman.

7 If we could just have two minutes just to get
8 everything organized.

9 CHAIRMAN BAGLEY: You may have two minutes.

10 Let's make that five minutes. Anyone who needs a
11 bio break, please take that too.

12 (Hearing proceedings recessed

13 3:48 a.m. to 3:57 p.m.)

14 CHAIRMAN BAGLEY: Okay. We are back at it.

15 So, Mr. Kuhlmann, please proceed.

16 MR. KUHLMANN: Thank you, Mr. Chairman.

17 The Department would call its first witness,
18 Mr. Bj Kristiansen, who is sitting up here for us already.

19 Mr. Kristiansen --

20 THE REPORTER: I'll swear him in.

21 (Witness sworn.)

22 BJARNE KRISTIANSEN,

23 called for examination by DEQ, being first duly sworn,
24 testified as follows:

25 DIRECT EXAMINATION

1 Q. (BY MR. KUHLMANN) Please state your full name
2 for the record.

3 A. My name is Bjarne Kristiansen, also known as Bj.

4 Q. What is your current job?

5 A. Currently, I work for the Land Quality Division
6 of the Wyoming Department of Environmental Quality. I am
7 a geologist. I work as such, as well as the assistant
8 district supervisor for District 3 here in Sheridan.

9 Q. What are your general duties in your current
10 position?

11 A. General duties in my current position is to
12 oversee geology, hydrology and some of the other aspects
13 of mining and permit details that are worked on in areas
14 that are not quite as related to coal as I was used to
15 back earlier when I first joined DEQ. A lot of these
16 areas we have some information that has to be pulled
17 together for permits. I pull a lot of this information
18 together primarily and then take this information and
19 utilize it on a permit-making process.

20 Q. What's your educational background?

21 A. I have a bachelor's degree in geology and
22 history.

23 Q. And you mentioned work prior to coming to DEQ.
24 Can you tell us about that?

25 A. Indeed. When I graduated from college, I went

1 to work for a company called Peter Kiewit & Sons. I
2 worked for the Kiewit company for 25 years as a geologist,
3 as an exploration geologist. Spent 15 years on drilling
4 rigs exploring the western United States in most of the
5 coal producing areas. And I also worked for 10 years in a
6 coal mine as both a geologist and as a support specialist
7 for determining some of the pit just -- different pit
8 justifications, alignments, and also worked as a surveyor
9 and some other jobs that were put together. We were
10 people with many hats in those days.

11 Q. About how long have you worked in the mining
12 industry?

13 A. About 35 years.

14 Q. Are you a licensed geologist in Wyoming?

15 A. I am. I'm a professional geologist, certified
16 by State of Wyoming.

17 Q. As part of your job at the department, do you
18 review mine permit applications?

19 A. I do.

20 Q. Do you review coal mine permit applications?

21 A. I do.

22 Q. How about other types of mines?

23 A. Also other kinds of mines.

24 Q. Can you tell us a little bit about it?

25 A. Other kinds of mines, primarily uranium in this

1 day and age. We also review smaller mines. Gravel
2 operations, scoria pits, all those smaller mines that are
3 mom-and-pop kind of organizations and still have to, you
4 know, live with their rules and regulations, but we also
5 review those pretty heavily.

6 Q. About how many applications related to coal
7 mines have you reviewed?

8 A. That would be 10 to 12 over the last three and a
9 half, four years.

10 Q. And how long have you been with the Department?

11 A. I've been with the department since May 20,
12 2013.

13 Q. About how often do you work on permit
14 applications related to coal mines?

15 A. Pretty frequently. We have a lot of
16 applications from coal mines for various and sundry
17 reasons. There may be amendments being put in or major
18 plannings that have taken place that have to have in-depth
19 detail, in-depth analysis performed. So I work to help
20 some of the permit coordinators fulfill the goal of
21 checking out the geology, the hydrology, how everything
22 works together for two, three or four a year, depending
23 how much the workload is.

24 Q. Okay. Can you describe some of the types of
25 permit applications related to coal mines you've worked

1 on?

2 A. Some of the amendments and other types, you
3 mean? Major influences or --

4 Q. What kinds of applications are there that you've
5 reviewed?

6 A. That I've reviewed? Straightforward permit
7 applications, amendments to coal mines, major revisions to
8 coal mines, minor revisions to coal mines, annual reports,
9 for those.

10 Q. Do those follow a similar process?

11 A. They do. They all follow the same basic
12 process.

13 Q. Do those acquire public input?

14 A. They do at one point.

15 Q. Okay. Can you briefly describe the application
16 review process DEQ goes through.

17 A. Certainly. Part of the application review
18 process starts prior to receiving the application. In
19 many cases we will get the operator, assist them in cases
20 if they need to do some exploration work. Many times
21 they will be granted what's known as a coal notification,
22 or a CN, so they can do exploration drilling and
23 exploration coring for coal mines or other kinds of mines.
24 And in these notifications, they're allowed to utilize
25 their resources to determine where the coal is at, what

1 will happen with the coal, how weather dries the coal, and
2 you put together a lot of the information they'll need for
3 their baseline. At about the point in time they have
4 sufficient baseline, determined by our in-house experts,
5 they will then send us a permit application. When we
6 receive that application, we check for completeness, how
7 complete is this, as related to the statutes, rules and
8 regulations.

9 And so we go over the entire permit application,
10 every bit and piece of that permit application, to
11 determine whether it is complete or not based on the legal
12 ramifications in the necessities imbued by the rules and
13 regulations and the statutes.

14 Q. What is the Department checking for when it
15 reviews completeness of an application?

16 A. There are sections to a permit application that
17 are defined by law. And what we're looking for is every
18 one of those sections in place; do we have Volume I, the
19 adjudication; do we have Volume II, further adjudication
20 or other things; do we have Volumes IV, V, VI, VII,
21 depending upon what they may consist of, we have to make
22 sure they're all there and all available for researchers.

23 And so we ensure that every one of those
24 documents -- and the parts of those documents -- each
25 document isn't just a single whole. They're composed of

1 series of parts of documents that address different bits
2 and pieces of the statutes, the rules and the regulations.
3 And so what we have to do is go through these individual
4 books, determine whether or not the materials in there are
5 available and present, as they need to be, and then
6 determine the completeness based on that.

7 Q. After the Department has determined an
8 application is complete, what happens next?

9 A. We send the mining company a notification that
10 we have deemed their application complete and have gone
11 into the review process. The review process is 150 days
12 long, by statute. And we analyze the entire document from
13 front to back cover and determine how technically accurate
14 this can possibly be. Are some of the completeness -- in
15 other words, some of the completeness items as technically
16 accurate as they need to be or do they need to be beefed
17 up with some further work or research.

18 Q. Does the Department communicate its thoughts
19 about the technical completeness to the operator?

20 A. Yes, we do.

21 Q. How does it do that?

22 A. Okay. We put together comments in a series of
23 comments to all of our experts that we utilize and send
24 those comments after the first round to the operator for
25 his diagnosis, trying to answer the different comments

1 that are brought up, attempt to create data, if no data
2 existed in a particular area, find it, examine it, using
3 it when needed, be sure all the bits and pieces that I
4 talked about in the application need to be put together
5 based on our commentary now. So they now have a different
6 sense of direction or different way of looking at the
7 permit based on what we told them they have to look at.

8 These would all be considered pieces of
9 information that need clarification, correction,
10 modification in one way, shape or form.

11 Q. How many rounds of comments and responses are
12 there in the permit review process?

13 A. That varies from permit to permit. This
14 particular permit had six rounds of comments and
15 responses.

16 Q. Okay. When do the rounds of comments and
17 responses end?

18 A. When we finally deem the permit to be
19 technically accurate.

20 Q. Okay. What is meant by "technically accurate,"
21 as you mentioned?

22 A. After we examine the entire document and find
23 there are no longer any issues existing as compared to
24 the -- what the statutes and rules and regulations
25 require, we make sure that the document fits into those

1 categories, that it does have a life, it can be utilized
2 during the life of the mine, that it has information in it
3 that can be utilized during life of mine, at least, based
4 on what the mine plan and reclamation plan say today.

5 Q. What happens after the Department determines
6 that an application is technically accurate?

7 A. It then goes to -- a notification goes to the
8 local publications, such as the newspaper in a town of the
9 area where the permit is going to be applied. It goes in
10 four weeks -- or I should say four different publications
11 periods a week apart. Then there's 30 days after the last
12 publication for the public comment period to continue.

13 So public -- the public can comment on this from
14 the first day it goes into publication until 30 days after
15 the last publication. For all intents and purposes, they
16 have, oh, approximately seven weeks to do this.

17 Q. Is that the normal time when the public's input
18 can be provided?

19 A. It is. It's defined by statute.

20 Q. Okay. Does DEQ just have one person reviewing
21 the application?

22 A. No. We utilize many of our in-house experts to
23 review the permit applications.

24 Q. How many different experts, like DEQ, do you use
25 to evaluate a permit application?

1 A. On this particular permit, we used 11 in-house
2 experts and four out-of-house experts, others that are not
3 LQD.

4 Q. Is there a person who keeps track of the review
5 process on DEQ's end?

6 A. Yes, there is. That would be the permit
7 coordinator.

8 Q. Can you describe the role of the permit
9 coordinator?

10 A. Permit coordinator is -- primary responsibility
11 is to ensure that all the responses, the comments that are
12 taking place, finds a central place to be housed. What
13 the permit coordinator has to do is take disparate pieces
14 of information that are being returned by the experts in
15 the field, whether it be vegetation or wildlife, geology
16 or hydrology, and bring them all together in one single
17 place that they can be then inserted into the mine plan
18 and rec plan, as well as the appendices that lead into
19 those things.

20 So, essentially, it's a -- it's a coordinating
21 position. We bring all the information together in one
22 spot, put it all together, make sure it flows, to make
23 sure it follows the statutes and rules and regulations,
24 and then put it in the document when it's time.

25 Q. Does the permit coordinator's role end after the

1 application process?

2 A. No, it doesn't. Permit coordinator stays with
3 that permit for as long a period of time as necessary --
4 deemed by LQD to be necessary.

5 Q. Okay. Have you been a -- served as a permit
6 coordinator?

7 A. I have.

8 Q. How often?

9 A. I have served as permit coordinate for this
10 particular property for four years.

11 Q. Have you been permit coordinator for any other
12 permits?

13 A. I have. I also was the permit coordinator -- or
14 was the permit coordinator for Wyodak Mine and Dry Fork
15 Mine, as well as the rare elements prospect that was over
16 near Sundance.

17 Q. Is the Wyodak Mine another coal mine?

18 A. It is.

19 Q. You mentioned that you've been permit
20 coordinator for this permit. By that you mean the Brook
21 Mine permit application?

22 A. Absolutely. Yes.

23 Q. And how long have you been the permit
24 coordinator?

25 A. For four years.

1 Q. When did you -- what stage in the application
2 process did you get involved with the Brook Mine as permit
3 coordinator?

4 A. I got involved very close to the beginning, when
5 they were operating underneath the CN. When they were
6 doing early preliminary exploration work and during their
7 attempt to set up their water monitoring systems,
8 determine where most of the holes needed to be drilled to
9 tell them the information they needed. By and large I got
10 involved in the last two-thirds of the exploration
11 program.

12 Q. Can you briefly describe the proposed Brook
13 Mine.

14 A. The Brook Mine's about eight miles north of
15 here, just north of the interstate, in an area that is
16 immediately adjacent to the Tongue River and some of the
17 other state highways, as well as the interstate, like I
18 mentioned before. It consists of rock units that are
19 varying ages. Predominantly about 50 million years old.
20 And these rocks were deposited in a swamp 50 million years
21 ago. And these deposits in swamp that were laying in
22 place for many, many millions of years began to get
23 coalified. And over time these deposits become much more
24 coalified and much more -- much better quality coal than
25 may be seen in the past.

1 On top of those, we get a lot of sequences of
2 sands and shales and clays that get washed into the coal
3 swamp during periods of flooding. And so what you'll have
4 is a very thick coal sequence that exists in the sequences
5 of sandstone and shale above it, whenever the environment
6 gets higher energy, such as during flood periods.

7 These rock units are exposed, an outcrop north
8 of town, about eight miles north of town in the Brook Mine
9 permit area. And they have been studied by Brook Mine and
10 determined what they need to do for their mining
11 applications.

12 Q. How big is a proposed mine?

13 A. About 4550 acres.

14 Q. What mining methods are proposed for the mine?

15 A. Currently, it's going to be highwall mine. By
16 and large, about 95 percent of the mine. It's a very
17 small area they're going treat as a surface mine because
18 there's some remnant coal up there they can access from
19 the surface in a small area they can get started in. But
20 it will be predominantly a highwall mine.

21 Q. Can you briefly describe what you mean by a
22 highwall mine?

23 A. Highwall mine is where you have to develop a
24 highwall, obviously, to approach with a highwall miner.
25 What you generally do is you'll take trench, a box cut, as

1 we used to call those. Remove all the overburden from the
2 box cut. Obviously mine the coal out of the box cut, and
3 then bring a highwall mining unit down into the bottom of
4 the pit. You then insert a series of drifts with a
5 highwall miner into the coal, follow the coal in. In this
6 case, about 2,000 feet each time. On different segments,
7 as you push your way down into the coal-bed, you also
8 leave bits and pieces between the coal extension, between
9 the drifts. So we have solidity and solid structure in
10 that mined area. So we have to prevent subsidence at the
11 same time we're mining.

12 Q. What's the predicted life of the Brook Mine?

13 A. Right now, 12 to 13 years.

14 Q. Who's the operator? Or who's -- who's the
15 applicant?

16 A. The Brook Mine is the applicant. Brook Mining
17 Company.

18 Q. Can you give us a brief description of the
19 timeline of DEQ's work on the permit application?

20 A. Oh, like I said, I began with this during
21 exploration phase in May 2013, the exploration continued
22 throughout 2013 and most of 2014. They were gathering the
23 information of the rock units. Like I said, putting in
24 monitor wells, observation wells, putting together their
25 plan of attack to determine how they're going to mine this

1 coal should that time ever come.

2 Approximately end of October 2014, they
3 submitted the mine permit application, which we found
4 complete on November 3, 2014, and began the first round of
5 analysis of that particular permit application. And then
6 we began to move through our processes, went through the
7 first 150 days. Comments were sent to the mine -- the
8 mining company, and those comments were treated and sent
9 back with their responses.

10 We again reviewed the mining permit application.
11 Those new responses now in place. When back to the
12 process of determining what we needed to require, once,
13 again, did they meet certain conditions in this place we
14 asked them to? Did they solve some of the issues we saw
15 over in this area? Did they take care of all the comments
16 we sent to them in a way that was statutorily and rule and
17 regulation compliant? This period take -- or took
18 approximately a year and a half.

19 Q. You mentioned that there were six rounds of
20 comments in the technical review.

21 A. Yes.

22 Q. When did the Department determine that the
23 application was technically adequate?

24 A. We determined in early December that the permit
25 was technically adequate. December of 2016.

1 Q. When was it published for public comment?

2 A. The first public comment period opened for
3 publication I think it was December 7th that year.

4 Q. Who were the folks at DEQ who worked on
5 reviewing the application?

6 A. Specific individuals you want?

7 Q. Uh-huh.

8 A. Okay. We have Mr. Doug Emme that worked with me
9 on the blasting part, the blasting component of the mine
10 plan, as well as bonding. Doug is our primary bond
11 analyst, as well as our primary blasting analyst. He is a
12 world-renowned expert in this, so I will defer a lot of
13 the blasting comments to him later.

14 We had Ms. Stacy Page, who is no longer with us,
15 that evaluated the vegetation. We had myself. I did the
16 geology and some of the hydrogeology. Some of the other
17 hydrogeology was done by Mr. Muthu Kuchanur and Matt
18 Kunze, who will be testifying later. We had a series of
19 individuals that we asked for assessment of the mine
20 permit application outside of the DEQ. We asked Game &
21 Fish to be our wildlife specialist to examine the wildlife
22 session. Also Fish & Wildlife Service, also to exam the
23 wildlife section. We asked the Army Corps of Engineers to
24 look at our wetland section to determine how robust it was
25 and whether it was meeting the various and sundry

1 requirements under federal law. Let's see. Who else do
2 we have? Drawing a blank right now.

3 Q. How are particular folks picked to review
4 particular parts of the application?

5 A. Primarily based on their expertise. We've been
6 hiring people in individual areas of expertise. When I
7 was hired, for example, it was for exploration and
8 prospecting, as well as mining related to geology.
9 Others, such as Doug Emme, as I talked about, had been a
10 blaster and a blasting foreman at a mine in Montana.

11 Obviously, the outside commenters we had, Game &
12 Fish and the others, are experts in their own rights. We
13 tend to hire individuals that have expertise in these
14 different disparate areas. So we have an expert in
15 vegetation. We have an expert in some of the other
16 aspects. We have engineers that are taking looks at some
17 of the mining plan sequences. We have a sequence of
18 individuals that look at this in their area of expertise
19 and then draw conclusions from that particular area.

20 Q. Who oversaw the decisions made on the Brook
21 Mining application?

22 A. There was a group of individuals. I primarily
23 oversaw most of the decisions that were involved with
24 minor issues that were in the permit application. Some
25 other issues that I'm an expert at fit the mining permit

1 application. Occasionally, we did have to ask for other
2 people's input. For example, sometimes it exceeded my pay
3 grade. It would go higher than me in the DEQ chain of
4 command, where we needed some additional decision makers
5 to give us approval for some things we weren't quite sure
6 on. So in some instances we utilized folks in Cheyenne to
7 give us the information we needed on a -- a higher level
8 than we were able to dictate ourselves.

9 Q. Who oversaw the permit application in Cheyenne?

10 A. That would be Mr. Alan Edwards, who was the
11 deputy director of the Department of Environmental Quality
12 and worked as the LQD administrator during the period of
13 time that we were utilizing him for this particular
14 permit.

15 Q. Is he the -- normally the Land Quality
16 administrator?

17 A. No, he is not.

18 Q. Who is that?

19 A. That would be Mr. Kyle Wendtland.

20 Q. Has he been involved with the Brook Mine permit
21 application decisions?

22 A. He has not.

23 Q. What other duties does Mr. Alan Edwards have
24 with the Department?

25 A. In addition to being the deputy director, he is

1 also the administrator of the Abandoned Mine Lands
2 Project -- or Abandoned Mine Lands -- just went blank --
3 Division.

4 Q. Looking back at the -- at the permit review for
5 this permit, what tools did DEQ use when it was evaluating
6 technical adequacy of the application?

7 A. Well, some of the principal tools that we
8 utilized were modeling systems that are commonly in place
9 for both the geology and hydrology aspects of this. And
10 there were other tools that are utilized in general in
11 mining practices, engineering principles that were
12 utilized, formulas and different kinds of results that
13 come out of those formulas and how efficient is the rock
14 units that bear weight, for example. What kind of
15 materials exist above and below the coal. So we utilized
16 a lot of mathematics and some modeling software that's
17 been recognized industrially and nationally as what we
18 consider to be world-class software. Things like MODFLOW
19 for hydrology that the USGS utilizes, other types of
20 modelers that EPA utilizes in a lot of their work. Models
21 we use and applications we use are all approved by --
22 generally, by large governmental agencies or private
23 agencies that utilize this in their day-to-day work. So
24 they've been agreed upon by many individuals in all
25 aspects of mining and engineering and geology.

1 Q. Did the Department look at statutes in reviewing
2 the Brook Mine application?

3 A. We did. Absolutely.

4 Q. Did the Department look at regulations?

5 A. We did.

6 Q. Generally, what regulations did the Department
7 review for this application?

8 A. A lot of regulations come out of our coal
9 Chapter 2. There was a lot of definition in there as to
10 different pieces of information we need to put together a
11 mine permit. We also utilized Statute 35-11-406 in
12 entirety because it presents in a statutory manner all
13 bits and pieces of information that must be in coal mine
14 application. That is probably the ground base regulation
15 that we primarily fall back on.

16 There are also other chapters that we utilized
17 bits and pieces of them. For example, we utilized Chapter
18 7, Section 2, Subsidence. And we utilized some other
19 chapters as they related to this particular permit
20 application.

21 Q. Did the Department look at any Land Quality
22 Division guidelines?

23 A. We did. We looked at several guidelines. We
24 have a large number of guidelines that cover a lot of
25 different aspects of mining. We utilized these, for

1 example, for hydrology. There's a guideline for
2 hydrology. There are other guidelines for vegetation,
3 guidelines for wildlife, guidelines for anything you can
4 possibly think of to put in the permit application to get
5 a viable stand-up permit application. So guidelines
6 utilize strongly -- we suggest them strongly and utilize
7 them strongly in this process.

8 Q. Are the guidelines -- are the guidelines binding
9 law?

10 A. No, they're not.

11 Q. Are they the measure by which the Department
12 determines if an application is technically adequate?

13 A. No, they're not.

14 Q. You mentioned earlier we talked about the rounds
15 of comments in the technical review process. I'd like you
16 to take the binder next to you that's got tabs inside of
17 it and turn to the tab for DEQ Exhibit 34.

18 A. Okay.

19 Q. Do you know what this document is?

20 A. This is the Index of Change to the actual permit
21 application throughout its rounds of commentary and
22 response.

23 Q. Okay. How many rounds of comments did this
24 document show comments and responses of?

25 A. Six rounds of comments and responses.

1 Q. All right. What -- just kind of generally, what
2 kinds of issues did the comments address?

3 A. There were groundwater issues that showed up.
4 Not so much groundwater issues, but difficulties sometimes
5 finding enough water to get water wells to work
6 efficiently. There were instances of, for example,
7 geologic, lithologic logs that were put into place that
8 appeared to have, in some cases, difficult descriptions of
9 particular materials that were in place. And the
10 descriptors were, in some cases, too short. We asked for
11 larger, longer descriptors so we can determine what
12 material was exactly -- the best we could down there.

13 The other -- for example, we were looking into
14 descriptors of some of the streambeds in that particular
15 area, some of the draws existed there. We wanted them to
16 flesh out some of the descriptions on a lot of draws on
17 there, give us a better sense and idea what they consisted
18 of.

19 Q. Did the comments in Exhibit 34, did those
20 require changes to the application?

21 A. These comments? These were the comments that
22 came in and produced the changes in the application. I
23 know the changes were catalogued right here inside this.

24 Q. Did the applicant -- did the applicant's
25 responses to DEQ's comments satisfy all DEQ's comments?

1 A. Ultimately they did, yes.

2 Q. At the end of the technical review, did Brook
3 Mine's application meet the statutory and regulatory
4 requirements for surface coal mine and permit application?

5 A. Would you rephrase that?

6 Q. After the applicant satisfied DEQ's technical
7 comments, did the application -- the application meet
8 statutory and regulatory requirements?

9 A. It did. That's why it was deemed technically
10 adequate.

11 Q. I'll have you start taking a look at the
12 contents of the application. If I can have you go ahead
13 and put away Exhibit 34. Let's take a look at Exhibit DEQ
14 1.

15 A. Okay.

16 Q. And can you tell me what that document is?

17 A. This is what's called the adjudication volume.
18 The adjudication volume is the area where we began to put
19 together the information on all different legal aspects of
20 ownership, legal aspects of water rights, all legal
21 aspects of right of ways, all the different legal parts of
22 this permit application are put together in this
23 adjudication section. So we can define who is with who,
24 what are the different bits and pieces of utilization of
25 these lands that may be related to some kind of statutes,

1 what is county, what is state, what is federal. It all
2 gets put together here in this one particular document.
3 So all the legal descriptions and all the legal
4 relationships are in here.

5 Q. Are there other parts of the application?

6 A. Yes, there are. There are further parts.

7 Q. About how many different volumes such as that
8 are there in the application?

9 A. In this case there are 12 volumes.

10 Q. All right. I'll have you turn to page -- Bates
11 numbered on the corner -- DEQ 1-002.

12 MR. KUHLMANN: And I'll note for the
13 council's purposes, to jump to the pages, the Bates number
14 for DEQ corresponds with PDF number, so you can just type
15 in the page number.

16 Q. (BY MR. KUHLMANN) Can you tell me what this
17 page is?

18 A. This is an Index of Change sheet.

19 Q. What does that show?

20 A. It shows changes to the adjudication by itself.
21 And so what it does is it puts in the entry that needs to
22 be removed or the part of the permit application that
23 needs to be removed, part of the application needs to be
24 replaced or augmented, and then description of the change
25 itself is...

1 Q. Okay. Is that the -- changes alleged, is that
2 updated over time?

3 A. It is.

4 Q. I'll have you turn to page DEQ 1-044. Can you
5 tell me what this page is?

6 A. This is the table of contents for all the
7 volumes of permit application.

8 Q. Okay. Can you describe generally how the
9 permit -- how a permit application like this is organized?

10 A. It is organized in kind of an outline manner.
11 Very first volume, as I mentioned, deals with the
12 adjudication, legal aspects of the permit application area
13 and the aspects of the interrelationships in that
14 particular area.

15 The second volume in this particular case was a
16 volume for the maps. The adjudication can produce a lot
17 of maps, ownership maps, right-of-way maps, that kind of
18 thing. And so the second adjudication volume is simply
19 all the maps that related to the narrative in the first
20 volume.

21 This is the -- excuse me, the third volume in
22 this -- in this case is -- consists of four different
23 areas. The first appendix is based -- bases itself on use
24 of the land. Ever since -- anybody knows all the way
25 through written history to the present.

1 The second one is primarily the history of the
2 area. So not just the use of the land, but who was there
3 and what were they doing at the time, throughout the
4 entire period of time.

5 The third one is archaeological resources,
6 cultural resources and paleontological resources, if they
7 exist or not exist.

8 Number four is climatology. So Appendix D4 in
9 that third volume dictates what the climate has been like
10 over the measurable period of time whenever that happened
11 to be.

12 The fourth volume, Appendix D5, the topography,
13 the geology, the overburden materials that exist in the
14 area, and define all the rock characteristics and rock --
15 hydraulic characteristics in the area.

16 Volume V defines the hydrology itself, how the
17 water is working in those aquifers, in those units that
18 have water in them, what is it doing, what is the water
19 quality like, what can we expect throughout my life and
20 afterwards.

21 The Volume VI, which is the Appendix D7, is the
22 resources -- soil resources that have been evaluated by
23 our soil scientist who is an expert in soils.

24 The Volume VIII -- excuse me, Volume VII is the
25 vegetation inventory. That is, our expert vegetation

1 analyst has covered all of the possible vegetation
2 communities in the area of the permit application and
3 outside the permit application.

4 Volume VIII is Appendix D9, which is the
5 wildlife. Again, I said the Game & Fish did this
6 section -- or I should say commented on the section.
7 Brook did the section. Game & Fish commented on it.
8 Critiqued it.

9 Volume IX is Appendix D10, which is the wetlands
10 that the Army Corps of Engineers reviewed for us.

11 Tenth volume, Appendix D11 is on alluvial valley
12 floors.

13 Volume XI and XII are the mine plan and
14 reclamation plan. The appendices actually are the
15 baseline data. All those different appendices in the
16 different areas are baseline data for the mine plan and
17 recollection. So everything is pointing towards the mine
18 plan and reclamation plan.

19 Q. You mentioned a number of appendices labeled D
20 and then a number following it. Are there other
21 appendices as well?

22 A. There are also appendices within the
23 adjudication volume, A, B C and E. It's the D appendices
24 that are pretty voluminous.

25 Q. I'll have you turn to page DEQ 1-050.

1 A. Okay.

2 Q. Can you tell me what this page is?

3 A. This is a Form 1 that is a Land Quality Division
4 form to fill out the basic information of the individuals
5 or individual that desires a coal mining permit. So all
6 the -- all the different pieces of information as far as
7 address, individuals that are responsible for things,
8 different bits and pieces of information that relate
9 directly to the mining are captured in this particular
10 document. This document is almost twofold in a way. They
11 begin the mining permit application with the document
12 filled in and primarily the first page, and there are
13 other aspects of this particular form that show up after
14 the review process has taken place. So the Form 1, when
15 it is finally completed and accepted by Land Quality
16 Division is the unit that they utilize for the legal right
17 to mine.

18 Q. You can turn to page DEQ 1-053.

19 A. Okay.

20 Q. What is the main purpose of this page?

21 A. This page is to add conditions on that may have
22 been -- may have shown up in a review of mining
23 application. These are items that may or may not be a
24 complex nature or a simple nature, depending upon what it
25 is, that needs to be ensured that it will be in this

1 permit and that these activities will occur
2 unquestionably. And this particular area here, then we
3 can put these very special conditions to point where we
4 want the miners to work. We want you to be careful of the
5 alluvial valley floors. We want you to be careful of some
6 of the overburden materials. What we'll do in these
7 particular conditions is outline exactly how LQD wants to
8 see it. It's enforceable. We enforce on that. So,
9 therefore, whatever we have in here, conditions must be
10 withheld and -- excuse me, upheld and practiced by the
11 company themselves.

12 Q. And turn now to DEQ page 1-066.

13 A. Okay.

14 Q. Can you tell me what this part of the
15 adjudication file is?

16 A. This is an estimate of the surface damage bond
17 for Big Horn Coal -- Big Horn Coal Company's surface
18 ownership area.

19 Q. Who created that document?

20 A. The document was created by Western Water
21 Consulting Engineering.

22 Q. Who do they work for?

23 A. They are working for Brook Mine.

24 Q. Has DEQ set a surface protection bond for Big
25 Horn Coal Company's property yet?

1 A. We have not.

2 Q. Will it do so?

3 A. We will.

4 Q. When?

5 A. Upon all of the -- the proceedings you find in
6 our original letter of technical adequacy was indeed
7 correct and straightforward and that the public review
8 process had been continued to the time it needed to be
9 continued and everything right before the director decides
10 to sign the permit into law -- or into -- excuse me, into
11 use. At that point in time the bond must be produced by
12 Brook Mine prior to the issuance of the permit.

13 Q. Thank you.

14 Can you turn now to DEQ 1-102.

15 A. Okay.

16 Q. And what is this section of the adjudication
17 file?

18 A. This is also a surface damage bond. Mine
19 surface damage bond for Padlock Ranch.

20 Q. Who created that document?

21 A. Western Water Consultants.

22 Q. Does DEQ need to require a surface protection
23 bond for Padlock Ranch's lands?

24 A. We do not have to have a mine surface damage
25 bond.

1 Q. Why is that?

2 A. There is, to the best of our knowledge, a
3 surface use agreement in place now between Brook Mine and
4 Padlock Ranch.

5 Q. Have you turn now to DEQ 1-232.

6 A. I'm there.

7 Q. Can you tell me what part of the adjudication
8 file this is?

9 A. Yeah, the -- this is Appendix A in the
10 adjudication volume. It has things like the names and
11 addresses of the surface and mineral rights holders, all
12 the maps that are related to the surface and mineral
13 rights holders as well. And also, if it existed, it would
14 be oil and gas leases within the area. There are no oil
15 and gas leases within the permit area, so they were not
16 listed.

17 Q. Are there any maps that reflect the information
18 Appendix A?

19 A. There are.

20 Q. Where are those located in the permit
21 application?

22 A. They are located in Volume I-A, excuse me, which
23 is called Volume II in this particular set of -- so I
24 can't --

25 Q. I won't ask you to go to that just yet.

1 A. Okay.

2 Q. Can you turn now to DEQ 1-264. Still in Exhibit
3 DEQ 1.

4 A. 264. Okay.

5 Q. Please tell me what this part of the
6 adjudication file is.

7 A. This is the names and addresses of -- again, of
8 surface rights and mineral rights within half mile of the
9 permit boundary. The first one was within permit
10 boundary, and these were all those people within half mile
11 of the permit boundary.

12 Q. Is there a map that also reflects this
13 information?

14 A. Yes, there is.

15 Q. Where is that map located?

16 A. It would be in this volume right here.

17 Q. What volume number is that?

18 A. That is Volume II in this book.

19 Q. Can you turn now to DEQ 1-372.

20 A. Okay.

21 Q. Can you tell me what this part of the permit
22 application is?

23 A. These are actually water rights within
24 three miles of the permit boundary -- within and in
25 three miles of the permit boundary.

1 Q. I'll have you turn now to DEQ 1-447.

2 A. Okay.

3 Q. Can you tell me what this part of the permit --
4 or the adjudication volume is?

5 A. This is Appendix C in the adjudication volume.
6 And this covers legal description of lands itself within
7 the permit application of the different survey plats that
8 were utilized in determining these lands, lands with --
9 sometimes within a different permit, as well as the permit
10 application that bond trying to do, different memorandums
11 of agreement between mineral owners and surface owners.
12 By and large, the actual land itself relationships of that
13 land to individuals or entities that are directly
14 responsible for it.

15 Q. Are there maps associated with this information
16 in Volume II?

17 A. There are.

18 Q. All right. Now I'll have you turn to DEQ 1-465.

19 A. Okay.

20 Q. And can you tell me what this part of the permit
21 application is?

22 A. This is the part of the application that
23 outlines the different surface rights that the Brook
24 Mine's been able to -- to acquire for right to mine --
25 consent for right to mine and right of entry.

1 Q. Okay. Can you turn to page DEQ 1-476.

2 A. Okay.

3 Q. Can you tell me what this document is?

4 A. This is a typical what we call the LQD Form 8.

5 And the form has two primary goals. One, of course, is to
6 list the lands involved in this landowner's consent. So
7 that lists the landowners with direct lands that are going
8 to be inside the permit boundary. And it states -- the
9 landowner states that he's examined the mine plan, the
10 reclamation plan and approves of them. And, secondly,
11 will give his or her consent to enter and inspect those
12 lands by the LQD.

13 Q. What landowner does this particular Form 8
14 relate to?

15 A. This one is for -- this would actually be for
16 Padlock. Mr. Hubert Patterson III, president and CEO of
17 Padlock Ranch.

18 Q. Can you turn now to DEQ 1-502. Can you tell me
19 what this document is?

20 A. This one is the -- I believe it's the order in
21 lieu of consent that Brook Mine received from this council
22 last year.

23 Q. When was this document put into the permit
24 application?

25 A. This was placed in the permit application on

1 November 23, 2016.

2 Q. Have you turn now to page DEQ 1-540.

3 A. Okay.

4 Q. Can you tell me what this part of the permit
5 application is?

6 A. This is a legal description of locations of
7 buildings within an adjacent -- within a half mile of the
8 permit area.

9 Q. What's the purpose of this section of the permit
10 application?

11 A. This is to categorize those pieces of
12 infrastructure that exist prior to any mining in the
13 permit area or close to the permit area.

14 Q. Have you turn now to DEQ 1-548.

15 A. Okay.

16 Q. Can you tell me what this document is?

17 A. This is a list of different permits and licenses
18 that Brook will have to have from various and sundry
19 agencies to do their mining operation.

20 Q. Does Brook Mine need to obtain all of these
21 types of permits or approvals listed on this page?

22 A. They may, but only the ones that LQD issues are
23 the ones we can actually enforce.

24 Q. So who would require the applicant to obtain
25 these types of permits?

1 A. The different agencies, reporting agencies
2 that -- these are associated with. For example, we have
3 Land Quality Division -- of course, us -- then we go into
4 Solid and Hazardous Waste Division, Water Quality, Air
5 Quality, MSHA license listing here. Also state mine
6 inspectors listed. An EATF is listed down there. And
7 Water Quality Division at the bottom.

8 Q. And if Brook -- if the applicant obtained any of
9 those permits, does the Land Quality Division enforce
10 those?

11 A. No, we don't. We don't enforce all those. Only
12 the ones that say Land Quality Division.

13 MR. KUHLMANN: All right. That's all the
14 questions I have for DEQ Exhibit 1. Since we haven't done
15 any stipulations at this point, I'd ask the council to
16 admit DEQ Exhibit 1.

17 CHAIRMAN BAGLEY: Are there any concerns?

18 MR. GILBERTZ: No objection.

19 MS. ANDERSON: No objection.

20 CHAIRMAN BAGLEY: Thank you. It's
21 admitted.

22 (DEQ Exhibit No. 1
23 received in evidence.)

24 MR. KUHLMANN: Thank you, Mr. Chairman.
25 I'd also ask DEQ Exhibit 34 be admitted.

1 CHAIRMAN BAGLEY: Any objections?

2 MS. BOOMGAARDEN: No objection.

3 MS. ANDERSON: No objection.

4 CHAIRMAN BAGLEY: We'll admit DEQ

5 Exhibit 34.

6 MR. KUHLMANN: Thank you.

7 (DEQ Exhibit No. 34

8 received in evidence.)

9 Q. (BY MR. KUHLMANN) Have you take a look now at
10 Exhibit DEQ 2. Can you tell me what this document is
11 first? Do you know what it is?

12 A. I am looking at it. This is the series of
13 comments, team responses to the permit application itself.
14 So these are all the documents that we generated in order
15 to come up with the technical adequacy classification.
16 These are the generated notes.

17 Q. And those documents relate to the particular
18 comments from the department process?

19 A. They do. They relate --

20 THE REPORTER: I'm sorry.

21 THE WITNESS: They relate to very specific
22 comments.

23 Q. (BY MR. KUHLMANN) Who created that document?

24 A. This document be created by -- the actual
25 authorship in letters is joint between me and

1 Mr. Jeff Barron of Western Water. But the document's
2 created by whole groups of individuals. The reviewer --
3 the first set of comments come back, the reviewers that
4 did the original work get to look at those comments, very
5 obviously, in the responses. And they may or may not have
6 further comments based on how well the original ones were
7 taken care of. And so what this represents is all the
8 different individuals we talked about earlier, the
9 experts, as well as the other ones who were involved in
10 the permitting application process and during the permit
11 application process.

12 Q. I'll ask you to go ahead and take a look now at
13 DEQ Exhibit 3.

14 A. Okay.

15 Q. Do you know what this document is?

16 A. This is the second part of the adjudication
17 volume that has the maps.

18 Q. Okay. I'm going to ask you to take a look at a
19 couple of those pages, and recognizing that they're
20 folded-up maps, as I have you pull them out and have you
21 answer some questions. Please don't worry about trying to
22 fold those back up entirely to put them away before I ask
23 you to take a look at the next map.

24 A. Okay.

25 Q. Can you please turn to page DEQ 3-008.

1 A. Okay.

2 Q. Can you tell me what this document is?

3 A. This is a depiction of the surface rights, the
4 different structures involved in and around the permit
5 boundary, more that may exist in there. There's some
6 different leases, conventional leaseholders, as well as
7 grazing leases. So this is all the surface information
8 necessary to determine who has what rights to the surface
9 in this area.

10 Q. Go ahead and please open that up.

11 For the council's benefit I'll ask, can you tell
12 me what the solid blue line indicates on that map?

13 A. The solid blue line is the Brook Mine
14 approximate -- oh, I should say permit boundary that's
15 being applied for in the permit application.

16 Q. Okay. Just tell us what the dashed blue line
17 indicates.

18 A. Dashed blue line is run one half mile off of
19 that permit boundary.

20 Q. Are those markings common to other maps inside
21 adjudication file?

22 A. They're similar.

23 Q. Go ahead and have you put that map aside for
24 now. That will do.

25 A. Good? Okay.

1 Q. Thank you.

2 Please turn to DEQ 3-011. Please tell me what
3 this document is.

4 A. Okay. These are lands that would be affected
5 by -- or have been affected by mining in the past, and
6 the -- showing the area of disturbance of the historical
7 mining, both underground as well as surface. And areas
8 within a half mile of permit boundary that have also
9 been -- historically been mined, either underground or
10 surface.

11 Q. There are a number of colored areas on this map.
12 Can you describe what the different colored areas
13 represent?

14 A. The brown areas that look like a -- in some
15 cases a linear feature along -- little sidebar features
16 are underground mines reflecting both the area of
17 underground mining, as well as sometimes gateways and
18 other aspects of underground mining. The -- should say
19 the blue on the upper right-hand corner and top of the map
20 are surface mined. They were mined previously by surface
21 mining operations. And the hatched area -- the purple
22 hatched area is the area Big Horn Coal has right now in
23 their permit -- in their permit.

24 Q. I believe there's an area colored in green. Can
25 you tell us what that is?

1 A. That green is a mine. It's a small mining
2 permit held by Taylor Quarry where they mine scoria and
3 sell the red rock for ballast and roads and everything
4 else. They're usually --

5 Q. Is that inside the Brook Mine permit area?

6 A. It is inside the Brook Mine permit area.

7 Q. Is the Big Horn Coal Company permit area inside
8 the Brook Mine permit area?

9 A. It is in places inside the Brook Mine permit
10 area.

11 Q. There's also an area I believe bordered in
12 orange in -- tell us what that area indicates.

13 A. This area is a pit. It's also a scoria pit.
14 Maintained and run by Tongue River Stone. It is an active
15 scoria pit at present. And a fairly small, fairly quiet
16 operation, but it does exist.

17 Q. Does the Tongue River Stone scoria pit fall
18 inside the Brook Mine permit area?

19 A. It does not.

20 Q. Ask you now to turn to DEQ 3-012. I won't ask
21 you to open up this map.

22 A. Okay. Well, thank you.

23 Q. Yeah. Are you familiar with all of the maps in
24 the --

25 A. I am, yes.

1 Q. -- permit application area?

2 A. I am.

3 Q. Can you tell us what this document is?

4 A. This is the -- all the water rights that occur
5 within the permit application boundary, as well as a half
6 mile outside of the permit application boundary.

7 Q. Can you turn to page DEQ 3-014.

8 A. Okay.

9 Q. And without opening that, can you tell me what
10 that document is?

11 A. This is the depiction of all the surface water
12 rights inside the proposed permit boundary, as well as
13 water rights within three miles of the outside of the
14 permit boundary.

15 Q. And is there a particular type of water rights
16 shown on that map?

17 A. I don't know. I'll have to open it.

18 Q. Okay. You can do that.

19 A. The primary type of water right generally is
20 a permit held by the State Engineer's Office. All the
21 water in the state of Wyoming is owned by the State of
22 Wyoming. In order to utilize that water, you've got
23 to file a permit for use of the water, estimating
24 how much you're going to use, how much water is
25 available, what the water quality's like in some cases,

1 not all.

2 Q. Does this map show surface or groundwater
3 rights?

4 A. In this case, this is surface water rights.

5 Q. Is there another map that shows the groundwater
6 rights in your permit area?

7 A. It is the next map.

8 Q. Okay.

9 A. Almost got it.

10 Q. And turning to page DEQ 1- -- I'm sorry --
11 DEQ 3-015. Can you tell me what that document is?

12 A. This is the groundwater rights inside and within
13 three miles of the permit boundary itself.

14 Q. Okay. Thank you.

15 MR. KUHLMANN: At this point, Mr. Chairman,
16 I think if we could have a short break. We have made
17 faster time than I thought we might, unless the council
18 is planning to recess here soon. We're coming up at
19 5:00?

20 CHAIRMAN BAGLEY: We won't be recessing for
21 the day yet, but we can take a five-minute break at this
22 time.

23 MS. ANDERSON: Were you going to admit 3?

24 MR. KUHLMANN: We'll ask that Exhibit 2 and
25 3 be admitted.

1 CHAIRMAN BAGLEY: Any objection?

2 MS. BOOMGAARDEN: No objection.

3 CHAIRMAN BAGLEY: Exhibits DEQ 2 and 3 are
4 admitted. So now we'll take a five-minute break.

5 (DEQ Exhibit Nos. 2 and 3
6 received in evidence.)

7 (Hearing proceedings recessed
8 5:01 p.m. to 5:12 p.m.)

9 CHAIRMAN BAGLEY: So we'll -- for those who
10 are looking at their watches and wondering if we'll ever
11 get to eat or anything like that, we're going to go -- it's
12 about 5:13. We'll go to no later than 6:15 tonight, then
13 we'll take a recess until morning.

14 Tomorrow morning we will start right at 9:00 a.m.
15 But if you need to get things set up, make sure you get
16 here before that. That's why we're starting at 9:00, so
17 there's time to get technology back up and everything in
18 place. And so we'll go for about another hour here. So,
19 please, Mr. Kuhlmann, continue.

20 MR. KUHLMANN: Thank you, Mr. Chairman.

21 For the benefit of council and for the parties,
22 we are intending to go through the remaining exhibits for
23 the permit application. We may also, depending upon how
24 far we can get, talk about Exhibit -- DEQ 15 and DEQ 16.
25 So DEQ Exhibits 1 through 13 and then 15 and 16, just in

1 case anyone has objections.

2 I also -- just to make it -- kind of short work
3 of it, DEQ Exhibits 1 through -- I guess, remaining ones, 4
4 through 13 are volumes of the permit application. I might
5 ask to just admit those now, if there are no objections.
6 If not, we can go through and establish --

7 CHAIRMAN BAGLEY: Any objections to
8 admitting those exhibits?

9 MS. ANDERSON: No objection.

10 MS. BOOMGAARDEN: No objection.

11 CHAIRMAN BAGLEY: We'll admit DEQ Exhibits
12 4 through 13.

13 (DEQ Exhibit Nos. 4-13 and
14 15 and 16 received in evidence.)

15 MR. KUHLMANN: Thank you, Mr. Chairman.

16 Q. (BY CHAIRMAN BAGLEY) Mr. Kristiansen, can you
17 please take a look at DEQ Exhibit 4.

18 A. I have it.

19 Q. All right. Can you please turn to DEQ 4-005.

20 A. I'm at it.

21 Q. Can you tell me what this part of the permit
22 application is?

23 A. This part of the permit application is Appendix
24 D1, one of the many appendices involved within D appendix
25 classification. And it is an appendix about land use.

1 Q. What's the purpose of this appendix?

2 A. To determine what different uses exist for the
3 land, as it existed, as exists today, and should exist in
4 the future.

5 Q. What kinds of uses does it -- does this appendix
6 discuss?

7 A. This discusses past land uses. For example,
8 it's grazing land, some -- in some cases there's
9 industrial, commercial development in some areas.
10 Actually, more in the past than there is now. And it's
11 also recreational land in some areas. Some of it's
12 residential land, where the landowner lives. So the land
13 use is -- covers quite a broad range of uses.

14 Q. I apologize. I believe you mentioned both past
15 and current uses?

16 A. Yes.

17 Q. Turning now to page 4-043. Can you tell me what
18 this part of the permit application is?

19 A. Not quite there.

20 Q. Sorry.

21 A. There we go.

22 Q. 4-043.

23 A. Yes. Appendix D2, history.

24 Q. What is the purpose of this appendix?

25 A. It outlines the history of the area. All the

1 history can be gleaned from the historical records,
2 anecdotal information, anyplace -- old publications
3 anyplace you can find history of the area, they have put
4 together -- paint a picture of the history of this
5 particular part of Sheridan County.

6 Q. Compared to other permit applications you
7 reviewed, how thorough is this appendix?

8 A. This is a very thorough appendix. A lot of
9 cases, history -- there's a lot of assumption based on
10 agricultural land, agricultural uses, particularly out in
11 the middle of the Powder River Basin where the mines are
12 very, very large and there are vast swaths of agricultural
13 land, you know, pastureland. It's been used for pasture
14 for generations.

15 The history of this area has a little bit more
16 activity taking place, and so some of these pieces of
17 information that are recorded here are of materials that I
18 didn't even know about in some cases.

19 Q. Turn now to page 4-066. And when you get there,
20 can you tell me what this part of the permit application
21 is?

22 A. This is Appendix D3 cultural and paleontological
23 resources.

24 Q. Is there anything unique about the Brook Mine
25 permit application as relates to Appendix D3 compared to

1 other applications you've reviewed?

2 A. This -- in this case, since it's all private
3 property and private coal rights, there are no cultural
4 and paleontological surveys that have been performed.

5 Q. Are cultural and paleontological surveys
6 required when there is surface -- private surface land,
7 private mineral owners?

8 A. They are not required when there's private
9 surface and private mineral owners.

10 Q. Did DEQ request comments from the State Historic
11 Preservation Office?

12 A. We did.

13 Q. When did that occur?

14 A. That would have been in November 2014. Late
15 November 2014.

16 Q. Okay. And what was provided to the State
17 Historic Preservation Office?

18 A. We gave them a letter that defined our reason
19 for contacting them, and where they could find the
20 information we were referring to. They can be found in
21 either our Sheridan or Cheyenne office. And gave them the
22 opportunity to go to those offices to look at the permit
23 application. Should they decide to do so. The Cheyenne
24 location was -- we felt was a good match because SHPO was
25 there in Cheyenne as well.

1 Q. What was their response to you?

2 A. We didn't have a response -- well, we did have a
3 response. It was this is private surface and private
4 mineral, we don't have any response -- comments.

5 Q. Does the permit application in other places
6 address what would happen if historic or archeological
7 resources are found during the mining operation?

8 A. Yes, it does. It's in the mine plan.

9 Q. And what are the commitments related to locating
10 historic or archeological resources during the mine?

11 A. In a nutshell, if any artifacts or objects are
12 discovered that would indicate cultural and
13 paleontological resources, mining would stop in that area.
14 The area would be essentially blocked off so no one could
15 get in there and do something to that particular area,
16 such as illegal collecting. And experts would be called
17 in to do a paleontological or archaeological clearance
18 survey in that area.

19 Q. Have you turn now to DEQ 4-077.

20 A. I'm there.

21 Q. Can you tell me what that part of the permit
22 application is?

23 A. This is Appendix D4, climatology. Covers the
24 climatological overview of this part of Sheridan County,
25 temperature, wind, evaporation, humidity, all the

1 different aspects of climate -- climatology that are
2 involved in that science are in this particular volume.
3 Also has historic climatological information from wind,
4 temperatures, rainfall also recorded in here.

5 Q. Thank you.

6 I'll have you close that volume. If you could
7 please turn to Exhibit DEQ 5. Can you tell us what this
8 exhibit is?

9 A. This is Appendix D5, geology and overburden.

10 Q. What's the purpose of Appendix D5?

11 A. D5 is to define all the geologic units I talked
12 about earlier to very great degrees so we can anticipate
13 what kind of mining practices may have to take place in
14 these areas. They may depict rock units that we have to
15 be -- pay special close attention to because they may be
16 soft rocks in an area that we may have to have harder rock
17 formations. They are bits and pieces of the topography.

18 For example, in those rock units above the coal
19 there can be constituents in there -- qualitywise
20 constituents that are unacceptable to be spoiled, for
21 example, into a groundwater zone. And so those parts of
22 overburden have to be special handled by the mining. They
23 would have to come in and move the dirt specially to place
24 it above the water table so that when that material goes
25 into the hole again, it stays above the water table and

1 below the root zone. There are special places to put that
2 material, and so the geology and overburden assessment
3 will help define where they have to go. One of the many
4 mines I worked at did this on a continual basis.

5 Q. Who reviewed Appendix D5?

6 A. I did.

7 Q. Can you briefly describe coal seams -- which
8 coal seams Brook Mine's proposing to mine?

9 A. Brook Mine's proposing to mine the Monarch coal
10 bed, the Carney coal bed and the Masters coal bed.

11 Q. Which of those coal seams would be mined with
12 the highwall mining technique?

13 A. That will be both the Carney and Masters beds.

14 Q. Does Appendix D5 include information about those
15 coal beds?

16 A. It does.

17 Q. Can you describe what the overburden is above
18 the coal beds?

19 A. What the nature of the overburden is?

20 Q. Right.

21 A. The overburden consists primarily of silts and
22 shales and sandstone -- interbed silts, shales and
23 sandstone. Blah. And these units above the coal are the
24 units that we have to be concerned with whether or not
25 their quality is suitable enough to place back in the

1 backfill. But by and large, these are deposits that were
2 deposited into a coal swamp during periods of high
3 velocity water. So you get very long, quiet period of
4 coal deposition taking place over thousands to hundreds of
5 thousands of years and Big Horn Mountains start getting
6 back up into the air again, kicking the weight up, and all
7 the material comes down off the mountains and washes out
8 across this big coal swamp and forms those burden units
9 above the coal.

10 Q. Are there any geologic hazards inside the permit
11 area?

12 A. There are several geologic hazards within the
13 area. Defined geologic hazards.

14 Q. What would you define a geologic hazard as?

15 A. Faulting. There's some faulting that takes
16 place within the mine. There is also -- there are always
17 geologic hazards of a highwall when you're mining in any
18 kind of open pit mine. There are also potential hazards
19 in locating pinch-out areas. For example, if you have
20 coal that may be pinching out into sandstone very quickly,
21 as happens in the eastern part of the Powder River Basin.
22 Your highwall conditions, you have to pay close attention
23 to those because the highwall starts getting unstable in
24 those areas.

25 None of those have been identified at Brook

1 Mine, as they have back in the other part of the basin.

2 But those are the kinds of geologic materials that we keep
3 our eyes -- particularly stringently looking and carrying
4 forward, the information forward.

5 Q. Does Appendix D5 characterize geologic hazards
6 inside the permit area?

7 A. It does.

8 Q. If there are geologic hazards in the permit
9 area, does that mean mining can't occur?

10 A. No, it does not.

11 Q. How are -- how does DEQ handle regulating mining
12 the geologic hazards present?

13 A. First, the hazards are identified, exactly what
14 kind of hazards they are and the nature of the hazards,
15 determine what kind of risks exists from these different
16 hazards. For example, the faults in this particular mine
17 are not very big. They're fairly small faults. We don't
18 expect a lot of movement along those fault planes when we
19 begin to move the overburden right next to them. We see
20 these up in Montana -- southern Montana as well. Same
21 kind of faulting systems show up in the Decker Mine up
22 there, as well as the Spring Creek Mine.

23 The mining hazards that we see in the geologic
24 hazards, after they're all listed, we establish
25 methodology for dealing with them, depending upon what

1 needs to be done by the mining engineers. They will
2 design the cuts, they will design the trenches, they'll
3 design everything else within the mines so it fits within
4 those geologic hazards and they are accounted for, so
5 they're not surprised later on down the road.

6 Q. How did the applicant obtain the information
7 included in the Appendix D6?

8 A. That came from all the drill holes they did in
9 2012, '13, '14. During that period they were drilling on
10 the coal notification.

11 Q. Did they consult with DEQ in picking locations
12 of the drill holes?

13 A. They did.

14 Q. When did they do that?

15 A. They did that starting in 2013 and 2014, when
16 they were doing overburden sampling and they needed to
17 know approximately where the holes needed to be for the
18 overburden sampling. We require holes initially to be in
19 the 160-acre spacing. Brook was putting them on 180-
20 spacings. So we were selecting those locations for those
21 particular holes off the original drilling they did.

22 Q. Was there more drilling than -- for the Brook
23 Mine than would be required in the regulations?

24 A. There was in this particular case. The
25 overburden sampling was on tighter configuration than

1 we're normally used to.

2 Q. Was there any testing of those samples?

3 A. They were tested.

4 Q. What kinds of things were tested for?

5 A. The coal, for example we tested for all its
6 burning characteristics, obviously. A lot of the
7 overburden materials were tested for nature of material,
8 what the clay density was, the sand density was and some
9 of these other that determined how heavy the overburden's
10 going to be were characterized by geotechnical
11 engineering. There were also some small amounts of tests
12 performed on the immediate roof of the coal material, the
13 coal material itself and the floor of the coal, so that
14 they could determine what might be the characteristics of
15 the highwall mining that's taking place.

16 Q. Is DEQ satisfied by the amount of drilling and
17 testing conducted for making Appendix D5?

18 A. There were a couple of areas they could not
19 access due to limitations, and so we were -- worked out a
20 considerable -- or, excuse me -- a consideration that they
21 were going to gather those overburden samples prior to any
22 mining activity taking place or disturbance taking place,
23 the condition of permit.

24 Q. Is the lack of the -- the mining samples from
25 those locations Brook Mine was not able to access prior to

1 the application, does the lack of having those in the
2 permit application make the application deficient?

3 A. No. It does not, primarily because the spacing
4 of the original holes. They were close enough together
5 that we could extrapolate through a lot of those holes
6 into the areas -- we need holes there, but there's enough
7 data we extrapolate into that area for now.

8 Q. So does the application accurately characterize
9 the geology inside and around the permit area?

10 A. It does.

11 Q. I'll have you take a look now at Exhibit D6.
12 It's in the next box. It's another volume.

13 A. Of course it's on the bottom. I forgot to tell
14 you that one of our reviewer's name is Murphy. Okay.

15 Q. He's not a legal expert, correct?

16 A. No.

17 Q. All right. If you will take a look at Exhibit
18 D6 -- excuse me, DEQ 6.

19 A. Yes.

20 Q. Can you tell us what this document is?

21 A. This is the hydrology appendix that covers the
22 hydrologic characteristics of the surface water and
23 groundwater regimes.

24 Q. What kinds of information does Appendix D6
25 contain?

1 A. For example, surface water will contain the
2 amount of surface water found in any of the areas of the
3 study, how regional it is, how dependent upon weather it
4 is, what the characteristics of the water are like, both
5 the amount of water and the quality of the water,
6 particularly very important. Water quality in the state
7 of Wyoming is something particularly precious to us, and
8 so a lot of it has to be calculated and determined.

9 Groundwater, the same, determine how much water
10 is down on the ground, are there any aquifers down there
11 that produce water of usable amounts, that can be used for
12 domestic purposes. Part of the problem with the
13 groundwater in this part of Wyoming in and around the coal
14 mines is the coal beds are the aquifers. And above and
15 below those coal beds there really are no really good
16 aquifers. So by and large, sometimes it's difficult to
17 locate water in some of those sandy and very dry units on
18 this side of the basin, unlike the other side. So these
19 are kinds of studies performed to determine what those
20 characteristics are like.

21 Q. Who at DEQ reviewed the surface -- I'm sorry --
22 the information in Appendix D6?

23 A. I reviewed it. Dr. Muthu Kuchanur reviewed it.
24 Mr. Matt Kunze reviewed it.

25 Q. What parts of Appendix D6 did you review?

1 A. I read the -- more the regional information,
2 regional description, drainage basin description, some of
3 the other large-scale -- the narrative that was involved
4 there. And the very much -- specifics and a lot of
5 modeling we left with Dr. Kuchanur and Mr. Kunze.

6 Q. Did you review the hydrogeology information
7 inside Appendix D6?

8 A. I did.

9 Q. I think you explained a little bit about the
10 hydrogeology inside the permit, correct?

11 A. Correct.

12 Q. Is there anything else you want to add in your
13 explanation to council?

14 A. The area -- the mining area is particularly
15 interesting. The area on the eastern side of the mine has
16 quite a bit of water in the coal. That -- it's just
17 always been that way. Whenever -- when I worked for Big
18 Horn Coal, we were in those pits, that water was just a
19 part of life. As you moved to the west -- fairly quickly
20 moved to the west, you get out of the bathtub. You get a
21 little higher up in the rock units and the water goes
22 away, both the overburden and the coal. There are some of
23 those water wells that had to have special practices put
24 into place to even get water samples. It's so dry. By
25 and large, when a drill works on it and they blow on that

1 hole, all they get is mist as the main water being made in
2 it. So the characteristics of the water change -- the
3 hydrology changed across the mine fairly quickly, from
4 that little bathtub that sits down there where the TR-1 is
5 at, very quickly up those hills where TR-2 and 3 and 4 and
6 the rest of them are at. So we get up out of the water
7 fairly quickly within the first two years of mine life.

8 Q. Does the permit application -- or does the
9 information in D6 address that description you had of the
10 differences in the hydrogeology between different parts of
11 the permit?

12 A. It does.

13 Q. How do they collect that -- how did the
14 applicant collect that information?

15 A. A lot of the information was collected from the
16 water wells that were put into place, the monitor wells
17 that were put into place to observe the characteristics.
18 They didn't just put monitor wells in the coal. They
19 attempted to put monitor wells in the overburden as well
20 to see if they could get any water out of some of those
21 sandstone units to monitors, if nothing else. And by and
22 large, that was -- that was not successful in those cases.

23 Q. Does Appendix D6 contain the results of that
24 monitoring?

25 A. It does, yes.

1 Q. Did the applicant consult with DEQ prior to
2 selecting the locations of the monitoring sites?

3 A. They did.

4 Q. And when did that occur?

5 A. That was approximately two-thirds of the way
6 through the CN period. When the water wells were
7 beginning to be put in, initially there were a lot of
8 drill holes put into places to see what was down there.
9 And then they began to select places to put water wells in
10 so they were best suited to monitor a fairly large area,
11 because the initial wells, it's pretty critical as to
12 where they put those. And so we determined spacing,
13 nature of material, what we're going to put into it, based
14 on some of the geologic logs, we went over this with
15 Western Water ourselves and determined where some of the
16 best characteristics were and try to measure hydrology of
17 the units.

18 Q. Did DEQ approve the locations of the monitoring
19 wells?

20 A. We did. There were locations preliminarily
21 located on a map. And by and large, they stuck pretty
22 close to the map.

23 Q. Did DEQ also approve of locations of surface
24 water monitoring?

25 A. Yes, we did.

1 Q. Did DEQ make those approvals prior to work
2 collecting that information?

3 A. We discussed the locations for the surface water
4 sampling sites, and agreed those were adequate locations
5 that should provide information for a bulk of the drainage
6 in that particular part of the mine permit.

7 Q. Okay. Those are all my questions on that
8 exhibit.

9 Ask you to take a look now at DEQ Exhibit 7.

10 A. And I have it.

11 Q. Can you tell us what this document is?

12 A. This is an appendix that addresses soil
13 resources in and around the permit application area.

14 Q. Is that Appendix D7?

15 A. It is.

16 Q. Can you tell us some of the information in
17 Appendix D7 that's relevant to the objections that are
18 filed?

19 A. Would you please rephrase that?

20 Q. Can you tell us some information that can be
21 found -- types of information that can be found in
22 Appendix D7 that are relevant to some of the objections
23 that have been filed against the permit application?

24 A. A lot of cases we utilized a soil analysis to
25 determine what is suitability for reclamation. And

1 there's been some concern about reclamation in most mines
2 for good reason. We don't have a lot of topsoil in the
3 state, and so got to deal with everything we can possibly
4 salvage. And so we have characterized these soils pretty
5 closely. We're pretty concerned about nature of the soil
6 we have and what we can do with it. And so special
7 adherence is placed to these kinds of studies. We are
8 ensuring that we can reclaim the surface to at least its
9 premining condition, if not a better post-mining
10 condition. And that's essentially why we really go all
11 out in getting these samples and doing individual analysis
12 on these soils, so we can match the soil, the post-mine
13 land use and the locations it's going to be in.

14 Q. What types of soils are analyzed in Appendix D7?

15 A. Generally, get these different loamy soils that
16 are analyzed. You also get some kinds of -- they define
17 them as soils by the outcrop, but the -- it's actually a
18 definition of no soil. There are also types of loams out
19 there that are conducive to certain kinds of vegetation.
20 Certain soil units are better for other kinds of
21 vegetation than some other ones are. And so what they've
22 done by this is mapped these units to also understand
23 where they want to put their vegetation species in after
24 the mining has occurred and reclamation starts to occur.

25 Q. Does Appendix D7 have information about the

1 topsoil?

2 A. It does.

3 Q. Was that some of the soils you were discussing?

4 A. Those are the topsoils, yes.

5 Q. Does it also have information about overburden?

6 A. It does not.

7 Q. Where is that information?

8 A. That is in D5, geology.

9 Q. Go ahead and close up that volume.

10 Have you take a look at DEQ Exhibit 8.

11 A. Okay.

12 Q. Can you tell us what this is? What this

13 document is?

14 A. This is the appendix that is related to

15 vegetation.

16 Q. Okay. And just for the council's benefit in

17 reviewing the record later, are there any objections

18 related to vegetation?

19 A. I didn't see any.

20 Q. Okay.

21 A. No, I didn't see any based on vegetation.

22 Q. We'll move on, then.

23 A. Okay.

24 Q. I think maybe in the next box, but DEQ

25 Exhibit 9.

1 A. I have Exhibit 9.

2 Q. Can you tell us what this exhibit is?

3 A. This is the wildlife exhibit.

4 Q. What kind --

5 A. And it is the exhibit that we send to both the
6 Wyoming Game & Fish and Fish & Wildlife Service.

7 Q. What kind of information does this exhibit
8 include?

9 A. There are -- there was information and data
10 collection on, for example, sage grouse. See if there
11 were sage grouse anywhere in this area. And raptors,
12 eagles, bald eagles, if possible, golden eagles. There
13 are migration patterns possible through this area of deer,
14 antelope. Saw an elk out there once. That was only one
15 time. So they generally take this information about all
16 the wildlife species. And this also includes rabbits and
17 ground squirrels, and all the wildlife that lives out
18 there, every species that exists out there and categorizes
19 it and places it in this format.

20 Q. You mentioned sage grouse. What does the
21 application say about sage grouse?

22 A. This is outside of the sage grouse core area,
23 and there is one lek within two miles of the proposed
24 permit application, northwest side of the permit
25 application.

1 Q. How does the permit application address that
2 lek?

3 A. It addresses the fact that they will be
4 monitoring the lek, and that if any observed changes are
5 taking place, they will attempt to determine why they are
6 taking place. It can be predation taking place. It can
7 be sometimes just they abandon leks for whatever reason,
8 and sometimes move to new ones. So it can be a lot of
9 reasons.

10 Q. Is that monitoring more than what the
11 regulations require?

12 A. No. It's -- it's what the regulations require.

13 Q. Were there any restrictions placed on the permit
14 based upon presence of sage grouse in the area?

15 A. There were not.

16 Q. Does the application discuss -- does the
17 application discuss endangered or threatened species?

18 A. It does.

19 Q. What does the application -- what does Appendix
20 D6 have to say about endangered species?

21 A. What it says is essentially any threatened or
22 endangered species will be monitored if they occur in the
23 mine permit -- or close to mine permit area. They didn't
24 find any threatened or endangered species in the area.
25 And so at this point in time it's a commitment within the

1 permit to take action if such species exist or shows up.

2 Q. You mentioned that the Department of Game --
3 Wyoming Department of Game & Fish had reviewed this
4 appendix, correct?

5 A. Right.

6 Q. Did they provide comments back to Brook about
7 this appendix?

8 A. They provided some suggestions. One of those
9 was to be mindful of the sage grouse lek that was in that
10 area, be mindful of the sage grouse different studies that
11 are taking place in the state, and to be very careful they
12 don't intrude on one that wasn't known about.

13 And golden eagle nests. They were saying please
14 observe the locations of golden eagle nests. There are
15 nesting areas close to mine area, in the cliffs in the
16 high country around there.

17 Q. Did the applicant incorporate into the
18 application Game & Fish's suggestions?

19 A. They did.

20 Q. And, similarly, for the US Fish & Wildlife
21 Service, who also reviewed this appendix, correct?

22 A. Yes.

23 Q. Did they have comments that they provided to the
24 applicant?

25 A. Very similar comments, the Game & Fish.

1 Primarily be careful for -- monitor for T&E species. And
2 if they exist, then create a mitigation plan. By and
3 large, it was just a suggestion to be mindful of the
4 wildlife, to observe what was taking place. And this, of
5 course, is done through the annual report every year.
6 Wildlife is monitored every year and the report on that
7 shows up in the annual report.

8 Q. Did the applicant incorporate into the
9 application all of the Fish & Wildlife Service's
10 suggestions?

11 A. The suggestions were so similar to Game & Fish
12 that they would be -- have been incorporated regardless.

13 Q. So there were no outstanding comments on this?

14 A. No, there were not. No, there were no comments
15 to be responded to in any of their correspondence.

16 Q. Okay. Have you take a look at DEQ Exhibit 10.
17 Can you tell us what this document is?

18 A. These are the wetland inventories of the area,
19 which is Appendix D10. And we have some assistance from
20 the Army Corps of Engineers, and, for all intents and
21 purposes, they stated this area was -- the work had been
22 done was sufficient. This area's not a concern.

23 Q. Okay. Moving right along. Have you take a look
24 at DEQ Exhibit 11. Can you tell us what this document is?

25 A. This is a document of alluvial valley floors.

1 Q. Can you describe what alluvial valley floors
2 are?

3 A. Oh. Alluvial valley floor is kind of a catchall
4 phrase for drainages that have the ability to be farmed,
5 for all intents and purposes. AVFs are determined by a
6 lot of different characteristics, by nature and material
7 in the soils, the kind of material that the alluvium, the
8 dirt, essentially, is deposited by the water body, what
9 the characteristics are like, is the area under
10 subirrigation because the water may be in the material,
11 does the area support farming, are there crops being grown
12 along the drainage within the drainage area? There are a
13 lot of different numbers or items to check off as we go
14 into these alluvial valley floors. There are different
15 kinds of alluvial valley floors. And so depending on what
16 we have in our rules and regulations and how they define
17 specific kinds of AVFs, we can utilize those, then, to
18 generate information on potential AVFs in the area.

19 Q. Who reviewed Appendix D11?

20 A. I did.

21 Q. Are alluvial valley floors addressed in DEQ's
22 regulations?

23 A. They are.

24 Q. Is a surface coal mining operation allowed to
25 disturb alluvial valley floors?

1 A. They are.

2 Q. What is -- what protections are required for
3 alluvial valley floors?

4 A. Depending upon whether you're going to disturb
5 them or not, if you can disturb them, they have to be --
6 the channel has to be rebuilt, rechannelized off away from
7 wherever the disturbance is going to be so that the water
8 can continue to flow down through downstream rights
9 holders. And so we generally will offset some distance
10 and put a channel in place for that water to be moving
11 through prior to and during the mining process. Once it's
12 getting reclaimed, then we'll reclaim it as an alluvial
13 valley floor, and so they very specifically place those
14 kinds of materials as almost a false alluvium and they
15 rebuild that material where they're going to put creek
16 bottom back. And so they essentially rebuild it. The
17 most successful one is, of course, is the -- the Belle
18 Fourche River that Cordero Mining mined through and
19 restored and reclaimed to its premining use.

20 Q. Does DEQ have experience with enforcing
21 reclamation of alluvial valley floors?

22 A. We do. Very much so.

23 Q. You mentioned the Belle Fourche River. Are you
24 familiar with any other instances where the alluvial
25 valley floors were disturbed?

1 A. Rawhide Creek in the eastern part of the basin.
2 There were also some Cordero Creek, Caballo Creek, and a
3 couple other ones that come to mind, no AVFs on this side
4 of the basin that I know of. So all the ones I can
5 remember over on the east side of the basin.

6 Q. What information does Appendix D11 include about
7 AVFs in the permit area?

8 A. Would you please clarify that?

9 Q. Generally, what kinds of information does
10 Appendix D11 include regarding the alluvial valley floors
11 in the permit area?

12 A. A narrative of alluvial valley floors, several
13 assessments of potential of alluvial valley floors in the
14 area that I underwent some testing, oh, in -- for a couple
15 of years during the permit application process, in trying
16 to determine where AVFs may be that exist within the mine
17 permit area, and where AVFs might exist outside the mine
18 permit area. I did define and locate one within the mine
19 permit area and studied it and characterized it and built
20 a narrative on it and put it into narrative format
21 document.

22 Q. Is there a map in Appendix D11 that identifies
23 potential alluvial valley floors?

24 A. There is a map in there that does.

25 Q. I'm going to ask you to turn to that map,

1 DEQ 11-031.

2 A. Which one?

3 Q. Page 11 -- page DEQ 11-031. I think you might
4 have gone past.

5 A. I have an 11.3-1, is that it? Superficial
6 geology?

7 Q. I'm looking for a map labeled D11.1-1.

8 A. Potentially Subirrigated Lands.

9 Q. Go ahead and open up that.

10 THE WITNESS: Sorry, Joe.

11 MS. ANDERSON: We needed to wake up a
12 little bit.

13 THE WITNESS: I'm sorry. I'm sorry.

14 Q. (BY MR. KUHLMANN) I'll ask you to open this
15 one, because I think it might be useful as we go through
16 different areas --

17 A. Sure.

18 Q. -- of this exhibit.

19 Can you tell us what the different shaded areas
20 on the map represent?

21 A. These primary shaded areas -- first of all, the
22 red coloration -- this is an aerial photograph. They're
23 taking color infrared photography rather than conventional
24 photography. And all the red or pink areas on there are
25 vegetation. And so the drainages stand out readily.

1 That's why this kind of photography is utilized for this
2 purpose. Drainages really show up and it's wherever
3 vegetation is growing.

4 There are different stippled patterns on this
5 particular map. Over in the eastern side of the map, the
6 right-hand side of the map, in and around the Big Horn
7 Coal mine area, there is a -- declared as an AVF. During
8 the Big Horn Coal mine life, that was declared all the way
9 over to where the clean burn pits are at. The clean burn
10 recreational area. So that area in there, with the
11 verti -- excuse me, the diagonal lines is declared AVF.

12 The other areas from that point on, as you
13 follow that in the southern part of the mine permit area
14 to the west, over to the left is an area that's been --
15 has been defined as potentially subirrigated land, and
16 land that could possibly be an AVF, depending on the
17 constituents and nature of the materials.

18 Q. I'll ask you first about the area you've
19 mentioned as already been confirmed as an AVF.

20 A. Okay.

21 Q. Does that remain declared an AVF for the
22 purposes of the Brook Mine application?

23 A. Once a declaration has been made, it remains in
24 place.

25 Q. Okay. Does the permit application identify that

1 area as an AVF?

2 A. It does.

3 Q. You mentioned that you had identified an area as
4 AVF or alluvial valley floor that was inside the permit
5 area for the purposes of reviewing the Brook application.

6 A. Right.

7 Q. Can you tell us what that area was?

8 A. That area was in the upper left-hand corner,
9 where this -- it's called Slater Creek, comes from the
10 northwest to the southeast and crosses over into the mine
11 and the -- crosses the blue line there. And there was an
12 area right as it crosses the permit boundary in there.
13 And there was a fence out there. Right as it crosses
14 there, there's a bit of alluvial valley floor that tapers
15 out fairly quickly in that area, because historically
16 someone had built a stock dam in there and modified the
17 creek bottom by moving dirt to build a stock dam. It was
18 then breached subsequent to the SEO saying you got to
19 permit all these ponds. So it's typical there are a lot
20 of ponds out here that got breached when they had to
21 permit those because they didn't want to permit the ponds.
22 So there is a pond up in there -- or original stock pond
23 that was breached and affected these properties from that
24 part of the alluvial material all the way downstream for
25 quite a ways.

1 Q. I'm going to hand you another binder here.

2 A. Oh.

3 Q. And ask you to turn to -- I opened it up to
4 Exhibit DEQ 15. Go ahead and keep that out.

5 A. Okay.

6 Q. Here you go. Trying to be careful of the
7 microphone.

8 A. Yeah.

9 Q. Okay. Do you know what this document is?

10 A. Yes. This document contains the AVF
11 determination that I made on Slater Creek and published
12 February 10, 2016.

13 Q. And this was the AVF area you were just talking
14 about?

15 A. It is.

16 Q. When did -- when did you determine that area was
17 an AVF?

18 A. On February 10th. Once I made my -- I did a
19 field walk or a field search on that as we walked up and
20 down the Slater Creek from the permit boundary all the way
21 down to the interstate and back and analyzed the material.
22 A lot of places this is a very incised stream. It's --
23 you know, it's six feet deep and three feet wide, and so
24 we were able to determine the nature of the alluvial
25 materials in these areas. So I classified the type of

1 material that was the alluvium, the amount of water that
2 was available to the system, whether it was being farmed
3 or not, and finally came up with my determination an AVF,
4 Class X AVF.

5 Q. Does the permit application identify the Slater
6 Creek AVF you just discussed?

7 A. Say that again.

8 Q. Does the permit application include description
9 of the AVFs that you just discussed?

10 A. It does not.

11 Q. Okay. Why is that?

12 A. The permit application was technically complete
13 for AVF studies prior to my publishing of AVF
14 determination. So at the time the technical completeness
15 was completed for AVFs, I had not yet accomplished the AVF
16 material and there was nothing for them to put in the
17 application. Once it was declared complete, then we don't
18 revisit that again.

19 Q. Was Brook required to identify or have DEQ
20 declare this area an AVF in order for its permit
21 application to be technically adequate?

22 A. Yes.

23 Q. Does Brook Mine propose to conduct any mining
24 through this AVF?

25 A. No.

1 Q. Is this AVF going to be affected through the
2 mining operations?

3 A. It does not plan to be affected in any way.

4 Q. Does DEQ need to identify alluvial valley floors
5 if they're not going to be affected by a mine operation?

6 A. No, we do not.

7 Q. Is that a regulatory requirement?

8 A. It is. It's a regulatory -- the language in the
9 regulation essentially says that if the AVF is not going
10 to be affected by mining, it does not have to be
11 classified at the time.

12 Q. So what was the purpose of identifying the
13 Slater Creek AVFs they weren't going to be affected?

14 A. Because it was inside the permit boundary, and I
15 felt it was important to get that one classified.

16 Q. Okay. Were there any other areas inside the
17 permit area -- inside the permit area --

18 A. Okay.

19 Q. -- that DEQ considered whether or not they may
20 be an alluvial valley floor?

21 A. Hidden Water Creek area on the north side of the
22 permit was also considered for AVF consideration.

23 Q. What was the conclusion of that consideration?

24 A. The Hidden Water Creek is an ephemeral drainage
25 that has never been farmed, does not have any

1 characteristics of alluvial valley floor, and, therefore,
2 we determined it was simply an ephemeral drainage that
3 flows water from sudden spring storms or runoff after the
4 snow melts. That's the only time water is in that
5 particular drainage. In fact, that drainage doesn't
6 usually flow for maybe years at a time sometimes.

7 Q. Okay. Does an alluvial valley floor have to
8 have sufficient water flow in order to be characterized as
9 an alluvial valley floor?

10 A. It does. It has to have water available.
11 Either through direct watering or at least irrigation.

12 Q. And one final area of possible alluvial valley
13 floors. And you had mentioned when you were describing
14 the map on the exhibit -- the map with the -- you
15 described the vegetation at the time.

16 A. Okay.

17 Q. The infrared.

18 A. Right.

19 Q. You mentioned there was an area that went from
20 along the Tongue River from what had been determined as an
21 alluvial valley floor for the Big Horn Coal permit --

22 A. Right.

23 Q. -- and moving west along the south side of the
24 Brook permit application. Has DEQ considered whether
25 those lands may be alluvial valley floors?

1 A. We have considered that.

2 Q. Are those areas going to be affected by the
3 mining under the permit application?

4 A. They are not.

5 Q. Has DEQ made a declaration of whether or not
6 those lands are alluvial valley floors?

7 A. We have not.

8 Q. Does it need to if those properties are not
9 going to be affected by the mining operations?

10 A. Since they're not going to be affected, they do
11 not yet at this time need to be declared AVF.

12 Q. Okay. I'll have you take a look at Exhibit DEQ
13 16. It's another tab inside the binder you have open, if
14 you can.

15 A. There we go.

16 Q. Do you recognize this document?

17 A. This is one I created on potential AVFs.

18 Q. Does this address that area we were just
19 discussing of the Tongue River -- areas along the Tongue
20 River south of the permit area?

21 A. It does. It shows both the Big Horn AVF
22 acreage, as well as the potential Tongue River AVF acreage
23 all the way toward the western side of the permit
24 boundary.

25 Q. And does that include the conclusions we just

1 talked about, the land being affected by mining?

2 A. Yes, it does.

3 Q. Are those lands otherwise included in permit
4 application?

5 A. They are only included as ancillary to the
6 permit application if they fall within a half-mile radius.
7 Some things occur within a three-mile radius. As they are
8 incidental to the permit boundary they show up.

9 Q. But do they need to be declared an alluvial
10 valley floor in order to make the permit application
11 technically adequate?

12 A. They do not if no affect is going to take place.
13 One of the things we'll have in that permit will be a
14 condition that if at any point in time they're going to
15 affect an AVF in any way, shape or form, we will halt
16 mining in that direction, if necessary, and do a full AVF
17 evaluation study prior to any kind of disturbance taking
18 place there. So one of the conditions of mining will be
19 to protect AVFs that are adjacent to the property.

20 Q. Thank you. You can close up that exhibit.

21 Now ask you to open up DEQ Exhibit 12. It may
22 be in the final box we have.

23 A. It looks like the final box.

24 Q. Hoping it's not in the bottom of the box.

25 A. It's actually --

1 Q. On the bottom?

2 A. -- on the bottom. Fire her.

3 All right.

4 Q. So you now have DEQ Exhibit 12 pulled up?

5 A. Yes, I do.

6 Q. Can you tell us what this document is?

7 A. This document is the mine plan. This is the
8 document that we'll utilize to enforce mining within that
9 permit boundary and enforce all the aspects of the law at
10 our disposal.

11 Q. Does the mine plan identify information about
12 the method of mining?

13 A. It does.

14 Q. Can you describe a little bit more information
15 about the highwall mining technique?

16 A. This is similar to auger mining. That was
17 something that took place 20 and 25 years ago. A couple
18 of the mines I worked at had considered doing it, but
19 decided not to because auger mining is very difficult to
20 keep the whole way straight. And as you're augering down
21 into that coal from the highwall, that hole can take off
22 in different directions, primarily based on the nature of
23 the coal, how fractured is it, how soft or hard is it, and
24 they wander away and have a tendency to cross each other.
25 When they cross each other like that, they start building

1 voids down there. They start building rooms and then you
2 get subsidence.

3 This process is totally different than that
4 particular process, other than they come in from the
5 highwall. Once the coal has been mined out of that
6 trench, they'll set the highwall miner up on one end of
7 the pit. They have these series of 40-foot rails that
8 come in that have a conveyor on them. Right in front of
9 it it has -- there's continuous miner head. It will mine
10 approximately 12 foot wide and 11 feet high. It can go
11 down into the coal bed 2,000 feet with every 40 feet being
12 a new conveyor attached to it and move down into it again.

13 And these are directionally intelligent. They
14 know where they are at in the particular mining sequence.
15 They know where they're at in the coal. They know
16 latitude, longitude, everything else. There are sensors
17 in place in these mining heads that will move it depending
18 on what the nature of the material is. They're looking
19 for coal at all times. They can determine that with a
20 special gamma probe. And they are advertised at least to
21 be accurate to 4 inches in a thousand feet. And so we get
22 away from a lot of those interference you used to get with
23 the auger mining, where they intersect each other. These
24 do not intersect each other. These obey the mine plan,
25 for example, and the -- the mining potential, it's there,

1 and builds a system that is as close to nonsubsiding as
2 possible, and yet can be accessed from the highwall safe.

3 And so, by and large, this new technology has
4 made this possible so it's safe and effective and
5 nonsubsiding.

6 Q. Is highwall mining an improvement on auger
7 mining?

8 A. Significant improvement on auger mining. Very
9 similar from the surface aspect of it. It's still sitting
10 in a bottom of the trench, going into a highwall, but
11 that's about the only similarity.

12 Q. Do both techniques leave ribs between the holes
13 that they dig?

14 A. There are a series of pillars or webs or
15 whatever you want to call them between the shafts that
16 are -- that are dug by the continuous miners. So it may
17 be 12 foot wide shaft and 12-foot wide web, 12-foot-wide
18 shaft, 12-foot web. So there are just intervening
19 pillars.

20 Q. So did DEQ apply the regulations for auger
21 mining to highwall mining technique?

22 A. We did.

23 Q. Through the highwall mining, is there anyone who
24 goes underground?

25 A. No. At no time. I'm sure MSHA would have a lot

1 to say about that.

2 Q. Does highwall mining remove all the coal in the
3 mine coal seam?

4 A. It does not.

5 Q. Does the application identify what percentage of
6 the coal in the mine coal seams that Brook Mining is
7 expected to be able to recover?

8 A. It does.

9 Q. Do you know what that number is?

10 A. The number average is 50 percent recovery, and
11 it varies from place to place, depending on the nature of
12 the material they'll be -- they'll be moving into. The
13 nature of the roof rock and floor.

14 Q. What does the coal that's left unmined do after
15 mining is over?

16 A. It serves to buttress the webs that they put in
17 there, and essentially works as a placeholder -- I should
18 say as a holder for the overburden not to subside in those
19 particular cavities in there in those openings. The idea
20 here is you may be able to come back sometime in the
21 future and get that coal with some other technology that
22 doesn't exist right now. Considering how things changed
23 in the last 20 years, it's quite realistic.

24 Q. I'm going to ask you to turn to page DEQ 12-028.

25 A. Okay. I have it.

1 Q. Okay. Can you describe generally the -- or, I
2 guess, what does this section discuss?

3 A. This particular section discusses the mining
4 methodology, the scheduling of the mining tools and
5 equipment, and the assessments that are made during the
6 mining process.

7 Q. Does that address the mining sequence?

8 A. It does.

9 Q. Can you describe generally the mining sequence
10 for the Brook Mine?

11 A. I'm not quite sure if you want -- where the cuts
12 will be or the nature of the sequential excavations, where
13 they're going to be or what they are.

14 Q. Can you describe the geographic sequence of the
15 mining?

16 A. I can. At present geographically they were
17 planning on starting in what they call TR-1, trench TR-1,
18 immediately south of the Big Horn Coal shop and warehouse
19 facility. And that particular mine trench was to be
20 opened up through an old mining area, Pit 1 that Big Horn
21 Coal had. And they would establish not only coal out of
22 that area, the mine out in that area, but establish a
23 long-term sump. Because, like I said, that is the bottom
24 of the bathtub. What they need to do, in order to have
25 water for their mining and continued water throughout the

1 mining life, they got to have a place to get it.

2 So the water is so deficient farther to the
3 west, they put a sump in at RT-1 and use that for mining
4 water. Again, moving to the west end at that point, very
5 gradually place trenches, remove the overburden sequence,
6 put it off to the side, remove coal, and we cut, do
7 highwall mining, back out of the trench, put overburden
8 back in the hole again, put topsoil on top of it. And
9 they'll do that moving east to west, trench after trench
10 after trench until they go get all the way to the western
11 side of the permit boundary. That will take about 13
12 years.

13 Q. Have you turn to DEQ page 12-129. It's going to
14 be a map.

15 A. Oh. There it is. I have it open.

16 Q. Can you tell us what this document is?

17 A. Okay. This shows the sequence of disturbance
18 that's going to happen on the surface. Obviously being a
19 highwall mine, there will be surficial disturbance in and
20 around the trench area and other areas that will need to
21 utilize overburden materials at. So this shows the
22 sequence under which that material will be moved, where it
23 will be placed and the approximate scheduling of that.

24 Q. How does the -- does the map indicate where the
25 trenches are located?

1 A. It does.

2 Q. How does it indicate those?

3 A. They have a number, TR-1, TR-2, TR-3. Those are
4 the trenches.

5 Q. Okay. What are the other shaded areas on the
6 map? What do those describe?

7 A. Those are the total disturbances that will take
8 place in a lot of areas. They can disturb up to permit
9 boundary. And so we're estimating in this first year
10 there will be quite a bit of disturbance. Probably a
11 topsoil condition. But ensure that they cover enough
12 topsoil in this particular area to take care of the lands
13 that are there at this time.

14 Q. Are there any areas that are indicated to not be
15 disturbed?

16 A. Yes, there are. The areas that don't have
17 coloration or a pattern on them will not be disturbed.

18 Q. Okay. Is there an area shaded in green or a
19 pattern of green?

20 A. Well, there are several.

21 Q. Okay. Is there -- there's a large patterned
22 area of green that's --

23 A. This.

24 Q. -- just on the right-hand side of the center of
25 the map.

1 A. This one here?

2 Q. Yes.

3 A. Okay.

4 Q. Can you describe what that indicates?

5 A. That is an area no mining activity will take
6 place. It is along the Padlock pastures, for example.
7 They -- I don't know if they winter in there, but they
8 utilize these as pastures for their livestock. And a
9 surface use agreement with Padlock has isolated that area,
10 saying there will be no mining in that area. And there
11 will be fencing to ensure that nothing crosses the
12 boundary between the mine and the pasturage. So that area
13 is going to have a special use.

14 It also is a walk-in area for hunting, and some
15 of that will still be utilized as walk-in area. Not the
16 entire section as it used to be in the past, but parts of
17 it will be suitable for walk-in hunting.

18 Q. Thank you.

19 Okay. Can you turn to page 12-134? This is
20 another map.

21 CHAIRMAN BAGLEY: Mr. Kuhlmann, will you be
22 at a good stopping point here soon?

23 MR. KUHLMANN: Yes, after we discuss this
24 page.

25 CHAIRMAN BAGLEY: Okay. Great.

1 THE WITNESS: Okay.

2 Q. (BY MR. KUHLMANN) Can you describe what this
3 document is?

4 A. Yes. This is what we call the coal removal
5 sequence that has to be planned five years in advance.
6 And so we have the sequences that the panels will take
7 place in. And we've got systems of mining that will be
8 taking place in here that are timed to a very specific
9 point in time. Month one, month two, month three, like
10 that, during year one, year two, year three, year four,
11 year five. The first five years has been engineered all
12 way down to what month you're going to be in that
13 particular part of the mine.

14 Q. Does the map indicate the location of the pits?

15 A. It does.

16 Q. Okay. How does it show those?

17 A. It locates the trenches diagonal to the actual
18 panels that we put in place for longwall miners. So
19 they're indicated as kind of long oblong shapes with a
20 TR-1, TR-2-type designation in script on that.

21 Q. You mentioned panels. Can you describe what
22 those are?

23 A. Longwall panels is the system that are being
24 developed as the longwall miners works its way down into
25 the coal and then it backs out, offsets. Those systems

1 are called panels, as they're being mined down into the
2 end of the miner's capacity. So this is the entire area
3 that will be mined, realizing 50 percent recovery will
4 take place.

5 Q. So in those areas -- I guess we'll call them
6 rainbow areas because of the colors.

7 A. Skittles.

8 Q. Is that --

9 A. I call it the Skittles map.

10 Q. Okay. Does the -- the boundaries where those
11 areas are, the rainbow areas are, what does that show?

12 A. That shows the -- the outside disturbance areas
13 that they will undermine, that they mine to. So it shows
14 the total outline of the area that will be subject to
15 highwall mining.

16 Q. So where the patterns end, that is where the
17 highwall mining will end?

18 A. Yes. There is no mining in those areas. Even
19 though they're within the permit boundary, they're areas
20 that will not be mined.

21 Q. Have the shapes of the panels changed over the
22 course of the permit review process?

23 A. They have changed a little bit from the very
24 first iteration we got to the last.

25 Q. Regarding a pit you described as TR-1 --

1 A. Okay.

2 Q. -- and that is the pit on the Big Horn Coal
3 property, correct?

4 A. Correct.

5 Q. Has the mine panels on that pit changed over the
6 course of the permit application?

7 A. They have. They've been shifted to the south
8 about 1700 feet.

9 Q. Okay. Do you recall when that change occurred?

10 A. I don't. I'd be guessing. I would say it was
11 in, I think, Round 1, but it could be Round 2. I don't
12 know exactly.

13 Q. So does that make the mine panel shorter than it
14 was?

15 A. It does.

16 Q. Okay.

17 A. In that area.

18 Q. Okay. All right. This is the most -- is this
19 the most recent version?

20 A. This is the most recent version. This is the
21 one that's inside the permit application now.

22 Q. So these would be the mine panels that council
23 and DEQ would be approving if they approve the permit?

24 A. Yes, they would. Yep. For the first five
25 years.

1 MR. KUHLMANN: Okay. That is my last
2 question on that map. I think this is a good breaking
3 point, Mr. Chairman.

4 CHAIRMAN BAGLEY: All right. Thank you
5 very much.

6 So we will recess now until 9 a.m. tomorrow
7 morning. Everybody have a good evening.

Subject: Dates for Final days in Final Hearing for Brook Mine LLC

Dear Counsel:

The final dates for the Brook Final Hearing will be June 7th and 8th 2017. The hearing will start at 9:00 a.m. on the 7th and will be held in Elk Room, Game and Fish Commission, 5400 Bishop Boulevard, Cheyenne WY.

Travel safe.

Shannon,

You missed the point of my question.

You have multiple names listed as "may call". Your email stated that you are "likely to have one 'may call' witness prior to Brook's rebuttal".

I merely was asking you to identify which one will likely be testifying. Tom

Hi Shannon!

When will you be able to identify the "may call" witness, so that we can prepare? Tom

From: Shannon Anderson [mailto:sanderson@powderriverbasin.org]
Sent: Tuesday, May 30, 2017 8:13 AM
To: Lynne Boomgaarden; cgregersen@crowleyfleck.com; jgilbertz@yonkeetoner.com; andrew.kuhlmann@wyo.gov; james.larock@wyo.gov; Isaac Sutphin; Thomas Sansonetti; Jeffrey S. Pope
Cc: Jim Ruby
Subject: Hearing Part 2

Counsel:

I am working with Dr. Marino's assistant to see if there is a way for him to come to Cheyenne to testify on June 8th. He is presenting at a conference in Indianapolis on June 9th so it may take some opportunistic flight options to make it work. Mr. Wireman and Ms. Spencer are both available June 8th and 9th, so likely we would have Dr. Marino testify and then Mr. Wireman. We are also likely to have one "may call" witness before Brook's rebuttal.

Hope to know by around noon if it will work.

If that date doesn't work, things may be tricky to schedule as Dr. Marino and I are both unavailable June 15-26th.

Thanks for your flexibility here.
Shannon

Date: Tuesday, May 30, 2017 9:37:22 AM

Dear Counsel:

The final two days of the hearing will be held in room 1699 of the Herschler Building in Cheyenne on the 8th and 9th of June. It will begin at 9:00 a.m. on the 8th.

If you are unable to have any witnesses personally present but they can attend either by video or telephone please let me know so we can get that set up.

Any motions to change the hearing date should be filed no later than Friday June 3, 2017. A hearing on any motions to change the date will be heard on Monday June 5 at 10:00 a.m..

Sincerely,

Jim Ruby

Subject: RE: New hearing dates

Hi Shannon,

Dr. Marino is presenting at a conference in Indianapolis on June 9th. He is generally unavailable on Fridays next month, but the beginning of the weeks look good. His schedule is below:

Unavailable:

May 30-31

June 8-9

June 15-16

June 19-23

June 26

June is a really busy month for us, sorry the low availability.

Please let me know if you need anything else!

Thanks,

Erin Williams

Administrative/Marketing Assistant

Marino Engineering Associates, Inc.

To: Erin Williams
Subject: New hearing dates

Hi Erin, in case Dr. Marino hasn't checked in with you yet, things took longer than anticipated and we'll need him to come back to WY for the rest of the hearing that has been continued. Could you check and see if he is available June 8-9, all day so travel a day before and then back late on the 9th if that works, if not the 10th (which is a Sat.) – it will be in Cheyenne so flying into Denver with a rental car should work. DIA to Cheyenne via a tollroad is about 1.5 hrs, so estimate about 2.5 from landing.

Thanks! Shannon

ATTORNEY FOR OBJECTORS
BIG HORN COAL COMPANY

IN RE BROOK MINE APPLICATION)
) **Docket Nos. 17-4802, 17-**
) **4803, and 17-4804**
TFN 6 2-025) **(Consolidated)**

Horn Exhibits 1, 3, 5, 6, 8, and 9. Brook objects to Big Horn's Exhibits 1, 3, 8 and 9 solely on the basis of hearsay. Brook objects to Exhibits 5 and 6 based on hearsay, but also alleges that Big Horn failed to produce Exhibit 5 in discovery and that Exhibit 6 lacks foundation and relevance.

The Council should summarily dismiss all of Brook's hearsay objections. The Wyoming Supreme Court has ruled on numerous occasions that hearsay evidence is admissible in administrative proceedings as long as the evidence meets the requirements of Wyo. Stat. Ann. § 16-3-108(a). *See e.g. Matter of Goddard*, 914 P.2d 1233, 1238 (Wyo. 1996); *Story v. Wyoming State Board of Medical Examiners*, 721 P.2d 1013, 1018 (Wyo.1986); *Lunde v. State ex rel. Wyo. Workers' Comp. Div.*, 6 P.3d 1256, 1260 (Wyo.2000). Wyo. Stat. Ann. § 16-3-108(a) requires that evidence offered and considered in a contested administrative proceeding not be "irrelevant, immaterial or unduly repetitious," and instead be "the type of evidence commonly relied upon by reasonably prudent men in the conduct of their serious affairs." Big Horn Exhibits 3, 4, 7, 8 and 9 are documents already part of the administrative record in this proceeding. Big Horn Exhibit 6 is comprised of documents of public record in Wyoming Department of Environmental Quality Land Quality Division files and are identified as such on the face of each page of the exhibit. These exhibits, as well as Big Horn Exhibit 1 (Big Horn witness Sweeney's CV) are, consistent with the Council's instructions to the parties and the intent of Wyo. Stat. Ann. § 16-3-108(a), offered in documentary form to expedite

the volume and duration of testimony required to be presented at hearing. For these reasons, Brook's hearsay objections lack merit. The appropriate evidentiary standard is whether the evidence is "probative, trustworthy and credible," which, if Brook won't stipulate to the exhibits, can be demonstrated by Big Horn and determined by the hearing examiner at the time the evidence is offered. *See Goddard*, 914 P.2d at 1238 (stating that the "[a]dmissibility of evidence is committed to the discretion of the hearing examiner").

Brook's allegation that Exhibit 5 was not produced in discovery is patently false. In delivering Exhibit 5 to the Council and to the parties, Big Horn expressly noted that the delivery of each exhibit, including Exhibit 5, constituted any necessary supplemental production to its discovery responses. *See Exhibit A*. Therefore the exhibit was appropriately produced in discovery.

Moreover, in its previous discovery responses, Big Horn noted the Council's specific deadline of May 17, 2017 for identifying exhibits and thus the ability to produce additional documents as exhibits at that time. This is exactly what Big Horn did in its delivery of Exhibit 5. Rule 26 of the Wyoming Rules of Civil Procedure makes clear that all discovery obligations of the rules may be superseded by court orders, and thus it is the Council's requirement from the Order of Consolidation and Schedule that dictates when exhibits must be provided to other parties.¹ Big Horn's

¹ Wyo. Stat. Ann. § 16-3-107(g) states that "In all contested cases the taking of depositions and discovery shall be available to the parties in accordance with the provisions of Rules 26, 28

prior discovery responses repeatedly referenced the Council's order and May 17, 2017 deadline for delivery of exhibits as the controlling deadline. Exhibit 5 is an important aspect of Big Horn's case, was continually being developed, was not completed until May 17, 2017, and could not have been provided earlier; therefore, Big Horn did not belatedly produce Exhibit 5.

As to Brook's additional objection to Big Horn Exhibit 6, foundation and relevancy are determinations that must be made at the time the exhibit is introduced and offered into evidence. The hearing officer has discretion to determine whether or not evidence is admissible at a contested case hearing. *Clark v. State ex rel. Wyoming Workers' Safety and Compensation Div.*, 968 P.2d 436 (Wyo. 1998). Big Horn Exhibit 6 cannot be excluded based on Brook's objection alone.

In sum, Brook's objections premised upon various rules of evidence are red herrings that disregard the nature of this case and this Council's discretion. Administrative hearings are governed by the Wyoming Administrative Procedure Act, not the rules of evidence. "Administrative agencies acting in a judicial or quasi judicial capacity are not bound by the rules of evidence that govern trials by courts or juries." *Griffin v. State ex rel. Dept. of Transp.*, 2002 WY 82, ¶ 11 (Wyo. 2002).

through 37 (excepting Rule 37(b)(1) and 37(b)(2)(D) therefrom) of the Wyoming Rules of Civil Procedure in effect on the date of the enactment of this act and any subsequent rule amendments thereto. All references therein to the "court" shall be deemed to refer to the appropriate 'agency'["]

Rather it is Wyo. Stat. Ann. § 16-8-108(a) and the discretion of the hearing officer which set the standard for the admission of evidence.

II. Stipulations and Judicial Notice

In order to expedite the presentation of evidence at the hearing, Big Horn would also like to put on the record its stipulation to various exhibits and request that the Council take judicial (official) notice of certain exhibits.

Big Horn will stipulate to the admissibility of any document kept in the records of DEQ and publicly available, including DEQ Exhibits 1-13, 22-27, 29, and 31-35. Big Horn will stipulate to additional DEQ Exhibits and Brook Exhibits to the extent that DEQ and/or Brook affirmatively represents that any such additional exhibit is kept in the records of DEQ and publicly available. Big Horn also has no objection and will stipulate to the admissibility of all exhibits proposed by PRBRC and the Fishers.

As with its Prehearing Memorandum, and to avoid consuming time at hearing establishing unnecessary foundation and offering as exhibits, Big Horn requests, pursuant to Wyo. Stat. Ann. § 16-23-108(d), that the Council take judicial (official) notice of all **current versions** of applicable statutes, rules and regulations, and official, governmental guidance documents. This would include DEQ Exhibits 22-24 and Exhibits A and B to Big Horn's Prehearing Memorandum. In this vein, Big Horn objects that Brook has proposed as Exhibits copies of inapplicable, outdated versions of Wyoming law. Specifically, Big Horn objects to Brook's

Exhibits 3-5 and requests that the Council prohibit admission of those exhibits into evidence and instead take judicial notice of current law.

Jeff,

We second those stipulations and objections.

Additionally, there are some dual exhibits between the parties that we should clear up. One I am particularly thinking about is the OSMRE course materials on subsidence. We have included the complete version of the course materials in our exhibits and request that we use that version. There are some other overlaps that I am happy to stipulate to use the other parties' exhibit number and remove them from our list. In terms of the emails from our exhibit list that are also part of Brook's Exhibit 6, for the reasons that they we object to Exhibit 6 and its voluminous production that is not carefully tailored to the proceeding, nor will it be easy to use by the parties at the hearing, we request that our version of those emails remain on our exhibit list even if Exhibit 6 is ultimately admitted.

Also, please see the attached just filed with the EQC.

Thanks,
Shannon

Subject: RE: Brook Mine Application - Brook's Objections to Admissibility of Objectors' Witness and Exhibits

Jeff: The Fishers are willing to stipulate to the admissibility of those documents Brook and DEQ has identified which constitute aspects of the *formal* and official DEQ public file on the mine application (for example the mine plan and its appendixes).

I cannot advance stipulate to the entirety of things like Exhibit 6 which appears to constitute 8,000 plus pages of emails. It is hard to believe each and every email has some relevance and importance to the issues in the proceeding. If there are specific emails that you or others plan

to use, I guess we would need to take them as they come. I am also a bit perplexed at the desire to offer as exhibits copies of the law, rules and regulations. I understand this is an administrative proceeding, but it seems the law is the law and evidence is evidence. Law is not evidence.

This is not to suggest the law cannot be talked about or even shown and talked about during the hearing.

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
)
 TFN 6 2-025) **DOCKET 17-4802**

**POWDER RIVER BASIN RESOURCE COUNCIL’S RESPONSE TO BROOK MINING
COMPANY, LLC’S OBJECTIONS TO ADMISSIBILITY OF WITNESSES AND
EXHIBITS**

Late on the day on Friday, May 19, 2017 Brook Mining Company, LLC (“Brook” or “Applicant” or “Company”) filed a series of far-reaching objections to the witnesses and exhibits of Powder River Basin Resource Council (“Resource Council”) and other parties.

The Company wishes to exclude the vast majority of the Resource Council's and other parties' exhibits and seeks to exclude four fact witnesses named by the Resource Council. The fact witnesses are members of the Resource Council and they are represented by the Resource Council for purposes of these proceedings.

Based on instructions from Dr. Bagley, through Mr. Ruby, the Resource Council was prepared to meet with the parties in advance of the hearing to discuss stipulations and objections to witnesses and exhibits. However, the Company circumvented this discussion and filed its objections before the parties had the opportunity to meet.

Given the late hour, and the far-reaching scope of the Company's objections, the Resource Council requests the opportunity to provide its responses through oral argument at the

hearing today. Our responses will show that the Environmental Quality Council should summarily dismiss the objections and let the parties proceed to the hearing.

The Resource Council also requests the right to object to certain exhibits of the Company and the Department of Environmental Quality, as needed. Again, the Resource Council was prepared to discuss these objections with the parties in advance of the hearing, but such discussion was circumvented by the Company.

Dated this 22nd day of May, 2017.

Shannon,

We will stipulate to the admissibility of the exhibits to which we did not object. Assuming no one else has objections to exhibits, we can prepare a list of the stipulated exhibits.

Jeff

Well then. I guess that answers Jim's request as to whether the parties will be able to stipulate to a set of exhibits.

See you all Monday.

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINING COMPANY, LLC' OBJECTIONS TO ADMISSIBILITY OF OBJECTORS' WITNESS
AND EXHIBITS**

Pursuant to the Council's May 17, 2017 request, Brook Mining Company, LLC (Brook) hereby files its objections to the admissibility of witnesses and exhibits listed by Powder River Basin Resource Council (PRBRC), Big Horn Coal Company and the Fishers.

I. PRBRC Witnesses

Brook objects to PRBRC witnesses Anton Bocek, John Buyok, Gillian Malone, and Brooke Collins testifying. Each of them filed an individual objection letter but did not request a contested case hearing. As a result, they are not parties to this action and should not get to present testimony about their objections. Likewise, none of them took part in preparing the PRBRC's objections. Discovery in this case showed that PRBRC's attorney, Shannon Anderson, and Executive Director, Jill Morrison, prepared the objections and have personal knowledge about those objections. (See Answer to Interrogatory, attached as Ex. 1; excerpt from Ms. Morrison's deposition transcript, attached as Ex. 2; excerpt from Ms. Malone's deposition

transcript, attached as Ex. 3; excerpt from Mr. Bocek's deposition transcript, attached as Ex. 4; and excerpt from Mr. Buyok's deposition transcript, attached as Ex. 5.)

II. Exhibits

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
1.	Objections to the coal mining permit application filed by the Resource Council	Exhibit is hearsay (WRE 802)
2.	Objections to the coal mining permit application filed by Anton Bocek	Exhibit lacks relevance because Mr. Bocek did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-403); Exhibit is hearsay (WRE 802)
3.	Objections to the coal mining permit application filed by Jane Buyok	Exhibit lacks relevance because Ms. Buyock did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)
4.	Objections to the coal mining permit application filed by Joan Tellez	Exhibit lacks relevance because Ms. Tellez did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)

¹ Exhibit Nos. 1-90 are PRBRC's exhibits.

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
5.	Objections to the coal mining permit application filed by John & Vanessa Buyok	Exhibit lacks relevance because neither Mr. nor Mrs. Buyock requested a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802).
6.	Objections to the coal mining permit application filed by Bill Bense	Exhibit lacks relevance because Mr. Bense did not request a contested case hearing (WRE 401-03); Exhibit is hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)
7.	Objections to the coal mining permit application filed by Wendy Condrat	Exhibit lacks relevance because Ms. Condrat did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)
8.	Objections to the coal mining permit application filed by Sadie Clarendon	Exhibit lacks relevance because Ms. Clarendon did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
9.	Objections to the coal mining permit application filed by Gillian Malone	Exhibit lacks relevance because Ms. Malone did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802).
10.	Objections to the coal mining permit application filed by Brooke Collins	Exhibit lacks relevance because Ms. Collins did not request a contested case hearing and this letter does not contribute facts or law in support of PRBRC's objections (WRE 401-03); Exhibit is hearsay (WRE 802).
11.	Power Point presentation prepared by Dr. Marino to use as a demonstrative exhibit at the hearing. This exhibit was finalized May 16, 2017 and may be slightly adjusted prior to the hearing	No OBJECTION
12. -14.	Dr. Marino's expert report separated into three files given size. This report was attached to the Resource Council's objections to the coal mining permit application filed with DEQ on January 27, 2017 and was also provided as a part of the expert disclosures filed in the docket to these proceedings	Exhibit is hearsay (WRE 802)
15.	A copy of the Academy of Geo-Professionals website providing information on board certified experts. The website copied is http://www.geoprofessionals.org/board-certifiedexperts/diplomate-categories	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
16.	A copy of the website listing board certified experts certified by the Academy of Geo-Professionals, including Dr. Marino. The website copied is http://www.geoprofessionals.org/board-certified-experts/diplomate-directory	Exhibit is hearsay (WRE 802)
17.	Mr. Wireman's expert report provided as a part of the expert disclosures filed in the docket to these proceedings	Exhibit is hearsay (WRE 802)

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
18.	CVs of experts Mr. Wireman and Dr. Marino	Exhibit is hearsay (WRE 802)
19.	Biography of Sue Ann Spencer from her company's website	Exhibit is hearsay (WRE 802)
20.	Attachments included with the Resource Council's objections to the coal mining permit application filed with DEQ on January 27, 2017	Exhibit is hearsay (WRE 802)
21.	Brook's answers to the Fishers to discovery questions	Exhibit lacks relevance (WRE 401-403)
22.	Brook's answers to the Resource Council to discovery questions	Exhibit lacks relevance (WRE 401-403)
23.	DEQ's answers to the Fishers to discovery questions	Exhibit lacks relevance (WRE 401-403)
24.	DEQ's answers to the Resource Council to discovery questions	Exhibit lacks relevance (WRE 401-403)
25.	Brook Mine Overview from Ramaco, downloaded from their website, dated May 2014	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
26.	February 27, 2017 Sheridan Press article entitled "Ramaco Carbon plans research, manufacturing facility for coal products"	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
27.	April 4, 2017 NPR radio story from the program <i>Here and Now</i> entitled "Coal CEO Looks For New Ways To Revive the Industry"	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
28.	October 16, 2015 electronic mail correspondence between Thomas Sansonetti and Jeffrey Pope (Brook attorneys) and Andrew Kuhlmann (DEQ attorney) regarding the proposed "Sheridan Industrial Park" associated with the proposed coal mine permit	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
29.	Air Quality Permit No. P0019732 issued to Wyoming Ramaco Coal Company, LLC on January 25, 2016	No Objection
30.	June 04, 2015 electronic mail correspondence between BJ Kristiansen and Deanna Hill	No Objection

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
31.	January 31, 2017 electronic mail correspondence between Mark Rogaczewski and Jim Ruby discussing "proposed mining operations within 100 feet of a public road"	Exhibit lacks relevance (WRE 401-403); Exhibit contains hearsay (WRE 802)
32.	May 19, 2014 electronic mail correspondence between Justin Douthat and Jeff Barron regarding "surface mining beneath the county road"	Exhibit lacks relevance (WRE 401-403)
33.	May 15, 2014 electronic mail correspondence between Jeff Barron and Justin Douthat regarding an "affected county road"	Exhibit lacks relevance (WRE 401-403)
34.	July 25, 2014 Google Earth picture identifying a county road to relocate	No Objection
35.	February 24, 2016 DEQ alluvial valley floor determinations for the Brook Mine	No Objection
36.	February 08, 2016 electronic mail correspondence between BJ Kristiansen and Jeff Barron regarding alluvial valley floor determinations	No Objection
37.	December 14, 2016 electronic mail correspondence between BJ Kristiansen and Shannon Anderson regarding alluvial valley floor determinations	Exhibit lacks relevance (WRE 401-403); Exhibit contains hearsay (WRE 802)
38. -40.	April 3, 2009 Contract Documents and Specifications for AML Project 17J, Carney Mine Subsidence Mitigation, submitted by PHC Reclamation, Inc. (This exhibit was split into thirds given its size)	Exhibit lacks relevance (WRE 401-403); Exhibits are hearsay (WRE 802)
41.	May 12, 2010 AML Contract Processing Slip, submitted by Earth Work Solutions, for the AML Project 17J, Carney Mine project	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
42.	May 12, 2009 information associated with AML Project 17J, Carney Mine Rd. Subsidence Abatement	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
43.	April 22, 2008 information associated with AML Project 17J, Acme No. 1 fire subsidence	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
44.	June 29, 2015 information associated with AML Project 17J, Old Monarch Mine subsidence	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
45.	December 12, 2016 electronic mail correspondence between Melissa Bautz and BJ Kristiansen regarding AML's study of subsidence risk in the permit area	Exhibit lacks relevance (WRE 401-403)
46.	Figure 5 from the Sheridan County Land Use Plan documenting "hazardous areas" including "Known Subsidence Area[s]"	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
47.	USGS Paper 1164, "Effects of Coal Mine Subsidence in the Sheridan, Wyoming Area," 1980	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)
48.	October 07, 2015 electronic mail correspondence between BJ Kristiansen and Jeff Barron regarding removal of a rail loadout facility from the permit application	NO OBJECTION
49.	July 9, 2014 electronic mail correspondence between Ron Destefano and Jeff Barron regarding coal handling facilities and an associated spur track for review by WYDOT	Exhibit lacks relevance (WRE 401-403); Exhibit contains hearsay (WRE 802)
50.	Handwritten notes from Mark Rogaczewski produced by DEQ during discovery discussing a conversation with Jeff Barron regarding rail facilities inside the permit boundary	Exhibit lacks relevance (WRE 401-403)
51.	June 07, 2015 electronic mail correspondence between Brian Wood and Doug Emme regarding subsidence control plans/highwall mining requirements (and snow)	NO OBJECTION
52.	October 21, 2015 electronic mail correspondence between Mark Rogaczewski and David Schellinger regarding overburden sampling analyses	NO OBJECTION
53.	July 05, 2016 electronic mail correspondence between Matthew Kunze and BJ Kristiansen regarding CHIA requirements	NO OBJECTION

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
54.	June 03, 2014 electronic mail correspondence between Matthew Kunze and BJ Kristiansen the permit and the CHIA	NO OBJECTION
55.	December 10, 2015 electronic mail correspondence between BJ Kristiansen and LQD staff regarding the permit application review	NO OBJECTION
56.	February 23, 2015 electronic mail correspondence between BJ Kristiansen and Andrew Kuhlmann regarding permit application review	NO OBJECTION
57.	March 16, 2015 electronic mail correspondence between BJ Kristiansen and Andrew Kuhlmann regarding permit application review	NO OBJECTION
58.	January 12, 2016 electronic mail correspondence between BJ Kristiansen and Andrew Kuhlmann regarding permit application review	NO OBJECTION
59.	January 14, 2016 electronic mail correspondence between BJ Kristiansen and Andrew Kuhlmann regarding permit application review	NO OBJECTION
60.	November 17, 2015 electronic mail correspondence between BJ Kristiansen and Kyle Wendtland regarding permit application review	NO OBJECTION
61.	March 24, 2016 electronic mail correspondence between BJ Kristiansen, Kyle Wendtland, and Alan Edwards regarding permit application review	NO OBJECTION
62.	April 12, 2016 electronic mail correspondence between Alan Edwards and Mark Rogaczewski (copying Kyle Wendtland) regarding permit application review	NO OBJECTION
63.	March 15, 2017 letter from Tony Wendtland to Joan Tellez	Exhibit lacks relevance (WRE 401-403); Exhibit is hearsay (WRE 802)

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
64.	April 5, 2000 OSMRE Directive 882, Handbook for Calculation of Reclamation Bond Amounts	Exhibit lacks relevance because DEQ standards govern this case not OSM (WRE 401-403); Exhibit contains hearsay (WRE 802)
65.	Brook draft reclamation bond calculation, provided through discovery	NO OBJECTION
66.	Another draft of a reclamation bond calculation	NO OBJECTION
67.	Brook Mine 2015 Bond	NO OBJECTION
68.	OSMRE 2013 Annual Evaluation Report for the Wyoming Regulatory Program, October 2013, excerpts related to evaluation of blasting	Exhibit lacks relevance because DEQ standards govern this case not OSM (WRE 401-403); Exhibit contains hearsay (WRE 802)
69.	Supplemental OSMRE Special Study Topic Oversight Report on Blasting in Wyoming for the 2013 Annual Evaluation Report for the Wyoming Regulatory Program	Exhibit lacks relevance because DEQ standards govern this case not OSM (WRE 401-403); Exhibit contains hearsay (WRE 802)
70.	April 12, 2016 electronic mail correspondence between Mark Rogaczewski and Kyle Wendtland regarding a meeting request from the Resource Council	Exhibit lacks relevance (WRE 401-403); Exhibit contains hearsay (WRE 802)
71.	April 27, 2016 electronic mail correspondence between Kyle Wendtland and Alan Edwards regarding a meeting request from the Resource Council	Evidence lacks relevance (WRE 401-03)
72.	April 7, 2017 presentation from Atlas Carbon on Advanced Carbon Products given in Gillette, Wyoming	Evidence lacks relevance (WRE 401-03); Exhibit is hearsay (WRE 802)
73.	Photo of Resource Council member home in the area, provided by John Buyok	NO OBJECTION
74.	Photo of recreation use on the Tongue River near the mine site provided by the Sheridan Community Land Trust	NO OBJECTION
75. -78.	Photos of the Bocek property, provided by Joan Tellez and Anton Bocek	NO OBJECTION
79.	Aerial photo of the area of Resource Council member properties, provided by the Sheridan Community Land Trust	NO OBJECTION

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
80. -82.	Photos of subsidence on the Buyok property, provided by John Buyok	NO OBJECTION
83.	Game & Fish Department Map of Sheridan County Walk-in Areas 1, 6, and 7	NO OBJECTION
84.	OSMRE subsidence course training materials provided by OSMRE to DEQ	NO OBJECTION
85.	March 6, 2017 electronic mail correspondence between Jeff Barron and BJ Kristiansen regarding a Sheridan County Board of County Commissioners meeting	Evidence lacks relevance (WRE 401-03)
86.	July 22, 2014 information on AML project 17.32 relating to the Buyok-Monarch mine fire	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
87.	July 31, 2014 information on AML project 17.32 for mine subsidence abatement at the Carney Mine	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
88.	September 2, 2016 information on AML project 17.32 for portal closures at the Acme, Kooi, and Old Monarch Mines	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
89.	Jan 30, 2017 electronic mail correspondence between LQD staff, Todd Parfitt, and Alan Edwards	NO OBJECTION
90.	Letter from the Tongue River Water Users regarding concerns with the proposed mine	Evidence lacks relevance because the Tongue River Water Users did not request a contested case or file a timely objection (WRE 401-03); Exhibit is Hearsay (WRE 802); Exhibit lacks foundation because no listed PRBRC witness has personal knowledge to testify about this exhibit (WRE 602)
FISHER 1	Aerial Photo of portion of Tongue River Valley	NO OBJECTION

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
FISHER 2	Photos of Fishers' house and property 2-A: Old Photo of House 2-B: Old Rock Barn Structure 2-C: Initials carved on rock barn: L.S. July 26, '13 2-D: Old Rock Building/Dwelling on Property 2-E: Fisher house at time of purchase in 1996 2-F: Phase 1 depiction of house remodel 2-G: Current depiction of Fisher house 2-H: Mature fruit trees and pine trees with new fence 2-I: Landscape photo of Fisher property from frontage road 2-J: Landscape photo of Fisher property from I-90	NO OBJECTION
FISHER 3	Photos of Boceks' property adjacent to Fishers 3-A: Bocek property view along frontage road 3-B: Bocek property view along frontage road	NO OBJECTION
FISHER 4	Photo of Mine Subsidence in Sheridan County	NO OBJECTION
FISHER 5	Letter from Todd Parfitt dated 01/30/17 denying informal conference	Evidence lacks relevance (WRE 401-03)
FISHER 6	Letter from Fishers to BKS Environmental Associates, Inc. dated 07/03/13	Exhibit is Hearsay (WRE 802)
FISHER 7	Email chain between BKS and Niles Veal (July, 2013) regarding trespass on Fisher property (<i>Brook 041660-041662</i>)	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
FISHER 8	Article dated 12/15/14 entitled "Feds To Boost Mine Blasting Emissions Rules" (Cheyenne (AP))	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
FISHER 9	Internet Blog posted on 02/04/14 entitled: "Photos: Hazardous Gas Clouds From Coal Mine Blasting In Southeastern Montana"	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
FISHER 10	WyoFile Article by Bleizeffer dated 02/22/13: "There's \$428M in Unfunded Abandoned Mine Reclamation Work in Wyoming"	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)

Exhibit No.¹	Description	Brooks' Specific Objection by Wyoming Rule of Evidence
FISHER 11	Sheridan Media Web Content Article dated 02/09/17 (<i>produced by Fishers in discovery</i>)	Evidence lacks relevance (WRE 401-03); Exhibit is Hearsay (WRE 802)
FISHER 12	Gerlach-Map (C-1 Objection Exhibit C) from Expert Report	NO OBJECTION

Exhibit 1

Interrogatory No. 3: Please identify the individuals who helped you prepare your objections to Brook Mining Co., LLC's Coal Mining Permit Application.

Answer: As discussed in the response to Interrogatory No. 1 above, Ms. Anderson consulted with Mr. Wireman, Dr. Marino, and Mr. Levit to prepare objections to the permit application. The objections were written by Ms. Anderson, and a draft was reviewed by Ms. Morrison and Bob LeResche, Powder River Basin Resource Council Board Chair.

Interrogatory No. 4: Please state the names, addresses, telephone numbers and places of occupation of all persons known to you to have any knowledge of any fact concerning the objections submitted by PRBRC, and for such person, please set forth the subject matter to which they are believed to have knowledge.

Answer: The facts relied upon in preparation of our objections were almost exclusively facts contained in the permit application, correspondence with DEQ staff about the permit application, and statements or representations made by Ramaco/Brook agents in the press or via the company's website, all of which are already known to Brook, its counsel, and its agents. Our objections were also based on personal knowledge of our staff, Shannon Anderson and Jill Morrison, about subsidence and coal fire issues in the area, landowner use of the area known to Ms. Anderson, landowner member concerns known to Ms. Anderson, and the recreation interests of our members known to Ms. Anderson. Our experts reviewed the permit application and correspondence between Brook and DEQ in developing their opinions. They also reviewed DEQ regulations and guidance documents related to coal mine permits. We have previously disclosed the scope of the expert review and the likely substance of their testimony at the hearing.

Certification

I have reviewed Powder River Basin Resource Council's responses to interrogatories provided to Brook Mining Co., LLC, and I attest to their truthfulness to the best of my information and belief.

Executed at Sheridan, WY, this 21 day of April, 2017.

Jill Morrison

On Behalf of Powder River Basin Resource Council

1 documents from the Environmental Quality Council
2 hearing on that matter?

3 **A Some of them.**

4 **Q** Did you happen to notice in those
5 documents that Big Horn Coal mentioned a rail
6 maintenance facility that it intended to
7 construct?

8 **A I don't remember seeing that.**

9 **Q** So with that example in mind, what other
10 places in these comments did you help gather facts
11 to support these comments?

12 **A The next section on impact of**
13 **conservation easements and recreation areas.**
14 **Yeah.**

15 **I mean, and every one of these issues,**
16 **you know, I had some sort of fact-gathering in**
17 **terms of reading and reviewing the permit, looking**
18 **at the maps, discussing it with our members, our**
19 **experts.**

20 **I would say, yes, I'm familiar with**
21 **every single area and pulled information related**
22 **to a lot of it.**

23 **Q** Given the facts that you gathered and
24 your knowledge of these comments, will you be
25 providing testimony to the Environmental Quality

O'BRYAN REPORTING SERVICE
(307) 672-3354

1 Council in support of these comments and
2 objections?

3 **A I don't plan to. We haven't determined**
4 **our final witness list, but we're relying**
5 **primarily upon our expert witnesses and our fact**
6 **witnesses with our landowners.**

7 **Q** That's what I'm driving at. What land
8 owners helped you prepare or gather the facts in
9 support of these comments?

10 **A Well, John Buyok, Anton Bocek. We've**
11 **had conversations with Mary and David Fisher,**
12 **Brook Collins, other members of ours that recreate**
13 **in the area, numerous members of ours that**
14 **recreate in the area.**

15 **Q** Besides landowners --

16 **A And then our experts Gerry Marino and**
17 **Mike Wireman.**

18 **Q** Fair enough. Besides the landowners you
19 just identified, who else that's employed by the
20 Council, so not a member, an employee, helped
21 gather facts that support the comments in
22 Exhibit 2?

23 **A Well, my colleague Shannon who is our**
24 **attorney.**

25 **Q** To your knowledge, does Ms. Anderson --
O'BRYAN REPORTING SERVICE
(307) 672-3354

1 did Ms. Anderson gather any facts that appear in
2 these comments or support these comments that are
3 known only to her?

4 **A The legal facts as a lawyer.**

5 **Q** Anything besides this?

6 **A I don't think so.**

7 **Q** If you would look back to Page Number 2,
8 Ms. Morrison, the top of Page 2, there's a Number
9 1 that says, General objections for the mine plan.
10 Do you see that?

11 **A Uh-huh.**

12 **Q** Under this section it's a discussion of
13 alleged varying estimates in the annual production
14 from the Brook Mine; is that a fair
15 characterization?

16 **A Yes.**

17 **Q** To your knowledge, does the Brook Mine
18 Permit Application list an estimate of annual coal
19 production?

20 **A What is listed in these comments is**
21 **Table MP-1-2. That looks like estimated annual**
22 **production.**

23 **Q** Do you know if that came from Brook
24 Mine's permit application?

25 **A I believe it did.**

O'BRYAN REPORTING SERVICE
(307) 672-3354

1 **Q** Now, you go on in here to -- the
2 comments go on to discuss that there have been
3 differing estimates The Press. And I see there's
4 a hyper link to an article, and I'm looking at
5 Page 3. I'm sorry, Ms. Morrison.

6 Are you aware of any changes that Brook
7 has made to its permit application in regard to
8 estimated annual production?

9 **A Well, I think as a question we have.**
10 **We've heard many different variations of what the**
11 **production is going to be.**

12 **And there's a few different places that**
13 **have been mentioned or listed, and so there's**
14 **conflicting information.**

15 **Q** My question, Ms. Morrison, is focused on
16 the permit application.

17 Are you aware of any changes that Brook
18 has made to the estimated annual production that
19 is listed in its permit application?

20 **A That's listed in the permit application,**
21 **I don't think so.**

22 **Q** All right. Would you turn with me to
23 Page Number 4 in Exhibit 2, please.

24 **A (Witness complies.)**

25 **Q** I'd like to talk to you about the bold

Adjudication

Comment AG 1

Please also provide copies of the complaint and the answer. If there are any motions that the court has ruled on limiting or deciding any of the claims or factual or legal questions originally at issue in the case, please also provide copies of the orders, the motions, the responses to the motions, and any supporting memoranda.

Response AG 1

The Applicant's position with regard to any surface interests that may be claimed by Padlock Ranch Company and/or Big Horn Coal Company is that the Applicant alone owns the sole dominant present property right to use these surface lands for the coal mining operation described in the application, as that application has been submitted and supplemented. Applicant's sole dominant surface ownership and use interest in the relevant lands derives directly from the 1954 Deed (Attachment B) and its express reservation language. Pursuant to the controlling Wyoming Supreme Court authority set out in *WYMO Fuels, Inc. v. Edwards*, 723 P.2d 1230 (Wyo. 1986) (Attachment C), when the Applicant already owns the dominant surface use rights for coal mining on the property, then the Applicant consents to its own use pursuant to its application by submitting the application and no other surface consents can or should be required under W.S. § 35-11-406(b)(xi). As the Land Quality Division is aware, to the extent that Padlock Ranch Company incorrectly claims some surface rights on any lands described in the 1954 Deed, it necessarily could only attempt to do so fully subject to the Applicant's sole dominant surface rights to mine coal. Under the *WYOMO Fuels, Inc.* decision, no consent from Padlock can be required. To the extent that Big Horn Coal incorrectly claims some surface use right in this area at this time, the Applicant is proceeding with quiet title litigation (Fourth Judicial District Court, Sheridan County, Wyoming Civil No. CV 2014-372) against Big Horn Coal on this issue and has asserted its sole dominant reserved surface right to use the surface described in the 1954 Deed to mine coal there without any consent from Big Horn Coal pursuant to the *WYOMO Fuels, Inc.* case decision. Accurate copies of the Applicant's pending summary judgment motion arguments on this issue are enclosed with this response (attachment D and E). The Applicant can and will supplement these pleadings with further documentation that is described in the pleadings upon request.

Comment AG 2

Therefore, the Division requests the Applicant to provide sufficient information and supporting documents for the Division to determine whether Padlock Ranch Company and Big Horn Coal Company are or are not "residential or agricultural landowners" under the statutory definition in W.S. § 35-11-406(b)(xi).

Response AG 2

Please see response AG 1.

Comment DM 1

Adjudication – Appendix B2 – Groundwater Rights – There is a groundwater well that is missing in this volume. The listing is as follows:

Barbula #2

Permit No. 85631W

Location: SW NW Section 21, T57N R84W

Please add this entry to the table and to any corresponding maps.

Response DM 1

Adjudication text page WR-12 has been updated to include Barbula # 2 (P85631W) as well as Adjudication Exhibits 5 & 8.

Appendix D1

Comment BJ 1

Appendix D1, Land Use, Table D1. 3-1; It is unnecessary to list the Expired Permit category of gas well permits. Since these APDs have expired without completion there is no related activity to the site. Listing of a non-event is not required. This also applies to the NO category since this indicates that the APD was refused, thus never became permitted through WOGCC.

Response BJ 1

Revised Table D1.3-1 as requested.

Comment SP 1

Appendix D-1. Exhibit D1.1-1. The landuses defined in Chapter 1 should be used on this Exhibit. Not the entire Brook Mine Permit falls neatly into these definitions so the following comments provide guidance:

- a) The railroad, primary roads, oil and gas wells, and the facilities for Taylor Quarry would be considered Industrial commercial and may be shown with the vertical line stippling. The rest of the vertical stippling should be removed.
- b) The 4.5 acres of Agricultural lands would have the Land use of Cropland. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no changes are needed to the map for this land use.

- c) The 12.8 acres of water might be listed under multiple landuses such as Grazingland, Fish and Wildlife habitat or Recreational. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no change is needed to the map for this land use.
- d) The 4,421.8 acres remaining should be shown as Grazingland and Fish and Wildlife habitat. The legend on the map should have Fish and Wildlife Habitat added to Past and Present Grazingland landuse. The stippled area on the map will stay the same.
- e) No changes are needed to the areas identified as Recreational.

Response SP 1

Revised Exhibit D1.1-1 as requested.

Comment SP 2

Appendix D-1. Text that refers to the areas mined as Industrial commercial should be revised to remove the mining. A reference to Section 1.6 on historic mining can be made in Section D1.3.1. Grazingland. The reclaimed mined lands are now being used as Grazingland. The difference between the mined and never been mined is defined as the vegetation community that is called Reclaimed. Section D1.6 discusses the historic mining of the area and the discussion on coal mining in Industrial commercial (D1.4.3) can be removed.

Response SP 2

Revised text as requested.

Appendix D2

Comment BJ 2

Appendix D2, History, There are no comments for this section of the application. The narrative is well written and comprehensive.

Response BJ 2

No response is necessary.

Appendix D3

No comments were received regarding Appendix D3.

Appendix D4

Comment BJ 3

Appendix D4, Climatology, General comment – Is there no data for climatology that is more recent than 1990? It exists, therefore needs to be represented. Please locate and include the most recent climatological data. Twenty year-old data bears little resemblance to Sheridan County climate today so characterization of the present climate with a 20 year gap is problematic. Please reevaluate the data in light of locating and use more recent information.

Response BJ 3

Revised wind, relative humidity, and degree day data to reflect period between 1990 and 2013. Note, as can be observed by updated data, little change occurred in averages reported for wind, relative humidity, and degree days. Therefore, the wind rose provided in Figure D4.2-6 is deemed to still be representative of the Sheridan area. Revised Figure D4.2-1, Figure D4.2-11, Table D4.1-1, Table D4.2-2, Table D4.2-3, and Table D4.2-7 in response to this comment.

Comment BJ 4

Appendix D4, Climatology, Section D4.2.6, Why was 65°F used as the baseline temperature? Also, why were the high and low temperatures set to 86°F and 50°F respectively? Please clarify.

Response BJ 4

Revised text to clarify the choice of high and low temperatures.

Comment BJ 5

Appendix D4, Climatology, Figure 4.2-11, Are the degree days the total number of days that match the data points for the entire period from 1961 through 1990? This indicates that the data represented along the Y axis covers a period of 30 years on a daily basis. Please clarify.

Response BJ 5

Revised text with definitions of heating, cooling, and growing degree days to clarify Figure 4.2-11. Degree days are essentially a unit of measure like temperature, velocity, etc. A degree day signifies the number of degrees per day to heat or cool to a specified base temperature (most commonly 65°F). Each degree day is summed over the course of a month to estimate the total number of degree days that month. For example, July may have 0 heating degree days because all days are over 65°F, but will have cooling degree days nearly every day of the month. Figure 4.2-11 shows the average monthly degree days over the specified periods of data.

Appendix D5

Comment BJ 6

Appendix D5, Topography, Geology, and Overburden Assessment, Section D5.4.1, Paragraph 2 refers to "marginally suitable Selenium levels" as defined in LQD Guideline No.1. Guideline 1 has two separate sets of chemical quality criteria tables. Appendix 1 occurs on pages 17-21 as well as on pages 38-43. The first set of tables have been superseded by the second set of tables. Please use the tables on pages 38-43 when determining material suitability. The first Appendix 1 is being removed from the guideline.

The newer tables define the Selenium target as follows:

Suitable < 0.3 ppm

Marginal 0.3 – 0.8 ppm

Unsuitable > 0.8 ppm (dependent on premining water quality and overburden quality)

These values are established for uplands and ephemeral drainages unless it can be shown that Selenium impregnated materials will be buried above the groundwater potentiometric surface and below the reclaimed surface root zone. Other quality criteria have not changed.

Response BJ 6

Revised text as requested to reflect the revised LQD Appendix 1.

Comment BJ 7

Appendix D5, Topography, Geology, and Overburden Assessment, Figure D5.3-2, What units are expressed in the figure as the %g? Please include a footnote clarifying the measurement parameter.

Response BJ 7

Updated Figure D5.3-2 as requested.

Comment BJ 8

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-1, Are the Northings and Eastings in State Plane coordinates? It is assumed that they are but please verify this. The title at the top of the page could read Drill Hole Tabulations (State Plane Coordinates)

Response BJ 8

Updated as requested.

Comment BJ 9

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-2, Please rearrange the Lithologic and Electric logs in such a way that the Electric log immediately follows the Lithologic log. This allows for a more comprehensive examination of the data.

Response BJ 9

Rearranged logs as requested.

Comment BJ 10

Appendix D5, Topography, Geology, and Overburden Assessment, Holes R12-000 through R12-020 have the Northings and Eastings reversed. Please correct.

Response BJ 10

Updated as requested.

Comment BJ 11

Appendix D5, Topography, Geology, and Overburden Assessment, The Lithologic logs with the AMBRE designation 02, 03, and 04 do not have coordinates or elevations. Please provide coordinates and elevations for these three holes.

Response BJ 11

Updated as requested.

Comment BJ 12

Appendix D5, Topography, Geology, and Overburden Assessment, Hole R13-018 appears to have erroneous coordinates. The Northing is listed as 11,941,802. It should probably be 1,941,802. The elevation is shown as 43,887.9, where it should probably be closer to 3,887.9. Please verify and correct.

Hole R13-024 has a very high Northing at 61,941,541 and elevation at 73,885.4. These may be 1,941,541 and 3,885.4, respectively. Please verify and correct

Response BJ 12

Updated as requested.

Comment BJ 13

Appendix D5, Topography, Geology, and Overburden Assessment, A suggestion for future exploration: Ask the geophysical logger to reduce the gain on the gamma logs. The readjustment bounce on the logs makes them a bit difficult to read and interpret.

Response BJ 13

No response required.

Comment BJ 14

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-5, Pg. D5-5-4, The splitting tensile strength tests were run on four (4) samples from two (2) holes representing roof, coal, and floor conditions.

- a) Why were these locations used as representative of the lithologies encountered during mining?
- b) Are these few samples representative of all conditions expected to be encountered by the continuous miner (CM)?

Please elaborate and clarify the narrative. A statement must be made that strength testing will be performed on at least one set of samples per mining panel prior to use of the CM to insure that conditions are favorable for roof retention without subsidence. Lithology in this area is inconsistent and rock strength can vary accordingly. Using the data provided on the four samples tested indicates that some of the overburden from hole R13-19 is unsuitable for highwall mining, based on the CAT® Site Evaluation Tool For Highwall Miners;

(<http://webtools.cat.com/globalmining/highwallminers/index.html>).

Response BJ 14

Appendix D5 Section D5.3.3.2 has been updated as requested.

Comment BJ 15

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-4, Exhibits 1 – 7, Please include the drill hole locations on these isopach maps.

Response BJ 15

Updated as requested.

Comment BJ 16

Appendix D5, Topography, Geology, and Overburden Assessment, Exhibit 8, The map labeled as the isopach map of the Lower Masters bed is a contour of a surface. Please replace the contour map with the appropriate isopach map

Response BJ 16

Updated as requested.

Comment BJ 59

EXHIBITS, Addendum D5-4, Exhibit 1, The title on the map declares that this is an overburden isopach, but the bed name is missing. Please indicate which bed this map pertains to.

Response BJ 59

Updated Exhibit 1 of Addendum D5-4 as requested.

Comment BJ 60

EXHIBITS, Addendum D5-4, Exhibit 8, The name of the PDF file for this exhibit indicates that this is an isopach map of the Masters Lower coal bed. The title in the map indicates that this is the contour of the base of the Masters coal seam. Please correct the title of the PDF file.

Response BJ 60

The title of Exhibit 8 of Addendum D5-4 will be revised in the electronic copy, as requested.

Comment BJ 61

EXHIBITS, Addendum D5-6, Exhibit 1, We commend RAMACO for sampling overburden locations on 80 acre spacing. There are some gaps in the sampling plan, however, that need to have core holes drilled to fill them. The underground Coal Rules and Regulations in Chapter 7, Section 1(a)(i) are specific on ensuring that overburden geology is characterized in all locations where overburden will be removed or subsidence may occur. This essentially means that all areas above the planned coal panels need representative cores drilled to a sufficient density, approximately one hole for every quarter section of affected area. Based on that, the following locations still need to be characterized by overburden sampling:

NE1/4, sec.22, T.57N., R.84W.

NW1/4, sec.15, T.57N., R.84W.

NW1/4, sec.14, T.57N., R.85W.

SE1/4, sec.10, T.57N., R.85W.

Response BJ 61

A drilling rig was not able to enter the areas NW1/4, Sec.14, T.57N., R.85W and SE1/4, Sec.10, T.57N., R.85W. due to the steepness of the terrain, therefore no samples were obtained. Sampling data for drill holes BH 166-78 and BE 326-78 have been incorporated into Addendum D5-2 and Addendum D5-7 to characterize the overburden in Sections 15 and 22.

Comment BJ 62

EXHIBITS, Addendum D5-6, Exhibit D5.1-1, Kudos to the staff member that created this slope analysis map. It is clear and concise and the histogram is very informative. Good job.

Response BJ 62

Thank you for this comment.

Comment DS 1

Appendix D5, The Coal Rules and Regulations, Chapter 7, Section 1(a)(i)(A) states that information required for the geological description pursuant to Chapter 2, shall be as follows: for areas where surface operations and facilities will cause removal of overburden down to a level of the coal seam, all information outlined in Chapter 2. Overburden sampling has not been performed in many of the locations where overburden will be removed during the mining operations. Additional sampling will be required to assess overburden chemistry in all areas where overburden removal will occur. The intensity of sampling should be 1 core per 160 acres (per quarter section). The LQD requests sampling every 1,900 linear feet on longer proposed disturbance areas or, at minimum, two cores within shorter disturbances separated sufficiently to provide a representative characterization of the proposed disturbance.

a. Not all overburden has been characterized during analysis. Several lenses of shallow coal mixed with partings or narrow coal seams that will not be mined were not characterized. Because all overburden must be handled so as not to negatively affect surface water, groundwater or vegetation, all overburden must be adequately characterized. Therefore, the LQD requests additional characterization of all overburden that will be backfilled into disturbed areas. It must also be stated that special handling and/or identification and use of topsoil/subsoil replacement may be required if unsuitable backfill or soil is placed within 4 feet of the surface on upland areas or within 10 feet of the surface in stream channels.

Response DS 1

Please see response to BJ 61.

Comment DS 2

Appendix D5, Section D5.4. – documentation of protocols that differ from those approved by the Administrator in Guideline 1 typically require a signed document by LQD staff, not a request for different procedure signed by the company. This issue has been discussed with other mining companies and it has been determined that documentation of approval by LQD staff will be required if sampling/analytical protocols differ from those required by standing LQD policy. Please provide documentation of LQD staff approval for the 10-ft. overburden sampling interval.

Response DS 2

See Attachment A to this response package. This has also been added to Addendum D5-6 pages 4 and 5.

Comment DS 3

Appendix D5, Table D5.4-1 and Table D5.4-2 do not provide the current approved selenium concentration limits of 0-3 ppm (suitable), 3-8 ppm (marginal) and > 8 ppm (unsuitable). Please be sure to include the current approved suitability criteria as shown in Guideline 1, page 42. This will change the conclusions of the discussion provided in the Appendix D5 text. Also, in Table D5.4-2, please provide the correct units for analytical results in mg/Kg, not mg/L.

Response DS 3

Please refer to BJ 6 response. Appendix D5 text, Table D5.4-1, and Table D5.4-2 are updated as requested.

Comment DS 4

Appendix D5, The permit application provided to LQD staff for review has duplicated data provided after the map identified as Exhibit 1 which should be deleted. The exhibit should also be better identified as Exhibit D5-1 or something similar to clarify placement in the permit application should it become separated from the document in the future.

Response DS 4

The electronic copies were provided to LQD staff for review purposes. The hard copy on file is the official version. Also, please see response to Comment DS 5.

Comment DS 5

Appendix D5, Comparisons were made between Exhibit 1, the soils map and the Mine Plan map. Distinct differences in the affected area and permit boundaries were observed. Please be sure that correct boundaries for the proposed affected area and permit area are provided on all maps. Please also provide the contour interval on this exhibit.

Response DS 5

Addendum D5-6 is a copy of the overburden sampling plan as presented to WDEQ on 8/26/2013, which referenced Exhibit 1. Therefore, no changes to the exhibit will be made.

Comment KM 2

Appendix D5, Page D 5-9 refers to samples collected from roof and floor from “many” locations throughout the permit area. However, supporting documentation appeared to be from only two borings and included two roof and one floor sample. In addition, the laboratory noted the floor sample did not have sufficient length and a correction factor was used to determine unconfined compressive strength. Additional structural analysis of the overburden, interburden and floor is required.

Response KM 2

During preparation of the MSHA Ground Control Plan additional coring of the coal and overburden will occur, data gathered from this activity will be supplied to WDEQ/LQD when it is received. Please see response to BJ 14.

Comment KM 3

Appendix D5, Please provide a discussion of the structural analysis of the overburden and interburden. The discussion shall address the potential for subsidence during and after mining.

Response KM 3

Structural analysis of the overburden, interburden, floor, and roof must be conducted for the MSHA Ground Control Plan. Information gathered for this plan will be provided when it is received. No text was updated in response to this comment. Please see response to BJ 14.

Comment KM 4

Appendix D5, Please discuss the aquifer(s) below the lowest coal seam and the potential for mining to impact these aquifer(s).

Response KM 4

The lowest coal seam targeted for mining is largely dry and is also confined by a clay layer. The underburden is not considered an aquifer therefore no impacts will occur.

Comment Muk 1

Appendix D5, Section D5.3.3.2 Overburden and Interburden, 1. This section provides a discussion of the thickness of interburden and not overburden. Please provide a discussion (or a reference) on the thickness of the overburden. (MK)

Response Muk 1

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.2.

Comment Muk 2

Appendix D5, Section D5.3.3.3 Coal, 2. On Page D5-10, there is a good discussion about the thickness of the two coal seams. Please provide a description on the depth from land surface to these coal seams. (MK)

Response Muk 2

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.3.

Comment Muk 3

Appendix D5, Section D5.3.3.3 Coal, 3. Page D5-10 states, "Monarch seam exist within isolated portions of the mine areas as shown on the geologic cross sections in Addendum D5-3 and may present a secondary target." However, Table D5.3-2 does not provide the coal quality characteristics for Monarch coal seam. If monarch seam is part of the mine plan, please include the coal quality characteristics of Monarch coal seam in Table D5.3-2 and a description of thickness and depth from land surface.

Response Muk 3

Table D5.3-2 has been updated with the coal quality characteristics for the Monarch seam. The overburden and seam thickness are included on the geologic cross-sections located in Addendum D5-3 referenced in the text.

Comment Muk 4

Appendix D5, Section D5.3.3.3 Coal, 4. Please include a discussion on Dietz (1, 2, 3) coal seams, if they are present in the mine permit boundary. If they are part of the mine plan, please include the coal quality characteristics in Table D5.3-2. (MK)

Response Muk 4

Discussion about the Dietz seams has been added in Section D5.3.3.3. These coal seams are not part of the currently proposed Mine Plan. Therefore, the quality data were not included in the table.

Comment Muk 5

Appendix D5, Section D5.3 Geology of Mine Area, 5. Please provide a description of the stratigraphic units below the Masters coal seam. (MK)

Response Muk 5

Section D5.3.3.4 has been added to discuss the underburden.

Comment Muk 6

Appendix D5, Addendum D5-3 Geologic Cross Sections, 6. Several of the geologic cross sections show UNK – unknown coal seam (Stringer). Please include a brief discussion about this stringer in Section D5.3.3.3 (MK)

Response Muk 6

Discussion about the stringers with unknown names has been added to Section D5.3.3.3.

Comment Muk 7

Appendix D5, Addendum D5-4 Isopachs, 7. Please include the wells/drill holes (control points) used to interpret the isopachs and elevation contours in the maps. In addition, label all the control points with names and the thickness (or elevation, as appropriate). This comment is applicable to Addendum D5-4, Exhibits 1 through 8. (MK)

Response Muk 7

Addendum D5-4 Exhibits 1 to 8 have been updated with drill hole locations as requested. A reference to Addendum D5-2 has been added to the exhibits for seam name and thickness.

Comment Muk 8

Appendix D5, Addendum D5-5 Overburden, Roof and Floor Sample Analysis Table, 8. Please describe these analyses, methodology, results and provide an interpretation of their applicability to the mine/reclamation plan. (MK)

Response Muk 8

Please see response to BJ 14.

Appendix D6

Comment BJ 17

Appendix D6, Hydrology, Section D6.2.3, Pg. D6-20, Narrative in the last paragraph – why were no samples taken in Hidden Water Creek? Please explain.

Response BJ 17

No flow was observed in Hidden Water Creek during baseline sampling, so no samples were taken. The text has been revised to reflect that there were no flows observed.

Comment BJ 18

Appendix D6, Hydrology, Table D6.1-8, Regarding the HEC-RAS modeling results – The values for Hidden Water Creek and Slater Creek are identical. Is this accurate or is it a typographical error? Please clarify.

Response BJ 18

Updated table to remove typographical error.

Comment BJ 19

Appendix D6, Hydrology, Addendum D6-7, The well construction summary sheets need to have the coal bed names listed on the well lithology sections to the right of the well diagrams. Please label accordingly.

Response BJ 19

Updated as requested.

Comment BJ 20

Appendix D6, Hydrology, Attachment D6-8-A, Pg. D6-8-20, A statement is made that water within both coal seams is expected to be "high quality" and "good" water. Please define the meaning of those characterizations. Are these judgments based on MCLs or some other value? Are they being classified by some constituent values? Or is there another metric being used? Please clarify.

For example; referencing WQD R&R, Chapter 8, Table I, Class I,II, or III would better define the essential characteristics of the water quality. Numerical values of critical constituents, such as TDS, could also serve to define the quality as "good". More descriptive qualifiers are needed to judge the water quality.

Response BJ 20

Revised text as requested.

Comment BJ 21

Appendix D6, Hydrology, Attachment D6-8-E, Hydrographs, The x parameter, time, is depicted in days. It appears that this scale should have been adjusted to show time in hours due to the rapid changes seen in the hydrographs. Please use a finer scale for the x axis.

Response BJ 21

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-36a and D6-8-37a. These additional hydrographs detail the water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 22

Appendix D6, Hydrology, Attachment D6-8-F, The above mentioned comment can also be applied to the Carney well hydrographs. Please adjust the x axis to hours.

Response BJ 22

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data as well. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-39a and D6-8-40a. These additional hydrographs detail the water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 23

Appendix D6, Hydrology, Addendum D6-9, Pg. D6-9-2, Please include a column in Table D6-1 that indicates the elevation of the bottom of the well or TD. The total water column is important when assessing groundwater characteristics. Please correct.

Response BJ 23

Table D6-1 has been revised as requested.

Comment BJ 24

Appendix D6, Hydrology, Addendum D6-10, Pgs. D6-10-28 through D6-10-53, On the sample analysis reports, Please provide a brief narrative at the beginning of the lab results to give context to the data. Footnotes on the pages refer to MCLs or other parameters of water quality used for classification. However, the context that is used to define these parameters is missing. The assumption is made that these quality values are derived from the WQD R&R, Chapter 8, Table I definitions. But that is

uncertain as no frame of reference is given. A brief sentence or two at the beginning of the section would clarify the numerical standards used in the report. Please adjust the narrative accordingly.

Response BJ 24

Page D6-10-27a was added to provide the requested narrative.

Comment BJ 25

Appendix D6, Hydrology, Please include the lithology of the sampled zone, either in the sampling information sheets, or on the sample analysis reports. Identification of the lithology sampled needs to be readily available with the analysis. This applies to all increments sampled. The sampled zones do have identification on the sample sheets with a shorthand nomenclature but persons unfamiliar with the lithology of the prospect area would be at a disadvantage when evaluating the sample results. A simple reference table at the beginning of the section would be sufficient. For example; MST=Masters, CRN=Carney, AL=Alluvium. Non-geologists need some frame of reference. Please create a clarifying narrative.

Response BJ 25

Reference text with abbreviations defined has been added on page Addendum D6-10-27a, as requested.

Comment DM 2

Appendix D6-Hydrology, D6.1x – The drainage basin description and surface water quantity sections are lacking detail. As mentioned in M. Kunze's comments, the data from the terminated Slater Creek USGS gauge, and historical monitoring data from Big Horn Mine (permit no. 213) should be included.

The data collected at the monitoring stations that is presented in Addendum D6-4 does not appear to agree with the statement that Slater Creek is a "predominantly ephemeral" stream. Please reconcile the text with the data.

Response DM 2

Peak flow data from the USGS gage station on Slater Creek has been provided. See response to MK 30. The text in Section D6.1.5.2 has been updated to clearly indicate that Slater Creek is an ephemeral stream.

Comment DM 3

Appendix D6-Hydrology, D6.2.4 States that Groundwater Rights are in Appendix E2 of the Adjudication Volume. Groundwater Rights are actually listed in Appendix B2. Please Correct.

Response DM 3

Text revised as requested.

Comment KM 5

Appendix D6, 2. The pre-mining potentiometric map for the Masters coal seam shows the elevation of the groundwater at a higher elevation than the surface elevation in Sections 11 and 12 (in the vicinity of Slater Creek outside of the permit area). Either show the potentiometric surface as dotted across this area or revise the potentiometric lines such that the groundwater elevation is below the ground surface elevation. Issue addressed by BJ Kristiansen. Please see comment No. 65.

Response KM 5

Exhibits D6.2-2 and D6.2-3 have been revised as requested.

Comment KM 6

Appendix D6, 3. The groundwater elevation for the Carney coal seam in monitor well 578417-CRN was given as 3795.59. The potentiometric contour for 3800 is drawn south of this monitor well. Please correct the contour line to be consistent with the groundwater elevation shown for monitor well 578417-CRN. Correction of this contour line may also adjust how the contour lines for 3780 and 3760 are drawn, such that they may be drawn consistent with other contour lines.

Response KM 6

Contours in Exhibit D6.2-3 have been revised as requested.

Comment KM 7

Appendix D6, 4. Page D6 8-8: The text refers to the pump test in the Carney coal seam. According to the procedures in the previous section, transducers were placed in CRN and CRN-OB; however on the referenced page, it states transducers remained in MST and MST-OB after pumping. LQD believes this to be a typographical error.

Response KM 7

LQD is Correct, this is a typographical error. The sentence should read "After the pumping period, the transducers remained in CRN1 and CRN-OB until 8:00AM on November 16, 2013. Page D6-8-8 has been updated with the typographical error corrected and a replacement page is included.

Comment KM 8

Appendix D6, 5. Please discuss why the water levels rose in the Carney coal seam during the pump test in the Masters coal seam.

Response KM 8

This comment is addressed in comment 19 from Muthu Kuchanur.

Comment KM 9

Appendix D6, 6. What effect would a leaking pump have on the results of the pump test in the Masters coal seam?

Response KM 9

This comment is assumed to originate from the note on page Addendum D6-8-30. This note is in reference to activities that occurred immediately after the pumping test was shut off. The pump used for the pumping test did not have a foot valve. Therefore, after the pump was shut off, water in the discharge pipe immediately began to drain back into the well. The pump and piping was pulled out of the well as fast as possible and not all of the water in the pipe drained back into the well. However, the personnel conducting the pumping test were concerned that the water draining into the well would result in a rapid rise in the water level in the well and wanted to note it for the record on the field data sheet. It is estimated that less than 2 gallons of water actually drained out of the line into the well while the pump was being pulled which would result in a water level rise in the well of less than 0.25 foot. Given that the water level recovery in the well was very rapid immediately upon cessation of the pumping test (approximately 2 feet in the first ten minutes after the pumping test ended) and the early time recovery data was largely ignored for the purposes of doing the aquifer characterization evaluations, the leaking pump would not have had an impact on the results of the pumping test.

Comment KM 10

Appendix D6, 7. Please make sure all maps that are stamped are also signed and dated by the engineer, as required by regulation.

Response KM 10

All maps that are stamped will be signed and dated by the engineer as required by law. This does not include digital versions. The digital copies have been provided for WDEQ review. The hard copy is the official copy.

Comment MK 29

Appendix D6-Hydrology, Section D6.1.2 Drainage Basin Description, 3. On Page D6-2 it is stated that Slater Creek is an ephemeral stream. Aerial imagery shows a riparian area with trees and subirrigation occurring along much of the channel. PEM wetlands are also present as documented in Appendix D10. It would seem that an ephemeral stream may not be able to support these features. Please provide the justification why Slater Creek is considered an ephemeral stream, and that the stream does not contain

intermittent characteristics where it is not below the local water table for a portion of the year. (MDK)

Response MK 29

Please see response to DM2.

Comment MK 30

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 4. The USGS operated a peak flow gage on Slater Creek from 1967 to 1981 (Station No. 06299900, http://nwis.waterdata.usgs.gov/wy/nwis/inventory/?site_no=06299900&agency_cd=USGS). The gage was located just downstream of the proposed permit boundary near the confluence with the Tongue River. Please incorporate the annual peak flow data from this station into the permit application to illustrate the range of peak flows that might be expected from Slater Creek. (MDK)

Response MK 30

The text and Tables D6.1-2 and D6.1-3 have been revised to include peak flow data for USGS Station No. 06299900.

Comment MK 31

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 5. Some of the U.S. Army Corps of Engineers references cited in the text (2000, 2001) do not appear in the References Section (Section D6.3). Please add these to the references list. (MDK)

Response MK 31

The text edits have been made as requested.

Comment MK 32

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 6. Please add the year to the Miller reference within the text (2003) and add this citation to the references list in Section D6.3. (MDK)

Response MK 32

The text edits have been made as requested.

Comment MK 33

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 7. Please explain in the text if the existing impoundments (stock reservoirs, old mine pits, etc.) in both the Slater Creek and Hidden Water Creek drainages were considered in the routing functions for

the HEC-HMS runoff estimates. These features would likely have an effect on attenuating peak flows. (MDK)

Response MK 33

The text has been revised to clarify the impoundments are not included the HEC-HMS model. As described, peak flow estimates should be conservatively high without attenuation of storm events by impoundments.

Comment MK 34

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 8. As the text states on Page D6-5, the HEC-HMS runoff estimates in Table D6.1-7 are higher than the Miller (2003) equation estimates. Please provide a discussion in the text as to the reasonableness of the HEC-HMS estimates and why the HEC-HMS estimates are so much higher than the Miller (2003) equation estimates.

The Miller (2003) equation for this region used, in part, data from the USGS peak flow gage on Slater Creek, so it would seem that the Miller (2003) estimates may be more reasonable. For example, compared to the HEC-HMS estimates, the 15-year record from the peak flow gage on Slater Creek would not register at anything greater than a five-year event. Furthermore, the May 18, 1978 event on Slater Creek resulted in a peak flow of 1,100 cfs, which according to the HEC-HMS estimates would only be around a 2-year event. USGS studies have shown that the May 1978 flood event was estimated to be a 100-year event on some parts of the Tongue River in this area (<http://pubs.usgs.gov/pp/1244/report.pdf>). (MDK)

Response MK 34

A discussion in the text has been included that speaks to why the HEC-HMS results are higher than the Miller results. Additionally, a discussion acknowledges the report by the USGS on the May 1978 flood. The Miller analysis does appear to more closely estimate the peak flowrates for flood events for the short data record on Slater Creek. However, hydraulic calculations will continue to use the HEC-HMS results because of the conservative results and the ease in comparing to the postmining hydrologic environment. HEC-HMS provides a way to change the properties of the drainage basins to reflect what will be present postmining, and the comparison between the premining and postmining HEC-HMS models quantifies the magnitude of the impact the Brook Mine will have on the hydrologic balance.

Comment MK 35

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 9. Please add the northing/easting State Plane coordinates for the four Brook Mine surface water monitoring stations to Table D6.1-11. (MDK)

Response MK 35

The locations of the surface water monitoring sites have been reported to the quarter-quarter, which is an adequate level of accuracy to report the monitoring locations.

Comment MK 36

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 10. On Page D6-8, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

Response MK 36

The text has been revised as requested.

Comment MK 37

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 11. On Page D6-8, second paragraph, it states that increased E.Coli from samples collected in 2006 were attributable to high flows in May-June 2010. Were the samples also collected in 2010 and not 2006? Please revise this sentence. (MDK)

Response MK 37

The sentence was revised to read more clearly. The sentence was saying that samples taken in 2010 experienced an increase in E.Coli bacteria compared to the samples collected in 2006.

Comment MK 38

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 12. On Page D6-8, second paragraph, it would be informative to add that, in addition to the SCCD, other entities such as the Big Horn Mine, USGS, and WDEQ/WQD have collected water quality data on the Tongue River and Goose Creek near the proposed mine. It may also be informative to mention that sections of the Tongue River in the vicinity of the proposed mine are on the State's 303(d) list since certain uses are not supported due to impaired water quality. Goose Creek has also been on the 303(d) list in the past and a TMDL has been prepared. Information can be found at: <http://deq.wyoming.gov/wqd/water-quality-assessment/resources/reports/> and <http://deq.wyoming.gov/wqd/tmdl/>. (MDK)

Response MK 38

The text has been revised as requested. Refer to Section D6.1.5.1.

Comment MK 39

Appendix D6-Hydrology, Section D6.1.5.2 Surface Water Quantity, 13. The Big Horn Mine (WDEQ/LQD Permit 213) operated a station on Hidden Water Creek (HWC1-79) from 1979 to 1998. This station was located approximately ¼ mile upstream from station SM578415-SW-1 that was installed by the Brook Mine. The LQD Hydrology Database contains mean daily flow data from this station from 1982 to 1997, although several years are missing data. Baseline water quantity characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic format upon request or a more complete dataset may be available if requested from the Big Horn Mine. (MDK)

Response MK 39

Please see response to DM 2 and MK 30.

Comment MK 40

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 14. Please briefly discuss in the text the water quality results from Slater Creek in the context of WQD Surface Water Quality Standards for Class 3B waters (see Chapter 1 of WQD Rules and Regulations). This would reveal whether or not designated uses were being met prior to mining. The two samples from Slater Creek indicate no exceedences of Class 3B criteria, indicating uses are supported. (MDK)

Response MK 40

The text has been updated as requested.

Comment MK 41

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 15. It is understood that water was not flowing in Hidden Water Creek so the applicant could not collect a sample for baseline purposes. However, as previously mentioned, the Big Horn Mine operated a station on Hidden Water Creek (HWC1-79) from 1979 to 1998. The LQD Hydrology Database contains nine water quality samples collected at this site from 1979 to 1989. Baseline characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic format upon request. (MDK)

Response MK 41

Request for information is pending. No update to the permit has occurred at this time in response to this comment.

Comment MK 42

Appendix D6-Hydrology, Section D6.1.5.4 Sediment Transport, 16. This section would be enhanced by including data from a single sediment sample collected on Slater Creek at USGS Station No. 06299900 (peak flow gage previously discussed in Comment No. 4). This sample was collected in June 1967 at a flow of 18 cfs. The TSS was 11,600 mg/L and the suspended sediment discharge was 564 tons/day. (MDK)

Response MK 42

The text has been revised to include the additional sediment sample as requested.

Comment MK 43

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 17. A rating curve developed using only the Manning equation will provide only a rough estimate of flows given the uncertainty in the Manning's roughness coefficient. It is recommended that direct discharge measurements also be taken over time to help evaluate the rating curves developed for the four monitoring sites. (MDK)

Response MK 43

The rating curves were developed for ephemeral streams that flow infrequently enough that water measurements cannot be taken at regular intervals. Manning's equation provides a reasonable and widely accepted mathematic approximation of stream flow rates.

Comment MK 44

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 18. Given the uncertainty in the Manning equation, the estimated flow rates provided in Table D6-3 and Attachment D6-5-A (Rating Tables) are reported at much too high a level of precision to be meaningful. Depending on the magnitude of the flow estimate, there should be only one or two significant figures provided. For example, 0.29 cfs = 0.3 cfs and 3,584.38 cfs = 3,600 cfs. Please revise these tables. (MDK)

Response MK 44

Summary Table D6-3 has been revised to engineering precision (no more than three significant figures). The values in Attachment D6-5-A are essentially raw data that are being reported to that magnitude to show the validity of calculations and to aid in curve development. Being raw data, the values were not revised from those previously reported.

Comment Muk 9

Appendix D6, Section D6.2.1 Regional Hydrogeology, 9. Page D6-12 states, "The potential groundwater in the formation as capable of yielding small quantities of water

for domestic and stock use”. Please consider providing a range of estimates for well yields based on literature review or from the baseline data collected by the Brook Mine. (MK)

Response Muk 9

The text has been revised to indicate that coal is the only regional shallow aquifer that has a sufficient quantity of water to support domestic and stock use.

Comment Muk 10

Appendix D6, Section D6.2.1 Regional Hydrogeology, 10. The description in this section discusses only about the Fort Union formation. Please provide a description of the overlying and underlying water-bearing formations (aquifers) and describe their hydrogeologic characteristics (flow direction, gradients, aquifer properties, general outcrop locations) on a regional context. It is noted that some of the overlying formations may be dry or discontinuous within the mine permit boundary. (MK)

Response Muk 10

Section D6.2.1 has been updated as requested.

Comment Muk 11

Appendix D6, Section D6.2.1 Regional Hydrogeology, 11. Page D6-12 states, “The overburden is comprised of sand lenses, clinker and alluvial that have the potential of water bearing bodies. Due to the topography in this area, the valley cut through these deposits. Therefore, they are discontinuous and would not hold large quantities of water.” It is noted that they are discontinuous and would not hold large quantities of water. Please provide additional justification for this statement by using the hydrogeologic data collected by the Brook Mine including any reference to the interpreted extent of dry zones based on drill holes, monitor wells and other applicable data. (MK)

Response Muk 11

Section D6.2.1.1 has been updated as requested.

Comment Muk 12

Appendix D6, Section D6.2.1 Regional Hydrogeology, 12. Please clarify if there were groundwater springs or seeps observed in the areas within or adjacent to the mine permit boundary. Include a discussion (or reference) on the surface water - groundwater interactions.(MK)

Response Muk 12

Section D6.2.2.5 has been updated as requested.

Comment Muk 13

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 13. Page D6-13 states, “No monitoring wells were completed in the overburden or interburden as no water was found in these units during drilling operations”. This information is critical in demonstrating the overlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (both overburden and interburden) and their depths that were used to make this determination. (MK)

Response Muk 13

Section D6.2.2.1 has been updated as requested.

Comment Muk 14

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 14. Page D6-13 states, “Also one well 578409-MST-UB showed the presence of water in the underburden, while all the other wells drilled into the underburden were dry and therefore not completed as wells.” Similar to the previous comment, this information is critical in demonstrating the underlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (underburden) and their depths that were used to make this determination. (MK)

Response Muk 14

Please see response to Muk 13.

Comment Muk 15

Appendix D6, Section D6.2.2.2 Aquifer Tests, 15. Page D6-15 states, “Alluvial materials were also not analyzed during the aquifer testing.” The alluvial aquifer materials are one of the key factors in determining any impacts caused by mining to the alluvial aquifer. Alluvial aquifer tests will be helpful in understanding any surface water – groundwater interactions. Please provide justification for not conducting any aquifer tests in the alluvial wells. (MK)

Response Muk 15

The text in Section D6.2.2.2 has been updated.

Comment Muk 16

Appendix D6, Section D6.2.2.2 Aquifer Tests, 16. Please provide justification for not observing the groundwater level responses in the alluvial aquifer during the two aquifer tests conducted by Brook mine. (MK)

Response Muk 16

No alluvial material was present in immediate vicinity of the clusters used for the pumping tests, hence there was no alluvial aquifer to monitor. Hidden water creek located to the east of the tested well cluster would be potentially the nearest location of alluvial material, however as noted in Appendix D11 the fill material in Hidden Water Creek is more colluvial than alluvial.

In addition, as shown on the well completion summary logs in Addendum D6-7, multiple claystone intervals are located between the Carney Coal and the surface at the well cluster where the pumping tests were conducted. The top of the Carney Coal is approximately 90 feet below ground surface at the cluster well location which is approximately 50 feet below the level of any colluvial/alluvial deposits in Hidden Water Creek. Similarly, the potentiometric head in the Carney coal is some 50 feet below the level of the colluvial/alluvial deposits in Hidden Water Creek and if there were a direct hydraulic connection, there would be no water in the Hidden Water Creek colluvium/alluvium. Given the confining intervals between and the significant difference in potentiometric head between the Carney Coal and the Hidden Water Creek colluvium/alluvium, additional shallow monitoring above the Carney Coal was not necessary.

Comment Muk 17

Appendix D6, Section D6.2.2.2 Aquifer Tests, 17. Page D6-16 states, "A report of these tests can be found in Addendum D6-8 and summary tabulation of the aquifer test results is included in Table D6.2.2". Please consider including a comparison of these estimated aquifer properties with the aquifer tests conducted in other similar coal seams in the Powder River Basin (Example: Bighorn Mine). Given the number of tests conducted by the mine, this will increase the robustness of the reported estimates from the two aquifer tests. (MK)

Response Muk 17

As requested aquifer test results from Big Horn Coal Company and from the Youngs Creek Mine were added to the text.

Comment Muk 18

Appendix D6, Section D6.2.2.2 Aquifer Tests, It is noted that the aquifer tests were conducted for ~640 minutes. Will an increased aquifer test duration change the observed lack of interaction between the coal seams and the underburden? Please clarify with a brief description. (MK)

Response Muk 18

Given the head differences between the static water levels in the Carney Coal, Masters Coal, and the underburden it is unlikely that additional pumping would have resulted

in any impacts to the water levels in the underburden. As shown on Table D6-2, (page Addendum D6-8-13) the initial water level in the Carney Coal was approximately 11.5 feet higher than the water level in the Masters Coal and the initial water level in the Masters Coal was approximately 9 feet higher than the initial water level in the underburden well. If there were a hydrologic connection between the aquifers, it is likely that the water levels in the aquifers would have already come into equilibrium.

Comment Muk 19

Appendix D6, Section D6.2.2.2 Aquifer Tests, 19. The referenced Addendum D6-8, Table D6-2 shows an increase in water levels in two of the Carney coal seam observation wells during the Masters coal seam well pumping test. Please provide an explanation for this increase in water levels during the aquifer test. (Noordbergum effect?). (MK)

Response Muk 19

Upon review of the raw data collected during the pumping test it was noted that the drawdowns reported in Tables D6-2 and D6-3 were incorrectly reported. Replacement tables are included with this round of comment responses. As shown on the updated version of Table D6-2, the water level in both Carney observation wells (CRN-1 and CRN-OB) increased by 0.23 feet during the Masters coal pumping test. While the Noordbergum effect or other natural phenomena such as earth tides could have potentially influenced the water levels in adjacent aquifers during the pumping test, the increase in water levels can be largely attributed to barometric pressure changes. Water levels in the Carney observation wells were monitored using hand held electric lines and there were no adjustments for barometric pressure reported in Table D6-2. No site specific barometric data was collected during the pumping test period. However, to evaluate how barometric pressure changes may have impacted water levels in the wells, barometric data from the automatic weather observing station (AWOS) at the Sheridan County airport was obtained from the National Oceanic and Atmospheric Administration (NOAA) database. Barometric data from the Sheridan County Airport AWOS site was compared to water level measurements in Attachment D6-8-K. The data in Attachment D6-8-K demonstrates a clear correlation between barometric pressure and water level variations in the Carney coal monitor wells during the Masters coal pumping test. Generally over the course of the Masters coal pumping test the barometric pressure went down (roughly 0.31 feet). A decrease in the barometric pressure is expected to result in an increase in water levels in a confined aquifer like the Carney coal aquifer which is what was observed.

Similar increases in water levels were also noted in the Masters Coal observation wells (MST-1 and MST-OB) during the Carney pumping test as noted on Table D6-3. Attachment D6-8-K demonstrates a clear correlation between decreasing barometric pressure and rising water levels in the Masters coal observation wells during the Carney Pumping test. In addition, during the Carney coal pumping test, water levels

in the Masters coal observation wells were still recovering from drawdowns induced during the Masters coal pumping test which may also have contributed to rising water levels in the Masters coal. The increase in water level measured in the Masters coal observation wells is attributed to a combination of continuing water level recovery and barometric effects.

Only very minor water level variations in the Masters underburden well (MST-UB) were noted during both pumping tests. As shown on the well completion form in Addendum D6-7, (Page D6-7-8) MST-UB was completed in an interval that was predominately claystone and the estimated yield is less than 2 gpm. Essentially the strata in which MST-UB is completed is more of an aquitard than an aquifer. As a result, it takes a lot longer for the water levels in the well to adjust to changing atmospheric pressure because water does not enter or discharge from the formation very fast. The lack of barometric responses in the MST-UB are attributed to the fact that the low yielding aquitard in which the well is completed has a lower barometric efficiency than the wells completed in the coal aquifers.

Vented transducers utilized to monitor water levels in the both the pumping and adjacent monitor wells during each pumping test, automatically compensated for the barometric pressure effects. Therefore, barometric pressure effects did not affect the aquifer analyses that were developed based on the pumping test data.

Comment Muk 20

Appendix D6, Section D6.2.2.2 Aquifer Tests, 20. Please provide a discussion (or reference) on the role of faults in the results of aquifer tests. (MK)

Response Muk 20

As noted in Addendum D6-8, (page D6-8-9) no hydrologic boundary conditions were observed in the pumping test data. As can be seen on Exhibit D6.2-2, the 578409 well cluster is located approximately 2,100 feet south and east of the nearest mapped fault. Since neither the Carney nor the Masters coal seams are very robust aquifers and have low transmissivity values, it is not surprising that the fault would not influence the pumping test results. For example, using Theis drawdown equations and the aquifer characteristics measured in the Masters coal (transmissivity of 3.2 ft²/day, storativity of 0.00025, and a pumping rate of 0.5 gpm) it is estimated that it would take over 70 days of continuous pumping for a water level response greater than 0.5ft to be observed 2,000 feet away. Therefore the likelihood that the faults would have influenced the pumping test results is very low.

Comment Muk 21

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 21. Please provide some additional discussion on the premining potentiometric surface maps, including

ranges of estimated hydraulic gradients and groundwater velocity in the different coal seams/aquifers. (MK)

Response Muk 21

As requested, additional discussion on the hydraulic gradients and groundwater velocity in the coal seams were added to Section D6.2.2.4.

Comment Muk 22

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 22. Please provide a discussion (or reference) on the hydrologic effects of any adjacent operations (including past coal mining activity by historic mines and Bighorn mine) on the premining information and data. (MK)

Response Muk 22

The last paragraph in Section D6.2.2.4 describes how CBNG production has affected water levels in the eastern side of the permit area. The drawdowns resulting from CBNG production have occurred since any historic coal mining activity and have superseded any drawdowns that may have occurred due to historic mining. Therefore, no lingering hydrologic effects from past coal mining activities are present. The text in the last paragraph in Section D6.2.2.4 has been updated to describe how CBNG impacts have superseded any impacts from historic coal mining activities.

Comment Muk 23

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 23. This section provides a good discussion on the recharge areas. However, please clarify if there are any discharges from the coal seams within the permit boundary. (MK)

Response Muk 23

Within the permit boundary there are no discharges from the coal seams with the possible exception of the Carney coal on the far west side of the permit area. As shown on Exhibit D6.2-3, the Carney coal outcrops in the far western side of the permit area along the ridge tops but has been eroded away in the stream valleys. As a result, the Carney coal is perched with no real source of recharge and is generally dry. However, on the down dip side of the outcrop the coal may discharge within the permit if there is water in the coal seam to discharge. As shown on Figures MP-3-4.7-1 and MP-3-4.7-2 it was determined during the groundwater modeling efforts that most of the Carney coal within the far western side of the permit area was dry. Therefore, there is minimal (if any) discharge from the Carney coal within the permit area. Section D6.2.2.5 has been updated to clarify where discharges from coal seams may occur within the permit boundary.

Comment Muk 24

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 24. Please provide a range of estimates for recharge from precipitation to the aquifers within the permit boundary. Also, provide a discussion if this is the primary recharge mechanism for the aquifers within the permit boundary. (MK)

Response Muk 24

The estimated recharge rates from precipitation are summarized in Section 4.2.2 of Addendum MP-3. Addendum MP-3 describes recharge within the permit area in more detail than Section D6.2.2.5. A reference to MP-3 was added in Section D6.2.2.5.

Comment Muk 25

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 25. Consider providing a description of the soil properties within the permit boundary and the use of these percent soil distributions in the discussion of infiltration within the permit boundary. (MK)

Response Muk 25

The soil properties within the permit boundary are described in detail within Appendix D7. While different soil types are expected to have variable infiltration rates, the only infiltration rate that is significant for the coal aquifers is the infiltration rate assigned to the strata near the outcrop of the coal seams. Throughout the permit area the strata overlying the coal aquifer are generally dry. Therefore the primary source of recharge occurs at the outcrops. Scoria, in particular, plays a significant role in recharge of the coal seams because it usually occurs near the coal outcrop. Because of its highly permeable characteristics most of the precipitation that falls on the scoria infiltrates into the scoria where it either infiltrates into the coal or discharges along a seep line at the base of the scoria. As noted in the response to BJ Kristiansen's comment number 57, ash material between the base of the scoria and the coal seams sometimes limits how much of the water in the scoria actually comes into direct contact with the coal. Nevertheless, because a large percentage of precipitation falling on the scoria actually infiltrates into it, the scoria does provide a consistent water source for recharge into the coal outcrops. As noted in Addendum MP-3 Section 4.2.2 the scoria areas were delineated and assigned their own recharge zone because they do play a significant role in recharging the coal seams. Within the permit area, there are several locations where the coal seams outcrop as well. These outcrop areas were also assigned their own recharge zone because they also have a hydrologic connection to the coals. Since the strata overlying the coal seams to be mined in the Brook Mine are generally dry, the recharge component from the overburden to the coal is very low away from the outcrop areas. Because of the limited hydrologic interaction between

the recharge at the surface and the coal in areas away from the outcrop, site specific changes in the recharge rates based on soil type will not impact the coal aquifers. For this reason additional analysis of the infiltration properties of the soils within the permit area represents a level of detail that is not necessary to describe the hydrologic impacts to the coal aquifers from the proposed mining operations.

Comment Muk 26

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 26. Page D6-18 states, “Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-8”. Please revise this statement to reference the correct addendum - Addendum D6-9. (MK)

Response Muk 26

The text has been updated to read "Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-9".

Comment Muk 27

Appendix D6, Section D6.2.3 Baseline Water Quality, 27. Page D6-20 states, “A piper diagram of the groundwater wells with measured values is presented in Figure D6.2-1. Please provide a discussion on the water quality types observed at each aquifer (Example: Is the water quality type variable within an aquifer? If yes, explain the potential reasons for this observed variability) based on the piper diagram. (MK)

Response Muk 27

Section D6.2.3 has been updated as requested.

Comment Muk 28

Appendix D6, Section D6.2.3 Baseline Water Quality, 28. Page D6-20 states, “The constituents that most frequently exceed the standard concentration limitations are ammonia, TDS, sulfate and manganese”. Please clarify if these constituents exceed the Chapter 8 standards at all the monitor wells. (MK)

Response Muk 28

Please refer to the Tables D6.2-8 thru D6.2-17 for exceedances of water quality based on Chapter 8 standards. Based on the tables, the concentrations are not exceeded at all monitor wells. No text edits were made in response to this comment.

Comment Muk 29

Appendix D6, Section D6.2.4 Groundwater Rights, 29. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Cheyenne copy of the TFN does not have a sheet separator and a tab for Appendix E2 in the Adjudication volume. Please provide a sheet separator and tab for Appendix E2. (MK)

Response Muk 29

Refer to Comment DM3. Groundwater rights are provided in Appendix B of the Adjudication Volume. This text edit has been made in Section D6.2.4.

Comment Muk 30

Appendix D6, Section D6.2.4 Groundwater Rights, 30. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Please provide a summary discussion/statistics on (i) total number of water rights, (ii) number of wells, (iii) aquifer, (iv) permitted water use and other relevant summary statistics. (MK)

Response Muk 30

Groundwater rights are listed in Appendix B of the Adjudication Volume. All of the aforementioned information is listed for each water right. Due to the constantly changing nature of water rights, a summary table is difficult to construct, and due to summary statistics not being required by WDEQ regulation, a summary statistics table has not been prepared.

Comment Muk 31

Appendix D6, Section D6.2.4 Groundwater Rights, 31. Please provide a discussion (or reference) on the premine groundwater use (including the uses reported to SEO) within the permit boundary and the adjacent areas. (MK)

Response Muk 31

The premine groundwater uses as reported to the SEO within the permit boundary and the adjacent 3 miles are listed with each individual water right in Appendix B of the Adjudication Volume.

Appendix D7

Comment DS 6

Appendix D7, Exhibit D7.3.-1 was compared with Exhibit MP.1-1. As required, it appears that the soil sampling was concentrated in areas where surface disturbance is to be expected. Please provide the contour interval on the soils map. For ease of review and to prevent misinterpretation, however, the map showing sampling locations should also clearly show the locations of proposed surface disturbances instead of providing these details on separate maps which may or may not present differing scale distances.

Response DS 6

The disturbance boundary can be found on Figure D7.1-1 and as the reviewer noted on Exhibit MP.1-1. No revision to exhibit D7.3-1 has occurred in response to this comment.

Comment DS 7

Appendix D7, Page D7-4. The second paragraph of this page contains text that should be deleted. It states "If for whatever reason overall sampling intensity.....was determined to not be enough, it is proposed that any additional sampling be deferred and included a stipulation of a future pre-stripping soil assessment program." The Mine Plan and Reclamation Plan soils handling and replacement is contingent on adequate baseline sampling of the proposed area that will be affected by mining operations (topsoil balance and stockpile location planning and bond calculation). Therefore, baseline sampling for soils must be adequate prior to approval of any permit application. Please remove the inappropriate language from the Appendix D7 text. If future changes to the Mine Plan require additional soil sampling the issue will be addressed at that time.

Response DS 7

As requested, the second sentence of the second paragraph on page D7-4 has been deleted.

Comment DS 8

Appendix D7, Page D7-9. Text appears in this section that upon NRCS declaration of prime farmlands occurring in the permit area, a letter will be provided to the DEQ. A letter from the NRCS has been received and inserted in the permit declaring no prime farmlands to exist. The text, therefore, is not appropriate and should be removed.

Response DS 8

As requested, the sentence about prime farmland (the last sentence of the first full paragraph on page D7-9) has been deleted. A new reference, citing the letter received

on October 31, 2015 (negative determination of prime farmland on Ramaco permit area) has been inserted on page D7-9 and the new reference has been added to the list of references on page D7-33.

Comment DS 9

Appendix D7, WS § 35-11-415(b)(iii) and the Coal Rules, Chapter 4, Section (c)(ix) state that if topsoil is virtually nonexistent or is not capable of sustaining vegetation then subsoil or a selected spoil material may be used as a topsoil or subsoil supplement. Additionally, due to the proximity of this mine to the Tongue River, a Class 2AB stream, limits for chemical contaminants will be imposed on discharges from the permit. Therefore, for areas where unsuitable or marginal topsoil chemistry is located (e.g. Wibaux channery loam, sample R13), an alternative soil replacement material should be identified and used in reclamation. Such a commitment must also be provided in the Mine Plan and Reclamation Plan to provide evidence that such issues that could affect the condition of reclamation and/or lead to off-site impacts will be addressed.

Response DS 9

No “alternate soil replacement material” is necessary for areas of Wibaux channery loam (Map Unit Wx). The lower soil material below 8 inches of Wibaux (any “C” horizon soil substratum below 8 inches, where existent) was not recommended for salvage and would be grouped with the overburden spoil for placement purposes. This lower material had an excessive volume of hard coarse fragments (>35%) and, based on one of the three Wibaux sample sites (R13), an “unsuitable” EC and SAR value for the 8 to 15 inch depth, EC=12.8 and SAR=17.3. Two new sentences, indicating no soil salvage of Wibaux below 8 inches in depth, has been added to the soils report on page D7-26, one sentence each for Map Unit Wx and Map Unit Wx-RO. Furthermore, the amount of suitable soil available for salvage across the entire proposed disturbance area is not limiting, with a calculated weight-average of 20.2 inches. Therefore, additional “alternate soil replacement material” is not necessary.

Comment DS 10

Appendix D7, The description of Map Unit G (Bauxson Loam, sample R-19) does not show marginal selenium that occurs between 22 – 48 inch depth range which could affect the salvage depth and may require special handling of the marginally suitable subsoil.

Response DS 10

Two new sentences have been added to the last paragraph on page D7-21 stating the presence of “marginal” rated Selenium values for lower material of Bauxson loam (Map Unit G) sample site R19. Strictly speaking, “marginal” rated soil material is not

“unsuitable” and does not need to be specially handled. This lower Bauxson material has been recommended for salvage as “Subsoil”, not “Topsoil”.

Appendix D8

Comment JJ 1

Appendix D8, 1. Please update the permit boundaries so that they are the same on Exhibit D8. 2-1 and Addendum D8 Map 1. I note specifically that lands should not be included within the permit boundary south of the interstate and that Section 10 TWN57N RNG85W displays different boundaries along the far west edge of the permit; it appears that the section lines are skewed between the two maps. The Addendum D8 Map 1 also is missing a sizeable amount of lands located in Section 21 TWN54N RNG84W which are included within the permit boundary of the Adjudication Exhibit 1 map. While comparing the maps I find that the maps display the same information in slightly different formats, please explain the necessity for two individual maps and at a minimum make them consistent against one another.

Response JJ 1

Baseline vegetation assessment maps have been updated to include the correct permit boundary. The discrepancy in the permit boundary is attributed to the difference in graphical representation between a USGS quad system and a PLSS system. The USGS quad system is now depicted. Exhibit D8.2-1 is a summary map for this Appendix and future updates made to this Appendix. This map will change throughout the life of the mine as future changes are incorporated. Addendum D8 Map 1 is for this Addendum and will not change throughout the life of the mine.

Comment JJ 2

Appendix D8, 2. Why does the study area not include all lands within the proposed permit boundary?

Response JJ 2

Portions of the proposed Brook Mine permit area not included within the study area were added during an October 2014 permit boundary change following completion of the baseline vegetation study. Additional studies were not conducted in these areas due to the limited size and similarity to areas within the study area. Section D8-1.1, page D8-1-5 text has been updated to explain the exclusion of these areas.

Comment JJ 3

Appendix D8, 3. The acreage displayed on Table D8.2-1 should equal that of the land permitted on the Form 11. The Form 11 displays 4,548.8 acres while the table shows 4,581.7 acres a difference of 32.9 acres. Please update either the Form 11 or Table

D8.2-1 to show the true permit acreage as it relates to the vegetation communities. Upon further review I find that Table D8-2 located on page Addendum D8-1-41 exhibits the proper acreages in relation to the Form 11, thus the values represented there may be more accurately displayed in Table D8.2-1.

Response JJ 3

Total acreage of the permit area is 4,548.8 acres as illustrated in Form 11 and Table D8-2. Table D8.2-1 has been updated to reflect the correct acreage.

Comment JJ 4

Appendix D8, 4. Table D8.2-1 states there are 56 acres of agricultural lands; however, I am unable to locate Agricultural lands north of the interstate. Please, discuss and edit the values to display true acreages in relation to the proposed permit boundary. (See comment 3 for more clarification and another table for utilization to update values.)

Response JJ 4

Agricultural Lands within the permit area total 4.5 acres and are located in Section 21 TWN54N RNG84W. Table D8.2-1 has been updated to reflect the correct acreage of Agricultural Lands and other vegetation communities within the permit boundary.

Comment SP 3

Appendix D-8 Vegetation Baseline, Page D8-3. Section D8.1.7. Guideline 2 is a non coal guideline. Please revise this sentence to reference the equation shown in Section D8-1.2.9 Sample Adequacy.

Response SP 3

Changed as requested. Additionally, Appendix D8 reference to Guideline 2 was replaced by reference for Chapter 2 in Section D8.1.1, page D8-1 and Section D8.3, page D8-4. Addendum D8 reference to Guideline 2 was replaced by reference for Chapter 2 in Section D8-1.2, page D8-1-5 and Section D8-1.9, page D8-1-38. Reference to Guideline 2 was removed from Section D8-1.2.9, page D8-1-12.

Comment SP 4

Appendix D-8 Vegetation Baseline, Page D8-4. Section D8.1.8. Please revise the second sentence to, "The EXREFA is all of the unaffected area for each native vegetation community."

Response SP 4

Changed as requested.

Comment SP 5

Appendix D-8 Vegetation Baseline, Page D8-1-8. Section D8-1.2.4. The last sentence in this section states that no sample locations occurred within the Brook Mine Permit Area. AG-13, 14, 17 and 25 are shown on Addendum: D8, Map 1 inside the permit area. Please correct this statement or the permit boundary on the Map.

Response SP 5

Baseline vegetation assessment maps have been updated to include correct permit boundary which illustrates AG-13, 14, 17, and 25 are not located within the permit boundary.

Comment SP 6

Appendix D-8 Vegetation Baseline, Page D8-1-11. Section D8-1.2.8. The last sentence of the first paragraph should be revised to, "Sample adequacy was not required for species diversity and composition."

Response SP 6

Changed as requested.

Appendix D9**Comment DM 4**

Appendix D9-Wildlife, Page D9-3 states that when a sage grouse confirmation letter is provided by WG&F, it will be provided to DEQ. It appears that the confirmation letter is already part of the package (Page D9-E3). Please reference the location of the letter.

Response DM 4

Page D9-3 was revised to reference Page D9-E3 as the location of the letter.

Comment WGF 1

(Appendix D9) , We recommend this report become part of the annual reporting which will ensue throughout the operation of the mine.

Response WGF 1

Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled "Monitoring and Mitigation" that references the sections of the Mine Plan where the annual wildlife report commitments are contained.

Comment WGF 2

(Appendix D9), We suggest coordinating with the USFWS regarding raptor mitigation as needed through the mining process.

Response WGF 2

The commitments to coordinate with the USFWS regarding raptors as well as T&E and other species of federal concern are provided in Section MP.18, Addendum MP-8 and Addendum MP-9 of the Mine Plan. Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references these discussions.

Comment WGF 3

(Appendix D9), We recommend mining reclamation practices consider providing suitable habitat for existing wildlife within the specifications required by DEQ-LQD.

Response WGF 3

The commitments to reclaim wildlife habitats are provided in the Reclamation Plan in Section RP.7 Wildlife Restoration. Discussion was added at the end of Addendum D9 - 1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references the Reclamation Plan.

Appendix D10

Comment BJ 63

EXHIBITS, Addendum D10, The permit boundary layer on all of the exhibits covering the aquatic resource boundaries is incorrect. Please correct the permit boundary layers.

Response BJ 63

Aquatic resource inventory maps have been updated to include the correct permit boundary.

Comment DM 5

Appendix D10-Wetlands, D10-1.4 – Please include a copy of the letter requesting concurrence and jurisdictional determination sent to the ACOE At the end of the text, and reference the letter in the text.

Response DM 5

BKS Environmental Associates, Inc., on behalf of RAMACO, requested concurrence and jurisdictional determination from the USACE on May 29, 2015. A copy of the

letter sent to the USACE has been included as Attachment D10-F. Section D10-4, page D10-10 text has been updated to reflect submittal of USACE request.

Comment MK 45

Appendix D10-Wetlands, Section D10.2 Results, 19. The text may want to state when (what date) RAMACO requested the jurisdictional determination from the USACE, and include this request letter as an Addendum to Appendix D10. This would provide documentation that the request was submitted, as receipt of the USACE determination may lag behind the LQD permitting process. (MDK)

Response MK 45

See response to DM5.

Appendix D11

Comment BJ 26

Appendix D11, Alluvial Valley Floor, Section D11.1, RAMACO has requested LQD to make a determination on the nature of the drainages as potential AVF within the permit boundary as well as within ½ mile of the permit boundary. This would then entail analysis of the following drainages (distances are approximations): • Hidden water Creek – all (4 mi.)

- East Fork Earley Creek – lower 1 mile
- Slater Creek – lower 3 miles
- Tongue River – ½ mi. east of Interstate 90 and 4 mi. west of Interstate 90 at the Acme exit.

Prior to such a declaration, LQD staff will have to perform a variety of assessments designed to assist us in making a declarative statement about AVF classification. An AVF declaration will be made after in-depth study of the drainages. Such investigation will consist of, but not be limited to:

1. Field evaluation of the geomorphic and lithologic character of the drainages in question;
2. Determination of the agricultural characteristics of the stream course;
3. Examination of available bore hole logs that can be used to characterize the subsurface materials beneath the valley floor;
4. Determination of groundwater and surface water characteristics, both quantitative and qualitative, within the drainages in question;

5. Other evaluation processes that may be deemed necessary should initial findings warrant further, in-depth analyses.

Response BJ 26

Revised D11 text throughout to expand discussion on the drainages mentioned above. Incorporated previous AVF studies into Appendix D11. Information satisfying each statement can be found in the following locations as well as many other locations throughout the document:

1. Borehole logs provided in Addendum D11-3. Hidden Water Creek test pits dug by Big Horn Mine and discussed in Section D11.3 “Stream Laid Deposits.”
2. Agricultural characteristics of the stream courses are discussed in Sections D11.4.2, D11.4.3, and D11.5, in particular.
3. Bore hole logs are provided in Addendum D11-3. Additional test pit and borehole information was analyzed from the Big Horn Mine Permit No. 213.
4. Groundwater and surface water characteristics are discussed extensively in Appendix D6. Potential impacts to surface water and groundwater are discussed in the Mine Plan. The water resources are generally discussed in Section D11.4.
5. Additional research has been incorporated from the Big Horn Mine Permit No. 213. Corrections and reevaluations of the AVF study have been made throughout Appendix D11.

Comment BJ 27

Appendix D11, Alluvial Valley Floor, Addendum D11-3, Some of the borehole and well logs indicate a damp or wet interval encountered during drilling. Was an attempt made to allow wet materials to produce water prior to continuation of the hole or was water noted after adding another drill steel and lowering the kelly to begin the next 20 feet of hole? Typically, after the steel has been added and the compressor is engaged, a small amount of water can be air-lifted before the rotary table begins to turn. If so, are there field notes indicating water was observed during the connection?

Response BJ 27

It is standard procedure during drilling operations to provide wet or damp intervals an opportunity to produce water. If the intervals had produced water, this would have been noted in the drilling logs provided in Addendum D11-3. There are no other separate field notes that would provide additional information. No changes to the text were made.

COMMENT MK 1

Appendix D11-AVF, Section D11.1 Introduction, 1. In the second paragraph on Page D11-1, the possible impacts of the proposed mining operation on the Tongue River

AVF are dismissed because the area is planned for facilities level disturbance only. However, the groundwater model (Mine Plan Addendum MP-3) predicts drawdown in the Tongue River alluvium, thereby possibly affecting the AVF. As discussed in subsequent comments, additional analysis and monitoring is needed to comply with LQD Coal Rules and Regulations regarding AVFs. (MDK)

RESPONSE MK 1

Revised text to reference Mine Plan Section MP.6 concerning the Brook Mine's effect on the Tongue River AVF.

COMMENT MK 2

Appendix D11-AVF, Section D11.2 Purpose and Scope, 2. On Page D11-2, please change "Wyoming Reclamation Act" to "Wyoming Environmental Quality Act". (MDK)

RESPONSE MK 2

Revised text to state "Wyoming Environmental Quality Act."

COMMENT MK 3

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 3. For identification of unconsolidated stream laid deposits, LQD Guideline No. 9 (AVF) lists two items that may be used to positively identify unconsolidated streamlaid deposits: (1) channel bars, splays, abandoned meanders, modern flood plains, or terraces, and (2) bedload or washload sediment deposited or transported in a nonbedrock channel bottom. Presumably, item (2) would be met at the streams identified within the AVF study area. However, the permit application does not address whether the channels contain geomorphic features from item (1). Please address in the text whether channel bars, splays, abandoned meanders, modern flood plains, or terraces are observed within the streams within the AVF study area. (MDK)

RESPONSE MK 3

Revised text to discuss the lack of channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs in the Hidden Water Creek, Slater Creek, East Fork Earley Creek, and Earley Creek valleys.

COMMENT MK 4

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 4. On Page D11-5, the conclusion that the materials in Hidden Water Creek valley do not meet the definition of unconsolidated streamlaid deposits, is in conflict with the conclusion from the Big Horn Mine Permit. The Big Horn Mine Permit (Appendix D6, Pages D6-151 to D6-158) describes the evaluation of unconsolidated streamlaid deposits on lower Hidden Water Creek. The permit states: "The conclusion verified from the pit observations is that

these deposits are unconsolidated and stream laid. Small isolated patches of colluvium or bedrock can be found throughout the alluvial deposits, but these characteristics do not exclude the deposit from being stream laid.” Please evaluate the data and findings from the Big Horn Mine Permit before a conclusion is drawn about the absence of unconsolidated streamlaid deposits on Hidden Water Creek. (MDK)

RESPONSE MK 4

Revised text to discuss the findings of the Big Horn Mine from test pits in the Hidden Water Creek valley. Additionally, Exhibit D11.3-1 was revised to show the locations of the Big Horn Mine test pits in Hidden Water Creek in relation to both the Brook Mine permit area and the Big Horn Mine permit area. Added the Big Horn Mine Permit State Decision Document (SDD) 213-T2 to Addendum D11-2.

COMMENT MK 5

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 5. The Big Horn Mine Permit also describes subirrigation and flood irrigation studies on lower Hidden Water Creek and concludes: “Due to the lack of subirrigation and extremely low potential for flood irrigation, Hidden Water Creek is not an alluvial valley floor.” Although this is in the approved mine permit, it does not appear that an explicit AVF determination for Hidden Water Creek was ever issued by the LQD, and the AVF findings in the SDDs for the Big Horn Mine Permit do not mention Hidden Water Creek. The Brook Mine Permit application should incorporate these previous AVF studies on Hidden Water Creek into Appendix D11. (MDK)

RESPONSE MK 5

See response to comment MK 4. Additionally, while the Big Horn Mine State Decision Documents do not mention Hidden Water Creek, the SDD 213-T2 states that “No other drainages are of significant size or lack the stream laid deposits necessary to be an Alluvial Valley floor within the renewal and/or amendment areas.” Hidden Water Creek is located within the renewal area and was not included within the originally declared AVF area. Although it was not mentioned by name, it has been declared not to be an AVF within the Big Horn Permit Area. This SDD has been added to Addendum D11-2 and discussion added to the text in Section D11.3.

COMMENT MK 6

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 6. On Page D11-6 it is stated the three monitor wells were installed along the thalweg of Slater Creek. The transects in Exhibit D11.3-2 show that two of the wells (578513-AL and 578418-AL) are not along the thalweg but are rather upgradient of the channel. Please revise this description in the text. (MDK)

RESPONSE MK 6

Revised text to more accurately state that the monitor wells are along or near the thalweg.

COMMENT MK 7

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 7. It appears that from Exhibit D11.1-1 that subirrigation is occurring on Earley Creek within the AVF study area. Please explain why subirrigation was not mapped on Earley Creek. (MDK)

RESPONSE MK 7

Revised Exhibit D11.1-1 to show potentially subirrigated lands on Earley Creek. The text was revised in Section D11.4.2 to reflect that subirrigation potentially occurs along Earley Creek.

COMMENT MK 8

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 8. On Page D11-6, second paragraph, the alluvial/colluvial potentiometric surface is dismissed as a source of subirrigation along Slater Creek. However, the other hydrologic processes responsible for the subirrigation are not identified. Please discuss in the text why subirrigation is occurring along Slater Creek. (MDK)

RESPONSE MK 8

Revised text to discuss the presence of burn areas overlying residual coal ash bands that serve as aquacludes which prevent water from entering or escaping the coal below.

COMMENT MK 9

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 9. The cross-sections in Exhibit D11-3-2 would be improved if the active channel and any floodplains or terraces were shown. A description of the materials in the active channel bottom would also help identify unconsolidated streamlaid deposits. (MDK)

RESPONSE MK 9

Revised Exhibit D11.3-2 to show the 2-year, 24-hour flood inundation area and the location of the active channel. Data regarding the materials in the active channel bottom are presented in the borehole logs in Addendum D11-3.

COMMENT MK 10

Exhibit D11.4-1, the extent of irrigated lands shown in Sections 2 and 11 along Slater Creek may not be correct. According to the summary for the Hart Brothers Ditches

water right (permit 1317) in the SEO database, the land being irrigated under the water right has decreased to 23 acres:

THIS FACILITY IS MADE UP OF TWO DITCHES. THE WEST DITCH HAVING A POINT OF DIVERSION IN LOT 2 AND THE EAST DITCH HAVING A POINT OF DIVERSION IN THE SENE OF SECTION 3, T57N, R85W. T57N, AND 58N, R85W HAS BEEN DEPENDENTLY RESURVEYED. REQUEST FROM PADLOCK RANCH TO ELIMINATE 67 ACRES AS FOLLOWS: 32 ACRES IN THE SWSW OF SECTION 2 - 30 ACRES IN THE NENW AND 5 ACRES IN THE NWNW OF SECTION 11 ALL IN T57N, R85W, RECEIVED AND GRANTED. REQUEST OF ELIMINATION AND PROOF OF OWNERSHIP FILED IN MISCELLANEOUS NOTICES. ADJUDICATED WITH H.H. WILLIAMS AS APPROPRIATOR. PERMIT RECORD REFLECTS SOURCE AS SLATER CREEK AND WATER STORED IN THE HART BROTHERS RESERVOIR, P60R, XR7825A, HOWEVER CERTIFICATE RECORD REFLECTS .91 CFS FOR THE IRRIGATION OF 64 ACRES. BOC PETITION II 89-4-2 BY PADLOCK RANCH WAS GRANTED TO ISSUE AMENDED CERTIFICATE C77/290A TO REDESCRIBE LANDS WITHOUT CHANGING LAND TOTALS AND TO CHANGE POINT OF DIVERSION FROM THE RECORD POINT IN THE NWNE AND SENE OF SECTION 3, 57N, R85W AND PARTIAL MEANS OF CONVEYANCE FOR 41 ACRES (.59 CFS) TO THE WILLIAMS DITCH, P8710D, C77/289A DIVERTING WATER FROM SLATER CREEK IN THE SESW OF SECTION 34, T58N, R85W AS RECORDED IN ORDER RECORD BOOK 36, PAGES 385-390 AND RECEIVED ON CD3/578A. THIS LEAVES 23 ACRES STILL IRRIGATED UNDER THIS PERMIT. LANDS SHOWN BELOW AS "AME" AND "ELI" ARE THOSE ORIGINALLY DESCRIBED UNDER THIS DITCH.

Please clarify the irrigated acreage status for the Hart Brothers Ditches water right with the SEO and revise Exhibit D11.4-1 accordingly. (MDK)

RESPONSE MK 10

Exhibit D11.4-1 was revised to more accurately capture irrigated lands on Slater Creek in Sections 2 and 11 of Township 57 North, Range 85 West.

COMMENT MK 11

Appendix D11-AVF, Section D11.4.4 Water Quality, 11. On Page D11-7, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

RESPONSE MK 11

Removed text referencing State of Montana water quality standards.

COMMENT MK 12

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 12. On Page D11-8, second paragraph, it states that Exhibit D11.1-1 shows that sufficient water supply does not exist for consistent agricultural practices in East Fork Earley Creek. However, Exhibit D11.4.1 shows a point of diversion for Earley Creek Ditch No. 1 and several areas of irrigated lands less than 40 acres in East Fork Earley Creek. As documented in Addendum D11-4, there is an adjudicated water right for irrigation in this location. So there may be sufficient water supply for consistent agricultural practices. The text needs to further expand on this discussion of East Fork Earley Creek since there is an adjudicated water right for irrigation. (MDK)

RESPONSE MK 12

Revised text to include the Earley Creek Ditch No. 1 water right, but explained that subirrigation must not be prevalent in East Fork Earley Creek because no culvert or other conveyance structure is present beneath I-90. If subirrigation was prevalent and without a conveyance structure beneath I-90, substantial amounts of water would back up against the interstate.

COMMENT MK 13

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 13. On Page D11-8, last paragraph, it states that the hay meadows along Slater Creek in Sections 2 and 11 are not within the boundaries of subirrigation or natural flood irrigation.

(a) The areas symbolized as irrigated lands in Exhibit D11.4-1 do not necessarily correspond to hay meadows, as the imagery shows hay meadows in the SWNE, SENE, and NESE of Section 11, and the NWSW of Section 12. The hay meadows appear to correspond with the area mapped as “AG” in the Vegetation Map (Exhibit D8.2-1) in Addendum D8.

(b) The irrigated area shown in Exhibit D11.4-1 near the Landen Ditch does overlap with subirrigation mapped in Exhibit D11.1-1.

Please re-evaluate the area of hay meadows along Slater Creek and revise the text accordingly. Comments No. 15 and 16 below also relate to this issue. (MDK)

RESPONSE MK 13

The text was revised in Section D11.5 to reflect the presence of limited hay meadows and overlapping of irrigation with subirrigation on the upper reaches of Slater Creek in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West. Exhibit D11.4-1 was revised to show irrigation in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West.

COMMENT MK 14

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, On Page D11-8, last paragraph, it states that, besides Hart Bros Ditches, the remaining portion of the Slater Creek valley does not contain SEO water rights. This is not the case as Exhibit D11.4-1 shows Landen Ditch in the NENW of Section 11. This water right (P11695) does not appear in Addendum D11-4. Please revise the text and add this water right to Addendum D11-4. (MDK)

RESPONSE MK 14

The text was revised in Section D11.5 to discuss the Landen Ditch water right (P11695). A copy of the Landen Ditch water right was added to Addendum D11-4.

COMMENT MK 15

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 15. The irrigated acreage for the Landen Ditch water right appears to be 18 acres for one point of use and 22 acres for a second point of use. Please add these areas to Exhibit D11.4-1. (MDK)

RESPONSE MK 15

Exhibit D11.4-1 was revised to more accurately reflect irrigated lands in the vicinity of the Landen Ditch.

COMMENT MK 16

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 16. The Hall Ditch (SEO Permit 5195), mapped in Section 11 of Exhibit D11.4.1, apparently provides irrigation water for hayfields in the NESE of Section 11 (30 acres) and the NWSW of Section 12 (22 acres). This water right does not appear in Addendum D11-4. Please add this water right to the Addendum and add the irrigated acreages to Exhibit D11.4-1. (MDK)

RESPONSE MK 16

A copy of the Hall Ditch water right (SEO Permit 5195) was added to Addendum D11-4. Exhibit D11.4-1 was revised to depict irrigated lands in Section 12, Township 57 North, Range 85 West. The text in Section D11.5 was revised to discuss the Hall Ditch water right.

COMMENT MK 17

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 17. Portions of Earley Creek and East Fork Earley Creek are within the AVF study area yet the permit application does not attempt to conclude if these streams contain AVFs. Presumably, the LQD will need to make an AVF finding on these streams. (MDK)

RESPONSE MK 17

See response to Comment BJ 26. Additional discussion has been added to aid WDEQ in the AVF findings of East Fork Earley Creek and Earley Creek. Both valleys are upstream of mining activities proposed by RAMACO such that no material damages are expected to either valley.

COMMENT MK 18

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 18. The first bullet for Slater Creek on Page D11-9 dismisses the positive identification of unconsolidated stream laid deposits because a layer of colluvial material was found over alluvial material. However, as stated in Appendix D5 on Page D5-8 and Page D5-9, sub-rounding of the clinker present in the cuttings suggests water driven deposition of limited extent. Also, as discussed in Comment No. 3, the application did not evaluate unconsolidated streamlaid deposits in a manner that is consistent with identification criteria listed in LQD Guideline No. 9. The application has not provided sufficient evidence that unconsolidated stream laid deposits are not present along Slater Creek. (MDK)

RESPONSE MK 18

See response to Comment MK 3. The discussion on the Slater Creek valley has been further expanded to include the absence of unconsolidated stream laid deposits such as channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs. Exhibit D11.3-1 clearly indicates the presence of undifferentiated alluvium and colluvium (Qac) in the Slater Creek valley.

COMMENT MK 19

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 19. The third bullet on Page D11-9 for Slater Creek should be clarified that the width of natural flood irrigation in the valley is generally insufficient to provide for economic agricultural practices. However, economic agricultural practices clearly occur immediately upstream of the proposed mine permit boundary because of artificial flood irrigation of hayfields adjacent to the channel. These practices are documented by existing water rights that are approximately 100 years old. Please revise this discussion. (MDK)

RESPONSE MK 19

The text in Section D11.6 of Slater Creek's third bullet was revised to include the irrigated hayfield upstream of the permit boundary.

COMMENT MK 20

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 20. The fifth bullet for Hidden Water Creek on Page D11-9 seems to dismiss the positive identification of

unconsolidated stream laid deposits because of colluvial material with shallow bedrock. However, as previously noted, this conflict with information in the Big Horn Mine permit concerning unconsolidated stream laid deposits on Hidden Water Creek. (MDK)

RESPONSE MK 20

Refer to response of Comment MK 4. The Big Horn Mine permit boundary has been added to Exhibit D11.1-1. The text in Section D11.6 has been updated to include a summary of the discussion stating that the Big Horn Coal Permit No. 213-T2 SDD determined the limits of the AVF, and no portion of Hidden Water Creek was determined as being AVF.

COMMENT MK 21

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, Although the LQD has not yet issued its formal finding, the segment of the Tongue River adjacent to the proposed permit area, which was not declared under previous LQD findings, likely contains an AVF.

(a) If this AVF is significant to farming, the applicant must comply with LQD Coal Rules and Regulations Chapter 3, Section 2(d)(ii) and demonstrate that the proposed mining operations will not materially damage the quantity and quality of water that supplies the Tongue River AVF. The absence of direct mining on the Tongue River AVF does not relieve the requirement of assessing the probable hydrologic impacts of the proposed operation to the AVF, particularly since the groundwater model in Mine Plan Addendum MP-3 predicts drawdown in the Tongue River alluvium. (MDK)

(b) Regardless of the significance to farming, the applicant must also maintain and/or restore the essential hydrologic functions of the Tongue River AVF. The applicant must therefore identify the essential hydrologic functions of the Tongue River AVF and either (1) provide an analysis that the proposed operation will not hamper the essential hydrologic functions, or (2) demonstrate that the essential hydrologic functions will be restored. The essential hydrologic functions for another part of the Tongue River AVF are described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27), so this may be a good starting point to consider. (MDK)

(c) A monitoring system is also required to demonstrate the essential hydrologic functions are maintained, as per LQD Coal Rules and Regulations, Chapter 5, Section 3(b)(ii). Since the groundwater model (Mine Plan Addendum MP-3) predicts 2.5 feet of drawdown in the Tongue River alluvium, the monitoring

system may likely contain alluvial monitoring wells and periodic evaluation of color-infrared imagery. (MDK)

RESPONSE MK 21

Revised text as requested. Revised text by adding information regarding the essential hydrologic functions of the declared AVFs (Tongue River and Goose Creek) from the SDD in Addendum D11-2. Also, added portion of text to describe possible monitoring system and plan for the AVFs that may be affected.

COMMENT MK 22

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, 22. The essential hydrologic functions of the adjacent Goose Creek AVF must also be maintained during the proposed mining operation. The application needs to list these functions, as described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27). A monitoring system is also required to demonstrate that the essential hydrologic functions will be maintained. (MDK).

RESPONSE MK 22

See response to comment MK 21.

Mine Plan

Comment BJ 28

Volume 11, Mine Plan, Section MP.1.2.1, pg. MP-4, Tunnel and pillar widths are discussed in general terms. Please approximate a range for the widths, in feet, in the narrative to give context to the discussion.

Response BJ 28

Added text as suggested.

Comment BJ 29

Volume 11, Mine Plan, The fifth sentence, beginning with "To minimize the amount of exposure..." does not make sense. Please rewrite the sentence for clarity.

Response BJ 29

Added text as suggested.

Comment BJ 30

Volume 11, Mine Plan, The narrative also references figure MP.1-3 as a general schematic of the highwall mining operation. The figure depicts significant vertical

highwalls above the mining operation. The text mentions that the highwalls will be vertical where the Masters and Carney converge but the illustration depicts conditions where the coal seams appear to be separated by a considerable thickness of parting. It is our experience that vertical highwalls in the Powder River Basin are unstable and should be discourage wherever possible. What would the maximum thickness of burden approximate where the vertical highwalls will exist? Please include an average on the schematic as has been done for pit width and bench width.

Response BJ 30

The figure has been updated to include the average depths.

Comment BJ 31

Volume 11, Mine Plan, Pages MP-3 and MP-4, These pages describe the highwall mining operation in vague generalities. The narrative states that the continuous miner will advance into the working face to a depth of 2,000 feet. The manufacturer's specifications for the ADDCAR system state that the depth of a cut is 1,600 feet. Is this a discrepancy of 400 feet or is there a difference in mining tools and the ADDCAR system comes with multiple depth capacities. Please clarify.

Response BJ 31

Conversations with ADDCAR representatives indicates that they will be able to extend the range of the highwall mining system so cuts up to 2,000 feet can be achieved.

Comment BJ 32

Volume 11, Mine Plan, A general word of guidance – Ramps are mentioned in the narrative as designed to an 8% grade. The Cat 777 can generally handle this grade fairly well under most conditions. The Mack Titan trucks, however, may be problematic under certain conditions. Entering the pit on the ramp could be difficult for the Mack trucks with pups if the ramp has been watered to control dust. The overburden materials used for ramp systems are generally silty with a clay matrix and overwatering can create slipping hazards for vehicles. A truck with multiple trailers will have difficulty navigating these conditions. A 6% ramp under these situations is strongly advised.

Response BJ 32

Revised text as suggested.

Comment BJ 33

Volume 11, Mine Plan, The narrative describes the tunnel width as variable, depending on the cutting head chosen. Please indicate approximate footages of the tunnel widths. For example, Bucyrus and Joy manufacture continuous miners that

have heads ranging from 11 to 12 feet in width. A mention of those widths would clarify the narrative. Also the protective coal pillars are described but have no dimensions indicated. The pillar width to tunnel width is crucial so an approximation of the remnant pillars width in feet is required. Please include approximate widths for tunnel and pillar widths.

Response BJ 33

See response to Comment BJ 28. The text has been updated as requested.

Comment BJ 34

Volume 11, Mine Plan, Section MP.1.2.2, The dozer push method of overburden removal is not adequately described. Though Figure MP.1-4 does depict the dozer push materials to some extent, the overlapping nature of the multiple lift system can be confusing to some. The narrative on page MP-4 is too brief. Please elaborate further on the dozer push staging and overburden removal. Perhaps an illustration that depicts the dozer removal in stages would be more appropriate. This can be accomplished by creating a series of illustrations rather than only one. Please clarify the methodology.

Response BJ 34

Revised text as requested. Created Figure MP.1-5.

Comment BJ 35

Volume 11, Mine Plan, Section MP.1.4, Pg. MP-5, The last sentence does not make sense. Please rewrite the sentence.

Response BJ 35

Removed last sentence for clarity.

Comment BJ 36

Volume 11, Mine Plan, Section MP.4.2.3, Pg. MP-15, The discussion of temporary topsoil stockpiles describes creating a ring ditch around the topsoil pile if there is a potential for water erosion during the 2 week to 6 month life of the pile. Since the climate is unpredictable and subject to rapid changes, temporary topsoil stockpiles (2 weeks to 6 months) will be required to have ring ditches in all cases with no qualifiers. LQD writes more violations concerning inadequate topsoil practices than any other issue. Rewrite the narrative to indicate that all temporary topsoil stockpiles will have a ring-ditch and berm created for piles having a life of 2 weeks or more. Keep in mind that even a short-lived topsoil stockpile could generate a violation if a sudden rainstorm were to erode the soil and waste it on the surrounding terrain. RAMACO may want to allow for this as well

Response BJ 36

Updated text as requested.

Comment BJ 37

Volume 11, Mine Plan, Section MP.4.3.4, Pg. Mp-17, A swell factor of 16% is being used to convert bank cubic yards to loose cubic yards. The number was generated from information attained from Big Horn Coal (PT213). Where was this information located? Many of the coal mines in the northwestern corner of the Powder River Basin use a swell factor of 13% - 14% since the overburden material is finer grained, with a higher clay content than mines on the eastern margin of the basin. Please cite the use of a 16% swell factor.

Response BJ 37

Revised text as requested. Table MP.4-9 provides typical swell and load factors of materials.

Comment BJ 38

Volume 11, Mine Plan, Section MP.6.1, Pg. MP-39, The second paragraph discusses surface runoff attenuation during mine years 4 and 5. The peak flow rates for precipitation events will be attenuated by the mining trenches that lie perpendicular to the flow in the local drainages. What flow events are expected to be attenuated by the trenches? Will the 2 year, 10 year, or 100 year events be considered as an average event? Please modify the narrative, in general terms, to define which precipitation event will be used when designing the pit drainage plans.

Response BJ 38

Updated text as requested.

Comment BJ 39

Volume 11, Mine Plan, Section MP.8, Pg. MP-47, The narrative mentions that potable water will be hauled to the mine and placed in a cistern. Why is a cistern system being considered for potable water instead of a reverse osmosis unit? The local residents use such systems as do the mines. How large of a cistern will be used for water storage? Please modify the narrative to expand on the rationale behind using a cistern.

Response BJ 39

The text has been revised. The final potable water system has not been determined.

Comment BJ 40

Volume 11, Mine Plan, Section MP.9.9, Pg. MP-52, When pre-dug mud pits are to be used for exploration drilling, the topsoil must be protected from contamination by removal and stockpiling. The pit location must be stripped to the base of the soil with an areal extent that allows the pit materials to be stacked as spoil without encroaching on native surface. Reclamation shall occur in a manner that will best restore the surface to its pre-disturbance condition. These contingencies need to be better described in the narrative. Please modify the text to reflect the aforementioned conditions.

Response BJ 40

Revised text as suggested.

Comment BJ 41

Volume 11, Mine Plan, Section MP.18, Pg. MP-68, The second paragraph discusses the speed limits that will be set on haulroads to protect wildlife. Approximately what speed limits will be used?

Response BJ 41

Updated text with a 45 MPH Speed Limit.

Comment BJ 42

Volume 11, Mine Plan, Section MP.20, Pg. MP-69, The brief description of underground mining should state that no "conventional" underground mining will occur. Highwall coal recovery is an underground mining technique, but no personnel work underground. Thus the mining is modified underground mining.

Response BJ 42

Revised text as requested.

Comment BJ 43

Volume 11, Mine Plan, Section MP.24, Pg. MP-70, The word "Operation" is misspelled in the title (OPERTATION).

Response BJ 43

Revised text as requested.

Comment BJ 44

Volume 11, Mine Plan, Section MP.25, Pg. MP-71, The second paragraph, third sentence, discusses requiring additional permitting. The word "additional" is misspelled (addidntional).

Response BJ 44

Revised text as requested.

Comment BJ 45

Volume 11, Mine Plan, TABLE MP.1-1, The total disturbance should read 895 acres, not 775. Please correct the table.

Response BJ 45

Revised text as requested.

Comment BJ 46

Volume 11, Mine Plan, FIGURE MP.1-3, The average width of the pit floor and safety bench have average widths indicated on the drawing. Please insert the average heights of the vertical highwalls in these situations.

Response BJ 46

Revised Figure MP.1-3 requested.

Comment BJ 47

Volume 11, Mine Plan, FIGURE MP.1-4, The cross section, as drawn, is confusing. It would appear that dozer pushed, loose material significantly exceeds the bank material available in the highwall. The figure is not drawn to scale but a more accurate attempt to represent dirt volumes would be appreciated. Also, the cross section itself does not make sense in the way that operational steps are illustrated. A series of cross sections over time would be much more beneficial to define the appearance of the dozer push. Please modify the figure accordingly. A sample of an idealized schematic is attached. It is volumetrically accurate.

Response BJ 47

Figure MP.1-4 has been updated to add clarity.

Comment BJ 48

Volume 11, Mine Plan, FIGURE MP.4-3, Pg. MP-F7, What is the narrow, vertical rectangle located in the center of the coal stockpile coming from the stacker?

Response BJ 48

The figure MP.4-3 has been updated to remove the rectangle

Comment BJ 49

Volume 11, Mine Plan, Addendum MP-3, Pg. MP-3-2, The introductory paragraph states that the Brook Mine is approximately 6 miles northwest of Sheridan, Wyoming. However, in earlier narrative, the mine is said to be 6 miles south of the Montana border and 8 miles northwest of Sheridan. This passage is found in the Land Use Appendix D1-1. The distances should be uniform in all instances throughout the narrative.

Response BJ 49

Revised text as requested.

Comment BJ 50

Volume 11, Mine Plan, Addendum MP-3, Section 2.3, Figures 2.3-1 and 2.3-2 show the potentiometric surfaces for the Carney and Masters coal beds. The contours daylight and appear to be in mid-air over the Slater Creek drainage. Please adjust the contours so they terminate at the outcrop.

Response BJ 50

Revised Figures 2.3-1 and 2.3-2 in Addendum MP-3-17 as requested.

Comment BJ 51

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-3, The second to last paragraph indicates that the depth of the penetration by the continuous miner will be 2,000 feet. Is this an approximation since the listed depth for the ADDCAR device is 1,600 feet. Please clarify the discrepancy.

Response BJ 51

Based on communication with ADDCAR's representative 2,000 ft penetration is achievable. Generally, users of the ADDCAR system encounter increasing depth of cover with greater penetrations requiring wider web pillar between holes. The loss in recovery due to the wider pillars potentially negates any production gain from increased penetration.

Comment BJ 52

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-4, The discussion in this sections centers around the necessity of maintaining a straight, even cutting depth to prevent pillars from being cut too narrow to hold up the roof material and

allow subsidence. The 1:1 ratio suggested by NIOSH is acceptable as long as roof strength tests bear up (no pun intended) the use of the general guidelines. A small sample of tests have been run on roof and coal rock intervals and those tests have been reported. LQD requests a narrative placed either in this location of the text or other location of RAMACO's choosing that discusses the strength tests results as it pertains to roof stability. Also, a commitment must be made in the document to sample roof material for strength testing for at least one location in every panel that will be mined by the continuous miner prior to mining. Our concern rests with the competence of the overlying lithologies and their possibility for subsidence. This has been a problem in this area for decades and care must be applied to characterize roof materials accurately.

A sampling plan to test compressive strength above each coal panel must be submitted prior to permit approval.

Response BJ 52

RAMACO must submit and have an approved MSHA Ground Control Plan that contains the strength test and commitments requested. RAMACO will provide this information when it is received and include it in the Subsidence Control Plan.

Comment BJ 53

Volume 11, Mine Plan, Addendum MP-6, Please provide the data used as input for the ARMPS-HWM program.

Response BJ 53

The following input values were used in the ARMPS-HWM program: compressive strength of coal - 660 psi, rock density - 162 lbs/ft³, abutment angle of 21°

Comment BJ 54

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-2, The scale of the photograph is too large to adequately depict the zones of surface subsidence from the old underground mines. Please blowup the scale to allow for clear visibility of the subsidence.

Response BJ 54

Cardno selected the larger scale to show that subsidence was limited to a small portion of the deep mine and not visible over other areas of the deep mine due to its increased depth of cover. See revised figure in revision to Cardno's Subsidence Report

Comment BJ 55

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-3, This figure is very effective. It clearly shows the subsidence evident on the air photo as it correlates to

the old underground map superimposed on it. One problem, though, is that the air photo base needs to be darker, with greater contrast. The photo is a bit washed out and manipulation of the brightness/contrast aspects of the photo would help its visibility greatly. Please recalibrate the photo tonality.

Response BJ 55

See revised figure in revision to Cardno's Subsidence Report

Comment BJ 56

Volume 11, Mine Plan, Addendum MP-8, Section MP-8.5.4, The last sentence in this section indicates that there is no suitable habitat available for the Northern Long-Eared Bat. Does this include the climax Cottonwood Forest along Tongue River? The well developed understory along the river is suitable for Long-eared bat habitation though none have been located in this area. Or does the negation of the existence of the bat only apply to the area in the hills above the river where the mining will occur. Please clarify the area that was considered for potential Long-Eared Bat occurrence.

Response BJ 56

The text was revised to clarify.

Comment BJ 64

EXHIBITS, Mine Plan, Exhibit MP.1-1, The patterns used to depict surface disturbance from year to year are too similar. It is difficult to differentiate between year 0 and year 2, for example. Please recreate the surface disturbance layers to be more unique. The overburden removal sequence map (Exhibit MP.4-4) is a good example.

Response BJ 64

Revised Exhibit MP.1-1 as requested.

Comment DM 6

Mine Plan, MP.3.1.3 – A primary haul road appears to cross the Tongue River using the bridge that is currently in place from previous mine usage. Please discuss any updates needed for that bridge to be adequate for the intended usage.

Response DM 6

The revised primary haul road alignments do not cross this bridge and the use of this bridge for haul trucks and other traffic associated with the mine is not planned. Updated Exhibit MP.3-1.

Comment DM 7

Mine Plan, Exhibit MP4-3 shows Overburden Stockpiles OB-12 and OB-13, and Topsoil Stockpile TS-6 being located directly in the Slater Creek channel, without any mention of redirecting Slater Creek, or otherwise preventing the hydrologic consequences of damming up the creek with Overburden and Topsoil stockpiles. Please correct.

Response DM 7

Revised Exhibit MP.4-3 as requested with OB-12 and 13 as well as TS-6 moved out of Slater Creek channel.

Comment DM 8

Mine Plan, MP.7 – Because of the proximity of the planned facilities primarily in T57, R84 Sec.15 to the Tongue River and Goose Creek, I would like to see surface water monitoring upstream of these facilities on Goose Creek and Tongue River, and downstream of these facilities on Tongue River. Please discuss the feasibility of fulfilling this request, with reasoning.

Response DM 8

Revised text as requested. Revise Exhibit MP.7-1 with USGS stream gage location that is within the viewing area.

Comment DS 11

Mine Plan, 11) Depending upon the outcome of required overburden sampling, commitment for special handling of unsuitable overburden will be required to assure that placement of unsuitable materials so as not to hinder plant growth or to adversely affect surface or groundwater quality will be required in the Mine Plan.

Response DS 11

See section MP.4.6.1, fourth paragraph.

Comment DS 12

Mine Plan, 12) Does RAMACO provide a better detailed description of the topsoil salvage and handling process than that discussed in section MP.4.2.1? The description provided is not detailed so as to provide a description of the equipment used, the methods for assuring adequate soil salvage, or whether topsoil and subsoil salvage will follow the recommendations in Appendix D7 for stockpiling topsoil separate from subsoil. (Map Unit A Cambira Loam, Map Unit B Zigweid Loam, Map Unit C Forkwood Loam, Map Unit G Bauxson Loam, Map Unit H Haverdad Loam, Map Unit U Ulm Clay Loam) Please understand that topsoil and subsoil may only be mixed

if both meet Guideline 1 suitability criteria. Please include more detail for topsoil salvage and handling or let the LQD know where the information may be accessed.

Response DS 12

Revised text as requested.

Comment DS 13

Mine Plan, 13) Section MP.4.2.3 all topsoil stockpiles, even those stockpiled temporarily or windrowed at the edge of a disturbance, must be identified by a topsoil sign from initiation of the salvage operation as required under Chapter 4, Section (c)(D) that states that signs must be in place at the time stockpiling is begun. Therefore, the text in the first paragraph of this section stating that signs will not be required must be corrected. Signs will always be required to identify all salvaged topsoil and must be placed on all approaches to the topsoil and no more than 150 feet from the stockpile location.

- a. Additionally, all stockpiled topsoil, even windrowed along the edge of a disturbance, must be protected against wind and runoff erosion, compaction or potentially toxic materials no matter what the longevity designation of the stockpiled material. The Mine Plan must provide a commitment to these requirements.

Response DS 13

Revised text as requested.

Comment DS 14

Mine Plan, 14) Section MP.4.2.4(4.2.1?) does not discuss topsoil salvage during winter months. Salvage during the winter months, especially of shallow soil profiles, is discouraged by the LQD due to a lack of depth control caused by varying depths of permafrost. Please provide discussion concerning this subject.

- a. Even short term and temporary topsoil stockpiles must be identified on maps and the volumes accounted for in annual reports. Several criteria that must be considered are well established for placement of topsoil stockpiles and include:
 - i. Construction of stable areas to minimize wind and water erosion
 - ii. Stockpiles will not be placed in areas where runoff water can contribute to the loss of topsoil (side hills or drainages)
 - iii. Stockpiles will not be constructed on unsuitable backfill locations
 - iv. Stockpiles will have associated sediment control established in advance of construction

- v. Stockpiles will not be constructed at locations of known cultural or wildlife resources for which protection or mitigation is required.
- b. Other topsoil stockpile construction and maintenance considerations include:
 - i. Stockpiles will be constructed with slopes of 3h:1v or less
 - ii. Bypass ditches, berms or equivalent may be used to divert runoff around stockpiles
 - iii. Stockpiles that will remain for less than 1 year may be revegetated or treated with urface roughing methods such as ripping or discing to reduce runoff and wind erosion potential.

Response DS 14

Revised text as requested.

Comment DS 15

Mine Plan, 15) Section MP.4.2.7, page MP 4-5. Aside from operation of soil salvage equipment with the potential for soil contamination due to blown hydraulic hoses or small fuel leaks, the LQD expects not contamination of soil during the mining operation. Contamination of subsoil and overburden is more likely. The LQD recommends that RAMACO re-phrase the section header and text to show petroleum contaminated materials being and not soils.

- a. What criteria will RAMACO use to determine if spills require reporting to the DEQ, and what process will be used in spill reporting?
- b. What will the operational procedure be for management of the proposed on-site landfarm for contaminated materials, and where will it be located? Will it be identified on the ground by a sign?

Response DS 15

Revised text as requested.

- a. See Section MP-4.5.2 of Addendum MP-4
- b. See Section MP-4.5.3 of Addendum MP-4

Comment DS 16

Mine Plan, Section MP.4.2.8. Please provide a detailed description for the disposal of empty drums, not just a citation of the EPA Rule which is probably not know by most readers of this public document.

Response DS 16

The EPA Code Federal Regulation cited is public information which may be accessed online or at a public library if the reader desires to know the specifics requirements and steps regarding container disposal.

Comment DS 17

Mine Plan, MP.4.3.1 discusses overburden removal processes. However, little detail is given to explain the actual process for overburden handling. Will the first cut be stockpiled and used to fill the last cut? When special handling is required, which is almost certain given the nature of some overburden and the need for some soil replacement materials, what assurance will be made that poor quality materials will be safely located in the backfill or in separate stockpiles, or that topsoil substitutes will be handled and stored as topsoil in a useful manner as required under Chapter 4, Section 2(b)(x)(A)? Please provide a more detailed overburden handling plan. Perhaps some of these details are observed in later sections. Please provide additional details not provided elsewhere.

Response DS 17

See Sections MP.4.3.5, MP.4.6 and MP.4.7. Revised text as requested.

Comment DS 18

Mine Plan, Section MP.4.3.4. The volumetric analysis shown in Table MP.4-4 and MP.4-5 may change depending on results of required additional overburden sampling and volumetric analysis. If the overburden depth overlying coal changes as a result of additional sampling, the volumetric analysis will also change. If post mining contour changes are necessary due to adjusted swell factors permit revision will probably not be required until the changed PMT exceeds plus or minus 20 feet of the approved at which time a Reclamation Plan revision will be required. This kind of detail should be included in the permit commitments.

Response DS 18

Revised text as requested.

Comment DS 19

Mine Plan, Section MP.4.6.1. The typical overburden sampling protocol as stated in Guideline 1 calls for one sample taken every 40 square acres of the permit area. Overburden sampling for underground mining operations differs from typical coal mine sampling protocols and is stated in the Coal Rules, Chapter 7, Section 1(a)(i)(A) which calls for overburden sampling and characterization on areas where surface operations will cause removal of overburden down to the level of the coal seam. Please

make changes to the text accordingly and perform additional overburden sampling where required.

Response DS 19

Revised text as requested.

Comment DS 20

Mine Plan, Section MP.4.3.5. A statement was made in this section that “Overburden stockpiles will only block ephemeral drainages if runoff control and sediment control measures are made and approved by WDEQ/LQD.” Placement of overburden in ephemeral drainages will require a discussion of how water will be diverted around the overburden stockpile to prevent impoundment of water in addition of a discussion of sediment control measures for the stockpile to prevent of-site impacts of erosion down-slope from the stockpile. The LQD recommends that no overburden stockpiles be placed in ephemeral drainages.

Response DS 20

Revised Exhibit MP.4-3.

Comment DS 21

Mine Plan, Tables MP.1-1, MP.1-2 and MP.4-1 must show the actual years for proposed progressions, or the year 1 progression must be tied to a specific year in the Mine Plan text.

Response DS 21

Revised tables as requested. Added note saying that Year 0 corresponds to the year 2016

Comment DS 22

Mine Plan, Tables MP.4-3 and MP.4-5. Topsoil volumes appear to be underestimated in TS- 2, TS-6, TS-10 and TS-11 while underestimating the proposed volume in TS-1. Also overburden volumes appear to be underestimated in OB-4, OB-7, OB-11, OB-14 and OB-15, and overestimated in OB-16, which may affect estimates presented in TableMP.4-4 as well.

Response DS 22

Volumes are estimated based on the stripping volumes and available backfill area with excess material going to and from stock pile for contemporaneous reclamation. No updates will occur in response to this comment.

Comment DS 23

Mine Plan, Exhibit MP.4-2 and MP.4-3 must show the dates (actual years) for the salvage of topsoil and removal of overburden, or year 1 must be tied to an actual year when operations will begin (2016, 2017, etc.). The map or tables in the Mine Plan must provide proposed years and volumes for stockpile construction as well.

Response DS 23

Revised Exhibits as requested. Added note saying that Year 0 corresponds to the year 2016 on all Exhibits with years.

Comment DS 30

Reclamation Plan, All Mine Plan Maps with progressions must show the actual years of the initial disturbance or mining activity, or the progression must be linked to a specific year in Reclamation Plan text. The maps must also include the contour interval.

Response DS 30

Revised Exhibits as requested.

Comment DE 1

Mine Plan, Figure MP.1.2 and page MP-3 – MSHA and best practices may require a safety berm on this safety bench which could require a wider bench. Figure MP.1.2 notes a minimum of 35' but the text on page MP-3 just states the bench will be 35' wide. There is a real possibility this safety bench might be used for light plants so it may need to be wider for access and small vehicle use as well as providing a safety bench.

Response DE 1

Revised text as requested.

Comment DE 2

Mine Plan, Table MP.1-1 – The total disturbance doesn't seem to match the overall disturbance listed for the trench mining and facilities. Please explain or correct.

Response DE 2

Revised table as requested.

Comment DE 3

Mine Plan, Section MP.2.3, page MP-9 – The 1st sentence would be better if it started, "The explosive materials...". The 2nd sentence should replace the word "detonating"

with “explosive”. The 5th sentence in the 2nd paragraph should include cast boosters. The 6th sentence in the 2nd paragraph should discuss storage of emulsions, water gels, and slurries also. This section should also commit to proper signage of the explosive storage area. Please correct.

Response DE 3

Revised text as requested.

Comment DE 4

Mine Plan, Section MP.5.7.5, page MP-34 – The word “of” in the 2nd line of the last paragraph should be “or”. Please correct.

Response DE 4

Revised text as requested.

Comment DE 5

Mine Plan, Section MP.6.1, page MP-39 – The 1st sentence of the 1st full paragraph needs some improvement so it reads properly and makes sense. Please correct.

Response DE 5

Revised text as requested.

Comment DE 6

Mine Plan, Section MP.14.2, page MP-55 – The 2nd paragraph discusses the use of “cast primers”. The term should be “cast boosters” as it doesn’t become a primer until the detonator is added or detonating cord is attached to it. The discussion of priming holes should describe the use of a cast booster and how it is made-up to become a primer, i.e. with detonating cord or a detonator (blasting cap). Please correct.

Response DE 6

Revised text as requested.

Comment DE 7

Mine Plan, Section MP.14.3.2, page MP-56 – In the 2nd line the item “(primer with detonator)” should be changed to “(cast booster with detonator)”. Please correct

Response DE 7

Revised text as requested.

Comment DE 8

Mine Plan, Section MP.14.3.2, page MP-56 – The 2nd paragraph discusses powder factors in coal and overburden and the high end of the ranges is extremely high for the type of rock and coal in this area. RAMACO should eliminate the range and simply state powder factors will be adequate to effectively fragment the overburden and coal.

Response DE 8

Revised text as requested.

Comment DE 9

Mine Plan, Section MP14.3.3, page MP-56 – RAMACO should reword this to say that initiation will be done using non-electric or electric systems, which may include electronic detonators, shock tube detonators, detonating cord, electric detonators or a combination of these. Igniter cord is used to initiate safety fuse and it's highly unlikely that any safety fuse will be used at this mine. Please correct.

Response DE 9

Revised text as requested.

Comment DE 10

Mine Plan, Section MP.14.4, pages MP-56 & 57 – It is probable that emulsions will also be stored on site so it should be mentioned since emulsion/ANFO blends are the most widely used product in wet holes. Please correct.

Response DE 10

Revised text as requested.

Comment DE 11

Mine Plan, Section MP.14.6, pages MP-57 & 58 – Residents who request a pre-blast survey must make the request to the permittee and the Administrator of Wyoming Land Quality Division (LQD). The permittee is responsible for getting the pre-blast survey done and distributed to the person that requested it and the LQD Administrator. Please correct.

Response DE 11

Revised text as requested.

Comment DE 12

Mine Plan, Section MP.14.7, pages MP-58 & 59 – LQD will not approve protecting uninhabited structures (what LQD refers to as engineered structures) at 8.0 inches

per second (ips) of peak particle velocity. LQD would allow a maximum limit of 5.0 ips. RAMACO would have to assure that this limit was not exceeded by the use of a seismograph at these structures on all blasts. RAMACO could apply for a modified scale distance factor to show compliance with this limit of 5.0 ips by submitting a vibration study and doing a regression analysis to show the allowable ppv is not exceeded at a 95% confidence level. However, this will require the vibration study be submitted with seismograph records from shots in the mining area so it cannot be done until after some blasting has been done at the mine. Please correct this text.

Response DE 12

Revised text as requested.

Comment DE 13

Mine Plan, Section MP.14.8.1, page MP-60 – The discussion on typical pattern size should be changed to more general language. Using the parameters given the powder factor used would be approximately 0.16 lbs./CY using ANFO and in the 0.23-0.25 lbs./CY range when shooting an emulsion blend. These powder factors are not high enough to adequately fragment the overburden. Please correct.

Response DE 13

Revised text as requested.

Comment DE 14

Mine Plan, Section MP.14.8.1, page MP-60 – The 2nd paragraph says if water is in the holes a slurry or water gel explosive will be used. Most likely an emulsion/ANFO blend with good water resistance will be used in wet holes and not a slurry or water gel. Please correct.

Response DE 14

Revised text as requested.

Comment DE 15

Mine Plan, Section MP.14.8.1, page MP-60 – The 3rd paragraph discusses the explosive weight per hole and the powder factors. The explosive densities listed are correct but the pounds per hole and powder factors are incorrect. In a 7.875" hole and with a density of ANFO of 0.85 g/cc the pounds/foot of hole is 17.95 lbs. and with 24' of powder column the pounds/hole is 431 lbs., making the powder factor = 0.16 lbs./CY. Similarly using an emulsion blend of 1.32 g/cc the pounds/foot = 27.87 lbs. and the pounds per hole would be 669 lbs. so the powder factor = 0.25 lbs./CY. In the 50' hole described with 26' of stemming and 24' of powder the powder distribution is

poor so it would likely lead to blocky material near the top of the bench. Please correct.

Response DE 15

Revised text as requested.

Comment DE 16

Mine Plan, Section MP.14.8.2, page MP-61 – Drilling a 35' x 35' pattern in a 15' thick coal seam with a 7.875" hole and 4.5' of stemming will probably result in excessive flyrock, stemming ejection, high airblast and hard zones between the holes. Expecting to stem 4.5' is not realistic – in the field the blaster is going to try to hold for 4' or 5' of stemming. Again RAMACO discusses using slurry or water gel in wet hole when an emulsion/ANFO blend with high water resistance would probably be used. Please correct. Also the powder factor listed for coal is probably a little high so it would be better to just say that the powder factor will sufficient to fragment the coal for the prime movers. Please correct.

Response DE 16

Revised text as requested.

Comment DE 17

Mine Plan, Section MP.14.10, page MP-63 – The last bullet item says that detonation during electric storms might be a reason for unscheduled blasting. This is confusing because it makes it sound like the operator would shoot during electric storms and the only safe thing to do when an electric storm approaches is clear the pattern and keep everyone a safe distance away until the storm passes. Please correct.

Response DE 17

Revised text as requested.

Comment DE 18

Mine Plan, Addendum MP-7, Blaster's Log – Under the "Holes" heading RAMACO should use "burden" not the term "burden spacing". On the 2nd page the word "signiture" should be changed to "signature". Please correct.

Response DE 18

Revised text as requested.

Comment MK 23

Mine Plan, Section MP.20 Alluvial Valley Floors, The discussion of underground mining in AVFs does not seem necessary given there is no plans for underground mining at the Brook Mine. Furthermore, it is conceivable that circumstances could exist where underground mining of an AVF would not be allowed by the LQD. For example, if the AVF was significant to farming and underground mining of the AVF would result in surface effects such that material damage to the AVF would occur. (MDK)

Response MK 23

While no underground mining is proposed within delineated AVFs, the mine maintains this option. If underground mining is ever planned under the AVF, the appropriate revisions will be made. Revised text as requested.

Comment MK 46

Mine Plan, Section MP.4.1 Mining Sequence, 20. On Exhibit MP.4-1, please attempt to show the areas that would be highwall mined versus surface mined. These layers are currently not found until Exhibit MP.15-1. Alternatively, the text in this Section could specify that the areas to be highwall versus surface mined are shown in Exhibit MP.15-1. (MDK)

Response MK 46

Revised text as requested.

Comment MK 47

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 21. Only Slater Creek and Hidden Water Creek are labeled and shown in Exhibit MP.5-1. In order to better evaluate the Hydrologic Control Plan, please provide labels and locations for the other stream channels, including Tongue River, Goose Creek, East Fork Earley Creek, and the other unnamed channels (as shown on the USGS 24K Quad) on the proposed permit area. (MDK)

Response MK 47

Revised Exhibit MP.5-1 as requested.

Comment MK 48

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 22. Exhibit MP.5-1 shows overburden stockpiles OB-13 and OB-12, as well as topsoil stockpile TS-6, occurring directly over the Slater Creek channel. The Exhibit does not show any diversion ditches to be used in these locations. Please either move the location of the

stockpiles or present a plan to use a diversion to route Slater Creek around the stockpiles. (MDK)

Response MK 48

Revised Exhibit MP.5-1 as requested.

Comment MK 49

Mine Plan, Section MP.5.2 Sedimentation and Wastewater Impoundments, 23. Exhibit MP.5-1 shows the locations of two “sediment basins”. Are these considered the same as “sedimentation impoundments”, as discussed in this Section? If so, the designs for these two impoundments are not found within the Mine Plan. (MDK)

Response MK 49

The “sediment basins” shown in Exhibit MP.5-1 are not considered the same as the “sediment impoundments(reservoirs)” . Sediment Basins are considered an Alternative Sediment Control Measure and are discussed in Addendum MP-1. As such, the design for these “sediment basins” are not included in the Mine Plan. However, the design criteria and construction standards for “sediment basins” are similar to those discussed within Section MP.5.2 of the Mine Plan. Revised text as requested.

Comment MK 50

Mine Plan, Section MP.5.3 Flood Control, 24. This section discusses flood control reservoirs but it is not mentioned how many flood control reservoirs would be constructed and where their locations would be. Please provide this information to comply with LQD Coal Rules and Regulations, Chapter 2, Section 5(a)(i)(D)(IV). (MDK)

Response MK 50

Revised text as requested.

Comment MK 51

Mine Plan, Section MP.5.4 Diversions, 25. This section mentions permanent diversions, but there are no apparent plans for permanent diversions. Please discuss if permanent diversions are anticipated as part of the mining operation, or if all diversions will be temporary. (MDK)

Response MK 51

Revised text as requested.

Comment MK 52

Mine Plan, Section MP.5.4 Diversions, 26. Exhibit MP.5-1 shows only one diversion ditch for Hidden Water Creek in T57N, R84W, Section 9. Please discuss this particular diversion and its typical design in more detail in Section MP.5.4. (MDK)

Response MK 52

Revised text as requested. Add design exhibit of the Hidden Water diversion ditch.

Comment MK 53

Mine Plan, Section MP.5.5 Culverts, 27. Please provide a brief statement that commits to a periodic culvert inspection and maintenance plan to ensure that culverts will function properly over time. (MDK)

Response MK 53

Revised text as requested.

Comment MK 54

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 28. The first sentence references a sedimentation reservoir. Where is the location of this sedimentation reservoir? Are these the “sediment basins” shown in Exhibit MP.5-1? If not these sedimentation reservoirs need to be added to this Exhibit. (MDK)

Response MK 54

Revised text as requested.

Comment MK 55

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 29. The first paragraph references treating and discharging pit water. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 55

Revised text as requested.

Comment MK 56

Mine Plan, Section MP.6.1 Surface Water, 30. Exhibit MP.1-1 shows surface disturbance directly over a few areas of Slater Creek and Hidden Water Creek. Please identify the source of disturbance in these areas. Direct disturbance of the channel should be avoided unless there is a plan for a diversion to route the stream around the disturbance. (MDK)

Response MK 56

See response to Comment MK 76, 88 and 99. Revised text as requested.

Comment MK 57

Mine Plan, Section MP.6.1 Surface Water, 31. The mining trenches are often discussed with reference to Exhibit MP.1-1. However, the trenches are not shown on this Exhibit. Please add the locations of the trenches to Exhibit MP.1-1. (MDK)

Response MK 57

Revised Exhibit MP.1-1 as requested.

Comment MK 58

Mine Plan, Section MP.6.1 Surface Water, 32. On Page MP-39, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining disturbance will be treated prior to discharge. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 58

Revised text as requested.

Comment MK 59

Mine Plan, Section MP.6.1 Surface Water, 33. Please discuss the diversion ditch for Hidden Water Creek in the first carryover paragraph on Page MP-39. (MDK)

Response MK 59

Revised text as requested. See Hidden Water Creek diversion Exhibit MP.5-2 for further details.

Comment MK 60

Mine Plan, Section MP.6.1 Surface Water, 34. On Page MP-40, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining activities will be treated prior to discharge. Please reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 60

Revised text as requested.

Comment MK 61

Mine Plan, Section MP.6.1 Surface Water, 35. On Page MP-40, there is a sentence: “The surface disturbance activities will have temporary impacts on Slater Creek geomorphology including ground cover and soil erodibility”. This statement is unclear. Are the impacts to the actual Slater Creek channel or the uplands and other tributaries in the watershed? Is it reduced ground cover and increased soil erodibility? Please provide a more explicit description of the possible impacts. (MDK)

Response MK 61

See response to Comment MK 56, 76, 88 and 99. Revised text as requested.

Comment MK 62

Mine Plan, Section MP.6.1 Surface Water, 36. Please provide a discussion on whether the proposed mining operation would affect surface water quality such that designated uses would be affected on the major streams on and adjacent to the proposed permit area. (MDK)

Response MK 62

Revised text as requested.

Comment MK 63

Mine Plan, Section MP.6.1 Surface Water, 37. The text describes possible reductions in peak flows and storm volumes. Please describe in the PHC if the proposed mining operation will have any effects on nearby or downstream surface water rights. (MDK)

Response MK 63

Revised text as requested.

Comment MK 64

Mine Plan, Section MP.6.1 Surface Water, 38. Please add a brief statement to the PHC that if it is determined that the mining operation affects a surface water right, that water right would be replaced with a water source of similar quantity and quality as provided by W.S. § 35-11-415(b)(xii). (MDK)

Response MK 64

Revised text as requested.

Comment MK 65

Mine Plan, Section MP.6.1.1 Land Erosion Stability, 39. It is unclear the intent of this section. It seems to be out of place in the mine plan, as it discusses the USLE in the

context of only native and reclaimed conditions. Furthermore, no data other than the K factors are presented in Mine Plan Tables (Table MP.6.1). The Reclamation Plan also does not discuss applying the USLE, so it would seem that Section MP.6.1.1 should be removed unless a USLE analysis is completed of pre- vs during- vs postmine erosion predictions. (MDK)

Response MK 65

Section MP.6.1.1 has been removed.

Comment MK 66

Mine Plan, Section MP.7.1 Surface Water Monitoring, 40. It is unclear why reservoirs will be monitored in the operational monitoring program when these features were not sampled for during baseline characterization. If the reservoirs have the potential to be affected by the mining operation they should be sampled prior to mining with this information presented in Appendix D6. (MDK)

Response MK 66

Revised text as requested.

Comment MK 67

Mine Plan, Section MP.7.1 Surface Water Monitoring, 41. Please add the reservoir monitoring locations listed in Table MP.7-1 to Exhibit MP.7.1. (MDK)

Response MK 67

Revised Exhibit MP.7.1 as requested.

Comment MK 68

Mine Plan, Section MP.7.1 Surface Water Monitoring, 42. Please add the northing/easting State Plane coordinates for the surface water monitoring stations to Table MP.7.1. (MDK)

Response MK 68

See response MK

Comment MK 69

Mine Plan, Section MP.7.1 Surface Water Monitoring, 43. Please identify what type of water quantity data will be generated from the continuous stage monitoring. For example, will mean daily flow rates and/or peak daily flow rates be estimated, as these would likely be submitted to the LQD in the Annual Report? (MDK)

Response MK 69

Revised text as requested.

Comment MK 70

Mine Plan, Section MP.7.1 Surface Water Monitoring, 44. The text in the last paragraph on Page MP-45 states that water quality samples will be collected from a single station using an ISCO automatic sampler. Please identify in the text which station this is. Also, please explain the rationale for using an ISCO sampler at only one of the four stream monitoring sites. (MDK)

Response MK 70

Revised text as requested. The station equipped with the ISCO automatic sampler was the only station equipped with such a device due to the stations location as well as expected flows. Quarterly grab samples taken at stations upstream of mining disturbances will give an accurate representation of water quality entering the permit boundary. Since the station equipped with an automatic sampler is located near the area in which Slater Creek exits the permit boundary, an automatic sampler allows the operator see if the mining activities of the Brook Mine have an impact on the water quality of Slater Creek as the highest chance water quality is affected will occur during precipitation events. An automatic recorder was not installed at the station downstream of disturbances on Hidden Water Creek because the recorded and modeled flows for the drainage are extremely low. No observable flow had been recorded on any surface water station along Hidden Water Creek, despite precipitation events having occurring. As such, any data collected by an automatic sampler on Hidden Water Creek would occur during extreme precipitation events in which the flows through Hidden Water Creek would likely have high turbidity and be an unrealistic representation of the water quality within Hidden Water Creek.

Comment MK 71

Mine Plan, Section MP.7.1 Surface Water Monitoring, 45. The text in the first paragraph on Page MP-46 states that data will be evaluated to determine if any surface water and groundwater interactions exist. It would seem that any interactions should have already been identified during the baseline characterization of the hydrological system on and near the proposed permit area. It does not appear that the permit application discusses surface/groundwater interactions. (MDK)

Response MK 71

Revised text as requested. The monitoring is a continuation of the baseline monitoring sites.

Comment MK 72

Mine Plan, Section MP.8 Water Use, 46. Please state in the text that all water from surface reservoirs or wells will be used under appropriate permits from the State Engineer's Office (SEO). (MDK)

Response MK 72

Revised text as requested.

Comment MK 73

Mine Plan, Section MP.8 Water Use, 47. It is advised that the applicant discuss with the SEO-Interstate Streams Division any implications that water use may have under the Yellowstone River Compact. (MDK)

Response MK 73

Revised text as requested.

Comment MK 74

Mine Plan, Addendum MP-6 Subsidence Control Plan, Section MP.6.3 Subsidence Monitoring and Assessment and Section MP-6.4 Subsidence Control and Remediation, 48. The text states that subsidence monitoring would be discontinued if no evidence of subsidence occurred after six months after highwall mining. Please include a clarifying statement that the applicant would remediate subsidence up until bond release is approved, even if the subsidence was detected later than the six months of initial monitoring. (MDK)

Response MK 74

Please see revision to last paragraph of Addendum MP-6

Comment MuK 32

Mine Plan, 32. Please provide an electronic copy of the groundwater model referenced in Addendum MP-3. In addition, please provide the GIS projection coordinate of the model files that will enable the LQD to plot the model results in GIS for the purposes of producing the CHIA (Cumulative Hydrologic Impact Assessment). The LQD review of the model files might potentially generate additional comments, clarifications or questions. (MK)

Response MuK 32

An electronic copy of the groundwater model Will be provided under separate cover. The elements in the model are based on the Wyoming East Central NAD 83 state plane coordinate system. To convert from model Grid to the state plane coordinates the X

offset is 1367387.512 and the Y offset is 1915004.382. There is no rotation from the model grid to the state plane coordinate system.

Comment MuK 33

Mine Plan, MP.1.1 Type of Mine, 33. Page MP-1 states, “Below the Tongue River Member is the Lebo shale member of the Fort Union Formation which contains the Masters Seam (Cardno MM&A, October 2013).” This statement is not consistent with Table D5.3-1, Page D5-T1 and other descriptions in Appendix D5. Table D5.3-1 indicates Masters Coal seam is in the Tongue River Member. Please clarify and make appropriate changes throughout the submittal (Example: MP 4.4). (MK)

Response MuK 33

Revised text as requested.

Comment MuK 34

Mine Plan, MP.1.1 Type of Mine, 34. Major coal seams on the Brook Mine include: Dietz (1,2,3), Monarch, Upper Carney, Lower Carney and Masters.”. Dietz (1,2,3) coal seam is not included in the description presented in Section D5.3.3.3, Appendix D5. Please clarify: (i) the seams that will be mined by the Brook Mine and (ii) include the description of all the coals seams as appropriate in Appendix D5 and Appendix D6. (MK)

Response MuK 34

Please refer to Mine Plan Section MP.4.4.1 for targeted coal seams at the Brook Mine.

Comment MuK 35

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, Consider using the groundwater model referenced in Appendix D-3 to provide a description for a range of estimates on anticipated dewatering rates/volumes and groundwater inflows to the mine pit. (MK)

Response MuK 35

The text in Section MP.5.8 is to indicate that water entering the pit from either groundwater or surface water will be controlled using sumps and treated prior to discharge.

Comment MuK 36

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, 36. Please clarify the anticipated effects of the faults on the dewatering plan or groundwater impacts during mining. (MK)

Response MuK 36

Since the water will be collected in a sump, treated, and then discharged, the faults should have no effect.

Comment MuK 37

Mine Plan, MP.5.9 Dewatering Wells, 37. Please provide a brief discussion on the anticipated quality of groundwater removed at various stages of mining. (MK)

Response MuK 37

Revised text as requested.

Comment MuK 38

Mine Plan, MP.5.9 Dewatering Wells, 38. If groundwater is discharged into a stream channel, anticipated discharge flow rate, water quality, and estimated seasonal discharge of the groundwater should be tabulated. The availability and suitability of this water for downstream water users should also be evaluated. Please clarify if this is an expected mechanism to discharge pumped groundwater. (MK)

Response MuK 38

Revised text as requested.

Comment MuK 39

Mine Plan, MP.5.8 Groundwater Rights, Please include a description on any expected degradation of groundwater quality caused by the mining operation (including lateral flow through spoils) in the adjudicated wells. (MK)

Response MuK 39

Revised text as requested.

Comment MuK 40

Mine Plan, MP.6.2.Groundwater, 40. Please provide a brief discussion on any hydrologic effects caused by anticipated changes in recharge to the aquifers during mining. (MK)

Response MuK 40

Revised text as requested.

Comment MuK 41

Mine Plan, MP.6.2.Groundwater, 41. Please provide an assessment of any subsidence effects (Addendum MP-6) on the hydrologic system during operations. (MK)

Response MuK 41

Revised text as requested.

Comment MuK 42

Mine Plan, MP.6.2.Groundwater, 42. Please discuss if there are any expected impacts on groundwater quality caused by subsidence. (MK)

Response MuK 42

Revised text as requested.

Comment MuK 43

Mine Plan, MP.6.3.2 Plan to Mitigate the Impacts on Groundwater, 43. If the quality or quantity of adjudicated water supplies are affected, then an alternative source should be identified as part of the mitigation plan. Please provide a statement to meet this statutory requirement (W.S. § 35-11-415(b)(xii)). (MK)

Response MuK 43

Revised text as requested.

Comment MuK 44

Mine Plan, MP.7.2 Groundwater Monitoring, 44. Please clarify the lack of any shallow monitor wells near Hidden Water Creek, Goose Creek and Tongue River alluvium and if this will be an impediment to completely characterize the groundwater impacts during mining. (MK)

Response MuK 44

Hidden Water Creek has no alluvium therefore, no shallow well can be installed. Goose Creek in the area of the permit is through a reclaimed mine area (pre-law) therefore there is not alluvium. As discussed throughout we will not impact the Tongue River Alluvium. RAMACO will add wells in the Tongue River Alluvium.

Comment MuK 45

Mine Plan, MP.7.2 Groundwater Monitoring, 45. Please clarify the possibility of any of the monitor wells shown in Exhibit MP.7-7 being discontinued due to any constraints in the proposed-mine plan (example: mined through). (MK)

Response MuK 45

Revised text as requested.

Comment MuK 46

Mine Plan, MP.8 Water use, 46. Page MP-47 states, “Industrial water will be obtained from groundwater wells or from water collected in sediment and flood control reservoirs.” Please clarify if the groundwater wells mentioned in this statement are wells that will be exclusively used as industrial supply wells or if they are same as dewatering wells. (MK)

Response MuK 46

Revised text as requested.

Comment MuK 47

Mine Plan, MP.8 Water use, 47. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a discussion comparing the reported water use by other mines of similar size in the Powder River Basin.

Response MuK 47

No record of reported water use was discussed in the annual reports submitted to WDEQ for several different mines within the Powder River Basin. As such, a comparison was unable to be made.

Comment MuK 48

Mine Plan, MP.8 Water use, 48. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a comparison of this estimated total water use against the various estimated water sources available during mining (Example: from dewatering wells). It will be very helpful to provide a discussion on contingency measures during extreme wet/dry years or if the proposed mine plan does not require extensive dewatering. (MK)

Response MuK 48

RAMACO is currently working to solidify the necessary water right for this water. The sources and associated amounts are in discussions and therefore not presented at this time.

Comment MuK 49

Mine Plan, MP.8 Water use, 49. Please clarify if there is any expected variability in this projected water use (example: is it closely related to the mine plan). (MK)

Response MuK 49

Revised text as requested.

Comment MuK 50

Mine Plan, Addendum MP-3 Groundwater Model, 50. Page Addendum MP-3-19 states, “Since, most of the wells within the modeled domain are stock wells with intermittent pumping and completed in geologic strata below the Masters Coals, they are relatively inconsequential to the groundwater system modeled in this report.” Please provide a Figure (or reference) to show these wells, their depths and discuss on why they are hydrogeologically isolated from the effects of the proposed mine. (MK)

Response MuK 50

All the groundwater rights are tabulated within Appendix B of the adjudication volume and Exhibits 5 and 8 in the adjudication volume show the locations of each respective groundwater right. Please note that adjudication Exhibits 5 and 8 include monitor wells in addition to stock and domestic wells so all the wells shown on the exhibits are not necessarily wells that are being used as water supply wells. In fact, almost all the completed water wells shown on Exhibit 5 of the adjudication volume within the Brook Mine permit area are actually monitor wells. The Cross Sections presented in Exhibit 2 of Addendum D5-3 show the depth of the coal seams at various locations within the Brook Mine Permit. For comparison, the depths of each well are listed in the tabulation in Appendix B of the adjudication volume.

The statement on Page MP-3-19 “they (the wells) are relatively inconsequential to the groundwater system modeled in this report” means that the wells are not believed to be significant stressors to the groundwater system because of their relatively low pumpage rates. This statement should not be interpreted to mean that all of the stock and domestic wells in the area are hydrologically isolated from the coals proposed for mining within the Brook Mine Permit area. In fact, Section 4.9 of Addendum MP-3 specifically describes 26 wells that, based on their depths and locations, are likely completed within the coals. The expected impacts to these wells were assessed as part of the modeling exercise. Based on a comparison between the reported depths in the water rights tabulation in Appendix B of the adjudication volume and the geologic cross sections in Addendum D5-3, the other stock and domestic wells in the area were determined to be completed either in the Tongue River alluvium, or deeper strata below the Carney coal and do not have a direct hydrologic connection to the coals proposed for mining in the Brook Mine and were not specifically evaluated in the groundwater model.

Along the eastern edge of the model domain there are a large number of CBM wells and, based on available data presented in the water rights tabulation in Appendix B of the Adjudication volume, these wells are likely pumping water from the Carney and Masters coal seams. The impacts from the CBM wells are described in detail within

later sections of the report. However, the text on page MP-3-19 does not speak to the CBM wells. Minor changes to the text on page Addendum MP-3-19 and additional explanatory text have been added to this page to provide further clarification.

Comment MuK 51

Mine Plan, Addendum MP-3 Groundwater Model, 51. Page Addendum MP-3-20 states, “The faults are significant in lateral extent and form natural no flow boundaries”. Please provide a discussion (or refer to a discussion) on how these faults were determined to be no flow boundaries. (MK)

Response MuK 51

Faulting within the permit area was mapped by B.E. Barnum on the USGS Monarch Quadrangle. As noted in Section D5.3.2, Barnum indicates fault displacements on the order of 50 feet within the mine area. Lithologic logs provided in Addendum D-5-3 demonstrate that the dominating lithology in the column is claystone and coal thicknesses are less than 20 feet. This offset geology from faulting results in a claystone hanging or footwall adjacent the coal aquifer and therefore discontinuity of the aquifer and an assumed hydrologic flow boundary.

Comment MuK 52

Mine Plan, Addendum MP-3 Groundwater Model, 52. Please clarify the reason for not estimating vertical hydraulic conductivity of the interburden using an aquifer test. (MK)

Response MuK 52

Response to this comment is partially clarified in responses to MK’s Comments 18 and 19 above. During the aquifer test conducted at the 578409 well cluster no response was observed across the interburden, therefore, the vertical hydraulic conductivity of the interburden was too low to measure in the aquifer test. Furthermore, the static water levels in the Masters and Carney coal seams are different which demonstrates that the hydraulic conductivity of the interburden is very low. Therefore, literature values were utilized and adjusted within reasonable bounds to improve model calibration.

Comment MuK 53

Mine Plan, Addendum MP-3 Groundwater Model, 53. Page Addendum MP-3-25 states, “With no unnatural stresses on the system ...” Please provide a discussion of the CBM impacts on the water levels. It appears that the hydrographs presented in Appendix D6 do not show the impacts of CBM. (MK)

Response MuK 53

There are multiple CBM production wells located along the eastern side of the groundwater domain. In order for the CBM producers to be able to produce gas it is necessary to significantly lower the water levels in the coal to release the gas in the coal fractures. CBM production began in this area around 1999. Therefore, it was conservatively assumed that CBM production has already resulted in lowering the water levels in the coal aquifers to the top of the coal aquifer along the eastern edge of the model domain and the general head boundaries were set accordingly to simulate this effect. Even though water level data in the coal aquifer prior to CBM production is limited because of the lack of monitor well data, prior to CBM production, the potentiometric head in the coal was estimated to be significantly higher than the top of coal.

The hydrographs presented in Appendix D6-9 do not show the impacts of CBM because they show water level changes over a one year period roughly 13 years after CBM production began in the area, and if the wells were going to be impacted by CBM, it is likely that they have already been impacted. Please note that the model assumed that CBM production would continue into the future resulting in the water levels in the coal being maintained at unnaturally low levels. Therefore, the model has conservatively estimated the combined impacts from both CBM and the proposed coal mining activities. Currently, a large majority of the CBM wells are being plugged and abandoned which may result in higher than predicted water level recovery rates in the coal aquifer.

Text edits were made to page MP-3-25 to help clarify the discussion.

Comment MuK 54

Mine Plan, Addendum MP-3 Groundwater Model, 54. There are two sub-sections for recharge, Section 2.5.3 and Section 2.6.1. Please clarify/consolidate. (MK)

Response MuK 54

The two subsections have been combined into one subsection under Section 2.6.1

Comment MuK 55

Mine Plan, Addendum MP-3 Groundwater Model, 55. Page Addendum MP-3-26 states, "... drain cells were placed in the model to simulate seeps from the outcrops." Please provide a discussion on the evidence for seeps (or reference) observed during field surveys. Were there any field data collected on the location and flow rates of these seeps? (MK)

Response MuK 55

Evidence of seeps from outcrops can be seen in Color Infrared Imagery (CIR), which is included in the permit as Exhibit D11.1-1. The areas of seepage are manifested on the CIR imagery as areas with more vegetation. Evapotranspiration from the vegetation growing along the seep removes all the water before it emanates from the formation into the drainage. Therefore, no measurements of the seepage rate at the outcrops were possible or are available. Additional discussion explaining the need for drain cells within the model is provided in Section D6.2.2. Also, text was added to Section D6.2.2 to clarify that no field flow measurements were available.

Comment MuK 56

Mine Plan, Addendum MP-3 Groundwater Model, 56. Page Addendum MP-3-27 states, "River cells from MODFLOW's river boundary conditions package were placed in the model to simulate the Tongue River and Goose Creek." Please provide a conceptual discussion supported by field observations on the type/nature of interaction of these streams with groundwater (Gaining stream vs. losing stream). (MK)

Response MuK 56

As described in Section 2.3 of MP-3, the dip of the strata in the project area is generally east-southeast into the Powder River Basin and the groundwater flow direction follows this trend regionally. As such, the Tongue River comes into contact with the coal seams of interest near the updip side of the coal seams. Interactions between the surface water and groundwater occur at those points where permeable formations sub-crop into alluvial/surface water bodies. Both the Carney and the Masters coal subcrop under the Tongue River near the western edge of the model domain. Conceptually these subcrops are the only places where the coals would be in contact with the surface water. Section 2.3 of Addendum MP-3 describes the conceptual groundwater flow in some detail.

As described in Addendum MP-3 Section 2.3, the Carney coal is largely dry to the north and west of its subcrop into the Tongue River alluvium and becomes saturated at an elevation just above the elevation where it subcrops beneath the Tongue River alluvium. Therefore it is likely that the Carney Coal would lose water to the Tongue River alluvium. The potentiometric surface in the Masters Coal is roughly the same as the potentiometric surface of the Tongue River where the Masters coal subcrops beneath it. A review of the steady state groundwater model shows that where the River boundary cells are immediately above the Masters Coal the net effect is that the River boundary cells input approximately 3.2 gpm into the model. Conversely, near the upper and lower Carney Coal/Tongue River outcrops the River cells are taking roughly 0.16 gpm out of the model. Since the coal outcrops occur beneath the Tongue River there is no way to field verify these flows but conceptually they do seem reasonable.

The river boundary cells extend to the bottom of the layer in which they are placed as discussed in response to comment MUK 74 and MUK 84. The River boundary cells were placed in Layer 1 to the confluence of Goose Creek and the Tongue River which extends east of the area where the Carney Coal would be in communication with the Tongue River alluvium. Due to the fact that the River boundary cells extend to the bottom of the layer they do provide a conduit for the River to provide recharge into the Carney Coal even though the River would be physically separated from the coal by multiple zones of low permeability shales. The estimated recharge occurring in this area from the Tongue River to both layers 1 and 2 is approximately 8 gpm. The discharge into the coals is likely conservatively overestimated and not all of the 8 gpm would necessarily end up in the coal as some of it also discharges to layer 1. As such, the model conservatively estimates that up to 11.2 gpm would be discharged from the river to the coals or overburden between the Carney Coal and the Tongue River.

The strata located above the coal seams of interest is generally claystone with low permeability as discussed in MP-3 Section 2.2. Therefore, interaction of groundwater between these units and the Tongue River or Goose Creek is very limited. Within the model domain, the Tongue River Alluvium does have large deciduous trees and other vegetation immediately adjacent to the river. Conceptually, evapotranspiration from the vegetation along the Tongue River would indicate that through the model domain the Tongue River is a losing Stream. Throughout most of the model domain where the Tongue River is present, there low permeability overburden strata between the Tongue River alluvium and the coal seams which hydrologically isolate the Tongue River from both the Masters and the Carney coal seams. Since Goose Creek is located in the eastern portion of the model domain where the coal is significantly below the alluvium and the clay intervals are even thicker, the Goose Creek alluvium is also hydrologically separated from the Masters and Carney Coals. The Goose Creek alluvium would likely see similar losses to evapotranspiration that would be observed in the Tongue River alluvium.

Comment MuK 57

Mine Plan, Addendum MP-3 Groundwater Model, 57. Please provide a discussion on any contribution of groundwater baseflow to the major surface water bodies within the permit boundary. (MK)

Response MuK 57

As described in the response to comment MuK 56, conceptually, very little groundwater base flow from the Carney and Masters coal seams are expected to contribute to the surface water bodies within the permit boundary. The mass balance table provided in response to comment MuK 73 demonstrates that much more water is expected to enter the groundwater system from the surface water bodies (river cells) than is contributed to the surface water bodies from groundwater baseflow.

Comment MuK 58

Mine Plan, Addendum MP-3 Groundwater Model, 58. In section 3.2 MODFLOW Input Files, was aerial recharge used as an input file? Please clarify if evapotranspiration was considered as a discrete input or lumped into net aerial recharge. (MK)

Response MuK 58

Yes, the recharge package was used as an input file. Section 3.2 of Addendum MP-3 was updated to include a discussion of the recharge package. The evapotranspiration (ET) package was not utilized in the model. To address the effects of ET, the recharge rates were adjusted down in proportion to the estimated losses created by ET. Within most of the model domain where evapotranspiration would occur, the low permeability overburden between the surface and the coal seams of interest provide a hydrologic barrier so the evapotranspiration was ignored in these areas.

Comment MuK 59

Mine Plan, Addendum MP-3 Groundwater Model, 59. Page Addendum MP-3-31 states, “Layer 1 – represents the coal overburden”. Please clarify if the alluvial aquifer was included in the model. Please provide justification for not considering the alluvial aquifer in the model. (MK)

Response MuK 59

As described in the responses to comments MuK 56 and MuK 57, the only place within the model domain where there is potential for interactions between any alluvial aquifers and the coal seams of interest is where the coal is directly below the Tongue River alluvium or Slater Creek colluvium. Where the coal is in direct contact with alluvium/colluvium, layer 1 (the coal overburden) was assigned a higher vertical hydraulic conductivity to allow the layer to better emulate the alluvial/colluvial aquifer in this location. This zone of higher hydraulic conductivity in layer 1 is depicted on Addendum MP-3 Figure 4.2-1. Groundwater Vistas does not allow discontinuous layers throughout the model domain so this allowed the alluvium/colluvium to be effectively be modeled without the need to add an additional layer across the top of the entire model domain. This helped to improve the computational efficiency of the model. Since the overburden has a very low hydraulic conductivity and hydrologically separates the coals from the other alluvial/colluvial deposits within a large portion of the model domain, there is no reason to model any additional alluvial/colluvial deposits. To help clarify this comment Figure 4.2-1, was prepared and sections 2.5 and 4.2 of MP-3 have been updated.

Comment MuK 60

Mine Plan, Addendum MP-3 Groundwater Model, 60. Page Addendum MP-3-31 states, “Layer 3- Carney Interburden. This interval is generally of low to very permeability in

the western portion of the Project Area”. Please clarify how the areas where Layer 3-Carney Interburden is absent are treated in the groundwater model. (MK)

Response MuK 60

Ground Water vistas does not allow discontinuous layers. Therefore, Layer 3 is continuous across the entire model domain. Where the coal seam coalesces on the east portion of the model, the Layer 3 interburden was modeled as coal by setting hydraulic properties of the layer equivalent to the values of the overlying and underlying coal seams. Additional text has been added to Section 4.2.1 of Addendum MP-3 to further describe how the hydraulic conductivities were assigned to layer 3.

Comment MuK 61

Mine Plan, Addendum MP-3 Groundwater Model, 61. Please include a discussion of the thickness of all model layers. (MK)

Response MuK 61

Addendum MP-3 Section 2.5 describes the thickness of the various coal seams. Additional text has been added to MP-3 Section 4.1 to generally describe the thickness of each layer. Following are the modeled thicknesses for each layer:

- Layer 1-The thickness for this layer varies throughout the model domain. Near the western side of the model the layer is often absent where all the strata geologically younger than the Carney coal has been eroded off. These areas are generally represented as no flow cells in the model. Within the eastern portion of the model Layer 1 can be substantial. In the model the maximum thickness of Layer 1 in the eastern side of the model domain was approximately 1,100 feet.
- Layer 2-The Upper Carney coal was modeled with a constant thickness of 7 feet throughout the model.
- Layer 3-The Carney coal interburden layer varied in thickness from 4 feet up to 15 feet within the active portion of the model.
- Layer 4-The Lower Carney coal was modeled with a constant thickness of 8 feet within the model.
- Layer 5 The Carney/Masters coal interbuden layer varied in thickness from 4 feet up to 107 feet within the model.
- Layer 6-The Masters coal was modeled with a constant thickness of 6 feet within the model.

Comment MuK 62

Mine Plan, Addendum MP-3 Groundwater Model, 62. Please include a justification for not considering the underlying zones beneath the Masters coal seam in the model. (MK)

Response MuK 62

The Masters coal is underlain by the Lebo Shale. The Lebo Shale is a thick (Appendix D5 Section D5.2.3), regional confining interval in the project area as described in Mine Plan Addendum MP-3 Section 2.1. There are no aquifer units identified within the model domain within the Lebo Shale with direct hydrologic connection to any of the elements of the model. Since the Lebo Shale is a regional confining unit, if it had been included in the groundwater model, it would have been assigned hydraulic parameters typical of a shale interval (very low hydraulic conductivity) and it would have essentially been a no flow barrier to the more permeable Masters coal above it. Groundwater Vistas treats the bottom of the model as a no flow boundary. Therefore, the Lebo Shale is for all practical purposes included in the model as a confining interval with the way the model is currently defined.

Comment MuK 63

Mine Plan, Addendum MP-3 Groundwater Model, 63. Please provide appropriate cross section(s) of the model grid overlaid with the drill hole data collected during baseline characterization. This will help the evaluation of the adequacy of model layer thicknesses against the stratigraphic field data. (MK)

Response MuK 63

As noted in Addendum MP-3 Section 4.1, the Groundwater model layers were developed from a 3D geologic model developed from drill hole data within the project area developed for the purposes of making volumetric coal estimates. Minor updates to the surfaces were made where new data provided by additional exploration drilling was completed. An additional figure was developed (Addendum MP-3 Figure 4.1-3) and included in Addendum MP-3 that depicts actual cross sections cut from the groundwater model. Addendum D5-3 of Appendix D5 includes geologic cross sections with drill hole data that can be compared back to the actual cross sections included in Figure 4.1-3 of Addendum MP-3.

Comment MuK 64

Mine Plan, Addendum MP-3 Groundwater Model, 64. Please clarify how the layers were modeled to represent the confined/unconfined aquifer types. (MK)

Response MuK 64

Groundwater Vistas has a “layer type” control that was set to #5: Confined/Unconfined, which allows the model to determine whether to use storativity or specific yield for the storage coefficient based on the elevation of the water elevation vs. formation tops. Groundwater Vistas handles the aquifer type classification without further inputs.

Comment MuK 65

Mine Plan, Addendum MP-3 Groundwater Model, 65. In addition to model calibration, please provide justification for the recharge rates applied in the model including any literature references. (MK)

Response MuK 65

The initial recharge rates utilized in the model were initially estimated based on a USGS study (Water-Resources Investigations Report 01-4278) conducted on the eastern side of the Powder River basin and the Black Hills area. The study entitled, “Estimated Recharge to the Madison and Minnelusa Aquifers in the Black Hills Area, South Dakota and Wyoming, Water Years 1931-98.” was prepared by JM Carter and D.G Driscoll. In the study Carter and Driscoll reported recharge rates varying from 0.04 inches per year to 2.93 inches per year. The 2.93 inch per year recharge rate was reported within the Madison limestone formation outcrops in the Black Hills while the lower range of recharge rates reported by Carter and Driscoll were estimated for areas in the eastern periphery of the Powder River Basin where the precipitation and soil types are similar in nature to the Brook Mine Permit area. Since calibrated recharge rates in the key recharge areas (the coal outcrops and the scoria outcrops) were within the range of values developed by Carter and Driscoll, the recharge rates used in the model are considered reasonable. Please note that the recharge rate throughout Layer 1 is much lower than the range of recharges developed by Carter and Driscoll. This is reasonable because much of Layer 1 has no hydrologic connection to the underlying coal seams. Additional justification for recharge rates applied in the model is discussed in response to comment BJ57.

Comment MuK 66

Mine Plan, Addendum MP-3 Groundwater Model, 66. Page Addendum MP-3-33 states, “Recharge is applied within the modeling software by applying the recharge to the highest active layer.” Please clarify the presence of any modeled ‘dry cells’ in the model and the influence of applying the recharge to the layers below the dry cells. (MK)

Response MuK 66

As noted in the responses for comments MuK 59 and MuK 60, Groundwater Vistas does not allow for discontinuous layers across the model domain. Along the north and

the west sides of the model there is a good portion of the model domain where the upper layers have been eroded off and do not actually exist. These areas of erosion were accounted for using no flow cells. As shown on Figures 4.4-1 through 4.4-4 of Addendum MP-3, the no flow cells in the top layer are the largest in areal extent while each underlying layer has a slightly decreased areal extent of no flow cells. In this case the no flow cell distribution was adjusted to match the outcrop of each layer. The fact that the software applies the recharge to the highest active layer was taken advantage of during the modeling process, since it is an effective way to apply recharge to an outcropping layer which is under another layer that is eroded away but due to software limitations is still present in the model.

Because CBM operations have generally removed most of the water from the coal seams, there are some locations within the model domain where dry cells during the modeling have caused cells in layer 1 to go dry and the recharge is applied to the next active layer below. While this could be problematic if a high recharge rate were assigned to the model cells, generally throughout the model domain the recharge rate is very low. Therefore, this results in a very minor amount of water coming into the model and did not significantly affect the model calibration.

Comment MuK 67

Mine Plan, Addendum MP-3 Groundwater Model, 67. Table 4.2-3. lists model porosity values. Typically, MODFLOW (flow model) does not use porosity in its calculations. Please clarify the need for this input parameter. (MK)

Response MuK 67

Modflow does not utilize porosity as part of its calculations. However, other modules included in the Groundwater Vistas package such as MODPATH do utilize porosity. In the case of this model, no MODPATH simulations were conducted. Therefore, the porosity term as put into the model has no impact on the calculations. However, porosity is a hydraulic parameter of the aquifer and may be important for future modeling simulations, therefore, the porosity values developed for each aquifer/aquitard unit will be left in the model report. Minor changes to the text in Addendum MP-3 have been made to clarify the role of porosity in this model.

Comment MuK 68

Mine Plan, Addendum MP-3 Groundwater Model, 68. The faults are not modeled in Layer 1. Please clarify the procedure for determining the vertical extents of the faults in the model. (MK)

Response MuK 68

The composition of Layer 1 is predominately claystone. Because Layer 1 is not composed of aquifer material and because the hanging and footwalls are composed of

strata with similar hydraulic properties, displacement due to faulting does not substantially change the flow through the aquitard and placing Horizontal flow barriers in the model in layer 1 was not necessary.

Comment MuK 69

Mine Plan, Addendum MP-3 Groundwater Model, 69. Please provide the input parameters used to model the horizontal flow barriers in the model and discuss their technical reasonableness. (MK)

Response MuK 69

Horizontal Flow Barriers were used in the model to simulate no-flow boundaries created by faulting within the project area. Horizontal flow barriers require two input parameters in Groundwater Vistas including wall thickness and hydraulic conductivity. The input parameter used in the model for wall thickness was 10 feet and a hydraulic conductivity of 1.0×10^{-5} ft/day was used. The horizontal flow barrier parameters as applied will essentially limit all but a very minor amount of flow across the barrier. As described in the response to comment MuK 51, the coal seams within the project area are relatively thin as compared to the fault offsets so it is reasonable to assume that the faults will significantly impede flow in the aquifer units.

Comment MuK 70

Mine Plan, Addendum MP-3 Groundwater Model, 70. Page Addendum MP-3-40 states, "As the current, post-CBM potentiometric surface is considered the static level....." Please provide the implications of this assumption, on the model calibration of hydraulic parameters and the mode predicted hydrologic impacts (over estimation of drawdown vs. underestimation) (MK)

Response MuK 70

Addendum MP-3 Sections 4.8.1, 4.10, and 4.11 all discuss the implications of CBM impacts. In addition, the response to comment MuK 53 also discusses CBM impacts to water levels. As discussed in the response to comment MuK 53, the model conservatively assumed that CBM operations have lowered the water levels in the eastern portion of the model domain to a level near the top of the coal seams. To simulate this drawdown, the elevations of each general head boundary on the east side of the model were set at an elevation just above the top of the coal seam. The general head boundaries elevations remained the same in both the steady state and the transient models. Essentially, this means that the model operated under the assumption that the post CBM impacts were permanent prior to and after the Brook Mine mining activities.

The assumption that the water levels have been permanently impacted by CBM did have a significant impact on model calibration. The severely depressed water levels

caused by CBM operations have resulted in a large number of cells going dry. The hydraulic parameters of the aquifer units within the eastern portion of the model domain were not adjusted to eliminate the dry cells since it is reasonable to assume that, with the severe drawdown modeled, the coal seams could have been dewatered in these areas. Therefore, even though the effects of the CBM drawdowns were observed during calibration, no specific adjustments were made to the modeled aquifer characteristics to eliminate these impacts. The dry cells did complicate calibration of the model because they cause instability in the MODFLOW model calculations and results.

The model was developed to take into account impacts from the combined effects of CBM and the proposed coal mining. In general, CBM development impacts are significantly larger than the predicted impacts from the Brook Mine. Therefore, ignoring CBM impacts would have significantly under predicted the potentiometric surfaces within the model domain and overestimated the impacts that Brook Mine would have on the system.

Many of the CBM wells are actively being plugged and abandoned. If this trend continues, there is a chance that recovery of water levels from CBM impacts may begin which will result in recharging of the coal seams. If this happens, it is anticipated that the model conservatively over predicts the impacts to the region especially in the long term recovery scenarios.

Comment MuK 71

Mine Plan, Addendum MP-3 Groundwater Model, 71. It is noted that Table 4.7-1 summarizes the calibration residuals and statistics from the calibrated model. Please consider providing additional presentations of the calibrated model statistics. This will enable an easier evaluation of any spatial bias in the model calibration. (MK)

- a. X-Y plot of observed vs. simulated water levels.
- b. A map plotting the residuals to show the spatial distribution
- c. Provide a summary statistics table with Mean Error, Mean Absolute Error, Sum of Squared residuals for the calibrated model. It is noted that some of these values are presented in the sensitivity analysis. However, a compiled summary statistics table would be very helpful.

Response MuK 71

As requested the following additions have been made to the groundwater model report:

- A. An X-Y plot of observed versus simulated water levels has been added in the report as Addendum MP-3 Figure 4.7-1.

- B. The residuals have been added to figures 4.7-2, 4.7-3, and 4.7-4 of Addendum MP-3.
- C. Table 4.7-1 of Addendum MP-3 has been updated to include additional statistics.

Comment MuK 72

Mine Plan, Addendum MP-3 Groundwater Model, 72. In addition, to the measured water levels, please clarify if there were any flow measurements used for model calibration. (MK)

Response MuK 72

There are no areas within the model domain where it was possible to collect any flow measurements that would support the modeling effort therefore, no flow measurement were used in the calibration.

Comment MuK 73

Mine Plan, Addendum MP-3 Groundwater Model, 73. Please provide a water budget table (in acre-feet per year or cubic-feet per day) showing all the inflows into the model and outflows from the model.

Response MuK 73

The following tables summarizes the inflows and outflows from the model domain during the steady state period, 5 years into mining, the end of mining, and at the end of recovery.

Mass Balance of Steady State Calibrated Model		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
General Heads	16,107	22,890
River	2,569	410
Drains	-	560
Recharge	5,168	-
Total	23,846	23,860

Mass Balance 5 years into Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	12,496	11,431
General Heads	16,130	22,904
River	2,688	385
Drains	-	1,774
Recharge	5,434	-
Total	36,749	36,494

Mass Balance End of Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	3,670	4,146
General Heads	16,135	22,902
River	2,705	365
Drains	-	532
Recharge	5,430	-
Total	27,941	27,945

Mass Balance End of Recovery		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	1,698	2183
General Heads	16,138	22,901
River	2,714	363
Drains	-	535
Recharge	5,427	-
Total	25,978	25,983

Comment MuK 74

Mine Plan, Addendum MP-3 Groundwater Model, 74. Please provide a comparison of model simulated inflows and outflows against conceptual estimates of inflows and outflows. This comparison will act as another verification/check for the technical adequacy of the groundwater model (Example model GHB flows vs. reasonable estimated conceptual flows). (MK)

Response MuK 74

Response to comment MuK 73 includes tables that show the inflows and outflows from the model during the steady state period, 5 years into mining, the end of mining, and at the end of recovery. The five main categories of inflows and outflows include 1) storage, 2) general head boundaries, 3) river boundaries, 4) drains, and 5) recharge. Following is discussion regarding model predicted inflows and outflows for each category:

- 1) Storage – During the steady state model there is no inflow or outflow from storage so storage is not included in the first mass balance table in prepare for comment MuK 73. The model predicts that during active mining more water will come out of storage than will go into storage. Conceptually this is reasonable since during mining, water from the coals would be draining into the mined out areas. There is a trend of water continuing to come out of storage even after mining ceases. Even though the volume of water coming out of storage is quite low, it is contrary to the conceptualization of the system to have water leaving storage after mining because at this point water should be going back into storage. This phenomenon is attributed to the fact that many of the

cells in the model go dry during mining because CBM operations have significantly dewatered the coals and there is not much water available in storage (see comment MuK 70). When the cells go dry, MODFLOW treats them as no flow areas and there can be a ripple effect that causes additional cells going dry. Since MODFLOW is not very efficient at rewetting dry cells when they should be resaturated, this ripple effect has caused permanent changes in the model. Over a long time the model would be expected to come to a steady state condition. The tables prepared in response to comment MuK 73 indicate that even at the end of recovery, the model is not yet at the new equilibrium that would eventually be reached with the additional dry cells.

- 2) General Head Boundaries – The amount of water going into and out of the model domain via the general head boundaries remains relatively consistent throughout the modeled operations. This is reasonable because the general head boundaries are a long distance from the mining area and would not be expected to be significantly impacted by mining. In addition, the total volume of outflows from the general head boundaries generally balances the inflows from other sources. This is conceptually correct.
- 3) River Boundaries – The conceptual inflow and outflow from the coals to the Tongue River are discussed in detail in comment MuK 56. Groundwater Vistas does apply the River Boundary cells to the bottom of the layer in which they are inserted. The Tongue River Boundary cells were inserted into the model up to the point where Goose Creek joins the Tongue River. At that location the top of the Carney coal is estimated to be approximately 100 feet below the surface. Since the alluvium is generally much thinner in this area and there is actually a large amount of low permeability strata between the Tongue River alluvium and the coal (described in comment MuK 56), the model likely overestimates the contribution of the River boundary cells to the model because the river boundary cells provide a direct connection (in the model) between the river and the coals where there is not a physical connection. This conservatively over estimates how much water discharges from the River Boundary Cells to the model.
- 4) Drains – One drain was placed into layer 1 in the northeast side of the model domain to allow water to drain from the model where the Tongue River crosses the domain boundary. This represents the amount of water in layer 1 lost to the surface water system. The total discharge from this drain during steady state conditions is 560 ft³/day (2.9 gpm). While no physical measurements were (or can be) made to verify this amount, conceptually it is reasonable. The strata along the Tongue River likely does discharge a small amount of water to the River where it cuts through the numerous perched sand lenses that become saturated from natural recharge. There is no evidence of large groundwater discharges to the Tongue River in this area so it makes sense that a small

discharge to the River (rather than a large discharge) would be observed in the model. During mining, drains were added to the model to remove water from the mine pits. The tables indicate that during mining the discharges from the drains do increase as expected. After mining is complete, discharges from the drains return approximately to premining levels which is conceptually correct.

- 5) The recharge amount used in the model stays at relatively the same level throughout the simulations. Total recharge across the model area is approximately 28 gpm. As is described in comment #65 the recharge rates are reasonable based on available studies.

Comment MuK 75

Mine Plan, Addendum MP-3 Groundwater Model, 75. Page Addendum MP-3-40 states, “Due to a system of thin aquifers with similar sources and sinks and homogeneous hydraulic conductivities, the head values of the steady-state model were nearly identical between the separate coal layers as noted in Table 4.7-1.” Please clarify whether this statement implies that the interburden (where present) between the coal seams is not a confining unit. (MK)

Response MuK 75

This statement is an observation only based on review of modeled values and does not suggest a lack of confinement exists. Pumping tests conducted in separate aquifers demonstrated that the interburden provides confinement between the Carney and Masters aquifers as described in Section D6-8.3.2.3 of Appendix D6. In addition, Table 4.7-1 of Addendum MP-3 shows that at each cluster where both coal seams contained measureable water, the difference in measured water levels between the coal seams was higher than the modeled difference. This suggests that the vertical hydraulic conductivity assigned to the interburden in the model may be higher than the actual hydraulic conductivity of the interburden in the field. The use of a higher hydraulic conductivity for the interburden in the model will overestimate the drawdown in the other coal seam therefore, the predicted drawdown will be conservative.

Comment MuK 76

Mine Plan, Addendum MP-3 Groundwater Model, 76. In figures 4.7-1, 4.7-2 and 4.7-3, please consider including the observed/interpreted water level contours and the measured water level elevations. This will enable to visually evaluate the observed vs. simulated water levels. (MK)

Response MuK 76

Figures 4.7-1, 4.7-2, and 4.7-3 of Addendum MP-3 have been updated to include both observation wells and observed elevations as well as observed potentiometric contours.

Please note that in response to Comment MuK 71 an additional figure was added to this section (Figure 4.7-1) and these figures have since been renumbered to 4.7-2, 4.7-3, and 4.7-4.

Comment MuK 77

Mine Plan, Addendum MP-3 Groundwater Model, 77. Page Addendum MP-3-45 states, “.....and if CBM production ceases, recovery rates will likely be higher than estimated in the model.” Please clarify if this statement implies that currently, there are CBM wells that are operational in the area and are pumping out groundwater. (MK)

Response MuK 77

Although substantially less than past years, some CBM wells in the area are still producing groundwater. Since CBM production has been ongoing for the last 15+ years the CBM operations have significantly lowered the water levels in the coals as is noted in the report. Records of groundwater withdrawals can be found on the Wyoming Oil and Gas Conservation Commission’s (WOGCC) online database at: wogcc.state.wy.us. According to WOGCC records there has been no groundwater production associated with CBM in Townships 57 and 58N Range 84W since 2012. However production is still occurring in Townships 57 and 58N Range 83W as well as Township 56N Range 83 and 84W. The portions of the model domain where CBM production may occur are located in Townships 56 and 57N Range 84W.

Comment MuK 78

Mine Plan, Addendum MP-3 Groundwater Model, 78. Please consider removing the model sensitivity to storage coefficients and porosity. Steady state groundwater model equations do not include these parameters in any of the model calculations. (MK)

Response MuK 78

As noted in this comment, the final model did not include a transient calibration and a sensitivity analysis on storage coefficient and porosity is not appropriate. The section and discussion regarding model sensitivity to the storage coefficient and porosity has been updated and removed as appropriate.

Comment MuK 79

Mine Plan, Addendum MP-3 Groundwater Model, 79. Please clarify if the faults in the model and their parameters were considered in any of the sensitivity analyses. If not, please consider performing a detailed and thorough sensitivity analysis, as the faults appear to influence the drawdowns simulated by the groundwater model. (MK)

Response MuK 79

The faults do influence the drawdowns and flow patterns simulated in the groundwater model. However, as noted in the response to comment MuK 51 the displacement observed in the faults roughly 5 times as thick as the modeled coal seams. Given the fact that the dominant lithology in the area is low permeability claystone/siltstone, it is very likely that where faulting has occurred the displacement has resulted in coals being immediately adjacent to the low permeability strata. Therefore the faults are assumed to be hydrologic barriers to water flow. Based on the best available mapping, these faults have been placed into the model. Because the faults are physical parameters that were developed along with development of the geological model (i.e. elevations and thicknesses of the geological layers), a sensitivity analysis was not performed on the faults.

Part of the reason that the faults influence the groundwater responses in the groundwater model to the degree that they do is because of the CBM impacts. Because the CBM operations have significantly lowered the water levels in the coal seams, the faults create a shadow effect that results in many of the cells immediately downstream of the faults going dry. If there had not been any CBM dewatering operations performed in the coals, the water levels would be significantly higher and the effects of the faults would not be as pronounced.

Comment MuK 80

Mine Plan, Addendum MP-3 Groundwater Model, 80. In addition to the simulated drawdown maps, please consider providing hydrographs at strategically selected locations. This will enable a better presentation of the impacts over time. (MK)

Response MuK 80

As suggested, Appendix A has been added to Addendum MP-3 which depicts the modeled water elevations during the model simulation period at all the water supply wells identified within the model domain (CBM wells excepted) and at selected alluvial target locations within the model domain.

Comment MuK 81

Mine Plan, Addendum MP-3 Groundwater Model, 81. Please clarify if the three wells listed in Table 4.9-1 are the only wells considered for the analysis. Also, provide a discussion on the methodology to narrow down the analysis from several wells shown in the groundwater rights maps to these three wells. (MK)

Response MuK 81

Additional wells beyond those originally presented in Table 4.9-1 were considered in the analysis. Table 4.9-1 has been updated to include all the wells considered in the analysis. To determine which wells were included in the analysis, completions were

compared to modeled surfaces to estimate which formation in which the well was completed. Those thought to be completed in the Carney/Masters sequence were included. Please note that the wells included in Table 4.9-1 error on the side of being over inclusive. Some of the wells are believed to be completed in multiple zones but the analysis assumes that they are only completed in the coal seams of interest. In addition, the well depths were determined based on the State Engineer's database and in many cases well depth data was left blank or was questionable. If there was a question whether a well was actually completed in the coal aquifer of interest the well was assumed to be completed in the coal. Therefore, the well list may include some wells that are not completed in the coals of concern.

Comment MuK 82

Mine Plan, Addendum MP-3 Groundwater Model, 82. Please provide (or reference) a discussion about the three wells listed in Table 4.9-1, their depths, screened intervals and other pertinent information. (MK).

Response MuK 82

Table 4.9-1 has been updated to include total depth as well as the screen intervals for all the wells. Additional details on the wells can be found in Adjudication Appendix B.

Comment MuK 83

Mine Plan, Addendum MP-3 Groundwater Model, 83. Page Addendum MP-3-60 states, "To measure the impacts to the Tongue River and Goose Creek, a series of targets were placed along these drainages in Layer 1" Please define the term target. Also, clarify if these targets are located in the alluvial aquifer. (MK)

Response MuK 83

The targets as used in Groundwater Vistas are simply locations where heads are measured and compared with measured heads (if there are any available). Ground Water Vistas generates a hydrograph throughout the transient period of mining and recovery for each target. These targets were placed in Layer 1 to estimate the impacts of mining to surface water bodies. These targets are located where the alluvial aquifer is simulated in Layer 1. Targets representing existing well locations were also put in layers 4 and 6 as well as discussed in Comment MuK 81.

Comment MuK 84

Mine Plan, Addendum MP-3 Groundwater Model, 84. Page Addendum MP-3-60 states, "These targets demonstrate that the estimated maximum impact to Tongue River Alluvium is conservatively estimated to reach 2.5 feet drawdown near the river." Please expand the discussion on the impacts to surface water flows including translating the

drawdown to an estimated decrease in the groundwater baseflows to Tongue River and Goose Creek. (MK)

Response MuK 84

As shown on the hydrographs included in Appendix A, the maximum water level decline of 2.5 feet to the Tongue River alluvium occurred permanently and was caused by dry cells. This 2.5 foot drawdown is not believed to be a real drawdown because it resulted from model instability rather than a real predicted result. If the model did not have dry cells that caused permanent changes in the model, the maximum drawdown due to mining is estimated to be less than 0.5 feet.

As noted in the response to comment MuK 56, the model estimates the coals will contribute a relatively insignificant amount to water to the base flow of the Tongue River. As noted in Comment MuK 73 in the steady state model the River contributed approximately 2,569 cubic feet per day to the model while the river received 410 cubic feet per from the model. The net result is that in the steady state model 2,159 cubic feet per day (11.2 gpm) was contributed from the river to the model. For comparison, at the end of mining, the River contributed 2,714 cubic feet per day to the model and received 363 cubic feet per day from the model. The net result at the end of mining was that 2,351 cubic feet per day (12.2 gpm) was contributed from the River to the model. Over the simulated mining period the model estimates that the increased contribution of flow from the River to the model will be 1 gpm which represents approximately a 9% increase in flow.

Please note that in Groundwater Vistas the river boundary cells go to the bottom of the layer which likely overestimates the impacts to the River. Within the eastern portion of the model domain the coal aquifers can be 200 or more feet below the level of the river while the Tongue River Alluvium is estimated to be between 15 and 30 feet thick based on the thickness of alluvial wells constructed by Big Horn Coal in the area. Therefore, within the eastern portion of the model domain, the coals may be significantly below the alluvium and no River boundary was included in this portion of the model. However, there is an intermediary region where the actual level of the River is some 30-70 feet higher than the coals. At these locations the River boundary cells were left on to conservatively show the impacts to the river. However, the alluvium in these areas is likely thinner than 40-70 feet. As a result, the model allows the River to directly contribute water to the coals below and the model is expected to overestimate the impacts to the Tongue River in these locations.

Comment MuK 85

Mine Plan, Addendum MP-3 Groundwater Model, 85. Please provide a statement on any hydrologic impacts predicted by the groundwater model to areas outside the Brook mine permit boundary. (MK)

Response MuK 85

The only impacts outside of the Brook Mine Permit Boundary would be observed at the existing water supply wells. Table 4.9-1 describes the estimated impacts at all the water supply wells in the Model domain that will be impacted both inside and outside of the Brook Mine Permit Boundary. Please note that most of these wells are located outside of the Brook Mine permit boundary. As shown on Table 4.9-1 the largest model predicted impact seen at any existing well outside of the Brook Mine Permit boundary is 20 feet which would be observed at P48251W. As shown in the hydrograph for this well in Addendum MP-3 Appendix A, this impact is estimated to be short lived (approximately 4 years). Model predicted drawdowns at the rest of the wells are less than 5 feet. At many of the wells predicted drawdowns are less than 1 foot over the life of the mine.

Comment MuK 86

Mine Plan, Addendum MP-3 Groundwater Model, 86. Please provide a discussion on the simulated impacts caused by mining to surface water – groundwater interaction within the model domain. (MK)

Response MuK 86

Please see the response to comment MuK 84.

Comment MuK 87

Mine Plan, Addendum MP-3 Groundwater Model, 87. Please compare the model simulated water balance between pre-mining, during mining and post mining conditions. Consider including a table that presents the water balance during select periods showing the flows from all sources and discharges to all the sinks within the model domain. Provide a detailed discussion addressing any changes in the model simulated water balance between pre-mining, during mining and post mining conditions. (MK)

Response MuK 87

Please see responses to comments MuK 73 and MuK 74. A detailed discussion is included in the responses to these comments.

Comment MuK 88

Mine Plan, Addendum MP-3 Groundwater Model, 88. In addition to the maps presented on the recovery estimates, please provide hydrographs at strategically selected locations. This will enable a better presentation of recovery over time. (MK)

Response MuK 88

As described in response to Comment MuK 80, an appendix (Appendix A) has been added to Addendum MP-3 which depicts the modeled water elevations at a number of well and target locations within the model domain.

Comment MuK 89

Mine Plan, Addendum MP-3 Groundwater Model, 89. The modeling documentation lacks discussion on the backfill aquifer. In the recovery model, please clarify how the model treats the backfill aquifer (spoils aquifer) and its resaturation. Please provide a discussion (or reference) to the hydraulic properties of the backfill materials used to create the backfill aquifer and the aerial extent of the backfill aquifer. (MK)

Response MuK 89

Mine Plan Section 4.10 discusses the backfill aquifer. Within the areas where the highwall miner is used for mining, an open cavern will be left behind. Unless the mined out areas collapse, the backfill aquifer is essentially an open cavern with 100% porosity. The modeling software used for this effort does not have the ability to transiently change aquifer properties, and during resaturation of the mined areas the assigned storage coefficients remained the same as the original aquifer properties. As a result, the model may underestimate the time that it takes for the aquifer to resaturate where the mining methods have increased the porosity and thereby resaturation volume. Inversely, in the slots mined with traditional open cut mining techniques, coal will be removed and replaced with overburden material. In these locations the backfilled material is expected to have poor aquifer characteristics because it will primarily be a mix of fine grained clay and silt with some sand. In these areas the aquifer will essentially be removed. Again, the modeling software does not have the ability to transiently change aquifer properties and this effect was ignored during the modeling.

Figure MP-3-4.9-1 shows the areal extent of mining and Addendum MP-3 Figures 4.7-2, 4.7-3, and 4.7-4 depict the areas that were modeled as dry within the Brook Mine permit area. It is important to note that a large percentage of the area that will be mined is dry prior to the initiation of mining. In addition, figures in MP-3 Section 4 show that after mining, some of the areas go dry and do not rewet. In the areas where slots are excavated this prediction is reasonable because the backfill will act as an aquitard with poor aquifer characteristics. A layer by layer review of the mined area at the end of mining was conducted to determine conceptually how ignoring the changes in the coal porosity and changes in backfill material may have impacted the model predictions.

Upper Carney-With exception of a very small portion of mine block 9 (Figure MP-3-4.9-1). The entire Upper Carney coal is unsaturated. Therefore, there is no resaturation and no recovery. The model estimates are appropriate for the Upper Carney coal.

Lower Carney - Most of the mine blocks as well as the open slots are dry in the Lower Carney at the end of mining. Only mine blocks 1, 2, 5, 9, and 10 had substantial portions that were saturated. As a result, the potential error created by transient aquifer properties in model predicted resaturation rates to the underground mined coal blocks in the Lower Carney coal, if any, is expected to be very low. With the exception of the slots cut to mine blocks 5, 9, and 10, all of the slots cut to mine the Carney Coal will also be dry; therefore, resaturation at those locations will not substantially impact model predictions. The slots cut for blocks 9 and 10 generally run parallel to the direction of water flow. If the coal in these locations is completely removed and replaced with an aquitard, the impact to the aquifer will be minimal because water will simply flow around the portion of the backfilled aquifer. The open pit slot cut adjacent to mine block 5 does run perpendicular to the direction that water is flowing and may change the groundwater flow patterns in this area. However, the location of the slot is near the groundwater divide caused by the fault just to the south. Therefore, this slot is not expected to substantially impact groundwater flows either

Masters - Most of the Masters Coal mine blocks are saturated. Only blocks, 4, 5, 6, and 7 have substantial areas that are not saturated. In the mine blocks where underground mining techniques are employed the model may underestimate the time it takes for resaturation to occur because the storage coefficient is not updated to account for the increased porosity of the mined out block. However this resaturation time will be balanced out by the fact that there will be no aquifer replaced in the open cuts to resaturate, and thus these areas would not resaturate as the model predicts. With the exception of the open cut for mine block 5, all of the open cuts are oriented so that they will have minimal impacts on the natural flow gradients in the wellfield or are located within or adjacent to dry areas. As previously noted, the open cut near mine block 5 is located adjacent the drainage divide so it will not significantly change the water flow within the aquifer.

Due to the fact that much of the mined area is dry, the actual area mined that is below the water table is relatively small, and that the open cuts are oriented such that they have minimal impacts to groundwater flow, the recovery analysis performed by the model is reasonable. Also, as noted, the areas where underground mining is employed and the model overestimates the rate at which the aquifer is resaturated are counterbalanced by the areas of open cuts where the aquifer will not be replaced and the model underestimates the time it takes for the strata to resaturate.

Comment MuK 90

Mine Plan, Addendum MP-6 Subsidence Control Plan, 90. Figure MP6.1-1 shows “Monarch Seam Surface Only Mining”. Please clarify if the Monarch seam is targeted for mining in the appropriate sections of Appendix D5, Appendix D6 and mine plan. (MK)

Response MuK 90

The appropriate sections of Appendix D5 and D6 have been updated.

Reclamation Plan

Comment BJ 57

Volume 12, Reclamation Plan, Section RP.8.3, Pg. RP-37, The narrative describes the sources of recharge to the coal seams. One lithology mentioned as a positive recharge contributor is the overlying burn, scoria, or clinker material, generated by coal fires. It is a common misunderstanding that the scoriaceous material recharges coal or overburden. It would appear, at first glance, that the broken, vuggy material would be capable of conveying large amounts of water from the surface to materials beneath. That is not the case, however, as the coal/scoria interface has a zone of partially metamorphosed coal ash that lies between the burned material and the remnant coal. I have seen this zone many times during my 25 year career in the coal mines when supervising coal and overburden removal. This zone is characterized by a white to light gray, clay band that ranges in thickness from 6 inches to a foot or more. It is the same high silica ash found in the bottom ash of the local power plants that burn PRB coal. This ash band acts as an aquaclude, preventing water from entering or escaping the coal. Because of this, any recharge models that were run using the scoria as a recharge source must be reevaluated using new layers that do not include the scoria. Rerun recharge models if needed.

Response BJ 57

It is true that the partially metamorphosed coal ash layer between the coal and the scoria has the potential to limit recharge from the scoria to the coal. However, even though the permeability of this layer is low, there will be areas where the coal has collapsed or other geologic variances such as a thinning section which will allow for water from the scoria to come into contact with the coal. Therefore, even though the scoria may not be directly in contact with the coal, there is still a recharge component to the scoria, albeit; significantly lower than if the scoria and coal were in direct contact. This low recharge rate is reflected in the groundwater model. The calibrated recharge rate used in the groundwater model for the areas covered by scoria was 0.35 inches per year. For comparison purposes, the recharge rates assigned to the Carney and Masters outcrops, where no scoria was present, varied from 0.2 to 0.88 inches per year. Considering that in the scoria areas a very large percentage of direct precipitation is expected to infiltrate into the scoria, the 0.35 inch per year recharge rate represents a significant reduction in the amount of water available (which could be upwards of 10 inches per year) to infiltrate into the coal seams. Therefore, the calibrated recharge rate included in the groundwater model does take into account the low permeability layer between the coal and the scoria.

Comment BJ 58

Volume 12, Reclamation Plan, Section RP.8.3, Pg. RP-39, The second sentence in the first paragraph has an odd, difficult to understand syntax. Please rewrite the sentence for clarity.

Response BJ 58

Revised page RP-39 text as requested. The sentence will now read “The mine will consult with WDEQ/LQD to determine the number of spoil wells that will be tested”.

Comment BJ 65

EXHIBITS, Reclamation Plan, Exhibit RP.6-1, The permit boundary on this map is inaccurate. Please recreate the permit boundary layer.

Response BJ 65

Revised Exhibit RP. 6-1 as requested.

Comment BJ 66

EXHIBITS, Reclamation Plan, Exhibit RP.8-3 and Exhibit RP.8-4, The post mining potentiometric surfaces for the Carney and Masters beds are suspended in mid-air over Slater Creek. Please terminate the contour lines at the outcrop or use a dotted line to indicate the calculated potentiometric surface.

Response BJ 66

Revised Exhibit RP.8-3 and RP.8-4 as requested.

Comment DS 24

Reclamation Plan, Section RP.4. This brief section discusses what is considered spoil material to be removed during mining. The section states that spoil does not include coal, but there are some very narrow coal seams with numerous stringers of clay or of such low quality that will probably not be mined and will be placed in backfill. Also, the top layers of most coal seams are quite “dirty” and would also be removed and backfilled. In order to provide the readers with a more accurate description of the mining and reclamation processes, please revise the text to show that some coal-laden materials will also be considered spoils and will be backfilled during reclamation.

Response DS 24

Revised text as requested.

Comment DS 25

Reclamation Plan, Section RP.5.2. Please provide a description of the methods used to control topsoil depth during replacement. Most mining operations use stakes with surveyed marks as guides for controlling soil application depths.

Response DS 25

See Section RP.5.4 for a description of the methods used to control topsoil depth during replacement.

Comment DS 26

Reclamation Plan, Section RP.5.4. Variability in topsoil depth cannot be avoided due to limitations imposed by the equipment used and the pre-application preparations which may include ripping of the compacted overburden surface. Typically, the depth of topsoil application may vary 25%, but the average depth should be closely monitored and should not exceed the average availability. Also, because some soils exhibit unsuitable characteristics and will not be used for reclamation, discussion of the use of substitute topsoil materials is warranted in this section.

Response DS 26

Revised text as requested. Added discussion about substitute topsoil being an option if not enough suitable topsoil is salvaged.

Comment DS 27

Reclamation Plan, Section RP.5.6. Sediment control measures will be required to prevent untreated runoff from exiting reclaimed lands onto adjacent native lands. Please provide a discussion of the sediment control measures to be used.

Response DS 27

Revised text as requested.

Comment DS 28

Reclamation Plan, Section RP.8.2. This section states only that impoundments will require Landowner, LQD and SEO approval. Prior to construction of post mining impoundments, SEO approved plans for the impoundments must be submitted for inclusion in the permit Reclamation Plan. Please include a statement that a Reclamation Plan revision will be approved by the LQD prior to construction of impoundments.

Response DS 28

Revised Section RP.8.2 to include a statement regarding LQD approval before the construction of postmine impoundments.

Comment DS 29

Reclamation Plan, Section RP.11.1. The primary final land use for the permitted acreage will be grazing and wildlife. Only areas where the current use is industrial will remain industrial land uses after mining is completed. Therefore, in order for any constructed buildings or railroad access to remain following mining, and a permit revision to change the land use will be required. It is not just a matter of demonstrating usefulness to the LQD and receiving landowner consent. This will be a major revision to the permit that will require public notice. Clarification should be provided concerning the steps involved to allow building to remain.

Response DS 29

Revised text as requested. Eliminated discussion in Section RP.11 regarding leaving any buildings, facilities, and equipment following completion of mining.

Comment DS 30

Reclamation Plan, All Mine Plan Maps with progressions must show the actual years of the initial disturbance or mining activity, or the progression must be linked to a specific year in Reclamation Plan text. The maps must also include the contour interval.

Response DS 30

See Mine Plan MP.1.6 for a description of permit terms and initial year. Revised text in Reclamation Plan Section RP.13 to reference Mine Plane MP.1.6. Revised Exhibit RP.5-1 adding “Note: Year 3 corresponds to the year 2019” in Legend.

Comment DE 19

Reclamation Plan, Section RP.5.1, page RP-6 – RAMACO states that the contoured surface will be scarified or ripped, if necessary. The mine should commit to scarifying or ripping all surfaces prior to topsoil replacement.

Response DE 19

Revised text as requested. Remove “if necessary” from sentence.

Comment DE 20

Reclamation Plan, Section RP.5.6, page RP-8 - The 1st sentence of the 2nd paragraph doesn't make sense. Please correct.

Response DE 20

Revised text as requested. The sentence now reads “Rills and gullies occurring in redistributed soil precluding the achievement of the approved postmining land use or the reestablishment of vegetative cover will be rectified”.

Comment JJ 5

Reclamation Plan, 5. Exhibit RP 6-1 also displays permit boundary discrepancies in regards to the section lines on it and those located on the Adjudication Exhibit 1. Please update accordingly.

Response JJ 5

See response to comment BJ 65. Revised Exhibit RP.6-1 as requested.

Comment JJ 6

Reclamation Plan, 6. Table RP 6-1 states that there are 11.6 acres of wetlands and other aquatic resources. Please discuss where these acres are to be reclaimed and show them on the Exhibit RP. 6-1 which displays the reclaimed vegetation communities and their locations.

Response JJ 6

Revised Section RP.9 to include reference to Exhibit RP.6-1 for location of reclaimed wetlands and OAR. Revised Exhibit RP.6-1 to include reclaimed wetlands and OAR locations.

Comment MK 24

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, Assuming the Tongue River is an AVF, this section should discuss how the essential hydrologic functions will be maintained and/or reestablished, as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(ii). As noted in Comment No. 21, the essential hydrologic functions of the Tongue River AVF need to be identified and a monitoring system needs to be installed. (MDK)

Response MK 24

Revised text as requested in Section RP.10.

Comment MK 25

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, 25. As noted in Comment No. 21, the adjacent Goose Creek AVF also needs a monitoring system to demonstrate essential

hydrologic functions are maintained and/or reestablished as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(i) and (ii). (MDK)

Response MK 25

Revised text as requested in Section RP.10.

Comment MK 26

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, 26. This section may also need to be addressed if the LQD finds that other AVFs exist on or near the permit area. If AVFs are determined to be present, the essential hydrologic functions must be maintained and/or reestablished as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(i) and (ii). (MDK)

Response MK 26

Revised text as requested in Section RP.10.

Comment MK 75

Reclamation Plan, Section RP.3.3 Postmine Slope Analysis, 49. Please provide a discussion that compares the pre-mine vs. post-mine slope characteristics. A table would be helpful that compared the minimum, maximum, and average slopes under pre-mine and post-mine conditions. (MDK)

Response MK 75

Added Table RP.3-1 comparing premining and postmining slopes. Updated Section RP.3.3 of text to include reference to the new table.

Comment MK 76

Reclamation Plan, Section RP.3.5 Drainage Reestablishment, 50. It is stated that mining will disturb portions of the Slater Creek channel and the reclamation will entail reconstruction. However, the Mine Plan PHC (Section MP.6.1) stated that Slater Creek “will still flow naturally around the trench”, and “Because Slater Creek’s flow will not come into contact with mining activities, no impact will be made to water quality”. Please provide a clear and explicit description of the extent of direct disturbance to the Slater Creek channel. This description should be consistent between the Mine Plan and Reclamation Plan. (MDK)

Response MK 76

As stated in the revised Section MP.6.1 of the Mine Plan, the only anticipated surface disturbance to Slater Creek during mining will be the redirection of the channel

through a culvert under a proposed haul road. No text was edited in response to this comment.

Comment MK 77

Reclamation Plan, Section RP.4.2 Mitigation of Unsuitable Material , 51. Minor channels are defined as ephemeral streams but there is no definition provided for “major channels”. Please provide a definition and also illustrate an example of a major channel within the proposed permit boundary that would fit into this category. (MDK)

Response MK 77

Revised text in Section RP.4.2 to provide the definition of major channels.

Comment MK 78

Reclamation Plan, Section RP.5.6 Erosion Control and Conservation Practices, 52. The first sentence of the second paragraph...”Rills and gullies...” needs revised, as it appears to be missing one or more words. (MDK)

Response MK 78

See response to Comment DE 20. Text revised as requested.

Comment MK 79

Reclamation Plan, Section RP.7.4 Aquatic Habitat, 53. The second sentence discusses stockponds possibly being disturbed by mining activities. The Mine Plan PHC did not mention that any existing stockponds would be disturbed by mining activities. If stockponds are to be disturbed by the mining operation, this should be discussed in the Mine Plan PHC. (MDK)

Response MK 79

The text in the Mine Plan PHC has been revised to clarify the disturbance to stockponds within the permit area. Section RP.7.4 has been revised to clarify the anticipated aquatic habitat locations.

Comment MK 80

Reclamation Plan, Section RP.7.4 Aquatic Habitat, 54. The text states that two additional postmine impoundments will be constructed and their location is shown in Exhibit RP.3-1. This Exhibit shows ten permanent impoundments, both on and adjacent to the proposed permit area. Please revise this discrepancy in the text or change the symbology in the Exhibit to clearly show the two permanent post-mine impoundments. (MDK)

Response MK 80

Revised text in Section RP.7.4. to clarify the postmine impoundment locations.

Comment MK 81

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 55. Please add the major stream name labels (Tongue River, Goose Creek, East Fork Earley Creek, Slater Creek, Hidden Water Creek) to Exhibit RP.8-1. (MDK)

Response MK 81

Revised Exhibit RP.8-1 as requested.

Comment MK 82

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 56. Please explain in the text how the postmine drainage basin parameters in Table RP.8-1 were determined. (MDK)

Response MK 82

Revised text in Section RP.8.1 as requested.

Comment MK 83

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 57. The text states that a comparison of drainage basin parameters in Table RP.8-1 and Exhibit RP.8-1 show that the overall hydrologic balance will remain largely unchanged. This conclusion is not obvious from the Table and Exhibit. How similar are the postmine drainage basin parameters to the pre-mine parameters? Which sub-drainages show the largest change from pre-mine conditions? The text needs to include a more thorough discussion to demonstrate to the reader why exactly the postmine hydrologic balance will be unchanged. (MDK)

Response MK 83

Revised text to include reference to Appendix D6 tables and exhibits regarding drainage basin parameters. Minor disturbance and mining methods contribute to the largely unchanged postmine drainage basin parameters.

Comment MK 84

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 58. The text provides no discussion of the comparison between the pre-mine and postmine modelled discharge values. Please provide this discussion so the reader can determine if the differences are minor or major. (MDK)

Response MK 84

Revised text in Section RP.8.1.1 as requested

Comment MK 85

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 59. Please add the year to the Miller reference within the text (2003) and add this citation to the references list in Section RP.17. (MDK)

Response MK 85

Revised text as requested.

Comment MK 86

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 60. Similar to Comment No. 8 made for Appendix D6, the HEC-HMS runoff estimates in Table RP.8.4 are much higher than the Miller (2003) equations. Please provide a discussion in the text as to the reasonableness of the HEC-HMS estimates and why the HEC-HMS estimates are so much higher than the Miller (2003) regression equations.

Response MK 86

See response to Comment MK 34. No revisions to the text were made.

Comment MK 87

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, The last sentence in the first paragraph states that stream reaches for which designed cross sections are provided are identified in plan on Exhibit RP.8-1. There is nothing on this Exhibit that shows which stream reaches have designed cross sections, nor which stream channels are being reconstructed. Please clearly identify this information on this Exhibit. (MDK)

Response MK 87

Exhibit RP.8-1 has been revised as requested.

Comment MK 88

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, 62. Exhibit RP.8-2 shows that the main Slater Creek channel will not be disturbed. Please consider this in light of Comment No. 50 that requested clarification on the extent of disturbance to the Slater Creek channel. (MDK)

Response MK 88

See response to Comment MK 76(referred to as Comment No. 50). Revised Exhibits RP.8-1 RP.8-2 as requested. A reconstructed Slater Creek (Figure RP.8-9) cross section has been added to reflect the correct disturbance boundary.

Comment MK 89

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, 63. On Page RP-35, second paragraph, it references “reclaimed Slater Creek channel” and channel hydraulics are presented in Table RP.8-5. It is not clear why channel hydraulics are presented for Slater Creek when it will not be disturbed. Is this because reclaimed tributaries to Slater Creek are changing such that the main channel of Slater Creek is expected to be change? Please clarify this in the text. (MDK)

Response MK 89

Slater Creek is included Table RP.8-5 to show that the postmine Slater Creek Channel will be hydraulically similar to premine conditions after mining and reclamation operations have been completed as reclamation of a portion of Slater Creek is expected.

Comment MK 90

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 64. It is unclear exactly how many new postmine impoundments will be constructed. Table RP.8-6 identifies two impoundments (Enhancement Stock Pond 1 and Replacement Stock Pond 1), and these are shown in Exhibit RP.3-1. Exhibit RP.3-1 shows eight other permanent impoundments. Please identify if these are new features to be constructed or if they are existing stockponds that may be affected by the mining operation. (MDK)

Response MK 90

The text in Section RP.8.2 has been revised to clarify that only the new features to be constructed are displayed in Table RP.8-6. Affected existing stockponds will be constructed approximately to premine conditions.

Comment MK 91

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 65. Please identify in this section if there will be a net increase or decrease in post-mine water storage capacity relative to pre-mine capacity. (MDK)

Response MK 91

Revised text in Section RP.8.2 to clarify a net increase in water storage capacity is expected due to the addition of two postmine impoundments.

Comment MK 92

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 66. As mentioned Comment No. 47, it is advised that the applicant discuss with the SEO-Interstate Streams Division any implications for the Yellowstone Compact if new water storage features are proposed that potentially decrease water quantity to the Tongue River. (MDK)

Response MK 92

See response to Comment DS 28(Comment No. 47 mentioned above). Revised text as requested.

Comment MK 93

Reclamation Plan, Section RP.8.4.2 Surface Water Monitoring, 67. The text on Page RP-40 states that the surface water monitoring stations are shown on Exhibit RP.8-4. However, the stations are not shown on this Exhibit. It may be make the most sense to add these to Exhibit RP.8-5 and rename the Exhibit “Postmine Hydrologic Monitoring Locations” so the surface water stations and monitoring wells are on one Exhibit. (MDK)

Response MK 93

Revised the reference in text to state “locations of these sites are shown on Exhibit RP.8-5”. Exhibit RP.8-5 was revised to include surface water monitoring stations and renamed as requested. Table RP.8-9 was edited to include all planned surface water stations including postmine impoundment monitoring sites.

Comment MK 94

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 68. The text on Page RP-41 states that water quality samples will be collected at each of the postmine impoundments listed in Table RP.8-6 and presented on Exhibit RP.3-1. Please clarify in the text that this sampling list includes all ten impoundments shown. (MDK)

Response MK 94

Revised text in Section RP.8.4.3 to reference Table RP.8-9 and Exhibit RP.8-5 for postmine surface water monitoring sites including postmine impoundments.

Comment MK 95

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 69. Please add the list of impoundments to be sampled to Table RP.8-9 “Surface Water Monitoring Sites”. (MDK)

Response MK 95

Revised Table RP.8-9 as requested.

Comment MK 96

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 70. The postmine impoundments to be sampled appears to be slightly different from the impoundments listed in Mine Plan Table MP.7-1 “Operational Surface Water Monitoring Locations”. Table MP.7-1 lists three impoundments (Hall Reservoir, Black Mountain No. 1 Stock Reservoir, and Legerski Bros #1 Stock Reservoir) that are not listed as postmine impoundments to be sampled. Please explain why there is a difference in the operational monitoring and postmine monitoring of some impoundments. (MDK)

Response MK 96

Black Mountain No.1 Stock Reservoir has been added as a postmine impoundment that will be monitored. Legerski No. 1 Stock Reservoir and Hall Reservoir are outside of the areas planned for mining disturbance, however in an effort to further monitor the surface water of the Brook Mine permit area, the reservoirs were added to be sampled quarterly during mining. Table RP.8-9 and Exhibit RP.8-5 have been updated to include Black Mountain Reservoir No. 1 Stock Reservoir.

Comment MK 97

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 71. In the second full paragraph on Page RP-41, “The water quality samples..” please also state that the water quality samples will be compared against WDEQ/WQD Class III groundwater standards, as suggested by LQD Guideline No. 17 for replacement and enhancement stockponds. (MDK)

Response MK 97

Revised text as requested in Section RP.8.4.3.

Comment MK 98

Reclamation Plan, Section RP.8.5.2 Surface Water, 72. At the end of the first paragraph on Page RP-44, it predicts a “slight change” in event peaks and volumes. Please further discuss what is meant by a “slight change”, i.e., what is the magnitude of the increase or decrease? (MDK)

Response MK 98

Section RP.8.5.2 has been updated to reflect the change in event peaks and volumes will be less than one percent when compared to premining conditions.

Comment MK 99

Reclamation Plan, Section RP.8.5.2 Surface Water, 73. In the second paragraph on Page RP-44, please clarify the extent of direct mining disturbance to Slater Creek versus tributaries of Slater Creek. This comment relates to previous Comments No. 50 and 62. (MDK)

Response MK 99

See response to Comments MK 76 (comment No. 50) and Mk 88 (Comment No. 62).

Comment MK 100

Reclamation Plan, Section RP.8.5.2 Surface Water, 74. Please provide a discussion as to whether the planned postmine impoundments will affect surface water quantity on or downstream of the proposed permit area. (MDK)

Response MK 100

Section RP.8.5.2 has been revised to include discussion of the effect of postmine impoundments to the surface water quantity on and downstream of the proposed permit area.

Comment MK 101

Reclamation Plan, Section RP.9.1 Introduction, 75. The second paragraph references Appendix D8. Should this be Appendix D10 (Wetlands)? Please revise this if necessary. (MDK)

Response MK 101

The reference has been revised to D10 as requested.

Comment MK 102

Reclamation Plan, Section RP.9.1 Introduction, 76. Please add a statement up front in the Wetland Mitigation section that the USACE has not yet issued a jurisdictional determination for the proposed Brook Mine. Please also provide a statement in the text that the information in Section RP.9 may be subject to change pending the USACE determination. The USACE jurisdictional determination should also be incorporated somewhere into the Mine Permit once that is received by the Brook Mine. (MDK)

Response MK 102

Sections RP.9.1 has been revised as requested.

Comment MK 103

Reclamation Plan, Section RP.14 Bond Release, 77. The LQD no longer requires a bond release verification for “sediment control release”. This is now termed “surficial stability verification”. More information is available in LQD Guideline No. 23. Please revise the text for this change. (MDK)

Response MK 103

The text in Section RP.14 has been revised by removing the reference to sediment control release.

Comment MuK 91

Reclamation Plan, RP 8.5.3 Groundwater, 91. Section 8.3, page RP-38 states, “The estimated Postmine Potentiometric surfaces for the reclaimed aquifer for the Masters and Carney Seams are presented respectively in Exhibit RP.8.3 and Exhibit RP.8-4. Please provide a summary comparing and contrasting the premine potentiometric surfaces vs. post mine potentiometric surfaces. This comparison should also consider any changes in the hydraulic properties (hydraulic conductivity, storativity, recharge capacity) of the premine aquifers vs. post mine aquifers. (MK)

Response MuK 91

Section RP.8.5.3 has been revised to include discussion regarding the comparison of premine and postmine potentiometric surfaces.

Comment MuK 92

Reclamation Plan, RP 8.5.3 Groundwater, 92. Please discuss any changes in the interaction between the surface water and groundwater systems from the premining through the postmining phases of the operation. (MK)

Response MuK 92

The response to Comment MuK 84 describes interaction between the surface water and groundwater systems from the premining through the postmining phases of operation. In general the changes between the surface water systems and the groundwater systems are expected to be minimal. For a short time during mining it is anticipated that there will be a small (less than 6%) increase in the amount of water that recharges the coal seams from the Tongue River. Once the water levels in the coals recover, no further impacts are expected.

Comment MuK 93

Reclamation Plan, RP 8.5.3 Groundwater, 93. Please discuss the intersection of the postmining topographic and potentiometric surfaces and their effects on the location and size of groundwater-fed water bodies. (MK)

Response MuK 93

Revised Section RP.8.5.3 as requested.

Comment MuK 94

Reclamation Plan, RP 8.5.3 Groundwater, 94. Section 8.5.3, page RP-46 states, “These water quality changes can be qualitatively predicted from the overburden mineralogy and projected post mine hydrology.” Please expand this discussion on projected groundwater quality. Provide a discussion on the estimated/ projected post mining groundwater quality. A detailed description of potential changes in water quality from flow through backfill/mined out areas should be included. Any potential changes to water quality in adjacent aquifers should be discussed with respect to the potential for offsite material damage. (MK)

Response MuK 94

Revised Section RP.8.5.3 text as requested.

Comment MuK 95

Reclamation Plan, RP 8.5.3 Groundwater, 95. Please provide a discussion on any anticipated water use during the reclamation period. (MK)

Response MuK 95

As discussed in Addendum MP-3, the only anticipated groundwater uses during the reclamation period are at existing water supply wells. Section RP.8.5.3 has been revised to include additional discussion.

Comment MuK 96

Reclamation Plan, RP 8.5.3 Groundwater, 96. Please address (or reference) any expected post-reclamation subsidence effects on the hydrologic system (both quantity and quality) and the plan to minimize these effects. (MK)

Response MuK 96

Section RP.8.5.3 has been revised to include discussion of expected postmine subsidence effects on the hydrologic system.

Comment SP 7

Reclamation Plan, Page RP-13. Section RP.6.2.6. In the last sentence please add that substitutions to the seed mix will be made only with WDEQ approval.

Response SP 7

Revised text in Section RP.6.2.6 as requested, the statement will now read “In the event that seed for primary species is not available, alternatives will be considered which match the life form and morphology of the primary choice only with WDEQ approval.”

Comment SP 8

Reclamation Plan, Page RP-16. Section RP.6.4.1. To demonstrate that all of the unaffected acres of each vegetation community are sufficient for an extended reference area please create a table with total acres and affected acres and reference this table in this section.

Response SP 8

Table RP.6-6 has been created to display the number of extended reference acres for the respective vegetation communities. The text in Section RP.6.4.1 has been revised to include a reference to the newly created table.

Comment SP 9

Reclamation Plan, Page RP-17. Section RP.6.4.1. Please add to the Ch. 4 reference in the first sentence on this page that the Handbook of Approved Sampling and Statistical Methods for Evaluation of Revegetation Success on Wyoming Coal Mines.

Response SP 9

Revised Section RP.6.4.1 as requested.

Comment SP 10

Reclamation Plan, Page RP-17. Section RP.6.4.1. Please remove the first sentence in the third paragraph. It appears in conflict with the next sentence which cites Ch. 4.Sec. 2(d)(ii)(B).

Response SP 10

Removed sentence as requested in Section RP.6.4.1.

Comment SP 11

Reclamation Plan, Page RP-19. Section RP.6.4.5.1. Please add a third sentence to the first paragraph to Pastureland land use with a full shrub density greater than 1 shrub/m² is also eligible.

Response SP 11

Sentence including pastureland land use as eligible added to Section RP.6.4.5.1 as requested.

Comment SP 12

Reclamation Plan, Page RP-24. Please revise the sentence after the • Shrub density bullet to “Additionally, a species list will be prepared” and delete the remainder of the sentence.

Response SP 12

Revised text as requested.

Comment SP 13

Reclamation Plan, Page RP-25. Section RP.6.7.3. Under Sampling Frequency in Guideline 14 the third sample may be included as part of your revegetation success (bond release) sampling which can begin in year seven. You may add more flexibility to your sampling interval such as beginning year 3 or 4, with the second sampling in year 5, 6 or 7 and then the third may be year 7 – 13 and may be used for revegetation success.

Response SP 13

Revised text per recommendations.

Comment SP 14

Reclamation Plan, Page RP-29. Section RP.7.2. There is a reference to RP.8 in this section. Please correct the reference if it is not correct.

Response SP 14

Revised text to reference Section RP.6 for seed mixtures and revegetation operations.

Comment SP 15

Reclamation Plan, Table RP6.1. Could you please add a footnote listing the disturbances that are included in the 87.3 acres of Disturbance and what the disturbances will be postmining in the 56.1 acres.

Response SP 15

Added footnote describing disturbance for premining and postmining to Table RP.6-1 as requested.

Comment SP 16

Reclamation Plan, Exhibit RP.2-1. Postmining the landuse will be Grazingland and Fish and Wildlife Habitat (937.7 acres) and Cropland (3.7 acres) with 56.1 acres of disturbance, 4.9 acres of water and 11.6 acres of wetland. These landuses will match the landuses on Exhibit D1.1-1. With just minor acreage changes shown in Table RP.6-1. Since the railroad and major roads are identified and Taylor Quarry is going to be reclaimed to Grazingland and Fish and Wildlife Habitat, the Industrial commercial stippling is not needed on these areas.

Response SP 16

Revised exhibit as requested.

Other Comments

Comment MK 27

Items Requested in Electronic Format for Preparation of CHIA, 1. Please provide a CAD or ArcGIS shapefile that contains the proposed permit boundary for the Brook Mine. This file will be used to prepare maps in the CHIA. This file can be emailed to: matthew.kunze@wyo.gov. (MDK)

Response MK 27

See response to comment MK 28.

Comment MK 28

Items Requested in Electronic Format for Preparation of CHIA, 2. Please provide the baseline surface and groundwater data collected to support baseline characterization for the permit application. All data can be submitted on Excel templates (Attachments) found on the LQD website for the Coal Annual Report Format (CARF): <http://deq.wyoming.gov/lqd/coal/resources/annual-report-3/>.

- Please provide all surface water flow and water quality data for the following surface water stations: SM578415-SW-1, SM578409-SW-1, SM578418-SW-1, and SM578512-SW-1.
- Please provide all groundwater level and water quality data for all Brook Mine monitoring wells shown in Table D6.2-1.

Response MK 28

The electronic data requested is being compiled in the requested format and will be provided when it is completed.

Adjudication

Comment AG 1 – Round 1

Please also provide copies of the complaint and the answer. If there are any motions that the court has ruled on limiting or deciding any of the claims or factual or legal questions originally at issue in the case, please also provide copies of the orders, the motions, the responses to the motions, and any supporting memoranda.

Response AG 1 – Round 1

The Applicant's position with regard to any surface interests that may be claimed by Padlock Ranch Company and/or Big Horn Coal Company is that the Applicant alone owns the sole dominant present property right to use these surface lands for the coal mining operation described in the application, as that application has been submitted and supplemented. Applicant's sole dominant surface ownership and use interest in the relevant lands derives directly from the 1954 Deed (Attachment B) and its express reservation language. Pursuant to the controlling Wyoming Supreme Court authority set out in *WYMO Fuels, Inc. v. Edwards*, 723 P.2d 1230 (Wyo. 1986) (Attachment C), when the Applicant already owns the dominant surface use rights for coal mining on the property, then the Applicant consents to its own use pursuant to its application by submitting the application and no other surface consents can or should be required under W.S. § 35-11-406(b)(xi). As the Land Quality Division is aware, to the extent that Padlock Ranch Company incorrectly claims some surface rights on any lands described in the 1954 Deed, it necessarily could only attempt to do so fully subject to the Applicant's sole dominant surface rights to mine coal. Under the *WYOMO Fuels, Inc.* decision, no consent from Padlock can be required. To the extent that Big Horn Coal incorrectly claims some surface use right in this area at this time, the Applicant is proceeding with quiet title litigation (Fourth Judicial District Court, Sheridan County, Wyoming Civil No. CV 2014-372) against Big Horn Coal on this issue and has asserted its sole dominant reserved surface right to use the surface described in the 1954 Deed to mine coal there without any consent from Big Horn Coal pursuant to the *WYOMO Fuels, Inc.* case decision. Accurate copies of the Applicant's pending summary judgment motion arguments on this issue are enclosed with this response (attachment D and E). The Applicant can and will supplement these pleadings with further documentation that is described in the pleadings upon request.

Comment AG 1 – Round 2

Please provide copies of the following documents related to the state district court litigation between the Applicant/Ramaco and Big Horn Coal Company:

- The complaint and answer filed in the case (if either has been amended, only the most recent amended version needs to be provided).

- For the Applicant's summary judgment motion: Big Horn Coal's response to the motion.
- For Big Horn Coal's motion for summary judgment: the memo supporting that motion, the Applicant's response to the motion, and Big Horn Coal's reply memorandum.
- The "Section 5" of the "May 6, 1983, Release Agreement" that the Applicant mentioned in its reply in support of its summary judgment motion.
- When it is available, the district court's order deciding the Applicant's and Big Horn Coal's summary judgment motions.

Response AG 1 – Round 2

The materials requested in this comment were supplied to the Attorney General on August 20, 2015 after the Round 2 comments had been released. It is assumed if any further comment is required, it will be received in Round 3.

Comment AG 2 – Round 1

Therefore, the Division requests the Applicant to provide sufficient information and supporting documents for the Division to determine whether Padlock Ranch Company and Big Horn Coal Company are or are not "residential or agricultural landowners" under the statutory definition in W.S. § 35-11-406(b)(xi).

Response AG 2 – Round 1

Please see response AG 1.

Comment AG 2 – Round 2

Please also provide sufficient information and supporting documents for the Division to determine whether Padlock Ranch or Big Horn Coal qualify as a "resident or agricultural landowner," as defined in W.S. § 35-11-406(b)(xi). The statutory requirements for a permit application differ depending on whether that status exists, and the Division must determine which set of requirements (W.S. § 35-11-406(b)(xi) or -406(b)(xii)) may apply to this Application.

Response AG 2 – Round 2

The materials requested in this comment were supplied to the Attorney General on August 20, 2015 after the Round 2 comments had been released. It is assumed if any further comment is required, it will be received in Round 3.

Comment AG 3 – Round 2 (New Comment)

Would the 1983 release agreement apply to the surface rights that originate with the 1954 Deed and are currently owned by Padlock Ranch? Did Padlock Ranch obtain its rights at issue before or after the 1980 release agreement?

Response AG 3 – Round 2 (New Comment)

No. The 1983 release agreement does not affect any of the rights reserved in the 1954 Deed. The 1954 Deed controls the surface use mining rights of Ramaco relative to both Big Horn Coal and Padlock Ranch. Even if the release agreement had an effect as to Big Horn, Padlock Ranch is not a party to the release agreement and as a non-party has no rights under that agreement. Ramaco has found no documents that might show Padlock Ranch acquired any kind of interest or rights under the 1983 release agreement.

Instead, Ramaco has found documents that show Padlock Ranch acquired certain lands from Big Horn Coal in 1965, almost 20 years **before** the release agreement. Padlock then sold some of the land back to Big Horn Coal and vice versa. But none of the documents showing these transfers mention the 1983 release agreement.

Comment AG 4 – Round 2 (New Comment)

If one assumes that Big Horn's arguments in the litigation are correct that the 1983 release agreement granted Big Horn rights greater than those under the 1954 Deed, would Big Horn's arguments and the rights it argues that it obtained through the release agreement also apply to any of Padlock Ranch's lands?

Response AG 4 – Round 2 (New Comment)

No. As discussed in response to the previous question, Padlock Ranch does not have any rights under the release agreement. Likewise, Ramaco could find no documents showing that Padlock Ranch ever acquired any rights in the 1983 release agreement.

Comment AG 5 – Round 2 (New Comment)

Are there any contractual documents or property records related to Padlock Ranch's lands that arguably may have altered Padlock Ranch's rights under the 1954 Deed? If so, please provide copies of those documents and explain the nature of the documents and how they may have affected Padlock Ranch's rights.

Response AG 5 – Round 2 (New Comment)

No. Ramaco has found several deeds purporting to convey land from Big Horn Coal to Padlock Ranch's predecessor. These deeds, however, do not alter or try to alter any rights under the 1954 Deed.

Comment DM 1 – Round 1

Adjudication – Appendix B2 – Groundwater Rights – There is a groundwater well that is missing in this volume. The listing is as follows:

Barbula #2

Permit No. 85631W

Location: SW NW Section 21, T57N R84W

Please add this entry to the table and to any corresponding maps.

Response DM 1 – Round 1

Adjudication text page WR-12 has been updated to include Barbula # 2 (P85631W) as well as Adjudication Exhibits 5 & 8.

Comment DM 1 – Round 2

No comment received.

Response DM 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D1

Comment BJ 1 – Round 1

Appendix D1, Land Use, Table D1. 3-1; It is unnecessary to list the Expired Permit category of gas well permits. Since these APDs have expired without completion there is no related activity to the site. Listing of a non-event is not required. This also applies to the NO category since this indicates that the APD was refused, thus never became permitted through WOGCC.

Response BJ 1 – Round 1

Revised Table D1.3-1 as requested.

Comment BJ 1 – Round 2

No comment received.

Response BJ 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 1 – Round 1

Appendix D-1. Exhibit D1.1-1. The landuses defined in Chapter 1 should be used on this Exhibit. Not the entire Brook Mine Permit falls neatly into these definitions so the following comments provide guidance:

a) The railroad, primary roads, oil and gas wells, and the facilities for Taylor Quarry would be considered Industrial commercial and may be shown with the vertical line stippling. The rest of the vertical stippling should be removed.

- b) The 4.5 acres of Agricultural lands would have the Land use of Cropland. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no changes are needed to the map for this land use.
- c) The 12.8 acres of water might be listed under multiple landuses such as Grazingland, Fish and Wildlife habitat or Recreational. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no change is needed to the map for this land use.
- d) The 4,421.8 acres remaining should be shown as Grazingland and Fish and Wildlife habitat. The legend on the map should have Fish and Wildlife Habitat added to Past and Present Grazingland landuse. The stippled area on the map will stay the same.
- e) No changes are needed to the areas identified as Recreational.

Response SP 1 – Round 1

Revised Exhibit D1.1-1 as requested.

Comment SP 1 – Round 2

No comment received.

Response SP 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 2 – Round 1

Appendix D-1. Text that refers to the areas mined as Industrial commercial should be revised to remove the mining. A reference to Section 1.6 on historic mining can be made in Section D1.3.1. Grazingland. The reclaimed mined lands are now being used as Grazingland. The difference between the mined and never been mined is defined as the vegetation community that is called Reclaimed. Section D1.6 discusses the historic mining of the area and the discussion on coal mining in Industrial commercial (D1.4.3) can be removed.

Response SP 2 – Round 1

Revised text as requested.

Comment SP 2 – Round 2

No comment received.

Response SP 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D2

Comment BJ 2 – Round 1

Appendix D2, History, There are no comments for this section of the application. The narrative is well written and comprehensive.

Response BJ 2 – Round 1

No response is necessary.

Appendix D3

No comments were received regarding Appendix D3.

Appendix D4

Comment BJ 3 – Round 1

Appendix D4, Climatology, General comment – Is there no data for climatology that is more recent than 1990? It exists, therefore needs to be represented. Please locate and include the most recent climatological data. Twenty year-old data bears little resemblance to Sheridan County climate today so characterization of the present climate with a 20 year gap is problematic. Please reevaluate the data in light of locating and use more recent information.

Response BJ 3 – Round 1

Revised wind, relative humidity, and degree day data to reflect period between 1990 and 2013. Note, as can be observed by updated data, little change occurred in averages reported for wind, relative humidity, and degree days. Therefore, the wind rose provided in Figure D4.2-6 is deemed to still be representative of the Sheridan area. Revised Figure D4.2-1, Figure D4.2-11, Table D4.1-1, Table D4.2-2, Table D4.2-3, and Table D4.2-7 in response to this comment.

Comment BJ 3 – Round 2

No comment received.

Response BJ 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 4 – Round 1

Appendix D4, Climatology, Section D4.2.6, Why was 65°F used as the baseline temperature? Also, why were the high and low temperatures set to 86°F and 50°F respectively? Please clarify.

Response BJ 4 – Round 1

Revised text to clarify the choice of high and low temperatures.

Comment BJ 4 – Round 2

No comment received.

Response BJ 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 5 – Round 1

Appendix D4, Climatology, Figure 4.2-11, Are the degree days the total number of days that match the data points for the entire period from 1961 through 1990? This indicates that the data represented along the Y axis covers a period of 30 years on a daily basis. Please clarify.

Response BJ 5 – Round 1

Revised text with definitions of heating, cooling, and growing degree days to clarify Figure 4.2-11. Degree days are essentially a unit of measure like temperature, velocity, etc. A degree day signifies the number of degrees per day to heat or cool to a specified base temperature (most commonly 65°F). Each degree day is summed over the course of a month to estimate the total number of degree days that month. For example, July may have 0 heating degree days because all days are over 65°F, but will have cooling degree days nearly every day of the month. Figure 4.2-11 shows the average monthly degree days over the specified periods of data.

Comment BJ 5 – Round 2

No comment received.

Response BJ 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D5

Comment BJ 6 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Section D5.4.1, Paragraph 2 refers to "marginally suitable Selenium levels" as defined in LQD Guideline No.1. Guideline 1 has two separate sets of chemical quality criteria tables. Appendix 1 occurs on pages 17-21 as well as on pages 38-43. The first set of tables have been superseded by the second set of tables. Please use the tables on pages 38-43 when determining material suitability. The first Appendix 1 is being removed from the guideline.

The newer tables define the Selenium target as follows:

Suitable < 0.3 ppm

Marginal 0.3 – 0.8 ppm

Unsuitable > 0.8 ppm (dependent on premining water quality and overburden quality)

These values are established for uplands and ephemeral drainages unless it can be shown that Selenium impregnated materials will be buried above the groundwater potentiometric surface and below the reclaimed surface root zone. Other quality criteria have not changed.

Response BJ 6 – Round 1

Revised text as requested to reflect the revised LQD Appendix 1.

Comment BJ 6 – Round 2

No comment received.

Response BJ 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 7 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Figure D5.3-2, What units are expressed in the figure as the %g? Please include a footnote clarifying the measurement parameter.

Response BJ 7 – Round 1

Updated Figure D5.3-2 as requested.

Comment BJ 7 – Round 2

No comment received.

Response BJ 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 8 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-1, Are the Northings and Eastings in State Plane coordinates? It is assumed that they are but please verify this. The title at the top of the page could read Drill Hole Tabulations (State Plane Coordinates)

Response BJ 8 – Round 1

Updated as requested.

Comment BJ 8 – Round 2

No comment received.

Response BJ 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 9 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-2, Please rearrange the Lithologic and Electric logs in such a way that the Electric log immediately follows the Lithologic log. This allows for a more comprehensive examination of the data.

Response BJ 9 – Round 1

Rearranged logs as requested.

Comment BJ 9 – Round 2

No comment received.

Response BJ 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 10 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Holes R12-000 through R12-020 have the Northings and Eastings reversed. Please correct.

Response BJ 10 – Round 1

Updated as requested.

Comment BJ 10 – Round 2

No comment received.

Response BJ 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 11 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, The Lithologic logs with the AMBRE designation 02, 03, and 04 do not have coordinates or elevations. Please provide coordinates and elevations for these three holes.

Response BJ 11 – Round 1

Updated as requested.

Comment BJ 11 – Round 2

No comment received.

Response BJ 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 12 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Hole R13-018 appears to have erroneous coordinates. The Northing is listed as 11,941,802. It should probably be 1,941,802. The elevation is shown as 43,887.9, where it should probably be closer to 3,887.9. Please verify and correct.

Hole R13-024 has a very high Northing at 61,941,541 and elevation at 73,885.4. These may be 1,941,541 and 3,885.4, respectively. Please verify and correct

Response BJ 12 – Round 1

Updated as requested.

Comment BJ 12 – Round 2

No comment received.

Response BJ 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 13 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, A suggestion for future exploration: Ask the geophysical logger to reduce the gain on the gamma logs. The readjustment bounce on the logs makes them a bit difficult to read and interpret.

Response BJ 13 – Round 1

No response required.

Comment BJ 13 – Round 2

No comment received.

Response BJ 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 14 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-5, Pg. D5-5-4, The splitting tensile strength tests were run on four (4) samples from two (2) holes representing roof, coal, and floor conditions.

- a) Why were these locations used as representative of the lithologies encountered during mining?
- b) Are these few samples representative of all conditions expected to be encountered by the continuous miner (CM)?

Please elaborate and clarify the narrative. A statement must be made that strength testing will be performed on at least one set of samples per mining panel prior to use of the CM to insure that conditions are favorable for roof retention without subsidence. Lithology in this area is inconsistent and rock strength can vary accordingly. Using the data provided on the four samples tested indicates that some of the overburden from hole R13-19 is unsuitable for highwall mining, based on the CAT® Site Evaluation Tool For Highwall Miners;

(<http://webtools.cat.com/globalmining/highwallminers/index.html>).

Response BJ 14 – Round 1

Appendix D5 Section D5.3.3.2 has been updated as requested.

Comment BJ 14 – Round 2

No comment received.

Response BJ 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 15 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-4, Exhibits 1 – 7, Please include the drill hole locations on these isopach maps.

Response BJ 15 – Round 1

Updated as requested.

Comment BJ 15 – Round 2

No comment received.

Response BJ 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 16 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Exhibit 8, The map labeled as the isopach map of the Lower Masters bed is a contour of a surface. Please replace the contour map with the appropriate isopach map

Response BJ 16 – Round 1

Updated as requested.

Comment BJ 16 – Round 2

No comment received.

Response BJ 16 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 59 – Round 1

EXHIBITS, Addendum D5-4, Exhibit 1, The title on the map declares that this is an overburden isopach, but the bed name is missing. Please indicate which bed this map pertains to.

Response BJ 59 – Round 1

Updated Exhibit 1 of Addendum D5-4 as requested.

Comment BJ 59 – Round 2

No comment received.

Response BJ 59 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 60 – Round 1

EXHIBITS, Addendum D5-4, Exhibit 8, The name of the PDF file for this exhibit indicates that this is an isopach map of the Masters Lower coal bed. The title in the map indicates that this is the contour of the base of the Masters coal seam. Please correct the title of the PDF file.

Response BJ 60 – Round 1

The title of Exhibit 8 of Addendum D5-4 will be revised in the electronic copy, as requested.

Comment BJ 60 – Round 2

The title of Exhibit 8 in Addendum D5-4 remains unchanged. This appears to be an inadvertent oversight on the part of WWC.

The Current PDF file name is:

ADD_D5_4_EX_8_MASTERS_ISO-MASTERS_LOWER_R1.

The Title of the map in the Title Block is:

BOTTOM ELEVATION OF MASTERS COAL SEAM.

Please correct the name on the PDF file to better represent the contents of the exhibit.

Response BJ 60 – Round 2

Thank you for catching the oversight. The name on the PDF file has been changed to more accurately represent the contents of the map. The PDF with the corrected name will be emailed to Mr. Kristiansen.

Comment BJ 61 – Round 1

EXHIBITS, Addendum D5-6, Exhibit 1, we commend RAMACO for sampling overburden locations on 80 acre spacing. There are some gaps in the sampling plan, however, that need to have core holes drilled to fill them. The underground Coal Rules and Regulations in Chapter 7, Section 1(a)(i) are specific on ensuring that overburden geology is characterized in all locations where overburden will be removed or subsidence may occur. This essentially means that all areas above the planned coal panels need representative cores drilled to a sufficient density, approximately one hole for every quarter section of affected area. Based on that, the following locations still need to be characterized by overburden sampling:

NE1/4, sec.22, T.57N., R.84W.

NW1/4, sec.15, T.57N., R.84W.

NW1/4, sec.14, T.57N., R.85W.

SE1/4, sec.10, T.57N., R.85W.

Response BJ 61 – Round 1

A drilling rig was not able to enter the areas NW1/4, Sec.14, T.57N., R.85W and SE1/4, Sec.10, T.57N., R.85W. due to the steepness of the terrain, therefore no

samples were obtained. Sampling data for drill holes BH 166-78 and BE 326-78 have been incorporated into Addendum D5-2 and Addendum D5-7 to characterize the overburden in Sections 15 and 22.

Comment BJ 61 – Round 2

No comment received.

Response BJ 61 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 62 – Round 1

EXHIBITS, Addendum D5-6, Exhibit D5.1-1, Kudos to the staff member that created this slope analysis map. It is clear and concise and the histogram is very informative. Good job.

Response BJ 62 – Round 1

Thank you for this comment.

Comment BJ 62 – Round 2

No comment received.

Response BJ 62 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 1 – Round 1

Appendix D5, The Coal Rules and Regulations, Chapter 7, Section 1(a)(i)(A) states that information required for the geological description pursuant to Chapter 2, shall be as follows: for areas where surface operations and facilities will cause removal of overburden down to a level of the coal seam, all information outlined in Chapter 2. Overburden sampling has not been performed in many of the locations where overburden will be removed during the mining operations. Additional sampling will be required to assess overburden chemistry in all areas where overburden removal will occur. The intensity of sampling should be 1 core per 160 acres (per quarter section). The LQD requests sampling every 1,900 linear feet on longer proposed disturbance areas or, at minimum, two cores within shorter disturbances separated sufficiently to provide a representative characterization of the proposed disturbance.

- a. Not all overburden has been characterized during analysis. Several lenses of shallow coal mixed with partings or narrow coal seams that will not be mined were not characterized. Because all overburden must be handled so as not to negatively affect surface water, groundwater or vegetation, all overburden must be adequately characterized. Therefore, the LQD requests additional

characterization of all overburden that will be backfilled into disturbed areas. It must also be stated that special handling and/or identification and use of topsoil/subsoil replacement may be required if unsuitable backfill or soil is placed within 4 feet of the surface on upland areas or within 10 feet of the surface in stream channels.

Response DS 1 – Round 1

Please see response to BJ 61.

Comment DS 1 – Round 2

Response is not adequate. The LQD requires additional overburden suitability analysis to be included for all areas to be disturbed during mining. No additional baseline overburden suitability assessment laboratory data was provided for holes BH 166-78 and BE 326-78. Please provide the raw data. Also, provide a commitment to sample overburden from areas to be disturbed by mining (specifically identify the pit sequence) where overburden baseline was not provided during baseline sampling. Sample every 1,300 feet in the sequence prior to overburden removal. Report the analytical results in the annual report for the year of initial disturbance for the pit sequence. Also, since RAMACO is reluctant to provide a special handling commitment, sampling must be performed at 500 ft. spacing on backfilled and rough graded pits (4 ft. depth on upland areas and 8 ft. depth under stream channel or permanent impoundments) to assure quality of surface materials. Also, if groundwater is expected in the pits, unsuitable materials must not be placed in the groundwater zone. Of the backfilled pit. (DS)

Response DS 1 – Round 2

For the location of the laboratory data for holes BH 166-78 and BE 326-78, please refer to Response BJ 61 (Round 1). Sampling data for drill holes BH 166-78 and BE 326-78 have been incorporated into Addendum D5-2, Addendum D5-7 and Table D5.4-2.

For the following commitments, please refer to the Mine Plan since these commitments are for operations rather than baseline studies. Please note that the text for these commitments has been in place. The following discussion provides the location of each commitment.

1. Section MP.4.6.1 states that the overburden sampling program will include one drill hole sample taken every 40 acres (16 sample locations per square mile) within areas where surface operations will cause removal of overburden down to the level of the coal seam. The delineation of 40 acres more correctly states the suggestion in Guideline No. 1 on page 9 in Section II(B)(3)(a)(1) as opposed to the suggestion of 1,300 feet. The first paragraph of Section MP.4.6.1 states that any additional overburden quality sampling will be submitted to WDEQ/LQD in

the mine's annual reports. No changes have been made in response to this comment since the text has been in place.

2. Section MP.4.6.2 states in the first paragraph that a backfill sampling program will be set on a 500-foot grid. The first paragraph of Section MP.4.6.2 also states that the sampling program will ensure that unsuitable materials aren't placed within the following depths of the land surface: four feet for uplands, six feet for ephemeral channels, and 10 feet for permanent impoundments or major channels and their 100-year floodplains. No changes have been made in response to this comment.

Comment DS 2 – Round 1

Appendix D5, Section D5.4. – documentation of protocols that differ from those approved by the Administrator in Guideline 1 typically require a signed document by LQD staff, not a request for different procedure signed by the company. This issue has been discussed with other mining companies and it has been determined that documentation of approval by LQD staff will be required if sampling/analytical protocols differ from those required by standing LQD policy. Please provide documentation of LQD staff approval for the 10-ft. overburden sampling interval.

Response DS 2 – Round 1

See Attachment A to this response package. This has also been added to Addendum D5-6 pages 4 and 5.

Comment DS 2 – Round 2

No comment received.

Response DS 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 3 – Round 1

Appendix D5, Table D5.4-1 and Table D5.4-2 do not provide the current approved selenium concentration limits of 0-3 ppm (suitable), 3-8 ppm (marginal) and > 8 ppm (unsuitable). Please be sure to include the current approved suitability criteria as shown in Guideline 1, page 42. This will change the conclusions of the discussion provided in the Appendix D5 text. Also, in Table D5.4-2, please provide the correct units for analytical results in mg/Kg, not mg/L.

Response DS 3 – Round 1

Please refer to BJ 6 response. Appendix D5 text, Table D5.4-1, and Table D5.4-2 are updated as requested.

Comment DS 3 – Round 2

No comment received.

Response DS 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 4 – Round 1

Appendix D5, The permit application provided to LQD staff for review has duplicated data provided after the map identified as Exhibit 1 which should be deleted. The exhibit should also be better identified as Exhibit D5-1 or something similar to clarify placement in the permit application should it become separated from the document in the future.

Response DS 4 – Round 1

The electronic copies were provided to LQD staff for review purposes. The hard copy on file is the official version. Also, please see response to Comment DS 5.

Comment DS 4 – Round 2

Response is not adequate. This issue was not addressed in the Round 1 comment response package. Duplicate data in the hard copy should be deleted.

Response DS 4 – Round 2

The duplicate soil analysis reports have been removed from Appendix D5. The reports were removed from Addendum D5-5 (pages Addendum D5-5-21 through Addendum D5-5-92). The reports remain in Addendum D5-7 since this is the addendum specified for the soil analysis reports. The Change Index identifies this revision. No other change is necessary since page Addendum D5-5-92 was the last page and Addendum D5-6 has unique pagination.

Because the exhibit name of “Exhibit 1” is specific to the overburden sampling plan of 8/26/2013 that was presented to WDEQ, and this name is referenced in the document, the name has not been changed. The exhibit has a unique page number (page Addendum D5-6-3) which will ensure that the exhibit is always located properly in the permit.

Comment DS 5 – Round 1

Appendix D5, Comparisons were made between Exhibit 1, the soils map and the Mine Plan map. Distinct differences in the affected area and permit boundaries were observed. Please be sure that correct boundaries for the proposed affected area and permit area are provided on all maps. Please also provide the contour interval on this exhibit.

Response DS 5 – Round 1

Addendum D5-6 is a copy of the overburden sampling plan as presented to WDEQ on 8/26/2013, which referenced Exhibit 1. Therefore, no changes to the exhibit will be made.

Comment DS 5 – Round 2

Response is not adequate. All exhibits presented in this permit must show the correct permit boundary and affected area boundaries, or, if the boundaries are removed, must reference a map of the same scale that contains the correct boundaries. Please correct the permit boundaries and affected area boundaries on all exhibits in this permit application.

Response DS 5 – Round 2

The permit boundary on Exhibit 1 in Addendum D5-6 was removed from the exhibit due to this boundary not being the same as that presented in the current permit as requested by the reviewer. However, the current boundary was not added to the exhibit because this exhibit represents the information provided to, and approved by, WDEQ for the overburden sampling plan. Instead, a note has been added to the exhibit that references Exhibit C1a of the Adjudication File for the correct permit boundary of the Brook Mine.

Comment KM 2 – Round 1

Appendix D5, Page D 5-9 refers to samples collected from roof and floor from “many” locations throughout the permit area. However, supporting documentation appeared to be from only two borings and included two roof and one floor sample. In addition, the laboratory noted the floor sample did not have sufficient length and a correction factor was used to determine unconfined compressive strength. Additional structural analysis of the overburden, interburden and floor is required.

Response KM 2 – Round 1

During preparation of the MSHA Ground Control Plan additional coring of the coal and overburden will occur, data gathered from this activity will be supplied to WDEQ/LQD when it is received. Please see response to BJ 14.

Comment KM 2 – Round 2

No comment received.

Response KM 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 3 – Round 1

Appendix D5, Please provide a discussion of the structural analysis of the overburden and interburden. The discussion shall address the potential for subsidence during and after mining.

Response KM 3 – Round 1

Structural analysis of the overburden, interburden, floor, and roof must be conducted for the MSHA Ground Control Plan. Information gathered for this plan will be provided when it is received. No text was updated in response to this comment. Please see response to BJ 14.

Comment KM 3 – Round 2

No comment received.

Response KM 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 4 – Round 1

Appendix D5, Please discuss the aquifer(s) below the lowest coal seam and the potential for mining to impact these aquifer(s).

Response KM 4 – Round 1

The lowest coal seam targeted for mining is largely dry and is also confined by a clay layer. The underburden is not considered an aquifer therefore no impacts will occur.

Comment KM 4 – Round 2

No comment received.

Response KM 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 1 – Round 1

Appendix D5, Section D5.3.3.2 Overburden and Interburden, 1. This section provides a discussion of the thickness of interburden and not overburden. Please provide a discussion (or a reference) on the thickness of the overburden. (MK)

Response Muk 1 – Round 1

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.2.

Comment Muk 1 – Round 2

Response not accepted. In addition to the reference to Addendum D5-3 cross section figures, please provide a textual interpretation on the overburden thickness. Please refer to D53.3.2 interburden thickness description as an example for the requested description. (MK)

Response Muk 1 – Round 2

A qualitative discussion of the Carney overburden thickness has been added to the first paragraph of Section D5.3.3.2.

Comment Muk 2 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 2. On Page D5-10, there is a good discussion about the thickness of the two coal seams. Please provide a description on the depth from land surface to these coal seams. (MK)

Response Muk 2 – Round 1

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.3.

Comment Muk 2 – Round 2

Response not accepted. In addition to the reference to Addendum D5-3 cross section figures, please provide a textual description/interpretation on the depth from land surface to the different coal seams targeted by the mine plan. (MK)

Response Muk 2 – Round 2

A qualitative description of the overburden material from the ground surface to the top of the Carney coal seam has been added to the middle of the second paragraph of Section D5.3.3.3. Discussion of the total material from the ground surface to the top of the Masters Seam has been added to the end of the third paragraph in Section D5.3.3.3. As requested, the revised text adds qualitative background on the varying depths of the total material from the land surface to the top of the two respective target coal seams, Carney and Masters.

Comment Muk 3 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 3. Page D5-10 states, “Monarch seam exist within isolated portions of the mine areas as shown on the geologic cross sections in Addendum D5-3 and may present a secondary target.” However, Table D5.3-2 does not provide the coal quality characteristics for Monarch coal seam. If Monarch seam is part of the mine plan, please include the coal quality characteristics of Monarch coal seam in Table D5.3-2 and a description of thickness and depth from land surface.

Response Muk 3 – Round 1

Table D5.3-2 has been updated with the coal quality characteristics for the Monarch seam. The overburden and seam thickness are included on the geologic cross-sections located in Addendum D5-3 referenced in the text.

Comment Muk 3 – Round 2

Response not accepted. It is acknowledged and accepted that Table 5.3-2 is updated with coal quality characteristics of Monarch coal seam. In addition to the reference to Addendum D5-3 cross section figures, provide a textual interpretation of thickness and depth from land surface for the Monarch coal seam. (MK)

Response Muk 3 – Round 2

Textual interpretation of the Monarch coal seam thickness and the depth of material above the top of the Monarch seam have been added to the end of fourth paragraph in Section D5.3.3.3.

Comment Muk 4 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 4. Please include a discussion on Dietz (1, 2, 3) coal seams, if they are present in the mine permit boundary. If they are part of the mine plan, please include the coal quality characteristics in Table D5.3-2. (MK)

Response Muk 4 – Round 1

Discussion about the Dietz seams has been added in Section D5.3.3.3. These coal seams are not part of the currently proposed Mine Plan. Therefore, the quality data were not included in the table.

Comment Muk 4 – Round 2

No comment received.

Response Muk 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 5 – Round 1

Appendix D5, Section D5.3 Geology of Mine Area, 5. Please provide a description of the stratigraphic units below the Masters coal seam. (MK)

Response Muk 5 – Round 1

Section D5.3.3.4 has been added to discuss the underburden.

Comment Muk 5 – Round 2

Response not accepted. Please expand the discussion in the newly added Section D5.3.3.4 to include a textual interpretation of the underburden thickness. (MK)

Response Muk 5 – Round 2

The text in Section D5.3.3.4 has been revised to include discussion of the underburden thickness.

Comment Muk 6 – Round 1

Appendix D5, Addendum D5-3 Geologic Cross Sections, 6. Several of the geologic cross sections show UNK – unknown coal seam (Stringer). Please include a brief discussion about this stringer in Section D5.3.3.3 (MK)

Response Muk 6 – Round 1

Discussion about the stringers with unknown names has been added to fifth paragraph in Section D5.3.3.3.

Comment Muk 6 – Round 2

Response not accepted. In addition to the reference to cross section figures, please provide a textual description on the variability, interpreted thicknesses of these stringers. (MK)

Response Muk 6 – Round 2

Further discussion of the unknown coal stringers has been added to the end of the fifth paragraph of Section D5.3.3.3.

Comment Muk 7 – Round 1

Appendix D5, Addendum D5-4 Isopachs, 7. Please include the wells/drill holes (control points) used to interpret the isopachs and elevation contours in the maps. In addition, label all the control points with names and the thickness (or elevation, as appropriate). This comment is applicable to Addendum D5-4, Exhibits 1 through 8. (MK)

Response Muk 7 – Round 1

Addendum D5-4 Exhibits 1 to 8 have been updated with drill hole locations as requested. A reference to Addendum D5-2 has been added to the exhibits for seam name and thickness.

Comment Muk 7 – Round 2

Response not accepted. It is acknowledged and accepted that the labels for all the control point names were included. However, thickness (or elevation, as appropriate)

labels are not included as requested. Is it relatively easy for the software that was used for isopach elevation contours to label the thickness (or elevation)? The intent of this comment is to increase the robustness of the review of the interpreted contours by having appropriate point control data plotted in the same map. This comment is applicable to Addendum D5-4, Exhibits 1 through 8. (MK)

Response Muk 7 – Round 2

As requested, Addendum D5-4 Exhibits 1-8 have been revised to include thickness or elevation, as appropriate, of the applicable seam at each drill hole. It's worth noting, that generally the thicknesses/elevations were obtained from the lithologic logs in Addendum D5-2; however, some drill holes were interpreted differently using analysis of the electric logs (Addendum D5-2), lithologic logs (Addendum D5-2) and cross sections (Addendum D5-3).

Comment Muk 8 – Round 1

Appendix D5, Addendum D5-5 Overburden, Roof and Floor Sample Analysis Table, 8. Please describe these analyses, methodology, results and provide an interpretation of their applicability to the mine/reclamation plan. (MK)

Response Muk 8 – Round 1

Please see response to BJ 14.

Comment Muk 8 – Round 2

No comment received.

Response Muk 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D6

Comment BJ 17 – Round 1

Appendix D6, Hydrology, Section D6.2.3, Pg. D6-20, Narrative in the last paragraph – why were no samples taken in Hidden Water Creek? Please explain.

Response BJ 17 – Round 1

No flow was observed in Hidden Water Creek during baseline sampling, so no samples were taken. The text has been revised to reflect that there were no flows observed.

Comment BJ 17 – Round 2

No comment received.

Response BJ 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 18 – Round 1

Appendix D6, Hydrology, Table D6.1-8, Regarding the HEC-RAS modeling results – The values for Hidden Water Creek and Slater Creek are identical. Is this accurate or is it a typographical error? Please clarify.

Response BJ 18 – Round 1

Updated table to remove typographical error.

Comment BJ 18 – Round 2

No comment received.

Response BJ 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 19 – Round 1

Appendix D6, Hydrology, Addendum D6-7, The well construction summary sheets need to have the coal bed names listed on the well lithology sections to the right of the well diagrams. Please label accordingly.

Response BJ 19 – Round 1

Updated as requested.

Comment BJ 19 – Round 2

No comment received.

Response BJ 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 20 – Round 1

Appendix D6, Hydrology, Attachment D6-8-A, Pg. D6-8-20, A statement is made that water within both coal seams is expected to be "high quality" and "good" water. Please define the meaning of those characterizations. Are these judgments based on MCLs or some other value? Are they being classified by some constituent values? Or is there another metric being used? Please clarify.

For example; referencing WQD R&R, Chapter 8, Table I, Class I, II, or III would better define the essential characteristics of the water quality. Numerical values of

critical constituents, such as TDS, could also serve to define the quality as "good". More descriptive qualifiers are needed to judge the water quality.

Response BJ 20 – Round 1

Revised text as requested.

Comment BJ 20 – Round 2

No comment received.

Response BJ 20 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 21 – Round 1

Appendix D6, Hydrology, Attachment D6-8-E, Hydrographs, The x parameter, time, is depicted in days. It appears that this scale should have been adjusted to show time in hours due to the rapid changes seen in the hydrographs. Please use a finer scale for the x axis.

Response BJ 21 – Round 1

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-36a and D6-8-37a. These additional hydrographs detail the water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 21 – Round 2

No comment received.

Response BJ 21 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 22 – Round 1

Appendix D6, Hydrology, Attachment D6-8-F, The above mentioned comment can also be applied to the Carney well hydrographs. Please adjust the x axis to hours.

Response BJ 22 – Round 1

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data as well. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-39a and D6-8-40a. These additional hydrographs detail

the water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 22 – Round 2

No comment received.

Response BJ 22 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 23 – Round 1

Appendix D6, Hydrology, Addendum D6-9, Pg. D6-9-2, Please include a column in Table D6-1 that indicates the elevation of the bottom of the well or TD. The total water column is important when assessing groundwater characteristics. Please correct.

Response BJ 23 – Round 1

Table D6-1 has been revised as requested.

Comment BJ 23 – Round 2

No comment received.

Response BJ 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 24 – Round 1

Appendix D6, Hydrology, Addendum D6-10, Pgs. D6-10-28 through D6-10-53, On the sample analysis reports, Please provide a brief narrative at the beginning of the lab results to give context to the data. Footnotes on the pages refer to MCLs or other parameters of water quality used for classification. However, the context that is used to define these parameters is missing. The assumption is made that these quality values are derived from the WQD R&R, Chapter 8, Table I definitions. But that is uncertain as no frame of reference is given. A brief sentence or two at the beginning of the section would clarify the numerical standards used in the report. Please adjust the narrative accordingly.

Response BJ 24 – Round 1

Page D6-10-27a was added to provide the requested narrative.

Comment BJ 24 – Round 2

No comment received.

Response BJ 24 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 25 – Round 1

Appendix D6, Hydrology, Please include the lithology of the sampled zone, either in the sampling information sheets, or on the sample analysis reports. Identification of the lithology sampled needs to be readily available with the analysis. This applies to all increments sampled. The sampled zones do have identification on the sample sheets with a shorthand nomenclature but persons unfamiliar with the lithology of the prospect area would be at a disadvantage when evaluating the sample results. A simple reference table at the beginning of the section would be sufficient. For example; MST=Masters, CRN=Carney, AL=Alluvium. Non-geologists need some frame of reference. Please create a clarifying narrative.

Response BJ 25 – Round 1

Reference text with abbreviations defined has been added on page Addendum D6-10-27a, as requested.

Comment BJ 25 – Round 2

No comment received.

Response BJ 25 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 2 – Round 1

Appendix D6-Hydrology, D6.1x – The drainage basin description and surface water quantity sections are lacking detail. As mentioned in M. Kunze's comments, the data from the terminated Slater Creek USGS gauge, and historical monitoring data from Big Horn Mine (permit no. 213) should be included.

The data collected at the monitoring stations that is presented in Addendum D6-4 does not appear to agree with the statement that Slater Creek is a "predominantly ephemeral" stream. Please reconcile the text with the data.

Response DM 2 – Round 1

Peak flow data from the USGS gage station on Slater Creek has been provided. See response to MK 30. The text in Section D6.1.5.2 has been updated to clearly indicate that Slater Creek is an ephemeral stream.

Comment DM 2 – Round 2

No comment received.

Response DM 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 3 – Round 1

Appendix D6-Hydrology, D6.2.4 States that Groundwater Rights are in Appendix E2 of the Adjudication Volume. Groundwater Rights are actually listed in Appendix B2. Please Correct.

Response DM 3 – Round 1

Text revised as requested.

Comment DM 3 – Round 2

No comment received.

Response DM 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 5 – Round 1

Appendix D6, 2. The pre-mining potentiometric map for the Masters coal seam shows the elevation of the groundwater at a higher elevation than the surface elevation in Sections 11 and 12 (in the vicinity of Slater Creek outside of the permit area). Either show the potentiometric surface as dotted across this area or revise the potentiometric lines such that the groundwater elevation is below the ground surface elevation. Issue addressed by BJ Kristiansen. Please see comment No. 65.

Response KM 5 – Round 1

Exhibits D6.2-2 and D6.2-3 have been revised as requested.

Comment KM 5 – Round 2

No comment received.

Response KM 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 6 – Round 1

Appendix D6, 3. The groundwater elevation for the Carney coal seam in monitor well 578417-CRN was given as 3795.59. The potentiometric contour for 3800 is drawn south of this monitor well. Please correct the contour line to be consistent with the groundwater elevation shown for monitor well 578417-CRN. Correction of this contour

line may also adjust how the contour lines for 3780 and 3760 are drawn, such that they may be drawn consistent with other contour lines.

Response KM 6 – Round 1

Contours in Exhibit D6.2-3 have been revised as requested.

Comment KM 6 – Round 2

No comment received.

Response KM 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 7 – Round 1

Appendix D6, 4. Page D6 8-8: The text refers to the pump test in the Carney coal seam. According to the procedures in the previous section, transducers were placed in CRN and CRN-OB; however on the referenced page, it states transducers remained in MST and MST-OB after pumping. LQD believes this to be a typographical error.

Response KM 7 – Round 1

LQD is Correct, this is a typographical error. The sentence should read “After the pumping period, the transducers remained in CRN1 and CRN-OB until 8:00AM on November 16, 2013.” Page D6-8-8 has been updated with the typographical error corrected and a replacement page is included.

Comment KM 7 – Round 2

No comment received.

Response KM 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 8 – Round 1

Appendix D6, 5. Please discuss why the water levels rose in the Carney coal seam during the pump test in the Masters coal seam.

Response KM 8 – Round 1

This comment is addressed in comment 19 from Muthu Kuchanur.

Comment KM 8 – Round 2

No comment received.

Response KM 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 9 – Round 1

Appendix D6, 6. What effect would a leaking pump have on the results of the pump test in the Masters coal seam?

Response KM 9 – Round 1

This comment is assumed to originate from the note on page Addendum D6-8-30. This note is in reference to activities that occurred immediately after the pumping test was shut off. The pump used for the pumping test did not have a foot valve. Therefore, after the pump was shut off, water in the discharge pipe immediately began to drain back into the well. The pump and piping was pulled out of the well as fast as possible and not all of the water in the pipe drained back into the well. However, the personnel conducting the pumping test were concerned that the water draining into the well would result in a rapid rise in the water level in the well and wanted to note it for the record on the field data sheet. It is estimated that less than 2 gallons of water actually drained out of the line into the well while the pump was being pulled which would result in a water level rise in the well of less than 0.25 foot. Given that the water level recovery in the well was very rapid immediately upon cessation of the pumping test (approximately 2 feet in the first ten minutes after the pumping test ended) and the early time recovery data was largely ignored for the purposes of doing the aquifer characterization evaluations, the leaking pump would not have had an impact on the results of the pumping test.

Comment KM 9 – Round 2

No comment received.

Response KM 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 10 – Round 1

Appendix D6, 7. Please make sure all maps that are stamped are also signed and dated by the engineer, as required by regulation.

Response KM 10 – Round 1

All maps that are stamped will be signed and dated by the engineer as required by law. This does not include digital versions. The digital copies have been provided for WDEQ review. The hard copy is the official copy.

Comment KM 10 – Round 2

No comment received.

Response KM 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 17 – Round 2 (New Comment)

Based on LQD's review of the well logs for Wells 578409-CRN-OB and 578409-MST-OB, the wells were screened in a coal seam, not in overburden. Please address all hydrologic information discussing overburden which was based on these wells and which may be in error.

Response KM 17 – Round 2 (New Comment)

The "OB" designation refers to "observation" rather than overburden. It is noted that this is a poor naming convention, but the naming had already been established. We apologize for the confusion. Additionally, Section D6.2.1.1 states that electric logs with resistivity data have demonstrated that the overburden is dry. Section D6.2.2.1 states that no monitoring wells were completed in the overburden or interburden because no water was found in these units during drilling. The nomenclature page in Addendum D6-10 (page Addendum D6-10-27A) has been revised to state: OB=observation.

Comment KM 18 – Round 2 (New Comment)

The well logs for 578409-CRN and 578409-CRN-OB show the wells are screened in a coal seam labeled "Masters", not Carney. This appears to be a typographical error on the well log. Please correct.

Response KM 18 – Round 2 (New Comment)

The typographical error has been corrected on the well logs 578409-CRN and 578409-CRN-OB.

Comment MK 29 – Round 1

Appendix D6-Hydrology, Section D6.1.2 Drainage Basin Description, 3. On Page D6-2 it is stated that Slater Creek is an ephemeral stream. Aerial imagery shows a riparian area with trees and subirrigation occurring along much of the channel. PEM wetlands are also present as documented in Appendix D10. It would seem that an ephemeral stream may not be able to support these features. Please provide the justification why Slater Creek is considered an ephemeral stream, and that the stream does not contain intermittent characteristics where it is not below the local water table for a portion of the year. (MDK)

Response MK 29 – Round 1

Please see response to DM2.

Comment MK 29 – Round 2

Response not accepted. Please include additional discussion on the hydrology of Slater Creek to include what was added to Page D11-8 in Appendix D-11 in response to Comment MK 8: *Infiltration of precipitation into the burn and then slow release of the stored water acts as a water source for the subirrigation and surface flow of Slater Creek.*

In addition, a comparison of the 2014 observed flows between the upstream and downstream stations on Slater Creek shows that flows were higher at the upstream station for the majority of the period. This may suggest Slater Creek is a losing stream. Please discuss this further in the description of the hydrology of Slater Creek. (MDK)

Response MK 29 – Round 2

The additional discussion for Slater Creek hydrology has been added to the middle of the third paragraph in Section D6.1.2 as requested.

Comment MK 30 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 4. The USGS operated a peak flow gage on Slater Creek from 1967 to 1981 (Station No. 06299900, http://nwis.waterdata.usgs.gov/wy/nwis/inventory/?site_no=06299900&agency_cd=USGS). The gage was located just downstream of the proposed permit boundary near the confluence with the Tongue River. Please incorporate the annual peak flow data from this station into the permit application to illustrate the range of peak flows that might be expected from Slater Creek. (MDK)

Response MK 30 – Round 1

The text and Tables D6.1-2 and D6.1-3 have been revised to include peak flow data for USGS Station No. 06299900.

Comment MK 30 – Round 2

No comment received.

Response MK 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 31 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 5. Some of the U.S. Army Corps of Engineers references cited in the text (2000, 2001) do not appear in the References Section (Section D6.3). Please add these to the references list. (MDK)

Response MK 31 – Round 1

The text edits have been made as requested.

Comment MK 31 – Round 2

Response not accepted. The citation (U.S. Army Corps of Engineers, 2001) on Page D6-3 still does not appear in the reference list. Please add this to the Reference Section (Section D6.3). (MDK)

Response MK 31 – Round 2

The year in the U.S. Army Corps of Engineers citation on page D6-3 was changed to 2009 to match the references provided in Section D6.3. The change was an inadvertent oversight on the part of WWC.

Comment MK 32 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 6. Please add the year to the Miller reference within the text (2003) and add this citation to the references list in Section D6.3. (MDK)

Response MK 32 – Round 1

The text edits have been made as requested.

Comment MK 32 – Round 2

No comment received.

Response MK 32 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 33 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 7. Please explain in the text if the existing impoundments (stock reservoirs, old mine pits, etc.) in both the Slater Creek and Hidden Water Creek drainages were considered in the routing functions for the HEC-HMS runoff estimates. These features would likely have an effect on attenuating peak flows. (MDK)

Response MK 33 – Round 1

The text has been revised to clarify the impoundments are not included the HEC-HMS model. As described, peak flow estimates should be conservatively high without attenuation of storm events by impoundments.

Comment MK 33 – Round 2

No comment received.

Response MK 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 34 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 8. As the text states on Page D6-5, the HEC-HMS runoff estimates in Table D6.1-7 are higher than the Miller (2003) equation estimates. Please provide a discussion in the text as to the reasonableness of the HEC-HMS estimates and why the HEC-HMS estimates are so much higher than the Miller (2003) equation estimates.

The Miller (2003) equation for this region used, in part, data from the USGS peak flow gage on Slater Creek, so it would seem that the Miller (2003) estimates may be more reasonable. For example, compared to the HEC-HMS estimates, the 15-year record from the peak flow gage on Slater Creek would not register at anything greater than a five-year event. Furthermore, the May 18, 1978 event on Slater Creek resulted in a peak flow of 1,100 cfs, which according to the HEC-HMS estimates would only be around a 2-year event. USGS studies have shown that the May 1978 flood event was estimated to be a 100-year event on some parts of the Tongue River in this area (<http://pubs.usgs.gov/pp/1244/report.pdf>). (MDK)

Response MK 34 – Round 1

A discussion in the text has been included that speaks to why the HEC-HMS results are higher than the Miller results. Additionally, a discussion acknowledges the report by the USGS on the May 1978 flood. The Miller analysis does appear to more closely estimate the peak flowrates for flood events for the short data record on Slater Creek. However, hydraulic calculations will continue to use the HEC-HMS results because of the conservative results and the ease in comparing to the postmining hydrologic environment. HEC-HMS provides a way to change the properties of the drainage basins to reflect what will be present postmining, and the comparison between the premining and postmining HEC-HMS models quantifies the magnitude of the impact the Brook Mine will have on the hydrologic balance.

Comment MK 34 – Round 2

No comment received.

Response MK 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 35 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 9. Please add the northing/easting State Plane coordinates for the four Brook Mine surface water monitoring stations to Table D6.1-11. (MDK)

Response MK 35 – Round 1

The locations of the surface water monitoring sites have been reported to the quarter-quarter, which is an adequate level of accuracy to report the monitoring locations.

Comment MK 35 – Round 2

Response not accepted. The location coordinates are needed for plotting the locations of the stations; the quarter-quarter does not provide the needed level of accuracy for this. Reporting the northing/easting State Plane coordinates for monitoring locations is standard practice in other LQD coal permits and would be required when reporting station information in the Annual Report as part of the LQD Coal Annual Report Format (CARF). Please add the northing/easting State Plane coordinates for the four Brook Mine surface water monitoring stations to Table D6.1-11. (MDK)

Response MK 35 – Round 2

The northing and eastings for the surface water monitoring station have been added to Table D6.1-11, as requested.

Comment MK 36 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations,10. On Page D6-8, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

Response MK 36 – Round 1

The text has been revised as requested.

Comment MK 36 – Round 2

No comment received.

Response MK 36 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 37 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 11. On Page D6-8, second paragraph, it states that increased E.Coli from samples collected in 2006 were attributable to high flows in May-June 2010. Were the samples also collected in 2010 and not 2006? Please revise this sentence. (MDK)

Response MK 37 – Round 1

The sentence was revised to read more clearly. The sentence was saying that samples taken in 2010 experienced an increase in E.Coli bacteria compared to the samples collected in 2006.

Comment MK 37 – Round 2

No comment received.

Response MK 37 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 38 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 12. On Page D6-8, second paragraph, it would be informative to add that, in addition to the SCCD, other entities such as the Big Horn Mine, USGS, and WDEQ/WQD have collected water quality data on the Tongue River and Goose Creek near the proposed mine. It may also be informative to mention that sections of the Tongue River in the vicinity of the proposed mine are on the State's 303(d) list since certain uses are not supported due to impaired water quality. Goose Creek has also been on the 303(d) list in the past and a TMDL has been prepared. Information can be found at: <http://deq.wyoming.gov/wqd/water-quality-assessment/resources/reports/> and <http://deq.wyoming.gov/wqd/tmdl/>. (MDK)

Response MK 38 – Round 1

The text has been revised as requested. Refer to Section D6.1.5.1.

Comment MK 38 – Round 2

No comment received.

Response MK 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 39 – Round 1

Appendix D6-Hydrology, Section D6.1.5.2 Surface Water Quantity, 13. The Big Horn Mine (WDEQ/LQD Permit 213) operated a station on Hidden Water Creek (HWC1-79)

from 1979 to 1998. This station was located approximately ¼ mile upstream from station SM578415-SW-1 that was installed by the Brook Mine. The LQD Hydrology Database contains mean daily flow data from this station from 1982 to 1997, although several years are missing data. Baseline water quantity characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic format upon request or a more complete dataset may be available if requested from the Big Horn Mine. (MDK)

Response MK 39 – Round 1

Please see response to DM 2 and MK 30.

Comment MK 39 – Round 2

Response not accepted. The response referenced Comments DM 2 and MK 30, which refer to Slater Creek, not Hidden Water Creek. The LQD emailed the Hidden Water Creek data to WWC Engineering on July 8, 2015. Please incorporate and discuss the data to strengthen the baseline water quantity characterization of Hidden Water Creek in the Brook Mine permit application. (MDK)

Response MK 39 – Round 2

Please refer to the added text at the bottom of the second paragraph of Section D6.1.5.2 summarizing the flow data from the Big Horn Mine Hidden Water Creek former surface water monitoring station, HWC1-79. In addition, Table D6.1-14 has been added which provides the number of flow days per month and the maximum average flow for each day during a given flow month for the 1982 through 1997 period of record. The approximate location of HWC1-79 has been added to Exhibit D6.1-2.

Comment MK 40 – Round 1

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 14. Please briefly discuss in the text the water quality results from Slater Creek in the context of WQD Surface Water Quality Standards for Class 3B waters (see Chapter 1 of WQD Rules and Regulations). This would reveal whether or not designated uses were being met prior to mining. The two samples from Slater Creek indicate no exceedances of Class 3B criteria, indicating uses are supported. (MDK)

Response MK 40 – Round 1

The text has been updated as requested.

Comment MK 40 – Round 2

No comment received.

Response MK 40 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 41 – Round 1

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 15. It is understood that water was not flowing in Hidden Water Creek so the applicant could not collect a sample for baseline purposes. However, as previously mentioned, the Big Horn Mine operated a station on Hidden Water Creek (HWC1-79) from 1979 to 1998. The LQD Hydrology Database contains nine water quality samples collected at this site from 1979 to 1989. Baseline characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic format upon request. (MDK)

Response MK 41 – Round 1

Request for information is pending. No update to the permit has occurred at this time in response to this comment.

Comment MK 41 – Round 2

Response to the comment is pending. As discussed in the review of the response to Comment MK 39, the LQD emailed the Hidden Water Creek data to WWC Engineering on July 8, 2015. Please incorporate and discuss the data to strengthen the baseline water quality characterization of Hidden Water Creek in the Brook Mine permit application. (MDK)

Response MK 41 – Round 2

Please refer to the added text at the bottom of the second paragraph of Section D6.1.5.3 summarizing the surface water quality in Hidden Water Creek for the Big Horn Mine surface water monitoring station, HWC1-79. In addition, Table D6.1-15 has been constructed which displays concentrations of the nine samples collected for the 1979 through 1989 period of record. The approximate location of HWC1-79 has been added to Exhibit D6.1-2.

Comment MK 42 – Round 1

Appendix D6-Hydrology, Section D6.1.5.4 Sediment Transport, 16. This section would be enhanced by including data from a single sediment sample collected on Slater Creek at USGS Station No. 06299900 (peak flow gage previously discussed in Comment No. 4). This sample was collected in June 1967 at a flow of 18 cfs. The TSS was 11,600 mg/L and the suspended sediment discharge was 564 tons/day. (MDK)

Response MK 42 – Round 1

The text has been revised to include the additional sediment sample as requested.

Comment MK 42 – Round 2

No comment received.

Response MK 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 43 – Round 1

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 17. A rating curve developed using only the Manning equation will provide only a rough estimate of flows given the uncertainty in the Manning's roughness coefficient. It is recommended that direct discharge measurements also be taken over time to help evaluate the rating curves developed for the four monitoring sites. (MDK)

Response MK 43 – Round 1

The rating curves were developed for ephemeral streams that flow infrequently enough that water measurements cannot be taken at regular intervals. Manning's equation provides a reasonable and widely accepted mathematic approximation of stream flow rates.

Comment MK 43 – Round 2

Response not accepted. Developing a rating curve for an open channel using only Manning's equation and no direct measurements is not a standard practice. If a direct discharge measurement is not occasionally taken, the accuracy of the modelled rating curve will never be known. Please commit to periodically taking a direct measurement to evaluate the rating curves. (MDK)

Response MK 43 – Round 2

A commitment to obtain direct measurements of surface water monitoring stations, when possible, was added to Section MP.7.1.

Comment MK 44 – Round 1

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 18. Given the uncertainty in the Manning equation, the estimated flow rates provided in Table D6-3 and Attachment D6-5-A (Rating Tables) are reported at much too high a level of precision to be meaningful. Depending on the magnitude of the flow estimate, there should be only one or two significant figures provided. For example, 0.29 cfs = 0.3 cfs and 3,584.38 cfs = 3,600 cfs. Please revise these tables. (MDK)

Response MK 44 – Round 1

Summary Table D6-3 has been revised to engineering precision (no more than three significant figures). The values in Attachment D6-5-A are essentially raw data that are

being reported to that magnitude to show the validity of calculations and to aid in curve development. Being raw data, the values were not revised from those previously reported.

Comment MK 44 – Round 2

No comment received.

Response MK 44 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 9 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 9. Page D6-12 states, “The potential groundwater in the formation as capable of yielding small quantities of water for domestic and stock use”. Please consider providing a range of estimates for well yields based on literature review or from the baseline data collected by the Brook Mine. (MK)

Response Muk 9 – Round 1

The text has been revised to indicate that coal is the only regional shallow aquifer that has a sufficient quantity of water to support domestic and stock use.

Comment Muk 9 – Round 2

No comment received.

Response Muk 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 10 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 10. The description in this section discusses only about the Fort Union formation. Please provide a description of the overlying and underlying water-bearing formations (aquifers) and describe their hydrogeologic characteristics (flow direction, gradients, aquifer properties, general outcrop locations) on a regional context. It is noted that some of the overlying formations may be dry or discontinuous within the mine permit boundary. (MK)

Response Muk 10 – Round 1

Section D6.2.1 has been updated as requested.

Comment Muk 10 – Round 2

No comment received.

Response Muk 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 11 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 11. Page D6-12 states, “The overburden is comprised of sand lenses, clinker and alluvial that have the potential of water bearing bodies. Due to the topography in this area, the valley cut through these deposits. Therefore, they are discontinuous and would not hold large quantities of water.” It is noted that they are discontinuous and would not hold large quantities of water. Please provide additional justification for this statement by using the hydrogeologic data collected by the Brook Mine including any reference to the interpreted extent of dry zones based on drill holes, monitor wells and other applicable data. (MK)

Response Muk 11 – Round 1

Section D6.2.1.1 has been updated as requested.

Comment Muk 11 – Round 2

Response not accepted. In addition to a reference to Addendum D5-2, please provide a description/interpretation on the aerial and vertical extent of dry zones. (MK)

Response Muk 11 – Round 2

Discussion of the interpreted dry zones was added to the first paragraph of Section D6.2.1.1 (page D6-14). As discussed, the overburden is primarily dry as indicated by the lithologic logs in Appendix D5. A few boreholes did indicate the presence of water in the overburden; however, water was generally located in the shallow alluvium/colluvium material or in burn areas. These boreholes were generally located near streams or supporting tributaries throughout the permit area and adjacent areas.

Comment Muk 12 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 12. Please clarify if there were groundwater springs or seeps observed in the areas within or adjacent to the mine permit boundary. Include a discussion (or reference) on the surface water - groundwater interactions.(MK)

Response Muk 12 – Round 1

Section D6.2.2.5 has been updated as requested.

Comment Muk 12 – Round 2

No comment received.

Response Muk 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 13 – Round 1

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 13. Page D6-13 states, “No monitoring wells were completed in the overburden or interburden as no water was found in these units during drilling operations”. This information is critical in demonstrating the overlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (both overburden and interburden) and their depths that were used to make this determination. (MK)

Response Muk 13 – Round 1

Section D6.2.2.1 has been updated as requested.

Comment Muk 13 – Round 2

No comment received.

Response Muk 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 14 – Round 1

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 14. Page D6-13 states, “Also one well 578409-MST-UB showed the presence of water in the underburden, while all the other wells drilled into the underburden were dry and therefore not completed as wells.” Similar to the previous comment, this information is critical in demonstrating the underlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (underburden) and their depths that were used to make this determination. (MK)

Response Muk 14 – Round 1

Please see response to Muk 13.

Comment Muk 14 – Round 2

No comment received.

Response Muk 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 15 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 15. Page D6-15 states, “Alluvial materials were also not analyzed during the aquifer testing.” The alluvial aquifer materials are one of the key factors in determining any impacts caused by mining to the alluvial aquifer. Alluvial aquifer tests will be helpful in understanding any surface water – groundwater interactions. Please provide justification for not conducting any aquifer tests in the alluvial wells. (MK)

Response Muk 15 – Round 1

The text in Section D6.2.2.2 has been updated.

Comment Muk 15 – Round 2

Response not accepted. The updated text just notes that there were three alluvial wells completed in Slater Creek. The original comment remains to be addressed. (MK)

Response Muk 15 – Round 2

A short discussion was added to the second paragraph of Section D6.2.2.2 after the context of the response to Comment MuK 16. The discussion explains that aquifer tests weren’t conducted in the alluvial wells because of the confining claystone intervals between colluvial/alluvial material and the differences in potentiometric head between the Carney coal and the colluvial/alluvial material. Therefore, it can be surmised that the confining intervals will provide a suitable barrier between the mining activities and the colluvium/alluvium, not necessitating aquifer tests in the alluvial aquifer.

Comment Muk 16 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 16. Please provide justification for not observing the groundwater level responses in the alluvial aquifer during the two aquifer tests conducted by Brook mine. (MK)

Response Muk 16 – Round 1

No alluvial material was present in immediate vicinity of the clusters used for the pumping tests, hence there was no alluvial aquifer to monitor. Hidden Water Creek located to the east of the tested well cluster would be potentially the nearest location of alluvial material. However, as noted in Appendix D11, the fill material in Hidden Water Creek is more colluvial than alluvial.

In addition, as shown on the well completion summary logs in Addendum D6-7, multiple claystone intervals are located between the Carney Coal and the surface at the well cluster where the pumping tests were conducted. The top of the Carney Coal is approximately 90 feet below ground surface at the cluster well location which is approximately 50 feet below the level of any colluvial/alluvial deposits in Hidden Water

Creek. Similarly, the potentiometric head in the Carney coal is some 50 feet below the level of the colluvial/alluvial deposits in Hidden Water Creek and if there were a direct hydraulic connection, there would be no water in the Hidden Water Creek colluvium/alluvium. Given the confining intervals between and the significant difference in potentiometric head between the Carney Coal and the Hidden Water Creek colluvium/alluvium, additional shallow monitoring above the Carney Coal was not necessary.

Comment Muk 16 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 16 – Round 2

The context of the response was added to the second paragraph of Section D6.2.2.2.

Comment Muk 17 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 17. Page D6-16 states, “A report of these tests can be found in Addendum D6-8 and summary tabulation of the aquifer test results is included in Table D6.2.2”. Please consider including a comparison of these estimated aquifer properties with the aquifer tests conducted in other similar coal seams in the Powder River Basin (Example: Bighorn Mine). Given the number of tests conducted by the mine, this will increase the robustness of the reported estimates from the two aquifer tests. (MK)

Response Muk 17 – Round 1

As requested aquifer test results from Big Horn Coal Company and from the Youngs Creek Mine were added to the text.

Comment Muk 17 – Round 2

No comment received.

Response Muk 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 18 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, It is noted that the aquifer tests were conducted for ~640 minutes. Will an increased aquifer test duration change the observed lack of interaction between the coal seams and the underburden? Please clarify with a brief description. (MK)

Response Muk 18 – Round 1

Given the head differences between the static water levels in the Carney Coal, Masters Coal, and the underburden it is unlikely that additional pumping would have resulted in any impacts to the water levels in the underburden. As shown on Table D6-2, (page Addendum D6-8-13) the initial water level in the Carney Coal was approximately 11.5 feet higher than the water level in the Masters Coal and the initial water level in the Masters Coal was approximately 9 feet higher than the initial water level in the underburden well. If there were a hydrologic connection between the aquifers, it is likely that the water levels in the aquifers would have already come into equilibrium.

Comment Muk 18 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 18 – Round 2

The context of the response has been added as the third paragraph of Section D6-8.3.2.3 of Addendum D6-8 “Pumping Test Report.” The context of the response seems to be better suited in the Pumping Test Report than in Section D6.2.2.2 of Appendix D6.

Comment Muk 19 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 19. The referenced Addendum D6-8, Table D6-2 shows an increase in water levels in two of the Carney coal seam observation wells during the Masters coal seam well pumping test. Please provide an explanation for this increase in water levels during the aquifer test. (Noordbergum effect?). (MK)

Response Muk 19 – Round 1

Upon review of the raw data collected during the pumping test it was noted that the drawdowns reported in Tables D6-2 and D6-3 were incorrectly reported. Replacement tables are included with this round of comment responses. As shown on the updated version of Table D6-2, the water level in both Carney observation wells (CRN-1 and CRN-OB) increased by 0.23 feet during the Masters coal pumping test. While the Noordbergum effect or other natural phenomena such as earth tides could have potentially influenced the water levels in adjacent aquifers during the pumping test, the increase in water levels can be largely attributed to barometric pressure changes. Water levels in the Carney observation wells were monitored using hand held electric lines and there were no adjustments for barometric pressure reported in Table D6-2. No site specific barometric data was collected during the pumping test period. However, to evaluate how barometric pressure changes may have impacted water levels in the wells, barometric data from the automatic weather observing station (AWOS) at the Sheridan County airport was obtained from the National Oceanic and

Atmospheric Administration (NOAA) database. Barometric data from the Sheridan County Airport AWOS site was compared to water level measurements in Attachment D6-8-K. The data in Attachment D6-8-K demonstrates a clear correlation between barometric pressure and water level variations in the Carney coal monitor wells during the Masters coal pumping test. Generally over the course of the Masters coal pumping test the barometric pressure went down (roughly 0.31 feet). A decrease in the barometric pressure is expected to result in an increase in water levels in a confined aquifer like the Carney coal aquifer which is what was observed.

Similar increases in water levels were also noted in the Masters Coal observation wells (MST-1 and MST-OB) during the Carney pumping test as noted on Table D6-3. Attachment D6-8-K demonstrates a clear correlation between decreasing barometric pressure and rising water levels in the Masters coal observation wells during the Carney Pumping test. In addition, during the Carney coal pumping test, water levels in the Masters coal observation wells were still recovering from drawdowns induced during the Masters coal pumping test which may also have contributed to rising water levels in the Masters coal. The increase in water level measured in the Masters coal observation wells is attributed to a combination of continuing water level recovery and barometric effects.

Only very minor water level variations in the Masters underburden well (MST-UB) were noted during both pumping tests. As shown on the well completion form in Addendum D6-7, (Page D6-7-8) MST-UB was completed in an interval that was predominately claystone and the estimated yield is less than 2 gpm. Essentially the strata in which MST-UB is completed is more of an aquitard than an aquifer. As a result, it takes a lot longer for the water levels in the well to adjust to changing atmospheric pressure because water does not enter or discharge from the formation very fast. The lack of barometric responses in the MST-UB are attributed to the fact that the low yielding aquitard in which the well is completed has a lower barometric efficiency than the wells completed in the coal aquifers.

Vented transducers utilized to monitor water levels in the both the pumping and adjacent monitor wells during each pumping test, automatically compensated for the barometric pressure effects. Therefore, barometric pressure effects did not affect the aquifer analyses that were developed based on the pumping test data.

Comment Muk 19 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 19 – Round 2

The context of the response has been added to Section D6-8.3.2.3 of Addendum D6-8 “Pumping Test Report.” The context of the response seemed to be better suited within the Pumping Test Report than Section D6.2.2.2 of Appendix D6.

Comment Muk 20 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 20. Please provide a discussion (or reference) on the role of faults in the results of aquifer tests. (MK)

Response Muk 20 – Round 1

As noted in Addendum D6-8, (page D6-8-9) no hydrologic boundary conditions were observed in the pumping test data. As can be seen on Exhibit D6.2-2, the 578409 well cluster is located approximately 2,100 feet south and east of the nearest mapped fault. Since neither the Carney nor the Masters coal seams are very robust aquifers and have low transmissivity values, it is not surprising that the fault would not influence the pumping test results. For example, using Theis drawdown equations and the aquifer characteristics measured in the Masters coal (transmissivity of 3.2 ft²/day, storativity of 0.00025, and a pumping rate of 0.5 gpm) it is estimated that it would take over 70 days of continuous pumping for a water level response greater than 0.5ft to be observed 2,000 feet away. Therefore the likelihood that the faults would have influenced the pumping test results is very low.

Comment Muk 20 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 20 – Round 2

The context of the response has been added to Section D6-8.4 of Addendum D6-8 “Pumping Test Report.” This seemed like a more appropriate location for the context of the response than within Section D6.2.2.2 of Appendix D6.

Comment Muk 21 – Round 1

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 21. Please provide some additional discussion on the premining potentiometric surface maps, including ranges of estimated hydraulic gradients and groundwater velocity in the different coal seams/aquifers. (MK)

Response Muk 21 – Round 1

As requested, additional discussion on the hydraulic gradients and groundwater velocity in the coal seams were added to Section D6.2.2.4.

Comment Muk 21 – Round 2

Response not accepted. The revised text states, “Groundwater gradients are low ranging from approximately 2 – 4 ft/year in the Masters Coal and 1 to 2.5 ft/year in the Carney Coal.” Please correct the sentence to reflect velocities. (MK)

Response Muk 21 – Round 2

The text in Section D6.2.2.4, second paragraph was revised to correctly refer to 2 to 4 ft/year and 1 to 2.5 ft/ year as velocities rather than gradients.

Comment Muk 22 – Round 1

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 22. Please provide a discussion (or reference) on the hydrologic effects of any adjacent operations (including past coal mining activity by historic mines and Bighorn mine) on the premining information and data. (MK)

Response Muk 22 – Round 1

The last paragraph in Section D6.2.2.4 describes how CBNG production has affected water levels in the eastern side of the permit area. The drawdowns resulting from CBNG production have occurred since any historic coal mining activity and have superseded any drawdowns that may have occurred due to historic mining. Therefore, no lingering hydrologic effects from past coal mining activities are present. The text in the last paragraph in Section D6.2.2.4 has been updated to describe how CBNG impacts have superseded any impacts from historic coal mining activities.

Comment Muk 22 – Round 2

No comment received.

Response Muk 22 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 23 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 23. This section provides a good discussion on the recharge areas. However, please clarify if there are any discharges from the coal seams within the permit boundary. (MK)

Response Muk 23 – Round 1

Within the permit boundary there are no discharges from the coal seams with the possible exception of the Carney coal on the far west side of the permit area. As shown on Exhibit D6.2-3, the Carney coal outcrops in the far western side of the permit area along the ridge tops but has been eroded away in the stream valleys. As a result, the Carney coal is perched with no real source of recharge and is generally dry. However, on the down dip side of the outcrop the coal may discharge within the permit if there is water in the coal seam to discharge. As shown on Figures MP-3-4.7-1 and MP-3-4.7-2 it was determined during the groundwater modeling efforts that

most of the Carney coal within the far western side of the permit area was dry. Therefore, there is minimal (if any) discharge from the Carney coal within the permit area. Section D6.2.2.5 has been updated to clarify where discharges from coal seams may occur within the permit boundary.

Comment Muk 23 – Round 2

No comment received.

Response Muk 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 24 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 24. Please provide a range of estimates for recharge from precipitation to the aquifers within the permit boundary. Also, provide a discussion if this is the primary recharge mechanism for the aquifers within the permit boundary. (MK)

Response Muk 24 – Round 1

The estimated recharge rates from precipitation are summarized in Section 4.2.2 of Addendum MP-3. Addendum MP-3 describes recharge within the permit area in more detail than Section D6.2.2.5. A reference to MP-3 was added in Section D6.2.2.5.

Comment Muk 24 – Round 2

No comment received.

Response Muk 24 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 25 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 25. Consider providing a description of the soil properties within the permit boundary and the use of these percent soil distributions in the discussion of infiltration within the permit boundary. (MK)

Response Muk 25 – Round 1

The soil properties within the permit boundary are described in detail within Appendix D7. While different soil types are expected to have variable infiltration rates, the only infiltration rate that is significant for the coal aquifers is the infiltration rate assigned

to the strata near the outcrop of the coal seams. Throughout the permit area the strata overlying the coal aquifer are generally dry. Therefore the primary source of recharge occurs at the outcrops. Scoria, in particular, plays a significant role in recharge of the coal seams because it usually occurs near the coal outcrop. Because of its highly permeable characteristics most of the precipitation that falls on the scoria infiltrates into the scoria where it either infiltrates into the coal or discharges along a seep line at the base of the scoria. As noted in the response to BJ Kristiansen's comment number 57, ash material between the base of the scoria and the coal seams sometimes limits how much of the water in the scoria actually comes into direct contact with the coal. Nevertheless, because a large percentage of precipitation falling on the scoria actually infiltrates into it, the scoria does provide a consistent water source for recharge into the coal outcrops. As noted in Addendum MP-3 Section 4.2.2 the scoria areas were delineated and assigned their own recharge zone because they do play a significant role in recharging the coal seams. Within the permit area, there are several locations where the coal seams outcrop as well. These outcrop areas were also assigned their own recharge zone because they also have a hydrologic connection to the coals. Since the strata overlying the coal seams to be mined in the Brook Mine are generally dry, the recharge component from the overburden to the coal is very low away from the outcrop areas. Because of the limited hydrologic interaction between the recharge at the surface and the coal in areas away from the outcrop, site specific changes in the recharge rates based on soil type will not impact the coal aquifers. For this reason additional analysis of the infiltration properties of the soils within the permit area represents a level of detail that is not necessary to describe the hydrologic impacts to the coal aquifers from the proposed mining operations.

Comment Muk 25 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application to document the justification for not including additional analysis on infiltration. (MK)

Response Muk 25 – Round 2

The context of the response has been added as the second paragraph of Section D6.2.2.5 of Appendix D6.

Comment Muk 26 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 26. Page D6-18 states, "Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-8". Please revise this statement to reference the correct addendum - Addendum D6-9. (MK)

Response Muk 26 – Round 1

The text has been updated to read "Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-9".

Comment Muk 26 – Round 2

No comment received.

Response Muk 26 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 27 – Round 1

Appendix D6, Section D6.2.3 Baseline Water Quality, 27. Page D6-20 states, "A piper diagram of the groundwater wells with measured values is presented in Figure D6.2-1. Please provide a discussion on the water quality types observed at each aquifer (Example: Is the water quality type variable within an aquifer? If yes, explain the potential reasons for this observed variability) based on the piper diagram. (MK)

Response Muk 27 – Round 1

Section D6.2.3 has been updated as requested.

Comment Muk 27 – Round 2

No comment received.

Response Muk 27 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 28 – Round 1

Appendix D6, Section D6.2.3 Baseline Water Quality, 28. Page D6-20 states, "The constituents that most frequently exceed the standard concentration limitations are ammonia, TDS, sulfate and manganese". Please clarify if these constituents exceed the Chapter 8 standards at all the monitor wells. (MK)

Response Muk 28 – Round 1

Please refer to the Tables D6.2-8 thru D6.2-17 for exceedances of water quality based on Chapter 8 standards. Based on the tables, the concentrations are not exceeded at all monitor wells. No text edits were made in response to this comment.

Comment Muk 28 – Round 2

No comment received.

Response Muk 28 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 29 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 29. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Cheyenne copy of the TFN does not have a sheet separator and a tab for Appendix E2 in the Adjudication volume. Please provide a sheet separator and tab for Appendix E2. (MK)

Response Muk 29 – Round 1

Refer to Comment DM3. Groundwater rights are provided in Appendix B of the Adjudication Volume. This text edit has been made in Section D6.2.4.

Comment Muk 29 – Round 2

Response not accepted. The response indicates Appendix B and the updated text indicated Appendix B2. Please clarify if that is Appendix B or Appendix B2. (MK)

Response Muk 29 – Round 2

The text in Section D6.2.4 was corrected to reference Appendix B as opposed to Appendix B2.

Comment Muk 30 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 30. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Please provide a summary discussion/statistics on (i) total number of water rights, (ii) number of wells, (iii) aquifer, (iv) permitted water use and other relevant summary statistics. (MK)

Response Muk 30 – Round 1

Groundwater rights are listed in Appendix B of the Adjudication Volume. All of the aforementioned information is listed for each water right. Due to the constantly changing nature of water rights, a summary table is difficult to construct, and due to summary statistics not being required by WDEQ regulation, a summary statistics table has not been prepared.

Comment Muk 30 – Round 2

Response not accepted. It is acknowledged and noted that water rights vary with time. The intent of this comment is to request a summary of the raw data on the water rights presented in Appendix B, which is a snapshot in time before the approval of the proposed operations. It will enable the reviewers to get a clear understanding of the existing groundwater water uses and if there is a significant dependence on the affected aquifers. In addition, it is very useful information for the CHIA to provide a summary on the groundwater hydrologic concerns within the impact area. Please summarize (i) total number of water rights, (ii) number of wells (iii) wells grouped by aquifer and (iv) permitted water use. Example: Sum the total number of wells, provide a description on the percent of different types of uses. (MK)

Response Muk 30 – Round 2

A summary table (Table D6.2-18) has been added to Appendix D6. Text referencing this table has been added to Section D6.2.4, as well as text referencing discussion of impacted wells found in Addendum MP-3. Table D6.2-18 summarizes the total number wells not including cancelled, expired, abandoned, or suspended water rights. The table lists the permitted water use, the number of wells for each permitted water use, and the percent of total for each permitted use category. The table does not group the wells by aquifer. With nearly 500 wells being reported, the research required to determine the aquifer that each well is completed in would be exhaustive and, ultimately, not possible. Additionally, upon review of several of these water rights, one will note that most water rights have poor completion information. Water rights have either no lithology or have lithology that is so nondescript that a specific aquifer cannot be determined.

Comment Muk 31 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 31. Please provide a discussion (or reference) on the premine groundwater use (including the uses reported to SEO) within the permit boundary and the adjacent areas. (MK)

Response Muk 31 – Round 1

The premine groundwater uses as reported to the SEO within the permit boundary and the adjacent 3 miles are listed with each individual water right in Appendix B of the Adjudication Volume.

Comment Muk 31 – Round 2

Response not accepted. In addition to the reference to Appendix B, please include a textual description and summary of the premine groundwater use within the permit boundary and adjacent areas. (MK)

Response Muk 31 – Round 2

The text in Section D6.2.4 has been changed to include a discussion listing the predominant water uses in permit area and the adjacent 3-mile buffer. The text references the newly created Table D6.2-18 for a groundwater use summary.

Appendix D7

Comment DS 6 – Round 1

Appendix D7, Exhibit D7.3.-1 was compared with Exhibit MP.1-1. As required, it appears that the soil sampling was concentrated in areas where surface disturbance is to be expected. Please provide the contour interval on the soils map. For ease of review and to prevent misinterpretation, however, the map showing sampling locations should also clearly show the locations of proposed surface disturbances instead of providing these details on separate maps which may or may not present differing scale distances.

Response DS 6 – Round 1

The disturbance boundary can be found on Figure D7.1-1 and as the reviewer noted on Exhibit MP.1-1. No revision to exhibit D7.3-1 has occurred in response to this comment.

Comment DS 6 – Round 2

Response is not adequate. Please show the proposed surface disturbance locations on Exhibit D7.3.-1.

Response DS 6 – Round 2

Please refer to Comment DS 22 of the Mine Plan. Soil polygons have been added to Exhibit MP.4-2 integrating the disturbance boundary with the associated soil polygons. No revision to Exhibit D7.3-1 has occurred in response to this comment.

The reasoning behind this is to separate Mine Plan disturbance from baseline studies. It is RAMACO's opinion that baseline studies should only show those conditions prior to RAMACO's proposed operations. Additionally, when future revisions to the Mine Plan are potentially made, references to the Mine Plan in baseline studies could inadvertently be missed causing mistakes in the permit. However, RAMACO is open to showing baseline information within the Mine Plan for an easier evaluation of topsoil types stripped within the topsoil stripping areas.

Comment DS 7 – Round 1

Appendix D7, Page D7-4. The second paragraph of this page contains text that should be deleted. It states "If for whatever reason overall sampling intensity.....was determined to not be enough, it is proposed that any additional sampling be deferred

and included a stipulation of a future pre-stripping soil assessment program.” The Mine Plan and Reclamation Plan soils handling and replacement is contingent on adequate baseline sampling of the proposed area that will be affected by mining operations (topsoil balance and stockpile location planning and bond calculation). Therefore, baseline sampling for soils must be adequate prior to approval of any permit application. Please remove the inappropriate language from the Appendix D7 text. If future changes to the Mine Plan require additional soil sampling the issue will be addressed at that time.

Response DS 7 – Round 1

As requested, the second sentence of the second paragraph on page D7-4 has been deleted.

Comment DS 7 – Round 2

No comment received.

Response DS 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 8 – Round 1

Appendix D7, Page D7-9. Text appears in this section that upon NRCS declaration of prime farmlands occurring in the permit area, a letter will be provided to the DEQ. A letter from the NRCS has been received and inserted in the permit declaring no prime farmlands to exist. The text, therefore, is not appropriate and should be removed.

Response DS 8 – Round 1

As requested, the sentence about prime farmland (the last sentence of the first full paragraph on page D7-9) has been deleted. A new reference, citing the letter received on October 31, 2015 (negative determination of prime farmland on Ramaco permit area) has been inserted on page D7-9 and the new reference has been added to the list of references on page D7-33.

Comment DS 8 – Round 2

No comment received.

Response DS 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 9 – Round 1

Appendix D7, WS § 35-11-415(b)(iii) and the Coal Rules, Chapter 4, Section (c)(ix) state that if topsoil is virtually nonexistent or is not capable of sustaining vegetation

then subsoil or a selected spoil material may be used as a topsoil or subsoil supplement. Additionally, due to the proximity of this mine to the Tongue River, a Class 2AB stream, limits for chemical contaminants will be imposed on discharges from the permit. Therefore, for areas where unsuitable or marginal topsoil chemistry is located (e.g. Wibaux channery loam, sample R13), an alternative soil replacement material should be identified and used in reclamation. Such a commitment must also be provided in the Mine Plan and Reclamation Plan to provide evidence that such issues that could affect the condition of reclamation and/or lead to off-site impacts will be addressed.

Response DS 9 – Round 1

No “alternate soil replacement material” is necessary for areas of Wibaux channery loam (Map Unit Wx). The lower soil material below 8 inches of Wibaux (any “C” horizon soil substratum below 8 inches, where existent) was not recommended for salvage and would be grouped with the overburden spoil for placement purposes. This lower material had an excessive volume of hard coarse fragments (>35%) and, based on one of the three Wibaux sample sites (R13), an “unsuitable” EC and SAR value for the 8 to 15 inch depth, EC=12.8 and SAR=17.3. Two new sentences, indicating no soil salvage of Wibaux below 8 inches in depth, has been added to the soils report on page D7-26, one sentence each for Map Unit Wx and Map Unit Wx-RO. Furthermore, the amount of suitable soil available for salvage across the entire proposed disturbance area is not limiting, with a calculated weight-average of 20.2 inches. Therefore, additional “alternate soil replacement material” is not necessary.

Comment DS 9 – Round 2

No comment received.

Response DS 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 10 – Round 1

Appendix D7, The description of Map Unit G (Bauxson Loam, sample R-19) does not show marginal selenium that occurs between 22 – 48 inch depth range which could affect the salvage depth and may require special handling of the marginally suitable subsoil.

Response DS 10 – Round 1

Two new sentences have been added to the last paragraph on page D7-21 stating the presence of “marginal” rated Selenium values for lower material of Bauxson loam (Map Unit G) sample site R19. Strictly speaking, “marginal” rated soil material is not “unsuitable” and does not need to be specially handled. This lower Bauxson material has been recommended for salvage as “Subsoil”, not “Topsoil”.

Comment DS 10 – Round 2

No comment received.

Response DS 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 31 – Round 2 (New Comment)

Section D7-2, Page D7-3 – A quotation and reference related to Schellinger, 2014, must be removed from the permit document as must all other quotations not supported by LQD documentation.

Response DS 31 – Round 2 (New Comment)

This quotation and reference is supported by LQD documentation. Please refer to Exhibit D7.2-1 of Appendix D7 which is a memorandum authored by David Schellinger, Soils Specialist on June 14, 2014. The quotation on page D7-3 accurately represents the sentence in the memorandum. Therefore, the quotation and reference remain in Appendix D7 as evidence for the extent of soil sampling in the Brook Mine permit area.

Appendix D8

Comment JJ 1 – Round 1

Appendix D8, 1. Please update the permit boundaries so that they are the same on Exhibit D8. 2-1 and Addendum D8 Map 1. I note specifically that lands should not be included within the permit boundary south of the interstate and that Section 10 TWN57N RNG85W displays different boundaries along the far west edge of the permit; it appears that the section lines are skewed between the two maps. The Addendum D8 Map 1 also is missing a sizeable amount of lands located in Section 21 TWN54N RNG84W which are included within the permit boundary of the Adjudication Exhibit 1 map. While comparing the maps I find that the maps display the same information in slightly different formats, please explain the necessity for two individual maps and at a minimum make them consistent against one another.

Response JJ 1 – Round 1

Baseline vegetation assessment maps have been updated to include the correct permit boundary. The discrepancy in the permit boundary is attributed to the difference in graphical representation between a USGS quad system and a PLSS system. The USGS quad system is now depicted. Exhibit D8.2-1 is a summary map for this Appendix and future updates made to this Appendix. This map will change throughout the life of the mine as future changes are incorporated. Addendum D8 Map 1 is for this Addendum and will not change throughout the life of the mine.

Comment JJ 1 – Round 2

The response is acceptable. The DEQ now understands the two separate maps and the boundaries now match.

Response JJ 1 – Round 2

Round 1 response is adequate. No response is necessary.

Comment JJ 2 – Round 1

Appendix D8, 2. Why does the study area not include all lands within the proposed permit boundary?

Response JJ 2 – Round 1

Portions of the proposed Brook Mine permit area not included within the study area were added during an October 2014 permit boundary change following completion of the baseline vegetation study. Additional studies were not conducted in these areas due to the limited size and similarity to areas within the study area. Section D8-1.1, page D8-1-5 text has been updated to explain the exclusion of these areas.

Comment JJ 2 – Round 2

The DEQ rules and regulations require vegetative characterization and baseline data for the entire permit area. Therefore, the lands located in Section 21, 22, and 15 that had not been previously included in the 2013 vegetation study area will require further attention. Please contact the DEQ to discuss the required baseline vegetation surveys. Due to the nature of the missing baseline vegetation data more comments may occur once all the data is submitted and applicable tables are updated.

Response JJ 2 – Round 2

The lands that are located in Sections 21, 22, and 15 that were not previously sampled in 2013 were sampled during 2015 quantitative baseline vegetation fieldwork. The data gathered for the areas in the above listed sections will be summarized for the WDEQ when the vegetation report is completed. The study area also needs to be updated on both Exhibit D8.2-1 and Addendum D8 Map 1, and will be provided to WDEQ in a supplemental submittal.

Comment JJ 3 – Round 1

Appendix D8, 3. The acreage displayed on Table D8.2-1 should equal that of the land permitted on the Form 11. The Form 11 displays 4,548.8 acres while the table shows 4,581.7 acres a difference of 32.9 acres. Please update either the Form 11 or Table D8.2-1 to show the true permit acreage as it relates to the vegetation communities. Upon further review I find that Table D8-2 located on page Addendum D8-1-41

exhibits the proper acreages in relation to the Form 11, thus the values represented there may be more accurately displayed in Table D8.2-1.

Response JJ 3 – Round 1

Total acreage of the permit area is 4,548.8 acres as illustrated in Form 11 and Table D8-2. Table D8.2-1 has been updated to reflect the correct acreage.

Comment JJ 3 – Round 2

The response is acceptable.

Response JJ 3 – Round 2

Round 1 response is adequate. No response is necessary.

Comment JJ 4 – Round 1

Appendix D8, 4. Table D8.2-1 states there are 56 acres of agricultural lands; however, I am unable to locate Agricultural lands north of the interstate. Please, discuss and edit the values to display true acreages in relation to the proposed permit boundary. (See comment 3 for more clarification and another table for utilization to update values.)

Response JJ 4 – Round 1

Agricultural Lands within the permit area total 4.5 acres and are located in Section 21 TWN54N RNG84W. Table D8.2-1 has been updated to reflect the correct acreage of Agricultural Lands and other vegetation communities within the permit boundary.

Comment JJ 4 – Round 2

The response is acceptable.

Response JJ 4 – Round 2

Round 1 response is adequate. No response is necessary.

Comment SP 3 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-3. Section D8.1.7. Guideline 2 is a non coal guideline. Please revise this sentence to reference the equation shown in Section D8-1.2.9 Sample Adequacy.

Response SP 3 – Round 1

Changed as requested. Additionally, Appendix D8 reference to Guideline 2 was replaced by reference for Chapter 2 in Section D8.1.1, page D8-1 and Section D8.3, page D8-4. Addendum D8 reference to Guideline 2 was replaced by reference for

Chapter 2 in Section D8-1.2, page D8-1-5 and Section D8-1.9, page D8-1-38.
Reference to Guideline 2 was removed from Section D8-1.2.9, page D8-1-12.

Comment SP 3 – Round 2

No comment received.

Response SP 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 4 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-4. Section D8.1.8. Please revise the second sentence to, “The EXREFA is all of the unaffected area for each native vegetation community.”

Response SP 4 – Round 1

Changed as requested.

Comment SP 4 – Round 2

No comment received.

Response SP 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 5 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-1-8. Section D8-1.2.4. The last sentence in this section states that no sample locations occurred within the Brook Mine Permit Area. AG-13, 14, 17 and 25 are shown on Addendum: D8, Map 1 inside the permit area. Please correct this statement or the permit boundary on the Map.

Response SP 5 – Round 1

Baseline vegetation assessment maps have been updated to include correct permit boundary which illustrates AG-13, 14, 17, and 25 are not located within the permit boundary.

Comment SP 5 – Round 2

No comment received.

Response SP 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 6 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-1-11. Section D8-1.2.8. The last sentence of the first paragraph should be revised to, “Sample adequacy was not required for species diversity and composition.”

Response SP 6 – Round 1

Changed as requested.

Comment SP 6 – Round 2

No comment received.

Response SP 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D9

Comment DM 4 – Round 1

Appendix D9-Wildlife, Page D9-3 states that when a sage grouse confirmation letter is provided by WG&F, it will be provided to DEQ. It appears that the confirmation letter is already part of the package (Page D9-E3). Please reference the location of the letter.

Response DM 4 – Round 1

Page D9-3 was revised to reference Page D9-E3 as the location of the letter.

Comment DM 4 – Round 2

No comment received.

Response DM 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 1 – Round 1

(Appendix D9), We recommend this report become part of the annual reporting which will ensue throughout the operation of the mine.

Response WGF 1 – Round 1

Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references the sections of the Mine Plan where the annual wildlife report commitments are contained.

Comment WGF 1 – Round 2

No comment received.

Response WGF 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 2 – Round 1

(Appendix D9), We suggest coordinating with the USFWS regarding raptor mitigation as needed through the mining process.

Response WGF 2 – Round 1

The commitments to coordinate with the USFWS regarding raptors as well as T&E and other species of federal concern are provided in Section MP.18, Addendum MP-8 and Addendum MP-9 of the Mine Plan. Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references these discussions.

Comment WGF 2 – Round 2

No comment received.

Response WGF 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 3 – Round 1

(Appendix D9), We recommend mining reclamation practices consider providing suitable habitat for existing wildlife within the specifications required by DEQ-LQD.

Response WGF 3 – Round 1

The commitments to reclaim wildlife habitats are provided in the Reclamation Plan in Section RP.7 Wildlife Restoration. Discussion was added at the end of Addendum D9 - 1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references the Reclamation Plan.

Comment WGF 3 – Round 2

No comment received.

Response WGF 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D10

Comment BJ 63 – Round 1

EXHIBITS, Addendum D10, The permit boundary layer on all of the exhibits covering the aquatic resource boundaries is incorrect. Please correct the permit boundary layers.

Response BJ 63 – Round 1

Aquatic resource inventory maps have been updated to include the correct permit boundary.

Comment BJ 63 – Round 2

No comment received.

Response BJ 63 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 5 – Round 1

Appendix D10-Wetlands, D10-1.4 – Please include a copy of the letter requesting concurrence and jurisdictional determination sent to the ACOE At the end of the text, and reference the letter in the text.

Response DM 5 – Round 1

BKS Environmental Associates, Inc., on behalf of RAMACO, requested concurrence and jurisdictional determination from the USACE on May 29, 2015. A copy of the letter sent to the USACE has been included as Attachment D10-F. Section D10-4, page D10-10 text has been updated to reflect submittal of USACE request.

Comment DM 5 – Round 2

No comment received.

Response DM 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 45 – Round 1

Appendix D10-Wetlands, Section D10.2 Results, 19. The text may want to state when (what date) RAMACO requested the jurisdictional determination from the USACE, and include this request letter as an Addendum to Appendix D10. This would provide documentation that the request was submitted, as receipt of the USACE determination may lag behind the LQD permitting process. (MDK)

Response MK 45 – Round 1

See response to DM5.

Comment MK 45 – Round 2

No comment received.

Response MK 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D11

Comment BJ 26 – Round 1

Appendix D11, Alluvial Valley Floor, Section D11.1, RAMACO has requested LQD to make a determination on the nature of the drainages as potential AVF within the permit boundary as well as within ½ mile of the permit boundary. This would then entail analysis of the following drainages (distances are approximations): • Hidden water Creek – all (4 mi.)

- East Fork Earley Creek – lower 1 mile
- Slater Creek – lower 3 miles
- Tongue River – ½ mi. east of Interstate 90 and 4 mi. west of Interstate 90 at the Acme exit.

Prior to such a declaration, LQD staff will have to perform a variety of assessments designed to assist us in making a declarative statement about AVF classification. An AVF declaration will be made after in-depth study of the drainages. Such investigation will consist of, but not be limited to:

1. Field evaluation of the geomorphic and lithologic character of the drainages in question;
2. Determination of the agricultural characteristics of the stream course;
3. Examination of available bore hole logs that can be used to characterize the subsurface materials beneath the valley floor;
4. Determination of groundwater and surface water characteristics, both quantitative and qualitative, within the drainages in question;
5. Other evaluation processes that may be deemed necessary should initial findings warrant further, in-depth analyses.

Response BJ 26 – Round 1

Revised D11 text throughout to expand discussion on the drainages mentioned above. Incorporated previous AVF studies into Appendix D11. Information satisfying each statement can be found in the following locations as well as many other locations throughout the document:

1. Borehole logs provided in Addendum D11-3. Hidden Water Creek test pits dug by Big Horn Mine and discussed in Section D11.3 “Stream Laid Deposits.”
2. Agricultural characteristics of the stream courses are discussed in Sections D11.4.2, D11.4.3, and D11.5, in particular.
3. Bore hole logs are provided in Addendum D11-3. Additional test pit and borehole information was analyzed from the Big Horn Mine Permit No. 213.
4. Groundwater and surface water characteristics are discussed extensively in Appendix D6. Potential impacts to surface water and groundwater are discussed in the Mine Plan. The water resources are generally discussed in Section D11.4.
5. Additional research has been incorporated from the Big Horn Mine Permit No. 213. Corrections and reevaluations of the AVF study have been made throughout Appendix D11.

Comment BJ 26 – Round 2

The response to the Round 1 comment is adequate. The original comment from round 1 was intended to create dialogue between Brook Mine Brook Mine and LQD:

- a) The first goal was to engender further discussion in the permit document covering baseline information regarding the nature of all potential AVFs within the permit boundary. The Round 1 Response effectively established a starting point for both LQD and Brook Mine.
- b) Now that there is a common foundation for all parties, field analysis and data studies can be initiated. This work needs to be scheduled.
- c) Brook Mine must provide written surface owner consent enabling LQD staff access to all acreages covered in the AVF determination analysis. This includes lands defined in Round 1, BJ comment 26, itemized stream lengths by stream name and distance.

Response BJ 26 – Round 2

A field analysis and data study of the potential AVFs within the permit boundary and adjacent areas was scheduled for September 24, 2015. RAMACO has provided LQD personnel with written surface owner consent enabling LQD staff to access acreages covered in the AVF determination analysis. No edits to the text were made in response to this comment.

Comment BJ 27 – Round 1

Appendix D11, Alluvial Valley Floor, Addendum D11-3, Some of the borehole and well logs indicate a damp or wet interval encountered during drilling. Was an attempt made to allow wet materials to produce water prior to continuation of the hole or was water noted after adding another drill steel and lowering the kelly to begin the next 20 feet of hole? Typically, after the steel has been added and the compressor is engaged, a small amount of water can be air-lifted before the rotary table begins to turn. If so, are there field notes indicating water was observed during the connection?

Response BJ 27 – Round 1

It is standard procedure during drilling operations to provide wet or damp intervals an opportunity to produce water. If the intervals had produced water, this would have been noted in the drilling logs provided in Addendum D11-3. There are no other separate field notes that would provide additional information. No changes to the text were made.

Comment BJ 27 – Round 2

No comment received.

Response BJ 27 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 1 – Round 1

Appendix D11-AVF, Section D11.1 Introduction, 1. In the second paragraph on Page D11-1, the possible impacts of the proposed mining operation on the Tongue River AVF are dismissed because the area is planned for facilities level disturbance only. However, the groundwater model (Mine Plan Addendum MP-3) predicts drawdown in the Tongue River alluvium, thereby possibly affecting the AVF. As discussed in subsequent comments, additional analysis and monitoring is needed to comply with LQD Coal Rules and Regulations regarding AVFs. (MDK)

Response MK 1 – Round 1

Revised text to reference Mine Plan Section MP.6 concerning the Brook Mine's effect on the Tongue River AVF.

Comment MK 1 – Round 2

Response not accepted. Mine Plan Section MP.6 does not explicitly mention or discuss the Tongue River AVF, or AVFs in general. Please provide a more thorough discussion in MP.6 on the possible effects of mining on the AVFs, particularly the Tongue River AVF with respect to drawdown in the Tongue River alluvium. Please also see the review of the response to Comment MK 21 below. (MDK)

Response MK 1 – Round 2

Discussion of the Tongue River and Goose Creek AVFs and their associated impacts has been added to the Mine Plan in Section MP.25. In addition, a reference to this section was added to Section D11.7 in Appendix D11 and Section MP.6 in the Mine Plan. As discussed in the text, no significant impacts to the alluvial valley floors within and adjacent to the permit area are expected as no mining is planned within these areas. Potential minor impacts that could occur is the insignificant loss of water due to temporary loss of flow from ephemeral tributaries contributing to the Tongue River and Slater Creek.

Comment MK 2 – Round 1

Appendix D11-AVF, Section D11.2 Purpose and Scope, 2. On Page D11-2, please change “Wyoming Reclamation Act” to “Wyoming Environmental Quality Act”. (MDK)

Response MK 2 – Round 1

Revised text to state “Wyoming Environmental Quality Act.”

Comment MK 2 – Round 2

No comment received.

Response MK 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 3 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 3. For identification of unconsolidated stream laid deposits, LQD Guideline No. 9 (AVF) lists two items that may be used to positively identify unconsolidated streamlaid deposits: (1) channel bars, splays, abandoned meanders, modern flood plains, or terraces, and (2) bedload or washload sediment deposited or transported in a nonbedrock channel bottom. Presumably, item (2) would be met at the streams identified within the AVF study area. However, the permit application does not address whether the channels contain geomorphic features from item (1). Please address in the text whether channel bars, splays, abandoned meanders, modern flood plains, or terraces are observed within the streams within the AVF study area. (MDK)

Response MK 3 – Round 1

Revised text to discuss the lack of channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs in the Hidden Water Creek, Slater Creek, East Fork Earley Creek, and Earley Creek valleys.

Comment MK 3 – Round 2

No comment received.

Response MK 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 4 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 4. On Page D11-5, the conclusion that the materials in Hidden Water Creek valley do not meet the definition of unconsolidated streamlaid deposits, is in conflict with the conclusion from the Big Horn Mine Permit. The Big Horn Mine Permit (Appendix D6, Pages D6-151 to D6-158) describes the evaluation of unconsolidated streamlaid deposits on lower Hidden Water Creek. The permit states: “The conclusion verified from the pit observations is that these deposits are unconsolidated and stream laid. Small isolated patches of colluvium or bedrock can be found throughout the alluvial deposits, but these characteristics do not exclude the deposit from being stream laid.” Please evaluate the data and findings from the Big Horn Mine Permit before a conclusion is drawn about the absence of unconsolidated streamlaid deposits on Hidden Water Creek. (MDK)

Response MK 4 – Round 1

Revised text to discuss the findings of the Big Horn Mine from test pits in the Hidden Water Creek valley. Additionally, Exhibit D11.3-1 was revised to show the locations of the Big Horn Mine test pits in Hidden Water Creek in relation to both the Brook Mine permit area and the Big Horn Mine permit area. Added the Big Horn Mine Permit State Decision Document (SDD) 213-T2 to Addendum D11-2.

Comment MK 4 – Round 2

No comment received.

Response MK 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 5 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 5. The Big Horn Mine Permit also describes subirrigation and flood irrigation studies on lower Hidden Water Creek and concludes: “Due to the lack of subirrigation and extremely low potential for flood irrigation, Hidden Water Creek is not an alluvial valley floor.” Although this is in the approved mine permit, it does not appear that an explicit AVF determination for Hidden Water Creek was ever issued by the LQD, and the AVF findings in the SDDs for the Big Horn Mine Permit do not mention Hidden Water Creek. The Brook Mine

Permit application should incorporate these previous AVF studies on Hidden Water Creek into Appendix D11. (MDK)

Response MK 5 – Round 1

See response to comment MK 4. Additionally, while the Big Horn Mine State Decision Documents do not mention Hidden Water Creek, the SDD 213-T2 states that “No other drainages are of significant size or lack the stream laid deposits necessary to be an Alluvial Valley floor within the renewal and/or amendment areas.” Hidden Water Creek is located within the renewal area and was not included within the originally declared AVF area. Although it was not mentioned by name, it has been declared not to be an AVF within the Big Horn Permit Area. This SDD has been added to Addendum D11-2 and discussion added to the text in Section D11.3.

Comment MK 5 – Round 2

No comment received.

Response MK 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 6 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 6. On Page D11-6 it is stated the three monitor wells were installed along the thalweg of Slater Creek. The transects in Exhibit D11.3-2 show that two of the wells (578513-AL and 578418-AL) are not along the thalweg but are rather upgradient of the channel. Please revise this description in the text. (MDK)

Response MK 6 – Round 1

Revised text to more accurately state that the monitor wells are along or near the thalweg.

Comment MK 6 – Round 2

No comment received.

Response MK 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 7 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 7. It appears that from Exhibit D11.1-1 that subirrigation is occurring on Earley Creek within the AVF study area. Please explain why subirrigation was not mapped on Earley Creek. (MDK)

Response MK 7 – Round 1

Revised Exhibit D11.1-1 to show potentially subirrigated lands on Earley Creek. The text was revised in Section D11.4.2 to reflect that subirrigation potentially occurs along Earley Creek.

Comment MK 7 – Round 2

No comment received.

Response MK 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 8 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 8. On Page D11-6, second paragraph, the alluvial/colluvial potentiometric surface is dismissed as a source of subirrigation along Slater Creek. However, the other hydrologic processes responsible for the subirrigation are not identified. Please discuss in the text why subirrigation is occurring along Slater Creek. (MDK)

Response MK 8 – Round 1

Revised text to discuss the presence of burn areas overlying residual coal ash bands that serve as aquacludes which prevent water from entering or escaping the coal below.

Comment MK 8 – Round 2

No comment received.

Response MK 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 9 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 9. The cross-sections in Exhibit D11-3-2 would be improved if the active channel and any floodplains or terraces were shown. A description of the materials in the active channel bottom would also help identify unconsolidated streamlaid deposits. (MDK)

Response MK 9 – Round 1

Revised Exhibit D11.3-2 to show the 2-year, 24-hour flood inundation area and the location of the active channel. Data regarding the materials in the active channel bottom are presented in the borehole logs in Addendum D11-3.

Comment MK 9 – Round 2

Response not accepted. The cross-sections were updated as requested but it is not clear if the materials from the borehole logs truly represent the active stream channel, as many of the borehole logs are shown to be tens to hundreds of feet away from the active channel. Please provide a description of the materials in the active channel bottom of both Hidden Water Creek and Slater Creek. (MDK)

Response MK 9 – Round 2

Borehole locations were chosen in areas that would represent the natural extent of the alluvium in the channel and those that could be accessed in order to obtain these boreholes. So while boreholes are located ten to a hundred feet off the natural channel in actuality, these areas are the closest location that could be physically accessed to obtain the boreholes due to the limitations of the drilling equipment. In addition, to ensure the boreholes were drilled in a location that was properly depicting the potential alluvial/colluvial material of the channel, the presence of scoria alluvial/colluvial material was used as an identifier. As exhibited in Addendum D11-3, scoria material was recorded in the majority of borehole logs. Text has been added to Section D11.3 regarding the selection of borehole locations.

Comment MK 10 – Round 1

Exhibit D11.4-1, the extent of irrigated lands shown in Sections 2 and 11 along Slater Creek may not be correct. According to the summary for the Hart Brothers Ditches water right (permit 1317) in the SEO database, the land being irrigated under the water right has decreased to 23 acres:

THIS FACILITY IS MADE UP OF TWO DITCHES. THE WEST DITCH HAVING A POINT OF DIVERSION IN LOT 2 AND THE EAST DITCH HAVING A POINT OF DIVERSION IN THE SENE OF SECTION 3, T57N, R85W. T57N, AND 58N, R85W HAS BEEN DEPENDENTLY RESURVEYED. REQUEST FROM PADLOCK RANCH TO ELIMINATE 67 ACRES AS FOLLOWS: 32 ACRES IN THE SWSW OF SECTION 2 - 30 ACRES IN THE NENW AND 5 ACRES IN THE NWNW OF SECTION 11 ALL IN T57N, R85W, RECEIVED AND GRANTED. REQUEST OF ELIMINATION AND PROOF OF OWNERSHIP FILED IN MISCELLANEOUS NOTICES. ADJUDICATED WITH H.H. WILLIAMS AS APPROPRIATOR. PERMIT RECORD REFLECTS SOURCE AS SLATER CREEK AND WATER STORED IN THE HART BROTHERS RESERVOIR, P60R, XR7825A, HOWEVER CERTIFICATE RECORD REFLECTS .91 CFS FOR THE IRRIGATION OF 64 ACRES. BOC PETITION II 89-4-2 BY PADLOCK RANCH WAS GRANTED TO ISSUE AMENDED CERTIFICATE C77/290A TO REDESCRIBE LANDS WITHOUT CHANGING LAND TOTALS AND TO CHANGE POINT OF DIVERSION FROM THE RECORD POINT IN THE NWNE AND SENE OF SECTION 3, 57N, R85W AND PARTIAL MEANS OF CONVEYANCE FOR 41 ACRES (.59 CFS) TO THE WILLIAMS DITCH, P8710D, C77/289A DIVERTING WATER FROM

SLATER CREEK IN THE SESW OF SECTION 34, T58N, R85W AS RECORDED IN ORDER RECORD BOOK 36, PAGES 385-390 AND RECEIVED ON CD3/578A. THIS LEAVES 23 ACRES STILL IRRIGATED UNDER THIS PERMIT. LANDS SHOWN BELOW AS "AME" AND "ELI" ARE THOSE ORIGINALLY DESCRIBED UNDER THIS DITCH.

Please clarify the irrigated acreage status for the Hart Brothers Ditches water right with the SEO and revise Exhibit D11.4-1 accordingly. (MDK)

Response MK 10 – Round 1

Exhibit D11.4-1 was revised to more accurately capture irrigated lands on Slater Creek in Sections 2 and 11 of Township 57 North, Range 85 West.

Comment MK 10 – Round 2

No comment received.

Response MK 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 11 – Round 1

Appendix D11-AVF, Section D11.4.4 Water Quality, 11. On Page D11-7, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

Response MK 11 – Round 1

Removed text referencing State of Montana water quality standards.

Comment MK 11 – Round 2

No comment received.

Response MK 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 12 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 12. On Page D11-8, second paragraph, it states that Exhibit D11.1-1 shows that sufficient water supply does not exist for consistent agricultural practices in East Fork Earley Creek. However, Exhibit D11.4.1 shows a point of diversion for Earley Creek Ditch No. 1 and several areas of irrigated lands less than 40 acres in East Fork Earley Creek. As documented in Addendum D11-4, there is an adjudicated water right for irrigation in this location. So there may be sufficient water supply for consistent agricultural

practices. The text needs to further expand on this discussion of East Fork Earley Creek since there is an adjudicated water right for irrigation. (MDK)

Response MK 12 – Round 1

Revised text to include the Earley Creek Ditch No. 1 water right, but explained that subirrigation must not be prevalent in East Fork Earley Creek because no culvert or other conveyance structure is present beneath I-90. If subirrigation was prevalent and without a conveyance structure beneath I-90, substantial amounts of water would back up against the interstate.

Comment MK 12 – Round 2

Response not accepted. Please also add to the text any history available on the Early Creek Ditch No. 1 water right and the irrigation associated with the water right. I looked at several years of aerial imagery and it does not appear that any areas have been irrigated under this water right in recent times. I am able to view what appears to be the headgate and two ditches. It is possible that irrigation was abandoned long ago, which would support the contention that there is not sufficient water supply for consistent agricultural practices. Nonetheless, the water right remains fully adjudicated according to the SEO water rights database, so more discussion of this area is warranted in the text. (MDK)

Response MK 12 – Round 2

Text at the end of the second paragraph of Section D11.5 was added regarding the Earley Creek Ditch No.1. As presented in the text, based on CIR, imagery of the area, vegetation studies and absence of a conveyance structure under Interstate 90, the Earley Creek Ditch No.1 doesn't appear to have been used for irrigation purposes for some time.

Comment MK 13 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 13. On Page D11-8, last paragraph, it states that the hay meadows along Slater Creek in Sections 2 and 11 are not within the boundaries of subirrigation or natural flood irrigation.

(a) The areas symbolized as irrigated lands in Exhibit D11.4-1 do not necessarily correspond to hay meadows, as the imagery shows hay meadows in the SWNE, SENE, and NESE of Section 11, and the NWSW of Section 12. The hay meadows appear to correspond with the area mapped as "AG" in the Vegetation Map (Exhibit D8.2-1) in Addendum D8.

(b) The irrigated area shown in Exhibit D11.4-1 near the Landen Ditch does overlap with subirrigation mapped in Exhibit D11.1-1.

Please re-evaluate the area of hay meadows along Slater Creek and revise the text accordingly. Comments No. 15 and 16 below also relate to this issue. (MDK)

Response MK 13 – Round 1

The text was revised in Section D11.5 to reflect the presence of limited hay meadows and overlapping of irrigation with subirrigation on the upper reaches of Slater Creek in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West. Exhibit D11.4-1 was revised to show irrigation in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West.

Comment MK 13 – Round 2

No comment received.

Response MK 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 14 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, On Page D11-8, last paragraph, it states that, besides Hart Bros Ditches, the remaining portion of the Slater Creek valley does not contain SEO water rights. This is not the case as Exhibit D11.4-1 shows Landen Ditch in the NENW of Section 11. This water right (P11695) does not appear in Addendum D11-4. Please revise the text and add this water right to Addendum D11-4. (MDK)

Response MK 14 – Round 1

The text was revised in Section D11.5 to discuss the Landen Ditch water right (P11695). A copy of the Landen Ditch water right was added to Addendum D11-4.

Comment MK 14 – Round 2

No comment received.

Response MK 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 15 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 15. The irrigated acreage for the Landen Ditch water right appears to be 18 acres for one point of use and 22 acres for a second point of use. Please add these areas to Exhibit D11.4-1. (MDK)

Response MK 15 – Round 1

Exhibit D11.4-1 was revised to more accurately reflect irrigated lands in the vicinity of the Landen Ditch.

Comment MK 15 – Round 2

No comment received.

Response MK 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 16 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 16. The Hall Ditch (SEO Permit 5195), mapped in Section 11 of Exhibit D11.4.1, apparently provides irrigation water for hayfields in the NESE of Section 11 (30 acres) and the NWSW of Section 12 (22 acres). This water right does not appear in Addendum D11-4. Please add this water right to the Addendum and add the irrigated acreages to Exhibit D11.4-1. (MDK)

Response MK 16 – Round 1

A copy of the Hall Ditch water right (SEO Permit 5195) was added to Addendum D11-4. Exhibit D11.4-1 was revised to depict irrigated lands in Section 12, Township 57 North, Range 85 West. The text in Section D11.5 was revised to discuss the Hall Ditch water right.

Comment MK 16 – Round 2

No comment received.

Response MK 16 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 17 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 17. Portions of Earley Creek and East Fork Earley Creek are within the AVF study area yet the permit application does not attempt to conclude if these streams contain AVFs. Presumably, the LQD will need to make an AVF finding on these streams. (MDK)

Response MK 17 – Round 1

See response to Comment BJ 26. Additional discussion has been added to aid WDEQ in the AVF findings of East Fork Earley Creek and Earley Creek. Both valleys are upstream of mining activities proposed by RAMACO such that no material damages are expected to either valley.

Comment MK 17 – Round 2

Response not accepted. Additional discussion was added for East Fork Earley Creek, but not Earley Creek. However, it is unclear from Comment BJ 26 if the LQD intends to make an AVF determination for Earley Creek. Additional response to this comment may be needed after checking with other LQD staff on whether or not a determination will be made for Earley Creek. (MDK)

Response MK 17 – Round 2

As discussed with LQD personnel, the majority of Earley Creek is outside of the permit area and ½ mile adjacent study boundary, however a small portion of the creek intersects the ½ mile study boundary in T.57N., R.84W. in the northwest quarter of Section 16 and southwest quarter of Section 9. These portions of land are outside of any planned surface disturbance and groundwater impacts to the area are not expected; therefore, a study of these lands was not included in Appendix D11. Discussion of Earley Creek will remain in Appendix D6. No changes to the D11 text were made in response to this comment.

Comment MK 18 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 18. The first bullet for Slater Creek on Page D11-9 dismisses the positive identification of unconsolidated stream laid deposits because a layer of colluvial material was found over alluvial material. However, as stated in Appendix D5 on Page D5-8 and Page D5-9, sub-rounding of the clinker present in the cuttings suggests water driven deposition of limited extent. Also, as discussed in Comment No. 3, the application did not evaluate unconsolidated streamlaid deposits in a manner that is consistent with identification criteria listed in LQD Guideline No. 9. The application has not provided sufficient evidence that unconsolidated stream laid deposits are not present along Slater Creek. (MDK)

Response MK 18 – Round 1

See response to Comment MK 3. The discussion on the Slater Creek valley has been further expanded to include the absence of unconsolidated stream laid deposits such as channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs. Exhibit D11.3-1 clearly indicates the presence of undifferentiated alluvium and colluvium (Qac) in the Slater Creek valley.

Comment MK 18 – Round 2

No comment received.

Response MK 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 19 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 19. The third bullet on Page D11-9 for Slater Creek should be clarified that the width of natural flood irrigation in the valley is generally insufficient to provide for economic agricultural practices. However, economic agricultural practices clearly occur immediately upstream of the proposed mine permit boundary because of artificial flood irrigation of hayfields adjacent to the channel. These practices are documented by existing water rights that are approximately 100 years old. Please revise this discussion. (MDK)

Response MK 19 – Round 1

The text in Section D11.6 of Slater Creek's third bullet was revised to include the irrigated hayfield upstream of the permit boundary.

Comment MK 19 – Round 2

No comment received.

Response MK 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 20 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 20. The fifth bullet for Hidden Water Creek on Page D11-9 seems to dismiss the positive identification of unconsolidated stream laid deposits because of colluvial material with shallow bedrock. However, as previously noted, this conflict with information in the Big Horn Mine permit concerning unconsolidated stream laid deposits on Hidden Water Creek. (MDK)

Response MK 20 – Round 1

Refer to response of Comment MK 4. The Big Horn Mine permit boundary has been added to Exhibit D11.1-1. The text in Section D11.6 has been updated to include a summary of the discussion stating that the Big Horn Coal Permit No. 213-T2 SDD determined the limits of the AVF, and no portion of Hidden Water Creek was determined as being AVF.

Comment MK 20 – Round 2

No comment received.

Response MK 20 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 21 – Round 1

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, Although the LQD has not yet issued its formal finding, the segment of the Tongue River adjacent to the proposed permit area, which was not declared under previous LQD findings, likely contains an AVF.

(a) If this AVF is significant to farming, the applicant must comply with LQD Coal Rules and Regulations Chapter 3, Section 2(d)(ii) and demonstrate that the proposed mining operations will not materially damage the quantity and quality of water that supplies the Tongue River AVF. The absence of direct mining on the Tongue River AVF does not relieve the requirement of assessing the probable hydrologic impacts of the proposed operation to the AVF, particularly since the groundwater model in Mine Plan Addendum MP-3 predicts drawdown in the Tongue River alluvium. (MDK)

(b) Regardless of the significance to farming, the applicant must also maintain and/or restore the essential hydrologic functions of the Tongue River AVF. The applicant must therefore identify the essential hydrologic functions of the Tongue River AVF and either (1) provide an analysis that the proposed operation will not hamper the essential hydrologic functions, or (2) demonstrate that the essential hydrologic functions will be restored. The essential hydrologic functions for another part of the Tongue River AVF are described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27), so this may be a good starting point to consider. (MDK)

(c) A monitoring system is also required to demonstrate the essential hydrologic functions are maintained, as per LQD Coal Rules and Regulations, Chapter 5, Section 3(b)(ii). Since the groundwater model (Mine Plan Addendum MP-3) predicts 2.5 feet of drawdown in the Tongue River alluvium, the monitoring system may likely contain alluvial monitoring wells and periodic evaluation of color-infrared imagery. (MDK)

Response MK 21 – Round 1

Revised text as requested. Revised text by adding information regarding the essential hydrologic functions of the declared AVFs (Tongue River and Goose Creek) from the SDD in Addendum D11-2. Also, added portion of text to describe possible monitoring system and plan for the AVFs that may be affected.

Comment MK 21 – Round 2

Response not accepted. Please see the review of the response to Comment MK 1. Please provide a more specific reference to the section of the Mine Plan (MP.6) that discusses the probable hydrologic impacts to the Tongue River and Goose Creek AVFs.

Please also provide a more specific reference to the appropriate portion of the Mine Plan or Reclamation Plan that provides further details on the AVF monitoring plan. (MDK)

Response MK 21 – Round 2

See comment MK 1-Round 2 response. Discussion of the AVF monitoring plan for the Tongue River has been added to the Mine Plan in Section MP.25 as well as the Reclamation Plan in Section RP.10. In addition, monitoring locations have been updated on Table MP.7-4, Exhibit MP.7-1 and Exhibit RP.8-5.

Comment MK 22 – Round 1

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, 22. The essential hydrologic functions of the adjacent Goose Creek AVF must also be maintained during the proposed mining operation. The application needs to list these functions, as described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27). A monitoring system is also required to demonstrate that the essential hydrologic functions will be maintained. (MDK).

Response MK 22 – Round 1

See response to comment MK 21.

Comment MK 22 – Round 2

Response not accepted. The essential hydrologic functions of the Goose Creek AVF are listed, but the text does not explicitly address a monitoring system for the Goose Creek AVF, only the Tongue River AVF. Please commit to a similar monitoring system for the Goose Creek AVF to demonstrate that the essential hydrologic functions will be maintained. The text should also reference the appropriate portion of the Mine Plan or Reclamation Plan that provides further details on the AVF monitoring plan. (MDK)

Response MK 22 – Round 2

See comment MK 1-Round 2 response. Discussion of the AVF monitoring plan for Goose Creek has been added to the Mine Plan in Section MP.25 as well as the Reclamation Plan in Section RP.10. In addition, monitoring locations have been updated on Table MP.7-4, Exhibit MP.7-1 and Exhibit RP.8-5.

Comment MK 104 – Round 2 (New Comment)

The permit application suggests that the Tongue River and Goose Creek contain AVFs. Appendix D-11 must therefore also include a discussion of the importance of these AVFs to farming, as discussed in LQD Guideline No. 9 (see Part IV, Section C). (MDK)

Response MK 104 – Round 2 (New Comment)

Text in Section D11.5 has been revised to discuss the importance of AVFs to farming.

Comment MK 105 – Round 2 (New Comment)

Appendix D-11 (or perhaps Mine Plan MP.6) should also include a discussion of whether the proposed operation would interrupt, discontinue, or preclude agriculture use of the Tongue River and Goose Creek AVFs. This discussion should evaluate if the predicted drawdown in the Tongue River alluvium (Mine Plan Addendum MP-3) would result in any loss of agricultural use of the AVF. (MDK)

Response MK 105 – Round 2 (New Comment)

Text has been added to Mine Plan Section MP.25 to describe how agricultural use of the Tongue River and Goose Creek AVFs will not be precluded.

Mine Plan

Comment BJ 28 – Round 1

Volume 11, Mine Plan, Section MP.1.2.1, pg. MP-4, Tunnel and pillar widths are discussed in general terms. Please approximate a range for the widths, in feet, in the narrative to give context to the discussion.

Response BJ 28 – Round 1

Added text as suggested.

Comment BJ 28 – Round 2

No comment received.

Response BJ 28 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 29 – Round 1

Volume 11, Mine Plan, The fifth sentence, beginning with "To minimize the amount of exposure..." does not make sense. Please rewrite the sentence for clarity.

Response BJ 29 – Round 1

Added text as suggested.

Comment BJ 29 – Round 2

No comment received.

Response BJ 29 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 30 – Round 1

Volume 11, Mine Plan, The narrative also references figure MP.1-3 as a general schematic of the highwall mining operation. The figure depicts significant vertical highwalls above the mining operation. The text mentions that the highwalls will be vertical where the Masters and Carney converge but the illustration depicts conditions where the coal seams appear to be separated by a considerable thickness of parting. It is our experience that vertical highwalls in the Powder River Basin are unstable and should be discourage wherever possible. What would the maximum thickness of burden approximate where the vertical highwalls will exist? Please include an average on the schematic as has been done for pit width and bench width.

Response BJ 30 – Round 1

The figure has been updated to include the average depths.

Comment BJ 30 – Round 2

No comment received.

Response BJ 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 31 – Round 1

Volume 11, Mine Plan, Pages MP-3 and MP-4, These pages describe the highwall mining operation in vague generalities. The narrative states that the continuous miner will advance into the working face to a depth of 2,000 feet. The manufacturer's specifications for the ADDCAR system state that the depth of a cut is 1,600 feet. Is this a discrepancy of 400 feet or is there a difference in mining tools and the ADDCAR system comes with multiple depth capacities. Please clarify.

Response BJ 31 – Round 1

Conversations with ADDCAR representatives indicates that they will be able to extend the range of the highwall mining system so cuts up to 2,000 feet can be achieved.

Comment BJ 31 – Round 2

No comment received.

Response BJ 31 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 32 – Round 1

Volume 11, Mine Plan, A general word of guidance – Ramps are mentioned in the narrative as designed to an 8% grade. The Cat 777 can generally handle this grade

fairly well under most conditions. The Mack Titan trucks, however, may be problematic under certain conditions. Entering the pit on the ramp could be difficult for the Mack trucks with pups if the ramp has been watered to control dust. The overburden materials used for ramp systems are generally silty with a clay matrix and overwatering can create slipping hazards for vehicles. A truck with multiple trailers will have difficulty navigating these conditions. A 6% ramp under these situations is strongly advised.

Response BJ 32 – Round 1

Revised text as suggested.

Comment BJ 32 – Round 2

No comment received.

Response BJ 32 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 33 – Round 1

Volume 11, Mine Plan, The narrative describes the tunnel width as variable, depending on the cutting head chosen. Please indicate approximate footages of the tunnel widths. For example, Bucyrus and Joy manufacture continuous miners that have heads ranging from 11 to 12 feet in width. A mention of those widths would clarify the narrative. Also the protective coal pillars are described but have no dimensions indicated. The pillar width to tunnel width is crucial so an approximation of the remnant pillars width in feet is required. Please include approximate widths for tunnel and pillar widths.

Response BJ 33 – Round 1

See response to Comment BJ 28. The text has been updated as requested.

Comment BJ 33 – Round 2

No comment received.

Response BJ 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 34 – Round 1

Volume 11, Mine Plan, Section MP.1.2.2, The dozer push method of overburden removal is not adequately described. Though Figure MP.1-4 does depict the dozer push materials to some extent, the overlapping nature of the multiple lift system can be confusing to some. The narrative on page MP-4 is too brief. Please elaborate

further on the dozer push staging and overburden removal. Perhaps an illustration that depicts the dozer removal in stages would be more appropriate. This can be accomplished by creating a series of illustrations rather than only one. Please clarify the methodology.

Response BJ 34 – Round 1

Revised text as requested. Created Figure MP.1-5.

Comment BJ 34 – Round 2

No comment received.

Response BJ 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 35 – Round 1

Volume 11, Mine Plan, Section MP.1.4, Pg. MP-5, The last sentence does not make sense. Please rewrite the sentence.

Response BJ 35 – Round 1

Removed last sentence for clarity.

Comment BJ 35 – Round 2

No comment received.

Response BJ 35 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 36 – Round 1

Volume 11, Mine Plan, Section MP.4.2.3, Pg. MP-15, The discussion of temporary topsoil stockpiles describes creating a ring ditch around the topsoil pile if there is a potential for water erosion during the 2 week to 6 month life of the pile. Since the climate is unpredictable and subject to rapid changes, temporary topsoil stockpiles (2 weeks to 6 months) will be required to have ring ditches in all cases with no qualifiers. LQD writes more violations concerning inadequate topsoil practices than any other issue. Rewrite the narrative to indicate that all temporary topsoil stockpiles will have a ring-ditch and berm created for piles having a life of 2 weeks or more. Keep in mind that even a short-lived topsoil stockpile could generate a violation if a sudden rainstorm were to erode the soil and waste it on the surrounding terrain. RAMACO may want to allow for this as well

Response BJ 36 – Round 1

Updated text as requested.

Comment BJ 36 – Round 2

No comment received.

Response BJ 36 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 37 – Round 1

Volume 11, Mine Plan, Section MP.4.3.4, Pg. Mp-17, A swell factor of 16% is being used to convert bank cubic yards to loose cubic yards. The number was generated from information attained from Big Horn Coal (PT213). Where was this information located? Many of the coal mines in the northwestern corner of the Powder River Basin use a swell factor of 13% - 14% since the overburden material is finer grained, with a higher clay content than mines on the eastern margin of the basin. Please cite the use of a 16% swell factor.

Response BJ 37 – Round 1

Revised text as requested. Table MP.4-9 provides typical swell and load factors of materials.

Comment BJ 37 – Round 2

No comment received.

Response BJ 37 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 38 – Round 1

Volume 11, Mine Plan, Section MP.6.1, Pg. MP-39, The second paragraph discusses surface runoff attenuation during mine years 4 and 5. The peak flow rates for precipitation events will be attenuated by the mining trenches that lie perpendicular to the flow in the local drainages. What flow events are expected to be attenuated by the trenches? Will the 2 year, 10 year, or 100 year events be considered as an average event? Please modify the narrative, in general terms, to define which precipitation event will be used when designing the pit drainage plans.

Response BJ 38 – Round 1

Updated text as requested.

Comment BJ 38 – Round 2

No comment received.

Response BJ 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 39 – Round 1

Volume 11, Mine Plan, Section MP.8, Pg. MP-47, The narrative mentions that potable water will be hauled to the mine and placed in a cistern. Why is a cistern system being considered for potable water instead of a reverse osmosis unit? The local residents use such systems as do the mines. How large of a cistern will be used for water storage? Please modify the narrative to expand on the rationale behind using a cistern.

Response BJ 39 – Round 1

The text has been revised. The final potable water system has not been determined.

Comment BJ 39 – Round 2

No comment received.

Response BJ 39 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 40 – Round 1

Volume 11, Mine Plan, Section MP.9.9, Pg. MP-52, When pre-dug mud pits are to be used for exploration drilling, the topsoil must be protected from contamination by removal and stockpiling. The pit location must be stripped to the base of the soil with an areal extent that allows the pit materials to be stacked as spoil without encroaching on native surface. Reclamation shall occur in a manner that will best restore the surface to its pre-disturbance condition. These contingencies need to be better described in the narrative. Please modify the text to reflect the aforementioned conditions.

Response BJ 40 – Round 1

Revised text as suggested.

Comment BJ 40 – Round 2

No comment received.

Response BJ 40 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 41 – Round 1

Volume 11, Mine Plan, Section MP.18, Pg. MP-68, The second paragraph discusses the speed limits that will be set on haulroads to protect wildlife. Approximately what speed limits will be used?

Response BJ 41 – Round 1

Updated text with a 45 MPH Speed Limit.

Comment BJ 41 – Round 2

No comment received.

Response BJ 41 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 42 – Round 1

Volume 11, Mine Plan, Section MP.20, Pg. MP-69, The brief description of underground mining should state that no "conventional" underground mining will occur. Highwall coal recovery is an underground mining technique, but no personnel work underground. Thus the mining is modified underground mining.

Response BJ 42 – Round 1

Revised text as requested.

Comment BJ 42 – Round 2

No comment received.

Response BJ 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 43 – Round 1

Volume 11, Mine Plan, Section MP.24, Pg. MP-70, The word "Operation" is misspelled in the title (OPERTATION).

Response BJ 43 – Round 1

Revised text as requested.

Comment BJ 43 – Round 2

No comment received.

Response BJ 43 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 44 – Round 1

Volume 11, Mine Plan, Section MP.25, Pg. MP-71, The second paragraph, third sentence, discusses requiring additional permitting. The word "additional" is misspelled (additdional).

Response BJ 44 – Round 1

Revised text as requested.

Comment BJ 44 – Round 2

No comment received.

Response BJ 44 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 45 – Round 1

Volume 11, Mine Plan, TABLE MP.1-1, The total disturbance should read 895 acres, not 775. Please correct the table.

Response BJ 45 – Round 1

Revised text as requested.

Comment BJ 45 – Round 2

No comment received.

Response BJ 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 46 – Round 1

Volume 11, Mine Plan, FIGURE MP.1-3, The average width of the pit floor and safety bench have average widths indicated on the drawing. Please insert the average heights of the vertical highwalls in these situations.

Response BJ 46 – Round 1

Revised Figure MP.1-3 requested.

Comment BJ 46 – Round 2

No comment received.

Response BJ 46 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 47 – Round 1

Volume 11, Mine Plan, FIGURE MP.1-4, The cross section, as drawn, is confusing. It would appear that dozer pushed, loose material significantly exceeds the bank material available in the highwall. The figure is not drawn to scale but a more accurate attempt to represent dirt volumes would be appreciated. Also, the cross section itself does not make sense in the way that operational steps are illustrated. A series of cross sections over time would be much more beneficial to define the appearance of the dozer push. Please modify the figure accordingly. A sample of an idealized schematic is attached. It is volumetrically accurate.

Response BJ 47 – Round 1

Figure MP.1-4 has been updated to add clarity.

Comment BJ 47 – Round 2

No comment received.

Response BJ 47 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 48 – Round 1

Volume 11, Mine Plan, FIGURE MP.4-3, Pg. MP-F7, What is the narrow, vertical rectangle located in the center of the coal stockpile coming from the stacker?

Response BJ 48 – Round 1

The figure MP.4-3 has been updated to remove the rectangle.

Comment BJ 48 – Round 2

No comment received.

Response BJ 48 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 49 – Round 1

Volume 11, Mine Plan, Addendum MP-3, Pg. MP-3-2, The introductory paragraph states that the Brook Mine is approximately 6 miles northwest of Sheridan, Wyoming. However, in earlier narrative, the mine is said to be 6 miles south of the Montana border and 8 miles northwest of Sheridan. This passage is found in the Land Use

Appendix D1-1. The distances should be uniform in all instances throughout the narrative.

Response BJ 49 – Round 1

Revised text as requested.

Comment BJ 49 – Round 2

No comment received.

Response BJ 49 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 50 – Round 1

Volume 11, Mine Plan, Addendum MP-3, Section 2.3, Figures 2.3-1 and 2.3-2 show the potentiometric surfaces for the Carney and Masters coal beds. The contours daylight and appear to be in mid-air over the Slater Creek drainage. Please adjust the contours so they terminate at the outcrop.

Response BJ 50 – Round 1

Revised Figures 2.3-1 and 2.3-2 in Addendum MP-3-17 as requested.

Comment BJ 50 – Round 2

No comment received.

Response BJ 50 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 51 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-3, The second to last paragraph indicates that the depth of the penetration by the continuous miner will be 2,000 feet. Is this an approximation since the listed depth for the ADDCAR device is 1,600 feet. Please clarify the discrepancy.

Response BJ 51 – Round 1

Based on communication with ADDCAR's representative 2,000 ft penetration is achievable. Generally, users of the ADDCAR system encounter increasing depth of cover with greater penetrations requiring wider web pillar between holes. The loss in recovery due to the wider pillars potentially negates any production gain from increased penetration.

Comment BJ 51 – Round 2

No comment received.

Response BJ 51 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 52 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-4, The discussion in this sections centers around the necessity of maintaining a straight, even cutting depth to prevent pillars from being cut too narrow to hold up the roof material and allow subsidence. The 1:1 ratio suggested by NIOSH is acceptable as long as roof strength tests bear up (no pun intended) the use of the general guidelines. A small sample of tests have been run on roof and coal rock intervals and those tests have been reported. LQD requests a narrative placed either in this location of the text or other location of RAMACO's choosing that discusses the strength tests results as it pertains to roof stability. Also, a commitment must be made in the document to sample roof material for strength testing for at least one location in every panel that will mined by the continuous miner prior to mining. Our concern rests with the competence of the overlying lithologies and their possibility for subsidence. This has been a problem in this area for decades and care must applied to characterize roof materials accurately.

A sampling plan to test compressive strength above each coal panel must be submitted prior to permit approval.

Response BJ 52 – Round 1

RAMACO must submit and have an approved MSHA Ground Control Plan that contains the strength test and commitments requested. RAMACO will provide this information when it is received and include it in the Subsidence Control Plan.

Comment BJ 52 – Round 2

No comment received.

Response BJ 52 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 53 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Please provide the data used as input for the ARMPS-HWM program.

Response BJ 53 – Round 1

The following input values were used in the ARMPS-HWM program: compressive strength of coal - 660 psi, rock density - 162 lbs/ft³, abutment angle of 21°

Comment BJ 53 – Round 2

No comment received.

Response BJ 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 54 – Round 1

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-2, The scale of the photograph is too large to adequately depict the zones of surface subsidence from the old underground mines. Please blowup the scale to allow for clear visibility of the subsidence.

Response BJ 54 – Round 1

Cardno selected the larger scale to show that subsidence was limited to a small portion of the deep mine and not visible over other areas of the deep mine due its increased depth of cover. See revised figure in revision to Cardno's Subsidence Report

Comment BJ 54 – Round 2

No comment received.

Response BJ 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 55 – Round 1

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-3, This figure is very effective. It clearly shows the subsidence evident on the air photo as it correlates to the old underground map superimposed on it. One problem, though, is that the air photo base needs to be darker, with greater contrast. The photo is a bit washed out and manipulation of the brightness/contrast aspects of the photo would help its visibility greatly. Please recalibrate the photo tonality.

Response BJ 55 – Round 1

See revised figure in revision to Cardno's Subsidence Report

Comment BJ 55 – Round 2

No comment received.

Response BJ 55 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 56 – Round 1

Volume 11, Mine Plan, Addendum MP-8, Section MP-8.5.4, The last sentence in this section indicates that there is no suitable habitat available for the Northern Long-Eared Bat. Does this include the climax Cottonwood Forest along Tongue River? The well developed understory along the river is suitable for Long-eared bat habitation though none have been located in this area. Or does the negation of the existence of the bat only apply to the area in the hills above the river where the mining will occur. Please clarify the area that was considered for potential Long-Eared Bat occurrence.

Response BJ 56 – Round 1

The text was revised to clarify.

Comment BJ 56 – Round 2

No comment received.

Response BJ 56 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 64 – Round 1

EXHIBITS, Mine Plan, Exhibit MP.1-1, The patterns used to depict surface disturbance from year to year are too similar. It is difficult to differentiate between year 0 and year 2, for example. Please recreate the surface disturbance layers to be more unique. The overburden removal sequence map (Exhibit MP.4-4) is a good example.

Response BJ 64 – Round 1

Revised Exhibit MP.1-1 as requested.

Comment BJ 64 – Round 2

No comment received.

Response BJ 64 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 67 – Round 2 (New Comment)

Mine Plan, Table MP.4-5., Overburden Stockpile Design –

The Estimated Capacity volumetrics for the Overburden stockpiles appear to be low. Based on a recalculation of the volumes given the acreage and average heights, each stockpile has a higher volume of capacity than which is shown in the table. A recalculated table would look like this:

Table MP.4-5. Overburden Stockpile Design

Stockpile Designation	Estimated Capacity <u>E</u> (cy)	Approximate Basal Area <u>A</u> (ac)	Average Height <u>H</u> (ft)	Calculated Capacity <u>C</u> (cy) ¹	Difference ²
OB-1	300,000	4.7	55	417,047	117,047
OB-2	500,000	9.4	55	834,093	334,093
OB-3	950,000	13.4	95	1,189,027	239,027

¹Calculated Capacity C = ((A*43560)*H)/27

²Difference = C-E

Based on the Recreated Table, Volumes derived from acreage and average height formulas give values that are approximately 35% too low. Please reevaluate the table in light of the mathematical calculations. Or, if there are extenuating circumstances that help create the overburden volumes in column B, please explain the seeming inconsistency.

Response BJ 67 – Round 2 (New Comment)

The capacities of the overburden stockpiles calculated by WDEQ do not account for the sideslopes of the overburden stockpiles. The calculations are appropriate for rectangular prisms with a uniform rectangular cross section. This explains why the calculations area significantly higher. The reported volumes by RAMACO are outputs from AutoCAD which uses 3D surfaces to construct stockpiles and calculate volumes. AutoCAD also takes into account the variation in a topographical surface that the stockpiles are placed on, which can affect the extent of the basal area and the average height. The volumes of the stockpiles were also rounded up to be conservative in the reported volumes. The average height is only a rough approximation because the height will change considerably depending upon the topographic surface beneath each

pile. No changes have been made to the volumes of overburden. However, Table MP.4-5 has been revised to indicate sideslope angles and that the volumes have been computed using AutoCAD.

Comment DM 6 – Round 1

Mine Plan, MP.3.1.3 – A primary haul road appears to cross the Tongue River using the bridge that is currently in place from previous mine usage. Please discuss any updates needed for that bridge to be adequate for the intended usage.

Response DM 6 – Round 1

The revised primary haul road alignments do not cross this bridge and the use of this bridge for haul trucks and other traffic associated with the mine is not planned. Updated Exhibit MP.3-1.

Comment DM 6 – Round 2

No comment received.

Response DM 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 7 – Round 1

Mine Plan, Exhibit MP4-3 shows Overburden Stockpiles OB-12 and OB-13, and Topsoil Stockpile TS-6 being located directly in the Slater Creek channel, without any mention of redirecting Slater Creek, or otherwise preventing the hydrologic consequences of damming up the creek with Overburden and Topsoil stockpiles. Please correct.

Response DM 7 – Round 1

Revised Exhibit MP.4-3 as requested with OB-12 and 13 as well as TS-6 moved out of Slater Creek channel.

Comment DM 7 – Round 2

No comment received.

Response DM 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 8 – Round 1

Mine Plan, MP.7 – Because of the proximity of the planned facilities primarily in T57, R84 Sec.15 to the Tongue River and Goose Creek, I would like to see surface water monitoring upstream of these facilities on Goose Creek and Tongue River, and

downstream of these facilities on Tongue River. Please discuss the feasibility of fulfilling this request, with reasoning.

Response DM 8 – Round 1

Revised text as requested. Revise Exhibit MP.7-1 with USGS stream gage location that is within the viewing area.

Comment DM 8 – Round 2

No comment received.

Response DM 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 11 – Round 1

Mine Plan, 11) Depending upon the outcome of required overburden sampling, commitment for special handling of unsuitable overburden will be required to assure that placement of unsuitable materials so as not to hinder plant growth or to adversely affect surface or groundwater quality will be required in the Mine Plan.

Response DS 11 – Round 1

See section MP.4.6.1, fourth paragraph.

Comment DS 11 – Round 2

Response is not adequate. Section MP.4.1.6 does not discuss placement of unsuitable materials above groundwater sources which will undoubtedly be encountered in early mining progressions at this mine. Unsuitable materials taken from above the groundwater level cannot be placed within the groundwater zone. Please address this and describe how the mine plan pit sequence of removal and backfill will be altered to accommodate placement of suitable materials near the surface or in the aquifer zone during mining. This may require stockpiling of materials to assure the best quality materials will be used.

Response DS 11 – Round 2

The majority of the permit area is dry. Therefore, most backfill materials will not be placed in an aquifer. Additionally, it is generally accepted that if unsuitable materials are placed below the water table, there will not be cause for concern. If unsuitable materials are placed below the water table, they will not have the opportunity to oxidize. If unsuitable materials are above the water table, they may oxidize, but they won't be transported by groundwater flow. The only zone that could potentially cause concern is the limited area where the potentiometric surface fluctuates. In this way, unsuitable materials can be oxidized and transported by groundwater flow. Due to the overburden and coal seams being primarily dry and the majority of mining activities

occurring above the potentiometric surface, placement of unsuitable materials within an aquifer is not anticipated to be a concern.

Comment DS 12 – Round 1

Mine Plan, 12) Does RAMACO provide a better detailed description of the topsoil salvage and handling process than that discussed in section MP.4.2.1? The description provided is not detailed so as to provide a description of the equipment used, the methods for assuring adequate soil salvage, or whether topsoil and subsoil salvage will follow the recommendations in Appendix D7 for stockpiling topsoil separate from subsoil. (Map Unit A Cambira Loam, Map Unit B Zigweid Loam, Map Unit C Forkwood Loam, Map Unit G Bauxson Loam, Map Unit H Haverdad Loam, Map Unit U Ulm Clay Loam) Please understand that topsoil and subsoil may only be mixed if both meet Guideline 1 suitability criteria. Please include more detail for topsoil salvage and handling or let the LQD know where the information may be accessed.

Response DS 12 – Round 1

Revised text as requested.

Comment DS 12 – Round 2

Response is not adequate. Details of your topsoil salvage operation have not been adequately provided in the Mine Plan. Please provide the requested details of the topsoil salvage operation as stated above.

Response DS 12 – Round 2

The text in Section MP.4.2.1 has been supplemented to describe the topsoil salvage operation in more detail. The text now states that RAMACO will likely salvage topsoil with dozers, loaders, and trucks based on the current plan for equipment purchase. However, planning is still in its infancy and different, though typical, topsoil salvage equipment could be used. Methods to assure accurate salvage were already outlined in Section MP.4.2.1 in the three bulleted steps provided by WDEQ/LQD Guideline 1. However, these were supplemented with examples. Drilling or test pits ahead of salvage will ensure proper topsoil removal. Equipment operators and qualified personnel will be trained to recognize the difference in soil profiles. Additionally, Section MP.4.2.1 now states that RAMACO will generally follow the recommendations of Appendix D7 for the separation of topsoil and subsoil to ensure that unsuitable subsoil will not be mixed with topsoil. However, RAMACO reserves the right to mix topsoil and subsoil, if subsoil is suitable as a plant-growth medium, according to WDEQ/LQD R&R Chapter 4, Section 2(c). For example, Map Unit A, Map Unit B, Map Unit C, Map Unit H, and Map Unit U are all suitable across the entire profile (topsoil and subsoil) and are not required by rules and regulations to be separated. Therefore, RAMACO will not have separate stockpiles for subsoil. If subsoil is suitable, it will be salvaged. If subsoil is not suitable, it will not be salvaged. Any suitable subsoil that is salvaged will be mixed into topsoil stockpiles.

Comment DS 13 – Round 1

Mine Plan, 13) Section MP.4.2.3 all topsoil stockpiles, even those stockpiled temporarily or windrowed at the edge of a disturbance, must be identified by a topsoil sign from initiation of the salvage operation as required under Chapter 4, Section (c)(D) that states that signs must be in place at the time stockpiling is begun. Therefore, the text in the first paragraph of this section stating that signs will not be required must be corrected. Signs will always be required to identify all salvaged topsoil and must be placed on all approaches to the topsoil and no more than 150 feet from the stockpile location.

- a. Additionally, all stockpiled topsoil, even windrowed along the edge of a disturbance, must be protected against wind and runoff erosion, compaction or potentially toxic materials no matter what the longevity designation of the stockpiled material. The Mine Plan must provide a commitment to these requirements.

Response DS 13 – Round 1

Revised text as requested.

Comment DS 13 – Round 2

No comment received.

Response DS 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 14 – Round 1

Mine Plan, 14) Section MP.4.2.4(4.2.1?) does not discuss topsoil salvage during winter months. Salvage during the winter months, especially of shallow soil profiles, is discouraged by the LQD due to a lack of depth control caused by varying depths of permafrost. Please provide discussion concerning this subject.

- a. Even short term and temporary topsoil stockpiles must be identified on maps and the volumes accounted for in annual reports. Several criteria that must be considered are well established for placement of topsoil stockpiles and include:
 - i. Construction of stable areas to minimize wind and water erosion
 - ii. Stockpiles will not be placed in areas where runoff water can contribute to the loss of topsoil (side hills or drainages)
 - iii. Stockpiles will not be constructed on unsuitable backfill locations
 - iv. Stockpiles will have associated sediment control established in advance of construction

- v. Stockpiles will not be constructed at locations of known cultural or wildlife resources for which protection or mitigation is required.
- b. Other topsoil stockpile construction and maintenance considerations include:
 - i. Stockpiles will be constructed with slopes of 3h:1v or less
 - ii. Bypass ditches, berms or equivalent may be used to divert runoff around stockpiles
 - iii. Stockpiles that will remain for less than 1 year may be revegetated or treated with surface roughing methods such as ripping or discing to reduce runoff and wind erosion potential.

Response DS 14 – Round 1

Revised text as requested.

Comment DS 14 – Round 2

Section MP.4.2.1 does not discuss topsoil salvage during winter months. Salvage during the winter months, especially of shallow soil profiles, is discouraged by the LQD due to a lack of depth control caused by varying depths of permafrost. Please provide discussion concerning this subject.

a. Even short term and temporary topsoil stockpiles must be identified on maps and the volumes accounted for in annual reports. Several criteria that must be considered are well established for placement of topsoil stockpiles and include:

- iii. Stockpiles will not be constructed on unsuitable backfill locations
- v. Stockpiles will not be constructed at locations of known cultural or wildlife resources for which protection or mitigation is required.

Responses to the above items were not adequate. Please provide the required permit commitments.

Response DS 14 – Round 2

A statement to Section MP.4.2.1 has been added that states RAMACO will not salvage topsoil if high antecedent moisture conditions have led to deep frost cementing topsoil to overburden. Additionally, the statement has been made that RAMACO will salvage topsoil ahead of planned winter mining activities to avoid complications with deep frost.

All currently planned topsoil stockpiles have been identified on Exhibit MP.4-3. A statement has been added to Section MP.4.2.3 in the first paragraph that any accumulations of topsoil that meet the definition of a stockpile will be mapped with

volumes accounted for in the Annual Report. Another statement has been added to the first paragraph of Section MP.4.2.3 that topsoil stockpiles will not be constructed on unsuitable backfill or known locations of cultural or wildlife significance that require protection and mitigation.

Comment DS 15 – Round 1

Mine Plan, 15) Section MP.4.2.7, page MP 4-5. Aside from operation of soil salvage equipment with the potential for soil contamination due to blown hydraulic hoses or small fuel leaks, the LQD expects not contamination of soil during the mining operation. Contamination of subsoil and overburden is more likely. The LQD recommends that RAMACO re-phrase the section header and text to show petroleum contaminated materials being and not soils.

- a. What criteria will RAMACO use to determine if spills require reporting to the DEQ, and what process will be used in spill reporting?
- b. What will the operational procedure be for management of the proposed on-site landfarm for contaminated materials, and where will it be located? Will it be identified on the ground by a sign?

Response DS 15 – Round 1

Revised text as requested.

- a. See Section MP-4.5.2 of Addendum MP-4
- b. See Section MP-4.5.3 of Addendum MP-4

Comment DS 15 – Round 2

No comment received.

Response DS 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 16 – Round 1

Mine Plan, Section MP.4.2.8. Please provide a detailed description for the disposal of empty drums, not just a citation of the EPA Rule which is probably not know by most readers of this public document.

Response DS 16 – Round 1

The EPA Code Federal Regulation cited is public information which may be accessed online or at a public library if the reader desires to know the specifics requirements and steps regarding container disposal.

Comment DS 16 – Round 2

Response is not adequate. The Round 1 review comment was not addressed. Please provide the required detail in the drum disposal discussion. The general public may or may not have access to the Federal Register, but must provide a public document which stands alone, without need to reference other documents to provide the information required to explain the commitments made. Therefore, RAMACO must expand on what the EPA Rule requires for the readers of this permit.

Response DS 16 – Round 2

RAMACO has committed to disposing of empty drums according to Title 40 CFR Part 261.7. RAMACO has cited the federal regulation that stipulates the disposal of empty containers. RAMACO will not summarize this federal regulation in the Brook Mine Permit for two reasons:

1. Federal regulations are made public. Any member of the public has access to the Code of Federal Regulations. This regulation was accessed by WWC on the internet, meaning any person with access to the internet can search and find this regulation. If a member of the public does not personally have access to the internet, said person can go to the local public library to obtain access to the internet.
2. The Code of Federal Regulations is a living document that is subject to change at any time. By committing to the stipulations of Title 40 CFR Part 261.7 without summarizing the regulation, RAMACO commits to observing any requirements of the regulation at any time no matter how the regulation might change in the future. If RAMACO summarizes the regulation and the regulation changes in the future contrary to what it originally stipulated, RAMACO will be automatically stating commitments contrary to federal regulation. The possibility of being out of compliance with federal regulation is avoided by simply citing the regulation RAMACO commits to observing.

Addendum MP-4 remains unchanged.

Comment DS 17 – Round 1

Mine Plan, MP.4.3.1 discusses overburden removal processes. However, little detail is given to explain the actual process for overburden handling. Will the first cut be stockpiled and used to fill the last cut? When special handling is required, which is almost certain given the nature of some overburden and the need for some soil replacement materials, what assurance will be made that poor quality materials will be safely located in the backfill or in separate stockpiles, or that topsoil substitutes will be handled and stored as topsoil in a useful manner as required under Chapter 4, Section 2(b)(x)(A)? Please provide a more detailed overburden handling plan. Perhaps some of these details are observed in later sections. Please provide additional details not provided elsewhere.

Response DS 17 – Round 1

See Sections MP.4.3.5, MP.4.6 and MP.4.7. Revised text as requested.

Comment DS 17 – Round 2

No comment received.

Response DS 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 18 – Round 1

Mine Plan, Section MP.4.3.4. The volumetric analysis shown in Table MP.4-4 and MP.4-5 may change depending on results of required additional overburden sampling and volumetric analysis. If the overburden depth overlying coal changes as a result of additional sampling, the volumetric analysis will also change. If post mining contour changes are necessary due to adjusted swell factors permit revision will probably not be required until the changed PMT exceeds plus or minus 20 feet of the approved at which time a Reclamation Plan revision will be required. This kind of detail should be included in the permit commitments.

Response DS 18 – Round 1

Revised text as requested.

Comment DS 18 – Round 2

Response is not adequate. Does the volumetrics of stockpiles include the coal partings and heavily oxidized coal seams that will not be mined for sale and have not been included in overburden quality assessment data? Will swell factors be adequate to meet PMT requirements after mining of coal from box cuts? What steps will be taken, such as borrow areas not currently shown on any maps, would be used to mitigate inadequate backfill, keeping in mind that contouring must provide reestablishment of drainage patterns on the mine.

Response DS 18 – Round 2

The volumes of materials required to be placed in stockpiles were calculated from grid files in AutoCAD. The grid files are based on borehole/exploration hole data. These volumes were then increased by 16% (as stated in Section MP.4.3.4) to account for swell. In response to Comment DS 22 – Round 2, the topsoil volumes have been recalculated using the specified depths in Appendix D7 within each soil polygon. In most of these cases, the salvage depth of topsoil was increased from 0.5 feet to nearly 1.5 feet (or whatever the appropriate salvage depth was in the specific area). This significantly increased the volume expected to be placed in topsoil stockpiles. However, that volume that was originally assumed to be overburden that is now in

topsoil stockpiles was not removed from the overburden stockpiles. Therefore, the volumes shown for overburden stockpiles should be slightly high. This will provide for additional storage of coal partings or materials from heavily oxidized coal seams should such volume requirements be necessary. The overestimate of overburden stockpile size is conservative. This simply shows that the mine does have the capability to store all the overburden materials. It is unnecessary to readjust overburden stockpiles to be smaller after topsoil calculations since this material was planned to be placed during reclamation.

As stated in Section MP.4.3.4, the actual swell factors will be monitored. Also stated in Section MP.4.3.4, if the actual swell factors differ significantly from what is approved, the post mining topography will be adjusted. This is standard practice for coal mines, and RAMACO is prepared to meet this obligation. RAMACO cannot be certain what the swell factors will be until after material is excavated, stockpiled, handled, and reclaimed. Once the material is monitored and volumes of swelled material are better known, this data will be reported in the Annual Report, as stated in Section MP.4.3.4.

In reference to the PMT, please refer to the Reclamation Plan. As shown in Exhibit RP.3-1, all drainage patterns were maintained. Any borrow to tie the PMT into the existing ground occurred within the disturbance boundary. Because of the relatively minimal disturbance by the Brook Mine, reclaiming the surface to nearly premining conditions was relatively simple. Again, should the swell factor vary significantly from what is currently assumed, the PMT will be redone to account for this adjustment and should any additional borrow areas be required, the disturbance boundary will be increased.

Comment DS 19 – Round 1

Mine Plan, Section MP.4.6.1. The typical overburden sampling protocol as stated in Guideline 1 calls for one sample taken every 40 square acres of the permit area. Overburden sampling for underground mining operations differs from typical coal mine sampling protocols and is stated in the Coal Rules, Chapter 7, Section 1(a)(i)(A) which calls for overburden sampling and characterization on areas where surface operations will cause removal of overburden down to the level of the coal seam. Please make changes to the text accordingly and perform additional overburden sampling where required.

Response DS 19 – Round 1

Revised text as requested.

Comment DS 19 – Round 2

No comment received.

Response DS 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 20 – Round 1

Mine Plan, Section MP.4.3.5. A statement was made in this section that “Overburden stockpiles will only block ephemeral drainages if runoff control and sediment control measures are made and approved by WDEQ/LQD.” Placement of overburden in ephemeral drainages will require a discussion of how water will be diverted around the overburden stockpile to prevent impoundment of water in addition of a discussion of sediment control measures for the stockpile to prevent off-site impacts of erosion down-slope from the stockpile. The LQD recommends that no overburden stockpiles be placed in ephemeral drainages.

Response DS 20 – Round 1

Revised Exhibit MP.4-3.

Comment DS 20 – Round 2

Response is not adequate. No response was provided. Please make necessary changes to the Mine Plan language concerning placement of overburden stockpiles.

Response DS 20 – Round 2

The statement reflects the allowances made by WDEQ/LQD rules and regulations. The statement was not made as a certainty that overburden piles will be placed in ephemeral drainages. Instead, the statement is provided in case overburden piles have to be placed in ephemeral drainages and provides the guidance as to how this will be done according to WDEQ R&R. WDEQ/LQD R&R Chapter 4, Section 2(c)(xi)(B) states:

“Ephemeral drainages may be blocked if environmentally sound methods for dealing with runoff control and sedimentation are approved by the Administrator.”

The Mine Plan currently states in Section MP.4.3.5 in the first paragraph:

“Overburden stockpiles will only block ephemeral drainages if runoff control and sediment control measures are made and approved by WDEQ/LQD.”

“...runoff control and sediment control measures are made and approved by WDEQ/LQD” implies that if an overburden stockpile blocks an ephemeral drainage, discussion and approvals by WDEQ will be made for diverting water, use of ASCMS, prevention of down-slope impacts, etc. before the placement of the stockpile. Because the permit text meets WDEQ/LQD R&R, no changes have been made to the text.

As shown in Exhibit MP.5-1, all of the overburden stockpiles avoid being placed such that they block ephemeral drainages. All ephemeral drainages flow around the

stockpiles. However, the statement remains in the permit should RAMACO be required to block an ephemeral drainage and seeks the permission and approval of WDEQ/LQD, as allowed by WDEQ/LQD R&R Chapter 4, Section 2(c)(xi)(B).

Comment DS 21 – Round 1

Mine Plan, Tables MP.1-1, MP.1-2 and MP.4-1 must show the actual years for proposed progressions, or the year 1 progression must be tied to a specific year in the Mine Plan text.

Response DS 21 – Round 1

Revised tables as requested. Added note saying that Year 0 corresponds to the year 2016.

Comment DS 21 – Round 2

No comment received.

Response DS 21 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 22 – Round 1

Mine Plan, Tables MP.4-3 and MP.4-5. Topsoil volumes appear to be underestimated in TS- 2, TS-6, TS-10 and TS-11 while underestimating the proposed volume in TS-1. Also overburden volumes appear to be underestimated in OB-4, OB-7, OB-11, OB-14 and OB-15, and overestimated in OB-16, which may affect estimates presented in Table MP.4-4 as well.

Response DS 22 – Round 1

Volumes are estimated based on the stripping volumes and available backfill area with excess material going to and from stockpile for contemporaneous reclamation. No updates will occur in response to this comment.

Comment DS 22 – Round 2

Response is not adequate. Several discrepancies have been discovered during the review. TS-1 capacity according to Table MP.4-3 is 89,600 cubic yards, but Table MP.4-1 shows 120,200 cubic yards added to the stockpile. Our estimate are significantly different from yours based on the footprint and average height.

Stockpile	Basal Area (acres)	Average Height (ft)	Volume Estimate (cy)	RAMACO's Volume Estimate (cy)
TS1	1.4	20	22,587	89,600
TS2	3.5	45	127,051	85,100
TS3	1.5	30	36,300	70,300
TS4	1.1	25	22,183	26,600
TS5	3.0	55	133,101	98,400
TS6	4.5	45	163,351	150,800
TS7	0.7	20	11,293	13,800
TS8	0.9	25	18,150	19,300
TS9	0.8	20	12,907	15,900
TS10	2.0	50	80,667	70,300
TS11	0.9	20	14,520	12,000

The volume of topsoil in stockpiles by year presented in Table MP.4-1 appears to be based on a six-inch salvage depth as shown below. Perhaps the salvage depth was intended to be 2 ft. but the volumes would have to increase by a factor of 4.

Stockpile	Acres Salvaged	Volume Salvaged (cy)	Depth (ft) (Volume (cu.ft./Area (sq.ft.))
TS1	80	64,500	0.50
TS1	43	34,700	0.50
TS1	23	18,600	0.50
TS1	13	10,500	0.50
TS1	19	15,300	0.50
TS1	5	4,000	0.50
TS1	9	7,300	0.50

The LQD requires RAMACO to evaluate topsoil stockpile volumes and depths of soil salvage expressed on specific areas of disturbance since each disturbance will undoubtedly result in different salvage and replacement depths.

All volumetric data in tables presented in the Mine Plan and in the reclamation bond estimate must be must be correct, so the LQD requires that:

- a) All topsoil salvage and bond estimates must be based on depth estimates provided in Appendix D7 and the approximate acreage of each soil series disturbed. Therefore, the soil salvage depth and topsoil volumes expressed in table MP.4-3 must be linked to site-specific soil depths. Table MP.4-1 must also include salvage depths for each calculation.
- b) All following topsoil salvage and volumetric tables must be corrected based on volumes for TableMP.4-1.

- c) All reclamation performance bond estimates must be changed to reflect corrected topsoil volumes.
- d) An average depth of topsoil to be salvaged for the entire mining operation must be provided in the Mine Plan text.
- e) Topsoil stockpile footprints and heights will need to be corrected on tables and figures.

Response DS 22 – Round 2

Responses to the list of WDEQ/LQD requests are as follows:

- a) Topsoil salvage estimates were updated to reflect the salvage depths of specific soil types in Appendix D7. To accomplish this, the soil polygons in Appendix D7 Exhibit D7.3-1 were used to create a 3D grid in AutoCAD that represented the salvage depth for each soil type. Volumes were then “removed” within each topsoil stripping area shown in Exhibit MP.4-2. Outputs from AutoCAD included the average cut depth within each topsoil stripping area. The average cut depth essentially reflects the weighted average of cut depths depending on recommended salvage depth of each soil and the areal extent of each soil type within the stripping areas. The average cut depth is now provided in Table MP.4-1. Again, this depth reflects a weighted average and will not match the recommended salvage depths in Appendix D7. To reflect what topsoil types will be salvaged in each stripping area, the soil polygons shown on Exhibit D7.3-1 were added to Exhibit MP.4-2 which already shows the topsoil stripping areas. This exhibit can be compared to Table MP.4-1 for volume calculations.
- b) Table MP.4-1, Table MP.4-2, and Table MP.4-3 were all updated to show the corrected topsoil volumes.
- c) The weighted average of salvage depth is provided in the Mine Plan text in Section MP.4.2.1 in the second paragraph.
- d) The topsoil stockpile footprints and heights have been corrected on Table MP.4-3 to reflect the new volumes. Please note: Stockpile heights are only averages. The stockpile height varies considerably for most stockpiles because of the nature of the topography in the Brook Mine permit area. When AutoCAD builds the 3D stockpiles, the topography is taken into account for the areal extent of the base. Therefore, hand calculations will unlikely replicate the volumes of stockpile by only considering basal area, average height, and typical side slope. To reflect the change in the topsoil stockpile footprints, the disturbance boundary was updated in Exhibits MP.1-1, MP.4-1, MP.4-2, MP.4-3, MP.4-4, MP.4-5, MP.5-1, MP.5-2, and MP.16-1. The hatches that represent the stockpile footprints were updates in Exhibit MP.4-3 and Exhibit MP.5-1.

Comment DS 23 – Round 1

Mine Plan, Exhibit MP.4-2 and MP.4-3 must show the dates (actual years) for the salvage of topsoil and removal of overburden, or year 1 must be tied to an actual year

when operations will begin (2016, 2017, etc.). The map or tables in the Mine Plan must provide proposed years and volumes for stockpile construction as well.

Response DS 23 – Round 1

Revised Exhibits as requested. Added note saying that Year 0 corresponds to the year 2016 on all Exhibits with years.

Comment DS 23 – Round 2

No comment received.

Response DS 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 30 – Round 1

Reclamation Plan, All Mine Plan Maps with progressions must show the actual years of the initial disturbance or mining activity, or the progression must be linked to a specific year in Reclamation Plan text. The maps must also include the contour interval.

Response DS 30 – Round 1

Revised Exhibits as requested.

Comment DS 30 – Round 2

No comment received.

Response DS 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 32 – Round 2 (New Comment)

The LQD requests that RAMACO provide pit identification number/names for all proposed initial box cut locations which will reduce confusion for identification of incident locations or for descriptions during inspections. (DS)

Response DS 32 – Round 2 (New Comment)

Exhibits MP.1-1, MP.4-1, MP.4-4, MP.5-1, MP.15-1, and MP.15-2 were all updated to include pit identification numbers. The text in Section MP.6.1 was also updated to include pit identification numbers to more conclusively identify pits in the hydrologic consequences discussion.

Comment DE 1 – Round 1

Mine Plan, Figure MP.1.2 and page MP-3 – MSHA and best practices may require a safety berm on this safety bench which could require a wider bench. Figure MP.1.2 notes a minimum of 35' but the text on page MP-3 just states the bench will be 35' wide. There is a real possibility this safety bench might be used for light plants so it may need to be wider for access and small vehicle use as well as providing a safety bench.

Response DE 1 – Round 1

Revised text as requested.

Comment DE 1 – Round 2

No comment received.

Response DE 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 2 – Round 1

Mine Plan, Table MP.1-1 – The total disturbance doesn't seem to match the overall disturbance listed for the trench mining and facilities. Please explain or correct.

Response DE 2 – Round 1

Revised table as requested.

Comment DE 2 – Round 2

No comment received.

Response DE 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 3 – Round 1

Mine Plan, Section MP.2.3, page MP-9 – The 1st sentence would be better if it started, "The explosive materials...". The 2nd sentence should replace the word "detonating" with "explosive". The 5th sentence in the 2nd paragraph should include cast boosters. The 6th sentence in the 2nd paragraph should discuss storage of emulsions, water gels, and slurries also. This section should also commit to proper signage of the explosive storage area. Please correct.

Response DE 3 – Round 1

Revised text as requested.

Comment DE 3 – Round 2

The third sentence in the 2nd paragraph needs to be corrected. It states one magazine will contain cast boosters and the other magazine will contain detonating cord and boosters. Boosters cannot be stored with detonating cord or detonators. I believe the text should say, "...the other magazine ...will contain detonating cord, detonators and other initiation products. Please correct.

Response DE 3 – Round 2

The third sentence of the second paragraph in Section MP.2.3 was changed as suggested to reflect that boosters will be stored separately from detonating cord, detonators, and other initiation products.

Comment DE 4 – Round 1

Mine Plan, Section MP.5.7.5, page MP-34 – The word "of" in the 2nd line of the last paragraph should be "or". Please correct.

Response DE 4 – Round 1

Revised text as requested.

Comment DE 4 – Round 2

No comment received.

Response DE 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 5 – Round 1

Mine Plan, Section MP.6.1, page MP-39 – The 1st sentence of the 1st full paragraph needs some improvement so it reads properly and makes sense. Please correct.

Response DE 5 – Round 1

Revised text as requested.

Comment DE 5 – Round 2

The 1st sentence of the 1st full paragraph still needs to be improved so it makes sense. The current version says "... Hidden Water Creek watershed will occur..." It doesn't make sense as it is written. Please correct.

Response DE 5 – Round 2

The text was corrected in the fourth paragraph of Section MP.6.1 to state:

“In the fourth and fifth years, mining occurs east of the Slater Creek watershed and west of the Hidden Water Creek watershed. Mining will occur primarily in minor drainages of the Tongue River in Sections 8, 17, and 18, T57N, R84W, as seen on Exhibit MP.1-1.”

Comment DE 6 – Round 1

Mine Plan, Section MP.14.2, page MP-55 – The 2nd paragraph discusses the use of “cast primers”. The term should be “cast boosters” as it doesn’t become a primer until the detonator is added or detonating cord is attached to it. The discussion of priming holes should describe the use of a cast booster and how it is made-up to become a primer, i.e. with detonating cord or a detonator (blasting cap). Please correct.

Response DE 6 – Round 1

Revised text as requested.

Comment DE 6 – Round 2

No comment received.

Response DE 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 7 – Round 1

Mine Plan, Section MP.14.3.2, page MP-56 – In the 2nd line the item “(primer with detonator)” should be changed to “(cast booster with detonator)”. Please correct

Response DE 7 – Round 1

Revised text as requested.

Comment DE 7 – Round 2

No comment received.

Response DE 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 8 – Round 1

Mine Plan, Section MP.14.3.2, page MP-56 – The 2nd paragraph discusses powder factors in coal and overburden and the high end of the ranges is extremely high for the type of rock and coal in this area. RAMACO should eliminate the range and simply state powder factors will be adequate to effectively fragment the overburden and coal.

Response DE 8 – Round 1

Revised text as requested.

Comment DE 8 – Round 2

RAMACO kept the powder factor range of 0.2-0.7 pounds per ton in the text. As stated in the 1st round review the high end of the range is extremely high for coal. I would recommend that the text simply state that the powder factors will be adequate to effectively fragment the coal and overburden. Please correct.

Response DE 8 – Round 2

In Section MP.14.3.2, the powder factor ranges for coal and overburden were removed as suggested. The text now states that the powder factors will be chosen to adequately fragment coal or overburden, depending upon which is being blasted.

Comment DE 9 – Round 1

Mine Plan, Section MP14.3.3, page MP-56 – RAMACO should reword this to say that initiation will be done using non-electric or electric systems, which may include electronic detonators, shock tube detonators, detonating cord, electric detonators or a combination of these. Igniter cord is used to initiate safety fuse and it's highly unlikely that any safety fuse will be used at this mine. Please correct.

Response DE 9 – Round 1

Revised text as requested.

Comment DE 9 – Round 2

No comment received.

Response DE 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 10 – Round 1

Mine Plan, Section MP.14.4, pages MP-56 & 57 – It is probable that emulsions will also be stored on site so it should be mentioned since emulsion/ANFO blends are the most widely used product in wet holes. Please correct.

Response DE 10 – Round 1

Revised text as requested.

Comment DE 10 – Round 2

No comment received.

Response DE 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 11 – Round 1

Mine Plan, Section MP.14.6, pages MP-57 & 58 – Residents who request a pre-blast survey must make the request to the permittee and the Administrator of Wyoming Land Quality Division (LQD). The permittee is responsible for getting the pre-blast survey done and distributed to the person that requested it and the LQD Administrator. Please correct.

Response DE 11 – Round 1

Revised text as requested.

Comment DE 11 – Round 2

No comment received.

Response DE 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 12 – Round 1

Mine Plan, Section MP.14.7, pages MP-58 & 59 – LQD will not approve protecting uninhabited structures (what LQD refers to as engineered structures) at 8.0 inches per second (ips) of peak particle velocity. LQD would allow a maximum limit of 5.0 ips. RAMACO would have to assure that this limit was not exceeded by the use of a seismograph at these structures on all blasts. RAMACO could apply for a modified scale distance factor to show compliance with this limit of 5.0 ips by submitting a vibration study and doing a regression analysis to show the allowable ppv is not exceeded at a 95% confidence level. However, this will require the vibration study be submitted with seismograph records from shots in the mining area so it cannot be done until after some blasting has been done at the mine. Please correct this text.

Response DE 12 – Round 1

Revised text as requested.

Comment DE 12 – Round 2

No comment received.

Response DE 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 13 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The discussion on typical pattern size should be changed to more general language. Using the parameters given the powder factor used would be approximately 0.16 lbs./CY using ANFO and in the 0.23-0.25 lbs./CY range when shooting an emulsion blend. These powder factors are not high enough to adequately fragment the overburden. Please correct.

Response DE 13 – Round 1

Revised text as requested.

Comment DE 13 – Round 2

RAMACO continues to discuss a “typical” pattern size and stemming amount. Given the bench height, pattern size, stemming height, hole diameter listed it would be nearly impossible to get powder factors high enough to adequately fragment the overburden. The large burdens and spacings in a 50’ high bench would likely leave hard zones between the holes. The large amount of stemming compared to powder column height gives poor powder distribution in the holes which will likely lead to hard zones in the upper portions of the bench. This discussion needs to be improved.

Response DE 13 – Round 2

The text in Section MP.14.8.1 has been edited to discuss generalities in overburden blast design as opposed to listing the specifics of before. The text now provides more open design standards for RAMACO to function as necessary for safe and efficient blasting during mining operations.

Comment DE 14 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The 2nd paragraph says if water is in the holes a slurry or water gel explosive will be used. Most likely an emulsion/ANFO blend with good water resistance will be used in wet holes and not a slurry or water gel. Please correct.

Response DE 14 – Round 1

Revised text as requested.

Comment DE 14 – Round 2

No comment received.

Response DE 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 15 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The 3rd paragraph discusses the explosive weight per hole and the powder factors. The explosive densities listed are correct but the pounds per hole and powder factors are incorrect. In a 7.875” hole and with a density of ANFO of 0.85 g/cc the pounds/foot of hole is 17.95 lbs. and with 24’ of powder column the pounds/hole is 431 lbs., making the powder factor = 0.16 lbs./CY. Similarly using an emulsion blend of 1.32 g/cc the pounds/foot = 27.87 lbs. and the pounds per hole would be 669 lbs. so the powder factor = 0.25 lbs./CY. In the 50’ hole described with 26’ of stemming and 24’ of powder the powder distribution is poor so it would likely lead to blocky material near the top of the bench. Please correct.

Response DE 15 – Round 1

Revised text as requested.

Comment DE 15 – Round 2

No comment received.

Response DE 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 16 – Round 1

Mine Plan, Section MP.14.8.2, page MP-61 – Drilling a 35’ x 35’ pattern in a 15’ thick coal seam with a 7.875” hole and 4.5’ of stemming will probably result in excessive flyrock, stemming ejection, high airblast and hard zones between the holes. Expecting to stem 4.5’ is not realistic – in the field the blaster is going to try to hold for 4’ or 5’ of stemming. Again RAMACO discusses using slurry or water gel in wet hole when an emulsion/ANFO blend with high water resistance would probably be used. Please correct. Also the powder factor listed for coal is probably a little high so it would be better to just say that the powder factor will be sufficient to fragment the coal for the prime movers. Please correct.

Response DE 16 – Round 1

Revised text as requested.

Comment DE 16 – Round 2

RAMACO lists a pattern Drilling size of 35’ x 35’ and then in the text states the burden and spacing will 17.4’ and 35.4’. As stated in the round 1 review comments, this pattern size in a 15’ thick coal seam with a 7.875” drill hole will probably result in excessive flyrock, airblast and leave behind hard zones between the holes. The 2nd paragraph discusses using slurry and water gel and it is likely that an emulsion/ANFO

blend with high water resistance would be used. RAMACO needs to revise the text in this section because this plan will not be effective.

Response DE 16 – Round 2

The text in Section MP.14.8.2 has been edited to discuss generalities in coal blast design as opposed to listing the specifics of before. The text now provides more open design standards for RAMACO to function as necessary for safe and efficient blasting during mining operations.

Comment DE 17 – Round 1

Mine Plan, Section MP.14.10, page MP-63 – The last bullet item says that detonation during electric storms might be a reason for unscheduled blasting. This is confusing because it makes it sound like the operator would shoot during electric storms and the only safe thing to do when an electric storm approaches is clear the pattern and keep everyone a safe distance away until the storm passes. Please correct.

Response DE 17 – Round 1

Revised text as requested.

Comment DE 17 – Round 2

No comment received.

Response DE 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 18 – Round 1

Mine Plan, Addendum MP-7, Blaster's Log – Under the "Holes" heading RAMACO should use "burden" not the term "burden spacing". On the 2nd page the word "signiture" should be changed to "signature". Please correct.

Response DE 18 – Round 1

Revised text as requested.

Comment DE 18 – Round 2

No comment received.

Response DE 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 11 – Round 2 (New Comment)

LQD recommends that sequence maps be revised to include only yearly backfilling and/or replacement, monthly backfilling and/or replacement areas may not be achievable as a permit commitment.

Response KM 11 – Round 2 (New Comment)

RAMACO appreciates the comment and understands the potential difficulty, but the permit remains unchanged.

Comment KM 12 – Round 2 (New Comment)

Exhibit MP.1-1 shows surface disturbance beginning in 2017. However, other maps show disturbance beginning in Year “0”, which according to the maps is Year 2016. Please be consistent.

Response KM 12 – Round 2 (New Comment)

Exhibit MP.1-1 has been corrected to properly show surface disturbance beginning in 2016.

Comment KM 13 – Round 2 (New Comment)

Exhibits MP.4-2 and RP.5-1 use the same symbol for all years of activities; only color designates different years. Some of the color variations denoting years are not easily discernible from the legend to the map.

Response KM 13 – Round 2 (New Comment)

The exhibits have been changed to use different hatch patterns and colors for years to make separate years more easily discernible.

Comment KM 14 – Round 2 (New Comment)

Do the slot openings include truck ramps? How will truck ramps be constructed in each slot?

Response KM 14 – Round 2 (New Comment)

The slot openings will include truck ramps that will be used to remove spoil and coal from the slots to the haul roads. By WDEQ/LQD definition in Chapter 1, Section 2(ds), ramps are not considered roads. As discussed in Section MP.3.1.4, ramps are exempt from mine plan design considerations. The ramps will move and change frequently as mining progresses. To describe a specific way in which the truck ramps will be constructed in each slot would be difficult to accomplish due to the variability in each slot and at each phase of construction of the slot. As Section MP.3.1.4 states, the ramps will be developed with consideration given to the type of equipment

operating on them, safety considerations, and surrounding conditions. Safety berms will be installed on all elevated edges.

Comment KM 15 – Round 2 (New Comment)

Please confirm the volume of the overburden stockpiles. For example, based on LQD's review of the mine plan and the spoil backfilling sequence maps, it appears that OB-3 will be used to contain all overburden removed from the first slot opening.

Response KM 15 – Round 2 (New Comment)

Please see response to Comment BJ 67. WDEQ/LQD calculations did not consider the side slope of overburden stockpiles, therefore overestimating the volume of overburden stockpiles. Overburden stockpile volumes will be constantly changing over the course of mining due to ongoing reclamation activities. The overburden stockpiles have been sized to accept the required volume of spoil from the trenches, but spoil will likely be cycled in and out of the stockpiles on a regular basis to meet backfilling requirements. Volumes to be placed in stockpiles were calculated from 3D grid files in AutoCAD and given a swell of 16% to approximate the required space.

Comment KM 16 – Round 2 (New Comment)

LQD recommends using a swell factor of 11 to 13%, based on our experience in the area.

Response KM 16 – Round 2 (New Comment)

A swell factor of 16% was used as an average approximation. Swell factors of material at other mines in the area have been as high as 20%-22%. After the first pit has been backfilled, a swell study will be conducted and stockpile and PMT design will be reevaluated if necessary. Refer to Section MP.4.3.4 for a discussion that states that actual swell factors will be monitored and PMT will be adjusted if necessary.

Comment KM 19 – Round 2 (New Comment)

Page MP-8 states that the "approved Spill Prevention, Control, and Countermeasure (SPCC) plan will be on file with WDEQ and available at the Brook Mine. Who is responsible for approving the plan? WDEQ does not require a SPCC plan to be filed with the agency. SPCC plans is a federal requirement.

Response KM 19 – Round 2 (New Comment)

The text in Section MP.2.1.4 was edited to correctly state that the SPCC plan will be kept onsite at the mine for review and inspection by the EPA.

Comment KM 20 – Round 2 (New Comment)

Page MP-8 states that the leachfield(s) will accept water from the change house and equipment service shop. Discharge of industrial wastewater from the equipment service shop into a leachfield may be subject to Chapter 16, Wyoming Water Quality Rules and Regulations.

Response KM 20 – Round 2 (New Comment)

Section MP.2.1.6 states that sewage wastewater from the change house and equipment service shop will be discharged into the leach field. The section does not mention disposal of industrial wastewater into a leach field. However, a statement was added that the septic tank and leach field will be constructed in accordance with WDEQ/WQD rules and regulations.

Comment KM 21 – Round 2 (New Comment)

Page MP-8 states that wash down water will be sent to a wastewater impoundment. However Section MP5.2 (page MP-26) state that no wastewater impoundments are currently planned for the Brook Mine. Please discuss.

Response KM 21 – Round 2 (New Comment)

The statement made in Section MP.5.2 that no wastewater impoundments are currently planned was revised to state that designs for a wastewater impoundment are provided in Addendum MP-2. A wastewater impoundment will be required to treat wash down water.

Comment KM 22 – Round 2 (New Comment)

Groundwater from dewatering pumps is to be pumped to sumps or NPDES treatment for use in road dust control. What kind of “NPDES” treatment is proposed?

Response KM 22 – Round 2 (New Comment)

The third paragraph of Section MP.5.9 states that the treatment facilities will be sedimentation ponds.

Comment KM 23 – Round 2 (New Comment)

The State of Wyoming has primacy for the National Pollutant Discharge Elimination System and issues permits under the Wyoming Pollutant Discharge Elimination System (WYPDES). Please change all references to NPDES to WYPDES to accurately reflect the current regulatory situation.

Response KM 23 – Round 2 (New Comment)

The reference in the third paragraph of Section MP.5.9 to NPDES was removed. A statement was added that all water is intended to be used, and discharge from the permit area is not anticipated.

Comment MK 23 – Round 1

Mine Plan, Section MP.20 Alluvial Valley Floors, The discussion of underground mining in AVFs does not seem necessary given there is no plans for underground mining at the Brook Mine. Furthermore, it is conceivable that circumstances could exist where underground mining of an AVF would not be allowed by the LQD. For example, if the AVF was significant to farming and underground mining of the AVF would result in surface effects such that material damage to the AVF would occur. (MDK)

Response MK 23 – Round 1

While no underground mining is proposed within delineated AVFs, the mine maintains this option. If underground mining is ever planned under the AVF, the appropriate revisions will be made. Revised text as requested.

Comment MK 23 – Round 2

No comment received.

Response MK 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 46 – Round 1

Mine Plan, Section MP.4.1 Mining Sequence, 20. On Exhibit MP.4-1, please attempt to show the areas that would be highwall mined versus surface mined. These layers are currently not found until Exhibit MP.15-1. Alternatively, the text in this Section could specify that the areas to be highwall versus surface mined are shown in Exhibit MP.15-1. (MDK)

Response MK 46 – Round 1

Revised text as requested.

Comment MK 46 – Round 2

No comment received.

Response MK 46 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 47 – Round 1

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 21. Only Slater Creek and Hidden Water Creek are labeled and shown in Exhibit MP.5-1. In order to better evaluate the Hydrologic Control Plan, please provide labels and locations for the other stream channels, including Tongue River, Goose Creek, East Fork Earley Creek, and the other unnamed channels (as shown on the USGS 24K Quad) on the proposed permit area. (MDK)

Response MK 47 – Round 1

Revised Exhibit MP.5-1 as requested.

Comment MK 47 – Round 2

No comment received.

Response MK 47 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 48 – Round 1

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 22. Exhibit MP.5-1 shows overburden stockpiles OB-13 and OB-12, as well as topsoil stockpile TS-6, occurring directly over the Slater Creek channel. The Exhibit does not show any diversion ditches to be used in these locations. Please either move the location of the stockpiles or present a plan to use a diversion to route Slater Creek around the stockpiles. (MDK)

Response MK 48 – Round 1

Revised Exhibit MP.5-1 as requested.

Comment MK 48 – Round 2

No comment received.

Response MK 48 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 49 – Round 1

Mine Plan, Section MP.5.2 Sedimentation and Wastewater Impoundments, 23. Exhibit MP.5-1 shows the locations of two “sediment basins”. Are these considered the same as “sedimentation impoundments”, as discussed in this Section? If so, the designs for these two impoundments are not found within the Mine Plan. (MDK)

Response MK 49 – Round 1

The “sediment basins” shown in Exhibit MP.5-1 are not considered the same as the “sediment impoundments (reservoirs).” Sediment Basins are considered an Alternative Sediment Control Measure and are discussed in Addendum MP-1. As such, the design for these “sediment basins” are not included in the Mine Plan. However, the design criteria and construction standards for “sediment basins” are similar to those discussed within Section MP.5.2 of the Mine Plan. Revised text as requested.

Comment MK 49 – Round 2

Response accepted. The text states that there are no currently planned sedimentation impoundments planned at the Brook Mine. Please see new Mine Plan and Reclamation Plan comments below that request this clarification elsewhere in the permit. (MDK)

Response MK 49 – Round 2

The statement in Section MP.5.2 was revised to state that sedimentation and wastewater reservoirs will be required for mining operations. The designs of these impoundments are provided in Addendum MP-2. Exhibit MP.5-1 has been revised to show the locations of these impoundments. The disturbance boundary has also been adjusted to encompass the impoundments. Permit-level designs have only been provided for impoundments that are planned to be needed in the first five years of operations. Any potential impoundments required after the first five years will be provided once these impoundments are within five years of ensuing operations. Due to the fact that sedimentation, wastewater, and flood control reservoirs will be required, the text changes referenced in Comments MK 106, 108, 109, 110, 111, 112, 113, and 114 (New Comments) were not made. The responses to these comments reflect that.

Sedimentation reservoirs have been designed to replace the ASCMs originally shown within one half of a mile of the Tongue River and Goose Creek to satisfy the requirements set forth in Guideline 15 (as discussed in Comment MK 116 (New Comment)).

Comment MK 50 – Round 1

Mine Plan, Section MP.5.3 Flood Control, 24. This section discusses flood control reservoirs but it is not mentioned how many flood control reservoirs would be constructed and where their locations would be. Please provide this information to comply with LQD Coal Rules and Regulations, Chapter 2, Section 5(a)(i)(D)(IV). (MDK)

Response MK 50 – Round 1

Revised text as requested.

Comment MK 50 – Round 2

No comment received.

Response MK 50 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 51 – Round 1

Mine Plan, Section MP.5.4 Diversions, 25. This section mentions permanent diversions, but there are no apparent plans for permanent diversions. Please discuss if permanent diversions are anticipated as part of the mining operation, or if all diversions will be temporary. (MDK)

Response MK 51 – Round 1

Revised text as requested.

Comment MK 51 – Round 2

No comment received.

Response MK 51 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 52 – Round 1

Mine Plan, Section MP.5.4 Diversions, 26. Exhibit MP.5-1 shows only one diversion ditch for Hidden Water Creek in T57N, R84W, Section 9. Please discuss this particular diversion and its typical design in more detail in Section MP.5.4. (MDK)

Response MK 52 – Round 1

Revised text as requested. Add design exhibit of the Hidden Water diversion ditch.

Comment MK 52 – Round 2

No comment received.

Response MK 52 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 53 – Round 1

Mine Plan, Section MP.5.5 Culverts, 27. Please provide a brief statement that commits to a periodic culvert inspection and maintenance plan to ensure that culverts will function properly over time. (MDK)

Response MK 53 – Round 1

Revised text as requested.

Comment MK 53 – Round 2

No comment received.

Response MK 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 54 – Round 1

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 28. The first sentence references a sedimentation reservoir. Where is the location of this sedimentation reservoir? Are these the “sediment basins” shown in Exhibit MP.5-1? If not these sedimentation reservoirs need to be added to this Exhibit. (MDK)

Response MK 54 – Round 1

Revised text as requested.

Comment MK 54 – Round 2

No comment received.

Response MK 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 55 – Round 1

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 29. The first paragraph references treating and discharging pit water. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 55 – Round 1

Revised text as requested.

Comment MK 55 – Round 2

No comment received.

Response MK 55 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 56 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 30. Exhibit MP.1-1 shows surface disturbance directly over a few areas of Slater Creek and Hidden Water Creek. Please identify the source of disturbance in these areas. Direct disturbance of the channel should be avoided unless there is a plan for a diversion to route the stream around the disturbance. (MDK)

Response MK 56 – Round 1

See response to Comment MK 76, 88 and 99. Revised text as requested.

Comment MK 56 – Round 2

No comment received.

Response MK 56 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 57 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 31. The mining trenches are often discussed with reference to Exhibit MP.1-1. However, the trenches are not shown on this Exhibit. Please add the locations of the trenches to Exhibit MP.1-1. (MDK)

Response MK 57 – Round 1

Revised Exhibit MP.1-1 as requested.

Comment MK 57 – Round 2

Response not accepted. Exhibit MP.1-1 does show trenches in the east portion of the mine, but not the western portion. For example, in the first full paragraph on Page MP-42, it discusses trenches being constructed perpendicular to the flow path of the minor Tongue River drainages. On Page MP-43, several trenches are discussed: one trench constructed parallel to Slater Creek's flow in Section 18, a trench in associated with the surface mine to the west of Slater Creek, and a trench parallel to Slater Creek in Sections 11, 12, and 13. On Page MP-43, a trench is discussed along the "TRD5" channel. Please add all of these trench locations to Exhibit MP.1-1. Also, please use a different color other than grey for the trenches, as this color tends to blend with the topographic line color. (MDK)

Response MK 57 – Round 2

A hatch has been added to Exhibit MP.1-1 in the western portion of the permit boundary to more clearly show the trench locations. Another hatch has been added to Exhibit MP.1-1 to more clearly show the location of the surface mine. The hatch colors were chosen to stand out from the topographic line color. Additionally in

response to Comment DS32 (New Comment), RAMACO has provided pit identification numbers on several exhibits and in Section MP.6 to make pit locations more easily understood.

Comment MK 58 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 32. On Page MP-39, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining disturbance will be treated prior to discharge. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 58 – Round 1

Revised text as requested.

Comment MK 58 – Round 2

No comment received.

Response MK 58 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 59 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 33. Please discuss the diversion ditch for Hidden Water Creek in the first carryover paragraph on Page MP-39. (MDK)

Response MK 59 – Round 1

Revised text as requested. See Hidden Water Creek diversion Exhibit MP.5-2 for further details.

Comment MK 59 – Round 2

No comment received.

Response MK 59 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 60 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 34. On Page MP-40, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining activities will be treated prior to discharge. Please reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 60 – Round 1

Revised text as requested.

Comment MK 60 – Round 2

No comment received.

Response MK 60 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 61 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 35. On Page MP-40, there is a sentence: “The surface disturbance activities will have temporary impacts on Slater Creek geomorphology including ground cover and soil erodibility”. This statement is unclear. Are the impacts to the actual Slater Creek channel or the uplands and other tributaries in the watershed? Is it reduced ground cover and increased soil erodibility? Please provide a more explicit description of the possible impacts. (MDK)

Response MK 61 – Round 1

See response to Comment MK 56, 76, 88 and 99. Revised text as requested.

Comment MK 61 – Round 2

Response not accepted. The text clarified that the only direct disturbance to the Slater Creek channel is where the channel will be redirected through a culvert under a proposed haul road. However, the sentence: “The surface disturbance activities will have temporary impacts on Slater Creek geomorphology including ground cover and soil erodibility” is still unclear. This statement implies that the channel stability of Slater Creek will be affected, and that bed and banks could experience excessive erosion. Please provide more discussion on what is meant by impacts to Slater Creek channel geomorphology. (MDK)

Response MK 61 – Round 2

Text was added to the fifth paragraph of Section MP.6.1 to clarify that the geomorphology of the Slater Creek channel such as the bed and banks will not be impacted. The only impacts to ground cover and soil erodibility will be in upper portions of the Slater Creek drainage where surface disturbance activities are proposed. The text now clarifies that this is the case and that ASCMs and other sediment and runoff control measures will be used to control sediment transport to Slater Creek.

Comment MK 62 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 36. Please provide a discussion on whether the proposed mining operation would affect surface water quality such that designated uses would be affected on the major streams on and adjacent to the proposed permit area. (MDK)

Response MK 62 – Round 1

Revised text as requested.

Comment MK 62 – Round 2

No comment received.

Response MK 62 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 63 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 37. The text describes possible reductions in peak flows and storm volumes. Please describe in the PHC if the proposed mining operation will have any effects on nearby or downstream surface water rights. (MDK)

Response MK 63 – Round 1

Revised text as requested.

Comment MK 63 – Round 2

Response not accepted. The text speaks to impacts to existing reservoirs/water rights on the permit boundary but does not provide a statement as to possible impacts to water rights off or downstream of the permit boundary. Please provide this discussion in the text. (MDK)

Response MK 63 – Round 2

The last paragraph of Section MP.6.1 previously stated:

“...the Brook Mine is expected to have an extremely small effect on surface water quality in the Tongue River and other major streams adjacent to the permit boundary of the Brook Mine. As such, no effect on the designated uses present on major streams adjacent to the permit boundary is expected.”

Two sentences have been added to the last paragraph of Section MP.6.1. The first states:

“There is no anticipated impact to water rights downstream of the permit boundary either.” (In reference to water quality.)

The second sentence states:

“Additionally, the minimal reduction of any surface water runoff in the upper reaches of drainages in the Brook Mine permit area will not likely have any impact on downstream water rights.”

Comment MK 64 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 38. Please add a brief statement to the PHC that if it is determined that the mining operation affects a surface water right, that water right would be replaced with a water source of similar quantity and quality as provided by W.S. § 35-11-415(b)(xii). (MDK)

Response MK 64 – Round 1

Revised text as requested.

Comment MK 64 – Round 2

No comment received.

Response MK 64 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 65 – Round 1

Mine Plan, Section MP.6.1.1 Land Erosion Stability, 39. It is unclear the intent of this section. It seems to be out of place in the mine plan, as it discusses the USLE in the context of only native and reclaimed conditions. Furthermore, no data other than the K factors are presented in Mine Plan Tables (Table MP.6.1). The Reclamation Plan also does not discuss applying the USLE, so it would seem that Section MP.6.1.1 should be removed unless a USLE analysis is completed of pre- vs during- vs postmine erosion predictions. (MDK)

Response MK 65 – Round 1

Section MP.6.1.1 has been removed.

Comment MK 65 – Round 2

No comment received.

Response MK 65 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 66 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 40. It is unclear why reservoirs will be monitored in the operational monitoring program when these features were not sampled for during baseline characterization. If the reservoirs have the potential to be affected by the mining operation they should be sampled prior to mining with this information presented in Appendix D6. (MDK)

Response MK 66 – Round 1

Revised text as requested.

Comment MK 66 – Round 2

Response not accepted. Any reservoir potentially disturbed by mining activities should have a baseline water quality sampled collected with the information presented in Appendix D6. Section MP.6.1 states that Big Horn No. 2 Reservoir, Big Horn No. 14 Reservoir, Permanent Impoundment #1 Reservoir, and Legerski #1 Reservoir will be impacted by mining activities and will be reclaimed. At a minimum, the baseline water quality should be provided for these reservoirs in Appendix D6. RAMACO may also wish to expand the list of reservoirs sampled for baseline water quality to match those listed in Table RP.8-9. (MDK)

Also, there is now a statement on Page MP-49: *All existing reservoirs, stockponds, and proposed reservoirs that will be disturbed by surface mining activities as discussed in Section MP.6.1 will be monitored for relevant discharge through grab samples to ensure that any water released from these reservoirs meets the WDEQ/LQD guidelines discussed above.* It is unclear which WDEQ/LQD guidelines are being referred to. Also, if these reservoirs are going to be discharging, a WYPDES permit would likely be required. Please clarify these items in the text (MDK).

Response MK 66 – Round 2

A commitment has been added to the first paragraph of Section MP.7.1 that states RAMACO will collect water quality data from reservoirs that could potentially be impacted by mining prior to its disturbance and this data will be provided in the Annual Reports. Table MP.7-1 provides the expected monitoring locations.

Second, the statement in the third paragraph of Section MP.7.1 referring to discharge and citing aforementioned WDEQ/LQD guidelines was revised. Because these are existing reservoirs, discharge should not be the concern of RAMACO. RAMACO will monitor the reservoirs for the water quality constituents provided in Guideline 8, Appendix 7 for the time during mining upstream to ensure that mining has not impacted the reservoir.

These items should clarify that RAMACO will monitor reservoirs prior to mining operations upstream of the reservoir, and that the water quality monitoring will be to

evaluate the aforementioned list as opposed to discharge. RAMACO does not have control of these reservoirs or how they are operated.

Comment MK 67 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 41. Please add the reservoir monitoring locations listed in Table MP.7-1 to Exhibit MP.7.1. (MDK)

Response MK 67 – Round 1

Revised Exhibit MP.7.1 as requested.

Comment MK 67 – Round 2

No comment received.

Response MK 67 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 68 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 42. Please add the northing/easting State Plane coordinates for the surface water monitoring stations to Table MP.7.1. (MDK)

Response MK 68 – Round 1

See response MK

Comment MK 68 – Round 2

Response not accepted. The coordinates were not added to the Table. Please see response to Comment MK 35. Please add the northing/easting State Plane coordinates for the surface water monitoring stations to Table MP.7.1. (MDK)

Response MK 68 – Round 2

Table MP.7-1 has been updated to include the State Plane coordinates.

Comment MK 69 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 43. Please identify what type of water quantity data will be generated from the continuous stage monitoring. For example, will mean daily flow rates and/or peak daily flow rates be estimated, as these would likely be submitted to the LQD in the Annual Report? (MDK)

Response MK 69 – Round 1

Revised text as requested.

Comment MK 69 – Round 2

No comment received.

Response MK 69 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 70 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 44. The text in the last paragraph on Page MP-45 states that water quality samples will be collected from a single station using an ISCO automatic sampler. Please identify in the text which station this is. Also, please explain the rationale for using an ISCO sampler at only one of the four stream monitoring sites. (MDK)

Response MK 70 – Round 1

Revised text as requested. The station equipped with the ISCO automatic sampler was the only station equipped with such a device due to the stations location as well as expected flows. Quarterly grab samples taken at stations upstream of mining disturbances will give an accurate representation of water quality entering the permit boundary. Since the station equipped with an automatic sampler is located near the area in which Slater Creek exits the permit boundary, an automatic sampler allows the operator see if the mining activities of the Brook Mine have an impact on the water quality of Slater Creek as the highest chance water quality is affected will occur during precipitation events. An automatic recorder was not installed at the station downstream of disturbances on Hidden Water Creek because the recorded and modeled flows for the drainage are extremely low. No observable flow had been recorded on any surface water station along Hidden Water Creek, despite precipitation events having occurring. As such, any data collected by an automatic sampler on Hidden Water Creek would occur during extreme precipitation events in which the flows through Hidden Water Creek would likely have high turbidity and be an unrealistic representation of the water quality within Hidden Water Creek.

Comment MK 70 – Round 2

No comment received.

Response MK 70 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 71 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 45. The text in the first paragraph on Page MP-46 states that data will be evaluated to determine if any surface water and groundwater interactions exist. It would seem that any interactions

should have already been identified during the baseline characterization of the hydrological system on and near the proposed permit area. It does not appear that the permit application discusses surface/groundwater interactions. (MDK)

Response MK 71 – Round 1

Revised text as requested. The monitoring is a continuation of the baseline monitoring sites.

Comment MK 71 – Round 2

Response not accepted. The response states that the text was revised but the same statement remains without any additional explanation. If surface and groundwater interactions are expected to exist then these should have already been discussed in the baseline characterization of the hydrologic system. It does not appear that the permit application discusses surface/groundwater interactions. Please provide more explanation on this in the text. (MDK)

Response MK 71 – Round 2

The third and fourth to the last sentences in the last paragraph of Section MP.7.1 were edited to state:

“Baseline monitoring has not indicated any interactions between surface water and groundwater. However, surface water data will continue to be compared to groundwater monitoring data to determine if any surface water and groundwater interactions exist that weren’t observed in baseline studies.”

Comment MK 72 – Round 1

Mine Plan, Section MP.8 Water Use, 46. Please state in the text that all water from surface reservoirs or wells will be used under appropriate permits from the State Engineer’s Office (SEO). (MDK)

Response MK 72 – Round 1

Revised text as requested.

Comment MK 72 – Round 2

No comment received.

Response MK 72 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 73 – Round 1

Mine Plan, Section MP.8 Water Use, 47. It is advised that the applicant discuss with the SEO-Interstate Streams Division any implications that water use may have under the Yellowstone River Compact. (MDK)

Response MK 73 – Round 1

Revised text as requested.

Comment MK 73 – Round 2

No comment received.

Response MK 73 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 74 – Round 1

Mine Plan, Addendum MP-6 Subsidence Control Plan, Section MP.6.3 Subsidence Monitoring and Assessment and Section MP-6.4 Subsidence Control and Remediation, 48. The text states that subsidence monitoring would be discontinued if no evidence of subsidence occurred after six months after highwall mining. Please include a clarifying statement that the applicant would remediate subsidence up until bond release is approved, even if the subsidence was detected later than the six months of initial monitoring. (MDK)

Response MK 74 – Round 1

Please see revision to last paragraph of Addendum MP-6.

Comment MK 74 – Round 2

No comment received.

Response MK 74 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 106 – Round 2 (New Comment)

In Section MP.2.1.2 Change House and Equipment Service Shop, on Page MP-8, it states that wash down water will be routed to wastewater impoundment. As stated on Page MP-26, wastewater reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that wastewater reservoirs are not planned. (MDK)

Response MK 106 – Round 2 (New Comment)

The text in Section MP.2.1.2 was not revised. The text in Section MP.5.2 was changed to reflect that wastewater impoundment(s) will be required. Designs for the wastewater impoundment are provided in Addendum MP-2.

Comment MK 107 – Round 2 (New Comment)

In Section MP.5.2.1 General Design Criteria, there is a sentence: A discussion regarding the USLE method is provided in Section MP.6.1.1. As per to the response to Comment MK 65, Section MP.6.1.1 has been removed. Please remove the sentence that references Section MP.6.1.1. (MDK)

Response MK 107 – Round 2 (New Comment)

The sentence referencing the previously deleted Section MP.6.1.1 was removed.

Comment MK 108 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-42: *Any surface runoff to come in contact with mining disturbance will be treated in the pits or retained in sedimentation control structures in the vicinity of Hidden Water Creek to meet water quality standards before being discharged from the Permit Area.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 108 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 109 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-42: *As previously discussed, any runoff coming into contact with mining activities will be captured in a sedimentation impoundment or ASCM to meet water quality standards prior to discharge from the Permit Area.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 109 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 110 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-43: *Sedimentation impoundments will capture runoff that has come in contact with mining activities, and will treat the water to meet water quality standards before discharge.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 110 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 111 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-44: *Any runoff that does enter disturbed areas will be captured in a sedimentation pond or treated in the trenches to meet water quality requirements before being discharged from the Permit Area.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 111 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 112 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the first bullet is for a Sedimentation Pond. As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 112 – Round 2 (New Comment)

The bullet item in Section MP.12.5 was not deleted. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 113 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the second bullet is for a Wastewater Reservoir. As stated on Page MP-26, wastewater reservoirs are not currently planned as part of the

mining operation. The text in this section should also clarify that wastewater reservoirs are not planned. (MDK)

Response MK 113 – Round 2 (New Comment)

The bullet item in Section MP.12.5 was not deleted. The text in Section MP.5.2 was changed to reflect that wastewater reservoirs will be required for mining operations. The design for the wastewater impoundment is provided in Addendum MP-2.

Comment MK 114 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the third bullet is for a Flood Control Reservoir. As stated on Page MP-29, flood control reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that flood control reservoirs are not planned. (MDK)

Response MK 114 – Round 2 (New Comment)

The text in Section MP.5.3 in the second paragraph was revised to reflect that flood control reservoirs will be required for mining operations within the first five years. The designs of these flood control reservoirs are provided in Addendum MP-2 and the locations in relation to the permit area are shown on Exhibit MP.5-1. Therefore, the text in Section MP.12.5 was not revised to remove “Flood Control Reservoir” from the list.

Comment MK 115 – Round 2 (New Comment)

Mine Plan Addendum MP-1 commits to getting LQD approval and doing further sediment yield analysis for ASCMs that drain larger than 30 acres, as per LQD Guideline No. 15. It isn't clear from the Hydrologic Control Plan in Exhibit MP 5-1 if any of the currently proposed ASCMs drain more than 30 acres. Please indicate if any of the ASCMs shown in Exhibit MP 5-1 drain more than 30 acres. (MDK)

Response MK 115 – Round 2 (New Comment)

Exhibit MP.5-1 now shows the drainage areas for any ASCMs that drain more than 30 acres. Any ASCMs with drainage areas of more than 30 acres have designs provided in Addendum MP-2.

Comment MK 116 – Round 2 (New Comment)

LQD Guideline No. 15 states that ASCMs should not be used for disturbed or reclaimed areas that are within one-half mile (channel distance) of Class 1 or Class 2 streams. Since the Tongue River and Goose Creek are Class 2 streams, please provide an analysis of the distance of the currently proposed ASCMs on Exhibit MP 5-1 to the Tongue River and Goose Creek. In accordance with LQD Guideline No. 15, more traditional sediment control methods (i.e., sedimentation impoundments) may be needed for disturbed areas that are close to the Tongue River and Goose Creek. (MDK)

Response MK 116 – Round 2 (New Comment)

Exhibit MP.5-1 now shows a half mile buffer from the Tongue River and Goose Creek. In those locations where ASCMs had been proposed within a half mile of either the Tongue River or Goose Creek, more robust methods of sediment control have been implemented (primarily sediment impoundments and collector ditches). Because several locations that require such sediment control measures are within the first five years of operations, sediment impoundments have been designed and these designs are provided in Addendum MP-2. The locations of the sediment impoundments and collector ditches in relation to the permit area are shown on Exhibit MP.5-1.

Comment MK 117 – Round 2 (New Comment)

LQD Guideline No. 15 provides monitoring guidance for ASCMs based on the drainage area upstream of the ASCM. For large receiving streams (drainage area greater than 1.0 square mile), monitoring should include repeated surveys of channel cross-sections and/or upstream and downstream sediment yield stations. Please provide a commitment to conduct this monitoring to evaluate the performance of the proposed ASCMs that drain to large receiving streams. (MDK)

Response MK 117 – Round 2 (New Comment)

A commitment has been added to the last paragraph of Section MP.5.1 that RAMACO will either monitor the stream channel cross sections or will have upstream and downstream sediment yield monitoring stations to ensure the ASCMs are functioning properly in areas that drain to receiving streams with a drainage area of greater than 1.0 square mile.

Comment MuK 32 – Round 1

Mine Plan, 32. Please provide an electronic copy of the groundwater model referenced in Addendum MP-3. In addition, please provide the GIS projection coordinate of the model files that will enable the LQD to plot the model results in GIS for the purposes of producing the CHIA (Cumulative Hydrologic Impact Assessment). The LQD review of the model files might potentially generate additional comments, clarifications or questions. (MK)

Response MuK 32 – Round 1

An electronic copy of the groundwater model will be provided under separate cover. The elements in the model are based on the Wyoming East Central NAD 83 state plane coordinate system. To convert from model Grid to the state plane coordinates the X offset is 1367387.512 and the Y offset is 1915004.382. There is no rotation from the model grid to the state plane coordinate system.

Comment MuK 32 – Round 2

Response conditionally accepted. Because of a version compatibility issue between the software used by the LQD and the mine, the LQD was not able to review the model files. The LQD has contacted Office of Surface Mining (OSM) to explore the options (if any) to update the Groundwater Vistas software to the latest version. OSM is looking into this issue and has not responded during the completion of the review. The LQD would also welcome any suggestions from the mine to resolve this issue. (MK)

Response MuK 32 – Round 2

RAMACO suggests that WDEQ/LQD obtain a “Student License” for Groundwater Vistas. A student license will allow WDEQ/LQD to view the model but not to make any changes to the model. The Brook Mine model cannot be saved to an older version of Groundwater Vistas without causing significant issues in the functionality of the model. The newer versions of Groundwater Vistas contain features vital to the functionality of the model that are not available in older versions of Groundwater Vistas.

Comment MuK 33 – Round 1

Mine Plan, MP.1.1 Type of Mine, 33. Page MP-1 states, “Below the Tongue River Member is the Lebo shale member of the Fort Union Formation which contains the Masters Seam (Cardno MM&A, October 2013).” This statement is not consistent with Table D5.3-1, Page D5-T1 and other descriptions in Appendix D5. Table D5.3-1 indicates Masters Coal seam is in the Tongue River Member. Please clarify and make appropriate changes throughout the submittal (Example: MP 4.4). (MK)

Response MuK 33 – Round 1

Revised text as requested.

Comment MuK 33 – Round 2

No comment received.

Response MuK 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 34 – Round 1

Mine Plan, MP.1.1 Type of Mine, 34. Major coal seams on the Brook Mine include: Dietz (1,2,3), Monarch, Upper Carney, Lower Carney and Masters.”. Dietz (1,2,3) coal seam is not included in the description presented in Section D5.3.3.3, Appendix D5. Please clarify: (i) the seams that will be mined by the Brook Mine and (ii) include the description of all the coals seams as appropriate in Appendix D5 and Appendix D6. (MK)

Response MuK 34 – Round 1

Please refer to Mine Plan Section MP.4.4.1 for targeted coal seams at the Brook Mine.

Comment MuK 34 – Round 2

No comment received.

Response MuK 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 35 – Round 1

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, Consider using the groundwater model referenced in Appendix D-3 to provide a description for a range of estimates on anticipated dewatering rates/volumes and groundwater inflows to the mine pit. (MK)

Response MuK 35 – Round 1

The text in Section MP.5.8 is to indicate that water entering the pit from either groundwater or surface water will be controlled using sumps and treated prior to discharge.

Comment MuK 35 – Round 2

Response not accepted. Please provide a range of estimates of the expected groundwater inflows to the pit. The intent of this comment is to understand the volume/rate of water that will be dewatered to facilitate mine operations. In addition, please clarify if the groundwater model provides an estimate of this inflow to the pit. (MK)

Response MuK 35 – Round 2

Yes, the amount of water discharging from the drains to simulate mining can be used to estimate how much water would enter into the mine pits during the mining scenarios. The model predicted pit inflow rates are estimated to range between 0.3 gpm and 75 gpm depending on the location of the mine pits. Model predicted pit inflow rates have been added to Addendum MP-3 Section 4.9 (Table 4.9-2). Also, text describing the range of flows has been added to Section MP.5.8.

Comment MuK 36 – Round 1

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, 36. Please clarify the anticipated effects of the faults on the dewatering plan or groundwater impacts during mining. (MK)

Response MuK 36 – Round 1

Since the water will be collected in a sump, treated, and then discharged, the faults should have no effect.

Comment MuK 36 – Round 2

Response not accepted. It is acknowledged that the water will be collected in a sump. The intent of the comment is to get an understanding on the effects of faults on the inflows to the pit. For example, are the pit inflow rates sensitive to the location and permeability of the faults within the permit boundary? If yes, please provide a range of estimates to account for this sensitivity. (MK)

Response MuK 36 – Round 2

The faults do influence the inflow to the pits. As shown on MP-3 Figures 4.9-12, 4.9-13, and 4.9-14 the faults generally cause a shadow effect where the coals downstream of the faults dry out because the faults prevent efficient recharge of the coal aquifer downstream of the fault. An additional table added to Addendum MP-3 (Table 4.9-2) allows the influence of the faults on the pit inflows to be further evaluated. As shown on Table 4.9-2 the predicted pit inflow rates decline significantly between 2018 and 2019. Between 2018 and 2019 the mining moved closer to the fault located in the northeast side of the permit. The decline in pit inflow is partially due to the fact that the coals immediately downgradient of the fault are drier.

Comment MuK 37 – Round 1

Mine Plan, MP.5.9 Dewatering Wells, 37. Please provide a brief discussion on the anticipated quality of groundwater removed at various stages of mining. (MK)

Response MuK 37 – Round 1

Revised text as requested.

Comment MuK 37 – Round 2

Response not accepted. In addition to the reference to Appendix D6, please provide a description of any expected variability or trends in water quality of the groundwater removed as different coal seams are mined. Are there any expected groundwater constituents of concern based on Appendix D6? (MK)

Response MuK 37 – Round 2

The third paragraph of Section MP.5.9 now includes a short discussion summarizing information from Appendix D6. The discussion states some of reasons why water quality could vary during the progression of mining operations. However, the discussion also states that even with the variability, there are no expected groundwater constituents of concern that could cause problems during dewatering and surface containment. The following table is a summary of the information already provided in Appendix D6:

Constituent of Concern	Units	Acute Standard¹	CRN	MST	CRN-MST
Priority Pollutants					
Arsenic, dissolved	mg/L	0.34	<0.005	<0.005	<0.005 - 0.007
Cadmium, dissolved	mg/L	0.002	<0.001	<0.001	<0.001 - 0.001
Copper, dissolved	mg/L	0.0134	<0.01 - 0.02	<0.01	<0.01
Lead, dissolved	mg/L	0.0646			<0.02

¹ WDEQ-WQD Rules and Regulations Chapter 1, Appendix B, Aquatic Life Acute Value

² WDEQ-WQD Rules and Regulations Chapter 1, Appendix C, Ammonia Toxicity is pH and Temperature Dependent

³ WDEQ-WQD Rules and Regulations Chapter 1, Appendix B, Human Health Consumption of Fish and Drinking Water

As can be seen in this summary table, most constituents in the Carney and Masters coal seams fall below the acute standard. This table has not been included in the Mine Plan because this is baseline data that does not belong in the Mine Plan. This table has also not been added to Appendix D6 because the groundwater quality constituent concentrations are already summarized in Appendix D6. RAMACO has committed in the Mine Plan to monitoring groundwater quality during the course of operations in order to ensure that there are no constituents of concern that could cause issues while dewatering the mine pits in potential surface containment.

Comment MuK 38 – Round 1

Mine Plan, MP.5.9 Dewatering Wells, 38. If groundwater is discharged into a stream channel, anticipated discharge flow rate, water quality, and estimated seasonal discharge of the groundwater should be tabulated. The availability and suitability of this water for downstream water users should also be evaluated. Please clarify if this is an expected mechanism to discharge pumped groundwater. (MK)

Response MuK 38 – Round 1

Revised text as requested.

Comment MuK 38 – Round 2

No comment received.

Response MuK 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 39 – Round 1

Mine Plan, MP.5.8 Groundwater Rights, Please include a description on any expected degradation of groundwater quality caused by the mining operation (including lateral flow through spoils) in the adjudicated wells. (MK)

Response MuK 39 – Round 1

Revised text as requested.

Comment MuK 39 – Round 2

No comment received.

Response MuK 39 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 40 – Round 1

Mine Plan, MP.6.2.Groundwater, 40. Please provide a brief discussion on any hydrologic effects caused by anticipated changes in recharge to the aquifers during mining. (MK)

Response MuK 40 – Round 1

Revised text as requested.

Comment MuK 40 – Round 2

Response not accepted. Not able to locate the revision made. Typically, the revisions from other operators are highlighted with bolded text or a different color to enable the reviewer to efficiently review the changes made. Without that tracking mechanism, it is difficult to review the exact revisions. Please consider using a distinct tracking mechanism in the future submittals. (MK)

Response MuK 40 – Round 2

RAMACO does not anticipate significant changes to recharge rates due to disturbance at the Brook Mine. Two sentences have been added to the end of Section MP.6.2.1 that state that RAMACO doesn't expect significant fluctuations in recharge rates, but commits to monitoring groundwater levels according to Section MP.7 and will report any significant fluctuations in groundwater levels that could be attributed to altered recharge rates.

Comment MuK 41 – Round 1

Mine Plan, MP.6.2.Groundwater, 41. Please provide an assessment of any subsidence effects (Addendum MP-6) on the hydrologic system during operations. (MK)

Response MuK 41 – Round 1

Revised text as requested.

Comment MuK 41 – Round 2

No comment received.

Response MuK 41 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 42 – Round 1

Mine Plan, MP.6.2.Groundwater, 42. Please discuss if there are any expected impacts on groundwater quality caused by subsidence. (MK)

Response MuK 42 – Round 1

Revised text as requested.

Comment MuK 42 – Round 2

No comment received.

Response MuK 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 43 – Round 1

Mine Plan, MP.6.3.2 Plan to Mitigate the Impacts on Groundwater, 43. If the quality or quantity of adjudicated water supplies are affected, then an alternative source should be identified as part of the mitigation plan. Please provide a statement to meet this statutory requirement (W.S. § 35-11-415(b)(xii)). (MK)

Response MuK 43 – Round 1

Revised text as requested.

Comment MuK 43 – Round 2

No comment received.

Response MuK 43 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 44 – Round 1

Mine Plan, MP.7.2 Groundwater Monitoring, 44. Please clarify the lack of any shallow monitor wells near Hidden Water Creek, Goose Creek and Tongue River alluvium and if this will be an impediment to completely characterize the groundwater impacts during mining. (MK)

Response MuK 44 – Round 1

Hidden Water Creek has no alluvium therefore, no shallow well can be installed. Goose Creek in the area of the permit is through a reclaimed mine area (pre-law) therefore there is not alluvium. As discussed throughout we will not impact the Tongue River Alluvium. RAMACO will add wells in the Tongue River Alluvium.

Comment MuK 44 – Round 2

Response not accepted. Please provide a more detailed plan for installing the proposed alluvial monitoring well(s). (MK)

Response MuK 44 – Round 2

See comments MK-21,22 (Round 2) responses. Discussion of the potential AVF impacts and proposed alluvial monitoring plan is presented in Mine Plan Section MP.25.

Comment MuK 45 – Round 1

Mine Plan, MP.7.2 Groundwater Monitoring, 45. Please clarify the possibility of any of the monitor wells shown in Exhibit MP.7-7 being discontinued due to any constraints in the proposed-mine plan (example: mined through). (MK)

Response MuK 45 – Round 1

Revised text as requested.

Comment MuK 45 – Round 2

No comment received.

Response MuK 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 46 – Round 1

Mine Plan, MP.8 Water use, 46. Page MP-47 states, “Industrial water will be obtained from groundwater wells or from water collected in sediment and flood control reservoirs.” Please clarify if the groundwater wells mentioned in this statement are wells that will be exclusively used as industrial supply wells or if they are same as dewatering wells. (MK)

Response MuK 46 – Round 1

Revised text as requested.

Comment MuK 46 – Round 2

Response not accepted. Please provide additional description on the source aquifer for the proposed industrial supply wells. (MK)

Response MuK 46 – Round 2

Discussion regarding wells as a water source was removed from Section MP.8. Due to the coal seams being mostly dry and the only reliable aquifers being very deep, RAMACO will rely on surface water rights and water collected in the sediment and flood control reservoirs and other sources for supplying the quantities of water needed for industrial purposes. Refer to Table MP.8-1 for a summary of water quantity obtained from each source.

Comment MuK 47 – Round 1

Mine Plan, MP.8 Water use, 47. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a discussion comparing the reported water use by other mines of similar size in the Powder River Basin.

Response MuK 47 – Round 1

No record of reported water use was discussed in the annual reports submitted to WDEQ for several different mines within the Powder River Basin. As such, a comparison was unable to be made.

Comment MuK 47 – Round 2

Response not accepted. The SEO requires a submittal of the water use by the other mines. In addition, the coal review reports by the BLM also provide a summary of water use. Example: AECOM, Inc., 2014, Update of the Task 1B Report for the Powder River Basin Coal Review – Current Water Resources Conditions, prepared for Bureau of Land Management High Plains District Office and Wyoming State Office, <http://www.blm.gov/pgdata/etc/medialib/blm/wy/programs/energy/coal/prb/coalreview/phase2/Task1B.Par.91805.File.dat/Task1B.pdf>.

Response MuK 47 – Round 2

As discussed in the meeting between WDEQ and WWC on September 1, 2015, the AECOM report has been added as a reference to the Mine Plan. Water usage for the Brook Mine has been reevaluated and presented in Table MP.8-1. The fourth paragraph of Section MP.8 summarizes the expected water usage by the Brook Mine per year. This paragraph states that the approximate annual water usage at the Brook Mine will be 368 acre-feet which is on the lower end of water usage ranges provided in the report (300 to 920 acre-feet).

Comment MuK 48 – Round 1

Mine Plan, MP.8 Water use, 48. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a comparison of this estimated total water use against the various estimated water sources available during mining (Example: from dewatering wells). It will be very helpful to provide a discussion on contingency measures during extreme wet/dry years or if the proposed mine plan does not require extensive dewatering. (MK)

Response MuK 48 – Round 1

RAMACO is currently working to solidify the necessary water right for this water. The sources and associated amounts are in discussions and therefore not presented at this time.

Comment MuK 48 – Round 2

Response not accepted. The information will be reviewed as soon as it is made available to the LQD. (MK)

Response MuK 48 – Round 2

Table MP.8-1 has been added to the Mine Plan to outline the specific water uses with estimated quantities projected at the Brook Mine. Table MP.8-1 also shows the expected volume of water from each source. The fourth paragraph of Section MP.8 has been revised to state that the Brook Mine will use approximately 120 million gallons per year with an expected variability of plus or minus 20 percent. A statement was added to the fourth paragraph of Section MP.8 that enough water is available

from the surface water rights that any variations in the quantities from other sources can be covered by the surface water rights.

Comment MuK 49 – Round 1

Mine Plan, MP.8 Water use, 49. Please clarify if there is any expected variability in this projected water use (example: is it closely related to the mine plan). (MK)

Response MuK 49 – Round 1

Revised text as requested.

Comment MuK 49 – Round 2

Response not accepted. The text indicates that the total water use will be approximately 400 million gallons per year. Please provide at least a range of expected variability in this projected annual water use. (MK)

Response MuK 49 – Round 2

The water usage at the Brook Mine has been reevaluated. Table MP.8-1 has been added to the Mine Plan which summarizes the expected quantities of water usage per day by specific use. This table shows that the Brook Mine is expected to use approximately 328,200 gallons per day. The fourth paragraph of Section MP.8 states that this equates to approximately 120 million gallons per year (significantly less than originally reported). The text in the fourth paragraph of Section MP.8 also states that the water usage has an expected variability of plus or minus 20 percent.

Comment MuK 50 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 50. Page Addendum MP-3-19 states, “Since, most of the wells within the modeled domain are stock wells with intermittent pumping and completed in geologic strata below the Masters Coals, they are relatively inconsequential to the groundwater system modeled in this report.” Please provide a Figure (or reference) to show these wells, their depths and discuss on why they are hydrogeologically isolated from the effects of the proposed mine. (MK)

Response MuK 50 – Round 1

All the groundwater rights are tabulated within Appendix B of the adjudication volume and Exhibits 5 and 8 in the adjudication volume show the locations of each respective groundwater right. Please note that adjudication Exhibits 5 and 8 include monitor wells in addition to stock and domestic wells so all the wells shown on the exhibits are not necessarily wells that are being used as water supply wells. In fact, almost all the completed water wells shown on Exhibit 5 of the adjudication volume within the Brook Mine permit area are actually monitor wells. The Cross Sections presented in Exhibit 2 of Addendum D5-3 show the depth of the coal seams at various locations within the

Brook Mine Permit. For comparison, the depths of each well are listed in the tabulation in Appendix B of the adjudication volume.

The statement on Page MP-3-19 “they (the wells) are relatively inconsequential to the groundwater system modeled in this report” means that the wells are not believed to be significant stressors to the groundwater system because of their relatively low pumpage rates. This statement should not be interpreted to mean that all of the stock and domestic wells in the area are hydrologically isolated from the coals proposed for mining within the Brook Mine Permit area. In fact, Section 4.9 of Addendum MP-3 specifically describes 26 wells that, based on their depths and locations, are likely completed within the coals. The expected impacts to these wells were assessed as part of the modeling exercise. Based on a comparison between the reported depths in the water rights tabulation in Appendix B of the adjudication volume and the geologic cross sections in Addendum D5-3, the other stock and domestic wells in the area were determined to be completed either in the Tongue River alluvium, or deeper strata below the Carney coal and do not have a direct hydrologic connection to the coals proposed for mining in the Brook Mine and were not specifically evaluated in the groundwater model.

Along the eastern edge of the model domain there are a large number of CBM wells and, based on available data presented in the water rights tabulation in Appendix B of the Adjudication volume, these wells are likely pumping water from the Carney and Masters coal seams. The impacts from the CBM wells are described in detail within later sections of the report. However, the text on page MP-3-19 does not speak to the CBM wells. Minor changes to the text on page Addendum MP-3-19 and additional explanatory text have been added to this page to provide further clarification.

Comment MuK 50 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 50 – Round 2

Section 2.2 of Addendum MP-3 had previously been updated to incorporate this comment response. Additional explanatory text has also been added to Addendum MP-3 Section 2.3 to further incorporate the context of this response into the Permit Application.

Comment MuK 51 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 51. Page Addendum MP-3-20 states, “The faults are significant in lateral extent and form natural no flow boundaries”. Please provide a discussion (or refer to a discussion) on how these faults were determined to be no flow boundaries. (MK)

Response MuK 51 – Round 1

Faulting within the permit area was mapped by B.E. Barnum on the USGS Monarch Quadrangle. As noted in Section D5.3.2, Barnum indicates fault displacements on the order of 50 feet within the mine area. Lithologic logs provided in Addendum D-5-3 demonstrate that the dominating lithology in the column is claystone and coal thicknesses are less than 20 feet. This offset geology from faulting results in a claystone hanging or footwall adjacent the coal aquifer and therefore discontinuity of the aquifer and an assumed hydrologic flow boundary.

Comment MuK 51 – Round 2

Response not accepted. It is appreciated and acknowledged the note of lithologic logs. In addition, please clarify or substantiate if there is any hydrologic evidence to support the interpretation that the faults are no flow boundaries (Example: water levels, water quality or other hydrologic evidence). This will increase the validity of the no-flow assumption. (MK)

Response MuK 51 – Round 2

In addition to the lithological evidence discussed in the previous response that supports treatment of the faults as no flow barriers, comparisons of water levels in coal monitor wells on either side of the fault also demonstrate that the faults serve as no flow barriers. Exhibits D6.2-2 and D6.2-3 in Addendum D6 illustrate the potentiometric surface in Masters and Carney coal seams, respectively. As shown on Exhibits D6.2-2 and D6.2-3, within the northeastern portion of the Brook Mine permit area there are two monitor well clusters that straddle both sides of a fault (578408 and 578409). In the case of the Masters coal, the measured water level in the monitor well on the upper side of the fault (578408-MST) is 173 feet higher than the water level measured in the monitor well completed on the downblock side of the fault (578409-MST). Similarly, the measured water level difference across the fault in the Carney monitor wells is approximately 180 feet. The change in potentiometric head between the monitor wells on both sides of the fault is significantly higher than would be expected due to the natural gradient in this area. Therefore, the variation in the measured potentiometric head across the fault demonstrates that it does serve as a hydraulic barrier. Additional text has been added to Addendum MP-3 Section 2.4.1 to more fully describe the effects that the faults have on the conceptual flow model.

Supplemental analysis of water quality on opposite sides of the faults has been conducted to note any difference in water quality that would indicate that the faults serve as no-flow barriers. This analysis and discussion has been added to Addendum MP-3 in Section 2.4.1.

Comment MuK 52 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 52. Please clarify the reason for not estimating vertical hydraulic conductivity of the interburden using an aquifer test. (MK)

Response MuK 52 – Round 1

Response to this comment is partially clarified in responses to MK's Comments 18 and 19 above. During the aquifer test conducted at the 578409 well cluster no response was observed across the interburden, therefore, the vertical hydraulic conductivity of the interburden was too low to measure in the aquifer test. Furthermore, the static water levels in the Masters and Carney coal seams are different which demonstrates that the hydraulic conductivity of the interburden is very low. Therefore, literature values were utilized and adjusted within reasonable bounds to improve model calibration.

Comment MuK 52 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 52 – Round 2

The context of this response was incorporated into Addendum D6-8 "Pumping Test Report." The context was added into Section D6-8.4 "Determination of Aquifer Parameters."

Comment MuK 53 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 53. Page Addendum MP-3-25 states, "With no unnatural stresses on the system ..." Please provide a discussion of the CBM impacts on the water levels. It appears that the hydrographs presented in Appendix D6 do not show the impacts of CBM. (MK)

Response MuK 53 – Round 1

There are multiple CBM production wells located along the eastern side of the groundwater domain. In order for the CBM producers to be able to produce gas it is necessary to significantly lower the water levels in the coal to release the gas in the coal fractures. CBM production began in this area around 1999. Therefore, it was conservatively assumed that CBM production has already resulted in lowering the water levels in the coal aquifers to the top of the coal aquifer along the eastern edge of the model domain and the general head boundaries were set accordingly to simulate this effect. Even though water level data in the coal aquifer prior to CBM production is limited because of the lack of monitor well data, prior to CBM production, the potentiometric head in the coal was estimated to be significantly higher than the top of coal.

The hydrographs presented in Appendix D6-9 do not show the impacts of CBM because they show water level changes over a one year period roughly 13 years after CBM production began in the area, and if the wells were going to be impacted by CBM, it is likely that they have already been impacted. Please note that the model assumed that CBM production would continue into the future resulting in the water levels in the coal being maintained at unnaturally low levels. Therefore, the model has conservatively estimated the combined impacts from both CBM and the proposed coal mining activities. Currently, a large majority of the CBM wells are being plugged and abandoned which may result in higher than predicted water level recovery rates in the coal aquifer.

Text edits were made to page MP-3-25 to help clarify the discussion.

Comment MuK 53 – Round 2

No comment received.

Response MuK 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 54 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 54. There are two sub-sections for recharge, Section 2.5.3 and Section 2.6.1. Please clarify/consolidate. (MK)

Response MuK 54 – Round 1

The two subsections have been combined into one subsection under Section 2.6.1.

Comment MuK 54 – Round 2

No comment received.

Response MuK 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 55 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 55. Page Addendum MP-3-26 states, "... drain cells were placed in the model to simulate seeps from the outcrops." Please provide a discussion on the evidence for seeps (or reference) observed during field surveys. Were there any field data collected on the location and flow rates of these seeps? (MK)

Response MuK 55 – Round 1

Evidence of seeps from outcrops can be seen in Color Infrared Imagery (CIR), which is included in the permit as Exhibit D11.1-1. The areas of seepage are manifested on the

CIR imagery as areas with more vegetation. Evapotranspiration from the vegetation growing along the seep removes all the water before it emanates from the formation into the drainage. Therefore, no measurements of the seepage rate at the outcrops were possible or are available. Additional discussion explaining the need for drain cells within the model is provided in Section D6.2.2. Also, text was added to Section D6.2.2 to clarify that no field flow measurements were available.

Comment MuK 55 – Round 2

Response conditionally accepted. Please include the discussion on CIR into the permit application (MK)

Response MuK 55 – Round 2

Additional text describing the seeps was added to Addendum MP-3 Section 2.6 to incorporate the context of this response.

Comment MuK 56 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 56. Page Addendum MP-3-27 states, “River cells from MODFLOW’s river boundary conditions package were placed in the model to simulate the Tongue River and Goose Creek.” Please provide a conceptual discussion supported by field observations on the type/nature of interaction of these streams with groundwater (Gaining stream vs. losing stream). (MK)

Response MuK 56 – Round 1

As described in Section 2.3 of MP-3, the dip of the strata in the project area is generally east-southeast into the Powder River Basin and the groundwater flow direction follows this trend regionally. As such, the Tongue River comes into contact with the coal seams of interest near the updip side of the coal seams. Interactions between the surface water and groundwater occur at those points where permeable formations sub-crop into alluvial/surface water bodies. Both the Carney and the Masters coal subcrop under the Tongue River near the western edge of the model domain. Conceptually these subcrops are the only places where the coals would be in contact with the surface water. Section 2.3 of Addendum MP-3 describes the conceptual groundwater flow in some detail.

As described in Addendum MP-3 Section 2.3, the Carney coal is largely dry to the north and west of its subcrop into the Tongue River alluvium and becomes saturated at an elevation just above the elevation where it subcrops beneath the Tongue River alluvium. Therefore it is likely that the Carney Coal would lose water to the Tongue River alluvium. The potentiometric surface in the Masters Coal is roughly the same as the potentiometric surface of the Tongue River where the Masters coal subcrops beneath it. A review of the steady state groundwater model shows that where the River boundary cells are immediately above the Masters Coal the net effect is that the River boundary cells input approximately 3.2 gpm into the model. Conversely, near

the upper and lower Carney Coal/Tongue River outcrops the River cells are taking roughly 0.16 gpm out of the model. Since the coal outcrops occur beneath the Tongue River there is no way to field verify these flows but conceptually they do seem reasonable.

The river boundary cells extend to the bottom of the layer in which they are placed as discussed in response to comment MUK 74 and MUK 84. The River boundary cells were placed in Layer 1 to the confluence of Goose Creek and the Tongue River which extends east of the area where the Carney Coal would be in communication with the Tongue River alluvium. Due to the fact that the River boundary cells extend to the bottom of the layer they do provide a conduit for the River to provide recharge into the Carney Coal even though the River would be physically separated from the coal by multiple zones of low permeability shales. The estimated recharge occurring in this area from the Tongue River to both layers 1 and 2 is approximately 8 gpm. The discharge into the coals is likely conservatively overestimated and not all of the 8 gpm would necessarily end up in the coal as some of it also discharges to layer 1. As such, the model conservatively estimates that up to 11.2 gpm would be discharged from the river to the coals or overburden between the Carney Coal and the Tongue River.

The strata located above the coal seams of interest is generally claystone with low permeability as discussed in MP-3 Section 2.2. Therefore, interaction of groundwater between these units and the Tongue River or Goose Creek is very limited. Within the model domain, the Tongue River Alluvium does have large deciduous trees and other vegetation immediately adjacent to the river. Conceptually, evapotranspiration from the vegetation along the Tongue River would indicate that through the model domain the Tongue River is a losing Stream. Throughout most of the model domain where the Tongue River is present, there low permeability overburden strata between the Tongue River alluvium and the coal seams which hydrologically isolate the Tongue River from both the Masters and the Carney coal seams. Since Goose Creek is located in the eastern portion of the model domain where the coal is significantly below the alluvium and the clay intervals are even thicker, the Goose Creek alluvium is also hydrologically separated from the Masters and Carney Coals. The Goose Creek alluvium would likely see similar losses to evapotranspiration that would be observed in the Tongue River alluvium.

Comment MuK 56 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 56 – Round 2

Text from this response has been incorporated into Addendum MP-3 Sections 2.3 and 4.7.2 as appropriate.

Comment MuK 57 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 57. Please provide a discussion on any contribution of groundwater baseflow to the major surface water bodies within the permit boundary. (MK)

Response MuK 57 – Round 1

As described in the response to comment MuK 56, conceptually, very little groundwater base flow from the Carney and Masters coal seams are expected to contribute to the surface water bodies within the permit boundary. The mass balance table provided in response to comment MuK 73 demonstrates that much more water is expected to enter the groundwater system from the surface water bodies (river cells) than is contributed to the surface water bodies from groundwater baseflow.

Comment MuK 57 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 57 – Round 2

The context of this response has been added to Addendum MP-3 via additional text to address comments MuK 56 and MuK 73. Specifically, text additions to Addendum MP-3 Section 4.10 include the context of the Round 1 response.

Comment MuK 58 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 58. In section 3.2 MODFLOW Input Files, was aerial recharge used as an input file? Please clarify if evapotranspiration was considered as a discrete input or lumped into net aerial recharge. (MK)

Response MuK 58 – Round 1

Yes, the recharge package was used as an input file. Section 3.2 of Addendum MP-3 was updated to include a discussion of the recharge package. The evapotranspiration (ET) package was not utilized in the model. To address the effects of ET, the recharge rates were adjusted down in proportion to the estimated losses created by ET. Within most of the model domain where evapotranspiration would occur, the low permeability overburden between the surface and the coal seams of interest provide a hydrologic barrier so the evapotranspiration was ignored in these areas.

Comment MuK 58 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 58 – Round 2

Addendum MP-3 Section 4.2.2 was updated to incorporate the context of the Round 1 response.

Comment MuK 59 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 59. Page Addendum MP-3-31 states, “Layer 1 – represents the coal overburden”. Please clarify if the alluvial aquifer was included in the model. Please provide justification for not considering the alluvial aquifer in the model. (MK)

Response MuK 59 – Round 1

As described in the responses to comments MuK 56 and MuK 57, the only place within the model domain where there is potential for interactions between any alluvial aquifers and the coal seams of interest is where the coal is directly below the Tongue River alluvium or Slater Creek colluvium. Where the coal is in direct contact with alluvium/colluvium, layer 1 (the coal overburden) was assigned a higher vertical hydraulic conductivity to allow the layer to better emulate the alluvial/colluvial aquifer in this location. This zone of higher hydraulic conductivity in layer 1 is depicted on Addendum MP-3 Figure 4.2-1. Groundwater Vistas does not allow discontinuous layers throughout the model domain so this allowed the alluvium/colluvium to be effectively be modeled without the need to add an additional layer across the top of the entire model domain. This helped to improve the computational efficiency of the model. Since the overburden has a very low hydraulic conductivity and hydrologically separates the coals from the other alluvial/colluvial deposits within a large portion of the model domain, there is no reason to model any additional alluvial/colluvial deposits. To help clarify this comment Figure 4.2-1, was prepared and sections 2.5 and 4.2 of MP-3 have been updated.

Comment MuK 59 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 59 – Round 2

With the addition of the text to address comments MuK 56 and Muk 57 as well as the text added to Addendum MP-3 Section 4.2.1, the context of this comment has been incorporated into Addendum MP-3.

Comment MuK 60 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 60. Page Addendum MP-3-31 states, “Layer 3- Carney Interburden. This interval is generally of low to very permeability in the western portion of the Project Area”. Please clarify how the areas where Layer 3- Carney Interburden is absent are treated in the groundwater model. (MK)

Response MuK 60 – Round 1

Ground Water vistas does not allow discontinuous layers. Therefore, Layer 3 is continuous across the entire model domain. Where the coal seam coalesces on the east portion of the model, the Layer 3 interburden was modeled as coal by setting hydraulic properties of the layer equivalent to the values of the overlying and underlying coal seams. Additional text has been added to Section 4.2.1 of Addendum MP-3 to further describe how the hydraulic conductivities were assigned to layer 3.

Comment MuK 60 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 60 – Round 2

The context of the Round 1 response has been incorporated into Addendum MP-3 Section 4.2.1.

Comment MuK 61 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 61. Please include a discussion of the thickness of all model layers. (MK)

Response MuK 61 – Round 1

Addendum MP-3 Section 2.5 describes the thickness of the various coal seams. Additional text has been added to MP-3 Section 4.1 to generally describe the thickness of each layer. Following are the modeled thicknesses for each layer:

- Layer 1-The thickness for this layer varies throughout the model domain. Near the western side of the model the layer is often absent where all the strata geologically younger than the Carney coal has been eroded off. These areas are generally represented as no flow cells in the model. Within the eastern portion of the model Layer 1 can be substantial. In the model the maximum thickness of Layer 1 in the eastern side of the model domain was approximately 1,100 feet.
- Layer 2-The Upper Carney coal was modeled with a constant thickness of 7 feet throughout the model.
- Layer 3-The Carney coal interburden layer varied in thickness from 4 feet up to 15 feet within the active portion of the model.
- Layer 4-The Lower Carney coal was modeled with a constant thickness of 8 feet within the model.
- Layer 5 The Carney/Masters coal interbuden layer varied in thickness from 4 feet up to 107 feet within the model.

- Layer 6-The Masters coal was modeled with a constant thickness of 6 feet within the model.

Comment MuK 61 – Round 2

Response not accepted. It is acknowledged that Section 4.2.1 provides the thickness of the model layers. Also, the response states, “*Addendum MP-3 Section 2.5 describes the thickness of the various coal seams.*” Addendum MP-3, Section 2.5 does not describe the thickness but it is a section on hydraulic properties. Please clarify. (MK)

Response MuK 61 – Round 2

The previous sections reference was incorrect. Addendum MP-3 Section 2.5.1.3 provides a statement regarding the thickness of the Carney Coal. Addendum MP-3 Section 2.5.1.4 provides a statement regarding the thickness of the Masters Coal.

Comment MuK 62 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 62. Please include a justification for not considering the underlying zones beneath the Masters coal seam in the model. (MK)

Response MuK 62 – Round 1

The Masters coal is underlain by the Lebo Shale. The Lebo Shale is a thick (Appendix D5 Section D5.2.3), regional confining interval in the project area as described in Mine Plan Addendum MP-3 Section 2.1. There are no aquifer units identified within the model domain within the Lebo Shale with direct hydrologic connection to any of the elements of the model. Since the Lebo Shale is a regional confining unit, if it had been included in the groundwater model, it would have been assigned hydraulic parameters typical of a shale interval (very low hydraulic conductivity) and it would have essentially been a no flow barrier to the more permeable Masters coal above it. Groundwater Vistas treats the bottom of the model as a no flow boundary. Therefore, the Lebo Shale is for all practical purposes included in the model as a confining interval with the way the model is currently defined.

Comment MuK 62 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 62 – Round 2

The second to last paragraph in Addendum MP-3 Section 4.1 incorporates the context of the Round 1 response.

Comment MuK 63 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 63. Please provide appropriate cross section(s) of the model grid overlaid with the drill hole data collected during baseline characterization. This will help the evaluation of the adequacy of model layer thicknesses against the stratigraphic field data. (MK)

Response MuK 63 – Round 1

As noted in Addendum MP-3 Section 4.1, the Groundwater model layers were developed from a 3D geologic model developed from drill hole data within the project area developed for the purposes of making volumetric coal estimates. Minor updates to the surfaces were made where new data provided by additional exploration drilling was completed. An additional figure was developed (Addendum MP-3 Figure 4.1-3) and included in Addendum MP-3 that depicts actual cross sections cut from the groundwater model. Addendum D5-3 of Appendix D5 includes geologic cross sections with drill hole data that can be compared back to the actual cross sections included in Figure 4.1-3 of Addendum MP-3.

Comment MuK 63 – Round 2

No comment received.

Response MuK 63 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 64 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 64. Please clarify how the layers were modeled to represent the confined/unconfined aquifer types. (MK)

Response MuK 64 – Round 1

Groundwater Vistas has a “layer type” control that was set to #5: Confined/Unconfined, which allows the model to determine whether to use storativity or specific yield for the storage coefficient based on the elevation of the water elevation vs. formation tops. Groundwater Vistas handles the aquifer type classification without further inputs.

Comment MuK 64 – Round 2

Response not accepted. It is acknowledged and noted that GW Vistas handles it in an automated mode. Please provide a description on if there were any additional checks conducted on the results from the groundwater model to verify if the aquifer type used by GW Vistas is consistent with the conceptual model and field data. Example discussion: Are the deeper layers confined for the entire simulation or do they change from confined to unconfined due to mine operations? (MK)

Response MuK 64 – Round 2

Within the model domain the coal aquifers are relatively thin, ranging in thickness from 4 to 15 feet. Because the coal aquifers are relatively thin, during the model simulation the coals were typically either confined or dry. The only place where unconfined conditions occurred in the groundwater model simulations were near the outcrops or in the cells immediately adjacent to cells that went dry during the modeling simulations. Similarly, during mining simulations the cells immediately next to the mining areas became unconfined as well. When the water level in a cell drops below the top of the layer, Groundwater Vistas treats that cell as an unconfined aquifer which means that instead of using the specific storage term to calculate the amount of water in storage, the program uses specific yield to calculate the amount of water in storage. The total area of unconfined coal aquifer was relatively small as compared to the portion of the aquifer that was dry or fully saturated. Due to the relatively small area of potential unconfined aquifer, no specific analyses were conducted to determine whether changes in the specific yield in the unconfined aquifer would affect model calibration.

Comment MuK 65 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 65. In addition to model calibration, please provide justification for the recharge rates applied in the model including any literature references. (MK)

Response MuK 65 – Round 1

The initial recharge rates utilized in the model were initially estimated based on a USGS study (Water-Resources Investigations Report 01-4278) conducted on the eastern side of the Powder River basin and the Black Hills area. The study entitled, “Estimated Recharge to the Madison and Minnelusa Aquifers in the Black Hills Area, South Dakota and Wyoming, Water Years 1931-98.” was prepared by J.M. Carter and D.G. Driscoll. In the study Carter and Driscoll reported recharge rates varying from 0.04 inches per year to 2.93 inches per year. The 2.93 inch per year recharge rate was reported within the Madison limestone formation outcrops in the Black Hills while the lower range of recharge rates reported by Carter and Driscoll were estimated for areas in the eastern periphery of the Powder River Basin where the precipitation and soil types are similar in nature to the Brook Mine Permit area. Since calibrated recharge rates in the key recharge areas (the coal outcrops and the scoria outcrops) were within the range of values developed by Carter and Driscoll, the recharge rates used in the model are considered reasonable. Please note that the recharge rate throughout Layer 1 is much lower than the range of recharges developed by Carter and Driscoll. This is reasonable because much of Layer 1 has no hydrologic connection to the underlying coal seams. Additional justification for recharge rates applied in the model is discussed in response to comment BJ57.

Comment MuK 65 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 65 – Round 2

Addendum MP-3 Section 4.2.2 has been updated to incorporate the context of the Round 1 response.

Comment MuK 66 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 66. Page Addendum MP-3-33 states, “Recharge is applied within the modeling software by applying the recharge to the highest active layer.” Please clarify the presence of any modeled ‘dry cells’ in the model and the influence of applying the recharge to the layers below the dry cells. (MK)

Response MuK 66 – Round 1

As noted in the responses for comments MuK 59 and MuK 60, Groundwater Vistas does not allow for discontinuous layers across the model domain. Along the north and the west sides of the model there is a good portion of the model domain where the upper layers have been eroded off and do not actually exist. These areas of erosion were accounted for using no flow cells. As shown on Figures 4.4-1 through 4.4-4 of Addendum MP-3, the no flow cells in the top layer are the largest in areal extent while each underlying layer has a slightly decreased areal extent of no flow cells. In this case the no flow cell distribution was adjusted to match the outcrop of each layer. The fact that the software applies the recharge to the highest active layer was taken advantage of during the modeling process, since it is an effective way to apply recharge to an outcropping layer which is under another layer that is eroded away but due to software limitations is still present in the model.

Because CBM operations have generally removed most of the water from the coal seams, there are some locations within the model domain where dry cells during the modeling have caused cells in layer 1 to go dry and the recharge is applied to the next active layer below. While this could be problematic if a high recharge rate were assigned to the model cells, generally throughout the model domain the recharge rate is very low. Therefore, this results in a very minor amount of water coming into the model and did not significantly affect the model calibration.

Comment MuK 66 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 66 – Round 2

Addendum MP-3 Section 4.2.2 has been updated to incorporate the context of this response.

Comment MuK 67 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 67. Table 4.2-3. lists model porosity values. Typically, MODFLOW (flow model) does not use porosity in its calculations. Please clarify the need for this input parameter. (MK)

Response MuK 67 – Round 1

Modflow does not utilize porosity as part of its calculations. However, other modules included in the Groundwater Vistas package such as MODPATH do utilize porosity. In the case of this model, no MODPATH simulations were conducted. Therefore, the porosity term as put into the model has no impact on the calculations. However, porosity is a hydraulic parameter of the aquifer and may be important for future modeling simulations, therefore, the porosity values developed for each aquifer/aquitard unit will be left in the model report. Minor changes to the text in Addendum MP-3 have been made to clarify the role of porosity in this model.

Comment MuK 67 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 67 – Round 2

The context of the Round 1 response was incorporated into Addendum MP-3 Section 4.2.3 as part of the first round of comment responses.

Comment MuK 68 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 68. The faults are not modeled in Layer 1. Please clarify the procedure for determining the vertical extents of the faults in the model. (MK)

Response MuK 68 – Round 1

The composition of Layer 1 is predominately claystone. Because Layer 1 is not composed of aquifer material and because the hanging and footwalls are composed of strata with similar hydraulic properties, displacement due to faulting does not substantially change the flow through the aquitard and placing Horizontal flow barriers in the model in layer 1 was not necessary.

Comment MuK 68 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 68 – Round 2

Addendum MP-3 Section 4.4.1 was updated to incorporate the context of the Round 1 response.

Comment MuK 69 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 69. Please provide the input parameters used to model the horizontal flow barriers in the model and discuss their technical reasonableness. (MK)

Response MuK 69 – Round 1

Horizontal Flow Barriers were used in the model to simulate no-flow boundaries created by faulting within the project area. Horizontal flow barriers require two input parameters in Groundwater Vistas including wall thickness and hydraulic conductivity. The input parameter used in the model for wall thickness was 10 feet and a hydraulic conductivity of 1.0×10^{-5} ft/day was used. The horizontal flow barrier parameters as applied will essentially limit all but a very minor amount of flow across the barrier. As described in the response to comment MuK 51, the coal seams within the project area are relatively thin as compared to the fault offsets so it is reasonable to assume that the faults will significantly impede flow in the aquifer units.

Comment MuK 69 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 69 – Round 2

Addendum MP-3 Sections 4.4.2, 4.4.3, and 4.4.4 were updated to incorporate the context of the Round 1 response.

Comment MuK 70 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 70. Page Addendum MP-3-40 states, “As the current, post-CBM potentiometric surface is considered the static level.....” Please provide the implications of this assumption, on the model calibration of hydraulic parameters and the mode predicted hydrologic impacts (over estimation of drawdown vs. underestimation) (MK)

Response MuK 70 – Round 1

Addendum MP-3 Sections 4.8.1, 4.10, and 4.11 all discuss the implications of CBM impacts. In addition, the response to comment MuK 53 also discusses CBM impacts to water levels. As discussed in the response to comment MuK 53, the model conservatively assumed that CBM operations have lowered the water levels in the eastern portion of the model domain to a level near the top of the coal seams. To simulate this drawdown, the elevations of each general head boundary on the east side of the model were set at an elevation just above the top of the coal seam. The general head boundaries elevations remained the same in both the steady state and the transient models. Essentially, this means that the model operated under the assumption that the post CBM impacts were permanent prior to and after the Brook Mine mining activities.

The assumption that the water levels have been permanently impacted by CBM did have a significant impact on model calibration. The severely depressed water levels caused by CBM operations have resulted in a large number of cells going dry. The hydraulic parameters of the aquifer units within the eastern portion of the model domain were not adjusted to eliminate the dry cells since it is reasonable to assume that, with the severe drawdown modeled, the coal seams could have been dewatered in these areas. Therefore, even though the effects of the CBM drawdowns were observed during calibration, no specific adjustments were made to the modeled aquifer characteristics to eliminate these impacts. The dry cells did complicate calibration of the model because they cause instability in the MODFLOW model calculations and results.

The model was developed to take into account impacts from the combined effects of CBM and the proposed coal mining. In general, CBM development impacts are significantly larger than the predicted impacts from the Brook Mine. Therefore, ignoring CBM impacts would have significantly under predicted the potentiometric surfaces within the model domain and overestimated the impacts that Brook Mine would have on the system.

Many of the CBM wells are actively being plugged and abandoned. If this trend continues, there is a chance that recovery of water levels from CBM impacts may begin which will result in recharging of the coal seams. If this happens, it is anticipated that the model conservatively over predicts the impacts to the region especially in the long term recovery scenarios.

Comment MuK 70 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 70 – Round 2

Most of the discussion in the original comment has already been incorporated into Addendum MP-3 with the first round of comment responses. However, an additional concluding statement from this response was added to Addendum MP-3 Section 4.1.1 to incorporate the context of the Round 1 response into the permit application.

Comment MuK 71 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 71. It is noted that Table 4.7-1 summarizes the calibration residuals and statistics from the calibrated model. Please consider providing additional presentations of the calibrated model statistics. This will enable an easier evaluation of any spatial bias in the model calibration. (MK)

- a. X-Y plot of observed vs. simulated water levels.
- b. A map plotting the residuals to show the spatial distribution
- c. Provide a summary statistics table with Mean Error, Mean Absolute Error, Sum of Squared residuals for the calibrated model. It is noted that some of these values are presented in the sensitivity analysis. However, a compiled summary statistics table would be very helpful.

Response MuK 71 – Round 1

As requested the following additions have been made to the groundwater model report:

- A. An X-Y plot of observed versus simulated water levels has been added in the report as Addendum MP-3 Figure 4.7-1.
- B. The residuals have been added to figures 4.7-2, 4.7-3, and 4.7-4 of Addendum MP-3.
- C. Table 4.7-1 of Addendum MP-3 has been updated to include additional statistics.

Comment MuK 71 – Round 2

No comment received.

Response MuK 71 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 72 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 72. In addition, to the measured water levels, please clarify if there were any flow measurements used for model calibration. (MK)

Response MuK 72 – Round 1

There are no areas within the model domain where it was possible to collect any flow measurements that would support the modeling effort therefore, no flow measurement were used in the calibration.

Comment MuK 72 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 72 – Round 2

Discussion was added Addendum MP-3 Section 2.6 to clarify that no measurements of seepage at the outcrop were available. Also, text has been added to Section 4.7.2 clarifying that there are no measurements available for water that may leave or enter the Tongue River from the coal seams.

Comment MuK 73 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 73. Please provide a water budget table (in acre-feet per year or cubic-feet per day) showing all the inflows into the model and outflows from the model.

Response MuK 73 – Round 1

The following tables summarizes the inflows and outflows from the model domain during the steady state period, 5 years into mining, the end of mining, and at the end of recovery.

Mass Balance of Steady State Calibrated Model		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
General Heads	16,107	22,890
River	2,569	410
Drains	-	560
Recharge	5,168	-
Total	23,846	23,860

Mass Balance 5 years into Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	12,496	11,431
General Heads	16,130	22,904
River	2,688	385
Drains	-	1,774
Recharge	5,434	-
Total	36,749	36,494

Mass Balance End of Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	3,670	4,146
General Heads	16,135	22,902
River	2,705	365
Drains	-	532
Recharge	5,430	-
Total	27,941	27,945

Mass Balance End of Recovery		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	1,698	2183
General Heads	16,138	22,901
River	2,714	363
Drains	-	535
Recharge	5,427	-
Total	25,978	25,983

Comment MuK 73 – Round 2

Response conditionally accepted. Please incorporate the tables into the permit application. (MK)

Response MuK 73 – Round 2

Addendum MP-3 Section 4.10 has been updated to include the water budget. Specifically, Table 4.10-1 includes the mass balance throughout the mining simulations. A cross reference to the mass balance discussion in Addendum MP-3 Section 4.10 was also added to Addendum MP-3 Section 4.6 for clarity.

Comment MuK 74 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 74. Please provide a comparison of model simulated inflows and outflows against conceptual estimates of inflows and outflows. This comparison will act as another verification/check for the technical adequacy of the groundwater model (Example model GHB flows vs. reasonable estimated conceptual flows). (MK)

Response MuK 74 – Round 1

Response to comment MuK 73 includes tables that show the inflows and outflows from the model during the steady state period, 5 years into mining, the end of mining, and at the end of recovery. The five main categories of inflows and outflows include 1) storage, 2) general head boundaries, 3) river boundaries, 4) drains, and 5) recharge. Following is discussion regarding model predicted inflows and outflows for each category:

- 1) Storage – During the steady state model there is no inflow or outflow from storage so storage is not included in the first mass balance table in prepare for comment MuK 73. The model predicts that during active mining more water will come out of storage than will go into storage. Conceptually this is reasonable since during mining, water from the coals would be draining into the mined out areas. There is a trend of water continuing to come out of storage even after mining ceases. Even though the volume of water coming out of storage is quite low, it is contrary to the conceptualization of the system to have water leaving storage after mining because at this point water should be going back into storage. This phenomenon is attributed to the fact that many of the cells in the model go dry during mining because CBM operations have significantly dewatered the coals and there is not much water available in storage (see comment MuK 70). When the cells go dry, MODFLOW treats them as no flow areas and there can be a ripple effect that causes additional cells going dry. Since MODFLOW is not very efficient at rewetting dry cells when they should be resaturated, this ripple effect has caused permanent changes in the model. Over a long time the model would be expected to come to a steady state condition. The tables prepared in response to comment MuK 73 indicate

that even at the end of recovery, the model is not yet at the new equilibrium that would eventually be reached with the additional dry cells.

- 2) General Head Boundaries – The amount of water going into and out of the model domain via the general head boundaries remains relatively consistent throughout the modeled operations. This is reasonable because the general head boundaries are a long distance from the mining area and would not be expected to be significantly impacted by mining. In addition, the total volume of outflows from the general head boundaries generally balances the inflows from other sources. This is conceptually correct.
- 3) River Boundaries – The conceptual inflow and outflow from the coals to the Tongue River are discussed in detail in comment MuK 56. Groundwater Vistas does apply the River Boundary cells to the bottom of the layer in which they are inserted. The Tongue River Boundary cells were inserted into the model up to the point where Goose Creek joins the Tongue River. At that location the top of the Carney coal is estimated to be approximately 100 feet below the surface. Since the alluvium is generally much thinner in this area and there is actually a large amount of low permeability strata between the Tongue River alluvium and the coal (described in comment MuK 56), the model likely overestimates the contribution of the River boundary cells to the model because the river boundary cells provide a direct connection (in the model) between the river and the coals where there is not a physical connection. This conservatively over estimates how much water discharges from the River Boundary Cells to the model.
- 4) Drains – One drain was placed into layer 1 in the northeast side of the model domain to allow water to drain from the model where the Tongue River crosses the domain boundary. This represents the amount of water in layer 1 lost to the surface water system. The total discharge from this drain during steady state conditions is 560 ft³/day (2.9 gpm). While no physical measurements were (or can be) made to verify this amount, conceptually it is reasonable. The strata along the Tongue River likely does discharge a small amount of water to the River where it cuts through the numerous perched sand lenses that become saturated from natural recharge. There is no evidence of large groundwater discharges to the Tongue River in this area so it makes sense that a small discharge to the River (rather than a large discharge) would be observed in the model. During mining, drains were added to the model to remove water from the mine pits. The tables indicate that during mining the discharges from the drains do increase as expected. After mining is complete, discharges from the drains return approximately to premining levels which is conceptually correct.
- 5) The recharge amount used in the model stays at relatively the same level throughout the simulations. Total recharge across the model area is approximately 28 gpm. As is described in comment #65 the recharge rates are reasonable based on available studies.

Comment MuK 74 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. In addition, clarify the reason for increased recharge from the steady state to transient models (5,138 vs 5,434 cu.ft/day).

Response MuK 74 – Round 2

Addendum MP-3 Section 4.10 was updated to include the context of the Round 1 response. The model was also reviewed to determine why there was a slight difference in the recharge rates during the steady state simulation and the transient simulation period (5,168 vs 5434 cu ft/day). During the review of the model it was found that one of the recharge options in the MODFLOW options dialogue box was incorrect. The check box in the dialogue box entitled “Apply recharge from stress period 1 to all stress periods” had not been checked. After checking the option, the model was rerun and during the subsequent run the recharge was the same during the steady state portion and the transient portion of the model. Other minor changes in the mass balance numbers presented in Table 4.10-1 were also noted and the numbers were updated to reflect the model predicted values after changing the recharge settings.

Comment MuK 75 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 75. Page Addendum MP-3-40 states, “Due to a system of thin aquifers with similar sources and sinks and homogeneous hydraulic conductivities, the head values of the steady-state model were nearly identical between the separate coal layers as noted in Table 4.7-1.” Please clarify whether this statement implies that the interburden (where present) between the coal seams is not a confining unit. (MK)

Response MuK 75 – Round 1

This statement is an observation only based on review of modeled values and does not suggest a lack of confinement exists. Pumping tests conducted in separate aquifers demonstrated that the interburden provides confinement between the Carney and Masters aquifers as described in Section D6-8.3.2.3 of Appendix D6. In addition, Table 4.7-1 of Addendum MP-3 shows that at each cluster where both coal seams contained measureable water, the difference in measured water levels between the coal seams was higher than the modeled difference. This suggests that the vertical hydraulic conductivity assigned to the interburden in the model may be higher than the actual hydraulic conductivity of the interburden in the field. The use of a higher hydraulic conductivity for the interburden in the model will overestimate the drawdown in the other coal seam therefore, the predicted drawdown will be conservative.

Comment MuK 75 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 75 – Round 2

The last sentence in the first paragraph of Addendum MP-3 Section 4.7.2 has been revised for clarification. The Round 1 responses have been incorporated into Addendum MP-3.

Comment MuK 76 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 76. In figures 4.7-1, 4.7-2 and 4.7-3, please consider including the observed/interpreted water level contours and the measured water level elevations. This will enable to visually evaluate the observed vs. simulated water levels. (MK)

Response MuK 76 – Round 1

Figures 4.7-1, 4.7-2, and 4.7-3 of Addendum MP-3 have been updated to include both observation wells and observed elevations as well as observed potentiometric contours. Please note that in response to Comment MuK 71 an additional figure was added to this section (Figure 4.7-1) and these figures have since been renumbered to 4.7-2, 4.7-3, and 4.7-4.

Comment MuK 76 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 76 – Round 2

The figures previously added to the report (4.7-2, 4.7-3, and 4.7-4) during the first round of comment responses incorporate the context of the Round 1 response into Addendum MP-3.

Comment MuK 77 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 77. Page Addendum MP-3-45 states, “.....and if CBM production ceases, recovery rates will likely be higher than estimated in the model.” Please clarify if this statement implies that currently, there are CBM wells that are operational in the area and are pumping out groundwater. (MK)

Response MuK 77 – Round 1

Although substantially less than past years, some CBM wells in the area are still producing groundwater. Since CBM production has been ongoing for the last 15+ years the CBM operations have significantly lowered the water levels in the coals as is

noted in the report. Records of groundwater withdrawals can be found on the Wyoming Oil and Gas Conservation Commission's (WOGCC) online database at: wogcc.state.wy.us. According to WOGCC records there has been no groundwater production associated with CBM in Townships 57 and 58N Range 84W since 2012. However production is still occurring in Townships 57 and 58N Range 83W as well as Township 56N Range 83 and 84W. The portions of the model domain where CBM production may occur are located in Townships 56 and 57N Range 84W.

Comment MuK 77 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 77 – Round 2

Additional text was added to Addendum MP-3 Section 2.3 to describe the timeframe over which CBM wells have been in operation. Also Addendum MP-3 Section 4.8.1 was updated to further capture the context of the Round 1 response.

Comment MuK 78 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 78. Please consider removing the model sensitivity to storage coefficients and porosity. Steady state groundwater model equations do not include these parameters in any of the model calculations. (MK)

Response MuK 78 – Round 1

As noted in this comment, the final model did not include a transient calibration and a sensitivity analysis on storage coefficient and porosity is not appropriate. The section and discussion regarding model sensitivity to the storage coefficient and porosity has been updated and removed as appropriate.

Comment MuK 78 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 78 – Round 2

Addendum MP-3 Section 4.8.5 (last two sentences) was previously updated during the first round of comment responses to incorporate the context of the Round 1 response.

Comment MuK 79 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 79. Please clarify if the faults in the model and their parameters were considered in any of the sensitivity analyses. If not, please consider performing a detailed and thorough sensitivity analysis, as the faults appear to influence the drawdowns simulated by the groundwater model. (MK)

Response MuK 79 – Round 1

The faults do influence the drawdowns and flow patterns simulated in the groundwater model. However, as noted in the response to comment MuK 51 the displacement observed in the faults roughly 5 times as thick as the modeled coal seams. Given the fact that the dominant lithology in the area is low permeability claystone/siltstone, it is very likely that where faulting has occurred the displacement has resulted in coals being immediately adjacent to the low permeability strata. Therefore the faults are assumed to be hydrologic barriers to water flow. Based on the best available mapping, these faults have been placed into the model. Because the faults are physical parameters that were developed along with development of the geological model (i.e. elevations and thicknesses of the geological layers), a sensitivity analysis was not performed on the faults.

Part of the reason that the faults influence the groundwater responses in the groundwater model to the degree that they do is because of the CBM impacts. Because the CBM operations have significantly lowered the water levels in the coal seams, the faults create a shadow effect that results in many of the cells immediately downstream of the faults going dry. If there had not been any CBM dewatering operations performed in the coals, the water levels would be significantly higher and the effects of the faults would not be as pronounced.

Comment MuK 79 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 79 – Round 2

The context of the Round 1 response has been added to Addendum MP-3 Section 2.4.1.

Comment MuK 80 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 80. In addition to the simulated drawdown maps, please consider providing hydrographs at strategically selected locations. This will enable a better presentation of the impacts over time. (MK)

Response MuK 80 – Round 1

As suggested, Appendix A has been added to Addendum MP-3 which depicts the modeled water elevations during the model simulation period at all the water supply wells identified within the model domain (CBM wells excepted) and at selected alluvial target locations within the model domain.

Comment MuK 80 – Round 2

Response not accepted. Appendix A is missing with the electronic files provided to the Cheyenne Office. The hydrographs will be reviewed after the receipt of this Appendix A. (MK)

Response MuK 80 – Round 2

All the appendices for Addendum MP-3 for the first round of comment responses were inadvertently left out of the submittal. Both Appendix A and B are included in this round of comment responses.

Comment MuK 81 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 81. Please clarify if the three wells listed in Table 4.9-1 are the only wells considered for the analysis. Also, provide a discussion on the methodology to narrow down the analysis from several wells shown in the groundwater rights maps to these three wells. (MK)

Response MuK 81 – Round 1

Additional wells beyond those originally presented in Table 4.9-1 were considered in the analysis. Table 4.9-1 has been updated to include all the wells considered in the analysis. To determine which wells were included in the analysis, completions were compared to modeled surfaces to estimate which formation in which the well was completed. Those thought to be completed in the Carney/Masters sequence were included. Please note that the wells included in Table 4.9-1 error on the side of being over inclusive. Some of the wells are believed to be completed in multiple zones but the analysis assumes that they are only completed in the coal seams of interest. In addition, the well depths were determined based on the State Engineer's database and in many cases well depth data was left blank or was questionable. If there was a question whether a well was actually completed in the coal aquifer of interest the well was assumed to be completed in the coal. Therefore, the well list may include some wells that are not completed in the coals of concern.

Comment MuK 81 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 81 – Round 2

The context of the Round 1 response was added to Addendum MP-3 Section 4.9 during the first round of comment responses. In addition to updating Table 4.9-1, the text was also updated with verbiage from the round 1 comment response to describe how the wells were chosen for inclusion into the model.

Comment MuK 82 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 82. Please provide (or reference) a discussion about the three wells listed in Table 4.9-1, their depths, screened intervals and other pertinent information. (MK).

Response MuK 82 – Round 1

Table 4.9-1 has been updated to include total depth as well as the screen intervals for all the wells. Additional details on the wells can be found in Adjudication Appendix B.

Comment MuK 82 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 82 – Round 2

Addendum MP-3 Table 4.9-1 was previously updated as noted in the round 1 comment responses. Between the updated text in response to comments and this table, the context of this comment response have been captured in Addendum MP-3.

Comment MuK 83 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 83. Page Addendum MP-3-60 states, “ To measure the impacts to the Tongue River and Goose Creek, a series of targets were placed along these drainages in Layer 1” Please define the term target. Also, clarify if these targets are located in the alluvial aquifer. (MK)

Response MuK 83 – Round 1

The targets as used in Groundwater Vistas are simply locations where heads are measured and compared with measured heads (if there are any available). Ground Water Vistas generates a hydrograph throughout the transient period of mining and recovery for each target. These targets were placed in Layer 1 to estimate the impacts of mining to surface water bodies. These targets are located where the alluvial aquifer is simulated in Layer 1. Targets representing existing well locations were also put in layers 4 and 6 as well as discussed in Comment MuK 81.

Comment MuK 83 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 83 – Round 2

Additional text was added to Addendum MP-3 Section 4.9 to define what a target is. Also, the inclusion of Appendix A has been included with this round of comment

responses, which was inadvertently left out of the first round of comments. The appendix should also help incorporate the context of the Round 1 response.

Comment MuK 84 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 84. Page Addendum MP-3-60 states, “These targets demonstrate that the estimated maximum impact to Tongue River Alluvium is conservatively estimated to reach 2.5 feet drawdown near the river.” Please expand the discussion on the impacts to surface water flows including translating the drawdown to an estimated decrease in the groundwater baseflows to Tongue River and Goose Creek. (MK)

Response MuK 84 – Round 1

As shown on the hydrographs included in Appendix A, the maximum water level decline of 2.5 feet to the Tongue River alluvium occurred permanently and was caused by dry cells. This 2.5 foot drawdown is not believed to be a real drawdown because it resulted from model instability rather than a real predicted result. If the model did not have dry cells that caused permanent changes in the model, the maximum drawdown due to mining is estimated to be less than 0.5 feet.

As noted in the response to comment MuK 56, the model estimates the coals will contribute a relatively insignificant amount to water to the base flow of the Tongue River. As noted in Comment MuK 73 in the steady state model the River contributed approximately 2,569 cubic feet per day to the model while the river received 410 cubic feet per from the model. The net result is that in the steady state model 2,159 cubic feet per day (11.2 gpm) was contributed from the river to the model. For comparison, at the end of mining, the River contributed 2,714 cubic feet per day to the model and received 363 cubic feet per day from the model. The net result at the end of mining was that 2,351 cubic feet per day (12.2 gpm) was contributed from the River to the model. Over the simulated mining period the model estimates that the increased contribution of flow from the River to the model will be 1 gpm which represents approximately a 9% increase in flow.

Please note that in Groundwater Vistas the river boundary cells go to the bottom of the layer which likely overestimates the impacts to the River. Within the eastern portion of the model domain the coal aquifers can be 200 or more feet below the level of the river while the Tongue River Alluvium is estimated to be between 15 and 30 feet thick based on the thickness of alluvial wells constructed by Big Horn Coal in the area. Therefore, within the eastern portion of the model domain, the coals may be significantly below the alluvium and no River boundary was included in this portion of the model. However, there is an intermediary region where the actual level of the River is some 30-70 feet higher than the coals. At these locations the River boundary cells were left on to conservatively show the impacts to the river. However, the alluvium in these areas is likely thinner than 40-70 feet. As a result, the model allows the River to

directly contribute water to the coals below and the model is expected to overestimate the impacts to the Tongue River in these locations.

Comment MuK 84 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. The comment will be reviewed after the receipt of Appendix A. (MK)

Response MuK 84 – Round 2

Additional text was added to Addendum MP-3 Sections 2.6.3 and 4.9 to incorporate the context of the Round 1 response. Also, text was added to Section 4.10 in response to Comment MuK 73 which helps capture the context of the Round 1 response.

Comment MuK 85 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 85. Please provide a statement on any hydrologic impacts predicted by the groundwater model to areas outside the Brook mine permit boundary. (MK)

Response MuK 85 – Round 1

The only impacts outside of the Brook Mine Permit Boundary would be observed at the existing water supply wells. Table 4.9-1 describes the estimated impacts at all the water supply wells in the Model domain that will be impacted both inside and outside of the Brook Mine Permit Boundary. Please note that most of these wells are located outside of the Brook Mine permit boundary. As shown on Table 4.9-1 the largest model predicted impact seen at any existing well outside of the Brook Mine Permit boundary is 20 feet which would be observed at P48251W. As shown in the hydrograph for this well in Addendum MP-3 Appendix A, this impact is estimated to be short lived (approximately 4 years). Model predicted drawdowns at the rest of the wells are less than 5 feet. At many of the wells predicted drawdowns are less than 1 foot over the life of the mine.

Comment MuK 85 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. The comment will be reviewed after the receipt of Appendix A. (MK)

Response MuK 85 – Round 2

Additional text to capture the context of the Round 1 response has been added to Addendum MP-3 Section 4.11.

Comment MuK 86 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 86. Please provide a discussion on the simulated impacts caused by mining to surface water – groundwater interaction within the model domain. (MK)

Response MuK 86 – Round 1

Please see the response to comment MuK 84.

Comment MuK 86 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. The comment will be reviewed after the receipt of Appendix A. (MK)

Response MuK 86 – Round 2

Additional text has been added to Addendum MP-3 to incorporate the context of the Round 1 response (also see response to MuK 84).

Comment MuK 87 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 87. Please compare the model simulated water balance between pre-mining, during mining and post mining conditions. Consider including a table that presents the water balance during select periods showing the flows from all sources and discharges to all the sinks within the model domain. Provide a detailed discussion addressing any changes in the model simulated water balance between pre-mining, during mining and post mining conditions. (MK)

Response MuK 87 – Round 1

Please see responses to comments MuK 73 and MuK 74. A detailed discussion is included in the responses to these comments.

Comment MuK 87 – Round 2

Response accepted. (MK)

Response MuK 87 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 88 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 88. In addition to the maps presented on the recovery estimates, please provide hydrographs at strategically selected locations. This will enable a better presentation of recovery over time. (MK)

Response MuK 88 – Round 1

As described in response to Comment MuK 80, an appendix (Appendix A) has been added to Addendum MP-3 which depicts the modeled water elevations at a number of well and target locations within the model domain.

Comment MuK 88 – Round 2

Response not accepted. Appendix A is missing with the electronic files provided to the Cheyenne Office. The hydrographs will be reviewed after the receipt of this Appendix A. (MK)

Response MuK 88 – Round 2

Appendix A will be included with this second round of comment responses.

Comment MuK 89 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 89. The modeling documentation lacks discussion on the backfill aquifer. In the recovery model, please clarify how the model treats the backfill aquifer (spoils aquifer) and its resaturation. Please provide a discussion (or reference) to the hydraulic properties of the backfill materials used to create the backfill aquifer and the aerial extent of the backfill aquifer. (MK)

Response MuK 89 – Round 1

Mine Plan Section 4.10 discusses the backfill aquifer. Within the areas where the highwall miner is used for mining, an open cavern will be left behind. Unless the mined out areas collapse, the backfill aquifer is essentially an open cavern with 100% porosity. The modeling software used for this effort does not have the ability to transiently change aquifer properties, and during resaturation of the mined areas the assigned storage coefficients remained the same as the original aquifer properties. As a result, the model may underestimate the time that it takes for the aquifer to resaturate where the mining methods have increased the porosity and thereby resaturation volume. Inversely, in the slots mined with traditional open cut mining techniques, coal will be removed and replaced with overburden material. In these locations the backfilled material is expected to have poor aquifer characteristics because it will primarily be a mix of fine grained clay and silt with some sand. In these areas the aquifer will essentially be removed. Again, the modeling software does not have the ability to transiently change aquifer properties and this effect was ignored during the modeling.

Figure MP-3-4.9-1 shows the areal extent of mining and Addendum MP-3 Figures 4.7-2, 4.7-3, and 4.7-4 depict the areas that were modeled as dry within the Brook Mine permit area. It is important to note that a large percentage of the area that will be mined is dry prior to the initiation of mining. In addition, figures in MP-3 Section 4 show that after mining, some of the areas go dry and do not rewet. In the areas where slots are excavated this prediction is reasonable because the backfill will act as an

aquitard with poor aquifer characteristics. A layer by layer review of the mined area at the end of mining was conducted to determine conceptually how ignoring the changes in the coal porosity and changes in backfill material may have impacted the model predictions.

Upper Carney-With exception of a very small portion of mine block 9 (Figure MP-3-4.9-1). The entire Upper Carney coal is unsaturated. Therefore, there is no resaturation and no recovery. The model estimates are appropriate for the Upper Carney coal.

Lower Carney - Most of the mine blocks as well as the open slots are dry in the Lower Carney at the end of mining. Only mine blocks 1, 2, 5, 9, and 10 had substantial portions that were saturated. As a result, the potential error created by transient aquifer properties in model predicted resaturation rates to the underground mined coal blocks in the Lower Carney coal, if any, is expected to be very low. With the exception of the slots cut to mine blocks 5, 9, and 10, all of the slots cut to mine the Carney Coal will also be dry; therefore, resaturation at those locations will not substantially impact model predictions. The slots cut for blocks 9 and 10 generally run parallel to the direction of water flow. If the coal in these locations is completely removed and replaced with an aquitard, the impact to the aquifer will be minimal because water will simply flow around the portion of the backfilled aquifer. The open pit slot cut adjacent to mine block 5 does run perpendicular to the direction that water is flowing and may change the groundwater flow patterns in this area. However, the location of the slot is near the groundwater divide caused by the fault just to the south. Therefore, this slot is not expected to substantially impact groundwater flows either

Masters - Most of the Masters Coal mine blocks are saturated. Only blocks, 4, 5, 6, and 7 have substantial areas that are not saturated. In the mine blocks where underground mining techniques are employed the model may underestimate the time it takes for resaturation to occur because the storage coefficient is not updated to account for the increased porosity of the mined out block. However this resaturation time will be balanced out by the fact that there will be no aquifer replaced in the open cuts to resaturate, and thus these areas would not resaturate as the model predicts. With the exception of the open cut for mine block 5, all of the open cuts are oriented so that they will have minimal impacts on the natural flow gradients in the wellfield or are located within or adjacent to dry areas. As previously noted, the open cut near mine block 5 is located adjacent the drainage divide so it will not significantly change the water flow within the aquifer.

Due to the fact that much of the mined area is dry, the actual area mined that is below the water table is relatively small, and that the open cuts are oriented such that they have minimal impacts to groundwater flow, the recovery analysis performed by the model is reasonable. Also, as noted, the areas where underground mining is employed and the model overestimates the rate at which the aquifer is resaturated are counterbalanced by the areas of open cuts where the aquifer will not be replaced and the model underestimates the time it takes for the strata to resaturate.

Comment MuK 89 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 89 – Round 2

Text from this comment response was added to Addendum MP-3 Section 4.10 to capture the context of the Round 1 response.

Comment MuK 90 – Round 1

Mine Plan, Addendum MP-6 Subsidence Control Plan, 90. Figure MP6.1-1 shows “Monarch Seam Surface Only Mining”. Please clarify if the Monarch seam is targeted for mining in the appropriate sections of Appendix D5, Appendix D6 and mine plan. (MK)

Response MuK 90 – Round 1

The appropriate sections of Appendix D5 and D6 have been updated.

Comment MuK 90 – Round 2

No comment received.

Response MuK 90 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Reclamation Plan

Comment BJ 57 – Round 1

Volume 12, Reclamation Plan, Section RP.8.3, Pg. RP-37, The narrative describes the sources of recharge to the coal seams. One lithology mentioned as a positive recharge contributor is the overlying burn, scoria, or clinker material, generated by coal fires. It is a common misunderstanding that the scoriaceous material recharges coal or overburden. It would appear, at first glance, that the broken, vuggy material would be capable of conveying large amounts of water from the surface to materials beneath. That is not the case, however, as the coal/scoria interface has a zone of partially metamorphosed coal ash that lies between the burned material and the remnant coal. I have seen this zone many times during my 25 year career in the coal mines when supervising coal and overburden removal. This zone is characterized by a white to light gray, clay band that ranges in thickness from 6 inches to a foot or more. It is the same high silica ash found in the bottom ash of the local power plants that burn PRB coal. This ash band acts as an aquaclude, preventing water from entering or escaping the coal. Because of this, any recharge models that were run using the scoria as a

recharge source must be reevaluated using new layers that do not include the scoria. Rerun recharge models if needed.

Response BJ 57 – Round 1

It is true that the partially metamorphosed coal ash layer between the coal and the scoria has the potential to limit recharge from the scoria to the coal. However, even though the permeability of this layer is low, there will be areas where the coal has collapsed or other geologic variances such as a thinning section which will allow for water from the scoria to come into contact with the coal. Therefore, even though the scoria may not be directly in contact with the coal, there is still a recharge component to the scoria, albeit; significantly lower than if the scoria and coal were in direct contact. This low recharge rate is reflected in the groundwater model. The calibrated recharge rate used in the groundwater model for the areas covered by scoria was 0.35 inches per year. For comparison purposes, the recharge rates assigned to the Carney and Masters outcrops, where no scoria was present, varied from 0.2 to 0.88 inches per year. Considering that in the scoria areas a very large percentage of direct precipitation is expected to infiltrate into the scoria, the 0.35 inch per year recharge rate represents a significant reduction in the amount of water available (which could be upwards of 10 inches per year) to infiltrate into the coal seams. Therefore, the calibrated recharge rate included in the groundwater model does take into account the low permeability layer between the coal and the scoria.

Comment BJ 57 – Round 2

No comment received.

Response BJ 57 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 58 – Round 1

Volume 12, Reclamation Plan, Section RP.8.3, Pg. RP-39, The second sentence in the first paragraph has an odd, difficult to understand syntax. Please rewrite the sentence for clarity.

Response BJ 58 – Round 1

Revised page RP-39 text as requested. The sentence will now read “The mine will consult with WDEQ/LQD to determine the number of spoil wells that will be tested”.

Comment BJ 58 – Round 2

No comment received.

Response BJ 58 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 65 – Round 1

EXHIBITS, Reclamation Plan, Exhibit RP.6-1, The permit boundary on this map is inaccurate. Please recreate the permit boundary layer.

Response BJ 65 – Round 1

Revised Exhibit RP. 6-1 as requested.

Comment BJ 65 – Round 2

No comment received.

Response BJ 65 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 66 – Round 1

EXHIBITS, Reclamation Plan, Exhibit RP.8-3 and Exhibit RP.8-4, The post mining potentiometric surfaces for the Carney and Masters beds are suspended in mid-air over Slater Creek. Please terminate the contour lines at the outcrop or use a dotted line to indicate the calculated potentiometric surface.

Response BJ 66 – Round 1

Revised Exhibit RP.8-3 and RP.8-4 as requested.

Comment BJ 66 – Round 2

No comment received.

Response BJ 66 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 24 – Round 1

Reclamation Plan, Section RP.4. This brief section discusses what is considered spoil material to be removed during mining. The section states that spoil does not include coal, but there are some very narrow coal seams with numerous stringers of clay or of such low quality that will probably not be mined and will be placed in backfill. Also, the top layers of most coal seams are quite “dirty” and would also be removed and backfilled. In order to provide the readers with a more accurate description of the mining and reclamation processes, please revise the text to show that some coal-laden materials will also be considered spoils and will be backfilled during reclamation.

Response DS 24 – Round 1

Revised text as requested.

Comment DS 24 – Round 2

No comment received.

Response DS 24 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 25 – Round 1

Reclamation Plan, Section RP.5.2. Please provide a description of the methods used to control topsoil depth during replacement. Most mining operations use stakes with surveyed marks as guides for controlling soil application depths.

Response DS 25 – Round 1

See Section RP.5.4 for a description of the methods used to control topsoil depth during replacement.

Comment DS 25 – Round 2

No comment received.

Response DS 25 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 26 – Round 1

Reclamation Plan, Section RP.5.4. Variability in topsoil depth cannot be avoided due to limitations imposed by the equipment used and the pre-application preparations which may include ripping of the compacted overburden surface. Typically, the depth of topsoil application may vary 25%, but the average depth should be closely monitored and should not exceed the average availability. Also, because some soils exhibit unsuitable characteristics and will not be used for reclamation, discussion of the use of substitute topsoil materials is warranted in this section.

Response DS 26 – Round 1

Revised text as requested. Added discussion about substitute topsoil being an option if not enough suitable topsoil is salvaged.

Comment DS 26 – Round 2

No comment received.

Response DS 26 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 27 – Round 1

Reclamation Plan, Section RP.5.6. Sediment control measures will be required to prevent untreated runoff from exiting reclaimed lands onto adjacent native lands. Please provide a discussion of the sediment control measures to be used.

Response DS 27 – Round 1

Revised text as requested.

Comment DS 27 – Round 2

Response is not adequate. Use of ASCMs during mining and following reclamation as sediment control must follow the requirements of Guideline 15. Brook Mine must provide some detail about how the ASCMs will be sized, certified, permitted and terminated. ASCMs may not be used within ½ mile of the Tongue River. Please provide requested information in the Mine Plan.

Response DS 27 – Round 2

In response to Comment MK 116 (Round 2), ASCMs have been removed as the primary form of sediment control within half of a mile of the Tongue River and Goose Creek. In the place of ASCMs within the half-mile buffer, sediment impoundments have been designed. These designs are now provided in Addendum MP-2. Design standards for ASCMs, inspection and maintenance standards for ASCMs, and ASCM removal and site reclamation standards are provided in Addendum MP-1.

Comment DS 28 – Round 1

Reclamation Plan, Section RP.8.2. This section states only that impoundments will require Landowner, LQD and SEO approval. Prior to construction of post mining impoundments, SEO approved plans for the impoundments must be submitted for inclusion in the permit Reclamation Plan. Please include a statement that a Reclamation Plan revision will be approved by the LQD prior to construction of impoundments.

Response DS 28 – Round 1

Revised Section RP.8.2 to include a statement regarding LQD approval before the construction of postmine impoundments.

Comment DS 28 – Round 2

No comment received.

Response DS 28 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 29 – Round 1

Reclamation Plan, Section RP.11.1. The primary final land use for the permitted acreage will be grazing and wildlife. Only areas where the current use is industrial will remain industrial land uses after mining is completed. Therefore, in order for any constructed buildings or railroad access to remain following mining, and a permit revision to change the land use will be required. It is not just a matter of demonstrating usefulness to the LQD and receiving landowner consent. This will be a major revision to the permit that will require public notice. Clarification should be provided concerning the steps involved to allow building to remain.

Response DS 29 – Round 1

Revised text as requested. Eliminated discussion in Section RP.11 regarding leaving any buildings, facilities, and equipment following completion of mining.

Comment DS 29 – Round 2

No comment received.

Response DS 29 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 30 – Round 1

Reclamation Plan, All Mine Plan Maps with progressions must show the actual years of the initial disturbance or mining activity, or the progression must be linked to a specific year in Reclamation Plan text. The maps must also include the contour interval.

Response DS 30 – Round 1

See Mine Plan MP.1.6 for a description of permit terms and initial year. Revised text in Reclamation Plan Section RP.13 to reference Mine Plane MP.1.6. Revised Exhibit RP.5-1 adding “Note: Year 3 corresponds to the year 2019” in Legend.

Comment DS 30 – Round 2

No comment received.

Response DS 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 33 – Round 2 (New Comment)

New Comment: Reevaluate the average topsoil replacement depth based on salvage depth estimates shown in Appendix D7 and expected disturbance of each soil series during mining. 18 inches may not be adequate.

Response DS 33 – Round 2 (New Comment)

The topsoil depth has been revised in the first paragraph of Section RP.5.4.

Comment DE 19 – Round 1

Reclamation Plan, Section RP.5.1, page RP-6 – RAMACO states that the contoured surface will be scarified or ripped, if necessary. The mine should commit to scarifying or ripping all surfaces prior to topsoil replacement.

Response DE 19 – Round 1

Revised text as requested. Remove “if necessary” from sentence.

Comment DE 19 – Round 2

No comment received.

Response DE 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 20 – Round 1

Reclamation Plan, Section RP.5.6, page RP-8 - The 1st sentence of the 2nd paragraph doesn't make sense. Please correct.

Response DE 20 – Round 1

Revised text as requested. The sentence now reads “Rills and gullies occurring in redistributed soil precluding the achievement of the approved postmining land use or the reestablishment of vegetative cover will be rectified”.

Comment DE 20 – Round 2

No comment received.

Response DE 20 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 21 – Round 2 (New Comment)

There still has been no Reclamation Bond Estimate submitted at this time so there is nothing to review.

Response DE 20 – Round 2 (New Comment)

Reclamation Bond calculations are pending.

Comment JJ 5 – Round 1

Reclamation Plan, 5. Exhibit RP 6-1 also displays permit boundary discrepancies in regards to the section lines on it and those located on the Adjudication Exhibit 1. Please update accordingly.

Response JJ 5 – Round 1

See response to comment BJ 65. Revised Exhibit RP.6-1 as requested.

Comment JJ 5 – Round 2

No comment received.

Response JJ 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment JJ 6 – Round 1

Reclamation Plan, 6. Table RP 6-1 states that there are 11.6 acres of wetlands and other aquatic resources. Please discuss where these acres are to be reclaimed and show them on the Exhibit RP. 6-1 which displays the reclaimed vegetation communities and their locations.

Response JJ 6 – Round 1

Revised Section RP.9 to include reference to Exhibit RP.6-1 for location of reclaimed wetlands and OAR. Revised Exhibit RP.6-1 to include reclaimed wetlands and OAR locations.

Comment JJ 6 – Round 2

No comment received.

Response JJ 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 24 – Round 1

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, Assuming the Tongue River is an AVF, this section should discuss how the essential hydrologic functions will be maintained and/or reestablished, as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(ii). As noted in Comment No. 21, the essential hydrologic functions of the Tongue River AVF need to be identified and a monitoring system needs to be installed. (MDK)

Response MK 24 – Round 1

Revised text as requested in Section RP.10.

Comment MK 24 – Round 2

Response not accepted. Please provide a more thorough discussion for each identified essential hydrologic function to demonstrate that the functions will be maintained throughout the mining operation. In particular, since mining is predicted to cause some amount drawdown in the Tongue River alluvium (Mine Plan Addendum MP-3), this needs specific discussion to demonstrate that the essential hydrologic functions will be maintained and/or reestablished.

Please also provide more detail on the plan and frequency of analyzing the aerial imagery. In addition, please note that given that Mine Plan Addendum MP-3 predicts some amount of drawdown in the alluvium of the Tongue River, installation of alluvial monitoring wells would be required to monitor the AVF. Otherwise there will be no way to assess the validity of the predicted drawdowns. Please provide a more detailed plan for installing the alluvial monitoring well(s). (MDK)

Response MK 24 – Round 2

The text at the end of Section RP.10 has been revised to include the pertinent details on the essential hydrologic function monitoring plan. The plan includes obtaining infrared photography every 5 years and photo documentation annually, as well as installing and monitoring alluvial wells on the Tongue River and Goose Creek during mining and reclamation periods. Exhibit RP.8-5 has been revised to include the proposed locations of the alluvial wells. Also, Guideline 9 Alluvial Valley Floors has been added to the Reference Section RP.17.

Comment MK 25 – Round 1

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, 25. As noted in Comment No. 21, the adjacent Goose Creek AVF also needs a monitoring system to demonstrate essential hydrologic functions are maintained and/or reestablished as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(i) and (ii). (MDK)

Response MK 25 – Round 1

Revised text as requested in Section RP.10.

Comment MK 25 – Round 2

Response not accepted. Please revise the discussion on the Goose Creek AVF monitoring system as per the response to Comment MK 24. (MDK)

Response MK 25 – Round 2

See response MK 24 for discussion on the Goose Creek AVF monitoring system.

Comment MK 26 – Round 1

Reclamation Plan, Section RP.10 Reestablishment of Essential Hydrologic Functions and Agricultural Utility on Alluvial Valley Floors, 26. This section may also need to be addressed if the LQD finds that other AVFs exist on or near the permit area. If AVFs are determined to be present, the essential hydrologic functions must be maintained and/or reestablished as required by LQD Coal Rules and Regulations, Chapter 5, Section 3(c)(i) and (ii). (MDK)

Response MK 26 – Round 1

Revised text as requested in Section RP.10.

Comment MK 26 – Round 2

No comment received.

Response MK 26 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 75 – Round 1

Reclamation Plan, Section RP.3.3 Postmine Slope Analysis, 49. Please provide a discussion that compares the pre-mine vs. post-mine slope characteristics. A table would be helpful that compared the minimum, maximum, and average slopes under pre-mine and post-mine conditions. (MDK)

Response MK 75 – Round 1

Added Table RP.3-1 comparing premining and postmining slopes. Updated Section RP.3.3 of text to include reference to the new table.

Comment MK 75 – Round 2

No comment received.

Response MK 75 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 76 – Round 1

Reclamation Plan, Section RP.3.5 Drainage Reestablishment, 50. It is stated that mining will disturb portions of the Slater Creek channel and the reclamation will entail reconstruction. However, the Mine Plan PHC (Section MP.6.1) stated that Slater Creek

“will still flow naturally around the trench”, and “Because Slater Creek’s flow will not come into contact with mining activities, no impact will be made to water quality”. Please provide a clear and explicit description of the extent of direct disturbance to the Slater Creek channel. This description should be consistent between the Mine Plan and Reclamation Plan. (MDK)

Response MK 76 – Round 1

As stated in the revised Section MP.6.1 of the Mine Plan, the only anticipated surface disturbance to Slater Creek during mining will be the redirection of the channel through a culvert under a proposed haul road. No text was edited in response to this comment.

Comment MK 76 – Round 2

No comment received.

Response MK 76 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 77 – Round 1

Reclamation Plan, Section RP.4.2 Mitigation of Unsuitable Material , 51. Minor channels are defined as ephemeral streams but there is no definition provided for “major channels”. Please provide a definition and also illustrate an example of a major channel within the proposed permit boundary that would fit into this category. (MDK)

Response MK 77 – Round 1

Revised text in Section RP.4.2 to provide the definition of major channels.

Comment MK 77 – Round 2

No comment received.

Response MK 77 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 78 – Round 1

Reclamation Plan, Section RP.5.6 Erosion Control and Conservation Practices, 52. The first sentence of the second paragraph...”Rills and gullies...” needs revised, as it appears to be missing one or more words. (MDK)

Response MK 78 – Round 1

See response to Comment DE 20. Text revised as requested.

Comment MK 78 – Round 2

No comment received.

Response MK 78 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 79 – Round 1

Reclamation Plan, Section RP.7.4 Aquatic Habitat, 53. The second sentence discusses stockponds possibly being disturbed by mining activities. The Mine Plan PHC did not mention that any existing stockponds would be disturbed by mining activities. If stockponds are to be disturbed by the mining operation, this should be discussed in the Mine Plan PHC. (MDK)

Response MK 79 – Round 1

The text in the Mine Plan PHC has been revised to clarify the disturbance to stockponds within the permit area. Section RP.7.4 has been revised to clarify the anticipated aquatic habitat locations.

Comment MK 79 – Round 2

No comment received.

Response MK 79 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 80 – Round 1

Reclamation Plan, Section RP.7.4 Aquatic Habitat, 54. The text states that two additional postmine impoundments will be constructed and their location is shown in Exhibit RP.3-1. This Exhibit shows ten permanent impoundments, both on and adjacent to the proposed permit area. Please revise this discrepancy in the text or change the symbology in the Exhibit to clearly show the two permanent post-mine impoundments. (MDK)

Response MK 80 – Round 1

Revised text in Section RP.7.4. to clarify the postmine impoundment locations.

Comment MK 80 – Round 2

No comment received.

Response MK 80 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 81 – Round 1

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 55. Please add the major stream name labels (Tongue River, Goose Creek, East Fork Earley Creek, Slater Creek, Hidden Water Creek) to Exhibit RP.8-1. (MDK)

Response MK 81 – Round 1

Revised Exhibit RP.8-1 as requested.

Comment MK 81 – Round 2

No comment received.

Comment MK 81 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 82 – Round 1

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 56. Please explain in the text how the postmine drainage basin parameters in Table RP.8-1 were determined. (MDK)

Response MK 82 – Round 1

Revised text in Section RP.8.1 as requested.

Comment MK 82 – Round 2

No comment received.

Response MK 82 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 83 – Round 1

Reclamation Plan, Section RP.8.1 Drainage Basin Reconstruction, 57. The text states that a comparison of drainage basin parameters in Table RP.8-1 and Exhibit RP.8-1 show that the overall hydrologic balance will remain largely unchanged. This conclusion is not obvious from the Table and Exhibit. How similar are the postmine drainage basin parameters to the pre-mine parameters? Which sub-drainages show the largest change from pre-mine conditions? The text needs to include a more thorough discussion to demonstrate to the reader why exactly the postmine hydrologic balance will be unchanged. (MDK)

Response MK 83 – Round 1

Revised text to include reference to Appendix D6 tables and exhibits regarding drainage basin parameters. Minor disturbance and mining methods contribute to the largely unchanged postmine drainage basin parameters.

Comment MK 83 – Round 2

No comment received.

Response MK 83 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 84 – Round 1

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 58. The text provides no discussion of the comparison between the pre-mine and postmine modelled discharge values. Please provide this discussion so the reader can determine if the differences are minor or major. (MDK)

Response MK 84 – Round 1

Revised text in Section RP.8.1.1 as requested.

Comment MK 84 – Round 2

No comment received.

Response MK 84 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 85 – Round 1

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 59. Please add the year to the Miller reference within the text (2003) and add this citation to the references list in Section RP.17. (MDK)

Response MK 85 – Round 1

Revised text as requested.

Comment MK 85 – Round 2

No comment received.

Response MK 85 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 86 – Round 1

Reclamation Plan, Section RP.8.1.1 Discharge Estimates, 60. Similar to Comment No. 8 made for Appendix D6, the HEC-HMS runoff estimates in Table RP.8.4 are much higher than the Miller (2003) equations. Please provide a discussion in the text as to the reasonableness of the HEC-HMS estimates and why the HEC-HMS estimates are so much higher than the Miller (2003) regression equations.

Response MK 86 – Round 1

See response to Comment MK 34. No revisions to the text were made.

Comment MK 86 – Round 2

No comment received.

Response MK 86 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 87 – Round 1

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, The last sentence in the first paragraph states that stream reaches for which designed cross sections are provided are identified in plan on Exhibit RP.8-1. There is nothing on this Exhibit that shows which stream reaches have designed cross sections, nor which stream channels are being reconstructed. Please clearly identify this information on this Exhibit. (MDK)

Response MK 87 – Round 1

Exhibit RP.8-1 has been revised as requested.

Comment MK 87 – Round 2

No comment received.

Response MK 87 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 88 – Round 1

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, 62. Exhibit RP.8-2 shows that the main Slater Creek channel will not be disturbed. Please consider this in light of Comment No. 50 that requested clarification on the extent of disturbance to the Slater Creek channel. (MDK)

Response MK 88 – Round 1

See response to Comment MK 76(referred to as Comment No. 50). Revised Exhibits RP.8-1 RP.8-2 as requested. A reconstructed Slater Creek (Figure RP.8-9) cross section has been added to reflect the correct disturbance boundary.

Comment MK 88 – Round 2

No comment received.

Response MK 88 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 89 – Round 1

Reclamation Plan, Section RP.8.1.2 Channel/Floodplain Design, 63. On Page RP-35, second paragraph, it references “reclaimed Slater Creek channel” and channel hydraulics are presented in Table RP.8-5. It is not clear why channel hydraulics are presented for Slater Creek when it will not be disturbed. Is this because reclaimed tributaries to Slater Creek are changing such that the main channel of Slater Creek is expected to be change? Please clarify this in the text. (MDK)

Response MK 89 – Round 1

Slater Creek is included Table RP.8-5 to show that the postmine Slater Creek Channel will be hydraulically similar to premine conditions after mining and reclamation operations have been completed as reclamation of a portion of Slater Creek is expected.

Comment MK 89 – Round 2

No comment received.

Response MK 89 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 90 – Round 1

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 64. It is unclear exactly how many new postmine impoundments will be constructed. Table RP.8-6 identifies two impoundments (Enhancement Stock Pond 1 and Replacement Stock Pond 1), and these are shown in Exhibit RP.3-1. Exhibit RP.3-1 shows eight other permanent impoundments. Please identify if these are new features to be constructed or if they are existing stockponds that may be affected by the mining operation. (MDK)

Response MK 90 – Round 1

The text in Section RP.8.2 has been revised to clarify that only the new features to be constructed are displayed in Table RP.8-6. Affected existing stockponds will be constructed approximately to premine conditions.

Comment MK 90 – Round 2

No comment received.

Response MK 90 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 91 – Round 1

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 65. Please identify in this section if there will be a net increase or decrease in post-mine water storage capacity relative to pre-mine capacity. (MDK)

Response MK 91 – Round 1

Revised text in Section RP.8.2 to clarify a net increase in water storage capacity is expected due to the addition of two postmine impoundments.

Comment MK 91 – Round 2

No comment received.

Response MK 91 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 92 – Round 1

Reclamation Plan, Section RP.8.2 Permanent Impoundments, 66. As mentioned Comment No. 47, it is advised that the applicant discuss with the SEO-Interstate Streams Division any implications for the Yellowstone Compact if new water storage features are proposed that potentially decrease water quantity to the Tongue River. (MDK)

Response MK 92 – Round 1

See response to Comment DS 28(Comment No. 47 mentioned above). Revised text as requested.

Comment MK 92 – Round 2

Response not accepted. The response referenced Comment DS 28, which did not mention consulting with the SEO about the Yellowstone Compact. As indicated in the

response to Comment MK 73, RAMACO is aware of the Yellowstone Compact and will act in accordance with the guidelines outlined. Please add a similar statement to Section RP.8.2. (MDK)

Response MK 92 – Round 2

The text in Section RP.8.2 Permanent Impoundments has been revised in the second paragraph to acknowledge that RAMACO will obtain a permit from the SEO, therefore any implications to the Yellowstone Compact will be analyzed by the SEO.

Comment MK 93 – Round 1

Reclamation Plan, Section RP.8.4.2 Surface Water Monitoring, 67. The text on Page RP-40 states that the surface water monitoring stations are shown on Exhibit RP.8-4. However, the stations are not shown on this Exhibit. It may be make the most sense to add these to Exhibit RP.8-5 and rename the Exhibit “Postmine Hydrologic Monitoring Locations” so the surface water stations and monitoring wells are on one Exhibit. (MDK)

Response MK 93 – Round 1

Revised the reference in text to state “locations of these sites are shown on Exhibit RP.8-5”. Exhibit RP.8-5 was revised to include surface water monitoring stations and renamed as requested. Table RP.8-9 was edited to include all planned surface water stations including postmine impoundment monitoring sites.

Comment MK 93 – Round 2

No comment received.

Response MK 93 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 94 – Round 1

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 68. The text on Page RP-41 states that water quality samples will be collected at each of the postmine impoundments listed in Table RP.8-6 and presented on Exhibit RP.3-1. Please clarify in the text that this sampling list includes all ten impoundments shown. (MDK)

Response MK 94 – Round 1

Revised text in Section RP.8.4.3 to reference Table RP.8-9 and Exhibit RP.8-5 for postmine surface water monitoring sites including postmine impoundments.

Comment MK 94 – Round 2

No comment received.

Response MK 94 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 95 – Round 1

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 69. Please add the list of impoundments to be sampled to Table RP.8-9 “Surface Water Monitoring Sites”.
(MDK)

Response MK 95 – Round 1

Revised Table RP.8-9 as requested.

Comment MK 95 – Round 2

No comment received.

Response MK 95 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 96 – Round 1

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 70. The postmine impoundments to be sampled appears to be slightly different from the impoundments listed in Mine Plan Table MP.7-1 “Operational Surface Water Monitoring Locations”. Table MP.7-1 lists three impoundments (Hall Reservoir, Black Mountain No. 1 Stock Reservoir, and Legerski Bros #1 Stock Reservoir) that are not listed as postmine impoundments to be sampled. Please explain why there is a difference in the operational monitoring and postmine monitoring of some impoundments. (MDK)

Response MK 96 – Round 1

Black Mountain No.1 Stock Reservoir has been added as a postmine impoundment that will be monitored. Legerski No. 1 Stock Reservoir and Hall Reservoir are outside of the areas planned for mining disturbance, however in an effort to further monitor the surface water of the Brook Mine permit area, the reservoirs were added to be sampled quarterly during mining. Table RP.8-9 and Exhibit RP.8-5 have been updated to include Black Mountain Reservoir No. 1 Stock Reservoir.

Comment MK 96 – Round 2

No comment received.

Response MK 96 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 97 – Round 1

Reclamation Plan, Section RP.8.4.3 Postmine Impoundments, 71. In the second full paragraph on Page RP-41, “The water quality samples..” please also state that the water quality samples will be compared against WDEQ/WQD Class III groundwater standards, as suggested by LQD Guideline No. 17 for replacement and enhancement stockponds. (MDK)

Response MK 97 – Round 1

Revised text as requested in Section RP.8.4.3.

Comment MK 97 – Round 2

No comment received.

Response MK 97 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 98 – Round 1

Reclamation Plan, Section RP.8.5.2 Surface Water, 72. At the end of the first paragraph on Page RP-44, it predicts a “slight change” in event peaks and volumes. Please further discuss what is meant by a “slight change”, i.e., what is the magnitude of the increase or decrease? (MDK)

Response MK 98 – Round 1

Section RP.8.5.2 has been updated to reflect the change in event peaks and volumes will be less than one percent when compared to premining conditions.

Comment MK 98 – Round 2

No comment received.

Response MK 98 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 99 – Round 1

Reclamation Plan, Section RP.8.5.2 Surface Water, 73. In the second paragraph on Page RP-44, please clarify the extent of direct mining disturbance to Slater Creek versus tributaries of Slater Creek. This comment relates to previous Comments No. 50 and 62. (MDK)

Response MK 99 – Round 1

See response to Comments MK 76 (comment No. 50) and Mk 88 (Comment No. 62).

Comment MK 99 – Round 2

No comment received.

Response MK 99 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 100 – Round 1

Reclamation Plan, Section RP.8.5.2 Surface Water, 74. Please provide a discussion as to whether the planned postmine impoundments will affect surface water quantity on or downstream of the proposed permit area. (MDK)

Response MK 100 – Round 1

Section RP.8.5.2 has been revised to include discussion of the effect of postmine impoundments to the surface water quantity on and downstream of the proposed permit area.

Comment MK 100 – Round 2

No comment received.

Response MK 100 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 101 – Round 1

Reclamation Plan, Section RP.9.1 Introduction, 75. The second paragraph references Appendix D8. Should this be Appendix D10 (Wetlands)? Please revise this if necessary. (MDK)

Response MK 101 – Round 1

The reference has been revised to D10 as requested.

Comment MK 101 – Round 2

No comment received.

Response MK 101 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 102 – Round 1

Reclamation Plan, Section RP.9.1 Introduction, 76. Please add a statement up front in the Wetland Mitigation section that the USACE has not yet issued a jurisdictional determination for the proposed Brook Mine. Please also provide a statement in the

text that the information in Section RP.9 may be subject to change pending the USACE determination. The USACE jurisdictional determination should also be incorporated somewhere into the Mine Permit once that is received by the Brook Mine. (MDK)

Response MK 102 – Round 1

Sections RP.9.1 has been revised as requested.

Comment MK 102 – Round 2

No comment received.

Response MK 102 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 103 – Round 1

Reclamation Plan, Section RP.14 Bond Release, 77. The LQD no longer requires a bond release verification for “sediment control release”. This is now termed “surficial stability verification”. More information is available in LQD Guideline No. 23. Please revise the text for this change. (MDK)

Response MK 103 – Round 1

The text in Section RP.14 has been revised by removing the reference to sediment control release.

Comment MK 103 – Round 2

Response accepted. However please note that RAMACO may wish to also cite LQD Guidelines No. 20, 21, 22, 23, and 25, as these are key documents for assisting operators with bond release procedures. (MDK)

Response MK 103 – Round 2

The text in Section RP.14 Bond Release has been revised to include discussion of WDEQ/LQD Guidelines No. 20, 21, 22, 23 and 25 for bond release. In addition, the Guidelines mentioned above have been added to Section RP.17 References.

Comment MK 118 – Round 2 (New Comment)

In Section RP.3.4 Erosion and Sedimentation Control Practices, the first sentence on Page RP-4 references sedimentation impoundments. As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 118 – Round 2 (New Comment)

The Mine Plan has been revised to state that sedimentation impoundments will be required. Designs for sedimentation impoundments required in the first five years of operations are now provided in Addendum MP-2. Therefore, the reference to sedimentation impoundments in the Reclamation Plan has been left in place.

Comment MK 119 – Round 2 (New Comment)

In Section RP.8.5.2 Surface Water, the third sentence of the last paragraph on Page RP-46 references sedimentation reservoirs. As noted in the response to Comment MK 49, sedimentation reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation reservoirs are not planned. (MDK)

Response MK 119 – Round 2 (New Comment)

The Mine Plan has been revised to state that sedimentation impoundments will be required. Designs for sedimentation impoundments required in the first five years of operations are now provided in Addendum MP-2. Therefore, the reference to sedimentation impoundments in the Reclamation Plan has been left in place.

Comment MuK 91 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 91. Section 8.3, page RP-38 states, “The estimated Postmine Potentiometric surfaces for the reclaimed aquifer for the Masters and Carney Seams are presented respectively in Exhibit RP.8.3 and Exhibit RP.8-4. Please provide a summary comparing and contrasting the premine potentiometric surfaces vs. post mine potentiometric surfaces. This comparison should also consider any changes in the hydraulic properties (hydraulic conductivity, storativity, recharge capacity) of the premine aquifers vs. post mine aquifers. (MK)

Response MuK 91 – Round 1

Section RP.8.5.3 has been revised to include discussion regarding the comparison of premine and postmine potentiometric surfaces.

Comment MuK 91 – Round 2

No comment received.

Response MuK 91 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 92 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 92. Please discuss any changes in the interaction between the surface water and groundwater systems from the premining through the postmining phases of the operation. (MK)

Response MuK 92 – Round 1

The response to Comment MuK 84 describes interaction between the surface water and groundwater systems from the premining through the postmining phases of operation. In general the changes between the surface water systems and the groundwater systems are expected to be minimal. For a short time during mining it is anticipated that there will be a small (less than 6%) increase in the amount of water that recharges the coal seams from the Tongue River. Once the water levels in the coals recover, no further impacts are expected.

Comment MuK 92 – Round 2

No comment received.

Response MuK 92 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 93 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 93. Please discuss the intersection of the postmining topographic and potentiometric surfaces and their effects on the location and size of groundwater-fed water bodies. (MK)

Response MuK 93 – Round 1

Revised Section RP.8.5.3 as requested.

Comment MuK 93 – Round 2

No comment received.

Response MuK 93 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 94 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 94. Section 8.5.3, page RP-46 states, “These water quality changes can be qualitatively predicted from the overburden mineralogy and projected post mine hydrology.” Please expand this discussion on projected groundwater quality. Provide a discussion on the estimated/ projected post mining groundwater quality. A detailed description of potential changes in water quality from flow through backfill/mined out areas should be included. Any potential changes to

water quality in adjacent aquifers should be discussed with respect to the potential for offsite material damage. (MK)

Response MuK 94 – Round 1

Revised Section RP.8.5.3 text as requested.

Comment MuK 94 – Round 2

No comment received.

Response MuK 94 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 95 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 95. Please provide a discussion on any anticipated water use during the reclamation period. (MK)

Response MuK 95 – Round 1

As discussed in Addendum MP-3, the only anticipated groundwater uses during the reclamation period are at existing water supply wells. Section RP.8.5.3 has been revised to include additional discussion.

Comment MuK 95 – Round 2

No comment received.

Response MuK 95 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 96 – Round 1

Reclamation Plan, RP 8.5.3 Groundwater, 96. Please address (or reference) any expected post-reclamation subsidence effects on the hydrologic system (both quantity and quality) and the plan to minimize these effects. (MK)

Response MuK 96 – Round 1

Section RP.8.5.3 has been revised to include discussion of expected postmine subsidence effects on the hydrologic system.

Comment MuK 96 – Round 2

No comment received.

Response MuK 96 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 7 – Round 1

Reclamation Plan, Page RP-13. Section RP.6.2.6. In the last sentence please add that substitutions to the seed mix will be made only with WDEQ approval.

Response SP 7 – Round 1

Revised text in Section RP.6.2.6 as requested, the statement will now read “In the event that seed for primary species is not available, alternatives will be considered which match the life form and morphology of the primary choice only with WDEQ approval.”

Comment SP 7 – Round 2

No comment received.

Response SP 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 8 – Round 1

Reclamation Plan, Page RP-16. Section RP.6.4.1. To demonstrate that all of the unaffected acres of each vegetation community are sufficient for an extended reference area please create a table with total acres and affected acres and reference this table in this section.

Response SP 8 – Round 1

Table RP.6-6 has been created to display the number of extended reference acres for the respective vegetation communities. The text in Section RP.6.4.1 has been revised to include a reference to the newly created table.

Comment SP 8 – Round 2

No comment received.

Response SP 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 9 – Round 1

Reclamation Plan, Page RP-17. Section RP.6.4.1. Please add to the Ch. 4 reference in the first sentence on this page that the Handbook of Approved Sampling and Statistical Methods for Evaluation of Revegetation Success on Wyoming Coal Mines.

Response SP 9 – Round 1

Revised Section RP.6.4.1 as requested.

Comment SP 9 – Round 2

No comment received.

Response SP 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 10 – Round 1

Reclamation Plan, Page RP-17. Section RP.6.4.1. Please remove the first sentence in the third paragraph. It appears in conflict with the next sentence which cites Ch. 4.Sec. 2(d)(ii)(B).

Response SP 10 – Round 1

Removed sentence as requested in Section RP.6.4.1.

Comment SP 10 – Round 2

No comment received.

Response SP 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 11 – Round 1

Reclamation Plan, Page RP-19. Section RP.6.4.5.1. Please add a third sentence to the first paragraph to Pastureland land use with a full shrub density greater than 1 shrub/m² is also eligible.

Response SP 11 – Round 1

Sentence including pastureland land use as eligible added to Section RP.6.4.5.1 as requested.

Comment SP 11 – Round 2

No comment received.

Response SP 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 12 – Round 1

Reclamation Plan, Page RP-24. Please revise the sentence after the • Shrub density bullet to “Additionally, a species list will be prepared” and delete the remainder of the sentence.

Response SP 12 – Round 1

Revised text as requested.

Comment SP 12 – Round 2

No comment received.

Response SP 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 13 – Round 1

Reclamation Plan, Page RP-25. Section RP.6.7.3. Under Sampling Frequency in Guideline 14 the third sample may be included as part of your revegetation success (bond release) sampling which can begin in year seven. You may add more flexibility to your sampling interval such as beginning year 3 or 4, with the second sampling in year 5, 6 or 7 and then the third may be year 7 – 13 and may be used for revegetation success.

Response SP 13 – Round 1

Revised text per recommendations.

Comment SP 13 – Round 2

No comment received.

Response SP 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 14 – Round 1

Reclamation Plan, Page RP-29. Section RP.7.2. There is a reference to RP.8 in this section. Please correct the reference if it is not correct.

Response SP 14 – Round 1

Revised text to reference Section RP.6 for seed mixtures and revegetation operations.

Comment SP 14 – Round 2

No comment received.

Response SP 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 15 – Round 1

Reclamation Plan, Table RP6.1. Could you please add a footnote listing the disturbances that are included in the 87.3 acres of Disturbance and what the disturbances will be postmining in the 56.1 acres.

Response SP 15 – Round 1

Added footnote describing disturbance for premining and postmining to Table RP.6-1 as requested.

Comment SP 15 – Round 2

No comment received.

Response SP 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 16 – Round 1

Reclamation Plan, Exhibit RP.2-1. Postmining the landuse will be Grazingland and Fish and Wildlife Habitat (937.7 acres) and Cropland (3.7 acres) with 56.1 acres of disturbance, 4.9 acres of water and 11.6 acres of wetland. These landuses will match the landuses on Exhibit D1.1-1. With just minor acreage changes shown in Table RP.6-1. Since the railroad and major roads are identified and Taylor Quarry is going to be reclaimed to Grazingland and Fish and Wildlife Habitat, the Industrial commercial stippling is not needed on these areas.

Response SP 16 – Round 1

Revised exhibit as requested.

Comment SP 16 – Round 2

No comment received.

Response SP 16 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Other Comments

Comment MK 27 – Round 1

Items Requested in Electronic Format for Preparation of CHIA, 1. Please provide a CAD or ArcGIS shapefile that contains the proposed permit boundary for the Brook Mine. This file will be used to prepare maps in the CHIA. This file can be emailed to: matthew.kunze@wyo.gov. (MDK)

Response MK 27 – Round 1

See response to comment MK 28.

Comment MK 27 – Round 2

Response to the comment is pending. Review of the response to this comment will be completed when the information is received. (MDK)

Response MK 27 – Round 2

The permit boundary in CAD format was provided as an attachment in an e-mail dated September 1, 2015.

Comment MK 28 – Round 1

Items Requested in Electronic Format for Preparation of CHIA, 2. Please provide the baseline surface and groundwater data collected to support baseline characterization for the permit application. All data can be submitted on Excel templates (Attachments) found on the LQD website for the Coal Annual Report Format (CARF): <http://deq.wyoming.gov/lqd/coal/resources/annual-report-3/>.

- Please provide all surface water flow and water quality data for the following surface water stations: SM578415-SW-1, SM578409-SW-1, SM578418-SW-1, and SM578512-SW-1.
- Please provide all groundwater level and water quality data for all Brook Mine monitoring wells shown in Table D6.2-1.

Response MK 28 – Round 1

The electronic data requested is being compiled in the requested format and will be provided when it is completed.

Comment MK 28 – Round 2

Response to the comment is pending. Review of the response to this comment will be completed when the information is received. (MDK)

Response MK 28 – Round 2

The electronic data in CARF format was provided as an attachment in an e-mail dated September 1, 2015.

Comment MuK 97 – Round 2 (New Comment)

In the next submittal, please consider providing a text tracking mechanism that will highlight the changes that are made in response to the comments. Typically, it can be a bolded font for all the text that is revised. This will help the reviewer to review the appropriate revised text. Without this bold font or some distinct highlight for the revised text, the reviewer has to compare against the initial submittal to get a handle on the changes that were made in response to the LQD comments.

Response MuK 97 – Round 2 (New Comment)

RAMACO will coordinate with WDEQ to facilitate review in anyway once WDEQ has determined the method that is most suitable (as per the meeting on September 1, 2015). In the meantime, RAMACO has attempted to make it as clear as possible in comment responses what the location of textual changes has been. Additionally, please refer to the Change Index for locations of replaced or added text, tables, and figures. Also, any page with new changes will be updated with the submittal month and year in the footer. Pages in the permit without changes will maintain previous dates.

Adjudication

Comment AG 1 – Round 1

Please also provide copies of the complaint and the answer. If there are any motions that the court has ruled on limiting or deciding any of the claims or factual or legal questions originally at issue in the case, please also provide copies of the orders, the motions, the responses to the motions, and any supporting memoranda.

Response AG 1 – Round 1

The Applicant's position with regard to any surface interests that may be claimed by Padlock Ranch Company and/or Big Horn Coal Company is that the Applicant alone owns the sole dominant present property right to use these surface lands for the coal mining operation described in the application, as that application has been submitted and supplemented. Applicant's sole dominant surface ownership and use interest in the relevant lands derives directly from the 1954 Deed (Attachment B) and its express reservation language. Pursuant to the controlling Wyoming Supreme Court authority set out in *WYMO Fuels, Inc. v. Edwards*, 723 P.2d 1230 (Wyo. 1986) (Attachment C), when the Applicant already owns the dominant surface use rights for coal mining on the property, then the Applicant consents to its own use pursuant to its application by submitting the application and no other surface consents can or should be required under W.S. § 35-11-406(b)(xi). As the Land Quality Division is aware, to the extent that Padlock Ranch Company incorrectly claims some surface rights on any lands described in the 1954 Deed, it necessarily could only attempt to do so fully subject to the Applicant's sole dominant surface rights to mine coal. Under the *WYOMO Fuels, Inc.* decision, no consent from Padlock can be required. To the extent that Big Horn Coal incorrectly claims some surface use right in this area at this time, the Applicant is proceeding with quiet title litigation (Fourth Judicial District Court, Sheridan County, Wyoming Civil No. CV 2014-372) against Big Horn Coal on this issue and has asserted its sole dominant reserved surface right to use the surface described in the 1954 Deed to mine coal there without any consent from Big Horn Coal pursuant to the *WYOMO Fuels, Inc.* case decision. Accurate copies of the Applicant's pending summary judgment motion arguments on this issue are enclosed with this response (attachment D and E). The Applicant can and will supplement these pleadings with further documentation that is described in the pleadings upon request.

Comment AG 1 – Round 2

Please provide copies of the following documents related to the state district court litigation between the Applicant/Ramaco and Big Horn Coal Company:

- The complaint and answer filed in the case (if either has been amended, only the most recent amended version needs to be provided).

- For the Applicant's summary judgment motion: Big Horn Coal's response to the motion.
- For Big Horn Coal's motion for summary judgment: the memo supporting that motion, the Applicant's response to the motion, and Big Horn Coal's reply memorandum.
- The "Section 5" of the "May 6, 1983, Release Agreement" that the Applicant mentioned in its reply in support of its summary judgment motion.
- When it is available, the district court's order deciding the Applicant's and Big Horn Coal's summary judgment motions.

Response AG 1 – Round 2

The materials requested in this comment were supplied to the Attorney General on August 20, 2015 after the Round 2 comments had been released. It is assumed if any further comment is required, it will be received in Round 3.

Comment AG 2 – Round 1

Therefore, the Division requests the Applicant to provide sufficient information and supporting documents for the Division to determine whether Padlock Ranch Company and Big Horn Coal Company are or are not "residential or agricultural landowners" under the statutory definition in W.S. § 35-11-406(b)(xi).

Response AG 2 – Round 1

Please see response AG 1.

Comment AG 2 – Round 2

Please also provide sufficient information and supporting documents for the Division to determine whether Padlock Ranch or Big Horn Coal qualify as a "resident or agricultural landowner," as defined in W.S. § 35-11-406(b)(xi). The statutory requirements for a permit application differ depending on whether that status exists, and the Division must determine which set of requirements (W.S. § 35-11-406(b)(xi) or -406(b)(xii)) may apply to this Application.

Response AG 2 – Round 2

The materials requested in this comment were supplied to the Attorney General on August 20, 2015 after the Round 2 comments had been released. It is assumed if any further comment is required, it will be received in Round 3.

Comment AG 3 – Round 2 (New Comment)

Would the 1983 release agreement apply to the surface rights that originate with the 1954 Deed and are currently owned by Padlock Ranch? Did Padlock Ranch obtain its rights at issue before or after the 1980 release agreement?

Response AG 3 – Round 2 (New Comment)

No. The 1983 release agreement does not affect any of the rights reserved in the 1954 Deed. The 1954 Deed controls the surface use mining rights of Ramaco relative to both Big Horn Coal and Padlock Ranch. Even if the release agreement had an effect as to Big Horn, Padlock Ranch is not a party to the release agreement and as a non-party has no rights under that agreement. Ramaco has found no documents that might show Padlock Ranch acquired any kind of interest or rights under the 1983 release agreement.

Instead, Ramaco has found documents that show Padlock Ranch acquired certain lands from Big Horn Coal in 1965, almost 20 years **before** the release agreement. Padlock then sold some of the land back to Big Horn Coal and vice versa. But none of the documents showing these transfers mention the 1983 release agreement.

Comment AG 4 – Round 2 (New Comment)

If one assumes that Big Horn's arguments in the litigation are correct that the 1983 release agreement granted Big Horn rights greater than those under the 1954 Deed, would Big Horn's arguments and the rights it argues that it obtained through the release agreement also apply to any of Padlock Ranch's lands?

Response AG 4 – Round 2 (New Comment)

No. As discussed in response to the previous question, Padlock Ranch does not have any rights under the release agreement. Likewise, Ramaco could find no documents showing that Padlock Ranch ever acquired any rights in the 1983 release agreement.

Comment AG 5 – Round 2 (New Comment)

Are there any contractual documents or property records related to Padlock Ranch's lands that arguably may have altered Padlock Ranch's rights under the 1954 Deed? If so, please provide copies of those documents and explain the nature of the documents and how they may have affected Padlock Ranch's rights.

Response AG 5 – Round 2 (New Comment)

No. Ramaco has found several deeds purporting to convey land from Big Horn Coal to Padlock Ranch's predecessor. These deeds, however, do not alter or try to alter any rights under the 1954 Deed.

Comment BJ 68 – Round 3 (New Comment)

The Certificate of Liability Insurance appears to have expired on October 14, 2015. Please generate a new Certificate of Liability Insurance to cover the present period.

Response BJ 68 – Round 3 (New Comment)

A new Certificate of Liability Insurance covering the present period has been provided in this response package.

Comment DM 1 – Round 1

Adjudication – Appendix B2 – Groundwater Rights – There is a groundwater well that is missing in this volume. The listing is as follows:

Barbula #2

Permit No. 85631W

Location: SW NW Section 21, T57N R84W

Please add this entry to the table and to any corresponding maps.

Response DM 1 – Round 1

Adjudication text page WR-12 has been updated to include Barbula # 2 (P85631W) as well as Adjudication Exhibits 5 & 8.

Comment DM 1 – Round 2

No comment received.

Response DM 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 120 – Round 3 (New Comment)

Adjudication-Form 1. The index change sheet states that the affected area boundary was updated on several Exhibits. Has the affected area acreage changed? If so a new Form 1 will need submitted to show the correct affected area acreage. (MDK)

Response MK 120 – Round 3 (New Comment)

A new Form 1 has been provided with the revised affected acreage in this response package.

Appendix D1

Comment BJ 1 – Round 1

Appendix D1, Land Use, Table D1. 3-1; It is unnecessary to list the Expired Permit category of gas well permits. Since these APDs have expired without completion there is no related activity to the site. Listing of a non-event is not required. This also

applies to the NO category since this indicates that the APD was refused, thus never became permitted through WOGCC.

Response BJ 1 – Round 1

Revised Table D1.3-1 as requested.

Comment BJ 1 – Round 2

No comment received.

Response BJ 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 1 – Round 1

Appendix D-1. Exhibit D1.1-1. The landuses defined in Chapter 1 should be used on this Exhibit. Not the entire Brook Mine Permit falls neatly into these definitions so the following comments provide guidance:

- a) The railroad, primary roads, oil and gas wells, and the facilities for Taylor Quarry would be considered Industrial commercial and may be shown with the vertical line stippling. The rest of the vertical stippling should be removed.
- b) The 4.5 acres of Agricultural lands would have the Land use of Cropland. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no changes are needed to the map for this land use.
- c) The 12.8 acres of water might be listed under multiple landuses such as Grazingland, Fish and Wildlife habitat or Recreational. This small acreage will not show up well on this map but is listed in Tables D.8-2 and RP.6-1 so no change is needed to the map for this land use.
- d) The 4,421.8 acres remaining should be shown as Grazingland and Fish and Wildlife habitat. The legend on the map should have Fish and Wildlife Habitat added to Past and Present Grazingland landuse. The stippled area on the map will stay the same.
- e) No changes are needed to the areas identified as Recreational.

Response SP 1 – Round 1

Revised Exhibit D1.1-1 as requested.

Comment SP 1 – Round 2

No comment received.

Response SP 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 1 – Round 3

The response is satisfactory. Exhibit D1.1-1 has been revised to match the landuse definitions.

Comment SP 2 – Round 1

Appendix D-1. Text that refers to the areas mined as Industrial commercial should be revised to remove the mining. A reference to Section 1.6 on historic mining can be made in Section D1.3.1. Grazingland. The reclaimed mined lands are now being used as Grazingland. The difference between the mined and never been mined is defined as the vegetation community that is called Reclaimed. Section D1.6 discusses the historic mining of the area and the discussion on coal mining in Industrial commercial (D1.4.3) can be removed.

Response SP 2 – Round 1

Revised text as requested.

Comment SP 2 – Round 2

No comment received.

Response SP 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 2 – Round 3

The response is satisfactory. The text has been revised to identify the reclaimed land as Grazingland.

Appendix D2

Comment BJ 2 – Round 1

Appendix D2, History, There are no comments for this section of the application. The narrative is well written and comprehensive.

Response BJ 2 – Round 1

No response is necessary.

Appendix D3

No comments were received regarding Appendix D3.

Appendix D4

Comment BJ 3 – Round 1

Appendix D4, Climatology, General comment – Is there no data for climatology that is more recent than 1990? It exists, therefore needs to be represented. Please locate and include the most recent climatological data. Twenty year-old data bears little resemblance to Sheridan County climate today so characterization of the present climate with a 20 year gap is problematic. Please reevaluate the data in light of locating and use more recent information.

Response BJ 3 – Round 1

Revised wind, relative humidity, and degree day data to reflect period between 1990 and 2013. Note, as can be observed by updated data, little change occurred in averages reported for wind, relative humidity, and degree days. Therefore, the wind rose provided in Figure D4.2-6 is deemed to still be representative of the Sheridan area. Revised Figure D4.2-1, Figure D4.2-11, Table D4.1-1, Table D4.2-2, Table D4.2-3, and Table D4.2-7 in response to this comment.

Comment BJ 3 – Round 2

No comment received.

Response BJ 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 4 – Round 1

Appendix D4, Climatology, Section D4.2.6, Why was 65°F used as the baseline temperature? Also, why were the high and low temperatures set to 86°F and 50°F respectively? Please clarify.

Response BJ 4 – Round 1

Revised text to clarify the choice of high and low temperatures.

Comment BJ 4 – Round 2

No comment received.

Response BJ 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 5 – Round 1

Appendix D4, Climatology, Figure 4.2-11, Are the degree days the total number of days that match the data points for the entire period from 1961 through 1990? This

indicates that the data represented along the Y axis covers a period of 30 years on a daily basis. Please clarify.

Response BJ 5 – Round 1

Revised text with definitions of heating, cooling, and growing degree days to clarify Figure 4.2-11. Degree days are essentially a unit of measure like temperature, velocity, etc. A degree day signifies the number of degrees per day to heat or cool to a specified base temperature (most commonly 65°F). Each degree day is summed over the course of a month to estimate the total number of degree days that month. For example, July may have 0 heating degree days because all days are over 65°F, but will have cooling degree days nearly every day of the month. Figure 4.2-11 shows the average monthly degree days over the specified periods of data.

Comment BJ 5 – Round 2

No comment received.

Response BJ 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D5

Comment BJ 6 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Section D5.4.1, Paragraph 2 refers to "marginally suitable Selenium levels" as defined in LQD Guideline No.1. Guideline 1 has two separate sets of chemical quality criteria tables. Appendix 1 occurs on pages 17-21 as well as on pages 38-43. The first set of tables have been superseded by the second set of tables. Please use the tables on pages 38-43 when determining material suitability. The first Appendix 1 is being removed from the guideline.

The newer tables define the Selenium target as follows:

Suitable < 0.3 ppm

Marginal 0.3 – 0.8 ppm

Unsuitable > 0.8 ppm (dependent on premining water quality and overburden quality)

These values are established for uplands and ephemeral drainages unless it can be shown that Selenium impregnated materials will be buried above the groundwater potentiometric surface and below the reclaimed surface root zone. Other quality criteria have not changed.

Response BJ 6 – Round 1

Revised text as requested to reflect the revised LQD Appendix 1.

Comment BJ 6 – Round 2

No comment received.

Response BJ 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 7 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Figure D5.3-2, What units are expressed in the figure as the %g? Please include a footnote clarifying the measurement parameter.

Response BJ 7 – Round 1

Updated Figure D5.3-2 as requested.

Comment BJ 7 – Round 2

No comment received.

Response BJ 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 8 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-1, Are the Northings and Eastings in State Plane coordinates? It is assumed that they are but please verify this. The title at the top of the page could read Drill Hole Tabulations (State Plane Coordinates)

Response BJ 8 – Round 1

Updated as requested.

Comment BJ 8 – Round 2

No comment received.

Response BJ 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 9 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-2, Please rearrange the Lithologic and Electric logs in such a way that the Electric log immediately follows the Lithologic log. This allows for a more comprehensive examination of the data.

Response BJ 9 – Round 1

Rearranged logs as requested.

Comment BJ 9 – Round 2

No comment received.

Response BJ 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 10 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Holes R12-000 through R12-020 have the Northings and Eastings reversed. Please correct.

Response BJ 10 – Round 1

Updated as requested.

Comment BJ 10 – Round 2

No comment received.

Response BJ 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 11 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, The Lithologic logs with the AMBRE designation 02, 03, and 04 do not have coordinates or elevations. Please provide coordinates and elevations for these three holes.

Response BJ 11 – Round 1

Updated as requested.

Comment BJ 11 – Round 2

No comment received.

Response BJ 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 12 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Hole R13-018 appears to have erroneous coordinates. The Northing is listed as 11,941,802. It should probably be 1,941,802. The elevation is shown as 43,887.9, where it should probably be closer to 3,887.9. Please verify and correct.

Hole R13-024 has a very high Northing at 61,941,541 and elevation at 73,885.4. These may be 1,941,541 and 3,885.4, respectively. Please verify and correct

Response BJ 12 – Round 1

Updated as requested.

Comment BJ 12 – Round 2

No comment received.

Response BJ 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 13 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, A suggestion for future exploration: Ask the geophysical logger to reduce the gain on the gamma logs. The readjustment bounce on the logs makes them a bit difficult to read and interpret.

Response BJ 13 – Round 1

No response required.

Comment BJ 13 – Round 2

No comment received.

Response BJ 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 14 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-5, Pg. D5-5-4, The splitting tensile strength tests were run on four (4) samples from two (2) holes representing roof, coal, and floor conditions.

- a) Why were these locations used as representative of the lithologies encountered during mining?
- b) Are these few samples representative of all conditions expected to be encountered by the continuous miner (CM)?

Please elaborate and clarify the narrative. A statement must be made that strength testing will be performed on at least one set of samples per mining panel prior to use of the CM to insure that conditions are favorable for roof retention without subsidence. Lithology in this area is inconsistent and rock strength can vary accordingly. Using the data provided on the four samples tested indicates that some of the overburden from hole R13-19 is unsuitable for highwall mining, based on the CAT® Site Evaluation Tool For Highwall Miners;

(<http://webtools.cat.com/globalmining/highwallminers/index.html>).

Response BJ 14 – Round 1

Appendix D5 Section D5.3.3.2 has been updated as requested.

Comment BJ 14 – Round 2

No comment received.

Response BJ 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 15 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Addendum D5-4, Exhibits 1 – 7, Please include the drill hole locations on these isopach maps.

Response BJ 15 – Round 1

Updated as requested.

Comment BJ 15 – Round 2

No comment received.

Response BJ 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 16 – Round 1

Appendix D5, Topography, Geology, and Overburden Assessment, Exhibit 8, The map labeled as the isopach map of the Lower Masters bed is a contour of a surface. Please replace the contour map with the appropriate isopach map

Response BJ 16 – Round 1

Updated as requested.

Comment BJ 16 – Round 2

No comment received.

Response BJ 16 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 59 – Round 1

EXHIBITS, Addendum D5-4, Exhibit 1, The title on the map declares that this is an overburden isopach, but the bed name is missing. Please indicate which bed this map pertains to.

Response BJ 59 – Round 1

Updated Exhibit 1 of Addendum D5-4 as requested.

Comment BJ 59 – Round 2

No comment received.

Response BJ 59 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 60 – Round 1

EXHIBITS, Addendum D5-4, Exhibit 8, The name of the PDF file for this exhibit indicates that this is an isopach map of the Masters Lower coal bed. The title in the map indicates that this is the contour of the base of the Masters coal seam. Please correct the title of the PDF file.

Response BJ 60 – Round 1

The title of Exhibit 8 of Addendum D5-4 will be revised in the electronic copy, as requested.

Comment BJ 60 – Round 2

The title of Exhibit 8 in Addendum D5-4 remains unchanged. This appears to be an inadvertent oversight on the part of WWC.

The Current PDF file name is:

ADD_D5_4_EX_8_MASTERS_ISO-MASTERS_LOWER_R1.

The Title of the map in the Title Block is:

BOTTOM ELEVATION OF MASTERS COAL SEAM.

Please correct the name on the PDF file to better represent the contents of the exhibit.

Response BJ 60 – Round 2

Thank you for catching the oversight. The name on the PDF file has been changed to more accurately represent the contents of the map. The PDF with the corrected name will be emailed to Mr. Kristiansen.

Comment BJ 60 – Round 3

No comment received.

Response BJ 60 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment BJ 61 – Round 1

EXHIBITS, Addendum D5-6, Exhibit 1, we commend RAMACO for sampling overburden locations on 80 acre spacing. There are some gaps in the sampling plan, however, that need to have core holes drilled to fill them. The underground Coal Rules and Regulations in Chapter 7, Section 1(a)(i) are specific on ensuring that overburden geology is characterized in all locations where overburden will be removed or subsidence may occur. This essentially means that all areas above the planned coal panels need representative cores drilled to a sufficient density, approximately one hole for every quarter section of affected area. Based on that, the following locations still need to be characterized by overburden sampling:

NE1/4, sec.22, T.57N., R.84W.

NW1/4, sec.15, T.57N., R.84W.

NW1/4, sec.14, T.57N., R.85W.

SE1/4, sec.10, T.57N., R.85W.

Response BJ 61 – Round 1

A drilling rig was not able to enter the areas NW1/4, Sec.14, T.57N., R.85W and SE1/4, Sec.10, T.57N., R.85W. due to the steepness of the terrain, therefore no samples were obtained. Sampling data for drill holes BH 166-78 and BE 326-78 have been incorporated into Addendum D5-2 and Addendum D5-7 to characterize the overburden in Sections 15 and 22.

Comment BJ 61 – Round 2

No comment received.

Response BJ 61 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 62 – Round 1

EXHIBITS, Addendum D5-6, Exhibit D5.1-1, Kudos to the staff member that created this slope analysis map. It is clear and concise and the histogram is very informative. Good job.

Response BJ 62 – Round 1

Thank you for this comment.

Comment BJ 62 – Round 2

No comment received.

Response BJ 62 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 1 – Round 1

Appendix D5, The Coal Rules and Regulations, Chapter 7, Section 1(a)(i)(A) states that information required for the geological description pursuant to Chapter 2, shall be as follows: for areas where surface operations and facilities will cause removal of overburden down to a level of the coal seam, all information outlined in Chapter 2. Overburden sampling has not been performed in many of the locations where overburden will be removed during the mining operations. Additional sampling will be required to assess overburden chemistry in all areas where overburden removal will occur. The intensity of sampling should be 1 core per 160 acres (per quarter section). The LQD requests sampling every 1,900 linear feet on longer proposed disturbance areas or, at minimum, two cores within shorter disturbances separated sufficiently to provide a representative characterization of the proposed disturbance.

- a. Not all overburden has been characterized during analysis. Several lenses of shallow coal mixed with partings or narrow coal seams that will not be mined were not characterized. Because all overburden must be handled so as not to negatively affect surface water, groundwater or vegetation, all overburden must be adequately characterized. Therefore, the LQD requests additional characterization of all overburden that will be backfilled into disturbed areas. It must also be stated that special handling and/or identification and use of topsoil/subsoil replacement may be required if unsuitable backfill or soil is

placed within 4 feet of the surface on upland areas or within 10 feet of the surface in stream channels.

Response DS 1 – Round 1

Please see response to BJ 61.

Comment DS 1 – Round 2

Response is not adequate. The LQD requires additional overburden suitability analysis to be included for all areas to be disturbed during mining. No additional baseline overburden suitability assessment laboratory data was provided for holes BH 166-78 and BE 326-78. Please provide the raw data. Also, provide a commitment to sample overburden from areas to be disturbed by mining (specifically identify the pit sequence) where overburden baseline was not provided during baseline sampling. Sample every 1,300 feet in the sequence prior to overburden removal. Report the analytical results in the annual report for the year of initial disturbance for the pit sequence. Also, since RAMACO is reluctant to provide a special handling commitment, sampling must be performed at 500 ft. spacing on backfilled and rough graded pits (4 ft. depth on upland areas and 8 ft. depth under stream channel or permanent impoundments) to assure quality of surface materials. Also, if groundwater is expected in the pits, unsuitable materials must not be placed in the groundwater zone. Of the backfilled pit. (DS)

Response DS 1 – Round 2

For the location of the laboratory data for holes BH 166-78 and BE 326-78, please refer to Response BJ 61 (Round 1). Sampling data for drill holes BH 166-78 and BE 326-78 have been incorporated into Addendum D5-2, Addendum D5-7 and Table D5.4-2.

For the following commitments, please refer to the Mine Plan since these commitments are for operations rather than baseline studies. Please note that the text for these commitments has been in place. The following discussion provides the location of each commitment.

1. Section MP.4.6.1 states that the overburden sampling program will include one drill hole sample taken every 40 acres (16 sample locations per square mile) within areas where surface operations will cause removal of overburden down to the level of the coal seam. The delineation of 40 acres more correctly states the suggestion in Guideline No. 1 on page 9 in Section II(B)(3)(a)(1) as opposed to the suggestion of 1,300 feet. The first paragraph of Section MP.4.6.1 states that any additional overburden quality sampling will be submitted to WDEQ/LQD in the mine's annual reports. No changes have been made in response to this comment since the text has been in place.
2. Section MP.4.6.2 states in the first paragraph that a backfill sampling program will be set on a 500-foot grid. The first paragraph of Section MP.4.6.2 also

states that the sampling program will ensure that unsuitable materials aren't placed within the following depths of the land surface: four feet for uplands, six feet for ephemeral channels, and 10 feet for permanent impoundments or major channels and their 100-year floodplains. No changes have been made in response to this comment.

Comment DS 1 – Round 3

Response is not adequate. The LQD requires additional overburden suitability analysis to be included for all areas to be disturbed during mining. No additional baseline overburden suitability assessment raw data was provided for areas to be disturbed as previously requested.

Response DS 1 – Round 3

A commitment to obtain necessary overburden samples and conduct overburden suitability analysis prior to mining related disturbance, as required by WDEQ/LQD, has been incorporated into Section MP.4.3 of the Mine Plan. Also a commitment to obtain samples at least every 1,500 feet of trench length and at both ends of a trench has been added to Section MP.4.3. No change to Appendix D5 was made in response to this comment.

Comment DS 2 – Round 1

Appendix D5, Section D5.4. – documentation of protocols that differ from those approved by the Administrator in Guideline 1 typically require a signed document by LQD staff, not a request for different procedure signed by the company. This issue has been discussed with other mining companies and it has been determined that documentation of approval by LQD staff will be required if sampling/analytical protocols differ from those required by standing LQD policy. Please provide documentation of LQD staff approval for the 10-ft. overburden sampling interval.

Response DS 2 – Round 1

See Attachment A to this response package. This has also been added to Addendum D5-6 pages 4 and 5.

Comment DS 2 – Round 2

No comment received.

Response DS 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 3 – Round 1

Appendix D5, Table D5.4-1 and Table D5.4-2 do not provide the current approved selenium concentration limits of 0-3 ppm (suitable), 3-8 ppm (marginal) and > 8 ppm

(unsuitable). Please be sure to include the current approved suitability criteria as shown in Guideline 1, page 42. This will change the conclusions of the discussion provided in the Appendix D5 text. Also, in Table D5.4-2, please provide the correct units for analytical results in mg/Kg, not mg/L.

Response DS 3 – Round 1

Please refer to BJ 6 response. Appendix D5 text, Table D5.4-1, and Table D5.4-2 are updated as requested.

Comment DS 3 – Round 2

No comment received.

Response DS 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 4 – Round 1

Appendix D5, The permit application provided to LQD staff for review has duplicated data provided after the map identified as Exhibit 1 which should be deleted. The exhibit should also be better identified as Exhibit D5-1 or something similar to clarify placement in the permit application should it become separated from the document in the future.

Response DS 4 – Round 1

The electronic copies were provided to LQD staff for review purposes. The hard copy on file is the official version. Also, please see response to Comment DS 5.

Comment DS 4 – Round 2

Response is not adequate. This issue was not addressed in the Round 1 comment response package. Duplicate data in the hard copy should be deleted.

Response DS 4 – Round 2

The duplicate soil analysis reports have been removed from Appendix D5. The reports were removed from Addendum D5-5 (pages Addendum D5-5-21 through Addendum D5-5-92). The reports remain in Addendum D5-7 since this is the addendum specified for the soil analysis reports. The Change Index identifies this revision. No other change is necessary since page Addendum D5-5-92 was the last page and Addendum D5-6 has unique pagination.

Because the exhibit name of “Exhibit 1” is specific to the overburden sampling plan of 8/26/2013 that was presented to WDEQ, and this name is referenced in the document, the name has not been changed. The exhibit has a unique page number

(page Addendum D5-6-3) which will ensure that the exhibit is always located properly in the permit.

Comment DS 4 – Round 3

Response is not adequate. Two of the first proposed disturbance areas in Sections 22 and 15 have no overburden baseline sample analyses provided. The LQD understands that these areas are not accessible by drilling equipment at this time, but baseline sampling is required prior to initial disturbance. Therefore, the LQD may be amicable to approval of the application if a condition exists to provide an Appendix D5 revision with overburden.

Response DS 4 – Round 3

A commitment to obtain necessary overburden samples and conduct overburden suitability analysis prior to mining related disturbance, as required by WDEQ/LQD, has been incorporated into Section MP.4.3 of the Mine Plan. Also a commitment to obtain samples at least every 1,500 feet of trench length and at both ends of a trench has been added to Section MP.4.3. No change to Appendix D5 was made in response to this comment.

Comment DS 5 – Round 1

Appendix D5, Comparisons were made between Exhibit 1, the soils map and the Mine Plan map. Distinct differences in the affected area and permit boundaries were observed. Please be sure that correct boundaries for the proposed affected area and permit area are provided on all maps. Please also provide the contour interval on this exhibit.

Response DS 5 – Round 1

Addendum D5-6 is a copy of the overburden sampling plan as presented to WDEQ on 8/26/2013, which referenced Exhibit 1. Therefore, no changes to the exhibit will be made.

Comment DS 5 – Round 2

Response is not adequate. All exhibits presented in this permit must show the correct permit boundary and affected area boundaries, or, if the boundaries are removed, must reference a map of the same scale that contains the correct boundaries. Please correct the permit boundaries and affected area boundaries on all exhibits in this permit application.

Response DS 5 – Round 2

The permit boundary on Exhibit 1 in Addendum D5-6 was removed from the exhibit due to this boundary not being the same as that presented in the current permit as requested by the reviewer. However, the current boundary was not added to the

exhibit because this exhibit represents the information provided to, and approved by, WDEQ for the overburden sampling plan. Instead, a note has been added to the exhibit that references Exhibit C1a of the Adjudication File for the correct permit boundary of the Brook Mine.

Comment DS 5 – Round 3

No comment received.

Response DS 5 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 2 – Round 1

Appendix D5, Page D 5-9 refers to samples collected from roof and floor from “many” locations throughout the permit area. However, supporting documentation appeared to be from only two borings and included two roof and one floor sample. In addition, the laboratory noted the floor sample did not have sufficient length and a correction factor was used to determine unconfined compressive strength. Additional structural analysis of the overburden, interburden and floor is required.

Response KM 2 – Round 1

During preparation of the MSHA Ground Control Plan additional coring of the coal and overburden will occur, data gathered from this activity will be supplied to WDEQ/LQD when it is received. Please see response to BJ 14.

Comment KM 2 – Round 2

No comment received.

Response KM 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 3 – Round 1

Appendix D5, Please provide a discussion of the structural analysis of the overburden and interburden. The discussion shall address the potential for subsidence during and after mining.

Response KM 3 – Round 1

Structural analysis of the overburden, interburden, floor, and roof must be conducted for the MSHA Ground Control Plan. Information gathered for this plan will be provided when it is received. No text was updated in response to this comment. Please see response to BJ 14.

Comment KM 3 – Round 2

No comment received.

Response KM 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 4 – Round 1

Appendix D5, Please discuss the aquifer(s) below the lowest coal seam and the potential for mining to impact these aquifer(s).

Response KM 4 – Round 1

The lowest coal seam targeted for mining is largely dry and is also confined by a clay layer. The underburden is not considered an aquifer therefore no impacts will occur.

Comment KM 4 – Round 2

No comment received.

Response KM 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 24 – Round 3 (New Comment)

On page D5-12, Section D5.3.3.4, please specify what the underburden produces at 0.5 gpm.

Response KM 24 – Round 3 (New Comment)

Section D5.3.3.4 has been revised to clarify that groundwater is produced in the underburden at 0.5 gpm.

Comment Muk 1 – Round 1

Appendix D5, Section D5.3.3.2 Overburden and Interburden, 1. This section provides a discussion of the thickness of interburden and not overburden. Please provide a discussion (or a reference) on the thickness of the overburden. (MK)

Response Muk 1 – Round 1

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.2.

Comment Muk 1 – Round 2

Response not accepted. In addition to the reference to Addendum D5-3 cross section figures, please provide a textual interpretation on the overburden thickness. Please

refer to D5.3.2 interburden thickness description as an example for the requested description. (MK)

Response Muk 1 – Round 2

A qualitative discussion of the Carney overburden thickness has been added to the first paragraph of Section D5.3.3.2.

Comment MuK 1 – Round 3

Response accepted.

Comment Muk 2 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 2. On Page D5-10, there is a good discussion about the thickness of the two coal seams. Please provide a description on the depth from land surface to these coal seams. (MK)

Response Muk 2 – Round 1

A reference to the geologic cross-sections Addendum D5-3 has been added to Section D5.3.3.3.

Comment Muk 2 – Round 2

Response not accepted. In addition to the reference to Addendum D5-3 cross section figures, please provide a textual description/interpretation on the depth from land surface to the different coal seams targeted by the mine plan. (MK)

Response Muk 2 – Round 2

A qualitative description of the overburden material from the ground surface to the top of the Carney coal seam has been added to the middle of the second paragraph of Section D5.3.3.3. Discussion of the total material from the ground surface to the top of the Masters Seam has been added to the end of the third paragraph in Section D5.3.3.3. As requested, the revised text adds qualitative background on the varying depths of the total material from the land surface to the top of the two respective target coal seams, Carney and Masters.

Comment MuK 2 – Round 3

Response accepted.

Comment Muk 3 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 3. Page D5-10 states, “Monarch seam exist within isolated portions of the mine areas as shown on the geologic cross sections in Addendum D5-3 and may present a secondary target.” However, Table D5.3-2 does not provide the coal quality characteristics for Monarch coal seam. If Monarch seam

is part of the mine plan, please include the coal quality characteristics of Monarch coal seam in Table D5.3-2 and a description of thickness and depth from land surface.

Response Muk 3 – Round 1

Table D5.3-2 has been updated with the coal quality characteristics for the Monarch seam. The overburden and seam thickness are included on the geologic cross-sections located in Addendum D5-3 referenced in the text.

Comment Muk 3 – Round 2

Response not accepted. It is acknowledged and accepted that Table 5.3-2 is updated with coal quality characteristics of Monarch coal seam. In addition to the reference to Addendum D5-3 cross section figures, provide a textual interpretation of thickness and depth from land surface for the Monarch coal seam. (MK)

Response Muk 3 – Round 2

Textual interpretation of the Monarch coal seam thickness and the depth of material above the top of the Monarch seam have been added to the end of fourth paragraph in Section D5.3.3.3.

Comment MuK 3 – Round 3

Response accepted.

Comment Muk 4 – Round 1

Appendix D5, Section D5.3.3.3 Coal, 4. Please include a discussion on Dietz (1, 2, 3) coal seams, if they are present in the mine permit boundary. If they are part of the mine plan, please include the coal quality characteristics in Table D5.3-2. (MK)

Response Muk 4 – Round 1

Discussion about the Dietz seams has been added in Section D5.3.3.3. These coal seams are not part of the currently proposed Mine Plan. Therefore, the quality data were not included in the table.

Comment Muk 4 – Round 2

No comment received.

Response Muk 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 5 – Round 1

Appendix D5, Section D5.3 Geology of Mine Area, 5. Please provide a description of the stratigraphic units below the Masters coal seam. (MK)

Response Muk 5 – Round 1

Section D5.3.3.4 has been added to discuss the underburden.

Comment Muk 5 – Round 2

Response not accepted. Please expand the discussion in the newly added Section D5.3.3.4 to include a textual interpretation of the underburden thickness. (MK)

Response Muk 5 – Round 2

The text in Section D5.3.3.4 has been revised to include discussion of the underburden thickness.

Comment MuK 5 – Round 3

Response accepted.

Comment Muk 6 – Round 1

Appendix D5, Addendum D5-3 Geologic Cross Sections, 6. Several of the geologic cross sections show UNK – unknown coal seam (Stringer). Please include a brief discussion about this stringer in Section D5.3.3.3 (MK)

Response Muk 6 – Round 1

Discussion about the stringers with unknown names has been added to fifth paragraph in Section D5.3.3.3.

Comment Muk 6 – Round 2

Response not accepted. In addition to the reference to cross section figures, please provide a textual description on the variability, interpreted thicknesses of these stringers. (MK)

Response Muk 6 – Round 2

Further discussion of the unknown coal stringers has been added to the end of the fifth paragraph of Section D5.3.3.3.

Comment MuK 6 – Round 3

Response accepted.

Comment Muk 7 – Round 1

Appendix D5, Addendum D5-4 Isopachs, 7. Please include the wells/drill holes (control points) used to interpret the isopachs and elevation contours in the maps. In addition, label all the control points with names and the thickness (or elevation, as

appropriate). This comment is applicable to Addendum D5-4, Exhibits 1 through 8. (MK)

Response Muk 7 – Round 1

Addendum D5-4 Exhibits 1 to 8 have been updated with drill hole locations as requested. A reference to Addendum D5-2 has been added to the exhibits for seam name and thickness.

Comment Muk 7 – Round 2

Response not accepted. It is acknowledged and accepted that the labels for all the control point names were included. However, thickness (or elevation, as appropriate) labels are not included as requested. Is it relatively easy for the software that was used for isopach elevation contours to label the thickness (or elevation)? The intent of this comment is to increase the robustness of the review of the interpreted contours by having appropriate point control data plotted in the same map. This comment is applicable to Addendum D5-4, Exhibits 1 through 8. (MK)

Response Muk 7 – Round 2

As requested, Addendum D5-4 Exhibits 1-8 have been revised to include thickness or elevation, as appropriate, of the applicable seam at each drill hole. It's worth noting, that generally the thicknesses/elevations were obtained from the lithologic logs in Addendum D5-2; however, some drill holes were interpreted differently using analysis of the electric logs (Addendum D5-2), lithologic logs (Addendum D5-2) and cross sections (Addendum D5-3).

Comment MuK 7 – Round 3

Response not accepted. The Table of Contents for Addendum D5-4 indicates that there is an "Exhibit 1: Overburden Isopach Overlying the Carney Coal Seam". This Exhibit is not present in the Cheyenne Office copy of the Round 2 response submittal. (MK)

Response MuK 7 – Round 3

Exhibit 1 Overburden Isopach Overlying the Carney Seam was inadvertently left out of the Round 2 comment response package. The exhibit has been provided as part of the Round 3 response package.

Comment Muk 8 – Round 1

Appendix D5, Addendum D5-5 Overburden, Roof and Floor Sample Analysis Table, 8. Please describe these analyses, methodology, results and provide an interpretation of their applicability to the mine/reclamation plan. (MK)

Response Muk 8 – Round 1

Please see response to BJ 14.

Comment Muk 8 – Round 2

No comment received.

Response Muk 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D6

Comment BJ 17 – Round 1

Appendix D6, Hydrology, Section D6.2.3, Pg. D6-20, Narrative in the last paragraph – why were no samples taken in Hidden Water Creek? Please explain.

Response BJ 17 – Round 1

No flow was observed in Hidden Water Creek during baseline sampling, so no samples were taken. The text has been revised to reflect that there were no flows observed.

Comment BJ 17 – Round 2

No comment received.

Response BJ 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 18 – Round 1

Appendix D6, Hydrology, Table D6.1-8, Regarding the HEC-RAS modeling results – The values for Hidden Water Creek and Slater Creek are identical. Is this accurate or is it a typographical error? Please clarify.

Response BJ 18 – Round 1

Updated table to remove typographical error.

Comment BJ 18 – Round 2

No comment received.

Response BJ 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 19 – Round 1

Appendix D6, Hydrology, Addendum D6-7, The well construction summary sheets need to have the coal bed names listed on the well lithology sections to the right of the well diagrams. Please label accordingly.

Response BJ 19 – Round 1

Updated as requested.

Comment BJ 19 – Round 2

No comment received.

Response BJ 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 20 – Round 1

Appendix D6, Hydrology, Attachment D6-8-A, Pg. D6-8-20, A statement is made that water within both coal seams is expected to be "high quality" and "good" water. Please define the meaning of those characterizations. Are these judgments based on MCLs or some other value? Are they being classified by some constituent values? Or is there another metric being used? Please clarify.

For example; referencing WQD R&R, Chapter 8, Table I, Class I, II, or III would better define the essential characteristics of the water quality. Numerical values of critical constituents, such as TDS, could also serve to define the quality as "good". More descriptive qualifiers are needed to judge the water quality.

Response BJ 20 – Round 1

Revised text as requested.

Comment BJ 20 – Round 2

No comment received.

Response BJ 20 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 21 – Round 1

Appendix D6, Hydrology, Attachment D6-8-E, Hydrographs, The x parameter, time, is depicted in days. It appears that this scale should have been adjusted to show time in hours due to the rapid changes seen in the hydrographs. Please use a finer scale for the x axis.

Response BJ 21 – Round 1

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-36a and D6-8-37a. These additional hydrographs detail the

water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 21 – Round 2

No comment received.

Response BJ 21 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 22 – Round 1

Appendix D6, Hydrology, Attachment D6-8-F, The above mentioned comment can also be applied to the Carney well hydrographs. Please adjust the x axis to hours.

Response BJ 22 – Round 1

The hydrographs were originally set up with the x axis in days to allow the reader to review recovery data as well. Rather than modifying the original hydrographs, additional hydrographs, each of which depict the time axis in hours, were developed and included as pages D6-8-39a and D6-8-40a. These additional hydrographs detail the water level changes over the portion of the pumping test period where the water level changes in the wells were the most rapid.

Comment BJ 22 – Round 2

No comment received.

Response BJ 22 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 23 – Round 1

Appendix D6, Hydrology, Addendum D6-9, Pg. D6-9-2, Please include a column in Table D6-1 that indicates the elevation of the bottom of the well or TD. The total water column is important when assessing groundwater characteristics. Please correct.

Response BJ 23 – Round 1

Table D6-1 has been revised as requested.

Comment BJ 23 – Round 2

No comment received.

Response BJ 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 24 – Round 1

Appendix D6, Hydrology, Addendum D6-10, Pgs. D6-10-28 through D6-10-53, On the sample analysis reports, Please provide a brief narrative at the beginning of the lab results to give context to the data. Footnotes on the pages refer to MCLs or other parameters of water quality used for classification. However, the context that is used to define these parameters is missing. The assumption is made that these quality values are derived from the WQD R&R, Chapter 8, Table I definitions. But that is uncertain as no frame of reference is given. A brief sentence or two at the beginning of the section would clarify the numerical standards used in the report. Please adjust the narrative accordingly.

Response BJ 24 – Round 1

Page D6-10-27a was added to provide the requested narrative.

Comment BJ 24 – Round 2

No comment received.

Response BJ 24 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 25 – Round 1

Appendix D6, Hydrology, Please include the lithology of the sampled zone, either in the sampling information sheets, or on the sample analysis reports. Identification of the lithology sampled needs to be readily available with the analysis. This applies to all increments sampled. The sampled zones do have identification on the sample sheets with a shorthand nomenclature but persons unfamiliar with the lithology of the prospect area would be at a disadvantage when evaluating the sample results. A simple reference table at the beginning of the section would be sufficient. For example; MST=Masters, CRN=Carney, AL=Alluvium. Non-geologists need some frame of reference. Please create a clarifying narrative.

Response BJ 25 – Round 1

Reference text with abbreviations defined has been added on page Addendum D6-10-27a, as requested.

Comment BJ 25 – Round 2

No comment received.

Response BJ 25 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 2 – Round 1

Appendix D6-Hydrology, D6.1x – The drainage basin description and surface water quantity sections are lacking detail. As mentioned in M. Kunze’s comments, the data from the terminated Slater Creek USGS gauge, and historical monitoring data from Big Horn Mine (permit no. 213) should be included.

The data collected at the monitoring stations that is presented in Addendum D6-4 does not appear to agree with the statement that Slater Creek is a “predominantly ephemeral” stream. Please reconcile the text with the data.

Response DM 2 – Round 1

Peak flow data from the USGS gage station on Slater Creek has been provided. See response to MK 30. The text in Section D6.1.5.2 has been updated to clearly indicate that Slater Creek is an ephemeral stream.

Comment DM 2 – Round 2

No comment received.

Response DM 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 3 – Round 1

Appendix D6-Hydrology, D6.2.4 States that Groundwater Rights are in Appendix E2 of the Adjudication Volume. Groundwater Rights are actually listed in Appendix B2. Please Correct.

Response DM 3 – Round 1

Text revised as requested.

Comment DM 3 – Round 2

No comment received.

Response DM 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 5 – Round 1

Appendix D6, 2. The pre-mining potentiometric map for the Masters coal seam shows the elevation of the groundwater at a higher elevation than the surface elevation in Sections 11 and 12 (in the vicinity of Slater Creek outside of the permit area). Either show the potentiometric surface as dotted across this area or revise the potentiometric

lines such that the groundwater elevation is below the ground surface elevation. Issue addressed by BJ Kristiansen. Please see comment No. 65.

Response KM 5 – Round 1

Exhibits D6.2-2 and D6.2-3 have been revised as requested.

Comment KM 5 – Round 2

No comment received.

Response KM 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 6 – Round 1

Appendix D6, 3. The groundwater elevation for the Carney coal seam in monitor well 578417-CRN was given as 3795.59. The potentiometric contour for 3800 is drawn south of this monitor well. Please correct the contour line to be consistent with the groundwater elevation shown for monitor well 578417-CRN. Correction of this contour line may also adjust how the contour lines for 3780 and 3760 are drawn, such that they may be drawn consistent with other contour lines.

Response KM 6 – Round 1

Contours in Exhibit D6.2-3 have been revised as requested.

Comment KM 6 – Round 2

No comment received.

Response KM 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 7 – Round 1

Appendix D6, 4. Page D6 8-8: The text refers to the pump test in the Carney coal seam. According to the procedures in the previous section, transducers were placed in CRN and CRN-OB; however on the referenced page, it states transducers remained in MST and MST-OB after pumping. LQD believes this to be a typographical error.

Response KM 7 – Round 1

LQD is Correct, this is a typographical error. The sentence should read “After the pumping period, the transducers remained in CRN1 and CRN-OB until 8:00AM on November 16, 2013.” Page D6-8-8 has been updated with the typographical error corrected and a replacement page is included.

Comment KM 7 – Round 2

No comment received.

Response KM 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 8 – Round 1

Appendix D6, 5. Please discuss why the water levels rose in the Carney coal seam during the pump test in the Masters coal seam.

Response KM 8 – Round 1

This comment is addressed in comment 19 from Muthu Kuchanur.

Comment KM 8 – Round 2

No comment received.

Response KM 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 9 – Round 1

Appendix D6, 6. What effect would a leaking pump have on the results of the pump test in the Masters coal seam?

Response KM 9 – Round 1

This comment is assumed to originate from the note on page Addendum D6-8-30. This note is in reference to activities that occurred immediately after the pumping test was shut off. The pump used for the pumping test did not have a foot valve. Therefore, after the pump was shut off, water in the discharge pipe immediately began to drain back into the well. The pump and piping was pulled out of the well as fast as possible and not all of the water in the pipe drained back into the well. However, the personnel conducting the pumping test were concerned that the water draining into the well would result in a rapid rise in the water level in the well and wanted to note it for the record on the field data sheet. It is estimated that less than 2 gallons of water actually drained out of the line into the well while the pump was being pulled which would result in a water level rise in the well of less than 0.25 foot. Given that the water level recovery in the well was very rapid immediately upon cessation of the pumping test (approximately 2 feet in the first ten minutes after the pumping test ended) and the early time recovery data was largely ignored for the purposes of doing the aquifer characterization evaluations, the leaking pump would not have had an impact on the results of the pumping test.

Comment KM 9 – Round 2

No comment received.

Response KM 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 10 – Round 1

Appendix D6, 7. Please make sure all maps that are stamped are also signed and dated by the engineer, as required by regulation.

Response KM 10 – Round 1

All maps that are stamped will be signed and dated by the engineer as required by law. This does not include digital versions. The digital copies have been provided for WDEQ review. The hard copy is the official copy.

Comment KM 10 – Round 2

No comment received.

Response KM 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 17 – Round 2 (New Comment)

Based on LQD's review of the well logs for Wells 578409-CRN-OB and 578409-MST-OB, the wells were screened in a coal seam, not in overburden. Please address all hydrologic information discussing overburden which was based on these wells and which may be in error.

Response KM 17 – Round 2 (New Comment)

The "OB" designation refers to "observation" rather than overburden. It is noted that this is a poor naming convention, but the naming had already been established. We apologize for the confusion. Additionally, Section D6.2.1.1 states that electric logs with resistivity data have demonstrated that the overburden is dry. Section D6.2.2.1 states that no monitoring wells were completed in the overburden or interburden because no water was found in these units during drilling. The nomenclature page in Addendum D6-10 (page Addendum D6-10-27A) has been revised to state:
OB=observation.

Comment KM 17 – Round 3

No comment received.

Response KM 17 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 18 – Round 2 (New Comment)

The well logs for 578409-CRN and 578409-CRN-OB show the wells are screened in a coal seam labeled “Masters”, not Carney. This appears to be a typographical error on the well log. Please correct.

Response KM 18 – Round 2 (New Comment)

The typographical error has been corrected on the well logs 578409-CRN and 578409-CRN-OB.

Comment KM 18 – Round 3

No comment received.

Response KM 18 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment MK 29 – Round 1

Appendix D6-Hydrology, Section D6.1.2 Drainage Basin Description, 3. On Page D6-2 it is stated that Slater Creek is an ephemeral stream. Aerial imagery shows a riparian area with trees and subirrigation occurring along much of the channel. PEM wetlands are also present as documented in Appendix D10. It would seem that an ephemeral stream may not be able to support these features. Please provide the justification why Slater Creek is considered an ephemeral stream, and that the stream does not contain intermittent characteristics where it is not below the local water table for a portion of the year. (MDK)

Response MK 29 – Round 1

Please see response to DM2.

Comment MK 29 – Round 2

Response not accepted. Please include additional discussion on the hydrology of Slater Creek to include what was added to Page D11-8 in Appendix D-11 in response to Comment MK 8: *Infiltration of precipitation into the burn and then slow release of the stored water acts as a water source for the subirrigation and surface flow of Slater Creek.*

In addition, a comparison of the 2014 observed flows between the upstream and downstream stations on Slater Creek shows that flows were higher at the upstream

station for the majority of the period. This may suggest Slater Creek is a losing stream. Please discuss this further in the description of the hydrology of Slater Creek. (MDK)

Response MK 29 – Round 2

The additional discussion for Slater Creek hydrology has been added to the middle of the third paragraph in Section D6.1.2 as requested.

Comment MK 29 – Round 3

Response not accepted. The additional discussion on the hydrology of Slater Creek was included as requested. However, based on observations from the AVF reconnaissance site visit to Slater Creek on September 24, 2015, Slater Creek should not be characterized as an ephemeral stream. At the time of the site visit, standing water and a small amount of flow was observed in the channel, particularly in Section 12. This flow was observed during a dry period when no precipitation had occurred previously. Therefore the flow was due to some other source besides direct response to precipitation. The permit application indicates that some discharge to Slater Creek occurs from infiltration of precipitation into high perched scoria burn above the stream channel; this water is stored and slowly released to Slater Creek. It appears that this flow may form a shallow water table that provides baseflow to the channel.

In my opinion Slater Creek is better described as an intermittent stream with a few isolated reaches that may be perennial. Please revise any text in the permit application that describes Slater Creek as an ephemeral stream (Page D6-2-Section D6.1.2, Page D6-11 -Section D6.1.5.2, Page D6-11-Section D6. 1.5.3, Page RP-45-Section RP .8.5.2). (MDK)

Response MK 29 – Round 3

Slater Creek has been described as intermittent stream, as requested, in the following areas of the text: in Appendix D6, the third paragraph of Section D6.1.2, the third paragraph of Section D6.1.5.2, the second paragraph of Section D6.1.5.3.; in Appendix D11 the second paragraph of Section D11.3; and in the Reclamation Plan, the first paragraph of Section RP.8.5.2.

Comment MK 30 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 4. The USGS operated a peak flow gage on Slater Creek from 1967 to 1981 (Station No. 06299900, http://nwis.waterdata.usgs.gov/wy/nwis/inventory/?site_no=06299900&agency_cd=USGS). The gage was located just downstream of the proposed permit boundary near the confluence with the Tongue River. Please incorporate the annual peak flow data from this station into the permit application to illustrate the range of peak flows that might be expected from Slater Creek. (MDK)

Response MK 30 – Round 1

The text and Tables D6.1-2 and D6.1-3 have been revised to include peak flow data for USGS Station No. 06299900.

Comment MK 30 – Round 2

No comment received.

Response MK 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 31 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 5. Some of the U.S. Army Corps of Engineers references cited in the text (2000, 2001) do not appear in the References Section (Section D6.3). Please add these to the references list. (MDK)

Response MK 31 – Round 1

The text edits have been made as requested.

Comment MK 31 – Round 2

Response not accepted. The citation (U.S. Army Corps of Engineers, 2001) on Page D6-3 still does not appear in the reference list. Please add this to the Reference Section (Section D6.3). (MDK)

Response MK 31 – Round 2

The year in the U.S. Army Corps of Engineers citation on page D6-3 was changed to 2009 to match the references provided in Section D6.3. The change was an inadvertent oversight on the part of WWC.

Comment MK 31 – Round 3

Response accepted.

Comment MK 32 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 6. Please add the year to the Miller reference within the text (2003) and add this citation to the references list in Section D6.3. (MDK)

Response MK 32 – Round 1

The text edits have been made as requested.

Comment MK 32 – Round 2

No comment received.

Response MK 32 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 33 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 7. Please explain in the text if the existing impoundments (stock reservoirs, old mine pits, etc.) in both the Slater Creek and Hidden Water Creek drainages were considered in the routing functions for the HEC-HMS runoff estimates. These features would likely have an effect on attenuating peak flows. (MDK)

Response MK 33 – Round 1

The text has been revised to clarify the impoundments are not included the HEC-HMS model. As described, peak flow estimates should be conservatively high without attenuation of storm events by impoundments.

Comment MK 33 – Round 2

No comment received.

Response MK 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 34 – Round 1

Appendix D6-Hydrology, Section D6.1.3.2 Flood Studies, 8. As the text states on Page D6-5, the HEC-HMS runoff estimates in Table D6.1-7 are higher than the Miller (2003) equation estimates. Please provide a discussion in the text as to the reasonableness of the HEC-HMS estimates and why the HEC-HMS estimates are so much higher than the Miller (2003) equation estimates.

The Miller (2003) equation for this region used, in part, data from the USGS peak flow gage on Slater Creek, so it would seem that the Miller (2003) estimates may be more reasonable. For example, compared to the HEC-HMS estimates, the 15-year record from the peak flow gage on Slater Creek would not register at anything greater than a five-year event. Furthermore, the May 18, 1978 event on Slater Creek resulted in a peak flow of 1,100 cfs, which according to the HEC-HMS estimates would only be around a 2-year event. USGS studies have shown that the May 1978 flood event was estimated to be a 100-year event on some parts of the Tongue River in this area (<http://pubs.usgs.gov/pp/1244/report.pdf>). (MDK)

Response MK 34 – Round 1

A discussion in the text has been included that speaks to why the HEC-HMS results are higher than the Miller results. Additionally, a discussion acknowledges the report by the USGS on the May 1978 flood. The Miller analysis does appear to more closely estimate the peak flowrates for flood events for the short data record on Slater Creek. However, hydraulic calculations will continue to use the HEC-HMS results because of the conservative results and the ease in comparing to the postmining hydrologic environment. HEC-HMS provides a way to change the properties of the drainage basins to reflect what will be present postmining, and the comparison between the premining and postmining HEC-HMS models quantifies the magnitude of the impact the Brook Mine will have on the hydrologic balance.

Comment MK 34 – Round 2

No comment received.

Response MK 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 35 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 9. Please add the northing/easting State Plane coordinates for the four Brook Mine surface water monitoring stations to Table D6.1-11. (MDK)

Response MK 35 – Round 1

The locations of the surface water monitoring sites have been reported to the quarter-quarter, which is an adequate level of accuracy to report the monitoring locations.

Comment MK 35 – Round 2

Response not accepted. The location coordinates are needed for plotting the locations of the stations; the quarter-quarter does not provide the needed level of accuracy for this. Reporting the northing/easting State Plane coordinates for monitoring locations is standard practice in other LQD coal permits and would be required when reporting station information in the Annual Report as part of the LQD Coal Annual Report Format (CARF). Please add the northing/easting State Plane coordinates for the four Brook Mine surface water monitoring stations to Table D6.1-11. (MDK)

Response MK 35 – Round 2

The northing and eastings for the surface water monitoring station have been added to Table D6.1-11, as requested.

Comment MK 35 – Round 3

Response not accepted. Although the coordinates were included in Table D6.1-11 as requested, the location appears incorrect for the upstream monitoring station on Slater Creek (SM578512-SW-1). During the AVF reconnaissance site visit to Slater Creek on September 24, 2015, station SM578512-SW-1 was observed approximately 1,800 feet downstream from where it is currently shown in Exhibit D6.1-2. Please see the attached map and photo below. Please also note that the location observed in the field matches what is shown in Addendum D6-5 Figure D6-2. Please provide the correct coordinates and location for station SM578512-SW -1 in Table D6.1-11 and Exhibit D6.1-2. Please also update the coordinates in Table MP.7- 1 and the appropriate permit application Exhibits (Exhibit D6. 1-2, Exhibit MP.7- 1, Exhibit RP.8-5) to show the correct location of the station. (MDK)

Response MK 35 – Round 3

The locations of all the surface water stations have been revised throughout the permit to correctly match the surveyed locations. The following tables and exhibits have been revised as requested: Table D6.1-11, Table MP.7-1, Exhibit D6.1-2, Exhibit MP.7-1 and Exhibit RP.8-5.

Comment MK 36 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations,10. On Page D6-8, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

Response MK 36 – Round 1

The text has been revised as requested.

Comment MK 36 – Round 2

No comment received.

Response MK 36 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 37 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 11. On Page D6-8, second paragraph, it states that increased E.Coli from samples collected in 2006 were attributable to high flows in May-June 2010. Were the samples also collected in 2010 and not 2006? Please revise this sentence. (MDK)

Response MK 37 – Round 1

The sentence was revised to read more clearly. The sentence was saying that samples taken in 2010 experienced an increase in E.Coli bacteria compared to the samples collected in 2006.

Comment MK 37 – Round 2

No comment received.

Response MK 37 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 38 – Round 1

Appendix D6-Hydrology, Section D6.1.5.1 Monitoring Stations, 12. On Page D6-8, second paragraph, it would be informative to add that, in addition to the SCCD, other entities such as the Big Horn Mine, USGS, and WDEQ/WQD have collected water quality data on the Tongue River and Goose Creek near the proposed mine. It may also be informative to mention that sections of the Tongue River in the vicinity of the proposed mine are on the State's 303(d) list since certain uses are not supported due to impaired water quality. Goose Creek has also been on the 303(d) list in the past and a TMDL has been prepared. Information can be found at:

<http://deq.wyoming.gov/wqd/water-quality-assessment/resources/reports/> and <http://deq.wyoming.gov/wqd/tmdl/>. (MDK)

Response MK 38 – Round 1

The text has been revised as requested. Refer to Section D6.1.5.1.

Comment MK 38 – Round 2

No comment received.

Response MK 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 39 – Round 1

Appendix D6-Hydrology, Section D6.1.5.2 Surface Water Quantity, 13. The Big Horn Mine (WDEQ/LQD Permit 213) operated a station on Hidden Water Creek (HWC1-79) from 1979 to 1998. This station was located approximately ¼ mile upstream from station SM578415-SW-1 that was installed by the Brook Mine. The LQD Hydrology Database contains mean daily flow data from this station from 1982 to 1997, although several years are missing data. Baseline water quantity characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic

format upon request or a more complete dataset may be available if requested from the Big Horn Mine. (MDK)

Response MK 39 – Round 1

Please see response to DM 2 and MK 30.

Comment MK 39 – Round 2

Response not accepted. The response referenced Comments DM 2 and MK 30, which refer to Slater Creek, not Hidden Water Creek. The LQD emailed the Hidden Water Creek data to WWC Engineering on July 8, 2015. Please incorporate and discuss the data to strengthen the baseline water quantity characterization of Hidden Water Creek in the Brook Mine permit application. (MDK)

Response MK 39 – Round 2

Please refer to the added text at the bottom of the second paragraph of Section D6.1.5.2 summarizing the flow data from the Big Horn Mine Hidden Water Creek former surface water monitoring station, HWC1-79. In addition, Table D6.1-14 has been added which provides the number of flow days per month and the maximum average flow for each day during a given flow month for the 1982 through 1997 period of record. The approximate location of HWC1-79 has been added to Exhibit D6.1-2.

Comment MK 39 – Round 3

Response accepted.

Comment MK 40 – Round 1

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 14. Please briefly discuss in the text the water quality results from Slater Creek in the context of WQD Surface Water Quality Standards for Class 3B waters (see Chapter 1 of WQD Rules and Regulations). This would reveal whether or not designated uses were being met prior to mining. The two samples from Slater Creek indicate no exceedances of Class 3B criteria, indicating uses are supported. (MDK)

Response MK 40 – Round 1

The text has been updated as requested.

Comment MK 40 – Round 2

No comment received.

Response MK 40 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 41 – Round 1

Appendix D6-Hydrology, Section D6.1.5.3 Surface Water Quality, 15. It is understood that water was not flowing in Hidden Water Creek so the applicant could not collect a sample for baseline purposes. However, as previously mentioned, the Big Horn Mine operated a station on Hidden Water Creek (HWC1-79) from 1979 to 1998. The LQD Hydrology Database contains nine water quality samples collected at this site from 1979 to 1989. Baseline characterization of Hidden Water Creek in the Brook Mine permit application would be strengthened if these data were incorporated and discussed. The LQD can provide these data in electronic format upon request. (MDK)

Response MK 41 – Round 1

Request for information is pending. No update to the permit has occurred at this time in response to this comment.

Comment MK 41 – Round 2

Response to the comment is pending. As discussed in the review of the response to Comment MK 39, the LQD emailed the Hidden Water Creek data to WWC Engineering on July 8, 2015. Please incorporate and discuss the data to strengthen the baseline water quality characterization of Hidden Water Creek in the Brook Mine permit application. (MDK)

Response MK 41 – Round 2

Please refer to the added text at the bottom of the second paragraph of Section D6.1.5.3 summarizing the surface water quality in Hidden Water Creek for the Big Horn Mine surface water monitoring station, HWC1-79. In addition, Table D6.1-15 has been constructed which displays concentrations of the nine samples collected for the 1979 through 1989 period of record. The approximate location of HWC1-79 has been added to Exhibit D6.1-2.

Comment MK 41 – Round 3

Response accepted.

Comment MK 42 – Round 1

Appendix D6-Hydrology, Section D6.1.5.4 Sediment Transport, 16. This section would be enhanced by including data from a single sediment sample collected on Slater Creek at USGS Station No. 06299900 (peak flow gage previously discussed in Comment No. 4). This sample was collected in June 1967 at a flow of 18 cfs. The TSS was 11,600 mg/L and the suspended sediment discharge was 564 tons/day. (MDK)

Response MK 42 – Round 1

The text has been revised to include the additional sediment sample as requested.

Comment MK 42 – Round 2

No comment received.

Response MK 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 43 – Round 1

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 17. A rating curve developed using only the Manning equation will provide only a rough estimate of flows given the uncertainty in the Manning's roughness coefficient. It is recommended that direct discharge measurements also be taken over time to help evaluate the rating curves developed for the four monitoring sites. (MDK)

Response MK 43 – Round 1

The rating curves were developed for ephemeral streams that flow infrequently enough that water measurements cannot be taken at regular intervals. Manning's equation provides a reasonable and widely accepted mathematic approximation of stream flow rates.

Comment MK 43 – Round 2

Response not accepted. Developing a rating curve for an open channel using only Manning's equation and no direct measurements is not a standard practice. If a direct discharge measurement is not occasionally taken, the accuracy of the modelled rating curve will never be known. Please commit to periodically taking a direct measurement to evaluate the rating curves. (MDK)

Response MK 43 – Round 2

A commitment to obtain direct measurements of surface water monitoring stations, when possible, was added to Section MP.7.1.

Comment MK 43 – Round 3

Response not accepted. The text was updated but it is unclear what is going to be directly measured. For example, the text states: *In addition, direct measurements of surveyed cross sections will be obtained when possible.* It is not clear if the measurement will be of the water discharge or the cross section dimensions. Please revise the sentence so it is clear that direct discharge measurements will be taken when possible to evaluate the rating curves.(MDK)

Response MK 43 – Round 3

Section MP.7.1 has been revised to state that direct discharge measurements will be obtained when possible.

Comment MK 44 – Round 1

Appendix D6-Hydrology, Addendum D6-5 – Rating Curves, 18. Given the uncertainty in the Manning equation, the estimated flow rates provided in Table D6-3 and Attachment D6-5-A (Rating Tables) are reported at much too high a level of precision to be meaningful. Depending on the magnitude of the flow estimate, there should be only one or two significant figures provided. For example, 0.29 cfs = 0.3 cfs and 3,584.38 cfs = 3,600 cfs. Please revise these tables. (MDK)

Response MK 44 – Round 1

Summary Table D6-3 has been revised to engineering precision (no more than three significant figures). The values in Attachment D6-5-A are essentially raw data that are being reported to that magnitude to show the validity of calculations and to aid in curve development. Being raw data, the values were not revised from those previously reported.

Comment MK 44 – Round 2

No comment received.

Response MK 44 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 9 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 9. Page D6-12 states, “The potential groundwater in the formation as capable of yielding small quantities of water for domestic and stock use”. Please consider providing a range of estimates for well yields based on literature review or from the baseline data collected by the Brook Mine. (MK)

Response Muk 9 – Round 1

The text has been revised to indicate that coal is the only regional shallow aquifer that has a sufficient quantity of water to support domestic and stock use.

Comment Muk 9 – Round 2

No comment received.

Response Muk 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 10 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 10. The description in this section discusses only about the Fort Union formation. Please provide a description of

the overlying and underlying water-bearing formations (aquifers) and describe their hydrogeologic characteristics (flow direction, gradients, aquifer properties, general outcrop locations) on a regional context. It is noted that some of the overlying formations may be dry or discontinuous within the mine permit boundary. (MK)

Response Muk 10 – Round 1

Section D6.2.1 has been updated as requested.

Comment Muk 10 – Round 2

No comment received.

Response Muk 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 11 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 11. Page D6-12 states, “The overburden is comprised of sand lenses, clinker and alluvial that have the potential of water bearing bodies. Due to the topography in this area, the valley cut through these deposits. Therefore, they are discontinuous and would not hold large quantities of water.” It is noted that they are discontinuous and would not hold large quantities of water. Please provide additional justification for this statement by using the hydrogeologic data collected by the Brook Mine including any reference to the interpreted extent of dry zones based on drill holes, monitor wells and other applicable data. (MK)

Response Muk 11 – Round 1

Section D6.2.1.1 has been updated as requested.

Comment Muk 11 – Round 2

Response not accepted. In addition to a reference to Addendum D5-2, please provide a description/interpretation on the aerial and vertical extent of dry zones. (MK)

Response Muk 11 – Round 2

Discussion of the interpreted dry zones was added to the first paragraph of Section D6.2.1.1 (page D6-14). As discussed, the overburden is primarily dry as indicated by the lithologic logs in Appendix D5. A few boreholes did indicate the presence of water in the overburden; however, water was generally located in the shallow alluvium/colluvium material or in burn areas. These boreholes were generally located near streams or supporting tributaries throughout the permit area and adjacent areas.

Comment MuK 11 – Round 3

Response accepted.

Comment Muk 12 – Round 1

Appendix D6, Section D6.2.1 Regional Hydrogeology, 12. Please clarify if there were groundwater springs or seeps observed in the areas within or adjacent to the mine permit boundary. Include a discussion (or reference) on the surface water - groundwater interactions.(MK)

Response Muk 12 – Round 1

Section D6.2.2.5 has been updated as requested.

Comment Muk 12 – Round 2

No comment received.

Response Muk 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 13 – Round 1

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 13. Page D6-13 states, “No monitoring wells were completed in the overburden or interburden as no water was found in these units during drilling operations”. This information is critical in demonstrating the overlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (both overburden and interburden) and their depths that were used to make this determination. (MK)

Response Muk 13 – Round 1

Section D6.2.2.1 has been updated as requested.

Comment Muk 13 – Round 2

No comment received.

Response Muk 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 14 – Round 1

Appendix D6, Section D6.2.2.1 Monitor Well Construction, Completion and Development, 14. Page D6-13 states, “Also one well 578409-MST-UB showed the presence of water in the underburden, while all the other wells drilled into the

underburden were dry and therefore not completed as wells.” Similar to the previous comment, this information is critical in demonstrating the underlying units are dry. Therefore, for better documentation, please provide (or reference) a map with all the drill holes (underburden) and their depths that were used to make this determination. (MK)

Response Muk 14 – Round 1

Please see response to Muk 13.

Comment Muk 14 – Round 2

No comment received.

Response Muk 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 15 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 15. Page D6-15 states, “Alluvial materials were also not analyzed during the aquifer testing.” The alluvial aquifer materials are one of the key factors in determining any impacts caused by mining to the alluvial aquifer. Alluvial aquifer tests will be helpful in understanding any surface water – groundwater interactions. Please provide justification for not conducting any aquifer tests in the alluvial wells. (MK)

Response Muk 15 – Round 1

The text in Section D6.2.2.2 has been updated.

Comment MuK 15 – Round 2

Response not accepted. The updated text just notes that there were three alluvial wells completed in Slater Creek. The original comment remains to be addressed. (MK)

Response MuK 15 – Round 2

A short discussion was added to the second paragraph of Section D6.2.2.2 after the context of the response to Comment MuK 16. The discussion explains that aquifer tests weren’t conducted in the alluvial wells because of the confining claystone intervals between colluvial/alluvial material and the differences in potentiometric head between the Carney coal and the colluvial/alluvial material. Therefore, it can be surmised that the confining intervals will provide a suitable barrier between the mining activities and the colluvium/alluvium, not necessitating aquifer tests in the alluvial aquifer.

Comment MuK 15 – Round 3

Response not accepted. It is acknowledged that there is a potentiometric head difference between alluvium and Carney coal seam. Please clarify if this potentiometric head difference is an artifact caused by CBNG dewatering. (MK)

Response MuK 15 – Round 3

It is unlikely that the potentiometric head difference between the alluvium and the Carney coal seam can be attributed to CBNG dewatering. The CBNG dewatering efforts have occurred approximately 2 miles away from the wells utilized for aquifer testing. Given the relatively low transmissivity of the coal it is unlikely that the CBNG dewatering efforts have significantly affected water levels in the wells utilized for the aquifer tests. The water levels measured in the Carney coal during the aquifer test demonstrate that the Carney coal is confined (see Addendum D6-8). If the drawdowns from CBNG dewatering were significant it is unlikely that the coal aquifer would still be confined. Discussion of the potentiometric head differences between alluvium and Carney coal as it relates to CBNG dewatering has been added to the end of the second paragraph in Section D6.2.2.2.

Comment MuK 16 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 16. Please provide justification for not observing the groundwater level responses in the alluvial aquifer during the two aquifer tests conducted by Brook mine. (MK)

Response MuK 16 – Round 1

No alluvial material was present in immediate vicinity of the clusters used for the pumping tests, hence there was no alluvial aquifer to monitor. Hidden Water Creek located to the east of the tested well cluster would be potentially the nearest location of alluvial material. However, as noted in Appendix D11, the fill material in Hidden Water Creek is more colluvial than alluvial.

In addition, as shown on the well completion summary logs in Addendum D6-7, multiple claystone intervals are located between the Carney Coal and the surface at the well cluster where the pumping tests were conducted. The top of the Carney Coal is approximately 90 feet below ground surface at the cluster well location which is approximately 50 feet below the level of any colluvial/alluvial deposits in Hidden Water Creek. Similarly, the potentiometric head in the Carney coal is some 50 feet below the level of the colluvial/alluvial deposits in Hidden Water Creek and if there were a direct hydraulic connection, there would be no water in the Hidden Water Creek colluvium/alluvium. Given the confining intervals between and the significant difference in potentiometric head between the Carney Coal and the Hidden Water Creek colluvium/alluvium, additional shallow monitoring above the Carney Coal was not necessary.

Comment Muk 16 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 16 – Round 2

The context of the response was added to the second paragraph of Section D6.2.2.2.

Comment MuK 16 – Round 3

Response accepted.

Comment Muk 17 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 17. Page D6-16 states, “A report of these tests can be found in Addendum D6-8 and summary tabulation of the aquifer test results is included in Table D6.2.2”. Please consider including a comparison of these estimated aquifer properties with the aquifer tests conducted in other similar coal seams in the Powder River Basin (Example: Bighorn Mine). Given the number of tests conducted by the mine, this will increase the robustness of the reported estimates from the two aquifer tests. (MK)

Response Muk 17 – Round 1

As requested aquifer test results from Big Horn Coal Company and from the Youngs Creek Mine were added to the text.

Comment Muk 17 – Round 2

No comment received.

Response Muk 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 18 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, It is noted that the aquifer tests were conducted for ~640 minutes. Will an increased aquifer test duration change the observed lack of interaction between the coal seams and the underburden? Please clarify with a brief description. (MK)

Response Muk 18 – Round 1

Given the head differences between the static water levels in the Carney Coal, Masters Coal, and the underburden it is unlikely that additional pumping would have resulted in any impacts to the water levels in the underburden. As shown on Table D6-2, (page Addendum D6-8-13) the initial water level in the Carney Coal was approximately 11.5 feet higher than the water level in the Masters Coal and the initial water level in the

Masters Coal was approximately 9 feet higher than the initial water level in the underburden well. If there were a hydrologic connection between the aquifers, it is likely that the water levels in the aquifers would have already come into equilibrium.

Comment Muk 18 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 18 – Round 2

The context of the response has been added as the third paragraph of Section D6-8.3.2.3 of Addendum D6-8 “Pumping Test Report.” The context of the response seems to be better suited in the Pumping Test Report than in Section D6.2.2.2 of Appendix D6.

Comment MuK 18 – Round 3

Response accepted.

Comment Muk 19 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 19. The referenced Addendum D6-8, Table D6-2 shows an increase in water levels in two of the Carney coal seam observation wells during the Masters coal seam well pumping test. Please provide an explanation for this increase in water levels during the aquifer test. (Noordbergum effect?). (MK)

Response Muk 19 – Round 1

Upon review of the raw data collected during the pumping test it was noted that the drawdowns reported in Tables D6-2 and D6-3 were incorrectly reported. Replacement tables are included with this round of comment responses. As shown on the updated version of Table D6-2, the water level in both Carney observation wells (CRN-1 and CRN-OB) increased by 0.23 feet during the Masters coal pumping test. While the Noordbergum effect or other natural phenomena such as earth tides could have potentially influenced the water levels in adjacent aquifers during the pumping test, the increase in water levels can be largely attributed to barometric pressure changes. Water levels in the Carney observation wells were monitored using hand held electric lines and there were no adjustments for barometric pressure reported in Table D6-2. No site specific barometric data was collected during the pumping test period. However, to evaluate how barometric pressure changes may have impacted water levels in the wells, barometric data from the automatic weather observing station (AWOS) at the Sheridan County airport was obtained from the National Oceanic and Atmospheric Administration (NOAA) database. Barometric data from the Sheridan County Airport AWOS site was compared to water level measurements in Attachment D6-8-K. The data in Attachment D6-8-K demonstrates a clear correlation between barometric pressure and water level variations in the Carney coal monitor wells during

the Masters coal pumping test. Generally over the course of the Masters coal pumping test the barometric pressure went down (roughly 0.31 feet). A decrease in the barometric pressure is expected to result in an increase in water levels in a confined aquifer like the Carney coal aquifer which is what was observed.

Similar increases in water levels were also noted in the Masters Coal observation wells (MST-1 and MST-OB) during the Carney pumping test as noted on Table D6-3. Attachment D6-8-K demonstrates a clear correlation between decreasing barometric pressure and rising water levels in the Masters coal observation wells during the Carney Pumping test. In addition, during the Carney coal pumping test, water levels in the Masters coal observation wells were still recovering from drawdowns induced during the Masters coal pumping test which may also have contributed to rising water levels in the Masters coal. The increase in water level measured in the Masters coal observation wells is attributed to a combination of continuing water level recovery and barometric effects.

Only very minor water level variations in the Masters underburden well (MST-UB) were noted during both pumping tests. As shown on the well completion form in Addendum D6-7, (Page D6-7-8) MST-UB was completed in an interval that was predominately claystone and the estimated yield is less than 2 gpm. Essentially the strata in which MST-UB is completed is more of an aquitard than an aquifer. As a result, it takes a lot longer for the water levels in the well to adjust to changing atmospheric pressure because water does not enter or discharge from the formation very fast. The lack of barometric responses in the MST-UB are attributed to the fact that the low yielding aquitard in which the well is completed has a lower barometric efficiency than the wells completed in the coal aquifers.

Vented transducers utilized to monitor water levels in the both the pumping and adjacent monitor wells during each pumping test, automatically compensated for the barometric pressure effects. Therefore, barometric pressure effects did not affect the aquifer analyses that were developed based on the pumping test data.

Comment Muk 19 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 19 – Round 2

The context of the response has been added to Section D6-8.3.2.3 of Addendum D6-8 “Pumping Test Report.” The context of the response seemed to be better suited within the Pumping Test Report than Section D6.2.2.2 of Appendix D6.

Comment MuK 19 – Round 3

Response accepted.

Comment Muk 20 – Round 1

Appendix D6, Section D6.2.2.2 Aquifer Tests, 20. Please provide a discussion (or reference) on the role of faults in the results of aquifer tests. (MK)

Response Muk 20 – Round 1

As noted in Addendum D6-8, (page D6-8-9) no hydrologic boundary conditions were observed in the pumping test data. As can be seen on Exhibit D6.2-2, the 578409 well cluster is located approximately 2,100 feet south and east of the nearest mapped fault. Since neither the Carney nor the Masters coal seams are very robust aquifers and have low transmissivity values, it is not surprising that the fault would not influence the pumping test results. For example, using Theis drawdown equations and the aquifer characteristics measured in the Masters coal (transmissivity of 3.2 ft²/day, storativity of 0.00025, and a pumping rate of 0.5 gpm) it is estimated that it would take over 70 days of continuous pumping for a water level response greater than 0.5ft to be observed 2,000 feet away. Therefore the likelihood that the faults would have influenced the pumping test results is very low.

Comment Muk 20 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application. (MK)

Response Muk 20 – Round 2

The context of the response has been added to Section D6-8.4 of Addendum D6-8 “Pumping Test Report.” This seemed like a more appropriate location for the context of the response than within Section D6.2.2.2 of Appendix D6.

Comment MuK 20 – Round 3

Response accepted.

Comment Muk 21 – Round 1

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 21. Please provide some additional discussion on the premining potentiometric surface maps, including ranges of estimated hydraulic gradients and groundwater velocity in the different coal seams/aquifers. (MK)

Response Muk 21 – Round 1

As requested, additional discussion on the hydraulic gradients and groundwater velocity in the coal seams were added to Section D6.2.2.4.

Comment Muk 21 – Round 2

Response not accepted. The revised text states, “Groundwater gradients are low ranging from approximately 2 – 4 ft/year in the Masters Coal and 1 to 2.5 ft/year in the Carney Coal.” Please correct the sentence to reflect velocities. (MK)

Response Muk 21 – Round 2

The text in Section D6.2.2.4, second paragraph was revised to correctly refer to 2 to 4 ft/year and 1 to 2.5 ft/ year as velocities rather than gradients.

Comment MuK 21 – Round 3

Response accepted.

Comment Muk 22 – Round 1

Appendix D6, Section D6.2.2.4 Premining Potentiometric Surface, 22. Please provide a discussion (or reference) on the hydrologic effects of any adjacent operations (including past coal mining activity by historic mines and Bighorn mine) on the premining information and data. (MK)

Response Muk 22 – Round 1

The last paragraph in Section D6.2.2.4 describes how CBNG production has affected water levels in the eastern side of the permit area. The drawdowns resulting from CBNG production have occurred since any historic coal mining activity and have superseded any drawdowns that may have occurred due to historic mining. Therefore, no lingering hydrologic effects from past coal mining activities are present. The text in the last paragraph in Section D6.2.2.4 has been updated to describe how CBNG impacts have superseded any impacts from historic coal mining activities.

Comment Muk 22 – Round 2

No comment received.

Response Muk 22 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 23 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 23. This section provides a good discussion on the recharge areas. However, please clarify if there are any discharges from the coal seams within the permit boundary. (MK)

Response Muk 23 – Round 1

Within the permit boundary there are no discharges from the coal seams with the possible exception of the Carney coal on the far west side of the permit area. As shown on Exhibit D6.2-3, the Carney coal outcrops in the far western side of the permit area along the ridge tops but has been eroded away in the stream valleys. As a result, the Carney coal is perched with no real source of recharge and is generally dry. However, on the down dip side of the outcrop the coal may discharge within the permit if there is water in the coal seam to discharge. As shown on Figures MP-3-4.7-1 and MP-3-4.7-2 it was determined during the groundwater modeling efforts that most of the Carney coal within the far western side of the permit area was dry. Therefore, there is minimal (if any) discharge from the Carney coal within the permit area. Section D6.2.2.5 has been updated to clarify where discharges from coal seams may occur within the permit boundary.

Comment Muk 23 – Round 2

No comment received.

Response Muk 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 24 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 24. Please provide a range of estimates for recharge from precipitation to the aquifers within the permit boundary. Also, provide a discussion if this is the primary recharge mechanism for the aquifers within the permit boundary. (MK)

Response Muk 24 – Round 1

The estimated recharge rates from precipitation are summarized in Section 4.2.2 of Addendum MP-3. Addendum MP-3 describes recharge within the permit area in more detail than Section D6.2.2.5. A reference to MP-3 was added in Section D6.2.2.5.

Comment Muk 24 – Round 2

No comment received.

Response Muk 24 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 25 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 25. Consider providing a description of the soil properties within the permit boundary and the use of these percent soil distributions in the discussion of infiltration within the permit boundary. (MK)

Response Muk 25 – Round 1

The soil properties within the permit boundary are described in detail within Appendix D7. While different soil types are expected to have variable infiltration rates, the only infiltration rate that is significant for the coal aquifers is the infiltration rate assigned to the strata near the outcrop of the coal seams. Throughout the permit area the strata overlying the coal aquifer are generally dry. Therefore the primary source of recharge occurs at the outcrops. Scoria, in particular, plays a significant role in recharge of the coal seams because it usually occurs near the coal outcrop. Because of its highly permeable characteristics most of the precipitation that falls on the scoria infiltrates into the scoria where it either infiltrates into the coal or discharges along a seep line at the base of the scoria. As noted in the response to BJ Kristiansen's comment number 57, ash material between the base of the scoria and the coal seams sometimes limits how much of the water in the scoria actually comes into direct contact with the coal. Nevertheless, because a large percentage of precipitation falling on the scoria actually infiltrates into it, the scoria does provide a consistent water source for recharge into the coal outcrops. As noted in Addendum MP-3 Section 4.2.2 the scoria areas were delineated and assigned their own recharge zone because they do play a significant role in recharging the coal seams. Within the permit area, there are several locations where the coal seams outcrop as well. These outcrop areas were also assigned their own recharge zone because they also have a hydrologic connection to the coals. Since the strata overlying the coal seams to be mined in the Brook Mine are generally dry, the recharge component from the overburden to the coal is very low away from the outcrop areas. Because of the limited hydrologic interaction between the recharge at the surface and the coal in areas away from the outcrop, site specific changes in the recharge rates based on soil type will not impact the coal aquifers. For this reason additional analysis of the infiltration properties of the soils within the permit area represents a level of detail that is not necessary to describe the hydrologic impacts to the coal aquifers from the proposed mining operations.

Comment Muk 25 – Round 2

Response conditionally accepted. Please incorporate the response into the permit application to document the justification for not including additional analysis on infiltration. (MK)

Response Muk 25 – Round 2

The context of the response has been added as the second paragraph of Section D6.2.2.5 of Appendix D6.

Comment MuK 25 – Round 3

Response accepted.

Comment Muk 26 – Round 1

Appendix D6, Section D6.2.2.5 Recharge and Discharge Areas, 26. Page D6-18 states, “Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-8”. Please revise this statement to reference the correct addendum - Addendum D6-9. (MK)

Response Muk 26 – Round 1

The text has been updated to read "Collected groundwater elevation and hydrographs of the groundwater wells are found in Addendum D6-9".

Comment Muk 26 – Round 2

No comment received.

Response Muk 26 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 27 – Round 1

Appendix D6, Section D6.2.3 Baseline Water Quality, 27. Page D6-20 states, “A piper diagram of the groundwater wells with measured values is presented in Figure D6.2-1. Please provide a discussion on the water quality types observed at each aquifer (Example: Is the water quality type variable within an aquifer? If yes, explain the potential reasons for this observed variability) based on the piper diagram. (MK)

Response Muk 27 – Round 1

Section D6.2.3 has been updated as requested.

Comment Muk 27 – Round 2

No comment received.

Response Muk 27 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 28 – Round 1

Appendix D6, Section D6.2.3 Baseline Water Quality, 28. Page D6-20 states, “The constituents that most frequently exceed the standard concentration limitations are ammonia, TDS, sulfate and manganese”. Please clarify if these constituents exceed the Chapter 8 standards at all the monitor wells. (MK)

Response Muk 28 – Round 1

Please refer to the Tables D6.2-8 thru D6.2-17 for exceedances of water quality based on Chapter 8 standards. Based on the tables, the concentrations are not exceeded at all monitor wells. No text edits were made in response to this comment.

Comment Muk 28 – Round 2

No comment received.

Response Muk 28 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment Muk 29 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 29. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Cheyenne copy of the TFN does not have a sheet separator and a tab for Appendix E2 in the Adjudication volume. Please provide a sheet separator and tab for Appendix E2. (MK)

Response Muk 29 – Round 1

Refer to Comment DM3. Groundwater rights are provided in Appendix B of the Adjudication Volume. This text edit has been made in Section D6.2.4.

Comment Muk 29 – Round 2

Response not accepted. The response indicates Appendix B and the updated text indicated Appendix B2. Please clarify if that is Appendix B or Appendix B2. (MK)

Response Muk 29 – Round 2

The text in Section D6.2.4 was corrected to reference Appendix B as opposed to Appendix B2.

Comment Muk 29 – Round 3

Response accepted.

Comment Muk 30 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 30. Page D6-20 states, “Adjacent and on-site groundwater rights are listed in Appendix E2 in the Adjudication Volume.” Please provide a summary discussion/statistics on (i) total number of water rights, (ii) number of wells, (iii) aquifer, (iv) permitted water use and other relevant summary statistics. (MK)

Response Muk 30 – Round 1

Groundwater rights are listed in Appendix B of the Adjudication Volume. All of the aforementioned information is listed for each water right. Due to the constantly changing nature of water rights, a summary table is difficult to construct, and due to summary statistics not being required by WDEQ regulation, a summary statistics table has not been prepared.

Comment Muk 30 – Round 2

Response not accepted. It is acknowledged and noted that water rights vary with time. The intent of this comment is to request a summary of the raw data on the water rights presented in Appendix B, which is a snapshot in time before the approval of the proposed operations. It will enable the reviewers to get a clear understanding of the existing groundwater water uses and if there is a significant dependence on the affected aquifers. In addition, it is very useful information for the CHIA to provide a summary on the groundwater hydrologic concerns within the impact area. Please summarize (i) total number of water rights, (ii) number of wells (iii) wells grouped by aquifer and (iv) permitted water use. Example: Sum the total number of wells, provide a description on the percent of different types of uses. (MK)

Response Muk 30 – Round 2

A summary table (Table D6.2-18) has been added to Appendix D6. Text referencing this table has been added to Section D6.2.4, as well as text referencing discussion of impacted wells found in Addendum MP-3. Table D6.2-18 summarizes the total number wells not including cancelled, expired, abandoned, or suspended water rights. The table lists the permitted water use, the number of wells for each permitted water use, and the percent of total for each permitted use category. The table does not group the wells by aquifer. With nearly 500 wells being reported, the research required to determine the aquifer that each well is completed in would be exhaustive and, ultimately, not possible. Additionally, upon review of several of these water rights, one will note that most water rights have poor completion information. Water rights have either no lithology or have lithology that is so nondescript that a specific aquifer cannot be determined.

Comment MuK 30 – Round 3

Response accepted.

Comment Muk 31 – Round 1

Appendix D6, Section D6.2.4 Groundwater Rights, 31. Please provide a discussion (or reference) on the premine groundwater use (including the uses reported to SEO) within the permit boundary and the adjacent areas. (MK)

Response Muk 31 – Round 1

The premine groundwater uses as reported to the SEO within the permit boundary and the adjacent 3 miles are listed with each individual water right in Appendix B of the Adjudication Volume.

Comment Muk 31 – Round 2

Response not accepted. In addition to the reference to Appendix B, please include a textual description and summary of the premine groundwater use within the permit boundary and adjacent areas. (MK)

Response Muk 31 – Round 2

The text in Section D6.2.4 has been changed to include a discussion listing the predominant water uses in permit area and the adjacent 3-mile buffer. The text references the newly created Table D6.2-18 for a groundwater use summary.

Comment MuK 31 – Round 3

Response accepted.

Appendix D7

Comment DS 6 – Round 1

Appendix D7, Exhibit D7.3.-1 was compared with Exhibit MP.1-1. As required, it appears that the soil sampling was concentrated in areas where surface disturbance is to be expected. Please provide the contour interval on the soils map. For ease of review and to prevent misinterpretation, however, the map showing sampling locations should also clearly show the locations of proposed surface disturbances instead of providing these details on separate maps which may or may not present differing scale distances.

Response DS 6 – Round 1

The disturbance boundary can be found on Figure D7.1-1 and as the reviewer noted on Exhibit MP.1-1. No revision to exhibit D7.3-1 has occurred in response to this comment.

Comment DS 6 – Round 2

Response is not adequate. Please show the proposed surface disturbance locations on Exhibit D7.3.-1.

Response DS 6 – Round 2

Please refer to Comment DS 22 of the Mine Plan. Soil polygons have been added to Exhibit MP.4-2 integrating the disturbance boundary with the associated soil polygons. No revision to Exhibit D7.3-1 has occurred in response to this comment.

The reasoning behind this is to separate Mine Plan disturbance from baseline studies. It is RAMACO's opinion that baseline studies should only show those conditions prior to RAMACO's proposed operations. Additionally, when future revisions to the Mine Plan are potentially made, references to the Mine Plan in baseline studies could inadvertently be missed causing mistakes in the permit. However, RAMACO is open to showing baseline information within the Mine Plan for an easier evaluation of topsoil types stripped within the topsoil stripping areas.

Comment DS 6 – Round 3

No comment received.

Response DS 6 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 7 – Round 1

Appendix D7, Page D7-4. The second paragraph of this page contains text that should be deleted. It states "If for whatever reason overall sampling intensity.....was determined to not be enough, it is proposed that any additional sampling be deferred and included a stipulation of a future pre-stripping soil assessment program." The Mine Plan and Reclamation Plan soils handling and replacement is contingent on adequate baseline sampling of the proposed area that will be affected by mining operations (topsoil balance and stockpile location planning and bond calculation). Therefore, baseline sampling for soils must be adequate prior to approval of any permit application. Please remove the inappropriate language from the Appendix D7 text. If future changes to the Mine Plan require additional soil sampling the issue will be addressed at that time.

Response DS 7 – Round 1

As requested, the second sentence of the second paragraph on page D7-4 has been deleted.

Comment DS 7 – Round 2

No comment received.

Response DS 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 8 – Round 1

Appendix D7, Page D7-9. Text appears in this section that upon NRCS declaration of prime farmlands occurring in the permit area, a letter will be provided to the DEQ. A letter from the NRCS has been received and inserted in the permit declaring no prime farmlands to exist. The text, therefore, is not appropriate and should be removed.

Response DS 8 – Round 1

As requested, the sentence about prime farmland (the last sentence of the first full paragraph on page D7-9) has been deleted. A new reference, citing the letter received on October 31, 2015 (negative determination of prime farmland on Ramaco permit area) has been inserted on page D7-9 and the new reference has been added to the list of references on page D7-33.

Comment DS 8 – Round 2

No comment received.

Response DS 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 9 – Round 1

Appendix D7, WS § 35-11-415(b)(iii) and the Coal Rules, Chapter 4, Section (c)(ix) state that if topsoil is virtually nonexistent or is not capable of sustaining vegetation then subsoil or a selected spoil material may be used as a topsoil or subsoil supplement. Additionally, due to the proximity of this mine to the Tongue River, a Class 2AB stream, limits for chemical contaminants will be imposed on discharges from the permit. Therefore, for areas where unsuitable or marginal topsoil chemistry is located (e.g. Wibaux channery loam, sample R13), an alternative soil replacement material should be identified and used in reclamation. Such a commitment must also be provided in the Mine Plan and Reclamation Plan to provide evidence that such issues that could affect the condition of reclamation and/or lead to off-site impacts will be addressed.

Response DS 9 – Round 1

No “alternate soil replacement material” is necessary for areas of Wibaux channery loam (Map Unit Wx). The lower soil material below 8 inches of Wibaux (any “C” horizon soil substratum below 8 inches, where existent) was not recommended for salvage and would be grouped with the overburden spoil for placement purposes. This lower material had an excessive volume of hard coarse fragments (>35%) and, based on one of the three Wibaux sample sites (R13), an “unsuitable” EC and SAR value for the 8 to 15 inch depth, EC=12.8 and SAR=17.3. Two new sentences, indicating no soil salvage of Wibaux below 8 inches in depth, has been added to the soils report on page D7-26, one sentence each for Map Unit Wx and Map Unit Wx-RO. Furthermore, the amount of suitable soil available for salvage across the entire proposed disturbance area is not limiting, with a calculated weight-average of 20.2 inches. Therefore, additional “alternate soil replacement material” is not necessary.

Comment DS 9 – Round 2

No comment received.

Response DS 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 10 – Round 1

Appendix D7, The description of Map Unit G (Bauxson Loam, sample R-19) does not show marginal selenium that occurs between 22 – 48 inch depth range which could affect the salvage depth and may require special handling of the marginally suitable subsoil.

Response DS 10 – Round 1

Two new sentences have been added to the last paragraph on page D7-21 stating the presence of “marginal” rated Selenium values for lower material of Bauxson loam (Map Unit G) sample site R19. Strictly speaking, “marginal” rated soil material is not “unsuitable” and does not need to be specially handled. This lower Bauxson material has been recommended for salvage as “Subsoil”, not “Topsoil”.

Comment DS 10 – Round 2

No comment received.

Response DS 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 31 – Round 2 (New Comment)

Section D7-2, Page D7-3 – A quotation and reference related to Schellinger, 2014, must be removed from the permit document as must all other quotations not supported by LQD documentation.

Response DS 31 – Round 2 (New Comment)

This quotation and reference is supported by LQD documentation. Please refer to Exhibit D7.2-1 of Appendix D7 which is a memorandum authored by David Schellinger, Soils Specialist on June 14, 2014. The quotation on page D7-3 accurately represents the sentence in the memorandum. Therefore, the quotation and reference remain in Appendix D7 as evidence for the extent of soil sampling in the Brook Mine permit area.

Comment DS 31 – Round 3 (New Comment)

Response is not adequate. The LQD Administrator has determined that LQD staff quotations not directly attributed to peer reviewed documents or documents signed by LQD staff should not be used in the text of permit documents; the quotes have no standing. The quotation of Mr. Schellinger, 2014, related to the survey required on affected areas where surface excavation would not occur must be removed.

Response DS 31 – Round 3 (New Comment)

The author of the citation has been revised to Wyoming Department of Environmental Quality (WDEQ-LQD). 2014b. However, the quotations and reference for the Memorandum to File remain in the text. As previously stated the quotation accurately represents the sentence in the memorandum as evidence for the extent of soil sampling in the Brook Mine permit area therefore the quotations will remain.

Appendix D8

Comment JJ 1 – Round 1

Appendix D8, 1. Please update the permit boundaries so that they are the same on Exhibit D8. 2-1 and Addendum D8 Map 1. I note specifically that lands should not be included within the permit boundary south of the interstate and that Section 10 TWN57N RNG85W displays different boundaries along the far west edge of the permit; it appears that the section lines are skewed between the two maps. The Addendum D8 Map 1 also is missing a sizeable amount of lands located in Section 21 TWN54N RNG84W which are included within the permit boundary of the Adjudication Exhibit 1 map. While comparing the maps I find that the maps display the same information in slightly different formats, please explain the necessity for two individual maps and at a minimum make them consistent against one another.

Response JJ 1 – Round 1

Baseline vegetation assessment maps have been updated to include the correct permit boundary. The discrepancy in the permit boundary is attributed to the difference in graphical representation between a USGS quad system and a PLSS system. The USGS quad system is now depicted. Exhibit D8.2-1 is a summary map for this Appendix and future updates made to this Appendix. This map will change throughout the life of the mine as future changes are incorporated. Addendum D8 Map 1 is for this Addendum and will not change throughout the life of the mine.

Comment JJ 1 – Round 2

The response is acceptable. The DEQ now understands the two separate maps and the boundaries now match.

Response JJ 1 – Round 2

Round 1 response is adequate. No response is necessary.

Comment JJ 2 – Round 1

Appendix D8, 2. Why does the study area not include all lands within the proposed permit boundary?

Response JJ 2 – Round 1

Portions of the proposed Brook Mine permit area not included within the study area were added during an October 2014 permit boundary change following completion of the baseline vegetation study. Additional studies were not conducted in these areas due to the limited size and similarity to areas within the study area. Section D8-1.1, page D8-1-5 text has been updated to explain the exclusion of these areas.

Comment JJ 2 – Round 2

The DEQ rules and regulations require vegetative characterization and baseline data for the entire permit area. Therefore, the lands located in Section 21, 22, and 15 that had not been previously included in the 2013 vegetation study area will require further attention. Please contact the DEQ to discuss the required baseline vegetation surveys. Due to the nature of the missing baseline vegetation data more comments may occur once all the data is submitted and applicable tables are updated.

Response JJ 2 – Round 2

The lands that are located in Sections 21, 22, and 15 that were not previously sampled in 2013 were sampled during 2015 quantitative baseline vegetation fieldwork. The data gathered for the areas in the above listed sections will be summarized for the WDEQ when the vegetation report is completed. The study area also needs to be

updated on both Exhibit D8.2-1 and Addendum D8 Map 1, and will be provided to WDEQ in a supplemental submittal.

Comment JJ 2 – Round 3

Comment remains open until the data is provided and reviewed.

Response JJ 2 – Round 3

Addendum D8-1 text and Addendum D8-1 Table D8-2 have been revised to include the additional areas for the Brook Mine Study Area. Exhibit D8.2-1 and Addendum D8-1 Map 1 have been revised to include the updated Brook Mine Study Area boundary.

Comment JJ 3 – Round 1

Appendix D8, 3. The acreage displayed on Table D8.2-1 should equal that of the land permitted on the Form 11. The Form 11 displays 4,548.8 acres while the table shows 4,581.7 acres a difference of 32.9 acres. Please update either the Form 11 or Table D8.2-1 to show the true permit acreage as it relates to the vegetation communities. Upon further review I find that Table D8-2 located on page Addendum D8-1-41 exhibits the proper acreages in relation to the Form 11, thus the values represented there may be more accurately displayed in Table D8.2-1.

Response JJ 3 – Round 1

Total acreage of the permit area is 4,548.8 acres as illustrated in Form 11 and Table D8-2. Table D8.2-1 has been updated to reflect the correct acreage.

Comment JJ 3 – Round 2

The response is acceptable.

Response JJ 3 – Round 2

Round 1 response is adequate. No response is necessary.

Comment JJ 4 – Round 1

Appendix D8, 4. Table D8.2-1 states there are 56 acres of agricultural lands; however, I am unable to locate Agricultural lands north of the interstate. Please, discuss and edit the values to display true acreages in relation to the proposed permit boundary. (See comment 3 for more clarification and another table for utilization to update values.)

Response JJ 4 – Round 1

Agricultural Lands within the permit area total 4.5 acres and are located in Section 21 TWN54N RNG84W. Table D8.2-1 has been updated to reflect the correct acreage of Agricultural Lands and other vegetation communities within the permit boundary.

Comment JJ 4 – Round 2

The response is acceptable.

Response JJ 4 – Round 2

Round 1 response is adequate. No response is necessary.

Comment SP 3 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-3. Section D8.1.7. Guideline 2 is a non coal guideline. Please revise this sentence to reference the equation shown in Section D8-1.2.9 Sample Adequacy.

Response SP 3 – Round 1

Changed as requested. Additionally, Appendix D8 reference to Guideline 2 was replaced by reference for Chapter 2 in Section D8.1.1, page D8-1 and Section D8.3, page D8-4. Addendum D8 reference to Guideline 2 was replaced by reference for Chapter 2 in Section D8-1.2, page D8-1-5 and Section D8-1.9, page D8-1-38. Reference to Guideline 2 was removed from Section D8-1.2.9, page D8-1-12.

Comment SP 3 – Round 2

No comment received.

Response SP 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 3 – Round 3

The response is satisfactory. The references to Guideline 2 have been removed.

Comment SP 4 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-4. Section D8.1.8. Please revise the second sentence to, “The EXREFA is all of the unaffected area for each native vegetation community.”

Response SP 4 – Round 1

Changed as requested.

Comment SP 4 – Round 2

No comment received.

Response SP 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 4 – Round 3

The response is satisfactory. The term EXREFA has been incorporated.

Comment SP 5 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-1-8. Section D8-1.2.4. The last sentence in this section states that no sample locations occurred within the Brook Mine Permit Area. AG-13, 14, 17 and 25 are shown on Addendum: D8, Map 1 inside the permit area. Please correct this statement or the permit boundary on the Map.

Response SP 5 – Round 1

Baseline vegetation assessment maps have been updated to include correct permit boundary which illustrates AG-13, 14,17, and 25 are not located within the permit boundary.

Comment SP 5 – Round 2

No comment received.

Response SP 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 5 – Round 3

The response is satisfactory. The permit boundary has been corrected so that no Agricultural transects fell within the permit boundary.

Comment SP 6 – Round 1

Appendix D-8 Vegetation Baseline, Page D8-1-11. Section D8-1.2.8. The last sentence of the first paragraph should be revised to, “Sample adequacy was not required for species diversity and composition.”

Response SP 6 – Round 1

Changed as requested.

Comment SP 6 – Round 2

No comment received.

Response SP 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment SP 6 – Round 3

The response is satisfactory. A sentence on sample adequacy for species diversity and composition has been revised.

Appendix D9

Comment DM 4 – Round 1

Appendix D9-Wildlife, Page D9-3 states that when a sage grouse confirmation letter is provided by WG&F, it will be provided to DEQ. It appears that the confirmation letter is already part of the package (Page D9-E3). Please reference the location of the letter.

Response DM 4 – Round 1

Page D9-3 was revised to reference Page D9-E3 as the location of the letter.

Comment DM 4 – Round 2

No comment received.

Response DM 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 1 – Round 1

(Appendix D9), We recommend this report become part of the annual reporting which will ensue throughout the operation of the mine.

Response WGF 1 – Round 1

Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references the sections of the Mine Plan where the annual wildlife report commitments are contained.

Comment WGF 1 – Round 2

No comment received.

Response WGF 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 2 – Round 1

(Appendix D9), We suggest coordinating with the USFWS regarding raptor mitigation as needed through the mining process.

Response WGF 2 – Round 1

The commitments to coordinate with the USFWS regarding raptors as well as T&E and other species of federal concern are provided in Section MP.18, Addendum MP-8 and Addendum MP-9 of the Mine Plan. Discussion was added at the end of Addendum D9-1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references these discussions.

Comment WGF 2 – Round 2

No comment received.

Response WGF 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment WGF 3 – Round 1

(Appendix D9), We recommend mining reclamation practices consider providing suitable habitat for existing wildlife within the specifications required by DEQ-LQD.

Response WGF 3 – Round 1

The commitments to reclaim wildlife habitats are provided in the Reclamation Plan in Section RP.7 Wildlife Restoration. Discussion was added at the end of Addendum D9 - 1 Section D9-1.6 on Page Addendum D9-1-31 titled “Monitoring and Mitigation” that references the Reclamation Plan.

Comment WGF 3 – Round 2

No comment received.

Response WGF 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D10

Comment BJ 63 – Round 1

EXHIBITS, Addendum D10, The permit boundary layer on all of the exhibits covering the aquatic resource boundaries is incorrect. Please correct the permit boundary layers.

Response BJ 63 – Round 1

Aquatic resource inventory maps have been updated to include the correct permit boundary.

Comment BJ 63 – Round 2

No comment received.

Response BJ 63 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 5 – Round 1

Appendix D10-Wetlands, D10-1.4 – Please include a copy of the letter requesting concurrence and jurisdictional determination sent to the ACOE At the end of the text, and reference the letter in the text.

Response DM 5 – Round 1

BKS Environmental Associates, Inc., on behalf of RAMACO, requested concurrence and jurisdictional determination from the USACE on May 29, 2015. A copy of the letter sent to the USACE has been included as Attachment D10-F. Section D10-4, page D10-10 text has been updated to reflect submittal of USACE request.

Comment DM 5 – Round 2

No comment received.

Response DM 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 45 – Round 1

Appendix D10-Wetlands, Section D10.2 Results, 19. The text may want to state when (what date) RAMACO requested the jurisdictional determination from the USACE, and include this request letter as an Addendum to Appendix D10. This would provide documentation that the request was submitted, as receipt of the USACE determination may lag behind the LQD permitting process. (MDK)

Response MK 45 – Round 1

See response to DM5.

Comment MK 45 – Round 2

No comment received.

Response MK 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Appendix D11

Comment BJ 26 – Round 1

Appendix D11, Alluvial Valley Floor, Section D11.1, RAMACO has requested LQD to make a determination on the nature of the drainages as potential AVF within the permit boundary as well as within ½ mile of the permit boundary. This would then entail analysis of the following drainages (distances are approximations): • Hidden water Creek – all (4 mi.)

- East Fork Earley Creek – lower 1 mile
- Slater Creek – lower 3 miles
- Tongue River – ½ mi. east of Interstate 90 and 4 mi. west of Interstate 90 at the Acme exit.

Prior to such a declaration, LQD staff will have to perform a variety of assessments designed to assist us in making a declarative statement about AVF classification. An AVF declaration will be made after in-depth study of the drainages. Such investigation will consist of, but not be limited to:

1. Field evaluation of the geomorphic and lithologic character of the drainages in question;
2. Determination of the agricultural characteristics of the stream course;
3. Examination of available bore hole logs that can be used to characterize the subsurface materials beneath the valley floor;
4. Determination of groundwater and surface water characteristics, both quantitative and qualitative, within the drainages in question;
5. Other evaluation processes that may be deemed necessary should initial findings warrant further, in-depth analyses.

Response BJ 26 – Round 1

Revised D11 text throughout to expand discussion on the drainages mentioned above. Incorporated previous AVF studies into Appendix D11. Information satisfying each statement can be found in the following locations as well as many other locations throughout the document:

1. Borehole logs provided in Addendum D11-3. Hidden Water Creek test pits dug by Big Horn Mine and discussed in Section D11.3 “Stream Laid Deposits.”

2. Agricultural characteristics of the stream courses are discussed in Sections D11.4.2, D11.4.3, and D11.5, in particular.
3. Bore hole logs are provided in Addendum D11-3. Additional test pit and borehole information was analyzed from the Big Horn Mine Permit No. 213.
4. Groundwater and surface water characteristics are discussed extensively in Appendix D6. Potential impacts to surface water and groundwater are discussed in the Mine Plan. The water resources are generally discussed in Section D11.4.
5. Additional research has been incorporated from the Big Horn Mine Permit No. 213. Corrections and reevaluations of the AVF study have been made throughout Appendix D11.

Comment BJ 26 – Round 2

The response to the Round 1 comment is adequate. The original comment from round 1 was intended to create dialogue between Brook Mine Brook Mine and LQD:

- a) The first goal was to engender further discussion in the permit document covering baseline information regarding the nature of all potential AVFs within the permit boundary. The Round 1 Response effectively established a starting point for both LQD and Brook Mine.
- b) Now that there is a common foundation for all parties, field analysis and data studies can be initiated. This work needs to be scheduled.
- c) Brook Mine must provide written surface owner consent enabling LQD staff access to all acreages covered in the AVF determination analysis. This includes lands defined in Round 1, BJ comment 26, itemized stream lengths by stream name and distance.

Response BJ 26 – Round 2

A field analysis and data study of the potential AVFs within the permit boundary and adjacent areas was scheduled for September 24, 2015. RAMACO has provided LQD personnel with written surface owner consent enabling LQD staff to access acreages covered in the AVF determination analysis. No edits to the text were made in response to this comment.

Comment BJ 26 – Round 3

No comment received.

Response BJ 26 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment BJ 70 – Round 3

An AVF determination for Slater Creek has yet to be finalized. The site was visited by LQD staff on September 24, 2015 for the purpose of gathering field data for the future AVF determination. This determination is in the process of analysis of data and a decision will be issued by the beginning of 2016.

Response BJ 70 – Round 3

No response required. No changes were made in response to this comment.

Comment BJ 27 – Round 1

Appendix D11, Alluvial Valley Floor, Addendum D11-3, Some of the borehole and well logs indicate a damp or wet interval encountered during drilling. Was an attempt made to allow wet materials to produce water prior to continuation of the hole or was water noted after adding another drill steel and lowering the kelly to begin the next 20 feet of hole? Typically, after the steel has been added and the compressor is engaged, a small amount of water can be air-lifted before the rotary table begins to turn. If so, are there field notes indicating water was observed during the connection?

Response BJ 27 – Round 1

It is standard procedure during drilling operations to provide wet or damp intervals an opportunity to produce water. If the intervals had produced water, this would have been noted in the drilling logs provided in Addendum D11-3. There are no other separate field notes that would provide additional information. No changes to the text were made.

Comment BJ 27 – Round 2

No comment received.

Response BJ 27 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 1 – Round 1

Appendix D11-AVF, Section D11.1 Introduction, 1. In the second paragraph on Page D11-1, the possible impacts of the proposed mining operation on the Tongue River AVF are dismissed because the area is planned for facilities level disturbance only. However, the groundwater model (Mine Plan Addendum MP-3) predicts drawdown in the Tongue River alluvium, thereby possibly affecting the AVF. As discussed in subsequent comments, additional analysis and monitoring is needed to comply with LQD Coal Rules and Regulations regarding AVFs. (MDK)

Response MK 1 – Round 1

Revised text to reference Mine Plan Section MP.6 concerning the Brook Mine’s effect on the Tongue River AVF.

Comment MK 1 – Round 2

Response not accepted. Mine Plan Section MP.6 does not explicitly mention or discuss the Tongue River AVF, or AVFs in general. Please provide a more thorough discussion in MP.6 on the possible effects of mining on the AVFs, particularly the Tongue River AVF with respect to drawdown in the Tongue River alluvium. Please also see the review of the response to Comment MK 21 below. (MDK)

Response MK 1 – Round 2

Discussion of the Tongue River and Goose Creek AVFs and their associated impacts has been added to the Mine Plan in Section MP.25. In addition, a reference to this section was added to Section D11.7 in Appendix D11 and Section MP.6 in the Mine Plan. As discussed in the text, no significant impacts to the alluvial valley floors within and adjacent to the permit area are expected as no mining is planned within these areas. Potential minor impacts that could occur is the insignificant loss of water due to temporary loss of flow from ephemeral tributaries contributing to the Tongue River and Slater Creek.

Comment MK 1 – Round 3

Response accepted.

Comment MK 2 – Round 1

Appendix D11-AVF, Section D11.2 Purpose and Scope, 2. On Page D11-2, please change “Wyoming Reclamation Act” to “Wyoming Environmental Quality Act”. (MDK)

Response MK 2 – Round 1

Revised text to state “Wyoming Environmental Quality Act.”

Comment MK 2 – Round 2

No comment received.

Response MK 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 3 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 3. For identification of unconsolidated stream laid deposits, LQD Guideline No. 9 (AVF) lists two items that may be used to positively identify unconsolidated streamlaid deposits: (1) channel

bars, splays, abandoned meanders, modern flood plains, or terraces, and (2) bedload or washload sediment deposited or transported in a nonbedrock channel bottom. Presumably, item (2) would be met at the streams identified within the AVF study area. However, the permit application does not address whether the channels contain geomorphic features from item (1). Please address in the text whether channel bars, splays, abandoned meanders, modern flood plains, or terraces are observed within the streams within the AVF study area. (MDK)

Response MK 3 – Round 1

Revised text to discuss the lack of channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs in the Hidden Water Creek, Slater Creek, East Fork Earley Creek, and Earley Creek valleys.

Comment MK 3 – Round 2

No comment received.

Response MK 3 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 4 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 4. On Page D11-5, the conclusion that the materials in Hidden Water Creek valley do not meet the definition of unconsolidated streamlaid deposits, is in conflict with the conclusion from the Big Horn Mine Permit. The Big Horn Mine Permit (Appendix D6, Pages D6-151 to D6-158) describes the evaluation of unconsolidated streamlaid deposits on lower Hidden Water Creek. The permit states: “The conclusion verified from the pit observations is that these deposits are unconsolidated and stream laid. Small isolated patches of colluvium or bedrock can be found throughout the alluvial deposits, but these characteristics do not exclude the deposit from being stream laid.” Please evaluate the data and findings from the Big Horn Mine Permit before a conclusion is drawn about the absence of unconsolidated streamlaid deposits on Hidden Water Creek. (MDK)

Response MK 4 – Round 1

Revised text to discuss the findings of the Big Horn Mine from test pits in the Hidden Water Creek valley. Additionally, Exhibit D11.3-1 was revised to show the locations of the Big Horn Mine test pits in Hidden Water Creek in relation to both the Brook Mine permit area and the Big Horn Mine permit area. Added the Big Horn Mine Permit State Decision Document (SDD) 213-T2 to Addendum D11-2.

Comment MK 4 – Round 2

No comment received.

Response MK 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 5 – Round 1

Appendix D11-AVF, Section D11.3 Stream Laid Deposits, 5. The Big Horn Mine Permit also describes subirrigation and flood irrigation studies on lower Hidden Water Creek and concludes: “Due to the lack of subirrigation and extremely low potential for flood irrigation, Hidden Water Creek is not an alluvial valley floor.” Although this is in the approved mine permit, it does not appear that an explicit AVF determination for Hidden Water Creek was ever issued by the LQD, and the AVF findings in the SDDs for the Big Horn Mine Permit do not mention Hidden Water Creek. The Brook Mine Permit application should incorporate these previous AVF studies on Hidden Water Creek into Appendix D11. (MDK)

Response MK 5 – Round 1

See response to comment MK 4. Additionally, while the Big Horn Mine State Decision Documents do not mention Hidden Water Creek, the SDD 213-T2 states that “No other drainages are of significant size or lack the stream laid deposits necessary to be an Alluvial Valley floor within the renewal and/or amendment areas.” Hidden Water Creek is located within the renewal area and was not included within the originally declared AVF area. Although it was not mentioned by name, it has been declared not to be an AVF within the Big Horn Permit Area. This SDD has been added to Addendum D11-2 and discussion added to the text in Section D11.3.

Comment MK 5 – Round 2

No comment received.

Response MK 5 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 6 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 6. On Page D11-6 it is stated the three monitor wells were installed along the thalweg of Slater Creek. The transects in Exhibit D11.3-2 show that two of the wells (578513-AL and 578418-AL) are not along the thalweg but are rather upgradient of the channel. Please revise this description in the text. (MDK)

Response MK 6 – Round 1

Revised text to more accurately state that the monitor wells are along or near the thalweg.

Comment MK 6 – Round 2

No comment received.

Response MK 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 7 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 7. It appears that from Exhibit D11.1-1 that subirrigation is occurring on Earley Creek within the AVF study area. Please explain why subirrigation was not mapped on Earley Creek. (MDK)

Response MK 7 – Round 1

Revised Exhibit D11.1-1 to show potentially subirrigated lands on Earley Creek. The text was revised in Section D11.4.2 to reflect that subirrigation potentially occurs along Earley Creek.

Comment MK 7 – Round 2

No comment received.

Response MK 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 8 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 8. On Page D11-6, second paragraph, the alluvial/colluvial potentiometric surface is dismissed as a source of subirrigation along Slater Creek. However, the other hydrologic processes responsible for the subirrigation are not identified. Please discuss in the text why subirrigation is occurring along Slater Creek. (MDK)

Response MK 8 – Round 1

Revised text to discuss the presence of burn areas overlying residual coal ash bands that serve as aquacludes which prevent water from entering or escaping the coal below.

Comment MK 8 – Round 2

No comment received.

Response MK 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 9 – Round 1

Appendix D11-AVF, Section D11.4.2 Extent of Subirrigation, 9. The cross-sections in Exhibit D11-3-2 would be improved if the active channel and any floodplains or terraces were shown. A description of the materials in the active channel bottom would also help identify unconsolidated streamlaid deposits. (MDK)

Response MK 9 – Round 1

Revised Exhibit D11.3-2 to show the 2-year, 24-hour flood inundation area and the location of the active channel. Data regarding the materials in the active channel bottom are presented in the borehole logs in Addendum D11-3.

Comment MK 9 – Round 2

Response not accepted. The cross-sections were updated as requested but it is not clear if the materials from the borehole logs truly represent the active stream channel, as many of the borehole logs are shown to be tens to hundreds of feet away from the active channel. Please provide a description of the materials in the active channel bottom of both Hidden Water Creek and Slater Creek. (MDK)

Response MK 9 – Round 2

Borehole locations were chosen in areas that would represent the natural extent of the alluvium in the channel and those that could be accessed in order to obtain these boreholes. So while boreholes are located ten to a hundred feet off the natural channel in actuality, these areas are the closest location that could be physically accessed to obtain the boreholes due to the limitations of the drilling equipment. In addition, to ensure the boreholes were drilled in a location that was properly depicting the potential alluvial/colluvial material of the channel, the presence of scoria alluvial/colluvial material was used as an identifier. As exhibited in Addendum D11-3, scoria material was recorded in the majority of borehole logs. Text has been added to Section D11.3 regarding the selection of borehole locations.

Comment MK 9 – Round 3

Response accepted.

Comment MK 10 – Round 1

Exhibit D11.4-1, the extent of irrigated lands shown in Sections 2 and 11 along Slater Creek may not be correct. According to the summary for the Hart Brothers Ditches water right (permit 1317) in the SEO database, the land being irrigated under the water right has decreased to 23 acres:

THIS FACILITY IS MADE UP OF TWO DITCHES. THE WEST DITCH HAVING A POINT OF DIVERSION IN LOT 2 AND THE EAST DITCH HAVING A POINT OF DIVERSION IN THE SENE OF SECTION 3, T57N, R85W. T57N, AND 58N, R85W

HAS BEEN DEPENDENTLY RESURVEYED. REQUEST FROM PADLOCK RANCH TO ELIMINATE 67 ACRES AS FOLLOWS: 32 ACRES IN THE SWSW OF SECTION 2 - 30 ACRES IN THE NENW AND 5 ACRES IN THE NWNW OF SECTION 11 ALL IN T57N, R85W, RECEIVED AND GRANTED. REQUEST OF ELIMINATION AND PROOF OF OWNERSHIP FILED IN MISCELLANEOUS NOTICES. ADJUDICATED WITH H.H. WILLIAMS AS APPROPRIATOR. PERMIT RECORD REFLECTS SOURCE AS SLATER CREEK AND WATER STORED IN THE HART BROTHERS RESERVOIR, P60R, XR7825A, HOWEVER CERTIFICATE RECORD REFLECTS .91 CFS FOR THE IRRIGATION OF 64 ACRES. BOC PETITION II 89-4-2 BY PADLOCK RANCH WAS GRANTED TO ISSUE AMENDED CERTIFICATE C77/290A TO REDESCRIBE LANDS WITHOUT CHANGING LAND TOTALS AND TO CHANGE POINT OF DIVERSION FROM THE RECORD POINT IN THE NWNE AND SENE OF SECTION 3, 57N, R85W AND PARTIAL MEANS OF CONVEYANCE FOR 41 ACRES (.59 CFS) TO THE WILLIAMS DITCH, P8710D, C77/289A DIVERTING WATER FROM SLATER CREEK IN THE SESW OF SECTION 34, T58N, R85W AS RECORDED IN ORDER RECORD BOOK 36, PAGES 385-390 AND RECEIVED ON CD3/578A. THIS LEAVES 23 ACRES STILL IRRIGATED UNDER THIS PERMIT. LANDS SHOWN BELOW AS "AME" AND "ELI" ARE THOSE ORIGINALLY DESCRIBED UNDER THIS DITCH.

Please clarify the irrigated acreage status for the Hart Brothers Ditches water right with the SEO and revise Exhibit D11.4-1 accordingly. (MDK)

Response MK 10 – Round 1

Exhibit D11.4-1 was revised to more accurately capture irrigated lands on Slater Creek in Sections 2 and 11 of Township 57 North, Range 85 West.

Comment MK 10 – Round 2

No comment received.

Response MK 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 11 – Round 1

Appendix D11-AVF, Section D11.4.4 Water Quality, 11. On Page D11-7, it is not necessary to mention the State of Montana water quality classifications of the Tongue River, as only State of Wyoming classifications and standards would apply. Please remove reference to the Montana standards. (MDK)

Response MK 11 – Round 1

Removed text referencing State of Montana water quality standards.

Comment MK 11 – Round 2

No comment received.

Response MK 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 12 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 12. On Page D11-8, second paragraph, it states that Exhibit D11.1-1 shows that sufficient water supply does not exist for consistent agricultural practices in East Fork Earley Creek. However, Exhibit D11.4.1 shows a point of diversion for Earley Creek Ditch No. 1 and several areas of irrigated lands less than 40 acres in East Fork Earley Creek. As documented in Addendum D11-4, there is an adjudicated water right for irrigation in this location. So there may be sufficient water supply for consistent agricultural practices. The text needs to further expand on this discussion of East Fork Earley Creek since there is an adjudicated water right for irrigation. (MDK)

Response MK 12 – Round 1

Revised text to include the Earley Creek Ditch No. 1 water right, but explained that subirrigation must not be prevalent in East Fork Earley Creek because no culvert or other conveyance structure is present beneath I-90. If subirrigation was prevalent and without a conveyance structure beneath I-90, substantial amounts of water would back up against the interstate.

Comment MK 12 – Round 2

Response not accepted. Please also add to the text any history available on the Early Creek Ditch No. 1 water right and the irrigation associated with the water right. I looked at several years of aerial imagery and it does not appear that any areas have been irrigated under this water right in recent times. I am able to view what appears to be the headgate and two ditches. It is possible that irrigation was abandoned long ago, which would support the contention that there is not sufficient water supply for consistent agricultural practices. Nonetheless, the water right remains fully adjudicated according to the SEO water rights database, so more discussion of this area is warranted in the text. (MDK)

Response MK 12 – Round 2

Text at the end of the second paragraph of Section D11.5 was added regarding the Earley Creek Ditch No.1. As presented in the text, based on CIR, imagery of the area, vegetation studies and absence of a conveyance structure under Interstate 90, the Earley Creek Ditch No.1 doesn't appear to have been used for irrigation purposes for some time.

Comment MK 12 – Round 3

Response accepted.

Comment MK 13 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 13. On Page D11-8, last paragraph, it states that the hay meadows along Slater Creek in Sections 2 and 11 are not within the boundaries of subirrigation or natural flood irrigation.

(a) The areas symbolized as irrigated lands in Exhibit D11.4-1 do not necessarily correspond to hay meadows, as the imagery shows hay meadows in the SWNE, SENE, and NESE of Section 11, and the NWSW of Section 12. The hay meadows appear to correspond with the area mapped as “AG” in the Vegetation Map (Exhibit D8.2-1) in Addendum D8.

(b) The irrigated area shown in Exhibit D11.4-1 near the Landen Ditch does overlap with subirrigation mapped in Exhibit D11.1-1.

Please re-evaluate the area of hay meadows along Slater Creek and revise the text accordingly. Comments No. 15 and 16 below also relate to this issue. (MDK)

Response MK 13 – Round 1

The text was revised in Section D11.5 to reflect the presence of limited hay meadows and overlapping of irrigation with subirrigation on the upper reaches of Slater Creek in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West. Exhibit D11.4-1 was revised to show irrigation in Sections 2, 3, 11, and 12 of Township 57 North, Range 85 West.

Comment MK 13 – Round 2

No comment received.

Response MK 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 14 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, On Page D11-8, last paragraph, it states that, besides Hart Bros Ditches, the remaining portion of the Slater Creek valley does not contain SEO water rights. This is not the case as Exhibit D11.4-1 shows Landen Ditch in the NENW of Section 11. This water right (P11695) does not appear in Addendum D11-4. Please revise the text and add this water right to Addendum D11-4. (MDK)

Response MK 14 – Round 1

The text was revised in Section D11.5 to discuss the Landen Ditch water right (P11695). A copy of the Landen Ditch water right was added to Addendum D11-4.

Comment MK 14 – Round 2

No comment received.

Response MK 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 15 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 15. The irrigated acreage for the Landen Ditch water right appears to be 18 acres for one point of use and 22 acres for a second point of use. Please add these areas to Exhibit D11.4-1. (MDK)

Response MK 15 – Round 1

Exhibit D11.4-1 was revised to more accurately reflect irrigated lands in the vicinity of the Landen Ditch.

Comment MK 15 – Round 2

No comment received.

Response MK 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 16 – Round 1

Appendix D11-AVF, Section D11.4.5 Agricultural Practices, 16. The Hall Ditch (SEO Permit 5195), mapped in Section 11 of Exhibit D11.4.1, apparently provides irrigation water for hayfields in the NESE of Section 11 (30 acres) and the NWSW of Section 12 (22 acres). This water right does not appear in Addendum D11-4. Please add this water right to the Addendum and add the irrigated acreages to Exhibit D11.4-1. (MDK)

Response MK 16 – Round 1

A copy of the Hall Ditch water right (SEO Permit 5195) was added to Addendum D11-4. Exhibit D11.4-1 was revised to depict irrigated lands in Section 12, Township 57 North, Range 85 West. The text in Section D11.5 was revised to discuss the Hall Ditch water right.

Comment MK 16 – Round 2

No comment received.

Response MK 16 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 17 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 17. Portions of Earley Creek and East Fork Earley Creek are within the AVF study area yet the permit application does not attempt to conclude if these streams contain AVFs. Presumably, the LQD will need to make an AVF finding on these streams. (MDK)

Response MK 17 – Round 1

See response to Comment BJ 26. Additional discussion has been added to aid WDEQ in the AVF findings of East Fork Earley Creek and Earley Creek. Both valleys are upstream of mining activities proposed by RAMACO such that no material damages are expected to either valley.

Comment MK 17 – Round 2

Response not accepted. Additional discussion was added for East Fork Earley Creek, but not Earley Creek. However, it is unclear from Comment BJ 26 if the LQD intends to make an AVF determination for Earley Creek. Additional response to this comment may be needed after checking with other LQD staff on whether or not a determination will be made for Earley Creek. (MDK)

Response MK 17 – Round 2

As discussed with LQD personnel, the majority of Earley Creek is outside of the permit area and ½ mile adjacent study boundary, however a small portion of the creek intersects the ½ mile study boundary in T.57N., R.84W. in the northwest quarter of Section 16 and southwest quarter of Section 9. These portions of land are outside of any planned surface disturbance and groundwater impacts to the area are not expected; therefore, a study of these lands was not included in Appendix D11. Discussion of Earley Creek will remain in Appendix D6. No changes to the D11 text were made in response to this comment.

Comment MK 17 – Round 3

Response accepted.

Comment MK 18 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 18. The first bullet for Slater Creek on Page D11-9 dismisses the positive identification of unconsolidated

stream laid deposits because a layer of colluvial material was found over alluvial material. However, as stated in Appendix D5 on Page D5-8 and Page D5-9, sub-rounding of the clinker present in the cuttings suggests water driven deposition of limited extent. Also, as discussed in Comment No. 3, the application did not evaluate unconsolidated streamlaid deposits in a manner that is consistent with identification criteria listed in LQD Guideline No. 9. The application has not provided sufficient evidence that unconsolidated stream laid deposits are not present along Slater Creek. (MDK)

Response MK 18 – Round 1

See response to Comment MK 3. The discussion on the Slater Creek valley has been further expanded to include the absence of unconsolidated stream laid deposits such as channel bars, splays, abandoned meanders, modern flood plains, and terraces that qualify for AVFs. Exhibit D11.3-1 clearly indicates the presence of undifferentiated alluvium and colluvium (Qac) in the Slater Creek valley.

Comment MK 18 – Round 2

No comment received.

Response MK 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 19 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 19. The third bullet on Page D11-9 for Slater Creek should be clarified that the width of natural flood irrigation in the valley is generally insufficient to provide for economic agricultural practices. However, economic agricultural practices clearly occur immediately upstream of the proposed mine permit boundary because of artificial flood irrigation of hayfields adjacent to the channel. These practices are documented by existing water rights that are approximately 100 years old. Please revise this discussion. (MDK)

Response MK 19 – Round 1

The text in Section D11.6 of Slater Creek's third bullet was revised to include the irrigated hayfield upstream of the permit boundary.

Comment MK 19 – Round 2

No comment received.

Response MK 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 20 – Round 1

Appendix D11-AVF, Section D11.6 Extent of Alluvial Valley Floor, 20. The fifth bullet for Hidden Water Creek on Page D11-9 seems to dismiss the positive identification of unconsolidated stream laid deposits because of colluvial material with shallow bedrock. However, as previously noted, this conflict with information in the Big Horn Mine permit concerning unconsolidated stream laid deposits on Hidden Water Creek. (MDK)

Response MK 20 – Round 1

Refer to response of Comment MK 4. The Big Horn Mine permit boundary has been added to Exhibit D11.1-1. The text in Section D11.6 has been updated to include a summary of the discussion stating that the Big Horn Coal Permit No. 213-T2 SDD determined the limits of the AVF, and no portion of Hidden Water Creek was determined as being AVF.

Comment MK 20 – Round 2

No comment received.

Response MK 20 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 21 – Round 1

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, Although the LQD has not yet issued its formal finding, the segment of the Tongue River adjacent to the proposed permit area, which was not declared under previous LQD findings, likely contains an AVF.

(a) If this AVF is significant to farming, the applicant must comply with LQD Coal Rules and Regulations Chapter 3, Section 2(d)(ii) and demonstrate that the proposed mining operations will not materially damage the quantity and quality of water that supplies the Tongue River AVF. The absence of direct mining on the Tongue River AVF does not relieve the requirement of assessing the probable hydrologic impacts of the proposed operation to the AVF, particularly since the groundwater model in Mine Plan Addendum MP-3 predicts drawdown in the Tongue River alluvium. (MDK)

(b) Regardless of the significance to farming, the applicant must also maintain and/or restore the essential hydrologic functions of the Tongue River AVF. The applicant must therefore identify the essential hydrologic functions of the Tongue River AVF and either (1) provide an analysis that the proposed operation will not hamper the essential hydrologic functions, or (2) demonstrate that the essential hydrologic functions will be restored. The essential

hydrologic functions for another part of the Tongue River AVF are described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27), so this may be a good starting point to consider. (MDK)

(c) A monitoring system is also required to demonstrate the essential hydrologic functions are maintained, as per LQD Coal Rules and Regulations, Chapter 5, Section 3(b)(ii). Since the groundwater model (Mine Plan Addendum MP-3) predicts 2.5 feet of drawdown in the Tongue River alluvium, the monitoring system may likely contain alluvial monitoring wells and periodic evaluation of color-infrared imagery. (MDK)

Response MK 21 – Round 1

Revised text as requested. Revised text by adding information regarding the essential hydrologic functions of the declared AVFs (Tongue River and Goose Creek) from the SDD in Addendum D11-2. Also, added portion of text to describe possible monitoring system and plan for the AVFs that may be affected.

Comment MK 21 – Round 2

Response not accepted. Please see the review of the response to Comment MK 1. Please provide a more specific reference to the section of the Mine Plan (MP.6) that discusses the probable hydrologic impacts to the Tongue River and Goose Creek AVFs. Please also provide a more specific reference to the appropriate portion of the Mine Plan or Reclamation Plan that provides further details on the AVF monitoring plan. (MDK)

Response MK 21 – Round 2

See comment MK 1-Round 2 response. Discussion of the AVF monitoring plan for the Tongue River has been added to the Mine Plan in Section MP.25 as well as the Reclamation Plan in Section RP.10. In addition, monitoring locations have been updated on Table MP.7-4, Exhibit MP.7-1 and Exhibit RP.8-5.

Comment MK 21 – Round 3

Response not accepted. With respect to the three proposed alluvial monitoring wells, please state in the text in Section MP.25 that these wells will be installed prior to commencing any mining-related disturbance.

Response MK 21 – Round 3

A statement that the alluvial monitoring wells along the Tongue River will be installed prior to mining related disturbance was added to the last paragraph in Section MP.25 of the Mine Plan.

Comment MK 22 – Round 1

Appendix D11-AVF, Section D11.7 Mining of Alluvial Valley Floor, 22. The essential hydrologic functions of the adjacent Goose Creek AVF must also be maintained during the proposed mining operation. The application needs to list these functions, as described in the Big Horn Mine Permit SDD (shown in Brook Mine Appendix D11 on Page Addendum D11-2-27). A monitoring system is also required to demonstrate that the essential hydrologic functions will be maintained. (MDK).

Response MK 22 – Round 1

See response to comment MK 21.

Comment MK 22 – Round 2

Response not accepted. The essential hydrologic functions of the Goose Creek AVF are listed, but the text does not explicitly address a monitoring system for the Goose Creek AVF, only the Tongue River AVF. Please commit to a similar monitoring system for the Goose Creek AVF to demonstrate that the essential hydrologic functions will be maintained. The text should also reference the appropriate portion of the Mine Plan or Reclamation Plan that provides further details on the AVF monitoring plan. (MDK)

Response MK 22 – Round 2

See comment MK 1-Round 2 response. Discussion of the AVF monitoring plan for Goose Creek has been added to the Mine Plan in Section MP.25 as well as the Reclamation Plan in Section RP.10. In addition, monitoring locations have been updated on Table MP.7-4, Exhibit MP.7-1 and Exhibit RP.8-5.

Comment MK 22 – Round 3

Response accepted.

Comment MK 104 – Round 2 (New Comment)

The permit application suggests that the Tongue River and Goose Creek contain AVFs. Appendix D-11 must therefore also include a discussion of the importance of these AVFs to farming, as discussed in LQD Guideline No. 9 (see Part IV, Section C). (MDK)

Response MK 104 – Round 2 (New Comment)

Text in Section D11.5 has been revised to discuss the importance of AVFs to farming.

Comment MK 104 – Round 3

Response conditionally accepted. The permit application has not provided the information discussed in LQD Guideline No. 9, Part IV, Section C for determining the importance of farming to the AVFs that presumably will be declared by the LQD on the Tongue River and Goose Creek. However as per Guideline No. 9, this information is

only required for "affected AVFs". The permit application implies that the AVFs on the Tongue River and Goose Creek should not be considered "affected AVFs" since farming would not be interrupted, discontinued, or precluded, and the essential hydrological functions of the AVFs would be preserved during mining. No mining is scheduled for these areas and the disturbance that is proposed appears to be minor enough such that essential hydrologic functions would not be affected. Therefore a significance to farming determination for these AVFs does not appear to be required. This may be subject to change pending other LQD staff input when the AVF determinations are made. (MDK)

Response MK 104 – Round 3

No response is required. No changes have occurred in response to this comment.

Comment MK 105 – Round 2 (New Comment)

Appendix D-11 (or perhaps Mine Plan MP.6) should also include a discussion of whether the proposed operation would interrupt, discontinue, or preclude agriculture use of the Tongue River and Goose Creek AVFs. This discussion should evaluate if the predicted drawdown in the Tongue River alluvium (Mine Plan Addendum MP-3) would result in any loss of agricultural use of the AVF. (MDK)

Response MK 105 – Round 2 (New Comment)

Text has been added to Mine Plan Section MP.25 to describe how agricultural use of the Tongue River and Goose Creek AVFs will not be precluded.

Comment MK 105 – Round 3

Response accepted.

Comment MK 121 – Round 3 (New Comment)

D11.5 Agricultural Practices. The CHIA site inspection report (Dated October 21, 2015 and mailed to Randall Atkins c/o WWC Engineering) discussed the abandoned Conable Reservoir and Ditch and Lateral system in Sections 12 and 13 within the proposed Brook Mine permit area. According to the SEO water rights database, a water right for Conable Reservoir was granted in 1901 (P223.0R). The purpose of the reservoir was to store water for irrigation of lands under the Conable Ditch and Lateral, which also held a water right to divert 1.46 cfs (P3088.0D). The water right allowed for using the water for irrigation of 100 acres of land adjacent to Slater Creek in T57N, R85W, Section 13. Both water rights were cancelled in 1906, and it is unknown the extent that the irrigation was ever developed. The dam for the reservoir has long since failed, allowing Slater Creek to flow freely through. In Section D11.5, please incorporate the history of the Conable Reservoir and Ditch and Lateral System, as this demonstrates there was a historical attempt to irrigate lands in the Slater

Creek valley within Section 13 of the proposed permit boundary. The attempt apparently failed and was abandoned and the water rights were cancelled. (MDK)

Response MK 121 – Round 3 (New Comment)

Discussion of the Conable Reservoir and Conable Ditch and Lateral were added as the fourth paragraph in Section D11.5.

Comment MK 122 – Round 3 (New Comment)

D11.7 Mining of the Alluvial Valley Floor. Although no mining is planned on the AVFs on the Tongue River and Goose Creek, the disturbance boundary is within a small part of the Big Horn Mine AVF extent (Exhibit D 11.6-1). It appears that this area includes the SP-1, OB-1, and OB-2 features in Section 21 on Exhibit MP .5-1, which was updated for this round. Please include a statement in the text of Section D11.7 that there is some minor disturbance proposed within the AVF extent. Please also see Comments 7 (MK 126) and 8 (MK 127) below that request this be addressed in the relevant sections of the Mine Plan and Reclamation Plan. (MDK)

Response MK 122 – Round 3 (New Comment)

Minor disturbance is planned within the declared Big Horn Mine AVF extent in Section 21 of Township 57 North, Range 84 West. Text discussing the minor disturbance has been added to the first paragraph of Section D11.7, as well as a reference to the applicable sections of the Mine Plan and Reclamation Plan for further discussion of the disturbed AVF.

Mine Plan

Comment BJ 28 – Round 1

Volume 11, Mine Plan, Section MP.1.2.1, pg. MP-4, Tunnel and pillar widths are discussed in general terms. Please approximate a range for the widths, in feet, in the narrative to give context to the discussion.

Response BJ 28 – Round 1

Added text as suggested.

Comment BJ 28 – Round 2

No comment received.

Response BJ 28 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 29 – Round 1

Volume 11, Mine Plan, The fifth sentence, beginning with "To minimize the amount of exposure..." does not make sense. Please rewrite the sentence for clarity.

Response BJ 29 – Round 1

Added text as suggested.

Comment BJ 29 – Round 2

No comment received.

Response BJ 29 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 30 – Round 1

Volume 11, Mine Plan, The narrative also references figure MP.1-3 as a general schematic of the highwall mining operation. The figure depicts significant vertical highwalls above the mining operation. The text mentions that the highwalls will be vertical where the Masters and Carney converge but the illustration depicts conditions where the coal seams appear to be separated by a considerable thickness of parting. It is our experience that vertical highwalls in the Powder River Basin are unstable and should be discourage wherever possible. What would the maximum thickness of burden approximate where the vertical highwalls will exist? Please include an average on the schematic as has been done for pit width and bench width.

Response BJ 30 – Round 1

The figure has been updated to include the average depths.

Comment BJ 30 – Round 2

No comment received.

Response BJ 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 31 – Round 1

Volume 11, Mine Plan, Pages MP-3 and MP-4, These pages describe the highwall mining operation in vague generalities. The narrative states that the continuous miner will advance into the working face to a depth of 2,000 feet. The manufacturer's specifications for the ADDCAR system state that the depth of a cut is 1,600 feet. Is this a discrepancy of 400 feet or is there a difference in mining tools and the ADDCAR system comes with multiple depth capacities. Please clarify.

Response BJ 31 – Round 1

Conversations with ADDCAR representatives indicates that they will be able to extend the range of the highwall mining system so cuts up to 2,000 feet can be achieved.

Comment BJ 31 – Round 2

No comment received.

Response BJ 31 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 32 – Round 1

Volume 11, Mine Plan, A general word of guidance – Ramps are mentioned in the narrative as designed to an 8% grade. The Cat 777 can generally handle this grade fairly well under most conditions. The Mack Titan trucks, however, may be problematic under certain conditions. Entering the pit on the ramp could be difficult for the Mack trucks with pups if the ramp has been watered to control dust. The overburden materials used for ramp systems are generally silty with a clay matrix and overwatering can create slipping hazards for vehicles. A truck with multiple trailers will have difficulty navigating these conditions. A 6% ramp under these situations is strongly advised.

Response BJ 32 – Round 1

Revised text as suggested.

Comment BJ 32 – Round 2

No comment received.

Response BJ 32 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 33 – Round 1

Volume 11, Mine Plan, The narrative describes the tunnel width as variable, depending on the cutting head chosen. Please indicate approximate footages of the tunnel widths. For example, Bucyrus and Joy manufacture continuous miners that have heads ranging from 11 to 12 feet in width. A mention of those widths would clarify the narrative. Also the protective coal pillars are described but have no dimensions indicated. The pillar width to tunnel width is crucial so an approximation of the remnant pillars width in feet is required. Please include approximate widths for tunnel and pillar widths.

Response BJ 33 – Round 1

See response to Comment BJ 28. The text has been updated as requested.

Comment BJ 33 – Round 2

No comment received.

Response BJ 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 34 – Round 1

Volume 11, Mine Plan, Section MP.1.2.2, The dozer push method of overburden removal is not adequately described. Though Figure MP.1-4 does depict the dozer push materials to some extent, the overlapping nature of the multiple lift system can be confusing to some. The narrative on page MP-4 is too brief. Please elaborate further on the dozer push staging and overburden removal. Perhaps an illustration that depicts the dozer removal in stages would be more appropriate. This can be accomplished by creating a series of illustrations rather than only one. Please clarify the methodology.

Response BJ 34 – Round 1

Revised text as requested. Created Figure MP.1-5.

Comment BJ 34 – Round 2

No comment received.

Response BJ 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 35 – Round 1

Volume 11, Mine Plan, Section MP.1.4, Pg. MP-5, The last sentence does not make sense. Please rewrite the sentence.

Response BJ 35 – Round 1

Removed last sentence for clarity.

Comment BJ 35 – Round 2

No comment received.

Response BJ 35 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 36 – Round 1

Volume 11, Mine Plan, Section MP.4.2.3, Pg. MP-15, The discussion of temporary topsoil stockpiles describes creating a ring ditch around the topsoil pile if there is a potential for water erosion during the 2 week to 6 month life of the pile. Since the climate is unpredictable and subject to rapid changes, temporary topsoil stockpiles (2 weeks to 6 months) will be required to have ring ditches in all cases with no qualifiers. LQD writes more violations concerning inadequate topsoil practices than any other issue. Rewrite the narrative to indicate that all temporary topsoil stockpiles will have a ring-ditch and berm created for piles having a life of 2 weeks or more. Keep in mind that even a short-lived topsoil stockpile could generate a violation if a sudden rainstorm were to erode the soil and waste it on the surrounding terrain. RAMACO may want to allow for this as well

Response BJ 36 – Round 1

Updated text as requested.

Comment BJ 36 – Round 2

No comment received.

Response BJ 36 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 37 – Round 1

Volume 11, Mine Plan, Section MP.4.3.4, Pg. Mp-17, A swell factor of 16% is being used to convert bank cubic yards to loose cubic yards. The number was generated from information attained from Big Horn Coal (PT213). Where was this information located? Many of the coal mines in the northwestern corner of the Powder River Basin use a swell factor of 13% - 14% since the overburden material is finer grained, with a higher clay content than mines on the eastern margin of the basin. Please cite the use of a 16% swell factor.

Response BJ 37 – Round 1

Revised text as requested. Table MP.4-9 provides typical swell and load factors of materials.

Comment BJ 37 – Round 2

No comment received.

Response BJ 37 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 38 – Round 1

Volume 11, Mine Plan, Section MP.6.1, Pg. MP-39, The second paragraph discusses surface runoff attenuation during mine years 4 and 5. The peak flow rates for precipitation events will be attenuated by the mining trenches that lie perpendicular to the flow in the local drainages. What flow events are expected to be attenuated by the trenches? Will the 2 year, 10 year, or 100 year events be considered as an average event? Please modify the narrative, in general terms, to define which precipitation event will be used when designing the pit drainage plans.

Response BJ 38 – Round 1

Updated text as requested.

Comment BJ 38 – Round 2

No comment received.

Response BJ 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 39 – Round 1

Volume 11, Mine Plan, Section MP.8, Pg. MP-47, The narrative mentions that potable water will be hauled to the mine and placed in a cistern. Why is a cistern system being considered for potable water instead of a reverse osmosis unit? The local residents use such systems as do the mines. How large of a cistern will be used for water storage? Please modify the narrative to expand on the rationale behind using a cistern.

Response BJ 39 – Round 1

The text has been revised. The final potable water system has not been determined.

Comment BJ 39 – Round 2

No comment received.

Response BJ 39 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 40 – Round 1

Volume 11, Mine Plan, Section MP.9.9, Pg. MP-52, When pre-dug mud pits are to be used for exploration drilling, the topsoil must be protected from contamination by removal and stockpiling. The pit location must be stripped to the base of the soil with an areal extent that allows the pit materials to be stacked as spoil without encroaching on native surface. Reclamation shall occur in a manner that will best restore the surface to its pre-disturbance condition. These contingencies need to be

better described in the narrative. Please modify the text to reflect the aforementioned conditions.

Response BJ 40 – Round 1

Revised text as suggested.

Comment BJ 40 – Round 2

No comment received.

Response BJ 40 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 41 – Round 1

Volume 11, Mine Plan, Section MP.18, Pg. MP-68, The second paragraph discusses the speed limits that will be set on haulroads to protect wildlife. Approximately what speed limits will be used?

Response BJ 41 – Round 1

Updated text with a 45 MPH Speed Limit.

Comment BJ 41 – Round 2

No comment received.

Response BJ 41 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 42 – Round 1

Volume 11, Mine Plan, Section MP.20, Pg. MP-69, The brief description of underground mining should state that no "conventional" underground mining will occur. Highwall coal recovery is an underground mining technique, but no personnel work underground. Thus the mining is modified underground mining.

Response BJ 42 – Round 1

Revised text as requested.

Comment BJ 42 – Round 2

Response BJ 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 43 – Round 1

Volume 11, Mine Plan, Section MP.24, Pg. MP-70, The word "Operation" is misspelled in the title (OPERTATION).

Response BJ 43 – Round 1

Revised text as requested.

Comment BJ 43 – Round 2

No comment received.

Response BJ 43 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 44 – Round 1

Volume 11, Mine Plan, Section MP.25, Pg. MP-71, The second paragraph, third sentence, discusses requiring additional permitting. The word "additional" is misspelled (addiditional).

Response BJ 44 – Round 1

Revised text as requested.

Comment BJ 44 – Round 2

No comment received.

Response BJ 44 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 45 – Round 1

Volume 11, Mine Plan, TABLE MP.1-1, The total disturbance should read 895 acres, not 775. Please correct the table.

Response BJ 45 – Round 1

Revised text as requested.

Comment BJ 45 – Round 2

No comment received.

Response BJ 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 46 – Round 1

Volume 11, Mine Plan, FIGURE MP.1-3, The average width of the pit floor and safety bench have average widths indicated on the drawing. Please insert the average heights of the vertical highwalls in these situations.

Response BJ 46 – Round 1

Revised Figure MP.1-3 requested.

Comment BJ 46 – Round 2

No comment received.

Response BJ 46 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 47 – Round 1

Volume 11, Mine Plan, FIGURE MP.1-4, The cross section, as drawn, is confusing. It would appear that dozer pushed, loose material significantly exceeds the bank material available in the highwall. The figure is not drawn to scale but a more accurate attempt to represent dirt volumes would be appreciated. Also, the cross section itself does not make sense in the way that operational steps are illustrated. A series of cross sections over time would be much more beneficial to define the appearance of the dozer push. Please modify the figure accordingly. A sample of an idealized schematic is attached. It is volumetrically accurate.

Response BJ 47 – Round 1

Figure MP.1-4 has been updated to add clarity.

Comment BJ 47 – Round 2

No comment received.

Response BJ 47 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 48 – Round 1

Volume 11, Mine Plan, FIGURE MP.4-3, Pg. MP-F7, What is the narrow, vertical rectangle located in the center of the coal stockpile coming from the stacker?

Response BJ 48 – Round 1

The figure MP.4-3 has been updated to remove the rectangle.

Comment BJ 48 – Round 2

No comment received.

Response BJ 48 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 49 – Round 1

Volume 11, Mine Plan, Addendum MP-3, Pg. MP-3-2, The introductory paragraph states that the Brook Mine is approximately 6 miles northwest of Sheridan, Wyoming. However, in earlier narrative, the mine is said to be 6 miles south of the Montana border and 8 miles northwest of Sheridan. This passage is found in the Land Use Appendix D1-1. The distances should be uniform in all instances throughout the narrative.

Response BJ 49 – Round 1

Revised text as requested.

Comment BJ 49 – Round 2

No comment received.

Response BJ 49 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 50 – Round 1

Volume 11, Mine Plan, Addendum MP-3, Section 2.3, Figures 2.3-1 and 2.3-2 show the potentiometric surfaces for the Carney and Masters coal beds. The contours daylight and appear to be in mid-air over the Slater Creek drainage. Please adjust the contours so they terminate at the outcrop.

Response BJ 50 – Round 1

Revised Figures 2.3-1 and 2.3-2 in Addendum MP-3-17 as requested.

Comment BJ 50 – Round 2

No comment received.

Response BJ 50 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 51 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-3, The second to last paragraph indicates that the depth of the penetration by the continuous miner will be 2,000 feet. Is this an approximation since the listed depth for the ADDCAR device is 1,600 feet. Please clarify the discrepancy.

Response BJ 51 – Round 1

Based on communication with ADDCAR's representative 2,000 ft penetration is achievable. Generally, users of the ADDCAR system encounter increasing depth of cover with greater penetrations requiring wider web pillar between holes. The loss in recovery due to the wider pillars potentially negates any production gain from increased penetration.

Comment BJ 51 – Round 2

No comment received.

Response BJ 51 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 52 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Section MP-6.1, Pg. MP-6-4, The discussion in this sections centers around the necessity of maintaining a straight, even cutting depth to prevent pillars from being cut too narrow to hold up the roof material and allow subsidence. The 1:1 ratio suggested by NIOSH is acceptable as long as roof strength tests bear up (no pun intended) the use of the general guidelines. A small sample of tests have been run on roof and coal rock intervals and those tests have been reported. LQD requests a narrative placed either in this location of the text or other location of RAMACO's choosing that discusses the strength tests results as it pertains to roof stability. Also, a commitment must be made in the document to sample roof material for strength testing for at least one location in every panel that will mined by the continuous miner prior to mining. Our concern rests with the competence of the overlying lithologies and their possibility for subsidence. This has been a problem in this area for decades and care must applied to characterize roof materials accurately.

A sampling plan to test compressive strength above each coal panel must be submitted prior to permit approval.

Response BJ 52 – Round 1

RAMACO must submit and have an approved MSHA Ground Control Plan that contains the strength test and commitments requested. RAMACO will provide this information when it is received and include it in the Subsidence Control Plan.

Comment BJ 52 – Round 2

No comment received.

Response BJ 52 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 53 – Round 1

Volume 11, Mine Plan, Addendum MP-6, Please provide the data used as input for the ARMPS-HWM program.

Response BJ 53 – Round 1

The following input values were used in the ARMPS-HWM program: compressive strength of coal - 660 psi, rock density - 162 lbs/ft³, abutment angle of 21°

Comment BJ 53 – Round 2

No comment received.

Response BJ 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 54 – Round 1

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-2, The scale of the photograph is too large to adequately depict the zones of surface subsidence from the old underground mines. Please blowup the scale to allow for clear visibility of the subsidence.

Response BJ 54 – Round 1

Cardno selected the larger scale to show that subsidence was limited to a small portion of the deep mine and not visible over other areas of the deep mine due its increased depth of cover. See revised figure in revision to Cardno's Subsidence Report

Comment BJ 54 – Round 2

No comment received.

Response BJ 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 55 – Round 1

Volume 11, Mine Plan, Addendum MP-6, FIGURE MP-6.2-3, This figure is very effective. It clearly shows the subsidence evident on the air photo as it correlates to

the old underground map superimposed on it. One problem, though, is that the air photo base needs to be darker, with greater contrast. The photo is a bit washed out and manipulation of the brightness/contrast aspects of the photo would help its visibility greatly. Please recalibrate the photo tonality.

Response BJ 55 – Round 1

See revised figure in revision to Cardno's Subsidence Report

Comment BJ 55 – Round 2

No comment received.

Response BJ 55 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 56 – Round 1

Volume 11, Mine Plan, Addendum MP-8, Section MP-8.5.4, The last sentence in this section indicates that there is no suitable habitat available for the Northern Long-Eared Bat. Does this include the climax Cottonwood Forest along Tongue River? The well developed understory along the river is suitable for Long-eared bat habitation though none have been located in this area. Or does the negation of the existence of the bat only apply to the area in the hills above the river where the mining will occur. Please clarify the area that was considered for potential Long-Eared Bat occurrence.

Response BJ 56 – Round 1

The text was revised to clarify.

Comment BJ 56 – Round 2

No comment received.

Response BJ 56 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 64 – Round 1

EXHIBITS, Mine Plan, Exhibit MP.1-1, The patterns used to depict surface disturbance from year to year are too similar. It is difficult to differentiate between year 0 and year 2, for example. Please recreate the surface disturbance layers to be more unique. The overburden removal sequence map (Exhibit MP.4-4) is a good example.

Response BJ 64 – Round 1

Revised Exhibit MP.1-1 as requested.

Comment BJ 64 – Round 2

No comment received.

Response BJ 64 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment BJ 67 – Round 2 (New Comment)

Mine Plan, Table MP.4-5., Overburden Stockpile Design –

The Estimated Capacity volumetrics for the Overburden stockpiles appear to be low. Based on a recalculation of the volumes given the acreage and average heights, each stockpile has a higher volume of capacity than which is shown in the table. A recalculated table would look like this:

Table MP.4-5. Overburden Stockpile Design

Stockpile Designation	Estimated Capacity <u>E</u> (cy)	Approximate Basal Area <u>A</u> (ac)	Average Height <u>H</u> (ft)	Calculated Capacity <u>C</u> (cy) ¹	Difference ²
OB-1	300,000	4.7	55	417,047	117,047
OB-2	500,000	9.4	55	834,093	334,093
OB-3	950,000	13.4	95	1,189,027	239,027
OB-4	1,000,000	21.4	85	1,898,893	898,893
OB-5	730,000	9.2	70	816,347	86,347
OB-6	400,000	8.3	55	736,487	336,487
OB-7	400,000	8.9	70	789,727	389,727
OB-8	1,100,000	14.2	75	1,260,013	160,013
OB-9	510,000	8.7	55	771,980	261,980
OB-10	260,000	5.6	45	496,907	236,907
OB-11	100,000	4.1	50	363,807	263,807
OB-12	1,200,000	14.0	95	1,242,267	42,267
OB-13	165,000	4.2	45	372,680	207,680
OB-14	122,000	5.6	55	496,907	374,907
OB-15	76,000	3.2	30	283,947	207,947
OB-16	104,000	3.6	20	319,440	215,440
	7,917,000			12,289,567	4,372,567

¹Calculated Capacity C = ((A*43560)*H)/27

²Difference = C-E

Based on the Recreated Table, Volumes derived from acreage and average height formulas give values that are approximately 35% too low. Please reevaluate the table in light of the mathematical calculations. Or, if there are extenuating circumstances that help create the overburden volumes in column B, please explain the seeming inconsistency.

Response BJ 67 – Round 2 (New Comment)

The capacities of the overburden stockpiles calculated by WDEQ do not account for the sideslopes of the overburden stockpiles. The calculations are appropriate for rectangular prisms with a uniform rectangular cross section. This explains why the calculations area significantly higher. The reported volumes by RAMACO are outputs from AutoCAD which uses 3D surfaces to construct stockpiles and calculate volumes. AutoCAD also takes into account the variation in a topographical surface that the stockpiles are placed on, which can affect the extent of the basal area and the average height. The volumes of the stockpiles were also rounded up to be conservative in the reported volumes. The average height is only a rough approximation because the height will change considerably depending upon the topographic surface beneath each pile. No changes have been made to the volumes of overburden. However, Table MP.4-5 has been revised to indicate sideslope angles and that the volumes have been computed using AutoCAD.

Comment BJ 67 – Round 3

No comment received.

Response BJ 67 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment BJ 69 – Round 3 (New Comment)

The new haulroad design appears to be missing a haulroad for the first pit to be mined, in sec. 22 T.57N., R.84W. Is this an oversight or has a haulroad not yet been designed?

Response BJ 69 – Round 3 (New Comment)

A haulroad for pit TR-1 is currently not designed. With the uncertainty of the initial pit, the design has not been completed. The design will be provided prior to construction. No changes to the Mine Plan have been made in response to this comment.

Comment DM 6 – Round 1

Mine Plan, MP.3.1.3 – A primary haul road appears to cross the Tongue River using the bridge that is currently in place from previous mine usage. Please discuss any updates needed for that bridge to be adequate for the intended usage.

Response DM 6 – Round 1

The revised primary haul road alignments do not cross this bridge and the use of this bridge for haul trucks and other traffic associated with the mine is not planned. Updated Exhibit MP.3-1.

Comment DM 6 – Round 2

No comment received.

Response DM 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 7 – Round 1

Mine Plan, Exhibit MP4-3 shows Overburden Stockpiles OB-12 and OB-13, and Topsoil Stockpile TS-6 being located directly in the Slater Creek channel, without any mention of redirecting Slater Creek, or otherwise preventing the hydrologic consequences of damming up the creek with Overburden and Topsoil stockpiles. Please correct.

Response DM 7 – Round 1

Revised Exhibit MP.4-3 as requested with OB-12 and 13 as well as TS-6 moved out of Slater Creek channel.

Comment DM 7 – Round 2

No comment received.

Response DM 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DM 8 – Round 1

Mine Plan, MP.7 – Because of the proximity of the planned facilities primarily in T57, R84 Sec.15 to the Tongue River and Goose Creek, I would like to see surface water monitoring upstream of these facilities on Goose Creek and Tongue River, and downstream of these facilities on Tongue River. Please discuss the feasibility of fulfilling this request, with reasoning.

Response DM 8 – Round 1

Revised text as requested. Revise Exhibit MP.7-1 with USGS stream gage location that is within the viewing area.

Comment DM 8 – Round 2

No comment received.

Response DM 8 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 11 – Round 1

Mine Plan, 11) Depending upon the outcome of required overburden sampling, commitment for special handling of unsuitable overburden will be required to assure that placement of unsuitable materials so as not to hinder plant growth or to adversely affect surface or groundwater quality will be required in the Mine Plan.

Response DS 11 – Round 1

See section MP.4.6.1, fourth paragraph.

Comment DS 11 – Round 2

Response is not adequate. Section MP.4.1.6 does not discuss placement of unsuitable materials above groundwater sources which will undoubtedly be encountered in early mining progressions at this mine. Unsuitable materials taken from above the groundwater level cannot be placed within the groundwater zone. Please address this and describe how the mine plan pit sequence of removal and backfill will be altered to accommodate placement of suitable materials near the surface or in the aquifer zone during mining. This may require stockpiling of materials to assure the best quality materials will be used.

Response DS 11 – Round 2

The majority of the permit area is dry. Therefore, most backfill materials will not be placed in an aquifer. Additionally, it is generally accepted that if unsuitable materials are placed below the water table, there will not be cause for concern. If unsuitable materials are placed below the water table, they will not have the opportunity to oxidize. If unsuitable materials are above the water table, they may oxidize, but they won't be transported by groundwater flow. The only zone that could potentially cause concern is the limited area where the potentiometric surface fluctuates. In this way, unsuitable materials can be oxidized and transported by groundwater flow. Due to the overburden and coal seams being primarily dry and the majority of mining activities occurring above the potentiometric surface, placement of unsuitable materials within an aquifer is not anticipated to be a concern.

Comment DS 11 – Round 3

No comment received.

Response DS 11 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 12 – Round 1

Mine Plan, 12) Does RAMACO provide a better detailed description of the topsoil salvage and handling process than that discussed in section MP.4.2.1? The

description provided is not detailed so as to provide a description of the equipment used, the methods for assuring adequate soil salvage, or whether topsoil and subsoil salvage will follow the recommendations in Appendix D7 for stockpiling topsoil separate from subsoil. (Map Unit A Cambira Loam, Map Unit B Zigweid Loam, Map Unit C Forkwood Loam, Map Unit G Bauxson Loam, Map Unit H Haverdad Loam, Map Unit U Ulm Clay Loam) Please understand that topsoil and subsoil may only be mixed if both meet Guideline 1 suitability criteria. Please include more detail for topsoil salvage and handling or let the LQD know where the information may be accessed.

Response DS 12 – Round 1

Revised text as requested.

Comment DS 12 – Round 2

Response is not adequate. Details of your topsoil salvage operation have not been adequately provided in the Mine Plan. Please provide the requested details of the topsoil salvage operation as stated above.

Response DS 12 – Round 2

The text in Section MP.4.2.1 has been supplemented to describe the topsoil salvage operation in more detail. The text now states that RAMACO will likely salvage topsoil with dozers, loaders, and trucks based on the current plan for equipment purchase. However, planning is still in its infancy and different, though typical, topsoil salvage equipment could be used. Methods to assure accurate salvage were already outlined in Section MP.4.2.1 in the three bulleted steps provided by WDEQ/LQD Guideline 1. However, these were supplemented with examples. Drilling or test pits ahead of salvage will ensure proper topsoil removal. Equipment operators and qualified personnel will be trained to recognize the difference in soil profiles. Additionally, Section MP.4.2.1 now states that RAMACO will generally follow the recommendations of Appendix D7 for the separation of topsoil and subsoil to ensure that unsuitable subsoil will not be mixed with topsoil. However, RAMACO reserves the right to mix topsoil and subsoil, if subsoil is suitable as a plant-growth medium, according to WDEQ/LQD R&R Chapter 4, Section 2(c). For example, Map Unit A, Map Unit B, Map Unit C, Map Unit H, and Map Unit U are all suitable across the entire profile (topsoil and subsoil) and are not required by rules and regulations to be separated. Therefore, RAMACO will not have separate stockpiles for subsoil. If subsoil is suitable, it will be salvaged. If subsoil is not suitable, it will not be salvaged. Any suitable subsoil that is salvaged will be mixed into topsoil stockpiles.

Comment DS 12 – Round 3

Response is not adequate. The LQD will allow mixing of suitable and unsuitable soil/subsoil if the resulting mix is suitable or only slightly marginal. Chapter 4, Section 2(c)(iii) provides the Administrator with the ability to require segregation of topsoil and subsoil if the Administrator determines that the practice is necessary for

vegetation establishment. However, the subject of this comment was to provide more detail about the methods that will be employed by the company and equipment operators to ensure adequate salvage will occur (color change in soils, staking with depths ahead of salvage, etc.). The LQD recommends that RAMACO review other approved permits for adequate topsoil/subsoil handling language in order to assure adequate detail is provided in the RAMACO permit application for topsoil handling.

Response DS 12 – Round 3

Section MP.4.2.1 has been revised to include details on staking prior to topsoil salvage operations. Data obtained during drilling and test pits ahead of stripping activities will be used to conduct depth staking on 500 foot grid centers. Section MP.4.2.1 includes other details describing adequately the topsoil salvaging procedures. A commitment has been added to the end of Section MP.4.3.1 to prevent overburden materials on native topsoil areas during overburden removal operations.

Comment DS 13 – Round 1

Mine Plan, 13) Section MP.4.2.3 all topsoil stockpiles, even those stockpiled temporarily or windrowed at the edge of a disturbance, must be identified by a topsoil sign from initiation of the salvage operation as required under Chapter 4, Section (c)(D) that states that signs must be in place at the time stockpiling is begun. Therefore, the text in the first paragraph of this section stating that signs will not be required must be corrected. Signs will always be required to identify all salvaged topsoil and must be placed on all approaches to the topsoil and no more than 150 feet from the stockpile location.

- a. Additionally, all stockpiled topsoil, even windrowed along the edge of a disturbance, must be protected against wind and runoff erosion, compaction or potentially toxic materials no matter what the longevity designation of the stockpiled material. The Mine Plan must provide a commitment to these requirements.

Response DS 13 – Round 1

Revised text as requested.

Comment DS 13 – Round 2

No comment received.

Response DS 13 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 14 – Round 1

Mine Plan, 14) Section MP.4.2.4(4.2.1?) does not discuss topsoil salvage during winter months. Salvage during the winter months, especially of shallow soil profiles, is discouraged by the LQD due to a lack of depth control caused by varying depths of permafrost. Please provide discussion concerning this subject.

a. Even short term and temporary topsoil stockpiles must be identified on maps and the volumes accounted for in annual reports. Several criteria that must be considered are well established for placement of topsoil stockpiles and include:

- i. Construction of stable areas to minimize wind and water erosion
- ii. Stockpiles will not be placed in areas where runoff water can contribute to the loss of topsoil (side hills or drainages)
- iii. Stockpiles will not be constructed on unsuitable backfill locations
- iv. Stockpiles will have associated sediment control established in advance of construction
- v. Stockpiles will not be constructed at locations of known cultural or wildlife resources for which protection or mitigation is required.

b. Other topsoil stockpile construction and maintenance considerations include:

- i. Stockpiles will be constructed with slopes of 3h:1v or less
- ii. Bypass ditches, berms or equivalent may be used to divert runoff around stockpiles
- iii. Stockpiles that will remain for less than 1 year may be revegetated or treated with surface roughing methods such as ripping or discing to reduce runoff and wind erosion potential.

Response DS 14 – Round 1

Revised text as requested.

Comment DS 14 – Round 2

Section MP.4.2.1 does not discuss topsoil salvage during winter months. Salvage during the winter months, especially of shallow soil profiles, is discouraged by the LQD due to a lack of depth control caused by varying depths of permafrost. Please provide discussion concerning this subject.

a. Even short term and temporary topsoil stockpiles must be identified on maps and the volumes accounted for in annual reports. Several criteria that must be considered are well established for placement of topsoil stockpiles and include:

iii. Stockpiles will not be constructed on unsuitable backfill locations

v. Stockpiles will not be constructed at locations of known cultural or wildlife resources for which protection or mitigation is required.

Responses to the above items were not adequate. Please provide the required permit commitments.

Response DS 14 – Round 2

A statement to Section MP.4.2.1 has been added that states RAMACO will not salvage topsoil if high antecedent moisture conditions have led to deep frost cementing topsoil to overburden. Additionally, the statement has been made that RAMACO will salvage topsoil ahead of planned winter mining activities to avoid complications with deep frost.

All currently planned topsoil stockpiles have been identified on Exhibit MP.4-3. A statement has been added to Section MP.4.2.3 in the first paragraph that any accumulations of topsoil that meet the definition of a stockpile will be mapped with volumes accounted for in the Annual Report. Another statement has been added to the first paragraph of Section MP.4.2.3 that topsoil stockpiles will not be constructed on unsuitable backfill or known locations of cultural or wildlife significance that require protection and mitigation.

Comment DS 14 – Round 3

No comment received.

Response DS 14 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 15 – Round 1

Mine Plan, 15) Section MP.4.2.7, page MP 4-5. Aside from operation of soil salvage equipment with the potential for soil contamination due to blown hydraulic hoses or small fuel leaks, the LQD expects not contamination of soil during the mining operation. Contamination of subsoil and overburden is more likely. The LQD recommends that RAMACO re-phrase the section header and text to show petroleum contaminated materials being and not soils.

a. What criteria will RAMACO use to determine if spills require reporting to the DEQ, and what process will be used in spill reporting?

- b. What will the operational procedure be for management of the proposed on-site landfarm for contaminated materials, and where will it be located? Will it be identified on the ground by a sign?

Response DS 15 – Round 1

Revised text as requested.

- a. See Section MP-4.5.2 of Addendum MP-4
- b. See Section MP-4.5.3 of Addendum MP-4

Comment DS 15 – Round 2

No comment received.

Response DS 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 16 – Round 1

Mine Plan, Section MP.4.2.8. Please provide a detailed description for the disposal of empty drums, not just a citation of the EPA Rule which is probably not known by most readers of this public document.

Response DS 16 – Round 1

The EPA Code Federal Regulation cited is public information which may be accessed online or at a public library if the reader desires to know the specific requirements and steps regarding container disposal.

Comment DS 16 – Round 2

Response is not adequate. The Round 1 review comment was not addressed. Please provide the required detail in the drum disposal discussion. The general public may or may not have access to the Federal Register, but must provide a public document which stands alone, without need to reference other documents to provide the information required to explain the commitments made. Therefore, RAMACO must expand on what the EPA Rule requires for the readers of this permit.

Response DS 16 – Round 2

RAMACO has committed to disposing of empty drums according to Title 40 CFR Part 261.7. RAMACO has cited the federal regulation that stipulates the disposal of empty containers. RAMACO will not summarize this federal regulation in the Brook Mine Permit for two reasons:

1. Federal regulations are made public. Any member of the public has access to the Code of Federal Regulations. This regulation was accessed by WWC on the

internet, meaning any person with access to the internet can search and find this regulation. If a member of the public does not personally have access to the internet, said person can go to the local public library to obtain access to the internet.

2. The Code of Federal Regulations is a living document that is subject to change at any time. By committing to the stipulations of Title 40 CFR Part 261.7 without summarizing the regulation, RAMACO commits to observing any requirements of the regulation at any time no matter how the regulation might change in the future. If RAMACO summarizes the regulation and the regulation changes in the future contrary to what it originally stipulated, RAMACO will be automatically stating commitments contrary to federal regulation. The possibility of being out of compliance with federal regulation is avoided by simply citing the regulation RAMACO commits to observing.

Addendum MP-4 remains unchanged.

Comment DS 16 – Round 3

No comment received.

Response DS 16 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 17 – Round 1

Mine Plan, MP.4.3.1 discusses overburden removal processes. However, little detail is given to explain the actual process for overburden handling. Will the first cut be stockpiled and used to fill the last cut? When special handling is required, which is almost certain given the nature of some overburden and the need for some soil replacement materials, what assurance will be made that poor quality materials will be safely located in the backfill or in separate stockpiles, or that topsoil substitutes will be handled and stored as topsoil in a useful manner as required under Chapter 4, Section 2(b)(x)(A)? Please provide a more detailed overburden handling plan. Perhaps some of these details are observed in later sections. Please provide additional details not provided elsewhere.

Response DS 17 – Round 1

See Sections MP.4.3.5, MP.4.6 and MP.4.7. Revised text as requested.

Comment DS 17 – Round 2

No comment received.

Response DS 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 18 – Round 1

Mine Plan, Section MP.4.3.4. The volumetric analysis shown in Table MP.4-4 and MP.4-5 may change depending on results of required additional overburden sampling and volumetric analysis. If the overburden depth overlying coal changes as a result of additional sampling, the volumetric analysis will also change. If post mining contour changes are necessary due to adjusted swell factors permit revision will probably not be required until the changed PMT exceeds plus or minus 20 feet of the approved at which time a Reclamation Plan revision will be required. This kind of detail should be included in the permit commitments.

Response DS 18 – Round 1

Revised text as requested.

Comment DS 18 – Round 2

Response is not adequate. Does the volumetrics of stockpiles include the coal partings and heavily oxidized coal seams that will not be mined for sale and have not been included in overburden quality assessment data? Will swell factors be adequate to meet PMT requirements after mining of coal from box cuts? What steps will be taken, such as borrow areas not currently shown on any maps, would be used to mitigate inadequate backfill, keeping in mind that contouring must provide reestablishment of drainage patterns on the mine.

Response DS 18 – Round 2

The volumes of materials required to be placed in stockpiles were calculated from grid files in AutoCAD. The grid files are based on borehole/exploration hole data. These volumes were then increased by 16% (as stated in Section MP.4.3.4) to account for swell. In response to Comment DS 22 – Round 2, the topsoil volumes have been recalculated using the specified depths in Appendix D7 within each soil polygon. In most of these cases, the salvage depth of topsoil was increased from 0.5 feet to nearly 1.5 feet (or whatever the appropriate salvage depth was in the specific area). This significantly increased the volume expected to be placed in topsoil stockpiles. However, that volume that was originally assumed to be overburden that is now in topsoil stockpiles was not removed from the overburden stockpiles. Therefore, the volumes shown for overburden stockpiles should be slightly high. This will provide for additional storage of coal partings or materials from heavily oxidized coal seams should such volume requirements be necessary. The overestimate of overburden stockpile size is conservative. This simply shows that the mine does have the capability to store all the overburden materials. It is unnecessary to readjust overburden stockpiles to be smaller after topsoil calculations since this material was planned to be placed during reclamation.

As stated in Section MP.4.3.4, the actual swell factors will be monitored. Also stated in Section MP.4.3.4, if the actual swell factors differ significantly from what is

approved, the post mining topography will be adjusted. This is standard practice for coal mines, and RAMACO is prepared to meet this obligation. RAMACO cannot be certain what the swell factors will be until after material is excavated, stockpiled, handled, and reclaimed. Once the material is monitored and volumes of swelled material are better known, this data will be reported in the Annual Report, as stated in Section MP.4.3.4.

In reference to the PMT, please refer to the Reclamation Plan. As shown in Exhibit RP.3-1, all drainage patterns were maintained. Any borrow to tie the PMT into the existing ground occurred within the disturbance boundary. Because of the relatively minimal disturbance by the Brook Mine, reclaiming the surface to nearly premining conditions was relatively simple. Again, should the swell factor vary significantly from what is currently assumed, the PMT will be redone to account for this adjustment and should any additional borrow areas be required, the disturbance boundary will be increased.

Comment DS 18 – Round 3

No comment received.

Response DS 18 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 19 – Round 1

Mine Plan, Section MP.4.6.1. The typical overburden sampling protocol as stated in Guideline 1 calls for one sample taken every 40 square acres of the permit area. Overburden sampling for underground mining operations differs from typical coal mine sampling protocols and is stated in the Coal Rules, Chapter 7, Section 1(a)(i)(A) which calls for overburden sampling and characterization on areas where surface operations will cause removal of overburden down to the level of the coal seam. Please make changes to the text accordingly and perform additional overburden sampling where required.

Response DS 19 – Round 1

Revised text as requested.

Comment DS 19 – Round 2

No comment received.

Response DS 19 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 20 – Round 1

Mine Plan, Section MP.4.3.5. A statement was made in this section that “Overburden stockpiles will only block ephemeral drainages if runoff control and sediment control measures are made and approved by WDEQ/LQD.” Placement of overburden in ephemeral drainages will require a discussion of how water will be diverted around the overburden stockpile to prevent impoundment of water in addition of a discussion of sediment control measures for the stockpile to prevent off-site impacts of erosion down-slope from the stockpile. The LQD recommends that no overburden stockpiles be placed in ephemeral drainages.

Response DS 20 – Round 1

Revised Exhibit MP.4-3.

Comment DS 20 – Round 2

Response is not adequate. No response was provided. Please make necessary changes to the Mine Plan language concerning placement of overburden stockpiles.

Response DS 20 – Round 2

The statement reflects the allowances made by WDEQ/LQD rules and regulations. The statement was not made as a certainty that overburden piles will be placed in ephemeral drainages. Instead, the statement is provided in case overburden piles have to be placed in ephemeral drainages and provides the guidance as to how this will be done according to WDEQ R&R. WDEQ/LQD R&R Chapter 4, Section 2(c)(xi)(B) states:

“Ephemeral drainages may be blocked if environmentally sound methods for dealing with runoff control and sedimentation are approved by the Administrator.”

The Mine Plan currently states in Section MP.4.3.5 in the first paragraph:

“Overburden stockpiles will only block ephemeral drainages if runoff control and sediment control measures are made and approved by WDEQ/LQD.”

“...runoff control and sediment control measures are made and approved by WDEQ/LQD” implies that if an overburden stockpile blocks an ephemeral drainage, discussion and approvals by WDEQ will be made for diverting water, use of ASCMS, prevention of down-slope impacts, etc. before the placement of the stockpile. Because the permit text meets WDEQ/LQD R&R, no changes have been made to the text.

As shown in Exhibit MP.5-1, all of the overburden stockpiles avoid being placed such that they block ephemeral drainages. All ephemeral drainages flow around the stockpiles. However, the statement remains in the permit should RAMACO be required to block an ephemeral drainage and seeks the permission and approval of WDEQ/LQD, as allowed by WDEQ/LQD R&R Chapter 4, Section 2(c)(xi)(B).

Comment DS 20 – Round 3

No comment received.

Response DS 20 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 21 – Round 1

Mine Plan, Tables MP.1-1, MP.1-2 and MP.4-1 must show the actual years for proposed progressions, or the year 1 progression must be tied to a specific year in the Mine Plan text.

Response DS 21 – Round 1

Revised tables as requested. Added note saying that Year 0 corresponds to the year 2016.

Comment DS 21 – Round 2

No comment received.

Response DS 21 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 22 – Round 1

Mine Plan, Tables MP.4-3 and MP.4-5. Topsoil volumes appear to be underestimated in TS- 2, TS-6, TS-10 and TS-11 while underestimating the proposed volume in TS-1. Also overburden volumes appear to be underestimated in OB-4, OB-7, OB-11, OB-14 and OB-15, and overestimated in OB-16, which may affect estimates presented in Table MP.4-4 as well.

Response DS 22 – Round 1

Volumes are estimated based on the stripping volumes and available backfill area with excess material going to and from stockpile for contemporaneous reclamation. No updates will occur in response to this comment.

Comment DS 22 – Round 2

Response is not adequate. Several discrepancies have been discovered during the review. TS-1 capacity according to Table MP.4-3 is 89,600 cubic yards, but Table MP.4-1 shows 120,200 cubic yards added to the stockpile. Our estimate are significantly different from yours based on the footprint and average height.

Stockpile	Basal Area (acres)	Average Height (ft)	Volume Estimate (cy)	RAMACO's Volume Estimate (cy)
TS1	1.4	20	22,587	89,600
TS2	3.5	45	127,051	85,100
TS3	1.5	30	36,300	70,300
TS4	1.1	25	22,183	26,600
TS5	3.0	55	133,101	98,400
TS6	4.5	45	163,351	150,800
TS7	0.7	20	11,293	13,800
TS8	0.9	25	18,150	19,300
TS9	0.8	20	12,907	15,900
TS10	2.0	50	80,667	70,300
TS11	0.9	20	14,520	12,000

The volume of topsoil in stockpiles by year presented in Table MP.4-1 appears to be based on a six-inch salvage depth as shown below. Perhaps the salvage depth was intended to be 2 ft. but the volumes would have to increase by a factor of 4.

Stockpile	Acres Salvaged	Volume Salvaged (cy)	Depth (ft) (Volume (cu.ft./Area (sq.ft.))
TS1	80	64,500	0.50
TS1	43	34,700	0.50
TS1	23	18,600	0.50
TS1	13	10,500	0.50
TS1	19	15,300	0.50
TS1	5	4,000	0.50
TS1	9	7,300	0.50

The LQD requires RAMACO to evaluate topsoil stockpile volumes and depths of soil salvage expressed on specific areas of disturbance since each disturbance will undoubtedly result in different salvage and replacement depths.

All volumetric data in tables presented in the Mine Plan and in the reclamation bond estimate must be must be correct, so the LQD requires that:

- a) All topsoil salvage and bond estimates must be based on depth estimates provided in Appendix D7 and the approximate acreage of each soil series disturbed. Therefore, the soil salvage depth and topsoil volumes expressed in table MP.4-3 must be linked to site-specific soil depths. Table MP.4-1 must also include salvage depths for each calculation.
- b) All following topsoil salvage and volumetric tables must be corrected based on volumes for TableMP.4-1.

- c) All reclamation performance bond estimates must be changed to reflect corrected topsoil volumes.
- d) An average depth of topsoil to be salvaged for the entire mining operation must be provided in the Mine Plan text.
- e) Topsoil stockpile footprints and heights will need to be corrected on tables and figures.

Response DS 22 – Round 2

Responses to the list of WDEQ/LQD requests are as follows:

- a) Topsoil salvage estimates were updated to reflect the salvage depths of specific soil types in Appendix D7. To accomplish this, the soil polygons in Appendix D7 Exhibit D7.3-1 were used to create a 3D grid in AutoCAD that represented the salvage depth for each soil type. Volumes were then “removed” within each topsoil stripping area shown in Exhibit MP.4-2. Outputs from AutoCAD included the average cut depth within each topsoil stripping area. The average cut depth essentially reflects the weighted average of cut depths depending on recommended salvage depth of each soil and the areal extent of each soil type within the stripping areas. The average cut depth is now provided in Table MP.4-1. Again, this depth reflects a weighted average and will not match the recommended salvage depths in Appendix D7. To reflect what topsoil types will be salvaged in each stripping area, the soil polygons shown on Exhibit D7.3-1 were added to Exhibit MP.4-2 which already shows the topsoil stripping areas. This exhibit can be compared to Table MP.4-1 for volume calculations.
- b) Table MP.4-1, Table MP.4-2, and Table MP.4-3 were all updated to show the corrected topsoil volumes.
- c) The weighted average of salvage depth is provided in the Mine Plan text in Section MP.4.2.1 in the second paragraph.
- d) The topsoil stockpile footprints and heights have been corrected on Table MP.4-3 to reflect the new volumes. Please note: Stockpile heights are only averages. The stockpile height varies considerably for most stockpiles because of the nature of the topography in the Brook Mine permit area. When AutoCAD builds the 3D stockpiles, the topography is taken into account for the areal extent of the base. Therefore, hand calculations will unlikely replicate the volumes of stockpile by only considering basal area, average height, and typical side slope. To reflect the change in the topsoil stockpile footprints, the disturbance boundary was updated in Exhibits MP.1-1, MP.4-1, MP.4-2, MP.4-3, MP.4-4, MP.4-5, MP.5-1, MP.5-2, and MP.16-1. The hatches that represent the stockpile footprints were updates in Exhibit MP.4-3 and Exhibit MP.5

Comment DS 22 – Round 3

No comment received.

Response DS 22 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DS 23 – Round 1

Mine Plan, Exhibit MP.4-2 and MP.4-3 must show the dates (actual years) for the salvage of topsoil and removal of overburden, or year 1 must be tied to an actual year when operations will begin (2016, 2017, etc.). The map or tables in the Mine Plan must provide proposed years and volumes for stockpile construction as well.

Response DS 23 – Round 1

Revised Exhibits as requested. Added note saying that Year 0 corresponds to the year 2016 on all Exhibits with years.

Comment DS 23 – Round 2

No comment received.

Response DS 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 30 – Round 1

Reclamation Plan, All Mine Plan Maps with progressions must show the actual years of the initial disturbance or mining activity, or the progression must be linked to a specific year in Reclamation Plan text. The maps must also include the contour interval.

Response DS 30 – Round 1

Revised Exhibits as requested.

Comment DS 30 – Round 2

No comment received.

Response DS 30 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DS 32 – Round 2 (New Comment)

The LQD requests that RAMACO provide pit identification number/names for all proposed initial box cut locations which will reduce confusion for identification of incident locations or for descriptions during inspections. (DS)

Response DS 32 – Round 2 (New Comment)

Exhibits MP.1-1, MP.4-1, MP.4-4, MP.5-1, MP.15-1, and MP.15-2 were all updated to include pit identification numbers. The text in Section MP.6.1 was also updated to include pit identification numbers to more conclusively identify pits in the hydrologic consequences discussion.

Comment DS 32 – Round 3

No comment received.

Response DS 32 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment DE 1 – Round 1

Mine Plan, Figure MP.1.2 and page MP-3 – MSHA and best practices may require a safety berm on this safety bench which could require a wider bench. Figure MP.1.2 notes a minimum of 35' but the text on page MP-3 just states the bench will be 35' wide. There is a real possibility this safety bench might be used for light plants so it may need to be wider for access and small vehicle use as well as providing a safety bench.

Response DE 1 – Round 1

Revised text as requested.

Comment DE 1 – Round 2

No comment received.

Response DE 1 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 2 – Round 1

Mine Plan, Table MP.1-1 – The total disturbance doesn't seem to match the overall disturbance listed for the trench mining and facilities. Please explain or correct.

Response DE 2 – Round 1

Revised table as requested.

Comment DE 2 – Round 2

No comment received.

Response DE 2 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 3 – Round 1

Mine Plan, Section MP.2.3, page MP-9 – The 1st sentence would be better if it started, “The explosive materials...”. The 2nd sentence should replace the word “detonating” with “explosive”. The 5th sentence in the 2nd paragraph should include cast boosters. The 6th sentence in the 2nd paragraph should discuss storage of emulsions, water gels, and slurries also. This section should also commit to proper signage of the explosive storage area. Please correct.

Response DE 3 – Round 1

Revised text as requested.

Comment DE 3 – Round 2

The third sentence in the 2nd paragraph needs to be corrected. It states one magazine will contain cast boosters and the other magazine will contain detonating cord and boosters. Boosters cannot be stored with detonating cord or detonators. I believe the text should say, “...the other magazine ...will contain detonating cord, detonators and other initiation products. Please correct.

Response DE 3 – Round 2

The third sentence of the second paragraph in Section MP.2.3 was changed as suggested to reflect that boosters will be stored separately from detonating cord, detonators, and other initiation products.

Comment DE 3 – Round 3

Response adequate.

Comment DE 4 – Round 1

Mine Plan, Section MP.5.7.5, page MP-34 – The word “of” in the 2nd line of the last paragraph should be “or”. Please correct.

Response DE 4 – Round 1

Revised text as requested.

Comment DE 4 – Round 2

No comment received.

Response DE 4 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 5 – Round 1

Mine Plan, Section MP.6.1, page MP-39 – The 1st sentence of the 1st full paragraph needs some improvement so it reads properly and makes sense. Please correct.

Response DE 5 – Round 1

Revised text as requested.

Comment DE 5 – Round 2

The 1st sentence of the 1st full paragraph still needs to be improved so it makes sense. The current version says “... Hidden Water Creek watershed will occur...” It doesn’t make sense as it is written. Please correct.

Response DE 5 – Round 2

The text was corrected in the fourth paragraph of Section MP.6.1 to state:

“In the fourth and fifth years, mining occurs east of the Slater Creek watershed and west of the Hidden Water Creek watershed. Mining will occur primarily in minor drainages of the Tongue River in Sections 8, 17, and 18, T57N, R84W, as seen on Exhibit MP.1-1.”

Comment DE 5 – Round 3

Response adequate.

Comment DE 6 – Round 1

Mine Plan, Section MP.14.2, page MP-55 – The 2nd paragraph discusses the use of “cast primers”. The term should be “cast boosters” as it doesn’t become a primer until the detonator is added or detonating cord is attached to it. The discussion of priming holes should describe the use of a cast booster and how it is made-up to become a primer, i.e. with detonating cord or a detonator (blasting cap). Please correct.

Response DE 6 – Round 1

Revised text as requested.

Comment DE 6 – Round 2

No comment received.

Response DE 6 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 7 – Round 1

Mine Plan, Section MP.14.3.2, page MP-56 – In the 2nd line the item “(primer with detonator)” should be changed to “(cast booster with detonator)”. Please correct

Response DE 7 – Round 1

Revised text as requested.

Comment DE 7 – Round 2

No comment received.

Response DE 7 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 8 – Round 1

Mine Plan, Section MP.14.3.2, page MP-56 – The 2nd paragraph discusses powder factors in coal and overburden and the high end of the ranges is extremely high for the type of rock and coal in this area. RAMACO should eliminate the range and simply state powder factors will be adequate to effectively fragment the overburden and coal.

Response DE 8 – Round 1

Revised text as requested.

Comment DE 8 – Round 2

RAMACO kept the powder factor range of 0.2-0.7 pounds per ton in the text. As stated in the 1st round review the high end of the range is extremely high for coal. I would recommend that the text simply state that the powder factors will be adequate to effectively fragment the coal and overburden. Please correct.

Response DE 8 – Round 2

In Section MP.14.3.2, the powder factor ranges for coal and overburden were removed as suggested. The text now states that the powder factors will be chosen to adequately fragment coal or overburden, depending upon which is being blasted.

Comment DE 8 – Round 3

Response adequate.

Comment DE 9 – Round 1

Mine Plan, Section MP14.3.3, page MP-56 – RAMACO should reword this to say that initiation will be done using non-electric or electric systems, which may include electronic detonators, shock tube detonators, detonating cord, electric detonators or a

combination of these. Igniter cord is used to initiate safety fuse and it's highly unlikely that any safety fuse will be used at this mine. Please correct.

Response DE 9 – Round 1

Revised text as requested.

Comment DE 9 – Round 2

No comment received.

Response DE 9 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 10 – Round 1

Mine Plan, Section MP.14.4, pages MP-56 & 57 – It is probable that emulsions will also be stored on site so it should be mentioned since emulsion/ANFO blends are the most widely used product in wet holes. Please correct.

Response DE 10 – Round 1

Revised text as requested.

Comment DE 10 – Round 2

No comment received.

Response DE 10 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 11 – Round 1

Mine Plan, Section MP.14.6, pages MP-57 & 58 – Residents who request a pre-blast survey must make the request to the permittee and the Administrator of Wyoming Land Quality Division (LQD). The permittee is responsible for getting the pre-blast survey done and distributed to the person that requested it and the LQD Administrator. Please correct.

Response DE 11 – Round 1

Revised text as requested.

Comment DE 11 – Round 2

No comment received.

Response DE 11 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 12 – Round 1

Mine Plan, Section MP.14.7, pages MP-58 & 59 – LQD will not approve protecting uninhabited structures (what LQD refers to as engineered structures) at 8.0 inches per second (ips) of peak particle velocity. LQD would allow a maximum limit of 5.0 ips. RAMACO would have to assure that this limit was not exceeded by the use of a seismograph at these structures on all blasts. RAMACO could apply for a modified scale distance factor to show compliance with this limit of 5.0 ips by submitting a vibration study and doing a regression analysis to show the allowable ppv is not exceeded at a 95% confidence level. However, this will require the vibration study be submitted with seismograph records from shots in the mining area so it cannot be done until after some blasting has been done at the mine. Please correct this text.

Response DE 12 – Round 1

Revised text as requested.

Comment DE 12 – Round 2

No comment received.

Response DE 12 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 13 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The discussion on typical pattern size should be changed to more general language. Using the parameters given the powder factor used would be approximately 0.16 lbs./CY using ANFO and in the 0.23-0.25 lbs./CY range when shooting an emulsion blend. These powder factors are not high enough to adequately fragment the overburden. Please correct.

Response DE 13 – Round 1

Revised text as requested.

Comment DE 13 – Round 2

RAMACO continues to discuss a “typical” pattern size and stemming amount. Given the bench height, pattern size, stemming height, hole diameter listed it would be nearly impossible to get powder factors high enough to adequately fragment the overburden. The large burdens and spacings in a 50’ high bench would likely leave hard zones between the holes. The large amount of stemming compared to powder

column height gives poor powder distribution in the holes which will likely lead to hard zones in the upper portions of the bench. This discussion needs to be improved.

Response DE 13 – Round 2

The text in Section MP.14.8.1 has been edited to discuss generalities in overburden blast design as opposed to listing the specifics of before. The text now provides more open design standards for RAMACO to function as necessary for safe and efficient blasting during mining operations.

Comment DE 13 – Round 3

Response adequate.

Comment DE 14 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The 2nd paragraph says if water is in the holes a slurry or water gel explosive will be used. Most likely an emulsion/ANFO blend with good water resistance will be used in wet holes and not a slurry or water gel. Please correct.

Response DE 14 – Round 1

Revised text as requested.

Comment DE 14 – Round 2

No comment received.

Response DE 14 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 15 – Round 1

Mine Plan, Section MP.14.8.1, page MP-60 – The 3rd paragraph discusses the explosive weight per hole and the powder factors. The explosive densities listed are correct but the pounds per hole and powder factors are incorrect. In a 7.875" hole and with a density of ANFO of 0.85 g/cc the pounds/foot of hole is 17.95 lbs. and with 24' of powder column the pounds/hole is 431 lbs., making the powder factor = 0.16 lbs./CY. Similarly using an emulsion blend of 1.32 g/cc the pounds/foot = 27.87 lbs. and the pounds per hole would be 669 lbs. so the powder factor = 0.25 lbs./CY. In the 50' hole described with 26' of stemming and 24' of powder the powder distribution is poor so it would likely lead to blocky material near the top of the bench. Please correct.

Response DE 15 – Round 1

Revised text as requested.

Comment DE 15 – Round 2

No comment received.

Response DE 15 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 16 – Round 1

Mine Plan, Section MP.14.8.2, page MP-61 – Drilling a 35' x 35' pattern in a 15' thick coal seam with a 7.875" hole and 4.5' of stemming will probably result in excessive flyrock, stemming ejection, high airblast and hard zones between the holes. Expecting to stem 4.5' is not realistic – in the field the blaster is going to try to hold for 4' or 5' of stemming. Again RAMACO discusses using slurry or water gel in wet hole when an emulsion/ANFO blend with high water resistance would probably be used. Please correct. Also the powder factor listed for coal is probably a little high so it would be better to just say that the powder factor will sufficient to fragment the coal for the prime movers. Please correct.

Response DE 16 – Round 1

Revised text as requested.

Comment DE 16 – Round 2

RAMACO lists a pattern Drilling size of 35' x 35' and then in the text states the burden and spacing will 17.4' and 35.4'. As stated in the round 1 review comments, this pattern size in a 15' thick coal seam with a 7.875" drill hole will probably result in excessive flyrock, airblast and leave behind hard zones between the holes. The 2nd paragraph discusses using slurry and water gel and it is likely that an emulsion/ANFO blend with high water resistance would be used. RAMACO needs to revise the text in this section because this plan will not be effective.

Response DE 16 – Round 2

The text in Section MP.14.8.2 has been edited to discuss generalities in coal blast design as opposed to listing the specifics of before. The text now provides more open design standards for RAMACO to function as necessary for safe and efficient blasting during mining operations.

Comment DE 16 – Round 3

Response adequate.

Comment DE 17 – Round 1

Mine Plan, Section MP.14.10, page MP-63 – The last bullet item says that detonation during electric storms might be a reason for unscheduled blasting. This is confusing

because it makes it sound like the operator would shoot during electric storms and the only safe thing to do when an electric storm approaches is clear the pattern and keep everyone a safe distance away until the storm passes. Please correct.

Response DE 17 – Round 1

Revised text as requested.

Comment DE 17 – Round 2

No comment received.

Response DE 17 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment DE 18 – Round 1

Mine Plan, Addendum MP-7, Blaster's Log – Under the "Holes" heading RAMACO should use "burden" not the term "burden spacing". On the 2nd page the word "signiture" should be changed to "signature". Please correct.

Response DE 18 – Round 1

Revised text as requested.

Comment DE 18 – Round 2

No comment received.

Response DE 18 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment KM 11 – Round 2 (New Comment)

LQD recommends that sequence maps be revised to include only yearly backfilling and/or replacement, monthly backfilling and/or replacement areas may not be achievable as a permit commitment.

Response KM 11 – Round 2 (New Comment)

RAMACO appreciates the comment and understands the potential difficulty, but the permit remains unchanged.

Comment KM 11 – Round 3

No comment received.

Response KM 11 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 12 – Round 2 (New Comment)

Exhibit MP.1-1 shows surface disturbance beginning in 2017. However, other maps show disturbance beginning in Year “0”, which according to the maps is Year 2016. Please be consistent.

Response KM 12 – Round 2 (New Comment)

Exhibit MP.1-1 has been corrected to properly show surface disturbance beginning in 2016.

Comment KM 12 – Round 3

No comment received.

Response KM 12 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 13 – Round 2 (New Comment)

Exhibits MP.4-2 and RP.5-1 use the same symbol for all years of activities; only color designates different years. Some of the color variations denoting years are not easily discernible from the legend to the map.

Response KM 13 – Round 2 (New Comment)

The exhibits have been changed to use different hatch patterns and colors for years to make separate years more easily discernible.

Comment KM 13 – Round 3

No comment received.

Response KM 13 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 14 – Round 2 (New Comment)

Do the slot openings include truck ramps? How will truck ramps be constructed in each slot?

Response KM 14 – Round 2 (New Comment)

The slot openings will include truck ramps that will be used to remove spoil and coal from the slots to the haul roads. By WDEQ/LQD definition in Chapter 1, Section

2(ds), ramps are not considered roads. As discussed in Section MP.3.1.4, ramps are exempt from mine plan design considerations. The ramps will move and change frequently as mining progresses. To describe a specific way in which the truck ramps will be constructed in each slot would be difficult to accomplish due to the variability in each slot and at each phase of construction of the slot. As Section MP.3.1.4 states, the ramps will be developed with consideration given to the type of equipment operating on them, safety considerations, and surrounding conditions. Safety berms will be installed on all elevated edges.

Comment KM 14 – Round 3

No comment received.

Response KM 14 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 15 – Round 2 (New Comment)

Please confirm the volume of the overburden stockpiles. For example, based on LQD's review of the mine plan and the spoil backfilling sequence maps, it appears that OB-3 will be used to contain all overburden removed from the first slot opening.

Response KM 15 – Round 2 (New Comment)

Please see response to Comment BJ 67. WDEQ/LQD calculations did not consider the side slope of overburden stockpiles, therefore overestimating the volume of overburden stockpiles. Overburden stockpile volumes will be constantly changing over the course of mining due to ongoing reclamation activities. The overburden stockpiles have been sized to accept the required volume of spoil from the trenches, but spoil will likely be cycled in and out of the stockpiles on a regular basis to meet backfilling requirements. Volumes to be placed in stockpiles were calculated from 3D grid files in AutoCAD and given a swell of 16% to approximate the required space.

Comment KM 15 – Round 3

No comment received.

Response KM 15 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 16 – Round 2 (New Comment)

LQD recommends using a swell factor of 11 to 13%, based on our experience in the area.

Response KM 16 – Round 2 (New Comment)

A swell factor of 16% was used as an average approximation. Swell factors of material at other mines in the area have been as high as 20%-22%. After the first pit has been backfilled, a swell study will be conducted and stockpile and PMT design will be reevaluated if necessary. Refer to Section MP.4.3.4 for a discussion that states that actual swell factors will be monitored and PMT will be adjusted if necessary.

Comment KM 16 – Round 3

No comment received.

Response KM 16 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 19 – Round 2 (New Comment)

Page MP-8 states that the “approved Spill Prevention, Control, and Countermeasure (SPCC) plan will be on file with WDEQ and available at the Brook Mine. Who is responsible for approving the plan? WDEQ does not require a SPCC plan to be filed with the agency. SPCC plans is a federal requirement.

Response KM 19 – Round 2 (New Comment)

The text in Section MP.2.1.4 was edited to correctly state that the SPCC plan will be kept onsite at the mine for review and inspection by the EPA.

Comment KM 19 – Round 3

No comment received.

Response KM 19 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 20 – Round 2 (New Comment)

Page MP-8 states that the leachfield(s) will accept water from the change house and equipment service shop. Discharge of industrial wastewater from the equipment service shop into a leachfield may be subject to Chapter 16, Wyoming Water Quality Rules and Regulations.

Response KM 20 – Round 2 (New Comment)

Section MP.2.1.6 states that sewage wastewater from the change house and equipment service shop will be discharged into the leach field. The section does not mention disposal of industrial wastewater into a leach field. However, a statement was added that the septic tank and leach field will be constructed in accordance with WDEQ/WQD rules and regulations.

Comment KM 20 – Round 3

No comment received.

Response KM 20 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 21 – Round 2 (New Comment)

Page MP-8 states that wash down water will be sent to a wastewater impoundment. However Section MP5.2 (page MP-26) state that no wastewater impoundments are currently planned for the Brook Mine. Please discuss.

Response KM 21 – Round 2 (New Comment)

The statement made in Section MP.5.2 that no wastewater impoundments are currently planned was revised to state that designs for a wastewater impoundment are provided in Addendum MP-2. A wastewater impoundment will be required to treat wash down water.

Comment KM 21 – Round 3

No comment received.

Response KM 21 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 22 – Round 2 (New Comment)

Groundwater from dewatering pumps is to be pumped to sumps or NPDES treatment for use in road dust control. What kind of “NPDES” treatment is proposed?

Response KM 22 – Round 2 (New Comment)

The third paragraph of Section MP.5.9 states that the treatment facilities will be sedimentation ponds.

Comment KM 22 – Round 3

No comment received.

Response KM 22 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment KM 23 – Round 2 (New Comment)

The State of Wyoming has primacy for the National Pollutant Discharge Elimination System and issues permits under the Wyoming Pollutant Discharge Elimination

System (WYPDES). Please change all references to NPDES to WYPDES to accurately reflect the current regulatory situation.

Response KM 23 – Round 2 (New Comment)

The reference in the third paragraph of Section MP.5.9 to NPDES was removed. A statement was added that all water is intended to be used, and discharge from the permit area is not anticipated.

Comment KM 23 – Round 3

No comment received.

Response KM 23 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment MK 23 – Round 1

Mine Plan, Section MP.20 Alluvial Valley Floors, The discussion of underground mining in AVFs does not seem necessary given there is no plans for underground mining at the Brook Mine. Furthermore, it is conceivable that circumstances could exist where underground mining of an AVF would not be allowed by the LQD. For example, if the AVF was significant to farming and underground mining of the AVF would result in surface effects such that material damage to the AVF would occur. (MDK)

Response MK 23 – Round 1

While no underground mining is proposed within delineated AVFs, the mine maintains this option. If underground mining is ever planned under the AVF, the appropriate revisions will be made. Revised text as requested.

Comment MK 23 – Round 2

No comment received.

Response MK 23 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 46 – Round 1

Mine Plan, Section MP.4.1 Mining Sequence, 20. On Exhibit MP.4-1, please attempt to show the areas that would be highwall mined versus surface mined. These layers are currently not found until Exhibit MP.15-1. Alternatively, the text in this Section could specify that the areas to be highwall versus surface mined are shown in Exhibit MP.15-1. (MDK)

Response MK 46 – Round 1

Revised text as requested.

Comment MK 46 – Round 2

No comment received.

Response MK 46 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 47 – Round 1

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 21. Only Slater Creek and Hidden Water Creek are labeled and shown in Exhibit MP.5-1. In order to better evaluate the Hydrologic Control Plan, please provide labels and locations for the other stream channels, including Tongue River, Goose Creek, East Fork Earley Creek, and the other unnamed channels (as shown on the USGS 24K Quad) on the proposed permit area. (MDK)

Response MK 47 – Round 1

Revised Exhibit MP.5-1 as requested.

Comment MK 47 – Round 2

No comment received.

Response MK 47 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 48 – Round 1

Mine Plan, Section MP.5.1 Surface Drainage and Erosion Plan, 22. Exhibit MP.5-1 shows overburden stockpiles OB-13 and OB-12, as well as topsoil stockpile TS-6, occurring directly over the Slater Creek channel. The Exhibit does not show any diversion ditches to be used in these locations. Please either move the location of the stockpiles or present a plan to use a diversion to route Slater Creek around the stockpiles. (MDK)

Response MK 48 – Round 1

Revised Exhibit MP.5-1 as requested.

Comment MK 48 – Round 2

No comment received.

Response MK 48 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 49 – Round 1

Mine Plan, Section MP.5.2 Sedimentation and Wastewater Impoundments, 23. Exhibit MP.5-1 shows the locations of two “sediment basins”. Are these considered the same as “sedimentation impoundments”, as discussed in this Section? If so, the designs for these two impoundments are not found within the Mine Plan. (MDK)

Response MK 49 – Round 1

The “sediment basins” shown in Exhibit MP.5-1 are not considered the same as the “sediment impoundments (reservoirs).” Sediment Basins are considered an Alternative Sediment Control Measure and are discussed in Addendum MP-1. As such, the design for these “sediment basins” are not included in the Mine Plan. However, the design criteria and construction standards for “sediment basins” are similar to those discussed within Section MP.5.2 of the Mine Plan. Revised text as requested.

Comment MK 49 – Round 2

Response accepted. The text states that there are no currently planned sedimentation impoundments planned at the Brook Mine. Please see new Mine Plan and Reclamation Plan comments below that request this clarification elsewhere in the permit. (MDK)

Response MK 49 – Round 2

The statement in Section MP.5.2 was revised to state that sedimentation and wastewater reservoirs will be required for mining operations. The designs of these impoundments are provided in Addendum MP-2. Exhibit MP.5-1 has been revised to show the locations of these impoundments. The disturbance boundary has also been adjusted to encompass the impoundments. Permit-level designs have only been provided for impoundments that are planned to be needed in the first five years of operations. Any potential impoundments required after the first five years will be provided once these impoundments are within five years of ensuing operations. Due to the fact that sedimentation, wastewater, and flood control reservoirs will be required, the text changes referenced in Comments MK 106, 108, 109, 110, 111, 112, 113, and 114 (New Comments) were not made. The responses to these comments reflect that.

Sedimentation reservoirs have been designed to replace the ASCMs originally shown within one half of a mile of the Tongue River and Goose Creek to satisfy the requirements set forth in Guideline 15 (as discussed in Comment MK 116 (New Comment)).

Comment MK 49 – Round 3

No comment received.

Response MK 49 – Round 3

Round 2 response assumed to be adequate. No response is necessary.

Comment MK 50 – Round 1

Mine Plan, Section MP.5.3 Flood Control, 24. This section discusses flood control reservoirs but it is not mentioned how many flood control reservoirs would be constructed and where their locations would be. Please provide this information to comply with LQD Coal Rules and Regulations, Chapter 2, Section 5(a)(i)(D)(IV). (MDK)

Response MK 50 – Round 1

Revised text as requested.

Comment MK 50 – Round 2

No comment received.

Response MK 50 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 51 – Round 1

Mine Plan, Section MP.5.4 Diversions, 25. This section mentions permanent diversions, but there are no apparent plans for permanent diversions. Please discuss if permanent diversions are anticipated as part of the mining operation, or if all diversions will be temporary. (MDK)

Response MK 51 – Round 1

Revised text as requested.

Comment MK 51 – Round 2

No comment received.

Response MK 51 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 52 – Round 1

Mine Plan, Section MP.5.4 Diversions, 26. Exhibit MP.5-1 shows only one diversion ditch for Hidden Water Creek in T57N, R84W, Section 9. Please discuss this particular diversion and its typical design in more detail in Section MP.5.4. (MDK)

Response MK 52 – Round 1

Revised text as requested. Add design exhibit of the Hidden Water diversion ditch.

Comment MK 52 – Round 2

No comment received.

Response MK 52 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 53 – Round 1

Mine Plan, Section MP.5.5 Culverts, 27. Please provide a brief statement that commits to a periodic culvert inspection and maintenance plan to ensure that culverts will function properly over time. (MDK)

Response MK 53 – Round 1

Revised text as requested.

Comment MK 53 – Round 2

No comment received.

Response MK 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 54 – Round 1

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 28. The first sentence references a sedimentation reservoir. Where is the location of this sedimentation reservoir? Are these the “sediment basins” shown in Exhibit MP.5-1? If not these sedimentation reservoirs need to be added to this Exhibit. (MDK)

Response MK 54 – Round 1

Revised text as requested.

Comment MK 54 – Round 2

No comment received.

Response MK 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 55 – Round 1

Mine Plan, Section MP.5.8 Mine Pit Dewatering Plan, 29. The first paragraph references treating and discharging pit water. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 55 – Round 1

Revised text as requested.

Comment MK 55 – Round 2

No comment received.

Response MK 55 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 56 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 30. Exhibit MP.1-1 shows surface disturbance directly over a few areas of Slater Creek and Hidden Water Creek. Please identify the source of disturbance in these areas. Direct disturbance of the channel should be avoided unless there is a plan for a diversion to route the stream around the disturbance. (MDK)

Response MK 56 – Round 1

See response to Comment MK 76, 88 and 99. Revised text as requested.

Comment MK 56 – Round 2

No comment received.

Response MK 56 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 57 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 31. The mining trenches are often discussed with reference to Exhibit MP.1-1. However, the trenches are not shown on this Exhibit. Please add the locations of the trenches to Exhibit MP.1-1. (MDK)

Response MK 57 – Round 1

Revised Exhibit MP.1-1 as requested.

Comment MK 57 – Round 2

Response not accepted. Exhibit MP.1-1 does show trenches in the east portion of the mine, but not the western portion. For example, in the first full paragraph on Page MP-42, it discusses trenches being constructed perpendicular to the flow path of the minor Tongue River drainages. On Page MP-43, several trenches are discussed: one trench constructed parallel to Slater Creek's flow in Section 18, a trench in associated with the surface mine to the west of Slater Creek, and a trench parallel to Slater Creek in Sections 11, 12, and 13. On Page MP-43, a trench is discussed along the "TRD5" channel. Please add all of these trench locations to Exhibit MP.1-1. Also, please use a different color other than grey for the trenches, as this color tends to blend with the topographic line color. (MDK)

Response MK 57 – Round 2

A hatch has been added to Exhibit MP.1-1 in the western portion of the permit boundary to more clearly show the trench locations. Another hatch has been added to Exhibit MP.1-1 to more clearly show the location of the surface mine. The hatch colors were chosen to stand out from the topographic line color. Additionally in response to Comment DS32 (New Comment), RAMACO has provided pit identification numbers on several exhibits and in Section MP.6 to make pit locations more easily understood.

Comment MK 57 – Round 3

Response accepted.

Comment MK 58 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 32. On Page MP-39, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining disturbance will be treated prior to discharge. Please also reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 58 – Round 1

Revised text as requested.

Comment MK 58 – Round 2

No comment received.

Response MK 58 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 59 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 33. Please discuss the diversion ditch for Hidden Water Creek in the first carryover paragraph on Page MP-39. (MDK)

Response MK 59 – Round 1

Revised text as requested. See Hidden Water Creek diversion Exhibit MP.5-2 for further details.

Comment MK 59 – Round 2

No comment received.

Response MK 59 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 60 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 34. On Page MP-40, in the first carryover paragraph from the previous page, it states that any surface runoff to come in contact with mining activities will be treated prior to discharge. Please reference in the text that appropriate WDEQ/WQD discharge permits (e.g., WYPDES) will be obtained prior to any discharge. (MDK)

Response MK 60 – Round 1

Revised text as requested.

Comment MK 60 – Round 2

No comment received.

Response MK 60 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 61 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 35. On Page MP-40, there is a sentence: “The surface disturbance activities will have temporary impacts on Slater Creek geomorphology including ground cover and soil erodibility”. This statement is unclear. Are the impacts to the actual Slater Creek channel or the uplands and other tributaries in the watershed? Is it reduced ground cover and increased soil erodibility? Please provide a more explicit description of the possible impacts. (MDK)

Response MK 61 – Round 1

See response to Comment MK 56, 76, 88 and 99. Revised text as requested.

Comment MK 61 – Round 2

Response not accepted. The text clarified that the only direct disturbance to the Slater Creek channel is where the channel will be redirected through a culvert under a proposed haul road. However, the sentence: “The surface disturbance activities will have temporary impacts on Slater Creek geomorphology including ground cover and soil erodibility” is still unclear. This statement implies that the channel stability of Slater Creek will be affected, and that bed and banks could experience excessive erosion. Please provide more discussion on what is meant by impacts to Slater Creek channel geomorphology. (MDK)

Response MK 61 – Round 2

Text was added to the fifth paragraph of Section MP.6.1 to clarify that the geomorphology of the Slater Creek channel such as the bed and banks will not be impacted. The only impacts to ground cover and soil erodibility will be in upper portions of the Slater Creek drainage where surface disturbance activities are proposed. The text now clarifies that this is the case and that ASCMs and other sediment and runoff control measures will be used to control sediment transport to Slater Creek.

Comment MK 61 – Round 3

Response accepted.

Comment MK 62 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 36. Please provide a discussion on whether the proposed mining operation would affect surface water quality such that designated uses would be affected on the major streams on and adjacent to the proposed permit area. (MDK)

Response MK 62 – Round 1

Revised text as requested.

Comment MK 62 – Round 2

No comment received.

Response MK 62 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 63 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 37. The text describes possible reductions in peak flows and storm volumes. Please describe in the PHC if the proposed mining operation will have any effects on nearby or downstream surface water rights. (MDK)

Response MK 63 – Round 1

Revised text as requested.

Comment MK 63 – Round 2

Response not accepted. The text speaks to impacts to existing reservoirs/water rights on the permit boundary but does not provide a statement as to possible impacts to water rights off or downstream of the permit boundary. Please provide this discussion in the text. (MDK)

Response MK 63 – Round 2

The last paragraph of Section MP.6.1 previously stated:

“...the Brook Mine is expected to have an extremely small effect on surface water quality in the Tongue River and other major streams adjacent to the permit boundary of the Brook Mine. As such, no effect on the designated uses present on major streams adjacent to the permit boundary is expected.”

Two sentences have been added to the last paragraph of Section MP.6.1. The first states:

“There is no anticipated impact to water rights downstream of the permit boundary either.” (In reference to water quality.)

The second sentence states:

“Additionally, the minimal reduction of any surface water runoff in the upper reaches of drainages in the Brook Mine permit area will not likely have any impact on downstream water rights.”

Comment MK 63 – Round 3

Response accepted.

Comment MK 64 – Round 1

Mine Plan, Section MP.6.1 Surface Water, 38. Please add a brief statement to the PHC that if it is determined that the mining operation affects a surface water right, that water right would be replaced with a water source of similar quantity and quality as provided by W.S. § 35-11-415(b)(xii). (MDK)

Response MK 64 – Round 1

Revised text as requested.

Comment MK 64 – Round 2

No comment received.

Response MK 64 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 65 – Round 1

Mine Plan, Section MP.6.1.1 Land Erosion Stability, 39. It is unclear the intent of this section. It seems to be out of place in the mine plan, as it discusses the USLE in the context of only native and reclaimed conditions. Furthermore, no data other than the K factors are presented in Mine Plan Tables (Table MP.6.1). The Reclamation Plan also does not discuss applying the USLE, so it would seem that Section MP.6.1.1 should be removed unless a USLE analysis is completed of pre- vs during- vs postmine erosion predictions. (MDK)

Response MK 65 – Round 1

Section MP.6.1.1 has been removed.

Comment MK 65 – Round 2

No comment received.

Response MK 65 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 66 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 40. It is unclear why reservoirs will be monitored in the operational monitoring program when these features were not sampled for during baseline characterization. If the reservoirs have the potential to be affected by the mining operation they should be sampled prior to mining with this information presented in Appendix D6. (MDK)

Response MK 66 – Round 1

Revised text as requested.

Comment MK 66 – Round 2

Response not accepted. Any reservoir potentially disturbed by mining activities should have a baseline water quality sampled collected with the information presented in Appendix D6. Section MP.6.1 states that Big Horn No. 2 Reservoir, Big Horn No. 14 Reservoir, Permanent Impoundment #1 Reservoir, and Legerski #1 Reservoir will be impacted by mining activities and will be reclaimed. At a minimum, the baseline water quality should be provided for these reservoirs in Appendix D6. RAMACO may also wish to expand the list of reservoirs sampled for baseline water quality to match those listed in Table RP.8-9. (MDK)

Also, there is now a statement on Page MP-49: *All existing reservoirs, stockponds, and proposed reservoirs that will be disturbed by surface mining activities as discussed in Section MP.6.1 will be monitored for relevant discharge through grab samples to ensure that any water released from these reservoirs meets the WDEQ/LQD guidelines discussed above.* It is unclear which WDEQ/LQD guidelines are being referred to. Also, if these reservoirs are going to be discharging, a WYPDES permit would likely be required. Please clarify these items in the text (MDK).

Response MK 66 – Round 2

A commitment has been added to the first paragraph of Section MP.7.1 that states RAMACO will collect water quality data from reservoirs that could potentially be impacted by mining prior to its disturbance and this data will be provided in the Annual Reports. Table MP.7-1 provides the expected monitoring locations.

Second, the statement in the third paragraph of Section MP.7.1 referring to discharge and citing aforementioned WDEQ/LQD guidelines was revised. Because these are existing reservoirs, discharge should not be the concern of RAMACO. RAMACO will monitor the reservoirs for the water quality constituents provided in Guideline 8, Appendix 7 for the time during mining upstream to ensure that mining has not impacted the reservoir.

These items should clarify that RAMACO will monitor reservoirs prior to mining operations upstream of the reservoir, and that the water quality monitoring will be to evaluate the aforementioned list as opposed to discharge. RAMACO does not have control of these reservoirs or how they are operated.

Comment MK 66 – Round 3

Response accepted.

Comment MK 67 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 41. Please add the reservoir monitoring locations listed in Table MP.7-1 to Exhibit MP.7.1. (MDK)

Response MK 67 – Round 1

Revised Exhibit MP.7.1 as requested.

Comment MK 67 – Round 2

No comment received.

Response MK 67 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 68 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 42. Please add the northing/easting State Plane coordinates for the surface water monitoring stations to Table MP.7.1. (MDK)

Response MK 68 – Round 1

See response MK

Comment MK 68 – Round 2

Response not accepted. The coordinates were not added to the Table. Please see response to Comment MK 35. Please add the northing/easting State Plane coordinates for the surface water monitoring stations to Table MP.7.1. (MDK)

Response MK 68 – Round 2

Table MP.7-1 has been updated to include the State Plane coordinates.

Comment MK 68 – Round 3

Response accepted.

Comment MK 69 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 43. Please identify what type of water quantity data will be generated from the continuous stage monitoring. For example, will mean daily flow rates and/or peak daily flow rates be estimated, as these would likely be submitted to the LQD in the Annual Report? (MDK)

Response MK 69 – Round 1

Revised text as requested.

Comment MK 69 – Round 2

No comment received.

Response MK 69 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 70 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 44. The text in the last paragraph on Page MP-45 states that water quality samples will be collected from a single station using an ISCO automatic sampler. Please identify in the text which station this is. Also, please explain the rationale for using an ISCO sampler at only one of the four stream monitoring sites. (MDK)

Response MK 70 – Round 1

Revised text as requested. The station equipped with the ISCO automatic sampler was the only station equipped with such a device due to the stations location as well as expected flows. Quarterly grab samples taken at stations upstream of mining disturbances will give an accurate representation of water quality entering the permit boundary. Since the station equipped with an automatic sampler is located near the area in which Slater Creek exits the permit boundary, an automatic sampler allows the operator see if the mining activities of the Brook Mine have an impact on the water quality of Slater Creek as the highest chance water quality is affected will occur during precipitation events. An automatic recorder was not installed at the station downstream of disturbances on Hidden Water Creek because the recorded and modeled flows for the drainage are extremely low. No observable flow had been recorded on any surface water station along Hidden Water Creek, despite precipitation events having occurring. As such, any data collected by an automatic sampler on Hidden Water Creek would occur during extreme precipitation events in which the flows through Hidden Water Creek would likely have high turbidity and be an unrealistic representation of the water quality within Hidden Water Creek.

Comment MK 70 – Round 2

No comment received.

Response MK 70 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 71 – Round 1

Mine Plan, Section MP.7.1 Surface Water Monitoring, 45. The text in the first paragraph on Page MP-46 states that data will be evaluated to determine if any surface water and groundwater interactions exist. It would seem that any interactions should have already been identified during the baseline characterization of the hydrological system on and near the proposed permit area. It does not appear that the permit application discusses surface/groundwater interactions. (MDK)

Response MK 71 – Round 1

Revised text as requested. The monitoring is a continuation of the baseline monitoring sites.

Comment MK 71 – Round 2

Response not accepted. The response states that the text was revised but the same statement remains without any additional explanation. If surface and groundwater interactions are expected to exist then these should have already been discussed in the baseline characterization of the hydrologic system. It does not appear that the

permit application discusses surface/groundwater interactions. Please provide more explanation on this in the text. (MDK)

Response MK 71 – Round 2

The third and fourth to the last sentences in the last paragraph of Section MP.7.1 were edited to state:

“Baseline monitoring has not indicated any interactions between surface water and groundwater. However, surface water data will continue to be compared to groundwater monitoring data to determine if any surface water and groundwater interactions exist that weren’t observed in baseline studies.”

Comment MK 71 – Round 3

Response accepted.

Comment MK 72 – Round 1

Mine Plan, Section MP.8 Water Use, 46. Please state in the text that all water from surface reservoirs or wells will be used under appropriate permits from the State Engineer’s Office (SEO). (MDK)

Response MK 72 – Round 1

Revised text as requested.

Comment MK 72 – Round 2

No comment received.

Response MK 72 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 73 – Round 1

Mine Plan, Section MP.8 Water Use, 47. It is advised that the applicant discuss with the SEO-Interstate Streams Division any implications that water use may have under the Yellowstone River Compact. (MDK)

Response MK 73 – Round 1

Revised text as requested.

Comment MK 73 – Round 2

No comment received.

Response MK 73 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 74 – Round 1

Mine Plan, Addendum MP-6 Subsidence Control Plan, Section MP.6.3 Subsidence Monitoring and Assessment and Section MP-6.4 Subsidence Control and Remediation, 48. The text states that subsidence monitoring would be discontinued if no evidence of subsidence occurred after six months after highwall mining. Please include a clarifying statement that the applicant would remediate subsidence up until bond release is approved, even if the subsidence was detected later than the six months of initial monitoring. (MDK)

Response MK 74 – Round 1

Please see revision to last paragraph of Addendum MP-6.

Comment MK 74 – Round 2

No comment received.

Response MK 74 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MK 106 – Round 2 (New Comment)

In Section MP.2.1.2 Change House and Equipment Service Shop, on Page MP-8, it states that wash down water will be routed to wastewater impoundment. As stated on Page MP-26, wastewater reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that wastewater reservoirs are not planned. (MDK)

Response MK 106 – Round 2 (New Comment)

The text in Section MP.2.1.2 was not revised. The text in Section MP.5.2 was changed to reflect that wastewater impoundment(s) will be required. Designs for the wastewater impoundment are provided in Addendum MP-2.

Comment MK 106 – Round 3

Response not accepted. The location of the wastewater impoundment is not shown in Exhibit MP.5- 1, as the map contains labels for only sedimentation ponds and flood control reservoirs. Exhibit 12 in Addendum MP-2 shows the design for a "typical facilities reservoir". The text in Section MP 5.2 should acknowledge that the location for the wastewater impoundment is not shown on Exhibit MP.5-1 and has not been determined yet, but the typical design is shown in Exhibit 12 in Addendum MP-2.

Please make this correction or explain if my understanding of this issue is not accurate. (MDK)

Response MK 106 – Round 3

Text at the end of Mine Plan Section MP.5.2 has been revised, as requested. The text states the typical facilities reservoir location has yet to be determined and a typical design is included in Exhibit 12 of Addendum MP-2.

Comment MK 107 – Round 2 (New Comment)

In Section MP.5.2.1 General Design Criteria, there is a sentence: A discussion regarding the USLE method is provided in Section MP.6.1.1. As per to the response to Comment MK 65, Section MP.6.1.1 has been removed. Please remove the sentence that references Section MP.6.1.1. (MDK)

Response MK 107 – Round 2 (New Comment)

The sentence referencing the previously deleted Section MP.6.1.1 was removed.

Comment MK 107 – Round 3

Response accepted.

Comment MK 108 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-42: *Any surface runoff to come in contact with mining disturbance will be treated in the pits or retained in sedimentation control structures in the vicinity of Hidden Water Creek to meet water quality standards before being discharged from the Permit Area.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 108 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 108 – Round 3

Response accepted.

Comment MK 109 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-42: *As previously discussed, any runoff coming into contact with mining activities will be captured in a sedimentation impoundment or ASCM to meet water quality standards prior to discharge*

from the Permit Area. As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 109 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 109 – Round 3

Response accepted.

Comment MK 110 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-43: *Sedimentation impoundments will capture runoff that has come in contact with mining activities, and will treat the water to meet water quality standards before discharge.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 110 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 110 – Round 3

Response accepted.

Comment MK 111 – Round 2 (New Comment)

In Section MP.6.1 Surface Water, there is a sentence on Page MP-44: *Any runoff that does enter disturbed areas will be captured in a sedimentation pond or treated in the trenches to meet water quality requirements before being discharged from the Permit Area.* As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 111 – Round 2 (New Comment)

The text in Section MP.6.1 was not revised. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 111 – Round 3

Response accepted.

Comment MK 112 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the first bullet is for a Sedimentation Pond. As noted in the response to Comment MK 49, sedimentation impoundments are not currently planned as part of the mining operation. The text in this section should also clarify that sedimentation impoundments are not planned. (MDK)

Response MK 112 – Round 2 (New Comment)

The bullet item in Section MP.12.5 was not deleted. The text in Section MP.5.2 was changed to reflect that sedimentation reservoirs will be required for mining operations. The designs for sedimentation impoundments are provided in Addendum MP-2.

Comment MK 112 – Round 3

Response accepted.

Comment MK 113 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the second bullet is for a Wastewater Reservoir. As stated on Page MP-26, wastewater reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that wastewater reservoirs are not planned. (MDK)

Response MK 113 – Round 2 (New Comment)

The bullet item in Section MP.12.5 was not deleted. The text in Section MP.5.2 was changed to reflect that wastewater reservoirs will be required for mining operations. The design for the wastewater impoundment is provided in Addendum MP-2.

Comment MK 113 – Round 3

Response accepted.

Comment MK 114 – Round 2 (New Comment)

In Section MP.12.5 Mine Facilities, the third bullet is for a Flood Control Reservoir. As stated on Page MP-29, flood control reservoirs are not currently planned as part of the mining operation. The text in this section should also clarify that flood control reservoirs are not planned. (MDK)

Response MK 114 – Round 2 (New Comment)

The text in Section MP.5.3 in the second paragraph was revised to reflect that flood control reservoirs will be required for mining operations within the first five years. The designs of these flood control reservoirs are provided in Addendum MP-2 and the

locations in relation to the permit area are shown on Exhibit MP.5-1. Therefore, the text in Section MP.12.5 was not revised to remove “Flood Control Reservoir” from the list.

Comment MK 114 – Round 3

Response accepted.

Comment MK 115 – Round 2 (New Comment)

Mine Plan Addendum MP-1 commits to getting LQD approval and doing further sediment yield analysis for ASCMs that drain larger than 30 acres, as per LQD Guideline No. 15. It isn’t clear from the Hydrologic Control Plan in Exhibit MP 5-1 if any of the currently proposed ASCMs drain more than 30 acres. Please indicate if any of the ASCMs shown in Exhibit MP 5-1 drain more than 30 acres. (MDK)

Response MK 115 – Round 2 (New Comment)

Exhibit MP.5-1 now shows the drainage areas for any ASCMs that drain more than 30 acres. Any ASCMs with drainage areas of more than 30 acres have designs provided in Addendum MP-2.

Comment MK 115 – Round 3

Response accepted.

Comment MK 116 – Round 2 (New Comment)

LQD Guideline No. 15 states that ASCMs should not be used for disturbed or reclaimed areas that are within one-half mile (channel distance) of Class 1 or Class 2 streams. Since the Tongue River and Goose Creek are Class 2 streams, please provide an analysis of the distance of the currently proposed ASCMs on Exhibit MP 5-1 to the Tongue River and Goose Creek. In accordance with LQD Guideline No. 15, more traditional sediment control methods (i.e., sedimentation impoundments) may be needed for disturbed areas that are close to the Tongue River and Goose Creek. (MDK)

Response MK 116 – Round 2 (New Comment)

Exhibit MP.5-1 now shows a half mile buffer from the Tongue River and Goose Creek. In those locations where ASCMs had been proposed within a half mile of either the Tongue River or Goose Creek, more robust methods of sediment control have been implemented (primarily sediment impoundments and collector ditches). Because several locations that require such sediment control measures are within the first five years of operations, sediment impoundments have been designed and these designs are provided in Addendum MP-2. The locations of the sediment impoundments and collector ditches in relation to the permit area are shown on Exhibit MP.5-1.

Comment MK 116 – Round 3

Response not accepted. Thank you for providing the Class 1 and Class 2 Stream 1/2 mile buffer on Exhibit MP 5-1 and for showing other forms of sediment control besides ASCMs in the buffer. However, the text in this section should also state that the mine trenches will also serve as sediment control. This is important to demonstrate since there are some areas, for example in Section 18 near TR-6 and in Section 14 near TR-9A and TR-12 that are within the buffer to the Tongue River but sedimentation ponds will not be used. (MDK)

Response MK 116 – Round 3

The first paragraph of Section MP.5.1 has been revised to include discussion of mine trenches as a form of sediment control.

Comment MK 117 – Round 2 (New Comment)

LQD Guideline No. 15 provides monitoring guidance for ASCMs based on the drainage area upstream of the ASCM. For large receiving streams (drainage area greater than 1.0 square mile), monitoring should include repeated surveys of channel cross-sections and/or upstream and downstream sediment yield stations. Please provide a commitment to conduct this monitoring to evaluate the performance of the proposed ASCMs that drain to large receiving streams. (MDK)

Response MK 117 – Round 2 (New Comment)

A commitment has been added to the last paragraph of Section MP.5.1 that RAMACO will either monitor the stream channel cross sections or will have upstream and downstream sediment yield monitoring stations to ensure the ASCMs are functioning properly in areas that drain to receiving streams with a drainage area of greater than 1.0 square mile.

Comment MK 117 – Round 3

Response accepted.

Comment MK 123– Round 3 (New Comment)

MP.1.3 Acreage to Be Affected Annually. There is a sentence in the second paragraph of this section that is confusing and needs rewritten to improve clarity. The difference between disturbance boundary and affected area boundary would likely be confusing to the public and therefore a clear distinction should be made. The sentence states: The disturbance boundary includes all lands that will be physically disturbed during mining lands that are exclusive of the disturbance boundary but inclusive of the affected area boundary have the potential to be disturbed by mining. It is suggested that this be broken into two sentences: The disturbance boundary includes all lands that will be physically and directly disturbed during mining. The affected area

boundary includes all lands within the disturbance boundary plus additional lands that have the potential to be disturbed by mining.

Response MK 123 – Round 3 (New Comment)

The sentences in the second paragraph of Section MP.1.3 regarding the disturbance and affected area boundaries have been revised for clarity, as requested.

Comment MK 124– Round 3 (New Comment)

MP.8 Water Use. This section has been revised in this round to remove groundwater wells as a source of water for the mine. As shown in the new Table MP.8-1, surface water rights are now expected to provide 227,000 gpd, or 69 percent of the mine's water use. In the text, please provide further discussion on how and where these surface water rights will be obtained. For example, are these existing surface water rights that the mine already has rights to, and if so where are the rights located? The Mine Plan PHC (Section MP.6.1) also needs revised as this new plan for water use has not been analyzed for any effect on decreasing surface water quantity. (MDK)

Response MK 124 – Round 3 (New Comment)

Surface water rights will be obtained through the State Engineers Office and in accordance with the Yellowstone Compact. No changes to the Mine Plan have been made in response to this comment.

Comment MK 125– Round 3 (New Comment)

MP.12.4 Buffer Zones. Assuming Slater Creek is an intermittent stream (Comment MK 29), LQD Coal Rules and Regulations, Chapter 4, Section 2 (r)(ii)(B) states that a buffer zone shall be designated, marked in the field, and on a mine plan map. From Chapter 4, Section 2 (r)(ii)(A), this buffer zone is to be 100 feet. Please designate the buffer zone on Exhibit MP-5.1 and provide a commitment to marking the buffer zone at select locations in the field prior to commencing mining-related disturbance. (MDK)

Response MK 125 – Round 3 (New Comment)

A buffer zone boundary of Slater Creek has been added to Exhibit MP.5-1. A commitment to provide a buffer zone marked in the field prior to commencing mining related disturbance has been placed in the fifth paragraph of Section MP.6.1.

Comment MK 126– Round 3 (New Comment)

MP.25 Alluvial Valley Floors. Although no mining is planned on the AVFs on the Tongue River and Goose Creek, the disturbance boundary is within a small part of the Big Horn Mine AVF extent (Exhibit D11.6-1). It appears that this area includes the SP-1, OB-1, and OB-2 features in Section 21 on Exhibit MP.5-1, which was updated for this round. Please include a statement in the text of Section MP .25 that there is some minor disturbance proposed within the AVF extent. Please also discuss in the text of

MP.25 whether this disturbance would affect the essential hydrological functions of the AVF. (MDK)

Response MK 126 – Round 3 (New Comment)

Minor disturbance is planned within the Big Horn Mine AVF extent in Section 21 of Township 57 North, Range 84 West. The disturbance would include placement of an overburden pile (OB-1) and a sediment pond (SP-1). The disturbance should not affect the essential hydrologic functions of the AVF on the Tongue River as the disturbed area is minimal in size and should not preclude the conveyance of flow. Discussion of the planned AVF disturbance has been added to the second paragraph of Section MP.25.

Comment MuK 32 – Round 1

Mine Plan, 32. Please provide an electronic copy of the groundwater model referenced in Addendum MP-3. In addition, please provide the GIS projection coordinate of the model files that will enable the LQD to plot the model results in GIS for the purposes of producing the CHIA (Cumulative Hydrologic Impact Assessment). The LQD review of the model files might potentially generate additional comments, clarifications or questions. (MK)

Response MuK 32 – Round 1

An electronic copy of the groundwater model will be provided under separate cover. The elements in the model are based on the Wyoming East Central NAD 83 state plane coordinate system. To convert from model Grid to the state plane coordinates the X offset is 1367387.512 and the Y offset is 1915004.382. There is no rotation from the model grid to the state plane coordinate system.

Comment MuK 32 – Round 2

Response conditionally accepted. Because of a version compatibility issue between the software used by the LQD and the mine, the LQD was not able to review the model files. The LQD has contacted Office of Surface Mining (OSM) to explore the options (if any) to update the Groundwater Vistas software to the latest version. OSM is looking into this issue and has not responded during the completion of the review. The LQD would also welcome any suggestions from the mine to resolve this issue. (MK)

Response MuK 32 – Round 2

RAMACO suggests that WDEQ/LQD obtain a “Student License” for Groundwater Vistas. A student license will allow WDEQ/LQD to view the model but not to make any changes to the model. The Brook Mine model cannot be saved to an older version of Groundwater Vistas without causing significant issues in the functionality of the model. The newer versions of Groundwater Vistas contain features vital to the functionality of the model that are not available in older versions of Groundwater Vistas.

Comment MuK 32 – Round 3

Response not accepted. The LQD was able to obtain a newer version of Groundwater Vistas from the OSM. The model files provided in the initial submittal were attempted to run following the written instructions that came along with the model files. The steady state model ran and the results for mass balance were similar to the results provided in the application. However, the transient model results do not align with the results presented in the application. Please provide additional assistance and clarification to help the LQD replicate the model results. Depending on the results from this verification run, additional comments may be generated. In addition, please review comment# 74 on the revised model files.

Response MuK 32 – Round 3

During follow up discussions between WWC and Muthu Kuchanur it was discovered that from the time that the original model was developed and the time that the model files were reviewed at LQD, Groundwater Vistas had been updated. The model files provided to LQD were developed in Groundwater Vistas Version 6.43 Build 4. However LQD was using a later version of Groundwater Vistas (Version 6.78 Build 37). When the model files were run on the newer version of Groundwater Vistas they returned erroneous results. WWC downloaded the latest version of Groundwater Vistas (Version 6.80 Build1) available on December 1, 2015 and reconfigured the model to run on the latest version of Groundwater Vistas.

When the model files were configured to run on the later version of Groundwater Vistas, there were a few minor changes in the model results. While most of the differences in the model results were very minor, in order to ensure that the results reported in Addendum MP-3 matched the latest model simulations several pages in Addendum MP-3 were updated with the latest model results. Following are the pages in Addendum MP-3 that have been updated:

Executive summary, Page 4-the modeled drawdown to private wells was updated.

Executive summary, Page 5-the modeled drawdown to private wells was updated.

Section 3.1, Page 30-The version and build number used for the latest version of the model simulations was updated.

Table 4.7-1, Page 49, -The calibration Results were updated.

Figure 4.7-4, Page 54 -Model residuals on the figure were updated.

Table 4.8-1, Page 55-Model sensitivity results were updated.

Table 4.8-2 and Table 4.8-3 Page 56-Model sensitivity results were updated.

Table 4.8-4, Page 57- Model sensitivity results were updated.

Section 4.9, Page 58- To accommodate a more efficient mine plan, in December 2015, RAMACO shifted the slot location between mine blocks 1 and 2 to the north approximately 630 feet. Since the footprint of the mine blocks are still generally similar, this small change in the location of the slot is not expected to significantly alter the groundwater model predictions. As a result, the groundwater model was not adjusted to specifically address this minor change to the mine plan. Additional text was added to this page to address the changes in the mine plan.

Table 4.9-1, Page 69 Maximum modeled drawdowns for adjacent wells were updated.

Section 4.9, Page 72 (Includes Table 4.9-2)-text and table describing pit inflows were updated.

Table 4.10-1, Page 77-Table was updated to include text denoting stress period and time step when values were measured and total inflow value for 5 years into mining were updated.

The latest model files configured to run on Groundwater Vistas Version 6.80, Build 1 are provided on a DVD with these comment responses.

Comment MuK 33 – Round 1

Mine Plan, MP.1.1 Type of Mine, 33. Page MP-1 states, “Below the Tongue River Member is the Lebo shale member of the Fort Union Formation which contains the Masters Seam (Cardno MM&A, October 2013).” This statement is not consistent with Table D5.3-1, Page D5-T1 and other descriptions in Appendix D5. Table D5.3-1 indicates Masters Coal seam is in the Tongue River Member. Please clarify and make appropriate changes throughout the submittal (Example: MP 4.4). (MK)

Response MuK 33 – Round 1

Revised text as requested.

Comment MuK 33 – Round 2

No comment received.

Response MuK 33 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 34 – Round 1

Mine Plan, MP.1.1 Type of Mine, 34. Major coal seams on the Brook Mine include: Dietz (1,2,3), Monarch, Upper Carney, Lower Carney and Masters.”. Dietz (1,2,3) coal seam is not included in the description presented in Section D5.3.3.3, Appendix D5. Please clarify: (i) the seams that will be mined by the Brook Mine and (ii) include the description of all the coals seams as appropriate in Appendix D5 and Appendix D6. (MK)

Response MuK 34 – Round 1

Please refer to Mine Plan Section MP.4.4.1 for targeted coal seams at the Brook Mine.

Comment MuK 34 – Round 2

No comment received.

Response MuK 34 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 35 – Round 1

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, Consider using the groundwater model referenced in Appendix D-3 to provide a description for a range of estimates on anticipated dewatering rates/volumes and groundwater inflows to the mine pit. (MK)

Response MuK 35 – Round 1

The text in Section MP.5.8 is to indicate that water entering the pit from either groundwater or surface water will be controlled using sumps and treated prior to discharge.

Comment MuK 35 – Round 2

Response not accepted. Please provide a range of estimates of the expected groundwater inflows to the pit. The intent of this comment is to understand the volume/rate of water that will be dewatered to facilitate mine operations. In addition, please clarify if the groundwater model provides an estimate of this inflow to the pit. (MK)

Response MuK 35 – Round 2

Yes, the amount of water discharging from the drains to simulate mining can be used to estimate how much water would enter into the mine pits during the mining scenarios. The model predicted pit inflow rates are estimated to range between 0.3 gpm and 75 gpm depending on the location of the mine pits. Model predicted pit inflow rates have been added to Addendum MP-3 Section 4.9 (Table 4.9-2). Also, text describing the range of flows has been added to Section MP.5.8.

Comment MuK 35 – Round 3

Response accepted.

Comment MuK 36 – Round 1

Mine Plan, MP.5.8 Mine Pit Dewatering Plan, 36. Please clarify the anticipated effects of the faults on the dewatering plan or groundwater impacts during mining. (MK)

Response MuK 36 – Round 1

Since the water will be collected in a sump, treated, and then discharged, the faults should have no effect.

Comment MuK 36 – Round 2

Response not accepted. It is acknowledged that the water will be collected in a sump. The intent of the comment is to get an understanding on the effects of faults on the inflows to the pit. For example, are the pit inflow rates sensitive to the location and permeability of the faults within the permit boundary? If yes, please provide a range of estimates to account for this sensitivity. (MK)

Response MuK 36 – Round 2

The faults do influence the inflow to the pits. As shown on MP-3 Figures 4.9-12, 4.9-13, and 4.9-14 the faults generally cause a shadow effect where the coals downstream of the faults dry out because the faults prevent efficient recharge of the coal aquifer downstream of the fault. An additional table added to Addendum MP-3 (Table 4.9-2) allows the influence of the faults on the pit inflows to be further evaluated. As shown on Table 4.9-2 the predicted pit inflow rates decline significantly between 2018 and 2019. Between 2018 and 2019 the mining moved closer to the fault located in the northeast side of the permit. The decline in pit inflow is partially due to the fact that the coals immediately downgradient of the fault are drier.

Comment MuK 36 – Round 3

Response accepted.

Comment MuK 37 – Round 1

Mine Plan, MP.5.9 Dewatering Wells, 37. Please provide a brief discussion on the anticipated quality of groundwater removed at various stages of mining. (MK)

Response MuK 37 – Round 1

Revised text as requested.

Comment MuK 37 – Round 2

Response not accepted. In addition to the reference to Appendix D6, please provide a description of any expected variability or trends in water quality of the groundwater removed as different coal seams are mined. Are there any expected groundwater constituents of concern based on Appendix D6? (MK)

Response MuK 37 – Round 2

The third paragraph of Section MP.5.9 now includes a short discussion summarizing information from Appendix D6. The discussion states some of reasons why water

quality could vary during the progression of mining operations. However, the discussion also states that even with the variability, there are no expected groundwater constituents of concern that could cause problems during dewatering and surface containment. The following table is a summary of the information already provided in Appendix D6:

Constituent of Concern	Units	Acute Standard¹	CRN	MST	CRN-MST
Priority Pollutants					
Arsenic, dissolved	mg/L	0.34	<0.005	<0.005	<0.005 - 0.007
Cadmium, dissolved	mg/L	0.002	<0.001	<0.001	<0.001 - 0.001
Copper, dissolved	mg/L	0.0134	<0.01 - 0.02	<0.01	<0.01
Lead, dissolved	mg/L	0.0646			<0.02
Mercury, dissolved	mg/L	0.0014	<0.001	<0.001	<0.001
Nickel, dissolved	mg/L	0.4682	<0.01	<0.01	<0.01
Selenium, dissolved	mg/L	0.02	<0.005 - 0.005	<0.005	<0.005 - 0.005
Zinc, dissolved	mg/L	0.1172	<0.01 - 0.01	<0.01 - 0.02	<0.01
Non-Priority Pollutants					
Ammonia	mg/L	varies ²	<0.1 - 7.6	2 - 10.6	1 - 2.3
Chloride	mg/L	860	7 - 27	7 - 30	11 - 24
Fluoride	mg/L	2 ³	0.5 - 1.9	0.5 - 1.5	1.7 - 2
Laboratory pH	s.u.	6.5-9.0	7.6 - 8.3	7.6 - 8.4	8.3 - 8.4
Nitrate/Nitrite	mg/L	10 ³	<0.1 - 7.9	<0.1 - 8	<0.1 - 1.2
Barium, dissolved	mg/L	2 ³	<0.1	<0.1	<0.1
Iron, dissolved	mg/L	0.3 ³	<0.05 - 0.22	<0.05 - 0.68	<0.05 - 0.21

¹ WDEQ-WQD Rules and Regulations Chapter 1, Appendix B, Aquatic Life Acute Value

² WDEQ-WQD Rules and Regulations Chapter 1, Appendix C, Ammonia Toxicity is pH and Temperature Dependent

³ WDEQ-WQD Rules and Regulations Chapter 1, Appendix B, Human Health Consumption of Fish and Drinking Water

As can be seen in this summary table, most constituents in the Carney and Masters coal seams fall below the acute standard. This table has not been included in the Mine Plan because this is baseline data that does not belong in the Mine Plan. This table has also not been added to Appendix D6 because the groundwater quality constituent concentrations are already summarized in Appendix D6. RAMACO has

committed in the Mine Plan to monitoring groundwater quality during the course of operations in order to ensure that there are no constituents of concern that could cause issues while dewatering the mine pits in potential surface containment.

Comment MuK 37 – Round 3

Response accepted.

Comment MuK 38 – Round 1

Mine Plan, MP.5.9 Dewatering Wells, 38. If groundwater is discharged into a stream channel, anticipated discharge flow rate, water quality, and estimated seasonal discharge of the groundwater should be tabulated. The availability and suitability of this water for downstream water users should also be evaluated. Please clarify if this is an expected mechanism to discharge pumped groundwater. (MK)

Response MuK 38 – Round 1

Revised text as requested.

Comment MuK 38 – Round 2

No comment received.

Response MuK 38 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 39 – Round 1

Mine Plan, MP.5.8 Groundwater Rights, Please include a description on any expected degradation of groundwater quality caused by the mining operation (including lateral flow through spoils) in the adjudicated wells. (MK)

Response MuK 39 – Round 1

Revised text as requested.

Comment MuK 39 – Round 2

No comment received.

Response MuK 39 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 40 – Round 1

Mine Plan, MP.6.2.Groundwater, 40. Please provide a brief discussion on any hydrologic effects caused by anticipated changes in recharge to the aquifers during mining. (MK)

Response MuK 40 – Round 1

Revised text as requested.

Comment MuK 40 – Round 2

Response not accepted. Not able to locate the revision made. Typically, the revisions from other operators are highlighted with bolded text or a different color to enable the reviewer to efficiently review the changes made. Without that tracking mechanism, it is difficult to review the exact revisions. Please consider using a distinct tracking mechanism in the future submittals. (MK)

Response MuK 40 – Round 2

RAMACO does not anticipate significant changes to recharge rates due to disturbance at the Brook Mine. Two sentences have been added to the end of Section MP.6.2.1 that state that RAMACO doesn't expect significant fluctuations in recharge rates, but commits to monitoring groundwater levels according to Section MP.7 and will report any significant fluctuations in groundwater levels that could be attributed to altered recharge rates.

Comment MuK 40 – Round 3

Response accepted.

Comment MuK 41 – Round 1

Mine Plan, MP.6.2.Groundwater, 41. Please provide an assessment of any subsidence effects (Addendum MP-6) on the hydrologic system during operations. (MK)

Response MuK 41 – Round 1

Revised text as requested.

Comment MuK 41 – Round 2

No comment received.

Response MuK 41 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 42 – Round 1

Mine Plan, MP.6.2.Groundwater, 42. Please discuss if there are any expected impacts on groundwater quality caused by subsidence. (MK)

Response MuK 42 – Round 1

Revised text as requested.

Comment MuK 42 – Round 2

No comment received.

Response MuK 42 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 43 – Round 1

Mine Plan, MP.6.3.2 Plan to Mitigate the Impacts on Groundwater, 43. If the quality or quantity of adjudicated water supplies are affected, then an alternative source should be identified as part of the mitigation plan. Please provide a statement to meet this statutory requirement (W.S. § 35-11-415(b)(xii)). (MK)

Response MuK 43 – Round 1

Revised text as requested.

Comment MuK 43 – Round 2

No comment received.

Response MuK 43 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 44 – Round 1

Mine Plan, MP.7.2 Groundwater Monitoring, 44. Please clarify the lack of any shallow monitor wells near Hidden Water Creek, Goose Creek and Tongue River alluvium and if this will be an impediment to completely characterize the groundwater impacts during mining. (MK)

Response MuK 44 – Round 1

Hidden Water Creek has no alluvium therefore, no shallow well can be installed. Goose Creek in the area of the permit is through a reclaimed mine area (pre-law) therefore there is not alluvium. As discussed throughout we will not impact the Tongue River Alluvium. RAMACO will add wells in the Tongue River Alluvium.

Comment MuK 44 – Round 2

Response not accepted. Please provide a more detailed plan for installing the proposed alluvial monitoring well(s). (MK)

Response MuK 44 – Round 2

See comments MK-21,22 (Round 2) responses. Discussion of the potential AVF impacts and proposed alluvial monitoring plan is presented in Mine Plan Section MP.25.

Comment MuK 44 – Round 3

Response accepted.

Comment MuK 45 – Round 1

Mine Plan, MP.7.2 Groundwater Monitoring, 45. Please clarify the possibility of any of the monitor wells shown in Exhibit MP.7-7 being discontinued due to any constraints in the proposed-mine plan (example: mined through). (MK)

Response MuK 45 – Round 1

Revised text as requested.

Comment MuK 45 – Round 2

No comment received.

Response MuK 45 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 46 – Round 1

Mine Plan, MP.8 Water use, 46. Page MP-47 states, “Industrial water will be obtained from groundwater wells or from water collected in sediment and flood control reservoirs.” Please clarify if the groundwater wells mentioned in this statement are wells that will be exclusively used as industrial supply wells or if they are same as dewatering wells. (MK)

Response MuK 46 – Round 1

Revised text as requested.

Comment MuK 46 – Round 2

Response not accepted. Please provide additional description on the source aquifer for the proposed industrial supply wells. (MK)

Response MuK 46 – Round 2

Discussion regarding wells as a water source was removed from Section MP.8. Due to the coal seams being mostly dry and the only reliable aquifers being very deep, RAMACO will rely on surface water rights and water collected in the sediment and

flood control reservoirs and other sources for supplying the quantities of water needed for industrial purposes. Refer to Table MP.8-1 for a summary of water quantity obtained from each source.

Comment MuK 46 – Round 3

Response accepted.

Comment MuK 47 – Round 1

Mine Plan, MP.8 Water use, 47. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a discussion comparing the reported water use by other mines of similar size in the Powder River Basin.

Response MuK 47 – Round 1

No record of reported water use was discussed in the annual reports submitted to WDEQ for several different mines within the Powder River Basin. As such, a comparison was unable to be made.

Comment MuK 47 – Round 2

Response not accepted. The SEO requires a submittal of the water use by the other mines. In addition, the coal review reports by the BLM also provide a summary of water use. Example: AECOM, Inc., 2014, Update of the Task 1B Report for the Powder River Basin Coal Review – Current Water Resources Conditions, prepared for Bureau of Land Management High Plains District Office and Wyoming State Office, <http://www.blm.gov/pgdata/etc/medialib/blm/wy/programs/energy/coal/prb/coalreview/phase2/Task1B.Par.91805.File.dat/Task1B.pdf>.

Response MuK 47 – Round 2

As discussed in the meeting between WDEQ and WWC on September 1, 2015, the AECOM report has been added as a reference to the Mine Plan. Water usage for the Brook Mine has been reevaluated and presented in Table MP.8-1. The fourth paragraph of Section MP.8 summarizes the expected water usage by the Brook Mine per year. This paragraph states that the approximate annual water usage at the Brook Mine will be 368 acre-feet which is on the lower end of water usage ranges provided in the report (300 to 920 acre-feet).

Comment MuK 47 – Round 3

Response accepted.

Comment MuK 48 – Round 1

Mine Plan, MP.8 Water use, 48. Page MP-48 states, “It is estimated that the total water use will be approximately 400 million gallons per year.” Please provide a comparison of

this estimated total water use against the various estimated water sources available during mining (Example: from dewatering wells). It will be very helpful to provide a discussion on contingency measures during extreme wet/dry years or if the proposed mine plan does not require extensive dewatering. (MK)

Response MuK 48 – Round 1

RAMACO is currently working to solidify the necessary water right for this water. The sources and associated amounts are in discussions and therefore not presented at this time.

Comment MuK 48 – Round 2

Response not accepted. The information will be reviewed as soon as it is made available to the LQD. (MK)

Response MuK 48 – Round 2

Table MP.8-1 has been added to the Mine Plan to outline the specific water uses with estimated quantities projected at the Brook Mine. Table MP.8-1 also shows the expected volume of water from each source. The fourth paragraph of Section MP.8 has been revised to state that the Brook Mine will use approximately 120 million gallons per year with an expected variability of plus or minus 20 percent. A statement was added to the fourth paragraph of Section MP.8 that enough water is available from the surface water rights that any variations in the quantities from other sources can be covered by the surface water rights.

Comment MuK 48 – Round 3

Response accepted.

Comment MuK 49 – Round 1

Mine Plan, MP.8 Water use, 49. Please clarify if there is any expected variability in this projected water use (example: is it closely related to the mine plan). (MK)

Response MuK 49 – Round 1

Revised text as requested.

Comment MuK 49 – Round 2

Response not accepted. The text indicates that the total water use will be approximately 400 million gallons per year. Please provide at least a range of expected variability in this projected annual water use. (MK)

Response MuK 49 – Round 2

The water usage at the Brook Mine has been reevaluated. Table MP.8-1 has been added to the Mine Plan which summarizes the expected quantities of water usage per day by specific use. This table shows that the Brook Mine is expected to use approximately 328,200 gallons per day. The fourth paragraph of Section MP.8 states that this equates to approximately 120 million gallons per year (significantly less than originally reported). The text in the fourth paragraph of Section MP.8 also states that the water usage has an expected variability of plus or minus 20 percent.

Comment MuK 49 – Round 3

Response accepted.

Comment MuK 50 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 50. Page Addendum MP-3-19 states, “Since, most of the wells within the modeled domain are stock wells with intermittent pumping and completed in geologic strata below the Masters Coals, they are relatively inconsequential to the groundwater system modeled in this report.” Please provide a Figure (or reference) to show these wells, their depths and discuss on why they are hydrogeologically isolated from the effects of the proposed mine. (MK)

Response MuK 50 – Round 1

All the groundwater rights are tabulated within Appendix B of the adjudication volume and Exhibits 5 and 8 in the adjudication volume show the locations of each respective groundwater right. Please note that adjudication Exhibits 5 and 8 include monitor wells in addition to stock and domestic wells so all the wells shown on the exhibits are not necessarily wells that are being used as water supply wells. In fact, almost all the completed water wells shown on Exhibit 5 of the adjudication volume within the Brook Mine permit area are actually monitor wells. The Cross Sections presented in Exhibit 2 of Addendum D5-3 show the depth of the coal seams at various locations within the Brook Mine Permit. For comparison, the depths of each well are listed in the tabulation in Appendix B of the adjudication volume.

The statement on Page MP-3-19 “they (the wells) are relatively inconsequential to the groundwater system modeled in this report” means that the wells are not believed to be significant stressors to the groundwater system because of their relatively low pumpage rates. This statement should not be interpreted to mean that all of the stock and domestic wells in the area are hydrologically isolated from the coals proposed for mining within the Brook Mine Permit area. In fact, Section 4.9 of Addendum MP-3 specifically describes 26 wells that, based on their depths and locations, are likely completed within the coals. The expected impacts to these wells were assessed as part of the modeling exercise. Based on a comparison between the reported depths in the water rights tabulation in Appendix B of the adjudication volume and the geologic cross sections in Addendum D5-3, the other stock and domestic wells in the area were

determined to be completed either in the Tongue River alluvium, or deeper strata below the Carney coal and do not have a direct hydrologic connection to the coals proposed for mining in the Brook Mine and were not specifically evaluated in the groundwater model.

Along the eastern edge of the model domain there are a large number of CBM wells and, based on available data presented in the water rights tabulation in Appendix B of the Adjudication volume, these wells are likely pumping water from the Carney and Masters coal seams. The impacts from the CBM wells are described in detail within later sections of the report. However, the text on page MP-3-19 does not speak to the CBM wells. Minor changes to the text on page Addendum MP-3-19 and additional explanatory text have been added to this page to provide further clarification.

Comment MuK 50 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 50 – Round 2

Section 2.2 of Addendum MP-3 had previously been updated to incorporate this comment response. Additional explanatory text has also been added to Addendum MP-3 Section 2.3 to further incorporate the context of this response into the Permit Application.

Comment MuK 50 – Round 3

Response accepted.

Comment MuK 51 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 51. Page Addendum MP-3-20 states, “The faults are significant in lateral extent and form natural no flow boundaries”. Please provide a discussion (or refer to a discussion) on how these faults were determined to be no flow boundaries. (MK)

Response MuK 51 – Round 1

Faulting within the permit area was mapped by B.E. Barnum on the USGS Monarch Quadrangle. As noted in Section D5.3.2, Barnum indicates fault displacements on the order of 50 feet within the mine area. Lithologic logs provided in Addendum D-5-3 demonstrate that the dominating lithology in the column is claystone and coal thicknesses are less than 20 feet. This offset geology from faulting results in a claystone hanging or footwall adjacent the coal aquifer and therefore discontinuity of the aquifer and an assumed hydrologic flow boundary.

Comment MuK 51 – Round 2

Response not accepted. It is appreciated and acknowledged the note of lithologic logs. In addition, please clarify or substantiate if there is any hydrologic evidence to support the interpretation that the faults are no flow boundaries (Example: water levels, water quality or other hydrologic evidence). This will increase the validity of the no-flow assumption. (MK)

Response MuK 51 – Round 2

In addition to the lithological evidence discussed in the previous response that supports treatment of the faults as no flow barriers, comparisons of water levels in coal monitor wells on either side of the fault also demonstrate that the faults serve as no flow barriers. Exhibits D6.2-2 and D6.2-3 in Addendum D6 illustrate the potentiometric surface in Masters and Carney coal seams, respectively. As shown on Exhibits D6.2-2 and D6.2-3, within the northeastern portion of the Brook Mine permit area there are two monitor well clusters that straddle both sides of a fault (578408 and 578409). In the case of the Masters coal, the measured water level in the monitor well on the upper side of the fault (578408-MST) is 173 feet higher than the water level measured in the monitor well completed on the downblock side of the fault (578409-MST). Similarly, the measured water level difference across the fault in the Carney monitor wells is approximately 180 feet. The change in potentiometric head between the monitor wells on both sides of the fault is significantly higher than would be expected due to the natural gradient in this area. Therefore, the variation in the measured potentiometric head across the fault demonstrates that it does serve as a hydraulic barrier. Additional text has been added to Addendum MP-3 Section 2.4.1 to more fully describe the effects that the faults have on the conceptual flow model.

Supplemental analysis of water quality on opposite sides of the faults has been conducted to note any difference in water quality that would indicate that the faults serve as no-flow barriers. This analysis and discussion has been added to Addendum MP-3 in Section 2.4.1.

Comment MuK 51 – Round 3

Response accepted.

Comment MuK 52 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 52. Please clarify the reason for not estimating vertical hydraulic conductivity of the interburden using an aquifer test. (MK)

Response MuK 52 – Round 1

Response to this comment is partially clarified in responses to MK's Comments 18 and 19 above. During the aquifer test conducted at the 578409 well cluster no response was observed across the interburden, therefore, the vertical hydraulic conductivity of

the interburden was too low to measure in the aquifer test. Furthermore, the static water levels in the Masters and Carney coal seams are different which demonstrates that the hydraulic conductivity of the interburden is very low. Therefore, literature values were utilized and adjusted within reasonable bounds to improve model calibration.

Comment MuK 52 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 52 – Round 2

The context of this response was incorporated into Addendum D6-8 “Pumping Test Report.” The context was added into Section D6-8.4 “Determination of Aquifer Parameters.”

Comment MuK 52 – Round 3

Response accepted.

Comment MuK 53 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 53. Page Addendum MP-3-25 states, “With no unnatural stresses on the system ...” Please provide a discussion of the CBM impacts on the water levels. It appears that the hydrographs presented in Appendix D6 do not show the impacts of CBM. (MK)

Response MuK 53 – Round 1

There are multiple CBM production wells located along the eastern side of the groundwater domain. In order for the CBM producers to be able to produce gas it is necessary to significantly lower the water levels in the coal to release the gas in the coal fractures. CBM production began in this area around 1999. Therefore, it was conservatively assumed that CBM production has already resulted in lowering the water levels in the coal aquifers to the top of the coal aquifer along the eastern edge of the model domain and the general head boundaries were set accordingly to simulate this effect. Even though water level data in the coal aquifer prior to CBM production is limited because of the lack of monitor well data, prior to CBM production, the potentiometric head in the coal was estimated to be significantly higher than the top of coal.

The hydrographs presented in Appendix D6-9 do not show the impacts of CBM because they show water level changes over a one year period roughly 13 years after CBM production began in the area, and if the wells were going to be impacted by CBM, it is likely that they have already been impacted. Please note that the model assumed that CBM production would continue into the future resulting in the water levels in the coal being maintained at unnaturally low levels. Therefore, the model has

conservatively estimated the combined impacts from both CBM and the proposed coal mining activities. Currently, a large majority of the CBM wells are being plugged and abandoned which may result in higher than predicted water level recovery rates in the coal aquifer.

Text edits were made to page MP-3-25 to help clarify the discussion.

Comment MuK 53 – Round 2

No comment received.

Response MuK 53 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 54 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 54. There are two sub-sections for recharge, Section 2.5.3 and Section 2.6.1. Please clarify/consolidate. (MK)

Response MuK 54 – Round 1

The two subsections have been combined into one subsection under Section 2.6.1.

Comment MuK 54 – Round 2

No comment received.

Response MuK 54 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 55 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 55. Page Addendum MP-3-26 states, "... drain cells were placed in the model to simulate seeps from the outcrops." Please provide a discussion on the evidence for seeps (or reference) observed during field surveys. Were there any field data collected on the location and flow rates of these seeps? (MK)

Response MuK 55 – Round 1

Evidence of seeps from outcrops can be seen in Color Infrared Imagery (CIR), which is included in the permit as Exhibit D11.1-1. The areas of seepage are manifested on the CIR imagery as areas with more vegetation. Evapotranspiration from the vegetation growing along the seep removes all the water before it emanates from the formation into the drainage. Therefore, no measurements of the seepage rate at the outcrops were possible or are available. Additional discussion explaining the need for drain cells within the model is provided in Section D6.2.2. Also, text was added to Section D6.2.2 to clarify that no field flow measurements were available.

Comment MuK 55 – Round 2

Response conditionally accepted. Please include the discussion on CIR into the permit application (MK)

Response MuK 55 – Round 2

Additional text describing the seeps was added to Addendum MP-3 Section 2.6 to incorporate the context of this response.

Comment MuK 55 – Round 3

Response accepted.

Comment MuK 56 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 56. Page Addendum MP-3-27 states, “River cells from MODFLOW’s river boundary conditions package were placed in the model to simulate the Tongue River and Goose Creek.” Please provide a conceptual discussion supported by field observations on the type/nature of interaction of these streams with groundwater (Gaining stream vs. losing stream). (MK)

Response MuK 56 – Round 1

As described in Section 2.3 of MP-3, the dip of the strata in the project area is generally east-southeast into the Powder River Basin and the groundwater flow direction follows this trend regionally. As such, the Tongue River comes into contact with the coal seams of interest near the updip side of the coal seams. Interactions between the surface water and groundwater occur at those points where permeable formations sub-crop into alluvial/surface water bodies. Both the Carney and the Masters coal subcrop under the Tongue River near the western edge of the model domain. Conceptually these subcrops are the only places where the coals would be in contact with the surface water. Section 2.3 of Addendum MP-3 describes the conceptual groundwater flow in some detail.

As described in Addendum MP-3 Section 2.3, the Carney coal is largely dry to the north and west of its subcrop into the Tongue River alluvium and becomes saturated at an elevation just above the elevation where it subcrops beneath the Tongue River alluvium. Therefore it is likely that the Carney Coal would lose water to the Tongue River alluvium. The potentiometric surface in the Masters Coal is roughly the same as the potentiometric surface of the Tongue River where the Masters coal subcrops beneath it. A review of the steady state groundwater model shows that where the River boundary cells are immediately above the Masters Coal the net effect is that the River boundary cells input approximately 3.2 gpm into the model. Conversely, near the upper and lower Carney Coal/Tongue River outcrops the River cells are taking roughly 0.16 gpm out of the model. Since the coal outcrops occur beneath the Tongue River there is no way to field verify these flows but conceptually they do seem reasonable.

The river boundary cells extend to the bottom of the layer in which they are placed as discussed in response to comment MUK 74 and MUK 84. The River boundary cells were placed in Layer 1 to the confluence of Goose Creek and the Tongue River which extends east of the area where the Carney Coal would be in communication with the Tongue River alluvium. Due to the fact that the River boundary cells extend to the bottom of the layer they do provide a conduit for the River to provide recharge into the Carney Coal even though the River would be physically separated from the coal by multiple zones of low permeability shales. The estimated recharge occurring in this area from the Tongue River to both layers 1 and 2 is approximately 8 gpm. The discharge into the coals is likely conservatively overestimated and not all of the 8 gpm would necessarily end up in the coal as some of it also discharges to layer 1. As such, the model conservatively estimates that up to 11.2 gpm would be discharged from the river to the coals or overburden between the Carney Coal and the Tongue River.

The strata located above the coal seams of interest is generally claystone with low permeability as discussed in MP-3 Section 2.2. Therefore, interaction of groundwater between these units and the Tongue River or Goose Creek is very limited. Within the model domain, the Tongue River Alluvium does have large deciduous trees and other vegetation immediately adjacent to the river. Conceptually, evapotranspiration from the vegetation along the Tongue River would indicate that through the model domain the Tongue River is a losing Stream. Throughout most of the model domain where the Tongue River is present, there low permeability overburden strata between the Tongue River alluvium and the coal seams which hydrologically isolate the Tongue River from both the Masters and the Carney coal seams. Since Goose Creek is located in the eastern portion of the model domain where the coal is significantly below the alluvium and the clay intervals are even thicker, the Goose Creek alluvium is also hydrologically separated from the Masters and Carney Coals. The Goose Creek alluvium would likely see similar losses to evapotranspiration that would be observed in the Tongue River alluvium.

Comment MuK 56 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 56 – Round 2

Text from this response has been incorporated into Addendum MP-3 Sections 2.3 and 4.7.2 as appropriate.

Comment MuK 56 – Round 3

Response accepted.

Comment MuK 57 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 57. Please provide a discussion on any contribution of groundwater baseflow to the major surface water bodies within the permit boundary. (MK)

Response MuK 57 – Round 1

As described in the response to comment MuK 56, conceptually, very little groundwater base flow from the Carney and Masters coal seams are expected to contribute to the surface water bodies within the permit boundary. The mass balance table provided in response to comment MuK 73 demonstrates that much more water is expected to enter the groundwater system from the surface water bodies (river cells) than is contributed to the surface water bodies from groundwater baseflow.

Comment MuK 57 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 57 – Round 2

The context of this response has been added to Addendum MP-3 via additional text to address comments MuK 56 and MuK 73. Specifically, text additions to Addendum MP-3 Section 4.10 include the context of the Round 1 response.

Comment MuK 57 – Round 3

Response accepted.

Comment MuK 58 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 58. In section 3.2 MODFLOW Input Files, was aerial recharge used as an input file? Please clarify if evapotranspiration was considered as a discrete input or lumped into net aerial recharge. (MK)

Response MuK 58 – Round 1

Yes, the recharge package was used as an input file. Section 3.2 of Addendum MP-3 was updated to include a discussion of the recharge package. The evapotranspiration (ET) package was not utilized in the model. To address the effects of ET, the recharge rates were adjusted down in proportion to the estimated losses created by ET. Within most of the model domain where evapotranspiration would occur, the low permeability overburden between the surface and the coal seams of interest provide a hydrologic barrier so the evapotranspiration was ignored in these areas.

Comment MuK 58 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 58 – Round 2

Addendum MP-3 Section 4.2.2 was updated to incorporate the context of the Round 1 response.

Comment MuK 58 – Round 3

Response accepted.

Comment MuK 59 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 59. Page Addendum MP-3-31 states, “Layer 1 – represents the coal overburden”. Please clarify if the alluvial aquifer was included in the model. Please provide justification for not considering the alluvial aquifer in the model. (MK)

Response MuK 59 – Round 1

As described in the responses to comments MuK 56 and MuK 57, the only place within the model domain where there is potential for interactions between any alluvial aquifers and the coal seams of interest is where the coal is directly below the Tongue River alluvium or Slater Creek colluvium. Where the coal is in direct contact with alluvium/colluvium, layer 1 (the coal overburden) was assigned a higher vertical hydraulic conductivity to allow the layer to better emulate the alluvial/colluvial aquifer in this location. This zone of higher hydraulic conductivity in layer 1 is depicted on Addendum MP-3 Figure 4.2-1. Groundwater Vistas does not allow discontinuous layers throughout the model domain so this allowed the alluvium/colluvium to be effectively be modeled without the need to add an additional layer across the top of the entire model domain. This helped to improve the computational efficiency of the model. Since the overburden has a very low hydraulic conductivity and hydrologically separates the coals from the other alluvial/colluvial deposits within a large portion of the model domain, there is no reason to model any additional alluvial/colluvial deposits. To help clarify this comment Figure 4.2-1, was prepared and sections 2.5 and 4.2 of MP-3 have been updated.

Comment MuK 59 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 59 – Round 2

With the addition of the text to address comments MuK 56 and Muk 57 as well as the text added to Addendum MP-3 Section 4.2.1, the context of this comment has been incorporated into Addendum MP-3.

Comment MuK 59 – Round 3

Response accepted.

Comment MuK 60 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 60. Page Addendum MP-3-31 states, “Layer 3- Carney Interburden. This interval is generally of low to very permeability in the western portion of the Project Area”. Please clarify how the areas where Layer 3- Carney Interburden is absent are treated in the groundwater model. (MK)

Response MuK 60 – Round 1

Ground Water vistas does not allow discontinuous layers. Therefore, Layer 3 is continuous across the entire model domain. Where the coal seam coalesces on the east portion of the model, the Layer 3 interburden was modeled as coal by setting hydraulic properties of the layer equivalent to the values of the overlying and underlying coal seams. Additional text has been added to Section 4.2.1 of Addendum MP-3 to further describe how the hydraulic conductivities were assigned to layer 3.

Comment MuK 60 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 60 – Round 2

The context of the Round 1 response has been incorporated into Addendum MP-3 Section 4.2.1.

Comment MuK 60 – Round 3

Response accepted.

Comment MuK 61 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 61. Please include a discussion of the thickness of all model layers. (MK)

Response MuK 61 – Round 1

Addendum MP-3 Section 2.5 describes the thickness of the various coal seams. Additional text has been added to MP-3 Section 4.1 to generally describe the thickness of each layer. Following are the modeled thicknesses for each layer:

- Layer 1-The thickness for this layer varies throughout the model domain. Near the western side of the model the layer is often absent where all the strata geologically younger than the Carney coal has been eroded off. These areas are generally represented as no flow cells in the model. Within the eastern portion of the model Layer 1 can be substantial. In the model the maximum thickness of Layer 1 in the eastern side of the model domain was approximately 1,100 feet.
- Layer 2-The Upper Carney coal was modeled with a constant thickness of 7 feet throughout the model.
- Layer 3-The Carney coal interburden layer varied in thickness from 4 feet up to 15 feet within the active portion of the model.
- Layer 4-The Lower Carney coal was modeled with a constant thickness of 8 feet within the model.
- Layer 5 The Carney/Masters coal interburden layer varied in thickness from 4 feet up to 107 feet within the model.
- Layer 6-The Masters coal was modeled with a constant thickness of 6 feet within the model.

Comment MuK 61 – Round 2

Response not accepted. It is acknowledged that Section 4.2.1 provides the thickness of the model layers. Also, the response states, “*Addendum MP-3 Section 2.5 describes the thickness of the various coal seams.*” Addendum MP-3, Section 2.5 does not describe the thickness but it is a section on hydraulic properties. Please clarify. (MK)

Response MuK 61 – Round 2

The previous sections reference was incorrect. Addendum MP-3 Section 2.5.1.3 provides a statement regarding the thickness of the Carney Coal. Addendum MP-3 Section 2.5.1.4 provides a statement regarding the thickness of the Masters Coal.

Comment MuK 61 – Round 3

Response accepted.

Comment MuK 62 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 62. Please include a justification for not considering the underlying zones beneath the Masters coal seam in the model. (MK)

Response MuK 62 – Round 1

The Masters coal is underlain by the Lebo Shale. The Lebo Shale is a thick (Appendix D5 Section D5.2.3), regional confining interval in the project area as described in Mine Plan Addendum MP-3 Section 2.1. There are no aquifer units identified within the model domain within the Lebo Shale with direct hydrologic connection to any of the elements of the model. Since the Lebo Shale is a regional confining unit, if it had been included in the groundwater model, it would have been assigned hydraulic parameters typical of a shale interval (very low hydraulic conductivity) and it would have essentially been a no flow barrier to the more permeable Masters coal above it. Groundwater Vistas treats the bottom of the model as a no flow boundary. Therefore, the Lebo Shale is for all practical purposes included in the model as a confining interval with the way the model is currently defined.

Comment MuK 62 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 62 – Round 2

The second to last paragraph in Addendum MP-3 Section 4.1 incorporates the context of the Round 1 response.

Comment MuK 62 – Round 3

Response accepted.

Comment MuK 63 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 63. Please provide appropriate cross section(s) of the model grid overlaid with the drill hole data collected during baseline characterization. This will help the evaluation of the adequacy of model layer thicknesses against the stratigraphic field data. (MK)

Response MuK 63 – Round 1

As noted in Addendum MP-3 Section 4.1, the Groundwater model layers were developed from a 3D geologic model developed from drill hole data within the project area developed for the purposes of making volumetric coal estimates. Minor updates to the surfaces were made where new data provided by additional exploration drilling was completed. An additional figure was developed (Addendum MP-3 Figure 4.1-3) and included in Addendum MP-3 that depicts actual cross sections cut from the groundwater model. Addendum D5-3 of Appendix D5 includes geologic cross sections with drill hole data that can be compared back to the actual cross sections included in Figure 4.1-3 of Addendum MP-3.

Comment MuK 63 – Round 2

No comment received.

Response MuK 63 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 64 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 64. Please clarify how the layers were modeled to represent the confined/unconfined aquifer types. (MK)

Response MuK 64 – Round 1

Groundwater Vistas has a “layer type” control that was set to #5: Confined/Unconfined, which allows the model to determine whether to use storativity or specific yield for the storage coefficient based on the elevation of the water elevation vs. formation tops. Groundwater Vistas handles the aquifer type classification without further inputs.

Comment MuK 64 – Round 2

Response not accepted. It is acknowledged and noted that GW Vistas handles it in an automated mode. Please provide a description on if there were any additional checks conducted on the results from the groundwater model to verify if the aquifer type used by GW Vistas is consistent with the conceptual model and field data. Example discussion: Are the deeper layers confined for the entire simulation or do they change from confined to unconfined due to mine operations? (MK)

Response MuK 64 – Round 2

Within the model domain the coal aquifers are relatively thin, ranging in thickness from 4 to 15 feet. Because the coal aquifers are relatively thin, during the model simulation the coals were typically either confined or dry. The only place where unconfined conditions occurred in the groundwater model simulations were near the outcrops or in the cells immediately adjacent to cells that went dry during the modeling simulations. Similarly, during mining simulations the cells immediately next to the mining areas became unconfined as well. When the water level in a cell drops below the top of the layer, Groundwater Vistas treats that cell as an unconfined aquifer which means that instead of using the specific storage term to calculate the amount of water in storage, the program uses specific yield to calculate the amount of water in storage. The total area of unconfined coal aquifer was relatively small as compared to the portion of the aquifer that was dry or fully saturated. Due to the relatively small area of potential unconfined aquifer, no specific analyses were conducted to determine whether changes in the specific yield in the unconfined aquifer would affect model calibration.

Comment MuK 64 – Round 3

Response accepted.

Comment MuK 65 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 65. In addition to model calibration, please provide justification for the recharge rates applied in the model including any literature references. (MK)

Response MuK 65 – Round 1

The initial recharge rates utilized in the model were initially estimated based on a USGS study (Water-Resources Investigations Report 01-4278) conducted on the eastern side of the Powder River basin and the Black Hills area. The study entitled, “Estimated Recharge to the Madison and Minnelusa Aquifers in the Black Hills Area, South Dakota and Wyoming, Water Years 1931-98.” was prepared by J.M. Carter and D.G. Driscoll. In the study Carter and Driscoll reported recharge rates varying from 0.04 inches per year to 2.93 inches per year. The 2.93 inch per year recharge rate was reported within the Madison limestone formation outcrops in the Black Hills while the lower range of recharge rates reported by Carter and Driscoll were estimated for areas in the eastern periphery of the Powder River Basin where the precipitation and soil types are similar in nature to the Brook Mine Permit area. Since calibrated recharge rates in the key recharge areas (the coal outcrops and the scoria outcrops) were within the range of values developed by Carter and Driscoll, the recharge rates used in the model are considered reasonable. Please note that the recharge rate throughout Layer 1 is much lower than the range of recharges developed by Carter and Driscoll. This is reasonable because much of Layer 1 has no hydrologic connection to the underlying coal seams. Additional justification for recharge rates applied in the model is discussed in response to comment BJ57.

Comment MuK 65 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 65 – Round 2

Addendum MP-3 Section 4.2.2 has been updated to incorporate the context of the Round 1 response.

Comment MuK 65 – Round 3

Response accepted.

Comment MuK 66 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 66. Page Addendum MP-3-33 states, “Recharge is applied within the modeling software by applying the recharge to the highest active layer.” Please clarify the presence of any modeled ‘dry cells’ in the model and the influence of applying the recharge to the layers below the dry cells. (MK)

Response MuK 66 – Round 1

As noted in the responses for comments MuK 59 and MuK 60, Groundwater Vistas does not allow for discontinuous layers across the model domain. Along the north and the west sides of the model there is a good portion of the model domain where the upper layers have been eroded off and do not actually exist. These areas of erosion were accounted for using no flow cells. As shown on Figures 4.4-1 through 4.4-4 of Addendum MP-3, the no flow cells in the top layer are the largest in areal extent while each underlying layer has a slightly decreased areal extent of no flow cells. In this case the no flow cell distribution was adjusted to match the outcrop of each layer. The fact that the software applies the recharge to the highest active layer was taken advantage of during the modeling process, since it is an effective way to apply recharge to an outcropping layer which is under another layer that is eroded away but due to software limitations is still present in the model.

Because CBM operations have generally removed most of the water from the coal seams, there are some locations within the model domain where dry cells during the modeling have caused cells in layer 1 to go dry and the recharge is applied to the next active layer below. While this could be problematic if a high recharge rate were assigned to the model cells, generally throughout the model domain the recharge rate is very low. Therefore, this results in a very minor amount of water coming into the model and did not significantly affect the model calibration.

Comment MuK 66 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 66 – Round 2

Addendum MP-3 Section 4.2.2 has been updated to incorporate the context of this response.

Comment MuK 66 – Round 3

Response accepted.

Comment MuK 67 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 67. Table 4.2-3. lists model porosity values. Typically, MODFLOW (flow model) does not use porosity in its calculations. Please clarify the need for this input parameter. (MK)

Response MuK 67 – Round 1

Modflow does not utilize porosity as part of its calculations. However, other modules included in the Groundwater Vistas package such as MODPATH do utilize porosity. In the case of this model, no MODPATH simulations were conducted. Therefore, the porosity term as put into the model has no impact on the calculations. However, porosity is a hydraulic parameter of the aquifer and may be important for future modeling simulations, therefore, the porosity values developed for each aquifer/aquitard unit will be left in the model report. Minor changes to the text in Addendum MP-3 have been made to clarify the role of porosity in this model.

Comment MuK 67 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 67 – Round 2

The context of the Round 1 response was incorporated into Addendum MP-3 Section 4.2.3 as part of the first round of comment responses.

Comment MuK 67 – Round 3

Response accepted.

Comment MuK 68 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 68. The faults are not modeled in Layer 1. Please clarify the procedure for determining the vertical extents of the faults in the model. (MK)

Response MuK 68 – Round 1

The composition of Layer 1 is predominately claystone. Because Layer 1 is not composed of aquifer material and because the hanging and footwalls are composed of strata with similar hydraulic properties, displacement due to faulting does not substantially change the flow through the aquitard and placing Horizontal flow barriers in the model in layer 1 was not necessary.

Comment MuK 68 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 68 – Round 2

Addendum MP-3 Section 4.4.1 was updated to incorporate the context of the Round 1 response.

Comment MuK 68 – Round 3

Response accepted.

Comment MuK 69 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 69. Please provide the input parameters used to model the horizontal flow barriers in the model and discuss their technical reasonableness. (MK)

Response MuK 69 – Round 1

Horizontal Flow Barriers were used in the model to simulate no-flow boundaries created by faulting within the project area. Horizontal flow barriers require two input parameters in Groundwater Vistas including wall thickness and hydraulic conductivity. The input parameter used in the model for wall thickness was 10 feet and a hydraulic conductivity of 1.0×10^{-5} ft/day was used. The horizontal flow barrier parameters as applied will essentially limit all but a very minor amount of flow across the barrier. As described in the response to comment MuK 51, the coal seams within the project area are relatively thin as compared to the fault offsets so it is reasonable to assume that the faults will significantly impede flow in the aquifer units.

Comment MuK 69 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 69 – Round 2

Addendum MP-3 Sections 4.4.2, 4.4.3, and 4.4.4 were updated to incorporate the context of the Round 1 response.

Comment MuK 69 – Round 3

Response accepted.

Comment MuK 70 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 70. Page Addendum MP-3-40 states, “As the current, post-CBM potentiometric surface is considered the static level.....” Please provide the implications of this assumption, on the model calibration of hydraulic parameters and the model predicted hydrologic impacts (over estimation of drawdown vs. underestimation) (MK)

Response MuK 70 – Round 1

Addendum MP-3 Sections 4.8.1, 4.10, and 4.11 all discuss the implications of CBM impacts. In addition, the response to comment MuK 53 also discusses CBM impacts to water levels. As discussed in the response to comment MuK 53, the model conservatively assumed that CBM operations have lowered the water levels in the eastern portion of the model domain to a level near the top of the coal seams. To simulate this drawdown, the elevations of each general head boundary on the east side of the model were set at an elevation just above the top of the coal seam. The general head boundaries elevations remained the same in both the steady state and the transient models. Essentially, this means that the model operated under the assumption that the post CBM impacts were permanent prior to and after the Brook Mine mining activities.

The assumption that the water levels have been permanently impacted by CBM did have a significant impact on model calibration. The severely depressed water levels caused by CBM operations have resulted in a large number of cells going dry. The hydraulic parameters of the aquifer units within the eastern portion of the model domain were not adjusted to eliminate the dry cells since it is reasonable to assume that, with the severe drawdown modeled, the coal seams could have been dewatered in these areas. Therefore, even though the effects of the CBM drawdowns were observed during calibration, no specific adjustments were made to the modeled aquifer characteristics to eliminate these impacts. The dry cells did complicate calibration of the model because they cause instability in the MODFLOW model calculations and results.

The model was developed to take into account impacts from the combined effects of CBM and the proposed coal mining. In general, CBM development impacts are significantly larger than the predicted impacts from the Brook Mine. Therefore, ignoring CBM impacts would have significantly under predicted the potentiometric surfaces within the model domain and overestimated the impacts that Brook Mine would have on the system.

Many of the CBM wells are actively being plugged and abandoned. If this trend continues, there is a chance that recovery of water levels from CBM impacts may begin which will result in recharging of the coal seams. If this happens, it is anticipated that the model conservatively over predicts the impacts to the region especially in the long term recovery scenarios.

Comment MuK 70 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 70 – Round 2

Most of the discussion in the original comment has already been incorporated into Addendum MP-3 with the first round of comment responses. However, an additional concluding statement from this response was added to Addendum MP-3 Section 4.1.1 to incorporate the context of the Round 1 response into the permit application.

Comment MuK 70 – Round 3

Response accepted.

Comment MuK 71 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 71. It is noted that Table 4.7-1 summarizes the calibration residuals and statistics from the calibrated model. Please consider providing additional presentations of the calibrated model statistics. This will enable an easier evaluation of any spatial bias in the model calibration. (MK)

- a. X-Y plot of observed vs. simulated water levels.
- b. A map plotting the residuals to show the spatial distribution
- c. Provide a summary statistics table with Mean Error, Mean Absolute Error, Sum of Squared residuals for the calibrated model. It is noted that some of these values are presented in the sensitivity analysis. However, a compiled summary statistics table would be very helpful.

Response MuK 71 – Round 1

As requested the following additions have been made to the groundwater model report:

- A. An X-Y plot of observed versus simulated water levels has been added in the report as Addendum MP-3 Figure 4.7-1.
- B. The residuals have been added to figures 4.7-2, 4.7-3, and 4.7-4 of Addendum MP-3.
- C. Table 4.7-1 of Addendum MP-3 has been updated to include additional statistics.

Comment MuK 71 – Round 2

No comment received.

Response MuK 71 – Round 2

Round 1 response assumed to be adequate. No response is necessary.

Comment MuK 72 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 72. In addition, to the measured water levels, please clarify if there were any flow measurements used for model calibration. (MK)

Response MuK 72 – Round 1

There are no areas within the model domain where it was possible to collect any flow measurements that would support the modeling effort therefore, no flow measurement were used in the calibration.

Comment MuK 72 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 72 – Round 2

Discussion was added Addendum MP-3 Section 2.6 to clarify that no measurements of seepage at the outcrop were available. Also, text has been added to Section 4.7.2 clarifying that there are no measurements available for water that may leave or enter the Tongue River from the coal seams.

Comment MuK 72 – Round 3

Response accepted.

Comment MuK 73 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 73. Please provide a water budget table (in acre-feet per year or cubic-feet per day) showing all the inflows into the model and outflows from the model.

Response MuK 73 – Round 1

The following tables summarizes the inflows and outflows from the model domain during the steady state period, 5 years into mining, the end of mining, and at the end of recovery.

Mass Balance of Steady State Calibrated Model		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
General Heads	16,107	22,890
River	2,569	410
Drains	-	560

Recharge	5,168	-
Total	23,846	23,860

Mass Balance 5 years into Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	12,496	11,431
General Heads	16,130	22,904
River	2,688	385
Drains	-	1,774
Recharge	5,434	-
Total	36,749	36,494

Mass Balance End of Mining		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	3,670	4,146
General Heads	16,135	22,902
River	2,705	365
Drains	-	532
Recharge	5,430	-
Total	27,941	27,945

Mass Balance End of Recovery		
Source/Sink	Inflows (ft ³ /d)	Outflows (ft ³ /d)
Storage	1,698	2183
General Heads	16,138	22,901
River	2,714	363

Drains	-	535
Recharge	5,427	-
Total	25,978	25,983

Comment MuK 73 – Round 2

Response conditionally accepted. Please incorporate the tables into the permit application. (MK)

Response MuK 73 – Round 2

Addendum MP-3 Section 4.10 has been updated to include the water budget. Specifically, Table 4.10-1 includes the mass balance throughout the mining simulations. A cross reference to the mass balance discussion in Addendum MP-3 Section 4.10 was also added to Addendum MP-3 Section 4.6 for clarity.

Comment MuK 73 – Round 3

Response accepted.

Comment MuK 74 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 74. Please provide a comparison of model simulated inflows and outflows against conceptual estimates of inflows and outflows. This comparison will act as another verification/check for the technical adequacy of the groundwater model (Example model GHB flows vs. reasonable estimated conceptual flows). (MK)

Response MuK 74 – Round 1

Response to comment MuK 73 includes tables that show the inflows and outflows from the model during the steady state period, 5 years into mining, the end of mining, and at the end of recovery. The five main categories of inflows and outflows include 1) storage, 2) general head boundaries, 3) river boundaries, 4) drains, and 5) recharge. Following is discussion regarding model predicted inflows and outflows for each category:

- 1) Storage – During the steady state model there is no inflow or outflow from storage so storage is not included in the first mass balance table in prepare for comment MuK 73. The model predicts that during active mining more water will come out of storage than will go into storage. Conceptually this is reasonable since during mining, water from the coals would be draining into the mined out areas. There is a trend of water continuing to come out of storage even after mining ceases. Even though the volume of water coming out of storage is quite low, it is contrary to the conceptualization of the system to have

water leaving storage after mining because at this point water should be going back into storage. This phenomenon is attributed to the fact that many of the cells in the model go dry during mining because CBM operations have significantly dewatered the coals and there is not much water available in storage (see comment MuK 70). When the cells go dry, MODFLOW treats them as no flow areas and there can be a ripple effect that causes additional cells going dry. Since MODFLOW is not very efficient at rewetting dry cells when they should be resaturated, this ripple effect has caused permanent changes in the model. Over a long time the model would be expected to come to a steady state condition. The tables prepared in response to comment MuK 73 indicate that even at the end of recovery, the model is not yet at the new equilibrium that would eventually be reached with the additional dry cells.

- 2) General Head Boundaries – The amount of water going into and out of the model domain via the general head boundaries remains relatively consistent throughout the modeled operations. This is reasonable because the general head boundaries are a long distance from the mining area and would not be expected to be significantly impacted by mining. In addition, the total volume of outflows from the general head boundaries generally balances the inflows from other sources. This is conceptually correct.
- 3) River Boundaries – The conceptual inflow and outflow from the coals to the Tongue River are discussed in detail in comment MuK 56. Groundwater Vistas does apply the River Boundary cells to the bottom of the layer in which they are inserted. The Tongue River Boundary cells were inserted into the model up to the point where Goose Creek joins the Tongue River. At that location the top of the Carney coal is estimated to be approximately 100 feet below the surface. Since the alluvium is generally much thinner in this area and there is actually a large amount of low permeability strata between the Tongue River alluvium and the coal (described in comment MuK 56), the model likely overestimates the contribution of the River boundary cells to the model because the river boundary cells provide a direct connection (in the model) between the river and the coals where there is not a physical connection. This conservatively over estimates how much water discharges from the River Boundary Cells to the model.
- 4) Drains – One drain was placed into layer 1 in the northeast side of the model domain to allow water to drain from the model where the Tongue River crosses the domain boundary. This represents the amount of water in layer 1 lost to the surface water system. The total discharge from this drain during steady state conditions is 560 ft³/day (2.9 gpm). While no physical measurements were (or can be) made to verify this amount, conceptually it is reasonable. The strata along the Tongue River likely does discharge a small amount of water to the River where it cuts through the numerous perched sand lenses that become saturated from natural recharge. There is no evidence of large groundwater

discharges to the Tongue River in this area so it makes sense that a small discharge to the River (rather than a large discharge) would be observed in the model. During mining, drains were added to the model to remove water from the mine pits. The tables indicate that during mining the discharges from the drains do increase as expected. After mining is complete, discharges from the drains return approximately to premining levels which is conceptually correct.

- 5) The recharge amount used in the model stays at relatively the same level throughout the simulations. Total recharge across the model area is approximately 28 gpm. As is described in comment #65 the recharge rates are reasonable based on available studies.

Comment MuK 74 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. In addition, clarify the reason for increased recharge from the steady state to transient models (5,138 vs 5,434 cu.ft/day).

Response MuK 74 – Round 2

Addendum MP-3 Section 4.10 was updated to include the context of the Round 1 response. The model was also reviewed to determine why there was a slight difference in the recharge rates during the steady state simulation and the transient simulation period (5,168 vs 5434 cu ft/day). During the review of the model it was found that one of the recharge options in the MODFLOW options dialogue box was incorrect. The check box in the dialogue box entitled “Apply recharge from stress period 1 to all stress periods” had not been checked. After checking the option, the model was rerun and during the subsequent run the recharge was the same during the steady state portion and the transient portion of the model. Other minor changes in the mass balance numbers presented in Table 4.10-1 were also noted and the numbers were updated to reflect the model predicted values after changing the recharge settings.

Comment MuK 74 – Round 3

Response not accepted. Please provide the revised model files for the LQD review and records.

Response MuK 74 – Round 3

New Groundwater Vistas files configured to run in Groundwater Vistas Version 6.80 Build 1 are provided on a DVD with this submittal. Please see response to Comment 32 for details.

Comment MuK 75 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 75. Page Addendum MP-3-40 states, “Due to a system of thin aquifers with similar sources and sinks and homogeneous hydraulic conductivities, the head values of the steady-state model were nearly

identical between the separate coal layers as noted in Table 4.7-1.” Please clarify whether this statement implies that the interburden (where present) between the coal seams is not a confining unit. (MK)

Response MuK 75 – Round 1

This statement is an observation only based on review of modeled values and does not suggest a lack of confinement exists. Pumping tests conducted in separate aquifers demonstrated that the interburden provides confinement between the Carney and Masters aquifers as described in Section D6-8.3.2.3 of Appendix D6. In addition, Table 4.7-1 of Addendum MP-3 shows that at each cluster where both coal seams contained measureable water, the difference in measured water levels between the coal seams was higher than the modeled difference. This suggests that the vertical hydraulic conductivity assigned to the interburden in the model may be higher than the actual hydraulic conductivity of the interburden in the field. The use of a higher hydraulic conductivity for the interburden in the model will overestimate the drawdown in the other coal seam therefore, the predicted drawdown will be conservative.

Comment MuK 75 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 75 – Round 2

The last sentence in the first paragraph of Addendum MP-3 Section 4.7.2 has been revised for clarification. The Round 1 responses have been incorporated into Addendum MP-3.

Comment MuK 75 – Round 3

Response accepted.

Comment MuK 76 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 76. In figures 4.7-1, 4.7-2 and 4.7-3, please consider including the observed/interpreted water level contours and the measured water level elevations. This will enable to visually evaluate the observed vs. simulated water levels. (MK)

Response MuK 76 – Round 1

Figures 4.7-1, 4.7-2, and 4.7-3 of Addendum MP-3 have been updated to include both observation wells and observed elevations as well as observed potentiometric contours. Please note that in response to Comment MuK 71 an additional figure was added to this section (Figure 4.7-1) and these figures have since been renumbered to 4.7-2, 4.7-3, and 4.7-4.

Comment MuK 76 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 76 – Round 2

The figures previously added to the report (4.7-2, 4.7-3, and 4.7-4) during the first round of comment responses incorporate the context of the Round 1 response into Addendum MP-3.

Comment MuK 76 – Round 3

Response accepted.

Comment MuK 77 – Round 1

Mine Plan, Addendum MP-3 Groundwater Model, 77. Page Addendum MP-3-45 states, “.....and if CBM production ceases, recovery rates will likely be higher than estimated in the model.” Please clarify if this statement implies that currently, there are CBM wells that are operational in the area and are pumping out groundwater. (MK)

Response MuK 77 – Round 1

Although substantially less than past years, some CBM wells in the area are still producing groundwater. Since CBM production has been ongoing for the last 15+ years the CBM operations have significantly lowered the water levels in the coals as is noted in the report. Records of groundwater withdrawals can be found on the Wyoming Oil and Gas Conservation Commission’s (WOGCC) online database at: wogcc.state.wy.us. According to WOGCC records there has been no groundwater production associated with CBM in Townships 57 and 58N Range 84W since 2012. However production is still occurring in Townships 57 and 58N Range 83W as well as Township 56N Range 83 and 84W. The portions of the model domain where CBM production may occur are located in Townships 56 and 57N Range 84W.

Comment MuK 77 – Round 2

Response conditionally accepted. Please incorporate the context of the response into the permit application. (MK)

Response MuK 77 – Round 2
