**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	DOCKET 17-4802
)	
TFN 6 2-025)	FINDINGS OF FACT,
)	CONCLUSIONS OF LAW,
)	AND ORDER

*Final
Draft
Vagish*

I. APPEARANCES

The final contested case hearing in this matter occurred before the Environmental Quality Council (Council) on May 22 through 26, 2017, in Sheridan, Wyoming, and concluded on June 7 and 8, 2017, in Cheyenne, Wyoming.

Present for the Council during all or portions of the hearing was Chairman and Hearing Officer Dr. David Bagley, Vice-Chairman Meghan Lally, and Council members Tim Flitner, Nick Agopian, and Deb Baumer. Council members Rich Fairservis and Megan Degenfelder recused themselves from the proceeding because of conflicts. Council member Megan Degenfelder attended a portion of the hearing, however, she recused herself from the proceeding on June 6, 2017.

Present at the hearing for Petitioner, Brook Mine (Brook), was Thomas L. Sansonetti, Isaac N. Sutphin, and Jeffrey S. Pope from Holland & Hart LLP. Present at the hearing for the Wyoming Department of Environmental Quality (DEQ) was Andrew J. Kuhlman and James M. LaRock from the Wyoming Attorney General's Office. Present at the hearing for the Powder River Basin Resource Council (Powder River) was Shannon R. Anderson. Present at the hearing for Big Horn Coal and Lighthouse Resources (Big Horn) was Lynn Boomgaarden and Clayton H. Gregersen from Crowley Fleck PLLP. Present at the hearing for Mary Brezik-Fisher and David Fisher (Fishers) was Jay A. Gilbertz from Yonkee & Toner, LLP.

Testifying on behalf of Brook was Jeff Barron and Kenneth Woodring. Testifying on behalf of the DEQ was Bjarne Kristiansen, Matt Kunze, Muthu Kuchanur, PhD, and Doug Emme. Testifying on behalf of Big Horn was Jordan Sweeney and Paul Gerlach. Testifying on behalf of Powder River was Anton Bocek, John Buyok, Gillian Malone, Gennaro Marino, PhD, PE, DGE, Brooke Collins, Carol Bilbrough, Sue Spencer, and Mickel Wireman. Testifying on behalf of the Fishers was Mary Brezik-Fisher.

The following exhibits were admitted into evidence: DEQ exhibits 1 through 36; Brook exhibits 1, 2, and 7 through 14, and D15; Big Horn exhibits 1 through 19; Powder River exhibits 1 through 90, 93D, 94D, 95D; and Fishers exhibits 1 through 26, and 27D.

Following the final hearing, the parties submitted post hearing briefs and proposed findings of fact and conclusions of law. After reviewing the post-hearing filings, the Council deliberated and decided this matter on August 1, 2017, in Cheyenne. At that time, the hearing was officially closed.

Due to the length of the hearing, some of the Council members were not able to be present for the entire hearing and live testimony. However, each Council member participating in this matter listened to all the testimony by attending the in-person hearing or watching the video recordings of the hearing or read the testimony contained in the transcript or a combination of both.

The Council, having heard and considered all the evidence in this case and being fully advised, pursuant to the Wyoming Administrative Procedure Act, Wyo. Stat. Ann. § 16-3-110, finds and concludes as follows:

II. JURISDICTION

This case arises from petitions for hearing (also referred to as requests or appeals) from several interested persons to Brook's application for a coal surface mining permit. After its examination and review, the DEQ concluded that Brook's permit application contained no deficiencies and was "suitable for publication" under Wyoming Statute § 35-11-406(h). Brook subsequently published notice of its application under § 35-11-406(j). As allowed by section 406(k), several interested persons filed written objections to Brook's application and requested an informal conference with the DEQ director. The director denied those requests.

After the denial, three interested persons, Big Horn, Powder River, and the Fishers (sometimes collectively referred to as the objectors) timely filed petitions for hearing before this Council under section 406(k). Under that section, the Council was required to hold a contested case hearing in accordance with the Wyoming Administrative Procedure Act—the Council did so. Following the contested case, the Council is required to issue findings of fact and a decision on the application within sixty days after the final hearing—the ultimate decision being whether Brook's permit application should be granted. Wyo. Stat. Ann. § 35-11-406(p). This matter is properly before the Council and it has jurisdiction over this matter and the parties.

III. PRELIMINARY MATTERS

A. Brook's motions to dismiss

Brook filed three motions to dismiss requesting the Council dismiss the objectors' petitions for a contested case suggesting they were untimely. Brook claimed the objectors were required to file their petitions for a contested case with the Council within thirty days after the last publication date and at the same time that they requested an informal conference with the DEQ director. The

objectors argue the opposite. The Council agrees with the objectors. Wyoming Statute § 35-11-406(k) and the DEQ's rules of practice and procedure do not support Brook's position that the petitions were untimely.

The objectors, within thirty days after the last publication date, timely filed their written objections to Brook's application and at the same time requested informal conferences with the director. There is no requirement in statute or rule that requires the objectors to file simultaneous requests for a contested case with the Council at the time they request an informal conference. Such an interpretation is non-sensical and would lead to an absurd result as it would require objectors to file a request for a contested case with the Council prior to knowing whether an informal conference will be held and, if so, the outcome of the conference. If the conference was successful, there would be no need for a contested case. The Legislature could not have intended such a result.

In this case, the objectors timely filed requests for an informal conference with the DEQ director. The director denied those requests and immediately forwarded the matter to the Council on January 30, 2017, although no objector had filed a petition for a contested case. The Council initially accepted jurisdiction over Brook's application (docket #17-4801) but after reviewing the pleadings and hearing oral argument, the Council dismissed that case on February 22, 2017. The Council determined that it did not have jurisdiction over Brook's application because no objector had officially requested a contested case before the Council.

Following the Council's order of dismissal, the objectors filed petitions for a contested case, the latest being filed on February 24, 2017. Although there may be some ambiguity in the statutes and rules on when an objector must file a request for a contested case if their request for

an informal conference is denied, it certainly is not as Brook suggests. The Council concluded that the objectors timely filed their petitions with the Council and found that this matter is properly before it.

As part of its motion filed against Big Horn, Brook also argued that Big Horn's petition should be dismissed because Big Horn allegedly contracted away its right to appeal Brook's permit application. That issue is a private dispute between Big Horn and Brook and the Council will not enter that dispute—Big Horn was authorized to file its petition with the Council.

Last, as part of its motion filed against Powder River, Brook asked the Council to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference. The Council does not have the authority to remand the matter to the director to hold an informal conference, a duty that is purely discretionary.

As a result, Brook's motions to dismiss are denied. However, because the Council does not have the authority to remand the matter to the director to hold an informal conference, the Council grants Brook's motion to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference.

B. DEQ's motion to dismiss

The DEQ also filed a motion to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference. As stated earlier, the Council does not have the authority to order the director to hold an informal conference, a duty that is purely discretionary. The Council agreed with the DEQ and dismissed the portion of Powder River's appeal requesting the Council remand the matter to the director to hold an informal conference. The DEQ's motion to dismiss is granted.

IV. STATEMENT OF THE CASE/ISSUES AND CONTENTIONS

This case arises under Wyo. Stat. Ann. § 35-11-406(p) which requires the Council to issue findings of fact and a decision on Brook's permit application following a contested case. The objectors are challenging Brook's mine application permit. They argue that Brook's application contains deficiencies and that Brook has not met its burden of proof required under Wyo. Stat. Ann. § 35-11-406(n). Conversely, DEQ and Brook argue that Brook's application was "technically adequate" and was "suitable for publication" under Wyo. Stat. Ann. § 35-11-406(h). They argue that the application contains no deficiencies.

Although there is a dispute about the role of the Council in this matter, this dispute centers on whether Brook has met its burden of proof by affirmatively demonstrating that its application is in compliance with section 406(n).

Wyoming Statute § 35-11-406(n) states:

(n) **The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:**

- (i) The application is accurate and complete;
- (ii) The reclamation plan can accomplish reclamation as required by this act;
- (iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area;

(iv) The area proposed to be mined is not included within an area designated unsuitable for surface coal mining pursuant to W.S. 35-11-425, within an area where mining is prohibited pursuant to section 522(e) of P.L. 95-87 [30 U.S.C. § 1272(e)], or within an area as to which an administrative proceeding has commenced pursuant to W.S. 35-11-425, the operator making the permit application demonstrates that, prior to January 1, 1977, he has made

substantial legal and financial commitments in relation to the operation for which he is applying for a permit;

(v) The proposed operation would:

(A) Not interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated, but, excluding undeveloped range lands which are not significant to farming on said alluvial valley floors and those lands as to which the administrator finds that if the farming that will be interrupted, discontinued or precluded is of such small acreage as to be of negligible impact on the farm's agricultural production; or

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors. Paragraph (n)(v) of this section shall not affect those surface coal mining operations which in the year preceding August 3, 1977, produced coal in commercial quantities, and were located within or adjacent to alluvial valley floors or had obtained specific permit approval by the administrator to conduct surface coal mining operations within said alluvial valley floors. If coal deposits are precluded from being mined by this paragraph, the administrator shall certify to the secretary of the interior that the coal owner or lessee may be eligible for participation in a coal exchange program pursuant to section 510(b)(5) of P.L. 95-87 [30 U.S.C. § 1260(b)(5)].

(vi) If the area proposed to be surface coal mined contains prime farmland, the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as nonmined prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards of this act and the regulations promulgated pursuant thereto;

(vii) The schedule provided in paragraph (a)(xiv) of this section indicates that all surface coal mining operations owned or controlled by the applicant are currently in compliance with this act and all laws referred to in paragraph (a)(xiv) of this section or that any violation has been or is in the process of being corrected to the satisfaction of the authority, department or agency which has jurisdiction over the violation.

Wyo. Stat. Ann. § 35-11-406(n)(emphasis added).

V. FINDINGS OF FACT¹

1. On October 31, 2014, Brook submitted to DEQ's Land Quality Division (the Division) an application for a permit to mine coal. Brook's permit application proposed to mine coal in an area about eight miles north of Sheridan, Wyoming adjacent to the Tongue River. *Transcript – Kristianson testimony*, pp. 49-52. Most of the mine would lie north of the Tongue River and Interstate 90, with the southwestern portion of the permit area sitting adjacent to the Tongue River. *DEQ Exh. 12; Transcript – Kristianson testimony*, p. 49.
2. The permit area encompasses an area approximately 4,500 acres. *DEQ Exh 1; Transcript – Kristianson testimony*, p. 50.
3. The proposed mine would annually produce about two million tons of coal. *Transcript – Kristianson testimony*, pp. 276-77. The mine has a predicted life of 12 to 13 years. *Transcript – Kristianson testimony*, p. 51.
4. Adjacent to the proposed coal mine are many private landowners, including many homeowners within one-half mile of the proposed mine boundary. *Transcript – Enune testimony*, pp. 584, 594.
5. Brook's permit application consisted of 12 volumes. *Transcript – Kristianson testimony*, p. 61; *DEQ Exhs. 1 through 12.*
6. The Division determined that the application was "complete", under Wyo. Stat. Ann. § 35-11-406(e) on November 3, 2014. *Transcript – Kristianson testimony*, p. 52.

¹ To the extent opinions or testimony is cited as the basis for a finding of fact, the Council has resolved any conflicts or dispute between testimony of others in favor of the cited testimony or opinion.

7. The Division then began its technical review and comment process. The application had six rounds of comments and responses between the Division and Brook before the Division ultimately determined that the application was “technically adequate” and “suitable for publication” under Wyo. Stat. Ann. § 35-11-406(h). *DEQ Exh. 34; Transcript – Kristianson testimony, pp. 45, 52, 58-60.*

8. The Division determined in December 2016 that the application was “technically adequate” and “suitable for publication.” The Division determined that Brook satisfied the Division’s comments and concerns and the application had met all the statutory and regulatory requirements. *Transcript – Kristianson testimony, pp. 52-53, 59-60.*

9. The application permit was published as required under Wyo. Stat. Ann. § 35-11-406(j). *Transcript – Kristianson testimony, p. 53.*

10. In making its decision that the application contained no deficiencies, was “suitable for publication” and “technically adequate”, the Division failed to produce or create a cumulative hydrologic impact assessment (CHIA). *Transcript – Kunze testimony, pp. 413, 420, 436-437.*

11. A CHIA is a document that is produced by the Division for certain types of coal permitting actions. The CHIA takes an intensive look at surface and groundwater quality and quantity within the coal mine area. *Transcript – Kunze testimony, p. 413.*

12. The CHIA is necessary and required to support the findings required to be made under Wyo. Stat. Ann. § 35-11-406(n), specifically whether the proposed mine operation has been designed to prevent material damage to the hydrologic balance outside the permit area and whether the proposed operation will not materially damage the quantity or quality of water in surface or underground water systems that supply the alluvial valley floors. The CHIA is necessary before

the Division can approve a mine permit application. *Transcript – Kunze testimony, pp. 413-415, 427, 436-437, 444.*

13. A CHIA is typically produced and finalized prior to the end of the permit application comment period which enables the public to review it and make comments, if necessary. However, for the Brook application, the Division did not produce or create a CHIA and the public did not have an opportunity to review it or comment on it. *Transcript – Kunze testimony, pp. 423-426.*

14. In addition to not creating the CHIA, the administrator did not make any written findings required under Wyo. Stat. Ann. § 35-1-406(n).

15. Brook first published its permit application on December 27, 2016. *Transcript – Kristianson testimony, p. 53.*

16. Between December 27, 2016, and January 27, 2017, the Division received twenty public comments relating to the permit application. Of those twenty comments, fourteen were objections to Brook's permit application.

17. Those objections challenged many parts of Brook's permit application, including Brook's analysis of alluvial valley floors, blasting, bonding, probable hydrologic consequences, reclamation, and subsidence. *Big Horn Exh 3; Fisher Exh. 26; PRBRC Exhs. 1, 2, 5, 9, and 10.*

18. Upon review of all the objections, the Division still found Brook's application was "technically adequate." *Transcript – Kristianson testimony, pp. 196-197.*

19. The objectors requested that the DEQ director hold an informal conference to decide their objections. *Big Horn Exh 3; Fisher Exh. 26; PRBRC Exh. 1.*

20. The DEQ director exercised his discretion and denied the requests to hold an informal conference.

21. The objectors timely requested a contested case before the EQC.

22. Based upon Brook's application, generally, mining will proceed moving westward from the east side of the proposed permit area. The first area to be mined is called the TR-1 trench and it is located in the southeast corner of the proposed permit area. *DEQ Exh. 12; Transcript – Kristianson testimony, pp. 121-122.*

23. The proposed mine would predominately use a method known as "highwall mining," which is similar to auger mining and regulated as such. *DEQ Exh. 12; Transcript – Kristianson testimony, pp. 50, 117-119.*

24. Highwall mining begins by digging a box cut down to the coal seam. A remotely-operated highwall miner unit then mines tunnels up to 2,000 feet into panels of the exposed coal seam perpendicular to the trench. Walls or webs or pillars of coal are left unmined between the tunnel to provide support and prevent subsidence, with wider barrier pillars periodically placed to offer extra safety between sets of tunnels. The mine plan estimates that this method will recover 40% to 65% of the coal. *Transcript – Kristianson testimony, pp. 50-51, 118-120, 125-126; transcript – Barron testimony, pp. 654-656, 819.*

25. The overburden in the TR-1 mining area is geologically and hydrologically unique and can be distinguished from the overburden in the proposed permit area outside the TR-1 mining area. The TR-1 area overburden is composed of previously mined backfill material and is saturated with groundwater. *DEQ Exh. 5; Transcript – Kristianson testimony, pp. 205, 211-212, 214.*

26. In order to gather data as to the geology in the proposed mine area, including overburden geology, Brook conducted a drilling program consisting of a series of drill holes across the proposed permit area. *DEQ Exh. 5; Transcript – Kristianson testimony*, pp. 87, 91.

27. Brook did not conduct drill hole testing in the TR-1 mining area, nor did it conduct drill hole testing in any part of the approximately 360 acres comprising the SE1/4 of Section 15 and the NE1/4 of Section 22, Township 57 North, Range 84 West. The permit application contains no geologic data from the distinct overburden within these lands. *DEQ Exh. 5; Transcript – Kristianson testimony*, pp. 210-211.

28. Brook's permit application does not distinguish the TR-1 area overburden, and does not include specific geologic characterization or identification of the TR-1 area overburden, including its geologic strata, nature, structural geology, lithology, thickness, or other factors that may influence mining or reclamation activities. *Transcript – Kristianson testimony*, pp. 209-211.

29. The permit application does not characterize any part of the overburden within the proposed permit area as a "potential hydrogeologic unit," and concedes that Brook installed no groundwater monitor wells and conducted no aquifer tests in any part of the overburden. *DEQ Exh. 6.*

30. The permit application lacks required information as to the TR-1 overburden and its groundwater saturation, and the permit application inaccurately characterizes all overburden within the proposed permit area as dry. *Transcript – Kristianson testimony*, pp. 214-217.

31. Brook's application fails to describe groundwater in the TR-1 area overburden. The permit application contains no site-specific data regarding groundwater location, quantity, quality, lithology, or thickness, or its recharge, storage, or discharge characteristics within the TR-1 area

overburden. *Transcript – Kristianson testimony, p. 212; transcript – Barron testimony pp. 717, 720.*

32. The permit application contains no description or assessment of the hydrologic impacts of the proposed mining operations to the groundwater in the TR-1 overburden, and provides no plan whereby Brook will monitor the hydrologic impacts of the proposed mining operations on groundwater in the TR-1 area overburden. *DEQ Exhs. 5, 12; Transcript – Barron testimony, p. 717.*

33. Brook used a groundwater model to support its permit application.

34. The groundwater model was designed to analyze the potential cumulative hydrological effects of the project and simulate the regional groundwater impacts from the proposed mining operation. *DEQ Exh. 12.*

35. The hydrological data used in the groundwater model was limited to observation points, monitor wells and pumping tests, and private well information obtained from the State Engineer's Office database. None of these data sources provide information as to the unique textual and hydraulic characteristics of the saturated backfill in the TR-1 area overburden. *DEQ Exh. 12, Big Horn Exh. 9; Transcript – Kuchanur testimony, p. 513.*

36. There are approximately 357 domestic stock wells within three miles of the permit application boundary. The application does not discuss or explain what happens to the water in these wells if the coal is dewatered. *Transcript – Wireman testimony, pp. 1344, 1365.*

37. Drawdown in some of these wells are predicted to be as much as twenty-five feet. *Transcript – Kuchanur testimony, pp. 540-543.* Drawdowns in these wells could be significant for the wells and their productivity. *Transcript – Kuchanur testimony, pp. 542-43.*

38. The hydrology in and around the permit application boundary is complex.

Transcript – Kristianson testimony, p. 303.

39. The hydrologic review and assessment contained only one pump test in the far eastern portion of the permit application area. No aquifer testing was performed in the rest of the permit area. Only two site specific hydraulic conductivity values were obtained over the entire permit area. Hydraulic conductivity measures the rate at which water flows in an aquifer – it is a measurement of the degree of interconnected porosity. *Transcript – Wireman testimony, pp. 1354-55, 1360.*

40. The hydrologic review and assessment only used one porosity value or hydraulic conductivity value for the entire permit area which cannot account for the heterogeneity or diversity of the geology in the permit area. *Transcript – Wireman testimony, pp. 1354-55; Transcript – Kuchanur testimony, pp. 535-537.* The area is geologically fractured and highly variable. *Transcript – Kuchanur testimony, p. 535.*

41. There are no monitoring wells in the Tongue River. *Transcript – Kuchanur testimony, p. 539*

42. The Tongue River alluvium is an important aquifer for the region. *Transcript – Kuchanur testimony, p. 539.*

43. Using only one porosity value for the entire permit area fails to take into account seasonal changes which can alter direction of flow, velocity of flow and quantity of flow to a particular area. *Transcript – Wireman testimony, p. 1355.*

44. Inadequate testing and data collection was done on the overburden, underburden, Tongue River alluvium and Slater Creek alluvium to make scientific predictions about hydrologic impacts. *Transcript – Wireman testimony, pp. 1361, 1363, 1435-36.*

45. No monitoring or baseline wells were used to establish the baseline water in the Tongue River alluvium. *Transcript – Wireman testimony, pp. 1364-1365.*

46. The groundwater aquifer assessment contains no discussion of vertical intervals or lithology which affect the potentially impacted domestic wells. *Transcript – Wireman testimony, p. 1367.*

47. The assessment of the hydrology in the permit application area is inadequate. *Transcript – Wireman testimony, pp. 1372-73.*

48. Because of the inadequate hydrology assessment, it is premature to come to a decision of whether Brook's proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area. *Transcript – Wireman testimony, pp. 1373, 1398-1400, 1439, 1443.* Brook's application does not contain the information necessary to affirmatively demonstrate that material damage to the hydrological balance outside the permit area will be prevented. *Transcript – Wireman testimony, pp. 1398-1400, 1442-1443.*

49. The hydrologic studies done by Brook so far along with the other available data do not provide a sound scientific basis from which it can be concluded that the mining will not materially damage the quantity or quality of water in surface of underground water systems that supply alluvial valley floors that are within the mine boundary or within one-half mile of the proposed mine boundary. *Transcript – Wireman testimony, pp. 1399-1401, 1441-1443, 1439.*

50. There have been inadequate studies and testing done to draw any scientific conclusions as to the long-term risk of subsidence at the permit area. *Transcript – Marino testimony, pp. 1200, 1246.*

51. The deficiencies and lack of a subsidence plan were explained by Dr. Marino. 52. The permit application does not provide sufficient information to provide a meaningful review with respect to subsidence potential. *Transcript – Marino testimony, pp. 1237, 1284-85.*

53. Appropriate data was not collected to do a site-specific assessment of the strength and stability of the roof, floor, and pillar materials at the permit area. *Transcript – Marino testimony, pp. 1211, 1228-1229.*

54. The subsidence control plan exhibits a lack of geomechanical understanding of the long-term and short-term stability of the mine. *Transcript – Marino testimony, p. 1228.*

55. There is insufficient information or data in the permit application and very limited analysis of subsidence risk in the documents such that the subsidence potential cannot be assessed. *Transcript – Marino testimony, p. 1228.*

56. The calculation in the mine plan improperly used coal strength data for bituminous coal rather than the sub-bituminous coal which exists at the site. *Transcript – Marino testimony, pp. 1226-1227, 1234, 1247.*

57. Complete subsidence control plans are typically stamped by a professional engineer and such plan is part of the permit application. *Transcript – Marino testimony, pp. 1238-1239.*

58. The mine plan is not complete due to the lack of proper testing and analysis to determine the risk of subsidence due to mining activities. *Transcript – Marino testimony, p. 1244.*

59. Brook admitted that the studies and work suggested by Dr. Marino are necessary steps for a proper mine subsidence plan. *Transcript – Barron testimony, pp. 674-675.* However, Brook did not perform those studies or work as part of its subsidence control plan. *Transcript – Barron testimony, pp. 1532-33.* Brook chose not to perform the necessary engineering work in the permit application for permitting efficiency purposes. *Transcript – Barron testimony, pp. 1532-1535.*

60. Brook plans to do the necessary engineering work Dr. Marino suggests as part of the ground control plan. *Transcript – Barron testimony, pp. 1532-1533.*

61. The risk of subsidence and subsidence control have not yet properly been studied or assessed.

62. Brook's blasting plan allows Brook to blast sunrise to sunset every day of the year. *Transcript – Emme testimony, pp. 586, 593.*

63. It would be reasonable to place restrictions on the blasting schedule due to the number of houses nearby the permit area, however, no restrictions have been placed on the blasting schedule. *Transcript – Emme testimony, p. 639.*

64. There are no reasonable limits on the blasting schedule in the mine plan.

VI. CONCLUSIONS OF LAW

A. Principles of Law

65. Paragraphs 1 through 64 of the findings of fact are fully incorporated herein.

66. Wyoming Statute § 35-11-406(b) states, in part, that:

(b) . . . The mining plan and reclamation plan shall include the following:

. . .

(ii) Plans for surface gradient to a contour suitable for proposed use after reclamation is completed and proposed method of accomplishment;

...

(xvii) A blasting plan which shall outline the procedures and standards by which the operator of a surface coal mine will meet the provisions of W.S. 35-11-415(b)(xi);

(xviii) For surface coal mining operations, a plan to minimize the disturbance to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation. This paragraph does not alter the authority granted under any other section of this act with respect to requirements for maintaining the hydrologic balance in the minesite, or associated offsite areas, or other mining operations[.]

Wyo. Stat. Ann. § 35-11-406(b)(ii), (xvii), and (xviii).

67. Wyoming Statute § 35-11-406(e) states that:

(e) The administrator shall notify the applicant within sixty (60) days of submission of the application whether or not it is complete. If the administrator deems the application incomplete, he shall so advise and state in writing to the applicant the information required. All items not specified as incomplete at the end of the first sixty (60) day period shall be deemed complete for the purposes of this subsection.

Wyo. Stat. Ann. § 35-11-406(e).

68. Wyoming Statute § 35-11-406(g) states that:

(g) After the application is determined complete, the applicant shall publish a notice of the filing of the application once each week for two (2) consecutive weeks in a newspaper of general circulation in the locality of the proposed mining site.

Wyo. Stat. Ann. § 35-11-406(g).

69. Wyoming Statute § 35-11-406(h) states that:

(h) The administrator shall review the application and unless the applicant requests a delay advise the applicant in writing within one hundred fifty (150) days from the date of determining the application is complete, that it is suitable for

publication under subsection (j) of this section, that the application is deficient or that the application is denied. All reasons for deficiency or denial shall be stated in writing to the applicant. All items not specified as being deficient at the end of the first one hundred fifty (150) day period shall be deemed complete for the purposes of this subsection. After this period, for noncoal permits, the administrator shall not raise any item not previously specified as being deficient unless the applicant in subsequent revisions significantly modifies the application. If the applicant submits additional information in response to any deficiency notice, the administrator shall review such additional information within thirty (30) days of submission and advise the applicant in writing if the application is suitable for publication under subsection (j) of this section, that the application is still deficient or that the application is denied.

Wyo. Stat. Ann. § 35-11-406(h).

70. Wyoming Statute § 35-11-406(j) states that:

(j) The applicant shall cause notice of the application to be published in a newspaper of general circulation in the locality of the proposed mining site once a week for four (4) consecutive weeks commencing within fifteen (15) days after being notified by the administrator. The notice shall contain information regarding the identity of the applicant, the location of the proposed operation, the proposed dates of commencement and completion of the operation, the proposed future use of the affected land, the location at which information about the application may be obtained, and the location and final date for filing objections to the application. For initial applications or additions of new lands the applicant shall also mail a copy of the notice within five (5) days after first publication to all surface owners of record of the land within the permit area, to surface owners of record of immediately adjacent lands, and to any surface owners within one-half (½) mile of the proposed mining site. The applicant shall mail a copy of the application mining plan map within five (5) days after first publication to the Wyoming oil and gas commission. Proof of notice and sworn statement of mailing shall be attached to and become part of the application.

Wyo. Stat. Ann. § 35-11-406(j).

71. Wyoming Statute § 35-11-406(k) states that:

(k) Any interested person has the right to file written objections to the application with the administrator within thirty (30) days after the last publication of the above notice. For surface coal mining operations, the director may hold an informal conference if requested and take action on the application in accordance with the department's rules of practice and procedure, with the right of appeal to the council which shall be heard and tried de novo. A conference shall be held if

the director determines that the nature of the complaint or the position of the complainants indicates that an attempt to informally resolve the disputes is preferable to a contested case proceeding. An informal conference or a public hearing shall be held within twenty (20) days after the final date for filing objections unless a different period is stipulated to by the parties. The council or director shall publish notice of the time, date and location of the hearing or conference in a newspaper of general circulation in the locality of the proposed operation once a week for two (2) consecutive weeks immediately prior to the hearing or conference. The hearing shall be conducted as a contested case in accordance with the Wyoming Administrative Procedure Act, and right of judicial review shall be afforded as provided in that act.

Wyo. Stat. Ann. § 35-11-406(k).

72. Wyoming Statute § 35-11-406(n) states:

(n) The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:

(i) The application is accurate and complete;

(ii) The reclamation plan can accomplish reclamation as required by this act;

(iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area;

(iv) The area proposed to be mined is not included within an area designated unsuitable for surface coal mining pursuant to W.S. 35-11-425, within an area where mining is prohibited pursuant to section 522(e) of P.L. 95-87 [30 U.S.C. § 1272(e)], or within an area under review for this designation under an administrative proceeding, unless in such an area as to which an administrator proceeding has commenced pursuant to W.S. 35-11-425, the operator making the permit application demonstrates that, prior to January 1, 1977, he has made substantial legal and financial commitments in relation to the operation for which he is applying for a permit;

(v) The proposed operation would:

(A) Not interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated, but, excluding undeveloped range lands which are not significant to farming on said alluvial valley

Findings of Fact, Conclusions of Law, and Order

Docket 17-4802

Page 20 of 29

floors and those lands as to which the administrator finds that if the farming that will be interrupted, discontinued or precluded is of such small acreage as to be of negligible impact on the farm's agricultural production; or

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors. Paragraph (n)(v) of this section shall not affect those surface coal mining operations which in the year preceding August 3, 1977, produced coal in commercial quantities, and were located within or adjacent to alluvial valley floors or had obtained specific permit approval by the administrator to conduct surface coal mining operations within said alluvial valley floors. If coal deposits are precluded from being mined by this paragraph, the administrator shall certify to the secretary of the interior that the coal owner or lessee may be eligible for participation in a coal exchange program pursuant to section 510(b)(5) of P.L. 95-87 [30 U.S.C. § 1260(b)(5)].

(vi) If the area proposed to be surface coal mined contains prime farmland, the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as nonmined prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards of this act and the regulations promulgated pursuant thereto;

(vii) The schedule provided in paragraph (a)(xiv) of this section indicates that all surface coal mining operations owned or controlled by the applicant are currently in compliance with this act and all laws referred to in paragraph (a)(xiv) of this section or that any violation has been or is in the process of being corrected to the satisfaction of the authority, department or agency which has jurisdiction over the violation.

Wyo. Stat. Ann. § 35-11-406(n).

73. Wyoming Statute § 35-11-406(p) states that:

(p) The director shall render a decision on the application within thirty (30) days after completion of the notice period if no informal conference or hearing is requested. If an informal conference is held, all parties to the conference shall be furnished with a copy of the final written decision of the director issuing or denying the permit within sixty (60) days of the conference. If a hearing is held, the council shall issue findings of fact and a decision on the application within sixty (60) days after the final hearing. The director shall issue or deny the permit no later than fifteen (15) days from receipt of any findings of fact and decision of the environmental quality council.

74. Chapter 19, Section 2. Required Studies.

(a) In addition to other information required by the Act and these regulations, all surface coal mining permit application shall contain:

(i) A determination of the projected result of proposed surface coal mining and reclamation operations, both on and off the mine site, which may reasonably be expected to change the quantity or quality of the surface and groundwater; the surface and groundwater flow, timing and availability, the surface and groundwater quality under seasonal flow conditions, including dissolved and suspended solids; the effect of acid-forming and toxic material on surface and groundwaters; the stream channel conditions; and the aquatic habitat in the permit area and other affected areas. This information shall be in sufficient detail to enable the Administrator to determine the probable cumulative hydrologic impacts on surface and groundwater systems including the impacts resulting from the proposed operation and their interaction with the impact of all anticipated mining upon all affected hydrologic systems. Anticipated mining shall be projected over the life of the operation, and shall include all other existing coal mining operations, any proposed coal mining operation for which a permit application has been filed and all proposed operations required to meet diligent development requirements for leased federal coal where mine development and geological information is available. The assessment of the probable cumulative hydrologic impacts shall be sufficient to make the determination of W.S. § 35-11-406(n)(iii).

DEQ Rules, Land Quality – Coal, Chapter 19: Required Studies for Surface Coal Mining Permit Applications and Assistance for Such Studies, Section 2.

75. Chapter 19, Section 3. Assistance for the Studies and Investigations.

(a) For the purpose of the determination required by Section 2(a)(i) of this Chapter, hydrologic information on the general area prior to mining may be obtained from an appropriation Federal or State agency. The Administrator shall not make a determination of completeness nor approve or deny an application until such information is available, or until it is otherwise voluntarily submitted by the applicant.

DEQ Rules, Land Quality – Coal, Chapter 19: Required Studies for Surface Coal Mining Permit Applications and Assistance for Such Studies, Section 3.

76. Chapter 2, Section 5 Mine Plan.

(a) In addition to that information required by W.S. § 35-11-406(b), each application for a surface coal mining permit shall contain:

(x) Probable hydrologic consequences determination (PHC). A determination of the PHC of the proposed operation on the hydrologic regime and the quantity and quality of surface water and groundwater systems within the permit area and the general area consistent with the information required in Chapter 19, Section 2 of these regulations. The PHC determination shall be based on baseline hydrologic, geologic and other information collected for the permit application and may include data statistically representative of the site. The determination shall specifically address potential adverse hydrologic consequences and describe preventative and remedial measures.

DEQ Rules, Land Quality – Coal, Chapter 2: Permit Application Requirements, Section 5.

77. Chapter 7, Section 2. Environmental Protection Performance Standards Applicable to Underground Mining Operations.

(a) Performance standards applicable to underground coal mining operations:

(iii) Underground mining activities shall be planned and conducted so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources.

DEQ Rules, Land Quality – Coal, Chapter 7: Underground Coal Mining Permit Application Content Requirements, Section 2.

78. When analyzing the language of a statute, the “paramount consideration is the legislature’s intent as reflected in the plain and ordinary meaning of the words used in the statute.” *Horse Creek Conservation Dist. v. State ex rel. Wyo. Att’y Gen.*, 2009 WY 143, ¶ 14, 221 P.3d 306, 312 (Wyo. 2009) (citing *Krenning v. Heart Mountain Irrigation Dist.*, 2009 WY 11, ¶ 9, 200 P.3d 774, 778 (Wyo. 2009)). “A statute is clear and unambiguous if its wording is such that reasonable persons are able to agree on its meaning with consistency and predictability.” *Id.* “When a statute is sufficiently clear and unambiguous, we give effect to the plain and ordinary meaning

of the words and do not resort to the rules of statutory construction.” *Cheyenne Newspapers, Inc. v. Building Code Bd. of App. of City of Cheyenne*, 2010 WY 2, ¶ 9, 222 P.3d 158, 162 (Wyo. 2010) (quoting *BP Am. Prod. Co. v. Dep’t of Revenue*, 2005 WY 60, ¶ 15, 112 P.3d 596, 604 (Wyo. 2005)).

79. In this case, Brook has the burden of proof and it must affirmatively demonstrate compliance with section 406(n).

B. Applications of Principles of Law

80. The Council finds and concludes that it has jurisdiction over this matter under Wyo. Stat. Ann. § 35-1-406(k) and (p).

81. Based upon the evidence and testimony during the hearing, the Council finds and concludes that it cannot approve the permit application for several reasons: 1) the administrator has not made his required written determinations and findings under section 406(n); 2) Brook has failed to meet its burden under subsections 406(n)(i), (iii), and (v); and 3) the permit application is deficient under section 406(b) and the DEQ’s rules.

I. Wyoming Statute § 35-11-406(n) applies

82. The parties disagree about whether section 406(n) applies to this proceeding. Both DEQ and Brook contend that section 406(n) is not applicable, while the objectors assert it is. Brook and the DEQ allege that the Council is only authorized to determine whether the application was “technically adequate” and “suitable for publication” under section 406(h). They assert that the findings in section 406(n) are only made by the administrator after the Council makes its determination of whether the application was “technically adequate” and “suitable for

publication.” They contend that the Council is authorized to only review the permit application under 406(a) and (b) and the DEQ’s rules, nothing more. The Council disagrees.

83. Section 406(n) is unambiguous. Only one plausible and reasonable interpretation exists—in this proceeding Brook is required to affirmatively demonstrate and the administrator must have found in writing the requirements outlined in subsection (n).

84. This interpretation is supported by the Council’s long-standing interpretation of subsection (n). In past mining permit application disputes, the Council has determined that (n) applies and has required that the applicant affirmatively demonstrate and the administrator find in writing compliance with section 406(n).

85. The Wyoming Supreme Court has affirmed the Council’s long-standing interpretation. In *Grams v. Environmental Quality Council*, the Court, in reviewing the Council’s decision to grant a mining permit, stated “[i]t is true that the burden of proof rests upon the applicant to show that the application is in compliance with applicable law. § 35-11-406(n). The record reveals that AMAX recognized this in its prehearing memorandum, as did the EQC when it stated in its final conclusion of law that ‘AMAX Coal Company has met its burden of proof demonstrating that the Eagle Butte Mine is in compliance with W.S. § 35-11-406(n), and all other applicable state laws.’” *Grams v. Environmental Quality Council*, 730 P.2d 784, 789 (Wyo. 1986).

86. Brook agreed with the Council’s position when this case began. In its prehearing memorandum, Brook stated “[t]he Act requires that a permit applicant proves it has complied with the Act and all applicable state laws. Wyo. Stat. Ann. 35-11-406(n). The applicant must show that the application is “accurate and complete,” “the reclamation plan can accomplish reclamation as required by this Act,” “the proposed operation has been designed to prevent material damage to

the hydrologic balance outside the permit area," and that the area proposed to be mined is not designated as unsuitable for surface coal mining. *Id.* at (n)-(iv).'" "Here Brook has proven to DEQ that its permit application meets all of these requirements as demonstrated by DEQ deeming the application technically adequate and suitable for publication."

87. The Council finds and concludes that section 406(n) applies to this proceeding and that Brook has the burden of proof.

II. The administrator failed to make the required findings under section 406(n), therefore, the Council is without authority to approve the permit

88. It is undisputed that the administrator has failed to make any of the required written findings mandated by section 406(n).

89. Because the findings required by section 406(n) have not been made, the Council cannot make a finding that the application should be approved. Under subsection (n), the administrator is required to make his written findings at the time that he determines whether the application is "suitable for publication" under Wyo. Stat. Ann. § 35-11-406(h). These findings must be completed prior to the Council considering whether the permit application should be approved.

90. By the administrator failing to comply with 406(n), the Council finds and concludes that it is without authority to approve the permit. The findings in 406(n) are a prerequisite or condition precedent to the Council considering whether the application should be approved. As a result, the Council finds and concludes that at this time, it is without authority to approve the permit application as a matter law.

III. Brook has failed to meet its burden under subsections 406(n)(i), (iii), and (v)

91. It is undisputed that the CHIA is not completed. The CHIA is necessary for the administrator to make his findings under subsections 406(n)(iii) and (v). Without the CHIA, the Council finds and concludes that it is unknown whether the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area and determine whether the proposed operation would not materially damage the quantity or water in surface or underground water systems that supply the alluvial valley floors.

92. The Council finds and concludes that because the CHIA is not done, Brook cannot and has not met its burden under subsections 406(n)(iii) and (v).

93. In addition, the Council finds and concludes that Brook's permit application is not accurate or complete because the CHIA has not been produced.

94. Further, the Council finds and concludes that based upon the evidence and testimony provided during the hearing, Brook has not affirmatively demonstrated that its proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area or that it would not materially damage the quantity or quality of water in surface or underground water systems that supply the alluvial valley floors. The Council finds the testimony of Mr. Wireman persuasive and credible and concludes that the hydrologic studies done by Brook so far along with other data show that Brook has failed to meet its burden under subsections 406(n)(iii) and (v). Because Brook has failed to affirmatively demonstrate the requirements under subsections 406(n)(iii) and (v), the Council further finds and concludes that Brook's application is not accurate and complete under (n)(i).

95. The Council further finds the testimony of Dr. Marino persuasive and credible and concludes that Brook's subsidence plan is incomplete. Brook has failed to affirmatively demonstrate that its application is complete and accurate under subsection 406(n)(i).

IV. Brooks' permit application is also deficient under section 406(b)

96. The Council finds and concludes that Brook's permit application is also deficient in at least three areas: 1) hydrology; 2) subsidence; and 3) blasting plan.

97. The Council finds and concludes that Brook has not met its burden that there will not be material damage to the hydrologic balance at the minesite and outside the permit area under section 406(b)(xviii). In addition, Brook has not met its burden that the alluvial valley floors will not be damaged. The Council believes that more information and planning is needed, therefore, the application is deficient.

98. Although the subsidence control plan concludes that there will be no subsidence, the Council finds and concludes that it is based on insufficient analysis of the site. The Council does not believe the conclusion is merited based on the evidence. As a result, the Council finds and concludes that Brook has not met its burden under section 406(b) and Chapter 7, section 2 of the DEQ's rules, therefore, the application is deficient.

99. The Council finds and concludes that the blasting plan does not contain reasonable limits on the blasting schedule and therefore it is deficient. The Council concludes that reasonable limits shall be placed on the blasting schedule.

VII. ORDER AND DECISION

IT IS HEREBY ORDERED that Brook's permit application is not approved.

IT IS FURTHER ORDERED that Brook shall complete and revise its permit application and then resubmit it to the Division for the administrator to perform his mandatory section 406(n) determinations which are required to be performed prior to the permit application being declared "suitable for publication" under section 406(h). Further, upon the Division receiving the revised permit application, the Division shall also conduct its review and analysis required under section 406(h) and determine whether the application is "suitable for publication", and if so, the revised application shall then be republished for public comment under section 406(j) with the opportunity for interested persons to file written objections under section 406(k).

ENTERED this ____ day of September, 2017.

Dr. David M. Bagley, Hearing Officer
Environmental Quality Council

The parties that were present at the hearing wanted to have copies of the order even though it hadn't been signed. So attached is your copy of the unsigned order. The Order should be signed and available no later than tomorrow.

Have a great week and weekend.

Jim

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	DOCKET 17-4802
)	
TFN 6 2-025)	FINDINGS OF FACT,
)	CONCLUSIONS OF LAW,
)	AND ORDER

*Final
Draft
Unissued*

I. APPEARANCES

The final contested case hearing in this matter occurred before the Environmental Quality Council (Council) on May 22 through 26, 2017, in Sheridan, Wyoming, and concluded on June 7 and 8, 2017, in Cheyenne, Wyoming.

Present for the Council during all or portions of the hearing was Chairman and Hearing Officer Dr. David Bagley, Vice-Chairman Meghan Lally, and Council members Tim Flitner, Nick Agopian, and Deb Baumer. Council members Rich Fairservis and Megan Degenfelder recused themselves from the proceeding because of conflicts. Council member Megan Degenfelder attended a portion of the hearing, however, she recused herself from the proceeding on June 6, 2017.

Present at the hearing for Petitioner, Brook Mine (Brook), was Thomas L. Sansonetti, Isaac N. Sutphin, and Jeffrey S. Pope from Holland & Hart LLP. Present at the hearing for the Wyoming Department of Environmental Quality (DEQ) was Andrew J. Kuhlman and James M. LaRock from the Wyoming Attorney General's Office. Present at the hearing for the Powder River Basin Resource Council (Powder River) was Shannon R. Anderson. Present at the hearing for Big Horn Coal and Lighthouse Resources (Big Horn) was Lynn Boomgaarden and Clayton H. Gregersen from Crowley Fleck PLLP. Present at the hearing for Mary Brezik-Fisher and David Fisher (Fishers) was Jay A. Gilbertz from Yonkee & Toner, LLP.

II. JURISDICTION

This case arises from petitions for hearing (also referred to as requests or appeals) from several interested persons to Brook's application for a coal surface mining permit. After its examination and review, the DEQ concluded that Brook's permit application contained no deficiencies and was "suitable for publication" under Wyoming Statute § 35-11-406(h). Brook subsequently published notice of its application under § 35-11-406(j). As allowed by section 406(k), several interested persons filed written objections to Brook's application and requested an informal conference with the DEQ director. The director denied those requests.

After the denial, three interested persons, Big Horn, Powder River, and the Fishers (sometimes collectively referred to as the objectors) timely filed petitions for hearing before this Council under section 406(k). Under that section, the Council was required to hold a contested case hearing in accordance with the Wyoming Administrative Procedure Act—the Council did so. Following the contested case, the Council is required to issue findings of fact and a decision on the application within sixty days after the final hearing—the ultimate decision being whether Brook's permit application should be granted. Wyo. Stat. Ann. § 35-11-406(p). This matter is properly before the Council and it has jurisdiction over this matter and the parties.

III. PRELIMINARY MATTERS

A. Brook's motions to dismiss

Brook filed three motions to dismiss requesting the Council dismiss the objectors' petitions for a contested case suggesting they were untimely. Brook claimed the objectors were required to file their petitions for a contested case with the Council within thirty days after the last publication date and at the same time that they requested an informal conference with the DEQ director. The

an informal conference is denied, it certainly is not as Brook suggests. The Council concluded that the objectors timely filed their petitions with the Council and found that this matter is properly before it.

As part of its motion filed against Big Horn, Brook also argued that Big Horn's petition should be dismissed because Big Horn allegedly contracted away its right to appeal Brook's permit application. That issue is a private dispute between Big Horn and Brook and the Council will not enter that dispute—Big Horn was authorized to file its petition with the Council.

Last, as part of its motion filed against Powder River, Brook asked the Council to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference. The Council does not have the authority to remand the matter to the director to hold an informal conference, a duty that is purely discretionary.

As a result, Brook's motions to dismiss are denied. However, because the Council does not have the authority to remand the matter to the director to hold an informal conference, the Council grants Brook's motion to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference.

B. DEQ's motion to dismiss

The DEQ also filed a motion to dismiss the portion of Powder River's petition requesting the Council remand the matter to the director to hold an informal conference. As stated earlier, the Council does not have the authority to order the director to hold an informal conference, a duty that is purely discretionary. The Council agreed with the DEQ and dismissed the portion of Powder River's appeal requesting the Council remand the matter to the director to hold an informal conference. The DEQ's motion to dismiss is granted.

substantial legal and financial commitments in relation to the operation for which he is applying for a permit;

(v) The proposed operation would:

(A) Not interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated, but, excluding undeveloped range lands which are not significant to farming on said alluvial valley floors and those lands as to which the administrator finds that if the farming that will be interrupted, discontinued or precluded is of such small acreage as to be of negligible impact on the farm's agricultural production; or

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors. Paragraph (n)(v) of this section shall not affect those surface coal mining operations which in the year preceding August 3, 1977, produced coal in commercial quantities, and were located within or adjacent to alluvial valley floors or had obtained specific permit approval by the administrator to conduct surface coal mining operations within said alluvial valley floors. If coal deposits are precluded from being mined by this paragraph, the administrator shall certify to the secretary of the interior that the coal owner or lessee may be eligible for participation in a coal exchange program pursuant to section 510(b)(5) of P.L. 95-87 [30 U.S.C. § 1260(b)(5)].

(vi) If the area proposed to be surface coal mined contains prime farmland, the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as nonmined prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards of this act and the regulations promulgated pursuant thereto;

(vii) The schedule provided in paragraph (a)(xiv) of this section indicates that all surface coal mining operations owned or controlled by the applicant are currently in compliance with this act and all laws referred to in paragraph (a)(xiv) of this section or that any violation has been or is in the process of being corrected to the satisfaction of the authority, department or agency which has jurisdiction over the violation.

Wyo. Stat. Ann. § 35-11-406(n)(emphasis added).

7. The Division then began its technical review and comment process. The application had six rounds of comments and responses between the Division and Brook before the Division ultimately determined that the application was “technically adequate” and “suitable for publication” under Wyo. Stat. Ann. § 35-11-406(h). *DEQ Exh. 34; Transcript – Kristianson testimony, pp. 45, 52, 58-60.*

8. The Division determined in December 2016 that the application was “technically adequate” and “suitable for publication.” The Division determined that Brook satisfied the Division’s comments and concerns and the application had met all the statutory and regulatory requirements. *Transcript – Kristianson testimony, pp. 52-53, 59-60.*

9. The application permit was published as required under Wyo. Stat. Ann. § 35-11-406(j). *Transcript – Kristianson testimony, p. 53.*

10. In making its decision that the application contained no deficiencies, was “suitable for publication” and “technically adequate”, the Division failed to produce or create a cumulative hydrologic impact assessment (CHIA). *Transcript – Kunze testimony, pp. 413, 420, 436-437.*

11. A CHIA is a document that is produced by the Division for certain types of coal permitting actions. The CHIA takes an intensive look at surface and groundwater quality and quantity within the coal mine area. *Transcript – Kunze testimony, p. 413.*

12. The CHIA is necessary and required to support the findings required to be made under Wyo. Stat. Ann. § 35-11-406(n), specifically whether the proposed mine operation has been designed to prevent material damage to the hydrologic balance outside the permit area and whether the proposed operation will not materially damage the quantity or quality of water in surface or underground water systems that supply the alluvial valley floors. The CHIA is necessary before

20. The DEQ director exercised his discretion and denied the requests to hold an informal conference.

21. The objectors timely requested a contested case before the EQC.

22. Based upon Brook's application, generally, mining will proceed moving westward from the east side of the proposed permit area. The first area to be mined is called the TR-1 trench and it is located in the southeast corner of the proposed permit area. *DEQ Exh. 12; Transcript – Kristianson testimony, pp. 121-122.*

23. The proposed mine would predominately use a method known as "highwall mining," which is similar to auger mining and regulated as such. *DEQ Exh. 12; Transcript – Kristianson testimony, pp. 50, 117-119.*

24. Highwall mining begins by digging a box cut down to the coal seam. A remotely-operated highwall miner unit then mines tunnels up to 2,000 feet into panels of the exposed coal seam perpendicular to the trench. Walls or webs or pillars of coal are left unmined between the tunnel to provide support and prevent subsidence, with wider barrier pillars periodically placed to offer extra safety between sets of tunnels. The mine plan estimates that this method will recover 40% to 65% of the coal. *Transcript – Kristianson testimony, pp. 50-51, 118-120, 125-126; transcript – Barron testimony, pp. 654-656, 819.*

25. The overburden in the TR-1 mining area is geologically and hydrologically unique and can be distinguished from the overburden in the proposed permit area outside the TR-1 mining area. The TR-1 area overburden is composed of previously mined backfill material and is saturated with groundwater. *DEQ Exh. 5; Transcript – Kristianson testimony, pp. 205, 211-212, 214.*

overburden. *Transcript – Kristianson testimony, p. 212; transcript – Barron testimony pp. 717, 720.*

32. The permit application contains no description or assessment of the hydrologic impacts of the proposed mining operations to the groundwater in the TR-1 overburden, and provides no plan whereby Brook will monitor the hydrologic impacts of the proposed mining operations on groundwater in the TR-1 area overburden. *DEQ Exhs. 5, 12; Transcript – Barron testimony, p. 717.*

33. Brook used a groundwater model to support its permit application.

34. The groundwater model was designed to analyze the potential cumulative hydrological effects of the project and simulate the regional groundwater impacts from the proposed mining operation. *DEQ Exh. 12.*

35. The hydrological data used in the groundwater model was limited to observation points, monitor wells and pumping tests, and private well information obtained from the State Engineer's Office database. None of these data sources provide information as to the unique textual and hydraulic characteristics of the saturated backfill in the TR-1 area overburden. *DEQ Exh. 12, Big Horn Exh. 9; Transcript – Kuchanur testimony, p. 513.*

36. There are approximately 357 domestic stock wells within three miles of the permit application boundary. The application does not discuss or explain what happens to the water in these wells if the coal is dewatered. *Transcript – Wireman testimony, pp. 1344, 1365.*

37. Drawdown in some of these wells are predicted to be as much as twenty-five feet. *Transcript – Kuchanur testimony, pp. 540-543.* Drawdowns in these wells could be significant for the wells and their productivity. *Transcript – Kuchanur testimony, pp. 542-43.*

44. Inadequate testing and data collection was done on the overburden, underburden, Tongue River alluvium and Slater Creek alluvium to make scientific predictions about hydrologic impacts. *Transcript – Wireman testimony, pp. 1361, 1363, 1435-36.*

45. No monitoring or baseline wells were used to establish the baseline water in the Tongue River alluvium. *Transcript – Wireman testimony, pp. 1364-1365.*

46. The groundwater aquifer assessment contains no discussion of vertical intervals or lithology which affect the potentially impacted domestic wells. *Transcript – Wireman testimony, p. 1367.*

47. The assessment of the hydrology in the permit application area is inadequate. *Transcript – Wireman testimony, pp. 1372-73.*

48. Because of the inadequate hydrology assessment, it is premature to come to a decision of whether Brook's proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area. *Transcript – Wireman testimony, pp. 1373, 1398-1400, 1439, 1443.* Brook's application does not contain the information necessary to affirmatively demonstrate that material damage to the hydrological balance outside the permit area will be prevented. *Transcript – Wireman testimony, pp. 1398-1400, 1442-1443.*

49. The hydrologic studies done by Brook so far along with the other available data do not provide a sound scientific basis from which it can be concluded that the mining will not materially damage the quantity or quality of water in surface of underground water systems that supply alluvial valley floors that are within the mine boundary or within one-half mile of the proposed mine boundary. *Transcript – Wireman testimony, pp. 1399-1401, 1441-1443, 1439.*

59. Brook admitted that the studies and work suggested by Dr. Marino are necessary steps for a proper mine subsidence plan. *Transcript – Barron testimony, pp. 674-675.* However, Brook did not perform those studies or work as part of its subsidence control plan. *Transcript – Barron testimony, pp. 1532-33.* Brook chose not to perform the necessary engineering work in the permit application for permitting efficiency purposes. *Transcript – Barron testimony, pp. 1532-1535.*

60. Brook plans to do the necessary engineering work Dr. Marino suggests as part of the ground control plan. *Transcript – Barron testimony, pp. 1532-1533.*

61. The risk of subsidence and subsidence control have not yet properly been studied or assessed.

62. Brook's blasting plan allows Brook to blast sunrise to sunset every day of the year. *Transcript – Emme testimony, pp. 586, 593.*

63. It would be reasonable to place restrictions on the blasting schedule due to the number of houses nearby the permit area, however, no restrictions have been placed on the blasting schedule. *Transcript – Emme testimony, p. 639.*

64. There are no reasonable limits on the blasting schedule in the mine plan.

VI. CONCLUSIONS OF LAW

A. Principles of Law

65. Paragraphs 1 through 64 of the findings of fact are fully incorporated herein.

66. Wyoming Statute § 35-11-406(b) states, in part, that:

(b) . . . The mining plan and reclamation plan shall include the following:

. . .

publication under subsection (j) of this section, that the application is deficient or that the application is denied. All reasons for deficiency or denial shall be stated in writing to the applicant. All items not specified as being deficient at the end of the first one hundred fifty (150) day period shall be deemed complete for the purposes of this subsection. After this period, for noncoal permits, the administrator shall not raise any item not previously specified as being deficient unless the applicant in subsequent revisions significantly modifies the application. If the applicant submits additional information in response to any deficiency notice, the administrator shall review such additional information within thirty (30) days of submission and advise the applicant in writing if the application is suitable for publication under subsection (j) of this section, that the application is still deficient or that the application is denied.

Wyo. Stat. Ann. § 35-11-406(h).

70. Wyoming Statute § 35-11-406(j) states that:

(j) The applicant shall cause notice of the application to be published in a newspaper of general circulation in the locality of the proposed mining site once a week for four (4) consecutive weeks commencing within fifteen (15) days after being notified by the administrator. The notice shall contain information regarding the identity of the applicant, the location of the proposed operation, the proposed dates of commencement and completion of the operation, the proposed future use of the affected land, the location at which information about the application may be obtained, and the location and final date for filing objections to the application. For initial applications or additions of new lands the applicant shall also mail a copy of the notice within five (5) days after first publication to all surface owners of record of the land within the permit area, to surface owners of record of immediately adjacent lands, and to any surface owners within one-half (½) mile of the proposed mining site. The applicant shall mail a copy of the application mining plan map within five (5) days after first publication to the Wyoming oil and gas commission. Proof of notice and sworn statement of mailing shall be attached to and become part of the application.

Wyo. Stat. Ann. § 35-11-406(j).

71. Wyoming Statute § 35-11-406(k) states that:

(k) Any interested person has the right to file written objections to the application with the administrator within thirty (30) days after the last publication of the above notice. For surface coal mining operations, the director may hold an informal conference if requested and take action on the application in accordance with the department's rules of practice and procedure, with the right of appeal to the council which shall be heard and tried de novo. A conference shall be held if

floors and those lands as to which the administrator finds that if the farming that will be interrupted, discontinued or precluded is of such small acreage as to be of negligible impact on the farm's agricultural production; or

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors. Paragraph (n)(v) of this section shall not affect those surface coal mining operations which in the year preceding August 3, 1977, produced coal in commercial quantities, and were located within or adjacent to alluvial valley floors or had obtained specific permit approval by the administrator to conduct surface coal mining operations within said alluvial valley floors. If coal deposits are precluded from being mined by this paragraph, the administrator shall certify to the secretary of the interior that the coal owner or lessee may be eligible for participation in a coal exchange program pursuant to section 510(b)(5) of P.L. 95-87 [30 U.S.C. § 1260(b)(5)].

(vi) If the area proposed to be surface coal mined contains prime farmland, the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as nonmined prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards of this act and the regulations promulgated pursuant thereto;

(vii) The schedule provided in paragraph (a)(xiv) of this section indicates that all surface coal mining operations owned or controlled by the applicant are currently in compliance with this act and all laws referred to in paragraph (a)(xiv) of this section or that any violation has been or is in the process of being corrected to the satisfaction of the authority, department or agency which has jurisdiction over the violation.

Wyo. Stat. Ann. § 35-11-406(n).

73. Wyoming Statute § 35-11-406(p) states that:

(p) The director shall render a decision on the application within thirty (30) days after completion of the notice period if no informal conference or hearing is requested. If an informal conference is held, all parties to the conference shall be furnished with a copy of the final written decision of the director issuing or denying the permit within sixty (60) days of the conference. If a hearing is held, the council shall issue findings of fact and a decision on the application within sixty (60) days after the final hearing. The director shall issue or deny the permit no later than fifteen (15) days from receipt of any findings of fact and decision of the environmental quality council.

76. Chapter 2, Section 5 Mine Plan.

(a) In addition to that information required by W.S. § 35-11-406(b), each application for a surface coal mining permit shall contain:

(x) Probable hydrologic consequences determination (PHC). A determination of the PHC of the proposed operation on the hydrologic regime and the quantity and quality of surface water and groundwater systems within the permit area and the general area consistent with the information required in Chapter 19, Section 2 of these regulations. The PHC determination shall be based on baseline hydrologic, geologic and other information collected for the permit application and may include data statistically representative of the site. The determination shall specifically address potential adverse hydrologic consequences and describe preventative and remedial measures.

DEQ Rules, Land Quality – Coal, Chapter 2: Permit Application Requirements, Section 5.

77. Chapter 7, Section 2. Environmental Protection Performance Standards Applicable to Underground Mining Operations.

(a) Performance standards applicable to underground coal mining operations:

(iii) Underground mining activities shall be planned and conducted so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources.

DEQ Rules, Land Quality – Coal, Chapter 7: Underground Coal Mining Permit Application Content Requirements, Section 2.

78. When analyzing the language of a statute, the “paramount consideration is the legislature’s intent as reflected in the plain and ordinary meaning of the words used in the statute.” *Horse Creek Conservation Dist. v. State ex rel. Wyo. Att’y Gen.*, 2009 WY 143, ¶ 14, 221 P.3d 306, 312 (Wyo. 2009) (citing *Krenning v. Heart Mountain Irrigation Dist.*, 2009 WY 11, ¶ 9, 200 P.3d 774, 778 (Wyo. 2009)). “A statute is clear and unambiguous if its wording is such that reasonable persons are able to agree on its meaning with consistency and predictability.” *Id.* “When a statute is sufficiently clear and unambiguous, we give effect to the plain and ordinary meaning

publication.” They contend that the Council is authorized to only review the permit application under 406(a) and (b) and the DEQ’s rules, nothing more. The Council disagrees.

83. Section 406(n) is unambiguous. Only one plausible and reasonable interpretation exists—in this proceeding Brook is required to affirmatively demonstrate and the administrator must have found in writing the requirements outlined in subsection (n).

84. This interpretation is supported by the Council’s long-standing interpretation of subsection (n). In past mining permit application disputes, the Council has determined that (n) applies and has required that the applicant affirmatively demonstrate and the administrator find in writing compliance with section 406(n).

85. The Wyoming Supreme Court has affirmed the Council’s long-standing interpretation. In *Grams v. Environmental Quality Council*, the Court, in reviewing the Council’s decision to grant a mining permit, stated “[i]t is true that the burden of proof rests upon the applicant to show that the application is in compliance with applicable law. § 35-11-406(n). The record reveals that AMAX recognized this in its prehearing memorandum, as did the EQC when it stated in its final conclusion of law that ‘AMAX Coal Company has met its burden of proof demonstrating that the Eagle Butte Mine is in compliance with W.S. § 35-11-406(n), and all other applicable state laws.’” *Grams v. Environmental Quality Council*, 730 P.2d 784, 789 (Wyo. 1986).

86. Brook agreed with the Council’s position when this case began. In its prehearing memorandum, Brook stated “[t]he Act requires that a permit applicant proves it has complied with the Act and all applicable state laws. Wyo. Stat. Ann. 35-11-406(n). The applicant must show that the application is “accurate and complete,” “the reclamation plan can accomplish reclamation as required by this Act,” “the proposed operation has been designed to prevent material damage to

III. Brook has failed to meet its burden under subsections 406(n)(i), (iii), and (v)

91. It is undisputed that the CHIA is not completed. The CHIA is necessary for the administrator to make his findings under subsections 406(n)(iii) and (v). Without the CHIA, the Council finds and concludes that it is unknown whether the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area and determine whether the proposed operation would not materially damage the quantity or water in surface or underground water systems that supply the alluvial valley floors.

92. The Council finds and concludes that because the CHIA is not done, Brook cannot and has not met its burden under subsections 406(n)(iii) and (v).

93. In addition, the Council finds and concludes that Brook's permit application is not accurate or complete because the CHIA has not been produced.

94. Further, the Council finds and concludes that based upon the evidence and testimony provided during the hearing, Brook has not affirmatively demonstrated that its proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area or that it would not materially damage the quantity or quality of water in surface or underground water systems that supply the alluvial valley floors. The Council finds the testimony of Mr. Wireman persuasive and credible and concludes that the hydrologic studies done by Brook so far along with other data show that Brook has failed to meet its burden under subsections 406(n)(iii) and (v). Because Brook has failed to affirmatively demonstrate the requirements under subsections 406(n)(iii) and (v), the Council further finds and concludes that Brook's application is not accurate and complete under (n)(i).

VII. ORDER AND DECISION

IT IS HEREBY ORDERED that Brook's permit application is not approved.

IT IS FURTHER ORDERED that Brook shall complete and revise its permit application and then resubmit it to the Division for the administrator to perform his mandatory section 406(n) determinations which are required to be performed prior to the permit application being declared "suitable for publication" under section 406(h). Further, upon the Division receiving the revised permit application, the Division shall also conduct its review and analysis required under section 406(h) and determine whether the application is "suitable for publication", and if so, the revised application shall then be republished for public comment under section 406(j) with the opportunity for interested persons to file written objections under section 406(k).

ENTERED this ____ day of September, 2017.

Dear Counsel:

There will be a public meeting held when the Order is ready for a vote of the Council. The exact date has not yet been set but the 60th day from the day of the close of the hearing is September 30, 2017. It is anticipated that the Council will meet on or before that date to approve the Order. As soon as the date is set you will be notified.

Jim

8

9

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter reconvened for hearing on the
12 1st day of August, 2017, at the approximate hour of
13 3:01 p.m., at the Herschler Building, 122 West 25th
14 Street, Room 1699, Cheyenne, Wyoming, before the Wyoming
15 Environmental Quality Council, with Council Member David
16 Bagley, presiding, Chairperson Meghan Lally, Council
17 Member Tim Flitner, Council Member Deb Baumer and Council
18 Member Nick Agopian in attendance.

19 Mr. Ryan Schelhaas, Wyoming Attorney General's
20 Office, Attorney for the Council; Mr. Jim Ruby, Executive
21 Director to the Council; Mr. Joe Girardin, Business Office
22 Coordinator, were also in attendance.

1 P R O C E E D I N G S

2 (Hearing proceedings commenced

3 3:01 p.m., August 1, 2017.)

4 CHAIRPERSON LALLY: Okay. I will call this
5 meeting to order, and we will enter executive session for
6 legal advice.

7 MR. SCHELHAAS: Can I have motion and
8 second to vote?

9 CHAIRPERSON LALLY: Okay.

10 COUNCIL MEMBER AGOPIAN: I'll move we go
11 into executive session.

12 COUNCIL MEMBER BAUMER: I'll second.

13 MR. SCHELHAAS: For legal advice.

14 COUNCIL MEMBER AGOPIAN: For legal advice.

15 COUNCIL MEMBER BAUMER: I'll second.

16 CHAIRPERSON LALLY: All those in favor?

17 COUNCIL MEMBER DR. BAGLEY: Aye.

18 COUNCIL MEMBER BAUMER: Aye.

19 CHAIRPERSON LALLY: Those opposed. Motion
20 passed.

21 (Hearing proceedings recessed

22 3:01 p.m. to 3:57 p.m.)

23 CHAIRPERSON LALLY: I'll call this meeting
24 back to order.

25 MR. GIRARDIN: We're early, so...

1 CHAIRPERSON LALLY: I said 4:00, but we're
2 all here.

3 COUNCIL MEMBER BAUMER: It's 3:57.

4 CHAIRPERSON LALLY: 3:57. Well it says
5 approximately 4:00 on the agenda. So we will go with that.

6 COUNCIL MEMBER DR. BAGLEY: I guess the
7 question is do we have everybody on the line that needs to
8 be.

9 CHAIRPERSON LALLY: Yeah, is everybody
10 online, Joe?

11 MR. GIRARDIN: I'm broadcasting, so you can
12 go.

13 CHAIRPERSON LALLY: Okay. So first we'll
14 state that we took no action in executive session. And I
15 will call this meeting back to order. It's 4:00 --
16 approximately 4:00, August 1, 2017. Meghan Lally, chair of
17 the EQC. This meeting is being held in room 1699 of the
18 Herschler Building, 122 West 25th Street, Cheyenne,
19 Wyoming.

20 Present today from the council is Tim Flitner,
21 Meghan Lally, Nick Agopian, Deb Baumer and Rich Fairservis
22 [sic].

23 COUNCIL MEMBER DR. BAGLEY: And me. And --

24 CHAIRPERSON LALLY: And Dave Bagley.

25 Also present for the council are Jim Ruby,

1 executive officer, and Joe Girardin, council business
2 coordinator, and Ryan Schelhaas from the Attorney General's
3 Office.

4 I will turn the gavel over to Dr. Bagley at this
5 time as the hearing officer in the Brook matter.

6 COUNCIL MEMBER DR. BAGLEY: Thank you,
7 Madam Chair.

8 Good afternoon. It's 4 p.m., August 1, 2017. I
9 am Dr. David Bagley, the hearing officer in Docket 17-4802
10 in regards Brook Mine, LLC.

11 This meeting is being held in Room 1699 of the
12 Herschler Building, 122 West 25th Street, Cheyenne,
13 Wyoming. Joining me from the council are Tim Flitner,
14 Meghan Lally, Nick Agopian and Deb Baumer. Council Members
15 Fairservis and Degenfelder have recused themselves due to
16 conflicts.

17 Parties present today in person or on the phone
18 are -- and I will do as we've done in previous sessions of
19 this hearing, ask for you to identify yourself when I
20 identify your organization.

21 From Brook Mine, LLC.

22 MR. POPE: Jeff Pope and Carri Svec.

23 COUNCIL MEMBER DR. BAGLEY: Thank you.

24 From DEQ.

25 MR. KUHLMANN: Andrew Kuhlmann and

1 James LaRock.

2 COUNCIL MEMBER DR. BAGLEY: Thank you.

3 Powder River Basin Resource Council.

4 MS. MORRISON: Shannon Anderson is on
5 the --

6 MR. GIRARDIN: Yeah, they can't talk.

7 MS. MORRISON: -- watching, but --

8 MR. GIRARDIN: Yeah, they can't talk.

9 MS. MORRISON: So Jill Morrison is here.

10 COUNCIL MEMBER DR. BAGLEY: Okay. Great.

11 Thank you.

12 Big Horn Coal.

13 MS. BOOMGAARDEN: Lynn Boomgaarden on
14 behalf of Big Horn Coal. Thank you.

15 COUNCIL MEMBER DR. BAGLEY: And on behalf
16 of the Fishers.

17 MR. GIRARDIN: He's online.

18 COUNCIL MEMBER DR. BAGLEY: Jay Gilbertz
19 online.

20 The first thing I need to do is handle the
21 motions to strike that we've received. There was a
22 motion -- DEQ and Brook moved to strike the PRBRC
23 supplemental expert report. And there was also a motion by
24 the Fishers and PRBRC to strike the DEQ comment to proposed
25 permit conditions and Brook Mine's joinder in the DEQ

1 comments.

2 Having reviewed the record, I find that, one, the
3 supplemental expert report should be stricken from the
4 record. The motions of DEQ and Brook are granted. And,
5 two, the DEQ comment on proposed permit conditions and
6 Brook Mine joinder should both be stricken from the record.
7 The motions of the Fishers and PRBRC are granted.

8 I would like to remind legal counsel for DEQ,
9 Brook and PRBRC that the council is authorized under
10 35-11-112(a) (vi) to impose sanctions under Rule 11 of
11 Wyoming Rules of Civil Procedure. And some of the -- the
12 order I thought was very clear that went out. And some of
13 the things these -- all these things being submitted after
14 the fact were just simply inappropriate.

15 At this time I do not recommend that the council
16 impose sanctions, but just to let folks know, please follow
17 the rules as we described them in the order.

18 Now we'll continue on. And I'm going to ask each
19 council member if they've had time to review all the
20 evidence, since not all council members were able to be at
21 all the hearings.

22 Ms. Baumer, have you had sufficient time to
23 review the evidence in this matter?

24 COUNCIL MEMBER BAUMER: I have. I have
25 read the transcripts, reviewed all the evidence, and I'm

1 prepared.

2 COUNCIL MEMBER DR. BAGLEY: Thank you.

3 Mr. Flitner, have you had sufficient time to
4 review the evidence in this matter?

5 COUNCIL MEMBER FLITNER: Yes.

6 COUNCIL MEMBER DR. BAGLEY: Chair Lally,
7 have you had sufficient time to review the evidence in this
8 matter?

9 CHAIRPERSON LALLY: Yes.

10 COUNCIL MEMBER DR. BAGLEY: And I know you
11 were there with me, Mr. Agopian, but I'll ask you anyway.
12 Have you had sufficient time to review the evidence in this
13 matter?

14 COUNCIL MEMBER AGOPIAN: The great fortune
15 of spending 10 days with you, Mr. Bagley.

16 COUNCIL MEMBER DR. BAGLEY: And I also have
17 had sufficient time to review the evidence in this matter.
18 So the council is ready to proceed.

19 Do I have a motion affirming DEQ's decision that
20 the Brook Mine, LLC application was complete and suitable
21 for publication and not deficient under 35-11-406(h) and
22 (j)?

23 COUNCIL MEMBER AGOPIAN: So moved.

24 COUNCIL MEMBER DR. BAGLEY: Do I have a
25 second?

1 CHAIRPERSON LALLY: Second.

2 COUNCIL MEMBER DR. BAGLEY: Thank you.

3 So it's been moved and seconded. And what I'd
4 like to do is provide -- I normally like to go last with my
5 comments, but I'm going to go first, since I'm the hearing
6 officer, so I get to pick who gets to speak.

7 And I only have 30 pages of comments. I felt
8 that after seven days of listening to lawyers, they get a
9 chance to listen to me. No, it's not 30 days [sic]. That
10 was supposed to be a joke. I'm glad somebody laughed.

11 Let me give my comments on this. And then, of
12 course, I will ask every council member for their thoughts
13 and comments, and then we'll circle back around, discuss
14 the -- on the motion -- discussion on the motion.

15 I will vote against the motion. The reason that
16 I will vote against the motion is that application has
17 deficiencies. DEQ determination under 406(h) that the
18 application is suitable for publication was premature.
19 Before I propose a remedy in my comments, I will briefly
20 summarize my reasoning.

21 Based on the evidence I find under 406(n) that
22 Brook Mine has not met their burden to prove this mining
23 operation, one, will adequately provide reclamation. And I
24 am worried specifically about subsidence. Two, that there
25 will not be material damage to the hydrologic balance

1 outside the permit area. Or, three, that alluvial valley
2 floors will not be damaged.

3 But these are 406(n) considerations, and I can
4 hear the objections already, that the council has no
5 authority to consider 406(n). That is hogwash.
6 Determining that an application has no deficiencies under
7 406(h) when a 406(n) determination has not been made is a
8 flaw in the administration of the law. Clearly within the
9 council's authority, as specified in 35-11-112(a)(iii), the
10 council shall conduct hearings in any case contesting the
11 administration or enforcement of any law, rule, regulation,
12 standard or order issued or administered by the Department
13 or any division thereof.

14 I can readily show, but I won't, to save you
15 the -- another boring discussion, but I can readily show
16 that unless 406(n) is considered prior to 406(h)
17 determination, a completely illogical outcome of the law
18 could be achieved. To wit: I could show you is that the
19 director may have to deny a permit that nobody contested
20 solely because the 406(h) determination was made prior to
21 the 406(n) determination. I would also argue that the
22 legislators did not intend for the law to lead to this sort
23 of legal technicality and would expect the administration
24 of the law to be conducted so as to avoid such silliness.
25 Therefore, to avoid illogical outcomes, an application

1 should be considered deficient by definition if the 406(n)
2 determination has not been made.

3 Now, I am not going to push further on 406(n),
4 but I mention it at this point because that will be part of
5 the remedy I propose. So to clean this up legally, for
6 those who would want to object, I can -- based on the
7 evidence, I find under 3-11-406(b), that the Brook Mine
8 application has deficiencies in five areas. The first area
9 is Item 2, plans for surface gradient to a contour suitable
10 for proposed use after reclamation is completed and
11 proposed method of accomplishment. Specifically, the
12 subsidence control plan concludes that there will be no
13 subsidence, but this is based on insufficient analysis of
14 the site. I do not believe that conclusion is merited
15 based on the evidence. Subsidence itself is not forbidden,
16 but how can plans to accomplish a surface gradient contour
17 be developed when the future surface gradient contour does
18 not consider subsidence?

19 The second deficiency is Item 6, an estimate of
20 the total cost of reclaiming the affected lands as outlined
21 in the written proposal computed in accordance with
22 established engineering principles. We heard testimony
23 about reclamation cost estimates for the first year of
24 activity. As I read this part of 406(b), I see the words
25 "total cost of reclaiming affected lands." That I believe

1 is missing.

2 The third deficiency, Item 13. The procedures
3 proposed to avoid constituting a public nuisance,
4 endangering the public safety, human or animal life,
5 property, wildlife and plant life in or adjacent to the
6 permit area. And I'll end it there, that quote.

7 I am -- in particular, I am concerned with
8 traffic generated by the mine. I understand that DEQ does
9 not regulate traffic issues, but unless there's evidence of
10 coordination with WYDOT and the affected county included in
11 the mine plan, I cannot be convinced that there will not be
12 a public nuisance or risk to public safety from the traffic
13 leaving and entering this facility.

14 Fourth deficiency, Item 17, a blasting plan which
15 shall outline the procedures and standards by which the
16 operator of a surface coal mine will meet the provisions of
17 Wyoming Statute 35-11-415(b)(xi). Here I am concerned that
18 no reasonable limits on blasting schedule have been
19 presented in the mine plan. Without those limits in the
20 plan, blasting could occur at any time or day and that
21 seems unacceptable to me.

22 And the fifth deficiency is Item 18. For surface
23 coal mining operations, a plan to minimize the disturbances
24 to the prevailing hydrologic balance at the mine site and
25 in associated off-site areas and to the quality and

1 quantity of water in surface and groundwater systems both
2 during and after mining operations and during reclamation.

3 The evidence DEQ presented predicted that there
4 will be impacts to wells in the area. And some cases with
5 drawdowns on the order of feet. That is potentially
6 enormous impact for the hydrologic balance in a subsurface
7 as complicated as this one. The plan must include
8 additional detail in those areas identified as having the
9 largest potential impacts.

10 Alluvial valley floors fit into this. Alluvial
11 valley floors depend extensively on the hydrologic balance
12 results, and we will see there will be impacts. It was
13 presented in the evidence. More information and planning
14 is needed to address the potential for harm of alluvial
15 valley floors.

16 If you notice a similarity in my five
17 deficiencies to my 406(n) concerns, that is because, in my
18 opinion, the law is logically intended to have 406(n)
19 completed before a 406(h) determination is made. It just
20 does not specifically state that.

21 Arguments were made that a complete application
22 is really all that we need to consider. But the contents
23 of the application cannot have deficiencies as defined in
24 35-11-103(e)(xiv). Arguments have been made that the
25 council should accept the DEQ's determination of no

1 deficiencies in their suitable for publication
2 determination. The other alternatives they have under
3 406(h) were to deny the application or to identify
4 deficiencies themselves.

5 I want to be clear. I highly respect the
6 professionalism and expertise of the DEQ staff. DEQ has
7 done a thorough job reviewing this application. Based on
8 the evidence, though, I disagree with their conclusion that
9 the application was suitable for publication. There are
10 deficiencies, as I have indicated.

11 The evidence indicates, however, that DEQ has not
12 made their 406(n) determination. I don't know why, and I
13 won't speculate. But DEQ does not have the burden of proof
14 under that anyway. Under 406(n) Brook Mine has the burden
15 of proof.

16 Now a couple of other comments before I finally
17 propose my remedy. As I sat through seven days of
18 testimony on this case, I became more and more irritated by
19 the lack of public input in this application process to
20 date. I cannot find any legal requirements and none were
21 brought forward by the parties that require more
22 opportunities for public input. So as far as I can tell,
23 no laws have been broken and everything has been completely
24 legal. But I think common sense has been violated. Many
25 of the concerns raised by the parties could have been

1 readily addressed had Brook Mine held public meetings to
2 provide information and to answer questions during the
3 application process. This would have helped both Brook
4 Mine and DEQ to identify, examine and potentially address
5 areas of potential concern before a formal suitable for
6 publication determination was made. This would have also
7 helped members of the public learn about a new mining
8 method in Wyoming, as well as learn about issues related to
9 blasting, subsidence, hydrologic balances, the things we
10 heard about in the evidence.

11 I am not naive. I know that public information
12 meetings may not have resolved all the concerns, and we
13 probably would still have been in a contested case hearing.
14 But I would have had much more confidence that the concerns
15 had been thoroughly examined and evaluated, and also there
16 would be documentation of what Brook Mine and DEQ did
17 specifically to address concerns raised by the public.
18 Brook Mine would have basically built the material
19 necessary to achieve its burden of proof as part of this
20 application process through that. Instead, I found that
21 the process was opaque to the public and evidence is not
22 available at this time to address the deficiencies that I
23 have identified.

24 So, finally, now, my proposed remedy. Again,
25 this is just mine. You'll hear from other council members.

1 One, I recommend that the council members -- that we vote
2 down the current motion. Two, I would propose that we have
3 a motion that the application has deficiencies under
4 35-11-406(h) and is returned to DEQ to address the
5 deficiencies. A list of deficiencies will be contained in
6 our order. Three, a new suitable for publication
7 determination can be made after, A, Brook Mine has held at
8 least one public information meeting; and, B, Brook Mine
9 has addressed the deficiencies to DEQ's standards; and, C,
10 Brook Mine has addressed comments that arise from public
11 information meetings -- meeting or meetings; and finally,
12 D, the administrator has made the necessary 35-11-406(n)
13 findings.

14 Then four, once the new suitable for publication
15 determination under 35-11-406(h) has been made under the
16 conditions noted the procedures of 35-11-406(j) and (k)
17 will be followed with formal public notification and
18 opportunity for formal objections.

19 Five, if we end up in another contested case
20 hearing, it will be as short as possible. This will not
21 become an infinite loop.

22 And six, I think that we, as a council, would
23 tell the director of the DEQ that he neither issue nor deny
24 the permit within 15 days of receipt of our findings of
25 fact and decision because we would have found that the

1 suitable for publication determination under 35-11-406(h)
2 was premature and the deficiencies are still being
3 addressed.

4 So those are my comments. I thank you all for
5 staying awake through those, and I'll now work my way
6 through the council.

7 Councilman Flitner.

8 COUNCIL MEMBER FLITNER: Oh, okay. Well,
9 first of all, I guess I feel somewhat more confident in the
10 way I was thinking. I always worry about missing things
11 when I'm not here in person. I don't like reading
12 transcripts. I think you miss -- miss a lot of what's
13 going on, so -- but I feel better that I came almost to the
14 exact same conclusion that Presiding Officer Bagley found.
15 Three of those I have identified. One I don't know that I
16 agree with. And the fourth one, I dismissed but agree with
17 him today.

18 I also feel strongly about his common sense
19 comment. I feel it's just been absurd that we spent seven
20 days on this when really what it comes down to are the
21 issues that Dr. Bagley has verbalized, all of which are
22 very solvable if the people would have just been talking to
23 each other. And it's not like you didn't have time, even
24 after this process started.

25 I've voiced concerns about the alluvial water

1 early on, first day of the hearing. Some of the other
2 things we -- we knew these were issues. They should have
3 been worked on. I just feel like from -- from the very
4 beginning that this thing was headed down -- down paths
5 that could have been avoided.

6 And I think that the DEQ has a little bigger
7 responsibility making sure that we don't come to a
8 seven-day hearing. I realize you have your reasons for
9 doing what you do, and I don't always understand those, but
10 I think maybe you should try a little harder. And I'll use
11 the example of the -- what were we going to have -- the
12 optional.

13 CHAIRPERSON LALLY: Informal conference.

14 COUNCIL MEMBER DR. BAGLEY: Informal
15 conference.

16 COUNCIL MEMBER FLITNER: Informal
17 conference.

18 Who knows, maybe you could have cut this hearing
19 down by a couple days by having that conference. Maybe
20 there would have been some information that was brought to
21 light there that could have helped solve some of these
22 problems later. Because I didn't see this as being a
23 problem that was all that far apart, and it looks really
24 solvable. And I think Dr. Bagley's pointed that out.

25 So I guess I'm in complete concurrence. I

1 think -- I mean, I'm going to vote against it and I agree
2 with almost everything that you said. As a matter of fact,
3 it didn't leave much left to say, so I appreciate the time
4 I spent on it and you've obviously been thorough. And I
5 appreciate -- as one who has missed a lot of this hearing,
6 so I appreciate that. So that's all I've got.

7 COUNCIL MEMBER DR. BAGLEY: Councilman
8 Agopian.

9 BOARD MEMBER AGOPIAN: You know, at this
10 point I'm inclined to vote in favor of the motion, that the
11 permit is complete. At no time did we hear from the DEQ
12 that they had made the determinations under (n), so I don't
13 have any reason to believe that that's before us. We
14 haven't seen where they held themselves out that (n) was
15 there. I believe that is something that the DEQ, either
16 administrator or the director, prior to approving the
17 permit, the decision has only been made that it's complete.
18 I find, based on what's been presented by the permit
19 applicant and DEQ, that the permit was complete.

20 While I too share with you your feelings about
21 some of these things maybe could have been resolved, I
22 don't know that they would have been. It's disappointing,
23 extremely disappointing, that the permit applicant has
24 shown no record of public engagement for a mine site
25 located at the base of the Big Horn Mountains within close

1 proximity to many homes. Very disappointing to see that.
2 But at no time did I hear or see anything in the statute or
3 rules that requires it. And so I certainly believe that
4 would be well outside this council's purview and the
5 jurisdiction of the DEQ to require that, something that's
6 not in the rules and something that's not in the statutes.
7 But, again, I'm disappointed it didn't occur. I think that
8 it certainly answers a lot of questions. Doing business in
9 Wyoming requires to be a -- requires you to be a good
10 neighbor. And this would have been the most simple way to
11 show the community where a large-scale mine is going in,
12 that they are a good neighbor. So it's disappointing not
13 to see that.

14 And so with that, I am inclined to move the
15 permit forward to the administrator for decision on the
16 merits.

17 COUNCIL MEMBER DR. BAGLEY: Thank you.

18 Chair Lally.

19 CHAIRPERSON LALLY: First I'm going to echo
20 what everybody else says. The public acts -- or the public
21 comment on this was very lacking. Several of the members
22 of the public that came and testified in front of the
23 council said they weren't opposed to the mine. They just
24 hadn't -- nobody had told them anything and they were
25 opposed to not knowing. Many of them were miners

1 themselves. So, you know, the lack of opportunity for the
2 public to comment on this is troubling, and I think maybe
3 there needs to be a look at why that was able to happen.

4 So into the meat of my comments. I have a few
5 concerns. One is something that struck me is the -- the
6 new mining technique was supposed to limit the amount of
7 blasting. I mean, that was part of what the -- why they
8 wanted to do it that way. And then Brook said that they
9 were going to go ahead and publish that they could blast
10 any time they wanted. Seems to me, being a good neighbor,
11 there needs to be restrictions on, you know, notice.
12 That's why it was a -- in the law it says you need to have
13 30 days written notice for blasting. And then all the
14 sudden they're saying, you know, this isn't the Powder
15 River Basin. This is the Big Horn Basin. It has a
16 different method of mining. You need to have a different
17 method of blasting notice.

18 And then another concern I have is the ability,
19 if Ramaco does damage water wells, for them to possibly
20 provide water long-term to these properties based on their
21 corporate structure because they've just -- they've
22 utilized a method that oil and gas has used for a long
23 time, oil and gas and coal, to have subsidiary companies
24 run the -- run the actual operations. That means that if
25 they decide to close the mine, there's no remedy for those

1 people to continue to get water. And then also lack of
2 access does not excuse lack of data. There was some
3 concern about because they didn't have access to a portion
4 of property, they couldn't get data. We -- we issued an
5 order in lieu of consent. Because of that, that data needs
6 to be gathered before the application is complete.
7 However, using the legal argument that lack of information
8 makes the thing incomplete and then denying access is sort
9 of dirty pool.

10 So under those circumstances, which is (b) and
11 not (n), I will vote that it is not complete. However, I
12 do think that the council does have the ability to consider
13 (n) based on the fact that this is the last chance for the
14 public to have any input at all in the application. Thank
15 you.

16 COUNCIL MEMBER DR. BAGLEY: Thank you.

17 Council Member Baumer.

18 COUNCIL MEMBER BAUMER: Thank you.

19 Well, I wrote up eight pages of notes. And, like
20 Dr. Bagley, I won't bore you with all of them. But I also
21 intend to vote against this motion. I think there are
22 deficiencies in this application, and I just feel like I
23 can't in good faith approve this mine without the
24 hydrologic assessment, without that information. We don't
25 have any of that evidence, and nobody got -- gets to

1 comment on that evidence if we exclude (n), and I don't
2 think that's the way this thing is supposed to go. I think
3 (n) applies. I think we have solid case law that tells us
4 it applies in the Grams case. And I think we need to apply
5 it and it's not there. It's -- Grams is controlling and
6 directly on point, if you ask me.

7 I was bothered by the technically adequate
8 standard that was argued that this council should apply,
9 and I don't find those words anywhere in any part of the
10 statutes. And so I don't think that's our standard, that
11 it's technically adequate. It needs to be complete and
12 it's not. Without the (n) assessments, it's not complete.

13 And I agree with you, Dr. Bagley, with what you
14 stated on the record as the deficiencies. I have written
15 those deficiencies as well. And I think they're
16 deficiencies. They're not minor. And they're not
17 something that we can condition. They need to be
18 completed. I don't think they're subject to conditions.

19 So for those reasons, I intend to vote against
20 the motion as well.

21 COUNCIL MEMBER DR. BAGLEY: All right.

22 COUNCIL MEMBER BAUMER: Thank you.

23 COUNCIL MEMBER DR. BAGLEY: Thank you.

24 Any other comments from council members? So we
25 will take a roll call vote. Remind you the motion is to

1 affirm DEQ's decision that the Brook Mine, LLC application
2 was complete and suitable for publication and not deficient
3 under 35-11-406(h) and (j).

4 Councilman Flitner.

5 COUNCIL MEMBER FLITNER: Against.

6 COUNCIL MEMBER DR. BAGLEY: Chair Lally.

7 CHAIRPERSON LALLY: No.

8 COUNCIL MEMBER DR. BAGLEY: Councilman
9 Agopian.

10 BOARD MEMBER AGOPIAN: Aye. For.

11 CHAIRPERSON LALLY: Council Member Baumer.

12 COUNCIL MEMBER BAUMER: No.

13 COUNCIL MEMBER DR. BAGLEY: I vote no as
14 well.

15 So that motion has failed.

16 So I would like another motion so that we can
17 finish this up and -- does anyone have a motion out there?

18 COUNCIL MEMBER AGOPIAN: Well, is it a
19 motion to dismiss? Because I don't know what else is
20 before the council.

21 COUNCIL MEMBER BAUMER: Can we use your
22 language?

23 COUNCIL MEMBER DR. BAGLEY: If you'd like
24 to. Here's what I've written.

25 COUNCIL MEMBER BAUMER: All right. I'll

1 throw it out there. I move that the council deny the
2 application -- both the application -- vote against the
3 application because it has deficiencies under 35-11-406(h),
4 and should be returned to DEQ to address the deficiencies.
5 A list of deficiencies will be contained in our order. A
6 new suitable for publication determination can be made
7 after, A, Brook Mine has held at least one public
8 information meeting; and, B, Brook Mine has addressed the
9 deficiencies to DEQ's standards; and, C, Brook Mine has
10 addressed comments that arise from the public meetings;
11 and, D, the administrator has made the necessary
12 35-11-406(n) findings.

13 Once the new suitable for publication
14 determination under 35-11-406(h) has been made under the
15 conditions noted, the procedures of 35-11-406(j) and (k)
16 will be followed with formal public notification and
17 opportunity for formal objections.

18 If there is another contested case hearing, it
19 will be as short as possible. We don't need to put that in
20 there. And I'll leave out this is not a -- an infinite
21 loop. So none of that.

22 The director need neither issue or deny the
23 permit within 15 days of receipt of our findings of fact
24 and decision because we have found that the, quote,
25 suitable for publication determination under 35-11-406(h)

1 was premature and that deficiencies still need to be
2 addressed.

3 COUNCIL MEMBER DR. BAGLEY: Is there a
4 second?

5 COUNCIL MEMBER FLITNER: Could you repeat
6 that?

7 I'll second it.

8 COUNCIL MEMBER DR. BAGLEY: All right. So
9 now we'll have discussion on that.

10 Go ahead. Start with you, Councilman Agopian.

11 BOARD MEMBER AGOPIAN: I guess I'm confused
12 on the nature of the motion. We -- the motion to approve
13 failed. It seems like the permit isn't going forward. Is
14 there -- I'm confused as to what action the council's
15 seeking to take by voting down the completeness of the
16 permit. It's already determined that it's not complete.

17 COUNCIL MEMBER BAUMER: I feel like what we
18 need to do is actually have them resubmit with
19 consideration of the deficiencies --

20 CHAIRPERSON LALLY: Not to us.

21 COUNCIL MEMBER BAUMER: -- that the
22 majority have found.

23 CHAIRPERSON LALLY: Not to us.

24 COUNCIL MEMBER BAUMER: No, not to us.

25 But under (j), is it?

1 COUNCIL MEMBER DR. BAGLEY: (h), I think.

2 COUNCIL MEMBER BAUMER: (h). I feel like
3 with the deficiencies, if the deficiencies are addressed --

4 BOARD MEMBER AGOPIAN: So I guess --

5 COUNCIL MEMBER BAUMER: -- the permit may
6 be issued.

7 COUNCIL MEMBER AGOPIAN: So my comments, I
8 guess -- I'll leave them here. I've already identified my
9 feelings or my belief in whether deficiencies exist, and I
10 don't believe it's appropriate that the council at this
11 point add -- while I think that it would be very valuable,
12 don't get me wrong, very valuable to have public comments
13 and to have a proactive stakeholder engagement in the town
14 of Ranchester, I think it would be. I don't think that is
15 appropriate for us to require that now, outside the bounds
16 of the statute and outside the rules.

17 COUNCIL MEMBER DR. BAGLEY: Okay. Thank
18 you.

19 CHAIRPERSON LALLY: I'm wondering if we
20 have the authority.

21 COUNCIL MEMBER DR. BAGLEY: Well, the
22 motion can have amendments made to them.

23 Councilman Flitner.

24 COUNCIL MEMBER FLITNER: Yeah, I do agree
25 with Nick on that point. I think that, you know, there was

1 plenty of time for people to comment. Nobody kept them
2 away. They all had that opportunity. You know, like you
3 say, and I agreed with you earlier, the law was followed.
4 Maybe some people didn't act on it. So to require that
5 public comment I think might be a little bit of an
6 overreach.

7 I was wondering if there was a way instead of
8 specifically putting the things we want in a motion, would
9 it be better to just remand the -- the -- this back to the
10 DEQ with recommendations that are separate from the motion?
11 And that way they know what it's going to take to get it
12 past this, but we haven't limited to -- or ourselves I
13 guess, as well -- to those precise motions. Because these
14 things have a tendency to morph a little bit, and I don't
15 want that to come back and say, well, you said if this was
16 all taken care of, this was a done deal. We hope that to
17 be the case, but you can't guarantee it. So maybe a
18 recommendation would give -- give them the latitude to
19 address other problems as they come up and not just those
20 specifically, or maybe those -- you know, for some reason
21 maybe some of those would go away or whatever. But it
22 would allow some flexibility. So just the motion to remand
23 it, accompanied by our recommendations that were listed.
24 Is there a way maybe to do that?

25 COUNCIL MEMBER DR. BAGLEY: Yeah, I think

1 we can -- we can vote down this motion and then propose
2 that motion.

3 COUNCIL MEMBER FLITNER: If you're
4 agreeable to it.

5 COUNCIL MEMBER DR. BAGLEY: That's more --
6 that's more -- that's more than just amending something
7 out. It's like basically -- so, yeah, that's how we can
8 proceed. We can vote this down and bring forward a new
9 motion.

10 COUNCIL MEMBER FLITNER: Because -- and, I
11 guess, to clarify. I've always felt like on a practical
12 basis, this is a good project or could be. And early on, I
13 think there was a lot of sentiment this was something new
14 and people kind of got excited about. And so, you know,
15 nobody's excited about putting the skids to a project
16 that -- that this is how -- how sometimes things are -- are
17 learned. And this process looked like a good one, but
18 there were misgivings early on and they never really had
19 been addressed to our satisfaction. And I guess that's
20 really what we want to do is give you an avenue to get to
21 where you need to get because you didn't get there by
22 yourselves. And we're all part of it now and we're hanging
23 our names and integrity on as well. So now we're your
24 partners too. But we have things we'd like to get
25 accomplished as well. And one of these is getting this

1 done, so...

2 COUNCIL MEMBER DR. BAGLEY: So I've been
3 informed parliamentarily [sic], we can -- if the seconder
4 and motioner both withdraw the motion, then we don't vote
5 on it and the motion can move forward.

6 COUNCIL MEMBER BAUMER: I'll withdraw the
7 motion.

8 COUNCIL MEMBER DR. BAGLEY: All right.

9 COUNCIL MEMBER FLITNER: I'll withdraw the
10 second.

11 COUNCIL MEMBER DR. BAGLEY: All right. So
12 that motion has been withdrawn by both the seconder and
13 mover.

14 Do I have another motion?

15 CHAIRPERSON LALLY: Can we can get back
16 to --

17 COUNCIL MEMBER FLITNER: Come on, Deb.

18 COUNCIL MEMBER DR. BAGLEY: So let me
19 provide the answer to Councilman Agopian's question. We
20 have denied this, but we haven't given anybody any guidance
21 of where it should go. So I believe a motion is necessary.
22 And I think you were on -- you're on the right track, Tim,
23 where we say now this is what needs to happen next, but
24 give it as broad a view as possible, I think is what you
25 were saying.

1 COUNCIL MEMBER FLITNER: Right. Right.

2 COUNCIL MEMBER DR. BAGLEY: So we need to
3 say, though, I think, okay, send it back to DEQ with the --
4 the deficiencies and we will list and continue the 406(h)
5 determination. I think that's what -- something like that.

6 CHAIRPERSON LALLY: Take us back through
7 public comment.

8 COUNCIL MEMBER DR. BAGLEY: So do you have
9 a sample?

10 COUNCIL MEMBER FLITNER: I would make a
11 motion to remand it back to the DEQ with direction as
12 outlined in an order. Would that work? And then we can
13 put in your -- your -- what was part of your motion in the
14 order.

15 BOARD MEMBER AGOPIAN: We'll still have the
16 ability to vote. I guess we have to move the motion for
17 discussion.

18 COUNCIL MEMBER DR. BAGLEY: Yeah.

19 COUNCIL MEMBER AGOPIAN: So I'll second.

20 CHAIRPERSON LALLY: Second.

21 COUNCIL MEMBER DR. BAGLEY: All right.

22 Thank you.

23 So we now have a motion we'll send it back to DEQ
24 for their examination and we'll have things in the
25 motion -- written in the order which has to also be

1 approved by the council.

2 BOARD MEMBER AGOPIAN: So discussion now?

3 COUNCIL MEMBER DR. BAGLEY: Go ahead.

4 BOARD MEMBER AGOPIAN: That's all I want to
5 be clear about. We just approved -- we're moving a motion
6 to remand with direction at this point, which is a blank
7 slate. We have a guidance based on your comments and what
8 council thinks is --

9 COUNCIL MEMBER DR. BAGLEY: Right. We
10 would have --

11 COUNCIL MEMBER AGOPIAN: -- deficient.

12 COUNCIL MEMBER DR. BAGLEY: Right.

13 COUNCIL MEMBER AGOPIAN: But as members.

14 CHAIRPERSON LALLY: We still --

15 BOARD MEMBER AGOPIAN: We still have the
16 right to vote against what those deficiencies might be once
17 they're articulated on paper.

18 COUNCIL MEMBER BAUMER: Do we have to do
19 that right now, or can we articulate those on paper and
20 then have a vote on that?

21 CHAIRPERSON LALLY: Vote on it at the next
22 meeting.

23 MR. RUBY: You'll have to vote to approve
24 the order. Yeah.

25 COUNCIL MEMBER BAUMER: Okay.

1 MR. RUBY: And so you can certainly -- as
2 that -- because that order will go out to you before, and
3 certainly all of you can say I want this. I want that. I
4 don't want this. I don't want that.

5 COUNCIL MEMBER BAUMER: Okay.

6 MR. RUBY: Just as you would in any other
7 kind of negotiations on what your order would say. And
8 then at some point we will reach a -- a vote on the order,
9 and it will be approved in some form and sent out to the
10 parties.

11 COUNCIL MEMBER FLITNER: Do we hash that
12 out now?

13 COUNCIL MEMBER DR. BAGLEY: No. What I'm
14 hearing is we don't have to hash that out now.

15 COUNCIL MEMBER BAUMER: So we're looking --
16 who --

17 COUNCIL MEMBER AGOPIAN: Do we want to hash
18 that out now?

19 COUNCIL MEMBER BAUMER: Who is going to put
20 the list of deficiencies together if we're not going to
21 talk about it now?

22 COUNCIL MEMBER FLITNER: I was under the
23 understanding that those were -- that's pretty much it. I
24 mean, I agree with Nick on the -- maybe we can take that
25 one out, or -- I think we can hash this thing out in

1 15 minutes and then they'd have their direction right now
2 today, if you guys are not opposed to that.

3 CHAIRPERSON LALLY: I mean, I --

4 BOARD MEMBER AGOPIAN: I think that's
5 reasonable.

6 COUNCIL MEMBER DR. BAGLEY: Sure. That
7 works for me.

8 CHAIRPERSON LALLY: Do we still have a
9 motion on the floor?

10 COUNCIL MEMBER BAUMER: So is the motion to
11 deny the permit due to deficiencies that we articulate and
12 remand to DEQ to consider the deficiencies and proceed
13 under Section (h), is that --

14 CHAIRPERSON LALLY: Yes.

15 COUNCIL MEMBER FLITNER: No, I don't --

16 COUNCIL MEMBER BAUMER: What is it?

17 COUNCIL MEMBER DR. BAGLEY: I don't think
18 we used the words "deny the permit."

19 CHAIRPERSON LALLY: No. We --

20 COUNCIL MEMBER FLITNER: The motion said
21 remand. At least that's what I said.

22 COUNCIL MEMBER BAUMER: Remand, yes.

23 COUNCIL MEMBER FLITNER: I don't know
24 how --

25 COUNCIL MEMBER BAUMER: So the permit

1 isn't --

2 CHAIRPERSON LALLY: -- denied.

3 COUNCIL MEMBER BAUMER: -- denied. It's

4 remanded --

5 CHAIRPERSON LALLY: To correct

6 deficiencies.

7 COUNCIL MEMBER BAUMER: -- to correct

8 deficiencies.

9 CHAIRPERSON LALLY: Yeah. None of us are
10 denying --

11 COUNCIL MEMBER BAUMER: Yeah.

12 CHAIRPERSON LALLY: -- that there might
13 need to be a mine. We're just denying it's ready.

14 COUNCIL MEMBER BAUMER: Yeah.

15 CHAIRPERSON LALLY: Is that right?

16 COUNCIL MEMBER BAUMER: I -- I wasn't
17 paying close enough attention to how you started that
18 motion.

19 COUNCIL MEMBER FLITNER: Really?

20 COUNCIL MEMBER BAUMER: You started it with
21 the word "remand."

22 COUNCIL MEMBER FLITNER: I might have
23 changed a time or two.

24 COUNCIL MEMBER DR. BAGLEY: So one of
25 the -- the motion we have right now is -- is -- it is

1 general, but it does provide us the flexibility to make
2 sure that what's in the order, the council is happy about
3 and we don't happen to miss something. And we will get a
4 chance to all look at the order. So I might suggest, if we
5 approve that order, if the -- approve that motion, and if
6 the council wants to discuss potential deficiencies that
7 might be included in that order but not in part -- but not
8 make a formal motion about that, then that information
9 is -- is -- we've captured it. We can do some of that
10 discussion now, which is always best in public anyway.
11 Plus the people who have to help us write the order will
12 have some ideas. But that doesn't -- if we put that into a
13 motion, then we lock ourselves in. And I think that's what
14 you were trying to avoid in the first place.

15 So if we approve the motion and then we discuss
16 potential deficiencies, argue about them, whatever, for a
17 while, then -- but not make a motion on that.

18 CHAIRPERSON LALLY: Okay.

19 COUNCIL MEMBER DR. BAGLEY: That may give
20 us the best opportunity going forward.

21 CHAIRPERSON LALLY: And then Nick was --
22 Nick's question, I believe, was if we issue an order, can
23 he vote against it because he didn't agree with the
24 original idea behind the order.

25 MR. RUBY: Yeah.

1 COUNCIL MEMBER FLITNER: He has the
2 same --

3 BOARD MEMBER AGOPIAN: I wouldn't want to
4 presume how I would vote.

5 CHAIRPERSON LALLY: Right. No. That was my
6 understanding of your question.

7 COUNCIL MEMBER FLITNER: That would be a
8 separate --

9 CHAIRPERSON LALLY: I'm not presuming
10 you're voting --

11 COUNCIL MEMBER AGOPIAN: I know.

12 THE REPORTER: One at a time.

13 BOARD MEMBER AGOPIAN: I know. But, yeah,
14 we can move -- I seconded the motion. We can have the
15 vote, so forth.

16 COUNCIL MEMBER DR. BAGLEY: Yeah. Any
17 other discussion on that motion? I think it's a good
18 motion, and it -- it then allows us to discuss some general
19 deficiencies but not -- what the order will handle
20 separately.

21 So -- all right. Got to do a roll call vote.
22 I'll call that.

23 Councilman Flitner.

24 COUNCIL MEMBER FLITNER: Aye.

25 COUNCIL MEMBER DR. BAGLEY: Chair Lally.

1 CHAIRPERSON LALLY: Aye.

2 COUNCIL MEMBER DR. BAGLEY: Council Member
3 Baumer.

4 COUNCIL MEMBER BAUMER: Aye.

5 COUNCIL MEMBER DR. BAGLEY: Council Member
6 Agopian.

7 BOARD MEMBER AGOPIAN: No.

8 COUNCIL MEMBER DR. BAGLEY: I vote aye as
9 well. So that motion has been passed.

10 And what we'll do, then, the last little bit
11 here, open it up for council member -- council discussion
12 to perhaps suggest some ideas of what you may have
13 considered a deficiency. We will not be voting on those,
14 getting those into a motion, but just to discuss those. If
15 someone brought up an idea that you thought was bad, say
16 so. If you have another one you want to add. Just to get
17 some ideas. We'll kind of do that one at a time, like --
18 but we won't have a motion on that.

19 So we'll go ahead and start with Councilman
20 Flitner.

21 COUNCIL MEMBER FLITNER: Maybe it would be
22 helpful if you read those, because -- I mean, I can't think
23 of every one of them off the top of my head, but I remember
24 hearing when read that I agreed with most of it. And maybe
25 we can peel out the ones there's some disagreement on first

1 and take the rest of them and put them aside, the ones we
2 all agree on, and then at least everybody kind of have a
3 starting point.

4 CHAIRPERSON LALLY: Yeah, what the list
5 that you had?

6 COUNCIL MEMBER FLITNER: Most of those I
7 think, as I remember hearing them read, were kind of right
8 along the lines of what I was thinking before this thing
9 started today.

10 COUNCIL MEMBER DR. BAGLEY: Sure. I'll
11 give you the briefer version. A deficiency -- I felt there
12 was a deficiency in the plans for the surface gradient
13 because of the subsidence control plan, simply assuming no
14 subsidence. And so I didn't feel you could reclaim
15 something if you didn't know what it was going to look
16 like.

17 COUNCIL MEMBER BAUMER: Should we talk
18 about each one of these as you're --

19 COUNCIL MEMBER DR. BAGLEY: Sure.

20 COUNCIL MEMBER BAUMER: So we don't have to
21 remember all.

22 COUNCIL MEMBER DR. BAGLEY: Yeah.

23 COUNCIL MEMBER BAUMER: I had written
24 subsidence control plan was not complete, and so I agreed
25 with it just more generally that the subsidence control

1 plan was deficient.

2 COUNCIL MEMBER FLITNER: Agreed.

3 CHAIRPERSON LALLY: I agree that they
4 didn't address it properly, but I'm not sure how they can
5 decide what's subsidence related to the mine and what's
6 continuing subsidence related to other -- because if you
7 look at the landscape around there, it's pretty subsided
8 anyway. So I'm not sure how they can address that, but
9 saying there's not going to be any subsidence is probably
10 not the proper way to do it, but --

11 COUNCIL MEMBER FLITNER: Right.

12 COUNCIL MEMBER DR. BAGLEY: I thought
13 about this from an engineering standpoint. And I think the
14 one -- I don't think the subsidence control plan for the
15 entire site needs to be done today. But I would like --
16 there's -- there was not enough data collected on the
17 initial site where you're going to start first.

18 COUNCIL MEMBER BAUMER: On the TR-1.

19 COUNCIL MEMBER DR. BAGLEY: Right. And
20 they said it would be in the ground control plan. And
21 that's fine, except the ground control plan does not
22 specifically address long-term subsidence. It addresses
23 collapsing on people doing the mining at that time. And
24 so, you know, I'm just spitballing and people can -- you
25 know, I don't know how we would include it. And we may not

1 include it with this kind of detail because if it goes
2 back, DEQ will have it assigned. But I would think some
3 additional data related to where they want first to go, and
4 showing -- and additional data may confirm that they really
5 don't really expect subsidence. It just wasn't enough
6 data, I don't think. And if they could show for that as --
7 say, for that first part before they move on.

8 COUNCIL MEMBER BAUMER: I had written down
9 more sampling should be done in the TR-1 area. And it may
10 confirm what they suspect is there, but I don't think their
11 sampling was sufficient in the TR-1 area.

12 COUNCIL MEMBER FLITNER: We don't -- I
13 think the point is we don't need to tell them what to do.

14 COUNCIL MEMBER BAUMER: Right.

15 COUNCIL MEMBER DR. BAGLEY: No.

16 COUNCIL MEMBER FLITNER: That's their job.
17 We need to tell them these are where we have the questions.

18 COUNCIL MEMBER BAUMER: The subsidence
19 control plan.

20 COUNCIL MEMBER FLITNER: One of the issues
21 that we are unsure about is subsidence control plan. Bring
22 us some information and convince us. That's what we're
23 saying. Not -- we're not giving them direction on how to
24 fix it.

25 COUNCIL MEMBER BAUMER: No.

1 COUNCIL MEMBER FLITNER: We're saying show
2 us you made attempt to address it.

3 COUNCIL MEMBER BAUMER: Right.

4 COUNCIL MEMBER DR. BAGLEY: Right.

5 Any other questions or thoughts on that one?

6 Do you have any thoughts, Nick? Or should we
7 just jump in when you're ready --

8 BOARD MEMBER AGOPIAN: I don't have any
9 comments at this time about the mine's intended not to
10 subside. And there's every indication that the mine --
11 that Brook Mine would be responsible if subsidence were to
12 occur. So I don't foresee any issues.

13 COUNCIL MEMBER DR. BAGLEY: Okay. So the
14 second one I had was that an estimate of the total cost of
15 reclamation was -- was not presented. We heard testimony
16 about the reclamation cost estimates for the first year,
17 but not for the total cost of reclaiming the affected
18 lands. That was -- I felt that was a deficiency. That's
19 just me. Is there any discussion on that?

20 COUNCIL MEMBER FLITNER: I'm in the middle
21 on that. I can go either way, so no comment from me.

22 COUNCIL MEMBER BAUMER: I sort of felt like
23 DEQ would handle that, but --

24 CHAIRPERSON LALLY: As long as they bond on
25 the disturbed lands.

1 COUNCIL MEMBER BAUMER: Yeah.

2 COUNCIL MEMBER DR. BAGLEY: Okay.

3 CHAIRPERSON LALLY: That's really my only
4 concern.

5 COUNCIL MEMBER BAUMER: And I feel like
6 that's in the permit, that they have every intention of
7 making sure that it's okay. But I'm -- I'm in the middle
8 on it as well. You know, it's not a deal breaker for me,
9 so...

10 COUNCIL MEMBER DR. BAGLEY: So what I'm
11 hearing folks don't really consider that a major deficiency
12 because it's going to be covered by bonding and things
13 anyway. Okay. And that's -- that's fair. I'll cross that
14 one out.

15 The third one was I was concerned about
16 procedures proposed to avoid constituting a public nuisance
17 and endangering public safety, and that was specifically
18 worried about the traffic generated by the mine and whether
19 there was evidence. I know that DEQ doesn't regulate that,
20 but any evidence that coordination with WYDOT and the
21 County had been -- had gone on that issue.

22 COUNCIL MEMBER BAUMER: Doesn't -- I mean,
23 somebody else would issue road permits and things, correct?
24 The County would have to be involved in all of that. Is
25 that outside of our --

1 CHAIRPERSON LALLY: I think so.

2 COUNCIL MEMBER FLITNER: That was the only
3 one that I -- of the five that I didn't -- that I was
4 telling you that I disagreed with.

5 COUNCIL MEMBER DR. BAGLEY: Okay.

6 COUNCIL MEMBER FLITNER: Again, that was --
7 hopefully the mine plan will take care of a lot of that
8 and -- that's where I am on that one.

9 COUNCIL MEMBER DR. BAGLEY: I guess my
10 point was I didn't feel the mine plan had taken care of
11 that, and it's a public nuisance. We saw this a couple
12 years ago with the gravel pit.

13 COUNCIL MEMBER FLITNER: That's true.
14 Okay.

15 COUNCIL MEMBER DR. BAGLEY: But your
16 comment's still totally valid. Just arguing with you for
17 fun.

18 CHAIRPERSON LALLY: Again, I don't find
19 any -- that's outside the purview of --

20 THE REPORTER: Purview of --

21 CHAIRPERSON LALLY: This, I think is what I
22 said.

23 COUNCIL MEMBER DR. BAGLEY: Nick?

24 BOARD MEMBER AGOPIAN: No comments.

25 COUNCIL MEMBER DR. BAGLEY: All right. So

1 there wasn't real agreement on that one either. I'll go
2 ahead and get that one out.

3 Blasting plan, which shall outline the procedures
4 and standards. And I was concerned specifically about
5 limits on the blasting schedule that have basically the --
6 the plan is written that they would blast -- they had
7 ability to blast at any time, any day or any time of day.

8 COUNCIL MEMBER FLITNER: I totally agree
9 with that one. I don't know that comment -- or this
10 council's ever been in the habit of issuing permits that
11 don't have those kinds of things in there. I mean, even
12 gravel crushing have to have operational hours. I think
13 that is one of the things that the DEQ just missed. I
14 mean, that's a red flag that they weren't paying very close
15 attention. Got to have those things.

16 COUNCIL MEMBER BAUMER: I think in light of
17 all the homeowners that are so close --

18 COUNCIL MEMBER FLITNER: Yeah.

19 COUNCIL MEMBER BAUMER: -- it just is
20 necessary.

21 CHAIRPERSON LALLY: I've already made my
22 comments on that. I think there need to be limits based on
23 when they're actually blasting.

24 COUNCIL MEMBER DR. BAGLEY: Nick?

25 BOARD MEMBER AGOPIAN: I thought the Brook

1 Mine presented some valid reasons as to why they would like
2 discretion to blast that's appropriate. There's no
3 evidence to suggest they were going to do so in a way that
4 intentionally sought to harm any of the landowners.

5 COUNCIL MEMBER DR. BAGLEY: Okay. Thank
6 you.

7 And the fifth one was related to disturbances of
8 the prevailing hydrologic balance at the mine site, and in
9 associated off-site areas. And -- to the quality and
10 quantity of water surface groundwater systems, both during
11 and after mining operations and during reclamation. And my
12 concern there was that we -- there's already prediction
13 there will be impacts to wells, that alluvial valley floors
14 fit into this because they're part of the hydrologic
15 balance.

16 COUNCIL MEMBER FLITNER: I agree. I think
17 that's a difficult one, and I don't think you can really --
18 if you're going to err, err on the side of just a little
19 more data. I do appreciate the fact that they relied
20 heavily on 23 years of data from the old mine, and I think
21 that -- that needs to be said. I mean, I want to give them
22 credit for that. I don't want them to think they just
23 didn't do anything. That's not true. They researched it
24 pretty well. But I think there needs to be some more
25 recent stuff, just something to make us a little more

1 comfortable on that.

2 COUNCIL MEMBER DR. BAGLEY: Meghan?

3 CHAIRPERSON LALLY: Based on the data,
4 there's not going to be significant impacts in terms of
5 water amounts. However, you know, another drought comes
6 and somebody's well goes dry, you know, that leaves them in
7 a bad situation after 5 feet of drawdown or a hundred feet
8 of drawdown or whatever. My biggest concern is that they
9 have a way to remedy that that lasts beyond the life of the
10 mine because those people don't have a well after that, and
11 there has to be a way for that to be funded. And a company
12 that only has \$250,000 in assets, you know, where does that
13 leave the homeowners at the end of the day?

14 COUNCIL MEMBER BAUMER: And I wrote just
15 generally that the hydrologic assessment was deficient.
16 And I wrote that because of the TR-1 area. But I don't
17 think we need to -- I agree with Tim that we don't need to
18 be saying you have to do something in this little portion
19 but not anywhere else. I just felt like it was deficient.
20 The assessment wasn't done in certain areas, and I felt
21 like it needed to be.

22 COUNCIL MEMBER DR. BAGLEY: Council member?

23 COUNCIL MEMBER AGOPIAN: I don't have any
24 comments.

25 COUNCIL MEMBER DR. BAGLEY: Okay. Those

1 are the five I identified. And through this discussion I
2 went ahead and taken out the total cost and the public
3 nuisance ones, left the other three in.

4 Are there any others the folks want to bring
5 forward for discussion?

6 COUNCIL MEMBER BAUMER: No. I think some
7 other things that I had concerns about weren't really
8 deficiencies. They were just conditions that I would put
9 on it. Like if homeowners within a half a mile wanted
10 seismon -- seismic monitoring, they would be provided that.

11 CHAIRPERSON LALLY: I think that's --

12 COUNCIL MEMBER BAUMER: And pre-blast
13 surveys. But I don't think those are deficiencies. I
14 think those are more conditions that I would have added
15 should the -- had the permit been granted.

16 COUNCIL MEMBER DR. BAGLEY: Any others?

17 CHAIRPERSON LALLY: The only other one was
18 lack of data, which goes back to all the other pieces,
19 so...

20 COUNCIL MEMBER DR. BAGLEY: Okay. Well,
21 thank you very much for those comments. We've already
22 passed our motion.

23 So the council will prepare its findings of
24 facts, conclusions of law and order for approval within the
25 statutory 60 days from the close of this hearing. And I

1 hereby now close the hearing at this time.

2 Madam Chair, return the gavel to you.

3 CHAIRPERSON LALLY: Thank you, Dr. Bagley.

4 I think we will take a five-minute break and then
5 we'll return. We will go into executive session for
6 personnel, so we'll need a motion when we get back in a few
7 minutes. So the council can assemble and everybody can
8 take care of personal needs.

9 Thank you all for coming.

10 (Hearing proceedings concluded

Subject: Upcoming Ramaco Meetings

Jeff & Isaac,

We are wondering if you could elaborate on your client's quote in this article about meetings. We know you will respect the restrictions on ex parte communications with the EQC and its staff, but just wanted clarification about the "various" regulatory agencies your client will be meeting with.

The Wyoming council has 60 days to publish its findings. "There is still some confusion about what precise concerns and remedies are on the table," Ramaco's Atkins said. He expects to have "greater clarity" over the next few days after meeting with staff at various Wyoming regulatory agencies.

Thank you, Shannon

Wyoming panel temporarily blocks new PRB mine: Update

Adds comments from the Wyoming DEQ

Washington, 2 August (Argus) — Wyoming regulators have blocked temporarily the development of a controversial new mine in the Powder River basin (PRB).

The Environmental Quality Council yesterday voted 4-1 to send Ramaco's permit application for its Brook mine back to the state Department of Environmental Quality (DEQ) for revision, over concerns that the proposal does not adequately address the project's potential environmental effects.

Ramaco is still feeling "very positive and remain(s) confident that the mine permit will ultimately be approved," chief executive Randall Atkins said today.

But the council warned that the company has not yet met its "burden to prove that this mining operation will adequately provide reclamation," member David Bagley (D) said, noting that he is specifically worried about subsidence, or the development of sinkholes, near the mining site.

The proposed permit also fails to demonstrate that the operations will not cause damage to "alluvial valley floors" or hydrologic systems outside the permit area, Bagley added.

Bob LeResche, chair of the Powder River Basin Resource Council — a conservation group that has opposed the project — praised the council's decision.

The application "did not adequately protect public health and safety, land and water," he said. By advancing Ramaco's mining plan, the DEQ did not properly "represent the citizens of the state" and "they were pretty soundly rebuked."

The DEQ had deemed Ramaco's application technically complete but sent it to the state environmental council for review after LeResche's group filed a [complaint](#) asking for a face-to-face meeting about the proposal.

"We felt it was important to put this in front of an impartial group," said DEQ public information officer Keith Guille.

Ramaco started the process to develop Brook mine in 2014, when prompt quarter prices for PRB 8,800 Btu/lb coal averaged \$12.58/short ton and the basin produced 418.2mn st (379.4mn metric tonnes) of sub-bituminous coal. Last year, the prompt quarter price averaged \$10.45/st, while output fell to 319.2mn st, the lowest level in at least 13 years.

Weaker market conditions caused Ramaco to explore other options for Brook mine's coal. The company is now [planning](#) to develop a mine-mouth manufacturing site and research park that would help develop cost-effective technologies to use coal to create products like carbon fiber, activated carbon and building materials.

Council member Tim Flitner (R) said the Brook mine has the potential to be "a good project" but noted that Ramaco Carbon's plan has not addressed earlier "misgivings" about negative environmental impacts of the development.

LeResche questioned the economic wisdom of the new proposal.

Similar projects have been tried in recent years, drawing significant federal grant money without getting results, he said.

The Wyoming council has 60 days to publish its findings. "There is still some confusion about what precise concerns and remedies are on the table," Ramaco's Atkins said. He expects to have "greater clarity" over the next few days after meeting with staff at various Wyoming regulatory agencies.

Guille, of the DEQ, said he could not speculate on how long the permitting process might take.

"This isn't something that's put together within an afternoon — it takes years, months," he said. "But ultimately we've got something of an application here, it's not a complete start-over."

Attorneys for the State of Wyoming
Department of Environmental Quality

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	
TFN 6 2-025)	Docket 17-4802 (Consolidated)

DEPARTMENT OF ENVIRONMENTAL QUALITY'S
PROPOSED FINDINGS OF FACT, CONCLUSIONS OF LAW, AND DECISION

The State of Wyoming, Department of Environmental Quality ("Department"), through its undersigned counsel, hereby offers these proposed findings of fact, conclusions of law, and decision:

I. APPEARANCES

On May 22 through 26 and June 7 and 8, 2017, the parties, Brook Mining Company LLC ("Brook"), the Department, Mary Brezik-Fisher and David Fisher (the "Fishers"), Big Horn Coal Company ("Big Horn"), and the Powder River Basin Resource Council ("PRBRC"), appeared before the Environmental Quality Council ("Council") for a contested case hearing in the above-entitled matter. Present for the Council were Hearing Officer and Chairman Dr. David Bagley, Vice-Chairman Meghan Lally, and councilmembers Tim Flitner, Nick Agopian, and Deb Baumer. Councilmembers Rich Fairservis and Megan Degenfelder recused themselves.

Present at the hearing for Brook Mine were attorneys Tom Sansonetti, Isaac Sutphin, and Jeff Pope of Holland & Hart. Present for the Department were attorneys Andrew Kuhlmann and James LaRock. Present for the Fishers was attorney Jay Gilbertz of Yonkee & Toner. Present for Big Horn were attorneys Lynne Boomgaarden and Clayton Gregersen of Crowley Fleck. Present for PRBRC was attorney Shannon Anderson.

Present and testifying for Brook Mine was Jeff Barron and Kenneth Woodring. Present and testifying Department employees were Bj Kristiansen, Matt Kunze, Dr. Muthu Kuchanur, Doug Emme, and Carol Bilbrough. Mary Brezik-Fisher testified for herself. Present and testifying for Big Horn were Jordan Sweeney and Joe Gerlach. Present and testifying for PRBRC were Mickel Wireman, Dr. Gennaro Marino, and landowners near the proposed mine: John Buyok, Brooke Collins, Anton Bocek, and Gillian Malone. The following exhibits were admitted into evidence: Brook exhibits 1, 2, 6a, 6b, and 10 through 13; Department exhibits 1 through 36; Fishers' exhibits 1 through 26; Big Horn exhibits 1 through 19; and PRBRC exhibits 1 through 95.

The Council, having heard and considered all the evidence and the whole record in this case and being fully advised, and pursuant to the Wyoming Administrative Procedure Act, Wyoming Statute § 16-3-110, finds and concludes as follows:

II. JURISDICTION

1. This case arises from a dispute concerning objections filed against a permit application under Wyoming Statute § 35-11-406(k) of the Wyoming Environmental Quality Act ("Act"). In this case, the objectors to the permit application (the Fishers, Big Horn, and PRBRC) have advanced several arguments asserting that Brook Mine's surface coal mine permit application contains deficiencies. *See* Wyo. Stat. Ann. § 35-11-103(e)(xxiv) (defining "deficiency"). Brook Mine and the Department contend that the permit application contains no deficiencies.

2. Under Wyoming Statute § 35-11-406(k), the Council held a public hearing in this matter to resolve objections filed to Brook’s surface coal mine permit application after the Director found that an informal conference was not preferable. The Council must make a decision on the objections within 60 days after its hearing. Wyo. Stat. Ann. § 35-11-406(p).

3. This matter is properly before the Council and subject to the Council’s jurisdiction. The Council is required to resolve the objections. Wyo. Stat. Ann. § 35-11-406(k) and (p).

III. FINDINGS OF FACT

A. Course of Proceedings

4. During the comment period for the Brook Mine permit application, the Fishers, Big Horn, and PRBRC sent objections to the Department. (Exs. PRBRC 1, BHC 3, and Fishers 26.) All three objectors requested an informal conference with the Director on their objections. (*See id.*) After the Director decided not to hold an informal conference, the Council set, and then later vacated, a contested case hearing under Docket 17-4801. *Order Vacating Contested Case H’rg and Setting Oral Argument* (Docket 17-4801). The Council ultimately dismissed that docketed matter. *Order of Dismissal* (Docket 17-4801).

5. Subsequently, the three objector parties filed petitions with the Council to hold a contested case to resolve their objections. *Objector Big Horn Coal Co.’s Petition* (Docket 17-4802); *Objector Fishers’ Petition* (Docket 17-4803); and *PRBRC’s Petition* (Docket 17-4804). The Council consolidated Dockets 17-4802, 17-4803, and 17-4804, and set a single hearing to resolve all three sets of objections. *Order of Consolidation and Schedule* (Docket 17-4802). Prior to the contested case hearing, the Council heard and denied Brook’s motions to dismiss the three petitions. *Council H’rg Tr.* (Mar. 22, 2017). Also, the Council granted the Department’s motion to dismiss the part of PRBRC’s petition appealing the Director’s decision not to hold an informal

conference. The Council granted that motion because the Council could not grant PRBRC the relief it requested under that claim. *Id.*

B. Witnesses

6. Each party presented witnesses at the contested case hearing.

7. **The Department's Witnesses.** The Department's first witness, Bjarne "Bj" Kristiansen, is the assistant district supervisor for District III of the Department's Land Quality Division ("Division"). (Tr. at 38-39.) He is a licensed professional geologist in Wyoming and is the Department's coordinator for the permit application. (Tr. at 40 and 48.) He testified generally about the application's content, geology, subsidence, and alluvial valley floor ("AVF") issues.

8. The Department's second witness, Matt Kunze, is a natural resource program principal at the Division. (Tr. at 392) He is primarily responsible for preparing cumulative hydrologic impact assessments ("CHIAs"), but also assists with technical reviews of surface water aspects of permit applications. (Tr. at 393.) He reviewed sections of this permit application. (*Id.*) He generally testified to surface water quantity and quality issues. (Tr. at 393-451.)

9. The Department's third witness, Dr. Muthu Kuchanur, is a geology supervisor for the Division's support services. (Tr. at 458-59.) He has a Ph.D. in environmental engineering, is a professional engineer licensed in Wyoming, and specializes in groundwater modeling. (Tr. at 458-60.) He reviewed the Brook Mine groundwater model and groundwater related parts of Appendix D6. (Tr. at 460-461.) He generally testified to groundwater issues and the groundwater model.

10. The Department's fourth witness, Doug Emme, is the blasting program principal at the Division. (Tr. at 577-78.) He trains and certifies blasters in the State of Wyoming, investigates blasting complaints, and inspects mine sites for compliance with blasting rules and regulations. (Tr. at 578-80.) He generally testified to issues related to blasting and Brook's reclamation bond.

11. **Brook Mine's Witnesses.** Jeff Barron was Brook Mine's first witness. (Tr. at 645-646.) He is an engineer for Western Water Consultants and is licensed in Wyoming and Montana. (Tr. at 646 and 649.) He prepared the Brook Mine permit application. (Tr. at 650.) He generally testified to the application's contents and his experience with permitting.

12. Brook Mine's second witness, Kenneth Woodring, is the senior operating adviser for the Brook Mine. (Tr. at 809.) He helped prepare the permit application. (Tr. at 815-816.) He generally testified about highwall mining and the development of the permit application.

13. **Big Horn's Witnesses.** Jordan Sweeney was Big Horn's first witness. (Tr. at 834.) He is the regulatory affairs manager for Lighthouse Resources (Big Horn's parent company) and the general manager of the Big Horn Mine (Tr. at 835-36.) He generally testified to Big Horn's concerns and requested permit conditions.

14. Big Horn's second witness, Paul Joseph Gerlach, testified as an expert witness in hydrology and hydrogeology related to coal mine permitting. (Tr. at 902 and 907; Ex. BHC 9.) He is president of Aqua Terra Consulting and is a licensed professional geologist in Wyoming. (Tr. at 902 and 906; Ex. BHC 8.) He helped prepare Big Horn's objection letter. (Tr. at 910.) He generally testified about hydrologic issues related to the permit application.

15. **PRBRC's Witnesses.** The first three witnesses PRBRC called are landowners near the proposed mine: John Buyok, Brooke Collins, and Anton Bocek. (Tr. at 1010, 1068, and 1088.) PRBRC's fourth witness was Gillian Malone, who recreates in the area. (Tr. at 1115.) The witnesses expressed concerns about the proposed mine's potential impacts with regard to water, subsidence, blasting, traffic, and recreation.

16. PRBRC's fifth witness, Dr. Gennaro Marino, is president and chief engineer of Marino Engineering Associates and was called as an expert in geotechnical engineering. (Tr. at

1191-92 and 1198.) He is a licensed professional engineer in Wyoming and multiple other states. (Tr. at 1193.) He wrote a report for PRBRC. (Tr. at 1199-1200; Exs. PRBRC 1, 12, 13, and 14.)

17. PRBRC's sixth witness, Dr. Carol Bilbrough, is program manager for the Division's support services and was superficially involved in the permit application. (Tr. at 1298-1300.)

18. PRBRC's seventh witness, Sue Spencer, is a professional geologist licensed in Wyoming. (Tr. at 1314 and 1323.) She testified that Mr. Wireman's expert report and testimony met the standards of a Wyoming professional geologist. (Tr. at 1323.)

19. PRBRC's eighth and final witness, Mickel Wireman, is a groundwater analyst specializing in legacy mining hydrology. (Tr. at 1327, 1329-32.) He is not a licensed professional geologist in Wyoming. (Tr. at 1323, 1461.) He testified about the coal seams' hydrology and the data and analyses he would have collected and performed had he characterized the site.

20. **Fishers' Witness.** Mary Brezik-Fisher lives near the proposed mine. (Tr. at 1133-34.) She stated similar concerns to PRBRC's landowner witnesses.

C. Description of Brook Mine Permit and Process

21. **Description of Proposed Mine.** The Brook Mine would be located about eight miles north of the City of Sheridan, Wyoming. (Tr. at 49.) Most of the mine would lie north of the Tongue River and Interstate 90, with the southeastern portion of the permit area sitting adjacent to the Tongue River. (E.g., Ex. DEQ 12-139; Tr. at 49.) The Brook Mine permit area would cover around 4,550 acres. (Ex. DEQ 1-051; Tr. at 50.) The proposed mine would annually produce about 2 million tons of coal. (Tr. at 276-77.) The mine has a predicted life of 12 to 13 years. (Tr. at 51.)

22. **Description of Permit Application.** The permit application consists of 12 volumes. (Exs. DEQ 1 through 12; Tr. at 61.) Volumes I, IA, and II contain appendices A, B, C,

and E, and deal with adjudication, legal aspects of the permit area, landowner interrelationships, and related maps. (Exs. DEQ 1 through 3; Tr. at 62.) Volumes III through X contain appendices D1 through D11, which discuss baseline information on land use, history, archaeological resources, climatology, topography, geology, overburden, hydrology, soil resources, vegetation inventory, wildlife, wetlands, and AVFs. (Exs. DEQ 4 through 11; Tr. at 62-64.)

23. **Mine Plan.** The permit application also contains a mine plan. (Ex. DEQ 12; Tr. at 64.) Among other things, the mine plan includes maps identifying the affected areas and features of the mine. (Ex. DEQ 12-129 to -147.) It also describes the mining sequence and mining methods used at the proposed mine. (Tr. at 121; Ex. DEQ 12-028.) Mr. Kristiansen testified that, generally, mining will proceed moving westward from the east side of the proposed permit area. (Tr. at 121-22; Ex. DEQ 12-129 and -134.) The first area to be mined is called the TR-1 trench and it is located in the southeast corner of the proposed permit area. (Tr. at 121; Ex. DEQ 12-129.)

24. The proposed mine would predominantly use a method known as “highwall mining,” which is similar to auger mining and regulated as such. (Ex. DEQ 12-035; Tr. at 50 and 117-19.) Mr. Kristiansen and Mr. Barron testified that highwall mining begins by digging a box cut down to the coal seam. (Tr. at 50-51 and 654.) A remotely-operated highwall miner unit then mines tunnels up to 2,000 feet into “panels” of the exposed coal seam perpendicular to the trench. (Tr. at 50-51, 118-19, 125-26, and 654-55.) Walls (or “webs” or “pillars”) of coal are left unmined between the tunnels to provide support and prevent subsidence, with wider “barrier pillars” periodically placed to offer extra safety between sets of tunnels. (Tr. at 50-51, 120, 656, and 819.) The mine plan estimates that this method will recover 40% to 65% of the coal. (Ex. DEQ 12-035.)

25. **Reclamation Plan.** The permit application also contains a reclamation plan, which the Department uses to enforce reclamation of the permit area to achieve the post-mine land use.

(Tr. at 175-76; Ex. DEQ 13.) The Brook Mine's post-mine land uses will mostly be agricultural, primarily grazing. (Tr. at 176; Ex. DEQ 13-014.) The reclamation plan discusses post-mining grading, revegetation, and facility disposal. (Ex. DEQ 13-016 to -018, -023 to -041, -074, and -075.) The plan states the reclamation schedule and sequence. (Ex. DEQ 13-075, -076, and -114.)

26. Rather than disturbing the TR-1 area in years 1 and 2 and waiting to reclaim it until between years 12 and 16, Big Horn requested that Brook be required to reclaim the area immediately after mining and not use the pit as a water source. (Ex. BHC 3-008 and -009; Tr. at 859.) Mr. Kristiansen stated that reclaiming the pit immediately would pinch off a major water source for dust suppression, and that the pit would be reclaimed eventually. (Tr. at 192-93.)

27. **Permit Application Process.** Mr. Kristiansen testified that Brook filed the permit application in October of 2014, and the Division found that the application was complete on November 3, 2014. (Tr. at 52.) The Division then began their technical review and comment process. (*Id.*) The application had six rounds of comments and responses before the Division determined the application was suitable for publication. (Tr. at 45 and 58; Ex. DEQ 34.)

28. Mr. Kristiansen worked with other Department employees and agencies with expertise in different subjects to review the permit application. (Tr. at 53-54.) Alan Edwards, the Department's deputy director, acted as the Division's Administrator for the application. (Tr. at 55.)

29. In December of 2016, the Division determined that the application was suitable for publication and notice of the public comment period was published. (Tr. at 52-53.) The objectors filed timely objections before January 27, 2017. (Exs. BHC 3, Fishers 26, and PRBRC 1.)

D. Overlapping Permits

30. In the TR-1 area, Brook Mine's proposed permit boundary will overlap with Big Horn's existing permit boundary. (Ex. DEQ 13-075.) Mr. Kristiansen testified that overlapping

permits are not uncommon and that the Department regulates each mine in the overlap area so that the party responsible for the reclamation liability provides a bond for that liability. (Tr. at 154-55 and 189.) He testified that Brook will have to bond for everything they do in that area. (Tr. at 188-89; Ex. DEQ 13-075.) The reclamation plan states that each party must separately and fully bond the areas disturbed by their mining activities and the final party to disturb an area will have final responsibility to reclaim that disturbance. (Ex. DEQ 13-075.) The mine plan includes a statement, “Agreements between the permittees are located in the Adjudication File.” (Ex. DEQ 12-088.)

31. In its objection letter, Big Horn notes that it has not consented to overlapping permit boundaries. (Ex. BHC 3-002.) Mr. Sweeney testified that the application does not actually contain any agreement between Big Horn and Brook addressing operations and reclamation in the overlap area. (Tr. at 865-66 and 868-69; Ex. BHC 7.) Big Horn requested a permit condition to amend the application to specify Big Horn’s and Brook’s respective responsibilities on the lands in both of their permits. (Ex. BHC 5-003.) Big Horn also requested a change to the Mine Plan to reflect that a joint-use agreement does not exist between Big Horn and Brook. (*Id.*)

E. Surface Water Issues

32. **Surface Water Baseline Information.** The permit application contains several sections detailing baseline surface water quantity and quality data. Appendix D6 includes a narrative describing the hydrological baseline. (Ex. DEQ 6-011 to -022.) The permit application notes that two monitoring stations each on Slater Creek and Hidden Water Creek were used to collect baseline data. (Ex. DEQ 6-017 to -019.) It also includes several tables, exhibits, and addenda containing data and analysis of the baseline hydrology. (Exs. DEQ 6-038 to -057, -086 to -089, -092 to -094, and -165 to -236.)

33. The objectors generally allege that this baseline data is not adequate. In particular, PRBRC alleged in its objection letter that monitoring stations should have been operated longer and that Appendix D6 should include more hydraulic conductivity data. (Ex. PRBRC 1, at 8.)

34. Mr. Kunze testified about the permit application's baseline hydrology. Mr. Kunze testified that Brook collected baseline data according to Guideline 8, the Division's guideline on baseline surface water monitoring. (Tr. at 394-45, Ex. DEQ 22.) Beyond what Guideline 8 recommends, Brook submitted additional data from a USGS peak flow gauge on Slater Creek and data collected by the Big Horn mine on Hidden Water Creek. (Tr. at 396, Ex. DEQ 6-039.)

35. **Surface Water Monitoring Stations.** The permit application commits to two monitoring stations each on Slater Creek and Hidden Water Creek. (Ex. DEQ 12-062 (citing Ex. DEQ 6-017 to -019).) In addition, the application commits to using two USGS gaging sites on the Tongue River: one at Monarch, and one near the Wyoming-Montana state line. (Ex. DEQ 12-112.)

36. PRBRC requested in their objection letter that water quality sampling stations be established on the Tongue River near the upstream and downstream boundaries of the permit area. (Ex. PRBRC 1, at 8.) Ms. Brezik-Fisher also objected to the way the Tongue River would be monitored. (Tr. at 1162-63); (Ex. Fisher 26, at 3.)

37. At the hearing, Mr. Kunze testified that he did not consider additional monitoring stations on the Tongue River to be required by the Act or the Division's coal rules and regulations ("*Coal Rules*"). (Tr. at 411.) However, he recommended that, rather than use the USGS gaging sites on the Tongue River as proposed, the mine use new monitoring stations. (Tr. at 411-12.) Two monitoring stations would be installed on the Tongue River near the upstream and downstream edges of the permit boundary and one station would go on Goose Creek. (Tr. at 411-12.)

38. **Hydrologic Control Measures.** The permit application commits to several hydrologic control measures to prevent impacts to surface water quality and quantity in Mine Plan section MP.5. The mine plan details the use, design, and location of sedimentation impoundments (or “sediment ponds”), flood control reservoirs, and diversions. (Ex. DEQ 12-039 to -052; DEQ 12-163 to -082.) The mine plan also discusses the use of alternative sediment control measures (“ASCMs”). (Ex. DEQ 12-149 to -162.) Finally, the mine plan describes a 100-foot buffer around Slater Creek that is designed to protect it from impacts from mining. (Ex. DEQ 12-139.)

39. Several objectors alleged in general their concerns about impacts to surface water quantity and quality. In particular, Mr. Gerlach wrote in his expert report that Mine Plan section MP.5 does not provide an alternative plan to control surface water flows if groundwater inflow exceeds the design capacities of the hydrologic control measures. (Ex. BHC 9-005.)

40. Mr. Kunze testified that a licensed professional engineer must design and supervise the construction of sediment ponds, flood control reservoirs, and diversions. (Tr. 401-03.) He testified that sediment ponds must be designed in accordance with Guideline 13, the Division’s guideline on sediment pond design. (Tr. at 401.) He testified that ASCMs must be designed in accordance with Guideline 15, the Division’s guideline on ASCM design. (Tr. at 405-07.)

41. Mr. Kunze testified that ASCMs will not be the sole method of hydrologic control within half a mile of Class II streams as designated by the Water Quality Division. (Tr. at 405-07.) The Water Quality Division has designated Tongue River and Goose Creek as Class II streams. (Tr. at 405-07.) Mr. Kunze testified that sediment ponds will be inspected quarterly and after significant storm events, defined as 1.5 inches of precipitation. (Tr. at 402-03.) He testified that ASCMs will be inspected monthly and during regular quarterly inspections. (Tr. at 407.)

42. **Replacing Affected Surface Water Supplies.** The permit application declares that existing uses of the Tongue River and Goose Creek are not expected to be impaired. (Ex. DEQ 12-055 to -059.) Several objectors were concerned that the mine could damage surface water rights.

43. Mr. Kunze testified that the highwall mining method will only directly disturb 0.2 percent of the Goose Creek and Tongue River watershed. (Tr. at 397.) The mine will employ hydrologic control measures to protect flows during the life of the mine. (Tr. at 401 to 403.) Mr. Kunze testified that he modeled post-mining flows and that they would be almost identical to pre-mining flows. (Tr. at 410.) In the event that the mine impairs a water right, Brook must replace the water with a source of similar quality and quantity. (Tr. at 409.)

F. Groundwater Issues

44. **Groundwater Baseline Information.** The permit application contains a description of the geology in the permit area, including the presence or absence of groundwater in the different strata. (Ex. DEQ 5-016 to -020.) The application also contains information on the hydrology in the permit area, including water levels, groundwater movement, recharge and discharge areas, and information about baseline water monitoring. (Ex. DEQ 6-023 to -031.) Mr. Kristiansen stated that Brook consulted with the Department to select the baseline groundwater monitoring sites before they were drilled. (Tr. at 97; Ex. DEQ 6-024 and -025.) The application includes a description that the overburden in the permit area is dry. (Ex. DEQ 6-023 and -024.) Mr. Kristiansen testified that about 70 to 80 percent of the permit area is dry. (Tr. at 337.)

45. Big Horn argued that the application lacks sufficient baseline groundwater information because it does not include information specifically from the TR-1 area. (Tr. at 211-12 and 939-40.) Mr. Kristiansen agreed that Brook had not drilled for groundwater samples near the TR-1 trench. (Tr. at 210.) Mr. Gerlach testified that the application could not have sufficient

baseline without information about the TR-1 area, which contains backfill from a reclaimed Big Horn pit. (Tr. at 939-40; Ex. BHC 14.) He stated that Brook should have used data from Big Horn's 2002 groundwater restoration document ("GRD") to characterize the groundwater in the TR-1 area. (Tr. at 927-29 and 940-41; Ex. BHC 15.) He also speculated that the application's groundwater model would have been improved if it included GRD information. (Tr. at 954.)

46. Dr. Kuchanur testified that he reviewed the GRD when reviewing Brook's model, but determined that the GRD and the model were made for two different purposes and the data in the GRD were not reliable inputs for the model. (Tr. at 1464-66 and 1475-80.) However, he used the GRD to cross-check the model's results and it supported them. (Tr. at 1466 and 1472-75.)

47. **Groundwater Drawdowns.** The permit application identifies and maps the groundwater rights near the mine. (Ex. DEQ 1-372 to -412; Ex. DEQ 3-012 and -014; Tr. at 78-80.) It also includes a model to predict drawdowns to nearby wells. (Ex. DEQ 12-183 and -251.)

48. The objectors raised concerns that the drawdowns would harm their wells. (*E.g.*, Tr. at 1039 and 1104.) Also, Mr. Gerlach speculated that mining in the TR-1 trench would draw water from the Tongue River into the trench and the coal seams being mined. (Tr. at 947-52.)

49. Dr. Kuchanur testified that the drawdowns predicted in the groundwater model were small. (Tr. at 485 and 488-89; Ex. DEQ 12-187 and -251.) He testified that the groundwater model conservatively estimated that the peak pit inflow that will occur at the Brook Mine would be in year 7 and would only be 0.22 cubic feet per second ("cfs"). (Tr. at 487 and 1470; Ex. DEQ 12-254.) He stated that 0.22 cfs was small even when compared with the Tongue River's lowest flow rate in the last 10 years of 100 cfs. (Tr. at 488-89.) He also stated that the GRD concluded that backfill in the TR-1 area took 23 years to recharge, which was only 0.06 cfs per year and is in line with the drawdown estimates in Brook's model. (Tr. at 1469-71; Ex. BHC 15-009.)

50. **Replacing Affected Groundwater Supplies.** Dr. Kuchanur testified about the commitment to replace “any adjudicated water right” that is disturbed or affected by the mining operations. (Tr. at 500; Ex. DEQ 12-062.) He stated that the Department agrees with objectors that the language should change to cover all valid rights, and not just adjudicated rights. (Tr. at 500.)

G. Alluvial Valley Floors (“AVF”)

51. The objectors raised concerns that the Department had not evaluated all potential AVF locations near the permit area. (PRBRC’s Prehearing Memo. at 9.) The objectors also argued that the potential AVFs that the Department had not designated would be affected by mining. (*Id.*) Mr. Wireman speculated that in the western part of the permit area, the coals “probably subcrop” in the alluvium of Slater Creek and the Tongue River, and hydrologically connect the coals and the river. (Tr. at 1388.) He expressed concerns that dewatering the coal would affect Slater Creek, Hidden Water Creek, and the Tongue River alluvium and potential AVF. (Tr. at 1362-65, 1374-76, 1380-81.) He expressed concern that mining could irreversibly change hydrologic flows underground. (Tr. at 1370-72.)

52. Mr. Kristiansen testified that AVFs are drainages that have the ability to be farmed. (Tr. at 105.) He testified about AVF determinations in four areas in or near the permit area. (Tr. at 108-16; Ex. DEQ 11-031.) First, the Division declared part of the Tongue River Valley on the east side of the Brook Mine permit area to be an AVF as part of Big Horn Mine’s operations. (Tr. at 109; Ex. DEQ 11-010.) Brook will disturb this AVF with an overburden pile and sediment pond, but it will also monitor, maintain, and restore the AVF. (Exs. DEQ 12-090, -092 to -094, and -139, and 13-073 and -074.) Mr. Barron stated that AVFs that are not significant to farming can be disturbed but must be reclaimed. (Tr. at 680-81.) The reclamation plan commits to maintaining the AVFs’ essential hydrologic functions and restoring flows to AVFs. (Ex. DEQ 13-073 and -074.)

53. Second, the Department determined that an area along Hidden Water Creek in the permit area is not an AVF. (Tr. at 113-14; Ex. DEQ 11-021.)

54. Third, an area along Slater Creek within the permit area was determined to be an AVF. (Tr. at 110-12; Ex. DEQ 15.) However, Mr. Kristiansen testified that the Slater Creek AVF is not going to be affected by mining operations and, therefore, was not required to be designated in the application. (Tr. at 112-13.) The Slater Creek AVF will not be affected because the surface activities are located away from the AVF and highwall mine panels will terminate underground at least 100 feet from the AVF part of Slater Creek. (Tr. at 156-57; Exs. DEQ 12-131, and 15-005.)

55. Fourth, Mr. Kristiansen stated that an area lying south of the permit area along the Tongue River is potentially an AVF, but is not going to be affected by mining and does not have to be designated in the application. (Tr. at 109 and 114-16; Ex. DEQ 16-002.) The determination that this area would not be affected by mining was based on the information in the permit application, the lack of discharge, and the lack of affected area outside of the permit boundary. (Tr. at 266; *see* Exs. DEQ 12-091 to -092, 13-073, and 16-002.) Dr. Kuchanur testified that, based on groundwater modeling, he does not believe there is a hydrologic connection between the Carney coal seam and the surface water of the Tongue River. (Tr. at 554-55.) Mr. Kristiansen stated that the Department would evaluate and designate additional AVFs if there were indications that the potential AVF lands would be affected by mining operation. (Tr. at 266.)

H. Subsidence

56. The application identifies the location of existing or abandoned mines and includes baseline information on geology. (Ex. DEQ 3-011 and DEQ 5; Tr. at 77-78.) The mine plan also includes a subsidence control plan. (Tr. at 666; Ex. DEQ 12-319 to 333.)

57. The objectors criticized the amount of baseline information in the application and the detail in the subsidence control plan. Mr. Sweeney testified that overburden sampling was not conducted in the TR-1 area and that it should be required. (Tr. at 861-62.) Dr. Marino testified that, in his opinion, the application needs more information to analyze the likelihood of future subsidence. (Tr. at 1200.) Regarding the subsidence control plan, Dr. Marino opined that the plan does not demonstrate that it would control the subsidence. (Tr. at 1228.) He also testified that he has never seen the Mine Safety and Health Administration (“MSHA”) referenced in a permit application as the entity that approves a mine for surface subsidence. (Tr. at 1203.)

58. Mr. Kristiansen testified that the permit application accurately characterizes the geology in and around the permit area. (Tr. at 93.) He stated that the application describes the characteristics of the overburden and coal in the permit area, including geologic hazards. (Ex. DEQ 5-017 to -021; Tr. at 88-91.) He stated that the Department approved locations of drill holes for overburden sampling with a tighter configuration than normal. (Tr. at 91-92.) Although Brook was not able to access all of the planned drilling locations, such as the TR-1 area, the Department was satisfied by the holes Brook drilled for the purpose of collecting pre-application information. (Tr. at 92-93 and 186-88.) Mr. Barron and Mr. Woodring testified that Brook will conduct additional geologic sampling and testing of the roof, coal seams, and floor material in the locations of each highwall mine panel prior to mining. (Exs. DEQ 5-018 and 12-032; Tr. at 662 and 818.) That will include sampling near the TR-1 trench. (Tr. at 663-64.)

59. Mr. Kristiansen testified that the subsidence control plan analyzes the potential for subsidence within the mine area. (Tr. at 162; Ex. DEQ 12-322 to -326.) He described his training from the Office of Surface Mining Reclamation and Enforcement (“OSMRE”) on reviewing subsidence control plans. (Tr. at 163-65; Exs. DEQ 17 through 20.) He stated that based on

computer models and using formulas developed by OSMRE, the Brook Mine was determined to be a non-subsiding mine. (Tr. at 162 and 169.) He testified that historic underground mines in the area were considered in the plan's analysis and that Brook Mine's highwall panels would be at least 500 feet away from known underground workings. (Tr. at 169-71; Ex. DEQ 12-322 to -326.)

60. Mr. Kristiansen and Mr. Barron stated that the plan also includes how Brook would monitor and address subsidence, if it does occur. (Tr. at 171-72 and 676; Ex. DEQ 12-326 and -327.) Mr. Barron testified that the permit application commits to designing web and barrier pillars to comply with the mine's ground control plan approved by MSHA. (Tr. at 661-63; Exs. DEQ 5-018 and DEQ 12-322.) He stated that MSHA requires highwall miner ground control plans to meet certain subsidence-related standards, such as a 1.3 stability factor. (Tr. at 670-74; Ex. Brook 10d.)

I. Blasting

61. The permit application contains a blasting plan and schedule. (Ex. DEQ 12-073 to -082.) The blasting plan provides that the mine will comply with all federal and state laws regulating explosive storage, handling, preparation, and use. (Ex. DEQ 12-074.)

62. All of the objectors expressed concerns about blasting. Mr. Buyok and Ms. Collins expressed concerns that blasting could exacerbate historical subsidence. (Tr. at 1022, 1070.) Ms. Malone testified that she worried that blasting would require Brook Mine to shut down Interstate 90. (Tr. at 1118.) Ms. Brezik-Fisher, Mr. Bocek, and Ms. Collins, as well as Big Horn, expressed support for a condition requiring Brook Mine to use seismographs to monitor vibrations from blasting on request. (Tr. at 858-60, 1091-93, 1086-87, and 1165-66.)

63. Mr. Emme testified about the mine's blasting plan. He stated that the rules only allow airblast and ground vibrations that would not damage structures or wells. (Tr. at 581-82.) He testified that blasts may cause a house to shake but cannot damage it, and explained that day-to-

day events like high wind or slamming doors would cause stronger vibrations. (Tr. at 581-82, 584.) He explained that Wyoming regulations do not require a detailed blasting plan listing exact specifications of explosives, but rather that they allow a mine flexibility for each shot. (Tr. at 585.) He testified that Brook must publish notice of when blasting will occur, how access to the area will be restricted, and the operator's contact information. (Tr. at 585.)

64. Mr. Emme testified that he was not aware of a single incident where blasting was proven to impact a water well, though companies often settle such claims. (Tr. at 578, 607-08.) He testified based on his knowledge and experience as a blasting expert that the vibrations from blasting at the mine would likely not cause subsidence in historic mines. (Tr. at 602.) He testified that the Department has, in the past, used seismographic monitors to measure vibrations near structures to ensure that the vibrations do not exceed regulatory limits. (Tr. at 618.)

J. Fire Control Plan

65. The mine plan contains a fire control plan, which addresses fire prevention, control equipment, and control procedures. (Ex. DEQ 12-312 to -317.) Mr. Kristiansen testified that MSHA, not the Department, is the regulator that ensures that a fire is safely extinguished and prevented from returning. (Tr. at 159-61.) Mr. Barron testified that there are no known underground coal fires near the proposed operation, but that if one was encountered, extinguishing it would probably be possible. (Tr. at 691-93.) He stated that the fire control plan gives the operator latitude to use the best practices to deal with a fire. (Tr. at 694-95.)

66. The objectors questioned Mr. Barron's basis for concluding that there are no underground coal fires near the permit area. (Tr. at 722-23.) Mr. Barron acknowledged that he and his company had not independently surveyed whether mine fires were present. (Tr. at 716 and 722-

23.) Big Horn requested a permit condition requiring Brook to map underground coal fires within 500 feet adjacent to the highwall mining areas prior to mining. (Ex. BHC 5-002; Tr. at 859-60.)

K. Traffic

67. The application includes a description of the roads the mine will use to transport coal from the permit area. (Ex. DEQ 12-025 to -027, and -131.) The mine plan commits Brook to coordinate with the Wyoming Highway Department when constructing access roads joining with public roads. (Ex. DEQ 12-026.) Mr. Bocek testified that he uses a frontage road next to Interstate 90 and was concerned the Brook Mine would increase traffic. (Tr. at 1090-91.) Ms. Brezik-Fisher testified that she had heard an estimate of around 200 semi-trailer trips per day. (Tr. at 1166.)

68. Mr. Kristiansen testified that coal will be transported from Brook Mine by semi-trailers. (Tr. at 147.) He testified that the application does not contain any road use agreements between Brook and government entities, but such agreements are not required to be made or placed in the application. (Tr. at 151-52.) Mr. Barron agreed that there were no road use agreements in the application. (Tr. at 701-02.)

L. Recreational Uses

69. Ms. Malone testified about the Kleenburn Recreation Area and other recreation near the permit. (Tr. at 1115-16.) She stated that she was not aware of how Brook was protecting recreation and speculated that some recreation areas may close due to mining. (Tr. at 1118-19.)

70. The permit application includes an evaluation of the current and past land uses near the proposed permit area, including recreational use. (Ex. DEQ 4-010 and 4-013 to -015; Tr. at 271-72.) The Kleenburn Recreation Area is located south outside of the permit area. (Ex. DEQ 4-041.) The lands will be reclaimed so that conditions facilitate post-mine recreation replicating pre-mine recreation. (Ex. DEQ 13-015.) Hunting walk-in areas will be re-established post-mining. (*Id.*)

O. Bonding

71. **Reclamation Bond.** In their pre-hearing memorandum, PRBRC alleged that the Department had not yet calculated a reclamation bond amount. (*PRBRC's Pre-Hearing Memo.* at 9.) PRBRC alleged that this frustrated public review. (*PRBRC's Pre-Hearing Memo.* at 9.)

72. Mr. Emme testified that the Department must set a bond amount before mining can begin. (Tr. at 586-87, 610.) He testified that reclamation bonds must provide sufficient funding to reclaim a mine's present operations and for its projected disturbance for 12 months. (Tr. at 587.) In Brook's first operating year, the mine will disturb 30 acres; the mine offered a reclamation bond of \$371,000. (Tr. at 589-90.) Mr. Emme stated that this amount exceeds the amount that Guideline 12, the Division's guideline for reclamation bond calculation, would require. (Tr. at 590.)

73. **Surface Protection Bond.** The permit application contains a proposed calculation for a surface protection bond under Wyoming Statute § 35-11-416(a) for Big Horn's property within the permit area. (Ex. DEQ 1-066 to -101; Tr. at 66.) Brook's consultants prepared the calculation. (Tr. at 66.) The Department has not set the amount of a surface protection bond for Big Horn's property; it will do so after these proceedings, prior to permit issuance. (Tr. at 66-67.)

74. Mr. Sweeney testified that Big Horn has not waived its right to a surface protection bond by agreement with Brook. (Tr. at 873.) Big Horn asked for a condition requiring a surface protection bond be in place for its property prior to permit issuance. (Tr. at 871; Ex. BHC 5-003.)

P. Cumulative Hydrologic Impact Assessment ("CHIA")

75. Big Horn and PRBRC assert that the permit application has not been designed to ensure prevention of material damage to the hydrologic balance outside the permit area. (*Big Horn's Prehearing Memo.* at 2; *PRBRC's Pre-Hearing Memo.* at 8-9.) Mr. Kunze testified that the Department will make that finding after the Council has made a decision here. (Tr. at 413-414.)

76. PRBRC also complains that the CHIA for Brook Mine has not been completed yet. (*PRBRC's Pre-Hearing Memo.* at 8-9.) Mr. Kunze testified that the CHIA is not part of the permit application. (Tr. at 413 and 416.) He testified that the permit application must have a section detailing the probable hydrologic consequences of the mine, one of the data sources the Division uses to build CHIAs. (Tr. at 414-415; Ex. DEQ 12-055 to -059.) He testified that the probable hydrologic consequences section of the permit application contained no deficiencies. (Tr. at 415.)

IV. CONCLUSIONS OF LAW

1. PRINCIPLES OF LAW

A. Principles of Statutory Interpretation

77. Interpreting the meaning of a statute begins by looking at the plain and ordinary meaning of the words in the statute. *Bender v. Decaria*, 998 P.3d 953, 955 (Wyo. 2000). If the statute is unambiguous, then the plain meaning controls. *Id.* Every word in legislation is presumed to have a meaning, and a statute should be construed so that no part will be superfluous. *Basin Elec. Power Co-op. v. Bowen*, 979 P.2d 503, 509 (Wyo. 1999). “All statutes must be construed in pari materia and, in ascertaining the meaning of a given law, all statutes relating to the same subject or having the same general purpose must be considered and construed in harmony.” *BP America Prod. Co. v. Dept. of Revenue, State of Wyo.*, 2005 WY 60, ¶ 15, 112 P.3d 596, 604 (Wyo. 2005).

B. Surface Coal Mine Permit Application Process

78. An applicant seeking a surface coal mining permit must apply in writing to the Administrator. Wyo. Stat. Ann. § 35-11-406(a). The applicant has the burden of establishing that his application complies with the Act and all applicable state laws. Wyo. Stat. Ann. § 35-11-406(n).

79. After receiving an application, the Department determines if the application is “complete”, meaning that it “contains all the essential and necessary elements and is acceptable

for further review for substance and compliance” with the Act. Wyo. Stat. Ann. §§ 35-11-103(e)(xxii) and -406(e).

80. Next, the Division reviews the application’s substance to find whether it contains deficiencies. Wyo. Stat. Ann. §§ 35-11-103(e)(xxii) and -406(h). “‘Deficiency’ means an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the [D]irector[.]” Wyo. Stat. Ann. § 35-11-103(e)(xxiv). At the conclusion of this review, the Division may decide that the application is suitable for publication, deficient, or denied. *Id.* The phrase “suitable for publication” refers to the Division finding that an application complies with the requirements in the Act and the *Coal Rules* based upon the information known to the Division prior to public objections or comments. *Id.*

81. If the Division concludes that the application is deficient, the applicant may submit additional information to cure the deficiency. Wyo. Stat. Ann. § 35-11-406(h). There may be multiple rounds of Division review and applicant response until the Division either determines that the application is suitable for publication or denies the permit. *See id.*

82. Once an application is suitable for publication, the applicant publishes and mails notices of the application and the permit is subject to public comment. Wyo. Stat. Ann. § 35-11-406(j). Interested persons may comment on or object to the application in writing within 30 days after the notice’s last date of publication. Wyo. Stat. Ann. § 35-11-406(k). To resolve the objections, either the Director holds an informal conference or the Council holds a contested case hearing. *Id.*

83. If the Council holds a hearing, the Council “shall issue findings of fact and a decision on the application within sixty (60) days after the final hearing.” Wyo. Stat. Ann. § 35-11-406(p). After the Council issues its findings and decision resolving the objections, the

Administrator must review the application and the Council's decision and decide if he can make the seven required findings in Wyoming Statute § 35-11-406(n). The rules require the Administrator to also make three other findings at that time. *Coal Rules*, ch. 12, § 1(a)(iv) and (x). The Director may not approve the permit unless and until the Administrator makes the findings. Wyo. Stat. Ann. § 35-11-406(n) and (p).

84. No later than 15 days after he receives the Council's findings of fact and decision resolving the objections, the Director shall issue or deny the permit. Wyo. Stat. Ann. § 35-11-406(p). "In granting permits, the director may impose such conditions as may be necessary to accomplish the purpose of [the Act] which are not inconsistent with the existing rules, regulations and standards." Wyo. Stat. Ann. § 35-11-801(a). The rules also require the Director to place certain conditions on a surface coal mining permit. *Coal Rules*, ch. 12, § 1(a)(xviii)(A) through (E).

C. General Permit Application Requirements

85. **Permit Application.** The Act and the *Coal Rules* contain substantive requirements that an application must satisfy in order to be issued. *See, e.g.*, Wyo. Stat. Ann. § 35-11-406(a) and (b); *Coal Rules*, chs. 2, 3, 7, 12, and 19. An application must include baseline information on the applicant, the proposed mining operation, and lands inside and around the proposed permit area. Wyo. Stat. Ann. § 35-11-406(a) and (b). The applicant must also provide plans for mining operations and reclamation. Wyo. Stat. Ann. § 35-11-406(b); *Coal Rules*, ch. 2, §§ 5 and 6.

86. **Mine Plan.** The applicant must provide a plan for the mining operations, also referred to as a "mine plan", to describe how the applicant will conduct mining. Wyo. Stat. Ann. § 35-11-406(b); *Coal Rules*, ch. 2, § 5(a)(i). The applicant must map the affected areas and the locations of pits, buildings, operations, roads, and other features of the proposed mine. Wyo. Stat.

Ann. § 35-11-406(b)(v) and (viii); *Coal Rules*, ch. 2 § 5(a)(xvi). The applicant is also required to describe the sequence and timing of mining. *Coal Rules*, ch. 2, §§ 4(a) and 5(a)(i)(B).

87. **Reclamation Plan.** A permit application must include a plan for reclamation that identifies the post-mine land use. Wyo. Stat. Ann. § 35-11-406(b)(i); *Coal Rules*, ch. 2, § 6(a). The reclamation plan must describe post-mining operations, like grading and revegetating disturbed areas. Wyo. Stat. Ann. § 35-11-406(b)(ii), (iii), (iv), and (vii); *Coal Rules*, ch. 2, § 6(b)(ii), (iii), and (viii). The plan must provide a schedule and provide for prompt reclamation as mining progresses. Wyo. Stat. Ann. §§ 35-11-406(b)(xix) and -415(b)(ix); *Coal Rules*, ch. 2, § 6(a).

D. Overlapping Permits

88. Under Chapter 2, Section 5(a)(xviii) of the *Coal Rules*, when mine facilities, including overstrip areas, are shared by two or more separately permitted mining operations,

“[e]ach permittee shall bond the mine facilities unless the permittees sharing it agree to another arrangement for assuming their respective responsibilities. If such agreement is reached, the application shall include a copy of the agreement between or among the parties setting forth the respective bonding responsibilities of each party for the mine facilities. The agreement shall demonstrate to the satisfaction of the Administrator that all responsibilities under the Act and regulations for the mine facilities will be met.”

E. Surface Water Issues

89. **Surface Water Baseline Information.** The Act requires that mine permit applications include a description of annual rainfall, current surface waters, water rights, water uses, and a map showing water bodies and wells. Wyo. Stat. Ann. § 35-11-406(a)(vii), and 406(a)(ix). In addition, the *Coal Rules* require that mine permit applications include baseline monitoring information, including information on seasonal flow rates and the acreage of drainage areas, as well as data sufficient to identify seasonal variability in water quality. *Coal Rules*, ch. 2 § 4(a)(xi)(C) and (D).

90. **Surface Water Monitoring Stations.** Mine permit applications must include a surface water monitoring plan, identifying the quantity and quality parameters to be monitored, sampling frequency, and monitoring locations. *Coal Rules*, ch. 2 § 5(a)(viii)(D)(I).

91. **Hydrologic Control Measures.** The Act requires that mine permit applications describe how surface water will be diverted around affected lands when necessary to protect water quality or quantity. Wyo. Stat. Ann. § 35-11-406(b)(xiv). In addition, the rules require that permit applications include maps of locations of surface water hydrologic control methods, including sediment ponds, diversions, stream channels, and erosion control methods. *Coal Rules*, ch. 2 § 5(a)(i)(D)(IV). The rules also require that the permit describe the typical design of ponds. *Id.*

92. **Replacing Affected Surface Water Supplies.** The Act provides that if a surface coal mine operation proximately causes contamination, diminution, or interruption of a surface owner's domestic, agricultural, industrial, or other legitimate use of an underground or surface source, the operator must replace the water source. Wyo. Stat. Ann. § 35-11-415(b)(xii).

F. Groundwater Issues

93. **Groundwater Baseline Information.** A permit application must contain baseline information about the groundwater in and near the permit area. It must include a detailed description of the geology within the permit area, including details about groundwater located there. *Coal Rules*, ch. 2, § 4(a)(vii). It also must contain a characterization of the geologic strata including the results of test borings to show, among other things, the location of groundwater. *Coal Rules*, ch. 2, § 4(a)(viii). An application also must contain information on potentially-affected waters, including estimates of depth and quantity of groundwater, the thickness of known aquifers, and the recharge, storage, and discharge characteristics of the groundwater. *Coal Rules*, ch. 2, §

4(a)(xii)(A), (B), and (D). The application must describe the groundwater and geology on affected lands in enough detail to assess probable hydrologic consequences. *Coal Rules*, ch. 2, § 4(a)(xiv).

94. **Groundwater Drawdowns.** A permit application also must identify the locations of wells and subsurface waters. Wyo. Stat. Ann. § 35-11-406(a)(vii) and (ix); *Coal Rules*, ch. 2 § 4(a)(xiii) and (xvi). The application also must include a “determination of the projected result of proposed surface coal mining and reclamation operations, both on and off the mine site, which may reasonably be expected to change the quantity or quality of the surface and groundwater; the surface and groundwater flow, timing and availability[.]” *Coal Rules*, ch. 19, § 2(a)(i).

95. **Replacing Affected Groundwater Supplies.** The Act requires surface coal operations to replace landowners’ water supplies that are affected by the mining operations. Wyo. Stat. Ann. § 35-11-415(b)(xii).

G. Alluvial Valley Floors (“AVF”)

96. The Act defines alluvial valley floors. Wyo. Stat. Ann. § 35-11-103(e)(xviii). A permit application must contain enough information to demonstrate the presence or absence of AVFs within the permit area and in adjacent areas where AVFs “may reasonably be expected to be affected” by mining. *Coal Rules*, ch. 3, § 2(b). Prior to an application being suitable for publication, the Administrator must determine the existence and extent of an AVF within the permit area or on adjacent areas where the mining operation may affect waters that supply an AVF. *Coal Rules*, ch. 12, § 1(a)(i). The Administrator determines that an AVF exists on affected lands if: “[u]nconsolidated streamlaid deposits holding streams are present” and “[t]here is sufficient water to support subirrigation or flood irrigation agricultural activities.” *Id.*

97. If the Administrator determines that an AVF exists inside the permit area on affected lands, the application must include measures to comply with performance standards for

mining AVFs, which include preserving and reestablishing the “geologic, hydrologic and biologic characteristics that support the essential hydrologic functions” of designated AVFs. *Coal Rules*, ch. 3, § 2(c)(ix), and ch. 5, § 3(a). An operator must monitor AVFs during mining and until bond release, and also shall restore the essential hydrologic functions of AVFs on affected lands and preserve those functions of AVFs not on affected lands.” *Coal Rules*, ch. 5, § 3(b)(ii) and (c).

H. Subsidence

98. The applicant must have a professional geologist describe the geology of the permit area and adjacent areas. *Coal Rules*, ch. 2, § 4(a)(vii) and (viii). The applicant must describe the overburden, topsoil, subsoil, mineral seams, or other deposits. Wyo. Stat. Ann. § 35-11-406(a)(vii); *Coal Rules*, ch. 2, § 4(a)(x).

99. Auger mining is a type of surface mining under the Act. Wyo. Stat. Ann. § 35-11-103(e)(xx)(A). It may be limited or prohibited to minimize unwarranted subsidence. *Coal Rules*, ch. 5, § 6(b). For auger mining, subsidence control shall be provided as required by Chapter 7, Section 2 of the *Coal Rules*, which governs underground mines. *Coal Rules*, ch. 5, § 6(d).

100. Regarding subsidence control, Chapter 7, Section 2 requires that “[u]nderground mining activities shall be planned and conducted so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources.” *Coal Rules*, ch. 7, § 2(b)(iii).

Chapter 7, Section 2(c) of the *Coal Rules* also requires that:

The operator of an underground coal mining operation shall submit a plan of underground workings The plan shall include maps and descriptions of significant features of the underground mine, extraction ratios, measures taken to prevent or minimize subsidence and related damage, areas of full extraction and other information, as required by the Administrator.

I. Blasting

101. The Act provides that the Division must have rules regarding providing notice of blasting; maintaining a log; limiting blasting to protect people, property, underground mines, and water flows outside the permit area; ensuring that blasting operations be conducted by trained and competent persons; and providing a pre-blast survey to any resident or owner of a dwelling or structure within half a mile of the permit area. Wyo. Stat. Ann. § 35-11-415(b)(xi). The *Coal Rules* supplement the Act. *Coal Rules*, ch. 6.

102. The rules require that applications include a blasting plan for the area to be mined, including how the operator will comply with Chapter 6's limitations on ground vibration and airblast. *Coal Rules*, ch. 2, § 5(a)(vii). The plan must also include information about the maximum amount of explosives detonated in any one blast; information about the nearest dwelling to any blasting area; a description of blasting monitoring, warning, and site access controls; a description of the procedure for recording and retaining a blast log; and a sample copy of public notices. *Id.*

J. Fire Control Plan

103. A mine plan must include a description of contingency plans developed to preclude sustained combustion of any materials constituting a fire hazard. *Coal Rules*, ch. 2, § 5(a)(iv). Wyoming Statute § 35-11-406(b)(ix) requires an applicant to provide a plan for insuring that:

materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent pollution of surface or subsurface water or threats to human or animal health and safety. Such method may include, but not be limited to covering, burying, impounding or otherwise containing or disposing of the . . . dangerous material[.]

104. An applicant must identify the extent of active or inactive mines. Wyo. Stat. Ann. § 35-11-406(a)(ix); *Coal Rules*, ch. 2, § 4(a)(ix)(C). However, the Act and the *Coal Rules* do not require an applicant to survey or map the locations of existing underground coal fires.

K. Traffic

105. An applicant must include maps of public highways and existing and proposed roads. Wyo. Stat. Ann. § 35-11-406(a)(ix) and (b)(v); *Coal Rules*, ch. 2, § 4(a)(xvi). The applicant must describe mineral transport and the major equipment used for all aspects of the operations. *Coal Rules*, ch. 2, § 5(a)(i)(A). The Act and the *Coal Rules* do not require an applicant to have or provide road use agreements with governmental entities for public roads, and do not authorize the Department to regulate traffic on public roads. *See Coal Rules*, ch. 12, § 1(a)(iv)(D).

L. Recreational Uses

106. An applicant must identify the past, current, and post-mine land uses of the permit and surrounding areas. Wyo. Stat. Ann. § 35-11-406(a)(vii) and (b)(i); *Coal Rules*, ch. 2, § 4(a)(i), (a)(ii), and (a)(xvii). An applicant also must describe procedures to avoid public nuisance or endangering public safety, human or animal life, property, wildlife and plant life in or adjacent to permit. Wyo. Stat. Ann. § 35-11-406(b)(xiii).

N. Bonding

107. **Reclamation Bond.** The Act requires operators to file a reclamation bond with the Administrator before commencing mining. Wyo. Stat. Ann. § 35-11-417(a) through (c). The bond must be enough to assure that the mine performs all legal requirements. Wyo. Stat. Ann. § 35-11-417(a). This primarily includes the cost of reclaiming the land. Wyo. Stat. Ann. § 35-11-417(c)(i).

108. **Surface Protection Bond.** The Act provides that a mineral owner must execute a surface protection bond prior to permit issuance to protect the interests of the surface owner, unless the surface owner waives this requirement by agreement. Wyo. Stat. Ann. § 35-11-416(a).

O. Cumulative Hydrologic Impact Assessment (“CHIA”)

109. The Act provides that the Director shall not approve a surface coal mining permit unless the applicant affirmatively demonstrates and the Administrator finds that the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area. Wyo. Stat. Ann. § 35-11-406(n)(iii). The Division has promulgated rules laying out the requirements for a CHIA, which is the analysis that permits the Administrator to make this finding. *Coal Rules*, ch. 19. The Council asked the parties for briefs discussing the applicability of Wyoming Statute § 35-11-406(n) to these proceedings. *Briefing Order* (June 13, 2017).

2. APPLICATION OF PRINCIPLES OF LAW

A. Surface Coal Mine Permit Application Process

110. **Permit Application Process.** Brook has completed all of the procedural steps required to this point. *See* Wyo. Stat. Ann. § 35-11-406(e) through (j); (*See* Tr. at 45, 52-55, and 58; Exs. BHC 3, Fishers 26, and PRBRC 1.) The Administrator is not yet required to make the findings under Wyoming Statute § 35-11-406(n) because how the Council resolves objections may affect the application and thus the required findings. Wyo. Stat. Ann. § 35-11-406(k), (n), and (p).

111. The Director shall issue or deny the permit within 15 days of receiving these findings of fact, conclusions of law, and decision. Wyo. Stat. Ann. § 35-11-406(p). The Director may issue the permit with conditions that are necessary to accomplish the purpose of the Act and which are not inconsistent with the existing rules and standards. Wyo. Stat. Ann. § 35-11-801(a).

B. General Permit Application Requirements

112. **Permit Application.** The application contains the required elements, including an adjudication file, baseline information, and mine and reclamation plans. *See* Wyo. Stat. Ann. § 35-11-406(a) and (b); *Coal Rules*, chs. 2, 3, 7, 12, and 19; (Exs. DEQ 1 through 12; Tr. at 61-64).

113. **Mine Plan.** The permit application's mine plan satisfies the applicable requirements in the Act and the *Coal Rules*. The mine plan includes the required maps of the mining operation. *See* Wyo. Stat. Ann. § 35-11-406(b)(v) and (viii); *Coal Rules*, ch. 2 § 5(a)(xvi); (Ex. DEQ 12-129 to -147.) It describes the mining sequence and the highwall mining method. *See* *Coal Rules*, ch. 2, §§ 4(a) and 5(a)(i); (Tr. at 121-22; Ex. DEQ 12-028, -035, -129, and -134.)

114. **Reclamation Plan.** The reclamation plan complies with the Act and the *Coal Rules* by identifying post-mine land uses, describing post-mining activities including grading, revegetation, and disposal of facilities, and including a reclamation schedule. *See* Wyo. Stat. Ann. §§ 35-11-406(b)(i), (ii), (iii), (iv), (vii), and (xix), and -415(b)(ix); *Coal Rules*, ch. 2, § 6(a), 6(b)(ii), 6(b)(iii), and 6(b)(viii); (Tr. at 176; Ex. DEQ 13-014, -016 to -018, -023 to -041, -074 to -076, and -114.) Although Big Horn has requested the TR-1 trench to be immediately reclaimed, the Council denies Big Horn's request because the trench is needed as a water source for mining activities, and even if it is used as a sump, it will still be reclaimed. (Tr. at 192-93.)

C. Overlapping Permits

115. The Act and the *Coal Rules* do not forbid mining permit areas from overlapping and they do not require permittees with overlapping permits to have agreements for reclamation responsibilities in the overlapping area. *See* *Coal Rules*, ch. 2, § 5(a)(xviii). However, if such an agreement exists, it must be provided to the Department. *Id.* The terms of the reclamation plan already require Brook to fully bond any disturbance it plans in the area where it and Big Horn's permit areas overlap. (Ex. DEQ 13-075.) Brook will be responsible for bonding and reclaiming its own disturbance, as will Big Horn. Therefore, the permit condition requested by Big Horn on the assignment of responsibility is unnecessary. However, the Council agrees that Brook should

correct the mine plan to state that the permit does not include an agreement between the companies. (See Tr. at 865-66 and 868-69; Ex. BHC 7; Ex. DEQ 12-088.)

D. Surface Water Issues

116. **Surface Water Baseline Information.** The permit application's baseline data collection complies with the requirements of the Act and the *Coal Rules*. The application includes a description of the permit area's annual rainfall. (Ex. DEQ 4-084 to -085, and -109.) It includes a description of current surface waters and water uses. (Ex. DEQ 6-011 to -017, and -092 to -094.) It includes a description of surface water rights. (Exs. DEQ 2-012 and DEQ 6-047 to -053.) It includes a map showing current water bodies and wells. (Ex. DEQ 2-012, -014, and -015.) This data satisfies the requirements of the Act. Wyo. Stat. Ann. § 35-11-406(a)(vii) and (ix). With respect to the *Coal Rules*, the permit application includes information on seasonal flow rates of surface waters. (Ex. DEQ 6-054 to -057.) It includes information on the acreage of drainage areas. (Ex. DEQ 6-011, -038, and -092.) It includes water quality information sufficient to identify seasonal variability. (Ex. DEQ 6-021 to -022, -087, and -203 to 235.) This data satisfies the requirements of the regulations. *Coal Rules*, ch. 2 § 4(a)(xi)(C) and (D). The objectors generally allege that the existing baseline data is not adequate, but additional baseline data is not required.

117. **Surface Water Monitoring Stations.** The permit application's surface water monitoring locations comply with the *Coal Rules*. The application includes a monitoring plan that identifies quantity and quality parameters, sampling frequency, and monitoring locations, as required by rule. *Coal Rules*, ch. 2 § 5(a)(viii)(D)(I); (DEQ 12-062 to -064, -112, and -144.)

118. Mr. Kunze suggested using three surface water monitoring stations in lieu of the USGS gaging sites on the Tongue River and Goose Creek in order to determine whether changes to the Tongue River were due to the mine's operations or due to Goose Creek's relatively lower

quality, although he stressed that they are not required by law. (Tr. at 411-12.) The Council agrees that additional monitoring stations are not required under the Act or the *Coal Rules*. (See Tr. at 411-12.) However, because the Department has suggested this condition, the Council will condition its decision in this matter on Brook submitting a revision to the permit within 150 days amending the location of its surface water monitoring stations.

119. **Hydrologic Control Measures.** The permit application adequately describes the hydrologic control methods that the mine will use to protect water quality and quantity. The permit application describes how Hidden Water Creek will be diverted around trench cuts. (Ex. DEQ 12-043 to -044.) This description satisfies the requirement that mine permit applications describe how surface water will be diverted around affected land. Wyo. Stat. Ann. § 35-11-406(b)(xiv). The permit application includes maps showing the location of hydrologic control methods that Brook proposes to use. (Ex. DEQ 12-139 to -143.) It also includes descriptions of the typical design of hydrologic control measures. (Ex. DEQ 12-149 to -181.) These maps and descriptions satisfy the Division's regulation requiring that a permit application describe the locations and typical design of hydrologic control methods. *Coal Rules*, ch. 2 § 5(a)(i)(D)(IV). These robust hydrologic control methods adequately address the objections regarding surface water quality.

120. **Replacing Affected Surface Water Supplies.** The Council finds that the mine is unlikely to affect surface water supplies, in light of Mr. Kunze's testimony. (Tr. at 397, 410.) If the mine proximately causes the contamination, diminution, or interruption of an underground or surface source of water for a surface owner, the Act requires the mine to replace the source. Wyo. Stat. Ann. § 35-11-415(b)(xii). No permit condition is necessary to ensure that the mine replaces contaminated or interrupted water sources, because the Act requires that the mine do so. *Id.*

E. Groundwater Issues

121. **Groundwater Baseline Information.** The permit application contains the required baseline information about groundwater. *Coal Rules*, ch. 2, § 4(a)(vii), (viii), (xii), and (xiv). (Exs. DEQ 5-016 to -020, and 6-023 to -031.) Although Big Horn’s GRD may have provided additional data points for the model, the law does not require that the application include the GRD, nor is the GRD reliable enough for modeling the proposed Brook Mine. (Tr. at 1464-66 and 1475-80.)

122. **Groundwater Drawdowns.** The permit application properly identifies nearby wells and groundwater. *See* Wyo. Stat. Ann. § 35-11-406(a)(vii) and (ix); *Coal Rules*, ch. 2 § 4(a)(xiii) and (xvi); (Ex. DEQ 1-372 to -412; Ex. DEQ 3-012 and -014; Tr. at 78-80.) It also includes a groundwater model and determines the projected result of mining and reclamation on groundwater both in and outside of the permit area. *See Coal Rules*, ch. 19, § 2(a)(i); (Ex. DEQ 12-183 and -251.) The model predicts that the proposed mine will have only small impacts on groundwater wells. (Tr. at 485 and 488-489; Ex. DEQ 12-187 and -251.) Based on Dr. Kuchanur’s testimony, the Council finds that the drawdowns to the Tongue River due to inflow into the TR-1 area will be minimal. (Tr. at 487-89 and 1469-71; Ex. DEQ 12-254; Ex. BHC 15-009.)

123. **Replacing Affected Groundwater Supplies.** The Council agrees that the Brook’s duty to replace groundwater supplies should expand to protect all valid water rights, not just adjudicated rights. *See* Wyo. Stat. Ann. § 35-11-415(b)(xii); (Ex. DEQ 12-062.)

F. Alluvial Valley Floors

124. Contrary to the objections, the applicant and the Department have met the AVF application requirements by evaluating and declaring all AVFs within the permit area or on adjacent areas that would be affected by mining. *See Coal Rules*, ch. 3, § 2(b), and ch. 12, § 1(a)(i); (*See* Tr. at 109-16, 156-57, 266, and 554-55; Exs. DEQ 11, 12, 13, 15, and 16.)

125. Inside the permit area, the application identifies the designated AVF along the Tongue River in the eastern corner of the area. (Tr. at 109; Ex. DEQ 11-010.) The application provides for protecting, monitoring, and restoring that AVF, as required. *Coal Rules*, ch. 3, § 2(c)(ix), and ch. 5, § 3(a); (See Exs. DEQ 12-092 to -094, and 13-073 and -074.) It also includes the finding that the Hidden Water Creek area is not an AVF. (Tr. at 113-14; Ex. DEQ 11-021.)

126. The Department also evaluated and then designated an area of Slater Creek within the permit area as an AVF. (Tr. at 110-12; Ex. DEQ 15.) The separation between surface mining activities and the Slater Creek AVF means that it will not be affected by mining. (Tr. at 112-13 and 156-57; Exs. DEQ 12-090 to -092, 13-073, and 15-005.)

127. Outside of the permit area, the Department determined that the Tongue River Valley south of the permit area would not be affected by mining and does not yet have to be designated as AVF. (Tr. at 109 and 114-16; Ex. DEQ 16-002.) Despite Mr. Wireman's suspicions, the Department demonstrated through groundwater modeling and analysis of the application that those lands would not be affected by mining. (Tr. at 266 and 554-55; Exs. DEQ 12-090 to -092, 13-073, and 16-002.) Because those lands are outside the permit area and will not be affected, the potential Tongue River AVF lands did not need to be categorized prior to the permit's approval. See *Coal Rules*, ch. 3, § 2(b), and ch. 12, § 1(a)(i). The Department may evaluate those lands for AVF in the future if mining operations change and will potentially affect the area. (Tr. at 266.)

G. Subsidence

128. Although baseline overburden sampling was not conducted in the TR-1 area, Brook's sampling was done on a tighter configuration than normal, and the application commits Brook to conduct and submit additional sampling for each mine panel prior to mining it, including the TR-1 panels. (Tr. at 91-93 and 186-88; Ex. DEQ 12-032.) Overall, the application contains

sufficient baseline data to characterize the overburden in the permit area. *See* Wyo. Stat. Ann. § 35-11-406(a)(vii); *Coal Rules*, ch. 2, § 4(a); (*See* Ex. DEQ 5-017 to -021.)

129. As a highwall mine, the Book Mine is subject to the requirements for auger mining related to subsidence. *Coal Rules*, ch. 5, § 6(d), and ch. 7, § 2(b)(iii) and 2(c). Although Dr. Marino testified that the subsidence control plan needs more analysis, the plan includes sufficient modeling and information to demonstrate that mining is planned so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources. *See Coal Rules*, ch. 7, § 2(b)(iii); (*See* Ex. DEQ 5-018; Ex. DEQ 12-319 to -333.) The application also contains maps and descriptions of the mine workings, significant features of the mine, extraction ratios, and measures to be taken to prevent or minimize subsidence and related damage. *See Coal Rules*, ch. 7, § 2(c); (*See* Tr. at 162 and 171-172; Ex. DEQ 12-035, -129, -131, -134, and -322 to -327.) Although the *Coal Rules*' requirements for a subsidence control plan are general, MSHA sets specific standards for its ground control plans and Brook will have to comply with those. *See Coal Rules*, ch. 7, § 2(b)(iii) and 2(c); (Ex. Brook 10d.) The additional information or analysis requested by the objectors is not necessary for the mine permit application.

H. Blasting

130. The permit application contains the information required by the *Coal Rules*. The permit application generally describes the blasting practices, explosives to be used, and blasting operations. *Coal Rules*, ch. 2, § 5(a)(vii)(A); (Ex. DEQ 12-073 to -075.) The permit application explains that the maximum shot in any eight-millisecond period would be limited depending on the distance to the nearest structure. *Coal Rules*, ch. 2, § 5(a)(vii)(A)(I); (Ex. DEQ 12-080.) The application contains a list of structures within half a mile of the permit boundary. *Coal Rules*, ch. 2, § 5(a)(vii)(A)(II); (Ex. DEQ 03-008.) It contains a description of monitoring, warning, and site

access control equipment and procedures. *Coal Rules*, ch. 2, § 5(a)(vii)(C); (Ex. DEQ 12-077, -080, and -081.) It contains a description of the procedures and plans for recording blasting logs. *Coal Rules*, ch. 2, § 5(a)(vii)(D); (Ex. DEQ 12-080.) And it contains a sample public notice for blasting operations. *Coal Rules*, ch. 2, § 5(a)(vii)(E); (Ex. DEQ 12-338.)

131. Several of the objectors expressed concerns that the blasting could exacerbate subsidence at historic mines. Mr. Emme testified that based on his knowledge and experience as a blasting expert, the vibrations from blasting at the mine would not cause subsidence in historic mines. (Tr. at 602.) He stated that for landowners, normal, day-to-day events like high wind would cause more vibrations in structures than the mine's blasting. (Tr. at 584.) The Council credits Mr. Emme's expert opinion and finds that the mine will not likely exacerbate historical subsidence.

132. Several objectors requested a condition that Brook use seismographic monitors to monitor vibrations from blasting near structures on request. Emme testified that DEQ, rather than mine operators, has historically placed seismographic monitors near structures to ensure that the vibrations reaching those structures did not exceed regulations. (Tr. at 618.) The Council finds that a permit condition requiring Brook to use seismographic monitors near structures is not necessary.

I. Fire Control Plan

133. The fire control plan in the permit application contains a sufficient description of the contingency plans to extinguish flammable substances. *See Coal Rules*, ch. 2, § 5(a)(iv); (*See* Ex. DEQ 12-312 to -317.) The application's fire control plan contains sufficient procedures to ensure that materials constituting a fire hazard are addressed to prevent pollution or threats to human or animal health and safety. *See* Wyo. Stat. Ann. § 35-11-406(b)(ix). Brook Mine is not required to identify the locations of coal fires in or near the proposed permit area.

J. Traffic

134. The landowners' objections to traffic from the Brook Mine do not demonstrate an application deficiency. Brook has provided the required information about the roads it will use and the method of coal transportation. *See* Wyo. Stat. Ann. § 35-11-406(a)(ix) and (b)(v); *Coal Rules*, ch. 2, §§ 4(a)(xvi), 5(a)(i)(A), and 5(a)(xvi); (*See* Ex. DEQ 12-025 to -027 and -131; Tr. at 147.) Public road use agreements are not required for an application and the Department does not have authority to regulate traffic on public roads. *See Coal Rules*, ch. 12, § 1(a)(iv)(D).

K. Recreational Uses

135. The permit application adequately addresses Ms. Malone's objections on recreation. The application includes baseline information about recreational uses and commits to restoring pre-mining recreational opportunities and conditions as part of reclamation, including hunting walk-in areas. (*See* Ex. DEQ 4-010, 4-013 to -015, and 13-015.) The Kleenburn Recreation Area is outside the permit area and will remain accessible to the public. (Ex. DEQ 4-041.)

M. Bonding

136. **Reclamation Bond.** A reclamation bond is not required at this stage of the permitting process. *See* Wyo. Stat. Ann. §§ 35-11-406(h) through (k) and (p), and -417. The Administrator must set a reclamation bond amount, and Brook must file a bond for that amount, before mining may commence. Wyo. Stat. Ann. § 35-11-417. The operator's proposed bond amount exceeds what the Department would have required under its bonding guideline. (Tr. at 589-90.) No permit condition is necessary to ensure that Brook post a reclamation bond, because the Act prohibits mining without such a bond. Wyo. Stat. Ann. § 35-11-417.

137. **Surface Protection Bond.** A surface protection bond is not required to be in place at this stage in the permitting process. *See* Wyo. Stat. Ann. § 35-11-416(a). In the event that Brook and Big Horn do not come to an agreement waiving this bond, the Administrator will set the bond

amount. Wyo. Stat. Ann. § 35-11-416(a). No permit condition requiring Brook to post this bond is necessary because such a bond is required by the Act. *Id.*; (Tr. at 871.)

N. Cumulative Hydrologic Impact Assessment (“CHIA”)

138. The Council finds that the Administrator shall make findings under Wyoming Statute § 35-11-406(n) after the Council’s decision here. The statute commits this decision to the Administrator. Wyo. Stat. Ann. § 35-11-406(n); *DEQ’s Br. on Role of Wyo. Stat. § 35-11-406(n) in this Proceeding* at 4. The Council cannot step into the Administrator’s role when the Act plainly commits this authority to him. *See Bender v. Decaria*, 998 P.2d 955, 956-57 (Wyo. 2000). The Department will finalize the CHIA after this hearing. *Coal Rules*, ch. 19. If the facts do not support the required findings, the Director cannot issue the permit. Wyo. Stat. Ann. § 35-11-406(n).

VI. DECISION

IT IS HEREBY DECIDED that the permit should contain the following condition:

Within 45 days of permit issuance, Brook shall submit a non-significant permit revision to the Department that includes the changes specified below. Brook shall respond within 30 days of receipt to any Department review comments on the proposed revisions.

1. Surface water quantity and quality data collection in the Tongue River and Goose Creek drainages in the Brook Mine permit will be enhanced by establishing additional surface water monitoring stations in these drainages. Brook shall install sample sites in three locations:

a. Upstream of the most western tributary of the Tongue River that may be affected by mining. This site will represent surface water conditions as water enters the vicinity of the Brook Mine permit acreage;

b. Downstream of the confluence with Goose Creek where impacts from the mine on Tongue River may be accurately determined;

c. Upstream on Goose Creek near the confluence of Goose Creek and Tongue River and adjacent to the Brook Mine permit boundary.

These sampling locations shall not be established without prior approval from the Division. Monitoring will occur on a quarterly basis for water quality and instantaneous streamflow measurements shall be taken at the time of water quality sampling.

2. Brook shall amend the last paragraph in MP.5.8 Mine Pit Dewatering Plan to state:

“If any water rights are determined to be affected by the mining operations of the Brook Mine, that water source will be replaced with a source of similar quantity and quality, as required by Wyoming Statute §35-11-415(b)(xii), until such time that the original water right's functionality is restored.”

3. Brook shall replace the final sentence in Section MP.6.3.2 Plan to Mitigate the Impacts on Groundwater with the following:

“The Brook Mine shall coordinate with WDEQ/LQD the investigation of all complaints of their mining activities causing a loss of quantity and/or quality of a water right. If any water rights are determined to be affected by the mining operations of the Brook Mine, that water source will be replaced with a source of similar quantity and quality as required by Wyoming Statute §35-11-415(b)(xii), until such time that the original water right's functionality is restored.”

4. Brook shall correct Section MP.22 Dual Permitted Areas to accurately reflect the agreements located in the Adjudication File.

IT IS FURTHER DECIDED that, notwithstanding all objections, the permit application is not deficient; and

IT IS FURTHER DECIDED that, unless otherwise addressed in this Decision, all objections to the permit application are resolved in the favor of the applicant.

Dated this 24th day of July, 2017.

Andrew J. Kuhlmann (Wyo. Bar No. 7-4595)

Senior Assistant Attorney General

James LaRock (Wyo. Bar No. 7-5814)

(307) 674-7451 (Phone)

issuance at this time. More thorough and scientifically complete studies and baseline monitoring need to be done in order to show that the mine will not cause subsidence or material damage to the hydrologic balance and the adjacent alluvial valley floor.

The Fishers' Findings of Fact and Conclusions of Law will be broken into two distinct sections. The first addresses findings and conclusions as they relate to the fact that the permit application is currently incomplete and thus not ready to move to the Director of the DEQ for review. The second addresses conditions that must be placed upon a permit that could be issued.

SECTION I. COMPLETENESS OF PERMIT

A. CONCLUSIONS OF LAW RELATED TO THE COMPLETENESS OF BROOK'S APPLICATION:

1. Before an application for a permit for a surface coal mine can proceed to the publication phase, the application must be "determined complete" by DEQ. Wyo. Stat. §35-11-406(g) (LexisNexis 2015).
2. The plain and ordinary definition of "complete" is "having all necessary parts, elements, or steps." *Merriam Webster's Collegiate Dictionary*, 10th Ed. (1995).
3. As part of reviewing decision making by the DEQ, the EQC has the authority to review DEQ's determination of whether or not the Brook Mine application is in fact "complete" and ready for further review. §35-11-406(k) (LexisNexis 2015).
4. "The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws" Wyo. Stat. §35-11-406(n) (LexisNexis 2015). Brook Mining Company, LLC is the applicant in this instance.
5. Wyoming Statute §35-11-106(n) is part of "this act" (meaning the Environmental Quality Act) and therefore applies to all surface coal mining applications. §35-11-406(n) (LexisNexis 2015) and §35-11-101 (LexisNexis 2015).
6. Wyoming Statute §35-11-106(n) provides in part:
 - (n) The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:
 - (i) The application is accurate and complete;

- (ii) The reclamation plan can accomplish reclamation as required by this act;
- (iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area;

*** *** *** ***

- (v) The proposed operation would:

*** *** *** ***

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors.

Wyo. Stat. §35-11-406(n) (LexisNexis 2015).

7. In order to be accurate and complete, a surface coal mining application must contain meaningfully complete information of compliance with all applicable rules and regulations, including the information which forms the basis for the applicant's affirmative demonstration of compliance with the requirements of Wyo. Stat. §35-11-406(n).
8. While Wyo. Stat. §35-11-406(n) provides that the administrator of the DEQ must make findings that the proposed mine will meet the subsection (n) requirements, the subsection also clearly states that a permit may not be issued unless "the applicant affirmatively demonstrates" that its mine will be in compliance with subsection (n). Wyo. Stat. §35-11-406(n) (LexisNexis 2015). In order to be complete, the application must contain the information affirmatively demonstrating compliance with subsection (n).
9. "Affirmatively demonstrating" as required by the Environmental Quality Act requires more than generalized or conclusory statements such as "no harm is expected". Wyo. Stat. §35-11-406(n) (LexisNexis 2015).
10. In addition to the requirements of §35-11-406, DEQ regulations require that as part of its application an applicant must also provide information "and evaluations on the potential for and the extent of subsidence, and the effect it may have on structures, the continued use of the surface land and aquifers or recharge areas". If subsidence may cause damage, a subsidence control plan is required. Wyo. Admin. Rules, DEQ-LQD, Underground Coal Mines, Ch. 7 §1(a)(v).

B. FINDINGS OF FACT RELATED TO THE COMPLETENESS OF BROOK'S APPLICATION:

11. Expert witness Mike Wireman (Wireman) testified before the EQC. Wireman is an

expert in geo-hydrology with extensive experience in hydrology and decades of experience as evidenced by his testimony and CV which are part of the record. (*POW Exhibit 18, Wireman Testimony Vol. VI @ pgs. 1327-1335*)

12. The EQC finds Mr. Wireman to be a well-qualified expert who gave credible and reliable testimony on the topic of hydrology. To the extent his opinions and testimony are cited as the basis of findings of fact in these findings, the EQC has resolved any conflicts or dispute between testimony of others and in favor of Mr. Wireman's testimony and has found him to be the more credible and reliable witness.
13. The hydrologic studies done by the applicant Brook Mine thus far along with the other available data do not provide a sound scientific basis from which it can be concluded that the proposed mining operation has been designed to "prevent material damage to the hydrologic balance outside the permit area". (*Wireman Testimony Vol. VI @ pgs. 1400-1401*)
14. Mr. Wireman testified to several deficiencies in the hydrologic studies done thus far which evidence that the applicant, Brook Mining Company, LLC, has not affirmatively demonstrated that its mine will prevent material damage to the hydrologic balance outside the permit area, including:
 - a. The hydrologic review and assessment failed to account in any way for how dewatering of the coal seams would impact the water in other ground water aquifers. (*Wireman Testimony Vol. VI @ pg. 1344*);
 - b. The hydrologic review and assessment was unacceptably sparse with only one (1) pump test done in the far eastern portion of the permit area and only two (2) site specific hydraulic conductivity values (one for each seam of coal) over the entire permit area. (*Wireman Testimony Vol. VI @ pg. 1354*) Hydraulic conductivity measures the rate at which water flows in an aquifer. (*Wireman Testimony Vol. VI @ pg. 1360*) The permit area encompassed an area of approximately 4,500 acres. (*Kuchanur Testimony Vol. III @ pg. 535; Kristiansen Testimony Vol. I @ pg. 50*);
 - i. DEQ admitted that the hydrology and flow of water and geology was complex and could change significantly in short distances. (*Kristiansen Testimony Vol. IV, @ pgs. 302-303*);
 - c. The hydrologic review and assessment only used one porosity value or hydraulic conductivity value for the entire permit area which cannot account for the heterogeneity or diversity of the geology in the permit area. (*Wireman Testimony Vol. VI @ pg. 1355*) Furthermore, data was not collected from monitoring wells

during the pumping tests in the Slater Creek area as would be expected and appropriate. (*Wireman Testimony Vol. VI @ pgs. 1363-64*)

- d. Using only one porosity value for the entire permit area fails to take into account seasonal changes which can alter direction of flow, velocity of flow and quantity of flow to a particular area. (*Wireman Testimony Vol. VI @ pg. 1355*)
 - e. Proper investigation and testing for potential ground water impacts require the development of a hydrograph over at least a full 12-month cycle to take into account seasonal changes in quantity, quality and flow of water in these aquifers. (*Wireman Testimony Vol. VI @ pg. 1345*) Brook's testing failed to collect any surface water data from October through March, a period of about 6 months or ½ of a yearly hydrograph, and historic data reflects that Hidden Water Creek only flows in the winter months during a time Brook collected no data on that drainage. (*Wireman Testimony Vol. VI @ pg. 1361*)
 - f. Inadequate testing and data collection was done on the overburden, underburden, Tongue River alluvium and Slater Creek alluvium to make scientific predictions about hydrologic impacts. (*Wireman Testimony Vol. VI @ pg. 1361*)
 - g. No monitoring or baseline wells were used to establish the baseline water in the Tongue River alluvium. (*Wireman Testimony Vol. VI @ pg. 1365*)
 - h. The data used for the recharge of the aquifers is not site specific and is vaguely identified not allowing for peer review of those assumptions. (*Wireman Testimony Vol. VI @ pg. 1363*) Moreover, the groundwater aquifer assessment contains no discussion of vertical intervals or lithology which affect the potentially impacted domestic wells. (*Wireman Testimony Vol. VI @ pg. 1367*)
 - i. In general, there is a dearth or lack of supporting hydrologic data to support the conclusions Brook attempts to draw from its study. (*Wireman Testimony Vol. VI @ pg. 1363*)
15. Substantial concern exists that material damage would be done to the hydrologic balance inside and/or outside the permit area (*Wireman Testimony Vol. VI @ pgs. 1398-1399*) and the testing done was wholly inadequate to conclude there will not be material hydrologic impacts. (*Wireman Testimony Vol. VI @ pgs. 1373; 1442*)
16. The permit application submitted by Brook Mine does not contain the information necessary to affirmatively demonstrate that material damage to the hydrological balance

outside the permit area will be prevented. (*Wireman Testimony Vol. VI @ pgs. 1398-1399; 1442*)

17. The hydrologic studies done thus far by the applicant Brook Mine, along with the other available data, do not provide a sound scientific basis from which it can be concluded that the mining will “not materially damage the quantity or quality of water in surface or underground water systems that supply” alluvial valley floors that are within the mine boundary or within one-half mile of the proposed mine boundary. (*Wireman Testimony Vol. VI @ pgs. 1400-1401, 1441-1443*)
18. Substantial concern remains that material damage would be done to the quantity or quality of water in the surface or underground water that supplies alluvial valley floors or areas likely to be alluvial valley floors that are either in or within one-half mile of the permit area. (*Wireman Testimony Vol. VI @ pgs. 1389-1392 and 1373*)
19. Wireman testified that even a small reduction in the amount or volume of water being supplied to the alluvium of the alluvial valley floors located within the permit boundary can cause material damage to the productivity of these valley floors. (*Wireman Testimony Vol. VI @ pgs. 1396-1398*)
20. A number of documents authored by Brook’s engineering expert acknowledge a communication or connectivity between the water in the coal seams and the water in the alluvium of alluvial valley floors or areas likely to be alluvial valley floors, including:
 - a. “Therefore, it is likely that the Carney coal would lose water to the Tongue River alluvium” – DEQ Exhibit 12, pg. 231.
 - b. Recognition of water communication between the alluvium and the Carney coal seam stating: “regions where the Carney seam subcrops into Slater Creek or Tongue River alluvial material” – See DEQ Exhibit 13, pg. 051, RP.8.3 *Aquifer Reconstruction*.
 - c. Recognition of water communication between the alluvium and Masters coal seam stating: “Masters Seam are assumed to include infiltration from overlying strata, communication with river alluvium” – See DEQ Exhibit 13, pg. 051, RP.8.3 *Aquifer Reconstruction*.
21. The above statements are consistent with Mr. Wireman’s opinions that there is communication between the water in the coal seams and the water in the alluvium of these alluvial valley floors. (*Wireman Testimony Vol. VI @ pgs. 1388-1389*)

22. It was uncontested that as part of mining the coal, Brook Mine will de-water the coal seam.
23. De-watering the coal seam will interrupt the natural flow of water in the coal seams which supply and communicate with the river alluvium. (*Wireman Testimony Vol. VI @ pgs. 1400-1401*)
24. The perturbing of the natural flow of water in this system will be further exacerbated if overburden subsides into the cavity left by coal removal. (*Wireman Testimony Vol. VI @ pgs. 1370-71*)
25. Brook Mine did not call a hydrology expert to demonstrate how its permit application contained the information and proof that its application demonstrated that the mining operation would be in compliance with Wyo. Stat. §35-11-406(n).
26. **Brook Mine, who bore the burden of proof, did not call its own hydrology expert to counter the testimony of Mr. Wireman.**
27. Testimony revealed that there are over 350 water wells (“357”) identified which could be potentially impacted. (*Barron Testimony Vol. IV @ pg. 778; Wireman Testimony Vol. VI @ pg. 1344*)
28. Draw-down in domestic/stock water wells are predicted to as much as 25 feet. (*Kuchanur Testimony Vol. III @ pgs. 541-543 and DEQ Exhibit 12-251, Table 4.9-1*)
29. Brook Mine has the burden of proof on these issues.
30. Wyo. Admin. Rules, DEQ-LQD, Underground Coal Mining, Ch. 7 §1(a)(v) requires that as part of its permit application, Brook Mine have a subsidence control plan.
31. Dr. Marino testified before the Council and is a very qualified expert in the area of underground mine subsidence with decades of experience as shown by his testimony and his CV which was received as POW Exhibit 18. (*Marino Testimony Vol. VI @ pgs. 1192-1198*)
32. The EQC finds Dr. Marino to be a well-qualified expert who gave credible and reliable testimony on the topic of hydrology. To the extent his opinions and testimony are cited as the basis of findings of fact in these findings, the EQC has resolved any conflicts or dispute between testimony in favor of Dr. Marino’s testimony and has found him to be

the more credible and reliable witness.

33. **Neither Brook Mine nor DEQ offered any expert testimony from an expert with similar qualifications to Dr. Marino.**
34. There have been inadequate studies and testing done to draw any scientific conclusions as to the long-term risk of subsidence at the proposed Brook Mine. (*Marino Testimony Vol. VI @ pg. 1246*)
35. Without these studies and based on current available information, the risk of subsidence as a result of the coal mining by Brook Mine is substantial. (*Marino Testimony Vol. VI @ pg. 1200 and POW Exhibit 11 Powerpoint*)
36. The deficiencies and total lack of a subsidence plan were explained in detail by Dr. Marino and are encompassed in his Powerpoint presentation received as Powder River demonstrative Exhibit 11 and include:
 - a. Proper mine subsidence assessment requires assessing the strength and stability of the roof, floor and pillar materials that will support the mine void. (*Marino Testimony Vol. VI @ pgs. 1205-10*)
 - b. Appropriate data was not collected to do a site specific assessment of the strength and stability of the roof, floor and pillar materials at the proposed Brook mine. (*Marino Testimony Vol. VI @ pgs. 1211, 1228-1229*)
 - c. Faulting in the overburden has not been studied or documented to know what impact known geologic faults may have on subsidence risk. (*Marino Testimony Vol. VI @ pgs. 1218-19*)
 - d. For long-term mine stability, safety factors should be 1.6 to 2.0 or higher depending on conditions. (*Marino Testimony Vol. VI @ pg. 1286*)
 - e. Using information from the permit, coal pillar pressures could reach 1,300 pounds per square inch resulting in a safety factor of less than 1.0. (*Marino Testimony Vol. VI @ pg. 1226*)
 - f. The clay-stone known to exist in the overburden and underburden can have bearing strength of as little as 300 pounds per square inch resulting in a safety factor of less than 1.0 (*Marino Testimony Vol. VI @ pg. 1227*)

- g. The subsidence control plan exhibits a lack geomechanical understanding of the long-term and short-term stability of the mine. (*Marino Testimony Vol. VI @ pg. 1228*)
 - h. There is insufficient information or data in the permit application and very limited analysis of subsidence risk in the documents such that the subsidence potential cannot be assessed. (*Marino Testimony Vol. VI @ pg. 1228*)
 - i. Based upon Dr. Marino's review of many subsidence control plans during the decades of his experience, the Brook Mine subsidence assessment is well below industry standards. (*Marino Testimony Vol. VI @ pg. 1228*)
 - j. Based upon what is reported in the mine plan the risk of subsidence at the Brook Mine is high. (*Marino Testimony Vol. VI @ pgs. 1228-29*)
 - k. The calculations in the mine plan improperly used coal strength data for bituminous coal rather than the sub-bituminous coal which exists at the site. (*Marino Testimony Vol. VI @ pgs. 1226-27, 1234, 1247*)
 - l. The formula used in the application to calculate strength/bearing capacity is for extraction heights of 7 feet or less and in the Brook Mine extraction can reach 20 feet. (*Marino Testimony Vol. VI @ pg. 1227*)
 - m. Complete subsidence control plans are typically stamped by a professional engineer and no such plan is part of the Brook Mine application. (*Marino Testimony Vol. VI @ pgs. 1238-39*)
 - n. The mine plan is not complete due to the lack of proper testing and analysis to determine the risk of subsidence due to mining activities. (*Marino Testimony Vol. VI @ pg. 1244*)
37. Through its engineer Jeff Barron, Brook Mine **admitted** that the studies and work suggested by Dr. Marino are necessary steps for a proper mine subsidence plan. (*Barron Testimony Vol.III @ pgs. 674-675*)
38. DEQ and Brook Mine have contended that a subsidence control plan would be part of an MSHA Ground Control Plan or that a MSHA Ground Control Plan would constitute a subsidence control plan. (*Barron Testimony Vol. VII @ pgs. 1533-1534*)

39. A MSHA Ground Control Plan and a subsidence plan are two different plans which address different things. They are not synonymous with each other. (*Marino Testimony Vol. VI @ pgs. 1202-03, 1237, 1241*)
40. A MSHA Ground Control Plan primarily addresses the safety of miners and workers during mining activities while a subsidence control plan addresses the potential for long-term subsidence for decades after mining is completed. *Id.*
41. Without the proper studies the risk for subsidence cannot be properly gauged or assessed and likewise the potential environmental and reclamation impacts and consequences cannot be properly gauged or assessed.
42. Absent this information it is not possible to determine whether the reclamation plan is likely to “accomplish reclamation as required by this act” as is dictated by Wyo. Stat. §35-11-406(n)(ii).
43. Because Brook Mine’s application does not contain the information which affirmatively demonstrates that the proposed mine would be in compliance with Wyo. Stat. §35-11-406(n), the application is incomplete and must be denied at this time.
44. Brook Mine may complete the necessary reports and studies to supply the information satisfying its obligation to affirmatively demonstrate that its mining activities will be in compliance with Wyo. Stat. §35-11-406(n) and properly study the subsidence risk and then resubmit its application.

SECTION II. PERMIT CONDITIONS REQUIRED

In the event the EQC determines that it will allow Brook Mine’s application for a coal mining permit and that it is ready to be further considered without the application containing the information which affirmatively demonstrates that the project will be in compliance with §35-11-406(n) and without a complete subsidence control plan, the Fishers request that the EQC place conditions on the permit which set parameters for the future potential mining activities. The following findings of fact and conclusions of law are proposed for that reason. The Fishers in no way concede or waive their claims that Brook Mine’s application is incomplete and does not provide the necessary background information and data to be in compliance with the Environmental Quality Act and associated rules and regulations, and they specifically retain their right to appeal and fully challenge these deficiencies.

A. FINDINGS OF FACT IN RELATION TO PERMIT CONDITIONS:

Subsidence Issues:

1. The risk of subsidence and subsidence control have not yet properly been studied or assessed by Brook Mining Company, LLC. (*See Findings of Fact in Section I above*).
2. Based upon the information reported and available in the mine plan the risk of subsidence at the Brook Mine is high, unless shown otherwise by proper studies and calculations. (*Marino Testimony Vol. VI @ pgs. 1228-29*)
3. Mining should not proceed if there is a risk of material subsidence.
4. Testimony from landowners demonstrate that subsidence issues related to historic mining in the area are ongoing. Mr. Buyok, a retired engineer, testified that he recently nearly lost a four-wheel-drive tractor in an area on his property which subsided as he drove over the area and that continual subsidence is an ongoing concern. (*Buyok Testimony Vol. IV @ pgs. 1019-1022; Buyok Testimony Vol. V @ pgs. 1045-1047*)
5. The EQC finds that it is appropriate, proper and reasonable that as a condition of permit issuance, the permit have a condition requiring that prior to any mining activity at any of the proposed locations, Brook Mine will be required to supply a study evidencing that there is a low risk of long-term subsidence at that location. The permit condition shall read as follows:

Prior to any mining activity at any location, the mining company shall submit and DEQ shall approve a Subsidence Control Plan that demonstrates a low risk of long-term subsidence bearing the stamp of a professional engineer licensed in Wyoming. Such plan will be a formal subsidence control plan addressing the long-term risk of subsidence and prepared consistently with the industry standards for long-term subsidence prediction and control and demonstrate reliance upon a safety factor of 2.0 or higher. An MSHA Ground Control Plan will not qualify as a Subsidence Control Plan.

Bonding Issues:

6. Wyoming environmental protection laws are designed to ensure proper and adequate reclamation is accomplished to protect Wyoming's land, air and water quality and avoid Wyoming and its taxpayers being left with reclamation responsibilities created by mining operators. See §35-11-102 et. seq.
7. Wyoming has experienced problems with Abandoned Mine Lands projects and has recently encountered risks of very large coal mining operations with significant resources

being unable to meet their reclamation obligations, including Arch Coal Company, Alpha Natural Resources, and Peabody.

8. Several witnesses, including Ramaco executive Kenneth Woodring, testified that coal mining operations can encounter unforeseen environmental challenges during operations which are not covered by the reclamation bond. (*Woodring Testimony Vol. IV @ pgs. 827-829*)
9. Incremental bonding is for reasonably “foreseen” reclamation costs. The Objectors have all questioned whether the potential problems and reclamation have been properly assessed by Brook Mine.
10. Brook Mining Company, LLC is the sole applicant for this mining permit and despite repeated references to Ramaco Resources, Inc., Ramaco is not a permit applicant. (*See Permit Application*) However, Ramaco and Brook Mining Company, LLC were often referred to interchangeably, and representatives of Ramaco (Ken Woodring) testified in support of the application.
11. Pursuant to Wyoming Statute §17-16-1630, all corporations registered in the State of Wyoming must submit an Annual Report to the Wyoming Secretary of State’s Office. Wyo.Stat. §17-16-1630 (LexisNexis 2015)
12. An offer of proof was made by the Fishers demonstrating that Brook Mining Company, LLC has reported to the Wyoming Secretary of State that its total assets are worth \$250,000 or less. (*Fishers’ Exhibit 27, Offer Of Proof filed with EQC on May 25, 2017*) [A recent Annual Report was filed with the Wyoming Secretary of State’s Office by Brook Mining Company, LLC dated June 19, 2017 still showing total assets worth \$250,000 or less.] (See Exhibit A attached hereto.)
13. Neither Brook nor Ramaco has an operating history in Wyoming or any other state demonstrating a history of satisfying its reclamation and environmental obligations.
14. Brook Mining Company, LLC has no current employees.
15. Brook Mining Company, LLC through its witnesses, including Jeff Barron and Ramaco’s consultant Ken Woodring, expressed confidence in the soundness and environmental safeguards of the mine plan. (*Woodring Testimony Vol. IV @ pgs. 828-829; Barron Testimony Vol. IV @ pg. 808*) These expressions of confidence are properly backed up by financial surety to the State of Wyoming to assure reclamation and environmental liabilities are born by the industry and not the State of Wyoming and its taxpayers, which

is the policy of this State. Wyo. Stat. §35-11-102 et. seq.

16. The EQC finds that it is appropriate, proper and reasonable that as a condition of permit issuance and to insure responsible development, and that reclamation is completed by the operator and not borne by the State of Wyoming and its taxpayers, that all reclamation and environmental liabilities of Brook Mining Company, LLC be guaranteed by Ramaco Resources, Inc. This condition shall read as follows:

Prior to commencement of any mining operations, Ramaco Resources, Inc. shall provide a written guarantee to the State of Wyoming guaranteeing the payment and satisfaction of all reclamation and environmental liabilities of Brook Mining Company, LLC.

Blasting Issues:

17. As proposed, Brook Mine's blasting plan provides that the company can conduct blasting at any time during daylight hours (sunrise to sunset) without any further restrictions on blasting times. (*Emme Testimony Vol. III @ pg. 638*)
18. No justification or reason was given by Brook or DEQ as to why blasting would be a necessary aspect of mining operations on such a broad daylight to dark basis every day.
19. Indeed, Doug Emme of the DEQ indicated that Brook Mine originally proposed a more restricted blasting schedule and were encouraged by DEQ to broaden the blasting schedule to all daylight hours every day of the year. (*Emme Testimony Vol. III @ pg. 623; Barron Testimony Vol. IV @ pg. 800*)
20. Witnesses from both Brook Mine and the DEQ testified that the blasting at Brook Mine **would not be** similar to that in the Campbell County coal mines where unlimited daylight blasting is allowed and necessary. Mr. Woodring indicated that the Brook Mine operation would be a "small mine by comparison" to other coal mines. (*Emme Testimony Vol. III @ pgs. 638-639; Barron Testimony Vol. IV @ pg. 782; Woodring Testimony Vol. IV @ pg. 820*)
21. The only justification given for the unlimited daylight blasting was that "safety concerns" might arise if a blasting time was about to expire after explosives had been set and for unforeseen reasons the company could not facilitate blasting within the designated blasting time. (*Barron Testimony Vol. IV @ pg. 801*)
22. However, Doug Emme testified that the DEQ will allow blasting outside of designated times, including in the dark, for safety or emergency reasons and only requires or requests that the operator alert DEQ of the situation. (*Emme Testimony Vol. III @ pg.*

586)

23. When asked by Council Members Lally, Agopian and counsel if it would be reasonable to put some restrictions on blasting given the nature of Brook Mine's proposed operation and the large number of landowners involved, DEQ's Emme replied that it is possible to include conditions restricting the blasting operation. (*Emme Testimony Vol. III @ pgs. 617-618, 639-640*)
24. Testimony revealed that many residential homes are located within one-half mile of the permit boundary and blasting has the potential to be disruptive and bothersome to a large number of residents as well as concerns about damage from vibrations associated with the blasting. (*Emme Testimony Vol. III @ pg. 584; Buyok Testimony Vol. IV @ pgs. 1019-1020, 1022, 1045-1046*)
25. Although working from DEQ's Sheridan offices only a few miles from the proposed mine site, Mr. Emme who reviewed and approved Brook Mine's blasting plan on behalf of DEQ, had not visited the area of the mine site or explored the large number of potentially affected landowners or historic stone structures and other structures prior to approving the blasting plan. (*Emme Testimony Vol. III @ pg. 603*)
26. There is no provision in the current mine plan to restrict or limit blasting during high wind or weather events. (*Emme Testimony Vol. III @ pgs. 608-609*)
27. DEQ has implemented conditions on other mine permits regarding restrictions on blasting during inversions or high wind events and the mines themselves have voluntarily put restrictions on their blasting operations. (*Emme Testimony Vol. III @ pgs. 608-609*)
28. Neither Brook Mine nor DEQ presented any evidence to suggest why such restrictions were not appropriate or infeasible at the proposed Brook mine.
29. For the above reasons, including the fact that no justification or reason was stated for why blasting will be necessary from sunrise to sunset every day of the week throughout the year, the EQC finds that reasonable limitations on blasting times are an appropriate condition of permit issuance. This condition shall read substantially as follows:

Absent a demonstration of good cause, Brook Mine shall restrict its blasting to daylight hours between 9:00 a.m. and 4:00 p.m. local time, Monday through Friday and shall conduct no blasting on legal holidays. Brook Mine shall also be required to limit blasting as directed by the DEQ during inversions, high wind events and other conditions deemed by the DEQ to constitute a safety or health concern.

Seismic Monitoring:

30. The Fishers and other landowners expressed a desire to have seismic monitoring placed on their property to measure the strength of the shock waves or “vibration” which reach their residence during blasting. (*Fisher Testimony Vol. V @ pgs. 1165-1166*); *Bocek Testimony Vol V @ pg. 1093*; *Collins Testimony Vol. V @ pgs. 1086-1087*)
31. DEQ personnel, including Doug Emme, testified that in other mining operations the DEQ has installed such seismic monitoring on the property of homeowners near mines where blasting is occurring. (*Emme Testimony Vol. III @ pgs. 618-619*)
32. Brook’s engineer, Jeff Barron, testified that he is familiar with requests for seismic monitoring and that his employer Western Water has installed seismic monitoring regarding other mine operations in the Powder River Basin. (*Barron Testimony Vol. IV @ pgs. 770-771, 783*)
33. Neither Brook nor DEQ offered any evidence why such seismic monitoring was not appropriate or was impractical at the Brook Mine.
34. Testimony from several landowners, including Mary Fisher, indicated that historic rock structures are located on their property and they are concerned about the impact blasting will have on these structures. (*Bocek Testimony Vol. V @ pg. 1093*; *Collins Testimony Vol. V @ pg. 1086*); *Fisher Testimony Vol. V @ pg. 1143*)
35. For the above reasons, the EQC finds that it is reasonable and appropriate that as a condition of permit issuance, the operator Brook Mine will be required at its expense to install and maintain appropriate seismic monitoring during blasting. Such condition shall read substantially as follows:

Brook Mine shall install and maintain seismic monitoring as directed by DEQ on the property of any residential homeowner who requests such monitoring and lives within one-half mile of the permit boundary. Brook Mine shall share all data or information collected from such monitoring with the DEQ and with the homeowner requesting the monitoring.

Alluvial Valley Floors:

36. DEQ Exhibit #16 reflects that DEQ has designated a significant area adjacent to the Brook Mine as “Potential AVF” (alluvial valley floor). The regulations provide that alluvial valley floors are subject to greater protections.
37. DEQ Exhibit #16 reflected that this “potential AVF” was not formally classified by DEQ

as AVF due to claims of access being denied by landowners in the area. (*Kristiansen Testimony Vol. II @ pg. 304*)

38. On cross-examination, BJ Kristiansen, could not or would not name one landowner who had refused DEQ access for purposes of determining if their property was classified as AVF and admitted that the Objectors such as the Fishers, Mr. Bocek and Mr. Buyok had not denied DEQ access nor had DEQ even asked for access. (*Kristiansen Testimony Vol. II @ pgs. 303-305*)
39. DEQ admitted that the lands labeled as “Potential AVF” on DEQ #16 and shown in Fisher Exhibit #1 are “probably” alluvial valley floor lands although DEQ has not yet designated them as such. *Id.*
40. DEQ admitted there could be communication between the coal seam aquifers and the alluvial valley floor aquifers and therefore DEQ could not say that material damage to the AVF aquifer would not happen as a result of mining. *Id.*
41. **For the above reasons, the EQC finds that it is reasonable and appropriate that as a condition of permit issuance, the DEQ shall seek access from all willing landowners and perform a formal assessment of whether the areas it has already designated as “Potential AVF” in DEQ Exhibit #16 qualify for formal designation as AVF, and the EQC directs the DEQ to do so and further determine if additional alluvial valley aquifer monitoring wells should be required in this area.**

Domestic Water Wells:

42. Draw-down in domestic/stock water wells are predicted to be as much as 25 feet. (*Kuchanur Testimony Vol. III @ pg. 541 and DEQ Exhibit 12-251, Table 4.9-1*)
43. Expert Wireman testified that due to the confined nature of the coal aquifer, even a small reduction in the water available could have a material impact on domestic water users such as the Fishers who obtain their water from the coal seam. (*Wireman Testimony, Vol. VI @ pgs. 1382-85*)
44. Landowner John Buyok testified that in times of prolonged drought his water well became incapable of producing water and pumped only sediment from the bottom of the well. (*Buyok Testimony, Vol. V, @ pgs. 1038-39*). This testimony is consistent with the description and concerns expressed by Mr. Wireman.
45. Brook Mine has committed in its mine plan to remedy any material damage to the quantity or quality of the water in the domestic water wells for landowners within one-

half mile of the permit boundary. (*See Brook Mine Permit*)

46. The EQC determines that it is appropriate that the permit should contain a condition which further defines Brook's obligations in the event a domestic/stock water well is materially harmed in quantity or quality. Such condition shall read as follows:

In the event DEQ determines there is a reasonable basis to conclude that mining operations have caused material damage to the quantity or quality of water in a domestic water well located in the permit area or within one-half mile of the permit boundary, Brook shall supply substitute water of the same or better quality and quantity as previously existed, including drilling a replacement well when appropriate.

Conditions Conceded by Brook and DEQ Which Must Be Incorporated In The Permit:

47. DEQ and Brook Mine have agreed that it would be appropriate to include both registered and adjudicated wells in the mine plan. (*DEQ Answer To Fishers' Interrogatory No. 10* (attached as Exhibit B); *Kristiansen Testimony Vol. II @ pgs. 290-291*; *Barron Testimony Vol. IV @ pg. 800*; *Kuchanur Testimony Vol. III @ pgs. 500-501*)
48. DEQ has agreed to amend the mine plan to include additional monitoring stations upstream and downstream of the Tongue River. (*DEQ Answer To Fishers' Interrogatory No. 11* (attached as Exhibit B); *Kristiansen Testimony Vol. II @ pg. 290*; *Barron Testimony Vol. IV @ pg. 800*; *Kunze Testimony Vol. II @ pgs. 411-412*)
49. Matt Kunze from DEQ further recommended that there be a monitoring site on Goose Creek to have additional data to ensure a more accurate interpretation of the upstream-downstream comparison in the Tongue River. (*Kunze Testimony Vol. II @ pg. 412*)
50. **Therefore, all three of the above conditions should be incorporated in the Brook Mine Plan.**

DEQ's and Brook Mine's Acceptance Of Conditions Imposed by EQC:

51. Importantly, throughout the contested case hearing in this matter, both DEQ and Brook Mine (through its engineer Jeff Barron) repeatedly agreed to comply with conditions that EQC deemed appropriate and reasonable. Mr. Barron testified that conditions could be "useful information for the council" and conditions would be "welcome" and "accepted". (*Barron Testimony Vol. IV @ pgs. 779-780, 781-788. See also references above regarding DEQ acknowledgments and Kristiansen Testimony Vol. II @ pg. 291*)

B. CONCLUSIONS OF LAW RELATIVE TO THE CONDITIONS:

1. Wyoming DEQ and the EQC are empowered to place conditions on the issuance of a coal mining permit which relate to blasting, seismic monitoring and blasting during certain atmospheric conditions by virtue of the fact that Chapter 2 of the Land Quality Division Rules-Coal relating to “Application Requirements” requires that the operator submit a blasting plan acceptable to the DEQ. Wyo. Admin. Rules, DEQ-LQD, Coal, Ch. 2 §5(a)(vii).
2. Wyoming DEQ and EQC are empowered to place conditions on issuance of a coal mining permit which assure financial responsibility for environmental obligations. The Environmental Quality Act’s stated goal and the policy of Wyoming are to ensure proper reclamation of disturbance and the protection of the quality of Wyoming’s land, air and water. See §35-11-102 et. seq. Hence, requiring sufficient financial surety for such obligations, such as requiring that a parent or related company to the applicant provide a financial guarantee of the reclamation and environmental obligations of an applicant, is within the power of the agency.
3. Wyoming DEQ and EQC are empowered to place a condition on issuance of a coal mining permit requiring that appropriate and proper subsidence investigation and mitigation are undertaken as part of issuing a permit, because a Subsidence Control Plan is a required part of any such application involving a component of underground mining. Wyo. Admin. Rules, DEQ-LQD-Underground Coal Mines, Ch. 7 §1(a)(v).
4. Wyoming DEQ and EQC are empowered to place a condition on issuance of a coal mining permit requiring that appropriate and proper hydrologic studies, monitoring and protections be regulated as part of issuing a permit so as to prevent material damage to hydrologic balance outside the permit area and protections in the event of such damage. Wyo. Stat. §35-11-406(n)(iii) (LexisNexis 2015).
5. DEQ and the EQC are empowered with the designation and protection of alluvial valley floors through the permitting and enforcement process. Wyo. Stat. §35-11-406(n)(v) (LexisNexis 2015).

IV. CONCLUSION

There have been insufficient studies done to demonstrate that the proposed mine plan will not cause material damage to the hydrologic balance in this historic and important river valley, and the application is thus incomplete and must be denied at this time pending a more scientific and reasoned assessment of the risks. In the event the permit is allowed to proceed, it must only be allowed to do so with the critical conditions set forth above which provide protection for the rugged and resilient landowners who have been here for decades and for the valuable air, land

and water resources of the State of Wyoming.

DATED this 24th day of July, 2017.

STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
)
 TFN 6 2-025) **DOCKET 17-4802**

POWDER RIVER BASIN RESOURCE COUNCIL'S PROPOSED FINDINGS OF FACT AND CONCLUSIONS OF LAW

Pursuant to the June 13, 2017 Order from the Environmental Quality Council (“EQC” or “Council”), the Powder River Basin Resource Council (“Resource Council” or “PRBRC”) hereby submits its Proposed Findings of Fact and Conclusions of Law in the above-captioned proceedings.

I. General Findings

1. According to the Wyoming Environmental Quality Act (“WEQA” or “Act”), “No mining operation may be commenced or conducted on land for which there is not in effect a valid mining permit to which the operator possesses the rights.” W.S. § 35-11-405(a).

2. Requirements for coal mine permit applications as well as grounds for approval and denial are governed by Section 406 of the Wyoming Environmental Quality Act, along with the Land Quality Division's ("LQD") Coal Rules and Regulations (hereafter "Coal Rules").

3. Specifically, as discussed below, certain findings related to the application's compliance with the WEQA and DEQ regulations must be made before the EQC can reach a decision on the permit application. *Id.* at §§ 406(n)(i)-(vii).

4. DEQ regulations require information in a permit application to be “current” . . . “accurate and complete.” Coal Rules, Ch. 2 § 1; *see also* W.S. § 35-11-406(n)(i) (requiring a permit applicant to prove that the application is “accurate and complete.”).

5. In response to the required public notice, the Resource Council timely filed objections to Brook Mining Company, LLC’s (“Brook” or “applicant” or “company”) coal mine permit application on January 27, 2017. Ex. POW 1. The Resource Council also timely requested a hearing before the EQC, initiating this contested case hearing.

6. Members of the Resource Council also timely filed objections to Brook’s coal mine permit application. John and Vanessa Buyok, Gillian Malone, Sadie Clarendon, Jane Buyok, Anton Bocek, Joan Tellez, Wendy Condrat, Brooke Collins, and William Bensel filed objections. Ex. POW 2-10. Their objections and concerns demonstrate that the Resource Council, through representation of its members, is an “interested person” within the meaning of Section 406(k) and a “person with an interest which is or may be adversely affected” within the meaning of Ch.1 § 17(b) of DEQ’s Rules of Practice and Procedure.

7. A contested case hearing was held in this matter on May 22-26 and June 7-8, 2017.

8. After the contested case hearing, the EQC must “issue findings of fact and a decision on the application.” W.S. § 35-11-406(p). This “decision on the application” is consistent with the authority granted to the EQC under the WEQA that the agency may “Order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified.” *Id.* at § 112(c)(ii).

9. In making this decision, the EQC’s review of DEQ’s permitting decisions and of the permit application is *de novo*. Under *de novo* review, the EQC must look afresh or “from the

new” at the permit application and cannot afford deference to DEQ in issuing any findings of fact or in making the decision on the permit application.¹

10. As discussed below, the permit application is deficient because it contains “omission[s] or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” *Id.* at § 103(e)(xxiv). If a deficiency exists, by definition it *cannot* be remedied by a permit condition.

11. Also, as discussed below, the applicant has not met its burden of proof to demonstrate compliance with key parts of the law, including the findings of Section 406(n) and bonding.

12. Since the application contains deficiencies, and it is not in compliance with the law, the EQC must order the Director to deny the permit. *Id.* at §§ 406(h), 406(n), 406(p).

II. The Permit Applicant Has Not Met Its Burden of Proof

13. Under Section 406(n), “The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with [the WEQA] and all applicable state laws.” The Wyoming Supreme Court has held that this burden extends to any hearing before the EQC on a coal mine permit. *Grams v. Env’tl Quality Council*, 730 P.2d 784, 789 (Wyo. 1986).

14. The burden of proof rests on the permit applicant alone. *Id.* at 406(n). The EQC cannot rely on DEQ’s testimony or evidence production designed to assist the permit applicant in meeting its burden of proof. *See, e.g.* Tr. at 1539 (Mr. Pope: “Brook has a burden of proof in this hearing. And in particular one of the things that Brook has to demonstrate is that everything in the statutes and regulations is included within the permit application.”). This is an important requirement because DEQ must remain in a neutral position as the permit has not yet been issued.

¹ This standard of review is especially applicable here where the scope of the EQC’s decision is to make the decision on the permit application, a decision DEQ has not made.

15. Through these proceedings, the permit applicant did not meet its burden of proof to demonstrate compliance with the law, including the findings of Section 406(n),² and to prove that no part of the permit application is deficient.³

16. The permit applicant presented only one witness who presented testimony about the application, Mr. Barron. Mr. Barron does not have personal experience in highwall mining, and has never helped to prepare a permit application for a highwall mine before. Tr. at 729 (Testimony of Mr. Barron).

17. Mr. Barron admitted that one needs to have a “certain level of expertise” to understand scientific principles, standards of best industry practice, and to interpret regulatory requirements. *Id.* at 733-34. However, Mr. Barron did not have expertise or professional knowledge to present testimony related to subsidence risk or hydrology. Mr. Barron is not a geologist or a hydrogeologist. *Id.* at 728, 1520-21. Nor is he an engineer with expertise in subsidence risk or control. *Id.* at 737; 757-58. Mr. Barron did not prepare the subsidence control plan and was not qualified to present testimony regarding its findings. *Id.* at 734.

18. Therefore, Brook did not present any testimony to meet its burden of proof to rebut the expert testimony, expert reports, and other evidence identifying deficiencies in the permit application presented by the Resource Council, Big Horn Coal, and the Fishers.

III. The Permit Application Does Not Include or Support the Findings of Section 406(n)

19. The critical findings of Section 406(n) have not yet been made, and as DEQ has admitted, they must be made before a decision on the permit application can be made. *See, e.g.* Tr. at 7-8 (Opening statement of DEQ).

² As discussed in the Resource Council’s recent brief on the subject, Section 406(p) dictates that once there is a hearing, the EQC makes the “decision on the application,” not the DEQ. There is no later opportunity for the DEQ to review the permit’s compliance with Section 406(n).

³ *See also* Tr. at 1504-05 (Testimony of Dr. Kuchanur regarding technical adequacy).

20. Additionally, as discussed below, testimony and evidence presented at the hearing demonstrate that the findings cannot be made at this time because of deficiencies in the permit application.

21. The lack of findings, and the inability for the DEQ or EQC to make the findings after the hearing, necessitates denial of the permit application. W.S. § 35-11-406(n).

A. A Finding that the “Application is Accurate and Complete” Cannot Be Made

22. As presented below, the application is neither accurate nor complete for a variety of important issues, including subsidence control, water quality and quantity data and assessment, facilities, coal production estimates, roads, blasting, and bonding.

23. Since a finding that “[t]he application is accurate and complete” cannot be made, the Council must order that the permit application should be denied. *Id.* at § 406(n)(i).

B. The 406(n)(v) Findings Related to Alluvial Valley Floors Cannot be Made

24. Alluvial valley floors (“AVFs”) are defined by the WEQA as “the unconsolidated stream laid deposits holding streams where water availability is sufficient for subirrigation or flood irrigation agricultural activities . . .” *Id.* at § 103(e)(xvii).

25. Protection of these AVFs, both on the mining site and in adjacent offsite areas, is a main requirement of SMCRA to preserve the ecological integrity and “essential hydrologic functions” of important agricultural areas as coal mining moved into the “arid and semiarid regions of the country.” *See* 30 U.S.C. § 1265(b)(10)(F); W.S. § 35-11-415(b)(x).

26. These federal requirements are reflected in Section 406(n)(v) and the findings required for a decision on a coal mine permit to ensure that a permit will protect the functions of AVFs.

27. These findings and affirmative obligations to prevent harm to alluvial valley floors are particularly ubiquitous here, where the alluvial aquifers are an important source of water for local agriculture. *See* Tr. at 532 (Testimony of Dr. Kuchanur affirming the importance of the alluvial aquifers in the permit area and adjacent lands).

28. The permit application does not support a finding that “the proposed operation would . . . [n]ot interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated . . .” or a finding that the proposed operation will “[n]ot materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors” as required by Section 406(n)(v)(A)-(B). *See also* Coal Rules, Ch. 12 § 1(a)(i).

29. This finding cannot be made because DEQ has not finished mapping alluvial valley floors in adjacent lands. *See* Tr. at 262 (Testimony of Mr. Kristiansen admitting DEQ did not assess or designate alluvial valley floors in all adjacent lands); Ex. POW 36-37 (describing incomplete surveying and DEQ commitments to do more surveying *after* the permit was deemed suitable for publication and went to public notice).

30. Nor did the permit application contain the important data and analysis required by DEQ rules. Coal Rules Ch. 3 § 2 (prescribing requirements for data and analysis related to AVFs in the permit area and in adjacent lands).

31. The permit application is deficient because it does not include delineation of, or assessment of impacts to, an alluvial valley floor designated by DEQ after the permit application was deemed “technically complete.” Tr. at 112 (Testimony of Mr. Kristiansen: “So at the time the technical completeness was completed for AVFs, I had not yet accomplished the AVF material and there was nothing for them to put in the application. Once it was declared complete,

then we don't revisit that again."'). However, in spite of the lack of designation at the time of permit review, DEQ later determined that the AVF would not be affected and therefore did not have to be designated in the permit application. *Id.* at 113.

32. The same goes for a much larger "potential" AVF along the Tongue River. Ex. DEQ 16; Tr. at 115, 263 (testimony from Mr. Kristiansen that because DEQ determined that the potential AVF won't be affected by mining, it doesn't need to be designated at this time).

33. But herein lies the catch 22 of the permit application: DEQ could not factually determine that the AVF would not be affected *unless* it was properly delineated and assessed *prior* to review of the permit application. *See, e.g.* Tr. at 1375-76 (Testimony of Mr. Wireman: "if you don't know where they are, how can you design a mine plan to protect them?").

34. Even assuming DEQ could determine whether AVFs will be affected *without* delineating them prior to making that assessment, DEQ's determination of whether AVFs will be "affected" by mining is much too simplistic and is based wholly on whether mining will directly occur in the AVF. Ex. DEQ 16; Ex. DEQ 12 at 90; *See also* Tr. at 156-57 (Testimony of Mr. Kristiansen arguing that because there is a 100 foot buffer between surface or underground mining and the creek that the AVF will not be affected); *Id.* at 386.⁴ Mr. Wireman's expert opinion is that you can damage the AVF without direct disturbance, damage that is not considered by Brook or DEQ. *Id.* at 1377-78.

35. DEQ underestimates a possible hydrologic connection between the coal seams and the AVFs because the agency assumed that the Tongue River is the sole source of recharge to the AVFs. Tr. at 339 (Testimony of Mr. Kristiansen). This is not the case. *Id.* at 1380 (Testimony of

⁴ Later Mr. Kristiansen said he made this determination also based on the fact that there would be no "discharge of any kind," tr. at 266, however, as was discussed at the hearing, the company will be applying for a WYPDES permit that will allow discharge of some pollution into waterways. Tr. at 398 (Testimony of Mr. Kunze).

Mr. Wireman that groundwater supports the Slater Creek AVF); *id.* at 1387-92, 1396 (testimony that the AVF along the Tongue River is recharged by the river and by groundwater and that there is a hydrologic connection between the AVFs and the coal seams); Ex. POW 17 at 6 (groundwater from the coal seams “is a source of recharge to Slater Creek alluvium.”); *id.* at 9 (discussing potential impacts to the Tongue River AVFs).

36. Additionally, DEQ even admits that at some point in the future mining could affect the “potential” AVF. Tr. at 266 (Testimony of Mr. Kristiansen saying mapping of the potential AVFs would be done in the future as the mine progresses toward them). DEQ and Brook testimony also admitted that there is a hydrologic connection between the coal seams Brook plans to mine and the AVFs. *Id.* at 295-96, 303 (Testimony of Mr. Kristiansen); *Id.* at 564-65 (Testimony of Dr. Kuchanur); *see also* Ex. DEQ 12 at 231 (identifying a connection between the Carney coal seam and the Tongue River alluvium); Tr. at 788-89 (Testimony of Mr. Barron).

37. This hydrologic connection is of particular importance in the TR-1 area, as the company plans to pump or dewater the area for a source of water for the mine, throughout the life of the mine. The permit application does not consider any impacts associated with this dewatering to the alluvial system along the Tongue River. Tr. at 300.

38. Therefore, as DEQ itself admitted, given the lack of designation of AVFs, and the lack of impacts analysis to these AVFs, DEQ is unable to make the Section 406(n) finding that mining will not materially damage the quantity or the quality of the water in the AVFs (both designated and “potential”). Tr. at 303 (Testimony of Mr. Kristiansen).

39. Since DEQ (or alternatively, the EQC) is unable to make the Section 406(n) findings that AVFs will be protected as required by the law, the permit must be denied.

C. A Finding that the Mine Has Been Designed to Prevent Material Damage to the Hydrologic Balance Cannot Be Made

40. 357 groundwater wells are present within three miles of the permit area. Tr. at 1344 (Testimony of Mr. Wireman).

41. Groundwater flow will be intercepted during mining, up to 99 gallons per minute at the anticipated peak rate. Tr. at 487 (Testimony of Dr. Kuchanur).

42. It is estimated that groundwater levels will not recover to within 10 feet of pre-mining levels for at least 10 years for the Carney Seam and 20 years for the Masters Seam, creating long-term impacts to regional water supply. *Id.* at 486.

43. However, as Mr. Wireman concludes, “[g]roundwater flow in the coal seams is poorly characterized. This constrains the ability to estimate dewatering rates and volumes and to assess probable cumulative hydrologic impacts.” Ex. POW 17 at 6.

44. Even given the limited data collection and modeling assumptions, the permit application acknowledges drawdown impacts to wells outside the permit boundary. Ex. DEQ 12 at 251. However, as explained during testimony, neither Brook nor DEQ did any analysis for the permit application to assess whether drawdown will create material impacts to quantity or quality of those water wells, *or* if those impacts occur, whether replacement water is available. Tr. at 549 (Testimony of Dr. Kuchanur); *Id.* at 1016-17, 1037-39 (Testimony of Mr. Buyok); *Id.* at 1094 (Testimony of Mr. Bocek); *Id.* at 1060-62 (Testimony of Ms Brezik-Fisher).

45. As Mr. Wireman’s expert testimony demonstrated, “That is simply not discussed or addressed in terms of what happens to the water in these wells if you dewater the coal, because they just haven’t dealt with it.” *Id.* at 1344; *see also id.* at 1382-85 (concluding that “there was no way to really assess the potential impact of these domestic wells due to declines in water

levels . . . there just was not enough information and data there” and “we don’t know enough here in this hydrologic system to make any judgments about risk or about impacts.”).

46. Furthermore, as demonstrated below, the permit application does not contain a baseline water quality or quantity assessment for surface and groundwater required by the WEQA and associated regulations. As Ms. Boomgaarden set forth in Big Horn Coal’s opening statement, “Without knowing and understanding the site-specific hydrologic conditions, it simply is impossible for Brook to adequately consider the impacts of its proposed highwall mining operations as the law requires.” Tr. at 19; *see also id.* at 1351 (Testimony of Mr. Wireman that if the baseline data does not exist, you “can’t assess risk” and “can’t assess changes to the hydrologic system”); *id.* at 1352 (“If you want an honest, thorough, rigorous assessment of what’s going on, and if the decisions that need to be made are based on that, then you need an adequate amount of data.”); *id.* at 1439, 1443.

47. These factual findings support a conclusion that the permit application does not contain “a plan to minimize the disturbances to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation” as required by the WEQA and corresponding DEQ regulations. W.S. §§ 35-11-406(b)(xvii), 406(n)(iii); Tr. at 945 (Testimony of Mr. Gerlach); *id.* at 1372-73 (Testimony of Mr. Wireman: “I don’t think there’s enough data and enough assessment to make any decision along those lines” regarding material damage to the hydrologic system; recommending the permit should be denied); Ex. POW 17 at 3.

48. Nor does the permit application contain the required “plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and

adjacent to the permit area” or “[a]n evaluation of the impact of the proposed mining activities that may result in contamination, diminution, or interruption of the quality and quantity of groundwater or surface water within the proposed mine permit area or adjacent areas that are used for domestic, agricultural, industrial, or other legitimate purposes.”. Coal Rules Ch. 2.

49. Nor does the permit application contain a probable hydrologic consequences determination “sufficient to make the determination of W.S. § 35-11-406(n)(iii).” *Id.* § 4(a)(xiv); Ch. 19 § 2(a)(i).

50. Additionally, the Cumulative Hydrologic Impacts Assessment (“CHIA”) has not been completed. DEQ admits that the CHIA is necessary to support the “material damage” finding under Section 406(n)(iii). Tr. at 413, 436, 444 (Testimony of Mr. Kunze that the DEQ cannot make the 406(n) findings without the CHIA).

51. While the CHIA is a document separate from the permit application, Tr. at 413, a “common practice” of DEQ is to finalize the CHIA by the time of public comment to afford an opportunity to raise comments or objections on the CHIA – a process that did not happen here. *Id.* at 423-25; Ex. POW 53.⁵

II. The Permit Application Does Not Include Sufficient Information to Assess and Control Subsidence Risk

52. The company has an obligation to prevent subsidence. A coal mining permit application with underground components, such as this permit application, must include “[i]nformation and evaluations on the potential for and the extent of subsidence, and the effect it may have on structures, the continued use of the surface land and aquifers or recharge areas” and “[e]xcept for areas where planned subsidence is projected to be used, measures to be taken in the

⁵ Testimony at the hearing established that the CHIA was started in 2014 but comments were not requested by reviewing agencies until December 2016, preventing the CHIA from being finalized by the end of the public comment period. Tr. at 425-26 (Testimony of Mr. Kunze with summary from Dr. Bagley).

mine to prevent or minimize subsidence, including backfilling of voids and leaving areas in which no coal is removed.” Coal Rules Ch. 7 § 1(a)(v).

53. Additionally, “[u]nderground mining activities shall be planned and conducted so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources.” Coal Rules Ch. 2 § 2(b)(iii); Ch. 7 § 2(b)(iii); *see also* Tr. at 57 (Mr. Kristiansen discussing the subsidence control requirements of Ch. 7 § 2).

54. DEQ regulations further provide that “[a]uger mining may be limited or prohibited to minimize . . . unwarranted subsidence” Coal Rules Ch. 5 § 6(b); *see also* Coal Rules Ch. 3 § 5 (requiring information in the permit application to demonstrate compliance with these standards). This regulation applies to the Brook permit because at various times in the mine plan, the company refers to highwall mining as auger mining or “a similar method to auger mining.” Ex. DEQ 12 at 59, 88, 192; *see also* Tr. at 119, 233 (testimony of Mr. Kristiansen that the auger mining regulations apply to the Brook Mine).

55. DEQ’s Guideline No. 6A, Format and General Content Guideline for Permit Applications, Amendments and Revisions for Coal Mining Operations, requires a subsidence control plan for underground mining operations. A subsidence control plan is also required by federal regulations, incorporated into the state SMCRA program. *See* 30 C.F.R. § 784.20, *et seq.*

56. As acknowledged by DEQ, “subsidence control is of key importance to the mine plan.” Tr. at 162 (Testimony of Mr. Kristiansen).

57. In spite of this “importance,” as explained below, DEQ let the permit applicant proceed with an admittedly deficient subsidence control plan that does not achieve its required objective: to assess, control, and prevent subsidence at the mine site.

A. Subsidence is Prevalent in the Area & Subsidence Risk is Amplified by an Overlap Between the Proposed Permit and Existing AML Projects

58. Abandoned mine land (“AML”) division reclamation work to address subsidence problems in the area is widespread and ongoing. *See* Ex. POW 38-47, 80-82, 86-88. The permit area and areas adjacent to the permit area has active subsidence. Tr. at 1225-26 (Testimony of Dr. Marino); *id.* at 1019-22 (Testimony of Mr. Buyok).

59. DEQ was fully aware of this history of subsidence at the time of its review of the permit application. Tr. at 165 (Testimony of Mr. Kristiansen: “The mines in the Sheridan area all subsided at one point in the past, sooner or later.”); *Id.* at 238; Ex. POW 54.

60. Brook’s proposed permit boundary overlaps with abandoned mines known to cause subsidence. DEQ Ex. 12-145; Tr. at 239-42 (Testimony of Mr. Kristiansen). Brook’s underground mining will occur in close proximity to, and in some cases overlap with these abandoned mines. *Id.*; *see also* Tr. at 244-45 (Testimony of Mr. Kristiansen).

61. In spite of the prevalence of subsidence in the area from abandoned mines, and in spite of the overlap between Brook’s permit and some of these abandoned mines, Brook did not assess potential impacts related to subsidence from its proposed mine. Tr. at 170 (Testimony of Mr. Kristiansen). The company merely partially mapped the historic mining and the potential overlap. *Id.* Brook did not include a discussion about the various AML projects and subsidence caused by historic mining in its subsidence control plan. *Id.* at 752-53 (Testimony of Mr. Barron).

62. Nor did DEQ conduct any independent analysis of potential impacts of ongoing subsidence in the area and its relationship to the proposed Brook Mine. Tr. at 244 (Testimony of Mr. Kristiansen).

63. Nor did Brook verify anticipated subsidence potential at their site with actual subsidence conditions in the permit area. Ex. POW 12 at 13-14, 18 (Dr. Marino concluding: “There is a massive amount of surface subsidence in the area at mine depths similar to that proposed . . . both sag and pit subsidence would be expected at the Brook Mine.”).

64. DEQ and Brook did not even consult with the AML Division staff during review of the permit application to discuss the implications of and concerns related to ongoing subsidence in the area. Tr. at 243 (Testimony of Mr. Kristiansen); Tr. at 757 (Testimony of Mr. Barron).

B. Testimony Demonstrated DEQ Did Not Have the Expertise to Review the Subsidence Control Plan for Technical Accuracy or Completeness

65. The review of the Brook permit was one of the first jobs Mr. Kristiansen had when he started working at DEQ. Tr. at 218-19 (Testimony of Mr. Kristiansen). The Brook permit was the first coal mine permit Mr. Kristiansen coordinated while at DEQ. *Id.* at 226.

66. Mr. Kristiansen does not have any prior experience in reviewing subsidence control plans or highwall mine permits. Tr. at 163 (Testimony of Mr. Kristiansen); *Id.* at 227; Ex. GIL 21-23. Mr. Kristiansen admitted that the District III office of the Land Quality Division did not have experience in reviewing underground mine permits, and Brook’s permit application was the first highwall mine proposal the District had reviewed. Tr. at 226-27.

67. Because of his lack of experience, Mr. Kristiansen “had to attend” training by the Office of Surface Mining Reclamation and Enforcement (“OSMRE”). Tr. at 164. However, in review of the permit application, Mr. Kristiansen did not utilize key chapters of the OSMRE training materials related to subsidence prevention and risk. *Compare* Ex. DEQ 17-20 to Ex. POW 84; *see also* Tr. at 167, 376-77. Notably, he did not consider or evaluate important formulas related to geotechnical engineering and subsidence risk. *Id.* at 251.

68. Nor did Mr. Kristiansen perform any independent verification of admittedly “limited” and “basic” analysis done by Brook’s consultant. Tr. at 166-68; 237.

69. Mr. Kristiansen testified that he did not conduct independent verification because Brook’s consultant had “levels of experience significantly higher than [he] has,” Tr. at 168, although he was not sure who actually prepared the subsidence control plan. *Id.* at 253. Mr. Kristiansen also admitted that Dr. Marino has more experience than him. *Id.* at 251.

70. In fact, Mr. Kristiansen testified that he “was not expert enough” to even know what “technical and scientific standards” a subsidence control plan must meet. *Id.* at 234.

71. Nor did he have any experience or background in using any of the formulas discussed in the OSMRE course materials. *Id.* at 251.

72. Thus, even after the OSMRE course, Mr. Kristiansen did not have expertise in reviewing a subsidence control plan. *Id.* at 252 (Testimony from Mr. Kristian: “I would not say I’m an expert, no.”)

73. Mr. Kristiansen was the only DEQ staff member who reviewed the subsidence control plan and he did not reach out for assistance from anyone else at DEQ for assistance with his review. *Id.* at 234. Nor did he consult any background information beyond the OSMRE course materials he reviewed. *Id.* at 252.

74. With this lack of experience and expertise on the part of DEQ, Brook’s subsidence control plan was essentially not reviewed and deemed “technically adequate” with no basis for that determination.

75. As such, DEQ’s determination of “technical adequacy” for the subsidence control plan was arbitrary and capricious and an abuse of discretion, as the agency had no factual basis for making its decision.

C. The Subsidence Control Is Deficient Because It Was Not “Stamped” by a Professional Engineer

76. Geotechnical information or analysis in a mine permit application must be provided by a licensed engineer in Wyoming. This is necessary for DEQ to be able to rely on the accuracy of the information. *See* Tr. at 379 (Testimony of Mr. Kristiansen that information provided by licensed engineers is “certifiably accurate.”); *id.* at 1238-39 (Testimony of Dr. Marino that other subsidence control plans he has seen have been stamped by professional engineers and if “you’re doing engineering work, there’s a stamp for it.”).

77. However, no professional engineer “stamped” the subsidence control plan, rendering it deficient. Tr. at 738 (Testimony of Mr. Barron).

D. The Subsidence Control Plan and Associated Geotechnical Data is Neither Accurate nor Complete

1) Dr. Marino Concluded That the Subsidence Control Plan Is Deficient

78. Geotechnical engineering expert Dr. Marino concluded that “the application is severely deficient in the analysis and data to be able to make any kind of analysis of what the likelihood of subsidence would be in the future.” Tr. at 1200 (Testimony of Dr. Marino); Ex. POW 12 at 17 (“A detailed and advanced subsidence engineering analysis is required given the reported geologic and mining conditions. However, the mine subsidence potential investigation provided in the mine application is wholly inadequate . . .”); Ex. POW 11 at 42 (The subsidence control plan has a “lack of geomechanical understanding” and “insufficient information”).

79. Dr. Marino also concluded that the data and analysis included in the subsidence control plan “is far below industry standards.” Tr. at 1228; POW 11 at 42. He also concluded that the permit application did not meet scientific standards. *Id.* at 1246 (“There’s no science, in essence”).

80. The application contained only “inferences of attempts at calculating” pillar strength, and Dr. Marino concluded “there’s no equations given, there’s no strengths given.” Tr. at 1208. Additionally, the equation that was used in the permit application is an equation for bituminous coal, not the subbituminous coal found in the permit area. *Id.* at 1208-09, 1247. There was also no assessment of pillar width and height. *Id.* at 1209.

81. The permit application did not include an assessment of the potential of roof or floor collapse. Tr. at 1211 (Testimony of Dr. Marino: “There’s no mention of failure of . . . roof or floor conditions in terms of analysis or safety factors or anything like that.”).

82. The permit application’s limited data prevents an accurate or complete analysis of subsidence risk and engineering safety factors. Tr. at 1216 (Testimony of Dr. Marino: “here, we don’t have hardly any input data. If you don’t have the right input data, even if you have the right prediction method, your calculated value is suspect.”); *id.* at 1223, 1234; Ex. POW 12 at 18 (concluding that the permit application “essentially [had] no short and long term mine stability analyses of all potential failure modes that can lead to surface subsidence” and “no appropriate examination of risk, severity, and types of potential subsidence”).

83. The permit application does not completely or accurately assess the complex and diverse geological conditions in the permit area. *See, eg.* Tr. at 1221 (Testimony of Dr. Marino: “we’ve got a variety of different depths, different thicknesses of coal, different interburden thicknesses, different seam splits, none of this is really addressed in the permit in the application.”); *id.* at 1244 (the permit application is “not complete in a technical form because there’s not enough information to evaluate various mining scenarios in the various geologic conditions.”); Ex. POW 12 at 17; Ex. POW 11 at 33.

2) Brook & DEQ Admit That the Subsidence Control Plan is Deficient

84. DEQ admits that “data and studies” related to subsidence “have to be complete enough in this permit application to make and support” the finding that subsidence is not likely to occur. Tr. at 257 (Testimony of Mr. Kristiansen); *see also* Tr. at 742-43 (Testimony of Mr. Barron regarding this finding, its scope, and that its justification is a part of the permit application).

85. Yet, DEQ and Brook admit that additional geotechnical studies are needed before the company can justify the finding. *Id.*; *see also* Tr. at 323-25 (Mr. Kristiansen admitting that the testing Brook has done to date is not sufficient to assess whether subsidence will occur); *Id.* at 380; Tr. at 662, 743, 762 (Testimony of Mr. Barron: “To comply with the commitments within the permit there are additional studies that need to be done.”).

86. DEQ admits that the subsidence control plan contained “narrative” not technical information. Tr. at 247, 254 (Testimony of Mr. Kristiansen).

87. Brook admits that the finding that subsidence will not occur is not actually supported by data in the permit application and is merely a commitment to achieve a performance standard with no basis no show it will actually be achieved. Tr. at 745 (Testimony of Mr. Barron that the limited data in the permit application provided a “general sense” but did not provide a “specific conclusion” and that the statement in the subsidence control plan that “Highwall mining should not result in surface subsidence” was merely “a commitment to the performance standard.”).

88. For instance, the permit application is deficient because there was only one coal strength test done for the entire permit area. Tr. at 328 (Testimony of Mr. Kristiansen); *id.* at 1290 (Testimony of Dr. Marino: “it means nothing to me, one test”).

E. Expert Dr. Marino Demonstrated Subsidence Risk if Mining Proceeds

89. Dr. Marino's expert report concludes that "There is a serious risk of surface subsidence from roof collapse in the proposed mining [area]." Ex. POW 12 at 15; *see also* Tr. at 1225-28.

90. Dr. Marino's analysis shows that mine collapse is likely to occur because of the dominant presence of clay materials in the roof and floor on the mine. Tr. at 1210 (Testimony of Dr. Marino: "from reading the permit, the vast majority of the material's claystone . . . claystone is made of clay. And when that gets exposed to water, it deteriorates. It softens and swells and it causes failure."); *see also* Ex. POW 12 at 6, 9, 15-16 ("from our experience with the claystone roof and floor, the proposed mining can result in sag subsidence"); *id.* at 18. Brook's safety factor calculations did not account for the presence of clay. Tr. at 1226 ("no significant clay seam [is] assumed in the analysis.").

91. The presence of thin interburden and faulting also presents subsidence risk. *Id.* at 1219-21.

92. Dr. Marino found that even when using Brook's assumptions, "the stability factor calculates to an unacceptable value of less than one at [Brook's] pillar pressure where the panels are sufficiently wide." Ex. POW 12 at 11.

F. Coal Recovery Ratios Do Not Cure the Deficiencies in the Permit Application

93. DEQ confirmed Brook's finding that the mine would not create subsidence because of heavy reliance on an understanding that 50% of the coal would be left in the seam post-mining. Tr. at 120, 126, 169, 311, 330, 358 (Testimony of Mr. Kristiansen).

94. However, Brook's own permit application shows that recovery ratios will be from 45-60% and therefore will exceed 50%. Ex. DEQ 12 at 35; Tr. at 677, 760 (Testimony of Mr. Barron).

95. Dr. Marino's expert analysis shows Brook's extraction ratio could be as high as 60-70 percent. Tr. at 1204, 1236 (Testimony of Dr. Marino); Ex. POW 12 at 7.

96. Regardless, even Mr. Kristiansen admitted that the recovery ratio is just one factor to consider, and that you must also consider the strength and width of the coal pillars, the roof materials, and the floor materials to properly assess whether subsidence will occur. Tr. at 313-14.

97. Dr. Marino's expert analysis also shows that the 50% ratio should not be given as much weight as DEQ gives it. Tr. at 1236 (Testimony of Dr. Marino: "That standard . . . really doesn't apply if you have safety factors that are lower than what are acceptable. It should be based on safety factors, not on a percent."); *id.* at 1291 (noting that Brook's recovery rates "are general numbers that encompass[] the whole complex."); Ex. POW 12 at 7, 10 (noting that Brook's information is "typical" and generalized, not specific enough to provide DEQ a basis to conclude subsidence will be prevented).

98. Moreover, even assuming that the 50% extraction rate is technically significant *and* assuming that Ramaco will meet that rate, DEQ will not be able to independently verify or enforce the rate as a permit term or condition. Tr. at 229-30 (Testimony of Mr. Kristiansen: "I can't verify that"; admitting there is "no way" for DEQ to ensure compliance).

G. The Future MSHA Ground Control Plan is Not a Substitute for a Technically Complete and Adequate Subsidence Control Plan

99. Brook testified that the yet-to-come MSHA ground control plan can be viewed as a remedy for its deficient subsidence control plan. *See* Tr. 15-16 (Brook opening statement); *Id.* at 663 (Testimony of Mr. Barron: "the calculations necessary to provide the information for MSHA

are exactly the same data that DEQ is looking for each one of these panels.”); *Id.* at 746, 1533-34.⁶

100. Mr. Barron testified that the additional studies suggested by Dr. Marino in his expert report “are appropriate.” Tr. at 674-75 (admitting Dr. Marino’s expertise). However, he testified that these studies would be done for the MSHA ground control plan, not as part of the subsidence control plan. *Id.* at 675 (“it is a commitment as part of the permit application in the ground control plan that those [studies] will be done.”).

101. As Dr. Marino testified, the ground control plan is not a substitute for the additional geotechnical studies that must be done for the permit’s subsidence control plan *before* permit issuance. Tr. at 1202-03 (Testimony of Dr. Marino that MSHA won’t be concerned about stability in areas of the mine where miners will not be present, that MSHA is not the agency that “determines whether or not the mine plan is approved for surface subsidence,” and that the agency “has a different scope”); *id.* at 1241-42, 1245 (Dr. Marino testifying that future testing and analysis through the MSHA permit will not cure deficiencies in the subsidence control plan); Ex. POW 12 at 9 (“[A]pproval from MSHA (whose responsibility is safety) is irrelevant as the concern here is land subsidence.”).

102. Additionally, MSHA is focused on “looking at short-term conditions, when the miners are in, not when it’s abandoned.” Tr. at 1273 (Testimony of Dr. Marino that MSHA does not consider the risk of long-term subsidence at a mine site); *id.* at 1286 (testimony that the 1.3 safety factor is a “short-term safety factor” not long-term); *compare to id.* at 1535 (Testimony of Mr. Barron: “For the short term, we will stick with the 1.3 factor of safety.”).

⁶ DEQ has never supported Brook’s assertions regarding the ground control plan. In fact, DEQ has little understanding of what a ground control plan even is or what it requires. *See* Tr. at 330, 344 (Testimony of Mr. Kristiansen saying “I do not know” in response to a question about what engineering studies MSHA requires).

103. Dr. Marino’s conclusion was based on significant professional experience in preparing and reviewing subsidence control plans over his multi-decade career. Tr. at 1196 (Testimony of Dr. Marino regarding his background and experience); *id.* at 1237 (“there’s nothing in [other subsidence control plans I have reviewed] about MSHA, because MSHA is not directly related to subsidence on the ground surface.”)

104. Dr. Marino’s conclusions that the ground control plan is not meant to control subsidence and is not a substitute for the subsidence control plan required as part of the permit application are verified by Mark Eslinger, a former Supervisory Mining Engineer for MSHA, who in the scope of his multi-decade career reviewed ground control plans. Exhibit A (letter from Mark Eslinger to Shannon Anderson, July 11, 2017 with attached C.V. of Mark Eslinger).⁷

105. Even Brook admits that the ground control plan is only meant to address the safety of miners. Tr. at 663, 747 (Testimony of Mr. Barron: MSHA is “an organization whose sole role is the protection of the safety of miners.”). As a result, Brook admits that MSHA will not focus on subsidence damage to land resources or any other potential impacts of subsidence except safety of workers. *Id.* at 748.

III. The Permit Application Does Not Have Sufficient Baseline Water Data

106. Coal seam aquifers are locally and regionally important sources of water. *See* Tr. at 192 (Testimony of Mr. Kristiansen: “By and large, the coal beds are the primary aquifers in the basin . . .”)

107. In the permit area, and in surrounding areas, other aquifers, including overburden aquifers, also supply water for homes and agriculture or are capable of supplying water for these purposes.

⁷ These exhibits are included as part of these findings to rebut testimony provided by Mr. Barron.

108. However, in spite of the presence of these aquifers, there was very little and in some cases *no* baseline data collected to analyze the characteristics of, and projected impacts to, these aquifers. *See, eg.* Tr. at 915 (Testimony of Mr. Gerlach); Ex. BHC 9.

109. Mr. Wireman's expert analysis shows that Brook did not collect baseline water samples in a scientifically defensible way, rendering the permit application deficient. *See, e.g.* Tr. at 1345-48; Ex. POW 17 at 3 (The permit application "present[s] a very incomplete characterization of the hydrogeology and surface water hydrology.").

110. For instance, Brook did not conduct baseline water monitoring in the critically important TR-1 area – the first area Brook proposes to mine. *See* Tr. at 210-14, 383 (Testimony of Mr. Kristiansen); *Id.* at 513, 518, 519 (Testimony of Dr. Kuchanur). During technical review, DEQ identified the lack of data as a deficiency; however, Brook never provided additional information to remedy this deficiency. *Id.* This means that the lack of baseline water quality data for the TR-1 area remains a deficiency in the permit application. *Id.* at 217 (Testimony of Mr. Kristiansen admitting the deficiency and that this lack of data prevents the permit application from being "accurate" and "complete"). Additionally, generalities regarding aquifer characteristics from other portions of the mine are not applicable to this area, preventing other data from curing any deficiencies. *Id.* at 513.

111. Aside from the TR-1 area, no monitoring wells were completed in the overburden or interburden aquifers, at any locations throughout the permit area. Tr. at 511-12 (Testimony of Dr. Kuchanur); Ex. DEQ 6 at 24.

112. Testimony confirmed that "[m]onitoring in the alluvium is important." Tr. at 533 (Testimony of Dr. Kuchanur). However, no baseline monitoring wells were completed in the alluvial aquifers – aquifers that are important to local agriculture and must be protected during

mining. *Id.* at 532, 539; *id.* at 1363-65, 1373 (Testimony of Mr. Wireman); Ex. POW 17 at 5 (Mr. Wireman's conclusion that "[t]his is a serious omission."); *see also id.* at 9.

113. Brook has committed to a limited set of three operational monitoring wells in the alluvium (Tr. at 533), but even if that operational monitoring was sufficient, it does not cure the lack of baseline monitoring.⁸

114. DEQ's groundwater expert was not involved in decisions allowing Brook to limit its baseline water monitoring program. Tr. at 523 (Testimony of Dr. Kuchanur).

115. Only fifteen wells were used for assessment of groundwater levels, in the entire permit area. Tr. at 523, 567 (Testimony of Dr. Kuchanur). And these wells only collected baseline water data from the coal seams. *Id.* at 524. This means that no water data was collected for non-coal bearing aquifers. *Id.* at 1382-83 (Testimony of Mr. Wireman, noting that Brook's application finds that most water wells in the area are not in the coal aquifers and no data is available for those aquifers).

116. Only *one* test was conducted to determine hydraulic conductivity, porosity, and storage coefficient values. Tr. at 524-25, 535, 1501 (Testimony of Dr. Kuchanur). This means that only *one* test was taken in the northeast portion of the permit for these very important water parameters and to characterize them for the entire permit area, rendering the analysis deficient. Tr. at 1354 (Testimony of Mr. Wireman); *id.* at 1355 ("a single value for the whole area . . . [can] in no way [] capture the complexity in the heterogeneity"); Ex. POW 17 at 5, 8; *see also id.* at 525 (Testimony of Dr. Kuchanur: "We need these parameters to characterize the aquifer"; acknowledging that if the test is not "an effective parameter that provides the best match to . . . what you see in the ground in terms of water levels" then the data is not sufficient.)

⁸ Additional operational monitoring for water quality and quantity will not remedy deficiencies related to baseline water data collection. Operational monitoring (during or post-mining) will itself be deficient without a scientifically defensible baseline to compare monitoring results to.

117. Mr. Wireman concluded that Brook did not “get data from monitoring stations throughout this permit area” as required to properly assess baseline water conditions and to understand the complexity and diversity of water quality and quantity in the area. Tr. at 1345 (Testimony of Mr. Wireman); *see also id.* at 1349-51.

118. For surface water monitoring, upstream and downstream monitoring stations on Slater Creek and Hidden Water Creek were used for baseline water monitoring. Tr. at 395 (Testimony of Mr. Kunze). However, data during the winter months was not collected. *Id.* This resulted in no water quality data being collected for Hidden Water Creek. *Id.* at 396. Historic data indicates that “in Hidden Water Creek, there was typically water in that creek in the winter, not in the summer” and that means water was not collected at the time the stream typically has water. *Id.* at 1361, 1402 (Testimony of Mr. Wireman); Ex. POW 17 at 7.

119. The lack of data collection from October to March prevented consideration of “seasonal differences” that can be significant and “very important.” Tr. at 1345, 1361-62 (Testimony of Mr. Wireman).

120. Groundwater data did also not account for seasonal changes, rendering it deficient. *Id.* at 1355 (“a potentiometric surface drawn for January water levels could be quite different than the one drawn with May water levels”).

121. Aside from seasonal deficiencies, Brook’s data of Slater Creek was deficient in other ways too. Tr. at 1366 (“There’s not enough characterization of Slater Creek.”); *id.* at 1363 (Slater Creek monitoring was not used to determine hydraulic conductivity values).

122. Brook’s lack of baseline water monitoring data was supplemented with other data sources. Tr. at 396 (Testimony of Mr. Kunze). However, this data was very old and still deficient. *Id.* at 1362-63 (Testimony of Mr. Wireman).

123. Determining the baseline water quality of Hidden Water Creek is especially important as Brook plans to divert the stream for at least three years. Tr. at 404 (Testimony of Mr. Kunze). Without baseline water quality data for Hidden Water Creek it will be impossible for DEQ to know if the creek's water quality or quantity will be impacted by mining operations.

124. No water monitoring was conducted on the Tongue River or Goose Creek in the permit area. Tr. at 408, 411-12 (Testimony of Mr. Kunze); *id.* at 1367 (Testimony of Mr. Wireman); Ex. POW 17 at 5.

125. As a result of this limited data collection, the hydrologic impacts model was limited and assumptions had to be made. Ex. DEQ 12 at 213 ("Limitations and assumptions specific to this modeling effort are primarily due to the complexity of the hydrogeologic system and a lack of data on physical and hydraulic characteristics of the aquifers and confining units being modeled."); *see also* Tr. at 528 (Testimony of Dr. Kuchanur agreeing that there are assumptions and limitations in the model). The data collected provided a "limited understanding of the coal location, continuity and hydrology." Ex. DEQ 12 at 529; Ex. POW 17 at 8.

126. Given these limitations and assumptions, the model was designed to provide a "general understanding of regional groundwater impacts." *Id.* The model was not, as Dr. Kuchanur testified, sufficient to serve as a "good predictive tool" of probable hydrologic consequences specific to proposed mining activities. *Id.*; Tr. at 530; *see also id.* at 1368-70 (Testimony of Mr. Wireman regarding the model's deficiencies).

127. The model was also deficient because it did not analyze or predict drawdowns to overburden aquifers. MP 6.2.3 ("Drawdowns of the overburden were not modeled . . ."); Tr. at 955 (Testimony of Mr. Gerlach: "there's no modeling of drawdown in the overburden."); Ex. POW 17 at 8 (Mr. Wireman concluding that "The modeling effort was limited to estimating

drawdowns in the coal seams . . . [m]odeling the coal seams as hydrologically isolated is not based on real data and is far too simplistic.”).

IV. The Permit Does Not Comply With Water Well Replacement Requirements

128. The WEQA requires coal mine operators to “replace” a surface or underground water supply “where the supply has been affected by contamination, diminution or interruption resulting from the surface coal mine operation.” W.S. § 35-11-415(b)(xii). A plan to meet these requirements must be a part of the permit application. Coal Rules Ch. 2 § 5(a)(ix)(E).

129. This requirement is especially important here, where 357 water wells are within the “zone of potential influence” of the mining operation. *See* Tr. at 288 (testimony of Mr. Kristiansen).

130. The permit application includes a commitment to replace only adjudicated water wells that will be impacted by mining activities. Ex. DEQ 12 at 52, 62.

131. The permit application’s water replacement limitations contravene the intent of Section 415’s requirements. Tr. at 521 (Testimony of Dr. Kuchanur); *see also* Ex. POW 17 at 4 (Mr. Wireman concluding that “Brook mine only agrees to replace impacted wells if they are adjudicated. This is not appropriate or sufficient since most domestic /stock wells are not adjudicated.”).

132. DEQ confirmed that removing “adjudicated” from the application is required through testimony at the hearing, and made the recommendation to the EQC to make the permit change. Tr. at 500, 520-22 (Testimony of Dr. Kuchanur).

V. The Permit Application Does Not Contain Any Limits or Restrictions on Blasting to Protect Property and Public Health

133. Blasting causes vibrations and is also a source of noise and air pollution. Tr. at 594-95 (Testimony of Mr. Emme).

134. “Orange clouds” produced from blasts often result from wet conditions. *Id.* at 597. Orange clouds have a high level of nitrogen oxides and the pollution that results is “highly toxic” and can be dangerous to breathe. *Id.* at 608. If an orange cloud “drifts” off site, it can settle back to the surface. *Id.*

135. Blasting is of particular concern to neighboring landowners. *Id.* at 1070-71 (Testimony of Ms. Collins); *Id.* at 1092-93 (Testimony of Mr. Bocek).

136. Blasting is also of concern to members of the public who recreate in the area given pollution, noise, and other impacts. Tr. at 1118 (Testimony of Ms. Malone).

137. A coal mine permit application must contain a blasting plan. Coal Rules Ch. 2 § 5(a)(vii). This plan must include “[p]roposed compliance with limitations on ground vibration and airblast, the basis for those limitations, and methods to be applied in controlling the adverse effects of blasting operations,” a “worst-case scenario” blasting estimate, identification of dwellings and structures in close proximity to proposed blasting locations, and a description and location of blasting monitors. *Id.*

138. The blasting plan must include sufficient terms and conditions for DEQ to determine compliance with the Chapter 6 blasting standards. To ensure compliance, the administrator (or his substitute) may request any additional information “determine[d] necessary” as part of the blasting plan. *Id.*; Tr. at 600 (Testimony of Mr. Emme). DEQ did not do that for this permit. *Id.*

139. Brook’s blasting plan is deficient because it does not describe how frequently blasting will occur and in what amounts or where blasting will occur. Tr. at 597-99 (Testimony of Mr. Emme).⁹ Nor does it include the proposed locations of monitors.

⁹ Brook originally proposed more detail but Mr. Emme asked them to remove it because if they would have blasted as proposed by the company “we’d have a lot of fly rock.” Tr. at 623.

140. It also does not describe what type of blasting will occur, for instance cast blasting, even though DEQ assumed that cast blasting would not be done in its review of the permit application. Tr. at 596 (Testimony of Mr. Emme).

141. Hundreds of residents live within a half-mile distance of the permit area, yet DEQ did not consider any restrictions or conditions on blasting to address impacts. Tr. at 593, 595 (Testimony of Mr. Emme).

142. DEQ (and in turn the EQC) has authority to limit blasting, in any number of ways, to protect public health and property. Tr. at 593-94 (Testimony of Mr. Emme that DEQ can put in place conditions if they are “advantageous.”).

VI. The Permit Application Does Not Disclose or Assess Impacts from Mine Traffic

143. The mine proposes to use large semi-trailer trucks with tandem trailers to transport coal. *See* Tr. at 148 (testimony of Mr. Kristiansen).

144. The mine plan is deficient because it does not estimate truck traffic, disclose any impacts to public or private roads used by the public, and does not include a traffic plan, even though according to the mine plan those “plans” have been “previously formulated.” Ex. DEQ 12 at 21.

VII. The Permit Application Illegally Allows Mining Through and Under a County Road

145. The permit application does not incorporate any agreements for road use with any governmental agencies or entities because no such agreements exist at this time. Tr. at 151 (Testimony of Mr. Kristiansen); Tr. at 702, 764 (Testimony of Mr. Barron that the permit applicant or consultants have not had any conversations with the county about road use).

146. Nor are there any proposals to relocate any public roads included in the permit application. *Id.* at 767 (Chairman Bagley: “Yeah, I would say that we have established that the plans to relocate that county road are not in the permit application.”).

147. Additionally, DEQ has not held a public comment opportunity or public hearing on any proposals to relocate any public roads within the permit area.

148. As such, the permit application is deficient because it does not include a 100 foot buffer around all public roads. Coal Rules Ch. 12 § 1(a)(v)(D); *see also* Ex. POW 31.

149. DEQ ignored this requirement in its permit review, partly because DEQ determined that only public roads outside the permit boundary would be impacted. Tr. at 277 (Testimony of Mr. Kristiansen that the “very minor” “narrative description” of impacts to public roads was sufficient because the roads are “outside the permit boundary.”).

150. However, the mine will directly impact Slater Creek Road inside the permit boundary, preventing landowners who use the road from accessing their property. *See* Ex. DEQ 12 at 131; Tr. at 279, 282 (Testimony of Mr. Kristiansen); *Id.* at 764-67 (Testimony of Mr. Barron that mining will come within 100 feet of Slater Creek Road and Slater Creek Road will have to be relocated); Ex. POW 33-34. The mine will also directly impact Hidden Water Road. *Id.*

VIII. The Permit Application Does Not Disclose or Include Any Facilities Necessary to Process, Transport, or Sell the Coal

151. For the purposes of delineating a permit boundary, the WEQA defines “Surface coal mining operation” to mean surface lands where surface coal mining activities take place and/or surface lands “incident” to underground coal mining activities. The operation shall also “include any adjacent land the use of which is incidental to any of these activities, all lands affected by the construction of new roads or the improvement or use of existing roads to gain access to the site

of these activities and for haulage . . . processing areas, shipping areas and other areas upon which are sited structures, facilities or other property or materials on the surface, resulting from or incident to these activities.” W.S. § 35-11-103(e)(xx); *see also* Tr. at 269 (Testimony of Mr. Kristiansen admitting that DEQ is supposed to require all facilities and roads that are incidental to mining to be included in the permit).

152. The permit application fails to include associated facilities necessary to get coal to a point of sale, including necessary roads and facilities. Ex. DEQ 12 at 21-22. These facilities were previously contemplated but were not included in the permit application. Ex. POW 48-50.

153. The permit application also is deficient because it does not include the proposed coal “processing areas” associated with Brook’s planned industrial park and manufacturing facilities, which are incidental to the mine. Ex. POW 26-27.

154. DEQ was fully aware of these facilities *before* the permit went to public notice and therefore they should have been considered by the agency in its review. Ex. POW 28.

IX. The Permit Application Does Not Include Other Facilities Planned at the Mine

155. Brook has planned a “long-term sump” at the TR-1 mine area. Tr. at 121-22; *Id.* at 193 (Testimony of Mr. Kristiansen: “The first pit, TR-1 pit is going to be kept as a sump . . . throughout mine life” for a variety of “different purposes.”).

156. Yet, this facility that will be in place the life of the mine is not identified or discussed *anywhere* in the permit application. Tr. at 198 (Testimony of Mr. Kristiansen).

157. There is also a corresponding lack of analysis of any associated impacts, including hydrologic impacts or impacts to land uses, which will result from this life of mine facility.

158. Brook anticipates it will need 328,200 gallons of water per day, and the TR-1 sump is a likely source for this water. Tr. at 433 (Testimony of Mr. Kunze).

X. The Permit Application Does Not Include an Accurate Projection of Coal Production

159. The mine plan must include “[a] complete operations plan proposed to be conducted during the life of the mine” with an accurate estimate of “the number of acres that will be affected annually” and the “anticipated annual and total production by tonnage.” *Id.* at § 5(a)(i).

160. Accurately estimating the amount of coal to be mined is a critical component of any mine plan as it establishes the time period of the permit and the level of anticipated impacts. Ex. POW 1 at 3, Ex. POW 17 at 3.

161. Originally, company representatives stated publicly that they anticipated mining 6-8 million tons per year when “Asian export markets” were the proposed market for the coal. Ex. POW 25 at 4, 13. However, now, the company plans to mine a small amount of coal for “feedstock” for their planned processing and manufacturing facilities. *See, e.g.* Ex. POW 72 at 9 (showing use of 30,000 tons of coal for a similar facility to that proposed by Brook).

162. The project keeps shifting, but meanwhile, the estimated annual production in the mine plan has not been updated since 2014. Tr. at 273-74 (Testimony of Mr. Kristiansen admitting that the projected production estimates in the permit application were not updated and DEQ did not ask any questions of the company related to production estimates).

163. The permit application is deficient because it does not contain an accurate estimate of annual and total coal production.

XI. Coal Production Will Exceed the Limit Established by the Air Quality Permit

164. The air quality permit is mentioned in the mine plan but says the permit “will be submitted.” Ex. DEQ 12 at 84. The permit application was not updated to disclose that there is a final air quality permit that was received *prior* the coal mining permit going to public notice nor does it explain any limits of on coal production that result from the air quality permit.

165. The air quality permit limits coal production at the Brook Mine to two million tons per year. Ex. POW 29 at 6.

166. For years four and five, estimated annual production exceeds two million tons, therefore proposing to violate the production limit established in the company's air quality permit. Ex. DEQ 12 at 98.

XII. The Permit Application Does Not Include a Proposed Bond that Meets the Requirements of Section 417

167. Requirements for mine reclamation bonds are governed by Section 417 of the WEQA and corresponding DEQ regulations. Coal Rules Ch. 12 § 2.

168. The reclamation bond must cover the *entire* cost of surface and water reclamation, including estimates of costs of third-party contractors necessary for the state to assume reclamation responsibilities in the case of a bond default. W.S. § 35-11-417(c)(i) (the bond should equal the “cost of reclaiming the affected land disturbed” . . . “plus the administrator’s estimate of the additional cost to the state of bringing in personnel and equipment should the operator fail or the site be abandoned.”); *see also* Tr. at 611 (Mr. Emme testifying that the bond is important “[s]o if an operator walks away, the state has revenue money in place to reclaim the mine site.”).

169. The bond amount must account for “the worst-case scenario.” Tr. at 636 (Testimony of Mr. Emme); Ex. POW 64 at 15 (“The bond amount will reflect the ‘worst case scenario’ i.e., the cost of reclaiming the site if the permittee forfeits the bond at the point of maximum reclamation cost liability, under the reclamation and operation plans approved as part of the permit.”).

170. Like the necessary findings of Section 406(n) discussed above, DEQ has stated that it has yet to calculate the bond amount. Tr. at 586-87 (Testimony of Mr. Emme). The bond

amount is not yet calculated because Brook has not provided “specifics” on their mining plans for the first year of their operations. *Id.* at 587, 609.

171. The lack of a bond in the permit at the time of public comment, like the CHIA, prevented adequate public review and comment on the proposed bond amount. *See* Tr. at 611 (Mr. Emme testifying that “The bond is set in the permit, and there is a public comment period before the permit is approved.”); *id.* at 612-13 (Testimony of Mr. Emme that the bond amount for an initial permit is generally set at a time that allows public comment, but for this permit there is no public comment opportunity for the bond amount).

172. Since DEQ has yet to set the bond amount, the only bond estimate that was available for public comment was Brook’s estimate.

173. Brook’s bond estimate was deficient because it did not include the costs of certain contingency factors and does not follow DEQ guidance to establish other contingency factor amounts. Ex. DEQ 31 at 16; Ex. POW 1 at 10-11.

174. Contingency costs are necessary *regardless* of the scope or extent of mining activities. Tr. at 614 (Testimony of Mr. Emme). These contingency costs “are very important if the state has to take over [the] bond.” Tr. at 613 (Testimony of Mr. Emme); *see also* Tr. at 773 (Testimony of Mr. Barron confirming Mr. Emme’s statement).

175. As such, these lines should not have zero estimates. *Id.* at 614 (Testimony of Mr. Emme: “There should be some number.”).

XIII. The Permit Application Does Not Contain a Surface Owner Protection Bond

176. In addition to the findings of Section 406(n), and the reclamation bond discussed above, a surface owner protection bond must be calculated prior to a decision on the permit application. *See* Tr. at 66-67 (Testimony of Mr. Kristiansen).

177. As far as the Resource Council is aware, the process to calculate that bond has not yet begun. Tr. at 201-02 (Testimony of Mr. Kristiansen).

178. Therefore, the EQC cannot find that the permit application should be approved.

PROPOSED PERMIT CONDITIONS OF APPROVAL & TERMS¹⁰

Proposed Blasting Permit Terms

Rationale: Blasting operations must prevent injury to persons and damage to public and private property outside the permit area. W.S. § 35-11-415(vi)(C). DEQ and the EQC have significant discretion to require permit terms to protect public health and safety and to prevent damage to homes and structures from blasting operations. *See Order, In the Matter of Objections by the Powder River Basin Resource Council to the Amendment of the RAG Eagle Butte Permit, Permit No. 428-T3, Docket No. 00-4802, June 26, 2003 at 10-12; Tr. at 608 (Mr. Emme testifying that “In the Powder River Basin, all the mines have either permit conditions or have voluntarily put restrictions on their operations.”); id. at 617-18, 639-40.*

Proposed Permit Terms:

Brook shall not conduct cast blasting. Blasting will only be authorized from 9 a.m. to 4 p.m., M-F. No blasting shall occur on public holidays. Brook shall not conduct blasting if wind is directed at any residence or business within 2,500 of the proposed blast. No blasting can take place on days with inversions or inclement weather (snow, rain). Brook will install, at its expense, a seismic monitor for any adjacent landowner that requests one as part of a pre-blast survey. The requesting landowner shall have access to all data collected. Brook will install, at its expense, a downhole camera for a water well to observe any impacts pre, during, and post blast for any landowner that requests one as part of a pre-blast survey.¹¹ The requesting landowner shall have access to all data collected. Brook will provide notice to any landowner within ½ mile of its permit area of proposed blasting times and locations.

Proposed Permit Term to Include the Buyoks’ Homes and Wells within the Area Designated For Pre-Blast Surveys

Rationale: A resident or owner of a man-made dwelling or structure within one-half mile of any portion of the permitted area can request a pre-blasting survey. W.S. § 35-11-415(vi)(E). According to Brook’s GIS mapping, Mr. Buyok’s home lies around 40 feet outside the ½ mile boundary and his water well lies about 20 feet outside the boundary. Tr. at 1017-18 (Testimony of Mr. Buyok). Brook has offered to include Mr. Buyok’s

¹⁰ Brook expressed a willingness to accept any permit condition proposed by the DEQ or the Council. Tr. at 713-14; 781 (Testimony of Mr. Barron: Brook would be “okay with any conditions that this council will find are necessary for the permit application.”).

¹¹ DEQ has required and used downhole cameras before. *See* Tr. at 607 (Testimony of Mr. Emme).

home and well within the zone for pre-blast surveys as an enforceable condition of the permit. *Id.* at 1055, 1524-25 (Testimony of Mr. Barron).

Proposed Permit Term: Brook will conduct a pre-blast survey for John Buyok and/or any member of his family if requested.

Proposed Permit Term to Implement the Proper County Road Buffer

Rationale: See section VII above.

Proposed Permit Term: No surface or underground mining shall occur within 100 feet of any public road. Should Brook obtain authorization to relocate a public road, the company shall incorporate that change as a permit amendment. Any request to relocate a road shall be subject to public comment and hearing pursuant to Ch. 12 § 1(a)(v)(D) of the Coal Rules and Regulations.

Proposed Permit Term for Replacement of Water Wells

Rationale: See section IV above.

Proposed Permit Term: Remove the word “adjudicated” from any description of water rights that will be replaced by Brook.

Proposed Condition of Approval to Defer Mining Until Baseline Water Quality Studies Are Complete & Findings Regarding Material Damage Are Made

Rationale: Baseline water quality sampling was deficient. While this means that the permit application should be denied, at the very least, mining should not be authorized until baseline samples are collected, analyzed, and reviewed by DEQ. DEQ itself agrees with this permit condition. Tr. at 363 (Testimony of Mr. Kristiansen); *Id.* at 411-12, 431 (Testimony of Mr. Kunze regarding monitoring on the Tongue and Goose Rivers).

Proposed Condition: Brook shall not commence coal mining operations until additional ground and surface water baseline water quality samples are collected, in a scientifically defensible manner, for the entire permit area.¹² Baseline samples must be taken for the overburden and alluvial aquifers, in addition to the coal seams. Samples must be collected seasonally for at least one year prior to mining. The inclusion of baseline water quality data shall be considered a major amendment to the permit and the new data will be subject to public notice and comment.

Brook shall also commit to continued monitoring at the baseline locations during operations and post-mining, until final bond release.

¹² If Brook wishes to amend its permit boundary to limit the scope of baseline monitoring or subsidence assessment, it can do so, but only as a major modification to its permit, subject to public notice and comment.

Proposed Condition of Approval to Defer Mining Until Alluvial Valley Floor Determinations Are Complete

Rationale: Mr. Kristiansen testified that DEQ is planning to include a permit condition that will “halt” mining should it be determined that an AVF would be “disturbed” by mining. Tr. at 116. However, given the vagueness of what that permit condition is, and the narrowness of equating “disturbance” to actual physical disturbance by mining (see discussion in Section III(B) above), a more carefully tailored permit condition is needed to comply with legal restrictions related to alluvial valley floor protection.

Proposed Condition: No coal operations can lawfully occur until DEQ finishes assessment and determination of all AVFs in lands adjacent to the permit.¹³ Specifically, no coal operations shall commence within ½ mile of the “potential” AVF identified in DEQ Exhibit 16 until a complete assessment of the delineation of the AVF is complete and until DEQ further reviews the mine permit application for potential impacts to the AVF from hydrologic connections between the mining area and the AVF.

Proposed Condition of Approval to Defer Mining Until Geotechnical Studies Are Complete to Demonstrate Subsidence Control and Prevention

Rationale: Dr. Marino’s testimony and exhibits discussed geotechnical studies and tests that must be complete in order to properly assess subsidence risk and to demonstrate subsidence control. *See, e.g.* Tr. at 1231-33.¹⁴

Proposed Condition: Brook shall not commence coal mining operations until it completes the geotechnical studies and tests identified by Dr. Marino in Ex. POW 94-D for the entire permit area. Brook will also at all times comply with the engineering design recommendations identified in Ex. POW 94-D. Brook must amend its permit application to include this information. Such an amendment will be considered a major modification to the permit and will be subject to public notice and comment (and public participation requirements of Sections 406(k) and (p)). A ground control plan submitted to MSHA shall not be sufficient to comply with this condition.

Proposed Permit Term that Requires Brook to Reclaim and Remediate All Subsidence Incidents in its Permit Area

Rationale: Given the overlap between historic abandoned mines and proposed mining by Brook, and given the ongoing subsidence problems caused by the abandoned mines in the area, testimony from Mr. Kristiansen showed that DEQ will have a difficult, if not “impossible” time, assigning liability to Brook if any subsidence occurs in the area, even if it is caused by the company. Tr. at 245, 320, 361-62 (Testimony of Mr. Kristiansen). If liability is not assigned, the AML Division will be responsible for all remediation. Brook

¹³ “Adjacent lands” is defined in the WEQA as “all lands within one-half mile of the proposed permit area.” W.S. § 35-11-103(e)(vii).

¹⁴ *See* note 15 *supra*.

has committed to remediate subsidence if it occurs, Tr. at 676, and the permit should be crafted to hold them to that commitment.¹⁵

Proposed Permit Terms: Brook shall conduct ongoing monitoring of subsidence activity within its permit boundary and DEQ shall include review of subsidence activity during regular inspections of the mine site. Brook will be responsible for all reclamation and remediation associated with any subsidence incidents that occur in areas that Brook is actively mining or has mined.

When subsidence-related damage to land, structures or facilities occurs, or when contamination, diminution, or interruption to a water supply occurs, DEQ will require Brook to obtain additional performance bond in the amount of the estimated cost of the repairs or in the amount of the estimated cost to replace the water supply, until the repair or replacement is completed.¹⁶ Before releasing the company's performance bond, DEQ must conduct a full assessment of subsidence risk and determine that subsidence is not likely to occur inside the area proposed for bond release. DEQ must consult with independent experts if the agency staff does not have the expertise to make that determination. Like the bond release proposal itself, DEQ's determination shall be subject to public notice and comment, and an affected party may object to DEQ's determination.

If subsidence causes damage to land or structures, DEQ must suspend mining under or adjacent to such land or structures until the subsidence control plan is modified to ensure prevention of further damage to such land or structures.

At all times Brook shall maintain at least a 500 foot horizontal and vertical buffer between previous mines and current mining operations.

Permit Term to Require a Public Comment Period on the Bond Amount Set by DEQ

Rationale: Testimony from Mr. Emme confirmed that DEQ normally has an initial bond amount available for public notice and comment as part of a permit application. However, in this case, the bond amount has yet to be set and DEQ did not have a draft bond amount available at the time of public notice and comment. This means that the bond amount will be unreviewable (by the public or in fact Brook itself), in violation of public participation opportunities.

¹⁵ This commitment is also required by federal SMCRA regulations, incorporated into the state program. 30 C.F.R. § 817.121 ("Repair of damage to surface lands. The permittee must correct any material damage resulting from subsidence caused to surface lands, to the extent technologically and economically feasible, by restoring the land to a condition capable of maintaining the value and reasonably foreseeable uses that it was capable of supporting before subsidence damage.")

¹⁶ The proposal for additional bond is consistent with federal requirements, incorporated into the state program. 30 C.F.R. § 817.121(c)(5).

Condition of Approval: Brook may not commence coal mining operations until such time as DEQ has made its proposed bond amount available for public inspection, notice, and a thirty (30) day comment period. Any interested member of the public may submit comments on or objections to the proposed bond amount within the 30 day comment period. Objections to the proposed bond amount shall be handled in accordance with Sections 406(k) and (p) of the Environmental Quality Act and corresponding DEQ public participation rules and regulations.¹⁷

Adoption of Permit Conditions and Terms Proposed by Big Horn Coal Company and the Fishers

Proposed Terms & Conditions: The Resource Council also adopts and hereby incorporates by reference any permit terms and conditions proposed by the other objecting parties, including but not limited to the terms and conditions proposed in Ex. BHC 5, to the extent that they do not conflict with the terms and conditions proposed above.

CONCLUSION & REQUESTED REMEDY

Given the deficiencies in the permit application described above, and the absence of specific regulatory findings necessary to issue a permit, the permit applicant has not met its burden to demonstrate that the application “is in compliance with this act and all applicable state laws” pursuant to Section 406(n).

As a result, the EQC must conclude that the permit application should be denied. The EQC should issue findings of fact and law and “a decision on the application” that orders the DEQ to deny the permit application within fifteen days of receipt of the EQC’s decision pursuant to Section 406(p).

Alternatively, the EQC could (1) make a finding that DEQ cannot issue the permit until all required findings under Section 406(n) are made, until the reclamation bond amount is calculated pursuant to Section 417 and the surface owner protection bond is calculated pursuant to Section 416, and until deficiencies in the permit application raised by the parties are addressed; (2) stay proceedings until DEQ makes its required findings; and (3) allow the parties’

¹⁷ In proposing this condition of approval, the Resource Council is not waiving its ability to exercise its rights and remedies to challenge DEQ’s bond calculation through W.S. § 35-11-1001.

time to respond and present additional evidence and testimony, as needed. Staying proceedings will afford DEQ time beyond the statutorily provided 15 days to finalize the CHIA and other needed documents and reviews and to respond to public comments and make any needed changes to the permit.

However, should the EQC decide to order the DEQ to approve the permit, it should be approved *only* with the permit terms and conditions listed above.

Respectfully submitted this 24th day of July, 2017.

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINING COMPANY, LLC’S FINDINGS OF FACT
AND CONCLUSIONS OF LAW**

I. INTRODUCTION

This case should decide a single question: did the Department of Environmental Quality (DEQ) correctly decide Brook Mine’s (Brook) permit application was complete and non-deficient? The Council has two methods for answering this question: 1) start from scratch and compare the application and law; or 2) rely on DEQ’s findings from its completeness and deficiency review (commonly known as a technical review) of Brook’s permit application. While both lead to the same result, the Council should rely on DEQ’s findings for four reasons.

First, DEQ is unbiased. It has nothing to gain should Brook’s permit application move forward. But the objectors have different motives. Big Horn Coal (BHC) wants money, offering not to oppose Brook’s application if Brook paid BHC approximately \$29 million. (Tr. Vol. IV, 876). Mary and David Fisher (Fishers) do not want a mine near them because it could affect their

property's value. (Tr. Vol. V, 1181-82). Powder River Basin Resource Council (PRBRC) does not want any mining near Sheridan. (*Id.*, 1123). As a result, the objectors did not objectively analyze Brook's permit application.

Second, DEQ has the most relevant experience and expertise for reviewing Brook's permit application. The DEQ personnel who reviewed Brook's permit application have reviewed dozens of permits, spent years working on the application, submitted hundreds of comments, and worked with Brook to ensure the permit application meets Wyoming law. (DEQ Ex. 34; Tr. Vol. I, 40-42, 45-46; Tr. Vol. II, 393-94; Tr. Vol. III, 461-62, 581). Dr. Muthu Kuchanur is a nationally recognized expert who worked as a consultant and who has designed, developed, applied, and evaluated groundwater models like those used in Brook's permit application. Doug Emme is also a nationally recognized expert on blasting who has been DEQ's blasting program principal for over 27 years. (Tr. Vol. III, 578-80). He also assisted in developing DEQ's bonding guideline. (*Id.*, 579). But PRBRC's experts, Dr. Marino and Mr. Wireman, have never attempted to draft a coal mine permit application in Wyoming. (Tr. Vol. VI 1254, 1263, 1403-05). Mr. Wireman does not hold a professional license in any state. Neither Mr. Wireman nor Dr. Marino are experts on the requirements for a permit application to be complete and non-deficient under Wyoming law. (*Id.*, 1254, 1258-60, 1403-05).

Third, DEQ applied the correct standard in reviewing Brook's permit application. DEQ applied the Environmental Quality Act, the corresponding regulations, and DEQ guidelines to determine Brook's application was complete and non-deficient. DEQ balanced the regulations and the necessary science. (Tr. Vol. VII, 1490). But objectors, nearby landowners, experts or otherwise, did not. They spent merely days, hours, or no time at all reviewing Brook's permit application. (Tr. Vol. IV, 887-88, Vol. V, 1077, 1098-1102, 1107-08, 1122-23, 1126; Vol. VI,

1428). For example, Ms. Collins did not look at the permit application until the beginning of the hearing in Sheridan. (Tr. Vol. V, 1077-78). This limited review often meant they did not consult statutes or regulations. For example, BHC did not review the statutory or regulatory requirements for a permit application. (Tr. Vol. IV, 885-89). Still, the objectors agreed that if a permit application complies with all Wyoming statutes and Wyoming regulations, the permit should issue. (*Id.*, 894, Vol. V, 1103).

Fourth, the objectors' expert testimony has fatal flaws. Dr. Marino assumed designs and extraction ratios using generalized diagrams that did not reflect Brook's actual design found in Brook's Mine Plan. (*See* DEQ Ex. 12-035; Tr. Vol. VI, 1274-77). He also did not take into account that Brook committed in its permit application to: 1) do site specific testing and engineering before starting to mine; and 2) submit a Mine Safety Health Administration (MSHA) ground control plan engineered to prevent short and long-term subsidence. (Tr. Vol. VI, 1265-69). Mr. Wireman did not evaluate all of the data in the permit application and did not evaluate external data available in the area. (*Id.*, 1404-06). He also doubted the data and statements in the permit application without studying whether his doubts were correct. (*Id.*, 1405-06). For example, he doubted Brook's groundwater model was accurate; but he did not run the model. (*Id.*, 1414-16). Mr. Gerlach's opinions relied on a 15 year-old groundwater restoration demonstration his company drafted for BHC. (Tr. Vol. IV, 972-73). That document, however, uses old data not designed to predict the future consequences of mining in the area. (Tr. Vol. VII, 1464-66).

The Council should also weigh DEQ's enforcement authority. Brook has committed to: 1) replacing water quantity and quality if its mine should affect domestic water wells; 2) do site specific studies and engineering to prevent subsidence; and 3) remediate subsidence if it occurs.

(DEQ Ex. 34-014-15; DEQ Ex. 5-017-18; Tr. Vol. III, 659-60, 673-76). These commitments directly address specific objections, and DEQ can enforce all of them because they are in the permit application. (Tr. Vol. II, 230, 349, 371-72).

Contrary to what the objectors suggest, this case does not require the Council to decide if Wyoming's permit application process should be more stringent, the public should have more input on the permitting process, or if DEQ should have held an informal conference. The case is also not about imposing conditions on Brook's permit application. The Council does not have any specific statutory authority to impose conditions on a permit application. Even if it did, many of the conditions the objectors have requested require Brook to access land the objectors own, which invites disputes about when Brook can access the property or how much it will cost to do so.¹ (Tr. Vol. IV, 879).

Therefore, Brook proposes the Council adopt the following findings of fact and conclusions of law.

II. FINDINGS OF FACT

A. Brook's Permit Application

1. On October 31, 2014, Brook submitted to DEQ's Land Quality Division (LQD) an application for a permit to mine coal. Brook's permit application proposed to mine coal in an area northwest of Sheridan, Wyoming. (DEQ Exs. 1-13, Tr. Vol. I, 51-52).

2. Brook's permit application consisted of 12 volumes filled with documents, maps, data, and other information to address applicable statutes, rules and regulations. (DEQ Exs. 1-13,

¹ If the Council imposes conditions that require Brook or even DEQ to access property Brook does not own, those conditions should apply only if the property owner grants access. Should the property owner refuse, then the Council should not require Brook or DEQ to follow those conditions. Although Brook has the use of the surface and surface access from the rights reserved in its 1954 Deed, the Council knows that many landowners ignore those rights.

Tr. Vol. I, 43-44, 52, 57-58). These volumes mirror the structure and documents in DEQ's completeness criteria. (Tr. Vol. VII, 1540). The completeness criteria lists "what is required for a permit application to mine coal in the state of Wyoming." (*Id.*, Brook Ex. 14). The document "cross-references all of the requirements to Wyoming, statutes, rules and regulations." (*Id.*).

3. Volumes I, IA, and II are the combined adjudication file in the permit application. (DEQ Exs. 1, 2, 3). The adjudication file contains information on the legal aspects of land and mineral ownership, water rights, rights of way, legal descriptions, and legal relationships. (*Id.*). The second volume of the adjudication file contains ownership maps, right-of-way maps, etc. Tr. Vol. I, 60-62, DEQ Exs. 1, 3. The adjudication file also contains an estimate of the surface damage bond for BHC's surface ownership. (Tr. Vol. I, 66, DEQ Ex. 1-066-101).

4. Appendix A of the adjudication file contains contact information and maps relating to surface and mineral rights holders within the proposed permit area, including coal. (Tr. Vol. I, 68, DEQ Ex. 1-232).

5. Appendix B of the adjudication file contains the names and addresses of surface and mineral rights owners adjacent to the permit boundary within one-half mile. (Tr. Vol. I, 69, DEQ Ex. 1-264).

6. Appendix C of the adjudication file contains the legal description of lands contained within the permit application area, including survey plats and maps. (Tr. Vol. I, 70, DEQ Ex. 1-447).

7. Appendix E of the adjudication file contains lands mining will affect, areas of previous disturbance by surface and underground mining, roads, utility lines, pipelines, rights of way, easements, names and last known addresses of present surface owners, and the legal

description of locations of buildings within and adjacent to the permit area. (Tr. Vol. I, 72, DEQ Ex. 1-540).

8. The adjudication volumes also contain landowner consent forms and this Council's order in lieu of consent issued on November 17, 2016. (DEQ Ex. 2).

9. Volume III contains appendices D1 through D4. (DEQ Ex. 4).

10. Appendix D1 is titled "Land use." (DEQ Ex. 4). The appendix explains the general use of the land within the permit application boundary from past to present, which includes grazing land, developed water resources, industrial, commercial, recreational, and residential. (Tr. Vol. I, 82-83, DEQ Ex. 4-008-11). The appendix also explains the areas any agency has designated as unsuitable for mining and whether previous mines exist within the area. (DEQ Ex. 4-016). The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (*Id.*, 4-020-41).

11. DEQ reviewed Appendix D1 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

12. Appendix D2, is titled "History." (DEQ Ex. 4). This appendix discusses the history of mining in the Brook Mine area, sites on the National Register of Historic Places, and the area around the proposed Brook mine. (*Id.*, 4-046-56). The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (*Id.*, 4-059-64).

13. DEQ reviewed Appendix D2 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

14. Appendix D3 is titled "Archeological and Paleontological Resources." (DEQ Ex. 4). This appendix contains little information because cultural and paleontological surveys "are not required when there's private surface and private mineral owners." (Tr. Vol. I, 85). The

appendix also contains a 2012 letter from DEQ stating the same. (DEQ Ex. 4-074-75). DEQ, however, did coordinate with the State's Historic Preservation Office, who had no comments. (Tr. Vol. I, 85-86).

15. In addition to this appendix, Brook's Mine Plan, found in a different volume, states Brook will stop mining in any areas where cultural or paleontological resources are discovered. (*Id.*, 86).

16. DEQ reviewed Appendix D3 and found it complied with the applicable statutes and regulations. (*Id.*, 85-86).

17. Appendix D4 is titled "Climatology." This appendix discusses the regional climatology around the proposed Brook Mine. (DEQ Ex. 4). This includes information on temperature, wind patterns, precipitation, evaporation, relative humidity, cooling, heating, and growing degree days. (*Id.*, 4-080-88).

18. The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (DEQ Ex. 4-091-112). The additional information includes data about meteorological stations, regional annual and monthly temperature statistics, average monthly wind speeds, regional and annual precipitation. (*Id.*).

19. DEQ reviewed Appendix D4 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

20. Volume IV of Brook's permit application contains Appendix D5, titled "Topography, Geology and Overburden Assessment." (DEQ Ex. 5). This appendix discusses topography, slope assessment, regional geology, geology of the mining area, and overburden assessment. (*Id.*, 5-006-23). The accompanying tables, figures, exhibits, and addenda provide data and information on coal quality, criteria to establish overburden suitability, geologic

structures, pre-mine slope analysis, surficial geology, lithologic and geophysical logs, geologic cross-sections, structure and isopach maps, overburden sample analysis. (*Id.*, 5-026-295).

21. In preparing this appendix, DEQ and Brook collaborated on the location of drill holes for assessing geology. (Tr. Vol. I, 92-93). Brook was unable to sample certain areas because of terrain, but the existing samples “were close enough together that [DEQ] could extrapolate...into that area for now.” (*Id.*, 93).

22. DEQ reviewed Appendix D5 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 92-93).

23. Volume V of Brook’s permit application contains Appendix D6 titled “Hydrology.” (DEQ Ex. 6). This appendix describes surface water, flood studies, surface water monitoring, surface water quality and quantity, groundwater, regional hydrogeology, baseline monitoring, groundwater testing, groundwater rights, and Brook’s groundwater model. (*Id.*, 6-005-34). The appendix also has tables, figures, exhibits, and addenda that provide additional data and information. (*Id.*, 6-037-553). This includes Brook’s groundwater model and input data for the model. (DEQ Ex. 12-183-265, Tr. Vol. III, 460-63). The data and information in this appendix showed the groundwater aquifers within about 85% of Brook’s proposed permit area is dry. (Tr. Vol. I, 95-96). The groundwater model also showed that any groundwater Brook affects would recharge within years of Brook ending its operations. (Tr. Vol. VII, 1496).

24. DEQ reviewed Appendix D6 and found it complied with the applicable statutes and regulations. (Tr. Vol. III, 496).

25. Volume VI of Brook’s permit application contains Appendix D7 titled “Soil Resources Assessment.” (DEQ Ex. 7). This appendix describes the methodology that Brook used to sample soils within the proposed permit area. (*Id.*, 7-007-14). It also describes the results of

the soil sampling, which includes soil information, soil suitability, salvage depth, and maps with soil unit descriptions. (*Id.*, 7-014-42). The appendix also includes tables, figures, exhibits, and addenda that provide additional information and data, including Brook's sampling protocol and laboratory results. (*Id.*, 7-043-114).

26. DEQ reviewed Appendix D7 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

27. Volume VII of Brook's permit application contains Appendix D8 titled "Vegetation Inventory." (DEQ Ex. 8). This appendix describes the methodology that Brook used to survey vegetation within the proposed permit area. (*Id.*, 8-005-11). It also describes the results of the survey. (*Id.*, 8-11). The appendix includes tables, exhibits, and addenda with additional information and data. (*Id.*, 8-12-452).

28. DEQ reviewed Appendix D8 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

29. Volume VIII of Brook's permit application contains Appendix D9 titled "Wildlife." (DEQ Ex. 9). This appendix describes Brook's wildlife studies, methods, and results. (*Id.*, 9-005-10). It also includes tables, exhibits, and addenda that describe baseline wildlife inventories and species lists. (*Id.*, 9-011-139).

30. DEQ reviewed Appendix D9 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97).

31. Volume IX of Brook's permit application contains Appendix D10 titled "Wetlands." (DEQ Ex. 10). This appendix describes the methodology that Brook used to inventory wetlands within the proposed permit boundary and subsequent results. (*Id.*, 10-005-9).

The appendix also has tables, exhibits, and addenda that provide additional information and baseline data. (*Id.*, 10-010-279).

32. DEQ reviewed this appendix and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97).

33. Volume X of Brook's permit application contains Appendix D11 titled "Alluvial Valley Floors." (DEQ Ex. 11). This appendix describes Brook's analysis of potential alluvial valley floors within the proposed permit boundary. (*Id.*, 11-006-12). The appendix explains stream laid deposits, water quantity, sub-irrigation, natural and artificial flood irrigation, water quality, and then determines the potential alluvial valley floors. (*Id.*, 11-012-18). The appendix also has tables, figures, exhibits, and addenda that provide additional information and data, including geologic cross-sections, potential and declared alluvial valley floors, isopach maps, prior state decision documents, and monitor well logs. (*Id.*, 11-024-313).

34. Based on the findings in Brook's permit application, DEQ conducted their assessment of potential alluvial valley floors in the area in and around where Brook proposes to mine. (Tr. Vol. I, 108-10). DEQ's assessment led it to designate one alluvial valley floor near the proposed Brook mine. (*Id.*, 109-10). But the proposed Brook mine will not disturb or mine through any designated alluvial valley floor. (*Id.*, 112-13). Even so, Brook's permit application states that Brook will halt mining should it enter a possible alluvial valley floor and allow DEQ to determine if an alluvial valley floor exists. (*Id.*, 116). Brook will also place monitor wells in areas designated as potential alluvial valley floors. (Tr. Vol. VII, 1489).

35. DEQ reviewed Appendix D11 and found it complied with the applicable statutes and regulations. (Tr. Vol. II, 156).

36. Volume XI of Brook's permit application contains Brook's Mine Plan. (DEQ Ex. 12). Brook's Mine Plan also contains a general description of mining operations (MP.1); mine facilities (MP.2); tonnage (MP.2.2, MP.6.1); roads, railroads and other transportation systems (MP.3); mining methods, schedules, and assessments (MP.4); mining hydrology (MP.5); probable hydrologic impacts (MP.6); operational monitoring program (MP.7); water use (MP.8); reclamation of exploration holes and wells (MP.9); refuse disposal (MP.10); signs, markers and buffer zones (MP.12); blasting plan and schedule (MP.14); surface mining activities near underground mines (MP.15); protection of other resources, structures and surfaces (MP.16); existing structures facilities operations (MP.17); plan to minimize adverse impacts on fish and wildlife (MP.18); protection of historical and archaeological resources (MP.19); underground mining (MP.20); auger mining (MP.21); dual permitted areas (MP.22); plan in cases of temporary cessation of operations (MP.23); protection of public safety, human or animal life, property, and the surface owner's ongoing operation (MP.24); alluvial valley floors (MP.25); separation and replacement of soils for prime farmlands (MP.26); request for variance from environmental performance standards (MP.27); and references (MP.28). (DEQ Ex. 12-001-372).

37. Brook's Mine Plan describes the proposed highwall mining method. (DEQ Ex. 12-016-18). The highwall mining process begins with a trench, a pit, or a box cut to expose the coal seam. (Tr. Vol. III, 654, Tr. Vol. I, 51-52, DEQ Ex. 12-121). The operator then uses a machine to extract coal in panels ranging between 1,500 and 2,000 feet in length. (Tr. Vol. III, 654-55, 665-66). Each panel has pillars that will minimize the potential for subsidence during mining. (Tr. Vol. I, 51, DEQ Ex. 12-121. Tr. Vol. I, 51.) During mining, the native topography and vegetation remain except for the excavated trench. (Tr. Vol. III, 655). In total, a trench will last only three years before getting reclaimed. (Tr. Vol. II, 397).

38. The Mine Plan contains a fire control and prevention plan for surface and subsurface operations. (Tr. Vol. II, 159, DEQ Ex. 12-314). The fire control and prevention plan establishes a mitigation system in the event of any type of fire during mining or other operations. (Tr. Vol. II, 159-60, DEQ Ex. 12-314). MSHA will regulate the ground control program for fires or other safety related items at the mine. (Tr. Vol. II, 160).

39. Brook's Mine Plan also addresses subsidence in three ways. First, addenda MP-6 contains Brook's subsidence control plan that analyzes potential subsidence at the mine. (Tr. Vol. II, 162, DEQ Ex. 12-319). The subsidence control plan discusses previous mining activity, Brook's plan to monitor and assess subsidence, and Brook's plan to control and remediate any subsidence that occurs. (DEQ Ex. 12-320-27). Cardno MMA prepared the subsidence control plan because it had "done a lot of work for highwall miner operations in the East" and knew people "that manufacture and operate the highwall miner systems very well." (Tr. Vol. II, 163; Tr. Vol. III 666; Tr. Vol. IV, 817).

40. In addition to the subsidence control plan, Brook has committed to developing the required MSHA ground control plan before it begins mining. (Tr. Vol. III, 662-65). The ground control plan will sample, test, design, and engineer each mine panel so that it meets MSHA's safety factor and creates both short and long-term subsidence protection. (Brook Ex. 10(d); Tr. Vol. II, 325-26; Tr. Vol. III, 662-63).

41. Brook's permit application states "[s]amples will be collected and strength testing will be conducted on those samples in order to satisfy the requirements of the MSHA ground control plan, which must be approved prior to mining. The future testing results and analysis in preparation of the MSHA ground control plan will be provided to WDEQ/LQD." (DEQ Ex. 5-018). The permit application also states that "[t]he results of the tensile strength tests will be

utilized to size both the web pillars and barrier pillars to achieve a factor of safety as set by the MSHA ground control plan to conduct mining and minimize the risk of subsidence.” (*Id.*)

42. Should subsidence occur, “mining operations have to cease immediately.” (Tr. Vol. II, 320). Brook then has to mitigate and repair any subsidence. (DEQ Ex. 12-318-33; Tr. Vol. II, 354-55).

43. Brook’s Mine Plan describes Brook’s blasting plan. (DEQ Ex. 12-335-38). The blasting plan describes Brook’s proposed blasting operations, explosive storage, and applicable laws and regulations. (DEQ 12-334-38). As part of its blasting plan, Brook does not intend to carry out any cast blasting or any blasting in its first year of operation. (Tr. Vol. III, 583, 589).

44. Brook’s Mine Plan discusses how Brook will control surface water. Brook’s plan will use reservoirs, diversions, ditches, and alternative sediment control measures to control surface water. (DEQ Ex. 12-055-59, 61). Brook will also monitor surface water sources. (DEQ Ex. 12-062-64).

45. Brook’s Mine Plan discusses groundwater, including domestic water wells. Brook has committed to replacing the quantity and quality of water sources lost because of Brook’s proposed operations. (DEQ Ex. 12-059-61). Brook will also conduct groundwater monitoring. (DEQ Ex. 12-064-65).

46. DEQ found the Mine Plan complied with the applicable statutes and regulations. (Tr. Vol. I, 45-46; Tr. Vol. II, 161-62).

47. Volume XII of Brook’s permit application contains Brook’s Reclamation Plan. (DEQ Ex. 13). The Reclamation Plan explains how reclamation will occur at the Brook Mine and how Brook will mitigate any modifications to overburden material, vegetation, and wildlife.

Id., Tr. Vol. II, 175. When mining is complete and reclamation has finished, the Reclamation Plan states Brook will return the land use to at least equal or better than the original use. *Id.*

48. The Reclamation Plan describes: post-mining land use (RP.2); contouring plan for affected lands (RP.3); spoil replacement (RP.4); topsoil replacement (RP.5); revegetation practices (RP.6); wildlife restoration (RP.7); final hydrologic restoration (RP.8); wetland mitigation (RP.9); reestablishment of essential hydrologic functions and agricultural utility on alluvial valley floors (RP.10); reclamation of mine facilities, road, and railroads (RP.11); reclamation and bonding of dual permitted and license to mine areas (RP.12); reclamation schedule (RP.13); bond release (RP.14); underground mines (RP.15); reclamation costs (RP.16); and references (RP.17). (DEQ Ex. 13-014-30; Tr. Vol. II, 192-95). In dually permitted areas, Brook must reclaim any areas it disturbs even if that disturbance occurs within a dually permitted area. (DEQ Ex. 13-075; Tr. Vol. II, 184, 188-89).

49. DEQ found the Reclamation Plan complied with the applicable statutes and regulations. (Tr. Vol. I, 45-46).

50. With its permit application, Brook submitted an estimated reclamation bond in the approximate amount of \$370,000 to cover 30.8 acres of disturbance in year 0. (Tr. Vol. III, 590, DEQ Ex. 32). For the areas where Brook's operations will overlap with existing permits, like BHC, Brook's bond will cover all disturbance from Brook's operations. (Tr. Vol. II, 188-90)

B. DEQ's review of Brook's permit application

51. Once Brook submitted its permit application, DEQ conducted two stages of review set out in the Environmental Quality Act. First, DEQ conducted a completeness review. (Tr. Vol. I, 43-44). For this step, DEQ reviewed Brook's permit application to determine whether it is complete based on requirements set forth in the rules, regulations, and statutes. (*Id.*, 43).

52. After DEQ determined Brook's permit application was complete, DEQ notified Brook that the application was complete and DEQ had gone into the technical review process. By statute, the technical review process can take up to 150 days. (*Id.*, 56).

53. The technical review process analyzed "the entire document from front to back cover" and determined "how technically accurate [the application] can possibly be." (*Id.*, 44). "Technically accurate" or "technically adequate" means the permit application "has met all the statutes, rules, regulations, and providing [sic] all the information that [DEQ] needs to make assessment." (Tr. Vol. VII, 1504, 45-46, Tr. Vol. I, 59-60).

54. As a result, the technical review compared Brook's permit application to Wyoming statutes, DEQ regulations, and DEQ guidelines. (Tr. Vol. I, 56-58).

55. For its technical review, DEQ enlisted eleven in-house experts and four external experts, including Wyoming Game & Fish, US Game & Fish, US Army Corps of Engineers, and State Historic Preservation Office, to review the substance of Brook's permit application. (*Id.*, 47, 64, 85-86, 104). DEQ also applied standard mining and engineering principles, used modeling software to review the geology and hydrology aspects of the permit application, and relied on sources of data outside the permit application to verify Brook's findings. (*Id.*, 56-57; Tr. Vol. II 395-96, 410).

56. When reviewing subsidence information in the permit application, DEQ worked through computer models and utilized formulas developed by the Office of Surface Mining. DEQ also attended training on analyzing subsidence and requested more information on the model used in the subsidence control plan. (Tr. Vol. II, 164, 168). DEQ concluded the Brook mine would not subside. (*Id.*, 162, 169).

57. During the technical review process, DEQ sent comments to Brook informing it of deficiencies in the permit application. (Tr. Vol. I, 44-45). Brook then responded to DEQ's comments with additional information; Brook also modified its application when necessary. (*Id.*, 58-60). DEQ and Brook went through six rounds of comments and responses on Brook's permit application. (*Id.*, 58; DEQ Ex. 34).

58. Brook's responses and revisions to the permit application ultimately satisfied DEQ, leading it to determine Brook's application was "technically accurate" and suitable for publication. (*Id.*, 59-60, 161-62, 188).

59. After DEQ deemed Brook's application complete and without deficiency, it directed Brook to publish its permit application for public review and comment. In making this decision, DEQ had not yet issued a cumulative hydrologic impact assessment or the findings set out in Wyo. Stat. Ann. § 35-11-406(n).

60. Brook first published its permit application on December 27, 2016. (Tr. Vol. I, 53).

61. Between December 27, 2016 and January 27, 2017, DEQ received twenty public comments relating to Brook's permit application. Of those twenty comments, fourteen were objections to Brook's permit application.

62. Those objections challenged many parts of Brook's permit application, including Brook's analysis of alluvial valley floors, blasting, bonding, probable hydrologic consequences, reclamation, and subsidence. (BHC Ex. 3, Fisher Ex. 26, PRBRC Exs. 1, 2, 5, 9, 10)

63. Upon review of all objections, DEQ still found Brook's permit application met the applicable statutes and regulations. (Tr. Vol. II, 196-97). DEQ, however, will add two conditions to Brook's permit. First, DEQ will require Brook to remove the word adjudicated on

pages MP-38 (DEQ Ex. 12-052) and MP-48 (DEQ Ex. 12-052) of its Mine Plan and replace with “permitted.” (Tr. Vol. II, 290-91). Second, DEQ will adjust the location of surface monitoring stations to better capture data. (*Id.*, 430-31).

C. The Council’s Involvement

64. The objectors requested that DEQ hold an informal conference to decide their objections. (BHC Ex. 3, Fisher Ex. 26, PRBRC Ex. 1). But the DEQ director exercised his discretion not to hold an informal conference and referred the matter to the Council. (February 22, 2017 Order of Dismissal, Docket 17-4801).

65. The Council originally scheduled a hearing on these objections for February 13, 2017 (Docket No. 17-4801). The Council also requested the parties brief whether the Council had jurisdiction to hear that case because no one had requested a contested case. After briefing, the Council dismissed that docket, ruling:

[u]nder Wyo. Stat. 35-11-406(k) and (p) and the Department of Environmental Quality’s rules of practice and procedure, the Council may only exercise jurisdiction over the Brook Mine permit application after an interested person has filed a petition for a contested case with the Council – something not done as part of this docket. Council, in this docket, is without authority to accept jurisdiction over the Brook Mine permit application through the referral from the Director.

(February 22, 2017 Order of Dismissal).

66. After this ruling, three of the objectors requested a contested case hearing: PRBRC (Docket No. 17-4804), BHC (Docket No. 17-4802), and Fishers (Docket No. 17-4803). The Council consolidated all dockets into Docket No. 17-4802.

67. Before the consolidated hearing, the Council set deadlines for discovery requests, naming of expert witnesses, and dispositive motions. (March 13, 2017 Order of Consolidation

and Schedule). The Council also set pre-hearing exhibit and witness disclosure dates and a hearing schedule and order. (*Id.*)

68. The Council conducted the first part of the hearing on May 22-26, 2017 in Sheridan, Wyoming. Unable to get all of the evidence in, the Council extended the hearing for two additional days on June 7-8, 2017 in Cheyenne, Wyoming (May 31, 2017 Order for Hearing). After those two days, the parties rested.

III. CONCLUSIONS OF LAW (DECISION ON THE APPLICATION)

A. The Scope of the Council's Decision

1. The Wyoming Environmental Quality Act (the Act) created the Council and specifies its authority. *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000). So the Council must exercise only the authority the Act granted to it. *Id.*; *Platte Dev. Co. v. State, Env'tl. Quality Council*, 966 P.2d 972, 975 (Wyo. 1998).

2. Under the Act, DEQ must evaluate a permit application and decide if it is complete. Wyo. Stat. Ann. § 35-11-406(e). Wyoming statutes define a complete application as “the application contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter. Wyo. Stat. Ann. § 35-11-103(e)(xxii).

3. After informing a permit applicant that the application is complete, “the administrator shall review the application and unless the applicant requests a delay advise the applicant in writing within one hundred fifty (150) days from the date of determining the application is complete, that it is suitable for publication under subsection (j) of this section, that the application is deficient or that the application is denied. All reasons for deficiency or denial shall be stated in writing to the applicant.” Wyo. Stat. Ann. § 35-11-406(h). The Act defines a

deficiency as “an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” *Id.* at 103(e)(xxiv).

4. Once an applicant publishes the permit application, an interested person can file an objection and receive either an informal conference with the DEQ director or a public hearing if the director elects not to have an informal conference. Wyo. Stat. Ann. § 35-11-406(k).

5. In a public hearing, the Council acts as the hearing examiner and decides “all cases or issues arising under the laws, rules, regulations, standards or orders issued or administered by the department or its air quality, land quality, solid and hazardous waste management or water quality divisions.” Wyo. Stat. Ann. § 35-11-112(a). The Council has the specific authority to conduct hearings: 1) to promulgate rules and regulations required to administer the Act; 2) adopt, amend, or repeal rules or regulations as recommended by advisory boards; 3) contesting “the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof;” or 4) contesting the “grant, denial, suspension, revocation or renewal of any permit, license, certification or variance authorized or required by this act.” Wyo. Stat. Ann. § 35-11-112(a)(i)-(iv).

6. The Council concludes it must exercise the authority listed under (a)(iii) because the case will decide DEQ’s administration and enforcement of the permitting procedures for a new coal mine, not rulemaking or an already granted or denied permit.

7. The Council finds that exercising this authority requires the Council to decide if DEQ correctly administered and enforced the requirements that a permit application is complete and non-deficient.

8. The Council notes that before a permit can issue, the Act requires that the administrator make specific findings under Wyo. Stat. Ann. § 35-11-406(n). These findings include the cumulative hydrologic impact assessment DEQ must perform. (Tr. Vol. II, 413-16).

9. Despite requests from the objectors, the Council concludes that it does not have the authority to make the findings under Section 406(n) for three reasons. First, section 406(n) explicitly states “the administrator” makes the findings in that section of the Act. Wyo. Stat. Ann. § 35-11-406(n). The Act defines “administrator” as “the administrator of each division of the department.” Wyo. Stat. Ann. § 35-11-103(a)(v). That definition does not include this Council. Second, the findings under 406(n) require DEQ, as the regulating agency, to issue a cumulative hydrologic impact assessment. *Id.* at § 406(n)(iii); WY ADC ENV LQC Ch. 19 § 2 (stating the cumulative hydrologic impact assessment “shall be sufficient to make the determination of W.S. § 35-11-406(n)(iii).”) That assessment takes “an intensive look at surface and groundwater quality and quantity within an area,” possibly including other nearby mines. (Tr. Vol. II, 413-15). The assessment can use data from multiple permits or permit applications and outside data sources. (*Id.*, 415). The Council concludes it does not possess the resources or expertise to make those findings. Third, DEQ has not yet issued findings under 406(n), and the Act does not require DEQ to issue the section 406(n) findings before it deems an application suitable for publication. *See generally* Wyo. Stat. Ann. § 35-11-406. As a result, DEQ has not administered or enforced that part of the Act. Without DEQ either administering or enforcing section 406(n), the Act does not grant the Council authority to step into the shoes of the regulator. *See* Wyo. Stat. Ann. § 35-11-112(a)(i)-(iv).

10. As a result, the Council must issue findings of fact and a decision on the relevant issues as described above within 60 days of the final hearing. *Id.* at 406(p).

B. The Amount of Votes Required

11. Under the Act, all matters that the Council hears “shall be decided by a majority vote of those on the Council.” Wyo. Stat. Ann. § 35-11-111(d).

12. Members of the Council, however, may recuse themselves by providing written notice of recusal or entering a verbal notice into the record. Wyo. Admin. Code Practice & Procedure Ch. 2 § 7(b). If a councilmember recuses him or herself, then that councilmember “shall not participate in the contested case.” *Id.*

13. The Council finds that a recusal from a case means the recused council member no longer serves on the Council for the purposes of that contested case.

14. Here, two members of the council, Richard Fairservis and Megan Degenfelder, have recused themselves. For purposes of this contested case neither Mr. Fairservis nor Ms. Degenfelder serve on the Council.

15. Therefore, the Council finds that Brook must obtain a majority of the five councilmembers serving on this case. *See* Wyo. Stat. Ann. § 35-11-111(d).

C. The Applicable Statutes and Regulations

16. Under the Act, Brook bears the burden of proving that its application is complete and non-deficient. To meet this standard, Brook must prove its application complies with the applicable statutes and regulations.

17. The applicable statutes are Wyo. Stat. Ann. § 35-11-406(a)-(b), (e)-(h).

18. Section 406(a) requires the permit applicant to provide information about the operator, surface owners, maps of the proposed permit area, and basic information about the proposed mining operation. Section 406(b) requires the applicant provide a Mine Plan and Reclamation Plan that explains in detail how the operator will disturb and restore the area within

the proposed permit area. The section also requires the applicant provide surface owner consent or an order in lieu of surface owner consent to the Mine Plan and Reclamation Plan.

19. Sections 406(e)-(h) require Brook's permit application be complete and non-deficient as described above.

20. The Land Quality Division (LQD) has also promulgated coal regulations that implement the Act. Brook must comply with those regulations as described below.

21. Chapter 2 of LQD's coal regulations requires Brook provide detailed information that complies with all applicable statutes and regulations. WY Admin Code ENV LQC Ch. 2, § 1. Brook must provide information on surface ownership, mineral ownership, previous mining history, and taxpayer information. *Id.* at § 2. Brook's application must also contain information on vegetation baseline information and methodology, wildlife studies, land use history, groundwater sampling data, geology and lithology data, soil assessments, water quality and quantity data, climatology, cultural resource assessments. *Id.* at §§ 3-4. Sections 5 and 6 expand the details Brook must include in its Mine and Reclamation Plans. *Id.* at §§ 5-6.

22. Chapter 3, § 2 requires Brook provide sufficient information relating to the presence or absence of alluvial valley floors within the permit area and on adjacent areas where an alluvial valley floor containing areas of sub-irrigation or flood irrigation agricultural activities may be affected. *Id.* at Ch. 3, § 2(b). Brook must include maps, geologic data, soils and vegetation data, geohydrologic descriptions, and information to identify geologic, hydrologic and biologic characteristics. *Id.* at § 2(c) Brook must also provide a monitoring plan to meet requirements of Chapter 5, § 3(b). *Id.*

23. Chapter 4, § 2 requires Brook to reclaim the land to a condition equal to or greater than its prior condition. *Id.* at Ch. 4, § 2(a). Brook must submit a proposed schedule for

backfilling and grading with supporting analysis and return all affected lands to their approximate original contour. *Id.* at § 2(b)-(c).

24. Chapter 5, §§ 3, 6 require Brook's operations to preserve and reestablish the geologic, hydrologic, and biologic characteristics to support essential hydrologic functions. *Id.* at Ch. 5, § 3(a), (c). Brook must install an environmental monitoring system to provide sufficient information showing essential hydrologic functions of the alluvial valley floor are being preserved and established on and outside affected lands. *Id.* at § 3(b). Brook must minimize disturbance of the prevailing hydrologic balance, unwarranted subsidence, submit a subsidence control plan, and prepare a written demonstration showing the fill has a minimum static safety factor of 1.3. *Id.* at § 6(d)-(e).

25. Chapter 6 requires Brook to comply with all applicable federal, state, and local laws when using explosives to mine. *Id.* at Ch. 6, § 1. Brook must publish a blasting schedule in a newspaper of general circulation and by mail to each residence or owner within one-half mile of blasting sites at least 30 days before blasting. *Id.* at § 3. The schedule shall be republished and redistributed every 12 months. *Id.* If the schedule changes, Brook must revise and republish the schedule at least 30 days but not more than 60 days before blasting. *Id.* Residents and owners within one-half mile shall be notified of the manner for requesting a pre-blast survey. *Id.*

26. Chapter 7, §§ 1, 2 requires Brook's application contain information relating to soils, vegetation, fish, wildlife, topography, geology, mineral deposits limited to the affected areas, subsidence control plan, and Reclamation Plan. Section 2 requires Brook adhere to the backfilling, grading and contouring requirements in Chapter 4, § 2(b). *Id.* at §§ 1, 2.

27. Chapter 12, § 1 requires the Administrator to make a determination in writing as to the existence and extent of an alluvial valley floor within the permit area or on adjacent areas

where the mining operation may affect surface water or groundwater that supply an alluvial valley floor. *Id.* at §1(a).

28. Chapter 19, § 2 requires Brook to provide information sufficient to enable the Administrator to determine the probable cumulative hydrologic impacts on surface and groundwater systems. *Id.* at § 2(a).

D. The Council's Decision on Brook's Application

29. Applying the findings of fact to this law, the Council concludes Brook's permit application is complete as defined in the Act. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxii), 406(e)-(f). The application includes all of the sections, information, data, and maps the Act and applicable regulations require. The Council is also convinced by DEQ's comprehensive testimony that Brook's permit application is complete. (Tr. Vol. 1, 52, 112, Tr. Vol. II, 257, 318, 344-45, Tr. Vol. VII, 1509).

30. The Council concludes Brook's application is also not deficient because it meets the requirements of all applicable statutes and regulations. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxiv), 406(h). Brook did all of the required studies and time to develop a non-deficient application. Likewise, the Council accepts DEQ's testimony that its technical review of Brook's application met the applicable statutes and regulations. (Tr. Vol. I, 43-46, Tr. Vol. II, 188, 316-17, Tr. Vol. III, 521).

31. Specifically, the Council finds the adjudication file in Volumes I, IA, and II contain the information required by applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a)-(b); WY Admin Code ENV LQC Ch. 2, §§ 1-2.

32. Appendix D1, Land Use, in Volume III meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 2-3.

33. Appendix D2, History, in Volume III meets the requirements of applicable law. *See Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 1-2.*

34. Appendix D3, Archeological and Paleontological Resource, in Volume III meets the requirements of applicable law. *See Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 3-4.*

35. Appendix D4, Climatology, in Volume III meets the requirements of applicable law. *See Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4.*

36. Appendix D5, Topography, Geology and Overburden Assessment, in Volume IV meets the requirements of applicable law. *See Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4.*

37. As for the objections related to this section of Brook's permit application, the Council adopts DEQ's findings. The Council notes DEQ found no geologic hazards exist at the proposed Brook mine (Tr. Vol. I, 89-90). But if they do, DEQ has a methodology for addressing geologic hazards. (*Id.*, 90-91).

38. Appendix D6, Hydrology, in Volume V meets the requirements of applicable law. *See Wyo. Stat. Ann. §§ 35-11-406(a)-(b); WY Admin Code ENV LQC Ch. 2, § 4.*

39. As for the objections related to this section of Brook's permit application, the Council is persuaded by the testimony of Dr. Muthu Kuchanur. Dr. Kuchanur has a PhD in environmental engineering and teaches national level training courses on groundwater modeling, coal mine permitting hydrology, quantitative hydrogeology, and applied engineering principles for the Office of Surface Mining. (Tr. Vol. III, 459-60). Dr. Kuchanur reviewed Brook's modeling process, the methodology used for the model, the input data used in the model, and the accuracy of the model. (*Id.*, 462-64). Dr. Kuchanur's review concluded that Brook's model

matched available data and multiple lines of evidence supported the accuracy of the model. (*Id.*, 480-83). Dr. Kuchanur also compared the predicted effect of Brook's mining on groundwater and found that it is small compared to existing groundwater sources. (*Id.*, 489-90). He noted that the groundwater model accounted for dewatering coal seams and the effect that could have on surrounding areas. (*Id.*, 561-62).

40. As a result, the Council concludes that Brook's groundwater model and the other hydrology aspects of the permit complied with the relevant statutes and regulations. (*Id.*, 496). Brook's permit application explains the probable hydrologic consequences of proposed mining. (Tr. Vol. VII, 1475). The baseline hydrology in Appendix D6, the probable hydrologic consequences discussion in the Mine Plan, and the Reclamation Plan explain the hydrologic consequences of Brook's proposed mining. (*Id.*, 1486). Brook's proposed mining would have little impact on groundwater inside the proposed permit boundary. (Tr. Vol. VII, 1482-83). Brook's isopach maps show a limited drawdown in groundwater, and the data in the permit application shows limited or no connection between the coal seams that Brook intends to mine and other water sources. (Tr. Vol. III, 555, 564). Brook's groundwater model also shows it is unlikely for Brook's operations to have a large impact on domestic wells. (*Id.*, 566).

41. In the TR-1 area specifically, the Council concludes that breaching the coal seam in that area will have limited impact on the Tongue River or other sources of groundwater. (*Id.*, 576). The Council notes Brook attempted to sample groundwater in the area around trench TR-1 but BHC had the sheriff's department escort Brook's contractor out of the area. (*Id.* 700-01). Still, Brook's groundwater model, geologic cross-sections, regional aquifer information, and other publically available data explain the groundwater in the saturated backfill of the TR-1 area. (Tr. Vol. VII, 1512).

42. The Council also agrees with Dr. Kuchanur's testimony about BHC's groundwater restoration demonstration (GRD). (Tr. Vol. VII, 1464- 1483, 1508-09). The GRD had a different objective than Brook's groundwater model and the permitting process in general. (Tr. Vol. VII, 1464-65). The GRD used past data to show recharge and does not predict the consequences of mining. (*Id.*, 1465-66). The GRD also used old data with unexplained variability, several orders of magnitude in some places. (*Id.*, 1477-78, BHC Ex. 15-040). Even so, the flow and recharge rates in the GRD matched predictions in Brook's groundwater model. (Tr. Vol. VII, 1466-71). The GRD also showed minimal interaction between the Tongue River and the saturated backfill, providing further evidence of the accuracy of Brook's groundwater model. (*Id.*, 1471-73, 1481-82).

43. Appendix D7, Soil Resources Assessment, in Volume VI meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, §§ 3-4.

44. Appendix D8, Vegetation Inventory, in Volume VII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 3.

45. Appendix D9, Wildlife, in Volume VIII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4, Ch. 4, § 2.

46. Appendix D10, Wetlands, in Volume IX meets the requirements of applicable law. *See* WY Admin Code ENV LQC Ch. 2, § 4, Ch. 4, § 2.

47. Appendix D11, Alluvial Valley Floors, in Volume X meets the requirements of applicable. *See* WY Admin Code ENV LQC Ch. 2, § 4, Ch. 3, § 2, Ch. 12, § 1. The Council concludes that Brook will not affect any alluvial valley floors, including those found in 2016. (Tr. Vol. II, 11-13).

48. The Mine Plan in Volume XI meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 5, Ch. 3, § 2, Ch. 4, § 2, Ch. 6, §§ 1-6, Ch. 12, § 1.

49. As to objections about blasting, the Council agrees with Mr. Doug Emme that Brook's blasting will have little effect on nearby structures. (Tr. Vol. III, 584, 608). Still, the Council notes landowners within a half mile of the mine can request a pre-blast survey and Brook will publish a blasting schedule. (*Id.*, 582, 584-85).

50. As to objections about Brook's subsidence control plan and subsidence generally, the Council concludes Brook has met the relatively minimal requirements for a subsidence control plan. (Tr. Vol. II, 247-48). The Council also concludes that Brook's commitment to compile the required MSHA ground control plan will address subsidence. (*Id.*, 326-28). The Council concludes the calculations necessary for the ground control plan provide the same data DEQ required for every mining panel. (Tr. Vol. III, 663). It will also provide data Dr. Marino tested was needed. (Tr. Vol. II, 325). The ground control plan will also engineer each mining trench for both long and term-subsidence prevention. (Tr. Vol. II, 355-56). The mining process will also protect against subsidence by having pillars that run the length of each mine panel. (Tr. Vol. I, 120; Tr. Vol. II, 369).

51. The Reclamation Plan in Volume XII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 6, Ch. 3, § 2, Ch. 4, § 2.

52. As to objections about the adequacy of Brook's proposed bond, the Council accepts Mr. Emme's testimony that Brook's proposed amount is "robust" and "higher" than DEQ would have required. (Tr. Vol. III, 590). The Council also notes that DEQ has not yet set a

bond but will do so before issuing a permit. (*Id.*, 586-87). Once DEQ sets the reclamation bond, it will remain in place until DEQ finds Brook has successfully reclaimed disturbed land. (Tr. Vol. II, 180).

53. The Council notes DEQ's authority to enforce Brook's commitments in the permit application. (Tr. Vol. I, 117, 175-76, 230, 334, 349, Tr. Vol. III, 491, 493, 495, 624-25, 627). The Council also notes that other administrative agencies like MSHA, Game & Fish, Department of Transportation, DEQ's water and air quality divisions, Solid and Hazardous Waste Department, and the State Engineer's Office will have oversight over parts of Brook's operations. (Tr. Vol I, 152-53, 160-61, 183-84, 330, 538).

54. The Council finds that it should not impose additional permit conditions for two reasons. First, the Act does not authorize the Council to impose permit conditions. Instead, the Act authorizes the administrator, the director, and DEQ generally to administer permits, including any conditions on them. *See* Wyo. Stat. Ann. § 35-11-109. Second, the Council finds that no additional permit conditions are necessary for Brook's permit application to be complete and non-deficient.

55. Therefore, the Council finds that DEQ correctly determined Brook's permit application was complete, non-deficient, and suitable for publication. The Council's decision on the application pursuant to Wyo. Stat. Ann. § 35-11-406(p) is that: 1) DEQ should make the findings under Section 406(n) of the Act; and 2) based on the findings, the DEQ Director take appropriate action on Brook's permit application based on those findings.

DATED: July 24, 2017.

*ATTORNEYS FOR OBJECTOR
BIG HORN COAL COMPANY*

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **Docket Nos. 17-4802, 17-4803,**
) **and 17-4804 (Consolidated)**
TFN 6 2-025)

**BIG HORN COAL COMPANY’S PROPOSED FINDINGS OF FACT AND
CONCLUSIONS OF LAW**

Big Horn Coal Company, LLC (“Big Horn”), by and through its undersigned counsel of record, hereby submits its Proposed Findings of Fact and Conclusions of Law as directed by the Environmental Quality Council’s (“EQC” or the “Council”) order following the close of evidence at hearing.

INTRODUCTION

The permit application submitted by Brook Mining Company, LLC (“Brook Mine”) fails to meet the legal requirements of a surface coal mining permit application. Brook Mine’s multiple failures to provide critical and required information in its permit application are not minor omissions. Rather, these failures are “deficiencies” that preclude permit approval. The EQC therefore should enter its Findings of Fact, Conclusions of Law,

and Order directing the Department of Environmental Quality (“DEQ”) to either deny Brook Mine’s requested permit, or deem the permit application deficient and require Brook Mine to affirmatively address each of the deficiencies, resubmit its permit application to DEQ, and then republish notice of the compliant permit application for public comment pursuant to the Environmental Quality Act (“EQA”), Wyo. Stat. Ann. § 35-11-406(h)-(k),¹ and the applicable rules and regulations.

I. Background

The record of this contested case hearing patently demonstrates that Brook Mine has spent over three years preparing a permit application that fails to meet statutory and regulatory requirements. Less critical for this Council’s decision, but an important consideration nonetheless, throughout the permit application process and in the hearing before the EQC, Brook Mine consistently demonstrated it has no intent to seriously consider the objections and concerns of nearby landowners or otherwise address the deficiencies in its permit application. It is now up to this Council to do so.

Broadly speaking, this Council must determine whether Brook Mine has satisfied its burden to affirmatively establish that its permit application is legally sufficient and direct whether (and on what terms) the permit application can proceed to the DEQ for final written findings and eventual issuance or denial. *See* Wyo. Stat. Ann. § 35-11-406(k), (p). To be sure, it is not the burden of Big Horn or any other objector to establish that the permit application is insufficient. Brook Mine readily admits it bears the burden of proof in these

¹ According to Wyo. Stat. Ann. § 35-11-103(e)(xxiv) “‘Deficiency’ means an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director[.]”

proceedings, which includes the burden of proving to the Council that its permit application is complete and without deficiencies. *See Brook Mine's Brief on Statutes and Regulations that the Council Must Consider*, p. 10. Yet when objectors identified application deficiencies at hearing, Brook Mine never showed the Council or the objectors where the required information could be found in the permit application, nor did Brook Mine demonstrate that the information contained in the application is accurate and complete. Brook Mine instead attempted to silence or cast doubt on objector testimony, and addressed the identified deficiencies in generalities – affirming the type of information contained in the application, how many pages the application contains, and how long Brook Mine and DEQ personnel spent preparing and reviewing the application. Generalities do not satisfy Brook Mine's burden of proof.

The law requires Brook Mine's permit application to stand on its own. Analytical gaps, missing data and inaccurate information required by law to be included in a surface coal mine permit application simply cannot be remedied with testimonial assurances or by reference to DEQ's review process. Moreover, specific surface coal mine application requirements cannot be satisfied with inaccurate assumptions resulting from limited data taken from a large, data diverse geographic area. Brook Mine's permit application itself must contain the information required by statute and regulation. The required data and analysis is either present in the permit application or it is not. Without establishing that its permit application contains *all* required information, and that *all* the required information is *accurate*, Brook Mine fails to meet its burden as a matter of law.

II. Scope of the Council's Review

As this Council is well aware from prior briefing, the parties disagree as to the proper role of the Council and the scope of its review and decision, particularly as to whether the Council is to consider the requirements of section -406(n) and whether the Council is to direct DEQ to approve or deny Brook Mine's permit application at this time. The Council is now well aware of precedent² and the parties' respective positions on this issue, and Big Horn will not repeat those arguments here. Because the Council has declined to rule on whether it will consider Section -406(n)'s requirements prior to the parties' submission of proposed findings of fact and conclusions of law, Big Horn will present its proposed conclusions of law related to section -406(n) requirements separate from its proposed conclusions of law related to the legal requirements for surface coal mine permit applications found elsewhere in the EQA and the DEQ's Land Quality coal rules and regulations. All parties do seem to agree that the Council must review and consider whether Brook Mine's permit application satisfies Wyo. Stat. Ann. § 35-11-406(a)-(k) and the DEQ's Land Quality coal rules and regulations. *See* Briefs of the Parties in response to the Council's *Briefing Order*, dated June 13, 2017.

III. Scope of Big Horn's Objections to Brook Mine's Permit Application

Brook Mine (also often denominated RAMACO in permit documents or testimony) plans to develop coal resources via both open pit and highwall/auger mining methods. DEQ

² See Exhibit 1 to *Brook Mine's Response Brief to Big Horn Coal's Brief Regarding the Scope of the [EQC's] Review and Request for Oral Argument* (demonstrating that in *The Matter of Objections to Amax Coal Company, Eagle Butte Mine, TFN 1 6/212*, the Council specifically made findings of fact and conclusions of law related to the requirements of Section -406(n), and ordered DEQ to take specific action on the permit application).

Exh. 12, p. 12-192. Big Horn is the owner of surface lands, including valuable improvements and facilities, located within Brook Mine's proposed permit area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn also holds an existing coal mine permit that overlaps Brook Mine's proposed permit area and imposes certain reclamation responsibilities on Big Horn, which are enforceable by DEQ. Tr. Vol. IV, p. 836, ln. 11-16. Big Horn's objections to Brook Mine's permit application therefore are reasonably focused on Brook Mine's proposed operations within this overlapping area, more particularly known as the TR-1 mining area, located in in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M. *See Figure 1; see also* DEQ Exh. 12, p. 12-134, Tr. Vol. II, p. 204, ln. 10-13.

Figure 1. Taken from DEQ Exh. 12, p. 12-134 and showing the TR-1 mining area as the southeastern most mining area.

Evidence of record indisputably demonstrates that Brook Mine failed to provide required, accurate TR-1 area information in its surface coal mine permit application. The evidence further demonstrates that Brook Mine has not satisfied certain legal requirements related to surface water monitoring, underground coal fire analysis and management, overlapping permit boundary analysis and management, and surface owner protection bonding. These requirements must be satisfied prior to permit approval and issuance.

More specifically, Brook Mine's permit application contains and relies on inaccurate, missing or inadequate data and analysis for the TR-1 area, predominantly as it relates to the geology and groundwater located in the overburden above the coal seams Brook Mine proposes to mine. Without complete and accurate information as to the TR-1 area and the projected impacts thereto, and without detailed plans regarding the monitoring of these impacts, it is impossible for Brook Mine, DEQ, Big Horn, or the public to adequately assess Brook Mine's proposed mining operations or the resulting impacts.

The Council cannot fairly or reasonably characterize the flaws in Brook Mine's surface coal mine permit application as minor omissions that can be cured by stipulation or minor permit revisions. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxiv); -406(h). The inaccurate, incomplete and missing geologic and hydrologic TR-1 area information constitute legal deficiencies in Brook Mine's permit application. The EQA does not tolerate such deficiencies. The permit application itself must include complete and accurate information, the DEQ must analyze complete and accurate information, and the

public must have the opportunity to review and comment on complete and accurate information *prior to* permit approval. Wyo. Stat. Ann. § 35-11-406(h) – (k).³

Accordingly, the Council must order Brook Mine to cure the deficiencies in its mine permit application by preparing, resubmitting to DEQ, and eventually republishing a legally sufficient surface mine permit application. At the very least, all deficiencies must be cured to the DEQ's and EQC's satisfaction prior to Brook Mine conducting any mining operations.⁴

IV. Relevant Legal Requirements

The following list sets forth the EQA and DEQ Land Quality – Coal Rules and Regulations permit application requirements specifically related to Big Horn's objections.⁵

i. Hydrology and Geology

- **Wyo. Stat. Ann. § 35-11-406(a)(vii)** - A general description of the land which shall include as nearly as possible ... if known, the nature and depth of the overburden, topsoil, subsoil, mineral seams or other deposits and any subsurface waters known to exist above the deepest projected depth of the mining operation.
- **Wyo. Stat. Ann. § 35-11-406(b)(v), (xvi), (xviii)** - A mine and reclamation plan dealing with the extent to which the mining operation will disturb or change the lands

³ Because Brook Mine intends to begin its mining operations in the TR-1 area, *see* DEQ Exh. 12, p. 12-134, any suggestion that Brook should be allowed to gather TR-1 area information and cure the TR-1 related permit application deficiencies following permit approval and/or the initiation of mining operations would risk unforeseen and permanent environmental damage and violate the EQA and DEQ Land Quality Division rules and regulations.

⁴ In its proposed *Conclusions of Law* below, Big Horn provides the Council alternative conclusions in the form of conditions intended to address the deficiencies in Brook Mine's permit application prior to the initiation of mining operations.

To be clear, Big Horn asserts that Brook Mine's permit application is deficient and not eligible for approval under the express provisions of the EQA. Big Horn only offers the proposed conditions as minimal, necessary steps that must be taken in the event the Council orders the DEQ to make its remaining findings and issue the permit.

⁵ All rules and regulations cited herein represent DEQ's, Land Quality – Coal Rules and Regulations. For brevity, the rules and regulations will be referred to herein by Chapter and Section number only.

to be affected and the plan whereby the operator will reclaim the affected lands, to include:

- A map setting forth the drainage plan on, below, above and away from the affected land including subsurface water above the mineral seam to be removed; and further showing the location of all waste water impoundments, any settling ponds, and other water treatment facilities, constructed drainways and natural drainways, and the surface bodies of water receiving this discharge.
 - A statement of the source, quality and quantity of water, if any, to be used in the mining and reclamation operations.
 - A plan to minimize the disturbances to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation.
- **ENV LQC Ch. 2 § 4(a)(vii), (viii), (x)(A), (xii), (xiv)** - A description of the lands to be affected within the permit area and how these lands will be affected, to include:
- A detailed description of the geology within the proposed permit area down to and including any aquifer⁶ to be adversely affected by mining below the lowest coal seam to be mined, to include structural geology that may influence the required reclamation, and the occurrence, availability, movement, quantity, and quality of potentially affected surface and groundwaters.
 - For the permit area, and adjacent areas, a characterization of the geologic strata down to and including the deeper of either the stratum immediately below the lowest coal seam to be mined, or any aquifer below the lowest coal seam to be mined that may be adversely impacted by mining, to include a statement of the results of test boring holes or core samples collected to show:
 - The location of any groundwater; and
 - Lithologic characteristics and thickness of each stratum and coal seam.
 - A description of the overburden, including the thickness, geological nature or any other factor that will influence the mining or reclamation activities.
 - Complete information on groundwater that may be affected in the permit area or adjacent areas, to include:

⁶ ENV LQC Ch. 1 § 2(j), defines “aquifer” as “a zone, stratum or group of strata that stores and transmits water in sufficient quantities for a specific use.” Nothing in this definition requires that water in a particular zone or stratum be currently used in order to qualify as an aquifer.

- An estimate of the depth and quantity of any groundwater existing in the proposed permit area down to and including the strata immediately below the lowest mineral seam to be mined, for which the operator may be required to conduct testing in order to determine the exact depth, quantity and quality of groundwater in geological formations affected by the mining operations;
 - The lithology and thickness of all known aquifers; and
 - The recharge, storage, and discharge characteristics of the groundwater, all according to the parameters and detail required by the Administrator of the Land Quality Division.
- A description of the surface water and groundwater and related geology in the permit area and general area sufficient to assess the probable hydrologic consequences (PHC). And if the determination of the PHC required by Chapter 19, Section 2(a)(i) indicates that adverse impacts on or off the proposed permit area may occur to the hydrologic balance, then information supplemental to that required under (a)(xi) and (a)(xii) of this Section (requiring complete surface and groundwater information) must be provided to evaluate such PHC and to plan remedial and reclamation activities.
- **ENV LQC Ch. 2 § 5(a)(x)** - A determination of the PHC of the proposed operation on the hydrologic regime and the quantity and quality of surface water and groundwater systems within the permit area and the general area consistent with the information required in Chapter 19, Section 2. The PHC determination shall be based on baseline hydrologic, geologic and other information collected for the permit application and may include data statistically representative of the site. This determination shall specifically address potential adverse hydrologic consequences and describe preventive and remedial measures.
- **ENV LQC Ch. 2 § 5(a)(ix)(C), (D)** - A plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and adjacent to the permit area, to include:
 - A plan to restore the approximate recharge capacity of the permit area in accordance with Chapter 4, Section 2(h), which requires the groundwater recharge capacity of reclaimed lands to be restored to a condition that provides a recharge rate approximating the pre-mining recharge rate; and
 - A Surface Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the surface water for current and approved postmining

land uses and to the objectives for protection of the hydrologic balance as set forth in subsection 5(a)(ix) of Chapter 2.

- The plan must identify the surface water quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- A Ground Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the groundwater for current and approved postmining land uses and to the objectives for protection of the hydrologic balance set forth in subsection 5(a)(ix) of Chapter 2.
 - The plan must identify the quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- **ENV LQC Ch. 2 § 6(b)** - A reclamation plan that describes how the operator will reclaim the affected lands to the proposed postmining land use in accordance with Chapter 4, Section 2(a), which requires restoration of the land to a condition equal to or greater than the highest previous use.
- **ENV LQC Ch. 19 § 2(a)(i)** - A determination of the projected result of proposed surface coal mining and reclamation operations, both on and off the mine site, which may reasonably be expected to change the quantity or quality of the surface and groundwater; the surface and groundwater flow, timing and availability, the surface and groundwater quality under seasonal flow conditions, including dissolved and suspended solids; and the stream channel conditions. This information shall be in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems including the impacts resulting from the proposed operation and their interaction with the impacts of all anticipated mining upon all affected hydrologic systems.
 - ii. Underground Coal Fires
- **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii)** – A plan for insuring that materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent threats to human or animal health and safety, as well as procedures

proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life.

- **ENV LQC Ch. 2 § 5(a)(iv)** – Contingency plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.

iii. Blasting Operations

- **Wyo. Stat. Ann. § 35-11-415(b)(xii)(E)** – surface coal mining operators **must**, upon request of a resident or owner, conduct a pre-blasting survey of any man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area.

iv. Overlapping Permits and Related Agreements

- **ENV LQC CH. 2 § 5(a)(xviii)** – Plans of mine facilities (including overstrip areas) that are to be shared by two or more separately permitted mining operations may be included in one permit application and referenced in the other application(s). Each permittee shall bond the mine facilities unless the permittees sharing it agree to another arrangement for assuming their respective responsibilities. If such agreement is reached, the application shall include a copy of the agreement between or among the parties setting forth the respective bonding responsibilities of each party for the mine facilities.

v. Surface Owner Protection Bond

- **Wyo. Stat. Ann. § 35-11-416(a)** - Where the surface owner is not the owner of the mineral estate proposed to be mined by mining operations, a permit shall not be issued without the execution of a bond or undertaking to the state for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate, to the crops and forage, or to the tangible improvements of the surface owner. The amount of the bond shall be determined by the administrator and shall be commensurate with the reasonable value of the surrounding land, and the effect of the overall operation of the landowner. Financial loss resulting from disruption of the surface owner's operation shall be considered as part of the damage.

vi. Wyo. Stat. Ann. § 35-11-406(n) Requirements

- **Wyo. Stat. Ann. § 35-11-406(n)** – The permit applicant must establish that its permit application is in compliance with the EQA and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:
 - The application is accurate and complete;

- The reclamation plan can accomplish reclamation as required by the EQA;
- The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

PROPOSED FINDINGS OF FACT

1. This matter arises from the application of Brook Mining Company, LLC (“Brook Mine”) to the Department of Environmental Quality (“DEQ”), Land Quality Division (“LQD”), for a permit to conduct surface coal mining activities.

2. DEQ/LQD determined Brook Mine’s permit application, TFN 6 2-025, complete and suitable for publication pursuant to Wyo. Stat. Ann. § 35-11-406(h). In accordance with Wyo. Stat. Ann. § 35-11-406(j) and (k), the permit was published to the public and interested parties were required to submit written objections to the application by January 27, 2017. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit D.

3. Objectors in this case, Big Horn Coal Company (“Big Horn”), Powder River Basin Resource Council (“PRBRC”), and Mary Brezik-Fisher and David Fisher, submitted timely objections to the application. *See* BHC Exh. 3; Fisher Exh. 26; PRBRC Exh. 1.

4. Objectors requested an informal conference. DEQ denied these requests, leading to this contested case proceeding. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit A.

5. The Environmental Quality Council (“EQC” or “Council”) conducted a seven (7) day contested case hearing in this matter, receiving evidence regarding the permit

application contents, proposed operations, characteristics of the proposed permit lands, and possible impacts from the proposed operations.

6. Big Horn owns lands and facilities within and immediately adjacent to Brook Mine's proposed permit boundary, particularly the TR-1 mining area and the southeastern portion of the proposed mining area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn owns and operates an industrial shop, rail loadout facility, bridge, access road, and railroad spur on the referenced lands. Big Horn also holds a state coal lease on S½ Section 23 and the N½ Section 26, Township 57 North, Range 84 West, 6th P.M. BHC Exh. 2; *see generally* Tr. Vol. IV, pp. 839-841.

7. Big Horn currently leases its shop to multiple tenants for industrial use and storage. Tr. Vol IV, p. 861, ln. 3-5.

8. Big Horn also holds an existing mining permit, No. 213-T8, that overlaps lands included in Brook Mine's proposed permit boundary. BHC Exh. 2; Tr. Vol. I, p. 78, ln. 7-10. Big Horn maintains a reclamation performance bond with DEQ/LQD on approximately 25 acres of land within Brook Mine's proposed permit boundary. BHC Exh. 5; Tr. Vol. IV, p. 863, ln. 18-22.

9. In its objection letter and at hearing, Big Horn, along with other Objectors, asserted that Brook Mine's permit application fails to meet applicable legal requirements found in the Environmental Quality Act ("EQA"), Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and DEQ/LQD—Coal Rules and Regulations. BHC Exh. 3. Big Horn primarily focused its objections on the area of the proposed mine overlapping and adjacent to its current

property and facilities, particularly the TR-1 mining area. *See* BHC Exh. 2; Tr. Vol. IV, pp. 841-843; *see generally* Tr. Vol. I-VII.

TR-1 Mining Area and Related Geology and Hydrology

10. Brook Mine proposes to begin mining operations in the TR-1 mining area. *See* DEQ Exh. 12, p. 12-134.

11. The TR-1 mining area is located entirely in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M., where Brook Mine proposes to cut a highwall trench through the overburden above the targeted coal seams. *See* DEQ Exh. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 10-20.

12. The overburden in the TR-1 mining area is geologically and hydrologically unique and can be distinguished from the overburden in the proposed permit area outside the TR-1 mining area. The TR-1 area overburden is composed of previously mined backfill material and is saturated with groundwater. DEQ Exh. 5, p. 5-014; Tr. Vol. II, p. 205, ln. 8-21, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24.

13. In order to gather data as to the geology in the proposed permit area, including overburden geology, Brook Mine conducted a drilling program consisting of a series of drill holes across the proposed permit area. *See* DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164; Tr. Vol I, p. 87, ln. 6-17, p. 91, ln. 6-10. The drill hole data is found in the permit application at Addendum D5-2. DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164.

14. Brook Mine conducted drill hole testing on a tighter configuration than DEQ's typical 160-acre spacing requirement. Tr. Vol. I, p. 48, ln. 9-10; p. 91, ln. 18-25; p. 92, ln. 1.

15. Brook Mine did not conduct drill hole testing in the TR-1 mining area, nor did it conduct drill hole testing in any part of the approximately 360 acres comprising the SE¹/₄ of Section 15 and the NE¹/₄ of Section 22, Township 57 North, Range 84 West. The permit application contains no geologic data from the distinct overburden within these lands. *See* DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

16. Brook Mine's permit application does not distinguish the TR-1 area overburden, and does not include specific geological characterization or identification of the TR-1 area overburden, including its geologic strata, nature, structural geology, lithology, thickness, or other factors that may influence mining or reclamation activities. *See* Tr. Vol. II, p. 209 – 211.

17. DEQ/LQD indicated that it intends to impose a permit condition requiring Brook Mine to gather overburden data from the TR-1 area prior to conducting any mining activity or creating any disturbance. Tr. Vol. I, p. 92, ln. 16-23. No such condition is referenced in the permit application or has otherwise been memorialized. *See* Tr. Vol. I, p. 65 ln. 18-25 (stating that DEQ Exh. 1, p. 1-053 contains the location of permit conditions); DEQ Exh. 1, p. 1-053 (showing no current permit conditions placed upon the permit application).

18. Appendix D6 of the permit application (DEQ Exh. 6) contains hydrologic information, including groundwater information. Tr. Vol. I, p. 93, ln. 17-23. Additional groundwater information is located in the Mine Plan, and its groundwater model. *See* DEQ Exh. 12.

19. Appendix D6 of the permit application characterizes the overburden as a whole, repeatedly describing the overburden within the entirety of the proposed permit area as “dry.” *See* DEQ Exh. 6, p. 23-27.

20. The permit application does not characterize any part of the overburden within the proposed permit area as a “potential hydrogeologic unit,” and concedes that Brook Mine installed no groundwater monitor wells and conducted no aquifer tests in any part of the overburden. *Id.*

21. In characterizing all overburden within the proposed permit area as “dry,” the permit application specifically relies on the drill hole logs and data found in Addendum D5-2, which is devoid of data from the TR-1 mining area. *Id.*; DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

22. DEQ witnesses Kristiansen and Kuchanur, and Big Horn witness Gerlach, all testified that unlike the overburden in the rest of the proposed permit area, the TR-1 area overburden consists of previously mined backfill material, and that this material is saturated with groundwater. *See* Tr. Vol. II, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24; Tr. Vol. III, p. 507, ln. 3-9; Tr. Vol. IV, p. 927-934; *see also* BHC Exh. 8, 9.

23. Nowhere does the permit application differentiate between the previously mined TR-1 area overburden and the overburden in other proposed mining areas which consist of native strata. Tr. Vol. II, p. 205, ln. 8-21, p. 212, ln. 6-19.

24. Brook Mine witness Barron testified that he does not know whether there is groundwater in the TR-1 overburden, Tr. Vol. IV, p. 720, ln. 11-23, and admitted that no

part of Brook Mine's permit application specifically addresses the TR-1 overburden or its groundwater saturation. Tr. Vol. IV, p. 717, ln. 1-4.

25. DEQ witness Kristiansen conceded that the permit application lacks required information as to the TR-1 overburden and its groundwater saturation, and that that the permit application inaccurately characterizes all overburden within the proposed permit area as dry. Tr. Vol. II, p. 214, ln 12-24, p. 216, ln 12-25, p. 217, ln 1-17.

26. Brook Mine's permit application fails to describe groundwater in the TR-1 area overburden. The permit application contains no site-specific data regarding groundwater location, quantity, quality, lithology, or thickness; or its recharge, storage, or discharge characteristics within the TR-1 area overburden. *See* Tr. Vol. II, p. 212, ln. 6-19; Tr. Vol. IV, p. 717, ln. 1-4, p. 720, ln. 19-23.

27. The permit application addresses "Probable Hydrologic Impacts" in section MP.6; groundwater impacts are specifically addressed in section MP.6.2. DEQ Exh. 5, p. 12-055, -059.

28. Section MP.6.2 of the permit application states that mining impacts to the groundwater found in the coal seams, including drawdown and pit inflows, are predicted and discussed in the groundwater model utilized by Brook Mine. *Id.* at 12-060.

29. As to the overburden, section MP 6.2 assumes that the overburden is dry and states that drawdown of groundwater in the overburden was not modeled. *Id.*

30. Brook Mine's "Operation Monitoring Program" is found in the permit application in section MP.7, with groundwater monitoring described in section MP.7.2. *Id.* at 12-062, -064 through -065.

31. Section MP 7.2 of the permit application states, “[g]roundwater monitoring during mining operations will be a continuation of the monitoring program” discussed in Appendix D6. *Id.* at 12-064. Appendix D6 states that no monitor wells exist to monitor the overburden. DEQ Exh. 6, p. 6-023 through -027.

32. The permit application contains no description or assessment of the hydrologic impacts of the proposed mining operations to the groundwater in the TR-1 overburden, and provides no plan whereby Brook Mine will monitor the hydrologic impacts of the proposed mining operations on groundwater in the TR-1 area overburden. *See generally* DEQ Exh. 5 and 12; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

33. The groundwater model utilized by Brook Mine to support its permit application is discussed in Addendum MP-3 of the Mine Plan. DEQ Exh. 12, p. 12-183 through -294.

34. The groundwater model was designed to analyze the potential cumulative hydrological effects of the project and simulate the regional groundwater impacts from the proposed mining operations. DEQ Exh. 12, p. 12-184, -192.

35. The hydrogeologic data used in the groundwater model was limited to observation points, monitor wells and pumping tests, and private well information obtained from the State Engineers Office database. *Id.* at pp. 12-192, -194, -264. None of these data sources provide information as to the unique textural and hydraulic characteristics of the saturated backfill in the TR-1 area overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. III, p. 513, ln. 11-19; BHC Exh. 9, p. 6.

36. The groundwater model primarily focuses on the Carney and Masters coal seams; treats all overburden within the proposed permit area as dry, native strata; does not utilize any site-specific hydraulic conductivity information from the TR-1 area overburden; and does not model any drawdowns in the TR-1 overburden resulting from mining operations. DEQ Exh. 12, pp. 12-060, -197, -205, -206; BHC Exh. 9, p. 6.

37. The TR-1 area is spatially contained within the geographic area examined by the groundwater model; however, by assuming all overburden in the proposed permit area is dry, impacts to the groundwater in the TR-1 area overburden were not accurately modeled. *See generally* DEQ Exh. 12, p. 12-183 through -294.

38. Brook Mine's permit application states that mining operations will use and rely on pit inflows as a source of water. DEQ Exh. 12, p. 12-066. The application estimates that the proposed mining operations will use approximately 53,000 gallons of water per day (approximately 37 gallons per minute) from pit inflows and states that the estimated inflow amounts are demonstrated in the groundwater model in Addendum MP-3. DEQ Exh. 12, p. 12-116. The groundwater model estimates pit inflows at anywhere between 100 gallons per minute to 0.03 gallons per minute for the life of the mine. *Id.* at 12-254.

39. To facilitate its use of pit inflow water, Brook Mine proposed to place a pump in the TR-1 trench cut to pump out water for operations use for the life of the mine. DEQ Exh. 12, p. 12-052; Tr. Vol. III, p. 556, ln. 1-15.

40. DEQ witness Kuchanur testified that once Brook Mine excavates the trench cut in the TR-1 mining area, groundwater from the TR-1 overburden will flow into the trench cut and mine panels. Tr. Vol. III, p. 556, ln. 1-15.

41. The groundwater model does not accurately reflect or identify the groundwater in the TR-1 overburden, and does not accurately simulate the pit inflows from the TR-1 overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

42. Brook Mine's permit application contemplates the use of groundwater found in the coal seams as a source of water to be used from pit inflows. *See* DEQ Exh. 12, p. 12-254. The permit application never acknowledges any use of the groundwater in the TR-1 overburden, does not identify this groundwater as a source of water for mine operations, and the quality and quantity of water to be used from this source is a complete unknown. *See generally* DEQ Exh. 12.

43. Appendix D6, section D6.2.2.5, of the permit application addresses recharge areas. The permit application does not specifically describe any recharge characteristics of the overburden generally, nor the TR-1 area specifically. DEQ Exh. 6, p. 6-029 through -031. Appendix D.6 of the permit application characterizes all overburden as dry, and relies on the groundwater model found at Addendum MP-3 for any detail concerning groundwater recharge. *Id.*

44. The groundwater model is devoid of any TR-1 overburden data and characterizes recharge in the overburden, generally, as having a uniform recharge rate of between 0.00000012 ft/day/ft² and 0.00008 ft/day/ft² and 0.0005 and 0.35 inches per year. DEQ Exh. 12, p. 12-221.

45. Upon review of materials not in or referenced by the permit application, DEQ witness Kuchanur estimated the TR-1 overburden recharge rate at 0.06 CFS. *See* Tr. Vol VII, p. 1470, ln. 1-16; p. 1471, ln. 14-15.

46. The groundwater in the TR-1 overburden is currently held in place by a low permeability, shale aquitard, or barrier, which physically separates the groundwater located in the overburden from the groundwater located in the coal seams. Tr. Vol. III, p. 508, ln. 2-25, p. 509, ln. 1.

47. In order to access the targeted coal seams, the proposed mining operations in the TR-1 area will excavate and cut through the shale barrier and allow the TR-1 overburden groundwater to flow directly into the trench and mining panels. *Id.*; *see also id* at p. 556, ln. 1-15.

48. Neither the permit application nor the groundwater model contains any data or analysis regarding whether and how Brook Mine will be able to restore the recharge rate of the groundwater in the TR-1 overburden after mining operations cease. *See generally* DEQ Exh. 6, 12 and 13.

Surface Water Monitoring

49. DEQ witness Kunze conceded that Brook Mine needs to revise the number and location of surface water monitor wells proposed in the permit application for the Tongue River. Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-12.

50. In order to adequately monitor mining impacts on the Tongue River, one monitor well needs to be placed further upstream on the Tongue River, near the furthest upstream point within the proposed permit area; an additional monitor well should be

placed near the proposed permit boundary on the Tongue River a short distance downstream from the confluence of the Tongue River and Goose Creek; and another additional monitor well should be placed on Goose Creek. *Id.*

51. DEQ policy requires permit applications to contain pre-mining monitoring and studies of both surface and groundwater to include monitoring data for a one year period, at minimum. *See* DEQ Exh. 22, pp. 3, 5, 15, 16; *see also* Tr. Vol. II, p. 395, ln. 9-17.

52. The TR-1 mining area is located immediately adjacent to both the Tongue River and Goose Creek, and the confluence of the two surface water bodies. DEQ Ex. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 25, p. 205, ln. 1-7.

53. The permit application does not discuss or analyze whether or to what extent the groundwater in the TR-1 overburden is hydrologically connected to the Tongue River or Goose Creek. *See generally* DEQ Exh. 5 and 12.

54. The evidence suggests a direct hydrological connection exists between the groundwater in the TR-1 overburden and the Tongue River. Tr. Vol. III, p. 498, ln. 19-25, p. 499, ln. 1-19; Tr. Vol. IV, p. 936, ln. 5-11; BHC Exh. 9.

55. Absent information in the permit application regarding the nature and extent of the hydrologic connection between the TR-1 overburden and the Tongue River, it is impossible for Brook Mine or DEQ to determine if or to what extent mining through the saturated TR-1 overburden will adversely impact the Tongue River. *See* Tr. Vol. II, p. 420, ln. 7-19.

56. Neither the monitor wells identified in Brook Mine's permit application nor the additional monitor wells DEQ proposed at hearing will adequately monitor impacts to the Tongue River from mining through the saturated overburden in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -112; *see also* Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-15; DEQ Exh. 6 and 12 *generally*. An additional monitor well on the Tongue River, just north of the TR-1 mining area, is necessary to adequately monitor impacts to the Tongue River from mining in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -0112; Tr. Vol. II, p. 420, ln. 7-19.

Access to the TR-1 Area for Testing

57. Brook Mine had legal authority to enter Big Horn property, including the TR-1 area, to conduct exploration and data recovery operations from July 2012 through July 2014, pursuant to an exploration agreement with Big Horn. Tr. Vol. IV, p. 847, ln. 9-16.

58. Brook Mine was gathering information for its permit application, including gathering geology information, and placing monitor and observation wells outside the TR-1 area, during this same period. *See* Tr. Vol. I, p. 51, ln. 18-25.

59. Brook Mine apparently chose not to gather information from the TR-1 mining area during the term of its agreement with Big Horn. *See generally* DEQ Exh. 1-13.

60. Brook Mine allowed its exploration agreement with Big Horn to expire, and never subsequently sought permission to enter Big Horn's property to conduct testing or gather information. Tr. Vol. IV, p. 848, ln. 1-9, p. 855, ln. 17-20.

61. After the expiration of the exploration agreement, and without notice to or permission from Big Horn, Brook Mine sent drilling rigs to Big Horn property. Big Horn discovered unauthorized drilling rigs on its property and contacted law enforcement, which instructed the drilling rig operator to leave Big Horn property. *Id.* at p. 848, ln. 10-25, p. 849, ln. 1-25, p. 850, ln. 1-4.

62. There is no evidence in the record that it was not possible for Brook Mine to acquire geologic or hydrologic information from the TR-1 area.

Underground Coal Fires

63. There is a history of underground coal fires in the proposed permit area. *See* Tr. Vol. II, p. 334, ln. 2-5.

64. Brook Mine acknowledged at hearing that coal fires may exist within the proposed permit boundary. Tr. Vol. IV, p. 722, ln. 16-21.

65. Brook Mine has not conducted any survey or examination of coal fires in the proposed permit area; and the permit application contains no information to support Brook Mine's testimony at hearing that although coal fires may exist, it believes no underground coal fires exist in the proposed permit area. *Id.* at p. 716, ln. 4-17.

Blasting Protections Afforded to Surface Owners

66. At hearing, Big Horn witness Sweeney requested a pre-blasting survey pursuant to Wyo. Stat. Ann. § 35-11-415(b)(xi)(E), and seismic monitoring for Big Horn's shop and other infrastructure located within the proposed permit area. Tr. Vol. IV, p. 860, ln. 17-25, p. 861, ln. 1-16.

67. DEQ and Brook Mine representatives testified that on request from a resident within one half-mile of the proposed permit boundary, seismic monitors could be placed near structures to measure the ongoing impacts from blasting. Tr. Vol. III, p. 618, ln. 12-25, p. 619, ln. 1-2.; Tr. Vol. IV, p. 770, ln. 20-25, p. 771, ln. 1-5, p. 783, ln. 5-19.

Overlapping Permit Boundaries and Related Agreements

68. Brook Mine's permit application states that Big Horn's "permit boundary [is] within Brook Mine's permit boundary," that "all mining operations are covered under individual Permits to Mine," and "[a]greements between the permittees are located in the Adjudication File." DEQ Exh. 12, p. 12-088. In its Reclamation Plan, the permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands." DEQ Exh. 13, p. 13-075.

69. Big Horn requires access to the overlapping property as a landowner with tenants and as a permit holder with outstanding reclamation responsibilities. *See* Tr. Vol. IV, p. 870, ln. 14-21.

70. When two or more parties have overlapping surface coal mine permits, the permit documents may specifically reference any agreements between the parties and expressly provide that each party is only responsible for reclamation resulting from its own disturbance. BHC Exh. 5 and 6.

71. There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal. Tr. Vol. IV, p. 865, ln. 9-15. Brook Mine's permit application incorrectly implies there is an agreement between Brook Mine and Big Horn in the adjudication file. *See* DEQ Exh. 12, p. 12-088.

72. Brook Mine's permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands" rather than stating as DEQ witness Kristiansen conceded, that each party will be responsible for reclamation and maintaining a reclamation bond only as to that party's facilities, operations, and disturbances. *See* DEQ Exh. 13, p. 13-075; Tr. Vol. II, p. 188, ln. 20-25, p. 189, ln. 1-25, p. 190, ln. 1-16.

Surface Owner Protection Bond

73. Brook Mine has not yet submitted a surface owner protection bond to DEQ, as required by Wyo. Stat. Ann. § 35-11-416(a), for the use and benefit of Big Horn as a surface owner within the proposed permit area. *See* Tr. Vol. II, p. 200, ln. 9-25, p. 201, ln. 1.

74. DEQ assured Big Horn that it will determine the amount of the surface owner protection bond prior to permit issuance and only after participation and input from Big Horn. Tr. Vol. II, p. 201, ln. 8-25, p. 202, ln. 1-4.

PROPOSED CONCLUSIONS OF LAW

1. The Council has jurisdiction over this matter pursuant to Wyo. Stat. Ann. §§ 35-11-406(k) and -112(a).

2. EQC conducted the contested case hearing pursuant to DEQ, Practice and Procedure Rules, Chapter 2.

3. Pursuant to the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations, Brook Mine's permit application must contain specific information,

data and other substantive content and analysis regarding the proposed surface coal mining operations, the land and water to be affected, foreseeable impacts from the proposed mining operations, and how the foreseeable impacts will be monitored, minimized and reclaimed.

4. The Council must determine whether Brook Mine has affirmatively established that its permit application contains all legal requirement imposed by the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations.

5. The Council also must determine whether Brook Mine has met its specific burden under Wyo. Stat. Ann. § 35-11-406(n) necessary for approval of its permit application, and, based on that determination, direct DEQ to either issue or deny Brook Mine a permit after making the requisite written findings.

6. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x)** require a surface coal mining permit application to provide a general description of the land, including the nature of the overburden, a detailed description of the geology down to the lowest coal seam to be mined, a characterization of the geologic strata down to the lowest coal seam to be mined, the lithological characteristics of each stratum, and a description of any factor in the overburden that will influence mining or reclamation activities.

7. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x) as to the overburden in the TR-1 mining area.

Descriptions and characterizations in the form of assumptions or based on an extrapolation of data from geographically and geologically distinct areas fail to satisfy these statutory and regulatory requirements.

8. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific geologic data and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the alternative, and without waiving BHC's stated position that the application must be denied and resubmitted, if the EQC elects to direct DEQ to impose permit conditions:⁷

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze TR-1 overburden samples and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

9. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii)** require a surface coal mining permit application to provide a description of any subsurface waters known to exist above the deepest projected

⁷ See *supra* Note 4. All alternative Conclusions of Law proposing permit conditions are provided by Big Horn with this same caveat that Big Horn first and foremost asserts that the permit application submitted by Brook Mine is deficient and must be either denied or sent back to Brook Mine to remedy these deficiencies, resubmit the application to DEQ for approval, and re-publish for public review pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

depth of the mining operation; the occurrence, availability, quality and quantity of potentially affected groundwaters; the location of any groundwater; and complete information of groundwater that may be affected in the permit area, including the lithology and thickness of known aquifers and the recharge, storage and discharge characteristics of the groundwater.

10. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii), as it fails to identify or describe any groundwater in the TR-1 mining area overburden.

11. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific groundwater information and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze additional groundwater information from the TR-1 area overburden and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

12. **Wyo. Stat. Ann. § 35-11-406(b)(xvi)** requires a surface coal mining permit application to contain a statement of the source, quality, and quantity of any water to be used in mining or reclamation operations.

13. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(b)(xvi), as it fails to identify the groundwater in the TR-1 overburden as a source of water for its proposed operations and similarly fails to identify the quality of that water or the quantity to be used in its mining or reclamation operations.

14. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate information and analysis regarding the TR-1 as a specific water source in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with the express written conditions that:

(1) prior to conducting any mining operations, Brook Mine must identify all water sources to be used in its proposed mining and reclamation operations, including groundwater from the TR-1 overburden, by geologic source, including quality and quantity characteristics, and submit this data and analysis to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations; and

(2) after the conclusion of mining operations in the TR-1 area, the TR-1 trench must be reclaimed without delay, in accordance with applicable law, and may not remain open for use as a source of water for subsequent mining operations on adjacent lands.

15. **Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a)** require a surface coal mining permit application to contain a plan to minimize disturbances to the prevailing hydrologic balance at the minesite and associated offsite areas and to the quality and quantity of surface and groundwater systems both during and after mining operations; a description of the groundwater and related geology in the permit area sufficient to assess the probable hydrologic consequences; a determination of the probable hydrologic consequences of the proposed operation on the hydrologic regime and the quantity and quality of surface and groundwater systems within the permit area; and a determination of the projected result of the proposed surface coal mining and reclamation operations, which may be expected to change the quality or quantity of the surface and groundwater, its flow, timing and availability, all in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems.

16. Brook Mine's permit application fails to meet the requirements of Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a), specifically, as to the lack of any plan or assessment related to probable impacts from mining through the TR-1 overburden, and

any probable change in the quality or quantity of the surface or groundwater in that area, its flow, timing or availability.

17. DEQ must either deny the permit application, or require Brook Mine to include sufficiently detailed, site-specific groundwater data for the TR-1 overburden in its permit application, including the anticipated impacts from mining the TR-1 area on ground and surface waters, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must provide a surface and groundwater impact analysis (during-mining and post-mining) that incorporates site-specific textural and hydrological data in the TR-1 mining area, to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

18. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** requires a surface coal mining permit application to contain both a groundwater and surface water monitoring plan, based on hydrologic, geologic and other information in the permit application, which identifies the quality and quantity parameters to be monitored, sampling frequency and site locations, and describes how the data will be used to determine the impacts of the mining operations on the hydrologic balance.

19. Brook Mine's permit application fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of the proposed mining operations in the TR-1 area on surface water within and adjacent to the permit area. The permit application further fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of mining the TR-1 area on the groundwater located in the TR-1 overburden.

20. DEQ must either deny the permit application, or require Brook Mine to identify and commit to installing additional monitoring locations within its permit application necessary to determine the impacts of mining the TR-1 area on the Tongue River and Goose Creek and the groundwater located in the TR-1 overburden, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations, alterations to its water monitoring locations as follows:

First, as recommended by DEQ, move one monitor well farther upstream on the Tongue River near the boundary of the proposed permit area, and add additional monitoring cites on the Tongue River just downstream of the

confluence with Goose Creek and an additional monitoring location on Goose Creek; and

Second, add groundwater monitoring locations in the TR-1 overburden and add an additional surface water monitoring location in the Tongue River just north of the TR-1 mining area.

21. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** and its incorporation of Ch. 4, Section 2(h) requires a surface coal mining permit application to include a plan to restore the approximate recharge capacity of groundwater within the permit area to a condition that approximates the pre-mining recharge rate.

22. Brook Mine's permit application fails to provide the information required by DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix) as to the groundwater in the TR-1 overburden, as there is no a plan to restore the recharge capacity and no accurate information as to the pre-mining recharge capacity of that groundwater.

23. DEQ must either deny the permit application, or require Brook Mine to provide and analyze data concerning the recharge capacity of the TR-1 overburden groundwater and include a plan in the permit application to restore the recharge capacity of the TR-1 overburden groundwater to pre-mining conditions, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must determine the recharge

capacity of the TR-1 overburden groundwater and provide a plan to restore the TR-1 overburden groundwater to pre-mining conditions to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

24. **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(iv)** require a surface coal mining permit application to include a plan for insuring that “materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent . . . threats to human or animal health and safety,” contain “procedures proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life,” and include “plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.”

25. Due to the prevalence and history of coal fires in the area, the lack of any information as to current coal fire activity within the permit area renders Brook Mine’s permit application deficient with regard to the required fire safety planning.

26. DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit and DEQ must approve a report providing maps, descriptions, photographs, and any existing evidence of underground coal fires within 500 feet of any proposed mining locations and a plan that identifies the specific safety measures Brook Mine will take where underground coal fires exist within 500 feet of any proposed mining location.

27. **Wyo. Stat. Ann. § 35-11-415(b)(xi)(E)** requires surface coal mining operators to provide a pre-blasting survey “of a man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area,” on request of a resident or owner.

28. Finding Big Horn’s request for a pre-blast survey to be mandated by law, and Big Horn’s request for seismic monitors to be reasonable and available, DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine, under DEQ direction, will conduct a pre-blast survey of all man-made structures and dwellings belonging to Big Horn within one-half mile of the permit area, and install seismic monitoring devices at each of Big Horn’s facilities sufficient to ensure the protection of Big Horn infrastructure, improvements and tenants.

29. Based on the testimony and evidence of record, Brook Mine’s permit application fails to accurately state there are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn. The permit application also fails to accurately and sufficiently set forth the reclamation responsibilities of each party as to disturbance within the overlapping permit boundaries.

30. DEQ shall issue the permit with an express written condition that section MP.22 and section RP.12 of Brook Mine’s mine and reclamation plans must be amended to accurately reflect the following:

- There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal.
- Big Horn maintains a reclamation performance bond adequate to reclaim Big Horn facilities and all disturbances associated within Big Horn operations within Big Horn’s permit area.

- Brook Mine shall maintain a reclamation performance bond sufficient to reclaim all disturbance associated with Brook Mine operations within its permit area.
- Big Horn shall not be responsible for reclamation of any disturbance unrelated to Big Horn operations or facilities, including, but not limited to, Brook Mine disturbance within the remaining lands subject to Big Horn's reclamation performance bond.

31. **Wyo. Stat. Ann. § 35-11-416(a)** requires that when the surface owner is not the mineral owner of the estate proposed to be mined, prior to permit issuance, the operator must execute a bond “for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate . . . or to the tangible improvements of the surface owner.”

32. In accordance with DEQ's stated assurance at hearing, no permit shall be issued to Brook Mine unless and until a surface owner protection bond is issued for the benefit of Big Horn and after good faith consultation with Big Horn as to the appropriate bond amount.

PROPOSED CONCLUSIONS OF LAW AS TO WYO. STAT. ANN. § 35-11-406(n)

33. **Wyo. Stat. Ann. § 35-11-406(n)** requires Book Mine, as a surface coal mining permit applicant, to meet its burden of “establishing that his application is in compliance with [the Environmental Quality Act] and all applicable state laws” and provides that “[n]o surface coal mining permit shall be approved unless the applicant affirmatively demonstrates” the following:

- (i) That the application is accurate and complete;
- (ii) That the reclamation plan can accomplish reclamation as required by [the Environmental Quality Act]; and

(iii) That the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

34. Based on the forgoing findings of fact and conclusions of law:

- Brook Mine has failed to affirmatively establish that its permit application is in compliance with the requirements of the Environmental Quality Act and all applicable rules and regulations.
- Brook Mine's permit application lacks required information, mischaracterizes, and contains inaccurate information as to the TR-1 mining area and its related overburden geology and hydrology, as well as lacks the additional legal requirements stated above. Therefore, Brook Mine has failed to affirmatively demonstrate that its permit application is accurate and complete.
- Brook Mine has failed to affirmatively demonstrate that the reclamation plan can accomplish reclamation as required by the Environmental Quality Act, which emphasizes a standard for restoration to pre-mining conditions⁸, because the permit application fails to sufficiently identify pre-mining conditions in the TR-1 area.
- Brook Mine has failed to affirmatively demonstrate that its proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area, because it fails to account for or consider critical and unique hydrological conditions in the TR-1

⁸ See DEQ, Land Quality Coal Rules, Ch. 4, Section 2.

area and fails to identify how it will monitor the impacts of the proposed TR-1 area mining operations on the hydrological balance within, let alone outside the proposed permit area.

35. DEQ must either:

- Deny the permit application; or
- Require Brook Mine to complete its permit application in light of the above identified deficiencies, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with all of the express written conditions listed above.

*ATTORNEYS FOR OBJECTOR
BIG HORN COAL COMPANY*

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **Docket Nos. 17-4802, 17-4803,**
) **and 17-4804 (Consolidated)**
TFN 6 2-025)

**BIG HORN COAL COMPANY’S PROPOSED FINDINGS OF FACT AND
CONCLUSIONS OF LAW**

Big Horn Coal Company, LLC (“Big Horn”), by and through its undersigned counsel of record, hereby submits its Proposed Findings of Fact and Conclusions of Law as directed by the Environmental Quality Council’s (“EQC” or the “Council”) order following the close of evidence at hearing.

INTRODUCTION

The permit application submitted by Brook Mining Company, LLC (“Brook Mine”) fails to meet the legal requirements of a surface coal mining permit application. Brook Mine’s multiple failures to provide critical and required information in its permit application are not minor omissions. Rather, these failures are “deficiencies” that preclude permit approval. The EQC therefore should enter its Findings of Fact, Conclusions of Law,

and Order directing the Department of Environmental Quality (“DEQ”) to either deny Brook Mine’s requested permit, or deem the permit application deficient and require Brook Mine to affirmatively address each of the deficiencies, resubmit its permit application to DEQ, and then republish notice of the compliant permit application for public comment pursuant to the Environmental Quality Act (“EQA”), Wyo. Stat. Ann. § 35-11-406(h)-(k),¹ and the applicable rules and regulations.

I. Background

The record of this contested case hearing patently demonstrates that Brook Mine has spent over three years preparing a permit application that fails to meet statutory and regulatory requirements. Less critical for this Council’s decision, but an important consideration nonetheless, throughout the permit application process and in the hearing before the EQC, Brook Mine consistently demonstrated it has no intent to seriously consider the objections and concerns of nearby landowners or otherwise address the deficiencies in its permit application. It is now up to this Council to do so.

Broadly speaking, this Council must determine whether Brook Mine has satisfied its burden to affirmatively establish that its permit application is legally sufficient and direct whether (and on what terms) the permit application can proceed to the DEQ for final written findings and eventual issuance or denial. *See* Wyo. Stat. Ann. § 35-11-406(k), (p). To be sure, it is not the burden of Big Horn or any other objector to establish that the permit application is insufficient. Brook Mine readily admits it bears the burden of proof in these

¹ According to Wyo. Stat. Ann. § 35-11-103(e)(xxiv) “‘Deficiency’ means an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director[.]”

proceedings, which includes the burden of proving to the Council that its permit application is complete and without deficiencies. *See Brook Mine's Brief on Statutes and Regulations that the Council Must Consider*, p. 10. Yet when objectors identified application deficiencies at hearing, Brook Mine never showed the Council or the objectors where the required information could be found in the permit application, nor did Brook Mine demonstrate that the information contained in the application is accurate and complete. Brook Mine instead attempted to silence or cast doubt on objector testimony, and addressed the identified deficiencies in generalities – affirming the type of information contained in the application, how many pages the application contains, and how long Brook Mine and DEQ personnel spent preparing and reviewing the application. Generalities do not satisfy Brook Mine's burden of proof.

The law requires Brook Mine's permit application to stand on its own. Analytical gaps, missing data and inaccurate information required by law to be included in a surface coal mine permit application simply cannot be remedied with testimonial assurances or by reference to DEQ's review process. Moreover, specific surface coal mine application requirements cannot be satisfied with inaccurate assumptions resulting from limited data taken from a large, data diverse geographic area. Brook Mine's permit application itself must contain the information required by statute and regulation. The required data and analysis is either present in the permit application or it is not. Without establishing that its permit application contains *all* required information, and that *all* the required information is *accurate*, Brook Mine fails to meet its burden as a matter of law.

II. Scope of the Council's Review

As this Council is well aware from prior briefing, the parties disagree as to the proper role of the Council and the scope of its review and decision, particularly as to whether the Council is to consider the requirements of section -406(n) and whether the Council is to direct DEQ to approve or deny Brook Mine's permit application at this time. The Council is now well aware of precedent² and the parties' respective positions on this issue, and Big Horn will not repeat those arguments here. Because the Council has declined to rule on whether it will consider Section -406(n)'s requirements prior to the parties' submission of proposed findings of fact and conclusions of law, Big Horn will present its proposed conclusions of law related to section -406(n) requirements separate from its proposed conclusions of law related to the legal requirements for surface coal mine permit applications found elsewhere in the EQA and the DEQ's Land Quality coal rules and regulations. All parties do seem to agree that the Council must review and consider whether Brook Mine's permit application satisfies Wyo. Stat. Ann. § 35-11-406(a)-(k) and the DEQ's Land Quality coal rules and regulations. *See* Briefs of the Parties in response to the Council's *Briefing Order*, dated June 13, 2017.

III. Scope of Big Horn's Objections to Brook Mine's Permit Application

Brook Mine (also often denominated RAMACO in permit documents or testimony) plans to develop coal resources via both open pit and highwall/auger mining methods. DEQ

² See Exhibit 1 to *Brook Mine's Response Brief to Big Horn Coal's Brief Regarding the Scope of the [EQC's] Review and Request for Oral Argument* (demonstrating that in *The Matter of Objections to Amax Coal Company, Eagle Butte Mine, TFN 1 6/212*, the Council specifically made findings of fact and conclusions of law related to the requirements of Section -406(n), and ordered DEQ to take specific action on the permit application).

Exh. 12, p. 12-192. Big Horn is the owner of surface lands, including valuable improvements and facilities, located within Brook Mine's proposed permit area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn also holds an existing coal mine permit that overlaps Brook Mine's proposed permit area and imposes certain reclamation responsibilities on Big Horn, which are enforceable by DEQ. Tr. Vol. IV, p. 836, ln. 11-16. Big Horn's objections to Brook Mine's permit application therefore are reasonably focused on Brook Mine's proposed operations within this overlapping area, more particularly known as the TR-1 mining area, located in in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M. *See Figure 1; see also* DEQ Exh. 12, p. 12-134, Tr. Vol. II, p. 204, ln. 10-13.

Figure 1. Taken from DEQ Exh. 12, p. 12-134 and showing the TR-1 mining area as the southeastern most mining area.

Evidence of record indisputably demonstrates that Brook Mine failed to provide required, accurate TR-1 area information in its surface coal mine permit application. The evidence further demonstrates that Brook Mine has not satisfied certain legal requirements related to surface water monitoring, underground coal fire analysis and management, overlapping permit boundary analysis and management, and surface owner protection bonding. These requirements must be satisfied prior to permit approval and issuance.

More specifically, Brook Mine's permit application contains and relies on inaccurate, missing or inadequate data and analysis for the TR-1 area, predominantly as it relates to the geology and groundwater located in the overburden above the coal seams Brook Mine proposes to mine. Without complete and accurate information as to the TR-1 area and the projected impacts thereto, and without detailed plans regarding the monitoring of these impacts, it is impossible for Brook Mine, DEQ, Big Horn, or the public to adequately assess Brook Mine's proposed mining operations or the resulting impacts.

The Council cannot fairly or reasonably characterize the flaws in Brook Mine's surface coal mine permit application as minor omissions that can be cured by stipulation or minor permit revisions. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxiv); -406(h). The inaccurate, incomplete and missing geologic and hydrologic TR-1 area information constitute legal deficiencies in Brook Mine's permit application. The EQA does not tolerate such deficiencies. The permit application itself must include complete and accurate information, the DEQ must analyze complete and accurate information, and the

public must have the opportunity to review and comment on complete and accurate information *prior to* permit approval. Wyo. Stat. Ann. § 35-11-406(h) – (k).³

Accordingly, the Council must order Brook Mine to cure the deficiencies in its mine permit application by preparing, resubmitting to DEQ, and eventually republishing a legally sufficient surface mine permit application. At the very least, all deficiencies must be cured to the DEQ's and EQC's satisfaction prior to Brook Mine conducting any mining operations.⁴

IV. Relevant Legal Requirements

The following list sets forth the EQA and DEQ Land Quality – Coal Rules and Regulations permit application requirements specifically related to Big Horn's objections.⁵

i. Hydrology and Geology

- **Wyo. Stat. Ann. § 35-11-406(a)(vii)** - A general description of the land which shall include as nearly as possible ... if known, the nature and depth of the overburden, topsoil, subsoil, mineral seams or other deposits and any subsurface waters known to exist above the deepest projected depth of the mining operation.
- **Wyo. Stat. Ann. § 35-11-406(b)(v), (xvi), (xviii)** - A mine and reclamation plan dealing with the extent to which the mining operation will disturb or change the lands

³ Because Brook Mine intends to begin its mining operations in the TR-1 area, *see* DEQ Exh. 12, p. 12-134, any suggestion that Brook should be allowed to gather TR-1 area information and cure the TR-1 related permit application deficiencies following permit approval and/or the initiation of mining operations would risk unforeseen and permanent environmental damage and violate the EQA and DEQ Land Quality Division rules and regulations.

⁴ In its proposed *Conclusions of Law* below, Big Horn provides the Council alternative conclusions in the form of conditions intended to address the deficiencies in Brook Mine's permit application prior to the initiation of mining operations.

To be clear, Big Horn asserts that Brook Mine's permit application is deficient and not eligible for approval under the express provisions of the EQA. Big Horn only offers the proposed conditions as minimal, necessary steps that must be taken in the event the Council orders the DEQ to make its remaining findings and issue the permit.

⁵ All rules and regulations cited herein represent DEQ's, Land Quality – Coal Rules and Regulations. For brevity, the rules and regulations will be referred to herein by Chapter and Section number only.

to be affected and the plan whereby the operator will reclaim the affected lands, to include:

- A map setting forth the drainage plan on, below, above and away from the affected land including subsurface water above the mineral seam to be removed; and further showing the location of all waste water impoundments, any settling ponds, and other water treatment facilities, constructed drainways and natural drainways, and the surface bodies of water receiving this discharge.
 - A statement of the source, quality and quantity of water, if any, to be used in the mining and reclamation operations.
 - A plan to minimize the disturbances to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation.
- **ENV LQC Ch. 2 § 4(a)(vii), (viii), (x)(A), (xii), (xiv)** - A description of the lands to be affected within the permit area and how these lands will be affected, to include:
- A detailed description of the geology within the proposed permit area down to and including any aquifer⁶ to be adversely affected by mining below the lowest coal seam to be mined, to include structural geology that may influence the required reclamation, and the occurrence, availability, movement, quantity, and quality of potentially affected surface and groundwaters.
 - For the permit area, and adjacent areas, a characterization of the geologic strata down to and including the deeper of either the stratum immediately below the lowest coal seam to be mined, or any aquifer below the lowest coal seam to be mined that may be adversely impacted by mining, to include a statement of the results of test boring holes or core samples collected to show:
 - The location of any groundwater; and
 - Lithologic characteristics and thickness of each stratum and coal seam.
 - A description of the overburden, including the thickness, geological nature or any other factor that will influence the mining or reclamation activities.
 - Complete information on groundwater that may be affected in the permit area or adjacent areas, to include:

⁶ ENV LQC Ch. 1 § 2(j), defines “aquifer” as “a zone, stratum or group of strata that stores and transmits water in sufficient quantities for a specific use.” Nothing in this definition requires that water in a particular zone or stratum be currently used in order to qualify as an aquifer.

- An estimate of the depth and quantity of any groundwater existing in the proposed permit area down to and including the strata immediately below the lowest mineral seam to be mined, for which the operator may be required to conduct testing in order to determine the exact depth, quantity and quality of groundwater in geological formations affected by the mining operations;
 - The lithology and thickness of all known aquifers; and
 - The recharge, storage, and discharge characteristics of the groundwater, all according to the parameters and detail required by the Administrator of the Land Quality Division.
- A description of the surface water and groundwater and related geology in the permit area and general area sufficient to assess the probable hydrologic consequences (PHC). And if the determination of the PHC required by Chapter 19, Section 2(a)(i) indicates that adverse impacts on or off the proposed permit area may occur to the hydrologic balance, then information supplemental to that required under (a)(xi) and (a)(xii) of this Section (requiring complete surface and groundwater information) must be provided to evaluate such PHC and to plan remedial and reclamation activities.
- **ENV LQC Ch. 2 § 5(a)(x)** - A determination of the PHC of the proposed operation on the hydrologic regime and the quantity and quality of surface water and groundwater systems within the permit area and the general area consistent with the information required in Chapter 19, Section 2. The PHC determination shall be based on baseline hydrologic, geologic and other information collected for the permit application and may include data statistically representative of the site. This determination shall specifically address potential adverse hydrologic consequences and describe preventive and remedial measures.
- **ENV LQC Ch. 2 § 5(a)(ix)(C), (D)** - A plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and adjacent to the permit area, to include:
 - A plan to restore the approximate recharge capacity of the permit area in accordance with Chapter 4, Section 2(h), which requires the groundwater recharge capacity of reclaimed lands to be restored to a condition that provides a recharge rate approximating the pre-mining recharge rate; and
 - A Surface Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the surface water for current and approved postmining

land uses and to the objectives for protection of the hydrologic balance as set forth in subsection 5(a)(ix) of Chapter 2.

- The plan must identify the surface water quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- A Ground Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the groundwater for current and approved postmining land uses and to the objectives for protection of the hydrologic balance set forth in subsection 5(a)(ix) of Chapter 2.
 - The plan must identify the quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- **ENV LQC Ch. 2 § 6(b)** - A reclamation plan that describes how the operator will reclaim the affected lands to the proposed postmining land use in accordance with Chapter 4, Section 2(a), which requires restoration of the land to a condition equal to or greater than the highest previous use.
- **ENV LQC Ch. 19 § 2(a)(i)** - A determination of the projected result of proposed surface coal mining and reclamation operations, both on and off the mine site, which may reasonably be expected to change the quantity or quality of the surface and groundwater; the surface and groundwater flow, timing and availability, the surface and groundwater quality under seasonal flow conditions, including dissolved and suspended solids; and the stream channel conditions. This information shall be in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems including the impacts resulting from the proposed operation and their interaction with the impacts of all anticipated mining upon all affected hydrologic systems.
 - ii. Underground Coal Fires
- **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii)** – A plan for insuring that materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent threats to human or animal health and safety, as well as procedures

proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life.

- **ENV LQC Ch. 2 § 5(a)(iv)** – Contingency plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.

iii. Blasting Operations

- **Wyo. Stat. Ann. § 35-11-415(b)(xii)(E)** – surface coal mining operators **must**, upon request of a resident or owner, conduct a pre-blasting survey of any man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area.

iv. Overlapping Permits and Related Agreements

- **ENV LQC CH. 2 § 5(a)(xviii)** – Plans of mine facilities (including overstrip areas) that are to be shared by two or more separately permitted mining operations may be included in one permit application and referenced in the other application(s). Each permittee shall bond the mine facilities unless the permittees sharing it agree to another arrangement for assuming their respective responsibilities. If such agreement is reached, the application shall include a copy of the agreement between or among the parties setting forth the respective bonding responsibilities of each party for the mine facilities.

v. Surface Owner Protection Bond

- **Wyo. Stat. Ann. § 35-11-416(a)** - Where the surface owner is not the owner of the mineral estate proposed to be mined by mining operations, a permit shall not be issued without the execution of a bond or undertaking to the state for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate, to the crops and forage, or to the tangible improvements of the surface owner. The amount of the bond shall be determined by the administrator and shall be commensurate with the reasonable value of the surrounding land, and the effect of the overall operation of the landowner. Financial loss resulting from disruption of the surface owner's operation shall be considered as part of the damage.

vi. Wyo. Stat. Ann. § 35-11-406(n) Requirements

- **Wyo. Stat. Ann. § 35-11-406(n)** – The permit applicant must establish that its permit application is in compliance with the EQA and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:
 - The application is accurate and complete;

- The reclamation plan can accomplish reclamation as required by the EQA;
- The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

PROPOSED FINDINGS OF FACT

1. This matter arises from the application of Brook Mining Company, LLC (“Brook Mine”) to the Department of Environmental Quality (“DEQ”), Land Quality Division (“LQD”), for a permit to conduct surface coal mining activities.

2. DEQ/LQD determined Brook Mine’s permit application, TFN 6 2-025, complete and suitable for publication pursuant to Wyo. Stat. Ann. § 35-11-406(h). In accordance with Wyo. Stat. Ann. § 35-11-406(j) and (k), the permit was published to the public and interested parties were required to submit written objections to the application by January 27, 2017. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit D.

3. Objectors in this case, Big Horn Coal Company (“Big Horn”), Powder River Basin Resource Council (“PRBRC”), and Mary Brezik-Fisher and David Fisher, submitted timely objections to the application. *See* BHC Exh. 3; Fisher Exh. 26; PRBRC Exh. 1.

4. Objectors requested an informal conference. DEQ denied these requests, leading to this contested case proceeding. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit A.

5. The Environmental Quality Council (“EQC” or “Council”) conducted a seven (7) day contested case hearing in this matter, receiving evidence regarding the permit

application contents, proposed operations, characteristics of the proposed permit lands, and possible impacts from the proposed operations.

6. Big Horn owns lands and facilities within and immediately adjacent to Brook Mine's proposed permit boundary, particularly the TR-1 mining area and the southeastern portion of the proposed mining area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn owns and operates an industrial shop, rail loadout facility, bridge, access road, and railroad spur on the referenced lands. Big Horn also holds a state coal lease on S½ Section 23 and the N½ Section 26, Township 57 North, Range 84 West, 6th P.M. BHC Exh. 2; *see generally* Tr. Vol. IV, pp. 839-841.

7. Big Horn currently leases its shop to multiple tenants for industrial use and storage. Tr. Vol IV, p. 861, ln. 3-5.

8. Big Horn also holds an existing mining permit, No. 213-T8, that overlaps lands included in Brook Mine's proposed permit boundary. BHC Exh. 2; Tr. Vol. I, p. 78, ln. 7-10. Big Horn maintains a reclamation performance bond with DEQ/LQD on approximately 25 acres of land within Brook Mine's proposed permit boundary. BHC Exh. 5; Tr. Vol. IV, p. 863, ln. 18-22.

9. In its objection letter and at hearing, Big Horn, along with other Objectors, asserted that Brook Mine's permit application fails to meet applicable legal requirements found in the Environmental Quality Act ("EQA"), Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and DEQ/LQD—Coal Rules and Regulations. BHC Exh. 3. Big Horn primarily focused its objections on the area of the proposed mine overlapping and adjacent to its current

property and facilities, particularly the TR-1 mining area. *See* BHC Exh. 2; Tr. Vol. IV, pp. 841-843; *see generally* Tr. Vol. I-VII.

TR-1 Mining Area and Related Geology and Hydrology

10. Brook Mine proposes to begin mining operations in the TR-1 mining area. *See* DEQ Exh. 12, p. 12-134.

11. The TR-1 mining area is located entirely in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M., where Brook Mine proposes to cut a highwall trench through the overburden above the targeted coal seams. *See* DEQ Exh. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 10-20.

12. The overburden in the TR-1 mining area is geologically and hydrologically unique and can be distinguished from the overburden in the proposed permit area outside the TR-1 mining area. The TR-1 area overburden is composed of previously mined backfill material and is saturated with groundwater. DEQ Exh. 5, p. 5-014; Tr. Vol. II, p. 205, ln. 8-21, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24.

13. In order to gather data as to the geology in the proposed permit area, including overburden geology, Brook Mine conducted a drilling program consisting of a series of drill holes across the proposed permit area. *See* DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164; Tr. Vol I, p. 87, ln. 6-17, p. 91, ln. 6-10. The drill hole data is found in the permit application at Addendum D5-2. DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164.

14. Brook Mine conducted drill hole testing on a tighter configuration than DEQ's typical 160-acre spacing requirement. Tr. Vol. I, p. 48, ln. 9-10; p. 91, ln. 18-25; p. 92, ln. 1.

15. Brook Mine did not conduct drill hole testing in the TR-1 mining area, nor did it conduct drill hole testing in any part of the approximately 360 acres comprising the SE¹/₄ of Section 15 and the NE¹/₄ of Section 22, Township 57 North, Range 84 West. The permit application contains no geologic data from the distinct overburden within these lands. *See* DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

16. Brook Mine's permit application does not distinguish the TR-1 area overburden, and does not include specific geological characterization or identification of the TR-1 area overburden, including its geologic strata, nature, structural geology, lithology, thickness, or other factors that may influence mining or reclamation activities. *See* Tr. Vol. II, p. 209 – 211.

17. DEQ/LQD indicated that it intends to impose a permit condition requiring Brook Mine to gather overburden data from the TR-1 area prior to conducting any mining activity or creating any disturbance. Tr. Vol. I, p. 92, ln. 16-23. No such condition is referenced in the permit application or has otherwise been memorialized. *See* Tr. Vol. I, p. 65 ln. 18-25 (stating that DEQ Exh. 1, p. 1-053 contains the location of permit conditions); DEQ Exh. 1, p. 1-053 (showing no current permit conditions placed upon the permit application).

18. Appendix D6 of the permit application (DEQ Exh. 6) contains hydrologic information, including groundwater information. Tr. Vol. I, p. 93, ln. 17-23. Additional groundwater information is located in the Mine Plan, and its groundwater model. *See* DEQ Exh. 12.

19. Appendix D6 of the permit application characterizes the overburden as a whole, repeatedly describing the overburden within the entirety of the proposed permit area as “dry.” *See* DEQ Exh. 6, p. 23-27.

20. The permit application does not characterize any part of the overburden within the proposed permit area as a “potential hydrogeologic unit,” and concedes that Brook Mine installed no groundwater monitor wells and conducted no aquifer tests in any part of the overburden. *Id.*

21. In characterizing all overburden within the proposed permit area as “dry,” the permit application specifically relies on the drill hole logs and data found in Addendum D5-2, which is devoid of data from the TR-1 mining area. *Id.*; DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

22. DEQ witnesses Kristiansen and Kuchanur, and Big Horn witness Gerlach, all testified that unlike the overburden in the rest of the proposed permit area, the TR-1 area overburden consists of previously mined backfill material, and that this material is saturated with groundwater. *See* Tr. Vol. II, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24; Tr. Vol. III, p. 507, ln. 3-9; Tr. Vol. IV, p. 927-934; *see also* BHC Exh. 8, 9.

23. Nowhere does the permit application differentiate between the previously mined TR-1 area overburden and the overburden in other proposed mining areas which consist of native strata. Tr. Vol. II, p. 205, ln. 8-21, p. 212, ln. 6-19.

24. Brook Mine witness Barron testified that he does not know whether there is groundwater in the TR-1 overburden, Tr. Vol. IV, p. 720, ln. 11-23, and admitted that no

part of Brook Mine's permit application specifically addresses the TR-1 overburden or its groundwater saturation. Tr. Vol. IV, p. 717, ln. 1-4.

25. DEQ witness Kristiansen conceded that the permit application lacks required information as to the TR-1 overburden and its groundwater saturation, and that that the permit application inaccurately characterizes all overburden within the proposed permit area as dry. Tr. Vol. II, p. 214, ln 12-24, p. 216, ln 12-25, p. 217, ln 1-17.

26. Brook Mine's permit application fails to describe groundwater in the TR-1 area overburden. The permit application contains no site-specific data regarding groundwater location, quantity, quality, lithology, or thickness; or its recharge, storage, or discharge characteristics within the TR-1 area overburden. *See* Tr. Vol. II, p. 212, ln. 6-19; Tr. Vol. IV, p. 717, ln. 1-4, p. 720, ln. 19-23.

27. The permit application addresses "Probable Hydrologic Impacts" in section MP.6; groundwater impacts are specifically addressed in section MP.6.2. DEQ Exh. 5, p. 12-055, -059.

28. Section MP.6.2 of the permit application states that mining impacts to the groundwater found in the coal seams, including drawdown and pit inflows, are predicted and discussed in the groundwater model utilized by Brook Mine. *Id.* at 12-060.

29. As to the overburden, section MP 6.2 assumes that the overburden is dry and states that drawdown of groundwater in the overburden was not modeled. *Id.*

30. Brook Mine's "Operation Monitoring Program" is found in the permit application in section MP.7, with groundwater monitoring described in section MP.7.2. *Id.* at 12-062, -064 through -065.

31. Section MP 7.2 of the permit application states, “[g]roundwater monitoring during mining operations will be a continuation of the monitoring program” discussed in Appendix D6. *Id.* at 12-064. Appendix D6 states that no monitor wells exist to monitor the overburden. DEQ Exh. 6, p. 6-023 through -027.

32. The permit application contains no description or assessment of the hydrologic impacts of the proposed mining operations to the groundwater in the TR-1 overburden, and provides no plan whereby Brook Mine will monitor the hydrologic impacts of the proposed mining operations on groundwater in the TR-1 area overburden. *See generally* DEQ Exh. 5 and 12; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

33. The groundwater model utilized by Brook Mine to support its permit application is discussed in Addendum MP-3 of the Mine Plan. DEQ Exh. 12, p. 12-183 through -294.

34. The groundwater model was designed to analyze the potential cumulative hydrological effects of the project and simulate the regional groundwater impacts from the proposed mining operations. DEQ Exh. 12, p. 12-184, -192.

35. The hydrogeologic data used in the groundwater model was limited to observation points, monitor wells and pumping tests, and private well information obtained from the State Engineers Office database. *Id.* at pp. 12-192, -194, -264. None of these data sources provide information as to the unique textural and hydraulic characteristics of the saturated backfill in the TR-1 area overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. III, p. 513, ln. 11-19; BHC Exh. 9, p. 6.

36. The groundwater model primarily focuses on the Carney and Masters coal seams; treats all overburden within the proposed permit area as dry, native strata; does not utilize any site-specific hydraulic conductivity information from the TR-1 area overburden; and does not model any drawdowns in the TR-1 overburden resulting from mining operations. DEQ Exh. 12, pp. 12-060, -197, -205, -206; BHC Exh. 9, p. 6.

37. The TR-1 area is spatially contained within the geographic area examined by the groundwater model; however, by assuming all overburden in the proposed permit area is dry, impacts to the groundwater in the TR-1 area overburden were not accurately modeled. *See generally* DEQ Exh. 12, p. 12-183 through -294.

38. Brook Mine's permit application states that mining operations will use and rely on pit inflows as a source of water. DEQ Exh. 12, p. 12-066. The application estimates that the proposed mining operations will use approximately 53,000 gallons of water per day (approximately 37 gallons per minute) from pit inflows and states that the estimated inflow amounts are demonstrated in the groundwater model in Addendum MP-3. DEQ Exh. 12, p. 12-116. The groundwater model estimates pit inflows at anywhere between 100 gallons per minute to 0.03 gallons per minute for the life of the mine. *Id.* at 12-254.

39. To facilitate its use of pit inflow water, Brook Mine proposed to place a pump in the TR-1 trench cut to pump out water for operations use for the life of the mine. DEQ Exh. 12, p. 12-052; Tr. Vol. III, p. 556, ln. 1-15.

40. DEQ witness Kuchanur testified that once Brook Mine excavates the trench cut in the TR-1 mining area, groundwater from the TR-1 overburden will flow into the trench cut and mine panels. Tr. Vol. III, p. 556, ln. 1-15.

41. The groundwater model does not accurately reflect or identify the groundwater in the TR-1 overburden, and does not accurately simulate the pit inflows from the TR-1 overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

42. Brook Mine's permit application contemplates the use of groundwater found in the coal seams as a source of water to be used from pit inflows. *See* DEQ Exh. 12, p. 12-254. The permit application never acknowledges any use of the groundwater in the TR-1 overburden, does not identify this groundwater as a source of water for mine operations, and the quality and quantity of water to be used from this source is a complete unknown. *See generally* DEQ Exh. 12.

43. Appendix D6, section D6.2.2.5, of the permit application addresses recharge areas. The permit application does not specifically describe any recharge characteristics of the overburden generally, nor the TR-1 area specifically. DEQ Exh. 6, p. 6-029 through -031. Appendix D.6 of the permit application characterizes all overburden as dry, and relies on the groundwater model found at Addendum MP-3 for any detail concerning groundwater recharge. *Id.*

44. The groundwater model is devoid of any TR-1 overburden data and characterizes recharge in the overburden, generally, as having a uniform recharge rate of between 0.00000012 ft/day/ft² and 0.00008 ft/day/ft² and 0.0005 and 0.35 inches per year. DEQ Exh. 12, p. 12-221.

45. Upon review of materials not in or referenced by the permit application, DEQ witness Kuchanur estimated the TR-1 overburden recharge rate at 0.06 CFS. *See* Tr. Vol VII, p. 1470, ln. 1-16; p. 1471, ln. 14-15.

46. The groundwater in the TR-1 overburden is currently held in place by a low permeability, shale aquitard, or barrier, which physically separates the groundwater located in the overburden from the groundwater located in the coal seams. Tr. Vol. III, p. 508, ln. 2-25, p. 509, ln. 1.

47. In order to access the targeted coal seams, the proposed mining operations in the TR-1 area will excavate and cut through the shale barrier and allow the TR-1 overburden groundwater to flow directly into the trench and mining panels. *Id.*; *see also id* at p. 556, ln. 1-15.

48. Neither the permit application nor the groundwater model contains any data or analysis regarding whether and how Brook Mine will be able to restore the recharge rate of the groundwater in the TR-1 overburden after mining operations cease. *See generally* DEQ Exh. 6, 12 and 13.

Surface Water Monitoring

49. DEQ witness Kunze conceded that Brook Mine needs to revise the number and location of surface water monitor wells proposed in the permit application for the Tongue River. Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-12.

50. In order to adequately monitor mining impacts on the Tongue River, one monitor well needs to be placed further upstream on the Tongue River, near the furthest upstream point within the proposed permit area; an additional monitor well should be

placed near the proposed permit boundary on the Tongue River a short distance downstream from the confluence of the Tongue River and Goose Creek; and another additional monitor well should be placed on Goose Creek. *Id.*

51. DEQ policy requires permit applications to contain pre-mining monitoring and studies of both surface and groundwater to include monitoring data for a one year period, at minimum. *See* DEQ Exh. 22, pp. 3, 5, 15, 16; *see also* Tr. Vol. II, p. 395, ln. 9-17.

52. The TR-1 mining area is located immediately adjacent to both the Tongue River and Goose Creek, and the confluence of the two surface water bodies. DEQ Ex. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 25, p. 205, ln. 1-7.

53. The permit application does not discuss or analyze whether or to what extent the groundwater in the TR-1 overburden is hydrologically connected to the Tongue River or Goose Creek. *See generally* DEQ Exh. 5 and 12.

54. The evidence suggests a direct hydrological connection exists between the groundwater in the TR-1 overburden and the Tongue River. Tr. Vol. III, p. 498, ln. 19-25, p. 499, ln. 1-19; Tr. Vol. IV, p. 936, ln. 5-11; BHC Exh. 9.

55. Absent information in the permit application regarding the nature and extent of the hydrologic connection between the TR-1 overburden and the Tongue River, it is impossible for Brook Mine or DEQ to determine if or to what extent mining through the saturated TR-1 overburden will adversely impact the Tongue River. *See* Tr. Vol. II, p. 420, ln. 7-19.

56. Neither the monitor wells identified in Brook Mine's permit application nor the additional monitor wells DEQ proposed at hearing will adequately monitor impacts to the Tongue River from mining through the saturated overburden in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -112; *see also* Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-15; DEQ Exh. 6 and 12 *generally*. An additional monitor well on the Tongue River, just north of the TR-1 mining area, is necessary to adequately monitor impacts to the Tongue River from mining in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -0112; Tr. Vol. II, p. 420, ln. 7-19.

Access to the TR-1 Area for Testing

57. Brook Mine had legal authority to enter Big Horn property, including the TR-1 area, to conduct exploration and data recovery operations from July 2012 through July 2014, pursuant to an exploration agreement with Big Horn. Tr. Vol. IV, p. 847, ln. 9-16.

58. Brook Mine was gathering information for its permit application, including gathering geology information, and placing monitor and observation wells outside the TR-1 area, during this same period. *See* Tr. Vol. I, p. 51, ln. 18-25.

59. Brook Mine apparently chose not to gather information from the TR-1 mining area during the term of its agreement with Big Horn. *See generally* DEQ Exh. 1-13.

60. Brook Mine allowed its exploration agreement with Big Horn to expire, and never subsequently sought permission to enter Big Horn's property to conduct testing or gather information. Tr. Vol. IV, p. 848, ln. 1-9, p. 855, ln. 17-20.

61. After the expiration of the exploration agreement, and without notice to or permission from Big Horn, Brook Mine sent drilling rigs to Big Horn property. Big Horn discovered unauthorized drilling rigs on its property and contacted law enforcement, which instructed the drilling rig operator to leave Big Horn property. *Id.* at p. 848, ln. 10-25, p. 849, ln. 1-25, p. 850, ln. 1-4.

62. There is no evidence in the record that it was not possible for Brook Mine to acquire geologic or hydrologic information from the TR-1 area.

Underground Coal Fires

63. There is a history of underground coal fires in the proposed permit area. *See* Tr. Vol. II, p. 334, ln. 2-5.

64. Brook Mine acknowledged at hearing that coal fires may exist within the proposed permit boundary. Tr. Vol. IV, p. 722, ln. 16-21.

65. Brook Mine has not conducted any survey or examination of coal fires in the proposed permit area; and the permit application contains no information to support Brook Mine's testimony at hearing that although coal fires may exist, it believes no underground coal fires exist in the proposed permit area. *Id.* at p. 716, ln. 4-17.

Blasting Protections Afforded to Surface Owners

66. At hearing, Big Horn witness Sweeney requested a pre-blasting survey pursuant to Wyo. Stat. Ann. § 35-11-415(b)(xi)(E), and seismic monitoring for Big Horn's shop and other infrastructure located within the proposed permit area. Tr. Vol. IV, p. 860, ln. 17-25, p. 861, ln. 1-16.

67. DEQ and Brook Mine representatives testified that on request from a resident within one half-mile of the proposed permit boundary, seismic monitors could be placed near structures to measure the ongoing impacts from blasting. Tr. Vol. III, p. 618, ln. 12-25, p. 619, ln. 1-2.; Tr. Vol. IV, p. 770, ln. 20-25, p. 771, ln. 1-5, p. 783, ln. 5-19.

Overlapping Permit Boundaries and Related Agreements

68. Brook Mine's permit application states that Big Horn's "permit boundary [is] within Brook Mine's permit boundary," that "all mining operations are covered under individual Permits to Mine," and "[a]greements between the permittees are located in the Adjudication File." DEQ Exh. 12, p. 12-088. In its Reclamation Plan, the permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands." DEQ Exh. 13, p. 13-075.

69. Big Horn requires access to the overlapping property as a landowner with tenants and as a permit holder with outstanding reclamation responsibilities. *See* Tr. Vol. IV, p. 870, ln. 14-21.

70. When two or more parties have overlapping surface coal mine permits, the permit documents may specifically reference any agreements between the parties and expressly provide that each party is only responsible for reclamation resulting from its own disturbance. BHC Exh. 5 and 6.

71. There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal. Tr. Vol. IV, p. 865, ln. 9-15. Brook Mine's permit application incorrectly implies there is an agreement between Brook Mine and Big Horn in the adjudication file. *See* DEQ Exh. 12, p. 12-088.

72. Brook Mine's permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands" rather than stating as DEQ witness Kristiansen conceded, that each party will be responsible for reclamation and maintaining a reclamation bond only as to that party's facilities, operations, and disturbances. *See* DEQ Exh. 13, p. 13-075; Tr. Vol. II, p. 188, ln. 20-25, p. 189, ln. 1-25, p. 190, ln. 1-16.

Surface Owner Protection Bond

73. Brook Mine has not yet submitted a surface owner protection bond to DEQ, as required by Wyo. Stat. Ann. § 35-11-416(a), for the use and benefit of Big Horn as a surface owner within the proposed permit area. *See* Tr. Vol. II, p. 200, ln. 9-25, p. 201, ln. 1.

74. DEQ assured Big Horn that it will determine the amount of the surface owner protection bond prior to permit issuance and only after participation and input from Big Horn. Tr. Vol. II, p. 201, ln. 8-25, p. 202, ln. 1-4.

PROPOSED CONCLUSIONS OF LAW

1. The Council has jurisdiction over this matter pursuant to Wyo. Stat. Ann. §§ 35-11-406(k) and -112(a).

2. EQC conducted the contested case hearing pursuant to DEQ, Practice and Procedure Rules, Chapter 2.

3. Pursuant to the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations, Brook Mine's permit application must contain specific information,

data and other substantive content and analysis regarding the proposed surface coal mining operations, the land and water to be affected, foreseeable impacts from the proposed mining operations, and how the foreseeable impacts will be monitored, minimized and reclaimed.

4. The Council must determine whether Brook Mine has affirmatively established that its permit application contains all legal requirement imposed by the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations.

5. The Council also must determine whether Brook Mine has met its specific burden under Wyo. Stat. Ann. § 35-11-406(n) necessary for approval of its permit application, and, based on that determination, direct DEQ to either issue or deny Brook Mine a permit after making the requisite written findings.

6. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x)** require a surface coal mining permit application to provide a general description of the land, including the nature of the overburden, a detailed description of the geology down to the lowest coal seam to be mined, a characterization of the geologic strata down to the lowest coal seam to be mined, the lithological characteristics of each stratum, and a description of any factor in the overburden that will influence mining or reclamation activities.

7. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x) as to the overburden in the TR-1 mining area.

Descriptions and characterizations in the form of assumptions or based on an extrapolation of data from geographically and geologically distinct areas fail to satisfy these statutory and regulatory requirements.

8. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific geologic data and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the alternative, and without waiving BHC's stated position that the application must be denied and resubmitted, if the EQC elects to direct DEQ to impose permit conditions:⁷

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze TR-1 overburden samples and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

9. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii)** require a surface coal mining permit application to provide a description of any subsurface waters known to exist above the deepest projected

⁷ See *supra* Note 4. All alternative Conclusions of Law proposing permit conditions are provided by Big Horn with this same caveat that Big Horn first and foremost asserts that the permit application submitted by Brook Mine is deficient and must be either denied or sent back to Brook Mine to remedy these deficiencies, resubmit the application to DEQ for approval, and re-publish for public review pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

depth of the mining operation; the occurrence, availability, quality and quantity of potentially affected groundwaters; the location of any groundwater; and complete information of groundwater that may be affected in the permit area, including the lithology and thickness of known aquifers and the recharge, storage and discharge characteristics of the groundwater.

10. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii), as it fails to identify or describe any groundwater in the TR-1 mining area overburden.

11. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific groundwater information and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze additional groundwater information from the TR-1 area overburden and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

12. **Wyo. Stat. Ann. § 35-11-406(b)(xvi)** requires a surface coal mining permit application to contain a statement of the source, quality, and quantity of any water to be used in mining or reclamation operations.

13. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(b)(xvi), as it fails to identify the groundwater in the TR-1 overburden as a source of water for its proposed operations and similarly fails to identify the quality of that water or the quantity to be used in its mining or reclamation operations.

14. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate information and analysis regarding the TR-1 as a specific water source in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with the express written conditions that:

(1) prior to conducting any mining operations, Brook Mine must identify all water sources to be used in its proposed mining and reclamation operations, including groundwater from the TR-1 overburden, by geologic source, including quality and quantity characteristics, and submit this data and analysis to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations; and

(2) after the conclusion of mining operations in the TR-1 area, the TR-1 trench must be reclaimed without delay, in accordance with applicable law, and may not remain open for use as a source of water for subsequent mining operations on adjacent lands.

15. **Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a)** require a surface coal mining permit application to contain a plan to minimize disturbances to the prevailing hydrologic balance at the minesite and associated offsite areas and to the quality and quantity of surface and groundwater systems both during and after mining operations; a description of the groundwater and related geology in the permit area sufficient to assess the probable hydrologic consequences; a determination of the probable hydrologic consequences of the proposed operation on the hydrologic regime and the quantity and quality of surface and groundwater systems within the permit area; and a determination of the projected result of the proposed surface coal mining and reclamation operations, which may be expected to change the quality or quantity of the surface and groundwater, its flow, timing and availability, all in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems.

16. Brook Mine's permit application fails to meet the requirements of Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a), specifically, as to the lack of any plan or assessment related to probable impacts from mining through the TR-1 overburden, and

any probable change in the quality or quantity of the surface or groundwater in that area, its flow, timing or availability.

17. DEQ must either deny the permit application, or require Brook Mine to include sufficiently detailed, site-specific groundwater data for the TR-1 overburden in its permit application, including the anticipated impacts from mining the TR-1 area on ground and surface waters, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must provide a surface and groundwater impact analysis (during-mining and post-mining) that incorporates site-specific textural and hydrological data in the TR-1 mining area, to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

18. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** requires a surface coal mining permit application to contain both a groundwater and surface water monitoring plan, based on hydrologic, geologic and other information in the permit application, which identifies the quality and quantity parameters to be monitored, sampling frequency and site locations, and describes how the data will be used to determine the impacts of the mining operations on the hydrologic balance.

19. Brook Mine's permit application fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of the proposed mining operations in the TR-1 area on surface water within and adjacent to the permit area. The permit application further fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of mining the TR-1 area on the groundwater located in the TR-1 overburden.

20. DEQ must either deny the permit application, or require Brook Mine to identify and commit to installing additional monitoring locations within its permit application necessary to determine the impacts of mining the TR-1 area on the Tongue River and Goose Creek and the groundwater located in the TR-1 overburden, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations, alterations to its water monitoring locations as follows:

First, as recommended by DEQ, move one monitor well farther upstream on the Tongue River near the boundary of the proposed permit area, and add additional monitoring cites on the Tongue River just downstream of the

confluence with Goose Creek and an additional monitoring location on Goose Creek; and

Second, add groundwater monitoring locations in the TR-1 overburden and add an additional surface water monitoring location in the Tongue River just north of the TR-1 mining area.

21. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** and its incorporation of Ch. 4, Section 2(h) requires a surface coal mining permit application to include a plan to restore the approximate recharge capacity of groundwater within the permit area to a condition that approximates the pre-mining recharge rate.

22. Brook Mine's permit application fails to provide the information required by DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix) as to the groundwater in the TR-1 overburden, as there is no a plan to restore the recharge capacity and no accurate information as to the pre-mining recharge capacity of that groundwater.

23. DEQ must either deny the permit application, or require Brook Mine to provide and analyze data concerning the recharge capacity of the TR-1 overburden groundwater and include a plan in the permit application to restore the recharge capacity of the TR-1 overburden groundwater to pre-mining conditions, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must determine the recharge

capacity of the TR-1 overburden groundwater and provide a plan to restore the TR-1 overburden groundwater to pre-mining conditions to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

24. **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(iv)** require a surface coal mining permit application to include a plan for insuring that “materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent . . . threats to human or animal health and safety,” contain “procedures proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life,” and include “plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.”

25. Due to the prevalence and history of coal fires in the area, the lack of any information as to current coal fire activity within the permit area renders Brook Mine’s permit application deficient with regard to the required fire safety planning.

26. DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit and DEQ must approve a report providing maps, descriptions, photographs, and any existing evidence of underground coal fires within 500 feet of any proposed mining locations and a plan that identifies the specific safety measures Brook Mine will take where underground coal fires exist within 500 feet of any proposed mining location.

27. **Wyo. Stat. Ann. § 35-11-415(b)(xi)(E)** requires surface coal mining operators to provide a pre-blasting survey “of a man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area,” on request of a resident or owner.

28. Finding Big Horn’s request for a pre-blast survey to be mandated by law, and Big Horn’s request for seismic monitors to be reasonable and available, DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine, under DEQ direction, will conduct a pre-blast survey of all man-made structures and dwellings belonging to Big Horn within one-half mile of the permit area, and install seismic monitoring devices at each of Big Horn’s facilities sufficient to ensure the protection of Big Horn infrastructure, improvements and tenants.

29. Based on the testimony and evidence of record, Brook Mine’s permit application fails to accurately state there are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn. The permit application also fails to accurately and sufficiently set forth the reclamation responsibilities of each party as to disturbance within the overlapping permit boundaries.

30. DEQ shall issue the permit with an express written condition that section MP.22 and section RP.12 of Brook Mine’s mine and reclamation plans must be amended to accurately reflect the following:

- There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal.
- Big Horn maintains a reclamation performance bond adequate to reclaim Big Horn facilities and all disturbances associated within Big Horn operations within Big Horn’s permit area.

- Brook Mine shall maintain a reclamation performance bond sufficient to reclaim all disturbance associated with Brook Mine operations within its permit area.
- Big Horn shall not be responsible for reclamation of any disturbance unrelated to Big Horn operations or facilities, including, but not limited to, Brook Mine disturbance within the remaining lands subject to Big Horn's reclamation performance bond.

31. **Wyo. Stat. Ann. § 35-11-416(a)** requires that when the surface owner is not the mineral owner of the estate proposed to be mined, prior to permit issuance, the operator must execute a bond “for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate . . . or to the tangible improvements of the surface owner.”

32. In accordance with DEQ's stated assurance at hearing, no permit shall be issued to Brook Mine unless and until a surface owner protection bond is issued for the benefit of Big Horn and after good faith consultation with Big Horn as to the appropriate bond amount.

PROPOSED CONCLUSIONS OF LAW AS TO WYO. STAT. ANN. § 35-11-406(n)

33. **Wyo. Stat. Ann. § 35-11-406(n)** requires Book Mine, as a surface coal mining permit applicant, to meet its burden of “establishing that his application is in compliance with [the Environmental Quality Act] and all applicable state laws” and provides that “[n]o surface coal mining permit shall be approved unless the applicant affirmatively demonstrates” the following:

- (i) That the application is accurate and complete;
- (ii) That the reclamation plan can accomplish reclamation as required by [the Environmental Quality Act]; and

(iii) That the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

34. Based on the forgoing findings of fact and conclusions of law:

- Brook Mine has failed to affirmatively establish that its permit application is in compliance with the requirements of the Environmental Quality Act and all applicable rules and regulations.
- Brook Mine's permit application lacks required information, mischaracterizes, and contains inaccurate information as to the TR-1 mining area and its related overburden geology and hydrology, as well as lacks the additional legal requirements stated above. Therefore, Brook Mine has failed to affirmatively demonstrate that its permit application is accurate and complete.
- Brook Mine has failed to affirmatively demonstrate that the reclamation plan can accomplish reclamation as required by the Environmental Quality Act, which emphasizes a standard for restoration to pre-mining conditions⁸, because the permit application fails to sufficiently identify pre-mining conditions in the TR-1 area.
- Brook Mine has failed to affirmatively demonstrate that its proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area, because it fails to account for or consider critical and unique hydrological conditions in the TR-1

⁸ See DEQ, Land Quality Coal Rules, Ch. 4, Section 2.

area and fails to identify how it will monitor the impacts of the proposed TR-1 area mining operations on the hydrological balance within, let alone outside the proposed permit area.

35. DEQ must either:

- Deny the permit application; or
- Require Brook Mine to complete its permit application in light of the above identified deficiencies, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with all of the express written conditions listed above.

Subject: Upcoming Ramaco Meetings
Date: Monday, August 07, 2017 8:37:31 AM

Jeff & Isaac,

We are wondering if you could elaborate on your client's quote in this article about meetings. We know you will respect the restrictions on ex parte communications with the EQC and its staff, but just wanted clarification about the "various" regulatory agencies your client will be meeting with.

The Wyoming council has 60 days to publish its findings. "There is still some confusion about what precise concerns and remedies are on the table," Ramaco's Atkins said. He expects to have "greater clarity" over the next few days after meeting with staff at various Wyoming regulatory agencies.

Thank you, Shannon

Wyoming panel temporarily blocks new PRB mine: Update

02 Aug 2017 13:38 (-04:00 GMT)

Adds comments from the Wyoming DEQ

Washington, 2 August (Argus) — Wyoming regulators have blocked temporarily the development of a controversial new mine in the Powder River basin (PRB).

The Environmental Quality Council yesterday voted 4-1 to send Ramaco's permit application for its Brook mine back to the state Department of Environmental Quality (DEQ) for revision, over concerns that the proposal does not adequately address the project's potential environmental effects.

Ramaco is still feeling "very positive and remain(s) confident that the mine permit will ultimately be approved," chief executive Randall Atkins said today.

But the council warned that the company has not yet met its "burden to prove that this mining operation will adequately provide reclamation," member David Bagley (D) said, noting that he is specifically worried about subsidence, or the development of sinkholes, near the mining site.

The proposed permit also fails to demonstrate that the operations will not cause damage to "alluvial valley floors" or hydrologic systems outside the permit area, Bagley added.

Bob LeResche, chair of the Powder River Basin Resource Council — a conservation group that has opposed the project — praised the council's decision.

The application "did not adequately protect public health and safety, land and water," he said. By advancing Ramaco's mining plan, the DEQ did not properly "represent the citizens of the state" and "they were pretty soundly rebuked."

The DEQ had deemed Ramaco's application technically complete but sent it to the state environmental council for review after LeResche's group filed a [complaint](#) asking for a face-to-face meeting about the proposal.

"We felt it was important to put this in front of an impartial group," said DEQ public information officer Keith Guille.

Ramaco started the process to develop Brook mine in 2014, when prompt quarter prices for PRB 8,800 Btu/lb coal averaged \$12.58/short ton and the basin produced 418.2mn st (379.4mn metric tonnes) of sub-bituminous coal. Last year, the prompt quarter price averaged \$10.45/st, while output fell to 319.2mn st, the lowest level in at least 13 years.

Weaker market conditions caused Ramaco to explore other options for Brook mine's coal. The company is now [planning](#) to develop a mine-mouth manufacturing site and research park that would help develop cost-effective technologies to use coal to create products like carbon fiber, activated carbon and building materials.

Council member Tim Flitner (R) said the Brook mine has the potential to be "a good project" but noted that Ramaco Carbon's plan has not addressed earlier "misgivings" about negative environmental impacts of the development.

LeResche questioned the economic wisdom of the new proposal.

Similar projects have been tried in recent years, drawing significant federal grant money without getting results, he said.

The Wyoming council has 60 days to publish its findings. "There is still some confusion about what precise concerns and remedies are on the table," Ramaco's Atkins said. He expects to have "greater clarity" over the next few days after meeting with staff at various Wyoming regulatory agencies.

Guille, of the DEQ, said he could not speculate on how long the permitting process might take.

"This isn't something that's put together within an afternoon — it takes years, months," he said. "But ultimately we've got something of an application here, it's not a complete start-over."

There is no question that these filings were not authorized, nor contemplated, by the Environmental Quality Council's *Briefing Order*, dated June 13, 2017. Neither DEQ, nor Brook Mine, requested by motion the ability to file these "comments," but rather injected their positions on their own accord. Only making matters worse, both DEQ and Brook Mine inappropriately used these pleadings as a method to further argue the merits of their position and assert additional legal argument. This practice is unauthorized, prejudicial to the other parties in this matter, and should not be permitted by the Council.

In addition, the comments made by DEQ are disingenuous and misleading. DEQ has attempted to lead the Council to believe that both it and Brook Mine lack access to private property, such as Big Horn's, within the permit area, and that because of this permit conditions requiring access to such property should be modified accordingly. *DEQ's Comments*, p. 2. As this Council is aware from earlier proceedings related to Brook Mine's proposed mining operations, Docket No. 16-1601, Brook Mine has obtained an Order in Lieu of Consent to access Big Horn property. Big Horn has stated it intends to abide by any access provided by a valid Order in Lieu of Consent, and Big Horn has executed a Surface Land Owner's Consent authorizing DEQ to enter upon Big Horn property to carry out mine inspections related to Brook Mine's permitted operations. Tr. Vol. IV, p. 900. The Surface Land Owner's Consent document is attached hereto as **Exhibit A**.

WHEREFORE, for the foregoing reasons and for those reasons set forth in both the Fishers' and Powder River Basin Resource Council's *Motions to Strike* DEQ's Comments on Proposed Permit Conditions and Brook Mine's Joinder of those Comments, Big Horn respectfully requests that the Council strike DEQ's "comments" and Brook Mine's joinder from the record of this matter, and not consider either of these filings in its deliberations or decision in this matter.

DATED: August 1, 2017.

SURFACE LAND OWNER'S CONSENT

Big Horn Coal Company, LLC (Surface Land Owner) CERTIFIES that it is the surface owner of the following described property on which Brook Mining Company, LLC (Applicant) proposes to operate or property which must be crossed to access Applicant's operations as proposed in Applicant's mining and reclamation plans:

As described in the attached Attachment A, incorporated herein

Land Owner and Applicant are parties to an action pending before the Wyoming Environmental Quality Council entitled *In Re Brook Mine Application*, Civil Action No. 16-1601. Without waiving any rights which Land Owner may have in that action or any subsequent appeal, Land Owner hereby grants access to the above described property to the Department of Environmental Quality, Land Quality Division, to enter and carry out mine inspections related to Applicant's permitted operations. Such entry and inspections shall be conducted during normal business hours and in compliance with all applicable federal, state and local laws, permit conditions, and mining industry safety practices. Nothing in this consent should be construed as consent by Land Owner to Applicant's mining and reclamation plans or consent to enter and carry out those mining and reclamation programs on said lands except as may be ordered by the Wyoming Environmental Quality Council or a court of competent jurisdiction.

IN RE BROOK MINE APPLICATION)
)
 TFN 6 2-025) DOCKET 17-4802

**POWDER RIVER BASIN RESOURCE COUNCIL'S MOTION TO STRIKE DEQ AND
BROOK MINE "COMMENTS" ON PERMIT CONDITIONS AND TERMS**

The Power River Basin Resource Council hereby moves to strike the Department of Environmental Quality (DEQ) “comments” filed with the EQC and Brook Mining Company, LLC’s (Brook) joinder to those comments.

The Fishers’ laid out a strong cause for a motion to strike, and for the sake of judicial efficiency we incorporate their arguments by reference here. The Resource Council finds it completely disingenuous for both Brook and DEQ to represent to the parties and the EQC that they would consider conditions from the EQC during the hearing and then act to prevent the EQC from weighing proposed conditions in its decision-making process.

Furthermore, it is also important to note that DEQ specifically asked the EQC for the opportunity to “comment” on the last day of the hearing. Tr. at 1561-62. At that time the EQC was noncommittal but said it would lay out the process in a briefing order. *Id.* That order – dated June 13, 2017 – did not provide an opportunity for the DEQ – or any other party – to provide “comments” on any other parties’ proposed findings or proposed permit terms and conditions.

Therefore, DEQ and Brook's pleadings are out of order, prejudicial to other parties, and should be stricken and not considered by the EQC in its decision today.

Respectfully submitted this 1st day of August, 2017.

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	DOCKET 17-4802
TFN 6 2-025)	
)	

**FISHERS' MOTION TO STRIKE
DEQ'S "COMMENTS" ON PROPOSED CONDITIONS
AND BROOK MINE'S JOINDER OF "COMMENTS"**

Objectors Mary Brezik-Fisher and David Fisher, through their undersigned attorney Jay A. Gilbertz, of Yonkee & Toner, LLP, hereby file this Motion to Strike the "Comments" of DEQ and Brook Mine and consideration of the same.

The EQC set a very specific briefing schedule at the conclusion of the contested case proceedings. That schedule required the parties to file "Findings of Fact and Conclusions of Law" within a specified time. The scheduling did not allow or provide for the parties to file rebuttal documents, responses, traverses or "comments" on the filings of other parties. Nevertheless, DEQ has attempted to gain the last word by improperly filing a subsequent pleading addressing the merits of the filings of the other parties and has been joined by Brook Mine in this effort.

The EQC did not provide for these later filings attempted by DEQ and Brook nor were the

other parties advised or permitted an opportunity to respond to the Findings and Conclusions offered by DEQ or Brook. The Objectors should not suffer prejudice by following the rules and procedure established by the EQC when others choose to willfully ignore the procedure and file responses anyway.

The result is both DEQ and Brook asserting rather silly propositions by taking the position (either directly or indirectly) that the EQC has no authority to modify the proposed permit through the use of conditions. Neither DEQ nor Brook took that position during the proceedings and both elicited testimony to the contrary. Brook elicited testimony from its engineer Jeff Barron that it “welcomed” conditions the EQC found appropriate, and DEQ asked every landowner to describe any conditions to the permit that the landowner requested the EQC to consider. Now, both claim the EQC has no authority to modify the permit.

Nothing could be further from the truth. Wyoming Statute §35-11-112 defines the power and authority of the EQC and specifically states that the council may “*Order that any permit, license, certification or variance be granted, denied, suspended, revoked or **modified***” Wyo. Stat. §35-11-112(c)(ii) (LexisNexis 2015) (emphasis added). Clearly, the EQC has the power and authority to modify the conditions of a pending permit, particularly when it finds that such modifications are in furtherance of the Act’s goal of protecting and reclaiming the land, air and water of Wyoming and protecting the health and safety of Wyoming residents.

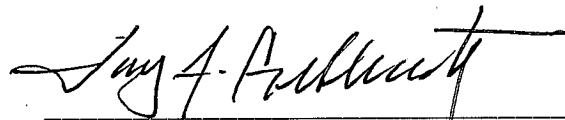

Amazingly, DEQ has gone so far as to advocate that the EQC should not consider more and better financial security for Wyoming and its land and water, claiming that a condition requiring Brook to have further financial assurance cannot be imposed as it “binds third parties”. Requiring that Brook (a company with no mining or reclamation history and evidently next to no assets) have further financial surety from its parent or partner company does not “bind third parties” to the permit

conditions, it simply requires that Brook obtain those assurances as a prerequisite to mining. No one is obligated to provide the assurance, but if Brook cannot obtain and present those assurances, it cannot mine. Brook has provided a plethora of non-binding verbal assurances, it and its partners or parent company should also provide Wyoming with the financial assurances to back up those claims. This assurance does not benefit the Objectors, just the state and citizens of Wyoming. It is astounding the DEQ does not seek this financial assurance itself.

WHEREFORE, for the foregoing reasons, the Fishers respectfully request that the “comments” of DEQ and “joinder” of Brook be struck and that the EQC consider neither pleading in its deliberations or decision in this matter.

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINE’S JOINDER IN THE DEPARTMENT OF ENVIRONMENTAL
QUALITY’S COMMENTS ON OTHER PARTIES’ PROPOSED PERMIT CONDITIONS**

Brook Mine (Brook) joins the Department of Environmental Quality’s (DEQ) comments on the objecting parties’ proposed permit conditions and objects to any conditions that differ from those DEQ has already stated it will require. Brook agrees with DEQ that no other permit conditions are necessary for the Council to find Brook’s permit is complete and without deficiencies. (DEQ Comments at 1.) Likewise, the Council lacks the authority to impose permit conditions because it exists to oversee DEQ action not assume DEQ’s regulatory mantle. (Brook’s Brief on Statutes and Regulations that the Council Must Consider, 2-6, 9.)

Brook would add only that the objectors’ proposed conditions seek to modify not just Brook’s permit application but the permitting process itself. The Environmental Quality Act allows the public to voice concerns about whether DEQ has properly analyzed a permit application. Neither the Act, case law, nor regulations suggest that members of the public have a

right to shape a permit application to fit their desires. As a result, no law suggests that the public hearing in Wyo. Stat. § 35-11-406(k) should be a forum to reshape a permit application.

Therefore, the Council should not accept the objecting parties' invitation to exceed its statutory authority and the language of the Act. *See Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000); *Platte Dev. Co. v. State, Envtl. Quality Council*, 966 P.2d 972, 975 (Wyo. 1998).

STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINE’S MOTION TO STRIKE POWDER RIVER BASIN RESOURCE
COUNCIL’S SUPPLEMENTAL EXPERT REPORT**

INTRODUCTION

A month and a half after the end of the June 7th hearing, three months after the April 21st deadline for written discovery, and four months after the March 17th deadline to name expert witnesses, Powder River Basin Resource Council (PRBRC) submitted a new expert report with its proposed findings of fact and conclusions of law. Exhibit A to those findings is a July 11, 2017 letter from Mark Eslinger to Shannon Anderson. Mr. Eslinger provides “information concerning the Ground Control Plan and its relation to subsidence.” Mr. Eslinger describes the law he believes applies to a ground control plan. He concludes that “the Ground Control Plan does not deal with subsidence.” He also attached his resume. Mr. Eslinger’s letter is an expert report. *See* Wyo. R. Civ. P. 26(a)(2)(B) (stating an expert report must contain an expert’s opinion, the basis for that opinion, and a curriculum vitae.)

Allowing or considering a new expert report after the expert designation deadline, after discovery, and after the hearing undermines Brook Mine's (Brook) basic right to a fair hearing—a reversible error. While Brook does not doubt the Council has tired of motions, PRBRC's attempt to introduce new expert testimony has left Brook no choice.¹ Therefore, Brook requests the Council strike Exhibit A and the reference to it in paragraph 104 of PRBRC's proposed findings.

ARGUMENT

The Council conducts contested cases with reference to the Wyoming Rules of Civil Procedure. Wyo. Admin. Code ENV Practice & Proc. Ch. 2, § 2. Wyoming's Rules of Civil Procedure allow a decision-maker to strike "redundant, immaterial, impertinent, or scandalous" matters from pleadings. Wyo. R. Civ. P. 12(f).

At best, PRBRC submitting Exhibit A is redundant. PRBRC's designated expert, Dr. Marino, discussed the Mine Safety and Health Administration (MSHA) generally and why he did not think Brook's ground control plan would address subsidence. At worst, PRBRC submitting Exhibit A is an underhanded tactic. PRBRC knew long ago that Brook planned to develop and submit an MSHA ground control plan engineered to prevent subsidence. PRBRC's objection letter dated January 27, 2017 states "[t]he Subsidence Control Plan references a Ground Control Plan that is approved by MSHA and is required under 30 C.F.R. § 77.1000." (PRBRC Hr'g Ex. 1 at 12.) From January 27, 2017 until the expert designation deadline of March 17, PRBRC had

¹ In an effort to avoid filing this motion, Brook's counsel emailed PRBRC's counsel and requested PRBRC withdraw Exhibit A and the reference to Exhibit A in paragraph 104. (See email attached as Exhibit 1.) PRBRC has not responded to Brook's request.

time to designate an expert on this issue. But PRBRC did not. It waited until discovery, the hearing, the final briefing, and any chance of Brook responding had ended.

This attempt to smuggle in additional expert testimony also fails Wyoming's five factor test for supplementing or adding expert reports after the expert designation or report deadline. Those factors are: 1) "whether allowing the evidence would incurably surprise or prejudice the opposing party;" 2) "whether excluding the evidence would incurably prejudice the party seeking to introduce it;" 3) "whether the party seeking to introduce the testimony failed to comply with the evidentiary rules inadvertently or willfully;" 4) "the impact of allowing the proposed testimony on the orderliness and efficiency of the trial;" and 5) "the impact of excluding the proposed testimony on the completeness of the information before the court or jury." *Forbes v. Forbes*, 2015 WY 13, ¶ 83, 341 P.3d 1041, 1063 (Wyo. 2015).

Allowing Exhibit A would incurably prejudice Brook because Brook has no chance to respond beyond this motion. But PRBRC would suffer no prejudice because it presented testimony about Brook's ground control plan. PRBRC has acted willfully because it could have designated and submitted the opinions in Exhibit A on time. Its knowledge of Brook's ground control plan in January and designation of three experts before the March 17th deadline prove as much. Allowing Exhibit A would impact more than the orderliness or efficiency of the hearing, it would defeat Brook's right to rebut evidence. Finally, excluding Exhibit A would not impact the completeness of information because PRBRC already presented testimony on the issue.

Therefore, Brook requests the Council strike Exhibit A to PRBRC's proposed findings of fact and conclusions of law and the reference to Exhibit A in paragraph 104. In the alternative, Brook requests the Council state it will not consider either as part of its decision in this case.²

² Brook has included a proposed order to this effect.

Subject: Exhibit A to Findings of Fact

Shannon,

We have reviewed the findings and conclusions you submitted yesterday, including Exhibit A. Exhibit A is an expert report submitted far beyond the expert designation deadline, after the close of evidence, and in a manner that precludes a response. It also attempts to rebut known issues, namely that the permit committed to an MSHA ground control plan as part of addressing subsidence. Simply put, it is improper.

We request that you withdraw Exhibit A and revise your findings to delete any reference to Exhibit A, which appears to be just paragraph 104. We are happy to stipulate to you filing a revised findings that delete Exhibit A and any references. We ask that you do this by 5pm today.

If you elect to do nothing, then we will file a motion to strike. I am emailing you in the hopes we can avoid having to file that motion.

Please let me know what you intend to do.

Thank you,

Jeff

**ORDER GRANTING BROOK MINE’S MOTION TO STRIKE POWDER RIVER BASIN
RESOURCE COUNCIL’S SUPPLEMENTAL EXPERT REPORT**

THIS MATTER having come before the Council on Brook Mine’s Motion to Strike Powder River Basin Resource Council’s Supplemental Expert Report, the Council FINDS the Powder River Basin Resource Council has included a supplemental expert report as Exhibit A to its proposed findings of fact and conclusions of law. The report is untimely and prejudicial to the other parties in the case.

IT IS HEREBY ORDERED that Exhibit A to PRBRC’s proposed findings of fact and conclusions of law and the reference to Exhibit A in paragraph 104 is stricken and the Council will not consider either as part of its decision in this case.

DATED: July ____, 2017.

Dr. David M. Bagley
Hearing Officer
Environmental Quality Council

CERTIFICATE OF SERVICE

I, Jim Ruby, hereby certify that on July _____, 2017, I served a true and correct copy of the foregoing by email to the following:

DOCKET 17-4802

**FISHERS' PROPOSED FINDINGS OF FACT AND
CONCLUSIONS OF LAW**

Objectors Mary Brezik-Fisher and David Fisher, through their undersigned attorney Jay A. Gilbertz, of Yonkee & Toner, LLP, hereby file their proposed findings of fact and conclusions of law.

As the Council now knows, this proposed coal mine is situated in and adjacent to the historically important Tongue River and its alluvial valley floor which is home to farming predating Wyoming's statehood, historic structures, abundant wildlife, recreation and over one hundred landowners and dozens of homeowners within one-half mile of the mine boundary. It is a very special place in Wyoming and mining should not be permitted unless it has been affirmatively demonstrated by sound scientific study that material harm to this resource will not occur.

Brook Mine's permit application is grossly inadequate in affirmatively demonstrating this in a number of ways and is consequently not a "complete" application allowing for permit issuance at this time. More thorough and scientifically complete studies and baseline monitoring need to be

done in order to show that the mine will not cause subsidence or material damage to the hydrologic balance and the adjacent alluvial valley floor.

The Fishers' Findings of Fact and Conclusions of Law will be broken into two distinct sections. The first addresses findings and conclusions as they relate to the fact that the permit application is currently incomplete and thus not ready to move to the Director of the DEQ for review. The second addresses conditions that must be placed upon a permit that could be issued.

SECTION I. COMPLETENESS OF PERMIT

A. CONCLUSIONS OF LAW RELATED TO THE COMPLETENESS OF BROOK'S APPLICATION:

1. Before an application for a permit for a surface coal mine can proceed to the publication phase, the application must be "determined complete" by DEQ. Wyo. Stat. §35-11-406(g) (LexisNexis 2015).
2. The plain and ordinary definition of "complete" is "having all necessary parts, elements, or steps." *Merriam Webster's Collegiate Dictionary*, 10th Ed. (1995).
3. As part of reviewing decision making by the DEQ, the EQC has the authority to review DEQ's determination of whether or not the Brook Mine application is in fact "complete" and ready for further review. §35-11-406(k) (LexisNexis 2015).
4. "The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws" Wyo. Stat. §35-11-406(n) (LexisNexis 2015). Brook Mining Company, LLC is the applicant in this instance.
5. Wyoming Statute §35-11-106(n) is part of "this act" (meaning the Environmental Quality Act) and therefore applies to all surface coal mining applications. §35-11-406(n) (LexisNexis 2015) and §35-11-101 (LexisNexis 2015).
6. Wyoming Statute §35-11-106(n) provides in part:
 - (n) The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with this act and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:
 - (i) The application is accurate and complete;
 - (ii) The reclamation plan can accomplish reclamation as required by this act;

(iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area;

(v) The proposed operation would:

(B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors.

Wyo. Stat. §35-11-406(n) (LexisNexis 2015).

7. In order to be accurate and complete, a surface coal mining application must contain meaningfully complete information of compliance with all applicable rules and regulations, including the information which forms the basis for the applicant's affirmative demonstration of compliance with the requirements of Wyo. Stat. §35-11-406(n).
8. While Wyo. Stat. §35-11-406(n) provides that the administrator of the DEQ must make findings that the proposed mine will meet the subsection (n) requirements, the subsection also clearly states that a permit may not be issued unless "the applicant affirmatively demonstrates" that its mine will be in compliance with subsection (n). Wyo. Stat. §35-11-406(n) (LexisNexis 2015). In order to be complete, the application must contain the information affirmatively demonstrating compliance with subsection (n).
9. "Affirmatively demonstrating" as required by the Environmental Quality Act requires more than generalized or conclusory statements such as "no harm is expected". Wyo. Stat. §35-11-406(n) (LexisNexis 2015).
10. In addition to the requirements of §35-11-406, DEQ regulations require that as part of its application an applicant must also provide information "and evaluations on the potential for and the extent of subsidence, and the effect it may have on structures, the continued use of the surface land and aquifers or recharge areas". If subsidence may cause damage, a subsidence control plan is required. Wyo. Admin. Rules, DEQ-LQD, Underground Coal Mines, Ch. 7 §1(a)(v).

B. FINDINGS OF FACT RELATED TO THE COMPLETENESS OF BROOK'S APPLICATION:

1. Expert witness Mike Wireman (Wireman) testified before the EQC. Wireman is an expert in geo-hydrology with extensive experience in hydrology and decades of experience as evidenced by his testimony and CV which are part of the record. (*POW Exhibit 18, Wireman Testimony Vol. VI @ pgs. 1327-1335*)

2. The EQC finds Mr. Wireman to be a well-qualified expert who gave credible and reliable testimony on the topic of hydrology. To the extent his opinions and testimony are cited as the basis of findings of fact in these findings, the EQC has resolved any conflicts or dispute between testimony of others and in favor of Mr. Wireman's testimony and has found him to be the more credible and reliable witness.
3. The hydrologic studies done by the applicant Brook Mine thus far along with the other available data do not provide a sound scientific basis from which it can be concluded that the proposed mining operation has been designed to "prevent material damage to the hydrologic balance outside the permit area". (*Wireman Testimony Vol. VI @ pgs. 1400-1401*)
4. Mr. Wireman testified to several deficiencies in the hydrologic studies done thus far which evidence that the applicant, Brook Mining Company, LLC, has not affirmatively demonstrated that its mine will prevent material damage to the hydrologic balance outside the permit area, including:
 - a. The hydrologic review and assessment failed to account in any way for how dewatering of the coal seams would impact the water in other ground water aquifers. (*Wireman Testimony Vol. VI @ pg. 1344*);
 - b. The hydrologic review and assessment was unacceptably sparse with only one (1) pump test done in the far eastern portion of the permit area and only two (2) site specific hydraulic conductivity values (one for each seam of coal) over the entire permit area. (*Wireman Testimony Vol. VI @ pg. 1354*) Hydraulic conductivity measures the rate at which water flows in an aquifer. (*Wireman Testimony Vol. VI @ pg. 1360*) The permit area encompassed an area of approximately 4,500 acres. (*Kuchanur Testimony Vol. III @ pg. 535; Kristiansen Testimony Vol. I @ pg. 50*);
 - i. DEQ admitted that the hydrology and flow of water and geology was complex and could change significantly in short distances. (*Kristiansen Testimony Vol. IV, @ pgs. 302-303*);
 - c. The hydrologic review and assessment only used one porosity value or hydraulic conductivity value for the entire permit area which cannot account for the heterogeneity or diversity of the geology in the permit area. (*Wireman Testimony Vol. VI @ pg. 1355*) Furthermore, data was not collected from monitoring wells during the pumping tests in the Slater Creek area as would be expected and appropriate. (*Wireman Testimony Vol. VI @ pgs. 1363-64*)
 - d. Using only one porosity value for the entire permit area fails to take into account seasonal changes which can alter direction of flow, velocity of flow and quantity of flow to a particular area. (*Wireman Testimony Vol. VI @ pg. 1355*)

- e. Proper investigation and testing for potential ground water impacts require the development of a hydrograph over at least a full 12-month cycle to take into account seasonal changes in quantity, quality and flow of water in these aquifers. (*Wireman Testimony Vol. VI @ pg. 1345*) Brook's testing failed to collect any surface water data from October through March, a period of about 6 months or ½ of a yearly hydrograph, and historic data reflects that Hidden Water Creek only flows in the winter months during a time Brook collected no data on that drainage. (*Wireman Testimony Vol. VI @ pg. 1361*)
 - f. Inadequate testing and data collection was done on the overburden, underburden, Tongue River alluvium and Slater Creek alluvium to make scientific predictions about hydrologic impacts. (*Wireman Testimony Vol. VI @ pg. 1361*)
 - g. No monitoring or baseline wells were used to establish the baseline water in the Tongue River alluvium. (*Wireman Testimony Vol. VI @ pg. 1365*)
 - h. The data used for the recharge of the aquifers is not site specific and is vaguely identified not allowing for peer review of those assumptions. (*Wireman Testimony Vol. VI @ pg. 1363*) Moreover, the groundwater aquifer assessment contains no discussion of vertical intervals or lithology which affect the potentially impacted domestic wells. (*Wireman Testimony Vol. VI @ pg. 1367*)
 - i. In general, there is a dearth or lack of supporting hydrologic data to support the conclusions Brook attempts to draw from its study. (*Wireman Testimony Vol. VI @ pg. 1363*)
5. Substantial concern exists that material damage would be done to the hydrologic balance inside and/or outside the permit area (*Wireman Testimony Vol. VI @ pgs. 1398-1399*) and the testing done was wholly inadequate to conclude there will not be material hydrologic impacts. (*Wireman Testimony Vol. VI @ pgs. 1373; 1442*)
 6. The permit application submitted by Brook Mine does not contain the information necessary to affirmatively demonstrate that material damage to the hydrological balance outside the permit area will be prevented. (*Wireman Testimony Vol. VI @ pgs. 1398-1399; 1442*)
 7. The hydrologic studies done thus far by the applicant Brook Mine, along with the other available data, do not provide a sound scientific basis from which it can be concluded that the mining will "not materially damage the quantity or quality of water in surface or underground water systems that supply" alluvial valley floors that are within the mine boundary or within one-half mile of the proposed mine boundary. (*Wireman Testimony Vol. VI @ pgs. 1400-1401, 1441-1443*)

8. Substantial concern remains that material damage would be done to the quantity or quality of water in the surface or underground water that supplies alluvial valley floors or areas likely to be alluvial valley floors that are either in or within one-half mile of the permit area. (*Wireman Testimony Vol. VI @ pgs. 1389-1392 and 1373*)
9. Wireman testified that even a small reduction in the amount or volume of water being supplied to the alluvium of the alluvial valley floors located within the permit boundary can cause material damage to the productivity of these valley floors. (*Wireman Testimony Vol. VI @ pgs. 1396-1398*)
10. A number of documents authored by Brook's engineering expert acknowledge a communication or connectivity between the water in the coal seams and the water in the alluvium of alluvial valley floors or areas likely to be alluvial valley floors, including:
 - a. "Therefore, it is likely that the Carney coal would lose water to the Tongue River alluvium" – DEQ Exhibit 12, pg. 231.
 - b. Recognition of water communication between the alluvium and the Carney coal seam stating: "regions where the Carney seam subcrops into Slater Creek or Tongue River alluvial material" – See DEQ Exhibit 13, pg. 051, RP.8.3 *Aquifer Reconstruction*.
 - c. Recognition of water communication between the alluvium and Masters coal seam stating: "Masters Seam are assumed to include infiltration from overlying strata, communication with river alluvium" – See DEQ Exhibit 13, pg. 051, RP.8.3 *Aquifer Reconstruction*.
11. The above statements are consistent with Mr. Wireman's opinions that there is communication between the water in the coal seams and the water in the alluvium of these alluvial valley floors. (*Wireman Testimony Vol. VI @ pgs. 1388-1389*)
12. It was uncontested that as part of mining the coal, Brook Mine will de-water the coal seam.
13. De-watering the coal seam will interrupt the natural flow of water in the coal seams which supply and communicate with the river alluvium. (*Wireman Testimony Vol. VI @ pgs. 1400-1401*)
14. The perturbing of the natural flow of water in this system will be further exacerbated if overburden subsidizes into the cavity left by coal removal. (*Wireman Testimony Vol. VI @ pgs. 1370-71*)
15. Brook Mine did not call a hydrology expert to demonstrate how its permit application contained the information and proof that its application demonstrated that the mining

operation would be in compliance with Wyo. Stat. §35-11-406(n).

16. **Brook Mine, who bore the burden of proof, did not call its own hydrology expert to counter the testimony of Mr. Wireman.**
17. Testimony revealed that there are over 350 water wells ("357") identified which could be potentially impacted. (*Barron Testimony Vol. IV @pg. 778; Wireman Testimony Vol. VI @pg. 1344*)
18. Draw-down in domestic/stock water wells are predicted to as much as 25 feet. (*Kuchanur Testimony Vol. III @pgs. 541-543 and DEQ Exhibit 12-251, Table 4.9-1*)
19. Brook Mine has the burden of proof on these issues.
20. Wyo. Admin. Rules, DEQ-LQD, Underground Coal Mining, Ch. 7 §1(a)(v) requires that as part of its permit application, Brook Mine have a subsidence control plan.
21. Dr. Marino testified before the Council and is a very qualified expert in the area of underground mine subsidence with decades of experience as shown by his testimony and his CV which was received as POW Exhibit 18. (*Marino Testimony Vol. VI @pgs. 1192-1198*)
22. The EQC finds Dr. Marino to be a well-qualified expert who gave credible and reliable testimony on the topic of hydrology. To the extent his opinions and testimony are cited as the basis of findings of fact in these findings, the EQC has resolved any conflicts or dispute between testimony in favor of Dr. Marino's testimony and has found him to be the more credible and reliable witness.
23. **Neither Brook Mine nor DEQ offered any expert testimony from an expert with similar qualifications to Dr. Marino.**
24. There have been inadequate studies and testing done to draw any scientific conclusions as to the long-term risk of subsidence at the proposed Brook Mine. (*Marino Testimony Vol. VI @pg. 1246*)
25. Without these studies and based on current available information, the risk of subsidence as a result of the coal mining by Brook Mine is substantial. (*Marino Testimony Vol. VI @pg. 1200 and POW Exhibit 11 Powerpoint*)
26. The deficiencies and total lack of a subsidence plan were explained in detail by Dr. Marino

and are encompassed in his Powerpoint presentation received as Powder River demonstrative Exhibit 11 and include:

- a. Proper mine subsidence assessment requires assessing the strength and stability of the roof, floor and pillar materials that will support the mine void. (*Marino Testimony Vol. VI @ pgs. 1205-10*)
- b. Appropriate data was not collected to do a site specific assessment of the strength and stability of the roof, floor and pillar materials at the proposed Brook mine. (*Marino Testimony Vol. VI @ pgs. 1211, 1228-1229*)
- c. Faulting in the overburden has not been studied or documented to know what impact known geologic faults may have on subsidence risk. (*Marino Testimony Vol. VI @ pgs. 1218-19*)
- d. For long-term mine stability, safety factors should be 1.6 to 2.0 or higher depending on conditions. (*Marino Testimony Vol. VI @ pg. 1286*)
- e. Using information from the permit, coal pillar pressures could reach 1,300 pounds per square inch resulting in a safety factor of less than 1.0. (*Marino Testimony Vol. VI @ pg. 1226*)
- f. The clay-stone known to exist in the overburden and underburden can have bearing strength of as little as 300 pounds per square inch resulting in a safety factor of less than 1.0 (*Marino Testimony Vol. VI @ pg. 1227*)
- g. The subsidence control plan exhibits a lack geomechanical understanding of the long-term and short-term stability of the mine. (*Marino Testimony Vol. VI @ pg. 1228*)
- h. There is insufficient information or data in the permit application and very limited analysis of subsidence risk in the documents such that the subsidence potential cannot be assessed. (*Marino Testimony Vol. VI @ pg. 1228*)
- i. Based upon Dr. Marino's review of many subsidence control plans during the decades of his experience, the Brook Mine subsidence assessment is well below industry standards. (*Marino Testimony Vol. VI @ pg. 1228*)
- j. Based upon what is reported in the mine plan the risk of subsidence at the Brook Mine is high. (*Marino Testimony Vol. VI @ pgs. 1228-29*)

- k. The calculations in the mine plan improperly used coal strength data for bituminous coal rather than the sub-bituminous coal which exists at the site. (*Marino Testimony Vol. VI @ pgs. 1226-27, 1234, 1247*)
 - l. The formula used in the application to calculate strength/bearing capacity is for extraction heights of 7 feet or less and in the Brook Mine extraction can reach 20 feet. (*Marino Testimony Vol. VI @ pg. 1227*)
 - m. Complete subsidence control plans are typically stamped by a professional engineer and no such plan is part of the Brook Mine application. (*Marino Testimony Vol. VI @ pgs. 1238-39*)
 - n. The mine plan is not complete due to the lack of proper testing and analysis to determine the risk of subsidence due to mining activities. (*Marino Testimony Vol. VI @ pg. 1244*)
- 27. Through its engineer Jeff Barron, Brook Mine **admitted** that the studies and work suggested by Dr. Marino are necessary steps for a proper mine subsidence plan. (*Barron Testimony Vol. III @ pgs. 674-675*)
 - 28. DEQ and Brook Mine have contended that a subsidence control plan would be part of an MSHA Ground Control Plan or that a MSHA Ground Control Plan would constitute a subsidence control plan. (*Barron Testimony Vol. VII @ pgs. 1533-1534*)
 - 29. A MSHA Ground Control Plan and a subsidence plan are two different plans which address different things. They are not synonymous with each other. (*Marino Testimony Vol. VI @ pgs. 1202-03, 1237, 1241*)
 - 30. A MSHA Ground Control Plan primarily addresses the safety of miners and workers during mining activities while a subsidence control plan addresses the potential for long-term subsidence for decades after mining is completed. *Id.*
 - 31. Without the proper studies the risk for subsidence cannot be properly gauged or assessed and likewise the potential environmental and reclamation impacts and consequences cannot be properly gauged or assessed.
 - 32. Absent this information it is not possible to determine whether the reclamation plan is likely to "accomplish reclamation as required by this act" as is dictated by Wyo. Stat. §35-11-406(n)(ii).

33. Because Brook Mine's application does not contain the information which affirmatively demonstrates that the proposed mine would be in compliance with Wyo. Stat. §35-11-406(n), the application is incomplete and must be denied at this time.
34. Brook Mine may complete the necessary reports and studies to supply the information satisfying its obligation to affirmatively demonstrate that its mining activities will be in compliance with Wyo. Stat. §35-11-406(n) and properly study the subsidence risk and then resubmit its application.

SECTION II. PERMIT CONDITIONS REQUIRED

In the event the EQC determines that it will allow Brook Mine's application for a coal mining permit and that it is ready to be further considered without the application containing the information which affirmatively demonstrates that the project will be in compliance with §35-11-406(n) and without a complete subsidence control plan, the Fishers request that the EQC place conditions on the permit which set parameters for the future potential mining activities. The following findings of fact and conclusions of law are proposed for that reason. The Fishers in no way concede or waive their claims that Brook Mine's application is incomplete and does not provide the necessary background information and data to be in compliance with the Environmental Quality Act and associated rules and regulations, and they specifically retain their right to appeal and fully challenge these deficiencies.

A. FINDINGS OF FACT IN RELATION TO PERMIT CONDITIONS:

Subsidence Issues:

1. The risk of subsidence and subsidence control have not yet properly been studied or assessed by Brook Mining Company, LLC. (*See Findings of Fact in Section I above*).
2. Based upon the information reported and available in the mine plan the risk of subsidence at the Brook Mine is high, unless shown otherwise by proper studies and calculations. (*Marino Testimony Vol. VI @ pgs. 1228-29*)
3. Mining should not proceed if there is a risk of material subsidence.

4. Testimony from landowners demonstrate that subsidence issues related to historic mining in the area are ongoing. Mr. Buyok, a retired engineer, testified that he recently nearly lost a four-wheel-drive tractor in an area on his property which subsided as he drove over the area and that continual subsidence is an ongoing concern. (*Buyok Testimony Vol. IV @ pgs. 1019-1022; Buyok Testimony Vol. V @ pgs. 1045-1047*)
5. The EQC finds that it is appropriate, proper and reasonable that as a condition of permit issuance, the permit have a condition requiring that prior to any mining activity at any of the proposed locations, Brook Mine will be required to supply a study evidencing that there is a low risk of long-term subsidence at that location. The permit condition shall read as follows:

Prior to any mining activity at any location, the mining company shall submit and DEQ shall approve a Subsidence Control Plan that demonstrates a low risk of long-term subsidence bearing the stamp of a professional engineer licensed in Wyoming. Such plan will be a formal subsidence control plan addressing the long-term risk of subsidence and prepared consistently with the industry standards for long-term subsidence prediction and control and demonstrate reliance upon a safety factor of 2.0 or higher. An MSHA Ground Control Plan will not qualify as a Subsidence Control Plan.

Bonding Issues:

6. Wyoming environmental protection laws are designed to ensure proper and adequate reclamation is accomplished to protect Wyoming's land, air and water quality and avoid Wyoming and its taxpayers being left with reclamation responsibilities created by mining operators. See §35-11-102 et. seq.
7. Wyoming has experienced problems with Abandoned Mine Lands projects and has recently encountered risks of very large coal mining operations with significant resources being unable to meet their reclamation obligations, including Arch Coal Company, Alpha Natural Resources, and Peabody.
8. Several witnesses, including Ramaco executive Kenneth Woodring, testified that coal mining operations can encounter unforeseen environmental challenges during operations which are not covered by the reclamation bond. (*Woodring Testimony Vol. IV @ pgs. 827-829*)
9. Incremental bonding is for reasonably "foreseen" reclamation costs. The Objectors have all questioned whether the potential problems and reclamation have been properly assessed by Brook Mine.
10. Brook Mining Company, LLC is the sole applicant for this mining permit and despite repeated references to Ramaco Resources, Inc., Ramaco is not a permit applicant. (*See Permit Application*) However, Ramaco and Brook Mining Company, LLC were often

referred to interchangeably, and representatives of Ramaco (Ken Woodring) testified in support of the application.

11. Pursuant to Wyoming Statute §17-16-1630, all corporations registered in the State of Wyoming must submit an Annual Report to the Wyoming Secretary of State's Office. Wyo.Stat. §17-16-1630 (LexisNexis 2015)
12. An offer of proof was made by the Fishers demonstrating that Brook Mining Company, LLC has reported to the Wyoming Secretary of State that its total assets are worth \$250,000 or less. (*Fishers' Exhibit 27, Offer Of Proof filed with EQC on May 25, 2017*) [A recent Annual Report was filed with the Wyoming Secretary of State's Office by Brook Mining Company, LLC dated June 19, 2017 still showing total assets worth \$250,000 or less.] (See Exhibit A attached hereto.)
13. Neither Brook nor Ramaco has an operating history in Wyoming or any other state demonstrating a history of satisfying its reclamation and environmental obligations.
14. Brook Mining Company, LLC has no current employees.
15. Brook Mining Company, LLC through its witnesses, including Jeff Barron and Ramaco's consultant Ken Woodring, expressed confidence in the soundness and environmental safeguards of the mine plan. (*Woodring Testimony Vol. IV @ pgs. 828-829; Barron Testimony Vol. IV @ pg. 808*) These expressions of confidence are properly backed up by financial surety to the State of Wyoming to assure reclamation and environmental liabilities are born by the industry and not the State of Wyoming and its taxpayers, which is the policy of this State. Wyo. Stat. §35-11-102 et. seq.
16. The EQC finds that it is appropriate, proper and reasonable that as a condition of permit issuance and to insure responsible development, and that reclamation is completed by the operator and not borne by the State of Wyoming and its taxpayers, that all reclamation and environmental liabilities of Brook Mining Company, LLC be guaranteed by Ramaco Resources, Inc. This condition shall read as follows:

Prior to commencement of any mining operations, Ramaco Resources, Inc. shall provide a written guarantee to the State of Wyoming guaranteeing the payment and satisfaction of all reclamation and environmental liabilities of Brook Mining Company, LLC.

Blasting Issues:

17. As proposed, Brook Mine's blasting plan provides that the company can conduct blasting at any time during daylight hours (sunrise to sunset) without any further restrictions on blasting times. (*Emme Testimony Vol. III @ pg. 638*)

18. No justification or reason was given by Brook or DEQ as to why blasting would be a necessary aspect of mining operations on such a broad daylight to dark basis every day.
19. Indeed, Doug Emme of the DEQ indicated that Brook Mine originally proposed a more restricted blasting schedule and were encouraged by DEQ to broaden the blasting schedule to all daylight hours every day of the year. (*Emme Testimony Vol. III @ pg. 623; Barron Testimony Vol. IV @ pg. 800*)
20. Witnesses from both Brook Mine and the DEQ testified that the blasting at Brook Mine **would not be** similar to that in the Campbell County coal mines where unlimited daylight blasting is allowed and necessary. Mr. Woodring indicated that the Brook Mine operation would be a "small mine by comparison" to other coal mines. (*Emme Testimony Vol. III @ pgs. 638-639; Barron Testimony Vol. IV @ pg. 782; Woodring Testimony Vol. IV @ pg. 820*)
21. The only justification given for the unlimited daylight blasting was that "safety concerns" might arise if a blasting time was about to expire after explosives had been set and for unforeseen reasons the company could not facilitate blasting within the designated blasting time. (*Barron Testimony Vol. IV @ pg. 801*)
22. However, Doug Emme testified that the DEQ will allow blasting outside of designated times, including in the dark, for safety or emergency reasons and only requires or requests that the operator alert DEQ of the situation. (*Emme Testimony Vol. III @ pg. 586*)
23. When asked by Council Members Lally, Agopian and counsel if it would be reasonable to put some restrictions on blasting given the nature of Brook Mine's proposed operation and the large number of landowners involved, DEQ's Emme replied that it is possible to include conditions restricting the blasting operation. (*Emme Testimony Vol. III @ pgs. 617-618, 639-640*)
24. Testimony revealed that many residential homes are located within one-half mile of the permit boundary and blasting has the potential to be disruptive and bothersome to a large number of residents as well as concerns about damage from vibrations associated with the blasting. (*Emme Testimony Vol. III @ pg. 584; Buyok Testimony Vol. IV @ pgs. 1019-1020, 1022, 1045-1046*)
25. Although working from DEQ's Sheridan offices only a few miles from the proposed mine site, Mr. Emme who reviewed and approved Brook Mine's blasting plan on behalf of DEQ, had not visited the area of the mine site or explored the large number of potentially affected landowners or historic stone structures and other structures prior to approving the blasting plan. (*Emme Testimony Vol. III @ pg. 603*)

26. There is no provision in the current mine plan to restrict or limit blasting during high wind or weather events. (*Emme Testimony Vol. III @ pgs. 608-609*)
27. DEQ has implemented conditions on other mine permits regarding restrictions on blasting during inversions or high wind events and the mines themselves have voluntarily put restrictions on their blasting operations. (*Emme Testimony Vol. III @ pgs. 608-609*)
28. Neither Brook Mine nor DEQ presented any evidence to suggest why such restrictions were not appropriate or infeasible at the proposed Brook mine.
29. For the above reasons, including the fact that no justification or reason was stated for why blasting will be necessary from sunrise to sunset every day of the week throughout the year, the EQC finds that reasonable limitations on blasting times are an appropriate condition of permit issuance. This condition shall read substantially as follows:

Absent a demonstration of good cause, Brook Mine shall restrict its blasting to daylight hours between 9:00 a.m. and 4:00 p.m. local time, Monday through Friday and shall conduct no blasting on legal holidays. Brook Mine shall also be required to limit blasting as directed by the DEQ during inversions, high wind events and other conditions deemed by the DEQ to constitute a safety or health concern.

Seismic Monitoring:

30. The Fishers and other landowners expressed a desire to have seismic monitoring placed on their property to measure the strength of the shock waves or "vibration" which reach their residence during blasting. (*Fisher Testimony Vol. V @ pgs. 1165-1166*); *Bocek Testimony Vol V @ pg. 1093*; *Collins Testimony Vol. V @ pgs. 1086-1087*)
31. DEQ personnel, including Doug Emme, testified that in other mining operations the DEQ has installed such seismic monitoring on the property of homeowners near mines where blasting is occurring. (*Emme Testimony Vol. III @ pgs. 618-619*)
32. Brook's engineer, Jeff Barron, testified that he is familiar with requests for seismic monitoring and that his employer Western Water has installed seismic monitoring regarding other mine operations in the Powder River Basin. (*Barron Testimony Vol. IV @ pgs. 770-771, 783*)
33. Neither Brook nor DEQ offered any evidence why such seismic monitoring was not appropriate or was impractical at the Brook Mine.
34. Testimony from several landowners, including Mary Fisher, indicated that historic rock

structures are located on their property and they are concerned about the impact blasting will have on these structures. (*Bocek Testimony Vol. V @pg. 1093; Collins Testimony Vol. V @pg. 1086; Fisher Testimony Vol. V @pg. 1143*)

35. For the above reasons, the EQC finds that it is reasonable and appropriate that as a condition of permit issuance, the operator Brook Mine will be required at its expense to install and maintain appropriate seismic monitoring during blasting. Such condition shall read substantially as follows:

Brook Mine shall install and maintain seismic monitoring as directed by DEQ on the property of any residential homeowner who requests such monitoring and lives within one-half mile of the permit boundary. Brook Mine shall share all data or information collected from such monitoring with the DEQ and with the homeowner requesting the monitoring.

Alluvial Valley Floors:

36. DEQ Exhibit #16 reflects that DEQ has designated a significant area adjacent to the Brook Mine as "Potential AVF" (alluvial valley floor). The regulations provide that alluvial valley floors are subject to greater protections.
37. DEQ Exhibit #16 reflected that this "potential AVF" was not formally classified by DEQ as AVF due to claims of access being denied by landowners in the area. (*Kristiansen Testimony Vol. II @pg. 304*)
38. On cross-examination, BJ Kristiansen, could not or would not name one landowner who had refused DEQ access for purposes of determining if their property was classified as AVF and admitted that the Objectors such as the Fishers, Mr. Bocek and Mr. Buyok had not denied DEQ access nor had DEQ even asked for access. (*Kristiansen Testimony Vol. II @pgs. 303-305*)
39. DEQ admitted that the lands labeled as "Potential AVF" on DEQ #16 and shown in Fisher Exhibit #1 are "probably" alluvial valley floor lands although DEQ has not yet designated them as such. *Id.*
40. DEQ admitted there could be communication between the coal seam aquifers and the alluvial valley floor aquifers and therefore DEQ could not say that material damage to the AVF aquifer would not happen as a result of mining. *Id.*
41. **For the above reasons, the EQC finds that it is reasonable and appropriate that as a condition of permit issuance, the DEQ shall seek access from all willing landowners and perform a formal assessment of whether the areas it has already designated as "Potential AVF" in DEQ Exhibit #16 qualify for formal designation as AVF, and the**

EQC directs the DEQ to do so and further determine if additional alluvial valley aquifer monitoring wells should be required in this area.

Domestic Water Wells:

42. Draw-down in domestic/stock water wells are predicted to be as much as 25 feet. (*Kuchanur Testimony Vol. III @ pg. 541 and DEQ Exhibit 12-251, Table 4.9-1*)
43. Expert Wireman testified that due to the confined nature of the coal aquifer, even a small reduction in the water available could have a material impact on domestic water users such as the Fishers who obtain their water from the coal seam. (*Wireman Testimony, Vol. VI @ pgs. 1382-85*)
44. Landowner John Buyok testified that in times of prolonged drought his water well became incapable of producing water and pumped only sediment from the bottom of the well. (*Buyok Testimony, Vol. V, @ pgs. 1038-39*). This testimony is consistent with the description and concerns expressed by Mr. Wireman.
45. Brook Mine has committed in its mine plan to remedy any material damage to the quantity or quality of the water in the domestic water wells for landowners within one-half mile of the permit boundary. (*See Brook Mine Permit*)
46. The EQC determines that it is appropriate that the permit should contain a condition which further defines Brook's obligations in the event a domestic/stock water well is materially harmed in quantity or quality. Such condition shall read as follows:

In the event DEQ determines there is a reasonable basis to conclude that mining operations have caused material damage to the quantity or quality of water in a domestic water well located in the permit area or within one-half mile of the permit boundary, Brook shall supply substitute water of the same or better quality and quantity as previously existed, including drilling a replacement well when appropriate.

Conditions Conceded by Brook and DEQ Which Must Be Incorporated In The Permit:

47. DEQ and Brook Mine have agreed that it would be appropriate to include both registered and adjudicated wells in the mine plan. (*DEQ Answer To Fishers' Interrogatory No. 10* (attached as Exhibit B); *Kristiansen Testimony Vol. II @ pgs. 290-291*; *Barron Testimony Vol. IV @ pg. 800*; *Kuchanur Testimony Vol. III @ pgs. 500-501*)
48. DEQ has agreed to amend the mine plan to include additional monitoring stations upstream and downstream of the Tongue River. (*DEQ Answer To Fishers' Interrogatory No. 11* (attached as Exhibit B); *Kristiansen Testimony Vol. II @ pg. 290*; *Barron Testimony Vol. IV @ pg. 800*; *Kunze Testimony Vol. II @ pgs. 411-412*)

49. Matt Kunze from DEQ further recommended that there be a monitoring site on Goose Creek to have additional data to ensure a more accurate interpretation of the upstream-downstream comparison in the Tongue River. (*Kunze Testimony Vol. II @ pg. 412*)
50. **Therefore, all three of the above conditions should be incorporated in the Brook Mine Plan.**

DEQ's and Brook Mine's Acceptance Of Conditions Imposed by EQC:

51. Importantly, throughout the contested case hearing in this matter, both DEQ and Brook Mine (through its engineer Jeff Barron) repeatedly agreed to comply with conditions that EQC deemed appropriate and reasonable. Mr. Barron testified that conditions could be "useful information for the council" and conditions would be "welcome" and "accepted". (*Barron Testimony Vol. IV @ pgs. 779-780, 781-788. See also references above regarding DEQ acknowledgments and Kristiansen Testimony Vol. II @ pg. 291*)

B. CONCLUSIONS OF LAW RELATIVE TO THE CONDITIONS:

1. Wyoming DEQ and the EQC are empowered to place conditions on the issuance of a coal mining permit which relate to blasting, seismic monitoring and blasting during certain atmospheric conditions by virtue of the fact that Chapter 2 of the Land Quality Division Rules-Coal relating to "Application Requirements" requires that the operator submit a blasting plan acceptable to the DEQ. Wyo. Admin. Rules, DEQ-LQD, Coal, Ch. 2 §5(a)(vii).
2. Wyoming DEQ and EQC are empowered to place conditions on issuance of a coal mining permit which assure financial responsibility for environmental obligations. The Environmental Quality Act's stated goal and the policy of Wyoming are to ensure proper reclamation of disturbance and the protection of the quality of Wyoming's land, air and water. See §35-11-102 et. seq. Hence, requiring sufficient financial surety for such obligations, such as requiring that a parent or related company to the applicant provide a financial guarantee of the reclamation and environmental obligations of an applicant, is within the power of the agency.
3. Wyoming DEQ and EQC are empowered to place a condition on issuance of a coal mining permit requiring that appropriate and proper subsidence investigation and mitigation are undertaken as part of issuing a permit, because a Subsidence Control Plan is a required part of any such application involving a component of underground mining. Wyo. Admin. Rules, DEQ-LQD-Underground Coal Mines, Ch. 7 §1(a)(v).
4. Wyoming DEQ and EQC are empowered to place a condition on issuance of a coal mining permit requiring that appropriate and proper hydrologic studies, monitoring and protections be regulated as part of issuing a permit so as to prevent material damage to hydrologic

balance outside the permit area and protections in the event of such damage. Wyo. Stat. §35-11-406(n)(iii) (LexisNexis 2015).

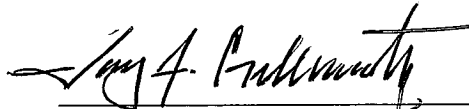

5. DEQ and the EQC are empowered with the designation and protection of alluvial valley floors through the permitting and enforcement process. Wyo. Stat. §35-11-406(n)(v) (LexisNexis 2015).

IV. CONCLUSION

There have been insufficient studies done to demonstrate that the proposed mine plan will not cause material damage to the hydrologic balance in this historic and important river valley, and the application is thus incomplete and must be denied at this time pending a more scientific and reasoned assessment of the risks. In the event the permit is allowed to proceed, it must only be allowed to do so with the critical conditions set forth above which provide protection for the rugged and resilient landowners who have been here for decades and for the valuable air, land and water resources of the State of Wyoming.

DEPARTMENT OF ENVIRONMENTAL QUALITY'S RESPONSE TO OBJECTORS
MARY BREZIK-FISHER AND DAVID FISHER'S INTERROGATORIES

Respondent, the State of Wyoming, Department of Environmental Quality ("Department"), through its undersigned counsel, hereby responds to Mary Brezik-Fisher and David Fisher's, Interrogatories. The following Discovery Responses are provided in accordance with Chapter 2, Sections 10 and 14 of the Department of Environmental Quality's and the Environmental Quality Council's Rules of Practice and Procedure, and Wyoming Rules of Civil Procedure 26 and 33.

INTERROGATORIES

INTERROGATORY NO. 1: Identify the basis for a determination by DEQ that geotechnical studies demonstrate a scientific basis for the conclusion that the proposed Mine Plan for Brook Mine does not present a risk of subsidence, sloughing or other geotechnical risks and the specific and mandatory requirements of the Mine Plan which dictate how the operator is obligated to respond in the event geotechnical problems are encountered. Your answer should include the name, address, and telephone number of all individuals or companies which DEQ is aware of that conducted Geotechnical studies for the purpose of investigating the geotechnical conditions in the area where Brook Mine proposes to conduct mining activities, whether the DEQ has conducted its own studies and the DEQ's basis for relying on any studies submitted by Brook Mine.

EXHIBIT B

Environmental Quality Council hearings. This interrogatory would also require DEQ to provide disclosures prior to the timeline established in the scheduling order in this matter. Additionally, this interrogatory requests information protected by work product and attorney-client privilege.

Moreover, this interrogatory is vague, overly broad, and unduly burdensome to the extent that it requests all documents supplied to, and "all other documents of any sort reviewed" by DEQ expert witnesses. DEQ's expert witnesses have not been specifically retained to provide expert testimony in this matter and therefore the documents they have reviewed or had available to them include all of DEQ's files regarding this permit application extending over the long period during which DEQ has reviewed the permit application.

Without waiving these objections, with respect to subparagraph #1, DEQ has already provided this information in its expert witness disclosures provided to the parties.

With respect to subparagraph #2, DEQ has already provided this information in its expert witness disclosures provided to the parties. DEQ reserves its right to provide its witness disclosures according to the scheduling order and the Rules of Civil Procedure.

With respect to subparagraph #3, this information can be found in documents produced in response to Request for Production 5.

With respect to subparagraph #4, this information can be found in document produced in response to Request for Production 5.

With respect to subparagraph #5, all of the expert witnesses designated by DEQ are employees of the agency and were not specifically retained to provide expert testimony in this case. DEQ's expert witnesses have reviewed and had available to them the permit application and its related files. DEQ experts have also reviewed or had available to them correspondence, email, and other documents exchanged between DEQ, its counsel, and those experts are privileged work product, attorney-client communication, or documents covered by the deliberative process privilege. It is unduly burdensome and unreasonable for DEQ to identify each document that its witnesses may have reviewed or had available to them over the last five years.

INTERROGATORY NO. 10: Identify whether the mine plan requires that domestic and stock wells which are impacted or damaged by mine operations will be repaired and/or replaced if the wells are "registered" with the Wyoming State Engineer's Office as opposed to being "adjudicated".

ANSWER:

The Brook Mine permit application, Mine Plan MP 5.8 currently states, "If any adjudicated water rights are determined to be effected by the dewatering process of the Brook Mine, that water right will be replaced with a water source of similar quantity and quality as required by Wyoming Statute §35-11-415(b)(xii), until such time that the original surface water right's functionality is restored." Based on the comments received during the public notice period, LQD will require the mine to revise the above language to include all wells that are registered with the Wyoming State Engineer's Office.

INTERROGATORY NO. 11: Identify the locations of all monitoring stations on the Tongue River which are included in the mine plan and include in your answer whether monitoring

stations are located upstream and downstream of the permit boundary and why DEQ considers the identified stations adequate to monitor for potential adverse impacts on the Tongue River by the Brook mining operation.

ANSWER:

As noted in Mine Plan Section MP.7.1 and Table MP.7-1 of the Brook Mine Permit Application, the Tongue River at two existing USGS stations outside the permit boundary (Station No. 06299980 – *Tongue River at Monarch, WY* and Station No. 06306300 - *Tongue River at State Line near Decker, MT*) will be part of the operational monitoring plan during the mining phase of the permit. The location of the USGS Station No. 06299980 is shown in Mine Plan Exhibit MP.7-1 of the Brook Mine permit application. The location of the USGS Station No. 06306300 is shown in Appendix D6 Exhibit D6.1-1 of the Brook Mine permit application. USGS Station No. 06299980 is not located upstream of the permit boundary; it is located downstream of the confluence of Slater Creek and the Tongue River. USGS Station No. 06306300 is located downstream of the permit boundary in Montana, just north of the Wyoming state line.

Based on the comments received during the public notice period, LQD may recommend revising the locations of monitoring stations on the Tongue River and Goose Creek.

INTERROGATORY NO. 12: What is DEQ's current understanding of the annual and total coal production estimates presented by Brook Mine and/or Ramaco representatives in the first five years of production, and since those estimates appear to have changed over time, explain how DEQ has been able to accurately evaluate the potential impacts to air quality, water quality and resources, and land resources?

ANSWER:

The production estimates in the Brook Mine permit application are located in Table MP.2-1. DEQ's understanding is that the estimates in that table are current.

INTERROGATORY NO. 13: How many surface coal mine applications and permits for new surface coal mines, including highwall mining, in the State of Wyoming have the DEQ offices in Wyoming and the DEQ offices in Sheridan County reviewed and evaluated within the last twenty years?

ANSWER:

During the past 20 years, LQD has reviewed and approved 4 new permit applications, 2 of which were processed by the Sheridan District 3 office. Also during the past 20 years, the LQD has reviewed and approved 46 permit amendments, which add new area to an existing permits. The Sheridan District 3 office has processed 29 of the 46 permit amendments. The information submitted by applicants and reviewed/approved by LQD is the same for an amendment and for a new application, with the only difference being that an amendment is not assigned a new permit number. In fact, amendments may be more complex than a new permit because the mine plan and reclamation plan have to combine with the existing permit.

Verification

I, Alan Edwards, the Deputy Director of the Wyoming Department of Environmental Quality, have reviewed the Wyoming Department of Environmental Quality's responses to Objector Mary Brezik-Fisher and David Fisher's interrogatories, and I hereby confirm that they have been prepared under my direction and are true and correct to the best of my knowledge and belief.

*ATTORNEYS FOR OBJECTOR
BIG HORN COAL COMPANY*

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **Docket Nos. 17-4802, 17-4803,**
) **and 17-4804 (Consolidated)**
TFN 6 2-025)

**BIG HORN COAL COMPANY'S PROPOSED FINDINGS OF FACT AND
CONCLUSIONS OF LAW**

Big Horn Coal Company, LLC ("Big Horn"), by and through its undersigned counsel of record, hereby submits its Proposed Findings of Fact and Conclusions of Law as directed by the Environmental Quality Council's ("EQC" or the "Council") order following the close of evidence at hearing.

INTRODUCTION

The permit application submitted by Brook Mining Company, LLC ("Brook Mine") fails to meet the legal requirements of a surface coal mining permit application. Brook Mine's multiple failures to provide critical and required information in its permit application are not minor omissions. Rather, these failures are "deficiencies" that preclude permit approval. The EQC therefore should enter its Findings of Fact, Conclusions of Law,

and Order directing the Department of Environmental Quality (“DEQ”) to either deny Brook Mine’s requested permit, or deem the permit application deficient and require Brook Mine to affirmatively address each of the deficiencies, resubmit its permit application to DEQ, and then republish notice of the compliant permit application for public comment pursuant to the Environmental Quality Act (“EQA”), Wyo. Stat. Ann. § 35-11-406(h)-(k),¹ and the applicable rules and regulations.

I. Background

The record of this contested case hearing patently demonstrates that Brook Mine has spent over three years preparing a permit application that fails to meet statutory and regulatory requirements. Less critical for this Council’s decision, but an important consideration nonetheless, throughout the permit application process and in the hearing before the EQC, Brook Mine consistently demonstrated it has no intent to seriously consider the objections and concerns of nearby landowners or otherwise address the deficiencies in its permit application. It is now up to this Council to do so.

Broadly speaking, this Council must determine whether Brook Mine has satisfied its burden to affirmatively establish that its permit application is legally sufficient and direct whether (and on what terms) the permit application can proceed to the DEQ for final written findings and eventual issuance or denial. *See* Wyo. Stat. Ann. § 35-11-406(k), (p). To be sure, it is not the burden of Big Horn or any other objector to establish that the permit application is insufficient. Brook Mine readily admits it bears the burden of proof in these

¹ According to Wyo. Stat. Ann. § 35-11-103(e)(xxiv) “‘Deficiency’ means an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director[.]”

proceedings, which includes the burden of proving to the Council that its permit application is complete and without deficiencies. *See Brook Mine's Brief on Statutes and Regulations that the Council Must Consider*, p. 10. Yet when objectors identified application deficiencies at hearing, Brook Mine never showed the Council or the objectors where the required information could be found in the permit application, nor did Brook Mine demonstrate that the information contained in the application is accurate and complete. Brook Mine instead attempted to silence or cast doubt on objector testimony, and addressed the identified deficiencies in generalities – affirming the type of information contained in the application, how many pages the application contains, and how long Brook Mine and DEQ personnel spent preparing and reviewing the application. Generalities do not satisfy Brook Mine's burden of proof.

The law requires Brook Mine's permit application to stand on its own. Analytical gaps, missing data and inaccurate information required by law to be included in a surface coal mine permit application simply cannot be remedied with testimonial assurances or by reference to DEQ's review process. Moreover, specific surface coal mine application requirements cannot be satisfied with inaccurate assumptions resulting from limited data taken from a large, data diverse geographic area. Brook Mine's permit application itself must contain the information required by statute and regulation. The required data and analysis is either present in the permit application or it is not. Without establishing that its permit application contains ***all*** required information, and that ***all*** the required information is ***accurate***, Brook Mine fails to meet its burden as a matter of law.

II. Scope of the Council's Review

As this Council is well aware from prior briefing, the parties disagree as to the proper role of the Council and the scope of its review and decision, particularly as to whether the Council is to consider the requirements of section -406(n) and whether the Council is to direct DEQ to approve or deny Brook Mine's permit application at this time. The Council is now well aware of precedent² and the parties' respective positions on this issue, and Big Horn will not repeat those arguments here. Because the Council has declined to rule on whether it will consider Section -406(n)'s requirements prior to the parties' submission of proposed findings of fact and conclusions of law, Big Horn will present its proposed conclusions of law related to section -406(n) requirements separate from its proposed conclusions of law related to the legal requirements for surface coal mine permit applications found elsewhere in the EQA and the DEQ's Land Quality coal rules and regulations. All parties do seem to agree that the Council must review and consider whether Brook Mine's permit application satisfies Wyo. Stat. Ann. § 35-11-406(a)-(k) and the DEQ's Land Quality coal rules and regulations. *See* Briefs of the Parties in response to the Council's *Briefing Order*, dated June 13, 2017.

III. Scope of Big Horn's Objections to Brook Mine's Permit Application

Brook Mine (also often denominated RAMACO in permit documents or testimony) plans to develop coal resources via both open pit and highwall/auger mining methods. DEQ

² See Exhibit 1 to *Brook Mine's Response Brief to Big Horn Coal's Brief Regarding the Scope of the [EQC's] Review and Request for Oral Argument* (demonstrating that in *The Matter of Objections to Amax Coal Company, Eagle Butte Mine, TFN 1 6/212*, the Council specifically made findings of fact and conclusions of law related to the requirements of Section -406(n), and ordered DEQ to take specific action on the permit application).

Exh. 12, p. 12-192. Big Horn is the owner of surface lands, including valuable improvements and facilities, located within Brook Mine's proposed permit area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn also holds an existing coal mine permit that overlaps Brook Mine's proposed permit area and imposes certain reclamation responsibilities on Big Horn, which are enforceable by DEQ. Tr. Vol. IV, p. 836, ln. 11-16. Big Horn's objections to Brook Mine's permit application therefore are reasonably focused on Brook Mine's proposed operations within this overlapping area, more particularly known as the TR-1 mining area, located in in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M. *See Figure 1; see also* DEQ Exh. 12, p. 12-134, Tr. Vol. II, p. 204, ln. 10-13.

Figure 1. Taken from DEQ Exh. 12, p. 12-134 and showing the TR-1 mining area as the southeastern most mining area.

Evidence of record indisputably demonstrates that Brook Mine failed to provide required, accurate TR-1 area information in its surface coal mine permit application. The evidence further demonstrates that Brook Mine has not satisfied certain legal requirements related to surface water monitoring, underground coal fire analysis and management, overlapping permit boundary analysis and management, and surface owner protection bonding. These requirements must be satisfied prior to permit approval and issuance.

More specifically, Brook Mine's permit application contains and relies on inaccurate, missing or inadequate data and analysis for the TR-1 area, predominantly as it relates to the geology and groundwater located in the overburden above the coal seams Brook Mine proposes to mine. Without complete and accurate information as to the TR-1 area and the projected impacts thereto, and without detailed plans regarding the monitoring of these impacts, it is impossible for Brook Mine, DEQ, Big Horn, or the public to adequately assess Brook Mine's proposed mining operations or the resulting impacts.

The Council cannot fairly or reasonably characterize the flaws in Brook Mine's surface coal mine permit application as minor omissions that can be cured by stipulation or minor permit revisions. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxiv); -406(h). The inaccurate, incomplete and missing geologic and hydrologic TR-1 area information constitute legal deficiencies in Brook Mine's permit application. The EQA does not tolerate such deficiencies. The permit application itself must include complete and accurate information, the DEQ must analyze complete and accurate information, and the

public must have the opportunity to review and comment on complete and accurate information *prior to* permit approval. Wyo. Stat. Ann. § 35-11-406(h) – (k).³

Accordingly, the Council must order Brook Mine to cure the deficiencies in its mine permit application by preparing, resubmitting to DEQ, and eventually republishing a legally sufficient surface mine permit application. At the very least, all deficiencies must be cured to the DEQ's and EQC's satisfaction prior to Brook Mine conducting any mining operations.⁴

IV. Relevant Legal Requirements

The following list sets forth the EQA and DEQ Land Quality – Coal Rules and Regulations permit application requirements specifically related to Big Horn's objections.⁵

i. Hydrology and Geology

- **Wyo. Stat. Ann. § 35-11-406(a)(vii)** - A general description of the land which shall include as nearly as possible ... if known, the nature and depth of the overburden, topsoil, subsoil, mineral seams or other deposits and any subsurface waters known to exist above the deepest projected depth of the mining operation.
- **Wyo. Stat. Ann. § 35-11-406(b)(v), (xvi), (xviii)** - A mine and reclamation plan dealing with the extent to which the mining operation will disturb or change the lands

³ Because Brook Mine intends to begin its mining operations in the TR-1 area, *see* DEQ Exh. 12, p. 12-134, any suggestion that Brook should be allowed to gather TR-1 area information and cure the TR-1 related permit application deficiencies following permit approval and/or the initiation of mining operations would risk unforeseen and permanent environmental damage and violate the EQA and DEQ Land Quality Division rules and regulations.

⁴ In its proposed *Conclusions of Law* below, Big Horn provides the Council alternative conclusions in the form of conditions intended to address the deficiencies in Brook Mine's permit application prior to the initiation of mining operations.

To be clear, Big Horn asserts that Brook Mine's permit application is deficient and not eligible for approval under the express provisions of the EQA. Big Horn only offers the proposed conditions as minimal, necessary steps that must be taken in the event the Council orders the DEQ to make its remaining findings and issue the permit.

⁵ All rules and regulations cited herein represent DEQ's, Land Quality – Coal Rules and Regulations. For brevity, the rules and regulations will be referred to herein by Chapter and Section number only.

to be affected and the plan whereby the operator will reclaim the affected lands, to include:

- A map setting forth the drainage plan on, below, above and away from the affected land including subsurface water above the mineral seam to be removed; and further showing the location of all waste water impoundments, any settling ponds, and other water treatment facilities, constructed drainways and natural drainways, and the surface bodies of water receiving this discharge.
 - A statement of the source, quality and quantity of water, if any, to be used in the mining and reclamation operations.
 - A plan to minimize the disturbances to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation.
- **ENV LQC Ch. 2 § 4(a)(vii), (viii), (x)(A), (xii), (xiv)** - A description of the lands to be affected within the permit area and how these lands will be affected, to include:
- A detailed description of the geology within the proposed permit area down to and including any aquifer⁶ to be adversely affected by mining below the lowest coal seam to be mined, to include structural geology that may influence the required reclamation, and the occurrence, availability, movement, quantity, and quality of potentially affected surface and groundwaters.
 - For the permit area, and adjacent areas, a characterization of the geologic strata down to and including the deeper of either the stratum immediately below the lowest coal seam to be mined, or any aquifer below the lowest coal seam to be mined that may be adversely impacted by mining, to include a statement of the results of test boring holes or core samples collected to show:
 - The location of any groundwater; and
 - Lithologic characteristics and thickness of each stratum and coal seam.
 - A description of the overburden, including the thickness, geological nature or any other factor that will influence the mining or reclamation activities.
 - Complete information on groundwater that may be affected in the permit area or adjacent areas, to include:

⁶ ENV LQC Ch. 1 § 2(j), defines “aquifer” as “a zone, stratum or group of strata that stores and transmits water in sufficient quantities for a specific use.” Nothing in this definition requires that water in a particular zone or stratum be currently used in order to qualify as an aquifer.

- An estimate of the depth and quantity of any groundwater existing in the proposed permit area down to and including the strata immediately below the lowest mineral seam to be mined, for which the operator may be required to conduct testing in order to determine the exact depth, quantity and quality of groundwater in geological formations affected by the mining operations;
 - The lithology and thickness of all known aquifers; and
 - The recharge, storage, and discharge characteristics of the groundwater, all according to the parameters and detail required by the Administrator of the Land Quality Division.
- A description of the surface water and groundwater and related geology in the permit area and general area sufficient to assess the probable hydrologic consequences (PHC). And if the determination of the PHC required by Chapter 19, Section 2(a)(i) indicates that adverse impacts on or off the proposed permit area may occur to the hydrologic balance, then information supplemental to that required under (a)(xi) and (a)(xii) of this Section (requiring complete surface and groundwater information) must be provided to evaluate such PHC and to plan remedial and reclamation activities.
- **ENV LQC Ch. 2 § 5(a)(x)** - A determination of the PHC of the proposed operation on the hydrologic regime and the quantity and quality of surface water and groundwater systems within the permit area and the general area consistent with the information required in Chapter 19, Section 2. The PHC determination shall be based on baseline hydrologic, geologic and other information collected for the permit application and may include data statistically representative of the site. This determination shall specifically address potential adverse hydrologic consequences and describe preventive and remedial measures.
- **ENV LQC Ch. 2 § 5(a)(ix)(C), (D)** - A plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and adjacent to the permit area, to include:
 - A plan to restore the approximate recharge capacity of the permit area in accordance with Chapter 4, Section 2(h), which requires the groundwater recharge capacity of reclaimed lands to be restored to a condition that provides a recharge rate approximating the pre-mining recharge rate; and
 - A Surface Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the surface water for current and approved postmining

land uses and to the objectives for protection of the hydrologic balance as set forth in subsection 5(a)(ix) of Chapter 2.

- The plan must identify the surface water quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- A Ground Water Monitoring Plan based on the PHC determination and the analysis of all baseline hydrologic, geologic, and other information in the permit application.
 - The plan must provide for the monitoring of parameters that relate to the suitability of the groundwater for current and approved postmining land uses and to the objectives for protection of the hydrologic balance set forth in subsection 5(a)(ix) of Chapter 2.
 - The plan must identify the quantity and quality parameters to be monitored, sampling frequency, and site locations, and describe how the data may be used to determine the impacts of the operation upon the hydrologic balance.
- **ENV LQC Ch. 2 § 6(b)** - A reclamation plan that describes how the operator will reclaim the affected lands to the proposed postmining land use in accordance with Chapter 4, Section 2(a), which requires restoration of the land to a condition equal to or greater than the highest previous use.
- **ENV LQC Ch. 19 § 2(a)(i)** - A determination of the projected result of proposed surface coal mining and reclamation operations, both on and off the mine site, which may reasonably be expected to change the quantity or quality of the surface and groundwater; the surface and groundwater flow, timing and availability, the surface and groundwater quality under seasonal flow conditions, including dissolved and suspended solids; and the stream channel conditions. This information shall be in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems including the impacts resulting from the proposed operation and their interaction with the impacts of all anticipated mining upon all affected hydrologic systems.
 - ii. Underground Coal Fires
- **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii)** – A plan for insuring that materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent threats to human or animal health and safety, as well as procedures

proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life.

- **ENV LQC Ch. 2 § 5(a)(iv)** – Contingency plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.

iii. Blasting Operations

- **Wyo. Stat. Ann. § 35-11-415(b)(xii)(E)** – surface coal mining operators **must**, upon request of a resident or owner, conduct a pre-blasting survey of any man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area.

iv. Overlapping Permits and Related Agreements

- **ENV LQC CH. 2 § 5(a)(xviii)** – Plans of mine facilities (including overstrip areas) that are to be shared by two or more separately permitted mining operations may be included in one permit application and referenced in the other application(s). Each permittee shall bond the mine facilities unless the permittees sharing it agree to another arrangement for assuming their respective responsibilities. If such agreement is reached, the application shall include a copy of the agreement between or among the parties setting forth the respective bonding responsibilities of each party for the mine facilities.

v. Surface Owner Protection Bond

- **Wyo. Stat. Ann. § 35-11-416(a)** - Where the surface owner is not the owner of the mineral estate proposed to be mined by mining operations, a permit shall not be issued without the execution of a bond or undertaking to the state for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate, to the crops and forage, or to the tangible improvements of the surface owner. The amount of the bond shall be determined by the administrator and shall be commensurate with the reasonable value of the surrounding land, and the effect of the overall operation of the landowner. Financial loss resulting from disruption of the surface owner's operation shall be considered as part of the damage.

vi. Wyo. Stat. Ann. § 35-11-406(n) Requirements

- **Wyo. Stat. Ann. § 35-11-406(n)** – The permit applicant must establish that its permit application is in compliance with the EQA and all applicable state laws. No surface coal mining permit shall be approved unless the applicant affirmatively demonstrates and the administrator finds in writing:
 - The application is accurate and complete;

- The reclamation plan can accomplish reclamation as required by the EQA;
- The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

PROPOSED FINDINGS OF FACT

1. This matter arises from the application of Brook Mining Company, LLC (“Brook Mine”) to the Department of Environmental Quality (“DEQ”), Land Quality Division (“LQD”), for a permit to conduct surface coal mining activities.

2. DEQ/LQD determined Brook Mine’s permit application, TFN 6 2-025, complete and suitable for publication pursuant to Wyo. Stat. Ann. § 35-11-406(h). In accordance with Wyo. Stat. Ann. § 35-11-406(j) and (k), the permit was published to the public and interested parties were required to submit written objections to the application by January 27, 2017. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit D.

3. Objectors in this case, Big Horn Coal Company (“Big Horn”), Powder River Basin Resource Council (“PRBRC”), and Mary Brezik-Fisher and David Fisher, submitted timely objections to the application. *See* BHC Exh. 3; Fisher Exh. 26; PRBRC Exh. 1.

4. Objectors requested an informal conference. DEQ denied these requests, leading to this contested case proceeding. *See Big Horn’s Response to Brook Mine’s Motion to Dismiss Big Horn Coal Company’s Petition for a Contested Case Hearing*, Exhibit A.

5. The Environmental Quality Council (“EQC” or “Council”) conducted a seven (7) day contested case hearing in this matter, receiving evidence regarding the permit

application contents, proposed operations, characteristics of the proposed permit lands, and possible impacts from the proposed operations.

6. Big Horn owns lands and facilities within and immediately adjacent to Brook Mine's proposed permit boundary, particularly the TR-1 mining area and the southeastern portion of the proposed mining area. BHC Exh. 2; Tr. Vol. IV, p. 840, ln. 7-25, p. 840, ln. 1-18. Big Horn owns and operates an industrial shop, rail loadout facility, bridge, access road, and railroad spur on the referenced lands. Big Horn also holds a state coal lease on S½ Section 23 and the N½ Section 26, Township 57 North, Range 84 West, 6th P.M. BHC Exh. 2; *see generally* Tr. Vol. IV, pp. 839-841.

7. Big Horn currently leases its shop to multiple tenants for industrial use and storage. Tr. Vol IV, p. 861, ln. 3-5.

8. Big Horn also holds an existing mining permit, No. 213-T8, that overlaps lands included in Brook Mine's proposed permit boundary. BHC Exh. 2; Tr. Vol. I, p. 78, ln. 7-10. Big Horn maintains a reclamation performance bond with DEQ/LQD on approximately 25 acres of land within Brook Mine's proposed permit boundary. BHC Exh. 5; Tr. Vol. IV, p. 863, ln. 18-22.

9. In its objection letter and at hearing, Big Horn, along with other Objectors, asserted that Brook Mine's permit application fails to meet applicable legal requirements found in the Environmental Quality Act ("EQA"), Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and DEQ/LQD—Coal Rules and Regulations. BHC Exh. 3. Big Horn primarily focused its objections on the area of the proposed mine overlapping and adjacent to its current

property and facilities, particularly the TR-1 mining area. *See* BHC Exh. 2; Tr. Vol. IV, pp. 841-843; *see generally* Tr. Vol. I-VII.

TR-1 Mining Area and Related Geology and Hydrology

10. Brook Mine proposes to begin mining operations in the TR-1 mining area. *See* DEQ Exh. 12, p. 12-134.

11. The TR-1 mining area is located entirely in the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West, 6th P.M., where Brook Mine proposes to cut a highwall trench through the overburden above the targeted coal seams. *See* DEQ Exh. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 10-20.

12. The overburden in the TR-1 mining area is geologically and hydrologically unique and can be distinguished from the overburden in the proposed permit area outside the TR-1 mining area. The TR-1 area overburden is composed of previously mined backfill material and is saturated with groundwater. DEQ Exh. 5, p. 5-014; Tr. Vol. II, p. 205, ln. 8-21, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24.

13. In order to gather data as to the geology in the proposed permit area, including overburden geology, Brook Mine conducted a drilling program consisting of a series of drill holes across the proposed permit area. *See* DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164; Tr. Vol I, p. 87, ln. 6-17, p. 91, ln. 6-10. The drill hole data is found in the permit application at Addendum D5-2. DEQ Exh. 5 at pp. 5-015, 5-054 through 5-164.

14. Brook Mine conducted drill hole testing on a tighter configuration than DEQ's typical 160-acre spacing requirement. Tr. Vol. I, p. 48, ln. 9-10; p. 91, ln. 18-25; p. 92, ln. 1.

15. Brook Mine did not conduct drill hole testing in the TR-1 mining area, nor did it conduct drill hole testing in any part of the approximately 360 acres comprising the SE¼ of Section 15 and the NE¼ of Section 22, Township 57 North, Range 84 West. The permit application contains no geologic data from the distinct overburden within these lands. *See* DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

16. Brook Mine's permit application does not distinguish the TR-1 area overburden, and does not include specific geological characterization or identification of the TR-1 area overburden, including its geologic strata, nature, structural geology, lithology, thickness, or other factors that may influence mining or reclamation activities. *See* Tr. Vol. II, p. 209 – 211.

17. DEQ/LQD indicated that it intends to impose a permit condition requiring Brook Mine to gather overburden data from the TR-1 area prior to conducting any mining activity or creating any disturbance. Tr. Vol. I, p. 92, ln. 16-23. No such condition is referenced in the permit application or has otherwise been memorialized. *See* Tr. Vol. I, p. 65 ln. 18-25 (stating that DEQ Exh. 1, p. 1-053 contains the location of permit conditions); DEQ Exh. 1, p. 1-053 (showing no current permit conditions placed upon the permit application).

18. Appendix D6 of the permit application (DEQ Exh. 6) contains hydrologic information, including groundwater information. Tr. Vol. I, p. 93, ln. 17-23. Additional groundwater information is located in the Mine Plan, and its groundwater model. *See* DEQ Exh. 12.

19. Appendix D6 of the permit application characterizes the overburden as a whole, repeatedly describing the overburden within the entirety of the proposed permit area as “dry.” *See* DEQ Exh. 6, p. 23-27.

20. The permit application does not characterize any part of the overburden within the proposed permit area as a “potential hydrogeologic unit,” and concedes that Brook Mine installed no groundwater monitor wells and conducted no aquifer tests in any part of the overburden. *Id.*

21. In characterizing all overburden within the proposed permit area as “dry,” the permit application specifically relies on the drill hole logs and data found in Addendum D5-2, which is devoid of data from the TR-1 mining area. *Id.*; DEQ Exh. 5, p. 5-054 through 5-164; Tr. Vol. II, p. 210, ln. 5-25, p. 211, ln. 1-23.

22. DEQ witnesses Kristiansen and Kuchanur, and Big Horn witness Gerlach, all testified that unlike the overburden in the rest of the proposed permit area, the TR-1 area overburden consists of previously mined backfill material, and that this material is saturated with groundwater. *See* Tr. Vol. II, p. 211, ln. 24-25, p. 212, ln. 1-8, p. 214, ln. 7-24; Tr. Vol. III, p. 507, ln. 3-9; Tr. Vol. IV, p. 927-934; *see also* BHC Exh. 8, 9.

23. Nowhere does the permit application differentiate between the previously mined TR-1 area overburden and the overburden in other proposed mining areas which consist of native strata. Tr. Vol. II, p. 205, ln. 8-21, p. 212, ln. 6-19.

24. Brook Mine witness Barron testified that he does not know whether there is groundwater in the TR-1 overburden, Tr. Vol. IV, p. 720, ln. 11-23, and admitted that no

part of Brook Mine's permit application specifically addresses the TR-1 overburden or its groundwater saturation. Tr. Vol. IV, p. 717, ln. 1-4.

25. DEQ witness Kristiansen conceded that the permit application lacks required information as to the TR-1 overburden and its groundwater saturation, and that that the permit application inaccurately characterizes all overburden within the proposed permit area as dry. Tr. Vol. II, p. 214, ln 12-24, p. 216, ln 12-25, p. 217, ln 1-17.

26. Brook Mine's permit application fails to describe groundwater in the TR-1 area overburden. The permit application contains no site-specific data regarding groundwater location, quantity, quality, lithology, or thickness; or its recharge, storage, or discharge characteristics within the TR-1 area overburden. *See* Tr. Vol. II, p. 212, ln. 6-19; Tr. Vol. IV, p. 717, ln. 1-4, p. 720, ln. 19-23.

27. The permit application addresses "Probable Hydrologic Impacts" in section MP.6; groundwater impacts are specifically addressed in section MP.6.2. DEQ Exh. 5, p. 12-055, -059.

28. Section MP.6.2 of the permit application states that mining impacts to the groundwater found in the coal seams, including drawdown and pit inflows, are predicted and discussed in the groundwater model utilized by Brook Mine. *Id.* at 12-060.

29. As to the overburden, section MP 6.2 assumes that the overburden is dry and states that drawdown of groundwater in the overburden was not modeled. *Id.*

30. Brook Mine's "Operation Monitoring Program" is found in the permit application in section MP.7, with groundwater monitoring described in section MP.7.2. *Id.* at 12-062, -064 through -065.

31. Section MP 7.2 of the permit application states, “[g]roundwater monitoring during mining operations will be a continuation of the monitoring program” discussed in Appendix D6. *Id.* at 12-064. Appendix D6 states that no monitor wells exist to monitor the overburden. DEQ Exh. 6, p. 6-023 through -027.

32. The permit application contains no description or assessment of the hydrologic impacts of the proposed mining operations to the groundwater in the TR-1 overburden, and provides no plan whereby Brook Mine will monitor the hydrologic impacts of the proposed mining operations on groundwater in the TR-1 area overburden. *See generally* DEQ Exh. 5 and 12; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

33. The groundwater model utilized by Brook Mine to support its permit application is discussed in Addendum MP-3 of the Mine Plan. DEQ Exh. 12, p. 12-183 through -294.

34. The groundwater model was designed to analyze the potential cumulative hydrological effects of the project and simulate the regional groundwater impacts from the proposed mining operations. DEQ Exh. 12, p. 12-184, -192.

35. The hydrogeologic data used in the groundwater model was limited to observation points, monitor wells and pumping tests, and private well information obtained from the State Engineers Office database. *Id.* at pp. 12-192, -194, -264. None of these data sources provide information as to the unique textural and hydraulic characteristics of the saturated backfill in the TR-1 area overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. III, p. 513, ln. 11-19; BHC Exh. 9, p. 6.

36. The groundwater model primarily focuses on the Carney and Masters coal seams; treats all overburden within the proposed permit area as dry, native strata; does not utilize any site-specific hydraulic conductivity information from the TR-1 area overburden; and does not model any drawdowns in the TR-1 overburden resulting from mining operations. DEQ Exh. 12, pp. 12-060, -197, -205, -206; BHC Exh. 9, p. 6.

37. The TR-1 area is spatially contained within the geographic area examined by the groundwater model; however, by assuming all overburden in the proposed permit area is dry, impacts to the groundwater in the TR-1 area overburden were not accurately modeled. *See generally* DEQ Exh. 12, p. 12-183 through -294.

38. Brook Mine's permit application states that mining operations will use and rely on pit inflows as a source of water. DEQ Exh. 12, p. 12-066. The application estimates that the proposed mining operations will use approximately 53,000 gallons of water per day (approximately 37 gallons per minute) from pit inflows and states that the estimated inflow amounts are demonstrated in the groundwater model in Addendum MP-3. DEQ Exh. 12, p. 12-116. The groundwater model estimates pit inflows at anywhere between 100 gallons per minute to 0.03 gallons per minute for the life of the mine. *Id.* at 12-254.

39. To facilitate its use of pit inflow water, Brook Mine proposed to place a pump in the TR-1 trench cut to pump out water for operations use for the life of the mine. DEQ Exh. 12, p. 12-052; Tr. Vol. III, p. 556, ln. 1-15.

40. DEQ witness Kuchanur testified that once Brook Mine excavates the trench cut in the TR-1 mining area, groundwater from the TR-1 overburden will flow into the trench cut and mine panels. Tr. Vol. III, p. 556, ln. 1-15.

41. The groundwater model does not accurately reflect or identify the groundwater in the TR-1 overburden, and does not accurately simulate the pit inflows from the TR-1 overburden. *See generally* DEQ Exh. 12, p. 12-183 through -294; *see also* Tr. Vol. IV, p. 717, ln. 1-4.

42. Brook Mine's permit application contemplates the use of groundwater found in the coal seams as a source of water to be used from pit inflows. *See* DEQ Exh. 12, p. 12-254. The permit application never acknowledges any use of the groundwater in the TR-1 overburden, does not identify this groundwater as a source of water for mine operations, and the quality and quantity of water to be used from this source is a complete unknown. *See generally* DEQ Exh. 12.

43. Appendix D6, section D6.2.2.5, of the permit application addresses recharge areas. The permit application does not specifically describe any recharge characteristics of the overburden generally, nor the TR-1 area specifically. DEQ Exh. 6, p. 6-029 through -031. Appendix D.6 of the permit application characterizes all overburden as dry, and relies on the groundwater model found at Addendum MP-3 for any detail concerning groundwater recharge. *Id.*

44. The groundwater model is devoid of any TR-1 overburden data and characterizes recharge in the overburden, generally, as having a uniform recharge rate of between 0.00000012 ft/day/ft² and 0.00008 ft/day/ft² and 0.0005 and 0.35 inches per year. DEQ Exh. 12, p. 12-221.

45. Upon review of materials not in or referenced by the permit application, DEQ witness Kuchanur estimated the TR-1 overburden recharge rate at 0.06 CFS. *See* Tr. Vol VII, p. 1470, ln. 1-16; p. 1471, ln. 14-15.

46. The groundwater in the TR-1 overburden is currently held in place by a low permeability, shale aquitard, or barrier, which physically separates the groundwater located in the overburden from the groundwater located in the coal seams. Tr. Vol. III, p. 508, ln. 2-25, p. 509, ln. 1.

47. In order to access the targeted coal seams, the proposed mining operations in the TR-1 area will excavate and cut through the shale barrier and allow the TR-1 overburden groundwater to flow directly into the trench and mining panels. *Id.*; *see also id* at p. 556, ln. 1-15.

48. Neither the permit application nor the groundwater model contains any data or analysis regarding whether and how Brook Mine will be able to restore the recharge rate of the groundwater in the TR-1 overburden after mining operations cease. *See generally* DEQ Exh. 6, 12 and 13.

Surface Water Monitoring

49. DEQ witness Kunze conceded that Brook Mine needs to revise the number and location of surface water monitor wells proposed in the permit application for the Tongue River. Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-12.

50. In order to adequately monitor mining impacts on the Tongue River, one monitor well needs to be placed further upstream on the Tongue River, near the furthest upstream point within the proposed permit area; an additional monitor well should be

placed near the proposed permit boundary on the Tongue River a short distance downstream from the confluence of the Tongue River and Goose Creek; and another additional monitor well should be placed on Goose Creek. *Id.*

51. DEQ policy requires permit applications to contain pre-mining monitoring and studies of both surface and groundwater to include monitoring data for a one year period, at minimum. *See* DEQ Exh. 22, pp. 3, 5, 15, 16; *see also* Tr. Vol. II, p. 395, ln. 9-17.

52. The TR-1 mining area is located immediately adjacent to both the Tongue River and Goose Creek, and the confluence of the two surface water bodies. DEQ Ex. 12, p. 12-134; Tr. Vol. II, p. 204, ln. 25, p. 205, ln. 1-7.

53. The permit application does not discuss or analyze whether or to what extent the groundwater in the TR-1 overburden is hydrologically connected to the Tongue River or Goose Creek. *See generally* DEQ Exh. 5 and 12.

54. The evidence suggests a direct hydrological connection exists between the groundwater in the TR-1 overburden and the Tongue River. Tr. Vol. III, p. 498, ln. 19-25, p. 499, ln. 1-19; Tr. Vol. IV, p. 936, ln. 5-11; BHC Exh. 9.

55. Absent information in the permit application regarding the nature and extent of the hydrologic connection between the TR-1 overburden and the Tongue River, it is impossible for Brook Mine or DEQ to determine if or to what extent mining through the saturated TR-1 overburden will adversely impact the Tongue River. *See* Tr. Vol. II, p. 420, ln. 7-19.

56. Neither the monitor wells identified in Brook Mine's permit application nor the additional monitor wells DEQ proposed at hearing will adequately monitor impacts to the Tongue River from mining through the saturated overburden in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -112; *see also* Tr. Vol. II, p. 411, ln. 18-25, p. 412, ln. 1-15; DEQ Exh. 6 and 12 *generally*. An additional monitor well on the Tongue River, just north of the TR-1 mining area, is necessary to adequately monitor impacts to the Tongue River from mining in the TR-1 area. *See* DEQ Exh. 12, p. 12-062 through -064, -0112; Tr. Vol. II, p. 420, ln. 7-19.

Access to the TR-1 Area for Testing

57. Brook Mine had legal authority to enter Big Horn property, including the TR-1 area, to conduct exploration and data recovery operations from July 2012 through July 2014, pursuant to an exploration agreement with Big Horn. Tr. Vol. IV, p. 847, ln. 9-16.

58. Brook Mine was gathering information for its permit application, including gathering geology information, and placing monitor and observation wells outside the TR-1 area, during this same period. *See* Tr. Vol. I, p. 51, ln. 18-25.

59. Brook Mine apparently chose not to gather information from the TR-1 mining area during the term of its agreement with Big Horn. *See generally* DEQ Exh. 1-13.

60. Brook Mine allowed its exploration agreement with Big Horn to expire, and never subsequently sought permission to enter Big Horn's property to conduct testing or gather information. Tr. Vol. IV, p. 848, ln. 1-9, p. 855, ln. 17-20.

61. After the expiration of the exploration agreement, and without notice to or permission from Big Horn, Brook Mine sent drilling rigs to Big Horn property. Big Horn discovered unauthorized drilling rigs on its property and contacted law enforcement, which instructed the drilling rig operator to leave Big Horn property. *Id.* at p. 848, ln. 10-25, p. 849, ln. 1-25, p. 850, ln. 1-4.

62. There is no evidence in the record that it was not possible for Brook Mine to acquire geologic or hydrologic information from the TR-1 area.

Underground Coal Fires

63. There is a history of underground coal fires in the proposed permit area. *See* Tr. Vol. II, p. 334, ln. 2-5.

64. Brook Mine acknowledged at hearing that coal fires may exist within the proposed permit boundary. Tr. Vol. IV, p. 722, ln. 16-21.

65. Brook Mine has not conducted any survey or examination of coal fires in the proposed permit area; and the permit application contains no information to support Brook Mine's testimony at hearing that although coal fires may exist, it believes no underground coal fires exist in the proposed permit area. *Id.* at p. 716, ln. 4-17.

Blasting Protections Afforded to Surface Owners

66. At hearing, Big Horn witness Sweeney requested a pre-blasting survey pursuant to Wyo. Stat. Ann. § 35-11-415(b)(xi)(E), and seismic monitoring for Big Horn's shop and other infrastructure located within the proposed permit area. Tr. Vol. IV, p. 860, ln. 17-25, p. 861, ln. 1-16.

67. DEQ and Brook Mine representatives testified that on request from a resident within one half-mile of the proposed permit boundary, seismic monitors could be placed near structures to measure the ongoing impacts from blasting. Tr. Vol. III, p. 618, ln. 12-25, p. 619, ln. 1-2.; Tr. Vol. IV, p. 770, ln. 20-25, p. 771, ln. 1-5, p. 783, ln. 5-19.

Overlapping Permit Boundaries and Related Agreements

68. Brook Mine's permit application states that Big Horn's "permit boundary [is] within Brook Mine's permit boundary," that "all mining operations are covered under individual Permits to Mine," and "[a]greements between the permittees are located in the Adjudication File." DEQ Exh. 12, p. 12-088. In its Reclamation Plan, the permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands." DEQ Exh. 13, p. 13-075.

69. Big Horn requires access to the overlapping property as a landowner with tenants and as a permit holder with outstanding reclamation responsibilities. *See* Tr. Vol. IV, p. 870, ln. 14-21.

70. When two or more parties have overlapping surface coal mine permits, the permit documents may specifically reference any agreements between the parties and expressly provide that each party is only responsible for reclamation resulting from its own disturbance. BHC Exh. 5 and 6.

71. There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal. Tr. Vol. IV, p. 865, ln. 9-15. Brook Mine's permit application incorrectly implies there is an agreement between Brook Mine and Big Horn in the adjudication file. *See* DEQ Exh. 12, p. 12-088.

72. Brook Mine's permit application states that "the last party to disturb an area will have final reclamation responsibility on the disturbed dual permitted lands" rather than stating as DEQ witness Kristiansen conceded, that each party will be responsible for reclamation and maintaining a reclamation bond only as to that party's facilities, operations, and disturbances. *See* DEQ Exh. 13, p. 13-075; Tr. Vol. II, p. 188, ln. 20-25, p. 189, ln. 1-25, p. 190, ln. 1-16.

Surface Owner Protection Bond

73. Brook Mine has not yet submitted a surface owner protection bond to DEQ, as required by Wyo. Stat. Ann. § 35-11-416(a), for the use and benefit of Big Horn as a surface owner within the proposed permit area. *See* Tr. Vol. II, p. 200, ln. 9-25, p. 201, ln. 1.

74. DEQ assured Big Horn that it will determine the amount of the surface owner protection bond prior to permit issuance and only after participation and input from Big Horn. Tr. Vol. II, p. 201, ln. 8-25, p. 202, ln. 1-4.

PROPOSED CONCLUSIONS OF LAW

1. The Council has jurisdiction over this matter pursuant to Wyo. Stat. Ann. §§ 35-11-406(k) and -112(a).

2. EQC conducted the contested case hearing pursuant to DEQ, Practice and Procedure Rules, Chapter 2.

3. Pursuant to the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations, Brook Mine's permit application must contain specific information,

data and other substantive content and analysis regarding the proposed surface coal mining operations, the land and water to be affected, foreseeable impacts from the proposed mining operations, and how the foreseeable impacts will be monitored, minimized and reclaimed.

4. The Council must determine whether Brook Mine has affirmatively established that its permit application contains all legal requirement imposed by the Environmental Quality Act, Wyo. Stat. Ann. §§ 35-11-101 *et seq.*, and applicable Department of Environmental Quality, Land Quality Division, Coal Rules and Regulations.

5. The Council also must determine whether Brook Mine has met its specific burden under Wyo. Stat. Ann. § 35-11-406(n) necessary for approval of its permit application, and, based on that determination, direct DEQ to either issue or deny Brook Mine a permit after making the requisite written findings.

6. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x)** require a surface coal mining permit application to provide a general description of the land, including the nature of the overburden, a detailed description of the geology down to the lowest coal seam to be mined, a characterization of the geologic strata down to the lowest coal seam to be mined, the lithological characteristics of each stratum, and a description of any factor in the overburden that will influence mining or reclamation activities.

7. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (x) as to the overburden in the TR-1 mining area.

Descriptions and characterizations in the form of assumptions or based on an extrapolation of data from geographically and geologically distinct areas fail to satisfy these statutory and regulatory requirements.

8. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific geologic data and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the alternative, and without waiving BHC's stated position that the application must be denied and resubmitted, if the EQC elects to direct DEQ to impose permit conditions:⁷

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze TR-1 overburden samples and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

9. **Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii)** require a surface coal mining permit application to provide a description of any subsurface waters known to exist above the deepest projected

⁷ See *supra* Note 4. All alternative Conclusions of Law proposing permit conditions are provided by Big Horn with this same caveat that Big Horn first and foremost asserts that the permit application submitted by Brook Mine is deficient and must be either denied or sent back to Brook Mine to remedy these deficiencies, resubmit the application to DEQ for approval, and re-publish for public review pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

depth of the mining operation; the occurrence, availability, quality and quantity of potentially affected groundwaters; the location of any groundwater; and complete information of groundwater that may be affected in the permit area, including the lithology and thickness of known aquifers and the recharge, storage and discharge characteristics of the groundwater.

10. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(a)(vii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(vii), (viii), (xii), as it fails to identify or describe any groundwater in the TR-1 mining area overburden.

11. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate TR-1 specific groundwater information and analysis in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must obtain and analyze additional groundwater information from the TR-1 area overburden and provide all such data and analysis to DEQ for review and approval in accordance with the applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

12. **Wyo. Stat. Ann. § 35-11-406(b)(xvi)** requires a surface coal mining permit application to contain a statement of the source, quality, and quantity of any water to be used in mining or reclamation operations.

13. Brook Mine's permit application fails to provide complete and accurate information required by Wyo. Stat. Ann. § 35-11-406(b)(xvi), as it fails to identify the groundwater in the TR-1 overburden as a source of water for its proposed operations and similarly fails to identify the quality of that water or the quantity to be used in its mining or reclamation operations.

14. DEQ must either deny the permit application, or require Brook Mine to include the complete and accurate information and analysis regarding the TR-1 as a specific water source in its permit application, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with the express written conditions that:

(1) prior to conducting any mining operations, Brook Mine must identify all water sources to be used in its proposed mining and reclamation operations, including groundwater from the TR-1 overburden, by geologic source, including quality and quantity characteristics, and submit this data and analysis to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations; and

(2) after the conclusion of mining operations in the TR-1 area, the TR-1 trench must be reclaimed without delay, in accordance with applicable law, and may not remain open for use as a source of water for subsequent mining operations on adjacent lands.

15. **Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a)** require a surface coal mining permit application to contain a plan to minimize disturbances to the prevailing hydrologic balance at the minesite and associated offsite areas and to the quality and quantity of surface and groundwater systems both during and after mining operations; a description of the groundwater and related geology in the permit area sufficient to assess the probable hydrologic consequences; a determination of the probable hydrologic consequences of the proposed operation on the hydrologic regime and the quantity and quality of surface and groundwater systems within the permit area; and a determination of the projected result of the proposed surface coal mining and reclamation operations, which may be expected to change the quality or quantity of the surface and groundwater, its flow, timing and availability, all in sufficient detail to enable the Administrator of the Land Quality Division to determine the probable cumulative hydrologic impacts on surface and groundwater systems.

16. Brook Mine's permit application fails to meet the requirements of Wyo. Stat. Ann. § 35-11-406(b)(xviii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 4(a)(xiv), Section 5(a)(x), Chapter 19 Section 2(a), specifically, as to the lack of any plan or assessment related to probable impacts from mining through the TR-1 overburden, and

any probable change in the quality or quantity of the surface or groundwater in that area, its flow, timing or availability.

17. DEQ must either deny the permit application, or require Brook Mine to include sufficiently detailed, site-specific groundwater data for the TR-1 overburden in its permit application, including the anticipated impacts from mining the TR-1 area on ground and surface waters, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must provide a surface and groundwater impact analysis (during-mining and post-mining) that incorporates site-specific textural and hydrological data in the TR-1 mining area, to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

18. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** requires a surface coal mining permit application to contain both a groundwater and surface water monitoring plan, based on hydrologic, geologic and other information in the permit application, which identifies the quality and quantity parameters to be monitored, sampling frequency and site locations, and describes how the data will be used to determine the impacts of the mining operations on the hydrologic balance.

19. Brook Mine's permit application fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of the proposed mining operations in the TR-1 area on surface water within and adjacent to the permit area. The permit application further fails to meet the requirements of DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix), as it fails to contain sufficient monitoring locations to determine the impacts of mining the TR-1 area on the groundwater located in the TR-1 overburden.

20. DEQ must either deny the permit application, or require Brook Mine to identify and commit to installing additional monitoring locations within its permit application necessary to determine the impacts of mining the TR-1 area on the Tongue River and Goose Creek and the groundwater located in the TR-1 overburden, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations, alterations to its water monitoring locations as follows:

First, as recommended by DEQ, move one monitor well farther upstream on the Tongue River near the boundary of the proposed permit area, and add additional monitoring cites on the Tongue River just downstream of the

confluence with Goose Creek and an additional monitoring location on Goose Creek; and

Second, add groundwater monitoring locations in the TR-1 overburden and add an additional surface water monitoring location in the Tongue River just north of the TR-1 mining area.

21. **DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix)** and its incorporation of Ch. 4, Section 2(h) requires a surface coal mining permit application to include a plan to restore the approximate recharge capacity of groundwater within the permit area to a condition that approximates the pre-mining recharge rate.

22. Brook Mine's permit application fails to provide the information required by DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(ix) as to the groundwater in the TR-1 overburden, as there is no a plan to restore the recharge capacity and no accurate information as to the pre-mining recharge capacity of that groundwater.

23. DEQ must either deny the permit application, or require Brook Mine to provide and analyze data concerning the recharge capacity of the TR-1 overburden groundwater and include a plan in the permit application to restore the recharge capacity of the TR-1 overburden groundwater to pre-mining conditions, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must determine the recharge

capacity of the TR-1 overburden groundwater and provide a plan to restore the TR-1 overburden groundwater to pre-mining conditions to DEQ for review and approval in accordance with applicable statutes and DEQ-Land Quality Coal Rules and Regulations.

24. **Wyo. Stat. Ann. § 35-11-406(b)(ix), (xiii) and DEQ, Land Quality Coal Rules, Ch. 2, Section 5(a)(iv)** require a surface coal mining permit application to include a plan for insuring that “materials constituting a fire, health or safety hazard uncovered during or created by the mining process are promptly treated or disposed of during the mining process in a manner designed to prevent . . . threats to human or animal health and safety,” contain “procedures proposed to avoid constituting a public nuisance, endangering the public safety, human or animal life,” and include “plans which have been developed to preclude sustained combustion of any materials constituting a fire hazard.”

25. Due to the prevalence and history of coal fires in the area, the lack of any information as to current coal fire activity within the permit area renders Brook Mine’s permit application deficient with regard to the required fire safety planning.

26. DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine must submit and DEQ must approve a report providing maps, descriptions, photographs, and any existing evidence of underground coal fires within 500 feet of any proposed mining locations and a plan that identifies the specific safety measures Brook Mine will take where underground coal fires exist within 500 feet of any proposed mining location.

27. **Wyo. Stat. Ann. § 35-11-415(b)(xi)(E)** requires surface coal mining operators to provide a pre-blasting survey “of a man-made dwelling or structure within one-half (1/2) mile of any portion of the permitted area,” on request of a resident or owner.

28. Finding Big Horn’s request for a pre-blast survey to be mandated by law, and Big Horn’s request for seismic monitors to be reasonable and available, DEQ shall issue the permit with an express written condition that, prior to conducting any mining operations, Brook Mine, under DEQ direction, will conduct a pre-blast survey of all man-made structures and dwellings belonging to Big Horn within one-half mile of the permit area, and install seismic monitoring devices at each of Big Horn’s facilities sufficient to ensure the protection of Big Horn infrastructure, improvements and tenants.

29. Based on the testimony and evidence of record, Brook Mine’s permit application fails to accurately state there are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn. The permit application also fails to accurately and sufficiently set forth the reclamation responsibilities of each party as to disturbance within the overlapping permit boundaries.

30. DEQ shall issue the permit with an express written condition that section MP.22 and section RP.12 of Brook Mine’s mine and reclamation plans must be amended to accurately reflect the following:

- There are no operational, surface use, or overlapping permit boundary agreements between Brook Mine and Big Horn Coal.
- Big Horn maintains a reclamation performance bond adequate to reclaim Big Horn facilities and all disturbances associated within Big Horn operations within Big Horn’s permit area.

- Brook Mine shall maintain a reclamation performance bond sufficient to reclaim all disturbance associated with Brook Mine operations within its permit area.
- Big Horn shall not be responsible for reclamation of any disturbance unrelated to Big Horn operations or facilities, including, but not limited to, Brook Mine disturbance within the remaining lands subject to Big Horn's reclamation performance bond.

31. **Wyo. Stat. Ann. § 35-11-416(a)** requires that when the surface owner is not the mineral owner of the estate proposed to be mined, prior to permit issuance, the operator must execute a bond "for the use and benefit of the surface owner or owners of the land, in an amount sufficient to secure the payment for any damages to the surface estate . . . or to the tangible improvements of the surface owner."

32. In accordance with DEQ's stated assurance at hearing, no permit shall be issued to Brook Mine unless and until a surface owner protection bond is issued for the benefit of Big Horn and after good faith consultation with Big Horn as to the appropriate bond amount.

PROPOSED CONCLUSIONS OF LAW AS TO WYO. STAT. ANN. § 35-11-406(n)

33. **Wyo. Stat. Ann. § 35-11-406(n)** requires Book Mine, as a surface coal mining permit applicant, to meet its burden of "establishing that his application is in compliance with [the Environmental Quality Act] and all applicable state laws" and provides that "[n]o surface coal mining permit shall be approved unless the applicant affirmatively demonstrates" the following:

- (i) That the application is accurate and complete;
- (ii) That the reclamation plan can accomplish reclamation as required by [the Environmental Quality Act]; and

(iii) That the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

34. Based on the forgoing findings of fact and conclusions of law:

- Brook Mine has failed to affirmatively establish that its permit application is in compliance with the requirements of the Environmental Quality Act and all applicable rules and regulations.
- Brook Mine's permit application lacks required information, mischaracterizes, and contains inaccurate information as to the TR-1 mining area and its related overburden geology and hydrology, as well as lacks the additional legal requirements stated above. Therefore, Brook Mine has failed to affirmatively demonstrate that its permit application is accurate and complete.
- Brook Mine has failed to affirmatively demonstrate that the reclamation plan can accomplish reclamation as required by the Environmental Quality Act, which emphasizes a standard for restoration to pre-mining conditions⁸, because the permit application fails to sufficiently identify pre-mining conditions in the TR-1 area.
- Brook Mine has failed to affirmatively demonstrate that its proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area, because it fails to account for or consider critical and unique hydrological conditions in the TR-1

⁸ See DEQ, Land Quality Coal Rules, Ch. 4, Section 2.

area and fails to identify how it will monitor the impacts of the proposed TR-1 area mining operations on the hydrological balance within, let alone outside the proposed permit area.

35. DEQ must either:

- Deny the permit application; or
- Require Brook Mine to complete its permit application in light of the above identified deficiencies, resubmit its application to DEQ and, after approval, re-publish notice of its complete application allowing interested persons to file written objections, pursuant to Wyo. Stat. Ann. § 35-11-406(h)-(k).

—In the Alternative—

DEQ shall issue the permit with all of the express written conditions listed above.

DATED: July 24, 2017.

Lynnette Boomgaarden (WSB # 5-2837)
Clayton H. Gregersen (WSB # 7-5677)

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

IN RE BROOK MINE APPLICATION)
) Civil Action No. 17-4802
TFN 6 2-025)

First, DEQ is unbiased. It has nothing to gain should Brook's permit application move forward. But the objectors have different motives. Big Horn Coal (BHC) wants money, offering not to oppose Brook's application if Brook paid BHC approximately \$29 million. (Tr. Vol. IV, 876). Mary and David Fisher (Fishers) do not want a mine near them because it could affect their

property's value. (Tr. Vol. V, 1181-82). Powder River Basin Resource Council (PRBRC) does not want any mining near Sheridan. (*Id.*, 1123). As a result, the objectors did not objectively analyze Brook's permit application.

Second, DEQ has the most relevant experience and expertise for reviewing Brook's permit application. The DEQ personnel who reviewed Brook's permit application have reviewed dozens of permits, spent years working on the application, submitted hundreds of comments, and worked with Brook to ensure the permit application meets Wyoming law. (DEQ Ex. 34; Tr. Vol. I, 40-42, 45-46; Tr. Vol. II, 393-94; Tr. Vol. III, 461-62, 581). Dr. Muthu Kuchanur is a nationally recognized expert who worked as a consultant and who has designed, developed, applied, and evaluated groundwater models like those used in Brook's permit application. Doug Emme is also a nationally recognized expert on blasting who has been DEQ's blasting program principal for over 27 years. (Tr. Vol. III, 578-80). He also assisted in developing DEQ's bonding guideline. (*Id.*, 579). But PRBRC's experts, Dr. Marino and Mr. Wireman, have never attempted to draft a coal mine permit application in Wyoming. (Tr. Vol. VI 1254, 1263, 1403-05). Mr. Wireman does not hold a professional license in any state. Neither Mr. Wireman nor Dr. Marino are experts on the requirements for a permit application to be complete and non-deficient under Wyoming law. (*Id.*, 1254, 1258-60, 1403-05).

Third, DEQ applied the correct standard in reviewing Brook's permit application. DEQ applied the Environmental Quality Act, the corresponding regulations, and DEQ guidelines to determine Brook's application was complete and non-deficient. DEQ balanced the regulations and the necessary science. (Tr. Vol. VII, 1490). But objectors, nearby landowners, experts or otherwise, did not. They spent merely days, hours, or no time at all reviewing Brook's permit application. (Tr. Vol. IV, 887-88, Vol. V, 1077, 1098-1102, 1107-08, 1122-23, 1126; Vol. VI,

1428). For example, Ms. Collins did not look at the permit application until the beginning of the hearing in Sheridan. (Tr. Vol. V, 1077-78). This limited review often meant they did not consult statutes or regulations. For example, BHC did not review the statutory or regulatory requirements for a permit application. (Tr. Vol. IV, 885-89). Still, the objectors agreed that if a permit application complies with all Wyoming statutes and Wyoming regulations, the permit should issue. (*Id.*, 894, Vol. V, 1103).

Fourth, the objectors' expert testimony has fatal flaws. Dr. Marino assumed designs and extraction ratios using generalized diagrams that did not reflect Brook's actual design found in Brook's Mine Plan. (*See* DEQ Ex. 12-035; Tr. Vol. VI, 1274-77). He also did not take into account that Brook committed in its permit application to: 1) do site specific testing and engineering before starting to mine; and 2) submit a Mine Safety Health Administration (MSHA) ground control plan engineered to prevent short and long-term subsidence. (Tr. Vol. VI, 1265-69). Mr. Wireman did not evaluate all of the data in the permit application and did not evaluate external data available in the area. (*Id.*, 1404-06). He also doubted the data and statements in the permit application without studying whether his doubts were correct. (*Id.*, 1405-06). For example, he doubted Brook's groundwater model was accurate; but he did not run the model. (*Id.*, 1414-16). Mr. Gerlach's opinions relied on a 15 year-old groundwater restoration demonstration his company drafted for BHC. (Tr. Vol. IV, 972-73). That document, however, uses old data not designed to predict the future consequences of mining in the area. (Tr. Vol. VII, 1464-66).

The Council should also weigh DEQ's enforcement authority. Brook has committed to: 1) replacing water quantity and quality if its mine should affect domestic water wells; 2) do site specific studies and engineering to prevent subsidence; and 3) remediate subsidence if it occurs.

(DEQ Ex. 34-014-15; DEQ Ex. 5-017-18; Tr. Vol. III, 659-60, 673-76). These commitments directly address specific objections, and DEQ can enforce all of them because they are in the permit application. (Tr. Vol. II, 230, 349, 371-72).

Contrary to what the objectors suggest, this case does not require the Council to decide if Wyoming's permit application process should be more stringent, the public should have more input on the permitting process, or if DEQ should have held an informal conference. The case is also not about imposing conditions on Brook's permit application. The Council does not have any specific statutory authority to impose conditions on a permit application. Even if it did, many of the conditions the objectors have requested require Brook to access land the objectors own, which invites disputes about when Brook can access the property or how much it will cost to do so.¹ (Tr. Vol. IV, 879).

Therefore, Brook proposes the Council adopt the following findings of fact and conclusions of law.

II. FINDINGS OF FACT

A. Brook's Permit Application

1. On October 31, 2014, Brook submitted to DEQ's Land Quality Division (LQD) an application for a permit to mine coal. Brook's permit application proposed to mine coal in an area northwest of Sheridan, Wyoming. (DEQ Exs. 1-13, Tr. Vol. I, 51-52).

2. Brook's permit application consisted of 12 volumes filled with documents, maps, data, and other information to address applicable statutes, rules and regulations. (DEQ Exs. 1-13,

¹ If the Council imposes conditions that require Brook or even DEQ to access property Brook does not own, those conditions should apply only if the property owner grants access. Should the property owner refuse, then the Council should not require Brook or DEQ to follow those conditions. Although Brook has the use of the surface and surface access from the rights reserved in its 1954 Deed, the Council knows that many landowners ignore those rights.

Tr. Vol. I, 43-44, 52, 57-58). These volumes mirror the structure and documents in DEQ's completeness criteria. (Tr. Vol. VII, 1540). The completeness criteria lists "what is required for a permit application to mine coal in the state of Wyoming." (*Id.*, Brook Ex. 14). The document "cross-references all of the requirements to Wyoming, statutes, rules and regulations." (*Id.*).

3. Volumes I, IA, and II are the combined adjudication file in the permit application. (DEQ Exs. 1, 2, 3). The adjudication file contains information on the legal aspects of land and mineral ownership, water rights, rights of way, legal descriptions, and legal relationships. (*Id.*). The second volume of the adjudication file contains ownership maps, right-of-way maps, etc. Tr. Vol. I, 60-62, DEQ Exs. 1, 3. The adjudication file also contains an estimate of the surface damage bond for BHC's surface ownership. (Tr. Vol. I, 66, DEQ Ex. 1-066-101).

4. Appendix A of the adjudication file contains contact information and maps relating to surface and mineral rights holders within the proposed permit area, including coal. (Tr. Vol. I, 68, DEQ Ex. 1-232).

5. Appendix B of the adjudication file contains the names and addresses of surface and mineral rights owners adjacent to the permit boundary within one-half mile. (Tr. Vol. I, 69, DEQ Ex. 1-264).

6. Appendix C of the adjudication file contains the legal description of lands contained within the permit application area, including survey plats and maps. (Tr. Vol. I, 70, DEQ Ex. 1-447).

7. Appendix E of the adjudication file contains lands mining will affect, areas of previous disturbance by surface and underground mining, roads, utility lines, pipelines, rights of way, easements, names and last known addresses of present surface owners, and the legal

description of locations of buildings within and adjacent to the permit area. (Tr. Vol. I, 72, DEQ Ex. 1-540).

8. The adjudication volumes also contain landowner consent forms and this Council's order in lieu of consent issued on November 17, 2016. (DEQ Ex. 2).

9. Volume III contains appendices D1 through D4. (DEQ Ex. 4).

10. Appendix D1 is titled "Land use." (DEQ Ex. 4). The appendix explains the general use of the land within the permit application boundary from past to present, which includes grazing land, developed water resources, industrial, commercial, recreational, and residential. (Tr. Vol. I, 82-83, DEQ Ex. 4-008-11). The appendix also explains the areas any agency has designated as unsuitable for mining and whether previous mines exist within the area. (DEQ Ex. 4-016). The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (*Id.*, 4-020-41).

11. DEQ reviewed Appendix D1 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

12. Appendix D2, is titled "History." (DEQ Ex. 4). This appendix discusses the history of mining in the Brook Mine area, sites on the National Register of Historic Places, and the area around the proposed Brook mine. (*Id.*, 4-046-56). The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (*Id.*, 4-059-64).

13. DEQ reviewed Appendix D2 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

14. Appendix D3 is titled "Archeological and Paleontological Resources." (DEQ Ex. 4). This appendix contains little information because cultural and paleontological surveys "are not required when there's private surface and private mineral owners." (Tr. Vol. I, 85). The

appendix also contains a 2012 letter from DEQ stating the same. (DEQ Ex. 4-074-75). DEQ, however, did coordinate with the State's Historic Preservation Office, who had no comments. (Tr. Vol. I, 85-86).

15. In addition to this appendix, Brook's Mine Plan, found in a different volume, states Brook will stop mining in any areas where cultural or paleontological resources are discovered. (*Id.*, 86).

16. DEQ reviewed Appendix D3 and found it complied with the applicable statutes and regulations. (*Id.*, 85-86).

17. Appendix D4 is titled "Climatology." This appendix discusses the regional climatology around the proposed Brook Mine. (DEQ Ex. 4). This includes information on temperature, wind patterns, precipitation, evaporation, relative humidity, cooling, heating, and growing degree days. (*Id.*, 4-080-88).

18. The appendix also has tables, figures, and exhibits that supplement the text and provide more information. (DEQ Ex. 4-091-112). The additional information includes data about meteorological stations, regional annual and monthly temperature statistics, average monthly wind speeds, regional and annual precipitation. (*Id.*).

19. DEQ reviewed Appendix D4 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

20. Volume IV of Brook's permit application contains Appendix D5, titled "Topography, Geology and Overburden Assessment." (DEQ Ex. 5). This appendix discusses topography, slope assessment, regional geology, geology of the mining area, and overburden assessment. (*Id.*, 5-006-23). The accompanying tables, figures, exhibits, and addenda provide data and information on coal quality, criteria to establish overburden suitability, geologic

structures, pre-mine slope analysis, surficial geology, lithologic and geophysical logs, geologic cross-sections, structure and isopach maps, overburden sample analysis. (*Id.*, 5-026-295).

21. In preparing this appendix, DEQ and Brook collaborated on the location of drill holes for assessing geology. (Tr. Vol. I, 92-93). Brook was unable to sample certain areas because of terrain, but the existing samples “were close enough together that [DEQ] could extrapolate...into that area for now.” (*Id.*, 93).

22. DEQ reviewed Appendix D5 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 92-93).

23. Volume V of Brook’s permit application contains Appendix D6 titled “Hydrology.” (DEQ Ex. 6). This appendix describes surface water, flood studies, surface water monitoring, surface water quality and quantity, groundwater, regional hydrogeology, baseline monitoring, groundwater testing, groundwater rights, and Brook’s groundwater model. (*Id.*, 6-005-34). The appendix also has tables, figures, exhibits, and addenda that provide additional data and information. (*Id.*, 6-037-553). This includes Brook’s groundwater model and input data for the model. (DEQ Ex. 12-183-265, Tr. Vol. III, 460-63). The data and information in this appendix showed the groundwater aquifers within about 85% of Brook’s proposed permit area is dry. (Tr. Vol. I, 95-96). The groundwater model also showed that any groundwater Brook affects would recharge within years of Brook ending its operations. (Tr. Vol. VII, 1496).

24. DEQ reviewed Appendix D6 and found it complied with the applicable statutes and regulations. (Tr. Vol. III, 496).

25. Volume VI of Brook’s permit application contains Appendix D7 titled “Soil Resources Assessment.” (DEQ Ex. 7). This appendix describes the methodology that Brook used to sample soils within the proposed permit area. (*Id.*, 7-007-14). It also describes the results of

the soil sampling, which includes soil information, soil suitability, salvage depth, and maps with soil unit descriptions. (*Id.*, 7-014-42). The appendix also includes tables, figures, exhibits, and addenda that provide additional information and data, including Brook's sampling protocol and laboratory results. (*Id.*, 7-043-114).

26. DEQ reviewed Appendix D7 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

27. Volume VII of Brook's permit application contains Appendix D8 titled "Vegetation Inventory." (DEQ Ex. 8). This appendix describes the methodology that Brook used to survey vegetation within the proposed permit area. (*Id.*, 8-005-11). It also describes the results of the survey. (*Id.*, 8-11). The appendix includes tables, exhibits, and addenda with additional information and data. (*Id.*, 8-12-452).

28. DEQ reviewed Appendix D8 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97, 411).

29. Volume VIII of Brook's permit application contains Appendix D9 titled "Wildlife." (DEQ Ex. 9). This appendix describes Brook's wildlife studies, methods, and results. (*Id.*, 9-005-10). It also includes tables, exhibits, and addenda that describe baseline wildlife inventories and species lists. (*Id.*, 9-011-139).

30. DEQ reviewed Appendix D9 and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97).

31. Volume IX of Brook's permit application contains Appendix D10 titled "Wetlands." (DEQ Ex. 10). This appendix describes the methodology that Brook used to inventory wetlands within the proposed permit boundary and subsequent results. (*Id.*, 10-005-9).

The appendix also has tables, exhibits, and addenda that provide additional information and baseline data. (*Id.*, 10-010-279).

32. DEQ reviewed this appendix and found it complied with the applicable statutes and regulations. (Tr. Vol. I, 52, 60, Tr. Vol II, 196-97).

33. Volume X of Brook's permit application contains Appendix D11 titled "Alluvial Valley Floors." (DEQ Ex. 11). This appendix describes Brook's analysis of potential alluvial valley floors within the proposed permit boundary. (*Id.*, 11-006-12). The appendix explains stream laid deposits, water quantity, sub-irrigation, natural and artificial flood irrigation, water quality, and then determines the potential alluvial valley floors. (*Id.*, 11-012-18). The appendix also has tables, figures, exhibits, and addenda that provide additional information and data, including geologic cross-sections, potential and declared alluvial valley floors, isopach maps, prior state decision documents, and monitor well logs. (*Id.*, 11-024-313).

34. Based on the findings in Brook's permit application, DEQ conducted their assessment of potential alluvial valley floors in the area in and around where Brook proposes to mine. (Tr. Vol. I, 108-10). DEQ's assessment led it to designate one alluvial valley floor near the proposed Brook mine. (*Id.*, 109-10). But the proposed Brook mine will not disturb or mine through any designated alluvial valley floor. (*Id.*, 112-13). Even so, Brook's permit application states that Brook will halt mining should it enter a possible alluvial valley floor and allow DEQ to determine if an alluvial valley floor exists. (*Id.*, 116). Brook will also place monitor wells in areas designated as potential alluvial valley floors. (Tr. Vol. VII, 1489).

35. DEQ reviewed Appendix D11 and found it complied with the applicable statutes and regulations. (Tr. Vol. II, 156).

36. Volume XI of Brook's permit application contains Brook's Mine Plan. (DEQ Ex. 12). Brook's Mine Plan also contains a general description of mining operations (MP.1); mine facilities (MP.2); tonnage (MP.2.2, MP.6.1); roads, railroads and other transportation systems (MP.3); mining methods, schedules, and assessments (MP.4); mining hydrology (MP.5); probable hydrologic impacts (MP.6); operational monitoring program (MP.7); water use (MP.8); reclamation of exploration holes and wells (MP.9); refuse disposal (MP.10); signs, markers and buffer zones (MP.12); blasting plan and schedule (MP.14); surface mining activities near underground mines (MP.15); protection of other resources, structures and surfaces (MP.16); existing structures facilities operations (MP.17); plan to minimize adverse impacts on fish and wildlife (MP.18); protection of historical and archaeological resources (MP.19); underground mining (MP.20); auger mining (MP.21); dual permitted areas (MP.22); plan in cases of temporary cessation of operations (MP.23); protection of public safety, human or animal life, property, and the surface owner's ongoing operation (MP.24); alluvial valley floors (MP.25); separation and replacement of soils for prime farmlands (MP.26); request for variance from environmental performance standards (MP.27); and references (MP.28). (DEQ Ex. 12-001-372).

37. Brook's Mine Plan describes the proposed highwall mining method. (DEQ Ex. 12-016-18). The highwall mining process begins with a trench, a pit, or a box cut to expose the coal seam. (Tr. Vol. III, 654, Tr. Vol. I, 51-52, DEQ Ex. 12-121). The operator then uses a machine to extract coal in panels ranging between 1,500 and 2,000 feet in length. (Tr. Vol. III, 654-55, 665-66). Each panel has pillars that will minimize the potential for subsidence during mining. (Tr. Vol. I, 51, DEQ Ex. 12-121. Tr. Vol. I, 51.) During mining, the native topography and vegetation remain except for the excavated trench. (Tr. Vol. III, 655). In total, a trench will last only three years before getting reclaimed. (Tr. Vol. II, 397).

38. The Mine Plan contains a fire control and prevention plan for surface and subsurface operations. (Tr. Vol. II, 159, DEQ Ex. 12-314). The fire control and prevention plan establishes a mitigation system in the event of any type of fire during mining or other operations. (Tr. Vol. II, 159-60, DEQ Ex. 12-314). MSHA will regulate the ground control program for fires or other safety related items at the mine. (Tr. Vol. II, 160).

39. Brook's Mine Plan also addresses subsidence in three ways. First, addenda MP-6 contains Brook's subsidence control plan that analyzes potential subsidence at the mine. (Tr. Vol. II, 162, DEQ Ex. 12-319). The subsidence control plan discusses previous mining activity, Brook's plan to monitor and assess subsidence, and Brook's plan to control and remediate any subsidence that occurs. (DEQ Ex. 12-320-27). Cardno MMA prepared the subsidence control plan because it had "done a lot of work for highwall miner operations in the East" and knew people "that manufacture and operate the highwall miner systems very well." (Tr. Vol. II, 163; Tr. Vol. III 666; Tr. Vol. IV, 817).

40. In addition to the subsidence control plan, Brook has committed to developing the required MSHA ground control plan before it begins mining. (Tr. Vol. III, 662-65). The ground control plan will sample, test, design, and engineer each mine panel so that it meets MSHA's safety factor and creates both short and long-term subsidence protection. (Brook Ex. 10(d); Tr. Vol. II, 325-26; Tr. Vol. III, 662-63).

41. Brook's permit application states "[s]amples will be collected and strength testing will be conducted on those samples in order to satisfy the requirements of the MSHA ground control plan, which must be approved prior to mining. The future testing results and analysis in preparation of the MSHA ground control plan will be provided to WDEQ/LQD." (DEQ Ex. 5-018). The permit application also states that "[t]he results of the tensile strength tests will be

utilized to size both the web pillars and barrier pillars to achieve a factor of safety as set by the MSHA ground control plan to conduct mining and minimize the risk of subsidence.” (*Id.*)

42. Should subsidence occur, “mining operations have to cease immediately.” (Tr. Vol. II, 320). Brook then has to mitigate and repair any subsidence. (DEQ Ex. 12-318-33; Tr. Vol. II, 354-55).

43. Brook’s Mine Plan describes Brook’s blasting plan. (DEQ Ex. 12-335-38). The blasting plan describes Brook’s proposed blasting operations, explosive storage, and applicable laws and regulations. (DEQ 12-334-38). As part of its blasting plan, Brook does not intend to carry out any cast blasting or any blasting in its first year of operation. (Tr. Vol. III, 583, 589).

44. Brook’s Mine Plan discusses how Brook will control surface water. Brook’s plan will use reservoirs, diversions, ditches, and alternative sediment control measures to control surface water. (DEQ Ex. 12-055-59, 61). Brook will also monitor surface water sources. (DEQ Ex. 12-062-64).

45. Brook’s Mine Plan discusses groundwater, including domestic water wells. Brook has committed to replacing the quantity and quality of water sources lost because of Brook’s proposed operations. (DEQ Ex. 12-059-61). Brook will also conduct groundwater monitoring. (DEQ Ex. 12-064-65).

46. DEQ found the Mine Plan complied with the applicable statutes and regulations. (Tr. Vol. I, 45-46; Tr. Vol. II, 161-62).

47. Volume XII of Brook’s permit application contains Brook’s Reclamation Plan. (DEQ Ex. 13). The Reclamation Plan explains how reclamation will occur at the Brook Mine and how Brook will mitigate any modifications to overburden material, vegetation, and wildlife.

Id., Tr. Vol. II, 175. When mining is complete and reclamation has finished, the Reclamation Plan states Brook will return the land use to at least equal or better than the original use. *Id.*

48. The Reclamation Plan describes: post-mining land use (RP.2); contouring plan for affected lands (RP.3); spoil replacement (RP.4); topsoil replacement (RP.5); revegetation practices (RP.6); wildlife restoration (RP.7); final hydrologic restoration (RP.8); wetland mitigation (RP.9); reestablishment of essential hydrologic functions and agricultural utility on alluvial valley floors (RP.10); reclamation of mine facilities, road, and railroads (RP.11); reclamation and bonding of dual permitted and license to mine areas (RP.12); reclamation schedule (RP.13); bond release (RP.14); underground mines (RP.15); reclamation costs (RP.16); and references (RP.17). (DEQ Ex. 13-014-30; Tr. Vol. II, 192-95). In dually permitted areas, Brook must reclaim any areas it disturbs even if that disturbance occurs within a dually permitted area. (DEQ Ex. 13-075; Tr. Vol. II, 184, 188-89).

49. DEQ found the Reclamation Plan complied with the applicable statutes and regulations. (Tr. Vol. I, 45-46).

50. With its permit application, Brook submitted an estimated reclamation bond in the approximate amount of \$370,000 to cover 30.8 acres of disturbance in year 0. (Tr. Vol. III, 590, DEQ Ex. 32). For the areas where Brook's operations will overlap with existing permits, like BHC, Brook's bond will cover all disturbance from Brook's operations. (Tr. Vol. II, 188-90)

B. DEQ's review of Brook's permit application

51. Once Brook submitted its permit application, DEQ conducted two stages of review set out in the Environmental Quality Act. First, DEQ conducted a completeness review. (Tr. Vol. I, 43-44). For this step, DEQ reviewed Brook's permit application to determine whether it is complete based on requirements set forth in the rules, regulations, and statutes. (*Id.*, 43).

52. After DEQ determined Brook's permit application was complete, DEQ notified Brook that the application was complete and DEQ had gone into the technical review process. By statute, the technical review process can take up to 150 days. (*Id.*, 56).

53. The technical review process analyzed "the entire document from front to back cover" and determined "how technically accurate [the application] can possibly be." (*Id.*, 44). "Technically accurate" or "technically adequate" means the permit application "has met all the statutes, rules, regulations, and providing [sic] all the information that [DEQ] needs to make assessment." (Tr. Vol. VII, 1504, 45-46, Tr. Vol. I, 59-60).

54. As a result, the technical review compared Brook's permit application to Wyoming statutes, DEQ regulations, and DEQ guidelines. (Tr. Vol. I, 56-58).

55. For its technical review, DEQ enlisted eleven in-house experts and four external experts, including Wyoming Game & Fish, US Game & Fish, US Army Corps of Engineers, and State Historic Preservation Office, to review the substance of Brook's permit application. (*Id.*, 47, 64, 85-86, 104). DEQ also applied standard mining and engineering principles, used modeling software to review the geology and hydrology aspects of the permit application, and relied on sources of data outside the permit application to verify Brook's findings. (*Id.*, 56-57; Tr. Vol. II 395-96, 410).

56. When reviewing subsidence information in the permit application, DEQ worked through computer models and utilized formulas developed by the Office of Surface Mining. DEQ also attended training on analyzing subsidence and requested more information on the model used in the subsidence control plan. (Tr. Vol. II, 164, 168). DEQ concluded the Brook mine would not subside. (*Id.*, 162, 169).

57. During the technical review process, DEQ sent comments to Brook informing it of deficiencies in the permit application. (Tr. Vol. I, 44-45). Brook then responded to DEQ's comments with additional information; Brook also modified its application when necessary. (*Id.*, 58-60). DEQ and Brook went through six rounds of comments and responses on Brook's permit application. (*Id.*, 58; DEQ Ex. 34).

58. Brook's responses and revisions to the permit application ultimately satisfied DEQ, leading it to determine Brook's application was "technically accurate" and suitable for publication. (*Id.*, 59-60, 161-62, 188).

59. After DEQ deemed Brook's application complete and without deficiency, it directed Brook to publish its permit application for public review and comment. In making this decision, DEQ had not yet issued a cumulative hydrologic impact assessment or the findings set out in Wyo. Stat. Ann. § 35-11-406(n).

60. Brook first published its permit application on December 27, 2016. (Tr. Vol. I, 53).

61. Between December 27, 2016 and January 27, 2017, DEQ received twenty public comments relating to Brook's permit application. Of those twenty comments, fourteen were objections to Brook's permit application.

62. Those objections challenged many parts of Brook's permit application, including Brook's analysis of alluvial valley floors, blasting, bonding, probable hydrologic consequences, reclamation, and subsidence. (BHC Ex. 3, Fisher Ex. 26, PRBRC Exs. 1, 2, 5, 9, 10)

63. Upon review of all objections, DEQ still found Brook's permit application met the applicable statutes and regulations. (Tr. Vol. II, 196-97). DEQ, however, will add two conditions to Brook's permit. First, DEQ will require Brook to remove the word adjudicated on

pages MP-38 (DEQ Ex. 12-052) and MP-48 (DEQ Ex. 12-052) of its Mine Plan and replace with “permitted.” (Tr. Vol. II, 290-91). Second, DEQ will adjust the location of surface monitoring stations to better capture data. (*Id.*, 430-31).

C. The Council’s Involvement

64. The objectors requested that DEQ hold an informal conference to decide their objections. (BHC Ex. 3, Fisher Ex. 26, PRBRC Ex. 1). But the DEQ director exercised his discretion not to hold an informal conference and referred the matter to the Council. (February 22, 2017 Order of Dismissal, Docket 17-4801).

65. The Council originally scheduled a hearing on these objections for February 13, 2017 (Docket No. 17-4801). The Council also requested the parties brief whether the Council had jurisdiction to hear that case because no one had requested a contested case. After briefing, the Council dismissed that docket, ruling:

[u]nder Wyo. Stat. 35-11-406(k) and (p) and the Department of Environmental Quality’s rules of practice and procedure, the Council may only exercise jurisdiction over the Brook Mine permit application after an interested person has filed a petition for a contested case with the Council – something not done as part of this docket. Council, in this docket, is without authority to accept jurisdiction over the Brook Mine permit application through the referral from the Director.

(February 22, 2017 Order of Dismissal).

66. After this ruling, three of the objectors requested a contested case hearing: PRBRC (Docket No. 17-4804), BHC (Docket No. 17-4802), and Fishers (Docket No. 17-4803). The Council consolidated all dockets into Docket No. 17-4802.

67. Before the consolidated hearing, the Council set deadlines for discovery requests, naming of expert witnesses, and dispositive motions. (March 13, 2017 Order of Consolidation

and Schedule). The Council also set pre-hearing exhibit and witness disclosure dates and a hearing schedule and order. (*Id.*)

68. The Council conducted the first part of the hearing on May 22-26, 2017 in Sheridan, Wyoming. Unable to get all of the evidence in, the Council extended the hearing for two additional days on June 7-8, 2017 in Cheyenne, Wyoming (May 31, 2017 Order for Hearing). After those two days, the parties rested.

III. CONCLUSIONS OF LAW (DECISION ON THE APPLICATION)

A. The Scope of the Council's Decision

1. The Wyoming Environmental Quality Act (the Act) created the Council and specifies its authority. *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000). So the Council must exercise only the authority the Act granted to it. *Id.*; *Platte Dev. Co. v. State, Env'tl. Quality Council*, 966 P.2d 972, 975 (Wyo. 1998).

2. Under the Act, DEQ must evaluate a permit application and decide if it is complete. Wyo. Stat. Ann. § 35-11-406(e). Wyoming statutes define a complete application as “the application contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter. Wyo. Stat. Ann. § 35-11-103(e)(xxii).

3. After informing a permit applicant that the application is complete, “the administrator shall review the application and unless the applicant requests a delay advise the applicant in writing within one hundred fifty (150) days from the date of determining the application is complete, that it is suitable for publication under subsection (j) of this section, that the application is deficient or that the application is denied. All reasons for deficiency or denial shall be stated in writing to the applicant.” Wyo. Stat. Ann. § 35-11-406(h). The Act defines a

deficiency as “an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” *Id.* at 103(e)(xxiv).

4. Once an applicant publishes the permit application, an interested person can file an objection and receive either an informal conference with the DEQ director or a public hearing if the director elects not to have an informal conference. Wyo. Stat. Ann. § 35-11-406(k).

5. In a public hearing, the Council acts as the hearing examiner and decides “all cases or issues arising under the laws, rules, regulations, standards or orders issued or administered by the department or its air quality, land quality, solid and hazardous waste management or water quality divisions.” Wyo. Stat. Ann. § 35-11-112(a). The Council has the specific authority to conduct hearings: 1) to promulgate rules and regulations required to administer the Act; 2) adopt, amend, or repeal rules or regulations as recommended by advisory boards; 3) contesting “the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof;” or 4) contesting the “grant, denial, suspension, revocation or renewal of any permit, license, certification or variance authorized or required by this act.” Wyo. Stat. Ann. § 35-11-112(a)(i)-(iv).

6. The Council concludes it must exercise the authority listed under (a)(iii) because the case will decide DEQ’s administration and enforcement of the permitting procedures for a new coal mine, not rulemaking or an already granted or denied permit.

7. The Council finds that exercising this authority requires the Council to decide if DEQ correctly administered and enforced the requirements that a permit application is complete and non-deficient.

8. The Council notes that before a permit can issue, the Act requires that the administrator make specific findings under Wyo. Stat. Ann. § 35-11-406(n). These findings include the cumulative hydrologic impact assessment DEQ must perform. (Tr. Vol. II, 413-16).

9. Despite requests from the objectors, the Council concludes that it does not have the authority to make the findings under Section 406(n) for three reasons. First, section 406(n) explicitly states “the administrator” makes the findings in that section of the Act. Wyo. Stat. Ann. § 35-11-406(n). The Act defines “administrator” as “the administrator of each division of the department.” Wyo. Stat. Ann. § 35-11-103(a)(v). That definition does not include this Council. Second, the findings under 406(n) require DEQ, as the regulating agency, to issue a cumulative hydrologic impact assessment. *Id.* at § 406(n)(iii); WY ADC ENV LQC Ch. 19 § 2 (stating the cumulative hydrologic impact assessment “shall be sufficient to make the determination of W.S. § 35-11-406(n)(iii).”) That assessment takes “an intensive look at surface and groundwater quality and quantity within an area,” possibly including other nearby mines. (Tr. Vol. II, 413-15). The assessment can use data from multiple permits or permit applications and outside data sources. (*Id.*, 415). The Council concludes it does not possess the resources or expertise to make those findings. Third, DEQ has not yet issued findings under 406(n), and the Act does not require DEQ to issue the section 406(n) findings before it deems an application suitable for publication. *See generally* Wyo. Stat. Ann. § 35-11-406. As a result, DEQ has not administered or enforced that part of the Act. Without DEQ either administering or enforcing section 406(n), the Act does not grant the Council authority to step into the shoes of the regulator. *See* Wyo. Stat. Ann. § 35-11-112(a)(i)-(iv).

10. As a result, the Council must issue findings of fact and a decision on the relevant issues as described above within 60 days of the final hearing. *Id.* at 406(p).

B. The Amount of Votes Required

11. Under the Act, all matters that the Council hears “shall be decided by a majority vote of those on the Council.” Wyo. Stat. Ann. § 35-11-111(d).

12. Members of the Council, however, may recuse themselves by providing written notice of recusal or entering a verbal notice into the record. Wyo. Admin. Code Practice & Procedure Ch. 2 § 7(b). If a councilmember recuses him or herself, then that councilmember “shall not participate in the contested case.” *Id.*

13. The Council finds that a recusal from a case means the recused council member no longer serves on the Council for the purposes of that contested case.

14. Here, two members of the council, Richard Fairservis and Megan Degenfelder, have recused themselves. For purposes of this contested case neither Mr. Fairservis nor Ms. Degenfelder serve on the Council.

15. Therefore, the Council finds that Brook must obtain a majority of the five councilmembers serving on this case. *See* Wyo. Stat. Ann. § 35-11-111(d).

C. The Applicable Statutes and Regulations

16. Under the Act, Brook bears the burden of proving that its application is complete and non-deficient. To meet this standard, Brook must prove its application complies with the applicable statutes and regulations.

17. The applicable statutes are Wyo. Stat. Ann. § 35-11-406(a)-(b), (e)-(h).

18. Section 406(a) requires the permit applicant to provide information about the operator, surface owners, maps of the proposed permit area, and basic information about the proposed mining operation. Section 406(b) requires the applicant provide a Mine Plan and Reclamation Plan that explains in detail how the operator will disturb and restore the area within

the proposed permit area. The section also requires the applicant provide surface owner consent or an order in lieu of surface owner consent to the Mine Plan and Reclamation Plan.

19. Sections 406(e)-(h) require Brook's permit application be complete and non-deficient as described above.

20. The Land Quality Division (LQD) has also promulgated coal regulations that implement the Act. Brook must comply with those regulations as described below.

21. Chapter 2 of LQD's coal regulations requires Brook provide detailed information that complies with all applicable statutes and regulations. WY Admin Code ENV LQC Ch. 2, § 1. Brook must provide information on surface ownership, mineral ownership, previous mining history, and taxpayer information. *Id.* at § 2. Brook's application must also contain information on vegetation baseline information and methodology, wildlife studies, land use history, groundwater sampling data, geology and lithology data, soil assessments, water quality and quantity data, climatology, cultural resource assessments. *Id.* at §§ 3-4. Sections 5 and 6 expand the details Brook must include in its Mine and Reclamation Plans. *Id.* at §§ 5-6.

22. Chapter 3, § 2 requires Brook provide sufficient information relating to the presence or absence of alluvial valley floors within the permit area and on adjacent areas where an alluvial valley floor containing areas of sub-irrigation or flood irrigation agricultural activities may be affected. *Id.* at Ch. 3, § 2(b). Brook must include maps, geologic data, soils and vegetation data, geohydrologic descriptions, and information to identify geologic, hydrologic and biologic characteristics. *Id.* at § 2(c) Brook must also provide a monitoring plan to meet requirements of Chapter 5, § 3(b). *Id.*

23. Chapter 4, § 2 requires Brook to reclaim the land to a condition equal to or greater than its prior condition. *Id.* at Ch. 4, § 2(a). Brook must submit a proposed schedule for

backfilling and grading with supporting analysis and return all affected lands to their approximate original contour. *Id.* at § 2(b)-(c).

24. Chapter 5, §§ 3, 6 require Brook's operations to preserve and reestablish the geologic, hydrologic, and biologic characteristics to support essential hydrologic functions. *Id.* at Ch. 5, § 3(a), (c). Brook must install an environmental monitoring system to provide sufficient information showing essential hydrologic functions of the alluvial valley floor are being preserved and established on and outside affected lands. *Id.* at § 3(b). Brook must minimize disturbance of the prevailing hydrologic balance, unwarranted subsidence, submit a subsidence control plan, and prepare a written demonstration showing the fill has a minimum static safety factor of 1.3. *Id.* at § 6(d)-(e).

25. Chapter 6 requires Brook to comply with all applicable federal, state, and local laws when using explosives to mine. *Id.* at Ch. 6, § 1. Brook must publish a blasting schedule in a newspaper of general circulation and by mail to each residence or owner within one-half mile of blasting sites at least 30 days before blasting. *Id.* at § 3. The schedule shall be republished and redistributed every 12 months. *Id.* If the schedule changes, Brook must revise and republish the schedule at least 30 days but not more than 60 days before blasting. *Id.* Residents and owners within one-half mile shall be notified of the manner for requesting a pre-blast survey. *Id.*

26. Chapter 7, §§ 1, 2 requires Brook's application contain information relating to soils, vegetation, fish, wildlife, topography, geology, mineral deposits limited to the affected areas, subsidence control plan, and Reclamation Plan. Section 2 requires Brook adhere to the backfilling, grading and contouring requirements in Chapter 4, § 2(b). *Id.* at §§ 1, 2.

27. Chapter 12, § 1 requires the Administrator to make a determination in writing as to the existence and extent of an alluvial valley floor within the permit area or on adjacent areas

where the mining operation may affect surface water or groundwater that supply an alluvial valley floor. *Id.* at §1(a).

28. Chapter 19, § 2 requires Brook to provide information sufficient to enable the Administrator to determine the probable cumulative hydrologic impacts on surface and groundwater systems. *Id.* at § 2(a).

D. The Council's Decision on Brook's Application

29. Applying the findings of fact to this law, the Council concludes Brook's permit application is complete as defined in the Act. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxii), 406(e)-(f). The application includes all of the sections, information, data, and maps the Act and applicable regulations require. The Council is also convinced by DEQ's comprehensive testimony that Brook's permit application is complete. (Tr. Vol. 1, 52, 112, Tr. Vol. II, 257, 318, 344-45, Tr. Vol. VII, 1509).

30. The Council concludes Brook's application is also not deficient because it meets the requirements of all applicable statutes and regulations. *See* Wyo. Stat. Ann. §§ 35-11-103(e)(xxiv), 406(h). Brook did all of the required studies and time to develop a non-deficient application. Likewise, the Council accepts DEQ's testimony that its technical review of Brook's application met the applicable statutes and regulations. (Tr. Vol. I, 43-46, Tr. Vol. II, 188, 316-17, Tr. Vol. III, 521).

31. Specifically, the Council finds the adjudication file in Volumes I, IA, and II contain the information required by applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a)-(b); WY Admin Code ENV LQC Ch. 2, §§ 1-2.

32. Appendix D1, Land Use, in Volume III meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 2-3.

33. Appendix D2, History, in Volume III meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 1-2.

34. Appendix D3, Archeological and Paleontological Resource, in Volume III meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, §§ 3-4.

35. Appendix D4, Climatology, in Volume III meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4.

36. Appendix D5, Topography, Geology and Overburden Assessment, in Volume IV meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4.

37. As for the objections related to this section of Brook's permit application, the Council adopts DEQ's findings. The Council notes DEQ found no geologic hazards exist at the proposed Brook mine (Tr. Vol. I, 89-90). But if they do, DEQ has a methodology for addressing geologic hazards. (*Id.*, 90-91).

38. Appendix D6, Hydrology, in Volume V meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a)-(b); WY Admin Code ENV LQC Ch. 2, § 4.

39. As for the objections related to this section of Brook's permit application, the Council is persuaded by the testimony of Dr. Muthu Kuchanur. Dr. Kuchanur has a PhD in environmental engineering and teaches national level training courses on groundwater modeling, coal mine permitting hydrology, quantitative hydrogeology, and applied engineering principles for the Office of Surface Mining. (Tr. Vol. III, 459-60). Dr. Kuchanur reviewed Brook's modeling process, the methodology used for the model, the input data used in the model, and the accuracy of the model. (*Id.*, 462-64). Dr. Kuchanur's review concluded that Brook's model

matched available data and multiple lines of evidence supported the accuracy of the model. (*Id.*, 480-83). Dr. Kuchanur also compared the predicted effect of Brook's mining on groundwater and found that it is small compared to existing groundwater sources. (*Id.*, 489-90). He noted that the groundwater model accounted for dewatering coal seams and the effect that could have on surrounding areas. (*Id.*, 561-62).

40. As a result, the Council concludes that Brook's groundwater model and the other hydrology aspects of the permit complied with the relevant statutes and regulations. (*Id.*, 496). Brook's permit application explains the probable hydrologic consequences of proposed mining. (Tr. Vol. VII, 1475). The baseline hydrology in Appendix D6, the probable hydrologic consequences discussion in the Mine Plan, and the Reclamation Plan explain the hydrologic consequences of Brook's proposed mining. (*Id.*, 1486). Brook's proposed mining would have little impact on groundwater inside the proposed permit boundary. (Tr. Vol. VII, 1482-83). Brook's isopach maps show a limited drawdown in groundwater, and the data in the permit application shows limited or no connection between the coal seams that Brook intends to mine and other water sources. (Tr. Vol. III, 555, 564). Brook's groundwater model also shows it is unlikely for Brook's operations to have a large impact on domestic wells. (*Id.*, 566).

41. In the TR-1 area specifically, the Council concludes that breaching the coal seam in that area will have limited impact on the Tongue River or other sources of groundwater. (*Id.*, 576). The Council notes Brook attempted to sample groundwater in the area around trench TR-1 but BHC had the sheriff's department escort Brook's contractor out of the area. (*Id.* 700-01). Still, Brook's groundwater model, geologic cross-sections, regional aquifer information, and other publically available data explain the groundwater in the saturated backfill of the TR-1 area. (Tr. Vol. VII, 1512).

42. The Council also agrees with Dr. Kuchanur's testimony about BHC's groundwater restoration demonstration (GRD). (Tr. Vol. VII, 1464- 1483, 1508-09). The GRD had a different objective than Brook's groundwater model and the permitting process in general. (Tr. Vol. VII, 1464-65). The GRD used past data to show recharge and does not predict the consequences of mining. (*Id.*, 1465-66). The GRD also used old data with unexplained variability, several orders of magnitude in some places. (*Id.*, 1477-78, BHC Ex. 15-040). Even so, the flow and recharge rates in the GRD matched predictions in Brook's groundwater model. (Tr. Vol. VII, 1466-71). The GRD also showed minimal interaction between the Tongue River and the saturated backfill, providing further evidence of the accuracy of Brook's groundwater model. (*Id.*, 1471-73, 1481-82).

43. Appendix D7, Soil Resources Assessment, in Volume VI meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, §§ 3-4.

44. Appendix D8, Vegetation Inventory, in Volume VII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 3.

45. Appendix D9, Wildlife, in Volume VIII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(a); WY Admin Code ENV LQC Ch. 2, § 4, Ch. 4, § 2.

46. Appendix D10, Wetlands, in Volume IX meets the requirements of applicable law. *See* WY Admin Code ENV LQC Ch. 2, § 4, Ch. 4, § 2.

47. Appendix D11, Alluvial Valley Floors, in Volume X meets the requirements of applicable. *See* WY Admin Code ENV LQC Ch. 2, § 4, Ch. 3, § 2, Ch. 12, § 1. The Council concludes that Brook will not affect any alluvial valley floors, including those found in 2016. (Tr. Vol. II, 11-13).

48. The Mine Plan in Volume XI meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 5, Ch. 3, § 2, Ch. 4, § 2, Ch. 6, §§ 1-6, Ch. 12, § 1.

49. As to objections about blasting, the Council agrees with Mr. Doug Emme that Brook's blasting will have little effect on nearby structures. (Tr. Vol. III, 584, 608). Still, the Council notes landowners within a half mile of the mine can request a pre-blast survey and Brook will publish a blasting schedule. (*Id.*, 582, 584-85).

50. As to objections about Brook's subsidence control plan and subsidence generally, the Council concludes Brook has met the relatively minimal requirements for a subsidence control plan. (Tr. Vol. II, 247-48). The Council also concludes that Brook's commitment to compile the required MSHA ground control plan will address subsidence. (*Id.*, 326-28). The Council concludes the calculations necessary for the ground control plan provide the same data DEQ required for every mining panel. (Tr. Vol. III, 663). It will also provide data Dr. Marino tested was needed. (Tr. Vol. II, 325). The ground control plan will also engineer each mining trench for both long and term-subsidence prevention. (Tr. Vol. II, 355-56). The mining process will also protect against subsidence by having pillars that run the length of each mine panel. (Tr. Vol. I, 120; Tr. Vol. II, 369).

51. The Reclamation Plan in Volume XII meets the requirements of applicable law. *See* Wyo. Stat. Ann. §§ 35-11-406(b); WY Admin Code ENV LQC Ch. 2, § 6, Ch. 3, § 2, Ch. 4, § 2.

52. As to objections about the adequacy of Brook's proposed bond, the Council accepts Mr. Emme's testimony that Brook's proposed amount is "robust" and "higher" than DEQ would have required. (Tr. Vol. III, 590). The Council also notes that DEQ has not yet set a

bond but will do so before issuing a permit. (*Id.*, 586-87). Once DEQ sets the reclamation bond, it will remain in place until DEQ finds Brook has successfully reclaimed disturbed land. (Tr. Vol. II, 180).

53. The Council notes DEQ's authority to enforce Brook's commitments in the permit application. (Tr. Vol. I, 117, 175-76, 230, 334, 349, Tr. Vol. III, 491, 493, 495, 624-25, 627). The Council also notes that other administrative agencies like MSHA, Game & Fish, Department of Transportation, DEQ's water and air quality divisions, Solid and Hazardous Waste Department, and the State Engineer's Office will have oversight over parts of Brook's operations. (Tr. Vol I, 152-53, 160-61, 183-84, 330, 538).

54. The Council finds that it should not impose additional permit conditions for two reasons. First, the Act does not authorize the Council to impose permit conditions. Instead, the Act authorizes the administrator, the director, and DEQ generally to administer permits, including any conditions on them. *See* Wyo. Stat. Ann. § 35-11-109. Second, the Council finds that no additional permit conditions are necessary for Brook's permit application to be complete and non-deficient.

55. Therefore, the Council finds that DEQ correctly determined Brook's permit application was complete, non-deficient, and suitable for publication. The Council's decision on the application pursuant to Wyo. Stat. Ann. § 35-11-406(p) is that: 1) DEQ should make the findings under Section 406(n) of the Act; and 2) based on the findings, the DEQ Director take appropriate action on Brook's permit application based on those findings.

DATED: July 24, 2017.

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) **DOCKET 17-4802**
TFN 6 2-025)

POWDER RIVER BASIN RESOURCE COUNCIL'S PROPOSED FINDINGS OF FACT AND CONCLUSIONS OF LAW

Pursuant to the June 13, 2017 Order from the Environmental Quality Council (“EQC” or “Council”), the Powder River Basin Resource Council (“Resource Council” or “PRBRC”) hereby submits its Proposed Findings of Fact and Conclusions of Law in the above-captioned proceedings.

I. General Findings

1. According to the Wyoming Environmental Quality Act (“WEQA” or “Act”), “No mining operation may be commenced or conducted on land for which there is not in effect a valid mining permit to which the operator possesses the rights.” W.S. § 35-11-405(a).

2. Requirements for coal mine permit applications as well as grounds for approval and denial are governed by Section 406 of the Wyoming Environmental Quality Act, along with the Land Quality Division's ("LQD") Coal Rules and Regulations (hereafter "Coal Rules").

3. Specifically, as discussed below, certain findings related to the application's compliance with the WEQA and DEQ regulations must be made before the EQC can reach a decision on the permit application. *Id.* at §§ 406(n)(i)-(vii).

4. DEQ regulations require information in a permit application to be “current” . . . “accurate and complete.” Coal Rules, Ch. 2 § 1; *see also* W.S. § 35-11-406(n)(i) (requiring a permit applicant to prove that the application is “accurate and complete.”).

5. In response to the required public notice, the Resource Council timely filed objections to Brook Mining Company, LLC’s (“Brook” or “applicant” or “company”) coal mine permit application on January 27, 2017. Ex. POW 1. The Resource Council also timely requested a hearing before the EQC, initiating this contested case hearing.

6. Members of the Resource Council also timely filed objections to Brook’s coal mine permit application. John and Vanessa Buyok, Gillian Malone, Sadie Clarendon, Jane Buyok, Anton Bocek, Joan Tellez, Wendy Condrat, Brooke Collins, and William Bensel filed objections. Ex. POW 2-10. Their objections and concerns demonstrate that the Resource Council, through representation of its members, is an “interested person” within the meaning of Section 406(k) and a “person with an interest which is or may be adversely affected” within the meaning of Ch.1 § 17(b) of DEQ’s Rules of Practice and Procedure.

7. A contested case hearing was held in this matter on May 22-26 and June 7-8, 2017.

8. After the contested case hearing, the EQC must “issue findings of fact and a decision on the application.” W.S. § 35-11-406(p). This “decision on the application” is consistent with the authority granted to the EQC under the WEQA that the agency may “Order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified.” *Id.* at § 112(c)(ii).

9. In making this decision, the EQC’s review of DEQ’s permitting decisions and of the permit application is *de novo*. Under *de novo* review, the EQC must look afresh or “from the

new” at the permit application and cannot afford deference to DEQ in issuing any findings of fact or in making the decision on the permit application.¹

10. As discussed below, the permit application is deficient because it contains “omission[s] or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” *Id.* at § 103(e)(xxiv). If a deficiency exists, by definition it *cannot* be remedied by a permit condition.

11. Also, as discussed below, the applicant has not met its burden of proof to demonstrate compliance with key parts of the law, including the findings of Section 406(n) and bonding.

12. Since the application contains deficiencies, and it is not in compliance with the law, the EQC must order the Director to deny the permit. *Id.* at §§ 406(h), 406(n), 406(p).

II. The Permit Applicant Has Not Met Its Burden of Proof

13. Under Section 406(n), “The applicant for a surface coal mining permit has the burden of establishing that his application is in compliance with [the WEQA] and all applicable state laws.” The Wyoming Supreme Court has held that this burden extends to any hearing before the EQC on a coal mine permit. *Grams v. Env’tl Quality Council*, 730 P.2d 784, 789 (Wyo. 1986).

14. The burden of proof rests on the permit applicant alone. *Id.* at 406(n). The EQC cannot rely on DEQ’s testimony or evidence production designed to assist the permit applicant in meeting its burden of proof. *See, e.g.* Tr. at 1539 (Mr. Pope: “Brook has a burden of proof in this hearing. And in particular one of the things that Brook has to demonstrate is that everything in the statutes and regulations is included within the permit application.”). This is an important requirement because DEQ must remain in a neutral position as the permit has not yet been issued.

¹ This standard of review is especially applicable here where the scope of the EQC’s decision is to make the decision on the permit application, a decision DEQ has not made.

15. Through these proceedings, the permit applicant did not meet its burden of proof to demonstrate compliance with the law, including the findings of Section 406(n),² and to prove that no part of the permit application is deficient.³

16. The permit applicant presented only one witness who presented testimony about the application, Mr. Barron. Mr. Barron does not have personal experience in highwall mining, and has never helped to prepare a permit application for a highwall mine before. Tr. at 729 (Testimony of Mr. Barron).

17. Mr. Barron admitted that one needs to have a “certain level of expertise” to understand scientific principles, standards of best industry practice, and to interpret regulatory requirements. *Id.* at 733-34. However, Mr. Barron did not have expertise or professional knowledge to present testimony related to subsidence risk or hydrology. Mr. Barron is not a geologist or a hydrogeologist. *Id.* at 728, 1520-21. Nor is he an engineer with expertise in subsidence risk or control. *Id.* at 737; 757-58. Mr. Barron did not prepare the subsidence control plan and was not qualified to present testimony regarding its findings. *Id.* at 734.

18. Therefore, Brook did not present any testimony to meet its burden of proof to rebut the expert testimony, expert reports, and other evidence identifying deficiencies in the permit application presented by the Resource Council, Big Horn Coal, and the Fishers.

III. The Permit Application Does Not Include or Support the Findings of Section 406(n)

19. The critical findings of Section 406(n) have not yet been made, and as DEQ has admitted, they must be made before a decision on the permit application can be made. *See, e.g.* Tr. at 7-8 (Opening statement of DEQ).

² As discussed in the Resource Council’s recent brief on the subject, Section 406(p) dictates that once there is a hearing, the EQC makes the “decision on the application,” not the DEQ. There is no later opportunity for the DEQ to review the permit’s compliance with Section 406(n).

³ *See also* Tr. at 1504-05 (Testimony of Dr. Kuchanur regarding technical adequacy).

20. Additionally, as discussed below, testimony and evidence presented at the hearing demonstrate that the findings cannot be made at this time because of deficiencies in the permit application.

21. The lack of findings, and the inability for the DEQ or EQC to make the findings after the hearing, necessitates denial of the permit application. W.S. § 35-11-406(n).

A. A Finding that the “Application is Accurate and Complete” Cannot Be Made

22. As presented below, the application is neither accurate nor complete for a variety of important issues, including subsidence control, water quality and quantity data and assessment, facilities, coal production estimates, roads, blasting, and bonding.

23. Since a finding that “[t]he application is accurate and complete” cannot be made, the Council must order that the permit application should be denied. *Id.* at § 406(n)(i).

B. The 406(n)(v) Findings Related to Alluvial Valley Floors Cannot be Made

24. Alluvial valley floors (“AVFs”) are defined by the WEQA as “the unconsolidated stream laid deposits holding streams where water availability is sufficient for subirrigation or flood irrigation agricultural activities . . .” *Id.* at § 103(e)(xvii).

25. Protection of these AVFs, both on the mining site and in adjacent offsite areas, is a main requirement of SMCRA to preserve the ecological integrity and “essential hydrologic functions” of important agricultural areas as coal mining moved into the “arid and semiarid regions of the country.” *See* 30 U.S.C. § 1265(b)(10)(F); W.S. § 35-11-415(b)(x).

26. These federal requirements are reflected in Section 406(n)(v) and the findings required for a decision on a coal mine permit to ensure that a permit will protect the functions of AVFs.

27. These findings and affirmative obligations to prevent harm to alluvial valley floors are particularly ubiquitous here, where the alluvial aquifers are an important source of water for local agriculture. *See* Tr. at 532 (Testimony of Dr. Kuchanur affirming the importance of the alluvial aquifers in the permit area and adjacent lands).

28. The permit application does not support a finding that “the proposed operation would . . . [n]ot interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated . . .” or a finding that the proposed operation will “[n]ot materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors” as required by Section 406(n)(v)(A)-(B). *See also* Coal Rules, Ch. 12 § 1(a)(i).

29. This finding cannot be made because DEQ has not finished mapping alluvial valley floors in adjacent lands. *See* Tr. at 262 (Testimony of Mr. Kristiansen admitting DEQ did not assess or designate alluvial valley floors in all adjacent lands); Ex. POW 36-37 (describing incomplete surveying and DEQ commitments to do more surveying *after* the permit was deemed suitable for publication and went to public notice).

30. Nor did the permit application contain the important data and analysis required by DEQ rules. Coal Rules Ch. 3 § 2 (prescribing requirements for data and analysis related to AVFs in the permit area and in adjacent lands).

31. The permit application is deficient because it does not include delineation of, or assessment of impacts to, an alluvial valley floor designated by DEQ after the permit application was deemed “technically complete.” Tr. at 112 (Testimony of Mr. Kristiansen: “So at the time the technical completeness was completed for AVFs, I had not yet accomplished the AVF material and there was nothing for them to put in the application. Once it was declared complete,

then we don't revisit that again."'). However, in spite of the lack of designation at the time of permit review, DEQ later determined that the AVF would not be affected and therefore did not have to be designated in the permit application. *Id.* at 113.

32. The same goes for a much larger "potential" AVF along the Tongue River. Ex. DEQ 16; Tr. at 115, 263 (testimony from Mr. Kristiansen that because DEQ determined that the potential AVF won't be affected by mining, it doesn't need to be designated at this time).

33. But herein lies the catch 22 of the permit application: DEQ could not factually determine that the AVF would not be affected *unless* it was properly delineated and assessed *prior* to review of the permit application. *See, e.g.* Tr. at 1375-76 (Testimony of Mr. Wireman: "if you don't know where they are, how can you design a mine plan to protect them?").

34. Even assuming DEQ could determine whether AVFs will be affected *without* delineating them prior to making that assessment, DEQ's determination of whether AVFs will be "affected" by mining is much too simplistic and is based wholly on whether mining will directly occur in the AVF. Ex. DEQ 16; Ex. DEQ 12 at 90; *See also* Tr. at 156-57 (Testimony of Mr. Kristiansen arguing that because there is a 100 foot buffer between surface or underground mining and the creek that the AVF will not be affected); *Id.* at 386.⁴ Mr. Wireman's expert opinion is that you can damage the AVF without direct disturbance, damage that is not considered by Brook or DEQ. *Id.* at 1377-78.

35. DEQ underestimates a possible hydrologic connection between the coal seams and the AVFs because the agency assumed that the Tongue River is the sole source of recharge to the AVFs. Tr. at 339 (Testimony of Mr. Kristiansen). This is not the case. *Id.* at 1380 (Testimony of

⁴ Later Mr. Kristiansen said he made this determination also based on the fact that there would be no "discharge of any kind," tr. at 266, however, as was discussed at the hearing, the company will be applying for a WYPDES permit that will allow discharge of some pollution into waterways. Tr. at 398 (Testimony of Mr. Kunze).

Mr. Wireman that groundwater supports the Slater Creek AVF); *id.* at 1387-92, 1396 (testimony that the AVF along the Tongue River is recharged by the river and by groundwater and that there is a hydrologic connection between the AVFs and the coal seams); Ex. POW 17 at 6 (groundwater from the coal seams “is a source of recharge to Slater Creek alluvium.”); *id.* at 9 (discussing potential impacts to the Tongue River AVFs).

36. Additionally, DEQ even admits that at some point in the future mining could affect the “potential” AVF. Tr. at 266 (Testimony of Mr. Kristiansen saying mapping of the potential AVFs would be done in the future as the mine progresses toward them). DEQ and Brook testimony also admitted that there is a hydrologic connection between the coal seams Brook plans to mine and the AVFs. *Id.* at 295-96, 303 (Testimony of Mr. Kristiansen); *Id.* at 564-65 (Testimony of Dr. Kuchanur); *see also* Ex. DEQ 12 at 231 (identifying a connection between the Carney coal seam and the Tongue River alluvium); Tr. at 788-89 (Testimony of Mr. Barron).

37. This hydrologic connection is of particular importance in the TR-1 area, as the company plans to pump or dewater the area for a source of water for the mine, throughout the life of the mine. The permit application does not consider any impacts associated with this dewatering to the alluvial system along the Tongue River. Tr. at 300.

38. Therefore, as DEQ itself admitted, given the lack of designation of AVFs, and the lack of impacts analysis to these AVFs, DEQ is unable to make the Section 406(n) finding that mining will not materially damage the quantity or the quality of the water in the AVFs (both designated and “potential”). Tr. at 303 (Testimony of Mr. Kristiansen).

39. Since DEQ (or alternatively, the EQC) is unable to make the Section 406(n) findings that AVFs will be protected as required by the law, the permit must be denied.

C. A Finding that the Mine Has Been Designed to Prevent Material Damage to the Hydrologic Balance Cannot Be Made

40. 357 groundwater wells are present within three miles of the permit area. Tr. at 1344 (Testimony of Mr. Wireman).

41. Groundwater flow will be intercepted during mining, up to 99 gallons per minute at the anticipated peak rate. Tr. at 487 (Testimony of Dr. Kuchanur).

42. It is estimated that groundwater levels will not recover to within 10 feet of pre-mining levels for at least 10 years for the Carney Seam and 20 years for the Masters Seam, creating long-term impacts to regional water supply. *Id.* at 486.

43. However, as Mr. Wireman concludes, “[g]roundwater flow in the coal seams is poorly characterized. This constrains the ability to estimate dewatering rates and volumes and to assess probable cumulative hydrologic impacts.” Ex. POW 17 at 6.

44. Even given the limited data collection and modeling assumptions, the permit application acknowledges drawdown impacts to wells outside the permit boundary. Ex. DEQ 12 at 251. However, as explained during testimony, neither Brook nor DEQ did any analysis for the permit application to assess whether drawdown will create material impacts to quantity or quality of those water wells, *or* if those impacts occur, whether replacement water is available. Tr. at 549 (Testimony of Dr. Kuchanur); *Id.* at 1016-17, 1037-39 (Testimony of Mr. Buyok); *Id.* at 1094 (Testimony of Mr. Bocek); *Id.* at 1060-62 (Testimony of Ms Brezik-Fisher).

45. As Mr. Wireman’s expert testimony demonstrated, “That is simply not discussed or addressed in terms of what happens to the water in these wells if you dewater the coal, because they just haven’t dealt with it.” *Id.* at 1344; *see also id.* at 1382-85 (concluding that “there was no way to really assess the potential impact of these domestic wells due to declines in water

levels . . . there just was not enough information and data there” and “we don’t know enough here in this hydrologic system to make any judgments about risk or about impacts.”).

46. Furthermore, as demonstrated below, the permit application does not contain a baseline water quality or quantity assessment for surface and groundwater required by the WEQA and associated regulations. As Ms. Boomgaarden set forth in Big Horn Coal’s opening statement, “Without knowing and understanding the site-specific hydrologic conditions, it simply is impossible for Brook to adequately consider the impacts of its proposed highwall mining operations as the law requires.” Tr. at 19; *see also id.* at 1351 (Testimony of Mr. Wireman that if the baseline data does not exist, you “can’t assess risk” and “can’t assess changes to the hydrologic system”); *id.* at 1352 (“If you want an honest, thorough, rigorous assessment of what’s going on, and if the decisions that need to be made are based on that, then you need an adequate amount of data.”); *id.* at 1439, 1443.

47. These factual findings support a conclusion that the permit application does not contain “a plan to minimize the disturbances to the prevailing hydrologic balance at the minesite and in associated offsite areas and to the quality and quantity of water in surface and ground water systems both during and after mining operations and during reclamation” as required by the WEQA and corresponding DEQ regulations. W.S. §§ 35-11-406(b)(xvii), 406(n)(iii); Tr. at 945 (Testimony of Mr. Gerlach); *id.* at 1372-73 (Testimony of Mr. Wireman: “I don’t think there’s enough data and enough assessment to make any decision along those lines” regarding material damage to the hydrologic system; recommending the permit should be denied); Ex. POW 17 at 3.

48. Nor does the permit application contain the required “plan to ensure the protection of the quantity and quality of, and rights to, surface water and groundwater both within and

adjacent to the permit area” or “[a]n evaluation of the impact of the proposed mining activities that may result in contamination, diminution, or interruption of the quality and quantity of groundwater or surface water within the proposed mine permit area or adjacent areas that are used for domestic, agricultural, industrial, or other legitimate purposes.”. Coal Rules Ch. 2.

49. Nor does the permit application contain a probable hydrologic consequences determination “sufficient to make the determination of W.S. § 35-11-406(n)(iii).” *Id.* § 4(a)(xiv); Ch. 19 § 2(a)(i).

50. Additionally, the Cumulative Hydrologic Impacts Assessment (“CHIA”) has not been completed. DEQ admits that the CHIA is necessary to support the “material damage” finding under Section 406(n)(iii). Tr. at 413, 436, 444 (Testimony of Mr. Kunze that the DEQ cannot make the 406(n) findings without the CHIA).

51. While the CHIA is a document separate from the permit application, Tr. at 413, a “common practice” of DEQ is to finalize the CHIA by the time of public comment to afford an opportunity to raise comments or objections on the CHIA – a process that did not happen here. *Id.* at 423-25; Ex. POW 53.⁵

II. The Permit Application Does Not Include Sufficient Information to Assess and Control Subsidence Risk

52. The company has an obligation to prevent subsidence. A coal mining permit application with underground components, such as this permit application, must include “[i]nformation and evaluations on the potential for and the extent of subsidence, and the effect it may have on structures, the continued use of the surface land and aquifers or recharge areas” and “[e]xcept for areas where planned subsidence is projected to be used, measures to be taken in the

⁵ Testimony at the hearing established that the CHIA was started in 2014 but comments were not requested by reviewing agencies until December 2016, preventing the CHIA from being finalized by the end of the public comment period. Tr. at 425-26 (Testimony of Mr. Kunze with summary from Dr. Bagley).

mine to prevent or minimize subsidence, including backfilling of voids and leaving areas in which no coal is removed.” Coal Rules Ch. 7 § 1(a)(v).

53. Additionally, “[u]nderground mining activities shall be planned and conducted so as to prevent subsidence from causing material damage to structures, the land surface, and groundwater resources.” Coal Rules Ch. 2 § 2(b)(iii); Ch. 7 § 2(b)(iii); *see also* Tr. at 57 (Mr. Kristiansen discussing the subsidence control requirements of Ch. 7 § 2).

54. DEQ regulations further provide that “[a]uger mining may be limited or prohibited to minimize . . . unwarranted subsidence” Coal Rules Ch. 5 § 6(b); *see also* Coal Rules Ch. 3 § 5 (requiring information in the permit application to demonstrate compliance with these standards). This regulation applies to the Brook permit because at various times in the mine plan, the company refers to highwall mining as auger mining or “a similar method to auger mining.” Ex. DEQ 12 at 59, 88, 192; *see also* Tr. at 119, 233 (testimony of Mr. Kristiansen that the auger mining regulations apply to the Brook Mine).

55. DEQ’s Guideline No. 6A, Format and General Content Guideline for Permit Applications, Amendments and Revisions for Coal Mining Operations, requires a subsidence control plan for underground mining operations. A subsidence control plan is also required by federal regulations, incorporated into the state SMCRA program. *See* 30 C.F.R. § 784.20, *et seq.*

56. As acknowledged by DEQ, “subsidence control is of key importance to the mine plan.” Tr. at 162 (Testimony of Mr. Kristiansen).

57. In spite of this “importance,” as explained below, DEQ let the permit applicant proceed with an admittedly deficient subsidence control plan that does not achieve its required objective: to assess, control, and prevent subsidence at the mine site.

A. Subsidence is Prevalent in the Area & Subsidence Risk is Amplified by an Overlap Between the Proposed Permit and Existing AML Projects

58. Abandoned mine land (“AML”) division reclamation work to address subsidence problems in the area is widespread and ongoing. *See* Ex. POW 38-47, 80-82, 86-88. The permit area and areas adjacent to the permit area has active subsidence. Tr. at 1225-26 (Testimony of Dr. Marino); *id.* at 1019-22 (Testimony of Mr. Buyok).

59. DEQ was fully aware of this history of subsidence at the time of its review of the permit application. Tr. at 165 (Testimony of Mr. Kristiansen: “The mines in the Sheridan area all subsided at one point in the past, sooner or later.”); *Id.* at 238; Ex. POW 54.

60. Brook’s proposed permit boundary overlaps with abandoned mines known to cause subsidence. DEQ Ex. 12-145; Tr. at 239-42 (Testimony of Mr. Kristiansen). Brook’s underground mining will occur in close proximity to, and in some cases overlap with these abandoned mines. *Id.*; *see also* Tr. at 244-45 (Testimony of Mr. Kristiansen).

61. In spite of the prevalence of subsidence in the area from abandoned mines, and in spite of the overlap between Brook’s permit and some of these abandoned mines, Brook did not assess potential impacts related to subsidence from its proposed mine. Tr. at 170 (Testimony of Mr. Kristiansen). The company merely partially mapped the historic mining and the potential overlap. *Id.* Brook did not include a discussion about the various AML projects and subsidence caused by historic mining in its subsidence control plan. *Id.* at 752-53 (Testimony of Mr. Barron).

62. Nor did DEQ conduct any independent analysis of potential impacts of ongoing subsidence in the area and its relationship to the proposed Brook Mine. Tr. at 244 (Testimony of Mr. Kristiansen).

63. Nor did Brook verify anticipated subsidence potential at their site with actual subsidence conditions in the permit area. Ex. POW 12 at 13-14, 18 (Dr. Marino concluding: “There is a massive amount of surface subsidence in the area at mine depths similar to that proposed . . . both sag and pit subsidence would be expected at the Brook Mine.”).

64. DEQ and Brook did not even consult with the AML Division staff during review of the permit application to discuss the implications of and concerns related to ongoing subsidence in the area. Tr. at 243 (Testimony of Mr. Kristiansen); Tr. at 757 (Testimony of Mr. Barron).

B. Testimony Demonstrated DEQ Did Not Have the Expertise to Review the Subsidence Control Plan for Technical Accuracy or Completeness

65. The review of the Brook permit was one of the first jobs Mr. Kristiansen had when he started working at DEQ. Tr. at 218-19 (Testimony of Mr. Kristiansen). The Brook permit was the first coal mine permit Mr. Kristiansen coordinated while at DEQ. *Id.* at 226.

66. Mr. Kristiansen does not have any prior experience in reviewing subsidence control plans or highwall mine permits. Tr. at 163 (Testimony of Mr. Kristiansen); *Id.* at 227; Ex. GIL 21-23. Mr. Kristiansen admitted that the District III office of the Land Quality Division did not have experience in reviewing underground mine permits, and Brook’s permit application was the first highwall mine proposal the District had reviewed. Tr. at 226-27.

67. Because of his lack of experience, Mr. Kristiansen “had to attend” training by the Office of Surface Mining Reclamation and Enforcement (“OSMRE”). Tr. at 164. However, in review of the permit application, Mr. Kristiansen did not utilize key chapters of the OSMRE training materials related to subsidence prevention and risk. *Compare* Ex. DEQ 17-20 to Ex. POW 84; *see also* Tr. at 167, 376-77. Notably, he did not consider or evaluate important formulas related to geotechnical engineering and subsidence risk. *Id.* at 251.

68. Nor did Mr. Kristiansen perform any independent verification of admittedly “limited” and “basic” analysis done by Brook’s consultant. Tr. at 166-68; 237.

69. Mr. Kristiansen testified that he did not conduct independent verification because Brook’s consultant had “levels of experience significantly higher than [he] has,” Tr. at 168, although he was not sure who actually prepared the subsidence control plan. *Id.* at 253. Mr. Kristiansen also admitted that Dr. Marino has more experience than him. *Id.* at 251.

70. In fact, Mr. Kristiansen testified that he “was not expert enough” to even know what “technical and scientific standards” a subsidence control plan must meet. *Id.* at 234.

71. Nor did he have any experience or background in using any of the formulas discussed in the OSMRE course materials. *Id.* at 251.

72. Thus, even after the OSMRE course, Mr. Kristiansen did not have expertise in reviewing a subsidence control plan. *Id.* at 252 (Testimony from Mr. Kristian: “I would not say I’m an expert, no.”)

73. Mr. Kristiansen was the only DEQ staff member who reviewed the subsidence control plan and he did not reach out for assistance from anyone else at DEQ for assistance with his review. *Id.* at 234. Nor did he consult any background information beyond the OSMRE course materials he reviewed. *Id.* at 252.

74. With this lack of experience and expertise on the part of DEQ, Brook’s subsidence control plan was essentially not reviewed and deemed “technically adequate” with no basis for that determination.

75. As such, DEQ’s determination of “technical adequacy” for the subsidence control plan was arbitrary and capricious and an abuse of discretion, as the agency had no factual basis for making its decision.

C. The Subsidence Control Is Deficient Because It Was Not “Stamped” by a Professional Engineer

76. Geotechnical information or analysis in a mine permit application must be provided by a licensed engineer in Wyoming. This is necessary for DEQ to be able to rely on the accuracy of the information. *See* Tr. at 379 (Testimony of Mr. Kristiansen that information provided by licensed engineers is “certifiably accurate.”); *id.* at 1238-39 (Testimony of Dr. Marino that other subsidence control plans he has seen have been stamped by professional engineers and if “you’re doing engineering work, there’s a stamp for it.”).

77. However, no professional engineer “stamped” the subsidence control plan, rendering it deficient. Tr. at 738 (Testimony of Mr. Barron).

D. The Subsidence Control Plan and Associated Geotechnical Data is Neither Accurate nor Complete

1) Dr. Marino Concluded That the Subsidence Control Plan Is Deficient

78. Geotechnical engineering expert Dr. Marino concluded that “the application is severely deficient in the analysis and data to be able to make any kind of analysis of what the likelihood of subsidence would be in the future.” Tr. at 1200 (Testimony of Dr. Marino); Ex. POW 12 at 17 (“A detailed and advanced subsidence engineering analysis is required given the reported geologic and mining conditions. However, the mine subsidence potential investigation provided in the mine application is wholly inadequate . . .”); Ex. POW 11 at 42 (The subsidence control plan has a “lack of geomechanical understanding” and “insufficient information”).

79. Dr. Marino also concluded that the data and analysis included in the subsidence control plan “is far below industry standards.” Tr. at 1228; POW 11 at 42. He also concluded that the permit application did not meet scientific standards. *Id.* at 1246 (“There’s no science, in essence”).

80. The application contained only “inferences of attempts at calculating” pillar strength, and Dr. Marino concluded “there’s no equations given, there’s no strengths given.” Tr. at 1208. Additionally, the equation that was used in the permit application is an equation for bituminous coal, not the subbituminous coal found in the permit area. *Id.* at 1208-09, 1247. There was also no assessment of pillar width and height. *Id.* at 1209.

81. The permit application did not include an assessment of the potential of roof or floor collapse. Tr. at 1211 (Testimony of Dr. Marino: “There’s no mention of failure of . . . roof or floor conditions in terms of analysis or safety factors or anything like that.”).

82. The permit application’s limited data prevents an accurate or complete analysis of subsidence risk and engineering safety factors. Tr. at 1216 (Testimony of Dr. Marino: “here, we don’t have hardly any input data. If you don’t have the right input data, even if you have the right prediction method, your calculated value is suspect.”); *id.* at 1223, 1234; Ex. POW 12 at 18 (concluding that the permit application “essentially [had] no short and long term mine stability analyses of all potential failure modes that can lead to surface subsidence” and “no appropriate examination of risk, severity, and types of potential subsidence”).

83. The permit application does not completely or accurately assess the complex and diverse geological conditions in the permit area. *See, eg.* Tr. at 1221 (Testimony of Dr. Marino: “we’ve got a variety of different depths, different thicknesses of coal, different interburden thicknesses, different seam splits, none of this is really addressed in the permit in the application.”); *id.* at 1244 (the permit application is “not complete in a technical form because there’s not enough information to evaluate various mining scenarios in the various geologic conditions.”); Ex. POW 12 at 17; Ex. POW 11 at 33.

2) Brook & DEQ Admit That the Subsidence Control Plan is Deficient

84. DEQ admits that “data and studies” related to subsidence “have to be complete enough in this permit application to make and support” the finding that subsidence is not likely to occur. Tr. at 257 (Testimony of Mr. Kristiansen); *see also* Tr. at 742-43 (Testimony of Mr. Barron regarding this finding, its scope, and that its justification is a part of the permit application).

85. Yet, DEQ and Brook admit that additional geotechnical studies are needed before the company can justify the finding. *Id.*; *see also* Tr. at 323-25 (Mr. Kristiansen admitting that the testing Brook has done to date is not sufficient to assess whether subsidence will occur); *Id.* at 380; Tr. at 662, 743, 762 (Testimony of Mr. Barron: “To comply with the commitments within the permit there are additional studies that need to be done.”).

86. DEQ admits that the subsidence control plan contained “narrative” not technical information. Tr. at 247, 254 (Testimony of Mr. Kristiansen).

87. Brook admits that the finding that subsidence will not occur is not actually supported by data in the permit application and is merely a commitment to achieve a performance standard with no basis to show it will actually be achieved. Tr. at 745 (Testimony of Mr. Barron that the limited data in the permit application provided a “general sense” but did not provide a “specific conclusion” and that the statement in the subsidence control plan that “Highwall mining should not result in surface subsidence” was merely “a commitment to the performance standard.”).

88. For instance, the permit application is deficient because there was only one coal strength test done for the entire permit area. Tr. at 328 (Testimony of Mr. Kristiansen); *id.* at 1290 (Testimony of Dr. Marino: “it means nothing to me, one test”).

E. Expert Dr. Marino Demonstrated Subsidence Risk if Mining Proceeds

89. Dr. Marino's expert report concludes that "There is a serious risk of surface subsidence from roof collapse in the proposed mining [area]." Ex. POW 12 at 15; *see also* Tr. at 1225-28.

90. Dr. Marino's analysis shows that mine collapse is likely to occur because of the dominant presence of clay materials in the roof and floor on the mine. Tr. at 1210 (Testimony of Dr. Marino: "from reading the permit, the vast majority of the material's claystone . . . claystone is made of clay. And when that gets exposed to water, it deteriorates. It softens and swells and it causes failure."); *see also* Ex. POW 12 at 6, 9, 15-16 ("from our experience with the claystone roof and floor, the proposed mining can result in sag subsidence"); *id.* at 18. Brook's safety factor calculations did not account for the presence of clay. Tr. at 1226 ("no significant clay seam [is] assumed in the analysis.").

91. The presence of thin interburden and faulting also presents subsidence risk. *Id.* at 1219-21.

92. Dr. Marino found that even when using Brook's assumptions, "the stability factor calculates to an unacceptable value of less than one at [Brook's] pillar pressure where the panels are sufficiently wide." Ex. POW 12 at 11.

F. Coal Recovery Ratios Do Not Cure the Deficiencies in the Permit Application

93. DEQ confirmed Brook's finding that the mine would not create subsidence because of heavy reliance on an understanding that 50% of the coal would be left in the seam post-mining. Tr. at 120, 126, 169, 311, 330, 358 (Testimony of Mr. Kristiansen).

94. However, Brook's own permit application shows that recovery ratios will be from 45-60% and therefore will exceed 50%. Ex. DEQ 12 at 35; Tr. at 677, 760 (Testimony of Mr. Barron).

95. Dr. Marino's expert analysis shows Brook's extraction ratio could be as high as 60-70 percent. Tr. at 1204, 1236 (Testimony of Dr. Marino); Ex. POW 12 at 7.

96. Regardless, even Mr. Kristiansen admitted that the recovery ratio is just one factor to consider, and that you must also consider the strength and width of the coal pillars, the roof materials, and the floor materials to properly assess whether subsidence will occur. Tr. at 313-14.

97. Dr. Marino's expert analysis also shows that the 50% ratio should not be given as much weight as DEQ gives it. Tr. at 1236 (Testimony of Dr. Marino: "That standard . . . really doesn't apply if you have safety factors that are lower than what are acceptable. It should be based on safety factors, not on a percent."); *id.* at 1291 (noting that Brook's recovery rates "are general numbers that encompass[] the whole complex."); Ex. POW 12 at 7, 10 (noting that Brook's information is "typical" and generalized, not specific enough to provide DEQ a basis to conclude subsidence will be prevented).

98. Moreover, even assuming that the 50% extraction rate is technically significant *and* assuming that Ramaco will meet that rate, DEQ will not be able to independently verify or enforce the rate as a permit term or condition. Tr. at 229-30 (Testimony of Mr. Kristiansen: "I can't verify that"; admitting there is "no way" for DEQ to ensure compliance).

G. The Future MSHA Ground Control Plan is Not a Substitute for a Technically Complete and Adequate Subsidence Control Plan

99. Brook testified that the yet-to-come MSHA ground control plan can be viewed as a remedy for its deficient subsidence control plan. *See* Tr. 15-16 (Brook opening statement); *Id.* at 663 (Testimony of Mr. Barron: "the calculations necessary to provide the information for MSHA

are exactly the same data that DEQ is looking for each one of these panels.”); *Id.* at 746, 1533-34.⁶

100. Mr. Barron testified that the additional studies suggested by Dr. Marino in his expert report “are appropriate.” Tr. at 674-75 (admitting Dr. Marino’s expertise). However, he testified that these studies would be done for the MSHA ground control plan, not as part of the subsidence control plan. *Id.* at 675 (“it is a commitment as part of the permit application in the ground control plan that those [studies] will be done.”).

101. As Dr. Marino testified, the ground control plan is not a substitute for the additional geotechnical studies that must be done for the permit’s subsidence control plan *before* permit issuance. Tr. at 1202-03 (Testimony of Dr. Marino that MSHA won’t be concerned about stability in areas of the mine where miners will not be present, that MSHA is not the agency that “determines whether or not the mine plan is approved for surface subsidence,” and that the agency “has a different scope”); *id.* at 1241-42, 1245 (Dr. Marino testifying that future testing and analysis through the MSHA permit will not cure deficiencies in the subsidence control plan); Ex. POW 12 at 9 (“[A]pproval from MSHA (whose responsibility is safety) is irrelevant as the concern here is land subsidence.”).

102. Additionally, MSHA is focused on “looking at short-term conditions, when the miners are in, not when it’s abandoned.” Tr. at 1273 (Testimony of Dr. Marino that MSHA does not consider the risk of long-term subsidence at a mine site); *id.* at 1286 (testimony that the 1.3 safety factor is a “short-term safety factor” not long-term); *compare to id.* at 1535 (Testimony of Mr. Barron: “For the short term, we will stick with the 1.3 factor of safety.”).

⁶ DEQ has never supported Brook’s assertions regarding the ground control plan. In fact, DEQ has little understanding of what a ground control plan even is or what it requires. *See* Tr. at 330, 344 (Testimony of Mr. Kristiansen saying “I do not know” in response to a question about what engineering studies MSHA requires).

103. Dr. Marino’s conclusion was based on significant professional experience in preparing and reviewing subsidence control plans over his multi-decade career. Tr. at 1196 (Testimony of Dr. Marino regarding his background and experience); *id.* at 1237 (“there’s nothing in [other subsidence control plans I have reviewed] about MSHA, because MSHA is not directly related to subsidence on the ground surface.”)

104. Dr. Marino’s conclusions that the ground control plan is not meant to control subsidence and is not a substitute for the subsidence control plan required as part of the permit application are verified by Mark Eslinger, a former Supervisory Mining Engineer for MSHA, who in the scope of his multi-decade career reviewed ground control plans. Exhibit A (letter from Mark Eslinger to Shannon Anderson, July 11, 2017 with attached C.V. of Mark Eslinger).⁷

105. Even Brook admits that the ground control plan is only meant to address the safety of miners. Tr. at 663, 747 (Testimony of Mr. Barron: MSHA is “an organization whose sole role is the protection of the safety of miners.”). As a result, Brook admits that MSHA will not focus on subsidence damage to land resources or any other potential impacts of subsidence except safety of workers. *Id.* at 748.

III. The Permit Application Does Not Have Sufficient Baseline Water Data

106. Coal seam aquifers are locally and regionally important sources of water. *See* Tr. at 192 (Testimony of Mr. Kristiansen: “By and large, the coal beds are the primary aquifers in the basin . . .”)

107. In the permit area, and in surrounding areas, other aquifers, including overburden aquifers, also supply water for homes and agriculture or are capable of supplying water for these purposes.

⁷ These exhibits are included as part of these findings to rebut testimony provided by Mr. Barron.

108. However, in spite of the presence of these aquifers, there was very little and in some cases *no* baseline data collected to analyze the characteristics of, and projected impacts to, these aquifers. *See, eg.* Tr. at 915 (Testimony of Mr. Gerlach); Ex. BHC 9.

109. Mr. Wireman’s expert analysis shows that Brook did not collect baseline water samples in a scientifically defensible way, rendering the permit application deficient. *See, e.g.* Tr. at 1345-48; Ex. POW 17 at 3 (The permit application “present[s] a very incomplete characterization of the hydrogeology and surface water hydrology.”).

110. For instance, Brook did not conduct baseline water monitoring in the critically important TR-1 area – the first area Brook proposes to mine. *See* Tr. at 210-14, 383 (Testimony of Mr. Kristiansen); *Id.* at 513, 518, 519 (Testimony of Dr. Kuchanur). During technical review, DEQ identified the lack of data as a deficiency; however, Brook never provided additional information to remedy this deficiency. *Id.* This means that the lack of baseline water quality data for the TR-1 area remains a deficiency in the permit application. *Id.* at 217 (Testimony of Mr. Kristiansen admitting the deficiency and that this lack of data prevents the permit application from being “accurate” and “complete”). Additionally, generalities regarding aquifer characteristics from other portions of the mine are not applicable to this area, preventing other data from curing any deficiencies. *Id.* at 513.

111. Aside from the TR-1 area, no monitoring wells were completed in the overburden or interburden aquifers, at any locations throughout the permit area. Tr. at 511-12 (Testimony of Dr. Kuchanur); Ex. DEQ 6 at 24.

112. Testimony confirmed that “[m]onitoring in the alluvium is important.” Tr. at 533 (Testimony of Dr. Kuchanur). However, no baseline monitoring wells were completed in the alluvial aquifers – aquifers that are important to local agriculture and must be protected during

mining. *Id.* at 532, 539; *id.* at 1363-65, 1373 (Testimony of Mr. Wireman); Ex. POW 17 at 5 (Mr. Wireman's conclusion that "[t]his is a serious omission."); *see also id.* at 9.

113. Brook has committed to a limited set of three operational monitoring wells in the alluvium (Tr. at 533), but even if that operational monitoring was sufficient, it does not cure the lack of baseline monitoring.⁸

114. DEQ's groundwater expert was not involved in decisions allowing Brook to limit its baseline water monitoring program. Tr. at 523 (Testimony of Dr. Kuchanur).

115. Only fifteen wells were used for assessment of groundwater levels, in the entire permit area. Tr. at 523, 567 (Testimony of Dr. Kuchanur). And these wells only collected baseline water data from the coal seams. *Id.* at 524. This means that no water data was collected for non-coal bearing aquifers. *Id.* at 1382-83 (Testimony of Mr. Wireman, noting that Brook's application finds that most water wells in the area are not in the coal aquifers and no data is available for those aquifers).

116. Only *one* test was conducted to determine hydraulic conductivity, porosity, and storage coefficient values. Tr. at 524-25, 535, 1501 (Testimony of Dr. Kuchanur). This means that only *one* test was taken in the northeast portion of the permit for these very important water parameters and to characterize them for the entire permit area, rendering the analysis deficient. Tr. at 1354 (Testimony of Mr. Wireman); *id.* at 1355 ("a single value for the whole area . . . [can] in no way [] capture the complexity in the heterogeneity"); Ex. POW 17 at 5, 8; *see also id.* at 525 (Testimony of Dr. Kuchanur: "We need these parameters to characterize the aquifer"; acknowledging that if the test is not "an effective parameter that provides the best match to . . . what you see in the ground in terms of water levels" then the data is not sufficient.)

⁸ Additional operational monitoring for water quality and quantity will not remedy deficiencies related to baseline water data collection. Operational monitoring (during or post-mining) will itself be deficient without a scientifically defensible baseline to compare monitoring results to.

117. Mr. Wireman concluded that Brook did not “get data from monitoring stations throughout this permit area” as required to properly assess baseline water conditions and to understand the complexity and diversity of water quality and quantity in the area. Tr. at 1345 (Testimony of Mr. Wireman); *see also id.* at 1349-51.

118. For surface water monitoring, upstream and downstream monitoring stations on Slater Creek and Hidden Water Creek were used for baseline water monitoring. Tr. at 395 (Testimony of Mr. Kunze). However, data during the winter months was not collected. *Id.* This resulted in no water quality data being collected for Hidden Water Creek. *Id.* at 396. Historic data indicates that “in Hidden Water Creek, there was typically water in that creek in the winter, not in the summer” and that means water was not collected at the time the stream typically has water. *Id.* at 1361, 1402 (Testimony of Mr. Wireman); Ex. POW 17 at 7.

119. The lack of data collection from October to March prevented consideration of “seasonal differences” that can be significant and “very important.” Tr. at 1345, 1361-62 (Testimony of Mr. Wireman).

120. Groundwater data did also not account for seasonal changes, rendering it deficient. *Id.* at 1355 (“a potentiometric surface drawn for January water levels could be quite different than the one drawn with May water levels”).

121. Aside from seasonal deficiencies, Brook’s data of Slater Creek was deficient in other ways too. Tr. at 1366 (“There’s not enough characterization of Slater Creek.”); *id.* at 1363 (Slater Creek monitoring was not used to determine hydraulic conductivity values).

122. Brook’s lack of baseline water monitoring data was supplemented with other data sources. Tr. at 396 (Testimony of Mr. Kunze). However, this data was very old and still deficient. *Id.* at 1362-63 (Testimony of Mr. Wireman).

123. Determining the baseline water quality of Hidden Water Creek is especially important as Brook plans to divert the stream for at least three years. Tr. at 404 (Testimony of Mr. Kunze). Without baseline water quality data for Hidden Water Creek it will be impossible for DEQ to know if the creek's water quality or quantity will be impacted by mining operations.

124. No water monitoring was conducted on the Tongue River or Goose Creek in the permit area. Tr. at 408, 411-12 (Testimony of Mr. Kunze); *id.* at 1367 (Testimony of Mr. Wireman); Ex. POW 17 at 5.

125. As a result of this limited data collection, the hydrologic impacts model was limited and assumptions had to be made. Ex. DEQ 12 at 213 ("Limitations and assumptions specific to this modeling effort are primarily due to the complexity of the hydrogeologic system and a lack of data on physical and hydraulic characteristics of the aquifers and confining units being modeled."); *see also* Tr. at 528 (Testimony of Dr. Kuchanur agreeing that there are assumptions and limitations in the model). The data collected provided a "limited understanding of the coal location, continuity and hydrology." Ex. DEQ 12 at 529; Ex. POW 17 at 8.

126. Given these limitations and assumptions, the model was designed to provide a "general understanding of regional groundwater impacts." *Id.* The model was not, as Dr. Kuchanur testified, sufficient to serve as a "good predictive tool" of probable hydrologic consequences specific to proposed mining activities. *Id.*; Tr. at 530; *see also id.* at 1368-70 (Testimony of Mr. Wireman regarding the model's deficiencies).

127. The model was also deficient because it did not analyze or predict drawdowns to overburden aquifers. MP 6.2.3 ("Drawdowns of the overburden were not modeled . . ."); Tr. at 955 (Testimony of Mr. Gerlach: "there's no modeling of drawdown in the overburden."); Ex. POW 17 at 8 (Mr. Wireman concluding that "The modeling effort was limited to estimating

drawdowns in the coal seams . . . [m]odeling the coal seams as hydrologically isolated is not based on real data and is far too simplistic.”).

IV. The Permit Does Not Comply With Water Well Replacement Requirements

128. The WEQA requires coal mine operators to “replace” a surface or underground water supply “where the supply has been affected by contamination, diminution or interruption resulting from the surface coal mine operation.” W.S. § 35-11-415(b)(xii). A plan to meet these requirements must be a part of the permit application. Coal Rules Ch. 2 § 5(a)(ix)(E).

129. This requirement is especially important here, where 357 water wells are within the “zone of potential influence” of the mining operation. *See* Tr. at 288 (testimony of Mr. Kristiansen).

130. The permit application includes a commitment to replace only adjudicated water wells that will be impacted by mining activities. Ex. DEQ 12 at 52, 62.

131. The permit application’s water replacement limitations contravene the intent of Section 415’s requirements. Tr. at 521 (Testimony of Dr. Kuchanur); *see also* Ex. POW 17 at 4 (Mr. Wireman concluding that “Brook mine only agrees to replace impacted wells if they are adjudicated. This is not appropriate or sufficient since most domestic /stock wells are not adjudicated.”).

132. DEQ confirmed that removing “adjudicated” from the application is required through testimony at the hearing, and made the recommendation to the EQC to make the permit change. Tr. at 500, 520-22 (Testimony of Dr. Kuchanur).

V. The Permit Application Does Not Contain Any Limits or Restrictions on Blasting to Protect Property and Public Health

133. Blasting causes vibrations and is also a source of noise and air pollution. Tr. at 594-95 (Testimony of Mr. Emme).

134. “Orange clouds” produced from blasts often result from wet conditions. *Id.* at 597. Orange clouds have a high level of nitrogen oxides and the pollution that results is “highly toxic” and can be dangerous to breathe. *Id.* at 608. If an orange cloud “drifts” off site, it can settle back to the surface. *Id.*

135. Blasting is of particular concern to neighboring landowners. *Id.* at 1070-71 (Testimony of Ms. Collins); *Id.* at 1092-93 (Testimony of Mr. Bocek).

136. Blasting is also of concern to members of the public who recreate in the area given pollution, noise, and other impacts. Tr. at 1118 (Testimony of Ms. Malone).

137. A coal mine permit application must contain a blasting plan. Coal Rules Ch. 2 § 5(a)(vii). This plan must include “[p]roposed compliance with limitations on ground vibration and airblast, the basis for those limitations, and methods to be applied in controlling the adverse effects of blasting operations,” a “worst-case scenario” blasting estimate, identification of dwellings and structures in close proximity to proposed blasting locations, and a description and location of blasting monitors. *Id.*

138. The blasting plan must include sufficient terms and conditions for DEQ to determine compliance with the Chapter 6 blasting standards. To ensure compliance, the administrator (or his substitute) may request any additional information “determine[d] necessary” as part of the blasting plan. *Id.*; Tr. at 600 (Testimony of Mr. Emme). DEQ did not do that for this permit. *Id.*

139. Brook’s blasting plan is deficient because it does not describe how frequently blasting will occur and in what amounts or where blasting will occur. Tr. at 597-99 (Testimony of Mr. Emme).⁹ Nor does it include the proposed locations of monitors.

⁹ Brook originally proposed more detail but Mr. Emme asked them to remove it because if they would have blasted as proposed by the company “we’d have a lot of fly rock.” Tr. at 623.

140. It also does not describe what type of blasting will occur, for instance cast blasting, even though DEQ assumed that cast blasting would not be done in its review of the permit application. Tr. at 596 (Testimony of Mr. Emme).

141. Hundreds of residents live within a half-mile distance of the permit area, yet DEQ did not consider any restrictions or conditions on blasting to address impacts. Tr. at 593, 595 (Testimony of Mr. Emme).

142. DEQ (and in turn the EQC) has authority to limit blasting, in any number of ways, to protect public health and property. Tr. at 593-94 (Testimony of Mr. Emme that DEQ can put in place conditions if they are “advantageous.”).

VI. The Permit Application Does Not Disclose or Assess Impacts from Mine Traffic

143. The mine proposes to use large semi-trailer trucks with tandem trailers to transport coal. *See* Tr. at 148 (testimony of Mr. Kristiansen).

144. The mine plan is deficient because it does not estimate truck traffic, disclose any impacts to public or private roads used by the public, and does not include a traffic plan, even though according to the mine plan those “plans” have been “previously formulated.” Ex. DEQ 12 at 21.

VII. The Permit Application Illegally Allows Mining Through and Under a County Road

145. The permit application does not incorporate any agreements for road use with any governmental agencies or entities because no such agreements exist at this time. Tr. at 151 (Testimony of Mr. Kristiansen); Tr. at 702, 764 (Testimony of Mr. Barron that the permit applicant or consultants have not had any conversations with the county about road use).

146. Nor are there any proposals to relocate any public roads included in the permit application. *Id.* at 767 (Chairman Bagley: “Yeah, I would say that we have established that the plans to relocate that county road are not in the permit application.”).

147. Additionally, DEQ has not held a public comment opportunity or public hearing on any proposals to relocate any public roads within the permit area.

148. As such, the permit application is deficient because it does not include a 100 foot buffer around all public roads. Coal Rules Ch. 12 § 1(a)(v)(D); *see also* Ex. POW 31.

149. DEQ ignored this requirement in its permit review, partly because DEQ determined that only public roads outside the permit boundary would be impacted. Tr. at 277 (Testimony of Mr. Kristiansen that the “very minor” “narrative description” of impacts to public roads was sufficient because the roads are “outside the permit boundary.”).

150. However, the mine will directly impact Slater Creek Road inside the permit boundary, preventing landowners who use the road from accessing their property. *See* Ex. DEQ 12 at 131; Tr. at 279, 282 (Testimony of Mr. Kristiansen); *Id.* at 764-67 (Testimony of Mr. Barron that mining will come within 100 feet of Slater Creek Road and Slater Creek Road will have to be relocated); Ex. POW 33-34. The mine will also directly impact Hidden Water Road. *Id.*

VIII. The Permit Application Does Not Disclose or Include Any Facilities Necessary to Process, Transport, or Sell the Coal

151. For the purposes of delineating a permit boundary, the WEQA defines “Surface coal mining operation” to mean surface lands where surface coal mining activities take place and/or surface lands “incident” to underground coal mining activities. The operation shall also “include any adjacent land the use of which is incidental to any of these activities, all lands affected by the construction of new roads or the improvement or use of existing roads to gain access to the site

of these activities and for haulage . . . processing areas, shipping areas and other areas upon which are sited structures, facilities or other property or materials on the surface, resulting from or incident to these activities.” W.S. § 35-11-103(e)(xx); *see also* Tr. at 269 (Testimony of Mr. Kristiansen admitting that DEQ is supposed to require all facilities and roads that are incidental to mining to be included in the permit).

152. The permit application fails to include associated facilities necessary to get coal to a point of sale, including necessary roads and facilities. Ex. DEQ 12 at 21-22. These facilities were previously contemplated but were not included in the permit application. Ex. POW 48-50.

153. The permit application also is deficient because it does not include the proposed coal “processing areas” associated with Brook’s planned industrial park and manufacturing facilities, which are incidental to the mine. Ex. POW 26-27.

154. DEQ was fully aware of these facilities *before* the permit went to public notice and therefore they should have been considered by the agency in its review. Ex. POW 28.

IX. The Permit Application Does Not Include Other Facilities Planned at the Mine

155. Brook has planned a “long-term sump” at the TR-1 mine area. Tr. at 121-22; *Id.* at 193 (Testimony of Mr. Kristiansen: “The first pit, TR-1 pit is going to be kept as a sump . . . throughout mine life” for a variety of “different purposes.”).

156. Yet, this facility that will be in place the life of the mine is not identified or discussed *anywhere* in the permit application. Tr. at 198 (Testimony of Mr. Kristiansen).

157. There is also a corresponding lack of analysis of any associated impacts, including hydrologic impacts or impacts to land uses, which will result from this life of mine facility.

158. Brook anticipates it will need 328,200 gallons of water per day, and the TR-1 sump is a likely source for this water. Tr. at 433 (Testimony of Mr. Kunze).

X. The Permit Application Does Not Include an Accurate Projection of Coal Production

159. The mine plan must include “[a] complete operations plan proposed to be conducted during the life of the mine” with an accurate estimate of “the number of acres that will be affected annually” and the “anticipated annual and total production by tonnage.” *Id.* at § 5(a)(i).

160. Accurately estimating the amount of coal to be mined is a critical component of any mine plan as it establishes the time period of the permit and the level of anticipated impacts. Ex. POW 1 at 3, Ex. POW 17 at 3.

161. Originally, company representatives stated publicly that they anticipated mining 6-8 million tons per year when “Asian export markets” were the proposed market for the coal. Ex. POW 25 at 4, 13. However, now, the company plans to mine a small amount of coal for “feedstock” for their planned processing and manufacturing facilities. *See, e.g.* Ex. POW 72 at 9 (showing use of 30,000 tons of coal for a similar facility to that proposed by Brook).

162. The project keeps shifting, but meanwhile, the estimated annual production in the mine plan has not been updated since 2014. Tr. at 273-74 (Testimony of Mr. Kristiansen admitting that the projected production estimates in the permit application were not updated and DEQ did not ask any questions of the company related to production estimates).

163. The permit application is deficient because it does not contain an accurate estimate of annual and total coal production.

XI. Coal Production Will Exceed the Limit Established by the Air Quality Permit

164. The air quality permit is mentioned in the mine plan but says the permit “will be submitted.” Ex. DEQ 12 at 84. The permit application was not updated to disclose that there is a final air quality permit that was received *prior* the coal mining permit going to public notice nor does it explain any limits of on coal production that result from the air quality permit.

165. The air quality permit limits coal production at the Brook Mine to two million tons per year. Ex. POW 29 at 6.

166. For years four and five, estimated annual production exceeds two million tons, therefore proposing to violate the production limit established in the company's air quality permit. Ex. DEQ 12 at 98.

XII. The Permit Application Does Not Include a Proposed Bond that Meets the Requirements of Section 417

167. Requirements for mine reclamation bonds are governed by Section 417 of the WEQA and corresponding DEQ regulations. Coal Rules Ch. 12 § 2.

168. The reclamation bond must cover the *entire* cost of surface and water reclamation, including estimates of costs of third-party contractors necessary for the state to assume reclamation responsibilities in the case of a bond default. W.S. § 35-11-417(c)(i) (the bond should equal the “cost of reclaiming the affected land disturbed” . . . “plus the administrator’s estimate of the additional cost to the state of bringing in personnel and equipment should the operator fail or the site be abandoned.”); *see also* Tr. at 611 (Mr. Emme testifying that the bond is important “[s]o if an operator walks away, the state has revenue money in place to reclaim the mine site.”).

169. The bond amount must account for “the worst-case scenario.” Tr. at 636 (Testimony of Mr. Emme); Ex. POW 64 at 15 (“The bond amount will reflect the ‘worst case scenario’ i.e., the cost of reclaiming the site if the permittee forfeits the bond at the point of maximum reclamation cost liability, under the reclamation and operation plans approved as part of the permit.”).

170. Like the necessary findings of Section 406(n) discussed above, DEQ has stated that it has yet to calculate the bond amount. Tr. at 586-87 (Testimony of Mr. Emme). The bond

amount is not yet calculated because Brook has not provided “specifics” on their mining plans for the first year of their operations. *Id.* at 587, 609.

171. The lack of a bond in the permit at the time of public comment, like the CHIA, prevented adequate public review and comment on the proposed bond amount. *See* Tr. at 611 (Mr. Emme testifying that “The bond is set in the permit, and there is a public comment period before the permit is approved.”); *id.* at 612-13 (Testimony of Mr. Emme that the bond amount for an initial permit is generally set at a time that allows public comment, but for this permit there is no public comment opportunity for the bond amount).

172. Since DEQ has yet to set the bond amount, the only bond estimate that was available for public comment was Brook’s estimate.

173. Brook’s bond estimate was deficient because it did not include the costs of certain contingency factors and does not follow DEQ guidance to establish other contingency factor amounts. Ex. DEQ 31 at 16; Ex. POW 1 at 10-11.

174. Contingency costs are necessary *regardless* of the scope or extent of mining activities. Tr. at 614 (Testimony of Mr. Emme). These contingency costs “are very important if the state has to take over [the] bond.” Tr. at 613 (Testimony of Mr. Emme); *see also* Tr. at 773 (Testimony of Mr. Barron confirming Mr. Emme’s statement).

175. As such, these lines should not have zero estimates. *Id.* at 614 (Testimony of Mr. Emme: “There should be some number.”).

XIII. The Permit Application Does Not Contain a Surface Owner Protection Bond

176. In addition to the findings of Section 406(n), and the reclamation bond discussed above, a surface owner protection bond must be calculated prior to a decision on the permit application. *See* Tr. at 66-67 (Testimony of Mr. Kristiansen).

177. As far as the Resource Council is aware, the process to calculate that bond has not yet begun. Tr. at 201-02 (Testimony of Mr. Kristiansen).

178. Therefore, the EQC cannot find that the permit application should be approved.

PROPOSED PERMIT CONDITIONS OF APPROVAL & TERMS¹⁰

Proposed Blasting Permit Terms

Rationale: Blasting operations must prevent injury to persons and damage to public and private property outside the permit area. W.S. § 35-11-415(vi)(C). DEQ and the EQC have significant discretion to require permit terms to protect public health and safety and to prevent damage to homes and structures from blasting operations. *See Order, In the Matter of Objections by the Powder River Basin Resource Council to the Amendment of the RAG Eagle Butte Permit, Permit No. 428-T3, Docket No. 00-4802, June 26, 2003 at 10-12; Tr. at 608 (Mr. Emme testifying that “In the Powder River Basin, all the mines have either permit conditions or have voluntarily put restrictions on their operations.”); id. at 617-18, 639-40.*

Proposed Permit Terms:

Brook shall not conduct cast blasting. Blasting will only be authorized from 9 a.m. to 4 p.m., M-F. No blasting shall occur on public holidays. Brook shall not conduct blasting if wind is directed at any residence or business within 2,500 of the proposed blast. No blasting can take place on days with inversions or inclement weather (snow, rain). Brook will install, at its expense, a seismic monitor for any adjacent landowner that requests one as part of a pre-blast survey. The requesting landowner shall have access to all data collected. Brook will install, at its expense, a downhole camera for a water well to observe any impacts pre, during, and post blast for any landowner that requests one as part of a pre-blast survey.¹¹ The requesting landowner shall have access to all data collected. Brook will provide notice to any landowner within ½ mile of its permit area of proposed blasting times and locations.

Proposed Permit Term to Include the Buyoks’ Homes and Wells within the Area Designated For Pre-Blast Surveys

Rationale: A resident or owner of a man-made dwelling or structure within one-half mile of any portion of the permitted area can request a pre-blasting survey. W.S. § 35-11-415(vi)(E). According to Brook’s GIS mapping, Mr. Buyok’s home lies around 40 feet outside the ½ mile boundary and his water well lies about 20 feet outside the boundary. Tr. at 1017-18 (Testimony of Mr. Buyok). Brook has offered to include Mr. Buyok’s

¹⁰ Brook expressed a willingness to accept any permit condition proposed by the DEQ or the Council. Tr. at 713-14; 781 (Testimony of Mr. Barron: Brook would be “okay with any conditions that this council will find are necessary for the permit application.”).

¹¹ DEQ has required and used downhole cameras before. *See* Tr. at 607 (Testimony of Mr. Emme).

home and well within the zone for pre-blast surveys as an enforceable condition of the permit. *Id.* at 1055, 1524-25 (Testimony of Mr. Barron).

Proposed Permit Term: Brook will conduct a pre-blast survey for John Buyok and/or any member of his family if requested.

Proposed Permit Term to Implement the Proper County Road Buffer

Rationale: See section VII above.

Proposed Permit Term: No surface or underground mining shall occur within 100 feet of any public road. Should Brook obtain authorization to relocate a public road, the company shall incorporate that change as a permit amendment. Any request to relocate a road shall be subject to public comment and hearing pursuant to Ch. 12 § 1(a)(v)(D) of the Coal Rules and Regulations.

Proposed Permit Term for Replacement of Water Wells

Rationale: See section IV above.

Proposed Permit Term: Remove the word “adjudicated” from any description of water rights that will be replaced by Brook.

Proposed Condition of Approval to Defer Mining Until Baseline Water Quality Studies Are Complete & Findings Regarding Material Damage Are Made

Rationale: Baseline water quality sampling was deficient. While this means that the permit application should be denied, at the very least, mining should not be authorized until baseline samples are collected, analyzed, and reviewed by DEQ. DEQ itself agrees with this permit condition. Tr. at 363 (Testimony of Mr. Kristiansen); *Id.* at 411-12, 431 (Testimony of Mr. Kunze regarding monitoring on the Tongue and Goose Rivers).

Proposed Condition: Brook shall not commence coal mining operations until additional ground and surface water baseline water quality samples are collected, in a scientifically defensible manner, for the entire permit area.¹² Baseline samples must be taken for the overburden and alluvial aquifers, in addition to the coal seams. Samples must be collected seasonally for at least one year prior to mining. The inclusion of baseline water quality data shall be considered a major amendment to the permit and the new data will be subject to public notice and comment.

Brook shall also commit to continued monitoring at the baseline locations during operations and post-mining, until final bond release.

¹² If Brook wishes to amend its permit boundary to limit the scope of baseline monitoring or subsidence assessment, it can do so, but only as a major modification to its permit, subject to public notice and comment.

Proposed Condition of Approval to Defer Mining Until Alluvial Valley Floor Determinations Are Complete

Rationale: Mr. Kristiansen testified that DEQ is planning to include a permit condition that will “halt” mining should it be determined that an AVF would be “disturbed” by mining. Tr. at 116. However, given the vagueness of what that permit condition is, and the narrowness of equating “disturbance” to actual physical disturbance by mining (see discussion in Section III(B) above), a more carefully tailored permit condition is needed to comply with legal restrictions related to alluvial valley floor protection.

Proposed Condition: No coal operations can lawfully occur until DEQ finishes assessment and determination of all AVFs in lands adjacent to the permit.¹³ Specifically, no coal operations shall commence within ½ mile of the “potential” AVF identified in DEQ Exhibit 16 until a complete assessment of the delineation of the AVF is complete and until DEQ further reviews the mine permit application for potential impacts to the AVF from hydrologic connections between the mining area and the AVF.

Proposed Condition of Approval to Defer Mining Until Geotechnical Studies Are Complete to Demonstrate Subsidence Control and Prevention

Rationale: Dr. Marino’s testimony and exhibits discussed geotechnical studies and tests that must be complete in order to properly assess subsidence risk and to demonstrate subsidence control. *See, e.g.* Tr. at 1231-33.¹⁴

Proposed Condition: Brook shall not commence coal mining operations until it completes the geotechnical studies and tests identified by Dr. Marino in Ex. POW 94-D for the entire permit area. Brook will also at all times comply with the engineering design recommendations identified in Ex. POW 94-D. Brook must amend its permit application to include this information. Such an amendment will be considered a major modification to the permit and will be subject to public notice and comment (and public participation requirements of Sections 406(k) and (p)). A ground control plan submitted to MSHA shall not be sufficient to comply with this condition.

Proposed Permit Term that Requires Brook to Reclaim and Remediate All Subsidence Incidents in its Permit Area

Rationale: Given the overlap between historic abandoned mines and proposed mining by Brook, and given the ongoing subsidence problems caused by the abandoned mines in the area, testimony from Mr. Kristiansen showed that DEQ will have a difficult, if not “impossible” time, assigning liability to Brook if any subsidence occurs in the area, even if it is caused by the company. Tr. at 245, 320, 361-62 (Testimony of Mr. Kristiansen). If liability is not assigned, the AML Division will be responsible for all remediation. Brook

¹³ “Adjacent lands” is defined in the WEQA as “all lands within one-half mile of the proposed permit area.” W.S. § 35-11-103(e)(vii).

¹⁴ *See* note 15 *supra*.

has committed to remediate subsidence if it occurs, Tr. at 676, and the permit should be crafted to hold them to that commitment.¹⁵

Proposed Permit Terms: Brook shall conduct ongoing monitoring of subsidence activity within its permit boundary and DEQ shall include review of subsidence activity during regular inspections of the mine site. Brook will be responsible for all reclamation and remediation associated with any subsidence incidents that occur in areas that Brook is actively mining or has mined.

When subsidence-related damage to land, structures or facilities occurs, or when contamination, diminution, or interruption to a water supply occurs, DEQ will require Brook to obtain additional performance bond in the amount of the estimated cost of the repairs or in the amount of the estimated cost to replace the water supply, until the repair or replacement is completed.¹⁶ Before releasing the company's performance bond, DEQ must conduct a full assessment of subsidence risk and determine that subsidence is not likely to occur inside the area proposed for bond release. DEQ must consult with independent experts if the agency staff does not have the expertise to make that determination. Like the bond release proposal itself, DEQ's determination shall be subject to public notice and comment, and an affected party may object to DEQ's determination.

If subsidence causes damage to land or structures, DEQ must suspend mining under or adjacent to such land or structures until the subsidence control plan is modified to ensure prevention of further damage to such land or structures.

At all times Brook shall maintain at least a 500 foot horizontal and vertical buffer between previous mines and current mining operations.

Permit Term to Require a Public Comment Period on the Bond Amount Set by DEQ

Rationale: Testimony from Mr. Emme confirmed that DEQ normally has an initial bond amount available for public notice and comment as part of a permit application. However, in this case, the bond amount has yet to be set and DEQ did not have a draft bond amount available at the time of public notice and comment. This means that the bond amount will be unreviewable (by the public or in fact Brook itself), in violation of public participation opportunities.

¹⁵ This commitment is also required by federal SMCRA regulations, incorporated into the state program. 30 C.F.R. § 817.121 ("Repair of damage to surface lands. The permittee must correct any material damage resulting from subsidence caused to surface lands, to the extent technologically and economically feasible, by restoring the land to a condition capable of maintaining the value and reasonably foreseeable uses that it was capable of supporting before subsidence damage.")

¹⁶ The proposal for additional bond is consistent with federal requirements, incorporated into the state program. 30 C.F.R. § 817.121(c)(5).

Condition of Approval: Brook may not commence coal mining operations until such time as DEQ has made its proposed bond amount available for public inspection, notice, and a thirty (30) day comment period. Any interested member of the public may submit comments on or objections to the proposed bond amount within the 30 day comment period. Objections to the proposed bond amount shall be handled in accordance with Sections 406(k) and (p) of the Environmental Quality Act and corresponding DEQ public participation rules and regulations.¹⁷

Adoption of Permit Conditions and Terms Proposed by Big Horn Coal Company and the Fishers

Proposed Terms & Conditions: The Resource Council also adopts and hereby incorporates by reference any permit terms and conditions proposed by the other objecting parties, including but not limited to the terms and conditions proposed in Ex. BHC 5, to the extent that they do not conflict with the terms and conditions proposed above.

CONCLUSION & REQUESTED REMEDY

Given the deficiencies in the permit application described above, and the absence of specific regulatory findings necessary to issue a permit, the permit applicant has not met its burden to demonstrate that the application “is in compliance with this act and all applicable state laws” pursuant to Section 406(n).

As a result, the EQC must conclude that the permit application should be denied. The EQC should issue findings of fact and law and “a decision on the application” that orders the DEQ to deny the permit application within fifteen days of receipt of the EQC’s decision pursuant to Section 406(p).

Alternatively, the EQC could (1) make a finding that DEQ cannot issue the permit until all required findings under Section 406(n) are made, until the reclamation bond amount is calculated pursuant to Section 417 and the surface owner protection bond is calculated pursuant to Section 416, and until deficiencies in the permit application raised by the parties are addressed; (2) stay proceedings until DEQ makes its required findings; and (3) allow the parties’

¹⁷ In proposing this condition of approval, the Resource Council is not waiving its ability to exercise its rights and remedies to challenge DEQ’s bond calculation through W.S. § 35-11-1001.

time to respond and present additional evidence and testimony, as needed. Staying proceedings will afford DEQ time beyond the statutorily provided 15 days to finalize the CHIA and other needed documents and reviews and to respond to public comments and make any needed changes to the permit.

However, should the EQC decide to order the DEQ to approve the permit, it should be approved *only* with the permit terms and conditions listed above.

Respectfully submitted this 24th day of July, 2017.

Re: Ground Control Plan

Dear Shannon:

As you have requested, I am providing information concerning the Ground Control Plan and its relation to subsidence. The plan, required by Title 30, Code of Federal Regulations (CFR), necessitates that a coal mine operator establish and follow a Ground Control Plan (see §§ 77.1000 and 77.1000-1). The operator must file a copy of the plan with the Coal Mine Safety and Health district office. Unlike most other plans mandated by the regulations, the Ground Control Plan is not required to be submitted for approval. The Mine Safety and Health Administration (MSHA) does not approve the plan but acknowledges receipt of the plan when the plan contains all the required information.

The purpose of the Ground Control Plan is for the protections of miners. It provides for control of highwalls, pits, and spoil banks but not subsidence. Additionally, MSHA's jurisdiction over the mine ends when mining is completed and the mine is abandoned.

§77.1000 Highwalls, pits and spoil banks; plans.

Each operator shall establish and follow a ground control plan for the safe control of all highwalls, pits and spoil banks to be developed after June 30, 1971, which shall be consistent with prudent engineering design and will insure safe working conditions. The mining methods employed by the operator shall be selected to insure highwall and spoil bank stability.

§77.1000-1 Filing of plan.

The operator shall file a copy of such plan, and revisions thereof, with the MSHA Coal Mine Safety and Health district office for the district in which the mine is located, and shall identify the name and location of the mine; the Mine Safety and Health Administration identification number if known; and the name and address of the mine operator.

This letter should make clear that the Ground Control Plan does not deal with subsidence.

Sincerely,

Mark O. Eslinger, P.E.

Work Experience

06/25/2009 to present: MOESLING, LLC

Title: Owner

I own a consulting services company providing assistance to the coal mining industry. I have knowledge and expertise in the area of compliance with the requirements of the Title 30 Code of Federal Regulations enforced by the Mine Safety Health Administration (MSHA). Assisting mine operators with laws, regulations, rules, and orders regulating coal mining, processing, and transportation facilities is the main focus of the business. Additionally, I have helped mine operators prepare mine ventilation and other plans.

01/01/2016 to present: Vincennes University, Vincennes, Indiana.

Title: Mine Trainer

I teach and train mine management and miners of the coal mining industry in areas of compliance with the requirements of MSHA. One key area that Vincennes University has employed me to teach are courses in impoundment construction and inspection.

8/30/2014 to 12/31/2017 Vectren Utility Services, Inc. (Vectren), One Vectren Square, 211 N.W. Riverside Drive, Evansville, Indiana 47708

Title: Consultant

I consulted with, advised, and assisted Vectren in connection with citations and orders issued for violations, or other matters relating to the mines issued by MSHA up to the time of closing of the mines; including pending matters; citations and orders issued for violations, or other matters relating to the regulatory permits associated with the mines; including pending matters; claims asserted by employees of the contractors, including worker's compensation claims related to the mines, including pending matters and any other such matters as Vectren requested. I did extensive work with a team of lawyers from a large law firm on settlement of MSHA penalties assessed against the mines.

06/07/2010 to 08/29/2014: Black Panther Mining, LLC, and Five Star Mining, Inc.

Title: General Safety Manager

I managed the safety and health programs at Black Panther Mining, LLC's Oaktown Fuels Mine No. 1 and Oaktown Fuels Mine No. 2 and Five Star Mining Inc.'s Prosperity Mine. Black Panther Mining LLC and Five Star Mining Inc. were contract mining companies for Vectren Fuels, Inc. The mining properties were owned by Vectren Fuels, Inc., a division of Vectren Energy. Five Star Mining, Inc., and Black Panther Mining, LLC, dictated the operations at the mines. Prosperity mined about 2.0 million clean tons per year, Oaktown Fuels Mine No. 1 mined about 3.4 million clean tons per year, and Oaktown Fuels Mine No. 2 mined about 2.0 million clean tons per year.

I coordinated and managed the safety and health programs at three underground coal mines and two preparation plants. The safety department at Black Panther Mining, LLC, had one manager, seven safety technicians, and one trainer. The safety department at Five Star Mining, Inc. had a one manager, six safety technicians, and an administrative assistant. Additionally, I managed an Accident Investigator/Job Analyst and a Mine Rescue Trainer. I also assisted the engineering departments at both companies. I did extensive work with a team of lawyers on settlement of MSHA penalties assessed against the mines.

08/15/1971 to 06/03/2009: United States Department of Labor, Mine Safety Health Administration (MSHA) and its predecessor agencies the Mining Enforcement and Safety Agency (MESA) and the United States Bureau of Mines (USBM) both in the Department of the Interior

Title: Supervisory Mining Engineer

Duties: I supervised as many as three Mining Engineers, four Coal Mine Safety and Health Specialists (Ventilation), and one Mine Safety and Health Clerk in District 8's Ventilation and Impoundment Group. My responsibilities included the review of Mine Ventilation Plans; Emergency Response Plans, Mine Emergency Evacuation and Firefighting Programs of Instruction, Engineering Plans for the Design, Construction, and Maintenance of Impoundments, Refuse Pile Reports, Ground Control Plans, and Slope and Shaft Sinking Plans submitted by mine operators. Also, I supervised and made inspections and investigations of coal mines, both surface and underground, for compliance with regulations and approved plans. I participated in accident investigations, pressure quantity surveys of mine ventilation systems, and made investigations of petitions for modifications.

I participated in MSHA'S recovery efforts of the mine after the explosion at Kerr-McGee Coal Corporation's Galatia Mine, May 1998. Also, I participated in MSHA's oversight in opening the area of the mine sealed after the spontaneous combustion fire at Kerr-McGee Coal Corporation's Galatia Mine, November 1997 through February 1998.

As a member of MSHA's committee, I assisted in writing Safety Standards for the Use of a Belt Entry as an Intake Air Course; Final Rule, April 2, 2004

I was a member of MSHA's committee responsible for writing the Safety Standards for Underground Coal Mine Ventilation; Rule, May 15, 1992

I was Team Leader for the Ventilation and Mapping / Flames and Forces Team and signer of the "Report of Investigation, Underground Coal Mine Explosion, Pyro No. 9 Slope, William Station Mine, Pyro Mining Company, Sullivan, Union County, Kentucky, September 13, 1989." The explosion killed ten miners.

As a member of MSHA's Task Force on Longwall Mining, I studied longwall mining under deep cover and helped the committee publish its findings in a report titled "Two-Entry Longwall Mining Systems A Technical Evaluation" June 12, 1985. Many of the report's recommendations later became parts of mandatory regulations.

Prior to becoming a Supervisory Mining Engineer, October 1, 1982, I was classified as a Mining Engineer. In preparation for the duties as a Mining Engineer, I attended many training sessions to become an inspector and engineer including a 5-month long training course for engineers in Pittsburgh, Pennsylvania.. After the initial in-class training and subsequent field training, I inspected coal mines, both surface and underground. I reviewed Mine Ventilation Plans; Engineering Plans for the Design, Construction, and Maintenance of Impoundments; Ground Control Plans; Refuse Pile Reports; Mine Maps; Slope and Shaft Sinking Plans; and other plans.

Dear Counsel:

The public deliberations for the Brook Mine matter will be held on August 1, 2017 at about 4:00 p.m. The meeting of the Council begins at 3:00 p.m. on the 1st. The Council will go into executive session upon the meeting starting to receive legal advice. When the Council exits executive session the Brook matter will be taken up.

If you have any questions please contact me.

Have a great week.

Jim Ruby

Shannon,

I will send you a link just before the meeting. I plan on using YouTube again and it doesn't allow me to invite people to attend until after it is started.

It would be best if you had headphones with a mic. If your computer has separate mic and headphone jack you will need an adapter to use a cell phone headset.

Subject: Brook Mine deliberations

Dear Counsel:

The public deliberations for the Brook Mine matter will be held on August 1, 2017 at about 4:00 p.m. The meeting of the Council begins at 3:00 p.m. on the 1st. The Council will go into executive session upon the meeting starting to receive legal advice. When the Council exits executive session the Brook matter will be taken up.

If you have any questions please contact me.

Have a great week.

Jim Ruby

BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING

IN RE BROOK MINE APPLICATION)	DOCKET 17-4802
)	
TFN 6 2-025)	BRIEFING ORDER
)	

On the 8th day of June 2017, the evidence portion of the contested case concluded and the hearing was recessed until further notice. Because there appears that there may be disagreement or confusion about what legal requirements or standards the Council is required to consider to decide this matter, I have decided to require the parties to file briefs addressing the legal issue of what specific statutes, rules, and other legal guidance the Council is required by law to consider in this matter. Specifically, I request that the parties brief whether the Council is required to consider all or portions of Wyo. Stat. Ann. § 35-11-406(n) when deciding this matter. As part of the briefs, the parties are specifically required to address whether subsection (n) is applicable in this matter, and if a party believes it is not applicable, that party must describe why it is not and further explain when subsection (n) becomes applicable with specific reference to other subsections that are applicable instead. As part of this brief, please describe the appropriate burden of proof standard and explain who has the burden. The parties' briefs must not exceed 15 pages. These briefs are due by June 26. The parties may file reply briefs by June 30.

In addition, it is expected that the contested case transcript will be available to the parties on or before June 30, 2017. When the transcript is available, Council staff will notify the parties in writing. Within 20 calendar days after that written notice, the parties shall file proposed findings of facts and conclusions of law with the Council. These filings are limited to 40 pages.

The proposed findings of fact and conclusions of law must focus on the law that is applicable in this matter and must include citations to the specific legal requirements found in statutes, rules, and other legal guidance that the Council is required to consider to decide this matter. The proposed findings of fact and conclusions of law must also include the necessary facts, with citations to the transcript and exhibits to support your legal conclusions. In this filing, please include the appropriate burden of proof standard.

Last, there was testimony about possible permit conditions or changes. The proposed findings of fact and conclusions of law should identify suggested permit changes or conditions that a party is requesting the Council consider, and any legal basis and facts that the party believes supports the inclusion of the condition or change to the permit.

SO ORDERED THIS 13th DAY OF JUNE 2017.

Dr. David M. Bagley
Hearing Officer

CERTIFICATE OF SERVICE

Dear all, please see the attached motion filed in response to Brook's filings yesterday.

Also, I will not file something to this effect because the Council is well aware of this but I wanted to note that Brook is incorrect in stating in its response to our request to the Council that the 60 day clock under 406(p) has started to run. Chairman Bagley specifically recessed the hearing on June 8th - he did not end it. See the transcript and the June 13 Order. The clock to issue the findings of fact and decision only starts to run after the hearing is concluded.

Best,
Shannon

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINE’S RESPONSE BRIEF TO BIG HORN COAL’S BRIEF REGARDING
THE SCOPE OF THE ENVIRONMENTAL QUALITY COUNCIL’S REVIEW AND
REQUEST FOR ORAL ARGUMENT**

INTRODUCTION

Despite differences as to sufficiency of Brook Mine’s (Brook) permit application, Brook and Big Horn Coal (Big Horn) agree about how the permitting process works from Brook filing its application through the public comment period. But Big Horn’s central premise that the Council must consider “all of the statutes and regulations relating to permit issuance” is untrue. (Big Horn Br. at 2.) This case does not require and the law does not allow the Council to consider all statutes and regulations. Instead, the Council decides whether Brook’s permit application is complete, without deficiencies, and suitable for publication. The DEQ administrator then makes the remaining findings under 406(n), and the DEQ director issues or denies the permit application.

Although the Wyoming Supreme Court has not addressed the legal issues the Council asked the parties to brief, that does not mean the Council can ignore established legal principles even if Big Horn wants the Council to do so. The rules of statutory interpretation and the Council's limited authority constrain the Council's role here. (*See* Brook's Br. at 2-6.)

ARGUMENT

I. The plain language of Section 406(n) and this Council's limited review do not allow the Council to make the 406(n) findings.

Like a court, the Council must give a statute's words their plain meaning to find the "most likely, most reasonable, interpretation of the statute, given its design and purpose." *In the Interest of JB*, 2017 WY 26, ¶ 12, 390 P.3d 357, 360 (Wyo. 2017). But the Council cannot read words into the statute or render provisions meaningless. *City of Casper v. Holloway*, 2015 WY 93, ¶ 20, 354 P.3d 65, 71 (Wyo. 2015).

The Council would have to violate these principles to make the 406(n) findings. The plain language of section 406(n) states that the administrator makes the findings. Wyo. Stat. Ann. § 35-11-406(n) ("the administrator finds in writing..."). To insert the Council into this process would ignore the word "administrator" and read the word "Council" into 406(n). Wyoming law permits neither approach. *In the Interest of JB*, ¶ 12, 390 P.3d at 360; *Holloway*, ¶ 20, 354 P.3d at 71. Beyond changing section 406(n), inserting the Council in the place of the administrator would render the administrator's specific statutory and regulatory authority to "enforce and administer [the Environmental Quality Act]" moot. *See* Wyo. Stat. Ann. § 35-11-110(a); Wyo. Admin. Code § ENV LQC Ch. 12 § 1(a)(iv) ("In addition to the specific findings required by W.S. § 35-11-406(n), no permit shall be approved unless the administrator also finds in writing...").

The Surface Mining Control and Reclamation Act (SMCRA) again provides a good foil to Big Horn's position. Under SMCRA, the "regulatory authority" makes the findings for the federal counterpart of 406(n). *See* 30 U.S.C. § 1260(b). Here, the regulatory authority is DEQ; so having the DEQ administrator make the findings under 406(n) ensures Wyoming's compliance with SMCRA.

Section 406(o), which deals with operators with previous violations, erases any doubt about 406(n)'s plain meaning. Section 406(o) states, "[n]o permit shall be issued to an applicant after a finding **by the director or council**...." *Id.* This language demonstrates that the legislature could allow either the administrator or the Council to make findings if it had wanted. But the legislature chose not to put language in 406(n) that specified the Council.

Big Horn's position would also ask the Council to exceed its statutory authority. (Brook Br. at 2-6.); *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000) (explaining an agency's power depends upon statutes, so "they must find within the statute warrant for the exercise of any authority which they claim.") Under the Environmental Quality Act, the Council has authority to conduct contested cases about "the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof." Wyo. Stat. Ann. § 35-11-112(a)(iii). This means the Council's review is limited to what DEQ has administered; in other words, whether DEQ correctly deemed the permit application complete, without deficiencies, and suitable for publication. (Brook Br. at 3-4.) This same logic means the Council does not consider section 406(n) because the DEQ administrator has not yet issued any findings under that section. (*Id.* at 4-5.)

Big Horn hints the Council should make the 406(n) findings because DEQ did not “pass judgment as to the substance of the application’s contents and its overall compliance with substantive or legal requirements and prerequisites to permit issuance.” (Big Horn Br. at 8.) DEQ, however, did evaluate the substance of Brook’s permit application. DEQ has a duty to review an application for deficiencies, which the Act defines as “an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” Wyo. Stat. Ann. § 35-11-103(e)(xxiv). Here, DEQ did that and after 6 rounds of comments and responses deemed Brook’s permit application without deficiencies and suitable for publication.

Even if Big Horn had not distorted DEQ’s review of Brook’s application, Big Horn still misses how section 406(n) functions in the larger scheme of the permitting process. Wyoming statutes and regulations require Brook’s permit application to provide detailed information necessary for the administrator to make the 406(n) findings. But that information alone is not sufficient to make the findings because DEQ must perform the cumulative hydrologic impact assessment and other analysis before it makes the 406(n) findings. *See* Wyo. Stat. Ann. § 35-11-406(n)(iii); Wyo. Admin. Code § ENV LQC Ch. 19 sec. 2; Wyo. Admin. Code § ENV LQC Ch. 12 § 1(a)(iv). Those assessments use information and data from the permit application along with internal DEQ information and data. The Council, however, does not have DEQ’s internal information or data, or the statutory authority to conduct the required assessments, making Big Horn’s argument legally and practically impossible.

Still, Big Horn claims the Council can bypass the plain language of 406(n) because the Council has authority to grant permits. (Big Horn Br. at 12.) This argument has two fatal flaws. First, the Council’s authority to grant a permit does not apply here. The specific statutes that

define the Council's authority in a contested case and DEQ's authority in the permitting process control over a general statute about granting permits. (Brook Br. at 5-6.)

Second, the statute that gives the Council authority to grant permits states the authority "is subject to applicable state law." Wyo. Stat. Ann. § 35-11-112(c)(ii). The applicable state law here is section 406, which gives the administrator the authority to make the findings under 406(n). Likewise, the director has the power to issue permits. Wyo. Stat. Ann. § 35-11-406(p). So the applicable state law divests the Council of authority to grant permits governed by Section 406.

On a practical level this makes sense because the Council has a different role. In a contested case, the Council acts as a quasi-judicial body—not a regulator. *See Amoco Prod. Co. v. Dep't of Revenue*, 2004 WY 89, ¶ 24, 94 P.3d 430, 441 (Wyo. 2004) (explaining the boards exercises quasi-judicial authority when deciding contested cases.) But if the Council makes the 406(n) findings, it becomes the regulator. This would prevent the Council from reviewing the regulator's work thus undermining the Council's purpose in a contested case. *See* Wyo. Stat. Ann. § 35-11-112(a)(iii).

Big Horn also contends the Council should not defer to DEQ's technical adequacy findings because that phrase does not appear in statute or regulations. (Big Horn Br. at 3-4.) This asks the Council to overlook expert testimony based on semantics. DEQ testified that technical adequacy is its way of describing the review to determine if a permit application is without deficiencies. DEQ's use of jargon does not change the statute or change that DEQ conducted the required review for deficiencies. It also should not change the weight the Council gives the testimony.

The lone legal support Big Horn cites for the Council to make the 406(n) findings is *Grams v. Env'tl Quality Council*, 730 P.2d 784 (Wyo. 1986). (Big Horn Br. at 11-12.) But Big Horn has misled the Council about what the Wyoming Supreme Court held in *Grams*. *Grams* decided the following:

- the objectors received adequate notice of the contested case. 730 P.2d at 786-86;
- the Council correctly denied the objectors' request for a continuance. *Id.* at 788;
- the limits on objectors' discovery rights. *Id.*;
- the permit applicant's revisions to the application were not *ex parte* communications with DEQ. *Id.* at 789;
- the Council did not shift the burden of proof from the permit applicant. *Id.*; and
- the Council correctly decided the permit application was complete. *Id.* at 790.

The Council did find that the applicant had proven the elements of 406(n). *Id.* at 789. But the Supreme Court never held the Council must make the 406(n) findings.¹

The *Grams* case still leaves the relevant law as the statute governing this Council's authority and the law for applying and interpreting statutes. That law leads to one outcome, the Council does not make the 406(n) findings.

CONCLUSION

Big Horn's brief relies on the faulty assumption that this hearing will decide all aspects of the permitting process. No law supports that reading. The legislature chose not to include a hearing specific to 406(n) or state that the 406(n) findings must occur before the public comment

¹ It is unknown from the Supreme Court's opinion and the Council's order if DEQ issued a CHIA or the 406(n) findings before the permit application went to publication. (See Decision attached as Ex. 1)

process. Likewise, section 406 does not grant the Council authority to make these decisions or render a final decision. Should Big Horn or any objector wish to change that reality, they can do so through the legislature—not through the Council.

Brook requests the Council schedule oral argument on the parties' briefings relating to statutes and regulations the Council must consider.

Exhibit 1

BEFORE THE
ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING

FILED

NOV 19 1985

Terri A. Lorenzon, Adm. Aide
Environmental Quality Council

IN THE MATTER OF OBJECTIONS)
TO THE PERMIT APPLICATION OF)
AMAX COAL COMPANY, EAGLE BUTTE MINE,)
TFN 1 6/212)

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER GRANTING PERMIT

The application of Amax Coal Company for a surface coal mining permit and the objections thereto of LeRoy Grams and Mary H. Grams were considered by the Environmental Quality Council at a public meeting in Jackson, Wyoming, on September 30, 1985, following an evidentiary hearing held in Cheyenne, Wyoming, on August 28, 1985. Amax Coal Company appeared and was represented by Steven R. Youngbauer of Amax Coal Company. Mary H. Grams did not appear and was not represented at the hearing, and LeRoy Grams appeared pro se. The Land Quality Division of the Department of Environmental Quality appeared and was represented by Weldon S. Caldbeck, an Assistant Attorney General. Having considered the evidence presented at the hearing and the arguments of counsel, the Environmental Quality Council hereby finds and concludes as follows:

FINDINGS OF FACT

1. This proceeding arises from the application of Amax Coal Company, a division of Amax Incorporated (hereinafter "Amax"), to the Department of Environmental Quality, Land Quality Division, to obtain a permit to conduct surface coal mining activities.

2. The Eagle Butte Mine received a permit from the Land Quality Division in 1976. This permit application was submitted pursuant to Wyoming statutes and regulations that implement the Surface Mining Control and Reclamation Act, P.L. 95-87.

3. On May 21, 1985, the Land Quality Division, determined the Eagle Butte Mine application, assigned the temporary filing number TFN

1 6/212, is complete and suitable for final publication pursuant to W.S, 35-11-406(g).

4. LeRoy Grams and Mary H. Grams, received notice of the filing of the permit application pursuant to W.S. 35-11-406(g) and (j).

5. On August 6, 1985, the Land Quality Division received timely, written objections from the protestants LeRoy Grams and Mary H. Grams.

6. On August 20, 1985, Amax filed a Motion to Dismiss alleging that specified allegations in the protestants' petitions failed to state a claim upon which relief could be granted, and further stating that the Council lacked subject-matter jurisdiction over the issues raised.

7. Mary H. Grams is the owner of the surface estate of lands contiguous to the proposed mine permit area and water rights appurtenant to such lands (as described subsequently by the protestants' attorney), comprising the NW $\frac{1}{4}$ of Section 34, NE $\frac{1}{4}$ of Section 33 and the NE $\frac{1}{4}$ NW $\frac{1}{4}$ of Section 32, Township 51 North, Range 72 West, 6th P.M., Campbell County, Wyoming.

8. LeRoy Grams is the owner of all mineral rights underlying the lands owned by Mary H. Grams described in the above paragraph.

9. The protestant, Mary H. Grams, presented no evidence to substantiate allegations in her petition protesting the issuance of the mining permit to Amax Coal Company.

10. Evidence at the hearing demonstrated that the Eagle Butte Mine application does not request approval to mine the Little Rawhide Tract which was purchased in the 1982 coal lease sale held by the Department of Interior.

11. Evidence at the hearing demonstrated that access to the Grams' property will not be limited due to the mining operation, and a highway location project to which Mr. Grams objected, is a project of the Wyoming Highway Department and not Amax Coal Company.

12. The protestant, LeRoy Grams, produced no evidence on the issues raised in his petition alleging that:

A. The mining operation constitutes a public and private nuisance;

B. The coal company originally sought authorization for mining on an area and for a time in excess of that authorized by the Environmental Quality Act;

C. The application does not contain a map required by the Environmental Quality Act;

D. The reclamation plan did not comply with the Environmental Quality Act;

E. Amax Coal Company is in non-compliance with its current permit;

F. The present operation has lowered the groundwater on the Grams' property;

G. The issuance of this permit is contrary to the law and policy of the State of Wyoming and the United States;

H. Unidentified test holes were drilled beyond the terms of an exploration permit; and

I. No accommodation was made for private oil and gas leases or abandoned oil and gas wells.

13. Section 1.8 of the permit application contains a legal description of the permit area and this description does include the railroad to the point it splits to the Carter spur.

14. Section 1.10 of the permit application contains a demonstration that the current and proposed operation is in compliance with the Environmental Quality Act.

15. Section 2 of the permit application contains a general description of the area including a description of wildlife. No bald eagle roosts, bald eagle nests, or black-footed ferrets have been observed within or adjacent to the permit area by the U.S. Fish and Wildlife Service, wildlife consultants, or Amax Coal Company during studies conducted through 1985.

16. Neither the Amax Coal Company permit area nor the Grams' property contains habitat, such as Ponderosa Pine Hills or wooded riparian bottoms, suitable for bald eagle roosts.

17. Neither the Amax Coal Company permit area nor the Grams' property contains extensive colonies of burrowing animals, primarily prairie dogs, which are needed to support black-footed ferret populations.

18. Although bald eagles and golden eagles have been seen on the Grams' property and on the permit area, no evidence was produced indicating they roosted or nested in the area.

19. It is highly unlikely that black-footed ferrets live in the Eagle Butte Mine permit area or in the vicinity of the permit area.

20. Although drainage into a livestock reservoir on the Grams' property will be affected by the mining operation, much of the drainage area will remain intact.

21. The three (3) groundwater wells located on the Grams' property will not be significantly affected by the mining operation, and permit provisions for mitigation are sufficient for any unforeseen problems.

22. The reclamation plan will accomplish reclamation as required by the Environmental Quality Act.

23. The permit application contains a plan for special handling of acid and toxic materials to prevent contamination of ground or surface waters.

24. Eagle Butte Mine is grandfathered under W.S. 35-11-406(n)(v)(B) in regard to mining an alluvial valley floor.

25. All maps required by the Environmental Quality Act are included in the permit application.

26. Section 3.0 of the permit application contains a ground control plan that identifies a safe slope and benching conditions in order that the topographic surface beyond the affected area will not be in danger of collapse or nor will there be danger of interior collapse. There will be no lack of lateral and subjacent support for the Grams' property.

27. Amax Coal Company's mining operation will not mine around the Grams' property, thus, leaving that property with unreclaimed, vertical walls.

28. Section 3.8 of the permit application contains a blasting plan which insures that explosives will be used in accordance with existing state and federal laws. No blasting activities will occur within one half mile of the Grams' ranch buildings.

29. The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

30. No prime farmland is included within the permit area.

CONCLUSIONS OF LAW

1. This proceeding is under the Wyoming Environmental Quality Act, W.S. 35-11-101 through 1207, 1977 as amended.

2. Statutory notice was given by the applicant, Amax Coal Company.

3. Actual and statutory notice of the application was received by the protestants.

4. As the Eagle Butte Mine application, TFN 1 6/212, does not request approval to mine the Little Rawhide Tract, which was issued in the 1982 coal lease sale held by the Department of Interior, allegations concerning the existing permit allegations that this permit application should be deemed incomplete because of the 1982 coal lease sale should be dismissed.

5. The protestants are not precluded by this order from seeking any relief from any state agency having jurisdiction in the event of future, adverse effects on groundwater underlying the Grams' property.

6. The protestants, LeRoy Grams and Mary H. Grams, have not met their burden of going forward with evidence to demonstrate this permit application is incomplete.

7. Amax Coal Company has met its burden of proof demonstrating that the Eagle Butte Mine is in compliance with W.S. 35-11-406(n), and all other applicable state laws.

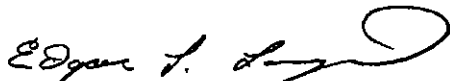

ORDER

IT IS HEREBY ORDERED THAT:

1. Allegations IV, V, VI, VII, VIII, X, XIV, and XV of the objections of LeRoy Grams, and allegations IV, V, VI, VII, and VIII of the objections of Mary H. Grams, are hereby dismissed; and

2. The permit to mine shall be granted pursuant to W.S. 35-11-406(p).

DATED this 19th day of November, 1985.

Edgar L. Langrand
Hearing Examiner

Brook diverges from Fishers and the other objectors on whether the Council or the administrator must make the findings under 406(n). Like the other objectors, Fishers brief is long on assertions but short on law. But the law matters. It defines the Council's authority and how the Council must interpret the statutes governing the permitting process. Applying that law means the Council reviews whether DEQ correctly decided Brook's permit application was complete and without deficiencies. (Brook Br. at 1-2.) After the Council issues findings of fact and conclusions of law on those issues, the administrator makes the required findings under 406(n), including the cumulative hydrologic impact assessment. (*Id.* at 5-6.) Fishers' assertions otherwise fail for the two reasons discussed below.

ARGUMENT

I. The plain language of Section 406(n) and this Council's limited review do not allow the Council to make the 406(n) findings.

Like a court, the Council must give a statute's words their plain meaning to find the "most likely, most reasonable, interpretation of the statute, given its design and purpose." *In the Interest of JB*, 2017 WY 26, ¶ 12, 390 P.3d 357, 360 (Wyo. 2017). But the Council cannot read words into the statute or render provisions meaningless. *City of Casper v. Holloway*, 2015 WY 93, ¶ 20, 354 P.3d 65, 71 (Wyo. 2015).

As Brook's opening brief explained, the Council would have to violate these principles to make the 406(n) findings. (Brook Br. at 2-6.) The plain language of section 406(n) states that the administrator makes the findings. Wyo. Stat. Ann. § 35-11-406(n) ("the administrator finds in writing..."). To insert the Council into this process would ignore the word "administrator" and read the word "Council" into 406(n). Wyoming law permits neither approach. *In the Interest of JB*, ¶ 12, 390 P.3d at 360; *Holloway*, ¶ 20, 354 P.3d at 71. Beyond changing section 406(n), inserting the Council in the place of the administrator would render the administrator's specific

statutory and regulatory authority to “enforce and administer [the Environmental Quality Act]” moot. *See* Wyo. Stat. Ann. § 35-11-110(a); Wyo. Admin. Code § ENV LQC Ch. 12 § 1(a)(iv) (“In addition to the specific findings required by W.S. § 35-11-406(n), no permit shall be approved unless the Administrator also finds in writing...”).

The Surface Mining Control and Reclamation Act (SMCRA) again provides a good foil to Fishers’ position. Under SMCRA, the “regulatory authority” makes the findings for the federal counterpart of 406(n). *See* 30 U.S.C. § 1260(b). Here, the regulatory authority is DEQ; so having the DEQ administrator make the findings under 406(n) ensures Wyoming’s compliance with SMCRA.

Section 406(o), which deals with operators with previous violations, erases any doubt about 406(n)’s plain meaning. Section 406(o) states, “[n]o permit shall be issued to an applicant after a finding **by the director or council...**” *Id.* This language demonstrates that the legislature could allow either the administrator or the Council to make findings if it had wanted. But the legislature chose not to put language in 406(n) that specified the Council.

Fishers’ position would also ask the Council to exceed its statutory authority. (*See* Brook Br. at 2-6.); *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000) (explaining an agency’s power depends upon statutes, so “they must find within the statute warrant for the exercise of any authority which they claim.”) Under the Environmental Quality Act, the Council has authority to conduct contested cases about “the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof.” Wyo. Stat. Ann. § 35-11-112(a)(iii). This means the Council’s review is limited to what DEQ has administered; in other words, whether DEQ correctly deemed the permit application complete, without deficiencies, and suitable for

publication. (Brook Br. at 3-4.) This same logic means the Council does not consider section 406(n) because the DEQ administrator has not yet issued any findings under that section. (*Id.* at 4-5.)

Fishers, however, do not make any attempt to reconcile their arguments with relevant law. Instead, Fishers argue that the Council must consider section 406(n) because that is necessary to prove Brook has a complete application. (Fishers Br. at 1-3, 6-7.) This distorts how the permitting process works. The Environmental Quality Act defines a complete application as one that “contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter.” Wyo. Stat. Ann. § 35-11-103(a)(xxii). DEQ has a duty to review an application for completeness before it reviews for deficiencies and before it deems the application suitable for publication. *Id.* at 406(e)-(f). Here, DEQ did that and after 6 rounds of comments and responses deemed Brook’s permit application without deficiencies and suitable for publication. No part of the Environmental Quality Act requires DEQ to make the 406(n) findings before Brook published its permit application. Instead, the Act only requires the administrator make the findings before a permit is issued. *See id.* at 406(n).

Even so, Brook agrees that the information and data in the permit application is necessary for the administrator to make the 406(n) findings. But that information alone is not sufficient to make the findings because DEQ must perform the cumulative hydrologic impact assessment and other analyses before it makes the 406(n) findings. *See* Wyo. Stat. Ann. § 35-11-406(n)(iii); Wyo. Admin. Code § ENV LQC Ch. 19 sec. 2; Wyo. Admin. Code § ENV LQC Ch. 12 § 1(a)(iv). Those assessments use information and data from the permit application along with internal DEQ information and data. The Council, however, does not have DEQ’s internal

information or data, or the statutory authority to conduct the required assessments, making Fishers' argument legally and practically impossible.

Fishers also contend that Brook attempts to duck some or all of the permitting requirements because DEQ's witnesses discussed technical adequacy. (Fishers Br. at 3-4.) This is just another attempt to manufacture support without facts. Brook has never claimed the phrase "technical adequacy" substitutes for the statutory and regulatory requirements. Instead, DEQ testified that technical adequacy is its way of describing the review to determine if a permit application is without deficiencies. DEQ's use of jargon does not change the statute or change that DEQ conducted the required review for deficiencies. It also does not provide a legal basis for the Council to conduct the 406(n) findings.

Fishers' lone legal support for any arguments comes from a quote in a United States Supreme Court case about the National Environmental Policy Act. (Fishers Br. at 5.) That case addresses a statutory requirement under federal law that has nothing to do with requirements under the Environmental Quality Act or its federal counterpart, SMCRA.

II. The public can still participate in the process if the Council does not make the 406(n) findings.

Fishers claim that the public may never have the chance to learn about the 406(n) findings or comment on them without the Council making the findings now. (Fishers' Br. at 5-6.) This wrongly implies Fishers or other objectors have no means to challenge DEQ's findings under 406(n). Any objector can appeal the Council's decision, including a decision not to make the 406(n) findings. Objectors can appeal the DEQ Director's decision to issue a permit to Brook. The objectors will also have access to DEQ's 406(n) findings and the cumulative hydrologic impact assessment because they will be publically available documents.

Even so, the public's right to participate in the permitting process is not unlimited. The Act sets out a single chance for the public to comment—after DEQ deems a permit suitable for publication. *See* Wyo. Stat. Ann. § 35-11-406(k). The Act does not give the public the right to comment or object at every stage of the process. The public does not even get the right to comment after DEQ deems a permit application complete and the applicant publishes notice. *Id.* at 406(g). While the Fishers may want more chances to comment, they do not have the statutory right or the due process right to do so. If the Fishers wish to change that, the legislature not the Council is the body who has the sole legal authority to help them.

CONCLUSION

The legislature chose not to include a hearing specific to 406(n) or state that the 406(n) findings must occur before the public comment process. Likewise, section 406 does not grant the Council authority to make these decisions or render a final decision. Fishers clearly dislike this reality and assert that the Council should find otherwise. But the Fishers have no law to support their claims and no logic to connect the sections of 406 and the statutes governing this Council's authority into a cohesive whole. As said at the start, the law matters. And it shows that Brook's reading of what the Council should decide is the most logical, coherent reading of all relevant statutes.

Brook requests the Council schedule oral argument on the parties' briefings relating to statutes and regulations the Council must consider.

While PRBRC argues otherwise, its arguments are long on assertions but short on proof. PRBRC fails to explain why the Council has the legal authority to make the findings under 406(n) or step into the place of the DEQ director. Although the Wyoming Supreme Court has not addressed the legal issues the Council asked the parties to brief, that does not mean the Council can ignore established legal principles even if PRBRC wants the Council to do so. The rules of statutory interpretation and the Council's limited authority constrain the Council's role here. (*See* Brook's Br. at 2-6.) By ignoring this settled law, PRBRC invites the Council to make two errors of law.

ARGUMENT

I. The plain language of Section 406(n) and this Council's limited review do not allow the Council to make the 406(n) findings.

Like a court, the Council must give a statute's words their plain meaning to find the "most likely, most reasonable, interpretation of the statute, given its design and purpose." *In the Interest of JB*, 2017 WY 26, ¶ 12, 390 P.3d 357, 360 (Wyo. 2017). But the Council cannot read words into the statute or render provisions meaningless. *City of Casper v. Holloway*, 2015 WY 93, ¶ 20, 354 P.3d 65, 71 (Wyo. 2015).

The Council would have to violate these principles to make the 406(n) findings. The plain language of section 406(n) states that the administrator makes the findings. Wyo. Stat. Ann. § 35-11-406(n) ("the administrator finds in writing..."). To insert the Council into this process would ignore the word "administrator" and read the word "Council" into 406(n). Wyoming law permits neither approach. *In the Interest of JB*, ¶ 12, 390 P.3d at 360; *Holloway*, ¶ 20, 354 P.3d at 71. Beyond changing section 406(n), inserting the Council in the place of the administrator would render the administrator's specific statutory and regulatory authority to "enforce and administer [the Environmental Quality Act]" moot. *See* Wyo. Stat. Ann. § 35-11-110(a); Wyo.

Admin. Code § ENV LQC Ch. 12 § 1(a)(iv) (“In addition to the specific findings required by W.S. § 35-11-406(n), no permit shall be approved unless the administrator also finds in writing...”).

The Surface Mining Control and Reclamation Act (SMCRA) again provides a good foil to PRBRC’s position. Under SMCRA, the “regulatory authority” makes the findings for the federal counterpart of 406(n). *See* 30 U.S.C. § 1260(b). Here, the regulatory authority is DEQ; so having the DEQ administrator make the findings under 406(n) ensures Wyoming’s compliance with SMCRA.

Section 406(o), which deals with operators with previous violations, erases any doubt about 406(n)’s plain meaning. Section 406(o) states, “[n]o permit shall be issued to an applicant after a finding **by the director or council...**” *Id.* This language demonstrates that the legislature could allow either the administrator or the Council to make findings if it had wanted. But the legislature chose not to put language in 406(n) that specified the Council.

PRBRC’s position would also ask the Council to exceed its statutory authority. (Brook Br. at 2-6.); *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000) (explaining an agency’s power depends upon statutes, so “they must find within the statute warrant for the exercise of any authority which they claim.”) Under the Environmental Quality Act, the Council has authority to conduct contested cases about “the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof.” Wyo. Stat. Ann. § 35-11-112(a)(iii). This means the Council’s review is limited to what DEQ has administered; in other words, whether DEQ correctly deemed the permit application complete, without deficiencies, and suitable for publication. (Brook Br. at 3-4.) This same logic means the Council does not consider section

406(n) because the DEQ administrator has not yet issued any findings under that section. (*Id.* at 4-5.)

Without any legal support, PRBRC claims the Council can bypass the plain language of 406(n) because the Council has authority to grant permits. (PRBRC Br. at 2.) This argument has two fatal flaws. First, the Council’s authority to grant a permit does not apply here. As Brook’s opening brief explained, the specific statutes that define the Council’s authority in a contested case and DEQ’s authority in the permitting process control over a general statute about granting permits. (Brook Br. at 5-6.)

Second, the statute that gives the Council authority to grant permits states the authority “is subject to applicable state law.” Wyo. Stat. Ann. § 35-11-112(c)(ii). The applicable state law here is section 406, which gives the administrator the authority to make the findings under 406(n). Likewise, the director has the power to issue permits. Wyo. Stat. Ann. § 35-11-406(p). So the applicable state law divests the Council of authority to grant permits governed by Section 406.

On a practical level this makes sense because the Council has a different role. In a contested case, the Council acts as a quasi-judicial body—not a regulator. *See Amoco Prod. Co. v. Dep’t of Revenue*, 2004 WY 89, ¶ 24, 94 P.3d 430, 441 (Wyo. 2004) (explaining the boards exercises quasi-judicial authority when deciding contested cases.) But if the Council makes the 406(n) findings, it becomes the regulator. This would prevent the Council from reviewing the regulator’s work thus undermining the Council’s purpose in a contested case. *See* Wyo. Stat. Ann. § 35-11-112(a)(iii).

PRBRC also asserts, without citing any legal support, that the Council must make the 406(n) findings to avoid the process becoming “meaningless.” (PRBRC Br. at 9.) This wrongly

implies PRBRC or other objectors have no means to challenge DEQ's findings under 406(n). PRBRC and any other objector can appeal the Council's decision, including a decision not to make the 406(n) findings. Objectors can appeal the DEQ Director's decision to issue a permit to Brook. The objectors will also have access to DEQ's 406(n) findings and the cumulative hydrologic impact assessment because they will be publically available documents.

Even so, PRBRC's assertion does not make sense. This process began because the objectors challenged DEQ's decision that Brook's permit application was suitable for publication. DEQ does not have to make the findings under 406(n) to deem a permit suitable for publication and did not here. *See* Wyo. Stat. Ann. § 35-11-406(a)-(h). To now inject 406(n) into the process is akin to allowing the public to allege deficiencies in Brook's permit application before DEQ has finished the completeness review to ensure the application has everything required. Neither approach makes practical sense.

PRBRC's approach also misses how section 406(n) functions in the larger scheme of the permitting process. Wyoming statutes and regulations require Brook's permit application to provide detailed information necessary for the administrator to make the 406(n) findings. But that information alone is not sufficient to make the findings because DEQ must perform the cumulative hydrologic impact assessment and other analyses before it makes the 406(n) findings. *See* Wyo. Stat. Ann. § 35-11-406(n)(iii); Wyo. Admin. Code § ENV LQC Ch. 19 sec. 2; Wyo. Admin. Code § ENV LQC Ch. 12 § 1(a)(iv). Those assessments use information and data from the permit application along with internal DEQ information and data. The Council, however,

does not have DEQ's internal information or data, or the statutory authority to conduct the required assessments, making PRBRC's argument legally and practically impossible.¹

The lone legal support PRBRC cites for the Council to make the 406(n) findings is *Grams v. Env't'l Quality Council*, 730 P.2d 784 (Wyo. 1986). (PRBRC Br. at 2.) But PRBRC has misled the Council about what the Wyoming Supreme Court held in *Grams*. *Grams* decided the following:

- the objectors received adequate notice of the contested case. 730 P.2d at 786-86;
- the Council correctly denied the objectors' request for a continuance. *Id.* at 788;
- the limits on objectors' discovery rights. *Id.*;
- the permit applicant's revisions to the application were not *ex parte* communications with DEQ. *Id.* at 789;
- the Council did not shift the burden of proof from the permit applicant. *Id.*; and
- the Council correctly decided the permit application was complete. *Id.* at 790.

The Council did find that the applicant had proven the elements of 406(n). *Id.* at 789. But the Supreme Court never held the Council must make the 406(n) findings.²

The *Grams* case still leaves the relevant law as the statute governing this Council's authority and the law for applying and interpreting statutes. That law leads to one outcome, the Council does not make the 406(n) findings.

¹ PRBRC suggests that the Council has to make these findings because no opportunity exists for DEQ to make them. (PRBRC Br. at 8.) But section 406(p) gives DEQ 15 days after the Council's decision to make the required findings under 406(n).

² It is unknown from the Supreme Court's opinion and the Council's order if DEQ issued a CHIA or the 406(n) findings before the permit application went to publication. (See Decision attached as Ex. 1)

II. The Council does not have the authority under Section 406(p) to “step into the place of the Director” and make a final decision on the permit application.

Section 406(p) states, “[i]f a hearing is held, the council shall issue findings of fact and a decision on the application within sixty (60) days after the final hearing. The director shall issue or deny the permit no later than fifteen (15) days from receipt of any findings of fact and decision of the environmental quality council.” Wyo. Stat. Ann. § 35-11-406(p). In deciding what this language means, the same rules described above apply. The Council must apply the plain language of the statute and avoid rendering provisions meaningless. *In the Interest of JB*, ¶ 12, 390 P.3d at 360; *Holloway*, ¶ 20, 354 P.3d at 71. The Council must also consider each statutory section *in pari materia* (sections with the same subject) giving effect to each “word, clause, and sentence according to their arrangement and connection.” *In the Interest of JB*, ¶ 12, 390 P.3d at 360.

These rules mean the phrase “decision on application” should be read together with the Council’s authority and the other parts of section 406. As Brook’s opening brief explains, the Council has the authority to review the laws and regulations DEQ has administered. (Brook Br. at 6-7.) To date, DEQ has decided only that Brook’s permit application was complete, without deficiency, and suitable for publication. Before a permit can issue, the remaining findings under section 406 fall to either the administrator or DEQ director. Wyo. Stat. Ann. § 35-11-406(m)-(n). And the DEQ director issues the permit. *Id.* at 406(p). Reading these provisions together means the Council’s “decision on the application” should decide if DEQ correctly determined the application was complete, without deficiency, and suitable for publication.

PRBRC, however, argues section 406(p) authorizes the Council to make a “final” decision on the permit application. (PRBRC Br. at 1-3.) This asks the Council to violate basic principles of statutory interpretation. To start, words and phrases key to PRBRC’s argument are

missing. The word “final” or anything similar do not appear in 406(p). The phrase “step into the place of” or anything similar also do not appear. So PRBRC asks the Council to insert words into the statute, something Wyoming law prohibits. *Holloway*, ¶ 20, 354 P.3d at 71. Likewise, the Council would have to make the 406(n) findings to render a final decision, which ignores the specific language of 406(n) that the administrator makes those findings and renders it meaningless in this case.³ *Id.* This leaves the only logical and legally permissible reading of “decision on the application” as a decision on whether Brook’s permit application was complete, without deficiencies, and suitable for publication.⁴

CONCLUSION

PRBRC’s brief relies on the faulty assumption that this hearing will decide all aspects of the permitting process. But no law supports that reading. The legislature chose not to include a hearing specific to 406(n) or state that the 406(n) findings must occur before the public comment process. Likewise, section 406 does not grant the Council authority to make these decisions or render a final decision. Should PRBRC or any objector wish to change that reality, they can do so through the legislature—not through the Council. Rather, the Council can exercise only the authority the legislature granted it. Here, that means reviewing whether DEQ correctly administered section 406(a)-(h) and its associated regulations.

³ PRBRC hints that DEQ cannot make the findings because Mr. Wendtland recused himself. (PRBRC Br. at 8.) This is nonsense. DEQ personnel testified that Alan Edwards serves as acting administrator for Brook’s permit application and can/will make the 406(n) findings.

⁴ PRBRC also claims in its list of applicable laws that the Council’s decision should include Wyo. Stat. Ann. §§ 35-11-415(b), 417(c). These claims require little discussion. Section 415 applies only if DEQ issued a permit. *Id.* at 415(a). Section 417 applies only before an operator begins mining, which requires a permit. So neither of these sections apply.

Brook requests the Council schedule oral argument on the parties' briefings relating to statutes and regulations the Council must consider.

Exhibit 1

BEFORE THE
ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING

FILED

NOV 19 1985

Terri A. Lorenzon, Adm. Aide
Environmental Quality Council

IN THE MATTER OF OBJECTIONS)
TO THE PERMIT APPLICATION OF)
AMAX COAL COMPANY, EAGLE BUTTE MINE,)
TFN 1 6/212)

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER GRANTING PERMIT

The application of Amax Coal Company for a surface coal mining permit and the objections thereto of LeRoy Grams and Mary H. Grams were considered by the Environmental Quality Council at a public meeting in Jackson, Wyoming, on September 30, 1985, following an evidentiary hearing held in Cheyenne, Wyoming, on August 28, 1985. Amax Coal Company appeared and was represented by Steven R. Youngbauer of Amax Coal Company. Mary H. Grams did not appear and was not represented at the hearing, and LeRoy Grams appeared pro se. The Land Quality Division of the Department of Environmental Quality appeared and was represented by Weldon S. Caldbeck, an Assistant Attorney General. Having considered the evidence presented at the hearing and the arguments of counsel, the Environmental Quality Council hereby finds and concludes as follows:

FINDINGS OF FACT

1. This proceeding arises from the application of Amax Coal Company, a division of Amax Incorporated (hereinafter "Amax"), to the Department of Environmental Quality, Land Quality Division, to obtain a permit to conduct surface coal mining activities.

2. The Eagle Butte Mine received a permit from the Land Quality Division in 1976. This permit application was submitted pursuant to Wyoming statutes and regulations that implement the Surface Mining Control and Reclamation Act, P.L. 95-87.

3. On May 21, 1985, the Land Quality Division, determined the Eagle Butte Mine application, assigned the temporary filing number TFN

1 6/212, is complete and suitable for final publication pursuant to W.S, 35-11-406(g).

4. LeRoy Grams and Mary H. Grams, received notice of the filing of the permit application pursuant to W.S. 35-11-406(g) and (j).

5. On August 6, 1985, the Land Quality Division received timely, written objections from the protestants LeRoy Grams and Mary H. Grams.

6. On August 20, 1985, Amax filed a Motion to Dismiss alleging that specified allegations in the protestants' petitions failed to state a claim upon which relief could be granted, and further stating that the Council lacked subject-matter jurisdiction over the issues raised.

7. Mary H. Grams is the owner of the surface estate of lands contiguous to the proposed mine permit area and water rights appurtenant to such lands (as described subsequently by the protestants' attorney), comprising the NW $\frac{1}{4}$ of Section 34, NE $\frac{1}{4}$ of Section 33 and the NE $\frac{1}{4}$ NW $\frac{1}{4}$ of Section 32, Township 51 North, Range 72 West, 6th P.M., Campbell County, Wyoming.

8. LeRoy Grams is the owner of all mineral rights underlying the lands owned by Mary H. Grams described in the above paragraph.

9. The protestant, Mary H. Grams, presented no evidence to substantiate allegations in her petition protesting the issuance of the mining permit to Amax Coal Company.

10. Evidence at the hearing demonstrated that the Eagle Butte Mine application does not request approval to mine the Little Rawhide Tract which was purchased in the 1982 coal lease sale held by the Department of Interior.

11. Evidence at the hearing demonstrated that access to the Grams' property will not be limited due to the mining operation, and a highway location project to which Mr. Grams objected, is a project of the Wyoming Highway Department and not Amax Coal Company.

12. The protestant, LeRoy Grams, produced no evidence on the issues raised in his petition alleging that:

A. The mining operation constitutes a public and private nuisance;

B. The coal company originally sought authorization for mining on an area and for a time in excess of that authorized by the Environmental Quality Act;

C. The application does not contain a map required by the Environmental Quality Act;

D. The reclamation plan did not comply with the Environmental Quality Act;

E. Amax Coal Company is in non-compliance with its current permit;

F. The present operation has lowered the groundwater on the Grams' property;

G. The issuance of this permit is contrary to the law and policy of the State of Wyoming and the United States;

H. Unidentified test holes were drilled beyond the terms of an exploration permit; and

I. No accommodation was made for private oil and gas leases or abandoned oil and gas wells.

13. Section 1.8 of the permit application contains a legal description of the permit area and this description does include the railroad to the point it splits to the Carter spur.

14. Section 1.10 of the permit application contains a demonstration that the current and proposed operation is in compliance with the Environmental Quality Act.

15. Section 2 of the permit application contains a general description of the area including a description of wildlife. No bald eagle roosts, bald eagle nests, or black-footed ferrets have been observed within or adjacent to the permit area by the U.S. Fish and Wildlife Service, wildlife consultants, or Amax Coal Company during studies conducted through 1985.

16. Neither the Amax Coal Company permit area nor the Grams' property contains habitat, such as Ponderosa Pine Hills or wooded riparian bottoms, suitable for bald eagle roosts.

17. Neither the Amax Coal Company permit area nor the Grams' property contains extensive colonies of burrowing animals, primarily prairie dogs, which are needed to support black-footed ferret populations.

18. Although bald eagles and golden eagles have been seen on the Grams' property and on the permit area, no evidence was produced indicating they roosted or nested in the area.

19. It is highly unlikely that black-footed ferrets live in the Eagle Butte Mine permit area or in the vicinity of the permit area.

20. Although drainage into a livestock reservoir on the Grams' property will be affected by the mining operation, much of the drainage area will remain intact.

21. The three (3) groundwater wells located on the Grams' property will not be significantly affected by the mining operation, and permit provisions for mitigation are sufficient for any unforeseen problems.

22. The reclamation plan will accomplish reclamation as required by the Environmental Quality Act.

23. The permit application contains a plan for special handling of acid and toxic materials to prevent contamination of ground or surface waters.

24. Eagle Butte Mine is grandfathered under W.S. 35-11-406(n)(v)(B) in regard to mining an alluvial valley floor.

25. All maps required by the Environmental Quality Act are included in the permit application.

26. Section 3.0 of the permit application contains a ground control plan that identifies a safe slope and benching conditions in order that the topographic surface beyond the affected area will not be in danger of collapse or nor will there be danger of interior collapse. There will be no lack of lateral and subjacent support for the Grams' property.

27. Amax Coal Company's mining operation will not mine around the Grams' property, thus, leaving that property with unreclaimed, vertical walls.

28. Section 3.8 of the permit application contains a blasting plan which insures that explosives will be used in accordance with existing state and federal laws. No blasting activities will occur within one half mile of the Grams' ranch buildings.

29. The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

30. No prime farmland is included within the permit area.

CONCLUSIONS OF LAW

1. This proceeding is under the Wyoming Environmental Quality Act, W.S. 35-11-101 through 1207, 1977 as amended.

2. Statutory notice was given by the applicant, Amax Coal Company.

3. Actual and statutory notice of the application was received by the protestants.

4. As the Eagle Butte Mine application, TFN 1 6/212, does not request approval to mine the Little Rawhide Tract, which was issued in the 1982 coal lease sale held by the Department of Interior, allegations concerning the existing permit allegations that this permit application should be deemed incomplete because of the 1982 coal lease sale should be dismissed.

5. The protestants are not precluded by this order from seeking any relief from any state agency having jurisdiction in the event of future, adverse effects on groundwater underlying the Grams' property.

6. The protestants, LeRoy Grams and Mary H. Grams, have not met their burden of going forward with evidence to demonstrate this permit application is incomplete.

7. Amax Coal Company has met its burden of proof demonstrating that the Eagle Butte Mine is in compliance with W.S. 35-11-406(n), and all other applicable state laws.

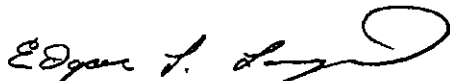

ORDER

IT IS HEREBY ORDERED THAT:

1. Allegations IV, V, VI, VII, VIII, X, XIV, and XV of the objections of LeRoy Grams, and allegations IV, V, VI, VII, and VIII of the objections of Mary H. Grams, are hereby dismissed; and

2. The permit to mine shall be granted pursuant to W.S. 35-11-406(p).

DATED this 19th day of November, 1985.

Edgar L. Langrand
Hearing Examiner

Brook objects to PRBRC's request to delay argument until the August meeting and the corresponding delay in deciding this case. The Council has 60 days "after the final hearing" to issue findings of fact and conclusions of law. Wyo. Stat. Ann. § 35-11-406(p). The final hearing has taken place, and the 60 days have begun. PRBRC's request is a delay tactic that continues its efforts to delay the process. Should the Council wish to hear oral argument, that can be accomplished next week. Brook will be available to appear in person or by phone.

ATTORNEY FOR OBJECTORS
BIG HORN COAL COMPANY

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)
) Docket Nos. 17-4802, 17-
) 4803, and 17-4804
TFN 6 2-025) (Consolidated)

**BIG HORN COAL COMPANY’S REPLY BRIEF REGARDING THE
SCOPE OF THE ENVIRONMENTAL QUALITY COUNCIL’S REVIEW**

Pursuant to the Environmental Quality Council’s (“EQC”) Briefing Order, dated June 13, 2017, Big Horn Coal Company (“Big Horn”), by and through its undersigned counsel of record, hereby submits this reply brief as to the legal parameters governing the EQC’s review in this matter, as well as the appropriate burden of proof standard.¹

¹ Though technically a response brief, this brief is denoted as a reply, which corresponds to the term used in the EQC’s June 13th Order.

INTRODUCTION

Big Horn presents this reply in response to the arguments and positions posited by the Wyoming Department of Environmental Quality (“DEQ”) and Brook Mining Company, LLC (“Brook Mine”).

DEQ and Brook Mine have incorrectly argued that the EQC should not consider the requirements from subsection (n) of Wyo. Stat. Ann. § 35-11-406 (sometimes referred to herein as “Section 406”) in reaching its decision in this matter, but rather only review and make a determination as to whether Brook Mine’s permit application is sufficiently complete and suitable for publication. In asserting this position, both DEQ and Brook Mine rely on that fact that Section 406(n) requires its specific findings be made by the Land Quality Division Administrator (the “Administrator”), not the EQC. Brook Mine also makes its argument in heavy reliance on its position that the EQC can only review prior actions of DEQ, and since no permit has been issued or denied, this contested case hearing does not implicate the EQC’s authority to “[c]onduct hearings in any case contesting the grant, denial, suspension, revocation or renewal of any permit, . . . authorized or required by [the Environmental Quality Act.]” Wyo. Stat. Ann. § 35-11-112(a)(iv).

The positions asserted by DEQ and Brook Mine, however, neglect to consider the plain language of Section 406 and relevant case law as to the appropriate framework of the EQC’s decision. Section 406(p), the final subsection of Section 406, specifically requires this contested case to culminate with the EQC

issuing “a decision on the permit[.]” *Id.* at -406(p). Moreover, the case of *Grams v. Environmental Quality Council*, 730 P.2d 784 (Wyo. 1986), clearly demonstrates that the EQC is to direct the DEQ in its decision on the permit application, and that the EQC must consider Section 406(n) in directing the DEQ towards its findings and eventual issuance or denial of the requested permit.

For the reasons stated in Big Horn’s brief submitted to the EQC on June 26, 2017, and the reasons stated herein, the EQC must consider the requirements of Section 406(n) in its decision regarding these contested case proceedings.

ARGUMENT

I. Section 406 and Relevant Wyoming Case Law Make Clear the EQC’s Responsibility to Consider Section 406(n).

As all parties appear to agree, Section 406 governs both the process of filing an application for surface coal mining as well as the governing requirements for its eventual issuance or denial. All parties appear to further agree on the role and applicability of subsections (a) through (j).² The disagreement pertains to the role of the EQC in presiding over a contested case hearing contemplated by Section 406(k) and the applicability of the requirements found in Section 406(n) to the EQC’s decision in this matter.

² To be clear, no party appears to disagree with the proposition that the EQC is to evaluate Brook Mine’s permit application in light of the applicable permit requirements in Section 406(a)-(h) as well as the related DEQ Rules and Regulations pertaining to permit requirements.

Section 406 is clear. After a surface coal mining permit application is deemed complete and suitable for publication pursuant to Section 406(h) and publication is made pursuant to Section 406(j), interested persons are given the opportunity to object to “the application.” Wyo. Stat. Ann. § 35-11-406(h) – (k). These objections to “the application” are then heard either in an informal conference by the DEQ or a contested case hearing. These proceedings will result in either DEQ “tak[ing] action on the application” after an informal conference, or the EQC “issu[ing] findings of fact and ***a decision on the application***” after a contested case hearing before the EQC. *Id.* at -406(k), (p) (emphasis added). Nowhere does Section 406 indicate that either form of review is based solely on whether the permit application is complete and suitable for publication, nor does any provision of Section 406 limit objections or the EQC’s resulting review to certain portions of the statute. Rather, the language clearly mandates that in a contested case hearing such as this, the EQC must “issue a decision on the permit,” which must direct the DEQ’s issuance or denial of the permit. *Id.* at -406(p).

In support of their position, DEQ and Brook rely on: (1) the linear progression of Section 406, specifically relying on the fact that 406(n) comes after Section 406(k)’s contemplation of a contested case hearing; and (2) the fact that Section 406(n)’s required findings (which have not been made) must be made by the Administrator, not the EQC. These arguments misconstrue the clear requirements and procedure of Section 406.

It is true that Section 406 proceeds in a linear and step by step fashion. In fact, the statute governs Brook Mine's permit application from its initiation to its eventual issuance or denial. *See id.* at -406(a) – (p). However, the fact that subsection (n) comes after subsection (k) does not mean that Section 406(n) is inapplicable to this contested case hearing. Following DEQ and Brook Mine's argument, it cannot be overlooked that subsection (p), which comes after subsection (n), provides that the EQC's statutory duty following the contested case hearing is to ***issue a decision*** on the application. Section 406(p) is the very last subsection of Section 406 and the culmination of the permit application process resulting in either the permit's issuance or denial. It is axiomatic, then, that the EQC's decision on the permit must pertain to the application's eventual issuance or denial and the EQC must consider all of the legal requirements and burdens placed on Brook Mine in its quest to have its permit application granted.

Pursuant to Section 406(k), objections to a surface coal mining permit can lead to either an informal conference or contested case hearing, which then will result in a decision on the application. *Id.* at -406(k),(p). The provisions following Section 406(k) provide the applicable criteria in the contested case or informal conference and direct the outcome of these proceedings, i.e., the decision regarding the approval or denial the permit application. For a surface coal mining permit application such as this, Section 406(n) specifically provides a portion of this criteria

and the EQC must consider it in reaching its “decision on the application[.]”³ *Id.* at -406(n),(p). This is only further supported by the fact that DEQ must “issue or deny the permit” within fifteen (15) days of the EQC’s decision on the application. *Id.* at -406(p).

Notwithstanding that the DEQ must actually issue any permit and the Administrator must make the required written findings under Section 406(n), in the event of a contested case hearing, this decision and these findings must be made at the direction of the EQC and pursuant to the EQC’s “decision on the application[.]” *See id.* at -406(p). This is the exact procedure outlined by the Wyoming Supreme Court in *Grams*, 730 P.2d at 786-89 (outlining the process leading to contested case hearings under Section 406 and stating that the EQC directed the DEQ as to whether to issue the requested permit after the EQC considered whether the permit applicant met its burden to establish that its application was in “compliance with W.S. § 35-11-406(n) and all other applicable state laws”).

Critical for the EQC’s consideration, in arguing for the purported limitations on the scope of EQC’s review in this matter, neither DEQ nor Brook Mine present any authority or precedent showing similar proceedings in which the EQC’s review

³ In applying Section 406(n), the EQC is inherently tasked with reviewing all permit requirements as Section 406(n) requires the applicant to establish that the application is “in compliance with [the Environmental Quality Act] and all applicable state laws” and is “accurate and complete[.]” Wyo. Stat. Ann. § 35-11-406(n).

was limited in the manner they assert, or in which the EQC's decision resulted in anything other than a directive to the DEQ regarding permit issuance after consideration of Section 406(n). As noted, *Grams* stands in opposition to this argument. *Id.*; see also *Pfeil v. Amex Coal West, Inc.*, 908 P.2d 956, 959 (outlining the same process under Section 406, but in the context of a revision to a mine permit, and noting that after hearing the EQC issued a decision on whether to grant the permit revision).

Therefore, in conducting this contested case hearing and issuing its decision, the EQC must consider the specific requirements of Section 406(n), and all laws and regulations incorporated therein. The DEQ must then ultimately issue or deny the permit and make the Section 406(n) findings in writing at the direction of and pursuant to the EQC's decision.

II. The EQC's Delegated Authority allows it to hear this Case Contesting the Grant of Brook Mine's Permit Application.

The EQC's delegated powers and functions under Wyo. Stat. Ann. § 35-11-112 allow it to "[c]onduct hearings in any case contesting the grant, denial, suspension, revocation or renewal of any permit, . . . authorized or required by [the Environmental Quality Act.]" *Id.* at -112(a)(iv).

The EQC's power to conduct hearings contesting the grant or denial of a permit application does not require that a permit application have been previously denied or approved by the DEQ. Rather, the statute simply requires a hearing

“contesting the grant, [or] denial” of a permit “authorized or required” by the Environmental Quality Act. This is exactly the issue before the EQC in this matter. Under the Environmental Quality Act, a permit is “required” before Brook Mine can conduct its proposed coal mining operations.⁴ Brook Mine has submitted a permit application that it seeks to have approved, and interested parties have filed objections and provided evidence at the contested case hearing citing deficiencies and thus contesting the grant of the permit application in its current condition.

CONCLUSION

In sum, although the Administrator must make the required written findings from Section 406(n) and DEQ must issue or deny the permit application, in the case of a contested case proceeding before the EQC such as this, these requirements are made at the directive of the EQC. The form and structure of Section 406 clearly outlines the process of an application for surface coal mining operations. When objections to the permit application are raised, Section 406(k) requires that either an

⁴ In its principle brief, Brook Mine argues that the terms used in Wyo. Stat. Ann. § 35-11-112(a) such as “issued or administered by” refer to prior actions by arguing that the words “issued” and “administered” are past tense forms of the underlying term. To the extent that Brook Mine would argue this same position regarding section -112(a)(iv)’s use of “authorized or required by this act” and argue that section -112(a)(iv) only applies to a hearing concerning previously granted or denied permits, this argument fails. The form of the words “authorized” and “required” do not refer to the past tense of the words “authorize” and “require.” Rather, the language of the statute clearly demonstrates that they simply refer to the fact that the relevant authorization or requirement stems from the Environmental Quality Act.

informal conference or contested case hearing must occur. In either event, the remaining portions of Section 406 clearly indicate that in either of these proceedings will result in the ultimate decision as to the issuance or denial of the permit and provide for the criteria in making this decision. *See* Wyo. Stat. Ann. § 35-11-406(k) – (p). As a contested case hearing before the EQC regarding an application for surface coal mining operations, it is the role of the EQC to review Section 406(n) and issue a decision on the application. Then, pursuant to the direction of the EQC's decision, the DEQ must perform its duties to either issue or deny the permit within fifteen (15) days and issue any required Section 406(n) findings in writing. This process and procedure is in complete accord with not only Section 406, but also relevant case law and the statutory powers and duties of the EQC.

Finally, Brook Mine admits that it bears the burden of proof in this matter and acknowledges that the EQC may independently weigh the evidence presented without particular deference to DEQ's positions. *See Brook Mine's Brief on Statutes and Regulations that the Council must Consider*, p. 10.

For the reasons stated herein, and those presented in Big Horn's principle brief addressing this topic, the EQC should reject the limited review asserted by DEQ and Brook Mine.

**OBJECTOR FISHERS' REPLY BRIEF ON THE APPLICATION OF
WYOMING STATUTE §35-11-406(n)**

Objectors Mary Brezik-Fisher and David Fisher, through their undersigned attorney Jay A. Gilbertz, of Yonkee & Toner, LLP, hereby file this reply brief addressing the application of Wyoming Statute §35-11-406(n) to these proceedings.

In large measure, the briefing filed by DEQ and Brook Mine focuses on the assertion that the EQC does not have the authority to make the *final* findings that Brook has proven compliance with the requirements of §35-11-406(n). This contention misses the point. The point is that Brook's application for a coal mining permit is not meaningfully complete unless it contains and affirmatively demonstrates that the requirements of subsection (n) have been satisfied. Without this information and proof set forth in the application, the application is incomplete and deficient. After all, without this necessary information, what would the Director base his decision on?

Evidently, Brook seeks to proceed with issuance of a permit without demonstrating that it has supplied the required affirmative proof of compliance with subsection (n) in the hope that the permit will be granted anyway. If it could accomplish this legally improper result then it will inappropriately flip the burden of proof to the public as was described in the Fishers' primary brief. Indeed, Brook goes even further in its brief on page 5, stating "The DEQ administrator has not yet issued any findings under 406(n) because DEQ has not conducted the cumulative hydrologic impact assessment (CHIA) **that allows the administrator to make findings under section 406(n)(iii).**" (emphasis added). This statement demonstrates that Brook's position is that it is somehow the obligation of DEQ to prove (through the CHIA) that Brook will not impact the hydrologic balance. This is not the case at all. Subsection 406(n) is clear that it is Brook which must affirmatively demonstrate that its mining will not negatively impact the hydrology. The CHIA performed by DEQ is only to confirm that DEQ agrees with the proof submitted by Brook.

The briefing submitted by DEQ and Brook warrant no further response or comment.

WHEREFORE, the Fishers request that the EQC find and hold that the requirements of §35-11-406(n) are substantive requirements of the Wyoming Environmental Quality Act and a coal mining applicant must prove its mining activities will be in compliance with these provisions as part of its permit application.

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	
TFN 6 2-025)	DOCKET 17-4802

REQUEST TO THE ENVIRONMENTAL QUALITY COUNCIL

After reviewing the parties' briefs, it is clear that there is great dispute on the applicability of Section 406(n). Since Section 406(n) is a significant part of the law, and whether it applies will greatly affect what findings of fact or conclusions of law must be made by the Council, the Powder River Basin Resource Council ("Resource Council") asks the Council to resolve the issue before the parties are ordered to submit post-hearing briefs with written closing arguments and proposed findings of fact and conclusions of law.

Furthermore, the Resource Council believes that this decision must be made by the full Council, not just the Hearing Officer, and as such, a public deliberation of the decision should be made at a forthcoming open meeting of the Council. The Resource Council has requested oral argument on the applicability of Section 406(n) and other issues of dispute among the parties, and offers that this oral argument could be held at that same meeting.

While this may create some additional time for the decision-making process, it seems necessary given the significance of the dispute between the parties. Moreover, this is a dispute created by DEQ and the permit applicant, not the Resource Council.

denied by the DEQ. Resource Council Br. at 1-2. However, also as discussed, under Section 406(p), that decision is only made *after* and *pursuant to* the Council’s “decision on the application.” *Id.* at 2. In other words, the decision to be made by the Council is a decision to instruct DEQ to issue or deny the permit, and if to issue it, under what conditions.

The Resource Council’s interpretation is consistent with EQC precedent, a Wyoming Supreme Court decision, and the plain language of Section 406(p). DEQ and Brook’s interpretations are consistent with none of this authority.

First, EQC precedent demonstrates that the Council’s role is to instruct DEQ to issue or deny the permit. In two cases in 1985, the Council held hearings on coal mine permit applications after objections were raised. *In the Matter of the Objections to the Permit Application of Fort Union Mine Partners (TFN 1 6/215)*, Findings of Fact, Conclusions of Law and Order, Mar. 8, 1985; *In the Matter of Objections to the Permit Application of Amax Coal Company, Eagle Butte Mine (TFN 1 6/212)*, Findings of Fact, Conclusions of Law and Order Granting Permit, Nov. 19, 1985.¹ In both decisions, the Council based its decision on Section 406(p) and Section 112(c)(ii), which provides that the Council has the power to “Order that any permit, license, certification or variance be granted, denied, suspended, revoked or modified.” W.S. § 35-11-112(c)(ii).² The Council’s decision was to order that the permits be granted.

¹ While there have been several other contested case hearings on new coal mine permit applications, or on renewals or amendments to coal mine permit applications (which also fall under Sections 406(k) and 406(p)), from a review of the EQC website, many of those cases were dismissed and/or settled so there are no final decisions from the Council available. Additionally, documents from some of the earlier cases are not available on the website and were unable to be reviewed by the Resource Council in the time allotted for this brief. However, if necessary, the EQC staff could work with the Council to review the archived files for consistency in precedent.

² Brook argues that the Council’s authority comes from Section 112(a). Brook Br. at 2-3. However, that is only true if there is not additional, and in this case more specific, authority for the Council’s hearing and decision, as there is here with Sections 406(k) and 406(p). Brook also

The Amax case was then appealed to the Wyoming Supreme Court. In its decision, the Supreme Court affirmed the EQC decision. *See Grams v. Env't'l Quality Council*, 730 P.2d 784, 786 (Wyo. 1986) (“On November 19, 1985, the EQC entered its order directing the LQD to issue a mining permit to AMAX.”).

In other words, EQC precedent, as affirmed by the Wyoming Supreme Court, demonstrates that the EQC’s “decision on the application” under Section 406(p) is not to merely determine whether the application is “complete” or “suitable for publication” or make other findings that are applicable at earlier stages in the permitting process, as DEQ and the permit applicant argue.³

Finally, a plain reading of Section 406(p) dictates that the Council makes the “decision on the application,” which is the *same* decision under the section the DEQ Director would make if an informal conference was held or if no informal conference or hearing was requested. Additionally, the section specifies that the DEQ action to issue or deny the permit is made a mere fifteen days after the decision of the Council, evidencing that the DEQ action is simply following through on the Council’s decision, not making a new decision on different or additional grounds, a decision that would almost certainly require time beyond fifteen days.

provides a passing cite to Section 112(b)(ii), which does not exist. This is likely a typo for Section 112(c)(ii), but the brief does not cite or explain that text in that location. Later, Brook tries to discount Section 112(c)(ii) by claiming that Section 112(a) controls because it is more “specific.” However, Section 406(p) is actually more specific and controls over the more general authority of Section 112(a), and 406(p) instructs that Section 112(c)(ii) applies. Additionally, Brook says Section 112(c)(ii) gives the Council “authority to grant or deny permits,” which misses the point, because the authority is to *order* that a permit be granted or denied, with the ultimate grant or denial still being a DEQ decision, as Section 406(p) specifies.

³ Although there was testimony as to the “technically adequate” or “technically accurate” determination by DEQ, these phrases do not appear in the Environmental Quality Act. The correct phrase is “suitable for publication.”

APPLICABILITY OF SECTION 406(n)⁴

Brook and DEQ's mischaracterization of the Council's decision colors their misinterpretation of whether Section 406(n) applies. They also raise other arguments, which equally fail.

First, they argue that the statute is laid out in chronological order and since (n) follows (k), and since, according to them, (k) governs here, (n) cannot yet apply. Brook Br. at 6-8 ("This sequence and structure suggests that the Council should review only what led DEQ to deem Brook's permit application suitable for publication"; "In the structure of the statute, the required findings under section 406(n) come after DEQ deems a permit application suitable for publication and after an informal conference or public hearing has taken place."); DEQ Br. at 3-4 ("The statute is laid out in a specific order and the Department takes steps in accordance with that order."; "In accordance with the order in which the statute is laid out, Wyoming Statute §35-11-406(n) only comes into play *after* the Director or the Council resolve the objections to the permit application." (emphasis in original)). However, as discussed above, Section 406(p) controls the scope of the EQC's decision after a contested case hearing is held, not 406(k). As such, applying their rationale would *necessarily* dictate that that the findings of 406(n) occur *before* the decision in 406(p) based on the sequence of the statute.

Second, DEQ and Brook argue that the Council cannot apply Section 406(n) because the "administrator" makes the findings under 406(n)(i)-(vii). Brook Br. at 8; DEQ Br. at 7. These arguments miss the point that the 406(n) findings must be made *prior* to "a decision on the application" – the very decision that the Council must make in this case. All parties agree that a

⁴ While there were minor disagreements between the parties on what statutory sections and regulations apply beyond Section 406(n), the bulk of the disagreement is over Section 406(n) and therefore this reply focuses there. The other disagreements will likely be covered in the Resource Council's forthcoming proposed findings of fact and conclusions of law.

“decision on the application” cannot be made without first determining whether the requirements of Section 406(n) have been met and all parties agree that these findings have not yet been made. Additionally, the DEQ and Brook’s argument ignores past Council precedent where the Council applied Section 406(n). For instance, in the Amax case discussed above, the Council found that “Amax Coal Company has met its burden of proof demonstrating that the Eagle Butte Mine is in compliance with W.S. 35-11-406(n), and all other applicable state laws.” *In the Matter of Objections to the Permit Application of Amax Coal Company*, Findings of Fact, Conclusions of Law and Order Granting Permit, at 6. More specifically, the Council issued findings of fact that quoted 406(n)(ii) and 406(n)(iii) verbatim, clearly evidencing that the Council made findings pursuant to 406(n) as part of its decision.⁵ *Id.* at 4-5.⁶

Third, DEQ and Brook are fixated on the fact that the cumulative hydrologic impact assessment (“CHIA”) has not been finalized at this time and argue that this prevents applying 406(n) to this proceeding. DEQ Br. at 4; Brook Br. at 8-9. Irrespective of the fact that testimony at the hearing showed that a CHIA is normally finalized before a public hearing, this is also a self-flawed argument as they previously argued that the “administrator” must make the findings of 406(n) and yet the CHIA is a document issued by the DEQ Director *and* the State Engineer⁷ – not the administrator or even the DEQ exclusively. Thus, under their own logic, the CHIA cannot be a “finding” under Section 406(n) because it is not a finding made by the administrator.

⁵ The findings were that “The reclamation plan will accomplish reclamation as required by the Environmental Quality Act” and that “The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.”

⁶ The EQC also made findings related to alluvial valley floors and prime farmland, finding that those sections of 406(n) did not apply.

⁷ See POW Exhibit 24 at 3 (“The final CHIA must be signed by the DEQ Director and the Wyoming State Engineer prior to issuance of the permit.”).

More importantly, as discussed in the Resource Council’s opening brief, the CHIA is a document separate from the permit application, and it does not abdicate the need for considering whether the permit applicant has met its burden to demonstrate that the requirements of Section 406(n) are met at this time. Resource Council Br. at 8-9.⁸

STANDARD OF REVIEW & BURDEN OF PROOF

There is no dispute that the permit applicant bears the burden of proof in this proceeding. *See* Brook Br. at 10. There is naturally some dispute about what the permit applicant must prove given the disagreements discussed above, but if 406(p) applies – as it clearly does – Brook’s burden *must* be to demonstrate that it complies with all applicable laws and regulations, and that its permit application does not have any deficiencies, and therefore that the Council can make “a decision on the application” to order the DEQ to grant the permit.⁹ This interpretation is fully consistent with section 406(n) and Wyoming Supreme Court precedent. *Grams*, 730 P.2d at 789 (citing Section 406(n) and holding “the burden of proof rests upon the applicant to show that the application is in compliance with applicable law.”).

CONCLUSION

Section 406(p) dictates that once there is a hearing before the Council, it is the Council that makes the “decision on the application,” not the DEQ. Thus, there is no later opportunity for the DEQ to review the permit’s compliance with Section 406(n). Compliance with Section 406(n) must be done now, as part of the Council’s “decision on the application.”

⁸ Brook (but not DEQ) also argues that SMCRA’s federal minimum standards requirement provides additional authority for its argument. Brook Br. at 8-9. It is interesting that now the company finds SMCRA’s provisions relevant when in past aspects of this hearing process, the company has argued that they are irrelevant. Nevertheless, this argument should be summarily dismissed because for purposes of the Wyoming state SMCRA program, approved by OSMRE, the EQC clearly has an important role, both in rulemaking and in contested case hearings.

⁹ The Resource Council’s forthcoming proposed findings of fact and conclusions of law will demonstrate this is not the case.

Alternatively, should the Council determine that the administrator (or a substitute DEQ staff member because of the conflict of interest) must make the findings of 406(n), the Council must hold that since these findings are not yet made, and since they must be made before a “decision on the application,” the application should be denied. Similarly, if the CHIA is a necessary component to making the findings, since the CHIA is not yet complete, the application should be denied because “a decision on the application” cannot be made.

Either way, Section 406(n) and the findings required by that section cannot be ignored in these proceedings.

Dated this 30th day of June, 2017.

2 (Hearing proceedings reconvened

3 9:04 a.m., June 7, 2017.)

4 CHAIRMAN BAGLEY: All right. Good morning.

5 It's 9:04 a.m., June 7, 2017. I'm Dr. David Bagley, the
6 hearing officer in Docket 17-4802 in regards to Brook Mine,
7 LLC. Present today from the council are Nick Agopian and
8 myself. Council members Fairservis and Degenfelder have
9 recused themselves.

10 Parties present today and I'll do like we did
11 before, I'll mention the party name and please ask you to
12 identify yourself because I know there's been some changing
13 names.

14 Parties present today are Brook Mine, LLC.

15 Please introduce yourself.

16 MR. POPE: Jeff Pope, Thomas Sansonetti,
17 Isaac Sutphin in spirit, and Carri Svec from Holland & Hart
18 on behalf of Brook Mine.

19 COUNCIL MEMBER AGOPIAN: Something happen
20 to Isaac?

21 MR. POPE: He's in Italy.

22 COUNCIL MEMBER AGOPIAN: Oh, no. I meant
23 the "in spirit."

24 MR. RUBY: He's still alive.

25 MS. ANDERSON: That would be the Italian

1 spirit.

2 CHAIRMAN BAGLEY: Department of
3 Environmental Quality.

4 MR. LaROCK: Andrew Kuhlmann and James
5 LaRock, the Department of Environmental Quality.

6 CHAIRMAN BAGLEY: Powder River Basin
7 Resource Council.

8 MS. ANDERSON: Hi. Good morning. Shannon
9 Anderson on behalf of Powder River Basin Resource Council.
10 I have with me today our director, Jill Morrison, and our
11 expert witnesses, Dr. Jerry Marino and Mr. Mike Wireman.

12 CHAIRMAN BAGLEY: Thank you.

13 The Fishers.

14 MR. GILBERTZ: Jay Gilbertz from Yonkee &
15 Toner on behalf of the Fishers, along with Mary Fisher.

16 CHAIRMAN BAGLEY: Thank you.

17 And Big Horn Coal.

18 MS. BOOMGAARDEN: Good morning. Lynn
19 Boomgaarden, Crowley Fleck, on behalf Big Horn Coal. And
20 with me today is Mr. Jordan Sweeney.

21 CHAIRMAN BAGLEY: Thank you.

22 Also present for the council are Jim Ruby,
23 Executive Officer; and Joe Girardin, Council Business
24 Coordinator; and Ryan Schelhaas from the Attorney General's
25 Office.

1 This hearing is being held in the Elk Room, Game
2 & Fish Commission, 5400 Bishop Boulevard, Cheyenne,
3 Wyoming. There is a court reporter present.

4 So we have set aside these last two days, today
5 and tomorrow, to finish up this final hearing. And we
6 are -- we are not able to go past 5 p.m. either day.
7 And -- but we will start tomorrow again at 8:30, if we are
8 still here tomorrow. So we will be done no later than
9 5 p.m., June 8, 2017. So I'm saying that, urging everyone
10 to be judicious in their questioning. We certainly want to
11 hear all the questions, but we will so appreciate everybody
12 getting to the point that you can with each and every
13 witness.

14 All right. I guess we're now ready to go. So
15 it's my understanding that Powder River Basin Resource
16 Council has two expert witnesses --

17 MS. ANDERSON: I do, Dr. Bagley.

18 CHAIRMAN BAGLEY: -- that you'd like to
19 call.

20 And so, please, Ms. Anderson, call your first
21 witness.

22 MS. ANDERSON: Thank you, Dr. Bagley.

23 I call Dr. Gennaro Marino.

24 (Witness sworn.)

25

1 GENNARO GERALD MARINO, PhD, PE, DGE,
2 called for examination by PRBRC, being first duly sworn,
3 testified as follows:

4 DIRECT EXAMINATION

5 Q. (BY MS. ANDERSON) Dr. Marino, could you please
6 state and spell your full name for the record.

7 A. It's Gennaro Gerald Marino, G-E-N-N-A-R-O,
8 Gerald, G-E-R-A-L-D, Marino, M-A-R-I-N-O.

9 Q. Okay. And you go by Jerry with a J, right?

10 A. Yes. Not G.

11 Q. Not G.

12 Okay. Thank you, Dr. Marino.

13 What is your title or position?

14 A. I have a geotechnical engineering company. We
15 are about 12 or 14 people, composed of engineers and
16 technicians and administrative staff. I'm the president
17 and also the chief engineer of the company.

18 Q. And what do you do in your capacity as president
19 of Marino Engineering Associates?

20 A. I basically oversee the organization. One of my
21 I think most important duties is to -- is in
22 qualification. In other words, quality control of reports
23 that go out from the company. I also get involved in
24 individual projects that interest me. You know, obviously
25 that's -- as president, you're also involved in taking

1 care of our big family, you know.

2 Q. Okay. Thank you.

3 Are you a registered professional engineer in
4 Wyoming?

5 A. Yes.

6 Q. And other states as well?

7 A. Yes.

8 Q. I have up on the screen POW Exhibit 18. Did you
9 provide this copy of your CV to me?

10 A. Yes.

11 Q. And is it an accurate reflection of your
12 background and qualifications?

13 A. Yes.

14 Q. Could you tell us a bit about your educational
15 background?

16 A. I received a bachelor's of science in civil
17 engineering from the University of Dayton. I went to work
18 for about a -- less than a year and realized that I wanted
19 to do more challenging work, and so I went back to school,
20 got a master's, at Rutgers University, and then worked for
21 almost five years and realized that I really like high-end
22 work. And to have a good license to do that, I needed a
23 PhD, so I went back to school again at the University of
24 Illinois to get my PhD.

25 Q. Okay. You also have on your little letters

1 after your name there a diplomate in geotechnical
2 engineering. What is that?

3 A. That's a -- that's the -- that's the
4 certification that's awarded to geotechnical engineers
5 that consider to have the next higher expertise in the
6 field. You know, one of the cream of the crop, if you
7 will.

8 Q. Okay. How does geotechnical engineering relate
9 to mine subsidence?

10 A. Basically, geotechnical engineering is related
11 to how the ground behaves mechanically. Basically, you
12 know, you're dealing with geology and how the geology
13 behaves to how nature or man affects it. And so one of
14 the things that how man affects geology is by mining. I
15 happened to do my PhD in mine subsidence. And so it's a
16 subject that really is not taught in school. I mean,
17 there's not many universities that you'll find that have
18 subsidence engineering courses. So I've been -- not many
19 people can say that their PhD ended up in something they
20 can make a business out of or be an expert in or be able
21 to consult.

22 Q. Okay. And there's a lot of different kinds of
23 engineers. So what is it -- do you have anything else to
24 add to what it means to be a subsidence specializing
25 engineer?

1 A. Yes. It's a very unique field because it deals
2 with so many aspects. You have -- you have the mine
3 stability issues, okay. Obviously, it's important to know
4 about the mine stability issues because that's what causes
5 subsidence, right? So the risk of instability is directly
6 proportional to the potential for subsidence in the
7 future. Then you have -- and, like I said, it's a
8 multi-discipline field because then you have the
9 propagation of the ground movements to the surface and how
10 they express themselves on the surface. And that's
11 important because if you have structures involved, you
12 need to know what the loading on those structures are
13 going to be so that you can then analyze those structures,
14 right?

15 And so you have -- you have to have some
16 understanding of structural response to ground movements.
17 And then you have what can you do to mitigate the
18 subsidence. Okay? So there's a lot of different things
19 that you can do, including ground stabilization methods.

20 Q. All right. And does that mine subsidence
21 experience matter for reviewing a project like this?

22 A. Oh, absolutely. Like I said, it's not --
23 there's -- there's not a lot of people that -- that have
24 this expertise. And you can only, in my mind, regulate as
25 good as you know. If you don't know something, you're not

1 going to be able to regulate it.

2 Q. Can you tell us a little bit about your
3 background in subsidence review related to coal mines
4 prior to this project?

5 A. I've done a lot of -- basically, I've done a lot
6 of review of coal mining permits back, I don't know, many
7 years ago, for both assisting with preparing subsidence
8 control plans and also reviewing them for different
9 individuals, pipeline companies, landowners. I really
10 don't care who it is that we represent. We're interested
11 in good science, and so that's why we've ranged from the
12 one group to another to consult with.

13 Q. Okay. Could you tell us about the distinguished
14 alumnus award you received from the University of
15 Illinois?

16 A. Yeah. It's a an award given every year to
17 people that have graduated from University of Illinois
18 that have made significant strides, either in industry or
19 research or academics.

20 Q. Have you published any journal articles or other
21 papers in your field?

22 A. I think I have about a hundred papers that I
23 published. The vast majority of them are in the area of
24 mine subsidence.

25 Q. Have you ever been qualified by a court as an

1 expert witness in related -- in a field related to the
2 mine subsidence or geotechnical engineering?

3 A. Yes. Many times.

4 Q. Have you ever been qualified as an expert by any
5 administrative agencies?

6 A. Yes.

7 Q. Do you know some of those states in which you've
8 worked and been qualified as an expert?

9 A. Illinois, Indiana, Ohio and West Virginia.

10 Q. Okay.

11 A. And Pennsylvania.

12 Q. And Pennsylvania.

13 Is there anything else you'd like to share with
14 the Environmental Quality Council about your background or
15 experience?

16 A. That I have -- I have a very long history of
17 investigating coal mines. It probably started back in --
18 over 35 years, where we've drilled and sampled old mines.
19 And I feel like I have a very good understanding of what a
20 mine goes through in terms of its structure and its
21 stability over time as a result.

22 A lot of that work is related to properties that
23 are undermined, that people want to develop and they want
24 to know what the subsidence risk is. So you have to be
25 able to have the expertise to drill, sample and analyze

1 these old coal mine structures to assess whether or not
2 there's a significant risk of subsidence on the surface
3 where they're going to put their structures.

4 Q. Okay. You wanted me to ask you about the ASTM
5 CE of the Year Award that you received.

6 A. I was the Civil Engineer of the Year for
7 middle -- for middle section of ASCE.

8 Q. And what is ASTM?

9 A. ASTM -- I'm a committee member of ASTM. ASTM is
10 American Standards for Testing and Materials. And I'm on
11 the committee that reviews standards for testing of soil
12 and rock.

13 MS. ANDERSON: Okay. Dr. Bagley, at this
14 time the Powder River Basin Resource Council would like to
15 offer Dr. Marino as an expert in the field of geotechnical
16 engineering.

17 CHAIRMAN BAGLEY: Any objections? Hearing
18 none, accepted.

19 MS. ANDERSON: Thank you.

20 Q. (BY MS. ANDERSON) Dr. Marino, just to get it
21 out in the open, are you being compensated for your time
22 here today?

23 A. Yes.

24 Q. And do you feel that compensation in any way
25 influenced any of the opinions you have drawn for these

1 proceedings?

2 A. No.

3 Q. For full disclosure here, do you often consult
4 for nonprofit organizations?

5 A. Yes.

6 Q. And why did you agree to consult for us?

7 A. Because you were willing to accept whatever I
8 thought my opinions were.

9 Q. Okay. All right. Let's get to your review of
10 the permit application. Could you tell us a bit about the
11 scope of your review?

12 A. Basically, I was sent materials by -- by the
13 council to review. The materials that I was sent was the
14 permit application, areas that I requested to be sent to
15 me that were related to the geotechnical issues on
16 subsidence. I also looked at some references that were
17 also sent to me related to subsidence in the area. I
18 looked at some OSM guidance materials as well. I think
19 that's probably it for that.

20 Q. Okay.

21 A. That's giving my report. My report has a list
22 of major documents that I did review.

23 Q. All right. I'm going to pull that report up
24 right now. So just for the record, this is our Exhibit 12
25 through 14. We split it up into three exhibits just

1 because of the size of the document. There's a lot of
2 maps and diagrams, and so we wanted it to be a little bit
3 smaller. So I'll pull it up.

4 So, Dr. Marino, can you identify this document
5 for us?

6 A. This is a copy of the report that I wrote after
7 review of the mining application for Brook Mine.

8 Q. Okay. And I think you were just talking about
9 this, but is this the list of parts of the showing on
10 page 1 and onto page 2, the parts of the application that
11 you reviewed and different reference documents you
12 reviewed?

13 A. Yes.

14 Q. Okay. Could you explain your main findings and
15 opinions based on your review?

16 A. My main findings is basically that the -- the
17 application is severely deficient in the analysis and data
18 to be able to make any kind of analysis of what the
19 likelihood of subsidence would be in the future.

20 Q. Okay. Dr. Marino, have you prepared a
21 PowerPoint presentation for your testimony today?

22 A. Yes.

23 Q. Okay. We'll go through that.

24 MS. ANDERSON: And for the record this is
25 POW Exhibit 11, and it's been supplemented just a little

1 bit with some other slides Dr. Marino has put in for
2 demonstrative purposes for his testimony today.

3 And, Dr. Bagley, I'd like Dr. Marino to mainly
4 just testify and talk to you about his presentation, but I
5 may ask some guiding questions along the way, if that's
6 okay with you.

7 CHAIRMAN BAGLEY: That's fine.

8 MS. ANDERSON: Okay.

9 A. Okay. So --

10 Q. (BY MS. ANDERSON) Yeah. Do you want the mouse?
11 Is that easy?

12 A. No. I've got it. If you could just flip to
13 them when I say.

14 Q. Okay. That works.

15 A. I don't know if this is kind of difficult me
16 pointing up here and people on the panel. I don't know
17 how to otherwise do it, but I'll try to be considerate and
18 point to both slides, if I can.

19 So the way I've arranged my presentation is I
20 know you've heard about the mining method, but I want
21 to -- because it's been a little time and I want to
22 summarize it maybe a little bit different way, mining
23 method that's been approved -- proposed by Brook Mine.
24 And then I want to talk about the mine stability issues
25 related to subsidence, that geological conditions as

1 reported in the application. And then from that, go into,
2 you know, what the subsidence potential is and then what
3 the conclusions were that I reached from my review and
4 examination of the information available. And then some
5 suggestions on basically where we can go from here in
6 terms of giving some direction on how the design should be
7 approached.

8 Okay. So -- so this is from the mining
9 application. And you can see the bench configuration that
10 we're -- the highwall mining will take place in the coal
11 seams. Note that this seam and this seam could also be
12 mined, so it could be benched out as well with the mine
13 proceeding inward.

14 One of the things to keep in mind is there's
15 been a lot of talk about MSHA. MSHA is Mine Safety and
16 Health Administration. And their concern is related to
17 mine -- obviously mine safety and health. So their
18 concern would not be in the room -- rooms or entries
19 because there's not going to be miners in the rooms or
20 entries.

21 MR. POPE: Dr. Bagley, I have to object at
22 this point. The -- what MSHA looks at is not within the
23 scope of Dr. Marino's expert report or the expertise he
24 discussed. MSHA's concerns are laid out in their
25 documents. He is speculating about what MSHA cares about.

1 MS. ANDERSON: Dr. Bagley, first of all,
2 Dr. Marino is an expert and he's allowed to speculate. But
3 second of all, this is testimony in direct response to what
4 was provided earlier by the company and their reliance on
5 the MSHA process to basically bootstrap the geotechnical
6 analysis that DEQ requires.

7 CHAIRMAN BAGLEY: This is an expert. I'll
8 allow his opinion. I imagine you may have questions later.

9 MR. POPE: Thank you, Dr. Bagley.

10 A. For example, you know, in the subsidence control
11 plans that I've reviewed, I've never seen MSHA mentioned
12 as a reference to be the one who determines whether or not
13 the mine plan is approved for surface subsidence. It's a
14 different issue. They have a different scope. So what
15 they -- what they -- what they would be concerned about
16 would be, you know, the slope stability issues that you
17 would have on these benches, and how they -- you know, how
18 that would affect the miners.

19 Here's -- here's just some photos to show the --
20 the highwall mining process. You can see the bench back.
21 There's no seams up here, but I would imagine that, you
22 know, this would be somewhat what it would look like if
23 you had seams on each bench. But you can see them here
24 longwall mining this coal seam down in this area.

25 Here's a closeup of one of these highwall mining

1 cavities. You can see these are the pillars that -- and
2 we talked about, the smaller pillars. These are the
3 barrier pillars. You can see for this formation where
4 this is happening, the rock here is fairly competent.
5 It's been weathered, but it's not falling off. It's
6 not -- it's different than the rock that we have at the
7 Brook's -- at the Brook Mine.

8 So looking at the last figure, we saw the web
9 pillars and then barrier pillars. This is also taken out
10 of the permit. And what I've done in red is put down or
11 summarized what the width of the pillars are and -- and
12 the entries are based on what they say is typical. Okay?

13 So there are two different areas of extraction.
14 You have the extraction between these -- these barrier
15 pillars, and then you have an overall extraction. For
16 mine stability purposes, what we're interested in is are
17 these higher extraction areas where the pillars are
18 smaller. And based on the data that's given in the -- in
19 the application, the extraction ratios would be on the
20 order of 60 to 70 percent.

21 So this is -- this is the -- these shaded areas
22 are the pillars. These are the rooms or entries. Up
23 above is the roof and down below is the floor. In all
24 those -- the pillar and floor and the roof are a part of
25 mine structure. They all have to work together to keep

1 the overburden stable above.

2 Q. (BY MS. ANDERSON) Okay. And for the record,
3 that was slide it looks like 7. So we're moving on to 8
4 now.

5 A. Okay. So you've seen -- probably seen a similar
6 drawing as this. This is from the mine permit. And the
7 red areas are the areas where there's room and pillar
8 mining that's planned. And what I have done is I've
9 labeled them by number, by block number, from 1 to -- I'm
10 not sure what the last number is. 20? Yes, 20. And then
11 between, that is where they're going to have those groups
12 into the ground in order to access those pillars -- those
13 coal seams.

14 So let's talk a little bit about mine stability
15 principles. Again, importance of this is it determines
16 what's the risk of subsidence on the surface.

17 Q. Okay. Now, on slide 10.

18 A. There are different modes of failure that can
19 cause surface subsidence. And we'll go through each one
20 of these in detail. The first is a room -- a -- a roof --
21 a room caving failure. That leads right into where the
22 void is created, the roof collapsed individually and
23 propagates up to the ground surface. The pillars -- you
24 can have the pillars have too much load on them and they
25 crush out. Or you can have a bearing failure. What that

1 means is the pillar's strong -- enough, but the -- but the
2 roof or floor isn't, and so it will either sink into the
3 roof or sink into the floor --

4 MS. ANDERSON: Are we okay with the audio
5 going forward?

6 A. -- will lead to subsidence.

7 Q. (BY MS. ANDERSON) Okay.

8 A. So this is -- this is kind of my illustration of
9 a roof collapse in a room. Here's the room or entry or
10 void space. Here's the coal on both sides. And so
11 originally there was a roof here, but this -- all this
12 material collapsed down and it breached the bedrock
13 surface. And once it breaches the bedrock surface, the
14 soil itself has no bridging capacity over the long term,
15 and so it will just follow suit.

16 So what is that room span capacity factor? What
17 are they? What are the things you need to look for when
18 you're assessing subsidence potential as with the
19 subsidence control plan? One of the things you need to
20 know is the durability of the beds. Now, what I mean by
21 durability, it's kind of the definition you would think.
22 It is rock material that does not degrade. Certain rocks
23 that will degrade. Like if you have a rock that has a lot
24 of clay in it, it will degrade.

25 Clay is the finest grain earth particle there

1 is. And when you get to the size of the finest grains
2 of clay, they have significant water absorption
3 characteristics. They get exposed to water and they break
4 down and they swell and they lose their strength
5 significantly.

6 So it's important to find out what are our
7 durable beds? What are the durables that are going to
8 bridge over from pillar to pillar? We also need to know
9 what the thickness of those beds are, because if it's a
10 thin durable bed, it's not going to be able to bridge.
11 It's got to have sufficient thickness to bridge from
12 pillar to pillar. What is the strength of the beds?
13 Okay. In other words, okay, it has some durability, but
14 does it have enough strength also to bridge.

15 And the last, but not least, is rock structure.
16 Okay. Rock structure is the fractures that are -- exist
17 in the rock. Rock isn't perfect. It has fractures in it.
18 And we know here, and we'll get into a little later, that
19 there is faults in this area. So that's significant rock
20 structure, the rock is going to be broken around it. The
21 durable beds are going to be broken, so they're not going
22 to have significant kind of bridging capacity in those
23 areas.

24 The other mode of failure is pillar failure.
25 This is my illustration of it. It could be a lot of

1 different ways, but this is the way I decided to show it.
2 Basically, the pillar is crushed out. Okay? It -- it --
3 the load on the pillars is too great and it crushes out
4 and causes it to fail. Normally, when you have something
5 like that, it's not one pillar. Because the roof didn't
6 fail, right? So if this one pillar fails, you're going to
7 have an adjacent one and another one adjacent to it on
8 either side that is also going to fail. You're going to
9 have a larger bowl of subsidence around surface.

10 Normally, those are much more abrupt when they occur.

11 What does the pillar strength depend on? And
12 there's some innuendos, some inferences of attempts at
13 calculating that in a -- in the application permit, but
14 there's no equations given, there's no strengths given.
15 There's no strength data. So it's difficult to know, when
16 you look at these different parameters that the pillar
17 strength depends on, coal strength. Okay. The pillar --
18 the equation that is said to be used, which is not
19 explained very well in the permit, is an equation for
20 what's called bituminous coal.

21 Just so you understand the differences, there's
22 different grades of coal. Okay? You have just basic
23 grades. You have lignite, you find that a lot of times in
24 Texas. There's a lot of fields of lignite in Texas. You
25 have subbituminous coal and you have bituminous coal and

1 you have anthracite.

2 And anthracite is the highest grade of coal.

3 And anthracite also has the highest strength. So the
4 equation that is used -- and we don't know for sure what
5 strength was used, but the one that's inferred in the
6 equation is for bituminous coal. We have subbituminous
7 coal. And there's no data that I found in the permit or I
8 can find in my research on subbituminous coal what the
9 strength is and how that strength changes when it gets --
10 becomes large cube sized, which is really what you use in
11 the pillar strength formula.

12 Pillar height. Okay. Pillar height. If you
13 look at the geologic cross-sections -- okay, we'll get to
14 those -- you'll see that the height changes all over the
15 place. There's quite a variation. And you don't get an
16 understanding in the permit on how -- how does that affect
17 the overall pillar strength?

18 Then you have the pillar width and length. You
19 know, the dimensions of the pillar in plan. Now, in our
20 case we don't have length because they're just long rows
21 of pillars. So it depends on the width also of the
22 pillar.

23 So all these different characteristics play a
24 significant role in what the ultimate strength of the
25 pillar is. Then you have bearing capacity failures. This

1 actually is my favorite mode of mine failure. And the
2 reason why, I guess, is because it's -- it's -- it's more
3 challenging to analyze.

4 What I'm showing here is a pillar that's
5 punching into the floor. You can see the floor is heaving
6 up on both sides. Okay? And you also see these tension
7 cracks that develop, and that's because the material
8 stretching -- the materials is moving out from underneath
9 the pillar and causing tension cracks -- that's called
10 rashing in the pillar -- to occur. And as a result of
11 that, the pillar itself doesn't have the stress
12 confinement it used to have. So it could fail or you have
13 a failure just as a result of punching into the floor
14 because of the softer materials.

15 In our case, from reading the permit, the vast
16 majority of the material's claystone. Okay? That's for
17 the roof and floor. Claystone is not a very good
18 engineering material. It -- claystone is made of clay.
19 And when that gets exposed to water, it deteriorates. It
20 softens and swells and it causes failure. A lot of the --
21 a lot of the failures that occur over time occur as a
22 result of these materials softening from groundwater
23 conditions. Obviously, they don't -- failure doesn't
24 occur right away. Something has deteriorated. Simply,
25 right? Well, what causes it to deteriorate? Water and

1 these materials that are nondurable.

2 So it's important to identify where these
3 durable materials and nondurable materials are. And
4 there's not even a mention of that in the application.
5 There's no mention of failure of roof and pillar
6 condition -- I'm sorry, roof or floor conditions in terms
7 of analysis or safety factors or anything like that.

8 Okay. So what does that depend on? Let's take
9 a little bit more narrow view on what should we be looking
10 for. It really -- the first item, strength and thickness
11 of nondurable zone. Obviously, nondurable means it's not
12 durable. Okay? It's a claystone of some material that
13 deteriorates. Where that exists right below the pillar or
14 above the pillar, that's a significant concern because
15 that's where all the bearing pressure is going to be
16 focused. So the strength of that, in the long term and
17 the thickness -- obviously, if it's only, say, a few
18 inches thick and you have a pillar that's, say, 10 feet
19 wide, no significance, right? But if you have a pillar 10
20 feet wide, and the thickness of that floor material that's
21 nondurable is 10 feet thick, that makes a big difference
22 in what the overall strength is going to be.

23 Again, we have structure. Structure, again,
24 being fracturing characteristics. What I found is from my
25 experience that where these materials have a lot of

1 microfractures in it, reduces the strength significantly.
2 Even in the short term. Doesn't even have to have the
3 softening effects. You can imagine, you know, a rock with
4 these -- all these intense microfractures versus a solid
5 piece of rock. Big difference in strength.

6 So also important is to find out what is the
7 resistance zone below. Right? In other words, okay, we
8 have this much soft material -- or nondurable material,
9 and now we have a resistant zone. That is going to be the
10 zone that's going to resist the shearing failure from
11 below. Does it have enough capacity at what depth? So
12 that has to also be defined.

13 If you are going to determine the bearing
14 capacity of the roof or the floor in terms of -- or a
15 failure in terms of a subsidence potential. And, you
16 know, we talked about this. The width makes a big
17 difference. The width ratio to the weakness of thickness
18 of material below, that ratio determines also the capacity
19 of the floor or roof.

20 Okay. Here's another instance to consider, is
21 let's say you have a nondurable floor -- I'm sorry, roof.
22 And you have groundwater that oscillates in it, okay, when
23 it's an abandoned mine. So it starts caving up. And as
24 it's caving up, this water level is going up and down with
25 seasonal variations. What happens? It dries and wets

1 these materials and causes them to break off and create a
2 greater cave or arch zone, in essence, causing the larger
3 or higher pillar and also causing this cave zone to
4 propagate upwards.

5 What I'm trying to do here is basically kind of
6 summarize just what I said with depth. Okay? And so what
7 we have here, here's the soil there. Okay? And then we
8 have -- this is topper rock. And then we have the roof,
9 the rock overburden here. This is the coal that's being
10 mined out. And then below you have the floor, now -- when
11 you're in a shallow depth -- like this mine, we go from
12 very shallow depths to very deep depths, like up to about
13 400 feet. So we've got this whole spectrum here that
14 could be present.

15 So at shallower depths, where the pressure on
16 the pillars isn't so great, you would -- even if you had
17 nondurable soft floor conditions, you would expect the
18 floor to be -- for the pillar to squeeze in the floor
19 because the pressures aren't high enough. The only thing
20 that you would be concerned about is for the ground above
21 these void areas propagate upwards and create a sink on
22 the surface. What could mitigate that is if you
23 identified this durable zone, like we have shown here as
24 an illustration, then you can propagate up. And you'll go
25 to that durable zone and it won't go any further. I've

1 done studies where we have this massive sandstone, you
2 don't see any subsidence. Okay?

3 So -- and then as we go deeper, now the stresses
4 on the pillars become greater and to the point where the
5 soft floor conditions cannot hold it up. Even though you
6 have a durable rock zone above, it's not going to be able
7 to bridge, say, a massive pillar squeeze condition or
8 floor squeeze condition. You're going to have a series of
9 these pillars that are squeezing into the floor and
10 causing the -- a bowl-shape depression on the surface,
11 despite having this rigid layer of rock here.

12 I have a case right now that's -- it started out
13 being 600 feet, and now it's 1200 feet. It's 200-foot
14 deep mine, and it has a very decent rock above, but the
15 floor is terrible. And so it's bridge -- it's collapsed
16 and it bridged over, even though great rock on the top.
17 And so then if we take a better look at the floor, what
18 I've done is I've drawn in this gray zone here, that's the
19 durable resistance zone. So now you thinned that soft
20 zone between the coal and -- and the -- the durable zone,
21 or here, from here to here, you can see it's only -- the
22 blue is very thin. It's so thin that it's not going to
23 cause a bearing failure, right? So the only thing at that
24 point you would be concerned about is pillar failure.
25 Right? That would be the only thing that can cause any

1 problems because you're not going to have a collapse in
2 the void because it's way too far below the ground surface
3 and reach the ground surface.

4 So -- and then you have a condition even deeper,
5 where we have resistant layers on both top and bottom.
6 You see that in Appalachian fields. Most of the rocks --
7 the roof rocks and the floor rocks are fairly durable and
8 compound rocks. In other words, they don't have
9 claystone. There may be pockets here and there, but they
10 don't have claystone. They're more durable rocks. And so
11 all you would be concerned about then is pillar safety
12 factors. What's the safety factor of the pillars.

13 So just to orient you on safety factor. Okay.
14 This is -- this is -- in our field this is a common term.
15 In civil engineering, this is a very common term that's
16 used to determine the risk of a design. Normally, there's
17 just a ratio that's established in design codes that tells
18 you, okay, if I get above this ratio, we should be okay.
19 And that's based on empirical evidence, right?

20 So it's the ratio of available capacity over the
21 overburden load. So, in other words, let's take this
22 table here. And table, say, is rated for 500 pounds,
23 right? We put a hundred pounds on it so that we would
24 have the safety factor of 5. Okay? It's -- when I say
25 rated, that's the -- the 500 pounds is what it's expected

1 to collapse at. Okay?

2 So if we put 250 pounds on it, that's a safety
3 factor of 2. Now, the code might say, well, if you have a
4 safety factor of 2, it's acceptable design. So you can
5 only -- you're only allowed to put 250 pounds on this
6 table. And that's how it works when you use safety factor
7 in design in civil engineering projects.

8 Next. And it's -- and as you know, Dr. Bagley,
9 as an engineer, you know it all depends on your input
10 data, prediction method and the calculated capacity.
11 Okay? If you have poor input data like we have here, we
12 don't have hardly any input data. If you don't have the
13 right input data, even if you have the right prediction
14 method, your calculated value is suspect.

15 So you have to have these two -- these two
16 building blocks, you have to have enough input data for
17 the circumstances that you have. The type of
18 circumstances. And that's -- a lot of that is engineering
19 judgment, especially in this case because we have such a
20 variety of mining conditions and geologic conditions. And
21 then you have to use the appropriate prediction method to
22 assess what the capacity is.

23 This kind of summarizes in a different way. Low
24 safety factors, obviously high risk. High safety factors,
25 negligible risk. So if you calculate, do all your

1 homework, do it right, and you have high safety factor,
2 you're going to have negligible risk of subsidence.

3 And so, you know, that -- that -- this scale
4 summarizes in another way how the subsidence risk relates
5 to the safety factor. Obviously, that factor hasn't any
6 kind of engineering -- is a quality -- is a function of
7 the knowledge and experience of whoever's doing the work.

8 So this summarizes -- it's a flowchart. It
9 summarizes, again, you have an immediate roof collapse,
10 different elements that can cause subsidence on the ground
11 surface. It starts out at mine level. You can have
12 immediate roof collapse or the void collapse. You can
13 have pillar crushing or you can have the pillar punching
14 into the floor or roof from bearing failure. Then
15 ultimately a roof has to fail above it. And then you have
16 surface subsidence.

17 Okay. So let's look at now what we understand
18 from the reported conditions -- conditions from the
19 application. This is -- this is a drawing that's taken
20 out of the application. I've put my block numbers on it,
21 1 through 20. You can see all these lines -- alphabetized
22 lines. Those represent slices that are taken through the
23 ground. Okay? In other words, there's been holes that
24 have been drilled along these lines or close to these
25 lines, drill holes, where they've been able to classify

1 the different geological materials. And so what was done,
2 to summarize and understand how these materials are
3 continuous across the mine site -- we were talking about
4 seven mines from here to here -- these slices are taken
5 through the ground to see where the coal seams are and
6 what are the other rocks related to it.

7 Also, which would have shown on here, you see
8 these huge -- D, nomenclatures, and then these lines.
9 Those are fault lines. And the D means that side has
10 dropped and the other side went up to the fault. Okay?
11 But there's not a lot of data given on the fault. All we
12 know is these lines. We don't know what the inclination
13 of the fault is, how it fractured. Don't know any of
14 that.

15 This type of arrangement of fault represents
16 what's called a horst and graben geologic formation. In
17 other words, in between the faults, like here and here,
18 the rock is -- one side is up versus the other side being
19 down. So if you want to cross, you'd have one side up
20 other side down, fault, but next side's up, and just kind
21 oscillates like that. And that's from tectonic activity
22 in the past.

23 So this is one of those cross-sections, this
24 goes east to west. And this is the Section A-A. And what
25 I'm trying to show here really is the variability what the

1 mining conditions are. You can see on top here for
2 reference, these are the block numbers, so these are the
3 areas where the room pillars would be, where this -- this
4 cross-section is sliced through the ground was taken. So
5 you can see block numbers -- like this is Block Number 10,
6 9, 7, and goes all the way to 6, right? 6 over here on
7 the side.

8 And so what it shows here is we have a thin
9 cover above this. This is a coal seam here, right?
10 There's thin cover above that coal seam. It's in a
11 valley. You know, if valley fills up with water and
12 there's propagation of a subsidence from a roof collapse
13 above, where's that water going to go? It's going to go
14 into the mine.

15 Then you have what I've called thin interburden.
16 Interburden is basically a term that's used in the
17 mining industry for the amount of rock in between the
18 coal seams. So it's important to know what the
19 interburden is because if you're going to mine two
20 seams, the stresses could overlap if they're too close.
21 So you have a complicated -- more complicated stability
22 condition.

23 So we have thin interburden here between these
24 two coal seams that are planned in the mine. We have, you
25 know, again the faulting here. And then on this side we

1 have deep cover, right? These coal seams are mined, but
2 they're under deep cover. So you can see the variation
3 just in one cross-section of different conditions we have.

4 Next slide. Here, again, we have thin
5 interburden in between the coal seams. Again, thin cover
6 up here. We have also the potential for flooding. You
7 know, if these coal seams here are mined out and water
8 fills in this ravine, we will have -- you can have
9 flooding of that mined-out area. Oh, hold on. Then you
10 can see a seam split.

11 That's important in this case, is because
12 there's a question of -- you have this whole seam that
13 wants to be -- that's going to be excavated. But at some
14 point, going to the west, it starts splitting and there's
15 a clay in between, the clay parting, it gets wider and
16 wider.

17 Well, that clay parting plays a role in the
18 composite of the pillar strength, right? At some point
19 it's going to get so thick, if you leave it in place, it's
20 going to really compromise the coal strength, especially
21 this clay, and it gets exposed to water. Where's the
22 criteria -- where's the analysis that tells us what that
23 limit is? There's no such analysis.

24 Here we have -- they talk about two seams, but
25 there's actually four minable seams here. We have the

1 deep seam, the Monarch seam, the Carney and then the
2 Masters. They have been offset because I talked to you
3 about before from the faulting. It's layer -- this layer
4 at one time was up here before the faulting. This layer
5 here was up here at one time. We have water that comes
6 along the faulting that is -- can recharge these areas
7 where there's going to be mining. Here we have another
8 condition of deep -- we have surface way up here. We have
9 deep mining condition.

10 Okay. Next. Faulting, again. Seam splits.
11 Again, we talked about that, the partings between the
12 seams. And another seam split here. So we've got a
13 variety of different depths, different thicknesses of
14 coal, different interburden thicknesses, different seam
15 splits, none of this is really addressed in the permit in
16 the application. Here, again, deep cover. Thin
17 interburden in between these two seams. Seam splits.

18 Okay. Here is an interesting -- I guess it's
19 not interesting, but another problematic condition. This
20 is what Big Horn Coal is concerned about, is all this
21 darker gray material, which is all stripped, dumped,
22 backfill material. If it's all made of claystone, it's
23 saturated, how the heck are you going to drive through
24 that without having slope problems? In my mind, I don't
25 even -- to me this would be the last place you'd want to

1 mine. I mean, is this a well-thought-out plan, comes to
2 my mind, is why would you want to deal with this first?
3 It's -- it's a significant slope problem. I don't know --
4 I don't know if MSHA would even allow it to be done. I
5 don't know. It's a slope condition. It's a mine safety
6 condition.

7 So from those different cross-sections where we
8 delayed where all the blocks were, we picked out all the
9 seams that looked like they could be mined. And also we
10 categorized -- and you can look at this -- when you have
11 an opportunity, you can see the varying thicknesses of the
12 coal. And then you see the depth of the coal and you'll
13 see it goes up to about 400 feet.

14 And what we've got here is I've shown where the
15 durable zones as they are delineated on the
16 cross-sections. So some places they exist. Sometimes
17 they're, you know, in the roof and on the floor, but
18 they're usually too far away from the pillar to make a
19 difference. They could make a difference where you have
20 the -- the cave collapsing upwards, the roof collapsing
21 upwards. WP means where present. That means it wasn't
22 present along the whole section where that block was.

23 Again, this is the summary of that table,
24 basically. So, you know, basically, as I've been saying,
25 there's a variety of conditions, the coal cover depth for

1 all the seams goes from the ground surface to 420 feet, so
2 we've got a variety.

3 Coal pressure -- I mean, you have -- the
4 pressure on the coal is going to be different, depending
5 on where you're mining.

6 Extraction height is from 2.5. And this is
7 about -- we don't really know what extraction height is
8 going to be completely. The miner -- they talk about the
9 miner being able to do up to 28 feet.

10 If you look at seams -- two seams come together,
11 the Masters and the Carney, where they come together, you
12 can get up to 25 feet. But with more boring, you don't
13 know how much variation there's going to be with that. I
14 used 20 here as an approximate number.

15 The panel extraction is 60 to 70 percent.
16 That's where I'm talking about, in the panel itself
17 between the barrier pillars. The only thing that's said
18 in the permit is that they will not have the minimum
19 pillar-to-width ratio will be 1. In other words, they'll
20 make the pillar as wide as it is high. Is that enough?
21 If you use that, you don't get a safety factor of 1 when
22 you get to the deeper depths. But that's not really
23 discussed. It's just a general -- there's no detailed
24 analysis of the varying conditions. And we have roof and
25 floor mainly of claystone, which is not a good engineering

1 material.

2 Okay. So in discussion of this site, what is
3 the possible expressions that you could see on the ground
4 surface as a result of the different types of mine
5 instabilities that are possible.

6 This was -- this is a drawing that I took out of
7 a publication, I believe it was 1980, by the USGS where
8 they did a study in Sheridan County on subsidence. And
9 this is their depiction of what the subsidence looks like.
10 And you can see here what we talked about before, about
11 the rooms caving in, right, and eventually come to the
12 surface and having these sinkholes that develop on the
13 ground surface as here.

14 On this side -- we'll talk about this also --
15 this is more of a bowl-shape depression where, you know,
16 you've got a massive collapse here of the pillars or floor
17 that causes this whole area to go. And there could have
18 been what I think the authors were trying to depict here
19 is that there were also some initial pits or sinkholes
20 before prior to the collapse of the whole area.

21 So one -- one calculation that is made in the --
22 in the permit application is with regard to explaining the
23 collapse over the areas of mining that exist in the area
24 in showing a relationship of that to what the mining
25 conditions were, using a certain formula. And this is

1 for -- purely for the caving up through the mine entry
2 conditions.

3 Using the same formula and the same extraction
4 height, which they didn't do for some reason. They didn't
5 do it for their condition. They did it for these older
6 mines, but if you take the same formula, and you can do it
7 on your own, and you plug in what they're proposing, you
8 end up with -- you end up with the potential to have pit
9 subsidence over 200 feet deep.

10 And this includes only one extraction height.
11 There's a mention in the report that they plan to stack
12 the pillars. In other words, if you -- if you're mining
13 one seam, the seam below, they'll put the pillars right
14 underneath that same -- right under the pillars above. So
15 essentially you have accumulated void height. You now
16 have 14 feet, interburden 30 feet, and then you might have
17 10 feet more extraction height. So, in essence, you've
18 got 24 feet of extraction height. And that should be
19 considered if you're doing this kind of calculation.

20 What we did is we did look at some air photos in
21 the area. Here's the outline of the -- of the proposed
22 mine application. And then you see in yellow the areas
23 where there's subsidence shown as a result of old mining.
24 What I wanted to show here -- we'll look at area A.

25 Next slide. Here you can see all the dotted

1 pattern showing all the subsidence within that area. And
2 based on the information available, this -- this
3 subsidence, it goes up to about 160 feet deep. So the
4 other condition, as we discussed, would be the sag
5 subsidences, these bowl-shaped depressions. Depending
6 upon the extraction height and extraction ratio, they can
7 maybe be up to 9 or 10 feet deep in the center, and they
8 would have tension cracks on the outside form as a result
9 of the subsidence.

10 So looking at the potential for that to happen,
11 we're looking at pillar failure, right? Massive number of
12 pillars failing, the roof above it collapsing, and a
13 larger area subsiding. We measure -- we calculated up to
14 almost 1300 PSI on the pillar, given the extraction ratios
15 we looked at in the permit. If you used the formula
16 that's used in the -- in the -- that's standard formula
17 that's used for pillar testing -- I'm sorry, pillar
18 calculations for strength, you end up with safety factors
19 less than one. So there's no discussion of -- all there
20 is is minimum of one safety factor. Doesn't really give
21 us enough to say if they're going to be able to control
22 subsidence.

23 There's no -- no significant clay seam assumed
24 in the analysis. As I said before, the -- the formula
25 that's used is a formula where they use the bituminous

1 coal strength. They didn't use the strength that's for
2 subbituminous coal. Do we know that the entries are going
3 to be truly parallel? I understand that they can control
4 the direction, but I'm not sure how the azimuth is
5 controlled or how much cover there is there.

6 And then the formula that issues, there's a
7 qualification in the formula saying that this formula was
8 developed based on coal heights of 7 feet or less. Okay.
9 We've got heights much higher than that and that's not
10 addressed at all.

11 Here, again, sag subsidence, the bowl-shaped
12 subsidence. Now, it could be from roof or pillar bearing
13 failure. Again, we have the same bearing pressures that
14 could come up. There are places that will be less than
15 one. If it has this clay zone, the vast majority -- we
16 talked about the vast majority of the geologic section
17 consists of. From my experience this claystone capacity
18 could be as low as 300 PSI. Way below the maximum, but
19 even -- and you're looking -- you want safety factors of
20 at least 2, right? So when you get to pillar pressures,
21 of 600, you start getting concerned about long-term
22 conditions related to pillar roof or floor capacity.

23 Also, as I mentioned in my illustration, when
24 you get yielding of the floor, you can also cause the
25 pillar to collapse because it's stretching apart the

1 pillar. So you can, in essence, you get yielding in the
2 floor, maybe not complete yielding. Pillar separates from
3 the stretching and collapses because it's not intact
4 anymore.

5 So, in conclusion, as I mentioned, there's
6 really not a lot of engineering geologic or geotechnical
7 information related to the mining interval. The
8 subsidence control plan exhibits a lack of geomechanical
9 understanding of short-term and long-term stability
10 proposed with multi-seam mining or even single-seam
11 mining.

12 In my opinion, there isn't sufficient
13 information, very limited analysis, that -- that
14 subsidence potential cannot be reasonably determined. But
15 if it is this claystone, as stated, you're going to have
16 problems. And for it to be a control plan -- and in my
17 mind, control means you're controlling it. You have to
18 demonstrate that you're controlling it. And I don't
19 believe that that is demonstrated in the permit
20 application.

21 From my view of subsidence control plans that
22 I've looked at over the years, this -- this is far below
23 industry standards. And, as I said, given what's reported
24 in the -- in the -- in the mine permit, I believe that
25 there is a serious risk of subsidence that will occur even

1 if -- even with the idea that's been proposed of we'll
2 submit design, you know, one month before. Well, that
3 doesn't really give any opportunity to do any -- any
4 check. You know, sort of we'll see how it goes kind of
5 attitude. I mean, I don't -- I don't think that's
6 regulatory.

7 Next slide. So what I've done is I've -- like I
8 said, I hope this is a help, and I -- that was the reason
9 I -- I am proffering this, is to get some idea of what
10 some of the things that, in a general way, should be done
11 to assess the mine risk.

12 Identification of the nondurable and durable
13 zones. Go to the next slide. And what I've done here is
14 just -- just to show you, near the site, you know, at the
15 Big Horn property, where we have -- you know we have these
16 outcrops here, right? Those are the durable rocks. Okay?
17 Those are the durable rocks. They sustained weathering,
18 right? They're intact. Then below you see all the sloped
19 soil material. That used to be rock. That's the material
20 we're talking about that's nondurable that reverts to rock
21 over time.

22 Methodology to assess the potential for chimney
23 subsidence. So I proffered that also, as well, what that
24 methodology would be.

25 Methodology to assess the potential for broad --

1 a broad or large subsidence. We talked about that.

2 That's the pillar failure and the bearing capacity
3 failure.

4 But, you know, it also needs to somehow assess
5 what these significant engineering geologic features are
6 and how they affect the mine structure, the faulting, for
7 example, that's already been reported in the area. Thank
8 you.

9 CHAIRMAN BAGLEY: So I think this is a good
10 time for a break.

11 MS. ANDERSON: Oh, sure.

12 CHAIRMAN BAGLEY: So let us take
13 10 minutes. Back at 10:26.

14 (Hearing proceedings recessed
15 10:14 a.m. to 10:27 a.m.)

16 CHAIRMAN BAGLEY: All right. We're back in
17 session. Please continue.

18 MS. ANDERSON: Thank you, Dr. Bagley. At
19 this time we have another demonstrative exhibit, which I'm
20 distributing to folks.

21 Q. (BY MS. ANDERSON) All right. And, Dr. Marino,
22 did you prepare this document?

23 A. Yes.

24 Q. And can you explain briefly what this is?

25 A. The purpose of this document was to help explain

1 my views on the approach that should be taken in terms of
2 subsidence control plan in terms of the design of the room
3 and pillar mine or highwall mine. And what I've tried to
4 address here in different items is basically what we've
5 talked about, summarized in a way that kind of gives
6 guidelines to step by step how to go about baking the
7 cake, if you will.

8 It's -- you can see it's not -- it's void of
9 basically equations, and that was purposefully done
10 because I didn't want it to be too restrictive. I have my
11 favorite equations or how I would want to do it, but a lot
12 of times you'll see in here appropriate analysis or words
13 like that, qualifying methodology used, ample data, kind
14 of things of that nature. But I think it's a good basic
15 step to provide guidance to appropriate measures that
16 should be taken in subsidence control.

17 Q. Okay. Could you briefly summarize some of the
18 sections in this document?

19 A. Yeah. So Section 1 deals with roof entry
20 failure analysis. This is the -- the analysis where we go
21 about determining a potential for the void itself
22 collapsing and propagating to the ground surface.

23 And 2 is the pillar failure analysis, that the
24 pillar failure analysis is basically looking at the
25 potential for the pillar to collapse and cause a broad --

1 broad-size subsidence to occur, and the steps that we
2 take -- that would be taken to do that.

3 And you can see the longest one is really
4 related to -- of the guidelines is Section 3 on roof and
5 floor bearing analysis -- failure analysis. And the
6 reason why that is is because of the different geological
7 scenarios that you can have. In terms of where the
8 durable layer is, is it right underneath the coal or right
9 above the coal, how thick the nondurable layer is, is it
10 old, nondurable, is it all durable? So all those I tried
11 to address all those different instances, the most common
12 instances.

13 CHAIRMAN BAGLEY: Excuse me. The copy we
14 got just has pages 1, 3 and 5. Pages 2 and 4, which I
15 think are double-sided, are --

16 MS. ANDERSON: That would be my error. I'm
17 sorry about that.

18 CHAIRMAN BAGLEY: As long as we get for the
19 record and Jim gets the full copy.

20 THE WITNESS: This is --

21 MS. ANDERSON: Yeah. That was the one I
22 copied, and -- it was a copying error on my part.

23 THE WITNESS: Okay.

24 MS. ANDERSON: So, yeah, I will make sure
25 that happens. Sorry about that. I can also email it to

1 the parties. I'll do that.

2 A. And there's a statement at the end about this
3 does not include any significant engineering geologic
4 features that might be present. It -- and it also
5 qualifies that there should be enough borings performed to
6 determine what the variability is, so that there is an
7 unlikely chance that an -- an adverse ground condition was
8 not uncovered.

9 Q. (BY MS. ANDERSON) Okay. So is it a fair
10 summary to say this is
11 a -- things that you would try and do if you were going to
12 prepare the subsidence control plan?

13 A. Yes.

14 Q. Okay. All right. Dr. Marino, I have some
15 questions for you about some of the testimony earlier from
16 the proceedings. Were you present for Mr. Barron's
17 testimony?

18 A. Yes.

19 Q. And do you remember him describing a pillar
20 design methodology that the mine plans to use called the
21 ARMPS?

22 A. Yes.

23 Q. And --

24 A. And that's Analysis of Retreat Mining Pillar
25 Analogy.

1 Q. Can you explain what that is?

2 A. It's a methodology that's fairly accepted in the
3 coal industry as a standard. It defines the coal strength
4 and provides guidance on what safety factors to use for
5 short-term and long-term conditions.

6 As I mentioned in my presentation, there are
7 certain inputs that need to be made when you're using that
8 equation. You know, the coal strength, for example, is an
9 important one. There's no data on the coal strength.
10 What was used, what was -- is the default value that's
11 given in the program. And this is for bituminous coals,
12 not for subbituminous coals.

13 So -- and then, again, there's a qualification
14 given that this -- this safety factor, this equation, it's
15 an equation that's used for not only for highwall mining,
16 but it's the same equation that's used for room --
17 standard room and pillar mining and it's used for longwall
18 mining. It's called a Mark-Bieniawski equation. Excuse
19 me. Because we really have the same situation, we have
20 pillars and rooms. But it talks about that this -- this
21 is based on case histories where the mining has occurred
22 with extraction heights less than 7 feet -- or at or less
23 than 7 feet. Here we're talking about potentially 20 feet
24 or more.

25 Q. Okay. Did you hear a lot of testimony earlier

1 about the TR-1 area?

2 A. Yes.

3 Q. And you touched a little bit on this in your
4 presentation, but do you have any concerns about highwall
5 mining in that area?

6 A. Yes. I've done a lot of slope stability
7 analysis as a geotechnical engineer, as part of our --
8 kind of like the woof and warp, if you will, of our
9 profession. And when you have heterogenous material
10 that's just dumped in place, saturated, it's -- and it's
11 over maybe a hundred feet high and you're going to cut
12 into it, I don't -- it just boggles my mind. I don't
13 know. I don't think you can get it past MSHA. I don't
14 know. But it's going to be very difficult. If you do,
15 it's going to have to be so flat. You're going to have to
16 take so much of that material out.

17 And just -- just as a -- an engineer, looking at
18 the scenario, without any data, engineering judgment tells
19 me why would you want to do that first? That is going to
20 be so challenging. I would start where it's going to be
21 the easiest, right?

22 Q. And just to kind of relate it back to the permit
23 application in the subsidence control plan, is there
24 anything in there that discusses these risks that you just
25 mentioned?

1 A. Well, that's not really a subsidence control
2 issue. I mean, that's more of an MSHA issue.

3 Q. Okay. Did you also hear some testimony about
4 this 50 percent extraction limits?

5 A. Yes.

6 Q. And how maybe that could help prevent
7 subsidence?

8 A. Yes. That -- that -- that comes from an old
9 standard back in the '70s about protecting structures, and
10 that you should use a 50 percent extraction limit. That
11 standard, obviously, it really doesn't apply if you have
12 safety factors that are lower than what are acceptable.
13 It should be based on safety factors, not on a percent.
14 It's like, well, we don't know what to do. We'll just say
15 50, 60 percent is okay, instead of actually calculating
16 what's -- what is -- you know, what is the risk?

17 Q. And based on your presentation, you believe that
18 the extraction maybe should be higher than 50 percent?

19 A. Excuse me?

20 Q. That the extraction may be higher than 50
21 percent?

22 A. Well, based on the typical range of the web and
23 entry widths that are given in the permits, they are
24 higher than that, yes.

25 Q. Were you here when Mr. Barron testified that the

1 Wyoming mine permit application's subsidence control plan
2 was quite extensive and in other states is often one page?

3 A. Yeah. That's not my experience at all. I mean,
4 the -- I believe -- I believe he was referring to the
5 entire permit. But all these permits are very extensive.
6 They're not one page. They're all extensive permits.

7 Q. Okay. And is it your testimony that you've seen
8 subsidence control plans with greater -- greater level of
9 detail than the one here?

10 A. Yes. And not -- there's nothing in them about
11 MSHA, because MSHA is not directly related to subsidence
12 on the ground surface.

13 Q. Okay. We'll get to that in just a minute.

14 In your opinion, does the application provide
15 sufficient information to provide a meaningful peer review
16 with respect to subsidence potential? So if you were in
17 the shoes of DEQ, would you be able to review this?

18 MR. POPE: Objection. Calls for
19 speculation. He isn't part of the DEQ and doesn't do their
20 review.

21 MS. ANDERSON: And, Dr. Bagley, he's an
22 expert. He's allowed to speculate. He's providing his
23 professional opinion on the quality of work provided by the
24 company.

25 CHAIRMAN BAGLEY: On the other hand, he's

1 just provided a review, peer review, which was pretty
2 clear.

3 Go ahead and answer.

4 Q. (BY MS. ANDERSON) Is there anything else you
5 want to say about the ability of doing a peer review on
6 this document?

7 A. No. As the chairman said, I think it was pretty
8 clear.

9 Q. Okay. Do you have an opinion on whether the
10 subsidence control plan should be certified by a
11 professional engineer?

12 A. All the ones I've seen have been. I mean, it --
13 it basically says when it's stamped that I take
14 responsibility for it and then I believe this is a valid
15 subsidence control plan.

16 Q. And were you here for the testimony from
17 Mr. Barron that he didn't stamp the subsidence control
18 plan?

19 A. Yes.

20 Q. So does the lack of that stamp from his PE
21 stamp, even from, you know, layperson's perspective, give
22 you any confidence that the subsidence control plan is
23 complete and technically adequate?

24 A. From my experience in working in other states,
25 there's always a PE stamp for engineering work. Always.

1 It may not be the same person, but there's always --
2 you're doing engineering work, there's a stamp for it.
3 Otherwise you're practicing without a license.

4 Q. Okay. In your opinion, do you believe there
5 should be significant revisions to the permit when the
6 design is complete for an area?

7 A. If there is -- when an area -- a significant
8 revision in my mind means there's -- in a -- let me step
9 back.

10 Q. Yeah.

11 A. This -- this mine application is all in one. My
12 experience has been normally you get a permit for an area
13 that's got all the detail that you need to get your
14 subsidence control plan done, and then you work that area
15 and then you put in a significant revision for the next
16 area. And then you provide the data for that area. Not
17 everything all at once, and where there's not any data for
18 anything.

19 Q. Okay. Were you here when there was testimony
20 about this, quote, directionally intelligent miner?

21 MR. POPE: Dr. Bagley, I'm going to have to
22 object. I know that Ms. Anderson wants to have Dr. Marino
23 rebut some of the earlier testimony. None of this
24 information is in his expert report. The reason that this
25 council set up a scheduling order to have expert reports

1 was to have ability for the parties to understand what each
2 expert would say, depose them if they want. We are way
3 outside the bounds of that, and, therefore, we haven't had
4 the chance to inquire with Dr. Marino on this. He was also
5 not designated a rebuttal expert, nor was there opportunity
6 for that.

7 MS. ANDERSON: Dr. Bagley, I think all the
8 witnesses throughout this whole hearing have been
9 testifying to what they heard from other witnesses. This
10 is no different than that.

11 CHAIRMAN BAGLEY: Can you repeat the
12 question?

13 MS. ANDERSON: Sure. It's about the
14 directionally intelligent miner. And if -- I'm going to
15 ask Dr. Marino if he has an opinion on that.

16 CHAIRMAN BAGLEY: You can go ahead and ask.
17 I'm not sure he's been qualified as a mining engineering
18 expert. So let's be careful how far you push that. I
19 mean, his credentials as a geotechnical expert are well
20 described, but mining engineering starts to push into
21 another area.

22 MS. ANDERSON: Sure. And I think he
23 appreciates that.

24 Q. (BY MS. ANDERSON) Dr. Marino, do you have an
25 opinion on the subsidence prevention capability of this

1 directionally intelligent, as it's been phrased to us,
2 miner?

3 A. I don't -- I can't say I'm an expert in mining
4 equipment, mining excavation, so I don't see the
5 relationship between that and subsidence. It really has
6 to do with the mine plan and how it's going to be
7 developed and what ends up being there.

8 Q. Okay. Thank you.

9 Okay. Mr. Barron talked a lot about this MSHA
10 ground control plan. And I'm going to pull up Brook 10c,
11 which has some of that in there.

12 Dr. Marino, do you have anything to say about
13 Mr. Barron's testimony related to the MSHA permit?

14 A. Well, it says right there what the ground
15 control plan is for. And if you read through it, you'll
16 see it's for safe working conditions. It's all about
17 workers and hazards, not -- not related to the -- it
18 doesn't say anything about subsidence.

19 Q. Okay. And do you believe that the mission of
20 MSHA is similar to the mission of DEQ in permitting a new
21 coal mine?

22 A. No. I mean, I don't know if -- if there are
23 areas that intertwine, but in terms of the subsidence
24 control plan, no.

25 Q. So is it your opinion, based on your experience,

1 that the MSHA process and the DEQ process are different?

2 MR. POPE: Objection, Dr. Bagley. It's the
3 same one. These are not opinions that Dr. Marino has in
4 his expert report. He's also not qualified himself as
5 expert in the regulatory process.

6 CHAIRMAN BAGLEY: Actually, I would agree.
7 Now we're asking, well, this regulatory agency does this,
8 does this. I think we need to come at this a different
9 way.

10 MS. ANDERSON: Okay. Thank you. We'll
11 stick to the deficiencies in the subsidence control plan.

12 Q. (BY MS. ANDERSON) All right. So at this time,
13 though, you didn't have a chance to review this permit,
14 the MSHA permit. It wasn't part of the subsidence control
15 plan?

16 A. I don't know of any that has been submitted.

17 Q. Okay. And, I guess, based on that, do you have
18 any recommendations for testing and analyses beyond what
19 will be required by MSHA later that should be required now
20 as part of the subsidence control plan?

21 MR. POPE: Objection. Same issue. This is
22 speaking to the regulatory process which should be
23 required. He's not an expert in that and has expressed no
24 opinions in this report.

25 MS. ANDERSON: Dr. Bagley, I think

1 Dr. Marino has testified that he's reviewed numerous
2 subsidence control plans and he served as an expert in
3 various capacities for those control plans. So I think he
4 has very good understanding what should go in the
5 subsidence control plan.

6 CHAIRMAN BAGLEY: Yeah. I think the
7 question should be what testing may be required to
8 specifically get at a subsidence control plan. MSHA may
9 have -- likely does have its own testing. That's not for
10 us to decide. I understand that that's what they're
11 referencing. But we can hear what his recommendations are
12 to get at the subsidence issues.

13 A. Yes. The testing -- types of testing I've
14 already outlined in my report for testing durable
15 materials, what tests tell you if it's durable or not, how
16 to determine what the strength is and when it becomes --
17 reverts back to a soil, what that strength is. That's all
18 given in my report.

19 Q. (BY MS. ANDERSON) Okay. And Dr. Marino, in
20 your expert opinion, do you consider the permit
21 application, as it currently stands, technically adequate?

22 MR. POPE: Objection. Same issue. He's
23 not an expert in regulatory process.

24 MS. ANDERSON: Dr. Bagley, I think he has
25 opinion --

1 CHAIRMAN BAGLEY: Yeah, but the question
2 is --

3 MS. ANDERSON: -- on if it's technically
4 adequate.

5 CHAIRMAN BAGLEY: -- is it technically
6 adequate. He's a technical expert, so we'll allow his
7 opinion on this issue.

8 MR. KUHLMANN: Mr. Hearing Officer, I'm
9 going to object that he has not established he's familiar
10 with what technical adequacy means under Wyoming law.

11 CHAIRMAN BAGLEY: You bring up a really
12 good question, which we'll probably have discussions on
13 later.

14 MS. ANDERSON: Yes.

15 CHAIRMAN BAGLEY: I would like to hear his
16 opinion on the -- and technical, as I understand it as an
17 engineer, and as Dr. Marino as an engineer, his views of
18 the technical -- not the legal parts, which I don't
19 consider technical, but -- so I'd like to go ahead -- but
20 thanks for the objection. I'd like to go ahead and ask --
21 have him answer that question.

22 A. In my mind, it's not complete in a technical
23 form because there's not enough information to evaluate
24 various mining scenarios in the various geologic
25 conditions.

1 Q. (BY MS. ANDERSON) Okay. Thank you.

2 So you've heard some of the testimony that there
3 will be some additional tests later on for MSHA or maybe
4 something else. Do you have any concerns about giving the
5 company the right to mine via permit at this time?

6 A. Well, that -- you know, those statements about
7 we're going to provide testing and analysis -- I mean,
8 what does that mean? There's no detail about what that
9 means and how it's going to be done. And it's kind of
10 putting the cart before the horse, you know, in terms of
11 determining the subsidence control plan.

12 Q. Okay. Understanding I may get an objection
13 here. Dr. Marino, if you were sitting in the chair of the
14 director, downtown in Cheyenne for DEQ, would you feel
15 comfortable approving this permit as it currently stands?

16 MR. POPE: Objection. He's not a part of
17 DEQ. He is not the director. He's not an expert in the
18 permitting process.

19 CHAIRMAN BAGLEY: I agree. He can't make
20 that conclusion.

21 MS. ANDERSON: Okay. That's fine.

22 THE WITNESS: Thank you.

23 Q. (BY MS. ANDERSON) Dr. Marino, I think that's
24 all I have for you, unless there's something else you are
25 remembering that you want to tell the council.

1 A. Maybe on cross I might think of something.

2 MS. ANDERSON: Okay. Great. Well, thank
3 you.

4 So that concludes my direct examination of
5 Dr. Marino.

6 CHAIRMAN BAGLEY: Great. Thank you.

7 So I have picked an order for cross. It will be
8 a surprise as we go through.

9 Mr. Gilbertz.

10 MR. GILBERTZ: Thank you.

11 CROSS-EXAMINATION

12 Q. (BY MR. GILBERTZ) Still good morning,
13 Dr. Marino. Just a couple of questions. You said at the
14 beginning of your testimony that your primary goal was to
15 be involved in good science. From your perspective, has
16 any good science went into the prediction of the potential
17 for subsidence at the Brook Mine?

18 A. There's no science there. I mean, I'm not
19 saying it's -- I'd like to see the science. There's no
20 science, in essence.

21 Q. Good. I think you inferred this, but was never
22 said directly. You talked about the fact that in this
23 model or the work that was done, there was an assumption
24 or a use of a formula that involved an amount in relation
25 to bituminous coal instead of subbituminous.

1 A. An amount?

2 Q. Yeah. An amount was placed into the calculation
3 which relied upon the coal being bituminous.

4 A. Yes.

5 Q. You told us that, in fact, this coal is
6 subbituminous.

7 A. Right.

8 Q. I think there was implication here, but you
9 never really said it, will the subbituminous have a
10 greater or lesser strength than the bituminous?

11 A. In general, lesser strength.

12 Q. Okay. And then I just wanted to confirm
13 something I heard you say. And I will butcher the name.
14 Is it Fenakowski?

15 A. Bieniawski.

16 Q. Bieniawski. Thank you.

17 Did you say that formula has a qualification on
18 it that it should not be used in -- when the extraction
19 height exceeds 7 feet?

20 A. First I have to correct it. It's Mark-
21 Bieniawski. Bieniawski was a professor at Pennsylvania --
22 Penn State. Mark worked under him. Mark worked under him
23 and he modified his equation.

24 Q. Very good.

25 A. And it was for, yes, the -- the equation was

1 developed for pillars with extraction heights of less than
2 7 feet.

3 Q. So from your perspective, in your
4 qualifications, is it appropriate to use that formula
5 as -- with confidence for extraction heights that exceed
6 7 feet?

7 A. I didn't -- I have not done that analysis to say
8 one way or another, but it's something that needs to be
9 addressed.

10 Q. Without having done the assessment you told us
11 is necessary to understand the risk of subsidence, do you
12 believe that without knowing the risks, a reclamation plan
13 can be developed that assures reclamation?

14 MR. POPE: Objection, Dr. Bagley. We're
15 now outside the scope of Dr. Marino's expert report. I
16 understand Mr. Gilbertz did not -- was not involved in
17 preparing that report, but, again, that's the reason why a
18 report exists, why the Rules of Civil Procedure are set up
19 they way they are and why council set up the scheduling
20 order the way they did.

21 MR. GILBERTZ: Well, I think what we have
22 is the potential for subsidence, which is going to then
23 require reclamation, and my question for him is without
24 knowing the risk of the subsidence fully, can we get to a
25 place where we can predict the reclamation as it relates to

1 subsidence.

2 CHAIRMAN BAGLEY: Yeah, I'll allow that
3 question, focusing on subsidence issues.

4 Q. (BY MR. GILBERTZ) With that qualification,
5 Doctor.

6 A. It all depends on the long-term stability of the
7 coal mine. And a lot of the effects that you see now in
8 the area are long-term effects. As I said before, in long
9 term these nondurable rocks deteriorate, and that's when
10 the instability occurs. I've seen it in many places where
11 we're talking 50 years later, what reclamation is going to
12 be around then to do that, where, you know, you have
13 subsidence conditions.

14 MR. GILBERTZ: No further questions. Thank
15 you.

16 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.
17 Ms. Boomgaarden.

18 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

19 CROSS-EXAMINATION

20 Q. (BY MS. BOOMGAARDEN) Good morning.

21 A. Good morning.

22 Q. I'm Lynn Boomgaarden. I'm representing Big Horn
23 Coal here today, and I have just a couple of questions.

24 I'd like to draw your attention back to the TR-1
25 area in particular and to the page in your PowerPoint

1 where you had geologic conditions and you had the K-K
2 prime cross-section, you're familiar with --

3 A. I think I know which one you're talking about.

4 Q. With that. And you're referring to the block 1
5 and block 2 areas. Is that your understanding that's also
6 the TR-1 area?

7 A. Yes.

8 Q. And you referred to that gray and consolidated
9 backfill area. And for the council's benefit, I have a
10 hard copy here if you have reason to want to refer to
11 that. But this is the page from the PowerPoint. I don't
12 have a page on the PowerPoint to refer to.

13 CHAIRMAN BAGLEY: I think I've seen it
14 enough, I dream about it, so...

15 MS. BOOMGAARDEN: Thank you.

16 Q. (BY MS. BOOMGAARDEN) And --

17 THE WITNESS: More cross-sections than you
18 wanted to see, right?

19 Q. (BY MS. BOOMGAARDEN) Dr. Marino, as I
20 understand the geologic conditions, it shows the strata
21 and the variability of the strata across that K-K prime
22 cross-section; is that correct?

23 A. Yes.

24 Q. And I understood your testimony to understand
25 that that unconsolidated backfill is saturated with

1 groundwater; is that correct?

2 A. That's what I understand from other testimony.

3 I would expect it to be.

4 Q. Okay. And do you -- and I appreciate your
5 testimony on slope stability, but I want to move past that
6 and talk about your opinion on the impacts on the risk of
7 subsidence, if any, if that backfill is cut through, as we
8 heard about in Sheridan, and that groundwater from the
9 backfill then is drained down into the various strata
10 below the backfill, which would constitute the roof, the
11 mined area and the floor.

12 A. I haven't really done a detailed analysis of
13 what the groundwater flows are. And, I mean, if -- if
14 water gets into the -- the rocks below, it's going to
15 affect, you know, those nondurable rocks.

16 Q. And one last question, then, following up on
17 that. And this is also referring to a page in your
18 PowerPoint called -- entitled Mine Stability Principles.
19 And it was -- had a subtitle oscillating groundwater level
20 within mine void interval. Do you recall that page?

21 A. Yes.

22 Q. And were you present for testimony during the
23 earlier part of the proceeding where there was discussion
24 that although it's not mentioned in the mine plan at this
25 point, there's a possibility that a sump or a pump system

1 would be installed to drain that groundwater as it flowed
2 down into the mine works. Did you hear that testimony?

3 A. Yes.

4 Q. So could you tell me, relative to your mine
5 stability principle chart here, if there is a drain and
6 subsequent pump feature that would cause variability to
7 the groundwater level, could that too affect the
8 subsidence risk?

9 MR. POPE: Objection, Dr. Bagley. I
10 apologize for sounding like a broken record. These
11 opinions are not in Dr. Marino's expert report. There's a
12 reason the report exists. We would object to him
13 testifying to this.

14 MS. BOOMGAARDEN: Dr. Bagley, I'm referring
15 specifically to the PowerPoint based on his report that
16 talks about mine stability principles related to the
17 fluctuation of water level from pumping and relating it
18 back to prior testimony.

19 MR. POPE: The specific opinion about the
20 TR-1 area, the pumping, draining, groundwater in that area,
21 is not in his expert report.

22 CHAIRMAN BAGLEY: No. The question,
23 though, is how would the changing water -- potentially
24 changing water levels due to pumping affect subsidence, so
25 I'll allow that question.

1 MS. BOOMGAARDEN: Thank you.

2 A. Pumping -- on and off pumping is going
3 to fluctuate, cause fluctuation in the groundwater
4 levels. But, again, it comes down to not having any
5 detail. We don't have the detail. Where's the pump
6 going to be? What's the capacity? We don't have
7 any of this. It's all just conceptual, cloud
8 in the sky stuff. As engineers we don't work off
9 cloud in the sky. We have hard calculation. We
10 have analysis. We have the ground truth to assess
11 whether something -- a project's going to be successful
12 or not.

13 Q. (BY MS. BOOMGAARDEN) So do I understand
14 correctly that you saw no data in the mine permit
15 application related to groundwater levels, groundwater
16 fluctuation or pumping?

17 A. I want to say that I did not focus on the
18 hydrogeologic conditions.

19 MS. BOOMGAARDEN: Thank you. No further
20 questions.

21 CHAIRMAN BAGLEY: Thank you,
22 Ms. Boomgaarden.

23 Mr. Kuhlmann.

24 MR. KUHLMANN: Thank you, Mr. Hearing
25 Officer. I just have a few.

1 CROSS-EXAMINATION

2 Q. (BY MR. KUHLMANN) Dr. Marino, have you ever
3 worked on a mine site in the Powder River Basin before?

4 A. I don't believe so, no. I did -- I did overall
5 geologic -- geotechnical study of rocks from various coal
6 fields, and Powder River Basin was part of that study.

7 Q. Have you ever worked on a mine site related to
8 the Masters or Carney coal seams?

9 A. No. But I understand that there hasn't been a
10 permit since 1980 on -- on coal mining. Maybe I'm wrong,
11 but that's what I heard from testimony.

12 Q. It sounds like you don't know that yourself,
13 correct?

14 A. That's what I heard from testimony.

15 Q. All right. You're not familiar with what is
16 required by Wyoming law to -- for a permit application to
17 be technically adequate, correct?

18 A. I don't claim to be a legal expert.

19 MR. KUHLMANN: That's all my questions.

20 Thank you.

21 CHAIRMAN BAGLEY: Thank you.

22 Mr. Pope.

23 MR. POPE: Thank you, Dr. Bagley.

24 CROSS-EXAMINATION

25 Q. (BY MR. POPE) Good morning, Dr. Marino.

1 A. Good morning, Mr. Pope.

2 Q. I know you're probably somewhat disappointed
3 Mr. Sutphin is not in this seat.

4 A. He said he's going to send me a postcard from
5 Italy, but we'll see. I gave him my business card, so...

6 Q. I have no doubt he will send you one.

7 Let's talk about something that I think you and
8 I can agree on. You would agree that it's important to
9 understand the method of mining proposed by a mine
10 applicant to evaluate the potential risks of subsidence?

11 A. You have to define what you mean by method of
12 mining.

13 Q. Sure. Are they going to do -- what I mean by
14 that is you agree that identifying whether it's a surface
15 mine, highwall mine, longwall mine factors into evaluating
16 the subsidence risk.

17 A. Well, in open mine -- or open pit, I don't
18 understand how that would relate to subsidence.

19 Q. Dr. Marino, understanding that. My question,
20 though, is a simple one. You would agree that
21 understanding the type of mining, the method, that an
22 applicant proposes to use matters in determining
23 subsidence risk?

24 A. To some -- some degree.

25 Q. In the instance of the Brook permit application,

1 at least in preparing your expert report, you considered
2 the highwall mining method that Brook intends to use as
3 the same method as room and pillar mining, right?

4 A. No. What I said was that you end up with a room
5 and pillar configuration. In fact, a lot of the older
6 mines --

7 Q. Dr. Marino, I'm sorry. I just -- it's a
8 yes-or-no question here. And I understand the desire to
9 explain, and I'm sure your counsel will give you that
10 opportunity. But I want to be very clear, is it your
11 testimony today that you do not consider highwall mining
12 and room and pillar mining the same?

13 A. I consider them, in terms of mine stability, the
14 same.

15 Q. But you're aware, though, that in the highwall
16 mining method that Brook intends to use, that as the coal
17 pillars run the length of the mining, the Brook Mine is
18 not going to then come and cut perpendicular into those
19 webs and pillars, right?

20 A. Yeah. What we know crosscuts.

21 Q. You would also agree with me, Dr. Marino, that
22 you have not reviewed any literature on the continuous
23 highwall miner that Brook proposes to use at its mine?

24 A. I did look at a video of the highwall miner
25 that's proposed.

1 Q. Fair enough. My question, however, was you have
2 not reviewed any literature on the proposed highwall miner
3 Brook intends to use?

4 A. So can you be more specific? I mean, there was
5 stuff on the website -- what are you specifically talking
6 about literature?

7 Q. Sorry, Dr. Marino. Give me one moment. I
8 picked up the wrong book.
9 So let me be very specific to your
10 clarification.

11 A. Thank you.

12 Q. You have not looked at any of the literature or
13 materials that any of the continuous highwall mining
14 companies produced on the subject of their miners, right?

15 A. Can you repeat that? I'm sorry.

16 Q. Sure. You have not looked at any of the
17 literature or materials that any of the continuous
18 highwall mining companies produced about their mining
19 vehicles.

20 MS. ANDERSON: Dr. Bagley, I'm going to
21 have to object on relevance grounds. I'm not sure what
22 other companies and the miners those other companies may
23 use has any relevance to this proceeding.

24 MR. POPE: His ability to evaluate the
25 subsidence risk, the subsidence control plan of the Brook

1 Mine, as he said on direct, depends on input data. One of
2 the pieces of the input data is how the mine works and how
3 the miner will engage in rock that will hold up that area.

4 CHAIRMAN BAGLEY: It's related, not as
5 directly as it might seem, but go ahead and answer that
6 question, please.

7 A. I have not -- I -- I -- whatever literature
8 you're talking about, I have not looked at. The only
9 thing I have looked at was some general information that
10 was provided on the website by the manufacturer and what's
11 given in the permit.

12 Q. On direct you testified about some experience
13 you had relating to figuring out if an area is undermined
14 beneath the structure, you had some experience with that.
15 You're aware, though, that there are no structures on the
16 surface in the areas where Brook Mine proposes to mine,
17 correct?

18 A. I -- I am not aware, but I did not study that.
19 I'm -- my task was to determine the subsidence potential.

20 Q. Let's -- let's talk about your review of how a
21 permit comes to be in Wyoming. Mr. Kuhlmann asked you a
22 question similar to this, but you've talked about the
23 purpose of a subsidence control plan, both in your report
24 and on direct. But you did not review any Wyoming
25 statutes for what is required in a subsidence control

1 plan, right?

2 MS. ANDERSON: Objection. There's actually
3 not a statute that references the subsidence control plan.
4 So I'm not sure what Dr. Pope -- or Mr. Pope is even
5 talking about at this point.

6 MR. POPE: Dr. Bagley, my point is that he
7 didn't even look at the law to figure out what the
8 standards are for a subsidence control plan, but then
9 testified about what is required for a distance control
10 plan that is directly relevant to whether the permit is
11 accurate and complete.

12 CHAIRMAN BAGLEY: All right. The question,
13 as I hear it, is has he looked at any of the Wyoming
14 statutes, regulations. We can ask that question.

15 Q. (BY MR. POPE) Dr. Marino, do you need me to
16 repeat the question?

17 A. No. I looked at a few brief phrases that were
18 shown to me, but I did not study the Wyoming regulations.

19 Q. Similar question here. You also did not review
20 any Wyoming regulations on what is required for a
21 subsidence control plan?

22 MS. ANDERSON: Asked and answered. He just
23 testified to that.

24 A. What's the difference in the question?

25 CHAIRMAN BAGLEY: Yeah. I --

1 MR. POPE: There's a difference between a
2 statute and a regulation.

3 CHAIRMAN BAGLEY: So he said no to the
4 regulations. You want to ask him about the statute?

5 MR. POPE: I asked the substitute question
6 first. Now I'm asking him about his review of the
7 regulations.

8 CHAIRMAN BAGLEY: Okay. Go ahead and
9 answer it.

10 A. Same.

11 Q. (BY MR. POPE) Same answer?

12 A. Same answer.

13 Q. Thank you.

14 Similar question, and probably have some
15 smirking faces in the room. You also did not review any
16 DEQ guidelines for what is required as part of the
17 subsidence control plan, right?

18 MS. ANDERSON: And I'll raise the same
19 objection. There's not actually DEQ guidelines in a
20 subsidence control plan, so...

21 MR. POPE: Dr. Bagley, the point here is
22 that to provide expert testimony on what is required in a
23 permit application would require someone to go look at what
24 actually is required as part of a permit application. And
25 if even there isn't anything required, that should serve

1 basis for offering opinion, expert or otherwise.

2 CHAIRMAN BAGLEY: Yeah. You're asking
3 about legal stuff, and he's a technical expert. But he can
4 go ahead and answer the question.

5 A. I did ask that question of counsel, and they
6 basically -- their response was there's not much on it to
7 look at.

8 Q. (BY MR. POPE) Fair enough. Thank you,
9 Dr. Marino.

10 Getting back to the permit application, you also
11 didn't review any of the comments and responses that went
12 back and forth between Brook and DEQ, correct?

13 A. After my deposition I did scan through those,
14 yes.

15 Q. But not before, right?

16 A. No.

17 Q. So, for example, at least at the time of your
18 deposition and at the time you prepared your expert
19 report, you weren't aware of any subsidence-related
20 comments DEQ had submitted to Brook Mine?

21 A. No.

22 Q. You also didn't ask any questions of DEQ
23 personnel in their review of the Brook permit application,
24 right?

25 A. No.

1 Q. And as a result of that, you don't know the
2 qualifications of the folks in the District 3 offices and
3 in the Cheyenne office of DEQ who reviewed the permit
4 application?

5 A. No.

6 Q. You mentioned on direct that you have never seen
7 MSHA referenced in a permit application and that your
8 experience has more been there is --

9 MS. ANDERSON: Objection. That's not what
10 he stated.

11 MR. POPE: Dr. Bagley, I explicitly heard
12 him say that he had not seen as part of -- maybe I wasn't
13 clear on the question -- as part of subsidence issues
14 discussing MSHA and actual MSHA.

15 CHAIRMAN BAGLEY: Yeah. Ask the question
16 more clearly, please.

17 MR. POPE: Sure.

18 Q. (BY MR. POPE) Dr. Marino, I heard you testify
19 on direct that in your experience, in terms of evaluating
20 subsidence, you had not seen in a permit application a
21 discussion of further work with MSHA. You also said that
22 in your experience, a permit will have a lot of site-
23 specific data on one area and then will go through a
24 significant revision process as it moves on. But you,
25 despite that experience, have no experience in permitting

1 a new coal mine in Wyoming, right?

2 MS. ANDERSON: Objection.

3 A. It's like --

4 MS. ANDERSON: I'm sorry. I'm going to
5 have to object to the form of the questions. I had a
6 really hard time following. There was like at least three
7 separate things in there about --

8 THE WITNESS: You made several assumptions
9 about --

10 CHAIRMAN BAGLEY: I got lost.

11 MS. ANDERSON: Yeah.

12 MR. POPE: I'll simplify the question.

13 Q. (BY MR. POPE) Dr. Marino, you have no
14 experience in permitting a new coal mine in Wyoming,
15 right?

16 A. As I said earlier, there hasn't been one and I
17 haven't, no.

18 Q. Let's talk about the ground control plan. At
19 least at the time you prepared your expert report, you
20 were not aware that the Brook permit application had a
21 commitment to do further engineering studies, right?

22 A. I think there's an inference of that in the
23 permit, in the application, that, you know, there was
24 going to be a -- that, in essence, the MSHA control --
25 ground control plan was going to make the subsidence

1 control plan complete.

2 Q. But you're at least aware now that Brook will
3 have a ground control plan approved by MSHA in place
4 before it begins mining?

5 A. I don't think they can mine without it.

6 Q. You're also aware that as part of preparing and
7 getting approval for that MSHA ground control plan, that a
8 professional engineer will have to stamp the ground
9 control plan, right?

10 MS. ANDERSON: Objection, actually.
11 Mr. Pope was raising all kinds of objections to the MSHA
12 permitting process. Now he wants Dr. Marino to testify
13 about it.

14 CHAIRMAN BAGLEY: That's probably because I
15 let the questions be answered -- asked. Yeah, he can go
16 ahead and ask that question.

17 Q. (BY MR. POPE) Dr. Bagley [sic], do you need me
18 to repeat the question?

19 A. No. I understand what you're saying. I would
20 expect it to be signed and sealed.

21 Q. I'm going to pull up on the screen for you,
22 Dr. Marino, DEQ Exhibit 5-017.

23 MR. POPE: If you can blow up the bottom
24 paragraph, please.

25 Q. (BY MR. POPE) Can you see that okay,

1 Dr. Marino?

2 A. Yes.

3 Q. Okay. I want you to go down to the second
4 sentence and -- you had mentioned that there was no
5 strength data in the permit application. Here on DEQ
6 5-017, it says that "Laboratory strength analysis was
7 conducted on four samples from two locations (R13-019 and
8 R13-023) and results provided in Addendum D5-5." Did I
9 read that correctly?

10 A. Yeah. I would like --

11 Q. Dr. Marino, my question was simply did I read
12 that correctly?

13 A. Yes.

14 Q. Thank you.

15 Let's go to the next page, please. DEQ 5-018.

16 MR. POPE: If you can blow up the top
17 paragraph, please. Thank you, Carri.

18 Q. (BY MR. POPE) Can you see that all right,
19 Dr. Marino?

20 A. Yes.

21 Q. Okay. I'd like you to look at the sentence that
22 begins "It is understood." Here it says, "It is
23 understood that due to the nature of the area and the
24 strike and dip of the coal seams and the ever-changing
25 overburden and interburden thickness that these samples

1 will not represent all conditions encountered by the
2 continuous miner. Samples will be collected and strength
3 testing will be conducted on those samples in order to
4 satisfy the requirements of the MSHA ground control plan
5 which must be approved prior to mining." Did I read that
6 correctly?

7 A. Yes.

8 Q. Goes on to say, "The future testing results and
9 analysis in preparation of the MSHA ground control plan
10 will be provided to WDEQ/LQD." Did I read that correctly?

11 A. Yes.

12 MR. POPE: Can we go to the next paragraph,
13 please, Carri?

14 Q. (BY MR. POPE) Can you see that, Dr. Marino?

15 A. Yes.

16 Q. Here it says, "The results of the tensile
17 strength tests will be utilized to size both the web
18 pillars and barrier pillars to achieve a factor of safety
19 as set by the MSHA ground control plan to conduct mining
20 and minimize the risk of subsidence." Did I read that
21 correctly?

22 A. Yes.

23 Q. I'd like to go now to Brook Exhibit 10d. We'll
24 put that up on the screen.

25 MR. POPE: Can you just blow up, Carri, the

1 title, please.

2 Q. (BY MR. POPE) Dr. Marino, is Brook Exhibit 10d
3 the District 9 highwall miner ground control plan check
4 sheet?

5 A. I guess it is.

6 Q. Just a point of clarification for the council.
7 Are you familiar with MSHA District 9?

8 A. No.

9 Q. Do you know -- and it's okay if you don't, but
10 do you know that District 9 is the district within MSHA
11 that regulates the state of Wyoming?

12 A. I actually talked to some MSHA officials. I
13 thought that they were the ones that -- I don't remember
14 the district number, but the ones that were in charge of
15 any permitting for the Brook Mine for open-pit mining and
16 highwall mining. And I -- they were not aware of any
17 application or anything being filed.

18 Q. Dr. Marino, my question was a little bit simpler
19 than that. Are you aware --

20 A. I'm trying to answer your question. And maybe
21 they were District 9, maybe they weren't. I'm not sure.

22 Q. To be fair -- and I don't mean to confuse you in
23 any way. I'm not asking you about people. I'm just
24 simply asking are you aware that District 9 of MSHA is the
25 district that regulates the state of Wyoming?

1 MS. ANDERSON: And I still don't see what
2 the relevancy as to some of these questions are, but --

3 MR. POPE: Dr. Bagley, the --

4 CHAIRMAN BAGLEY: I think he's answered
5 that question. I heard no, but --

6 Q. (BY MR. POPE) I apologize, Dr. Marino. If you
7 said no, I did not hear that.

8 A. That's fine. No.

9 Q. So let's -- I want to go into Brook Exhibit 10d.

10 MR. POPE: And, Carri, if you would -- that
11 long middle section there, if you would blow that up,
12 please.

13 Q. (BY MR. POPE) Dr. Marino, this is portions of
14 the checklist that in preparing a ground control plan for
15 MSHA that a mine must include, do you see up there where
16 it says in subpoint A, slope of the ground to be mined?

17 A. Yes.

18 Q. The next one under that is maximum highwall
19 height?

20 A. Yes.

21 Q. Then C is highwall slope?

22 A. Yes.

23 Q. Underneath that, in subsection D, it says width
24 of highwall benches?

25 A. Yes.

1 Q. All right. Is -- you would agree with me that
2 this information, based on what you testified on direct,
3 are some things that you would recommend that Brook Mine
4 study and provide engineering detail for?

5 A. Yes.

6 MR. POPE: Carri, would you mind shrinking
7 that, please, and going down to the bottom bullet, please.

8 Q. (BY MR. POPE) Dr. Marino, this is another
9 bullet, and it says Stability. And there it says "Use of
10 ARMPS," A-R-P-M-S. I believe you testified on direct that
11 that program is an industry standard; is that right?

12 A. Yes.

13 Q. All right. And below that, it says for this
14 checklist that the stability must have a minimum overall
15 safety factor of 1.3, right?

16 A. Yes.

17 Q. And as you said on direct, the safety factor is
18 very important, right?

19 A. Yes.

20 Q. I'm going to go to the next page in Exhibit 10d.
21 Sorry, Dr. Marino, give us one moment.

22 A. No problem.

23 MR. POPE: Carri, if you'd blow up the top
24 text, those two lines at the top, please. Thank you.

25 Q. (BY MR. POPE) Dr. Marino, this portion of the

1 MSHA ground control checklist continues the safety factor
2 discussion. You would agree with me here it says that the
3 ground control plan should include a drawing showing depth
4 of overburden, height of coal, maximum number of holes
5 between barriers, barrier and web dimensions used to
6 calculate 1.3 stability factor.

7 A. Yes.

8 Q. There was some discussion on direct and on cross
9 with Mr. Gilbertz with the difference between bituminous
10 and subbituminous coal. Do you remember that?

11 A. Yes.

12 Q. You're aware that the ARMPS program required by
13 MSHA includes an analysis of both subbituminous and
14 bituminous coal?

15 A. No.

16 Q. You're not aware of that?

17 A. I, in fact, talked to the individual, who's a
18 colleague of mine, Chris Mark. And, in fact, I talked to
19 him about subbituminous coal strengths --

20 Q. Dr. Marino, I apologize for interjecting again.
21 My question was simply are you aware of ARMPS using both
22 bituminous and subbituminous coal?

23 MS. ANDERSON: I think he's trying to give
24 him the answer, if he'd just let him.

25 MR. POPE: My question, Dr. Bagley, is just

1 is he aware. That's a yes or no.

2 CHAIRMAN BAGLEY: Not necessarily.

3 Go ahead and continue with your answer.

4 A. Okay. I know the person well, Chris Mark, who
5 is Mark-Bieniawski equation, and I emailed him about
6 subbituminous strengths. And he said he had no
7 information on -- he actually gave me one reference that
8 was kind of -- gave one or two strength values. So I
9 doubt, since he is the one that developed this program and
10 one I talked to recently, and from my review, I don't
11 remember saying anything about subbituminous strengths.

12 Q. (BY MR. POPE) Maybe we've gotten our wires
13 crossed here, Dr. Marino. Let me -- let's just back up
14 and ask a much more general question. Are you familiar
15 with the ARMPS program?

16 A. Yes.

17 Q. Have you used that software?

18 A. Yes.

19 Q. Have you looked at, whether as part of that
20 program, that program looks at both bituminous and
21 subbituminous coal?

22 A. I am aware of -- that there is no subbituminous
23 strength coal that's given in the program.

24 Q. Okay. You mentioned that MSHA's goal is the
25 safety of miners, right?

1 A. Yes.

2 Q. So at least in your experience, MSHA doesn't
3 want a mine area to cave in because it could endanger the
4 safety of miners, right?

5 MS. ANDERSON: Objection. Again -- I mean,
6 Mr. Pope is trying to limit Dr. Marino's testimony about
7 MSHA and his expertise related to what MSHA does or doesn't
8 do, and this is calling for that testimony. So, I mean,
9 I'd like to revisit some of his earlier objections, but...

10 MR. POPE: Dr. Bagley, as you said, you've
11 allowed this testimony --

12 CHAIRMAN BAGLEY: Yeah.

13 MR. POPE: -- in his discussion about the
14 mission statement.

15 CHAIRMAN BAGLEY: I think it's relevant.
16 Go ahead.

17 THE WITNESS: Can I give a qualification to
18 my answer?

19 CHAIRMAN BAGLEY: Sure.

20 THE WITNESS: Okay. So can you ask the
21 question again, please?

22 Q. (BY MR. POPE) Absolutely. You would agree that
23 MSHA, because it cares -- its goal is to protect miners,
24 doesn't want a mine -- mine area to collapse because that
25 could endanger the safety of miners?

1 A. Yes. And one of the distinctions that you have
2 is ground control. Ground control is typically related to
3 safety. So we're looking at short-term conditions, when
4 the miners are in, not when it's abandoned. So the safety
5 factors that you would use -- what you're concerned about
6 is just the local cave-in, you know, that small cave-ins
7 that can hit a miner and cause injury. Different focus
8 than is it going to chimney up in a year or three years or
9 50 years? So they don't -- they don't look at that.

10 Q. Thank you, Dr. Marino.

11 Let's talk about some of the substantive
12 conclusions you drew in your expert report. I'd like to
13 pull up on the screen DEQ Exhibit 12-121.

14 Dr. Marino, do you recognize this as Figure
15 MP.1-3 from the Brook Mine plan?

16 A. I don't remember the trees and the -- I don't
17 think that -- that's in my exhibit, is it? I don't think
18 so. And these other cloudy spots.

19 Q. So is that a, no, you do not recognize it?

20 A. I'd have to look at it in detail, but it looks
21 generally correct.

22 Q. Okay. And it's fair to say that you used this
23 schematic in preparing the cross-section we saw that had
24 web and pillar heights and width, right?

25 A. Yes.

1 MR. POPE: Carri, can you highlight the
2 very bottom where it says figure MP.1-3.

3 Q. (BY MR. POPE) Dr. Marino, you're aware this
4 states it is a generalized schematic of the highwall
5 mining operation?

6 A. Yes. And if I can give a qualification?

7 Q. Not right now.

8 MR. POPE: If you would exit out of that,
9 please, Carri, and blow up the nomenclature section,
10 please.

11 Q. (BY MR. POPE) As you -- as we mentioned a
12 moment ago, you used this in developing the heights and
13 widths in the figure in your report, right?

14 A. I used this to develop the heights and widths?
15 No. I got the heights and widths from the text.

16 Q. I'll ask the question about that in just a
17 moment.

18 Dr. Marino, you would agree with me that the
19 figure MP.1-3, which is a generalized schematic, indicates
20 on it that it is not to scale?

21 A. Okay. Yeah.

22 Q. Okay. You mentioned just a moment ago that you
23 pulled the heights and widths from the permit application.
24 Dr. Marino, you would agree that there are no specific
25 heights and widths for any of the trenches specified in

1 the permit application?

2 A. We're not talking -- this is not related to what
3 you're talking about. You're talking about trenches,
4 right?

5 Q. Let me re-ask the question. If I got you
6 confused, please let me know.

7 You stated a moment ago that you took the
8 heights and widths for various web and barrier pillars
9 from the text of the permit application, right?

10 A. I took -- for this diagram, I took the width of
11 the openings and the pillars. And I also put on the
12 drawing the potential extraction heights range that the
13 miner can utilize.

14 Q. And I just wanted -- I want to be clear here. I
15 thought I heard you testify a moment ago that you took the
16 heights and widths of barrier and web pillars from the
17 text of the permit application. Is that true?

18 A. Are we relating to this drawing or we just
19 talking in general.

20 Q. I'm talking in general in terms of your opinions
21 about heights and widths and how they factor into
22 stability and subsidence.

23 A. Okay.

24 Q. My question is, is it true that you testified a
25 moment ago that you pulled the heights and widths of web

1 and barrier pillars from the text of the permit
2 application?

3 A. I pulled the widths of the openings and the
4 pillars from the text. I determined the heights based on
5 the coal thicknesses that were provided.

6 Q. All right. I'm glad we cleared that up. My
7 ultimate question is you're aware that the text of the
8 permit application does not state anywhere the heights and
9 widths of web or barrier pillars for any of the areas in
10 the mine plan?

11 A. It just gives typical. It says typical.

12 Q. Okay.

13 A. And that comes to the crux of the matter.
14 There's nothing to go off.

15 Q. Understanding that, Dr. Marino. I want to turn
16 to extraction ratios. You testified on direct that you
17 believe the extraction ratios are somewhere between 60 to
18 70 percent, right?

19 A. Yes. In the panel areas.

20 Q. Yes. You're aware that the permit applications
21 states that the extraction ratios will be 45 to
22 60 percent?

23 A. Can you show me where that says that?

24 Q. Dr. Marino, my question is simply are you aware
25 that the permit application states the extraction ratios

1 will be 45 to 60 percent?

2 A. No.

3 Q. You testified on direct that there was no
4 strength data in the permit application. I'd like to go
5 to DEQ 5 -- Exhibit 5-202.

6 MR. POPE: Pull up the text, please, Carri.

7 Q. (BY MR. POPE) In this portion of Addendum D5,
8 you would agree with me, Dr. Marino, this section states
9 it is the unconfined compressive strength ASTM D 7011
10 Method D.

11 A. Yes. I've reviewed that actual standard.

12 Q. Let's turn to the next page, DEQ 5-203. I'll
13 blow up the table in the middle of the page. Near the
14 right-hand side, there is a heading that says Compressive
15 Strength and in parentheses it says PSI. Do you see that,
16 Dr. Marino?

17 A. Yes. I'm familiar with that table.

18 Q. All right. On the left-hand side there's a
19 portion that says Rock Type, and it says coal underneath
20 it, doesn't it?

21 A. Yes.

22 Q. And the PSI -- the compressive strength in PSI
23 for the coal, at least for boring R13-019, is 1460 PSI,
24 right?

25 A. Yes. Can I qualify?

1 Q. I'm sure Ms. Anderson will give you that
2 opportunity.

3 A. Okay.

4 Q. You mentioned near the end of your direct that
5 the -- your review is that there should be unlike -- it
6 should be subsidence in the area should be unlikely as a
7 result of the mining, right?

8 A. Say that again.

9 Q. Yeah, I jumbled my own words up. I apologize.
10 Your opinion in your expert report in which you
11 testified on direct was that the subsidence control plan
12 in the permit application should be designed such that
13 subsidence is unlikely, right?

14 A. Yes.

15 Q. But you would agree that the unlikely standard
16 you have used does not come from any Wyoming statute
17 regulation nor DEQ guideline?

18 A. Yes.

19 Q. Dr. Marino, you spoke with Ms. Anderson about a
20 picture of the permit area and it had pockmarks of
21 subsidence. Do you recall that?

22 A. Yes.

23 Q. And there was -- as I recall, there was a yellow
24 line around that area, right?

25 A. Yes.

1 Q. All right. You would agree with me that that
2 subsidence in that area is likely from historic mining in
3 that area?

4 A. Yes.

5 Q. But you're aware that even in the areas of
6 historic mining there are places where there are no
7 subsidence, right?

8 A. To date, yes.

9 Q. And you're also aware that the historic mining
10 done in that area was often a room and pillar method where
11 they retreat-mined the pillars, right?

12 A. I am aware that in certain areas that's the
13 case. I don't believe that's the case in the area
14 outlined above.

15 Q. And I just want to be clear so we all know what
16 we mean. Retreat pillar mining is a method by which as
17 the mine exits the area it has already mined, it extracts
18 the coal pillars holding up that area, right?

19 A. Yes. Or, in other words, second mining. When
20 you do retreat mining, normally that's considered planned
21 subsidence. There's two ways a subsidence control plan
22 can operate. One is unplanned. One is planned. Planned
23 is where you have high extraction mining, and they extract
24 the pillars and they plan for the surface to collapse for
25 subsidence to occur. It is done in a controlled way. And

1 they know about approximately how much subsidence occurs.
2 So if you have structures, you have some idea of when that
3 structure's going to be subsided and you can take
4 mitigation measures to help assist with any subsidence
5 damage.

6 Q. Dr. Marino, I heard you testify on direct that
7 at least in your experience, you had never seen a permit
8 that said one month before mining it will submit a design.
9 Do you recall that?

10 A. I didn't say in those words, no.

11 Q. But I did hear you say that at least there would
12 be a one-month time gap between submitting the design and
13 mining. You're aware, though, that the permit application
14 does not state that the ground control plan will be
15 submitted one month before mining begins.

16 A. Okay. Are we talking about the subsidence
17 control plan or the ground control plan?

18 Q. Ground control plan.

19 A. So can you restate your question, please?

20 Q. Absolutely. You're aware that the permit
21 application does not state that the ground control plan
22 will be submitted one month before mining begins?

23 A. I don't know. I don't remember. But I don't
24 see the relevance. I mean, we're talking about a
25 subsidence plan, not a ground control plan.

1 Q. I understand there's at least a disconnect
2 between Brook and everyone else on that front, and that's
3 fair.

4 You're aware, though, that before any mining can
5 take place at the Brook Mine, MSHA must approve a ground
6 control plan?

7 A. Yes.

8 MR. POPE: Dr. Marino, thank you very much.
9 I have no further questions.

10 THE WITNESS: Thank you.

11 CHAIRMAN BAGLEY: All right. Thank you.

12 It's just you and I, Nick. Do you have any
13 questions?

14 COUNCIL MEMBER AGOPIAN: No. The questions
15 that I had written down have already all been answered.

16 CHAIRMAN BAGLEY: Thank you. I have some
17 questions, Dr. Marino. Thank you for coming back.

18 EXAMINATION

19 Q. (BY CHAIRMAN BAGLEY) So I guess I have a minor
20 complaint. I would have liked to have seen the formula,
21 but I guess that's just me and you --

22 A. Being an engineer.

23 Q. Yeah, being an engineer. So -- oh, well?

24 A. I mean, I -- we can submit it later if you want,
25 if you need to see it.

1 Q. I was mostly joking.

2 Let me go back to a question. You were talking
3 about your experience. As I've listened to the testimony
4 and tried to understand what the plan is, my understanding
5 kind of boiled down to there's seven major areas or
6 trenches that will be constructed over time, and that
7 they'll go in and construct a box cut or trench or
8 whatever they call it, and then go in and highwall mine
9 and move on to the next one.

10 The -- would you expect, just in your
11 experience, that you'd have detailed subsidence plans for
12 all seven of those prior to starting one of them?

13 A. Yes. Yes. I mean, to me, the most reasonable
14 way would be you prepare one for one trench or two
15 trenches, and you have all the information you need. You
16 get that approved, and then you have significant revisions
17 after that. That's provided in the regulations, that I
18 understand from other states, and I assume they exist in
19 Wyoming because they're federal standards. And so you
20 would submit -- you submit, okay, I want to now trench
21 mine 3 and 4. Here's the data. Here's the analysis. DEQ
22 reviews that. There's a public hearing about it. And
23 then it -- if it gets approved, it gets approved, and they
24 go ahead and do the work.

25 Q. Okay. So let me -- I think you answered my

1 question. Just let me be sure.

2 A. I --

3 Q. So I want to go and do TR-1.

4 A. Okay.

5 Q. And so I should have a detailed subsidence
6 control plan, detailed technically -- by our definition of
7 technical -- prior to being allowed to mine that. But I
8 don't necessarily need one for TR-2 yet.

9 A. Right.

10 Q. Okay. So that -- of all seven that are shown we
11 really should have one defined, but then before they go to
12 the next one, we'd expect to have the same thing --

13 A. The same thing, different --

14 Q. And then you call that a significant revision?

15 A. Yes.

16 Q. Okay. Thank you.

17 A. And if I can add?

18 Q. Uh-huh.

19 A. I just worked on one for Illinois where the mine
20 is quite old. In fact, they've had a permit since the
21 early '80s. And they've worked off significant revisions
22 over the years. This last one was about mining underneath
23 an impoundment -- reservoir impoundment. So I was
24 consulted by the City to look at the significance of
25 mining, and we worked out a plan of how to protect those

1 dams. Okay? Subsidencewise. And that was all the
2 subsidence control plan. There was no MSHA involved.
3 MSHA had nothing to do with it. It was more the effects
4 of the surface on the public.

5 Q. Okay. Good. Thank you.

6 So the question that folks have danced around, I
7 guess, let's just try to answer it. And it doesn't have
8 to be a yes or no answer. In your opinion, will
9 subsidence occur at the Brook Mine facility?

10 A. Given the description of claystone and I talked
11 to you about -- I'm -- I'm concerned about slope stability
12 problems, but it's not a subsidence issue. That's more
13 MSHA. But you have claystone. It's going to break down
14 to a point where it's going to be soil like. So if you
15 don't take those things into account, I believe we're
16 going to have subsidence problems.

17 And there's no -- there's no testing or anything
18 to tell us otherwise that -- you know, how that's going to
19 be mitigated.

20 Q. Okay. So -- because you had said in one of
21 your -- on your conclusions, and I put little quotes
22 around it, serious subsidence risk.

23 A. As it -- as the permit -- as the data exists in
24 the permit currently.

25 Q. Okay. So there's a serious subsidence risk, and

1 the reason for that, in your opinion, is there just are
2 not enough data to know one way or the other?

3 A. And just that there -- the description of
4 claystone, as I said in my deposition, that -- I don't
5 believe it's claystone, but as an engineer, I work off
6 what is given. It says it's claystone. But testing can
7 prove it wrong and say, no, it's not claystone. It's a
8 siltstone. It's, you know, shale that's durable. That
9 changes the picture completely, right? But we don't have
10 the engineering data. It's all just narrative.

11 Q. Okay. Okay. So that -- that -- that's what I
12 thought. I just wanted to be clear that I understood
13 that. I'll ask this question. And, again, this doesn't
14 have to be a yes or no answer. Actually it's a question
15 I'm asking you as an expert, simply because it's a
16 question the council has to try to figure out too.

17 If there's subsidence, will it cause any
18 problems?

19 A. Well, is the -- that's an environmental
20 question. Environmental engineering question.
21 Geohydrologist question. Which I can only speak for
22 subsidence risk. If it was structures, I could expound
23 upon because I've done analysis of damage to structures
24 and pipelines and that sort of thing for subsidence, but
25 environmental/agricultural issues, that's an agricultural

1 engineer or something for an environmental engineer.

2 Q. Okay. That's all right. Worth a try.

3 A. Yeah.

4 Q. Now, we saw a District 9 form provided -- be
5 submitted, presumably District 9 of MSHA. In your
6 opinion, would that -- completing that form, regardless of
7 when -- I'm not asking when -- completing that form, would
8 that provide you enough information to further evaluate
9 the subsidence risk?

10 A. Further evaluate, yes. Sufficient, I don't
11 think so. Because they're concerned about mine safety,
12 and their concern is short term. So you see the safety
13 factor of 1.3, that's a short-term safety factor. Long
14 term is going to be 1.6 to 2, depending on the
15 design -- type of design.

16 So, again, different focus. You know, we showed
17 you the mission statement. This says nothing about
18 subsidence in it. It's more concerned about, you know,
19 safety and health issues related to mining.

20 Q. So by completing that form, which looks like it
21 would require a lot more sampling than currently exists --

22 A. Absolutely, it will.

23 Q. -- it still may not provide enough information
24 to deal with long-term subsidence issues?

25 A. Right. And the -- you know, we don't have --

1 what we have here, we don't have miners going into
2 entries, right? This is all done remotely. So don't have
3 to worry about caves. The only thing they have to worry
4 about is the instability of the mine as it affects the
5 slope. You following what I'm saying?

6 Q. Uh-huh.

7 A. So the near field affects instability on the
8 slope, because then you're going to have slope failure.

9 Q. I guess I imagine may also -- where it subsides
10 in on the continuous miner, that might hurt them. There
11 may not be a person in that mine, but it still may be
12 considered in that manner. I guess I might if I was MSHA.
13 But I see what you're saying.

14 A. Yeah, how would you go back in there? You have
15 the roof -- in order to go into the entry, you have to
16 have a roof bolt plan. What's called a roof bolt plan.
17 It's basically still bars that you nail into the roof that
18 hold the roof stable and keep it intact. They're not
19 going to do that in this case. It's all remote behind it.
20 So there's not going to be miners going in. If there is,
21 they have to do this whole roof bolt plan, and that's
22 going to be expensive to do that.

23 CHAIRMAN BAGLEY: Okay. Thank you. That
24 answered all my questions.

25 Before we go back to redirect, I just want to get

1 an idea, Ms. Anderson, how long do you think redirect will
2 take?

3 MS. ANDERSON: Not long, I don't think. I
4 think you actually covered some of the questions we were
5 just going to cover, so...

6 MR. GILBERTZ: My suggestion is you're
7 probably going to be more efficient if they take their
8 lunch break. Probably be way more efficient.

9 CHAIRMAN BAGLEY: That's what I'm getting
10 at.

11 MS. ANDERSON: Yeah.

12 CHAIRMAN BAGLEY: It's 5 to 12:00. Should
13 we take a lunch break, or if you have one minute of
14 redirect, I'd say finish.

15 MS. ANDERSON: It's going to be a little
16 longer than that.

17 CHAIRMAN BAGLEY: Okay. So let's go ahead
18 and take a break for lunch. Let's be back here at 1 p.m.

19 MS. ANDERSON: Okay.

20 (Hearing proceedings recessed

21 11:51 a.m. to 1:00 p.m.)

22 CHAIRMAN BAGLEY: All right. We're all
23 back, fueled, so let's continue.

24 Ms. Anderson, redirect.

25 MS. ANDERSON: Thank you, Dr. Bagley.

1 REDIRECT EXAMINATION

2 Q. (BY MS. ANDERSON) Dr. Marino, I speak lawyer.
3 You speak engineer. So let me ask you a question this
4 way. I saw you making notes about some of the things you
5 wanted to add to the questions being asked by Mr. Pope.
6 Could you relay those comments to the council?

7 A. Sure. There was one section that was shown that
8 talked about planned to do tensile strength tests on the
9 coal. There's the coal pillar design. That type of test
10 is not done for coal strength design. It indicates a lack
11 of understanding. So the way we wrote that for the type
12 of test, which should be -- which are compression tests.
13 Normally, when we run our laboratory cube test, one-to-one
14 side ratios, coal is known to have a strength change as it
15 grows in size. Because I talk about before, the
16 structure, it has in it micro fractures -- not micro --
17 fractures that are coal cleats, which are vertical
18 discontinuous fractures that may be 1 or 2 inches long.
19 And so as -- as you have a greater mass, you have less --
20 more of those, and the strength decreases, you get to a
21 certain point which had been tested in the past to be
22 about 3 feet in size, and that's when you come up with
23 that -- that's going to be the ultimate cube strength of
24 the coal. Then we have to apply to the dimensions of the
25 pillar: the height of the pillar, the width and length of

1 the pillar.

2 So using tensile strength doesn't get you there.

3 And you have to keep in mind that you're testing just a
4 piece like this and you have to have a way to understand
5 how it changes when it's larger. And for subbituminous
6 coal, I don't know of any studies that have been done to
7 do that, but there are equations that have been used for
8 bituminous coal that you could use to extrapolate what
9 that strength is from laboratory standards.

10 I also wanted to comment on -- it was brought up
11 about the testing that was done, that I didn't acknowledge
12 the testing. I did in my report. Under examination today
13 I just -- it's so little that I thought of it as not
14 deemed relevant. They did one compression test on the
15 coal. One seam for -- as I said before, the proposed mine
16 is 7 miles long, and it's one test. There's potentially
17 four seams that are going to be mined. Nowhere -- it
18 means nothing to me, one test.

19 The other thing that I think was a little bit
20 misconstrued is I was asked about extraction rates --
21 ratios where it states that it was 45 to 60 percent. It's
22 been brought up in previous testimony. When I read --
23 when you read the application, it doesn't say coal
24 extraction. It says coal recovery efficiency. In mining
25 that's a different terminology. What that means is the

1 efficiency of the -- how much coal you get after you
2 process it. Take the bulk coal and this is the percent
3 you're going to have.

4 Also, if we look at it in terms of extraction --
5 that's just a general number. What we're interested in is
6 the areas between -- the areas where there's going to be
7 the higher extraction areas, right? So these are general
8 numbers that encompasses the whole complex. We're looking
9 at where we have the smaller web pillars and we have the
10 barrier pillars that isolate, right? So where the
11 extraction areas is where you're going to have the higher
12 stress conditions. So those are the things you need to
13 focus on when you're doing stability analysis.

14 I think that those three things are what I'm
15 looking for.

16 Q. Okay. Great.

17 And just to recap here, one of your main
18 conclusions is that based on the information available to
19 you at this time, that there is a likely risk of
20 subsidence at this mine?

21 A. Yes.

22 Q. And given that, and based on your experience,
23 could you expound a little bit on some of the impacts to
24 agricultural lands that could occur from subsidence?

25 A. I could just talk about my experience.

1 MR. POPE: Dr. Bagley, I apologize again,
2 the broken record. These are not opinions in Mr. [sic]
3 Marino's expert report. The impact on --

4 CHAIRMAN BAGLEY: Yeah, the impact on
5 agricultural seems a bit afar from subsidence.

6 MS. ANDERSON: And, Dr. Bagley, I was
7 merely following up, asking the question you asked about so
8 there's going to be subsidence, then what? I'm kind of
9 trying to get maybe the next line of analysis there.

10 CHAIRMAN BAGLEY: Go ahead and answer it
11 based on your experience in the field. You may have some
12 opinions that could be useful.

13 A. I've seen where we don't have appropriate
14 drainage of a farm field where it's inhibiting the growth
15 of plants, and there's been damage as a result. I've seen
16 where they haven't been able to regrow the -- the crops
17 that used to grow there in the density it used to because
18 now the water table's at a different level.

19 You know, like I said before, I'm not an
20 agricultural engineer, and I can't go into detail. I can
21 just say about my observations. In terms of land use,
22 your proprietor value, especially if it's known to have
23 subsidence, will decrease. I worked with a lot of
24 developers that wanted to develop over properties. If
25 it's mined out, you know, their first inkling is is there

1 a better place to go? We don't want to deal with it.

2 You know, so there's -- there is a property
3 value aspect to it. I know this is out in the rural area,
4 so I'm not sure how much applicability that has. Maybe it
5 does in the future. I don't know.

6 Q. (BY MS. ANDERSON) Okay. Thank you.

7 Is there anything else you want to add or
8 clarify for your testimony?

9 A. No, I just wanted to thank everyone here for
10 being so cordial and friendly.

11 MS. ANDERSON: Okay. Thank you. That's
12 all I have for you.

13 CHAIRMAN BAGLEY: Great. Thank you,
14 Dr. Marino.

15 THE WITNESS: Uh-huh.

16 CHAIRMAN BAGLEY: Ms. Anderson, please call
17 your next witness.

18 MS. ANDERSON: Okay. Thank you.

19 Joe, do we have Sue on the line yet or --

20 MR. GIRARDIN: No.

21 MS. ANDERSON: We have a witness
22 availability issue. So our associating hydrogeologist,
23 who's licensed as a geologist here in Wyoming, Sue Spencer,
24 that will be testifying kind of jointly with Mr. Wireman is
25 out in the field, in Pavillion, actually, and she will be

1 available soon.

2 So at this point I would just like to call --
3 she's not in the room right now -- Carol Bilbrough. Is she
4 available or is she going to come back?

5 MR. KUHLMANN: My understanding was yes.
6 Yeah. She should be here shortly. I had no indication
7 that you were going to call her right after lunch, so...

8 MS. ANDERSON: Yeah, no. I'm sorry for
9 that too.

10 MR. GILBERTZ: Perhaps we could just start
11 with Mr. Wireman?

12 MS. ANDERSON: If that's okay with the
13 counsel. And I'll kind of explain what we need to do here
14 with Ms. Spencer. And I think the counsel's very familiar
15 with pro hac vice rules and requirements. So it's very
16 similar to that for geologists. So Mr. Wireman has been a
17 geologist his whole life. He has -- at one time in the
18 past was registered, certified --

19 MR. WIREMAN: In Wyoming.

20 MS. ANDERSON: -- in Wyoming, but he's let
21 that lapse, given his work with EPA, where it was no longer
22 needed. He lives and works in Colorado, primarily. So
23 it's a common practice of the Oil & Gas Commission, for
24 instance, to let an out-of-state geologist associate with
25 an in-state geologist for the purposes of reports and

1 testimony, just to give kind of that additional Wyoming
2 stamp of approval on the out-of-state geologist's
3 recommendations.

4 CHAIRMAN BAGLEY: So the in-state geologist
5 is the one we can't reach right now?

6 MS. ANDERSON: Right. She's the one we
7 can't reach. And that's just because --

8 CHAIRMAN BAGLEY: Mr. Wireman, is that
9 correct?

10 MR. WIREMAN: Yes.

11 CHAIRMAN BAGLEY: But he's also going to be
12 testifying?

13 MS. ANDERSON: Yeah. So he's going to be
14 testifying -- he'll be testifying mainly to the report
15 Ms. Spencer has already certified that meets the standards
16 of a Wyoming professional geologist. But we just want to
17 make sure that Ms. Spencer is available at some point
18 during Mr. Wireman's testimony to also just to affirm to
19 you all that she knows what's going on, and also, you know,
20 gives her stamp of approval, so to speak.

21 CHAIRMAN BAGLEY: Yeah, I'd say let's go
22 ahead and call Mr. Wireman and proceed from there.

23 MR. POPE: Dr. Bagley, understanding for
24 efficiency purposes we're going forward, I do need to put
25 an objection on the record. Without the actual testimony

1 of Ms. Spencer as to the credentials and work that
2 Mr. Wireman did, it is illegal for Mr. Wireman to offer
3 testimony to this council.

4 For purposes of the record, Wyoming Statute
5 33-41-104(a)(iii) indicates that if you are not a licensed
6 professional geologist in the state of Wyoming, you cannot
7 practice geology as it's defined by that act. Testifying
8 in front of the council would be practicing professional
9 geology. I understand at some point Ms. Spencer will get
10 up and testify, but there is a problem there that we will
11 demonstrate to the council, namely that Ms. Spencer has not
12 spoken to Mr. Wireman in verifying any of his findings or
13 opinions. So we think that procedurally should happen
14 first.

15 I understand for the sake of efficiency, the
16 council may want to proceed in a different direction, but
17 for purposes of the record, we want to get that objection
18 out there.

19 MS. ANDERSON: Yeah. And, Dr. Bagley,
20 similar to the line of questioning that Mr. Pope and his
21 colleagues raised on Mr. Gerlach, you know, this is smoke
22 and mirrors here, honestly. And what it does is it -- they
23 don't have much to go on. They're using this forum, when
24 there is another forum, which is the board of professional
25 geology. I think their phrase used was illegal. I don't

1 think Mr. Wireman is going to end up in jail here giving
2 testimony to you based on his findings and review. And,
3 again, I think if there's a professional complaint that
4 needs to be lodged by the company, the proper place to do
5 that is the Board of Geology.

6 CHAIRMAN BAGLEY: Yeah. We're kind of in
7 an interesting situation. Yeah, it looks like we have --
8 is the DEQ witness here?

9 MS. ANDERSON: Sure. Yeah, we can --

10 CHAIRMAN BAGLEY: I don't want anybody to
11 go to jail for testifying, and I don't want to have to take
12 an executive session to ask my lawyer what the situation is
13 either. So if we can move on with something that should be
14 more straightforward, let's do that.

15 MS. ANDERSON: Okay. And in the meantime,
16 Ms. Morrison will try and reach Ms. Spencer and hopefully
17 we can clear this all up. Again, she's just somewhere in
18 Fremont County and I think the cell coverage is a little
19 bit limited, and we're trying to do what we can.

20 CHAIRMAN BAGLEY: Nick, go ahead.

21 COUNCIL MEMBER AGOPIAN: I mean, I -- yes,
22 we're -- I live in Wyoming. I'm familiar with that
23 scenario, but we've had two weeks to prepare for today,
24 knowing that this was the day. If this was a witness that
25 you wanted to call, then it seems like preparations would

1 have been made. So I think we have -- we have -- as the
2 hearing examiner's indicated, we have an out here for the
3 next however long to move forward, but if we're not
4 prepared to do it in accordance with what we think is
5 proper, then we can't do it.

6 CHAIRMAN BAGLEY: Let's go ahead -- thank
7 you, Councilman. Let's go ahead with your DEQ witness.

8 MS. ANDERSON: Okay. With that, I call
9 Carol Bilbrough to the stand.

10 (Witness sworn.)

11 CAROL BILBROUGH,
12 called for examination by PRBRC, being first duly sworn,
13 testified as follows:

14 DIRECT EXAMINATION

15 Q. (BY MS. ANDERSON) All right. Ms. Bilbrough,
16 can you please state your name for the record.

17 A. Carol Bilbrough.

18 Q. And could you explain what you do?

19 A. At the DEQ? I am the program manager for the
20 division support services. So I oversee the group of
21 people who provide services across the division.

22 Q. Okay. And how do you work directly with the
23 Land Quality Division?

24 A. Direct -- well, I supervise the Land Quality --
25 you know, several people in the Land Quality Division.

1 The hydrologists, who perform CHIAs, the records manager
2 group, the people who do rulemaking, who oversee forms and
3 create forms, manage the Web page. Sort of the
4 overarching duties of divisionwide services as opposed to
5 a field officer services.

6 Q. So you're a manager, so to speak, for DEQ?

7 A. Yeah. Yes.

8 Q. Okay. And we heard a little bit about the chain
9 of commands in DEQ. Where do you fall in that chain of
10 command for this permit and other Land Quality work?

11 A. So there are four -- well, five now -- major
12 groups in the Land Quality Division. Three field offices,
13 Cheyenne, Lander and Sheridan. And then the division
14 support group, which is what I manage. And then there's a
15 uranium program that's just now standing up. The five of
16 us are all equal in terms of our management level and our
17 management standing. And we all report to Mr. Wendtland,
18 the administrator of the Land Quality Division.

19 Q. Okay. Perfect. How are you involved in this
20 permit application?

21 A. My involvement was very superficial. I -- as
22 the division services support group manager, I oversee at
23 a very high level all the permit actions that are
24 happening in the Land Quality Division. Are they
25 proceeding as they need to be? Are we at the division

1 level completing all of the requirements that we need to
2 complete? Are we running into any issues with records
3 management or records keeping or the documents or anything
4 else? Is there any kind of support that my staff needs,
5 fulfilling their individual review requirements and things
6 like that. This particular permit I didn't have much
7 involvement at all until the first hearing that we had.
8 And by the first hearing, I mean two weeks ago in
9 Sheridan.

10 Q. Okay. Have you had any conversations with your
11 colleagues at DEQ about the way forward for the permit?

12 MR. KUHLMANN: I'm going to object.

13 MS. ANDERSON: I know that's a little
14 general. I'll rephrase a little bit.

15 Q. (BY MS. ANDERSON) Okay. So one thing -- you
16 were here for the whole hearing in Sheridan, right?

17 A. Yes, I was.

18 Q. Did you recall testimony about some additional
19 work that needs to still happen, maybe some conditions of
20 approval that could be thought about?

21 MR. KUHLMANN: Objection. I think it's
22 mischaracterizing previous testimony to talk about things
23 that need to still happen. I don't think anyone's ever
24 said that.

25 MS. ANDERSON: Okay. I'll try again.

1 A. We talked about two things.

2 CHAIRMAN BAGLEY: Wait a minute. Wait a
3 minute.

4 Go ahead and try a different type of question.

5 MS. ANDERSON: Well, I think if the witness
6 wants to answer, we can go --

7 CHAIRMAN BAGLEY: No. Only if I say so.

8 THE WITNESS: Sorry.

9 CHAIRMAN BAGLEY: So...

10 Q. (BY MS. ANDERSON) So we heard a little bit
11 about some additional water data that may need to be
12 compiled and collected. Do you remember that testimony?

13 A. I don't recall -- I recall some of that
14 testimony --

15 Q. Yeah.

16 A. -- but not exactly whose testimony it was.

17 Q. Okay. That's fine.

18 Do you recall testimony about the Cumulative
19 Hydrologic Impact Assessment --

20 MR. KUHLMANN: Objection.

21 Q. (BY MS. ANDERSON) -- and that that has not --

22 COUNCIL MEMBER AGOPIAN: Please stop when
23 there's an objection.

24 MS. ANDERSON: Yes.

25 MR. KUHLMANN: I believe Ms. Anderson is

1 going down an irrelevant route, which is the Cumulative
2 Hydrologic Impact Assessment, which is not a requirement
3 for technically adequate and it's not part of the permit
4 application.

5 MS. ANDERSON: So, Dr. Bagley, where I'm
6 going here -- I think it's just a question on everyone's
7 mind right now -- is the process. So there's your process
8 of the council, and then there's the DEQ process. And I'm
9 trying to figure out, as someone who objected to this
10 permit application, how we square those two processes and
11 where we, as the public, are going to be involved going
12 forward.

13 MR. KUHLMANN: I --

14 CHAIRMAN BAGLEY: That's not why I'm here.
15 We're here because we're following -- we're trying to make
16 it -- hear all the evidence related to the permit
17 application. I wondered about the cumulative hydrologic
18 thing two weeks ago, if it wasn't a permit requirement.
19 But, you know, we let that go -- that evidence be presented
20 because we were interested in learning more -- I was
21 interested in learning more about the hydrological issues
22 of the situation.

23 So, no, I'm not really interested in getting into
24 a discussion about DEQ's process or regulations.

25 MS. ANDERSON: I think part --

1 CHAIRMAN BAGLEY: It is what it is.

2 MS. ANDERSON: -- of the questioning,
3 Dr. Bagley, that there's some findings that need to happen
4 under the statutes, and those findings have not yet been
5 made. So I want to know who has to make those findings,
6 when they're going to be made, and how we, as the public,
7 are going to participate in this process.

8 MR. KUHLMANN: Dr. Bagley.

9 MS. ANDERSON: And I need someone from DEQ
10 to answer those questions for me.

11 MR. KUHLMANN: I appreciate that she has
12 those questions, but I don't believe there is a public
13 comment or question hearing. And I don't believe this is
14 the proper venue to ask questions unrelated to the permit
15 application's technical adequacy.

16 CHAIRMAN BAGLEY: There's a different --

17 MS. ANDERSON: I'm just wondering -- I
18 mean, part of it is how is the council going to be able to
19 issue findings of fact and conclusions of law on findings
20 in Section 406 that have not yet been made.

21 MR. KUHLMANN: I believe there may be a
22 disagreement between the attorneys. But findings of 406
23 are not outside of the A and B in the technically adequate
24 determinations. They're not what needs to be determined
25 prior to going to public comment and this proceeding here.

1 Cumulative -- a Cumulative Hydrologic Impact Assessment is
2 a finding, I believe, under Section 35-11-406(n), and those
3 findings do not have to be made prior to permit going for
4 public comment or to be technically adequate. They would
5 have to be made prior to issuing the permit, but that is
6 not the stage we're at here.

7 MS. ANDERSON: So I guess the stage we're
8 going to be on eventually is you're going to issue a
9 decision, 15 days later DEQ has to grant or deny a permit.

10 CHAIRMAN BAGLEY: Right. And then after a
11 permit -- my understanding is after a permit is, let's say,
12 granted in whatever form, then there's another public
13 comment period, is there? Or am I misunderstanding this?

14 MR. KUHLMANN: Dr. Bagley, I believe that
15 could be a final action by the director that could be
16 appealed.

17 MS. ANDERSON: But there will not be
18 another public comment opportunity.

19 CHAIRMAN BAGLEY: Not another public
20 comment, okay. But it could be appealed and we could end
21 up in another contested case hearing on that, if someone --

22 MS. ANDERSON: Supposedly. Or -- I mean,
23 we haven't evaluated that. Again, this hasn't happened in
24 Wyoming in decades.

25 CHAIRMAN BAGLEY: So I guess my question

1 for you is if it we're asking a witness what she heard at
2 the -- at the hearing two weeks ago, I'm not sure how that
3 is moving us forward.

4 MS. ANDERSON: Yeah.

5 CHAIRMAN BAGLEY: Because we can all look
6 that up. I think it's online in the video.

7 MS. ANDERSON: I think my questions are
8 really going to be about asking the manager in DEQ what she
9 sees the process as going forward. If you don't think
10 that's relevant, that's okay, but that's -- I thought it
11 would be helpful for everyone in the room to get DEQ's
12 opinions and perspective on that.

13 CHAIRMAN BAGLEY: So after we issue our --
14 whatever finding -- whatever -- whatever we come up with,
15 the council comes up with, you want to know what the next
16 steps are from DEQ's standpoint, like following DEQ's
17 procedures.

18 MS. ANDERSON: Right. And how they're
19 going to do this body of work in 15 days.

20 MR. KUHLMANN: Dr. Bagley, I think a couple
21 of points. One, that would be entirely speculative at this
22 point in the process because we don't know what the
23 council's decision will be. We don't know the time frame
24 of what may be required or not required. Also, I don't
25 know that what is going to happen in the future has

1 anything to do with what is in the permit application today
2 and whether or not that meets the technical adequacy
3 requirements in the statutes and regulations.

4 CHAIRMAN BAGLEY: Yeah. And I guess the --
5 I am interested in what happens after council does whatever
6 it's going to do. We don't know what that's going to be.
7 That's why we're still in a hearing.

8 I'm not interested in speculation about how DEQ
9 might do or not do something. I mean, they're
10 professionals in what they do, and they will follow the law
11 as well. So that I'm not interested in speculation. If
12 we're looking at, you know, what are the next steps that
13 DEQ follows after this, I mean, I would be interested to
14 hear that just because it's something I continually like to
15 learn. But I'm not interested in speculation, whether we
16 think DEQ could do this or do that. They don't know what
17 they're going to do. We haven't even ruled yet.

18 So if we can keep -- so I'll allow some questions
19 along that line, but not speculative questions.

20 MR. KUHLMANN: Dr. Bagley, I apologize for
21 speaking again. I don't know that there's -- if we're
22 entirely talking about if the questions are going to what
23 happens next with this permit, that is entirely in the
24 future and all of those questions would be speculative. So
25 I don't know that there's a way to divide that.

1 CHAIRMAN BAGLEY: I disagree. There's a
2 process that will be followed, right? We make a decision,
3 and there's two choices -- or there's a couple options. We
4 say everybody goes back to the drawing board, and then
5 there's one set of process. And we say, oh, well, these
6 things might need fixed, and then there's where we say
7 everything's good. So there's like three different
8 alternatives. And I imagine that somewhere it says, next
9 step, let's say the council says everything's great, what
10 happens next? You know, it's already spelled out. You
11 got -- you got in terms of, well, the director does this
12 and then there's a possible for appeal or something.
13 That's what I'm getting at. Not -- not the details of,
14 well, we're going to go -- you don't know what you'd change
15 if there was anything -- because we haven't said anything.
16 But in terms of actions, there appears to be, as I see it,
17 like three pathways that lead to three different step --
18 processes that could follow.

19 MR. KUHLMANN: I guess I would only respond
20 that I believe that the process is governed by laws, and
21 that the statutes and regulations would be what governs,
22 not necessarily what Dr. Bilbrough would say today. And
23 that should speak for itself and would be something that
24 we, as the parties, could provide, I guess, as part of our
25 closing statements, which I believe are going to be written

1 to the council following this hearing.

2 CHAIRMAN BAGLEY: So we can see then what
3 the -- the steps are. Like I said, they're laid out in the
4 law for these different options.

5 Yeah, I mean, I have an interest in knowing that
6 too, because I don't spend all my time reading the law in
7 detail, and I don't imagine a lot of folks do. I'm still
8 going to allow questions related to what Dr. Bilbrough
9 feels the process would be from the standpoint of step
10 one and step two, but not the details. And with the
11 understanding -- and I imagine she'll also help clarify
12 that it's her understanding based on the law, and we'll get
13 details later, but I still -- I would like to hear that.
14 So I'm going to go ahead and allow those -- that line of
15 questions to be asked.

16 MR. KUHLMANN: Okay.

17 MS. ANDERSON: Okay. Thank you. And that
18 sounds great.

19 Q. (BY MS. ANDERSON) So there's three doors,
20 basically, we can go down, it sounds like. So the first
21 one is the council determine -- makes their decision on
22 the permit application and that basically saying, yes, the
23 permit is technically adequate and complete. What would
24 DEQ do then?

25 MR. KUHLMANN: I'm going to object. That

1 was very speculative, and I don't know if she was -- if
2 Ms. Anderson was reading a law to Ms. Bilbrough, asking if
3 she would agree that that's the law or exactly where she's
4 going with that.

5 MS. ANDERSON: So the exact phrase in the
6 statute is the council makes a decision on the permit
7 application. That's all it says. I'm trying to get what
8 does this mean for us here? What does it mean for you as
9 the council? Where do the parties go? What do we even put
10 in our post-hearing briefs on the subject without this
11 clarification?

12 MR. KUHLMANN: I -- I would just respond,
13 again, that is governed by the law, and the parties are, I
14 believe, perfectly capable of interpreting the law and
15 providing the council with recommendations of what they
16 think the next steps would be under the law.

17 CHAIRMAN BAGLEY: So I'm going to jump
18 ahead here, since it sounds like this is a -- question
19 coming up. I want to go ahead and tell you -- I was going
20 to tell you at the end of the hearing, which may be soon --
21 what we will be looking for. And I'll give you times and
22 stuff later, but the proposed -- what we're looking for,
23 from all the parties in part of their closing statement
24 will be proposed findings of fact and conclusions of law
25 focused on the laws that is applicable to this case, which

1 includes citations to the specific legal requirements,
2 statutes and rules the council is required to consider to
3 decide this matter, proposed findings of fact, conclusions
4 of law must also include the necessary facts cited to in
5 the transcript to support your legal conclusions. I'll
6 talk about the transcript later.

7 Because there was also testimony about possible
8 permit conditions or changes, the proposed findings of fact
9 and conclusions of law shall also identify suggested
10 changes or conditions that a party request the council to
11 consider and the legal grounds for such a condition to be
12 part of the permit.

13 So that's what I'm going to be asking for in your
14 closing statements. And then we will do what we need to do
15 after that, but -- so I'll probably say this again at the
16 end, just so nobody forgets.

17 Okay. Got it.

18 So counsel was reminding me that there is a
19 relevancy clause that we need to stick to, and the
20 relevance is the permit -- it's permit application. I am
21 interested in the permit itself as well, even though
22 maybe -- I may be pushing that a little further.

23 So what -- I guess the question to be asked is
24 following on from what Mr. Kuhlmann said, but council makes
25 a decision. I'd be interested to hear the speculation of

1 this witness, who works for the DEQ, as to what would
2 happen after that, and then we will probably push on from
3 there.

4 MS. ANDERSON: Okay. That sounds fine.

5 Q. (BY MS. ANDERSON) Is that something you feel
6 comfortable answering?

7 A. My answer's going to be we'll do what the
8 statute tells us to do. So we'll follow the directive of
9 the EQC, and then we'll do what the statutes tell us to
10 do.

11 MS. ANDERSON: That's fine. I actually
12 wanted to give DEQ an opportunity to talk to you, but it
13 seems like they don't want to. So I think I'm done with
14 this witness.

15 MR. KUHLMANN: I'm going to object to that
16 statement, but...

17 CHAIRMAN BAGLEY: All right. Thank you
18 for --

19 MR. KUHLMANN: I think that's argumentive.

20 CHAIRMAN BAGLEY: -- administering the
21 objection.

22 MS. ANDERSON: I don't know if there's
23 cross-examination by Mr. Gilbertz.

24 CHAIRMAN BAGLEY: Well, we'll follow my
25 little -- for cross-examination.

1 Mr. Gilbertz.

2 MR. GILBERTZ: Nothing from me.

3 CHAIRMAN BAGLEY: Ms. Boomgaarden?

4 MS. BOOMGAARDEN: No questions.

5 CHAIRMAN BAGLEY: Mr. Kuhlmann?

6 MR. KUHLMANN: No questions.

7 MR. POPE: No questions.

8 CHAIRMAN BAGLEY: All right. Thank you.

9 Actually, I do -- do you have any questions? I have --

10 COUNCIL MEMBER AGOPIAN: I don't have any
11 questions.

12 CHAIRMAN BAGLEY: I have a question.

13 EXAMINATION

14 Q. (BY CHAIRMAN BAGLEY) I don't know if you can
15 answer this or not, but you mentioned, you know, when you
16 hear what the council has come up with, of course, that's
17 when you'll know what DEQ needs to do.

18 One of the concerns that we've heard is the
19 opportunity for public input. And we've had public input
20 now as part of the contested case hearing, which is not
21 the friendliest, partly because you get interrupted by
22 objections all the time. But how -- how -- I don't know
23 if you can really answer this or not. But if the council
24 felt that there was a need for more public input and wrote
25 something like that into -- into our findings, not that we

1 would, but if we felt that, how would DEQ go about dealing
2 with that?

3 MR. KUHLMANN: I'm going to just object on
4 speculation. And that's, I guess, a future hypothetical.
5 I understand it was your question, Dr. Bagley.

6 CHAIRMAN BAGLEY: Yeah. Yeah. I know it
7 was a future hypothetical. Yeah, I'm going to go ahead and
8 let her answer my question. Your objection is noted.
9 Thank you.

10 MR. KUHLMANN: Thank you.

11 A. To my knowledge, we haven't encountered a
12 circumstance like that. And it would really be up to
13 Assistant Director Edwards and Director Parfitt as to how
14 we would deal with that kind of circumstance.

15 Q. (BY CHAIRMAN BAGLEY) Okay. That's actually --

16 A. I wish I could give you a more definitive answer
17 than that, but I can't.

18 Q. That was actually what I was wondering,
19 basically, is that something like that happened before.
20 And the answer is I'm hearing not to your knowledge.

21 A. Not to my knowledge.

22 CHAIRMAN BAGLEY: Yeah. Okay. So that was
23 the only question I had.

24 Any redirect, Ms. Anderson?

25 MS. ANDERSON: No. I think I'm fine.

1 Thank you.

2 CHAIRMAN BAGLEY: All right. Thank you,
3 Dr. Bilbrough.

4 Is your witness available?

5 MS. ANDERSON: Yes, she should be. Let's
6 just make sure.

7 Sue, are you on the line?

8 MS. SPENCER: Yes, I am. Yes. Sorry I
9 missed you before.

10 MS. ANDERSON: That's okay. We're just
11 going to make sure everyone can hear you okay.

12 MR. GIRARDIN: She can hear you.

13 MS. ANDERSON: So at this time I would call
14 Sue Spencer to testify:

15 THE REPORTER: Should I swear her in?

16 CHAIRMAN BAGLEY: Yeah. Go ahead and swear
17 her in, please.

18 (Witness sworn.)

19 SUE SPENCER,
20 called for examination by PRBRC, being first duly sworn,
21 testified as follows:

22 MS. ANDERSON: Sue?

23 THE WITNESS: I can't hear very well.

24 MS. ANDERSON: Okay.

25 CHAIRMAN BAGLEY: Can you hear me,

1 Ms. Spencer?

2 THE WITNESS: Yeah, I can hear you.

3 CHAIRMAN BAGLEY: Okay. Ms. or Dr.?

4 Dr. Spencer or Ms. Spencer? Just to be sure.

5 THE WITNESS: Ms.

6 CHAIRMAN BAGLEY: Okay. So the court
7 reporter was asking -- was swearing you in. I'll let her
8 speak again and we'll try again. Try that mic there.
9 Maybe lean towards it.

10 (Witness sworn.)

11 SUE SPENCER,
12 called for examination by PRBRC, being first duly sworn,
13 testified as follows:

14 THE WITNESS: I can't hear what she's
15 saying. It's breaking up very bad.

16 MR. GIRARDIN: Jim's mic is not -- hasn't
17 been used, so I haven't been adjusting for it. Just push
18 yours towards her.

19 CHAIRMAN BAGLEY: Okay. Here. Try that
20 that one.

21 THE REPORTER: Can you hear me?

22 THE WITNESS: Yeah, I can.

23 (Witness sworn.)

24

25

1 SUE SPENCER,

2 called for examination by PRBRC, being first duly sworn,

3 testified as follows:

4 MS. ANDERSON: Okay. Ms. Spencer, you can

5 hear me okay? Sue, are you still there?

6 MR. GIRARDIN: She's not hearing that.

7 CHAIRMAN BAGLEY: Ms. Spencer, this is

8 David Bagley. Can you hear Ms. Anderson when --

9 THE WITNESS: No.

10 CHAIRMAN BAGLEY: -- when she speaks?

11 THE WITNESS: If she just spoke, I didn't

12 hear her.

13 CHAIRMAN BAGLEY: Okay.

14 MR. GIRARDIN: Try it again.

15 MS. ANDERSON: Sue, can you hear me now?

16 CHAIRMAN BAGLEY: We're working to get the

17 microphones calibrated so you're able to hear us,

18 Ms. Spencer.

19 THE WITNESS: Okay. Okay. Thank you.

20 CHAIRMAN BAGLEY: I'm glad to say we can

21 here you fine, which is great.

22 THE WITNESS: Good.

23 (Off-the-record discussion.)

24 CHAIRMAN BAGLEY: What I'd like to do here

25 is take a five-minute recess and let the technical folks

1 get it sorted out.

2 If you can please stay on the line,

3 Ms. Spencer --

4 THE WITNESS: Okay.

5 CHAIRMAN BAGLEY: -- they'll be trying

6 different mics to make sure you can hear.

7 THE WITNESS: Okay. I will. Thank you.

8 CHAIRMAN BAGLEY: Okay. Thank you.

9 (Hearing proceedings recessed

10 1:38 p.m. to 1:52 p.m.)

11 MR. RUBY: Shannon, I give you what we got.

12 And I am sorry for it.

13 DIRECT EXAMINATION

14 Q. (BY MS. ANDERSON) We're back on the record.

15 Sue, can you hear me? Sue, are you there?

16 A. I'm here.

17 Q. You're a little shaky.

18 A. I can hear you fine.

19 MS. ANDERSON: Is that not working?

20 Q. (BY MS. ANDERSON) Okay. We need you to be a
21 little bit clearer for the court reporter. Can you talk
22 slowly?

23 A. Is it clear now?

24 Q. No. It's still really, really fuzzy.

25 A. How about now? Can you hear me?

1 MR. RUBY: It's her phone breaking up.

2 MS. ANDERSON: Yeah.

3 Q. (BY MS. ANDERSON) Sue, you're really hard to
4 hear right now.

5 A. Okay. Well, I -- I can hear you fine, so now
6 we're opposite.

7 MS. ANDERSON: Can we try? No?

8 The court report looking at me like this isn't
9 going to work.

10 Q. (BY MS. ANDERSON) Let's try again. Can you say
11 your name?

12 A. My name is Sue Ann Spencer.

13 Q. Okay. I think we're going to -- we're going to
14 give it a go. Just speak slowly and clearly. And as a
15 reminder, if you can stay on the line during Mr. Wireman's
16 testimony, because we're going to need to ask you some
17 questions at the end too.

18 Okay. Sue, can you state and spell your name
19 for the record?

20 A. Sue Ann Spencer.

21 Q. You broke up again.

22 A. What?

23 Q. Okay. So state your name.

24 A. Sue Ann Spencer.

25 Q. Okay. What is your current title or position?

1 A. Hydrogeologist with Weston Engineering.

2 Q. I think --

3 A. In Laramie.

4 Q. Okay. I think I heard senior hydrogeologist at
5 Western Engineering in Laramie, Wyoming?

6 MR. WIREMAN: Weston.

7 Q. (BY MS. ANDERSON) Weston Engineering.

8 A. Correct.

9 Q. Yeah, the court reporter's not going to be able
10 to get your testimony if this is broken up. But you can
11 hear me okay?

12 A. Yes. I --

13 MS. ANDERSON: Yeah, I mean, Joe, honestly
14 your bars keep going up and down. I mean, it's really -- I
15 think the service here is not very great either.

16 MR. GIRARDIN: It is not. You want to try
17 your phone.

18 MS. ANDERSON: Yeah. You barely have two
19 bars on this phone.

20 Sue, how far are you from a landline?

21 THE WITNESS: Not very far. I'm like about
22 three minutes away.

23 MS. ANDERSON: Can you get to a landline?
24 That's going to be the easier way.

25 THE WITNESS: Yeah, I can.

1 MS. ANDERSON: Okay.

2 THE WITNESS: I'll do that. And I'll call
3 back this number?

4 MS. MORRISON: No, don't call -- call into
5 the --

6 (Off-the-record discussion.)

7 MR. ANDERSON: I was going to say, I think
8 we can hear you now.

9 THE WITNESS: Really?

10 MS. ANDERSON: Yeah. We're going to try
11 again, and we're going to see how far we get. And if not,
12 we're three minutes away from landline.

13 Q. (BY MS. ANDERSON) Okay. Ms. Spencer, could you
14 state your name for the record?

15 A. My name is Sue -- Spencer.

16 Q. Oh, man.

17 CHAIRMAN BAGLEY: We need to go to a
18 landline.

19 MS. ANDERSON: Okay. So Sue, can you go to
20 a landline. And then call in --

21 MR. RUBY: 402 --

22 MS. ANDERSON: How about you just call her?

23 MR. RUBY: Yeah.

24 MS. ANDERSON: We'll call you back in
25 about --

1

2 MR. RUBY: Five.

3 MS. ANDERSON: -- five minutes.

4 MR. RUBY: No hurry.

5 THE WITNESS: Okay.

6 MS. ANDERSON: Okay. Thanks, Sue.

7 Actually we don't know the number of landline.

8 THE WITNESS: I'll just text it to Jill.

9 MS. ANDERSON: Okay. That works. Thank
10 you.

11 (Off-the-record discussion.)

12 CHAIRMAN BAGLEY: So we'll recess for
13 another five minutes so that court reporter can take a
14 break, and we will try again. We'll try one more time.

15 (Hearing proceedings recessed

16 1:59 p.m. to 2:11 p.m.)

17 CHAIRMAN BAGLEY: We are back in session.

18 MR. RUBY: Just don't try and do anything
19 funny while you're here.

20 MS. ANDERSON: You get the comfortable
21 chairs.

22 MR. RUBY: We do.

23 I'm going to go stand off over here.

24 Q. (BY MS. ANDERSON) All right. Ms. Spencer, can
25 you hear me?

1 A. Yes, I can.

2 Q. So this is Shannon Anderson with Powder River
3 Basin Resource Council.

4 Ms. Spencer, just to remind you, you're still
5 under oath.

6 A. Okay.

7 Q. Could you state your name for the record.

8 A. My name is Sue Ann Spencer.

9 Q. Okay. And can you tell us what your current
10 title or position is?

11 A. I'm a senior hydrogeologist with Weston
12 Engineering in Laramie, Wyoming.

13 Q. Okay. Can you tell us a little bit about what
14 you do in that position?

15 A. Yes. I do investigations for water well siting
16 studies. I do hydrogeological studies for -- mainly what
17 we do right now is Water Development Commission projects
18 where we identify locations. The drill wells -- we drill
19 wells and then test them and write reports that describe
20 the optimum conditions and the conditions of the well.

21 Q. Okay. Great. Can you tell the council a little
22 bit about your educational background?

23 A. I have a bachelor's degree in geology from the
24 University of Wyoming, 1980. And I have a master's degree
25 from the University in hydrogeology that I got in 1986.

1 Q. Okay. And, Ms. Spencer, are you a Registered
2 Professional Geologist in Wyoming?

3 A. Yes, I am.

4 Q. Okay. And it's fair to say you specialize in
5 hydrogeology?

6 A. Yes.

7 Q. Okay. And have you had a chance to review
8 Mr. Wireman's expert report for these proceedings?

9 A. Yes, I have.

10 Q. And would you agree that Mr. Wireman's report
11 meets the standards of a Wyoming Professional Geologist?

12 A. Yes, I do.

13 Q. And do you have any concerns about lending your
14 certification, so to speak, to Mr. Wireman's work for
15 these proceedings?

16 A. No. None whatsoever.

17 MS. ANDERSON: Okay. That's all I have for
18 you. There may be some additional questions from the other
19 parties.

20 THE WITNESS: Okay.

21 MS. ANDERSON: Just a reminder to stay on
22 the line through Mr. Wireman's testimony, if you can.

23 THE WITNESS: Okay.

24 MS. ANDERSON: Okay. Thank you.

25 THE WITNESS: Uh-huh.

1 CHAIRMAN BAGLEY: Oh, cross. Thank you.

2 Cross-examination. Mr. Gilbertz, any questions?

3 MR. GILBERTZ: Nothing from me.

4 CHAIRMAN BAGLEY: Ms. Boomgaarden?

5 MS. BOOMGAARDEN: No questions. Thank you.

6 CHAIRMAN BAGLEY: Mr. Kuhlmann.

7 MR. KUHLMANN: No questions. Thank you.

8 CHAIRMAN BAGLEY: Mr. Pope.

9 MR. POPE: I'll come join the hot seat.

10 CHAIRMAN BAGLEY: All right.

11 MS. ANDERSON: And Ms. Spencer can still
12 hear me if I need to object or something, right, from here?
13 Is that okay?

14 MR. RUBY: We'll make it work.

15 MS. ANDERSON: Okay.

16 CROSS-EXAMINATION

17 Q. (BY MR. POPE) Good afternoon, Ms. Spencer.

18 This is Jeff Pope on behalf of Brook Mine. Can you hear
19 me okay?

20 A. Yeah, I can.

21 Q. I just have a couple of questions about your
22 review of Mr. Wireman's report. Did you review any
23 statutes as part of reviewing Mr. Wireman's report?

24 A. No, I did not.

25 Q. Did you review any regulations in your review of

1 Mr. Wireman's report?

2 A. No.

3 Q. Did you yourself look at the Brook Mine permit
4 application when you reviewed Mr. Wireman's report?

5 A. No, I didn't.

6 Q. As I understand it -- and please correct me if
7 I'm wrong -- but when you reviewed Mr. Wireman's report,
8 you had never met him before?

9 A. No I haven't.

10 Q. You haven't -- in reviewing his report,
11 you didn't have any opportunities to speak with him
12 on the phone or via email about that report; isn't that
13 true?

14 A. Yes.

15 MR. POPE: Thank you, Ms. Spencer. That's
16 all the questions I have.

17 THE WITNESS: Okay.

18 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

19 Any questions from council.

20 COUNCIL MEMBER AGOPIAN: No.

21 CHAIRMAN BAGLEY: And none from me as well.

22 Any redirect?

23 MS. ANDERSON: I just have one question.

24 CHAIRMAN BAGLEY: Just a minute.

25 Ms. Anderson's coming back. Everyone is getting their

1 exercise today.

2 REDIRECT EXAMINATION

3 Q. (BY MS. ANDERSON) Hi, again, Ms. Spencer. I
4 just have one question for you to follow up on some of the
5 questions you were just asked. How do you know of
6 Mr. Wireman?

7 A. I know him through some other work that I've
8 done up in the -- in the Pavillion area. I reviewed and
9 read some of his reports that he's done. And I've also
10 came to know him through the Powder River Basin Resource
11 Council.

12 Q. Okay. And so you're generally familiar with his
13 expertise and work --

14 A. Yeah. Yeah.

15 Q. -- through --

16 A. As I said, I'm pretty familiar with the
17 Pavillion investigations, and I read, you know, the work
18 he's done for that. So it was just this I have reviewed
19 and looked at.

20 MS. ANDERSON: Okay. Great. So that's all
21 I have for you at this time. And, again, if you could just
22 hang on through Mr. Wireman, that would be great.

23 THE WITNESS: Okay.

24 MS. ANDERSON: Okay. Thanks.

25 CHAIRMAN BAGLEY: All right. Thank you.

1 Ms. Anderson, call your next witness.

2 MS. ANDERSON: I call Mike Wireman.

3 (Witness sworn.)

4 MICKEL WIREMAN,

5 called for examination by PRBRC, being first duly sworn,

6 testified as follows:

7 DIRECT EXAMINATION

8 Q. (BY MS. ANDERSON) Good afternoon, Mr. Wireman.

9 A. Good afternoon.

10 Q. Could you state and spell your name for the
11 record.

12 A. Yeah. My name is Mickel Wireman. It's
13 M-I-C-K-E-L W-I-R-E-M-A-N.

14 Q. Okay. And, Mr. Wireman, can you tell us a
15 little bit about your current title or position?

16 A. Well, I'm recently retired from the U.S. EPA,
17 where I served for 28 years as a national groundwater
18 expert the last 10 or 15 years. And in that capacity, I
19 was national groundwater expert, worked across the
20 country, worked in the western U.S., worked in Europe,
21 worked in Asia. All things related to groundwater, but
22 primarily related to mining hydrology. That was bulk of
23 my work the last 10 or 15 years.

24 And upon retirement a couple years ago, I formed
25 a small LLC called Granite Ridge Groundwater. I'm

1 president and sole employee of that small LLC.

2 Q. And what do you do in your capacity as president
3 of Granite Ridge Groundwater?

4 A. I consult on -- strictly on hydrology and
5 hydrogeology issues. The scientific aspect of those. I
6 know -- well, just leave it at that. My primary focus is
7 on the science of hydrogeology and hydrology. And I
8 consult primarily with NGOs. I work because I like to
9 work and because I have worked for a long time. So it's
10 not a business that I try to get rich at.

11 Q. All right. Mr. Wireman, I'm pulling up POW
12 Exhibit 18, page 17. And could you identify this
13 document?

14 A. Yes, that is my curriculum vitae.

15 Q. Okay. Did you prepare this document?

16 A. Yes. As of December 2001 -- 2016.

17 Q. Okay. And is it current and accurate?

18 A. It is current and accurate.

19 Q. Could you briefly summarize your education for
20 the council?

21 A. Yeah. I have an undergraduate degree in earth
22 science. A master of science in hydrogeology, and
23 extensive PhD-level work in hydrogeology as well.

24 Q. Okay. Where did you get your degrees?

25 A. I went to Western Michigan University in

1 Kalamazoo, Michigan for both my undergrad and master's,
2 and PhD-level classes at the Colorado School of Mines in
3 Golden, Colorado.

4 Q. Okay. So Dr. Marino testified a little bit
5 earlier about a distinguished alumni award. I think you
6 also wanted to get on the record about a distinguished
7 alumni award that you received?

8 A. Yeah. Two years ago I received a distinguished
9 alumni award from my alma mater, from the geology
10 department at Western Michigan University, which, in my
11 view, is an honor. And they give out once a year. As I
12 was saying earlier, that commits me now to being on their
13 advisory council for two years.

14 Q. (BY MS. ANDERSON) Okay. Great.

15 MS. ANDERSON: Should I just ignore the
16 beep -- the beeping?

17 MR. RUBY: Yeah.

18 MS. ANDERSON: Yeah. Okay.

19 Q. (BY MS. ANDERSON) Mr. Wireman, could you
20 summarize your experience and type of work for the
21 council.

22 A. Yes. I spent my whole career as a
23 hydrogeologist. Right out of college, I spent five years
24 doing water rights engineering work in Denver and in
25 Colorado, helping support clients with the consulting

1 firm, supporting clients' attempts, and hopefully
2 successful, to obtain water and water rights.

3 And then with EPA, I was a scientist at the
4 agency, not a regulator. And my job was to oversee
5 scientific efforts related to sites and issues that EPA
6 Region 8 was involved in. That included extensive --
7 many, many times where I designed and managed site
8 characterization, hydrologic characterization of large
9 watersheds, large aquifers, of mine sites, of contaminated
10 sites, solvent sites, agricultural sites. All kinds of
11 sites trying to put together the hydrogeologic conceptual
12 models and hydrology so that information can go up the
13 chain at EPA, through the decision-making process, and
14 eventually a decision could be made by the decision
15 makers, which was not me. And the model there was all
16 decisions based on sound science. So that's what I tried
17 to bring in my job to the managers and decision makers.

18 Q. Okay. You touched on this a little bit, but do
19 you have experience in mining specifically?

20 A. I have a lot of experience in mining, both hard
21 rock -- mainly hard rock, but also coal. I worked on a
22 number of major Superfund sites up and down the Rocky
23 Mountains, which were, for the most part, legacy sites
24 that had been abandoned. And EPA and/or the states were
25 managing these sites under their authorities under CERCLA.

1 And my job always was to go in first and try and assess
2 and characterize the hydrogeology and all the relationship
3 between groundwater, surface water, mine water, seeps,
4 springs, wetlands. And that was always put together first
5 so that you could then make decisions about remedies,
6 about mitigation, about future land use, about liability.
7 That's one answer.

8 I also spent seven or eight years working as a
9 consultant to The World Bank and to the State Department,
10 though still an EPA employee. Most of that happened in
11 Eastern Europe in the '90s, after collapse of the Soviet
12 Union and our State Department had a real vested interest
13 in helping those countries move forward in terms of
14 establishing democracies in the free market, and part of
15 that was dealing with the environmental issues.

16 And if you know much about the Soviet Union,
17 they have awful legacy when it comes to mining. And those
18 countries were doing two things. They were trying to deal
19 with the legacy sites, fix them, but at the same time they
20 had to re -- revise and restart the mining sector in those
21 countries because it was dead. It was entirely run by the
22 Soviet system. No free enterprise, no anything.

23 So trying to help those countries stand up a
24 mining sector again, stand up all the necessary statutes
25 and regulations and policies and all that that would guide

1 them down the road. And in that capacity, there were a
2 number of coal mines, particularly in the country of
3 Romania, which has a very significant amount of coal
4 deposits. So I kind of came at it from all sides.

5 Q. Okay. I think you touched on this a little bit,
6 but -- so you worked for Region 8 of EPA?

7 A. Region 8.

8 Q. And could you tell us a little bit about the
9 geographic scope of --

10 A. Region 8 --

11 Q. -- Region 8?

12 A. -- includes six states --

13 THE REPORTER: All right. Hold on. You
14 guys are overlapping here.

15 THE WITNESS: I'm sorry. That's my fault.
16 I will do better.

17 A. Region 8 includes six states: Colorado, Utah,
18 Wyoming, Montana and South Dakota and North Dakota. So
19 those states are included in EPA's Region 8. And I worked
20 extensively in all of those states, including state of
21 Wyoming.

22 Q. (BY MS. ANDERSON) Could you tell us a little
23 bit about that work in Wyoming?

24 A. Wyoming. There were a number of things over the
25 years. Early on I worked a lot with DEQ as they were

1 standing up and implementing their groundwater program
2 under the Water Quality Control Division at EPA -- or at
3 DEQ.

4 And we did a number of things. There was --
5 there was responsibilities that DEQ had as a primacy state
6 for federal environmental laws. One example I'll give
7 you. You may have -- some of you may have seen. There
8 are groundwater vulnerability maps for all 23 counties in
9 the state of Wyoming. And they're used quite extensively
10 for land use decisions. Well, I put that together, myself
11 and a professor at University of Wyoming, Peter Huntoon.
12 And then helped the state develop those into official maps
13 and distribute them and all of that. And that was done
14 through a grant from EPA.

15 I was involved in a lot of agricultural issues
16 in Torrington. Nitrate issues in Torrington. Not much
17 mining in Wyoming, because relative to Montana and Utah
18 and Colorado, there's not much mining in Wyoming. Coal
19 mining. But not much hard rock mining. So it was a lot
20 of variety of things with Wyoming.

21 Q. Okay. And over the years have you interacted
22 with DEQ staff?

23 A. Very much. Been -- interacted with DEQ staff,
24 with director, even with former governors here. So, yes,
25 I know them fairly well.

1 Q. Okay. Have you ever been qualified by a court
2 as an expert witness in the areas of hydrogeology or
3 geology?

4 A. Yes. I have testified in federal court. I have
5 testified in state court. I've testified before an
6 administrative law judge, testified before water quality
7 control commission in New Mexico and in civil court.
8 all -- every one of them exclusively on hydrogeology
9 issues.

10 Q. Okay. Have you ever published any research or
11 journal articles?

12 A. Yes, and they're listed on my CV, but I can't
13 remember. 30, roughly. 30, 35 professional peer-reviewed
14 papers.

15 Q. Okay. Great. And in doing that work, was that
16 background helpful in conducting a peer review of this
17 permit application?

18 A. Oh, absolutely helpful, yes.

19 Q. Would you like to elaborate anything -- any more
20 on peer review and that process?

21 A. Yeah, my job in EPA often involved review of
22 very large many-page documents. Occasionally a mine
23 permit. Not too often there because EPA is not in the
24 business of permitting mines. But a lot of -- of NEPA,
25 National Environment Policy Act assessments that are

1 required for new mines, Forest Service or BLM permit. A
2 lot of major reports on contaminated mine sites. Reports
3 in Europe about, as I said before, about strategies for
4 dealing with standing up the mining sectors. So many,
5 many report review was a very significant part of my job.

6 Q. Okay. Is there anything else you'd like to
7 highlight for the council regarding your background or
8 experience?

9 A. Just that I'm very familiar with Wyoming
10 geology. I've worked up here a lot. I know these basins
11 fairly well. I know the stratigraphy of the basins. I've
12 worked on UIC issues, underground injection control issues
13 here. I worked on uranium mines here, and now coal mine.

14 Q. Okay. How did you become involved in this
15 proceeding?

16 A. Powder River Basin, you, called me up and asked
17 if I would be willing to review this permit application.

18 Q. Okay. And what did I ask you to do?

19 A. Review permit application and submit a set of
20 comments.

21 Q. Okay. Did I ask you to draw any particular
22 conclusions?

23 A. No. I wouldn't have taken the job had you asked
24 that.

25 Q. Okay. Are you being compensated for your time

1 today?

2 A. Yes.

3 Q. And do you feel that compensation in any way
4 influenced any of your opinions you have drawn for these
5 proceedings?

6 A. No.

7 Q. Okay. We're going to pull up our Exhibit 17.
8 And, Mr. Wireman, is this the expert report you prepared
9 for these proceedings?

10 A. Yes.

11 Q. Could you tell us a little bit about the scope
12 of your review and what you reviewed in preparing your
13 conclusions?

14 A. I reviewed those portions of the permit
15 application which focused on hydrologic issues. And I
16 have listed them here. Appendices D6, D11, D5. I've
17 reviewed the revised mine plan I believe it was the 2015
18 date. I looked through all the objections to the permit
19 from the various parties that objected. I have reviewed
20 Wyoming administrative rules, particularly 3 -- that I
21 think are pertinent to my review. And then DEQ's review
22 comments. I did look some of the back and forth between
23 DEQ and Brook Mine, though clearly not all of them.

24 Q. Okay. Did you also look at some USGS --

25 A. I looked at --

1 Q. -- information?

2 A. USGS, over the decades, has done a fair amount
3 of work in Wyoming. Most of their reports, while they're
4 absolutely excellent, they're typically sort of more broad
5 or regional than that. They're not typically focused on a
6 site this small. But, yeah, I mean, that's kind of
7 standard of practice because you need a background for
8 these large sedimentary basins up here. You need to kind
9 of understand the big picture before you can zero in on
10 site-specific issues.

11 Q. Okay. Mr. Wireman, were you present at these
12 proceedings for the testimony of Mr. Gerlach?

13 A. Yes.

14 Q. And did you hear Mr. Gerlach testify some of the
15 baseline water assessment requirements and the Wyoming DEQ
16 rules and statute for coal mine permit applications?

17 A. Yes. I believe, if I remember correctly, he
18 focused on Wyoming administrative rules for Land Quality
19 coal Section 2, which are required studies for mine
20 permits. And then I do believe he also referenced
21 Statutes 35-11-406, parts of that statute.

22 Q. Okay. And would you agree with Mr. Gerlach's
23 professional understanding of those requirements?

24 MR. POPE: Objection, Dr. Bagley. This is
25 similar for any of these opinions are not in his expert

1 report. It defeats the purpose of his expert report.

2 CHAIRMAN BAGLEY: I'll let him answer it.

3 A. Yes. I -- I understand it this way. He was
4 pointing out what he believed the statutes required in
5 terms of information in this permit application. I've
6 looked at the same statutes. I interpreted more or less
7 the same way he does.

8 Q. (BY MS. ANDERSON) All right. Are there any
9 other rules or statutory provisions you would like to
10 highlight for the council that you relied on to draw
11 conclusions for your report or your testimony?

12 A. Again, I'll -- I'll mention there's two in
13 particular. Wyoming Statute 35-11-406 (b)(xviii) and
14 Wyoming Statute 35-11-406 (n)(iii). Those two in
15 particular I relied on to assess -- to develop my opinion
16 on the adequacy of the characterization -- hydrologic
17 characterization in the permit application.

18 Q. Okay. And did you also review the rules and
19 regulations and the statute related to alluvial valley
20 floors?

21 A. I did.

22 Q. Okay. All right. Let's turn to your findings
23 regarding the permit application, and let's start with
24 some basics. Could you tell us, based on your experience
25 and understanding, what is a hydrologic system and why is

1 that important?

2 A. Can you put up the --

3 Q. Yes. On --

4 A. I'd like to --

5 Q. So, Mr. Wireman, let's start with Mr. Wireman,
6 did you prepare a PowerPoint for demonstrative purposes
7 today?

8 A. I did.

9 Q. Okay. So I'm pulling that up and on -- this is
10 the last slide in that. And, again, the question is,
11 based on your experience and understanding, what is a
12 hydrologic system and why is that important?

13 A. I'd like to focus on the hydrology of a
14 watershed. If you'll --

15 MR. POPE: I apologize, Dr. Bagley, for
16 cutting him off. We've never seen this exhibit before.
17 This was not produced to us. Is this being introduced?

18 MS. ANDERSON: It's a demonstrative
19 exhibit.

20 MR. POPE: This is not going into evidence?

21 MS. ANDERSON: It's not going into
22 evidence.

23 MR. POPE: Thank you.

24 A. This is from a standard groundwater hydrology
25 textbook used in many universities in the country, so it's

1 not something I generated. Okay?

2 What I'd like to talk to you about, council
3 members, is hopefully provide some further understanding
4 about a watershed scale hydrology. What happens within a
5 watershed like the Tongue River watershed, with Goose
6 Creek as a tributary, with Slater Creek as a tributary.

7 And this is highly generalized, but it does
8 apply. And what I want to focus on for just a second is
9 how the water, where it gets in, where it goes. Where it
10 goes is an important question here. So if we look up here
11 and if we consider this to be the Tongue River right here,
12 and this sort of goes up on either side, and the Tongue
13 River's got a little more flat floodplain than this
14 diagram shows, but there's sort of two sources of water
15 that come into the Tongue River and come into the alluvium
16 of the Tongue River. And we'll get into a little later
17 why that's important.

18 And one is this -- and this has been mentioned
19 in the permit application. This sort of recharge of the
20 alluvial aquifer here by a high level of the Tongue River.
21 And the Tongue River is really screaming like it has been
22 the last two or three weeks, it actually -- water moves
23 from the river out into the alluvium for a certain
24 distance. That distance is tens of feet, maybe a hundred
25 feet. Typically not much more. So it provides some

1 amount of water into that alluvium and helps keep that
2 saturated thickness of the alluvium. However, that is a
3 transient thing. It happens in the spring and summer. As
4 you all know, by August or September the Tongue River is
5 much lower than it is now because all of the snowmelt in
6 the Big Horn Mountains has run through the system.

7 So what's left? What's left is this. And this
8 is very typical of major rivers and streams throughout the
9 West. In the fall and winter, the main source of water to
10 these rivers is what we call base flow, which is discharge
11 of groundwater from adjacent geologic formations into the
12 alluvium and sometimes directly into the river. Okay?

13 There's a fairly thick alluvial package along
14 the Tongue River; 50, 60, 70 feet of sand and gravel
15 deposited by that river. And so the important thing
16 here -- the take-home message is we have geology over
17 here.

18 In the case of our site, it's the Tongue
19 River -- or it's the Fort Union formation. And we know
20 this formation well. It occurs here in the Powder River
21 Basin. It occurs over in the Wind River Basin. It's home
22 to coal, uranium, water and oil and gas.

23 But the Fort Union, you know, the coals are in
24 the Fort Union. We have seen the cross-sections this
25 morning. And above the coal is the other part of the

1 Fort Union formation, which is essentially a very
2 heterogeneous mixture of sand, clay, gravel. It is very
3 heterogeneous. It is very complex.

4 And that formation contributes water to the
5 alluvium and to the river, mostly through the alluvium.
6 But if you look at the cross-sections, you will see that
7 in a couple places that coal, as depicted on the
8 cross-sections, subcrops almost directly into the river.
9 Okay?

10 So the other thing to remember here is if -- if
11 your coals are down here, let's say they're 50, a hundred
12 feet down, and Fort Union above the coal is fine grained
13 in places and results in the water in the coal and the
14 water in the lower portion of the Fort Union to be what we
15 call confined. That just means it's in there under
16 pressure. That's what that means.

17 So if the pressure head or the potentiometric
18 surface or the water level in a well put in that coal, if
19 that water level is above the river, then the water wants
20 to move through the Fort Union into the river. That's
21 pressure. You know, water don't flow uphill. Water flows
22 from high pressure to low pressure. The lowest pressure
23 in the entire system is the Tongue River. That's the
24 absolute -- that's atmospheric pressure. All the
25 groundwater is under pressure higher than that.

1 So if that pressure head is above the river, you
2 have this phenomenon where the groundwater moves up. And
3 sometimes it moves dead vertically up. So this happens in
4 rivers like the Tongue River, and it happens all the time.
5 And one of the things you really have to look at and
6 understand is the water budget there, where does that
7 water come from, and if you interrupt that or perturb that
8 or stop that, then you have an effect on the water level
9 in the alluvium critically, and a smaller effect on the
10 water in the Tongue River.

11 So that's the main point I want to make here.
12 The Fort Union is very thick. It has coal seams. It has
13 permeable zones. It has low permeability zones. It's
14 highly complex. But one thing's for sure, water will move
15 through it. It may take time. It might not be a whole
16 bunch, but water will move through it. And there's really
17 no such thing as an impermeable geologic unit. There's
18 some that are close, but all of them have some degree of
19 permeabilities. So that's the point I want to make in
20 terms of how far the water interacts. You have
21 interaction between the river, the Fort Union formation
22 and the alluvium both along Slater Creek and along the
23 Tongue River.

24 Q. (BY MS. ANDERSON) And is there anything you
25 want to add about the domestic and stock water wells in

1 the system?

2 A. Yeah. One thing that is indicated in the permit
3 application -- and it's a bit, I don't know if puzzling is
4 right word, but there should have been more information.
5 The coals -- as it turns out, coals are oftentimes a
6 pretty good aquifer. They will hold water, and they can
7 get water out of them pretty good. And, you know, it's
8 not intuitive, but the water quality's not bad all the
9 time. So people do use coal for water supply.

10 However, the permit indicates that the
11 majority -- I can't remember the exact word -- but the
12 majority of the 357 domestic stock wells that occur within
13 or -- within 3 miles of the permit boundary, the majority
14 of those take their water not from coals, but from some
15 other part of the Fort Union formation. And one of the
16 real problems I have here is that's simply not addressed.
17 That is simply not discussed or addressed in terms of what
18 happens to the water in these wells if you dewater the
19 coal, because they just haven't dealt with it. And so
20 that's an issue.

21 Q. Okay. And we'll get to that I think a little
22 bit later on too.

23 Mr. Wireman, do you have any experience in
24 designing and conducting baseline hydrologic assessments?

25 A. Yes. Lots of experience. I've designed and

1 overseen many of them.

2 Q. So based on that experience, how would you go
3 about assessing this hydrologic system?

4 A. There's two or three really important things
5 that one has to take into consideration when you design a
6 baseline characterization program. One, you have to
7 recognize that there's seasonal differences. Things are
8 not the same in the winter as they are in the summer. So
9 the first thing is you have to collect data from whatever
10 locations you've determined that you're going to get
11 hydrologic data from. You have to collect data, as we
12 called it, over a full hydrograph. Okay? It's very, very
13 important, because in many hydrogeologic settings, you can
14 have differences of tens of feet in water levels between
15 January and May. So that's one thing.

16 Secondly, you have to have the appropriate
17 spatial coverage. You have to get data from monitoring
18 stations throughout this permit area. It's a fairly large
19 permit area. The coals extend throughout the permit area.
20 They're different between east and west, but they're
21 there. The Fort Union occurs throughout the entire permit
22 area. So you have to have spatial coverage. You have to
23 sample Slater Creek. You have to sample Hidden Water
24 Creek. You have to sample the Tongue River. You have to
25 sample the alluvium of the Tongue River. You have to

1 sample the alluvium of Slater Creek, and the coals. And
2 you have to do this with an appropriate number of
3 locations over a full year at minimum.

4 And then the next part of this is what you
5 sample for. You know, it's not just willy-nilly. You can
6 divide this up into categories. And we do this all the
7 time. You want just what we refer to as standard ions.
8 You know, cations, calcium, sodium, potassium. The other
9 side of that are anions, chloride, nitrogen or nitrate,
10 those things. That's a standard group. On top of that
11 you would add metals. You always want some understanding
12 of metals. Hard, you know, chrome, all zinc, cadmium, all
13 those things. All these things occur in the rocks, so
14 they're there.

15 Next you would do what we call field parameters.
16 Temperature, pH, conductivity. Fairly easily done. Done
17 right at the well site or the stream site.

18 And then finally I always insist on stable water
19 isotope data. And I won't go into exactly what that is,
20 but it's just simply isotope -- give you just one example.
21 Oxygen can occur two different ways. It can occur with
22 18 electrons on the outer or 16. It occurs both.
23 99 and nine-tenths percent of it is O-16, but that very
24 small percentage of O-18, if you can measure that -- and
25 you can, very, very, very precisely -- what it tells you

1 is how much mixing's going on, and it gives you a rough
2 idea of how old it is.

3 The mixing is very important. If you -- for
4 instance, if you took a sample out of sandstone in the
5 Fort Union, then you took sample out of the coal. If the
6 O-18 values were the same, you can say, ah, there's mixing
7 going on here. These waters are mixing. If they're
8 drastically different, then you can say they're probably
9 not mixing. And it's very clear. It's not nebulous.

10 So we usually recommend those types of isotopes,
11 which include O-18 and deuterium. But then we also
12 recommend tritium, which is a radioactive isotope, which
13 really pins down the age of the water. How long -- it's
14 not age. That's -- that's a misnomer. What it tells you
15 is how long has the water been in the ground. Okay? How
16 long -- when did that water get recharged into the
17 aquifer? How long before you just took it out?

18 And that really tells you a lot about pathways,
19 about where the water flows. And that's a critical
20 understanding. So there's a whole approach that goes into
21 that in terms of the analytes. And, of course, the other
22 side is the procedures that goes along with collection
23 analysis, transport. And EPA wrote the Bible on that --

24 THE REPORTER: I'm sorry? Wrote the Bible
25 on that --

1 THE WITNESS: They wrote the Bible on
2 methods for analyzing water samples. And -- and the
3 standard operating procedure for collecting those samples,
4 transporting those samples, all of that. And it's used --
5 and it's referenced in Wyoming regulations or statutes.
6 Probably regulations. It's referenced. So it's used all
7 over the country.

8 So that's sort of the other side of this. And I
9 always had field technicians that I trusted to do all that,
10 but...

11 Q. (BY MS. ANDERSON) And then at some point you
12 get to draw conclusions and recommendations based on all
13 that data?

14 A. Once all this data comes in, then my job always
15 was to take all this data, put it into databases and do
16 all different types of analysis. All different -- there's
17 a whole wide variety of ways you can analyze chemistry
18 data, flow data, geologic data. And it doesn't always
19 require a model. You can use models. We use models. We
20 hardly ever use models to predict, but we do use models to
21 help us figure out what was going on. And there's a very
22 distinct difference there.

23 So, yes, that was the part -- and then once that
24 was done, and I sort of -- I can go to my decision makers
25 and say, okay, here's what's going on out there. Here's

1 how it works. So from that they then can go through the
2 rest of the process, make whatever decision EPA was, you
3 know, charged with making.

4 Q. Okay. And you spoke a little bit to the
5 complexity of the hydrology in this area. Is there
6 anything you'd like to add about why data's important,
7 given where we are right now with this process?

8 A. It's an age-old battle. And there's a paradigm
9 that says the more complex it is, the more data you need.
10 That's generally true. The opposite of that is the harder
11 it is to get that data. What we have done over the last
12 20 years is develop ways to collect data that do not
13 involve drilling 500 wells. You know, historically, that
14 was our tool. You drill all these wells. You get a core.
15 You collect a sample, kind of figure it out.

16 It's expensive to drill wells. And so now we --
17 we've devised a new set of tools that can be done from the
18 surface, surface geophysics, all the isotope data I talked
19 about. All of that goes together to help you understand
20 the complexity.

21 Now, in this site, the Fort Union is a very,
22 very complex formation. It's not complex in terms of how
23 it was deposited. It's very straightforward. Come off
24 the mountains, as the Bighorns went up and they shed off
25 the mountains out into this big Powder River Basin. But

1 it is complex in terms of what makes up the formation. It
2 is very common to have sandstone here and a siltstone
3 there and a claystone there, stacked on top of one
4 another. And the reason for that is really fairly simple.
5 As the mountain went up -- and geologically they went up
6 fast -- these streams came down carrying sand and gravel,
7 eroding all the rocks in the Bighorns. The steeper the
8 stream, the more material it moved. And then when it hit
9 the flatland, it all just slows right down, deposits the
10 large material. As it keeps going, deposits finer and
11 finer material.

12 So you can see how this laterally changes from
13 sandstone to siltstone to claystone laterally. Over time
14 it does the same thing. As you come up vertically, now
15 what used to be the place where gravel got deposited is
16 now a place where sand gets deposited or clay. So then
17 you stack it up that way. So the result is very
18 heterogeneous lithology. And all lithology refers to it as
19 a sand? Is it a gravel? Is it a clay?

20 But from a groundwater perspective, it's very
21 complicated, because groundwater moves through sandstone
22 very different than it moves through claystone. Very
23 differently. And moves through hard rock even
24 differently. And so we get in the hole business of what
25 we refer to in my business is Darcy flow, where you've got

1 groundwater flow through all of the pore spaces headed
2 down-gradient. That's nice. And you occasionally get
3 that, if you got well-sorted glacial sand.

4 What is more common and what occurs here is a
5 great portion of the water moves through preferable
6 pathways, whether that be fractures, whether that be
7 faults, whether that be an old stream channel that might
8 be buried that is full of sand, and next to it is clay,
9 all the water wants to be in the sand. So that -- that is
10 the complexity of it. And trying to understand that
11 enough to say, okay, I know where this water's going to go
12 from the Fort Union into the alluvium. I know where it's
13 going to go into the Tongue River. I have to know this
14 because if I don't know this, I can't assess risk and I
15 can't assess changes to the -- to the hydrologic system if
16 I don't know those things.

17 So it takes really quite -- in my view, the
18 upfront portion of all this, from a data collection and
19 baseline characterization, you're looking at two to three
20 years minimum. That's just kind of the way it goes. So
21 that just tells you kind of how far the rigor that's
22 required.

23 Q. Okay. So we talked quite a bit about
24 assessments of hydrologic systems. Is this particularly
25 important here, given the statutory and regulatory

1 requirements we visited about?

2 A. I think it's critically important if you look at
3 what's required under these statutes and these rules that
4 I referred to earlier.

5 Q. Okay. Mr. Wireman, were you present for
6 Dr. Kuchanur's testimony?

7 A. Yes.

8 Q. Okay. Did you hear him say that the amount of
9 data needed for a scientist and a regulator are different?

10 A. You know, as a scientist, I've kind of heard
11 that a lot over years. You know, scientists always hear
12 that, particularly from regulators. I don't -- you don't
13 want to misstate data. I just don't look at it that way.

14 If you want an honest, thorough, rigorous
15 assessment of what's going on, and if the decisions that
16 need to be made are based on that, then you need an
17 adequate amount of data. You simply do. Sometimes that's
18 a lot more than other times. Depends on the system. This
19 is a fairly large area. It's fairly complex. That says
20 to me you need more data. You need to pay attention to
21 the things I talked about earlier in term of spatial
22 distribution, temporal distribution of the data. That is
23 critical. You can't really come to an understanding
24 conceptually what's going on without it.

25 Q. So a fair summary, sound science equals sound

1 decision as a regulator?

2 A. Sound science is necessary for sound decisions.
3 Doesn't necessarily equal sound decisions, but it
4 certainly is necessary.

5 Q. All right. We're going to go back to your
6 PowerPoint here. And this is the first slide of that. If
7 you could just provide some summary about your main
8 findings related to this permit application.

9 A. Yes. I've put these statutes up here. And I
10 read those, you know. And I -- I understand what they're
11 asking for in terms of the assessments that need to be
12 done. They're focused, as they should be, understanding
13 risk and understanding activities that might change --
14 make major changes to hydrologic system, which then affect
15 people's use of that water or the environment's use of
16 that water. That's what I get out of this.

17 So then going through the permit application in
18 great detail and the appendices I looked at, including
19 MP.3, which is the addendum for the modeling, my view,
20 my -- my opinion is that these five bullets really
21 characterize what's missing, what's not here, and what
22 needs to be.

23 And I'll just go through them briefly.
24 there's very sparse hydrologic data. And the permit
25 application -- and this is a quote -- they understand it's

1 a complex groundwater system. And so the only site-
2 specific hydraulic data that I can see in this permit
3 application, to run a groundwater model, groundwater model
4 simply tells you about flow of the groundwater. How much,
5 kind of where it goes, where it discharges.

6 You need some fairly standard hydraulic data,
7 hydraulic conductivity, storage coefficient, velocity.
8 Most often that is obtained by doing what some people
9 refer to as a pump test. It's more accurately an aquifer
10 test. You pump an aquifer for an extended period of time
11 and you measure water levels in that well and in adjacent
12 wells. And that drawdown over time, plotted with standard
13 methods that we use, will tell you how much water you can
14 get out of that well. And it will tell you how fast it
15 can move. So -- but you have to have the data.

16 So in this permit application, a pump test was
17 only down at one location. That was the far eastern part
18 of the permit application area. There was no aquifer
19 testing done in the rest of the area. And they obtained
20 two site-specific hydraulic conductivity values, one for
21 each of the coals. One for the Carney and one for the
22 underlying Masters. Then they obtained storage values.
23 And that's it. That's it. They had those two things.

24 And then they -- a single storage coefficient --
25 specifically, these are essentially the same thing. A

1 slight difference. But in the porosity value, they used a
2 single value for the whole area. That in no way can
3 capture the complexity in the heterogeneity. The
4 potentiometric surface maps that are generated -- and I
5 have the reference here, but it's in -- it's figures in
6 D6 -- here, D6.2-2. They were based on average values.
7 And that's really kind of an odd way, in my opinion, to do
8 that. You have water level measurements over the course
9 of time. You add them up, take an average, and then
10 that's your water level. Well, the reality is you
11 probably never read that average water level out in the
12 well.

13 And it also prevents -- or doesn't allow for
14 seasonal changes. That's the important point, really.
15 Because a potentiometric surface drawn for January water
16 levels could be quite different than the one drawn with
17 May water levels. Very different. And what that means is
18 the direction of groundwater flow can change. That's
19 number one. The velocity can change. That's number two.
20 And number three, the quantity of water that goes to any
21 certain place can change. So it's really important to try
22 and capture the seasonal changes.

23 Q. I'm going to interrupt you really quick. Can
24 you explain what a po --

25 A. Potentiometric --

1 Q. You know what --

2 A. -- surface.

3 Q. -- I'm getting at. Yeah.

4 A. Let me just take one second. I wish I had a
5 board, but if --

6 MS. MORRISON: There's a piece of paper.

7 THE WITNESS: Is it okay if I draw
8 something real quickly for you?

9 CHAIRMAN BAGLEY: Yeah. Let Jim bring it
10 over.

11 THE WITNESS: Be a lot easier to explain.
12 Take a lot less time.

13 MS. ANDERSON: Potentiometric.

14 THE WITNESS: This one isn't dark enough.

15 Ah. Thank you, Jay.

16 MR. GILBERTZ: You need the --

17 THE WITNESS: The blue one. Give me a
18 couple darks.

19 MR. GILBERTZ: You want darks?

20 THE WITNESS: Yeah. Thank you.

21 MR. GILBERTZ: Here's purple and black if
22 you need them.

23 MS. ANDERSON: Thanks, Jay.

24 A. Land surface --

25 THE REPORTER: You're going to have to turn

1 towards the microphone.

2 THE WITNESS: Okay. Oh, sorry.

3 MR. RUBY: Hang on a second. I don't want
4 to touch it.

5 MS. ANDERSON: Don't move it, yeah.

6 THE WITNESS: I got in trouble for that
7 before.

8 MR. RUBY: Which one you want to use, Joe?

9 MR. GIRARDIN: I'm using four.

10 MR. RUBY: Can you get it? Is it okay,
11 even if he turns away?

12 MR. GIRARDIN: We'll find out in a second.

13 THE WITNESS: Okay. This good?

14 A. This is a well, this is the land surface. And
15 let's say this is the Fort Union. Okay. We got a coal
16 seam down here. They're dipping, not flat like this. So
17 we screen our well here. Okay? Then you measure the
18 water level. Water level can be up here. Okay? The
19 water level in this well is above the top of the aquifer
20 that it's screened in. What that says is you have
21 pressure head.

22 This water level elevation here is comprised of
23 two big components. One is called elevation head.
24 Everything is relative to sea level. Everything. And
25 it's -- it's just relative to sea level. So this water

1 level is sea level. And this is called the pressure
2 gadget.

3 Now, the important point here -- and this is
4 different than an unconfined aquifer. Let's say that over
5 here you have alluvium, and on top of the bedrock. And
6 you move through the well here and you screen it, the
7 water level will never come above the top of that aquifer,
8 ever. Because the pressure here is the same as the
9 pressure here at the surface. So this is called an
10 unconfined aquifer. This is a confined aquifer.

11 Now let's go to the storage. That's the key
12 thing here, because it's a key hydraulic parameter. What
13 storage means, storage coefficient, simply says if you
14 lower this water level -- let's say it's right there -- if
15 you lower that one foot, how much water do you get out of
16 that valve? How many gallons? Okay? That's what that
17 means.

18 In an unconfined aquifer, you get a lot more
19 water out of that well by drawing that down 1 foot than
20 you do here, because here, when you lower this one foot,
21 you're not taking any water out of the aquifer. You're
22 simply reducing the pressure.

23 Now, the importance of that is any pumping down
24 here is going to, relatively speaking, very quickly lower
25 this water level, because you're lowering the pressure

1 head, not the water. So storage coefficients for confined
2 aquifers are order of magnitude or more lower than storage
3 coefficient for an unconfined aquifer.

4 That's important for these domestic wells,
5 because in domestic well -- let's say this is a hundred
6 feet. You first drill that, the water level comes way up
7 here. You have a hundred feet of water in your well.
8 Well, it doesn't take a whole bunch of pumping to lower
9 that down there. You don't have to take a whole bunch of
10 water out before that happens. You have to take a whole
11 lot more water out of this one.

12 So it's important to recognize these are
13 confined aquifers, and these wells have potentiometric
14 surface. This is called a potentiometric surface. This
15 is called a water table. It's just terminology we use.
16 Okay?

17 So this is what's going on. The Fort Union not
18 only has the coals, they're on this Fort Union, which is
19 hundreds of feet thick, big sandstone thing there. If
20 you can find it -- drillers get pretty good at this over
21 time -- that's good water source.

22 The rest of it could be siltstone, claystone,
23 low permeability, has a lot of water in it. You just
24 can't get it out very good. That's the porosity equation.
25 Porosity simply is how much void space in this rock.

1 That's all it is. It's a percentage. Typical ranges are
2 10 to 30 percent.

3 So a claystone or a siltstone can have an awful
4 high porosity and have a lot of water, but it is very low
5 permeability. And all permeability, which is the
6 hydraulic conductivity -- and then I'll stop at this sort
7 of science lesson. What that is is how much water, if you
8 had a one-square-foot cross-section, how much water would
9 flow through that cross-section in one day or any time
10 period you want. How much would flow through there?

11 That's what hydraulic conductivity measures, is that.

12 And it is simply a measurement of the degree of
13 interconnected porosity. You can have all kinds of pore
14 spaces in these rocks, but if they're not connected water
15 won't move from one to the other. It just stays there.
16 So that's the reason that's an important parameter in
17 porosity and the storage. So all those things are very,
18 very important. If you want to assess impacts from
19 pumping somewhere in this formation to coals, the impacts
20 of that pumping on the rest of that formation and on the
21 domestic wells, that's the importance of that.

22 Q. (BY MS. ANDERSON) Okay. So let's go back to
23 this slide. Is there anything else you want to highlight
24 on the --

25 A. What I've done here is just try -- because

1 there's a fair amount of stuff here, I just tried to,
2 under these five headings, just give some examples of what
3 I'm talking about. I indicate there's sparse hydrologic
4 data for this complex system.

5 And then I -- you know, the data collection was
6 focused almost entirely on the coal seams. They're a coal
7 mining company. That what they need. But there is not
8 nearly enough data on the overburden, underburden, the
9 Tongue River alluvium, Slate Creek alluvium -- Slater
10 Creek.

11 As I indicated, a single storage coefficient,
12 specific deal, porosity value, at least the way I read it
13 in the application, was used. The limitations associated
14 with nonseasonal or average values here for potentiometric
15 surface. There's only four surface water locations that
16 were established for background and three noncoal wells.
17 That was it for the whole area.

18 And there's no data for the surface water
19 locations from October to March. So half the year there,
20 there's no data. So essentially you had a half year of
21 data. And I can tell you from reading some of the Big
22 Horn Coal's reports in the past, they indicated that, for
23 instance, in Hidden Water Creek, there was typically water
24 in that creek in the winter, not in the summer. Hidden
25 Water is mostly an ephemeral stream, compared to Slater

1 Creek, which is an intermittent stream. And what that
2 tells me, and it fits with what I hear and understand
3 about these coals, the Monarch coal is burned.

4 You know, we've all been around and seen major
5 coal fires the last few decades sometimes. That creates
6 what's called scoria, which is just highly burned coal.
7 But that has a complex storage of water because the sort
8 of geometry of that scoria is -- is very, very complex.
9 Water comes in there in recharge -- snow, rain -- and then
10 it is stored there for a time. And then it slowly
11 infiltrates down and move downgradient in the coal. Okay?
12 There's a lag time.

13 And it's not uncommon. We see many
14 hydrogeologic settings where the recharge happens in
15 May -- April, May, June, into the ground, but you won't
16 see, for instance, that discharge into a stream or spring
17 for six months or eight months. It just takes that long
18 to move through the system. Not uncommon. So that's
19 the sort of danger of not getting the winter data. You
20 just -- you miss that.

21 The data for the precipitation, which relates
22 directly to the recharge, they have no post-1973 data.
23 Well, we all know things have changed since 1973. We get
24 a lot more high-intensity storms. So I just don't think
25 that data's any good.

1 There's no data for recharge. And I -- I don't
2 want to pick on folks there. That's hard to get. I
3 readily admit that. It's hard to get recharge data to
4 figure out how much of the rain actually goes into the
5 subsurface. There are methods. Most of them are
6 estimates. But here, it just -- I have no idea where the
7 data came from. It indicates that regional values are
8 used. I have no idea what that means or where that came
9 from.

10 So that's -- that's just some examples here of
11 the dearth, as Jerry called it, of hydrologic data.

12 Q. Okay. Great. So we'll move on to your second
13 kind of finding here.

14 A. This finding really relates to what I think was
15 unmet task here, and that is to get some data for the
16 overburden, underburden, Tongue River alluvium, Slater
17 Creek alluvium. There are some wells in Slater Creek.
18 They've been sampled. There's some water levels.
19 However, I will say this. They were not used.

20 When the aquifer tests were done in the eastern
21 part of this permit area to determine hydraulic
22 conductivity values, no Slater Creek monitoring wells were
23 monitored. I just couldn't get over that. Why they
24 weren't monitored during that test is beyond me, because
25 one thing you would want to know is if you pump the coal

1 and dewater it, will you have an effect on the alluvial
2 water among Slater Creek? And that's determined if you
3 just monitor those during an aquifer test.

4 The potential impact of the alluvial aquifers on
5 the Tongue River and Slater Creek. There -- as I read
6 through -- and somebody can point it out to me -- but I
7 didn't see any monitoring wells in the Tongue River
8 alluvium. I didn't see any data about depth of water,
9 saturated thickness, water quality.

10 There was a statement made in the permit
11 application that it's a losing reach of stream across the
12 entire permit area. I have no idea where that comes from.
13 And I -- there was no basis for that whatsoever. And I
14 just don't believe it's the case. I think we have a more
15 temporal situation like I showed earlier.

16 And one of the reasons this is really important
17 is the potential to degrade the alluvial valley floors.
18 You have to remember, alluvial valley floor is simply the
19 Tongue River alluvium. That's what it is. It's 60,
20 70 feet of mostly saturated sand and gravel on that river
21 with a flat floodplain.

22 The water level, historically, has stayed high
23 enough there to allow alfalfa and other crops to be grown
24 because roots can get down to it. The risk you run, and
25 it's a very serious risk, there isn't a lot of freeboard

1 left here. You know, alfalfa roots don't go that deep.
2 So if you lower that water level below the depth of those
3 roots, you've got no more alfalfa. Okay?

4 That's the risk to the AVFs. And that's the
5 assessment that has to be done, is will this mining result
6 in less water going to those, and will that less water
7 cause the water level to go down below the root zones?
8 That is the critical, critical question with respect to
9 protecting AVFs.

10 And then finally here, as I've already mentioned
11 but these 357 wells, I just -- I just didn't see anything,
12 you know, to -- about those that I thought was adequate.

13 Q. Okay. So let's go to your next set of findings
14 here.

15 A. Okay. I talked about sort of the methodology
16 for designing and conducting background or baseline
17 characterization studies. The first thing you always do
18 is start to develop conceptual model. Those -- people in
19 my business, you know, we work in the subsurface. And so
20 it's as I've been told by some, it gives me ability to
21 wave my arms more than most people because you can't see
22 down there.

23 But, however, we have a fairly good
24 understanding of groundwater flow systems, how the
25 recharge happens, how the flow happens, how the discharge

1 happens, how the water quality -- why it exists the way it
2 does. So all of that goes into your thinking as you're
3 collecting and analyzing the data, running the models,
4 whatever you're doing to improve and evolve your
5 conceptual model, as time goes on. And that's the reason
6 you run numerical models, is to help you develop a better
7 conceptual model.

8 So that's what this is about. There's not
9 enough characterization of Slater Creek. I saw references
10 to intermittent. I didn't see much discussion of base
11 flow, though I did see in some DEQ documents where clearly
12 riparian zones have been identified out along Slater
13 Creek. There were cottonwoods growing out there. There's
14 some things that indicate clearly groundwater coming into
15 that creek.

16 As I said, no discussion of recharge or
17 discharge to and from the Tongue River alluvium. No
18 discussion of its interactions with the river. What's the
19 hydrologic -- the hydraulic relationship? It's what I
20 just said, between the river and alluvium.

21 I didn't see any water quality or flow data for
22 the Tongue River that I thought was appropriate. There is
23 one gauge on the Tongue River within the permit boundary,
24 but you've really got to have one upstream and downstream.
25 If you don't, you can't compare it.

1 No explanation of some things I found to be
2 interesting. The water chemistry within the coal
3 themselves was highly variable, and that just puzzles me.
4 That's not what I would expect to see. And I don't know
5 why that is, and somebody needs to address that.

6 The same is true for transmissivity, though
7 that's a little easier to understand conceptually because
8 of the scoria issue.

9 No discussion of which vertical intervals or
10 lithologies are being used by the domestic wells. Where
11 is the water coming from? You know, if you don't know
12 where they're getting their water, you really can't assess
13 impacts.

14 Inadequate understandings and data for
15 groundwater recharge and discharge. And one of the
16 critical questions here is water that was down-gradient in
17 these coals from the northwest to the southeast. And
18 those coals extend under the Tongue River. They go
19 further, I assume. I haven't seen any discussion of where
20 they go, but I can't imagine they just stop on the south
21 end of the Tongue River. So where does that go? And
22 where -- you know, if you mine part of this coal, then
23 you've disrupted the pathway. The water can't get down
24 there anymore. Now, maybe that's not an issue. I don't
25 know.

1 So those are some of the -- the issues here.

2 And then I think I've just got one more slide. I'm just
3 trying to demonstrate sort of some of the ways I would
4 approach this and some of the sort of missing things.

5 The modeling has large uncertainties, though
6 that's not uncommon. And I think most modelers would
7 agree that there's significant uncertainties all the time.
8 It's very difficult. I didn't see any discussion, really,
9 of error bars on this. So if you have a prediction or
10 drawdown X feet away from a pumping well, the prediction's
11 whatever, 10, it's really helpful to say
12 10 plus or minus, because you can't really hang your hat
13 on 10. It just doesn't work that way.

14 So -- and as I've indicated, there's only
15 empirical data for one of the four parameter site-specific
16 empirical data. As I understand reading the model, the --
17 all of the overburden was -- the model was totally
18 homogenous. Just one layer, all the same
19 characterization. No attempt to -- that had discrete
20 zones there.

21 And I recognize it's hard. You know, I'm not
22 knocking this model, but I think sometimes people put a
23 little too much faith in the -- in what comes out of it.
24 I didn't see really good water budget in terms of how much
25 the recharge is, how much flows through, how much goes

1 here and goes there. And then, as I indicated before, I
2 have a hard time thinking the Tongue River is a losing
3 river year-round through this whole stretch.

4 Q. Okay.

5 A. And this is the last one. This gets to the
6 cumulative hydrologic impacts. And this, I think, is
7 something that really needs to be looked at a little
8 closer. There have been some very significant impacts out
9 here. Significant -- impacts to groundwater. There's no
10 question that's occurred. There's absolutely no question
11 the mining has perturbed the groundwater system. Whether
12 that has resulted in material damage is a separate
13 question.

14 But some things we do know. Coal-bed methane
15 resulted in huge drawdowns out here. Tens of feet.
16 Eighty, hundred feet I've read. They had to dewater the
17 coal to get the methane out. So that's still there.
18 There's still a residual. Those water levels have not
19 come back.

20 I read in one of the Big Horn Coal mining
21 reports, and I stand corrected if somebody wants to, but
22 that when they were mining down in north -- in the T-1
23 area, there was, either inadvertently or not, some
24 excavation into the alluvium along Goose Creek/Tongue
25 Creek [sic]. And that caused a lot of the drainage out of

1 alluvium and water to leave. And as I recall, they fixed
2 it somehow. I don't really recall the details. But the
3 point I'm making here is that's another impact.

4 The model indicates that long-term recovery of
5 water levels at 20 years out, you're still going to have a
6 10-foot decline in head. Let's just say, for instance,
7 that's 20 feet, because the model's not correct. If
8 you're one of these guys with confined aquifer in domestic
9 well, you might not have 10 feet to lose. You just might
10 not. And that hasn't been checked. I mean, how do you
11 know?

12 The other thing is when they mine -- and Jerry
13 talked a lot about highwall mining this morning. And from
14 a hydrologic perspective, you excavate these large -- in
15 these panels, on these benches, you excavate large amounts
16 of void space in the Fort Union formation, and it's there.
17 Now, two things can happen. That can fill with water.
18 It's a giant void space. It's a giant porosity.

19 The other thing that can happen, which is more
20 problematic, is a collapse and material in-fills into
21 those void spaces. When that happens, the groundwater
22 flow path is changed dramatically because what's in-
23 filling is, in all likelihood, much lower permeability
24 than what was there before.

25 So now groundwater's coming down, hits those

1 previously void spaces, now filled with in-full, and it
2 can't get through. So it's going to go around. It's
3 going to go somewhere else. So the places where the
4 groundwater used to come into the alluvium, the timing of
5 when that used to come into the alluvium, is going to
6 change. And that could have -- I don't know if it will,
7 but it could have an effect on these alluvial valley
8 floors. So that's the importance of that.

9 And then, finally, I'll say -- and this is based
10 on very real world experience. You can't fix some of
11 these problems. Once you perturb a hydrologic system
12 that's in some sort of equilibrium with respect to
13 recharge and discharge, and where the flow paths are and
14 the velocities, you simply can't put it back. It couldn't
15 be done.

16 Now, that might not be a real problem in some
17 places. Other places it might. Just depends. I just
18 want to make the point here that you can't rely on "don't
19 worry I'll fix it." You just can't do that. And in
20 reading the statutes, that's why I see the word "prevent"
21 a lot. Prevent means you don't get in that spot to begin
22 with, so...

23 Q. Okay. Thank you.

24 A. I think that's the last of that.

25 Q. Okay. So you just talked a little bit about

1 some of the questions we were going to get to about -- you
2 know, so there's a lot of data here. Could we more
3 accurately predict potential environmental and reclamation
4 hazards and challenges and better plan for them with more
5 data?

6 A. With more data, significantly more data, and
7 monitoring. That's the other thing we haven't talked
8 about. You need not just -- the monitoring stations for
9 the baseline, in my opinion, were way, way too few. But
10 during operation of the mine, you need to monitor. During
11 post-closure, that's probably the most critical time to
12 monitor. Because in post-closure, you really get to learn
13 whether some of your assumptions were right or wrong.

14 And if there -- if impacts occur, you now have
15 some data, and you can deal with it. So if you had
16 significant amount more data and an adequate monitoring
17 plan -- what I read in the permit application was that,
18 essentially, they're going to use the same monitoring in
19 post-closure as they did for baseline, and I think that's
20 wholly inadequate.

21 Q. Okay. And without knowing these risks or having
22 this data, do you have an opinion on whether the company
23 is able to find that material damage to the hydrologic
24 system has been prevented?

25 A. I don't think there's enough data and enough

1 assessment to make any decision along those lines.

2 Q. Okay. In the absence of the studies and data
3 you told us are necessary to understand the hydrologic
4 balance and hydrologic systems, do you have an opinion on
5 whether DEQ should approve the permit application?

6 A. Based on the wholly inadequate assessment of the
7 hydrology, based only on that, I would say no.

8 Q. Okay.

9 A. But I can't really speak to the other aspects of
10 the permit application.

11 Q. So you were present for some of the testimony
12 previously about some additional monitoring that may be
13 required on the Tongue River and Goose Creek?

14 A. I heard, if I recall correctly, that there was a
15 commitment to put two or three wells in the Tongue River
16 alluvium. But I heard nothing about where they're going
17 to go and what their purpose is.

18 Q. And they're not currently in the permit
19 application or anything?

20 A. As I read the permit application -- and I'm
21 happy to be corrected on this -- I just didn't find any
22 existing Tongue River alluvium monitoring wells.

23 Q. Okay. If that additional monitoring would be
24 done, does that alleviate all your concerns?

25 A. I can't say until -- until the monitoring's

1 done, I get the data.

2 Q. Okay. But is it fair to say you have concerns
3 other than just that particular area?

4 A. I have concerns that the -- if you look at this
5 entire baseline characterization, and you say on a scale
6 of 1 to 10 how good is this one, this is a 2, in my view.
7 I mean, it's just not something that I would consider
8 adequate for me to go to a decision maker and say this is
9 what's going on. You can go ahead with your decision. I
10 would not do that based on this.

11 Q. Okay. Let's turn to the alluvial valley floors.
12 Could you tell us, based on your experience and
13 understanding, what is an alluvial valley floor and why is
14 it important?

15 A. Alluvial valley floor here -- and it's really
16 kind of an interesting thing. It's a western thing more
17 than anything else. We all know living in the West that,
18 you know, we're not the prime agricultural place in the
19 country. We're not Iowa or Illinois. So growing things
20 is not as easy.

21 One of the places that people figured out pretty
22 early on, that you can grow at least alfalfa for stock are
23 on those floodplains of major western rivers. They
24 figured that out. You can grow alfalfa there. And it's
25 been grown a lot. And the reason you can grow alfalfa in

1 a mostly arid place like we are is because of this
2 recharge I was talking about, where you get enough water
3 in through the spring recharge in the river, and then the
4 fall-winter recharge from the aquifer to keep the water
5 level in those alluvial aquifers within reach of the
6 roots. That's the -- that's why that exists. And if you
7 ride through this, what you'll find is in years of above-
8 average precip, there's a lot more alfalfa grown than in
9 years of below average. And that's because that maintains
10 that water level.

11 And in reading through the permit application,
12 through some of the other documents about AVFs, I kind of
13 deciphered that, first of all. Secondly, that there's a
14 fair amount less crop growing on these AVFs than there has
15 been in the past. And I think, in my opinion, that is
16 probably related to the fact that the water level is down,
17 compared to what it used to be, as a result of this
18 cumulative impacts. That's -- that's -- that would be my
19 professional guess at that.

20 Q. Okay. In your opinion, why is it important to
21 fully delineate these alluvial valley floors that might be
22 impacted by mining prior to mining occurring?

23 A. Well, if you don't know where they are, how can
24 you design a mine plan to protect them?

25 Q. Okay. Thank you.

1 I'm going to pull up DEQ Exhibit 16.

2 Mr. Wireman, are you familiar with this?

3 A. Yes. I've read this. Uh-huh.

4 Q. Okay. Do you have any concerns about the
5 alluvial valley floor mapping for this permit application
6 based on this document?

7 A. I have some concerns about the word "potential."
8 I mean, I don't know if this is the -- has a designation
9 process been completed and has a decision been made by DEQ
10 as to whether or not those are AVFs or not. So I don't
11 know the answer to that.

12 I will go on to say that they are located in --
13 along the river there, exactly where you would expect an
14 AVF to be. So I'm not surprised at the area they
15 designated. I'm a little surprised that they haven't made
16 a determination by this point.

17 Q. And does the lack of that determination cause
18 you any concern?

19 A. Well, it causes me, again, concern that a mine
20 plan can't be designed to protect that if they don't know
21 that they're there. I mean, I'm not a mining engineer,
22 but it -- you know, you need to know if you need -- some
23 places are highly sensitive and vulnerable and you need to
24 work around them or you don't. I mean, you just need to
25 know.

1 Q. Okay. I'm going to pull up DEQ 12, which is the
2 mine plan. And page 90 of that. Come on. All right. I
3 guess this is what I'm going to have to do. Sorry.

4 And, Mr. Wireman, I'd like you to read the two
5 sentences that start at the beginning of the last
6 paragraph, starting with "as discussed."

7 A. "As discussed in Appendix D11, no direct mining
8 is planned on the AVFs located in the Tongue River and
9 Goose Creek Valleys. Therefore, the essential hydrologic
10 functions within Tongue River and Goose Creek AVFs shall
11 be maintained."

12 Q. Okay. Is it really that simple?

13 A. Not at all. I mean, that's -- that's a little
14 apples and oranges to me. It says perturb the hydrologic
15 system. I mean, you can perturb that system without
16 digging up the alluvium, clearly. As we -- you cut off
17 the recharge, you've perturbed it. It's not receiving
18 that water in the places and time that it needs to be, and
19 that can be done without direct mining on the alluvial
20 deposits.

21 Q. Okay. How so?

22 A. Well, as I indicated before, if you -- and I --
23 again, I've looked at the mine plan, but I focused on
24 the hydrology. But I recall -- and I hope I'm right on
25 this -- that some of the panels, for instance along the

1 north side of the Slater Creek, those panels that benches
2 are going to be constructed and highwall augering was
3 going to occur, those were roughly parallel to Slater
4 Creek.

5 Now, if the water -- the base flow, groundwater,
6 is coming from northwest to southeast and some of that
7 enters Slater Creek, you've now cut a bench and stopped
8 that water from coming into Slater Creek alluvium and
9 you've stopped it from coming into the AVF and that lowers
10 water level and reduces abilities to grow crops.

11 Q. Okay. And do you have any opinions on whether
12 the permit application addresses or doesn't address those
13 kinds of impacts?

14 A. I think that the permit doesn't -- I need to
15 word this carefully. I think they should have taken it
16 quite a bit more seriously in terms of getting the data --
17 the quantitative data that's needed to make the
18 conclusions they've made. I mean, a conclusion like that
19 is really so, so general that -- I mean, what's it mean?

20 Q. Okay. I'm going to pull up DEQ 15 and go to
21 page, let's see, 10 of this document. Got to make it
22 smaller now. Where's my -- it's not Adobe, so I'm a
23 little bit perplexed. Okay. Just get us what we need.

24 Okay. Could you tell us a little bit about this
25 map?

1 A. This well appears to be one of the wells on
2 Slater Creek, and this appears to be the AVF that has been
3 delineated along Slater Creek.

4 Q. Do you have any opinions about the Slater Creek
5 alluvial valley floor that you'd like to share with the
6 council?

7 A. I, a couple, three weeks ago, I drove Slater
8 Creek. I went up there and drove from -- not the
9 headwaters, but fairly far up the creek and all the way
10 down to its confluence. And one of the things I noticed
11 that struck me was --

12 MR. KUHLMANN: Dr. Bagley --

13 A. -- there was a fair amount of vegetation.

14 MR. KUHLMANN: -- I'm going to object.
15 This was not in his report and this was not part of any of
16 his expert analysis that occurred prior to this hearing
17 that we would have had an opportunity to question him on,
18 such as at his deposition.

19 MS. ANDERSON: And, Dr. Bagley, similar to
20 previous responses I've had is the very purpose of this
21 hearing is for you to get evidence that will help you make
22 a decision, and that's exactly what Mr. Wireman's providing
23 to you today.

24 CHAIRMAN BAGLEY: You can answer the
25 question. I imagine you'll be crossed on it.

1 A. Again, I drove -- I had an opportunity to drive
2 down Slater Creek. And it's the spring of the year, so
3 it's sort of a high water time. But I did notice
4 indications of base flow coming into that. There was
5 vegetation. There was springs. There were little ponds
6 down through the valley of that. And what I took from all
7 that in my experience is there's base flow coming in here
8 to support some of that vegetation, because without
9 groundwater coming in, those vegetation couldn't make it
10 year-round. They just wouldn't have enough water supply.

11 So the first thing I picked up on is this is
12 intermittent stream, not an ephemeral stream. It's
13 intermittent in the sense that in times of the year when
14 there's a lot of groundwater coming in, there's flow in
15 the creek. And other times of the year, when there's not
16 much, there isn't. Slater Creek is different than the
17 Tongue River, because the Tongue River gets all that
18 snowmelt from the Bighorns. Slater Creek really doesn't,
19 and so it relies more on the base flow.

20 But that's why the AVF is there. I mean, that's
21 why they determined -- it wouldn't be there if there
22 wasn't significant amount of water in the alluvial
23 deposits to support an AVF, and that's groundwater.

24 Q. (BY MS. ANDERSON) Okay. Anything else you'd
25 like to add on the alluvial valley floors?

1 A. Just that they're highly sensitive. You know, I
2 applaud Wyoming, actually, for having such a thing as an
3 AVF. You don't see that. I haven't seen that hardly
4 anywhere else. It's a recognition that you can have some
5 agriculture in the right places in these arid
6 environments, and I think that's a good thing. However,
7 they're very sensitive to changes in that water level.
8 And you might not think that the total amount of water
9 that comes from that coal into the alluvium, if you just
10 put it out there in gallons or acre-feet, it's probably
11 not -- sound like very much. But if enough water to lower
12 the water level below the root zone, then it's a critical
13 amount of water, even though it's not a large amount of
14 water. And that's the concern I have. And I think we
15 need to recognize if you want to save these AVFs, they
16 have to be considered to be quite sensitive and quite
17 vulnerable to changes in the water level and changes in
18 the recharge. And that's -- that's, you know, really
19 critical for these. And it's pretty much spelled out.
20 You know, they recognize that in the regulation.

21 Q. Okay. So switching over a little bit to water
22 wells. I think your diagram speaks to this somewhat, but
23 do you have any opinion on whether water wells will be
24 impacted by mining operations?

25 A. I can't say. You know, that -- that's a real

1 frustration. And the modeling -- the modeling's very
2 careful. They -- they run the model, and then they say we
3 looked to see what the drawdowns are in locations where
4 there are existing wells. That's different from saying
5 there will be a drawdown in that well. It's a little bit
6 different.

7 Given the fact that they don't have any real
8 data for the portion of the Fort Union that supplies water
9 to many of these wells, and the water level data from the
10 wells, as I understand in reading the model -- MP --
11 Addendum MP-3 -- I'll be corrected if someone wants to --
12 but way I understand that was they had water levels from
13 about 15 coal wells that they used to help calibrate this
14 model. They then went to the State Engineer's Office and
15 obtained information on some number of these 357 wells. I
16 don't know how many. And they got water level data from
17 the SEO records. They then put that water level in the
18 model. And they couldn't get the model to calibrate at
19 all. So they essentially took that out and said, well, we
20 won't use it. We'll only generate these contours -- these
21 water level contours from the coal wells.

22 So what that gives you is simply the
23 potentiometric surface of the coal. It doesn't tell you
24 anything about potentiometric surfaces in the water in the
25 noncoal part of the Fort Union, which is where most of

1 these wells get their water. So that's the concern here.

2 Q. Okay. And based on your knowledge and
3 experience, there's some differences, again, between the
4 confined aquifers and the unconfined in terms of
5 vulnerability to these water wells?

6 A. Well, in terms of drawdown vulnerability, you
7 know, the unconfined aquifers around the country are
8 generally more vulnerable because they're at the surface,
9 so you can contaminate them with surface activities. In
10 terms of just drawdown, it is much, much easier to draw
11 down a water level in a confined water than in an
12 unconfined aquifer.

13 Q. Okay.

14 A. So you can't just look at so-called column of
15 water in the well. You know, where's the pump? Number
16 one, you can't get water below the pump. You can't just
17 say the depth of the well's a hundred feet. It's 10 feet
18 to water; therefore, I got 90 feet of water. What if the
19 pump's 50 feet, you don't have 90 feet of water. You got
20 40 feet of water. So that kind of information wasn't
21 really in here, so there was no way to really assess the
22 potential impact of these domestic wells due to declines
23 in water levels. So I really can't say. I mean, there
24 just was not enough information and data there.

25 Q. Okay. You've heard a little bit from the

1 company that they've replaced water wells if they're lost,
2 right?

3 A. Yes.

4 Q. Is it that simple?

5 A. Two concerns I have there. One I think has been
6 fixed. Originally I read that they would only replace
7 adjudicated wells, and I now understand the company has
8 agreed to replace nonadjudicated wells. And the reason
9 for that is -- and this is true all across the West in
10 prior appropriation systems -- people don't typically
11 adjudicate a domestic or stock well. They adjudicate
12 commercial wells, irrigation wells, municipal wells. So I
13 thought that was unfair. So that's been fixed.

14 The other concern is it states in the permit
15 application that water will be replaced until such time as
16 the essential function of the water has been replaced.
17 Don't hold me to that language. And my question was who
18 makes that determination? Who decides when at some point
19 post-mining the essential function of your well has been
20 returned, therefore, we're done. I don't know who decides
21 that or how you decide it.

22 And then thirdly, finally, as we've heard, it's
23 not that simple to just go out and put in a new well. In
24 this formation there are places where you can get plenty
25 of water. There's lots of places where you can't. So

1 knowing where that is, it's a crapshoot sometimes. And
2 we've heard that experience from a lot of the farmers out
3 there, the ranchers.

4 So, you know, you can spend money and figure
5 that out. You can drill pilot holes and do geophysical
6 logs and you would nail it. But most people can't afford
7 that.

8 Q. So going back to that complexity that we talked
9 about, does that raise any concerns for what you were just
10 talking about?

11 A. It raises the concerns that we don't know enough
12 here in this hydrologic system to make any judgments about
13 risk or about impacts. That's the concern it raises. I
14 can't say there will be major impacts. I just don't know.
15 There's just no way to come to that decision based on
16 what's in there.

17 MS. ANDERSON: Okay. Thank you. That is
18 all the questions I have for you at this time.

19 CHAIRMAN BAGLEY: Let us take a 10-minute
20 break. Be back here right around -- depends on what watch
21 I look at. Let's say 3:48.

22 (Hearing proceedings recessed

23 3:35 p.m. to 3:46 p.m.)

24 CHAIRMAN BAGLEY: Okay. Ready for
25 cross-examination.

1 Mr. Gilbertz.

2 MR. GILBERTZ: Thank you.

3 CROSS-EXAMINATION

4 Q. (BY MR. GILBERTZ) Good afternoon, Mr. Wireman.

5 A. Good afternoon.

6 Q. I have a few questions for you.

7 We have DEQ --

8 MR. GILBERTZ: That is 16, isn't it?

9 MS. ANDERSON: Yes.

10 Q. (BY MR. GILBERTZ) -- DEQ 16 up with the map
11 demonstrating areas marked as already designated AVFs and
12 then the potential AVF acreage. Do you see that?

13 A. Yes.

14 Q. Can you also see on there the lines that
15 delineate sections?

16 A. Yes.

17 Q. Okay. Assuming that these sections meet
18 standard protocol and they're a mile by a mile, can you
19 tell me how wide that AVF is, just roughly, in some
20 places?

21 A. Looks like a third to a half mile.

22 Q. Okay. Now earlier in your testimony, you
23 mentioned that when the river recharges or puts water into
24 the alluvium, it goes out tens or hundreds of feet.

25 A. Yes.

1 Q. From a hydrology perspective, then how can we
2 explain the place where the AVF, which would be an area
3 with this high groundwater table, right?

4 A. Uh-huh.

5 Q. How do we explain it extends much further than
6 that, beyond -- more than just hundreds of feet away from
7 the river itself?

8 A. Other sources of recharge.

9 Q. And what would those other sources of recharge
10 be?

11 A. I indicated groundwater is the primary other
12 source of recharge here. You also get direct
13 precipitation onto the floodplain itself, snow and rain,
14 which is different than the river.

15 Q. Very good.

16 A. Yeah.

17 Q. Now, while we're talking about that other source
18 of recharge -- I'm not going to put these up, but I
19 promise to come back to them for the council two weeks
20 ago, I guess. And in the reclamation plan, there was a
21 statement made by Brook that the -- there are regions
22 where the Carney seam subcrops into Slater Creek or Tongue
23 River alluvial material. And also states that there is
24 infiltration from overlying strata and communication with
25 the river alluvium. Are those statements important, from

1 a hydrological perspective, to you?

2 A. Yes.

3 Q. Why?

4 A. The cross-sections that are included in the
5 permit application, some of those show clearly the coal's
6 dipping beneath the river. And in some locations along
7 this permit area, those coals are very close to the bottom
8 of the river, and as you move east, they tend to be
9 deeper.

10 In any event, where they're close, per the
11 cross-sections, they probably subcrop in -- the alluvium's
12 in contact with the coals or alluvium's in contact perhaps
13 with the sandstone that's on top of the coal, but it
14 results in hydraulic communication between groundwater and
15 the Fort Union formation and the groundwater in the
16 alluvial deposits.

17 Q. Okay. And you say that that connection becomes
18 more pronounced as we move westward?

19 A. My remembrance of the cross-sections is as you
20 go west, the coals dip under the river, but they're
21 closer. They're higher up then as you go to the east.

22 Q. Okay. And you say with that becoming closer to
23 the surface, then there's more of a potential for
24 communication with the AVF?

25 A. That's true. Because the pathways that would

1 allow water to move from the Fort Union, whether it be
2 coals or other portion of the Fort Union up into the
3 alluvium, those pathways are shorter. It's just that
4 simple.

5 Q. And so to close that loop, if that's happening
6 more so on the west, then we're talking about this area on
7 our map that has been designated "potential AVF acreage"?

8 A. And this goes, as you can see, this AVF is
9 essentially the floodplain of the Tongue River, and it
10 goes all the way to the west end of the permit boundary,
11 yeah.

12 Q. Good. Now, I had a question about the drawing
13 you did for us to talk a little bit about potentiometric
14 pressures. And we were looking at this water well that
15 you drew for us. Part of your testimony was a discussion
16 of how the water well analysis did not discuss the impacts
17 of -- to water wells that may not be drilled within this
18 coal seam itself.

19 A. Yes. As I read in the permit application, it
20 states that it was either most majority -- I can't
21 remember the exact word, but many, many of these wells
22 take water from noncoal parts of the Fort Union formation.

23 Q. Why should we even be concerned about that,
24 then, if they're not taking water out of the coal that's
25 going to be dewatered?

1 A. You know, the -- the degree to which groundwater
2 in the Fort Union is connected to groundwater in the
3 alluvium varies across this -- this whole area. The
4 relationship between the coal and the AVFs, if you've got
5 an upper grade, as I indicated on the thing, water's
6 trying to move up. If the water level, potentiometric
7 surface, of the coal is above the river, or even if it's
8 high up in the Fort Union, water wants to move up there.
9 It's an upper gradient.

10 Let's say you have a water level in the
11 alluvium, and the potentiometric surface of the coal is
12 above that water level in the alluvium, that means the
13 direction of flow, to the extent that it occurs, is from
14 the coal into the alluvium. And if you lower the
15 potentiometric surface in the coal to where it is below
16 the water table in the alluvium, goes the other way. Then
17 the potential for flow is down from the alluvium into the
18 coal.

19 And it's been noted in the permit application
20 and in the modeling effort, that there is some places
21 where you -- the coal essentially drains water out of
22 alluvium. And if you mine it and expose it, it will do
23 that. If I recall correctly the model actually did both.
24 It had cells where it took water from the river and some
25 cells gave water to the river.

1 Q. Now, I think you've been clear about this, but I
2 want to be clear and close the loop. Why does any of that
3 matter to us if the coal mining isn't going to happen in
4 the alluvium itself? If we're way up on the hill a
5 hundred yards, 300 yards up and cutting through the coal
6 up there, why does it matter what's going on with the coal
7 as it interacts with the alluvium?

8 A. At any given AVF location, the groundwater that
9 comes into the alluvium, where the AVF occurs, that
10 groundwater, as I've indicated, is -- some of that is --
11 results from river recharge, some of that results from
12 recharge from the groundwater. If you take away the
13 groundwater recharge component of that, you run the risk
14 of lowering that water level in those alluvial deposits
15 below root zone. That's the risk you run.

16 Now, I can't say that will happen, but what I
17 can say is there's absolutely no discussion of it. It is
18 a hydrologic reality that water flows from high pressure
19 to low pressure. It is a reality that there are sandstone
20 units in this Fort Union that transmit water. In all
21 likelihood, there's fractures. It's a semi-consolidated
22 formation. You know, that's a geologic term. It's not
23 like granite. It's not that hard. But it's not just sand
24 either. It's kind of in between. What that means is
25 there's fractures in it and there are pathways in there

1 that water can move. So that delivers those pathways,
2 allow water from that Fort Union to move up into the
3 alluvium and help maintain that water level. So if you
4 cut that off, depending how much that is, you run that
5 risk.

6 Q. But now, again, to kind of further our
7 discussion of how these other aquifers could be impacted,
8 I wonder if you could do me a favor on your drawings for
9 us, if you could. I understood that you, as you've
10 ascribed -- I think all my pens are up there. So would
11 you use a different color so that it will be helpful, like
12 a green, please.

13 First of all, before you start drawing, I
14 understood you to tell us about why these various
15 claystones and sandstones and gravels have become
16 intermixed in your description how the river flowed
17 through historically. And I got this picture of
18 checkerboards of materials sometimes stacked on top of
19 each other and things of that nature.

20 If there was a -- a sandstone aquifer sitting
21 just above the -- the coal seam -- first of all, let me
22 ask you geologically, could that happen?

23 A. Well, sure.

24 Q. Okay. And then we had a person with a domestic
25 well drilled into the sandstone.

1 A. All right.

2 Q. If the water to the coal seam is interrupted --
3 we've kind of heard this discussion I think a couple weeks
4 ago about, well, this is a bathtub. It's fully confined.
5 Whatever happens to the water in it happens to the water
6 in it. So here's my question to you. From a hydrology
7 perspective, if the water in the coal seam is dewatered,
8 what, if any, impact does it have on the aquifer of
9 sandstone that is being used?

10 A. Okay. This is -- let's just look -- let's say
11 you have coal here and it's saturated, there's water in
12 it. And if you were to put a well into this coal -- let's
13 say it's confined by all this overlying Fort Union
14 formation and the alluvium of the Tongue River. So
15 there's a lot of material on top of that coal that results
16 in confining this well. If this water well potentiometric
17 surface is above that sandstone and then you have a sand
18 here that would have potentiometric surface associated
19 with the sand, and if that's -- you know, right now let's
20 say that's here, and now the water wants to move from the
21 coal up into the sand. Okay? Now, if you take all the
22 water out of the coal and this water level goes down here,
23 so then the flow direction's going to go the other way.
24 Then the -- the water in the sand, if it can get there,
25 will want to flow down because it's going from high

1 pressure to low pressure.

2 So a sand directly on top of the coal, in my
3 look at this, would be kind of a continuous water-bearing
4 zone. I wouldn't separate them out. They're both
5 permeable enough so that water will act as a single water-
6 bearing zone. You can call it an aquifer, and then go
7 back to the definition of aquifer. And if it pumps enough
8 water for somebody to use, it's aquifer, pretty much.

9 So that's the risk you run here. And not
10 knowing which portions of this Fort Union that have
11 significant sands that -- and, secondly, if these domestic
12 wells are developed in these sands -- because drillers,
13 you know, I've worked with drillers a long time. They get
14 pretty darn good. They drill a hundred wells out here.
15 They say I know there's a sand here. I know how deep it
16 is and where it is because I've hit it 10 times before.
17 So they look for that.

18 And that wasn't discussed, because the low
19 permeability portions of the Fort Union, where you have
20 claystone and siltstone, you're not going to want to put a
21 well there. It's just not going to get enough water.
22 So...

23 Q. And so the notion that if the domestic water
24 well is drilled into an aquifer other than the coal
25 itself, that, therefore, that aquifer is safe. It is not

1 a --

2 A. No, that's -- that's just not a correct
3 assumption.

4 Q. Okay. Very good.

5 Now, when you were working here with me just
6 now, you used a green marker to draw the sand and items
7 for us, right?

8 A. Right.

9 Q. And, previously, you had used what appears to me
10 to be a bluish marker?

11 A. Yeah. This can be sand and this can be sand.

12 MR. GILBERTZ: Okay. Just so our record
13 becomes clear, I'm not offering this for admission into
14 evidence, but I think it would be good for it to be offered
15 as a demonstrative exhibit to be part of the record so that
16 when someone reads this, they can understand what was being
17 discussed.

18 CHAIRMAN BAGLEY: Any objections? No?
19 We'll accept it as demonstrative.

20 (Fisher Exhibit No. 27D
21 received in evidence.)

22 MR. GILBERTZ: Okay. I think what I will
23 do, then -- we're at 27, correct? So we'll do it as
24 Fisher D27, the D for purposes of designating it as
25 Demonstrative. And I actually just labeled that Fish 27-D

1 instead of D27. Okay.

2 Q. (BY MR. GILBERTZ) Now, I wanted to visit about
3 another item that came up. And as it may relate to this
4 AVF, when I say as it came up, it came up a couple weeks
5 ago.

6 There was a discussion about how much water was
7 going to be removed from the coal. And a figure got
8 thrown out that it was going to be something like .2 CFS
9 was going to be pulled out of the coal. And how that
10 really is meaningless to the flow in the Tongue River.
11 Okay?

12 A. Uh-huh. Yes.

13 Q. My question to you is if you pull .2 CFS out of
14 the coal seam, is it meaningless to the AVF?

15 A. Perhaps not. You know, comparing the amount of
16 dewatering volume that will be taken out of the coals to
17 the flow in the Tongue River is not relevant to the issues
18 here. What is relevant is how will taking that water out
19 of the coals affect the water level in the alluvium?
20 That's really what's relevant here, because, as I've
21 indicated, that water level is very sensitive or crop
22 growth is very sensitive to that water level. So that's
23 where the focus has to be. Tongue River has a lot of
24 water in it. A lot more than these coals do, I'm sure.

25 Q. And I'm sorry to go back to you, but I want to

1 go back to Fisher 27D for just a second and just talk
2 about the well you originally showed us with
3 potentiometric -- yes, the one in blue. And you showed us
4 that water level would go high.

5 A. Depending on how confined this zone is, the more
6 it's confined --

7 Q. Yes.

8 A. -- the more pressure put on it, the higher that
9 goes.

10 Q. Okay. And then to be clear, you said it doesn't
11 take much to pull that water that has been pushed above
12 the coal seam and up the wellbore to draw it down?

13 A. That's right. Because of the low storage
14 coefficients to get, let's say, 15 gallons a minute, which
15 is typical sort of yield for domestic well, 10, 15 gallons
16 a minute. To get that 15 gallons a minute out of this
17 well, you have to lower the water well significantly more
18 than you would in this well.

19 Q. Okay. And so to sort of close that loop a
20 little bit, if -- when the well is first drilled and the
21 water rises to that level that you have shown us on your
22 drawing, and then it begins to be used for domestic
23 purposes, would it be fair, from a hydrological
24 perspective, to say that entire water column remains
25 available for use?

1 A. No. What happens -- it depends on your pump.
2 If your pump has a capacity of 15 gallons a minute and
3 that's what you pump it at, then eventually what's going
4 to happen is this water level is going to lower to a point
5 where the column of water that's here can sustain
6 15 GPM. And I didn't -- it's hard to say where that would
7 be, except for things going to be lower than here.

8 Q. Okay.

9 A. No question about it.

10 And it's fairly typical also for when wells are
11 first drilled and completed in confined aquifers, it takes
12 a while for this to stabilize, even without any pumping.
13 So you don't take this -- well, you can take it when you
14 first drill a well, but really ought to come back a couple
15 weeks and take it again, because that's likely to be what
16 we call static level. The static water level is simply
17 the water level in the well without any pumping. And so
18 it has to equilibrate. So it might not drop much, you're
19 right, but over time it will reach some point where that
20 amount of water can sustain what that pump pumps.

21 Q. Okay.

22 A. That varies all over the place, really.

23 Q. I have this question for you. From a
24 hydrologist 's perspective, based on the work that has
25 been done on the Brook Mine, can you say -- would it be

1 fair to say, from a hydrological perspective at this
2 point, that it has been demonstrated that this proposed
3 operation has been designed to prevent material damage to
4 the hydrologic balance outside the permit area?

5 A. Based on what I've read, it is premature to come
6 to a decision -- or conclusion like that. There simply
7 isn't enough assessment and enough understanding of this
8 system to draw that conclusion.

9 Q. From a hydrologist's perspective, would you say
10 that the proposed operation, based on the information you
11 have now, will not interrupt -- oh, excuse me -- will not
12 materially damage the quantity or quality of water in
13 surface or underground water systems that supply alluvial
14 valley floors in the Tongue River, as you understand it.

15 MR. KUHLMANN: I'm going to object to this,
16 and I should have objected to the last question, but I
17 didn't. This is irrelevant. This is a finding that does
18 not relate to the permit's technical adequacy. It's a
19 finding under 35-11-406(n), which takes place prior to
20 issuance of the permit, and those findings have not been
21 made by DEQ.

22 MS. ANDERSON: And, Dr. Bagley, there's
23 also a requirement to have a Probable Hydrologic
24 Consequences section inside the permit application, which I
25 think is what this testimony goes to.

1 MR. KUHLMANN: That -- I would disagree
2 with that. That was not what the question was. The
3 question was could he make the conclusion under 406(n).

4 CHAIRMAN BAGLEY: Yeah.

5 MS. ANDERSON: And you might have --

6 CHAIRMAN BAGLEY: Thanks for the objection.
7 Go ahead and -- the question seemed clearly worded to me.
8 And we're asking for his expert opinion. Answer that --
9 ask the question.

10 A. Can you repeat it, please?

11 Q. (BY MR. GILBERTZ) I will. From a hydrologist's
12 perspective at this point in time, is there sufficient
13 data and information to conclude, as a hydrologist, that
14 the proposed mining operation would not materially damage
15 the quantity or quality of water in surface or underground
16 water systems that supply the alluvial valley floors as
17 you understand them in the Tongue River?

18 A. I'll give you a two-part answer. It is my
19 opinion that it will reduce the amount of groundwater
20 discharge into the alluvium. Clearly, that's my opinion.

21 Whether or not that does material damage is a
22 bit more of a subjective thing. Material damage, you
23 know, I don't know exactly what the definition of that is,
24 and if there is a definition of statute or regulation, and
25 it's somewhat subjective. But clearly you're going to

1 lower the water level result in that. And if that water
2 level goes down below the root zone, then yes, you get
3 material damage. If I was the farmer growing the alfalfa,
4 I would certainly consider that.

5 MR. GILBERTZ: Very good. I think that's
6 all the questions I have.

7 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.
8 Ms. Boomgaarden.

9 MS. BOOMGAARDEN: No questions. Thank you.

10 CHAIRMAN BAGLEY: Thank you.
11 Mr. Kuhlmann.

12 MR. KUHLMANN: Thank you, Dr. Bagley. I
13 just have a couple of questions.

14 CROSS-EXAMINATION

15 Q. (BY MR. KUHLMANN) I just wanted to clarify for
16 the record, you said that you were not aware of whether
17 there is a definition under regulation for material
18 damage; is that correct?

19 A. I'm not aware.

20 Q. The other thing I just wanted to ask about
21 related to your -- your testimony earlier about Hidden
22 Water Creek.

23 A. Yes.

24 Q. I believe you mentioned that you had looked at
25 some Big Horn reports?

1 A. Yes.

2 Q. Could you identify what those reports are that
3 you looked at?

4 A. Actually, thank you for asking that. That was a
5 bit of a misstatement. That was actually mentioned in the
6 permit application, and that referenced Big Horn Coal. So
7 I did not read a specific Big Horn Coal report. That --
8 that statement that there is water in Hidden Water Creek
9 in the winter was actually mentioned in the permit
10 application on one of the appendices or addendums
11 somewhere. And I can't recall if it's cited -- Big Horn
12 was cited, but I don't recall if it specifically --

13 THE REPORTER: If it specifically?

14 THE WITNESS: A specific report was cited.

15 MR. KUHLMANN: I believe that's all my
16 questions. Thank you.

17 CHAIRMAN BAGLEY: Thank you, Mr. Kuhlman.

18 Mr. Pope.

19 MR. POPE: Thank you, Dr. Bagley.

20 CROSS-EXAMINATION

21 Q. (BY MR. POPE) Good afternoon, Mr. Wireman.

22 A. Good afternoon, Mr. Pope.

23 Q. I'd like to bring the discussion back to really
24 why we're here, and that's the standards for issuing
25 permit under Wyoming law. You would agree that at least

1 at the time you prepared your expert report in this case
2 you discussed with Ms. Anderson, you did not know a whole
3 lot about the Environmental Quality Act?

4 A. Depends how you defined a whole lot. But, yeah,
5 I don't know -- you know, I haven't had an occasion to
6 read it. So from that perspective, you're right.

7 Q. And in preparing your expert report, you didn't,
8 as you just said, read all the Environmental Quality Act,
9 right?

10 A. I did not.

11 Q. You didn't review all the regulations
12 promulgated under the Wyoming Environmental Quality Act?

13 A. Not all, but I read three of them that I think
14 are applicable to my review.

15 Q. You also didn't -- we've heard discussion about
16 what could happen in the future, impacts to water wells,
17 on the board up there. But you didn't do any specific
18 research in preparing your expert report on DEQ's
19 oversight authority of the Brook Mine, right?

20 A. I recall reading some information about their
21 inspections, about their authority to do inspections at
22 any coal mine in Wyoming. And sort of the -- how that
23 worked. But that's all I recall in terms of their
24 oversight.

25 Q. Now, you have no previous Wyoming permitting

1 experience, correct?

2 A. Of any kind of permit?

3 Q. You --

4 A. Or coal mine permits?

5 Q. That's --

6 A. I probably have experience with some kind of a
7 permit at one -- over 30 years. I'd be, you know, hard
8 pressed to recall what it is, but I can tell you exactly.
9 I've been involved with issuance of UIC permits.

10 Q. Let me be more precise, Mr. Wireman. You have
11 never helped anyone prepare a permit application in the
12 state of Wyoming?

13 A. No.

14 Q. In fact, you haven't helped anyone prepare a
15 permit application in any state?

16 A. That is correct. I worked for the federal
17 government, and we don't permit.

18 Q. In your expert report -- and it's actually
19 general finding -- I'm sorry. In your expert report you
20 have some discussion of the adequacy of Brook's bond. Do
21 you remember that being in your expert report?

22 A. Uh-huh. Yes.

23 Q. But you don't know any specifics, under Wyoming
24 law, about how a reclamation bond is calculated, right?

25 A. Not specifics, no.

1 Q. You didn't review DEQ Guideline 12 in asserting
2 that Brook's reclamation bond was inadequate?

3 A. That was not the basis for my conclusion.

4 Q. You also didn't review the statute in Wyoming
5 that governs how to calculate a reclamation bond?

6 A. No.

7 Q. You discussed with Mr. Kuhlmann a moment ago
8 about some information related to Big Horn Coal. I want
9 to follow up on that.

10 You didn't look at Big Horn Coal's permit file
11 or -- to investigate how Big Horn analyzed the
12 hydrogeology in the area it mined, correct?

13 A. I have read some -- some reports, some material
14 that Big Horn Coal put together over the years. I have.
15 And related to TR -- to T-1. And so, yes, I have read
16 some of their material.

17 Q. Let me be more specific. The question was, you
18 did not conduct an investigation of Big Horn Coal's permit
19 file to discover how Big Horn Coal had analyzed the
20 hydrogeology in the region?

21 A. I did not explore their files, no, I did not.

22 Q. I want to talk about something that's sort of
23 lurking under the surface at this whole hearing about
24 Brook's permit commitments. As we discussed at -- at the
25 deposition, you have concerns about whether Brook will be

1 able to carry out its permit commitments. But you would
2 agree you have no proof that Brook Mine will not live up
3 to the commitments it has made as part of the permit
4 application, correct?

5 A. I have concerns, but no proof.

6 Q. I want to shift gears a little bit and talk
7 about how you view the standard for acquiring a permit to
8 mine coal. You and I can agree that a company who wants
9 to mine coal in the state of Wyoming has to look at and
10 rely upon the statutes and regulations that discuss the
11 permitting process, right?

12 A. Yes.

13 Q. But you still think that Brook has to exceed, at
14 least in places, the requirements of Wyoming law to get a
15 permit, in your opinion?

16 A. No. I don't believe that at all.

17 Q. Your testimony here today -- and I want to be
18 clear, I'm not trying to trick you or anything here,
19 Mr. Wireman, I just want to make sure I understand your
20 testimony -- is that you do not believe Brook has to
21 exceed the requirements of Wyoming law to get a permit?

22 A. I don't believe they need to exceed the
23 requirements. The question is what are the requirements.
24 And my statements in my report are based in part on the
25 fact that many requirements require some interpretation by

1 the regulatory agency, DEQ or the coal company. It's not
2 checklist black and white. So there's some times when
3 people have to interpret what is meant by a particular
4 section of the statute or a particular requirement. And
5 sometimes those -- it's open to interpretation, slightly
6 differently, by different people.

7 Q. In forming that opinion about what Brook has to
8 do to get a permit application, you relied on standard
9 hydrogeologic concepts and practices rather than a
10 particular statute or regulation, right?

11 A. Relied upon both.

12 Q. As a result of relying on standard hydrogeologic
13 concepts and practices, you can't say whether some of your
14 opinions are based on a hydrogeology standard or on what
15 Wyoming law requires; isn't that right?

16 A. No, that's not right.

17 Q. Well, I've tried to avoid this to the best of my
18 abilities, Mr. Wireman, but --

19 MR. POPE: Permission to approach the
20 witness, Dr. Bagley?

21 CHAIRMAN BAGLEY: Granted.

22 Q. (BY MR. POPE) Mr. Wireman, I've handed you a
23 copy of your deposition transcript. You remember I guess
24 about a month ago at this point you came to the Denver
25 offices of Holland & Hart for a deposition, right?

1 A. Correct.

2 Q. And you and I had the chance to sit down in a
3 conference room and discuss the opinions in your report,
4 right?

5 A. We sat down and you asked me a whole bunch of
6 questions.

7 Q. Fair enough. And there was a court reporter
8 present who administered an oath to you to tell the truth,
9 right?

10 A. Yes.

11 Q. And you told the truth?

12 A. Yes.

13 Q. If you would turn to page 99 in that transcript.
14 It is a condensed version, so that page 99 appears at the
15 25th page of the transcript.

16 A. I'm there.

17 Q. I'd like to direct your attention to line 7.
18 Question here starts, "Let's be specific about that term.
19 You have lodged a criticism about the hydrogeologic
20 characterization within Brook Mine's permits application.

21 A. Yes.

22 Q. That criticism, the standard used for that
23 criticism is not the standard set out in Wyoming statutes
24 and regulations, rather it is the standard you described
25 as the commonly accepted method of hydrogeologists?

1 A. I can't answer that because I don't know
2 specifically what's in the Wyoming statute, so I can't --
3 so I can't really answer that. Their statute may require
4 a more rigorous characterization. I don't know. You
5 would have to show me the statute."

6 Did I reads that correctly?

7 A. You did.

8 Q. And in part, because you were relying upon your
9 professional experience as a hydrogeologist, you cannot
10 reconcile the data requirements that you spoke about on
11 direct with the data requirements under Wyoming law
12 because you haven't read those statutes?

13 A. I now have read the statutes.

14 Q. So let's be clear. At least at the time of
15 preparing your expert report, which you discussed with
16 Ms. Anderson on direct, you could not reconcile the data
17 requirements you discussed with the data requirements
18 under Wyoming law because you had not read Wyoming law?

19 A. No. I would not say that's true. I can
20 reconcile it. And if you'd like, I can explain.

21 Q. Well, actually, I'd like you to turn back to the
22 deposition transcript. Actually, if you're still on page
23 25, if you look at page 97. I'd like to direct your
24 attention to line 10. Do you see line 10?

25 A. I do.

1 Q. There the question is, "How do you reconcile the
2 standard you set for hydrologic detail with the standard
3 that the Wyoming legislature has set for hydrologic
4 detail?

5 A. I don't know what their standards are, so I
6 can't reconcile that." Did I read that correctly?

7 A. You did.

8 Q. In developing your opinions in this case, you
9 were not trying to develop a model for what's required as
10 part of the Wyoming permitting process, correct?

11 A. I don't know the answer to that because I don't
12 see them as distinct as you do. The statutes require a
13 characterization, and they required it for specific
14 reasons. And I know how to do, based on hydrologic
15 characterizations. And I know what's adequate. I know
16 what is good and what is bad. I now have read the
17 statutes, and based on what the statutes you're asking
18 for, I stand by my decision that it's not adequate.

19 Q. Now that you've read the statutes. Is that what
20 you said?

21 A. Yeah. Yeah.

22 Q. Okay. Let's talk for a moment about what you
23 think of the Department of Environmental Quality. You
24 believe that state agencies don't always pay enough to
25 acquire the best and the brightest people; is that right?

1 A. State agencies, federal agencies, private
2 consultants. It's across the board. Uh-huh.

3 Q. Fair enough, Mr. Wireman. But I asked a pretty
4 specific question, so I need an up or down answer. And
5 I'll re-ask it so there's no confusion.

6 A. Okay.

7 Q. You would agree that states, state agencies, do
8 not always pay enough to get the best and the brightest
9 people to work for them?

10 A. Some state agencies don't often pay enough. I
11 would not say that about every state agency in the country
12 at all. Because some pay plenty.

13 Q. You think that state agencies are typically
14 understaffed, right?

15 A. I wouldn't say typically. I'd say some state
16 agencies are often understaffed, yes.

17 Q. You also think that state agencies are
18 underfunded, right?

19 A. Well, that's, you know, subjective opinion.
20 But, yes, in some cases I do think that.

21 Q. All right. And, in fact, you told me at your
22 deposition that you don't think, based upon the permit
23 application that Brook Mine submitted to DEQ, that DEQ has
24 hired the best and the brightest, right?

25 A. I don't recall saying that to you. You know, I

1 pointed out the issues of state agencies often not being
2 funded enough, which is absolutely true. And that
3 sometimes results in the brightest and the best going
4 somewhere else. Private sector pays more money. We all
5 know that.

6 Q. I just want to be clear. If you turn to page 53
7 of your deposition transcript, and let me know when you're
8 there.

9 A. 52?

10 Q. 53.

11 A. 53.

12 Q. Should be in the top left.

13 A. I'm there.

14 Q. I'd like to direct your attention to line 13.
15 If you'd follow along with me, please. The question here,
16 "Have you come to an opinion on whether Wyoming DEQ has
17 hired, as you say, the best and brightest?

18 A. Well, I have an opinion based on this. If their
19 folks think this plan satisfies these two pieces of law,
20 then, yeah, I have some real suspect -- I have some real
21 concerns about that." Did I read that correctly?

22 A. You did.

23 Q. And, in fact, at your deposition you went on to
24 say that you don't trust DEQ in some regards, right?

25 A. If it's in the transcript, I said it.

1 Q. And the reason I'm asking this line of
2 questions, Mr. Wireman, is despite having opinions about
3 DEQ, you never spoke to anyone at DEQ about Brook's permit
4 application, right?

5 A. I did not.

6 Q. All right. You didn't know any of the
7 qualifications of the people who were reviewing Brook's
8 permit application?

9 A. No.

10 Q. So, for example, you didn't know that
11 Dr. Kuchanur has a PhD in environmental engineering?

12 A. Yes, I did know that, actually. It was in his
13 resume or CV that I have seen, so I knew that.

14 Q. At the time you prepared your expert report, you
15 knew that?

16 A. Probably not at the time I prepared the report.
17 That was March. I probably didn't know Dr. Kuchanur even
18 worked for DEQ.

19 Q. So let me be precise here. At the time you
20 prepared your expert report, in addition to not knowing
21 that Dr. Kuchanur had a PhD in environmental engineering,
22 you didn't know that his doctoral dissertation was on
23 optimizing groundwater models for environmental
24 protection, right?

25 A. No. I did not know that.

1 Q. At the time you prepared your report, you didn't
2 know that Dr. Kuchanur is a lead instructor for the Office
3 of Surface Mining's national training course on the
4 software that Brook used to build its groundwater model?

5 A. No.

6 Q. At the time you prepared your expert report, you
7 didn't know that Dr. Kuchanur taught coal mine permitting
8 hydrology, quantitative hydrogeology and applied
9 engineering principles for OSM either?

10 A. No, I did not.

11 Q. You also, as a result of not talking to anyone
12 at DEQ when you prepared your expert report, you didn't
13 know that DEQ had found that Brook's groundwater model
14 matched industry standards, right?

15 A. I'm not sure what industry standards you're
16 referring to.

17 Q. You didn't know that when DEQ reviewed Brook's
18 permit application, that they used an aquifer database to
19 cross-check the data in the Brook permit application?

20 A. I'm not sure what you mean by that.

21 Q. I'm just asking -- I'm stating you were not
22 aware that DEQ, in its review of the Brook permit
23 application, used an aquifer database to cross-check the
24 data in Brook's permit application?

25 A. No, I wasn't aware.

1 Q. All right. You also didn't know that in
2 reviewing the groundwater portions of the Brook permit
3 application, that Dr. Kuchanur reviewed the methodology of
4 the permit to ensure that it adhered to general industry
5 standards?

6 A. No. I don't know what that means, so obviously
7 I didn't know.

8 Q. You talked a lot about data. You were not aware
9 that in Dr. Kuchanur's review of the input data, that he
10 was able to determine that it was representative of
11 site-specific conditions, right?

12 A. I read that in the report, that they assumed it
13 was representative. I just disagree.

14 Q. I apologize, Mr. Wireman, if I wasn't clear. My
15 question is not about the Brook permit application. My
16 question is you didn't know that as DEQ reviewed the
17 permit application, that Dr. Kuchanur found that the input
18 data was representative of site-specific conditions.

19 A. Well, I knew that it was done because I read it
20 in the permit. I didn't know who specifically made that
21 conclusion. You're right.

22 Q. You also didn't know that Dr. Kuchanur, in his
23 review, ran Brook's groundwater model and evaluated the
24 results of that model?

25 A. Yes, I did know that. I don't know when I

1 learned it, but I do know that, yes. As I understand it,
2 the model was run both by the consultant for Brook Mine
3 and by DEQ. That's my understanding.

4 Q. And at least at the time you prepared your
5 expert report that you discussed with Ms. Anderson, you
6 didn't know that Dr. Kuchanur had confirmed that the
7 results of Brook's groundwater model were consistent with
8 what was found in the field in the area of the permit?

9 A. I knew that's what the permit application said,
10 but I didn't know who at DEQ made that. That's correct.

11 Q. Mr. Wireman, I think we might be getting our
12 wires crossed here. I'm not -- I'm not talking about
13 statements in the permit application. I'm talking about
14 DEQ's review process.

15 A. I never had a discussion with Dr. Kuchanur about
16 anything.

17 Q. So I need to back up so the record is clear on
18 this. In DEQ's review, because you didn't speak to
19 anyone, you didn't know that Dr. Kuchanur confirmed that
20 the results of Brook's groundwater model were consistent
21 with what was found in the field?

22 A. No.

23 Q. And you -- you yourself did not run Brook's
24 groundwater model, right?

25 A. No.

1 Q. Given that you didn't speak to DEQ, you also
2 didn't know that DEQ used conservative estimates in
3 evaluating Brook's permit application?

4 A. Yes, I knew that. Because, again, that's
5 written in the permit application, that they used
6 conservative estimates. I disagree with it, but that's
7 what it said, yes.

8 Q. Again, Mr. Wireman, if we're getting our wires
9 crossed here, I apologize. My question is not about
10 what's in the permit application --

11 A. You asked me if I knew, and I did know.

12 Q. What I'm asking you is, you did not know that
13 DEQ in reviewing Brook's permit application, used
14 conservative estimates as part of that review?

15 A. Yes, I did know that. That comes through pretty
16 clear. I knew DEQ ran the model, and I knew that the
17 permit application said they used conservative values.

18 Q. Okay. You also -- you may have heard testimony
19 a couple weeks ago that DEQ used other sources of data
20 beyond Brook's permit application in evaluating the
21 application, right? Did you hear that?

22 A. Yes, I did hear that.

23 Q. But you didn't speak to anyone at DEQ about
24 these additional sources of data used in the review
25 process?

1 A. No. I looked at the references. Uh-huh.

2 Q. All right. Let's talk about some of your
3 substantive opinions you talked about on direct. You
4 mentioned that there is a potential for unfixable
5 problems. Do you remember that?

6 A. Yes.

7 Q. You weren't aware, at least at the time you
8 prepared your expert report and at the time we talked at
9 your deposition, of any mines in Wyoming with unfixable
10 hydrogeology problems?

11 A. Not in Wyoming.

12 MS. ANDERSON: Objection. I mean -- never
13 mind. I should have raised it --

14 A. But I do at other mines.

15 Q. (BY MR. POPE) And my question is limited to
16 Wyoming mines, and we've got our answer, so --

17 A. Geology is not that different --

18 THE REPORTER: I'm sorry?

19 THE WITNESS: It's okay. I --

20 THE REPORTER: No, say it again.

21 THE WITNESS: Okay. I said geology in
22 Wyoming is not drastically different than other places.

23 Q. (BY MR. POPE) And at least at the deposition,
24 you told me, Mr. Wireman, that you were not aware if Big
25 Horn Coal, in its operations in and around Brook -- the

1 proposed Brook permit area, had any unfixable hydrology
2 problems.

3 MS. ANDERSON: Objection. Relevance. I'm
4 not sure what some other company's past practices have to
5 do with the permit application before us.

6 MR. POPE: Dr. Bagley, he stated that it's
7 all about data and evaluating the data. He has made an
8 assertion that there's a potential for unfixable hydrology
9 problems. I'm getting to the point there are data sources
10 that speak to that that he hasn't reviewed.

11 CHAIRMAN BAGLEY: He did mention that he
12 felt that could happen. I'll allow the question.

13 A. What was the question?

14 Q. (BY MR. POPE) Certainly, Mr. Wireman.

15 You don't know if Big Horn Coal, as part of its
16 operations in and around the proposed Brook permit area,
17 had any unfixable hydrology problems?

18 A. I did not ask them, huh-uh.

19 Q. Let's talk about alluvial valley floors for a
20 moment. At least at the time you prepared your expert
21 report, and at the time we spoke at your deposition, you
22 had not looked at any DEQ decision documents designating
23 certain places in and around the permit area as alluvial
24 valley floors, right?

25 A. Yes, I had. I knew that there had been a

1 determination of an AVF on Slater Creek, and I knew that
2 there were potential AVFs along the Tongue River. But
3 Tongue River, as I understand, they haven't been formally
4 designated.

5 Q. And let me be precise. I think, again, we may
6 be passing in the night here. You did not go and look at
7 any DEQ decision documents in preparing your expert report
8 that designated any AVFs along the Tongue River?

9 A. I think I did. I think I saw a letter dated
10 March 2016. Don't hold me to that. That was a letter,
11 DEQ letterhead, that said we have designated an AVF on
12 Slater Creek.

13 Q. Would you pick up your deposition transcript
14 again for me, please, and turn to page 135.

15 A. It's possible I hadn't seen it at the time of
16 the deposition.

17 Q. Are you at page 135?

18 A. Yes, I am.

19 Q. I'd like to direct your attention to line 19.
20 Do you see that?

21 A. Yes.

22 Q. Question here, "So did you, as part of figuring
23 out how many AVFs there were -- I'm not going to hold you
24 to a number -- did you go look at DEQ's decision documents
25 designating AVFs on the Tongue River?"

1 A. No. It wasn't available to me, or at least I
2 haven't seen it."

3 A. That was probably true at the time, and since
4 then I have seen it.

5 Q. Just a moment, Mr. Wireman. I did read that
6 passage from your deposition correctly?

7 A. You did.

8 Q. Mr. Wireman, are you aware that Wyoming law
9 permits a mine to disturb certain types of alluvial valley
10 floors?

11 A. I --

12 MS. ANDERSON: And I will raise an
13 objection to the extent that calls for a legal conclusion.

14 MR. POPE: Dr. Bagley, there have been
15 numerous questions both by Ms. Anderson and Mr. Gilbertz
16 about his ultimate conclusions about hydrology under
17 Wyoming's permitting requirements. I'm simply asking a
18 similar type question.

19 MS. ANDERSON: I think if he phrases it as
20 his professional understanding of -- that would --

21 CHAIRMAN BAGLEY: Could I hear the question
22 again, please?

23 MR. POPE: Absolutely. The question is,
24 are you aware, Mr. Wireman, that Wyoming law permits mines
25 to disturb alluvial valley floors?

1 CHAIRMAN BAGLEY: Yeah, that's a -- that's
2 not a -- doesn't require a legal analysis, just whether
3 he's aware of something or not. I'll allow that question.

4 A. I'm aware.

5 Q. (BY MR. POPE) Did you know that the Cordero
6 Rojo Mine was able to successfully replace alluvial valley
7 floors in the Belle Fourche River that it disturbed as
8 part of its mining?

9 A. No.

10 Q. Did you know that three other coal mines in
11 Wyoming accomplished similar feats of restoring disturbed
12 alluvial valley floors?

13 A. No.

14 Q. I want to pull DEQ Exhibit 16 back up and
15 discuss a couple of things with you.

16 You spent time talking with Ms. Anderson and
17 Mr. Gilbertz about the potential AVF acreage at the bottom
18 of the screen. Mr. Wireman, you would agree with me that
19 that likely green-shaded potential AVF acreage has not
20 actually been designated as AVF acreage by DEQ?

21 A. That's my understanding.

22 Q. Mr. Wireman, I think you said you drove out
23 somewhere in this area. Did you happen to notice on the
24 north side of that potential AVF acreage the Tongue River
25 ditch?

1 A. No.

2 Q. Are you aware that the Tongue River ditch that
3 is on the north side of that potential AVF acreage serves
4 as recharge to the Tongue River?

5 A. No.

6 MS. ANDERSON: Objection. I don't know
7 where that is found in the permit application or any
8 information, but there was no foundation laid for that
9 question.

10 CHAIRMAN BAGLEY: Well, he did mention that
11 he'd driven the area, and I had one objection, which I
12 overruled.

13 So I'm going to overrule this one and let you
14 answer that question.

15 A. I'd like to hear your question again, Mr. Pope.
16 That it recharges the river? That a ditch recharges the
17 river.

18 Q. (BY MR. POPE) My question, Mr. Wireman, are you
19 aware that water from the Tongue River ditch, the area
20 along the north side of that potential AVF acreage, serves
21 to recharge the Tongue River?

22 A. I'm not aware. And I'd be very surprised if
23 that's the case.

24 Q. Okay. I want to get into your hydrogeology
25 characterization opinions in a moment. I have a couple of

1 quick questions for you about some of the other opinions
2 you had. General finding number one in your expert report
3 is there are variability in the estimates of coal
4 production. Just for purposes of the record, you would
5 agree that there is a single estimate of coal production
6 in Brook's permit application, right?

7 A. Yes.

8 Q. You also make the statement in your expert
9 report -- and this speaks to the cumulative impacts of the
10 Brook Mine, that there needs to be a discussion of the
11 degradation of riparian and fish ecologies that rely on
12 groundwater discharge. Do you recall that in your report?

13 A. Yes.

14 Q. Mr. Wireman, are you aware there are no fish
15 ecologies that rely on water discharge from any of the
16 areas within the proposed Brook Mine?

17 A. I don't know that, if that's true or not. Is
18 that true?

19 Q. I'm asking if you know.

20 A. Oh, I'm not aware of fish ecologies, but I am
21 aware of riparian ecologies.

22 Q. All right. Let's talk for a moment about water
23 wells. You would agree that the Brook permit application
24 has a groundwater model that predicts potential drawdown
25 of water in the proposed permit area?

1 A. I'm not sure I'd agree with that. I don't know
2 that it predicts at all. It attempts to predict.

3 Q. All right. So it sounds like we have a -- a
4 semantic disagreement on that. And that's fine. Were you
5 aware, in your review of the Brook groundwater model, that
6 it took into account the potential reduction of pressure
7 that you discussed in that demonstrative exhibit?

8 A. Can you explain that? It took into account a
9 reduction in pressure for what?

10 Q. Mr. Wireman, you spent some time discussing, as
11 part of that demonstrative exhibit, that changes in
12 pressure could affect water well drawdown, right?

13 A. No. What I said was changes in recharge could
14 affect water levels in the alluvium. That's what I said.

15 Q. Okay. I -- and I guess the transcript will
16 reflect this. I'm going to ask the question anyway. You
17 spent some time discussing how pressure can impact the
18 water level in wells. My question is, are you aware that
19 the Brook groundwater model, its water drawdown
20 predictions, takes into account potential changes in
21 pressure?

22 A. Not specifically, but I'm not surprised.

23 Q. Okay. You said on direct that there is a lack
24 of understanding of where domestic water users get their
25 water. Are you aware that the state engineer's office has

1 drilling logs that indicate the depth and -- the depth of
2 water wells?

3 A. I'm very aware what the water database is, yes.

4 Q. All right. Let's -- let's get into some of the
5 cumulative impacts that you talk about in your report.

6 One of them is they suggest that there needs to be a
7 better discussion of the effect of coal-bed methane. Do
8 you recall that in your report?

9 A. Yes.

10 Q. You're aware -- I guess I should ask this -- ask
11 it this way. Are you aware that the Brook permit
12 application discusses the impacts of coal-bed methane
13 drawdown in 20 different places?

14 A. It mentions it. It does not discuss it.
15 There's a difference.

16 Q. Let's talk about that for a moment. I'd like to
17 go to DEQ Exhibit 12-059. Pull that up on the screen for
18 you. I'm sorry. DEQ Exhibit 12-058. I'm going to blow
19 up a paragraph for you, Mr. Wireman. And this is going to
20 continue on the next page, but I want to start here.

21 Paragraph says, "As described above, the Brook
22 Mine is expected to have an extremely small effect on
23 surface water quality in the Tongue River and other major
24 streams adjacent to the permit boundary of the Brook Mine.
25 As such, no effect on designated uses present on major

1 streams adjacent to the permit boundary is expected." Did
2 I read that correctly?

3 A. Yes.

4 Q. All right. Now let's go to DEQ Exhibit 12-059.
5 Just the last paragraph. The second sentence there,
6 Mr. Wireman, says that "The Target Coal seams are
7 predominantly dry in the western portion of the permit
8 area and eastern portions have been affected by CBNG
9 development." Did I read that correctly?

10 A. Yes.

11 Q. Mr. Wireman, in your review of the permit
12 application, did you look at Appendix D6, where it
13 explains how Brook analyzed the drawdown effects of
14 coal-bed methane?

15 A. I read all Appendix D6. I'm assuming I did,
16 yes.

17 Q. Sticking with the cumulative impacts and the
18 characterization of the area, you -- you stated on direct
19 that you had reviewed some utilities Geological Survey
20 data, correct?

21 A. Yes.

22 Q. Did you review a study conducted by Mr. Barnum?

23 A. I've seen the reference, but, no, I haven't read
24 the report.

25 Q. Did you review the study that the USGS did by

1 Mr. -- Driscoll and Carter?

2 A. I might have. Can you tell me the name.

3 Q. Those are the authors of the study.

4 A. Yeah, but I'd have to know the name of the
5 report. I can't remember it by author. I read many,
6 many, many USGS reports, so...

7 Q. Mr. Wireman, it's true that you, in analyzing
8 how the Brook permit application characterizes the
9 hydrogeology, you didn't review all the available historic
10 data on the area, correct?

11 A. Probably not all of it, no.

12 Q. You made some comments that you just think
13 it's -- it's unlikely or -- and I apologize. I forget the
14 exact phrase you use. But you think it's unlikely that
15 Brook's assertion that the groundwater in the area is
16 isolated is likely to be true, right?

17 A. I don't believe it's true. I don't believe it's
18 isolated.

19 Q. But you didn't do any independent studies to
20 determine whether or not the groundwater within the Brook
21 permit area is isolated or not, right?

22 A. I've read a number of studies about groundwater
23 in the Fort Union formation, but I have not personally
24 conducted those studies.

25 Q. Now, you express some opinions in your expert

1 report that call into question whether or not the western
2 area of the permit area is dry, right?

3 A. It's termed as predominantly dry, partially dry.
4 I've heard all those terms. And it's really kind of hard
5 to figure out what that means. I think of it as variably
6 saturated. That's the term I would use.

7 Q. Are you aware that Addendum MP-3 Brook cited to
8 data available from the Big Horn Coal permit that says
9 that Big Horn Coal did extensive exploratory drilling and
10 confirmed no aquifers?

11 A. That depends on how you define an aquifer.
12 Yeah, they determined that, but doesn't mean I agree with
13 it.

14 Q. Are you -- are you also aware that the Brook
15 permit application indicates that baseline studies showed
16 the area above the Masters coal seam is not a robust
17 water-bearing interval?

18 A. I have no idea what the term "robust" means, so
19 I can't really answer that question.

20 Q. Mr. Wireman, I'm just asking, are you aware that
21 the permit document states that baseline studies indicate
22 the area above Masters coal seam is not a robust --

23 A. If it's in the permit application, I probably
24 read that, yes.

25 Q. Mr. Wireman, are you aware that in Appendix D6

1 there are logs and resistance data that show the
2 overburden is dry based upon drilling that Brook
3 conducted?

4 A. At the locations of those tests.

5 Q. All right. And you're also aware, I would
6 assume, from reading permit application, that one of the
7 reasons that drilling took place on the eastern side of
8 the permit application was because DEQ and Brook had
9 collaborated to locate those wells based upon available
10 data showing the dryness of the western portion of the
11 permit area?

12 A. I'm aware that they collaborated. I have no
13 idea what their criteria were for locating those wells.

14 Q. Let's go to DEQ Exhibit 6-025. We're going to
15 blow up a paragraph here for you, Mr. Wireman. Can you
16 see that okay?

17 A. Yep. I can.

18 Q. This states that "In a July 15, 2013 meeting
19 between RAMACO and WDEQ/LQD to discuss acquisition of
20 baseline at RAMACO's Brook Mine property, it was the
21 consensus of the group, based on recent and historical
22 drilling, that areas of the RAMACO Brook Mine property
23 contained -- contain limited groundwater resources and
24 could be dry." Did I read that correctly?

25 A. You did.

1 Q. All right.

2 A. I have no idea what it means, but you read it
3 correctly.

4 Q. Sure. You mentioned that you considered the
5 area to be variably saturated is the word -- phrase you
6 used?

7 A. The coal -- the coals that are outcropping and
8 close to the surface. The deeper coals are completely
9 saturated.

10 Q. Let's go to DEQ Exhibit 6-265. Mr. Wireman, I'd
11 like to direct your attention to the middle of the first
12 paragraph. There's a sentence that starts "after." Do
13 you see that?

14 A. Yes, I do.

15 Q. And that sentence states, "After discussion with
16 WDEQ and analysis of historic well data surrounding the
17 permit area, a cluster of wells in the eastern portion of
18 permit was chosen because the coal seam aquifers in the
19 western portion of the permit area were dry, or exhibited
20 very little saturation." Did I read that correctly?

21 A. You did.

22 Q. All right. There was some discussion on direct
23 about the lack of data on rainfall and major storm events,
24 and that's also an opinion you reach in your expert
25 report, right?

1 A. Yes.

2 Q. Are you aware that in the latest estimate done,
3 the State of Wyoming has reduced the predicted number of
4 probable maximum floods in the years to come?

5 A. The State of Wyoming?

6 MS. ANDERSON: Objection. I don't know
7 where this is in evidence. I don't know if Mr. Wireman's
8 ever seen this. I don't know where this is coming from.

9 MR. POPE: Dr. Bagley, this is another
10 question about whether he is aware. His opinions were all
11 based upon Brook having a limited set of data. I'm
12 inquiring into the data that he looked at to reach that
13 conclusion.

14 CHAIRMAN BAGLEY: Could you ask the
15 question --

16 MS. ANDERSON: We can always get --

17 CHAIRMAN BAGLEY: -- again?

18 MS. ANDERSON: -- the source of the data.

19 CHAIRMAN BAGLEY: I just want to hear the
20 question again.

21 MR. POPE: Absolutely. The question is,
22 are you aware that in the State of Wyoming's latest
23 estimate, it has reduced the predicted number of probable
24 maximum floods.

25 MS. ANDERSON: And I'm not clear what the

1 source of this information is. And I don't know if
2 Mr. Wireman can answer the question without a little bit
3 more --

4 A. I can answer that question. I have no idea
5 about Wyoming efforts to predict floods. My comments
6 weren't based on that.

7 MR. POPE: That frankly answered my
8 question, as to whether he is aware of that information or
9 not.

10 CHAIRMAN BAGLEY: Yeah. Let me decide
11 whether you should answer the question or not next time.

12 THE WITNESS: Okay. I'm sorry.

13 CHAIRMAN BAGLEY: Thank you. Go ahead,
14 Mr. Pope.

15 MR. POPE: All right.

16 Q. (BY MR. POPE) Now, in your expert report in
17 describing some opinions about storms and flooding, you
18 didn't rely, at least in drafting the report, on a statute
19 or regulation for including a more detailed discussion of
20 large storm events, right?

21 A. No, I did not.

22 Q. Let's talk about the conceptual model. You have
23 some opinions about the lack of a conceptual model for the
24 Brook Mine plan. You read the mine -- you read the mine
25 plan. So you're aware that Section 2.0 of Addendum MP-3

1 contains the conceptual model that Brook used.

2 A. No. It's entitled Conceptual Model. I disagree
3 that it contains the conceptual model.

4 Q. That clarifies that.

5 There was some discussion on direct about you
6 questioning whether the Tongue River is a losing stream.
7 I'd like to go to DEQ Exhibit 12-201.

8 Mr. Wireman, I'd like to direct your attention,
9 I think it's the third sentence that begins with
10 "Conceptually." Do you see that?

11 A. Yes.

12 Q. And I apologize. I'm going to read some more to
13 you. Just kind of how you have to do it on cross. It
14 says, "Conceptually, evapotranspiration from the
15 vegetation along the Tongue River would indicate that
16 throughout the model domain the Tongue River is a losing
17 stream. Throughout most of the model domain where the
18 Tongue River is present, there are overburden strata with
19 low permeability between the Tongue River alluvium and the
20 coal seams which hydrologically isolate the Tongue River
21 from both the Masters and the Carney coal seams." Did I
22 read that correctly?

23 A. You did.

24 Q. In your expert report -- and I apologize, I'm
25 sort of circling back to something we covered a little bit

1 ago -- you stated that you could not find wells located in
2 specific aquifers or the wells that will be affected by
3 drawdown. My question here is, are you aware that
4 Figure 4.9-1 and Figure 4.9.11 in the mine plan contain
5 that information?

6 A. Contain what information? I did not understand
7 your question. The first part of your question.

8 Q. Let me re-ask it. And if it helps, I'm looking
9 at page 8 of your expert report. At first full paragraph
10 on the page, you pose several questions. Where are the
11 locations of wells completed within specific aquifers,
12 where is the existing domestic well with predicted
13 drawdown of 25.8 feet, where are the additional targets on
14 the -- along the Tongue River alluvium. The data is
15 insufficient to draw appropriate conclusions."

16 My question is, based upon that opinion, are you
17 aware that Figures 4.9-1 and 4.9.11 within the mine plan
18 contain the data you are asking about?

19 A. I have no idea if it contains the data I'm
20 asking for.

21 Q. Okay.

22 A. My sense is it doesn't or I would have known.

23 Q. All right. You -- you discussed on direct that
24 there is inadequate monitoring of the underburden,
25 overburden and interburden in a permit application. I'd

1 like to go to -- actually, in the effort to avoid reading
2 to you, and since we're almost near 5:00, I'll ask the
3 question this way. Are you aware that in D6, within the
4 mine permit application, it discusses that no wells were
5 completed in the overburden or interburden because
6 drilling operations did not show any water in those
7 strata?

8 A. I'm aware of that statement, yes. Doesn't
9 change my opinion.

10 Q. Just a few more questions for you, Mr. Wireman.
11 You stated on direct that you believe that two
12 to three years minimum is required to gather sufficient
13 data. You do not have a specific Wyoming statute or
14 regulation that you contend requires two to three years of
15 data collection?

16 A. I didn't suggest that.

17 MR. POPE: Thank you, Mr. Wireman. I have
18 no more questions.

19 THE WITNESS: Thank you.

20 CHAIRMAN BAGLEY: Does council have any
21 questions?

22 COUNCIL MEMBER AGOPIAN: No.

23 CHAIRMAN BAGLEY: I have no questions
24 either.

25 About how long do you -- would you like for

1 redirect? It's 2 minutes to 5:00, but --

2 MS. ANDERSON: Yeah. More than
3 five minutes, so...

4 CHAIRMAN BAGLEY: More than five minutes?

5 MS. ANDERSON: Yeah. So if we need to be
6 out of here by 5:00...

7 CHAIRMAN BAGLEY: So we'll --

8 MR. RUBY: I've been given permission to
9 stay after 5:00 if you want to stay. The only thing that
10 has to happen is when people leave, you have to go out this
11 side door here. You cannot go out the front door. It has
12 to be this side door right here.

13 THE WITNESS: I understand.

14 CHAIRMAN BAGLEY: About how long, do you
15 think?

16 MS. ANDERSON: I don't know. We'll see.
17 Probably 15, 20 minutes, maybe.

18 CHAIRMAN BAGLEY: All right.

19 MS. ANDERSON: Maybe half an hour. I don't
20 know.

21 CHAIRMAN BAGLEY: Let's go ahead and finish
22 this up. Go ahead and do your redirect, Ms. Anderson.

23 MR. POPE: Dr. Bagley, sorry. I have a
24 question. I know Ms. Anderson indicated that Ms. Spencer
25 was going to testify some more. I don't know if she's

1 still on the line? And also is that still the plan?

2 MS. ANDERSON: She's going to be here at
3 8:30 tomorrow morning.

4 MR. POPE: I don't know if that impacts the
5 plan you talked about.

6 CHAIRMAN BAGLEY: Oh. Yeah. Good
7 question. Let's go ahead and finish redirect on
8 Mr. Wireman.

9 THE REPORTER: Can you remove your
10 computer from that height?

11 MS. ANDERSON: Oh, yeah. Sure. Yes.

12 REDIRECT EXAMINATION

13 Q. (BY MS. ANDERSON) Okay. Mr. Wireman, I'll
14 start with a question you were asked about the definition
15 of material damage. And just in the interest of not
16 having you purger yourself, do you remember some
17 conversations we've had about long-term impairment and
18 significant damage and --

19 A. Yes.

20 Q. -- things like that in the regulations?

21 A. Yes, I do. And that's -- you know, that's -- to
22 some degree it's broad language. And so what constitutes
23 material damage on one part might not on another. So it's
24 a little bit subjective. But long-term damage to a
25 hydrologic system is a different issue because it's

1 permanent, and it does result in an impact that sometimes
2 is significant and sometimes is not --

3 Q. Okay.

4 A. -- in terms of human use.

5 Q. Okay. So you're generally familiar with
6 material damage and how that applies to both the
7 hydrologic system and then separately to the alluvial
8 valley floors?

9 A. I'm very familiar with the concept in the term.
10 It's used in environmental statutes and laws around the
11 country, and it's just -- it's undue damage. It's damage
12 that people don't want and have a difficult time dealing
13 with.

14 Q. Okay. And so based on that, do you believe in
15 your opinion, that there is a lack of data in the permit
16 application to prevent material damage outside of the
17 permit area?

18 A. I don't think there's enough data and assessment
19 in this application to make that determination.

20 Q. Okay. All right. You were asked a lot about
21 the qualifications of Dr. Kuchanur. Now that you've
22 reviewed his CV and you know a little bit more about him,
23 does that change any of your opinions or concerns about
24 the adequacy of this permit application?

25 A. No.

1 Q. Okay. You were asked a couple of questions
2 about whether you had ever worked as a consultant to
3 prepare a permit application for a coal mine in Wyoming.
4 Do you remember those questions?

5 A. Yes. Yes.

6 Q. So for this review that you did for us, were you
7 actually preparing a permit application?

8 A. No.

9 Q. What were you doing?

10 A. I was reviewing a permit application. And I've
11 reviewed permit applications in the past. I've never
12 prepared a permit application. And I've never reviewed a
13 coal mine permit application in Wyoming.

14 Q. Okay. So there's a little distinction between
15 whether you prepared it or reviewed it and --

16 A. As I said, my career at EPA, we did not permit
17 coal mines, but we reviewed a lot of coal mine permits,
18 so -- for adequacy.

19 Q. Okay. You were asked some questions about, you
20 know, this issue kept coming up about regulatory
21 requirements versus industry standards. Do you remember
22 those questions?

23 A. Yes.

24 Q. So based on your experience as a scientist who
25 works for a regulator, do you have anything to say about

1 how industry standards inform regulatory requirements?

2 A. Yes. I appreciate the question. As we went
3 through some of this last material that Mr. Pope was
4 asking about the statements in the permit that I simply
5 flat-out just disagree with, you know, the base there -- a
6 statement that all the western portion of this is dry
7 based on one or two drill holes, I just don't think is
8 adequate. There are -- there's water in old drill holes
9 way to the west. If you work at the potentiometric
10 surface maps, one of the wells they used is way to the
11 west and it comes all the way across. So there's clearly
12 water in those coals across the entire permit area. As to
13 how much water, it's really difficult to say.

14 The other thing you notice, some of their
15 statements were saying in July of this year it was dry.
16 Well, that could be true. But what about April of this
17 year, was it dry? You cannot make an assumption based on
18 one piece of data from one time from one place that that
19 represents this entire permit area. It does not. And
20 that's really, in my view, stretching it, to make those
21 kind of conclusions based on this very limited amount of
22 data.

23 Secondly, you know, if you read these statutes,
24 you know, they're very clear in my mind about what you
25 need to do, the types of data that you have to prevent --

1 or present enough data and assessment to minimize -- to be
2 able to minimize perturbation -- or perturbations to the
3 hydrologic balance. You have to do that. It says that in
4 the statute. You have to have a mine plan designed to
5 prevent material damage. I just didn't see any of that in
6 this permit where they can say we assessed it. We've done
7 this. Here's what's going on. Here's how we prevent
8 material damage. That is not discussed in this permit
9 application.

10 So it's a -- in my opinion, you cannot make
11 conclusions over an area this large based on a couple of
12 pieces of data from one location and assumptions about the
13 rest of the area.

14 Q. Okay. You got a lot of questions about permit
15 application says this, permit application says that, and
16 permit application maybe proved some things. Do you have
17 an opinion whether the permit application gives a lot of
18 proof or does it draw a lot of assumptions?

19 A. You know, my expertise and my testimony is
20 related to what -- from a scientific point of view, what
21 constitutes an adequate characterization and assessment of
22 the hydrologic system in a given watershed, a given
23 aquifer, a given place. That's what I am good at. That's
24 what I have been doing. I've tried to relate that to the
25 statutes in Wyoming, which are fairly broad, but which say

1 you need to generate enough data and understanding to make
2 these decisions. So there's a connection there. And I
3 just don't believe that's been done, that they have enough
4 data and understanding to say they have satisfied
5 35-11-406(b) or 406(n). They just don't have enough data
6 to be able to say this will prevent material damage.
7 Can't say that. And I don't think it is said anywhere in
8 the permit application, in all honesty. If it is, it will
9 have to be pointed out.

10 So that's really what -- there is a connection
11 between these two. And the statute assumes an adequate
12 characterization. But an adequate characterization is not
13 guaranteed by the statute. They're different. And so
14 that's where the professional scientist has to come in and
15 say given what I know, given this situation, here's what
16 adequacy is from a characterization point of view, and
17 then say okay, have we met what the statute says.

18 Q. And then draw conclusions based on that?

19 A. (Witness nods head.)

20 Q. Okay. You were asked a little bit about the
21 Tongue River ditch.

22 A. Yeah.

23 Q. And whether the ditch recharges --

24 A. The river.

25 Q. -- the river?

1 A. I don't know what that means. Is the ditch
2 water -- it's taken out of the Tongue River. You are
3 meaning then it goes right back into the Tongue River and
4 recharges the river? I don't really understand a ditch
5 that takes water out up here and then puts back in the
6 river down here. I would assume the water's used for
7 irrigation.

8 Q. Right. So what's your understanding of what a
9 ditch does?

10 A. Probably what's happening is there's leakage out
11 of the ditch. It happens in almost all ditches throughout
12 the West, where diversion ditches transport water to the
13 head of the field. There's some leakage out of the bottom
14 of those ditches, and that leakage becomes what we refer
15 to as return flow. It gets in the subsurface. It moves
16 typically to a stream or something nearby. I have no
17 doubt the ditch does that.

18 But remember, the ditch doesn't run year-round.
19 You know, ditches out here don't run year-round. They're
20 used for agriculture. So probably most of the months
21 during the year the ditch isn't running. I mean, I don't
22 know that for sure. I don't know the ditch. But if it's
23 an agricultural ditch, it's not going to run year-round.

24 So you have a finite amount of recharge into
25 this alluvium from this ditch. That is not sufficient in

1 and of itself, in my view, to sustain the water levels
2 needed in the alluvium.

3 Q. Okay.

4 A. But it's a contributor.

5 Q. And I think there was some questions about the
6 river specifically, but -- I mean, do you want to draw a
7 distinction between the river and Tongue River alluvium?

8 A. Absolutely you have to draw that distinction,
9 yeah.

10 Q. Okay. You also were asked some questions, and I
11 hope I get this right because I was taking notes, but I
12 might have missed it, about the aquifer above the Masters
13 coal seam, and there was a phrase about robust.

14 A. Yeah, you know, that's -- let me explain that.
15 There's a definition of an aquifer that is absolutely
16 standard and used all across the United States. And it --
17 it's actually quite simple. It just says geologic
18 formation, part of a formation or group of formations,
19 that will yield usable amounts of water to a well. That's
20 it.

21 You know, I live in a place in Colorado where my
22 well makes 7 gallons a minute. And nobody east of the
23 Mississippi would spend a nickel on a well that gets
24 7 gallons a minute. But in my world that's huge. It's
25 absolutely a huge amount of water. So usable just depends

1 on a lot of things. For a domestic well, 15 gallons a
2 minute is pretty good. For irrigation you needs more.

3 So the point is the Fort Union is an aquifer
4 throughout most of its occurrence. It just doesn't yield
5 a lot of water in some places, many places. But in other
6 places it does yield a lot of water. So I don't think
7 that's a fair term. I don't know what's meant by robust.
8 If there's some quantitative measure there. But clearly
9 with 357 wells in this formation, it's an aquifer.

10 Q. So, in your opinion, there's not generally a
11 robust qualifier to definition of aquifer?

12 A. I've never heard the term or seen the term in a
13 textbook. I'm not sure what it means.

14 Q. Okay. Can I get back to using my computer -- or
15 this computer that my stuff is on?

16 CHAIRMAN BAGLEY: Yeah. Looks like
17 we're --

18 MR. RUBY: He's getting it.

19 CHAIRMAN BAGLEY: He's getting the cable.

20 Okay. There you go.

21 MS. ANDERSON: Great. Thank you.

22 If I could change the number in that box, it
23 would be easier, but I tried it earlier and I couldn't,
24 so...

25 Q. (BY MS. ANDERSON) I'm pulling up DEQ Exhibit

1 12, page 201.

2 And, Mr. Wireman, you were asked some questions
3 about -- about these sentences here about
4 evapotranspiration and -- do you remember those questions?

5 A. I do.

6 Q. Do you have anything to say in addition to what
7 you already testified to?

8 A. I'm confused about how evaporation from the
9 vegetation indicates that Tongue River's a losing stream.
10 It indicates that the plants have access to water, but it
11 doesn't automatically indicate that that water comes from
12 the stream. It can come from groundwater. But clearly
13 you know, evaporation's a real thing. You can measure it.
14 But I don't really agree or understand how conceptually
15 the fact that there's evapotranspiration from the
16 vegetation indicates the Tongue River's a losing river. I
17 don't get that connection.

18 Q. Okay. And so it's your opinion that the permit
19 application is -- if this is a conclusion that's drawn,
20 it's lacking in the data, this is a foregone conclusion?

21 A. There is no data in this permit application --
22 it's easy to determine if the stream is losing or gaining.
23 It's not a difficult thing to do. You can measure flow
24 here and measure it here and if you lose flow, it's
25 losing. If you gain flow, it's gaining. That wasn't

1 done, to my knowledge. There's only one flow gauge on the
2 Tongue in this area, and one gauge won't do it.

3 There are other ways to do it, with tracing and
4 other more complicated ways, but you can clearly do it.
5 It's just not that difficult. So it should have been
6 determined, because it's a -- it's an important factor
7 with respect to the alluvial deposits and the AVFs as to
8 what the Tongue River's really doing, its hydraulic
9 connection with the alluvium. And it's just not
10 determined enough to make many conclusions.

11 Q. Okay. To further the reading exercise here,
12 would you agree that this sentence also has the word
13 "conceptually" in it, and based on your experience, what
14 does that generally mean?

15 A. I think -- and, you know, I didn't write this.
16 So let's just state that up front. But if I had to sort
17 of decipher this, I would say that they -- you need to
18 have some basis for modeling the river as a losing river
19 in the model. This is the basis for that. That would be
20 my guess at what this meant, but it's not.

21 Q. And is conceptually --

22 A. There's no data.

23 Q. Yeah. And is conceptually generally a qualifier
24 to mining?

25 A. Yeah. I could say, you know, conceptually the

1 evapotranspiration means there's water the plants are
2 getting to. That's true. But what does it mean? I mean,
3 it doesn't help in terms of furthering our understanding
4 about the AVFs and the alluvial process. Doesn't happen
5 with that.

6 Q. Okay. Mr. Wireman, you were asked some
7 questions about weather data and precipitation
8 specifically. And recognizing you're not a climatologist,
9 do you have any further response to the question asked
10 about --

11 A. Yeah.

12 Q. -- how recent data matters here?

13 A. The reason I brought that up --

14 MR. POPE: Objection. There was no
15 question about recent data. There was a question about
16 predict the estimates of probable maximum floods.

17 MS. ANDERSON: Then that's fine.

18 Q. (BY MS. ANDERSON) Then let's talk about that.

19 A. And the reason that comment is in my report is,
20 first of all, there's no empirical recharge data here.
21 None.

22 Secondly, we know that a significant portion of
23 the recharge comes from precipitation. If you don't have
24 recharge data and you have to put in the model some number
25 for recharge, it's pretty standard to use precip. But

1 there's no precip after 1973. No precip data. Since
2 1973, all across this country, we know that there are more
3 intense storms. They're more frequent. It happens. And
4 so that combined with what I read in the permit
5 application, which says that the water control structures
6 here are designed for 24-hour, 10-year storm, I believe is
7 what it said. And in my opinion, that's just not enough.
8 I think there's high likelihood you'll get bigger storms
9 than that. A very high likelihood. So it should be
10 designed for something bigger. That was the whole reason
11 behind that.

12 And you can't really -- you know, without the
13 data on recharge, without the data on precip, without the
14 data on how many storms of certain magnitudes that have
15 happened in the last 10 years, you don't know. You don't
16 know what to do, you know? So that data's critical and
17 it's not there.

18 Q. Okay. You also have in your report a little bit
19 about subsidence and damage that can be resulting to the
20 hydrologic balance, alluvial valley floors. Could you
21 tell us a little bit more about that?

22 A. Yeah, when you -- when you construct these
23 panels, these box cuts or trench cuts of X feet long, and
24 you cut down through the coal, you mine the coal. There's
25 two things that happen there in terms of the hydrologic

1 balance.

2 As I said, you create these giant voids with
3 automatic miner. And those are there. If they collapse
4 in the future, then the groundwater flow pattern in the
5 coals is altered. The recharge still happens up in the
6 outcrop areas. It flows down these coals now and comes to
7 this jumbled-up mess of low permeability material and it
8 will not reach the alluvium in the same place or the same
9 time it did before. That could have an effect on those
10 AVFs. That's one thing.

11 Other thing is just if they fill with water and
12 become storage, then what? Where does it go? Can't fill
13 up -- can only fill up so much. So my point is that
14 should have been addressed, because mining, particularly
15 when those panels are parallel to the river, will, in
16 fact, cut off recharge. And they can put it back. I've
17 seen this happen a number of times over the years. The
18 water's collected, just put back in down -- downhill or
19 downgradient of the disturbance. We've required many
20 times.

21 But I didn't see any of that kind of discussion
22 here. So that gets partly to what I'm saying can't be
23 fixed. You can't go into those void spaces filled with
24 low material, jumbled-up stuff and take it out and replace
25 it. It can't be done. Perhaps could be done, but

1 certainly won't be done. So those are some of the things
2 that are unfixable.

3 The CBM is another example. Eighty to a hundred
4 feet water level declines. The model modeled that as
5 boundary but because it's over there. But has it
6 recovered? How much has it recovered? It hasn't
7 recovered very much. That could very well be a permanent
8 thing, or a -- such a long-term thing that it becomes not
9 fixable. And it wasn't fixed. I mean, look at what CBM
10 did. Has any of that been fixed? Has any of those water
11 levels come back? No.

12 You have to really be careful with hydrologics.
13 It's not as straightforward as engineering, where you
14 build something, you can fix something. But we didn't
15 build the groundwater flow system, so it's little hard to
16 fix sometimes.

17 Q. Okay. Is there anything else you'd like to tell
18 the council today?

19 A. I would just encourage the council to consider
20 very strongly completing the task of the characterization.
21 Just getting it finished and getting a better hydrologic
22 characterization on the record for the public, for
23 everybody to see, and then that just brings a lot more
24 comfort, in my mind, to -- to assuring everybody that
25 there will be minimal impacts from this, so...

1 MS. ANDERSON: Okay. Thank you, Dr. -- or
2 Mr. Wireman. I just upgraded you. That's all I have for
3 you today. Thank you.

4 CHAIRMAN BAGLEY: Thank you, Mr. Wireman.

5 THE WITNESS: Yep.

6 CHAIRMAN BAGLEY: And we are recessed until
7 8:30 tomorrow morning.

8 (Hearing proceeds beings recessed

9 5:17 p.m., June 7, 2017.)

BEFORE THE ENVIRONMENTAL QUALITY COUNCIL

STATE OF WYOMING

IN RE BROOK MINE APPLICATION Docket No. 17-4802

TRANSCRIPT OF HEARING PROCEEDINGS

VOLUME VII

PURSUANT TO NOTICE duly given to all parties
in interest, this matter reconvened for hearing on the
8th day of June, 2017, at the approximate hour of
8:30 a.m., at the Wyoming Game & Fish, Elk Room, 5500
Bishop Boulevard, Cheyenne, Wyoming, before the Wyoming
Environmental Quality Council, with Chairman David Bagley,
presiding, and Council Member Nick Agopian in attendance.
Mr. Ryan Schelhaas, Wyoming Attorney General's
Office, Attorney for the Council; Mr. Jim Ruby, Executive
Director to the Council; Mr. Joe Girardin, Business Office
Coordinator, were also in attendance.

1 P R O C E E D I N G S

2 (Hearing proceedings reconvened

3 8:30 a.m., June 8, 2017.)

4 CHAIRMAN BAGLEY: You have choice of
5 hearing entertainment today. We could all be listening to
6 former FBI director getting grilled by the Senate, but I'm
7 glad you're here instead.

8 So good morning. It's 8:30 a.m., June 8, 2017.
9 I am Dr. David Bagley, the hearing officer in Docket
10 17-4802 in regards to Brook Mine, LLC.

11 Present today from the council are Nick Agopian
12 and myself. Council Members Fairservis and Degenfelder
13 have recused themselves.

14 Parties present today are -- and, again, I'll
15 allow you to introduce yourselves. We'll start with Brook
16 Mine, LLC.

17 MR. POPE: Thank you, Dr. Bagley.

18 Jeff Pope, Isaac Sutphin, Tom Sansonetti,
19 and Carri Svec from Holland & Hart.

20 CHAIRMAN BAGLEY: Thank you.

21 DEQ.

22 MR. KUHLMANN: Andrew Kuhlmann and
23 James LaRock, Wyoming Attorney General's Office,
24 representing the Wyoming Department of Environmental
25 Quality, Land Quality Division.

1 CHAIRMAN BAGLEY: Thank you.

2 Powder River Basin Resource Council.

3 MS. ANDERSON: Good morning. Shannon

4 Anderson on behalf of Powder River Basin Resource Council.

5 CHAIRMAN BAGLEY: Thank you.

6 The Fishers.

7 MR. GILBERTZ: Jay Gilbertz from Yonkee &

8 Toner for Mary and David Fisher.

9 CHAIRMAN BAGLEY: Thank you.

10 Big Horn Coal.

11 MS. BOOMGAARDEN: Good morning.

12 Lynn Boomgaarden, Crowley Fleck, on behalf of Big Horn

13 Coal.

14 And with me today again is Mr. Jordan Sweeney.

15 CHAIRMAN BAGLEY: Thank you.

16 Also present for the council, Jim Ruby, Executive

17 Officer; and Joe Girardin, Council Business Coordinator;

18 and Ryan Schelhaas from the Attorney General's Office.

19 This hearing is being held in the Elk Room, Game

20 & Fish Commission, 5400 Bishop Boulevard, Cheyenne,

21 Wyoming. There is a court reporter present.

22 So today we will continue from where we finished

23 last night. I believe, Ms. Anderson, you have a witness to

24 recall.

25 MS. ANDERSON: I do. And, Dr. Bagley,

1 before we do that, I just wanted to note for the record
2 that I have placed over with our exhibits our demonstrative
3 Exhibit 93, which is Dr. Marino's PowerPoint with -- which
4 was our already-filed exhibit with some additional slides
5 he prepared for demonstrative purposes; Exhibit Number 94D,
6 which was document Dr. Marino prepared; and then
7 Exhibit 95D, which is the PowerPoint Mr. Wireman went
8 through in his presentation.

9 CHAIRMAN BAGLEY: All right. Thank you.

10 MS. ANDERSON: And for Ms. Spencer, do I
11 need to go there?

12 MR. GIRARDIN: Yes.

13 MS. ANDERSON: Okay.

14 CHAIRMAN BAGLEY: Ms. Spencer, can you hear
15 me?

16 THE WITNESS: Yes, I can.

17 CHAIRMAN BAGLEY: This is Dave Bagley.

18 Just to remind you, you're still under oath.

19 THE WITNESS: Okay. I'm here.

20 MS. ANDERSON: Okay. Sue, can you hear me?

21 THE WITNESS: Yes.

22 MS. ANDERSON: Okay. Thank you. I just
23 have a couple of additional questions for you.

24

25

1 SUE ANN SPENCER,
2 called as a witness on behalf of the PRBRC, having been
3 previously sworn, testified further as follows:

4 REDIRECT EXAMINATION

5 Q. (BY MS. ANDERSON) Ms. Spencer, after hearing
6 Mr. Wireman's testimony yesterday, would you still agree
7 that his opinions and findings meet the standards of a
8 Wyoming Professional Geologist?

9 A. Yes, I do.

10 Q. And do you have any concerns about lending your
11 Wyoming certification to Mr. Wireman's findings and
12 opinions in his report and testimony?

13 A. No, I do not.

14 MS. ANDERSON: Okay. Thank you. That is
15 all I have for you.

16 THE WITNESS: Okay. Thank you.

17 CHAIRMAN BAGLEY: Time for
18 cross-examinations.

19 Mr. Gilbertz.

20 MR. GILBERTZ: Nothing from me. Thank you.

21 CHAIRMAN BAGLEY: Ms. Boomgaarden.

22 MS. BOOMGAARDEN: No questions. Thank you.

23 CHAIRMAN BAGLEY: Mr. Kuhlmann.

24 MR. KUHLMANN: Thank you, Mr. Hearing
25 Officer. I just have one question.

1 MR. GIRARDIN: Come over here.

2 MR. KUHLMANN: Oh, that's right.

3 CROSS-EXAMINATION

4 Q. (BY MR. KUHLMANN) Good morning, Ms. Spencer.

5 A. Good morning.

6 Q. I just have one question for you. Were you able
7 to listen to all of Mr. Wireman's testimony yesterday?

8 A. Yes, I was.

9 Q. Okay.

10 A. I was up at 4:00 this morning watching it on
11 video.

12 Q. Okay. All right. Thank you very much.

13 A. You're welcome.

14 MR. KUHLMANN: That was my question.

15 CHAIRMAN BAGLEY: Thank you, Mr. Kuhlmann.

16 Mr. Pope.

17 MR. POPE: No questions.

18 CHAIRMAN BAGLEY: No questions.

19 Any questions from council?

20 COUNCIL MEMBER AGOPIAN: Nope.

21 CHAIRMAN BAGLEY: I have none either.

22 Any redirect, Ms. Anderson?

23 MS. ANDERSON: No.

24 CHAIRMAN BAGLEY: All right. Well, thank
25 you very much, Ms. Spencer. And I hope you enjoyed your

1 morning video. Wow.

2 THE WITNESS: I did. It was fascinating.

3 CHAIRMAN BAGLEY: So I believe you are free
4 to now go about your business for the rest of the day.

5 THE WITNESS: Okay. Thank you.

6 CHAIRMAN BAGLEY: Thank you.

7 Do you have any additional witnesses?

8 MS. ANDERSON: I do not. Thank you.

9 CHAIRMAN BAGLEY: All right. Thank you.

10 Mr. Pope, do you have any rebuttal evidence you'd
11 like to present?

12 MR. POPE: We do. We'd call Dr. Muthu
13 Kuchanur to the stand.

14 CHAIRMAN BAGLEY: Thank you.

15 THE REPORTER: Should I re-swear him since
16 it's been a while?

17 CHAIRMAN BAGLEY: Let's go ahead and
18 re-swear him, yeah.

19 (Witness sworn.)

20 MUTHU KUCHANUR, PhD,
21 called for examination by Brook Mine, being first duly
22 sworn, testified as follows:

23 DIRECT EXAMINATION

24 Q. (BY MR. POPE) Good morning, Dr. Kuchanur. How
25 are you today?

1 A. Good morning.

2 Q. I have three topics I'd like to discuss with you
3 this morning. The first is the Big Horn Coal groundwater
4 restoration demonstration. Were you present when
5 Mr. Gerlach discussed the groundwater restoration
6 demonstration in Sheridan?

7 A. Yes, I was.

8 Q. Did you use the groundwater restoration
9 demonstration in your review of the Brook permit
10 application?

11 A. Yes.

12 Q. How did you use that demonstration?

13 A. So I'd like to step back a little bit and
14 explain to the council what this document is and how I
15 used this document -- document to reconcile the pieces of
16 information that I used versus the ones I did not think
17 were applicable in this specific instance.

18 So I think Big Horn has done some good
19 groundwater restoration at this site and have
20 demonstrated, through the Big Horn Exhibit Number 15, the
21 groundwater restoration document.

22 So one thing I'd like to highlight to the
23 council is the objective of this document is different
24 than the objectives of the Brook Mine MODFLOW model. So
25 the objective of the Brook Mine -- or the Big Horn Mine

1 groundwater restoration document is to demonstrate to the
2 LQD, the Land Quality Division, that the Big Horn Mine has
3 met all the commitments and restored the groundwater to
4 pre-mining conditions. So that's the primary objective of
5 that document.

6 Brook Mine's objective is -- so in Big Horn's
7 case, they are at the tail end of the whole process, the
8 reclamation and restoration process. They have collected
9 about like -- more than 23 years of information of water
10 levels and water quality of those wells. And they are at
11 the tail end of the process, demonstrating to LQD, as part
12 of the bond release process, that the water levels they
13 collected in the past is demonstrating to LQD that the
14 current conditions meet the statutory requirement that the
15 groundwater at their site is capable of meeting the
16 approved post-mining land use, which is livestock in this
17 instance.

18 So that's -- that's the situation that they are
19 in. And if you look at Brook Mine, the position that they
20 are in is -- they are like looking at the future. They
21 have a good handle on like what is right now at the site,
22 but they're trying to predict future. So they are relying
23 on a model to get to the future. And Big Horn's relying
24 on hard evidence, the data that they have collected over
25 23 years to demonstrate to LQD everything has been

1 restored to -- that the groundwater has been restored to
2 pre-mining conditions.

3 So that's -- that's the primary difference in
4 objectives between these two documents. With that in
5 mind -- so I used -- I looked into this document and I
6 made some analyses and decided to use the results from
7 Big Horn Mine's GRD to mostly cross-check and verify what
8 the MODFLOW model has to say, rather than using the
9 parameters that the GRD has used as a supplement for the
10 hard evidence that they have in water wells.

11 So the requirement that LQD had in terms of bond
12 release is whether the mine -- the Big Horn Mine has met
13 or demonstrated that the water levels have recovered to
14 pre-mining conditions. The water quality, the groundwater
15 qualities suitable to meet the approved post-mining land
16 use.

17 So how did they do that? They had a set of
18 monitoring. They went there every quarter, collected the
19 information over 23 years and they plotted a hydrograph.
20 Hydrograph is nothing but the product water levels over
21 time. So they plotted this thing, the hydrograph, and the
22 hydrograph clearly demonstrated to LQD the groundwater
23 levels are back to -- back to where it was before mining.

24 So, in other words, it's a successful case of
25 groundwater restoration demonstration by a coal mine in

1 this area -- in this area -- in the general area of
2 interest, meeting satisfactorily the LQD requirements.

3 So in that sense -- so I used -- from that
4 perspective, I used the information that Big Horn had in
5 their groundwater restoration document to see, okay, this
6 is independent analysis that was collected by Big Horn in
7 2002. And Brook Mine comes in like 2015, '16 with this
8 MODFLOW model. So there are lines of evidence that
9 indicates -- indicate that these two information, you
10 know, are they contradicting each other, are they lining
11 up with each of theirs. So as a modeler, I think that's
12 more in line of evidence I'd like to look at.

13 So I think I'd like to point the council to
14 Big Horn Coal Exhibit Number 15, page number 10.

15 Q. Let's go ahead and we'll pull that up for you,
16 Dr. Kuchanur, as you discuss that.

17 Is there -- before you jump into your discussion
18 here, is there any particular portion of page 10, Big Horn
19 Exhibit 15, that you'd like to discuss with the council?

20 A. I'd like to point to paragraph number 2.

21 Q. We'll go ahead and blow that up for you.

22 A. The second full paragraph, please.

23 So I'd like to point specifically to statement
24 here that says, "The rates may also be biased somewhat
25 high by the assumption that the total recharge period for

1 Pits 1 and 2 was only 23.2 years prior to October 2001
2 when, in fact, the backfill of both pits was subject to
3 some constant recharge..." So I think this is the
4 statement that I relied on. It tells me that it took
5 23 years, if not more, for the backfill in the Big Horn
6 mine to saturate. It's not one year. It's not two years.
7 It took 23 years.

8 So that the -- that -- the number of years.
9 This is line of evidence to me that indicated that given
10 Brook Mine's proposing to mine for 12 to 13 years, that
11 that puts the 23 years in perspective how long it took for
12 the backfill to re-saturate.

13 Another thing that interested -- and I'd like to
14 look at this as like, okay, it's like 23 years, given that
15 it's right next to the Tongue River. They mined the
16 shallow coal using a different mining methodology. So I'm
17 also interested in like what's the rate that they predict.
18 So we know it took 23 years, so we are also interested in
19 the rates, the recharge rates that came in and filled the
20 backfill over time.

21 So I would like to highlight page number 41 of
22 the same exhibit to the council. That's a table from Big
23 Horn Mine.

24 Q. We'll go there. Is there anyplace on this
25 table, Dr. Kuchanur, that you would like to highlight?

1 A. I'd like to highlight several pieces of this
2 table. One thing is -- the first thing I'd like to
3 highlight is on the left -- on the right column that you
4 have. If you can zoom in that, please.

5 CHAIRMAN BAGLEY: I'm sorry. What page is
6 that, again?

7 MR. POPE: It's page 41.

8 CHAIRMAN BAGLEY: Thank you.

9 MR. POPE: It's Big Horn Coal 15-041.

10 CHAIRMAN BAGLEY: Thank you.

11 A. So here I'm there now. They show when they
12 started collecting the water levels, 1978. And the last
13 data point that they collected was in October of 2001.
14 This is where the 23.2 years is coming from.

15 So if we can get out of the zoom and over to the
16 other portion of the table that shows the calculations.
17 Maybe we'll zoom into the first section of the table.

18 So -- I mean, I want to clarify to the council
19 that this is not a model. It's a pretty straightforward
20 automatic calculation based on the information that they
21 collected over 23 years. So why they did this? They know
22 the area of the backfill already, and they know the depth
23 of the saturated thickness based on the water level
24 information they collected. So they calculated the volume
25 of groundwater that's available in this pit location.

1 Once you know the volume and if you know how long it took
2 to reach there, you can back-calculate the recharge rates.

3 So I think to make it more interesting, the
4 units that we see here is .04 acre-feet per day. So, I
5 mean, during my direct testimony and the mine predictions,
6 we are familiar with the number of CFS. So the mine --
7 these kinds of calculations for like the four distinct
8 areas within their backfill so that we can get an idea
9 of recharge rates on an average over the 23-year period of
10 these distinct areas within the backfill aquifer.

11 So, similarly, the other four years are shown in
12 this specific exhibit. So I did a calculation on the
13 average recharge rates, all four areas that's presented by
14 Big Horn. And I did the unit calculation so Dr. Bagley
15 doesn't need to pull his calculator out. So it turned out
16 to be like .06 CFS.

17 So I'd like to repeat the -- just to refresh our
18 memory from the hearing last week. So the lowest flow
19 that we have seen in the USGS gauging station at Monarch
20 over the past 10 years is 100 CFS. The mine -- the Brook
21 Mine predicted MODFLOW predictions on the maximum
22 intercepted -- detailed maximum intercepted groundwater is
23 .22 CFS.

24 And this independent calculation that was
25 collected by Big Horn in 2002 states it's .06 CFS. So

1 this is like -- this is like a good line of evidence that
2 tells me Big Horn, even with their own field study for
3 like 23 years, shows us a recharge rate that's pretty much
4 in line with -- if not conservative, it's in line with
5 estimates that's provided by Brook Mine.

6 I'd also like to highlight the differences in
7 mining methods and how deep these coal seams are. Brook
8 is planning on getting into a deeper coal seam. They're
9 like proposing minimal -- relatively minimal difference
10 compared to what Big Horn did in their mining. So even
11 though there are like differences in the approaches, this
12 tells me that the estimates, the model is a pretty simple
13 tool for us to rely on for our predictions.

14 So we know that .06 CFS is what came into the
15 Big Horn Mine's backfill over 23 years. So we are also
16 interested in like where does this water come from?
17 What's the source of this water? We know it's relatively
18 minimal, but don't want to discount -- just because it's
19 minimal, we don't want to know the source of this water.
20 So what does Big Horn have to say about the source of the
21 water?

22 So I'd like to point the council to like Exhibit
23 15, page 34.

24 Q. We'll pull that up for you right now.

25 Is there anyplace on Big Horn Exhibit 15-034

1 that you'd like to highlight for the council?

2 A. There is a specific sentence that starts with
3 "Streamflow depletion in Tongue River." I think it's
4 III.A.2 heading, line number 5, I believe.

5 So I'd like to start from the second sentence
6 here, "The coal seams, particularly the Monarch, are
7 projected to the principal source of groundwater recharge
8 to the backfill of Pits 1 through 3. Streamflow depletion
9 in Tongue River associated with the aquifer drawdown
10 described as minute, if any, and project to cease after
11 reclamation is complete and groundwater elevations in the
12 coals and spoils aquifers have recovered."

13 So I'd also like to go back to the cross-section
14 that Big Horn presented in their exhibits, Mr. Pope.

15 Q. Certainly. That's Big Horn Exhibit 14. We'll
16 pull that up for you.

17 A. So this exhibit shows the backfill area. And it
18 shows the Monarch coal seam. That's the line -- that's
19 the seam you are seeing above the yellow-shaded -- the
20 lines that you see here in this exhibit. So the Monarch
21 coal seam connects to the backfill aquifer. And then
22 there is the Tongue River. So there are potentially two
23 sources.

24 Thank you.

25 So that's the Monarch coal seam. And that's the

1 backfill. And that's the Tongue River. So this exhibit
2 shows that there are potentially two sources of recharge
3 to the backfill. The .06 CFS that we are talking about.

4 So what is the primary source and what Big Horn
5 has to say about it, and does that contradict -- does it
6 align with what Brook has to say? So they say in their
7 demonstration that the Monarch coal seam is the primary
8 source and the depletion in the Tongue River is minimal.
9 That's like one more line of evidence for me from one
10 other company that's pretty much lining up with what Brook
11 is saying.

12 And the last one that I'd like to highlight
13 is -- I know that the public and the council's interested
14 in like what's going to happen to the alluvial wells. So
15 right now we are just talking about the water in the
16 Tongue River, not the alluvium.

17 So I'd like to point to page number 31 of Big
18 Horn Coal Exhibit Number 15.

19 Q. We'll pull that up for you. Is there a place on
20 Big Horn Coal Exhibit 15-031 that you would like to
21 highlight?

22 A. I'd like to go to this slide that says, "The
23 southern boundary of Pit 3. So I'd like to highlight
24 the specific sentence for the council. "The southern
25 boundary of Pit 3 intercepted saturated alluvium of Tongue

1 River" --

2 THE REPORTER: You're going to have to slow
3 down.

4 THE WITNESS: Sorry.

5 A. -- "along a length of about 2,000 feet. This
6 caused the water table in the alluvium to decline over a
7 portion of the valley floor between the river and the mine
8 pit. Mining did not cause water table declines in
9 alluvial wells monitored by the mine other than those
10 proximate to the southern boundary of Pit 3."

11 So I think the specific sentence that I relied
12 on is, "Mining did not cause water table declines in
13 alluvial wells monitored by the mine other than those
14 proximate to the southern boundary of Pit 3." That's like
15 one of the line of evidence that shows even in the case
16 that they intercepted the alluvial aquifer.

17 So, I mean, they been there, dug there and
18 disturbed it. And that's not the case we are looking at
19 with Brook Mine. So even in the -- in the worst possible
20 case of a mine mining the alluvial floor, alluvial
21 aquifer, the alluvial sediments, their observation and
22 data indicated to them that aquifer -- that drawdowns in
23 the alluvial aquifer is not extensive.

24 So these are like multiple lines of evidence
25 that tells me that the predictions from Brook Mine, this

1 is lining up with what Big Horn did 15 years ago at their
2 site based on data that they collected at the site. Not
3 any modeling. It's data. So the data that was collected
4 from Big Horn lines up with the model that Brook Mine's
5 proposing, the model that Brook Mine's conducted for the
6 proposed mine at the site.

7 So this -- I mean, I'm -- these lines of
8 evidence tells me that -- increases my confidence in the
9 model --

10 THE REPORTER: Increases your confidence
11 in?

12 THE WITNESS: In the model predictions.

13 A. And so I think -- I mean, this is the piece that
14 I thought this was pretty useful for me to like check
15 against what the groundwater model said. And then there
16 is the second piece that Mr. Gerlach testified to that --
17 the information that we should be potentially -- Brook
18 Mine should have considered into the model. And I'd like
19 to highlight the table. I think it's page 40 of the same
20 exhibit.

21 Q. (BY MR. POPE) Is there a particular place in
22 this table that you'd like to highlight for the council?

23 A. So first maybe we'll highlight the table
24 heading. So this table in the groundwater restoration
25 document by Big Horn summarizes the aquifer hydraulic

1 properties conducted in the Big Horn Coal area. So they
2 did aquifer tests in the spoils area. And what aquifer
3 test is, you pump a specific well in the backfill aquifer.
4 You install monitor wells. Monitor the effects of this
5 pumping on the monitor well. And then you -- then you use
6 mathematical calculations, mostly curve fitting, to
7 estimate the properties of the aquifer, specifically
8 transmissivity of the aquifer.

9 So I'd like to also clarify that this aquifer
10 test, if we can like highlight to the date of the test
11 here. Can you zoom in the whole row that shows the date?

12 So the dates of these tests are 1981, '81, '82,
13 '81, '82, '84, '84. So I'll repeat the dates of these
14 tests are -- the first one was conducted in '75, '81, '81,
15 '82, '81, '81, '82, '84, '84.

16 So the point that I'd like to make is these
17 tests were not conducted as part of the groundwater
18 restoration process that -- so these tests were not
19 conducted in 2002. These tests were conducted in 1984, as
20 part of the permit application and the tests that they
21 were conducting at this site.

22 So we know that the -- the groundwater levels of
23 the backfill approximately zero, are dry in 1978. And
24 2002 is the time period that we know that the aquifer
25 re-saturated to pre-mining conditions. So between dry

1 and -- dry in '78 and completely saturated pre-mining
2 conditions in 2002, they picked the time period of 1981
3 through '84 to conduct these tests. So when they
4 conducted these tests, the aquifer is not fully saturated
5 to the pre-mining conditions.

6 So that's an important point to remember. I
7 mean, these tests are not conducted as part of the
8 groundwater restoration document. And these were earlier
9 tests that were conducted in 1984, and the aquifer was
10 nowhere close to like our pre-mining conditions.

11 And then I'd like to highlight the
12 transmissivity and the hydraulic conductivity rows here
13 for the council.

14 So the aquifer test gives here the hydraul --
15 the transmissivity. So once you get the transmissivity
16 from the calculations, you'll have to know the thickness
17 of the aquifer that you're testing. So take the
18 transmissivity value, divide it by the aquifer thickness,
19 and that gives us the hydraulic conductivity. And that's
20 the value that Brook Mine will be plugging into the model.
21 So the aquifer test gives you hydraulic transmissivity.
22 You divide it by the saturated thickness, and that gives
23 you the hydraulic conductivity.

24 And here in the comments, I mean, right next to
25 all these hydraulic conductivity values there are question

1 marks.

2 THE REPORTER: You're going to have to slow
3 down a little bit.

4 THE WITNESS: Sorry.

5 A. So right next to the hydraulic conductivity
6 values you'll see question marks right next to them. But
7 you don't see question marks right next to the
8 transmissivity because these are the values that they got
9 from the test, from the calculations, the curve fitting
10 procedures.

11 So why did the question marks show up here?
12 Because we can read from the comments here, the saturated
13 thickness is questionable. So as I mentioned before, you
14 take the transmissivity and divide it by the saturated
15 thickness. And if the saturated thickness was
16 questionable, then it puts -- puts a question mark on the
17 hydraulic conductivity, which is the key input parameter
18 for the model. And I think why is there not a question
19 mark and do we need to worry about this value without
20 question mark? No, we don't, because I think if you look
21 at the specific column heading points to this value,
22 that's the place that -- but not -- that's not the pit
23 area that we are interested in. So on the -- on the
24 values that we are interested in for the TR-1 area, they
25 all have a question mark right next to them.

1 And in addition to the saturated thickness being
2 questionable, I'd like to like maybe provide a simple
3 calculation for the council here. The transmissivity
4 value is 58. And the hydraulic conductivity value is 58.
5 So can I calculate the thickness from here? Yes. 58
6 divided by 58, that's one. So the saturated thickness --
7 and they tested this aquifer at this specific well as
8 1 foot. And we know that the current saturated thickness
9 on an average at the site is 60 to 70 feet. So this --
10 these values are not just questionable. They are not even
11 representative of the saturated thickness of interest to
12 us.

13 And the other thing that was like brought up by
14 the council during my direct testimony is how water
15 particularly moves downwards once they begin the trench,
16 from the trench area into the coal seams. So the
17 parameter that gives you that information is vertical
18 hydraulic conductivity. So these tests that were
19 connected by Big Horn, they do not provide the vertical
20 hydraulic conductivity. They us the horizontal hydraulic
21 conductivity. They give us the rates that water moves
22 laterally, not vertically.

23 So these tests are -- to begin with, they are
24 questionable. They are not representative of the
25 saturated thickness we are in. They are incomplete

1 because they do not prorate the vertical hydraulic
2 conductivity information and we can see that they provide
3 three orders of magnitude variability here. So I'm not
4 convinced that this information is reliable enough to get
5 into the predictive model that Brook Mine is using.

6 And the other thing I'd like to point out about
7 vertical hydraulic conductivity, it's typically to an
8 order of magnitude of -- two orders of magnitude lower
9 than the horizontal hydraulic conductivity. Because it's
10 how the laid -- the materials are laid out. And once the
11 mine starts moving, their equipment's on top of the
12 backfill, over time it gets compacted a lot more. So it's
13 a pretty well documented fact in Powder River Basin mines
14 in the backfills, the vertical hydraulic conductivity is a
15 lot lower than the horizontal hydraulic conductivity.

16 So this is the piece of information that's in
17 the GRD, but I did not recommend Brook Mine to use their
18 model.

19 Q. (BY MR. POPE) I have a follow-up question for
20 you, Dr. Kuchanur. You mentioned the distinction between
21 horizontal and vertical hydraulic conductivity. You
22 mentioned the council had some questions about what
23 happens when you come into the TR-1 area and dig. How
24 does the vertical hydraulic conductivity impact the
25 analysis of groundwater flow in the TR-1 area in that

1 respect?

2 A. Just for my own clarification. Are we talking
3 about after it's backfilled or during operations?

4 Q. Both, if you would discuss.

5 A. So during operations -- I mean, as long as the
6 mine has water management plan, and if the water, the
7 groundwater that's going to be intercepted is lining up
8 with the .06 CFS predicted by Big Horn are the range of
9 the values as predicted by Brook, we are looking at
10 relatively minimum amount of waters they can handle
11 because of the lower permeabilities of the materials
12 during operations.

13 So during operations, it's more a mine
14 operational procedure, how do they handle the water, how
15 do they store the water, how do they dispose of the water,
16 how do they manage the water. But when it comes to
17 re-saturation and backfilling the aquifer, that's when the
18 vertical hydraulic conductivities plays a significant
19 role, because once you put in the backfill material, and
20 where the backfill material came from, it's the original
21 clay that was in there, the original siltstone that was in
22 there, they take it out and they put it back.

23 Typically mines follow a pretty sequential
24 procedure in how they lay these materials back into the
25 aquifer for their own operational benefit. So they track

1 where they put these materials when they put dig it out,
2 and then also track how they put it back into the
3 backfill. So once they put these materials back into the
4 backfill, even though they have dug it out and changed the
5 hydraulic properties to a certain extent.

6 Over time and how they place these materials,
7 vertical layers, using truck and shovel operations.
8 Because of the way that they place these materials, they
9 get compacted vertically and not horizontal. So they get
10 compactd more vertically.

11 So, in general -- I mean, I these materials, to
12 begin, with a low permeability, that coal. So when you
13 disturb the horizontal hydraulic conductivities might
14 increase a little bit more, but the vertical hydraulic
15 conductivities will be -- will not be extremely dissimilar
16 to what you had in the background.

17 So the vertical movement of groundwater from the
18 Tongue River, flowing through the alluvium into the
19 backfill, getting into the TR-1 and then migrating
20 vertically downwards, we are talking about an extremely
21 slow process, a relatively minimal amount of water over
22 time.

23 I would not discount that there will not be any
24 water that's seeping from the Tongue River, of the
25 alluvium or coal seams, into the backfill, but it's going

1 to be a slow process, a relatively minimum amount of
2 water.

3 Q. Thank you, Dr. Kuchanur.

4 I want to shift gears here and discuss some of
5 the opinions that Mr. Wireman talked about yesterday.
6 Were you present to hear his discussion?

7 A. Yes, I was.

8 Q. Did anything Mr. Wireman said change your mind
9 about the accuracy and completeness of the Brook permit
10 application?

11 A. Mr. Wireman had pointed out several concerns for
12 the council. When we had two hydrogeologists or
13 hydrologists testify before the council from the
14 objectors' point of view -- one is Mr. Gerlach, the other
15 one is Mr. Wireman -- for me, it was like little easier.
16 I was more readily able to provide information to the
17 benefit of the council for Mr. Gerlach's testimony because
18 he pointed out a specific document that's readily
19 applicable to the site. And he pointed out some specific
20 concerns of why you did not use this information or this
21 information should have been used into the model. So it
22 was -- it's easy for me to wrap my head around and explain
23 to the council why I -- or how I did this review and how I
24 incorporated some pieces of information versus others. So
25 it makes -- it helps me to explain to the council and

1 others how I did my job.

2 But in Wireman -- Mr. Wireman's testimony, there
3 was a lot of scientific principles based on textbook
4 publications that are of a general nature. So, I mean,
5 the scientific principles I agree with, but I think like
6 the hearing has been long and I've been listening really
7 closely to the testimony to see like how I can connect the
8 dots and see like how -- are there any points I need to be
9 concerned about for future purposes.

10 But for the benefit of the council, I'm finding
11 myself in a fix to offer any specific explanations.

12 Q. And I apologize. I may have asked a poor
13 question, Dr. Kuchanur. My question, though, is did you
14 hear anything from Mr. Wireman that changes your opinion
15 on the technical adequacy of Brook's permit application?

16 A. No.

17 Q. I heard -- we discussed, when you were
18 testifying in Sheridan, about the principle of parsimony.
19 Does the principle of parsimony inform any of your
20 opinions about Mr. Wireman's testimony?

21 A. I think I'd like to highlight for the council,
22 Brook Mine collected the baseline data that tells us
23 what's in the ground right now. DEQ reviewed it. And
24 then they synthesized this information into a predictive
25 model to predict future -- future impacts. So definitely

1 there are uncertainties.

2 So, I mean, we -- I mean, I consider the model
3 as a predictive tool that gives us information and
4 knowledge to represent reality, but it's not reality. So
5 that's where I'd like to like go back to the backstop
6 mechanisms DEQ has in place. So, I mean, I don't want to
7 repeat this phrase, but I can't help myself. We should
8 not be losing the -- losing the forest for the trees. We
9 should not be representing a lot of technical details and
10 heterogeneity to the model and make it so complex that we
11 don't understand how the model behaves and make meaningful
12 interpretations for 20 and 25 years.

13 We are not just interested in the near future of
14 what's happening in the next month or so. We are in
15 charge of regulating the groundwater impacts for the next
16 decade or however long it takes. In Big Horn's case, it
17 took 23 years. So I think that's what I'd like to
18 highlight, that it's a model. It has its limitations,
19 uncertainties. We should not be making it any more
20 complex than what is dictated by what you see at the site.

21 Q. Just have one other topic I want to discuss with
22 you, and that's the probable hydrologic consequences piece
23 of the permit application. From the data provided in the
24 Brook permit application, the publicly available data and
25 DEQ's data, were you able to determine the probable

1 hydrologic consequences of the proposed Brook Mine?

2 A. Yes.

3 Q. And I know you discussed some of this with the
4 council back in Sheridan, but it's been a while. Can you
5 refresh the -- refresh everyone's mind about what areas of
6 the permit application allow you to assess the probable
7 hydrologic consequences?

8 A. So the -- there are three pieces of information
9 that I can think of. First one is the Appendix D6 that
10 baseline hydrology. That's where they collected the water
11 levels, the hydraulic properties, the hydrogeology
12 properties. So that's base information on hydrology and
13 hydrogeology.

14 And then the mine plan, it has a specific
15 section within the mine plan that's titled as Probable
16 Hydrologic Impacts. So that's one of the key pieces of
17 information that they predict the probable hydrologic
18 impacts.

19 And the last piece of information is in the
20 reclamation plan. So the mine plan gives what's -- or
21 predicts or estimates what are the impacts during mining,
22 during operations. And the reclamation plan, there is a
23 specific section in there that discusses what's the
24 impacts? How the water levels would be recovering
25 post-mining.

1 So these are the three pieces of information
2 that I reviewed to help me understand probable hydrologic
3 consequences of the proposed mine.

4 MR. POPE: Thank you, Dr. Kuchanur. I have
5 no further questions.

6 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

7 So I've changed the order of cross, just to keep
8 everybody on their toes.

9 Mr. Kuhlmann.

10 MR. KUHLMANN: Thank you, Mr. Hearing
11 Officer. I apologize. I had written some questions.

12 I don't believe I have any additional questions
13 to what Mr. Pope asked.

14 CHAIRMAN BAGLEY: Thank you.

15 Mr. Gilbertz.

16 MR. GILBERTZ: Thank you.

17 CROSS-EXAMINATION

18 Q. (BY MR. GILBERTZ) Good morning, Doctor.

19 A. Good morning.

20 Q. A couple of follow-up questions. You had a nice
21 discussion with the council about interaction, recharge
22 rates and things down in TR-1 area, correct?

23 A. Yes.

24 Q. And the TR-1 area is different from the
25 remainder of the mine -- proposed mine area in two

1 important ways. One, it's the only mine area laying south
2 of the Tongue River, correct?

3 A. That's correct.

4 Q. And it is also the only mine area which had been
5 previously mined?

6 A. Previously mined by Big Horn?

7 Q. Yes.

8 A. Yes.

9 Q. And so in that instance we're analyzing the data
10 that comes from there is an area which has been previously
11 strip mined and is south of the Tongue River?

12 A. That's correct, yes.

13 Q. And the remainder of the mine area is different
14 than that, correct? In the -- in those two ways?

15 A. Yes.

16 Q. Okay. Now, I won't bother putting the map up
17 again for fear that Dr. Bagley would dream of it. But we
18 have seen the map of the AVFs and potential AVFs in the
19 Tongue River Valley represented in DEQ Exhibit Number 16.
20 You're familiar with that map, correct?

21 A. Yes.

22 Q. Okay. To be clear, there was no monitoring
23 wells ever placed within the potential AVF area; is that
24 right?

25 A. That's correct.

1 Q. And there is no plan to put any monitoring wells
2 within the potential AVF area, correct?

3 A. So the mine permit -- the mine application
4 currently commits to three monitor wells in the Tongue
5 River alluvium. So there is a commitment from the mine,
6 as it take us right now, to put three additional monitor
7 wells in the Tongue River alluvium.

8 Q. Okay. And that commitment could be construed as
9 a commitment to put the three monitoring wells in the
10 currently designated AVFs, correct?

11 A. Not exactly sure of those locations.

12 Q. As a scientist and an engineer, would you agree
13 that it would be sensible and appropriate to put
14 monitoring wells in the potential AVF?

15 A. Of the Tongue River alluvium?

16 Q. Yes.

17 A. Depending on the location, they can provide
18 useful information.

19 Q. As it stands right now today, we have no
20 baseline information about the water levels in the Tongue
21 River potential AVF.

22 MR. KUHLMANN: Is that -- is that a
23 question? Is that a question?

24 MR. GILBERTZ: It is.

25 A. So the information that we have is -- there is a

1 perennial river that is flowing that is alluvial right
2 next to it. The alluvium water levels, on average, would
3 be replicative of the stage elevations in the Tongue
4 River. So once you have stage elevations in the Tongue
5 River, you have a good understanding of the water levels
6 in the alluvium.

7 Q. Do you have a clear understanding of the actuals
8 as they exist in the field? You would agree with me, as a
9 scientist and an engineer, it would be prudent to put in
10 monitoring wells to get that baseline from the potential
11 AVF in the Tongue River?

12 A. It's not a regulatory --

13 THE REPORTER: Not a regulatory?

14 THE WITNESS: Requirement. Requirement.

15 Q. (BY MR. GILBERTZ) I understand that. But my
16 question to you is, as a scientist and engineer, wouldn't
17 you agree it's prudent to get the direct data?

18 A. From my role, I have to look at both regulations
19 and science together.

20 Q. Okay. As an engineer and scientist, would you
21 not agree with me that it is prudent to have monitoring
22 wells in the Tongue River potential AVF to know precisely
23 what the baseline is?

24 MR. KUHLMANN: I'll object. Asked and
25 answered.

1 MR. GILBERTZ: It hasn't been answered.

2 MR. KUHLMANN: He just said he has to look
3 at both regulations and his experience.

4 CHAIRMAN BAGLEY: It's being asked as a
5 yes-or-no question, and I'm not sure can be answered as a
6 yes-or-no question. I'll give Dr. Kuchanur one more crack
7 at answering that, then we'll move on.

8 A. It's not in my job role's responsibility to ask
9 more than what the regulations require us to do.

10 Q. (BY MR. GILBERTZ) Isn't it part of your job to
11 ensure that there will not be material damage to the
12 hydrologic balance inside and outside the permit area?

13 A. Yes.

14 Q. Okay. And how will we know if there's a
15 material damage if we do not have good baseline data to
16 begin with?

17 A. We have the information that we need for
18 baseline to make reasonable interpretations on the impacts
19 to these resources.

20 Q. Without that data, the operator will be free to
21 argue that they are not the cause of the change or that
22 that -- that the baseline was something different than
23 what your interpretation is?

24 MR. POPE: Objection. Speculation. Calls
25 for him to opine about what the operator will do.

1 MR. GILBERTZ: I didn't ask what the
2 operator would do. I said the operator would be free to.

3 MR. POPE: Same objection. It's asking him
4 to speculate about what the operator can and can't do.

5 CHAIRMAN BAGLEY: Yeah, that's a question
6 Dr. Kuchanur would not be able to answer. Doesn't know
7 what the operator would be free to do.

8 Q. (BY MR. GILBERTZ) Without the actual baseline
9 data, there will be plenty of room for disagreement
10 amongst the experts, correct?

11 MR. POPE: Objection. Calls for him to
12 speculate about what the experts are going to do.

13 MR. GILBERTZ: I don't think it does. He's
14 dealt himself out as an expert in this area. I'm asking
15 him without the data, experts can disagree, can't they?

16 CHAIRMAN BAGLEY: I'll allow that question.

17 A. Even with data, experts tend to disagree.

18 Q. (BY MR. GILBERTZ) And as it -- as it stands
19 today, there is no commitment to put in monitoring wells
20 in the future which would act once mining begins, correct?
21 In -- in the Tongue River potential AVF.

22 MR. POPE: Objection. Asked and answered.
23 He already asked him about the location of potential
24 monitoring wells and potential AVF.

25 CHAIRMAN BAGLEY: Yeah. I think the answer

1 I heard was there's no plan to put them in at this point.

2 MR. GILBERTZ: Okay.

3 CHAIRMAN BAGLEY: So yeah.

4 MR. KUHLMANN: Mr. Hearing Officer, I think
5 his testimony was that he didn't know where the location
6 would be.

7 CHAIRMAN BAGLEY: Okay. Well, good point.
8 I'm going to go ahead -- ask the question one more time and
9 let him answer one more time.

10 MR. GILBERTZ: We are --

11 CHAIRMAN BAGLEY: Since there's a
12 disagreement by my understanding, I guess I need a
13 clarification. Ask the question and let him answer it.

14 MR. GILBERTZ: We're clearly in a very
15 sensitive area.

16 I think you have answered the question, Doctor.
17 Thank you.

18 I have no further questions. Thank you.

19 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

20 Ms. Boomgaarden.

21 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

22 CROSS-EXAMINATION

23 Q. (BY MS. BOOMGAARDEN) Good morning,
24 Dr. Kuchanur. I have just two simple yes-or-no questions
25 for you.

1 Did you rely on a definition in the
2 Environmental Quality Act to determine the meaning of the
3 phrase "technically adequate"?

4 A. I cannot specifically recall the definition.

5 Q. Second question, did you rely on definition in
6 the Land Quality Division Rules and Regulations to
7 determine the meaning of the phrase "technically
8 adequate"?

9 A. I cannot recall a specific recollection.

10 MS. BOOMGAARDEN: Thank you.

11 No further questions.

12 CHAIRMAN BAGLEY: Thank you,

13 Ms. Boomgaarden.

14 Ms. Anderson.

15 MS. ANDERSON: Thank you, Dr. Bagley.

16 CROSS-EXAMINATION

17 Q. (BY MS. ANDERSON) Good morning, Dr. Kuchanur.

18 A. Good morning.

19 Q. I have -- my first question for you is did you
20 work with Mr. Pope to prepare your testimony today?

21 MR. POPE: Objection. Relevance.

22 MS. ANDERSON: I mean, part of what I'm
23 getting at here is that DEQ has put themselves out as being
24 somewhat unbiased in these proceedings and willing to work
25 with -- you know, listen to the public and receive our

1 information. And if they're working directly with the
2 company to provide rebuttal evidence, that impeaches that.

3 MR. POPE: Dr. Bagley, I think that
4 mischaracterizes what's happened. I don't think there's
5 been any statement that DEQ has held themselves apart from
6 the company as part of this process. In fact, the
7 testimony has been that they've collaborated with Brook
8 Mine in preparing the permit application to comply with the
9 rules and regulations. It's totally irrelevant whether
10 Dr. Kuchanur talked to the company about any issues.

11 CHAIRMAN BAGLEY: In this case, this
12 actually does appear to be a yes-or-no question. I'll
13 allow this question. We'll see if any others come up.

14 MS. ANDERSON: Okay. Thank you.

15 Q. (BY MS. ANDERSON) So to remind you of the
16 question. Did you work at all with Mr. Pope to prepare
17 your testimony today?

18 A. I worked with Mr. Kuhlmann, DEQ AG. In the
19 presence of Mr. Kuhlmann, Mr. Pope had some questions that
20 he asked me.

21 Q. Okay. So he was present when you were doing
22 your preparation for today?

23 A. Not on my preparation, but there was a
24 conference call, but Mr. Pope was there and the AG's
25 office, of course.

1 Q. Okay. Thank you.

2 All right. We'll get to the science now. So we
3 can talk about that. You gave some testimony about the
4 23 years that it took to recharge that backfill aquifer.
5 Is that -- is that the right understanding of that? 23
6 years?

7 A. That's correct.

8 Q. Okay. What is Brook's estimate of recharge in
9 this area in the Brook years?

10 A. Depending on the coal seam areas, between 10 to
11 20 years.

12 Q. 10 to 20 years. Okay.

13 Would you consider that long term?

14 A. In a general sense, yes.

15 Q. Okay. So -- and we talked a little bit just now
16 about the recharge and how to estimate the number of years
17 for that recharge. Is there any uncertainty in those
18 calculations and estimates?

19 A. So that's noted in Big Horn's GRD, the
20 groundwater restoration document. They acknowledge one of
21 the --

22 THE REPORTER: I'm sorry.

23 THE WITNESS: They acknowledge that one of
24 the uncertainties is when the re-saturation began. So
25 that's one uncertainty I can think of.

1 Q. (BY MS. ANDERSON) Okay. How about in Brook's
2 information, are there any error bars related to the
3 recharge estimates?

4 A. Yes.

5 Q. What are those error bars?

6 A. That's the 10 to 20 years.

7 Q. Okay. So roughly an error of 10 years?

8 A. So 10 years is for one specific coal seam. The
9 Carney coal seam. And the 20 years is for the Masters
10 coal seam. So that, in general, gives you an estimate on
11 how long it takes to recharge these coal seams.

12 Q. And that's for the entire permit area?

13 A. On an average, yes.

14 Q. Okay. And what data was used to calculate those
15 estimates?

16 A. Those estimates are provided as part of the
17 predictive values that are --

18 THE REPORTER: That are?

19 THE WITNESS: Provided by the MODFLOW
20 model.

21 Q. (BY MS. ANDERSON) Was there any recharge data
22 provided by the company for the Dietz or the Monarch coal
23 seams?

24 A. Yes.

25 Q. Okay. Do you remember offhand what those

1 recharge values were, the number of -- estimated number of
2 years for recharge? It's okay. I know it's a long
3 application. So if you don't remember, that's okay.

4 A. Yeah. I'm not sure, but I think I'm going -- I
5 don't understand what recharge means, but I can't recall.
6 That's the answer.

7 Q. Okay. Great.

8 Would you generally agree, as a scientist, the
9 ability to predict long-term impacts is subject to the
10 same uncertainties as predicting near-term impacts?

11 A. No.

12 Q. And what is the difference?

13 A. Near-term impacts, like, for example, the
14 uncertainties that you have deal with near term are lesser
15 related to that certainties you deal with on on a longer
16 term. So I see progress with time there's more potential
17 for things to be uncertain.

18 Q. Okay. Thank you.

19 Would you agree that the observations by
20 Big Horn Coal in their report regarding the alluvium are
21 qualitative and not necessarily based on empirical
22 quantitative data?

23 A. Can you please restate that question?

24 Q. Yeah. I guess I'm getting to what -- whether
25 you think the data regarding the alluvium that you spoke

1 to today is qualitative or quantitative.

2 A. It's based on the information data they
3 collected at the monitor wells.

4 Q. Okay. All right. So going back to that a
5 little bit. Did Big Horn Coal, in their data, look at
6 alluvium in Slater Creek or the potential AVFs in the
7 Tongue River? Along the Tongue River?

8 A. I did not review the AVFs.

9 Q. Okay. Would you generally agree that there
10 are -- as Mr. Gilbertz just explored with you, there are
11 currently no monitoring wells in that potential alluvial
12 valley floor area along the Tongue River?

13 A. Yes.

14 MR. KUHLMANN: Objection. Asked and
15 answered.

16 MS. ANDERSON: Okay.

17 Q. (BY MS. ANDERSON) My next question is how do
18 you determine a probable hydrologic consequences if you
19 have no monitoring wells?

20 A. So there are like two parts to that response to
21 your question. Number one, it was -- there was this
22 pre-application phase, before even the mine submitted an
23 application, that District 3 Sheridan office staff worked
24 with the Brook Mine to determine where the monitors wells
25 need to be placed. So I cannot speak to those -- where

1 they placed and why they placed those locations. Number
2 one.

3 So number two, from a modeling perspective, the
4 best impressions of the mine are predominantly dry so
5 there is lesser water from the coal seams that will be
6 discharging into the alluvium. So from that significance
7 perspective, I did not think the impacts of these
8 locations are going to be significant enough for modeling
9 purposes.

10 Q. Okay. You just spoke to a meeting with the
11 District 3 Land Quality Division office. So you weren't
12 present at that meeting?

13 A. I was not.

14 Q. Okay. And I think you gave testimony in
15 Sheridan that that kind of predated your review of the
16 permit application, right?

17 A. That's correct.

18 Q. During your review, did you ever try and revisit
19 that decision that was made, or did you feel the need to
20 do that?

21 A. So you asked me instances where I did not
22 understand the rationale. I asked for justification from
23 the mine for locations that the monitor wells were present
24 or not. So I asked for justification for my own
25 understanding.

1 Q. Okay. As a scientist, how can you deny the
2 importance of baseline data for the alluvial valley floor
3 system of the Tongue River?

4 MR. KUHLMANN: Objection. I don't think he
5 said that.

6 CHAIRMAN BAGLEY: I agree.

7 MS. ANDERSON: Okay.

8 CHAIRMAN BAGLEY: Rephrase that question.

9 MS. ANDERSON: It's fine. I think we've
10 covered this quite a bit, so...

11 Q. (BY MR. ANDERSON) What data did you rely on to
12 get aquifer thickness in the area?

13 A. The aquifer thickness provided in Appendix D5 of
14 the mine permit application.

15 Q. Okay. So you spoke a lot to the hydraulic
16 conductivity data and what that means. But would you
17 agree that a large part of that data was not obtained from
18 site-specific baseline monitoring wells?

19 A. Can you please restate the question?

20 Q. Yeah. I guess we talked a little bit in
21 Sheridan about this too, but how many baseline monitoring
22 wells were used to calculate hydraulic conductivity for
23 the Brook Mine permit area?

24 A. There was one aquifer test they relied on.

25 Q. Thank you.

1 All right. You spoke a little bit this morning
2 about the amount of data in response to Mr. Wireman's
3 testimony. I think you said, you know, there's
4 uncertainties, but there's some backstop mechanisms, but
5 you made a statement that I'm interested in. And you said
6 that the model should be dictated by what you see at the
7 site. Would you agree that this is a complex hydrologic
8 system?

9 A. Most hydrologic systems are complex.

10 Q. Sure. Would you agree that the permit
11 application itself calls this area complex in terms of
12 hydrology?

13 A. Cannot recall of a specific section.

14 Q. Do you remember Mr. Wireman's testimony about
15 that yesterday?

16 A. Can't remember the exact testimony.

17 Q. Okay. Well, assuming this area is complex,
18 would you agree with me that the model should be equally
19 complex if that's what you see at the site?

20 A. So the model should not be made any complex than
21 what's at the site. So you should not be introducing
22 heterogeneity and complexity to the model if it's not
23 supported by the model's ability to represent water
24 levels.

25 Q. Okay. Thank you.

1 Okay. Let's get back to the regulatory
2 requirements a little bit. So we've talked a little bit
3 about what data is there and not there and some error bars
4 and some estimates. Given all this, are you still
5 confident that the permit application prevents material
6 damage outside the permit boundary?

7 MR. KUHLMANN: Objection. I don't think
8 he's made that determination. We talked about this
9 yesterday.

10 CHAIRMAN BAGLEY: I was writing something.
11 Could you restate -- re -- tell me the question again so I
12 can hear it. I was writing something.

13 MS. ANDERSON: I was asking Dr. Kuchanur if
14 he's confident still that the permit application prevents
15 impacts to the material -- to material damage of the
16 hydrologic balance outside the permit boundary.

17 MR. KUHLMANN: Mr. Hearing Officer, I just
18 remind you this is something out of 406(n). It's
19 cumulative hydrologic impact. Determination that needs to
20 be made prior to issuance, but not for technical adequacy.

21 CHAIRMAN BAGLEY: Yeah, I -- I feel like
22 this question has been asked and asked and answered and
23 answered. I don't know that everybody's happy with the
24 answers they're hearing, but I've been hearing answers to
25 this. Rephrase that.

1 MS. ANDERSON: Sure. I'll ask it a
2 different way.

3 Q. (BY MS. ANDERSON) So you testified you believe
4 the permit application is technically adequate; is that
5 right?

6 A. That's correct.

7 Q. Does that have anything to do with material
8 damage prevention?

9 A. The material damage assessment is a separate
10 assessment --

11 THE REPORTER: It's a separate?

12 THE WITNESS: It's a separate assessment
13 that relies on the permit application.

14 Q. (BY MS. ANDERSON) It relies on the permit
15 application.

16 A. That's correct.

17 Q. Okay. So what, in your opinion and your review,
18 what does it mean to be technically adequate at this
19 stage? What does that mean in terms of prevention of
20 material damage and what the company has and hasn't
21 demonstrated?

22 A. The determination of technically adequate means
23 it has met all the statutes, rules, regulations and
24 providing all the information that we need to make
25 assessment.

1 Q. Okay. And would you agree that an important
2 part of the statute is to prevent material damage to the
3 hydrologic balance outside the permit area?

4 A. There is the 406(n) that's in the statute.

5 Q. Okay. All right. All right. Now, I have some
6 questions from the other scientist next to me.

7 Are there any permeability tests which were
8 taken in the fault zones? Do you remember that in the
9 permit application?

10 A. The aquifer test that Brook relied on was closer
11 to the fault. The fault lines that was documented.

12 Q. Okay. So one test?

13 A. Yes.

14 Q. Okay. Do you believe that the model accounts
15 for data in these fault zones?

16 A. Yes. The MODFLOW model accounts for faults and
17 they are presented as horizontal flow values within the
18 MODFLOW model.

19 Q. Okay. Did the model consider any subsidence
20 effects at the permit area or potential subsidence
21 effects?

22 A. No.

23 Q. In your opinion, how is the model complete
24 without considering potential subsidence impacts and
25 affects?

1 A. The model relied on the information that's
2 provided in the permit and their determination of
3 subsidence impacts.

4 MS. ANDERSON: Okay. I think that is all I
5 have for you. Thank you.

6 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
7 Council have any questions? Mr. Agopian?

8 COUNCIL MEMBER AGOPIAN: I don't have any.

9 EXAMINATION

10 Q. (BY CHAIRMAN BAGLEY) So, Dr. Kuchanur, thank
11 you for doing the conversion for me today. Appreciate
12 that.

13 I -- I just want to ask in general about the
14 MODFLOW model and the complexity of groundwater models in
15 general. Does the MOD -- the MODFLOW model deals with
16 changes in time; is that correct?

17 A. Yes.

18 Q. So it's got to solve a four-dimensional partial
19 differential equation; is that correct?

20 A. Yes.

21 Q. So is that a trivial exercise, to solve a
22 four-dimensional partial differential equation?

23 A. It's not.

24 Q. Who in this room do you think would be able to
25 solve that?

1 A. I can say that I can.

2 Q. I think you may be the only one, because I took
3 that class a long time ago. Maybe Dr. Marino can as well.
4 It's not a trivial issue.

5 So the question, then, when you talk about
6 ground flow model complexity, it's a balancing act, is it
7 not?

8 A. That's a great point, yes.

9 Q. So when you try to get a resolution to a very
10 small area, is that an easier situation to solve than if
11 you're trying to a larger area?

12 A. I think you're getting back -- or you're sort of
13 getting into the grid sizes, Dr. Bagley, I assume. Is
14 that --

15 Q. Sure. Yeah.

16 A. So I think it's -- if the number of grid sizes
17 are lesser, it's easier to solve.

18 Q. So I guess I just personally took some offense
19 to people calling a ground flow model not complex. That
20 doesn't mean that you can't always do better at ground
21 flow groundwater modeling. So I just wanted to make that
22 clarification. These are not trivial models that can
23 solve with simple arithmetic. I don't have any other
24 questions.

25 Redirect, Mr. Pope?

1 MR. POPE: Briefly. Thank you.

2 REDIRECT EXAMINATION

3 Q. (BY MR. POPE) Dr. Kuchanur, we're going to pull
4 up on the screen DEQ Exhibit 12-144. We're going to zoom
5 in for everybody.

6 Dr. Kuchanur, based on the legend that we've
7 zoomed in on, what does DEQ Exhibit 12-144 show?

8 A. It's the Operational Surface Water and
9 Groundwater Monitoring Program.

10 Q. To your knowledge, does this show the locations
11 of monitoring wells?

12 A. Yes, they do.

13 Q. The reason we're here is your discussion with
14 Mr. Gilbertz about the location of alluvial monitoring
15 wells.

16 Zoom out.

17 Dr. Kuchanur, do you see any alluvial monitoring
18 wells in the portion that we just zoomed in on?

19 A. Yes. I believe those are the purple triangles.

20 Q. All right. And you spoke with Mr. Gilbertz
21 about DEQ Exhibit 16 and the potential AVF acreage. Do
22 you recognize the area zoomed in on as a portion of
23 that -- near that potential AVF acreage?

24 A. That's correct.

25 Q. I have a very simple question here for you based

1 on Ms. Anderson's question about the conference call you
2 and I had. Did I tell you what to say as part of your
3 testimony?

4 A. No, you did not.

5 Q. Final question for you, actually. There's been
6 some discussion about technical adequacy. What does
7 technical adequacy mean? Does technical adequacy, in the
8 minds of DEQ, indicate that a permit application is
9 accurate and complete?

10 A. That's correct.

11 MR. POPE: I have no further questions.

12 CHAIRMAN BAGLEY: All right. Thank you,
13 Mr. Pope.

14 Thank you, Dr. Kuchanur.

15 THE WITNESS: Thank you.

16 CHAIRMAN BAGLEY: You can step down.

17 Let us take a 10-minute break. Be back here at
18 5 minutes to 10:00.

19 (Hearing proceedings recessed

20 9:44 a.m. to 9:57 a.m.)

21 CHAIRMAN BAGLEY: All right. Let's get
22 started again.

23 Mr. Pope, do you have any other witnesses?

24 MR. POPE: We do. We call Jeff Barron to
25 the stand.

1 (Witness sworn.)

2 JEFF BARRON,

3 called for examination by Brook Mine, being first duly
4 sworn, testified as follows:

5 DIRECT EXAMINATION

6 Q. (BY MR. POPE) Good morning, Mr. Barron.

7 A. Good morning.

8 Q. Welcome back to the hot seat.

9 I'd like to start our discussion today in the
10 TR-1 area. We heard a lot of discussion in Sheridan about
11 whether or not the permit application allows someone to
12 figure out what's going to happen in the TR-1 area. In
13 your opinion, as the professional engineer who coordinated
14 and assembled this permit application, does the permit
15 allow a determination of the probable hydrologic
16 consequences of mining in the TR-1 area?

17 A. It does.

18 Q. How?

19 A. The TR-1 area is described as a backfill area.
20 And -- so we've outlined in Appendix D5 that it's
21 comprised mostly of unconsolidated backfill material.
22 It's very localized. It does not have any wells completed
23 in it. Appendix D6 does not note any wells. So it --
24 it's not an aquifer that's being utilized for a beneficial
25 use of any kind. So the impacts, even if it's saturated,

1 there's no one using it, so no one is impacted. And the
2 permit application describes that.

3 Q. In your opinion, does the lack of monitoring
4 wells in the TR-1 area hinder the determination of
5 probable hydrologic consequences in any way?

6 MS. ANDERSON: Objection. Mr. Barron is
7 not a hydrogeologist.

8 MS. BOOMGAARDEN: I would like to note that
9 objection for the record as well.

10 MR. GILBERTZ: Join.

11 MR. POPE: Dr. Bagley, Mr. Barron is a
12 professional engineer who prepared the permit application,
13 participated in many of the studies, and did many of the
14 pieces of analysis that are contained in the permit
15 application, both about the TR-1 area and about other
16 areas.

17 MS. ANDERSON: He did not prepare this
18 portion of the permit application, or if he did, I'd be
19 surprised.

20 CHAIRMAN BAGLEY: Can I hear the question
21 again?

22 MR. POPE: Absolutely. My question was in
23 his opinion does the lack of monitoring wells in the TR-1
24 area hinder the ability to determine the probable
25 hydrologic consequences of mining in that area.

1 MS. BOOMGAARDEN: Dr. Bagley, if I could
2 also note for objection that this is in the scope of
3 rebuttal testimony, and so it needs to -- the questions
4 need to be very directly related to anything that
5 Mr. Barron is qualified to rebut from the witnesses put on
6 by PRBRC, the Fishers or Big Horn Coal. This isn't a
7 second bite at the apple for Mr. Barron to supplement his
8 earlier testimony, and particularly in the area for which
9 he's not qualified.

10 MR. POPE: Dr. Bagley, we aren't
11 supplementing. There was evidence put on by both
12 Mr. Sweeney and Mr. Gerlach that monitoring wells were not
13 completed in the TR-1 area. There was a back and forth
14 about why that happened. The question still remains of
15 whether that matters, and that's what we are rebutting
16 here. And certainly that's inference Big Horn Coal wishes
17 the council to draw.

18 CHAIRMAN BAGLEY: Objection's noted, but
19 I'll let him answer that question.

20 A. So short answer is yes, that is because we put
21 monitoring wells in the regional aquifer in the area, the
22 Carney coal seam.

23 Q. (BY MR. POPE) Mr. Barron, you just -- you
24 mentioned regional aquifer. I think that's something that
25 I don't think was clear in previous discussions about the

1 TR-1 area. How large is the TR-1 area compared to the
2 rest of the proposed permit area?

3 A. So if you want to describe the TR-1 area
4 compared to the permit application, the TR-1 area would be
5 this stack of papers on my desk as opposed to this room
6 that would be representative of the permit application
7 area.

8 Q. Do you know, in terms of acres, about how many
9 acres the TR-1 area encompasses?

10 A. Probably covers a quarter of a square mile.

11 Q. And for -- it requires me to do math, so I'm
12 going to avoid that. Can you convert that to acres for
13 us, please?

14 A. Yeah. A hundred acres or so.

15 Q. How many acres are in the permit -- proposed
16 permit area?

17 A. Approximately 4400 acres.

18 Q. Given the relative size of the TR-1 area to the
19 overall permit, what does that mean about the probable
20 hydrologic impacts of the mine in the TR-1 area?

21 A. In the TR-1 area, the mine would have minimal
22 impacts.

23 Q. Let's talk about breaking the seal. That was a
24 question posed both by objectors and by members of the
25 council about the effect of mining in TR-1 area. Can

1 Brook, as part of its reclamation, restore the seal, in
2 effect, restore the hydrologic connection between the
3 upper area of the TR-1 area and lower area?

4 A. We could, yes.

5 Q. How could you do that?

6 A. We could special handle some material. There is
7 clay throughout the permit area, and even in the TR-1
8 area, we could take clay that we have removed and store it
9 separately and then put that clay back in somewhat
10 compacted fashion and reestablish that low permeability
11 zone.

12 Q. In your previous experience with mining
13 operations, have you ever done special handling?

14 A. Yes.

15 Q. Where?

16 A. I've done it in Cordero Mine, Black Thunder
17 Mine, Eagle Butte Mine.

18 Q. Were those special handling efforts successful?

19 A. They were.

20 Q. We're going to put up on the screen the
21 regulation.

22 MR. POPE: Can you zoom into the title,
23 please, Carri?

24 Q. (BY MR. POPE) This is Chapter 2, Section 4 of
25 the coal regulations. I'd like to go to a specific

1 portion that Big Horn Coal discussed up in Sheridan. This
2 section here says that for the proposed permit area, and
3 by extrapolation, adjacent areas, characterization of the
4 geologic strata down to and including the deeper of either
5 of the stratum immediately below the lowest coal seam to
6 be mined, or any aquifer below the lowest coal seam to be
7 mined, which may be adversely impacted by mining. Does
8 the permit application characterize these geologic strata?

9 A. It does.

10 Q. Where?

11 A. You would find those in both Appendix D5 and
12 Appendix D6.

13 Q. Continuing on with this part of the regulation
14 which was discussed by Mr. Gregersen. It then says this
15 information shall include a statement of the results of
16 test borings or core samples which had been collected and
17 analyzed to show, and then subpart A is location of any
18 groundwater. Does the permit application include a
19 statement of the results of test borings or bore samples
20 which had been collected and analyzed to show location of
21 groundwater?

22 A. It does.

23 Q. Where are those?

24 A. Those, again, are in Appendix D5 and Appendix
25 D6.

1 Q. There were some questions by Mr. Gregersen about
2 the lack of test borings or core samples in Sections 15
3 and 22.

4 Mr. Barron, to be very clear, I am not asking
5 you to draw any legal conclusions, interpret the statute.
6 Do you see anywhere -- excuse me, the regulation. Do you
7 see anywhere in this regulation that requires a section-
8 by-section sampling?

9 A. No.

10 Q. Are you aware, in your review of Wyoming
11 statutes or regulations, that requires a section-
12 by-section sampling for test borings in any way?

13 A. No.

14 Q. Let's shift gears for a moment and talk about
15 alluvial valley floors. Going to pull up DEQ
16 Exhibit 12-144. Mr. Barron, do you recognize this as the
17 map that I spoke with Dr. Kuchanur about?

18 A. I do, yes.

19 Q. Does this show the proposed alluvial monitoring
20 wells?

21 A. It does.

22 Q. Where are -- and you have a laser pointer up
23 there, Mr. Barron. Can you please point to where the
24 proposed alluvial monitoring wells are? And if you need
25 us to zoom in, let me know.

1 A. Let's see. Up on the screen, there's one
2 located just south of permit boundary in that location.
3 There's also one south in Section 24. And then -- might
4 need to zoom out. I think there's another one, a third
5 one. There's one at the intersection, right there.

6 Q. Are any of those proposed monitoring wells
7 within the potential AVF acreage we've seen on DEQ
8 Exhibit 16?

9 A. Two of them are.

10 Q. Let's -- I'm going to shift gears here, and I'm
11 going to bounce around on subjects with you, Mr. Barron,
12 so please bear with me. There's a lot of discussion in
13 the previous hearing days about Brook's interaction with
14 the public. Did you ever meet with any members of the
15 public on behalf of Brook Mine?

16 A. I interacted with members of the public at a
17 meeting that the PRBRC held at the public library. I
18 interacted with the public at a county commissioners
19 meeting. I had some interaction with a single individual
20 who called me in reference to the permit application. I
21 also interacted with an older lady who emailed me and had
22 some questions on the permit application. I also
23 interacted -- one resident had a concern that his well
24 wasn't listed in the permit application. We researched
25 that and found that the well was mischaracterized on the

1 SEO database. We corrected the record, offered to study
2 that well for that individual, and we were refused to do
3 that study, but -- several instances I've interacted with
4 the public.

5 Q. If a member of the public had wanted to find out
6 information about the Brook permit application, could they
7 have called you or met with you?

8 A. Throughout the whole permitting process, even
9 before we submitted to DEQ, I maintained an open-door
10 policy.

11 Q. How would someone have known that they should
12 contact you in particular?

13 A. After the submittal -- the initial submittal of
14 the permit application, there was a public notice in the
15 newspaper saying the permit had been submitted to DEQ.
16 The documents held -- had our company name in and amongst
17 those, as well as my name on those documents I signed.

18 Q. Let's talk about well drawdown. We've heard
19 some concerns about the potential impacts of the Brook
20 Mine on domestic wells. In particular, we've heard some
21 discussion about Mr. Buyok's well and Mrs. Fisher's well.
22 I want to talk to you about each of those wells. Are you
23 familiar with information about Mr. Buyok's well?

24 A. The information on his well is, again, stored at
25 the state engineer's office. So, yes, I am aware of that

1 information.

2 Q. What is the predicted drawdown in the area
3 around Mr. Buyok's well?

4 A. With the groundwater model, we did some
5 prediction on drawdowns. The furthest extent is a 10-foot
6 drawdown ring. You can assume at some length beyond that
7 there's a 5-foot drawdown. So in the case of Mr. Buyok,
8 it's assumed that there's somewhere between a 0- and
9 5-foot drawdown.

10 Q. Do you know the height of the water column in
11 Mr. Buyok's well?

12 A. It was listed in the SEO data.

13 Q. What is the height of that water column?

14 A. If I recall, it's about 15 feet from the
15 surface.

16 Q. What is the depth of Mr. Buyok's well?

17 A. I believe his well is about 190 feet deep.

18 Q. We heard some discussion about, you know,
19 locations of pumps in a well and how that could affect
20 drawdown. Do you know the location of the pump in
21 Mr. Buyok's well?

22 A. Mr. Buyok's pump is a couple of feet from the
23 bottom of the well.

24 Q. Based on the information you described from the
25 state engineer's office and the information and

1 predictions in the permit application, what is your
2 opinion about the effect of the Brook Mine on Mr. Buyok's
3 well?

4 MS. ANDERSON: Objection. Again,
5 Mr. Barron is not a hydrogeologist. This is testimony
6 outside his area of expertise.

7 MR. GILBERTZ: I'll join that objection.

8 MR. POPE: Dr. Bagley --

9 CHAIRMAN BAGLEY: Maybe I wasn't paying
10 attention. It sounded like he answered by saying
11 prediction of 0-to-5-foot drawdown of the well. So I don't
12 know what --

13 MR. POPE: He did say that, Dr. Bagley.
14 What I'm getting at, maybe I didn't ask a good enough
15 question.

16 Q. (BY MR. POPE) Perhaps the question, Mr. Barron,
17 may draw the same objections, but I'll give it a try.
18 Based on the information available from the State
19 Engineer's Office and the information available in the
20 Brook permit application, does that data show whether
21 Mr. Buyok will still have water available in his well?

22 MR. ANDERSON: Objection. This data from
23 SEO has nothing to do with the mine. This requires a
24 conclusion that the witness is not qualified to make.

25 MR. POPE: Dr. Bagley --

1 CHAIRMAN BAGLEY: I'm going to actually
2 sustain the objection because I don't believe he can make
3 that answer based on my understanding of the data. As an
4 engineer, he would not want to try to. So move on to
5 another question.

6 MR. POPE: Okay.

7 Q. (BY MR. POPE) Okay. We'll actually shift gears
8 here, Mr. Barron, and talk about Mrs. Fisher's well and
9 we'll probably end up at the same place. And we'll give
10 it a go.

11 Do you know, is there public information about
12 Mrs. Fisher's water wells?

13 A. Yes, there is.

14 Q. Where is that information?

15 A. That is at the State Engineer's Office.

16 Q. Does that information show the depth of
17 Mrs. Fisher's well?

18 A. It does.

19 Q. And I apologize. I've been saying well and
20 wells. How many well or wells does Mrs. Fisher have?

21 A. I'm aware of two.

22 Q. Does the information on the State Engineer's
23 Office website provide information about where the pumps
24 are located in those wells?

25 A. It does. An applicant for a water well with the

1 state has to submit a notice of completion once the well
2 has been drilled, and it has details of both the location
3 of the water column and the pump in the well.

4 Q. Where is the pump in Mrs. -- in the two Fisher
5 wells?

6 A. Again, both wells [sic] are a few feet off the
7 bottom of the well.

8 Q. Does the information on the State Engineer's
9 website contain the depth of those wells?

10 A. It does.

11 Q. Does it show the height of the water column?

12 A. It does.

13 Q. I think we'll draw the same objection, so I
14 won't ask you to render that final opinion. But I would
15 like to talk to you, while we're on the subject of water
16 wells, about recharge. We've heard a little bit about it,
17 but in the context -- in the general context of the permit
18 application, what is recharge?

19 A. So recharge, in the permit application, deals
20 with an aquifer and its ability to receive new waters or
21 waters that are already in the aquifer to fill areas that
22 have been dewatered.

23 Q. Dr. Kuchanur discussed that there's a 10-to-
24 20-year recharge prediction in the permit application.
25 Where is that prediction in the permit application?

1 A. That's found in an addendum within the mine
2 plan.

3 Q. In the context of domestic water wells, why is
4 it important to understand the recharge after mining?

5 MS. ANDERSON: And I'll raise the same
6 objection. This called for a conclusion that the witness
7 is not qualified to make.

8 MR. POPE: Dr. Bagley, he is a professional
9 engineer. He's studied and put together this permit
10 application, including the data about recharge. He's
11 qualified to talk at least on a general level about what
12 that means.

13 CHAIRMAN BAGLEY: Let me hear the question
14 again.

15 MR. POPE: Sure. In the context of
16 domestic water wells, what is the importance of
17 understanding the recharge after Brook mines.

18 CHAIRMAN BAGLEY: Yeah, I think that's
19 appropriate. Go ahead and -- objection noted, but ask the
20 question.

21 A. So in the first sense, we do a prediction to
22 understand what effect and what drawdown we may have on a
23 well. But I want to understand how long before that well
24 will recover. The case of John Buyok's well, where it's a
25 0-to-5-foot drawdown, we would want to know how many years

1 before that comes back.

2 Q. (BY MR. POPE) If I'm a landowner who has a
3 domestic well, based on the data and the permit
4 application, can I figure out how long it will take before
5 the drawdown in my well comes back?

6 A. Yes.

7 Q. We talked about Mr. Buyok. I want to just wrap
8 up on a couple of points about him, clarify some of the
9 testimony in Sheridan.

10 Did Brook require Mr. Buyok to drop his
11 objections when Brook offered to include his house within
12 the half-mile buffer?

13 A. We did not.

14 Q. Were you present when Mr. Buyok expressed
15 concerns about the legal issues surrounding including his
16 house within the half-mile buffer?

17 A. Yes.

18 Q. To your understanding, as a -- as an expert in
19 the permitting process, if Brook includes Mr. Buyok's
20 house within the half-mile buffer in the permit, can he,
21 for example, request a pre-blast survey?

22 A. He could, yes.

23 Q. Why?

24 A. Because he would be -- if we offered and
25 included him in the half-mile boundary, then that becomes

1 an enforceable action by DEQ within the permit document.

2 Q. So we talked pre-blast surveys. Let's shift a
3 little bit and talk about blasting. There was discussion
4 by Mr. Emme that the blasting that the Brook Mine will do
5 is overburden and coal blasting. Have you ever witnessed
6 overburden or coal blasting?

7 A. I have, yes.

8 Q. Where did you witness that?

9 A. Cordero Mine.

10 Q. Do you recall how close you were when you
11 witnessed those blasts?

12 A. Within a thousand feet.

13 Q. We heard a lot of discussion about, you know,
14 what blasting may feel like. As someone who's actually
15 been there, what did that blast feel like?

16 A. It -- to be honest with you, when we were there,
17 I didn't feel the blast more than I observed the blast at
18 the time.

19 Q. Would you clarify for the council what you mean
20 by that?

21 A. I didn't feel a noticeable vibration on the
22 ground, but I did witness a cloud of dust that came up
23 from the blast.

24 Q. Are you familiar with the Wyodak Mine?

25 A. Yes.

1 Q. Where is the Wyodak Mine?

2 A. Near the city of Gillette.

3 Q. How close to Gillette is the Wyodak Mine?

4 A. Immediately adjacent to it.

5 Q. Is it close to I-90?

6 A. It is.

7 Q. Do you know how close?

8 A. Within a few hundred feet.

9 Q. Do they do cast blasting at the Wyodak Mine, to
10 your knowledge?

11 A. Yes.

12 Q. And is cast -- I think we heard some discussion
13 about this, but is cast blasting more powerful than
14 overburden or coal blasting?

15 A. There is more explosive used, and so a general
16 assumption is yes.

17 Q. To your knowledge, given their proximity to
18 I-90, has the Wyodak Mine ever had to shut the interstate
19 down to do cast blasting?

20 MS. ANDERSON: Objection. Relevance. I'm
21 not sure what the practice of some other mine has to do
22 with this permit application.

23 CHAIRMAN BAGLEY: I was wondering when
24 someone would object. Actually, I agree, the Wyodak Mine
25 is out east of Gillette. This one is in Sheridan. The

1 geography, geology, everything can be different.

2 MR. POPE: Understanding that, Dr. Bagley.

3 The point here is there have been, particularly by some of
4 the landowners in the area, concerns about the effect of
5 blasting. In fact, Ms. Malone, in her objection letter and
6 in her direct testimony, discussed closing the interstate
7 what effect would that have on it. This is an example of a
8 mine, coal mine, that uses a more powerful blasting
9 technique closer to inhabited areas, including I-90. It's
10 relevant for the council to compare the effects of blasting
11 at that area to the blasting concerns expressed as part of
12 this hearing.

13 CHAIRMAN BAGLEY: Nah, you have to figure
14 out another way to get at this. I was wondering when
15 someone was going to object, but I let the lawyers figure
16 that out.

17 MR. POPE: Fair enough. I think we can
18 move on from that subject.

19 Q. (BY MR. POPE) Let's talk about subsidence.
20 Dr. Marino discussed his opinions about highwall mining
21 and room and pillar mining and that he believed they were
22 the same. Do you share that opinion?

23 A. I don't believe that they're exactly the same.

24 Q. Why not?

25 A. Mostly because room and pillar has a set of

1 hallways and then perpendicular cuts that are different
2 from highwall mining. Highwall mining is merely just a
3 hallway cut into a coal seam.

4 Q. Does that difference matter in determining the
5 potential risk of subsidence?

6 MS. ANDERSON: Objection. Mr. Barron did
7 not prepare the subsidence control plan for the company.
8 He has no expertise on subsidence prevention or mitigation
9 or assessing that risk, as was discussed in detail in
10 Sheridan.

11 MR. POPE: Dr. Bagley, Mr. Barron is a
12 professional engineer who analyzed the subsidence control
13 plan, who analyzed the subsidence control statutes and
14 regulations --

15 MS. ANDERSON: But he did not put his
16 professional engineer's stamp on the subsidence control
17 plan.

18 MR. POPE: Understanding that, Dr. Bagley.
19 Mr. Barron has already testified that he took training
20 courses on subsidence. This is a very general question
21 about mining methodology and how that relates to
22 subsidence. I'm not asking him to do the hard science.

23 CHAIRMAN BAGLEY: Re -- I want to hear the
24 question again, please.

25 MR. POPE: Sure. Is there a -- is the

1 difference between highwall mining and room and pillar
2 mining important in assessing the risk of subsidence?

3 CHAIRMAN BAGLEY: Yeah. I'll allow that
4 question.

5 A. Yes.

6 Q. (BY MR. POPE) Why?

7 A. In our subsidence control plan, we go through a
8 narrative describing the historic mining subsidence in the
9 area. Outside of retreat mining, where we pull the
10 pillars in areas where the pillars weren't pulled, the
11 subsidence control plan discusses at those intersections,
12 those perpendicular intersects, that's another place where
13 subsidence was likely to occur and did occur. As a matter
14 of fact, the subsidence control plan lists a map with an
15 overlay of historic subsidence compared to a map of the
16 underground mining that took place in that area and
17 describes that very thing happening.

18 Q. Since we're on the subject of subsidence. In
19 your preparation of the permit application, did you review
20 the statutes and regulations concerning the subsidence
21 control plan?

22 A. I did, yes.

23 Q. And what do those statutes and regulations
24 require?

25 MS. ANDERSON: I'm going to -- objection to

1 the extent this calls for a legal conclusion.

2 MR. POPE: Dr. Bagley.

3 MS. ANDERSON: Or to the extent it requires
4 Mr. Barron to interpret subsidence risks or prevention,
5 that he's not qualified to make those conclusions.

6 CHAIRMAN BAGLEY: Let me hear the question
7 again.

8 MR. POPE: I asked him what are the
9 statutes and regulation -- what do the statutes and
10 regulations require for a subsidence control plan?
11 Mr. Barron testified that he is an expert in the permitting
12 process. That was qualified during his direct testimony in
13 Sheridan. He just said that he reviewed these particular
14 statutes and regulations. And at the end of the day, part
15 of what this hearing is about is measuring what's in the
16 permit application against what is in the statutes and
17 regulations. It is an unavoidable question, both for the
18 council and the witnesses, about what does that require?

19 MS. ANDERSON: Well, it's not our fault
20 they don't have Cardno and their consultants who actually
21 prepared --

22 CHAIRMAN BAGLEY: I've heard your
23 objection. And the question really, to me, can be a list
24 of things that are in a regulation and not a legal opinion.
25 I'll allow this question.

1 Q. (BY MR. POPE) Do you need me to repeat the
2 question?

3 A. Please.

4 Q. Okay. What are the -- what does Wyoming
5 statutes and regulations require for a subsidence control
6 plan?

7 A. They're very brief and they require that a
8 subsidence control plan be submitted.

9 Q. I'd like to clarify something that Dr. Marino
10 discussed, and that's the extraction ratios in the permit
11 application. The phrase that was brought up was coal
12 recovery efficiency as 45 to 60 percent. Do you recall
13 that testimony?

14 A. I do, yes.

15 Q. As the person who prepared the permit
16 application, does that in any way refer to extraction
17 ratios?

18 A. It directly relates to it.

19 Q. How so?

20 A. In the permit application, the recovery
21 efficiency is also the extraction ratio. Dr. Marino went
22 on to describe as a recovery efficiency loss of coal
23 during the mining process. You might have some fines that
24 are lost, but in the permit application that's not what
25 that's describing.

1 Q. So is it -- just want to make sure everyone's on
2 the same page on this. Does Brook plan to have an
3 extraction ratio of 45 to 60 percent?

4 A. I believe it's 40 to 60 percent, but yes.

5 Q. Thank you for that clarification.

6 There's been a lot of discussion by Dr. Marino
7 about ground control plan versus subsidence control plan
8 and why work wasn't done in certain places. Why is it
9 that the Brook Mine decided to do the engineering
10 Dr. Marino discussed in these ground control plan rather
11 than the subsidence control plan?

12 MS. ANDERSON: And I would just raise an
13 objection that he's asked to give an opinion on behalf of
14 the company. He doesn't actually work for the company.

15 MR. POPE: He prepared the permit
16 application. He was the permit coordinator for the Brook
17 Mine. He was the ultimate decision maker in terms of how
18 the permit was going to be put together. This is a
19 question of why those decisions were made.

20 CHAIRMAN BAGLEY: Can I hear that question
21 again?

22 MR. POPE: Sure. The question is why did
23 Brook, in preparing its permit application, decide to do
24 the engineering work that Dr. Marino discussed as part of
25 the ground control plan rather than the subsidence control

1 plan?

2 CHAIRMAN BAGLEY: Yeah. I don't think he
3 can answer that question. Rephrase it. I mean, you asked
4 why did Brook.

5 MR. POPE: I'll lay some foundation before
6 I get to that question. I think that might help us.

7 Q. (BY MR. POPE) Mr. Barron, did you -- were you
8 involved in the decision-making process about how to
9 engineer for the risks of subsidence?

10 A. Yes.

11 Q. Were you involved in decisions related to doing
12 engineering studies as part of a ground control plan?

13 A. Yes.

14 Q. Were you involved in decisions about doing that
15 work in the ground control plan rather than in the
16 subsidence control plan?

17 A. Yes.

18 Q. Why, based on your experience in that
19 decision-making process, did -- is the engineering work
20 going to be done as part of the ground control plan rather
21 than the subsidence control plan?

22 A. In this case, it was a -- a question of
23 permitting efficiency. And so because the regulations
24 required the submittal of a subsidence control plan, but
25 doesn't have a lot of detail on what that required, we, in

1 essence, wanted to kill two birds with one stone and put
2 the detail in the ground control plan that already
3 requires a great level of detail, and then we could add to
4 that as necessary for the permit application.

5 Q. Will you be involved in preparing the MSHA
6 ground control plan?

7 A. Yes.

8 Q. What were your -- what will your role be?

9 A. My role in preparing the ground control plan
10 will be conducting all of the studies, the geotechnical
11 engineering surrounding the ground control plan, and
12 likely I'll be assigning the document.

13 Q. As part of doing those geotechnical studies,
14 will there be an analysis how to create a ground control
15 plan to prevent subsidence?

16 A. Yes.

17 Q. Why?

18 A. One, it's a requirement of the ground control
19 plan. As far as -- if you connect the dots between
20 addressing the factor of safety surrounding the mining in
21 the area and relate it to subsidence, and certainly
22 because the permit application, we'll want to bolster
23 that. So we will connect the dot, from just the factor of
24 safety to miners, back to subsidence for the permit
25 application.

1 Q. There is some discussion by Dr. Marino about
2 short term versus long term. How does what you just said
3 relate to a short term versus long term?

4 A. Dr. Marino pointed out that the 1.3 factor of
5 safety is a short-term factor of safety. And in the
6 effort to kill two birds with one stone, and Dr. Marino
7 went through a description of several times of factors of
8 safety from 1.5 to 2.0 that could be a long-term factor of
9 safety, those would be included in the permit -- or in the
10 ground control plan and subsequently included in the
11 permit application.

12 Q. So just so we're clear, will Brook engineer its
13 ground control plan for both the short and the long term?

14 A. Yes.

15 Q. There was discussion about a minimum required
16 safety factor of 1.3. Do you recall that?

17 A. Yes.

18 Q. Can Brook, as part of the ground control plan,
19 engineer a higher safety factor?

20 A. Yes.

21 Q. Will Brook?

22 A. For the short term, we will stick with the 1.3
23 factor of safety. But as we investigate each one of these
24 panels and it's determined that it needs to be larger,
25 then we will certainly make it larger.

1 Q. Let's talk about the ARMPS program for a moment.
2 I want to clarify a few things with you. Are you familiar
3 with the ARMPS program?

4 A. I am, yes.

5 Q. How so?

6 A. I've got a version of it on my computer at my
7 office.

8 Q. Have you used the program?

9 A. I have.

10 Q. There was discussion about the ARMPS program and
11 how it relates to subbituminous and bituminous coal. Can
12 you clarify how the program works in regards to those two
13 types of coal?

14 A. So the program has in it a list of default
15 values that you can use. And depending on the coal, you
16 can pick strength parameters based on default values. So
17 in the case of subbituminous coal, there's -- I think
18 there may be one or none in the program, if I remember
19 right, on subbituminous coals as far as its strength
20 parameters, is it a default value in the program.

21 Q. In preparing the ground control plan, will you
22 rely on those default values?

23 A. No. We'll use tested values from the field.

24 Q. Let's talk about the permitting process at a
25 broader level. Were you present when several witnesses in

1 Sheridan suggested that they wished the permitting process
2 had more protection for landowners?

3 A. Yes.

4 Q. Do you agree that the permitting process does
5 not protect landowners?

6 A. No.

7 Q. Why not?

8 A. So when SMCRA was passed and then Wyoming
9 adopted those rules to obtain primacy, one of the primary
10 objectives of the rulemaking that the lawmakers did was to
11 protect landowners.

12 Q. Can you give us some specific examples of either
13 statutory or regulatory requirements that protect
14 landowners?

15 A. One is a discussion on, you know, do we
16 materially damage an area? And we have to study that and
17 offer those protections outside the permit boundary.
18 Those are discussed in the legislation and in the rules.

19 Q. We heard a lot about the Brook Mine commitment
20 to replace water quality and water quantity. Do you
21 believe that's another landowner protection?

22 A. Yes.

23 Q. While we're on the subject of permit
24 commitments, there's been allegations, and, frankly, sort
25 of the undercurrent of this entire hearing about whether

1 Brook will live up to those commitments. I want to talk
2 to you about a couple specific ones. The first is there
3 was an allegation made that Brook could take more coal out
4 of the ground than what is stated in its application. Do
5 you remember that?

6 A. I do.

7 Q. Is that true?

8 A. No.

9 Q. Why not?

10 A. One, we have put forth a permit application to
11 describe exactly what we're going to do. We live under
12 the oversight of DEQ. And although we don't report to
13 them on a daily basis, the mine will collect records of
14 extraction on a daily basis. And at any time DEQ can view
15 those and establish whether we're doing what we said we
16 were going to do.

17 Q. Does the mining equipment that Brook intends to
18 use assist in the collection of that data?

19 A. It does. It collects data minute by minute as
20 it mines.

21 Q. Will that data be available to DEQ?

22 A. Yes.

23 Q. I have to ask you a question general -- general
24 statement here, Mr. Barron. You prepared this permit
25 application. You have interacted with the represent --

1 the company representatives of Brook. Will Brook follow
2 the permit commitments in its permits application?

3 MS. ANDERSON: Objection. That's complete
4 speculation. Again, Mr. Barron does not work for the
5 company. He will not be doing actually the mining. He
6 will not be the mine plan manager. He cannot speak to
7 this.

8 CHAIRMAN BAGLEY: I agree. That's -- how
9 would he know? That is very speculative.

10 MR. POPE: Okay. Unfortunately that means
11 we'll have to call another witness, but so be it.

12 Q. (BY MR. POPE) Mr. Barron, there is a board
13 behind you. I want to turn to that board in just a
14 second. But Brook has a burden of proof in this hearing.
15 And in particular one of the things that Brook has to
16 demonstrate is that everything in the statutes and
17 regulations is included within the permit application.
18 Are you aware of a document that DEQ publishes that
19 explains what must be in a permit application?

20 A. I am, yes.

21 MR. POPE: Dr. Bagley, permission to
22 approach the witness.

23 CHAIRMAN BAGLEY: Yes.

24 Q. (BY MR. POPE) Mr. Barron, I've just handed you
25 a document. What is that document?

1 A. This document is the completeness criteria as
2 published by DEQ.

3 Q. Are you familiar with this document?

4 A. Very.

5 Q. How so?

6 A. I use this document on a regular basis in
7 preparing permit applications, amendments on substantial
8 revisions.

9 Q. What does this document explain?

10 A. This document is a list of what is required for
11 a permit application to mine coal in the state of Wyoming.

12 Q. Does the completeness criteria indicate what
13 statutes and regulations require certain parts to be in a
14 permit application?

15 A. It does. In the back of this document, I think
16 Section 4 cross-references all of the requirements to
17 Wyoming statutes, rules and regulations.

18 MR. POPE: Dr. Bagley, we would offer this
19 into evidence as Brook I think we're at 15.

20 MR. RUBY: Do you have a marked copy?

21 MR. POPE: No.

22 CHAIRMAN BAGLEY: Any objection --

23 MR. POPE: I'm sorry. Brook 14.

24 CHAIRMAN BAGLEY: Any objection?

25 MS. BOOMGAARDEN: No objection.

1 CHAIRMAN BAGLEY: All right. Accepted.

2 (Brook Mine Exhibit No. 14

3 received in evidence.)

4 MR. POPE: We'll mark that in just a
5 moment.

6 MR. RUBY: What is the number? 14.

7 MR. POPE: 14.

8 Q. (BY MR. POPE) Mr. Barron, what is the date of
9 the completeness criteria?

10 A. August of 1995.

11 Q. So we were just talking it includes
12 cross-references to statutes. Are the statutes referenced
13 in Section 4 the most recent versions of statutes and
14 regulations?

15 A. They are not in some cases.

16 Q. So how, in using this completeness criteria, do
17 you account for that difference?

18 A. So I regularly go to the legislative website and
19 cross-check for updated rules and regulations as they
20 compare this document.

21 Q. You mentioned that the completeness criteria
22 explains what must be in a permit application. Does the
23 Brook permit application mirror the requirements contained
24 in the completeness criteria document?

25 A. It does.

1 Q. Does it follow the same structure as what's in
2 the completeness criteria document?

3 A. It does.

4 Q. Are you aware that DEQ conducts a completeness
5 review of a permit application?

6 A. Yes, I am.

7 Q. What is a completeness review?

8 MS. BOOMGAARDEN: Objection.

9 MR. GILBERTZ: I'm going to -- yeah. Go
10 ahead.

11 MS. BOOMGAARDEN: Dr. Bagley, one, I think
12 we're well beyond the scope of rebuttal. And, second, the
13 completeness determination by DEQ is not the same as the
14 technical adequacy determination that is at issue under the
15 regulations and statutes here. And, thirdly, I think we're
16 getting into an area where it's prejudicial to the other
17 parties because they're asking this witness to essentially
18 provide an oral closing.

19 MS. ANDERSON: Right.

20 MS. BOOMGAARDEN: That none of the other
21 parties have been allowed to provide.

22 MR. POPE: Dr. Bagley.

23 MS. BOOMGAARDEN: I believe there's another
24 objection.

25 MS. ANDERSON: We would join in that

1 objection, just to put it on the record. That's exactly
2 what I was going to say.

3 MR. GILBERTZ: I'll refer to that to say
4 this is supposed to be rebuttal. No other witness has
5 talked about this document. It's not rebuttal. Again,
6 it's just an effort to backfill the prior testimony and
7 also perform some form of closing --

8 MS. ANDERSON: Yeah.

9 MR. GILBERTZ: -- that the other parties
10 aren't going to get. So, yeah, I object too.

11 MS. ANDERSON: Yeah.

12 MR. POPE: Dr. Bagley, the objector's case
13 has been the permit application is deficient. This
14 document speaks to the technically adequate, and, as we
15 heard from Dr. Kuchanur, the accuracy and completeness,
16 which is a statutory requirement. And, yes, part of this
17 does speak to our burden of proof. That's the whole point
18 of having this hearing to have that discussed. We are
19 discussing that burden of proof as it applies to the
20 objections that have been raised, and we are going to rebut
21 those specifically. But for the council's benefit, we want
22 to explain the completeness process as Mr. Barron
23 understands it.

24 MS. ANDERSON: And that is something they
25 can do --

1 CHAIRMAN BAGLEY: Just a minute.

2 MS. ANDERSON: -- post hearing.

3 CHAIRMAN BAGLEY: Let me rehear the
4 question.

5 MR. POPE: The question was, what -- does
6 DEQ conduct a completeness review of the permit
7 application.

8 CHAIRMAN BAGLEY: Yeah, this isn't a DEQ
9 witness, so I agree. We'll sustain the objections as need
10 to.

11 Q. (BY MR. POPE) Let's turn to the board behind
12 you, Mr. Barron. Do you recognize that board?

13 A. Yes.

14 Q. How do you recognize that board?

15 A. I helped prepare it.

16 Q. All right. At the top it says "406(n) states in
17 part." I'd like to turn to the first romanette, that the
18 application is accurate and complete. There's a chart
19 under there. What is that chart?

20 A. That chart contains a list of some of the pieces
21 that are listed in the completeness criteria. And then it
22 further, in the blue letter text, describes where in the
23 permit applications those can be found.

24 MR. GILBERTZ: I'm going to weigh in again
25 with an objection. Rebuttal is a very specific thing, and

1 that is the ability to have witnesses recalled to address
2 something that was presented by these other parties during
3 their cases in chief. And so I know what Mr. Pope is going
4 to say, we have a right to come in and defend that we have
5 a complete permit, but at this point in time, that right is
6 limited to responding to criticisms directly that were made
7 by the objectors and their presentations of their case in
8 chief, not an opportunity to go back and revisit the entire
9 plan and do a second go at why this is complete. It needs
10 to be restricted to responding to the evidence presented by
11 the objectors. And this is just an overall, we're going to
12 talk about everything again, we're not going to talk about
13 the specifics. If they got specific questions, that's
14 okay. And I got to say, this is just a very clever way to
15 try to do a closing argument when there isn't one allowed,
16 so I object.

17 MS. BOOMGAARDEN: I join in that objection.

18 MR. GILBERTZ: It's not rebuttal.

19 MS. ANDERSON: Yeah. And we would ask --

20 CHAIRMAN BAGLEY: One objection, two
21 objection, three objection.

22 Mr. Agopian, you had a comment you'd like to
23 make.

24 COUNCIL MEMBER AGOPIAN: It seemed like
25 yesterday -- I might ask if I can just look at the

1 PowerPoint that's sitting here on the table.

2 CHAIRMAN BAGLEY: You may.

3 COUNCIL MEMBER AGOPIAN: Seems like I
4 recall yesterday's presentation or PowerPoint identified
5 406(n) as being one of the main concerns that the Powder
6 River Basin Resource Council put with the Doctor's
7 testimony, that he identified on numerous occasions that he
8 was concerned about subsection (n).

9 MS. ANDERSON: You might be confusing
10 Dr. Marino with Mr. Wireman, but...

11 COUNCIL MEMBER AGOPIAN: Okay. That was
12 still your -- your witness and it was still in that
13 presentation, so...

14 When I see 406(n) up there, and we're talking
15 about rebuttal, I fail to see what the objection is in
16 their rebuttal.

17 MS. ANDERSON: And you can -- if it's
18 limited to the scope of what we talked about yesterday and
19 specific as Mr. Gilbertz said --

20 CHAIRMAN BAGLEY: Okay. So --

21 MS. ANDERSON: -- we'll see those
22 questions, but --

23 CHAIRMAN BAGLEY: Let's hear what Mr. Pope
24 has to say.

25 MR. POPE: Dr. Bagley, as general

1 principle, I don't disagree that rebuttal should be limited
2 to the evidence presented. The reason I asked Mr. Barron
3 that previous question and the answer that ensued, that
4 table is limited to the areas of objections and as those
5 apply to the accurate and completeness of the Brook permit
6 application.

7 We only intend, with this chart, to discuss areas
8 that were brought up by objectors as part of this hearing.
9 So that is proper rebuttal.

10 CHAIRMAN BAGLEY: So I'll let the lawyers
11 argue about what belongs in rebuttal and what doesn't,
12 since I'm not trained in the law. What I don't want to
13 hear is complete rehash all of this. This is the seventh
14 day. I've got a pretty good handle on what is and is --
15 has not been done. And I'm beginning to think that folks
16 are trying to waste my time. So that by itself is -- is
17 troublesome.

18 Let's keep -- I'm going to allow you to talk
19 briefly about this, but we need to keep it very short
20 because I have seen a lot of presentation of evidence from
21 everybody on all of these issues. I don't need to hear it
22 all again. I don't really need to hear too much more
23 again. In fact, I don't think I need to hear any more
24 again, but allow you to go ahead.

25 MR. POPE: I appreciate that, Dr. Bagley.

1 We will not rehash anything. I think Ms. Svec will poke me
2 if I get anywhere close to that.

3 Q. (BY MR. POPE) Mr. Barron, in the interest of
4 efficiency, does that chart identify areas that have been
5 objected to in the permit application?

6 A. Yes.

7 Q. What is the blue ink in that chart -- what does
8 the text in the blue ink tell someone looking at that
9 chart?

10 A. That that's where you can find those components
11 addressed in the permit application.

12 Q. All right. Mr. Barron, we were going to have
13 you check some boxes, but we are not going to do that.

14 CHAIRMAN BAGLEY: That's good.

15 MR. POPE: Mr. Sutphin will be terribly
16 disappointed, but not going to do that.

17 Q. (BY MR. POPE) To wrap up with you, are you
18 aware of any permit conditions that have been suggested by
19 the objectors that in your opinion is required to make the
20 Brook permit application accurate and complete?

21 A. No.

22 MR. POPE: No further questions.

23 CHAIRMAN BAGLEY: Thank you.

24 MR. POPE: Actually, before I yield the
25 floor, we would offer that as a demonstrative exhibit,

1 Brook D15.

2 MR. RUBY: Mark it.

3 CHAIRMAN BAGLEY: All right. Any concerns?

4 MS. ANDERSON: Can we put a D on there?

5 MR. POPE: Yeah, D-15.

6 CHAIRMAN BAGLEY: Yeah, D15.

7 MR. GILBERTZ: No objection to it being
8 received as demonstrative.

9 CHAIRMAN BAGLEY: All right. Accepted.

10 (Brook Mine Exhibit No. D15
11 received in evidence.)

12 CHAIRMAN BAGLEY: All right. Thank you,

13 Mr. Pope.

14 Mr. Kuhlmann.

15 MR. KUHLMANN: I don't think we have any
16 questions.

17 CHAIRMAN BAGLEY: All right. Thank you.

18 Mr. Gilbertz.

19 MR. GILBERTZ: I have no questions for this
20 witness.

21 CHAIRMAN BAGLEY: Thank you.

22 Ms. Boomgaarden.

23 MS. BOOMGAARDEN: Thank you. Just a few.

24 CROSS-EXAMINATION

25 Q. (BY MS. BOOMGAARDEN) Good morning, Mr. Barron.

1 A. Good morning.

2 Q. We can agree, can't we, that the TR-1 area is
3 that area of the confluence of Goose Creek and the Tongue
4 River?

5 A. Yes.

6 Q. And we can also agree that the TR-1 area is the
7 first area that Brook intends to mine?

8 A. Yes.

9 Q. Can you please tell me where in the permit
10 application it describes, as you testified this morning,
11 how Brook can use special handling to fix the seal?

12 A. There's not a discussion specifically on the
13 seal, but we do have the ability to special handle
14 material.

15 Q. And we can agree, I believe, based on body of
16 testimony at this hearing, that the geologic strata across
17 the permit area is not homogenous; is that correct?

18 A. That's correct.

19 Q. Can you tell me where in Appendices D5 and D6
20 each of the heterogenous characteristics were sampled and
21 analyzed?

22 A. If they were found in the addendum to those
23 appendices.

24 Q. And same two questions I asked Dr. Kuchanur.
25 Did you rely on a definition in the Wyoming Environmental

1 Quality Act to determine what the phrase "technically
2 adequate" means?

3 MR. POPE: I'm going to object to that.
4 We've established the technically adequate is a DEQ term,
5 as the council ruled, he's not a DEQ witness.

6 MS. BOOMGAARDEN: I disagree. I don't
7 think anybody has said it's a DEQ term. Dr. Kuchanur said
8 he couldn't recall relying on anything, and he asked --
9 answered Mr. Pope's question on redirect. This is a
10 different witness, and who, as we know, has been charged
11 with responsibility for developing this permit application.
12 I'd like to know whether he relied on a definition.

13 MS. ANDERSON: And it's the very subject of
14 this hearing, I would just add.

15 CHAIRMAN BAGLEY: Can I hear the question
16 again?

17 MS. BOOMGAARDEN: Yes. Did you rely on a
18 definition from the Wyoming Environmental Quality Act to
19 determine what the phrase "technically adequate" means?

20 CHAIRMAN BAGLEY: Yeah, I'll allow that
21 question.

22 MS. BOOMGAARDEN: Thank you.

23 A. No.

24 Q. (BY MS. BOOMGAARDEN) Thank you.

25 A. Technically acc --

1 Q. Thank you.

2 Did you rely on definition in the Land Quality
3 Division rules and regulations to determine what the
4 phrase technically adequate means?

5 A. No.

6 MS. BOOMGAARDEN: Thank you. No further
7 questions.

8 CHAIRMAN BAGLEY: Thank you,
9 Ms. Boomgaarden.

10 Ms. Anderson.

11 MS. ANDERSON: Thank you, Dr. Bagley.

12 CROSS-EXAMINATION

13 Q. (BY MS. ANDERSON) I just have a few questions
14 for ya, Mr. Barron. Good aft -- good morning. I think
15 it's still morning.

16 A. I hope it's not afternoon.

17 Q. Okay. You talked a little bit about Mr. Buyok's
18 house and the half-mile buffer around the permit boundary.
19 And there is -- you testified to a commitment made by the
20 company and maybe yourself directly on behalf of the
21 company, that, you know, you kind of fudged the line a
22 little bit and allowed Mr. Buyok's house within that
23 buffer, right?

24 A. We've made no such commitment at this time.

25 Q. Okay. So it's -- it's not currently in the

1 permit application at this time to allow Mr. Buyok's house
2 to be considered for the purposes of the law, really,
3 within that half-mile buffer?

4 A. No.

5 Q. Okay. You testified a little bit to the idea
6 that, you know, you're waiting for the ground control plan
7 from MSHA because you wanted to kill two birds with one
8 stone. I think that was your testimony, right?

9 A. No. We're not waiting on a ground control plan
10 from MSHA.

11 Q. Okay. So did you testify that, you know, you're
12 trying to kill two birds with one stone here?

13 A. Yes.

14 Q. What did you mean by that if there's not a
15 ground control plan right now for this permit application
16 and all this stuff up here on the chart?

17 A. A ground control plan does not need to be
18 submitted as part of this permit application for DEQ.

19 Q. Okay. But it's -- how are you relying on it,
20 then, for the subsidence control plan?

21 A. Rephrase the question, please.

22 Q. Yeah. So you were saying that the ground
23 control plan is killing two birds with one stone. I'm
24 assuming that the two birds are both the ground control
25 plan and the permit application, right?

1 A. No.

2 Q. So what are the two birds?

3 A. So the two birds are on the discussion of
4 subsidence. The permit application has a subsidence
5 control plan. DEQ has made a request of some additional
6 information for mining in a specific area. The ground
7 control plan is for each specific panel. And there is a
8 ground control plan that will need to be submitted for
9 each individual panel. So we have committed in the permit
10 application to provide that data when we submit the ground
11 control plan. It's reviewed by MSHA and then approved and
12 that becomes part of the permit application. So the
13 additional detail that DEQ requested as part of its
14 technical review of the permit, we have committed to
15 providing, and they have found that response adequate.

16 Q. Okay. Just to be very clear, it's not part of
17 the permit application right now?

18 A. No.

19 Q. Okay. And when that additional data is
20 submitted to DEQ, will the public have a chance to review
21 this data and information?

22 A. Once it's submitted to DEQ, it becomes part of
23 the public record and any one of the public can review it
24 at any time.

25 Q. Are you aware there will be major or minor

1 modification to the permit?

2 A. My general sense is it will probably be a minor
3 modification to the permit.

4 Q. So that doesn't mean there's -- so does that
5 mean there won't be an opportunity for objections and
6 comments officially into DEQ from the public?

7 MR. POPE: Objection. That's a question of
8 DEQ processes, and it's also not part of what he discussed
9 on direct. He's not a DEQ person, so he can't speak to
10 that specifically.

11 CHAIRMAN BAGLEY: Yeah, I agree. Since
12 he's not DEQ, he wouldn't know.

13 MS. ANDERSON: Okay. That's fine.

14 Q. (BY MS. ANDERSON) Mr. Barron, have you prepared
15 any other ground control plans for MSHA permits?

16 A. Yes.

17 Q. For highwall mines specifically?

18 A. No.

19 Q. So this would be the first one that you would
20 do --

21 A. Yes.

22 Q. -- for highwall mine?

23 Okay. I have a somewhat technical question.
24 What difference in the stability calculations are made
25 from more conventional and highwall versus room and pillar

1 mines, and what are those differences?

2 MR. POPE: Objection, Dr. Bagley. This is
3 what was objected to on direct, that he isn't a subsidence
4 control expert. Those questions, when I asked them, were
5 not allowed. It wouldn't be fair to allow those kinds of
6 technical questions now on cross.

7 CHAIRMAN BAGLEY: Could I hear the question
8 again?

9 MS. ANDERSON: So my question -- I may ask
10 a different question, just to clear this all up.

11 CHAIRMAN BAGLEY: Okay.

12 MS. ANDERSON: And I appreciate what
13 Mr. Pope just said. That actually is interesting.

14 Q. (BY MS. ANDERSON) Okay. Mr. Barron, did you
15 perform the ARMPs calculations for this permit
16 application?

17 A. I did not.

18 Q. You did not. Okay.

19 Oh, okay. And if you didn't, why weren't these
20 calculations provided for review in the permit
21 application?

22 A. Those calculations will be part of the ground
23 control plan. They have not yet been conducted.

24 MS. ANDERSON: Okay. Just give me one
25 moment to consult.

1 Q. (BY MS. ANDERSON) Mr. Barron, do you know if
2 the ARMPs program determines floor and roof stability?

3 A. I do not believe that it does.

4 MS. ANDERSON: Okay. Thank you. I think
5 that is all the questions we have.

6 CHAIRMAN BAGLEY: All right. Thank you,
7 Ms. Anderson.

8 Council, any questions?

9 COUNCIL MEMBER AGOPIAN: I have none.

10 CHAIRMAN BAGLEY: I do have a question.

11 EXAMINATION

12 Q. (BY CHAIRMAN BAGLEY) So, Mr. Barron, you
13 mentioned at different times you had -- you were available
14 to the public. Did you or -- or Brook Mine host any
15 informational meetings with the public as part of the --
16 while this process was going on? While the mine permit
17 application was being prepared?

18 A. I did not.

19 Q. Are you aware if Brook Mine did?

20 A. I am not aware.

21 CHAIRMAN BAGLEY: Okay. All right. Thank
22 you. That was all the questions I had.

23 Mr. Pope.

24 MR. POPE: I have no redirect questions.

25 CHAIRMAN BAGLEY: All right. Well, thank

1 you, Mr. Barron.

2 THE WITNESS: Thank you.

3 CHAIRMAN BAGLEY: Step down.

4 Let us take a 10-minute break. Be back at 11:10.

5 (Hearing proceedings recessed

6 10:59 a.m. to 11:09 a.m.)

7 CHAIRMAN BAGLEY: Mr. Pope, do you have any
8 other witnesses?

9 MR. POPE: Brook Mine rests.

10 CHAIRMAN BAGLEY: Oh. Thank you. Good.

11 So I want to thank everybody for the
12 presentations and the time and effort everybody has put
13 into this.

14 So due to the length and complexity of this case,
15 it has been pretty long, I am going to have parties prepare
16 written proposed findings of fact and conclusions of law
17 instead of doing oral closings.

18 It's my understanding that the transcript will be
19 ready sometime around the end of June. We don't know the
20 exact date, but that's the time frame we're looking at. So
21 the parties will have 20 calendar days after notification
22 by council staff that the transcript is available to file
23 their proposed findings and conclusions of law, and there
24 may also be additional information requested. I'll get to
25 that in a minute.

1 We will issue an order notifying the parties the
2 transcript is available and the order will contain the
3 filing date for the findings of fact and conclusions of
4 law. Those documents we're expecting to be in the order of
5 40 pages. We will finalize that in detail in a minute as
6 I'll explain.

7 Proposed findings of fact and conclusions of law
8 should be focused on the law that is applicable to this
9 case, which includes citations to the specified -- specific
10 legal requirements, statutes and rules that the council's
11 required to consider to decide this matter.

12 The proposed findings of fact and conclusions of
13 law must also include necessary facts cited to in the
14 transcript to support your legal conclusions. Because
15 there was also testimony about possible permit conditions
16 or changes, the proposed findings of facts and conclusions
17 of law should also identify suggested changes or conditions
18 that a party requests the council to consider and the legal
19 grounds for such a condition to be part of that permit.

20 Now as we've been listening, the council does --
21 has had some additional questions that we've come up with.
22 We will be preparing an order on this briefing to be
23 submitted to you early next week. And that will clarify
24 some of the additional questions that we have that we will
25 be requesting you to brief us on. So that will be

1 available early next week. We have to finalize that
2 document.

3 And in that we will also further clarify, like I
4 said, pages and things, and was thinking in the order of
5 40 pages. I was told one page was not long enough. So you
6 have a little longer than that. So I guess the short
7 answer is you might be able to take tomorrow off and wait
8 until early -- but that's up to you.

9 Because all the council members were not present
10 to hear all the evidence in this case during the entire
11 final hearing, those council members will have to read and
12 review all of the evidence, including the transcript, upon
13 it being done, and/or listen to the audio-video recording
14 of the hearing.

15 I believe Mr. Agopian wanted to see it all live,
16 so here he has been watching it live. It's always better
17 live, right there.

18 COUNCIL MEMBER AGOPIAN: Wouldn't have
19 missed it.

20 CHAIRMAN BAGLEY: This matter shall remain
21 open until the proposed findings of fact and conclusions of
22 law have been filed with the council, and the council has
23 had an opportunity to read them.

24 We will target our August meeting for final
25 deliberations and vote on this matter. If we can do that

1 earlier, we will. And, of course, we will let all parties
2 know.

3 At the time of deliberations, at that point we
4 will be closing the hearing. But it is not closed now.
5 And the meeting date for those who are trying to plan is
6 currently for the first week in August. We have another
7 meeting schedule. The exact dates of that are still being
8 finalized, but that is when we are targeting to be able to
9 also finalize -- finalize this.

10 Are there any final questions?

11 Yes, Mr. Kuhlmann.

12 MR. KUHLMANN: Mr. Hearing Officer. Thank
13 you.

14 DEQ has thought about the idea of proposed
15 conditions and appreciates the council inviting those. And
16 we have suggested, you know, some revisions ourselves
17 through a proposed change. One thing we were concerned
18 about is making sure that the proposed changes that the --
19 or the conditions that the council might accept and place
20 upon the permit would be ones that we can enforce, that are
21 practical, and also we have legal authority as DEQ to
22 enforce.

23 And, therefore, not trying to create significant
24 amount of additional filings or paper, we would ask that
25 the council build into this process an ability for the

1 parties to comment to the council at some point, in some
2 form, comment prior to the council approving changes, if
3 necessary -- you know, if necessary, if there are concerns
4 about the practicality of those conditions, improvements in
5 the wording of those conditions, or just general concern
6 there's not a legal authority to enforce those conditions.

7 I would like to say the DEQ would just provide
8 those comments, but I'm certain that the other parties are
9 also interested in trying to have a say in that. So we'd
10 ask that for all parties.

11 CHAIRMAN BAGLEY: All right. Thank you for
12 that comment. I'll take that under advisement. And since
13 the hearing is still open, as we continue forward, we'll
14 examine that -- the potential for that. Thank you for
15 bringing that forward.

16 Any other questions? Thank you, all, for your
17 patience. This hearing is recessed.

18 (Hearing proceedings recessed

19 11:16 a.m., June 8, 2017.)

7 TRANSCRIPT OF HEARING PROCEEDINGS

8 VOLUME V

9

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter reconvened for hearing on the
12 26th day of May, 2017, at the approximate hour of
13 8:30 a.m., at the Sheridan College, Thorne-Rider Campus
14 Center, Room TRCC 008, 3059 Coffeen Avenue, Sheridan,
15 Wyoming, before the Wyoming Environmental Quality Council,
16 with Chairman David Bagley, presiding, and Council Member
17 Meghan Lally, Council Member Nick Agopian and Council
18 Member Deb Baumer in attendance.

19 Mr. McKenzie Williams, Wyoming Attorney
20 General's Office, Attorney for the Council; Mr. Jim Ruby,
21 Executive Director to the Council; Mr. Joe Girardin,
22 Business Office Coordinator, were also in attendance.

1 P R O C E E D I N G S

2 (Hearing proceedings reconvened

3 8:30 a.m., May 26, 2017.)

4 CHAIRMAN BAGLEY: All right. Good morning.

5 It is 8:30 a.m., May 26, 2017. I'm Dr. David Bagley, the
6 hearing officer in Docket 17-4802 in regards to Brook Mine,
7 LLC.

8 Present today from the council are Meghan Lally,
9 Nick Agopian, Deb Baumer. Megan Degenfelder and
10 Tim Flitner are absent. Councilman Fairservis has recused
11 himself.

12 Parties present today, I will allow them to
13 introduce themselves. We'll just go in the same order
14 we've been going. So start with Brook Mine.

15 MR. SUTPHIN: Good morning, Dr. Bagley.
16 Thank you. Isaac Sutphin, Jeffrey Pope and Tom Sansonetti
17 from Holland & Hart.

18 CHAIRMAN BAGLEY: Thank you.

19 DEQ.

20 MR. LAROCK: Andrew Kuhlmann and James
21 LaRock from the Attorney General's Office.

22 CHAIRMAN BAGLEY: Thank you.

23 Powder River Basin Resource Council.

24 MS. ANDERSON: Good morning. Shannon
25 Anderson on behalf of Powder River Basin Resource Council.

1 CHAIRMAN BAGLEY: Thank you.

2 The Fishers.

3 MR. GILBERTZ: Jay Gilbertz, still with
4 Yonkee & Toner.

5 CHAIRMAN BAGLEY: Thank you.

6 And Big Horn Coal.

7 MS. BOOMGAARDEN: Good morning. Lynn
8 Boomgaarden and Clay Gregersen.

9 CHAIRMAN BAGLEY: Thank you.

10 Also present for the council are Jim Ruby,
11 Executive Officer and Joe Girardin, Council Business
12 Coordinator. And we have McKenzie -- what's your last
13 name?

14 MR. WILLIAMS: Williams.

15 CHAIRMAN BAGLEY: McKenzie Williams joining
16 us from the Attorney General's Office.

17 This hearing is being held at Sheridan College,
18 Room TRCC 008 in the Thorne-Rider Campus Center,
19 3059 Coffeen Avenue, Sheridan, Wyoming. There is a court
20 reporter present.

21 So we had just yesterday evening completed direct
22 of a witness, and so, Ms. Anderson, if you can please --
23 oh, you're done with the direct, so --

24 I do want to remind the witness -- make sure I
25 get your name here correctly --

1 MR. GILBERTZ: Buyok.

2 CHAIRMAN BAGLEY: -- John Buyok. Just
3 remind you you're still under oath.

4 And now we will begin cross-examination. We'll
5 start with you, Mr. Gilbertz.

6 JOHN PAUL BUYOK,
7 called for examination by PRBRC, having been previously
8 sworn, testified further as follows:

9 MR. GILBERTZ: Thank you.

10 CROSS-EXAMINATION

11 Q. (BY MR. GILBERTZ) Good morning, Mr. Buyok.

12 A. Good morning.

13 Q. We met I think at your deposition, which was
14 taken by Holland & Hart, right?

15 A. Yes.

16 Q. I have a few questions for you this morning.
17 Yesterday you said you were an engineer by training; is
18 that right?

19 A. Yes.

20 Q. What did you do in your career as an engineer?

21 A. Well, the first four or five years I worked for
22 the State Engineer's Office down in Cheyenne on water
23 rights. I was assistant superintendent of Division 1 and
24 then interstate streams engineer for the State of Wyoming.
25 Then I went to work for Western Water Consultants. I

1 worked with them for -- it's either seven or eight years.
2 I can't remember exactly. And then after that I went to
3 work for --

4 THE REPORTER: You went to work for where?

5 THE WITNESS: Aqua Terra Consultants.

6 A. I worked for them for seven or eight years also.
7 And then ever since 1998 I've been out on my own.

8 Q. (BY MR. GILBERTZ) Okay. Sounds, then, from
9 that description, like a focus of your engineering work
10 has been in water-related matters.

11 A. Mostly. Did a lot of mining engineering also.

12 Q. Okay. Tell me about that. What mining
13 engineering did you do?

14 A. While I was primarily working on reclamation
15 plan that -- did some mine planning also over the years.
16 Did quite a bit of work on highwall stability and things
17 like that.

18 Q. Okay. There was a statement made in the
19 openings that some of the objectors or folks that were
20 concerned about this project hadn't spent any time with
21 the mine plan to try to understand it. Did you spend time
22 with the mine plan?

23 A. I'd have to say hundreds of hours by now.

24 Q. Okay. And did you -- go ahead.

25 A. I should say with the permit document. Not just

1 the mine plan.

2 Q. Okay. The entire permit document. This thing
3 that's sitting up on the wall behind you?

4 A. Yes.

5 Q. Good. And you said hundreds of hours?

6 A. I think so.

7 Q. Were your concerns informed by what you did or
8 did not see in this mine plan?

9 A. Yes, they are.

10 Q. Now, with this understanding that you've had a
11 background in dealing with water issues, did I hear you
12 testify yesterday that you had attempted to drill a well
13 below the Carney seam and had drilled to a depth of a
14 thousand feet?

15 A. Yes, I did. In two different places.

16 Q. Two wells to a thousand feet each?

17 A. Yes.

18 Q. Okay. And neither one you could find any usable
19 water for your house below the Carney seam?

20 A. Yes, that's correct.

21 Q. As the crow flies, Mr. Buyok, about -- and let's
22 use a crow so we don't get wet -- how far is it to the
23 Fisher house?

24 A. About three-eighths of a mile.

25 Q. Three-eighths of a mile. Little less than half

1 a mile?

2 A. Yeah.

3 Q. Okay. And so your real world experience in that
4 area in drilling these two wells is that there isn't a
5 good aquifer at 4 or 500 feet that would serve as a
6 replacement well for the Fishers as Jeff Barron testified
7 to yesterday?

8 A. You know, geology can change from place to
9 place, but I know at least that close to the Fishers there
10 isn't.

11 Q. Three-eighths of a mile away, you couldn't find
12 one?

13 A. I couldn't find one. Well, actually, the one --
14 the one that we did try that was up on the hill above my
15 sister's house was probably 400 yards from their house,
16 maybe only 200 yards from their property.

17 Q. Okay. And so that well up on the hill is only,
18 what did you say, 400 yards from the Fishers' property --
19 or Fishers' house?

20 A. Yeah. Uh-huh.

21 Q. And I also wanted to explore a little bit about
22 this. You mentioned that in some extremely dry years, you
23 had problems with the water in your water well?

24 A. Yeah. We -- the water level dropped so much we
25 were pumping sediment up from the bottom of the well, and

1 we were having to change filters about every other day to
2 keep our water supply.

3 Q. Okay. Does that fact inform your concern about
4 the notion that there will be drawdown in these wells?

5 A. Yes. According to the mine plan, there will be
6 1.2 feet of drawdown in our house well. And in a dry year
7 that would -- that would run us out of water.

8 Q. And so you understand it is your -- excuse me.
9 Let me start over. It's your understanding that the
10 documents in the mine plan suggest that there will be a
11 1.2 foot drawdown in your domestic well?

12 A. Yes.

13 Q. Okay. And then I think you testified yesterday,
14 when was it that you learned there was an assertion that
15 your well and house fell just feet outside of the
16 one-half-mile boundary?

17 A. That was in my deposition -- or right after my
18 deposition.

19 Q. Right after your deposition, which is just a
20 couple weeks ago?

21 A. Yes.

22 Q. Okay. Is that a matter of concern to you?

23 A. Of course.

24 Q. Why?

25 A. Well, we're not -- according to the law, we're

1 not eligible for pre-blast survey. And I can't remember
2 all the other things -- there were other things that go
3 along with the half mile.

4 Q. Okay. If it were true that because you're just
5 indeed outside that half-mile boundary, you would also not
6 be entitled to the well -- replacement water. Is that
7 something you'd like this council to consider adding as a
8 condition?

9 A. I'm not sure if it is or isn't, but I would like
10 them to add that as a condition.

11 Q. Thank you.

12 Now, before I do that, in your review of the
13 mine plan, was there anything that caused you to be
14 concerned about any particular area of mining?

15 A. Well, of course, I was interested in areas that
16 were closest to our house, but I was also a little
17 concerned about the TR-1 area.

18 Q. What was your concern about the TR-1 area?

19 A. Well, to kind of add more detail to it, we did
20 take a tour out there on Wednesday. And --

21 MR. SUTPHIN: So, Mr. Bagley, I'm sorry.
22 I'm going to need to interject with an objection here.
23 This is information that is not included in Mr. Buyok's own
24 personal objection letter, nor is any of this referenced in
25 the Powder River Basin Resource Council's objection letter.

1 And I certainly think it's highly inappropriate for him to
2 testify about things he's done and site visits he's
3 conducted as part of this case. He's not an expert
4 witness. He's never been submitted to be an expert
5 witness. I think it's highly inappropriate.

6 MS. ANDERSON: Dr. Bagley, if I may respond
7 and I'll let Mr. Gilbertz as well, given it was his
8 question. But -- so the whole purpose of us being here
9 today is to receive public comment. That's the very
10 purpose of this hearing. The very purpose of us being here
11 is to allow the parties that have objected to the permit
12 application to prevent -- to present information to you, as
13 the council, to consider when you're reviewing the permit
14 application. It's not limited to what we wrote in our
15 objection letter back in January. It's not limited to even
16 what we put in the petition for review. It's limited to
17 what we provide to you today.

18 This is the point of this hearing is evidentiary
19 hearing to present information to you for you to consider
20 in your decision-making process. Brook will have some
21 opportunity to ask some clarifying questions about this, if
22 they so choose, but Mr. Buyok is a neighbor to this mine.
23 He's well informed about the property, his interest. I
24 think we've established he has some background and
25 experience. He is not -- we're not offering him as an

1 expert witness, but he does have some relevant factual
2 information that we think would benefit the council. And
3 that's all we're trying to do here today.

4 MR. GILBERTZ: Thank you, Dr. Bagley.

5 I would say I did not ask him for an expert
6 opinion. I asked him if he had any concerns, and he said
7 that he did. And he also then said those concerns were
8 heightened by a recent visit. I will add, lastly, that
9 this continues a phenomenally disturbing pattern of an
10 effort to keep these landowners from being heard. They
11 have to be here today with you guys because nobody would
12 give them an opportunity to have a simple meeting. And
13 then we have efforts to kick out their objections and say,
14 nope, can't even have this hearing. And then we get here
15 and now it's, nope, can't let -- we can't hear from these
16 folks. It's just a terribly disturbing pattern. So if
17 I --

18 MR. SUTPHIN: Dr. Bagley, if I might.
19 There are two things that need to be clarified. First,
20 Mr. Gilbertz began Mr. Buyok's questioning by establishing
21 his background and his experience as an engineer in water-
22 related issues. Clearly an attempt to bootstrap him in as
23 expert witness that was not designated to testify as such.
24 And, secondly, the only thing we're asking is the same
25 thing that all the objectors are asking, to look at this

1 carefully and to apply the law and the rules the way
2 they're supposed to be applied.

3 The fact that we have ended up in a contested
4 case hearing has nothing to do with decisions made by
5 Brook. The director of the DEQ chose to exercise his
6 discretion not to hold informal conferences. But the fact
7 that we are in a contested case hearing means certain
8 formalities of the law need to be applied. Mr. Gilbertz,
9 Ms. Anderson and all the attorneys involved in this case
10 understand that. And we are not trying to silence anyone.
11 We're trying to keep this within the rules and the -- the
12 law.

13 CHAIRMAN BAGLEY: So on this particular
14 objection, the question was related to TR-1. And from what
15 I could tell on the maps, Mr. Buyok's property is not up
16 against that part of the mine. The planned mine is further
17 upgradient. I don't know if the rest of council agrees
18 with me. We've heard an awful lot about TR-1. I mean,
19 important information, but what I'd like to do is keep the
20 focus of Mr. Buyok's questions on the areas that are
21 related to his -- his experience as a property owner. I
22 appreciate his background as an engineer, being an engineer
23 myself, but he has not been hired to be the expert on this.
24 So we want to hear what the -- the landowners' views are,
25 but really how it is related to their experience. And we

1 don't need additional expert opinion on other aspects of
2 the mine plan from landowners. That's not what we're --
3 we've heard lots of experts, and I think we'll even hear
4 more. So let's -- let's keep the focus related to
5 Mr. Buyok's experiences in his property, which I think
6 there are plenty.

7 COUNCIL MEMBER AGOPIAN: Dr. Bagley, do we
8 need, as a council, to be advised by the Attorney General's
9 Office about the appropriateness of conducting a public
10 comment session in the middle of a contested case hearing?
11 It's my understanding we're here today to hear about
12 technical deficiencies associated with the mine permit
13 that's been applied. And for whatever reason we're here
14 today, in the course of events that occurred this year, the
15 informal conference was not held. We did not adhere to the
16 20-day schedule, and a variety of things have gone in a
17 variety of directions. So I would hope that the testimony
18 today is focused on technical deficiencies associated with
19 the permit. And, unfortunately, while we didn't have a
20 public hearing, as associated with informal conference or
21 requested within that 30-day period. I think we need to be
22 mindful of that and mindful why we're here today.

23 CHAIRMAN BAGLEY: Thank you, Mr. Agopian.

24 Yeah, I've already spoken with our Attorney
25 General representatives, and it's our view -- or his

1 recommendation was that we allow evidence that we feel
2 could have bearing, as long as it's not irrelevant,
3 immaterial or unduly repetitious. And in this case, TR-1 I
4 feel we definitely discussed a lot, but I would like to
5 hear the landowners called as witnesses by one of the
6 contestants.

7 COUNCIL MEMBER AGOPIAN: Okay.

8 CHAIRMAN BAGLEY: So we'll continue that.

9 COUNCIL MEMBER AGOPIAN: I wanted to share
10 my feelings about that.

11 CHAIRMAN BAGLEY: Thank you.

12 MR. GILBERTZ: Are we ready?

13 CHAIRMAN BAGLEY: We are ready.

14 MR. GILBERTZ: Thank you.

15 Q. (BY MR. GILBERTZ) Mr. Buyok, I wanted to talk
16 to you about some of your testimony regarding subsidence
17 from yesterday. You said something yesterday about how
18 the Tongue River Valley transfers shock vibrations well or
19 something like that. Do you remember that?

20 A. Yes.

21 Q. What were you meaning by that? I didn't fully
22 understand that.

23 A. Just that it's -- the alluvium is flow of water,
24 for the most part, and so it's pretty unconsolidated. If
25 you have a vibration on one side of the valley, it tends

1 to transfer across the valley much more easily than
2 necessarily a vibration would through dry ground -- dry
3 ground overburden.

4 Q. Okay. And I wanted to follow up on your
5 personal experience with subsidence. If I understood you
6 correctly yesterday, you were showing the council a photo
7 of some subsidence and explaining how it was actually in
8 the process of subsiding within the last several weeks?

9 A. Yes.

10 Q. Okay. And then I understand that you personally
11 have had experience with a subsidence in your tractor. We
12 heard about that during your deposition. Could you
13 explain that?

14 A. Yeah, I was harrowing a field -- I can't
15 remember, it was either three or four years ago -- the
16 front wheel of my tractor fell in a subsidence pit and
17 luckily it didn't subside more than 4 or 5 feet in
18 diameter. The other three wheels I was able to keep on
19 the ground and pull the tractor back out. It was a
20 four-wheel-drive tractor.

21 Q. Now, to understand that, make sure we're clear
22 about that, did it actually subside as you were driving
23 over it or did you just drive into one you didn't see?

24 A. No. It subsided as I drove over it.

25 Q. Okay. Good. Now, Mr. Emme told this council

1 earlier this week that even though he had not been out in
2 that area of subsidence for years, that, in effect, there
3 was no reason to be concerned about further subsidence of
4 these old mines because they had subsided already. Does
5 that square with your real world experience of subsidence
6 out in your area?

7 A. No. They're continuing to subside every year
8 almost. We have another -- another area that subsides.

9 MR. GILBERTZ: Thank you, Mr. Buyok.

10 I have no further questions.

11 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

12 Mr. Sutphin.

13 MS. ANDERSON: Dr. Bagley, I'm sorry. Did
14 you want to ask Ms. Boomgaarden -- I don't know what order
15 we're going in, but --

16 MS. BOOMGAARDEN: We have no questions, but
17 I would appreciate the opportunity if we do have questions
18 with each of these witnesses.

19 CHAIRMAN BAGLEY: You're on my list, yes.
20 I'm just going on the order I have here.

21 MS. BOOMGAARDEN: Okay. Thank you.

22 CHAIRMAN BAGLEY: So, no, I'm not going to
23 miss anybody's --

24 MS. ANDERSON: Okay.

25 CHAIRMAN BAGLEY: -- chance to speak.

1 MS. ANDERSON: The order just kept
2 changing, so I wanted to clarify the order. Okay. Thank
3 you.

4 CHAIRMAN BAGLEY: Yeah, well, it's been
5 moving a little, yeah.

6 MS. ANDERSON: Okay.

7 CHAIRMAN BAGLEY: Correct, it has been
8 changing. It's not random. It has been changing. Thank
9 you.

10 MR. SUTPHIN: Thank you, Mr. Chairman.
11 Dr. Bagley, thank you.

12 CROSS-EXAMINATION

13 Q. (BY MR. SUTPHIN) Mr. Buyok, how are you this
14 morning?

15 A. Okay.

16 Q. I know in your deposition you mentioned that you
17 weren't going to testify at this trial, right? This
18 hearing?

19 A. Yes.

20 Q. And I appreciate that you apparently changed
21 your mind, due to at least in part to me wanting to take
22 your deposition, right?

23 A. Yeah.

24 Q. During your deposition, did I do anything that
25 offended or intimidated you in any way?

1 A. I don't think so.

2 Q. Okay. You were here, though, during opening
3 statements, right?

4 A. Yes.

5 Q. And you heard Ms. Anderson talk about how we
6 tried to use intimidation factors. Do you remember that?

7 A. Yes.

8 Q. You wouldn't agree, though, that I did anything
9 to intimidate you, would you?

10 A. No.

11 Q. I understand you have a lot of questions and
12 concerns about how Brook Mine plan might affect your
13 property. You never actually asked anyone at Brook Mine
14 to respond to any of your concerns, did you?

15 A. No, I didn't.

16 Q. And you never asked Mr. Barron, the engineer
17 from Western Water Consultants, primarily responsible for
18 this permit file, did you?

19 A. No, I didn't.

20 Q. One of your primary concerns is protecting your
21 water well. Is that fair to say?

22 A. Yes.

23 Q. And you were concerned about the lack of
24 protection if those wells are not considered adjudicated,
25 right?

1 A. Yes.

2 Q. But you heard Dr. Kuchanur testify that he
3 acknowledged your concern. Fair?

4 A. Yes.

5 Q. And he agreed that the term "adjudicated" needs
6 to be removed so that all permitted wells that are
7 impaired fall under the protections. Fair?

8 A. Yeah.

9 Q. Must feel pretty good to have a PhD
10 hydrogeologist agree with your objection, right?

11 A. It doesn't hurt.

12 Q. Would you agree that as long as that change is
13 included in the State decision document, your concern
14 about the water well can be resolved?

15 A. My concern about the Brook Mine's responsibility
16 to replace it would be resolved, but not my concern about
17 whether it would be able to be replaced.

18 Q. Right. But you do agree that the permit
19 commitments would require Brook to either replace it or to
20 provide similar quality and quantity of water if it's
21 found that they impaired your well, right?

22 A. Yes.

23 Q. They may not be able to drill a new well for
24 you, but they have an obligation to provide you with
25 water, right?

1 A. That's the way I understand it. Although I
2 would have the same concern that was mentioned before with
3 it, that if the only other option was hauling in water,
4 how would I ensure that that happened in perpetuity?

5 Q. Well, right. But as you sit here today, you
6 have no reason to believe that Brook Mine couldn't
7 accomplish hauling in water as long as it was necessary,
8 right?

9 A. Right.

10 Q. You testified when you were asked by
11 Ms. Anderson that these water wells were not a minor
12 concern, right?

13 A. Right.

14 Q. And she talked about how earlier testimony had
15 referred to that as a minor revision. You remember her
16 saying that?

17 A. I think so.

18 Q. You would agree with me, based on your
19 experience with mine permits, that deletion of a single
20 word would be considered a minor modification under the
21 DEQ process, right?

22 MS. ANDERSON: Objection. Calls for a
23 legal conclusion. And we just established from Holland &
24 Hart Mr. Buyok is not an expert.

25 MR. SUTPHIN: I'm asking this witness if

1 removal of a single word would constitute anything more
2 than a minor modification to the permit because they've
3 tried to mischaracterize that testimony as some sort of dig
4 at these landowners. That's all I'm asking.

5 CHAIRMAN BAGLEY: It's -- it is an
6 interpretive question. I mean, and Mr. Buyok has indicated
7 that if his well goes dry, that's a major issue to him.
8 You can go ahead and ask that question, but let's keep it
9 focused.

10 Q. (BY MR. SUTPHIN) Do you --

11 A. I would say it depends on the word. Some words
12 could make major changes.

13 Q. What about the removal of the word "adjudicated"
14 to satisfy your concerns?

15 A. I think that would be --

16 THE REPORTER: I'm sorry. You think that
17 would be?

18 THE WITNESS: A minor revision.

19 Q. (BY MR. SUTPHIN) Let's talk a little bit about
20 the pre-blast survey. I'm going to ask Carri to bring up
21 an aerial image, except we don't have the dongle.
22 Amazing.

23 MR. GIRARDIN: I've got it.

24 Q. (BY MR. SUTPHIN) Mr. Buyok, while we're pulling
25 this up, would you mind grabbing the pointer, please.

1 Mr. Buyok, I acknowledge it's a little tough to
2 see up there, but you recognize the bottom portion of this
3 is an aerial view of your home?

4 A. Yes.

5 Q. Can you use the pointer and point out to council
6 where your residence is?

7 A. Right here.

8 Q. Okay. And --

9 MR. SUTPHIN: Thank you for dimming the
10 lights.

11 MS. ANDERSON: Sorry. Dr. Bagley, just for
12 the record, is this an exhibit that's being offered or was
13 it provided to the parties or --

14 MR. SUTPHIN: Mr. Chairman, this is simply
15 a demonstrative exhibit to show council where Mr. Buyok's
16 residence is in location to the Brook Mine permit and the
17 half-mile buffer. We're not submitting it as evidence,
18 just as demonstrative.

19 CHAIRMAN BAGLEY: I'll allow this. I've
20 been wondering myself how close we are, given his
21 testimony.

22 MR. SUTPHIN: Absolutely. Thank you,
23 Mr. Chairman.

24 Q. (BY MR. SUTPHIN) Mr. Buyok, can you please --
25 well, what is the structure that's near the top of the --

1 the aerial view here?

2 A. This one here?

3 Q. Yes, sir.

4 A. It's a machinery --

5 THE REPORTER: It's a what?

6 THE WITNESS: Machinery shed.

7 Q. (BY MR. SUTPHIN) You recognize this image as an
8 aerial view that Mr. Barron showed you shortly after your
9 deposition?

10 A. He just showed me on his phone. It's hard to
11 tell exactly, but it looks like it's the same thing.

12 Q. And he showed you that the half-mile buffer line
13 for the permit boundary is the orange line right between
14 your machinery shed and your home, right?

15 A. Yes.

16 Q. Okay. I think you testified that the well --
17 your domestic well is about 20 feet outside of the half-
18 mile buffer, right?

19 A. Yes.

20 Q. Can you point on this aerial roughly where your
21 water well is located?

22 A. About right here.

23 Q. Thank you.

24 I think you also said that your house is
25 approximately 40 feet outside; is that fair to say?

1 A. Yes.

2 Q. Okay. And I think the words you used yesterday
3 were that that leaves you out of the legal remedies with
4 respect to the Brook Mine. Do you remember that?

5 A. Yes.

6 Q. Okay. But isn't it true that -- that Brook Mine
7 has offered to include you in that half-mile buffer zone
8 because you're so close?

9 A. They've offered, but as I was told by the
10 attorneys, that doesn't matter. The half-mile buffer is a
11 half-mile buffer.

12 Q. Isn't it true --

13 A. That's --

14 Q. Isn't it true that Brook Mine offered to make a
15 condition of this permit, including you within the
16 half-mile buffer, if all -- all you had to do is ask,
17 right?

18 A. I didn't understand it as a condition of the
19 permit. I did understand that they offered to do that.

20 Q. Let's talk briefly about blasting. You don't
21 consider yourself an expert on blasting, do you?

22 A. No.

23 Q. So you would agree with me that you would defer
24 to someone like Mr. Emme, who is an expert with 27-plus
25 years of experience in blasting?

1 A. Yes.

2 Q. Okay. Let's pull up Exhibit PRBRC Number 80.

3 Do you remember this is the picture of the subsidence that
4 you talked about yesterday? One of them.

5 A. Yes.

6 Q. And I think you told us that when you went out
7 this week with PRBRC's expert witnesses, that there was
8 another crack that had formed; is that right?

9 A. Yes.

10 Q. Can you show us on this image -- on this picture
11 where that new crack has formed?

12 A. It's hard to tell exactly, but basically it runs
13 about 4 feet outside the outside perimeter of this all the
14 way around.

15 Q. You said it's about 4 feet. So, in other words,
16 the -- the sinkhole is now approximately -- well, I'm
17 careful -- I guess it would be 8 feet bigger in diameter?

18 A. Well. It's not yet. But it will be soon.

19 Q. I see. Brook hasn't been doing any blasting out
20 in the vicinity of this sinkhole in the last two weeks,
21 have they?

22 A. No.

23 Q. And you would agree they haven't done any
24 highwall mining anywhere near here in the last few weeks,
25 wouldn't you?

1 A. Yes.

2 Q. And you do know, right, Mr. Buyok, that these
3 old underground mines were designed as planned subsidence
4 mines, right?

5 A. Yes.

6 Q. Oh, before we leave the issue of the -- well,
7 we've already left it, I guess, so it's -- I can't say
8 before we leave it. But before we move on, I want to go
9 back and ask you a question about that half-mile buffer
10 again. Okay?

11 I think I heard you say that you didn't know
12 until after your deposition that your house was outside of
13 that half-mile buffer, right?

14 A. Yeah. The other maps that I'd seen had appeared
15 to me my house was within the half-mile buffer.

16 Q. But you would agree you knew you weren't
17 included on the list of residences within the half-mile
18 buffer that's a part of the permit file, right?

19 A. Yes.

20 Q. Okay. So, I mean, you're --

21 A. None of my buildings were, though, either.
22 Although these are definitely within, but they weren't on
23 the list either.

24 Q. Yeah. I appreciate that.

25 Let's talk just briefly about those vibrations

1 and the -- the Tongue River alluvium that you talked
2 about. I think in your objection letter you mentioned
3 that when the trains go by on the BNSF mainline, dishes in
4 your house rattle, right?

5 A. Yes.

6 Q. And you were here when Mr. Emme talked about how
7 rattling dishes and maybe rattling photographs or pictures
8 on the wall are typical manifestations that you might
9 experience during blasting. Were you here for that?

10 A. Yes, I was.

11 Q. Okay. And wouldn't you agree with me that that
12 sounds an awful lot like what you're experiencing now?

13 A. I -- I don't have enough experience to tell
14 whether a blast would give more vibrations than the train
15 would.

16 Q. You do agree with me, though, that the railroad
17 mine line is only about a quarter mile from your house,
18 right?

19 A. Yes.

20 Q. And you would also agree that the blasting is
21 only going -- rather, is going to be at least a half mile
22 away from your house, right?

23 A. That's correct.

24 Q. Okay. In your objection letter, you stated that
25 blasting can only exacerbate the subsidence. Do you

1 remember that?

2 A. Yes.

3 Q. But you've -- you also admitted in your
4 deposition that you can't prove that statement,
5 correct?

6 A. Correct.

7 Q. At the end of your testimony yesterday, you made
8 some suggestions for -- maybe the Brook Mine could start
9 their operations at the TR-2 pit. Do you remember saying
10 that?

11 A. Yes.

12 Q. You also mentioned maybe they could start at
13 the -- with the surface mining operation rather than doing
14 highwall mining first, right?

15 A. Right.

16 Q. Would you agree with me if they started in
17 either the TR-2 area or the surface mine area you would
18 withdraw your objections?

19 A. For TR-2 area, I think I would. I'm not sure
20 about the open-pit mine area because it's -- it's pretty
21 close to our place also. There will be blasting involved
22 there as well.

23 MR. SUTPHIN: Thank you, Mr. Buyok. I
24 appreciate your candor today.

25 I have no further questions.

1 CHAIRMAN BAGLEY: Thank you, Mr. Sutphin.

2 Mr. Kuhlmann or Mr. LaRock.

3 CROSS-EXAMINATION

4 Q. (BY MR. LAROCK) Good morning, John.

5 A. Good morning.

6 Q. I just want to say we really appreciate you
7 coming in, taking time out of your day to tell us about
8 your concerns.

9 And I just want to explain -- I think Isaac's
10 already touched on this -- when we say a change is minor,
11 we just mean we're changing a couple words out of that.

12 MS. ANDERSON: Objection. Counsel is
13 testifying.

14 CHAIRMAN BAGLEY: Yeah.

15 MR. LAROCK: Dr. Buyok [sic], I'm going to
16 admit that I am testifying, and so I'll concede that that's
17 true, but if --

18 MS. ANDERSON: This is the process.

19 MR. LAROCK: If Ms. Anderson is
20 concerned that maybe the State hasn't talked enough
21 with landowners, she's objecting to my question. I'm
22 just going to point that out. But I will withdraw the
23 question.

24 CHAIRMAN BAGLEY: Thank you.

25 MS. ANDERSON: I would, just for the

1 record, note this is not the only forum the Department can
2 speak to landowners.

3 CHAIRMAN BAGLEY: Yeah. We're here just to
4 this forum. That's all we're worried about right now.
5 So...

6 Q. (BY MR. LAROCK) All right. Mr. Buyok, do you
7 have any other questions or concerns or anything else you
8 want to say about this permit application that you haven't
9 felt you've had the chance to say yet?

10 A. I don't think so.

11 MR. LAROCK: Thank you very much. We have
12 no further questions.

13 CHAIRMAN BAGLEY: Thank you, Mr. LaRock.
14 Ms. Boomgaarden?

15 MS. BOOMGAARDEN: No questions. Thank you.

16 CHAIRMAN BAGLEY: Thank you.

17 Council members, any questions?

18 Nick.

19 COUNCIL MEMBER AGOPIAN: No questions.

20 CHAIRMAN BAGLEY: Meghan?

21 COUNCIL MEMBER LALLY: I have one, if I can
22 find my notes from yesterday. I can't find it. Sorry.
23 Thank you very much.

24 CHAIRMAN BAGLEY: Deb?

25 COUNCIL MEMBER BAUMER: No questions.

1 Thank you.

2 CHAIRMAN BAGLEY: I actually have a
3 question.

4 EXAMINATION

5 Q. (BY CHAIRMAN BAGLEY) I want to thank you,
6 Mr. Buyok, for coming and testifying. I did -- as the
7 maps were flying back and forth yesterday, I -- I got a
8 little bit lost. Are you -- is your property -- or your
9 home south of I-90?

10 A. Yes, it is.

11 Q. And are you south of the Tongue River?

12 A. Yes.

13 Q. Okay. So you're south of both of those. But
14 it -- it seems like you might be quite close to both of
15 those. Could you give me an idea about how close you are
16 to I-90 and the Tongue River?

17 A. Well, the property or house?

18 Q. Both, please.

19 A. Okay. Well, our property's probably
20 200 yards -- the nearest point is maybe 200 yards from
21 I-90. Our house is probably a little over quarter of mile
22 from I-90. Part of the river goes -- we have a hayfield
23 that's in an oxbow of the river, so the river is our
24 property boundary on one side.

25 Q. Okay.

1 A. As far as the house goes, our house is located,
2 I guess, around a hundred feet from the river.

3 CHAIRMAN BAGLEY: Okay. Thank you.

4 That's all the questions I have. Thank you.

5 Ms. Anderson.

6 MS. ANDERSON: Thank you, Dr. Bagley.

7 REDIRECT EXAMINATION

8 Q. (BY MS. ANDERSON) John, I have just a couple
9 questions for you to follow up on questions that were
10 asked of you a few minutes ago.

11 You talked a little bit about replacement of
12 water wells and that concern that you had. But I want to
13 clarify, you also had concerns about impairment of your
14 water, right?

15 A. Yes.

16 Q. Do you believe that the permit operator and the
17 Department of Environment Quality also have an affirmative
18 duty to prevent harm?

19 A. Yes. I do.

20 Q. Yes, you do.

21 You also were asked a question about, you know,
22 the map and you're a little bit outside the half mile,
23 and, you know, maybe you could be in the half mile if the
24 company lets you basically kind of get a little exception
25 there. Do you remember anything else about that

1 conversation with the company and kind of offer they were
2 asking of you?

3 A. They said they would get me on the list to be
4 within the half mile of the boundary. And they also asked
5 if I would drop all my other objections if they agreed to
6 do that.

7 Q. So it was your understanding that in order to
8 make that happen, you had to withdraw your objections?

9 A. Oh, no. I think Mr. Barron said that they would
10 do it anyway. But they did want to know if I would drop
11 my other objections.

12 Q. And just to be clear with the council, would
13 you -- do you think it's important that that condition is
14 a part of the permit enforceable by the Department?

15 A. I think it would be helpful.

16 MS. ANDERSON: Okay. I think that's all I
17 have for you. Thank you.

18 CHAIRMAN BAGLEY: Thank you, Mr. Buyok.

19 THE WITNESS: Thank you.

20 CHAIRMAN BAGLEY: Ms. Anderson, please call
21 your next witness.

22 MS. ANDERSON: I call Brooke Collins.

23 Can I have the projector thing?

24 (Witness sworn.)

25

1 BROOKE COLLINS,

2 called for examination by PRBRC, being first duly sworn,

3 testified as follows:

4 DIRECT EXAMINATION

5 Q. (BY MS. ANDERSON) Good morning. Could you
6 please say your -- say and spell your name for the record,
7 please.

8 A. Yes, ma'am. My name is Brooke Ann Collins.
9 B-R-O-O-K-E, Ann is A-N-N, and Collins is C-O-L-L-I-N-S.

10 Q. Okay. So not to be confused with Brook the
11 party?

12 A. Correct.

13 Q. Okay. Excellent. So we'll add that E to your
14 name --

15 A. Great.

16 Q. -- just for the record.

17 All right. Could you also state your address
18 and explain where you live, please.

19 A. Yes. My address is 38 --

20 THE REPORTER: I'm sorry. I can't -- hold
21 on.

22 THE WITNESS: Yes, ma'am.

23 THE REPORTER: I just can't hear very well.

24 MR. GILBERTZ: Got a reverb somewhere.

25 THE REPORTER: Just speak up, if you can.

1 THE WITNESS: Okay. I live at 38 Monarch
2 Road, and the mailing address is Ranchester, but it's in
3 the old mining town of Monarch.

4 Q. (BY MS. ANDERSON) Okay. Great. I have on the
5 screen our Exhibit 91. Brooke, is this the house that you
6 live in?

7 A. Yes, ma'am, it is.

8 Q. Okay. I'm going to pull up another photo for
9 us. This is exhibit -- our Exhibit 92. Is this also a
10 picture of the house you live in?

11 A. Yes, ma'am. It is.

12 MS. ANDERSON: And these were late-filed
13 exhibit, Exhibits 91 and 92. Ms. Collins decided she was
14 going to testify after last Wednesday. So I have filed
15 them with the council's website, and I have copies
16 available for the court reporter. The parties have all
17 received them and it's my understanding there are no
18 objections.

19 Q. (BY MS. ANDERSON) All right. Brooke, I'm going
20 to pull back this map that John was testifying to a little
21 bit about the location of his property. Could you show us
22 on this map approximately where you live? If you can see
23 that map. No? Is that easier?

24 MS. ANDERSON: Okay. And for the record,
25 this is DEQ Exhibit 12, page 145. And Ms. Collins just

1 indicated where -- approximately where she lives.

2 Q. (BY MS. ANDERSON) All right. Can you tell
3 us -- I'll pull back up this picture of your house,
4 Exhibit 91. Can you tell us anything about this
5 particular structure in which you live?

6 A. Oh, I can. This is a -- was built in 1923 as a
7 result of some kind of strange behavior that had happened
8 in the late 1800s and early 1900s. There was Catholic
9 church that was in the town of Carneyville and it was
10 burned down. The only people that talked about it
11 wouldn't tell you who exactly burned it down. But,
12 basically, it was a way to get to the immigrants. If you
13 burnt down the Catholic Church, you hurt the immigrants.
14 So they rebuilt another Catholic Church, and this was then
15 in Kleenburn because Carneyville changed their name to
16 Kleenburn to reflect the clean-burning coal. So they
17 built another one in Kleenburn, and it was also burnt
18 down.

19 And so they built another Catholic Church. This
20 time in Monarch and this time out of 14-inch thick-cut
21 stone, and it hadn't been burnt down yet.

22 Q. All right. Thank you.

23 Would you say you have a multi-generational
24 connection to the area?

25 A. I do. I'm actually the fifth generation of my

1 family to live in Monarch. I had two -- I had two great-
2 grandmothers that lived in Monarch. One came from Bolivia
3 and the other came from Iowa. So, yes, I've got family
4 members who were married in the Monarch Church across the
5 way under the Brook Mine property. Yes, I've got strong
6 family ties to it.

7 Q. Excellent. And just for the record, how long
8 have you lived where you lived?

9 A. I started working in investing in this property
10 in 1990s. I moved in in 2001. I also have neighbors,
11 Willy and Olga Long. When Olga passed away, Mr. Long went
12 and lived with his family, and since that time I have been
13 a -- the caretaker of the Long property, which is right
14 next door to me as well.

15 Q. Brooke, did you file an objection to the permit
16 application back in January?

17 A. Yes, ma'am, I did.

18 Q. I'm going to pull up our Exhibit 10.

19 MR. POPE: Dr. Bagley, just for the sake of
20 the record, since Ms. Collins has already begun testifying,
21 we would object. She did not request contested case in
22 this matter. Understanding, however, the council's going
23 to permit those folks to testify, we just wanted that for
24 the purposes of the record.

25 CHAIRMAN BAGLEY: Thank you for putting

1 that on the record.

2 MS. ANDERSON: Thank you. And I was
3 actually just about to get to why she didn't do that,
4 but...

5 Q. (BY MS. ANDERSON) So is this the letter that
6 you submitted to DEQ back in January?

7 A. Yes, ma'am.

8 Q. Okay. And at the time did you ask for an
9 informal conference?

10 A. I did.

11 Q. Okay. And that request was denied by DEQ?

12 A. It was.

13 Q. Okay. After that was denied, did you try to
14 participate in a contested case proceeding?

15 A. Yes, ma'am, I did.

16 Q. And how did that go?

17 A. Not incredibly well. I was actually over my
18 head pretty quickly. The problem is I'm a graduate
19 student, and so I couldn't afford to hire an attorney,
20 well into the stage.

21 Q. And you still get some filings related to these
22 case, don't you?

23 A. I do. I still get all the emails and the
24 attachments and all the things that go along with it, yes.

25 Q. Yeah. I've seen your name on some service lists

1 I've been confused about.

2 All right. Could you tell us a little bit about
3 your background and experience in coal mining.

4 A. Sure. I was a coal miner for a little over a
5 decade at Decker Coal Mine.

6 Q. Okay. And based on that experience, in your
7 opinion, what makes a good operator?

8 A. What makes a good operator?

9 Q. Yeah.

10 A. I think a good operator cares about all the
11 stakeholders and doesn't just follow the regulations and
12 goes over and above that to make sure that the people and
13 the land is taken care of.

14 Q. Yeah. Based on your experience and your
15 knowledge of the area, are there any impacts you think
16 should be prevented by DEQ with this permit application?

17 A. Yeah. Actually, there's several things I'm
18 concerned about. One for certain is the blasts from the
19 explosions. I got to learn -- I've learned so much this
20 week by being able to listen to everybody. And Mr. Emme
21 talked about blasts. We did talk about he got the
22 foundation incorrect for my house. So I am concerned
23 about how the blasts are going to affect the building.
24 And also the subsidence in the area. I don't mean just
25 the mining subsidence behind all of this, but that entire

1 place was a town. Monarch went from the old church all
2 the way to the river. And there are root cellars and
3 there are subsidences that happen in route, and I think
4 that potentially the blasts will increase that and worsen
5 that. I'm concerned about the water, both the quality and
6 the quantity of it, both groundwater and surface water. I
7 just don't know for sure.

8 Q. Yeah, do you have a well that -- do you have a
9 well that serves your property -- or the property on which
10 you live?

11 A. I do have a well, and I've had some problems
12 with it. So it's not potable. I don't drink it. I
13 actually haul water from town.

14 Q. Okay.

15 A. I do have two livestock reservoirs that I use
16 that are over on the Long property.

17 Q. Okay. So to go a little more into blasting.
18 Did you ever see a blast when you worked at the coal mine?

19 A. Yes, ma'am. Quite a few.

20 Q. Yeah. So it's a little bit -- I don't know. Is
21 it clear to you what blasting will look like at the Brook
22 Mine?

23 A. Yes, it is. I mean, I'm not familiar with the
24 continuous longwall mining operations, but I do know what
25 a coal shot sounds like and looks like and certainly know

1 what an overburden shot is like. I don't think they're
2 going to be doing any cast blasting, but I know what those
3 are as well.

4 Q. Okay. So I'll ask the same question I asked
5 Mr. Buyok. If you were sitting in the chair of the
6 director of the DEQ down in Cheyenne and making a decision
7 on this permit application, what would you want to see
8 happen?

9 A. I would want to make sure that there were things
10 in the permit that covered contingencies that aren't
11 covered by the technical -- what is the word -- technical
12 adequacy. Because I've heard a lot about that this week,
13 and that there's -- you know, does this meet technical
14 adequacy? And, certainly, I'm not an expert witness on
15 any of that. I'm kind more on the practical side of
16 things. And so I know they sell T-shirts that say "The
17 Engineer's Always Right," but my experience as coal miners
18 there are a lot of contingencies that come up that aren't
19 covered in the models. So I want to make sure there was
20 some kind of wording in the permit that covered the things
21 that the model doesn't cover.

22 Q. Okay. Is there anything else you want to share
23 with the council about your place or your background or
24 your concerns?

25 A. First of all, I'd like to thank the council for

1 coming to be here, because if this would have been held in
2 Cheyenne, I certainly wouldn't have been able to learn as
3 much as I did. And so I thank you for you coming to do
4 that. I know it's been a long few days and sure
5 appreciate you being here.

6 I really have felt like there has been something
7 of a disregard and sometimes even an antipathy towards
8 stakeholders like myself. Even little, tiny stakeholders
9 like myself. And I just mean that the ability to access
10 information, to get people to discuss things has been so
11 difficult. And there's such an adversarial relationship
12 with all of this. It's just ridiculous. And it doesn't
13 need to be. And I sure hope that you all would help
14 provide that leadership to make sure that doesn't happen.
15 Because the state of Wyoming can't afford to keep doing it
16 this way.

17 Q. Thank you, Brooke.

18 I think it -- have you ever approached the
19 company to try to address any of your concerns?

20 A. On numerous occasions. Actually, when I first
21 heard about the Brook Mine, somebody said, "Is that your
22 mine?"

23 And I said, "What mine?" I think that would
24 have been maybe 2015 when they told me about a mine, and
25 figured, "Well, it must be mine. It's named after me."

1 At that point, I did some research on Ramaco. I sent a
2 couple of emails. I called the office. I've actually
3 been by the office several times, and it's a little bit
4 odd to leave the door wide open with nobody there.

5 But I was really kind of looking to maybe get a
6 job, because I have had experience as a coal miner. I was
7 certified as a foreman in the state of Montana, and I am
8 just about ready to graduate with my MBA so I thought,
9 hey, I can walk to work from there. So I started
10 contacting them about that, and never did hear anything
11 back, but maybe it's because I did say I lived in Monarch.
12 But I know that we had a prehearing conference call where
13 the legal counsel said that they would get with their
14 client and be willing to speak with us, and nothing ever
15 came of that. I spoke with Jaylyn, maybe the PR person
16 that worked in the office, and asked her to contact me and
17 get me some information.

18 Q. Shelleen? Is that --

19 A. Shelleen. Shelleen. Okay.

20 Mr. Barron, and certainly Niles for, you know, a
21 year has been promising me he would come have coffee and
22 tell me about why I shouldn't be worried about the
23 blasting.

24 Q. You mentioned just a moment ago that you
25 originally wanted to get a job from the company?

1 A. I did.

2 Q. Would you still work for them?

3 A. Well, sure depends on how their philosophy is.
4 I might be a great mine manager.

5 Q. Anything else you would like to share today with
6 the council?

7 A. I guess I have a great appreciation, as I
8 listened through -- to everybody's testimony about the
9 technical parts of it and the models and I know what
10 strong software we have now to make predictions and do
11 forecasting. But there really are a whole lot of things
12 that aren't covered, and I would say that comes from
13 practical experience.

14 And what I mean by that is I just finally got
15 access to the entire mine plan, I guess, Monday, and was
16 able to look at it, particularly Volume IX, although III
17 was a really good volume too. And there are numbers that
18 stick in my head like the water usage, the daily water
19 usage. It says some 300,000 I think a day -- gallons a
20 day. And the thing that stuck in my mind was the 220,000
21 for dust suppression.

22 And I spent thousands of hours on a water truck,
23 and I know that you can use that in about hour and a half.
24 And I know that you can go through a million gallons of
25 water when hot and it's windy. But then it's summertime.

1 Or in the wintertime maybe you only go through 50 gallons
2 to do dust suppression. And I suppose the middle ground
3 there is 220,000, however that's figured, the formulas.

4 It's when it's a lot more than that and a lot
5 less than that that it's going to start affecting us, the
6 residents that live there, because they're going to have
7 way too much water and they're going to have not enough
8 water. And most of the technical aspects that I see are
9 really kind of the Goldilocks theory. And I'm just
10 concerned the permit doesn't cover when the Goldilocks
11 things aren't there, and sure hope they would take a look
12 at that.

13 MS. ANDERSON: Okay. Thanks, Brooke. I
14 have no more questions for you at this time.

15 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
16 Mr. Gilbertz.

17 MR. GILBERTZ: No questions.

18 CHAIRMAN BAGLEY: Thank you.

19 Mr. Sutphin -- oh, Mr. Pope.

20 MR. POPE: Thank you, Dr. Bagley.

21 CROSS-EXAMINATION

22 Q. (BY MR. POPE) Good morning, Ms. Collins.

23 A. Good morning.

24 Q. My name is Jeff Pope. I'm an attorney here on
25 behalf of Ramaco. We haven't had a chance to meet yet.

1 It's nice to meet you.

2 I want to follow up on something you mentioned
3 just a moment ago. I think I heard you say that you just
4 got access this Monday to the mine plan. Is that
5 accurate?

6 A. Yes, it is.

7 Q. Okay. So just to sort of understand what you've
8 done here. When you prepared the objection letter, had
9 you reviewed the permit application?

10 A. No. I couldn't find it.

11 Q. So, for example, you -- you were not aware,
12 then, I take it, that there was a copy -- a paper copy on
13 file at the Department of Environmental Quality?

14 A. No.

15 Q. Were you also aware that the Department had
16 circulated an electronic copy, at least to the folks who
17 were parties in this contested case?

18 A. No, I was not.

19 Q. Similar question about what you did in preparing
20 your objection letter. Did you review any Wyoming
21 statutes or regulations in preparing that letter?

22 A. In preparing my objection letter, I relied
23 entirely on my experience as a coal miner and --

24 THE REPORTER: I'm sorry. I can't hear.

25 THE WITNESS: Sorry.

1 A. I relied entirely on my experience as a coal
2 miner and living there in the area.

3 Q. (BY MR. POPE) And I appreciate that,
4 Ms. Collins. Unfortunately, for the sake of the record, I
5 just have to get the precise answer.

6 So is it fair to say that you did not look at
7 Wyoming statutes or regulations in preparing your
8 objection letter?

9 A. Not until now. I actually have a copy of it.
10 I'm kind of a nerd. I'm into reading it.

11 Q. Fair enough.

12 Let's talk a moment about blasting. I heard you
13 had some concerns about that, both in your letter and what
14 you said here today. And I understand you just got a full
15 copy on Monday, so you're not aware. It's okay to say
16 that too. But are you aware that inside its permit
17 application Brook Mine has a blasting plan?

18 A. Yes, I am.

19 Q. And are you aware that there are statutes and
20 regulations in Wyoming that control what types, what
21 frequency and what intensity the Brook Mine can use to
22 blast?

23 A. Yes, I am.

24 Q. Are you aware that Brook has to publish -- Brook
25 Mine has to publish a blasting schedule?

1 A. Yes, I am.

2 Q. I'll keep trying to say Brook Mine.

3 A. Thank you.

4 Q. Are you aware that Brook Mine will also have
5 fences, signs and sirens inside the permit boundary to
6 keep people out and notify people about blasting?

7 A. Yes, I am.

8 Q. And are you aware that Brook Mine has a
9 commitment in its permit application to protect engineered
10 structures, like the old Catholic Church, from blasting?

11 A. Yes. In Volume IX is a PDF. It's on page 338,
12 which made me really aggravated that I had to read through
13 that much to get to the one piece of paper that somebody
14 could have told me about much sooner. Yes, I am aware of
15 that.

16 Q. And I'm sure from your experience at the Decker
17 Mine, you're probably also aware that folks who live
18 within the half-mile buffer around the Brook Mine permit
19 boundary can request a pre-blast survey of a house. For
20 example, right?

21 A. Yes.

22 Q. Now, I think you mentioned that the church
23 you -- you have restored was built in 1919; is that
24 correct?

25 A. 1923.

1 Q. I'm sorry. 1923.

2 And I apologize. I may have been a little
3 confused because you mentioned it had been burned down a
4 couple times and rebuilt. I just want to make sure the
5 church that was built in 1923 is that -- was that built on
6 the same location we're looking at in this photo?

7 A. This is the one that was built in 1923.

8 Q. Thank you.

9 A. Uh-huh.

10 Q. You're aware that after 1923, the Big Horn Coal
11 mine operated nearby where the proposed Brook Mine is,
12 right?

13 A. Yes.

14 Q. You're aware that the Big Horn Coal mine did
15 blasting as part of its operations in that area?

16 A. I am.

17 Q. Let's talk about the water issues you raised in
18 your objection and here today. And, again, understanding
19 you just had the permit on Monday. Are you aware that
20 Brook's permit application contains a dewatering plan?

21 A. I am.

22 Q. And are you aware that within the permit
23 application Brook has -- Brook Mine has studied the
24 impacts of the mine on domestic sources of water?

25 A. Yes. I'm aware of that.

1 Q. Did you happen to -- I realize I'm asking for
2 specific page here, but sounds like you're familiar with
3 the pages.

4 A. I know it.

5 Q. Did you have the chance to look at page MP-47,
6 which discusses the expected impact on domestic water
7 users in the area?

8 A. I would have to look at it, but I do know that I
9 read that. I was able to identify which well was mine and
10 looked through all those --

11 THE REPORTER: I'm sorry. I can't hear.

12 A. I did look through all of the -- all of that and
13 identify which of those wells was mine and looked through
14 all the different tables in the commentary on it.

15 Q. (BY MR. POPE) Do you recall the Brook Mine's
16 studies and models revealed that the impact on domestic
17 sources of water would be low?

18 A. Yes.

19 Q. And you -- you sat through the hearing, so I'm
20 sure you heard this before. But were you aware that the
21 Brook Mine permit application has a commitment to replace
22 both water quantity and water quality that may be
23 adversely impacted by the mine?

24 A. I am, but it doesn't specify anything about how
25 you determine whether or not Brook Mine is responsible for

1 it and where the burden of that proof is.

2 Q. And that's a great point. And it's -- it's a
3 great segue to transition to the next set of my questions.
4 You mentioned in your close of your testimony that there
5 are sometimes unknowns and contingencies that may be
6 encountered as part of mining operations based on your
7 experience at Decker Mine, right?

8 A. Yes, sir.

9 Q. Would you agree with me that the permit
10 application and the mining process in Wyoming is designed
11 somewhat to be general to allow operators flexibility to
12 deal with contingencies?

13 A. Would you say that again?

14 Q. It's a long question. I will only ask you two
15 questions instead of one. Would you agree with me that
16 mining operators need flexibility to address contingencies
17 in operations?

18 A. Yes, sir. As an MBA --

19 THE REPORTER: I'm sorry?

20 A. As an MBA, I totally understand the importance
21 of that.

22 Q. (BY MR. POPE) Would you also agree that the
23 permit the mine operates under also needs to be a little
24 bit general in nature to provide operational flexibility?

25 A. Yes.

1 Q. Let's talk about roads. And I realize you and
2 Ms. Anderson didn't discuss roads, but I believe you talk
3 about them in your objection letter. So I want to ask you
4 a few questions about those.

5 And, again, understanding you just had the
6 application on Monday. Are you aware that the mine plan
7 document contains a transportation network narrative and
8 map?

9 A. I was told that was in there. I'm not sure I
10 actually saw that.

11 Q. Okay.

12 A. If there's a huge part about secondary roads,
13 tertiary roads, but I didn't actually see where any roads
14 were.

15 Q. You also -- you talked about driving a water
16 truck and dust suppression issues. In your review of the
17 permit application, did you happen to find Brook Mine's
18 dust suppression plan?

19 A. No, I didn't see the dust suppression. I just
20 saw how many gallons they were planning on using for dust
21 suppression a day.

22 Q. Similar question here. In your review of the
23 permit application, did you also come across, excuse me,
24 the Brook Mine coal dust suppression plan?

25 A. I don't know.

1 MR. POPE: Okay. Thank you, Ms. Collins.

2 I have no further questions.

3 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

4 Mr. LaRock.

5 CROSS-EXAMINATION

6 Q. (BY MR. LAROCK) Good morning, Brooke.

7 A. Uh-huh.

8 Q. Again, like I said with Mr. Buyok, thank you so
9 much for coming for your testimony. We appreciate you
10 taking the time to participate in the hearing with us.

11 Just one question, is there anything or any
12 concerns or problems that you haven't yet addressed, now
13 that we're here on the record, you want to talk about?

14 A. No. My primary concern is just to make sure the
15 contingencies that aren't covered in the models do somehow
16 get covered in the permit to protect the local residents.

17 MR. LAROCK: Thank you.

18 We have no further questions.

19 CHAIRMAN BAGLEY: Thank you, Mr. LaRock.

20 Ms. Boomgaarden?

21 MS. BOOMGAARDEN: No questions. Thank you.

22 CHAIRMAN BAGLEY: Thank you.

23 Council, any questions?

24 Deb?

25 COUNCIL MEMBER BAUMER: No questions.

1 CHAIRMAN BAGLEY: Meghan?

2 EXAMINATION

3 Q. (BY COUNCIL MEMBER LALLY) Something that Brook
4 said, that they would be able to replace --

5 THE REPORTER: I'm sorry?

6 Q. (BY COUNCIL MEMBER LALLY) Brook stated that
7 they would replace -- or that the law stated they would
8 replace engineered structures. Being that your house was
9 built in 1923, is it an engineered structure?

10 A. Is it what?

11 Q. An engineered structure.

12 A. I don't know what the legal definition of an
13 engineered structure is.

14 COUNCIL MEMBER LALLY: Okay. Thank you.

15 CHAIRMAN BAGLEY: Any questions, Nick?

16 COUNCIL MEMBER AGOPIAN: Nope.

17 CHAIRMAN BAGLEY: I have no questions, but
18 I want to thank you as well for being here today.

19 Ms. Anderson.

20 MS. ANDERSON: Thank you, Dr. Bagley.

21 REDIRECT EXAMINATION

22 Q. (BY MS. ANDERSON) Brooke, I just have one more
23 question for you, similar to a question I asked John. So
24 a moment ago you were just visiting a little bit with the
25 attorneys for the company about the pre-blast survey and

1 what that means. Do you think there's a difference
2 between remediating environmental harm versus preventing
3 it?

4 A. I think there's a huge difference.

5 Q. And could you explain what you mean, I guess,
6 for your structure too with blasting.

7 A. Sure. I just learned yesterday, really, that --
8 well, actually it would have been Tuesday morning, in
9 looking at the Volume IX, where I had been kind of
10 concerned because I didn't think I was going to be able to
11 afford a pre-blast survey to be -- to be -- to even find
12 out, you know, to have a baseline for that. And then
13 through the process of all of this I learned I'm not the
14 one responsible for paying for that, and I'm pretty happy
15 about that.

16 And I did speak with Mr. Emme, and he talked
17 about putting his -- his very willingness to put
18 seismographic monitors around, because I think it will be
19 real important to notice immediately if it starts to
20 shaking that building. Unlike some of the other homes, if
21 things start rattling in my house, it's because the walls
22 are falling down. So I'd very be interested in making
23 sure that there's something in place where if it seems to
24 be doing industrial damage, they won't continue doing
25 that.

1 Q. So did I just hear you, then, would you ask the
2 council, maybe, to have the seismographs as a condition of
3 approval for the permit application?

4 A. I would -- I would love that.

5 MS. ANDERSON: Thank you. That's all I
6 have for you. Thank you go for your testimony.

7 THE WITNESS: Thank you very much.

8 CHAIRMAN BAGLEY: Thank you, Ms. Collins.

9 Let us recess for 10 minutes. Be back at 9:50.

10 (Hearing proceedings recessed

11 9:40 a.m. to 9:52 a.m.)

12 CHAIRMAN BAGLEY: Okay. We are back in
13 session.

14 Ms. Anderson, please call your next witness.

15 MS. ANDERSON: Thank you, Dr. Bagley. Call
16 Mr. Anton Bocek, please.

17 MR. POPE: Dr. Bagley, while Mr. Bocek
18 comes up here, we'll put on the record again our objection
19 to folks who did not request a contested case. That's
20 already been explained before.

21 CHAIRMAN BAGLEY: Great. Thank you.

22 (Witness sworn.)

23 ANTON JOSEPH BOCEK,
24 called for examination by PRBRC, being first duly sworn,
25 testified as follows:

1 DIRECT EXAMINATION

2 Q. (BY MS. ANDERSON) Good morning.

3 A. Good morning.

4 Q. Good morning, Anton. Could you please say and
5 spell your name for the record.

6 A. Anton Joseph Bocek, A-N-T-O-N B-O-C-E-K.

7 Q. Okay. Could you also state your address and
8 explain where you live?

9 A. The address that I live in is 11 Slater Creek
10 Lane, Ranchester, Wyoming.

11 Q. Mr. Bocek, I have on the screen here Exhibit 77
12 of ours. Can you tell us a little bit about what we're
13 looking at?

14 A. That's the picture our family farm that my
15 brothers and sister and children and nephews are a part
16 of. That was a farm that my grandparents bought in 1920,
17 and it's been in the family ever since. And that is in
18 part of the -- within a half mile of the mine --

19 Q. Okay.

20 A. -- plan.

21 Q. So you've lived out there your whole life,
22 basically?

23 A. I have.

24 Q. And you've raised kids out there?

25 A. Yes.

1 Q. And you were with your parents their whole
2 lives?

3 A. Yes.

4 Q. At least your whole life with them?

5 A. Yes.

6 Q. Okay. So it's -- this is an important place to
7 you, right?

8 A. It is.

9 Q. Okay. I'm going to pull up DEQ Exhibit 12,
10 page 145. This is a map we've been looking at a little
11 bit this morning and yesterday. Is this kind of
12 geographic area familiar to you on this map?

13 A. Yes, it is.

14 Q. Okay. Could you point out approximately where
15 you live on this map? You want me to blow it up a little
16 bit more?

17 A. Well, it's -- yeah, I just need to find where
18 the -- I can't tell where the Slater Creek Lane is on
19 this.

20 Q. How --

21 A. It would have -- it would have to be in this
22 area here.

23 Q. Okay. Approximately how far do you live from --
24 you know, there's a -- looks like a town of Monarch on
25 this map.

1 A. I'm probably to the -- a quarter mile, you know,
2 across the river from Monarch.

3 Q. Okay. So you live between the river and the
4 interstate?

5 A. Yes.

6 Q. Okay. And does your property abut the frontage
7 road?

8 A. The property doesn't, but it is close to the
9 frontage road.

10 Q. Okay. If you would travel home from here today
11 at this hearing, what roads would you use?

12 A. I-90, and I'd take I-90 and get on Highway 345,
13 which would be the frontage road.

14 Q. So that -- the frontage road is the main access
15 to your property?

16 A. Yes. It's the only one.

17 Q. It's the only one. Okay.

18 Are you familiar that the mine would maybe use
19 that frontage road at times during its operations?

20 A. Yes.

21 Q. Do you have any concerns about that?

22 A. Yes, I do. Those -- you know, the extra traffic
23 on that road would certainly be a concern. We've had
24 that -- a few years ago they had some interstate work
25 which diverted a lot of the traffic back onto that road,

1 and it was quite dangerous. We had some close calls
2 because of the extra traffic, the extra speed.

3 Q. Okay. Is there anything you would like to tell
4 the council about maybe requirements or conditions that
5 would be useful in the permit related to the use of that
6 road? Have you given that any thought?

7 A. I haven't. Other than, you know, consideration
8 that, you know, maybe the speed limits and weight limits
9 on that, especially in those areas with the extra traffic
10 and extra weight on it.

11 Q. Are you concerned that -- did you hear some
12 testimony here this week about the company really hasn't
13 reached out to the Department of Transportation?

14 A. I haven't. I wasn't here that day.

15 Q. You also have a little bit of background in coal
16 mining.

17 A. Yes.

18 Q. Can you tell us about that?

19 A. Yes. I worked at Big Horn Coal for about
20 14 years. Started out as laborer, ran some heavy
21 equipment, haul trucks, coal trucks, then I was on the
22 blasting crew for several years.

23 Q. So you were on the blasting crew. Did that
24 background help inform any of your concerns about this
25 proposal here today?

1 A. It did. With the mine doing blasting, I'm
2 concerned about foundations in my well and the well on the
3 family farm.

4 Q. Yeah. So I think we've heard a little bit about
5 from the company that Big Horn Coal's operations were all
6 good and there weren't any impacts in the area. Would you
7 agree with that?

8 MR. POPE: Objection. We have not
9 presented that testimony. We have only presented testimony
10 Big Horn Coal operated in the area.

11 CHAIRMAN BAGLEY: That is correct.

12 MS. ANDERSON: Okay. That's fine,
13 Dr. Bagley. I'll rephrase.

14 Q. (BY MS. ANDERSON) Anton, in your experience on
15 those blasting crews, were there any -- were there ever
16 any problems?

17 A. There were some neighbors that had well issues,
18 that had wells redrilled because of blasting.

19 Q. Yeah. Okay. And that history that you have,
20 that's helped inform why maybe you're concerned about
21 blasting that happened at the Brook Mine?

22 A. Yes. Especially the proximity of mine to my
23 house and family farm. It's actually closer than what Big
24 Horn Coal was to these people that did have some problems.

25 Q. Okay. Do you -- when you were on those blasting

1 crews, did you see pollution from blasting?

2 A. We did have some issues at times with nitrous
3 oxide gas, especially in the wet areas.

4 Q. Uh-huh. And do you have any concerns about that
5 happening with this mine?

6 A. Yes. Yes, I would. It's another issue that --
7 especially where it's going to be right across the
8 interstate from my home.

9 Q. Okay. Do you have any concerns about blasting
10 for, you know, vibrations and impact to structures?

11 A. I would. Again, my house is only a tenth of a
12 mile off Highway 345, so it's not too far across the
13 interstate. And the family farm, the house that is there
14 is a block structure. And there's a barn that's
15 approximately a hundred years old with rock taken from the
16 area that is the foundation of that barn.

17 Q. Uh-huh. Okay. Is there anything you'd like to
18 tell the council about maybe conditions they could
19 consider for blasting, like seismographs?

20 A. I would like to have, you know, consideration
21 that we would have a seismograph at the -- at both places.

22 Q. Yeah. And your experience with blasting in the
23 past, were they useful, do you ever know about --

24 A. I don't. I didn't know of anyone that did have
25 them.

1 Q. Okay. Could you tell us a little bit about the
2 water sources for your property?

3 A. The -- my water well is close to 500 foot deep.
4 It is an artesian well. I'd hate to have that loss. The
5 family farm's well is shallower. It's under 200 feet.
6 But both would be a concern to -- you know, if we had some
7 disturbance on those wells.

8 Q. Yeah. Do you think there would be an adequate
9 replacement source for the water in the area?

10 A. I don't know. I know my well has -- I built
11 my home in '78 and it's -- it's been a good well.
12 It's good water. If something happened to that aquifer,
13 it may be hard to replace the source and the quality of
14 water.

15 Q. Okay. So I know you know a little bit about
16 Slater Creek, right?

17 A. Yes.

18 Q. Do you have any concerns about any surface water
19 impacts?

20 A. I do. Slater Creek flows right out my back
21 yard. It's been probably a hundred feet or so from the
22 house. It -- mining on Slater Creek or in that area could
23 greatly concern some -- you know, would concern me with
24 the water issues.

25 Q. I think it's been represented that Slater Creek

1 is an intermittent stream. Do you remember hearing that
2 at all this week?

3 A. I heard it. I wasn't here when the testimony
4 was made, but --

5 Q. Yeah, would you agree with that, based on your
6 experience?

7 A. You know, flows -- Slater Creek flows through
8 our property for probably 600 yards or better. I've lived
9 there 65 years, and I've never seen it dry up. It slows
10 up, depending on years, but it has never dried up in that
11 area.

12 Q. Okay. Anton, I'm pulling up our Exhibit 2. I'm
13 going to display it. Do you recognize this letter?

14 A. Yes.

15 Q. I'll probably have to scroll down so much so you
16 can see it.

17 A. Have to be up so I can look at my name.

18 Q. Okay. Is this the letter you sent DEQ back in
19 January?

20 A. It is.

21 Q. Okay. At the time what did you think was going
22 to happen with this letter?

23 A. Well, I was hoping that we may get a -- a public
24 hearing that all the landowners might be able to speak and
25 address our concerns.

1 Q. Yeah. Since that time has DEQ -- anybody from
2 DEQ reached out to you about any of your concerns?

3 A. No.

4 Q. Has the company?

5 A. No.

6 Q. Have you -- do you have anything to say about
7 that?

8 A. Well, I just think that the new kid on the
9 block, it would be nice to have them come tell the
10 neighbors and those are going to be affected by this mine.

11 Q. Is there anything else you'd like to add or
12 share with the council?

13 A. No. I just -- I -- I'm really concerned about
14 the water issues and the foundation issues, the air
15 quality and the water quality being affected in this area.
16 I believe that the Slater Creek area is being taken too
17 lightly. That stream can be quite a raging torrent at
18 times, depending on the snowfall, the rainfall. I've seen
19 it in the 3rd of July being quite severe over the banks
20 because of rain.

21 MS. ANDERSON: Okay. I think that's all I
22 have for you at this time. Thank you.

23 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
24 Mr. Gilbertz.

25 MR. GILBERTZ: I do not believe I have any

1 questions.

2 CHAIRMAN BAGLEY: Thank you.

3 Mr. Pope.

4 CROSS-EXAMINATION

5 Q. (BY MR. POPE) Good morning, Mr. Bocek.

6 A. Good morning.

7 Q. We had the chance to meet a couple weeks ago at
8 your deposition?

9 A. Yes.

10 Q. Good to see you again.

11 I'd like to start with just some clarification
12 from up on a couple of issues. As we discussed at the
13 deposition, you did not assist the Powder River Basin
14 Resource Council in preparing its objection letter, right?

15 A. No.

16 Q. And at least at the time it was sent out, you
17 had not reviewed that letter?

18 A. No.

19 Q. And, again, at the time we spoke at your
20 deposition you didn't have an opinion about that letter,
21 right?

22 A. No.

23 Q. So that established, let's talk about the letter
24 that's on the screen right now.

25 A. Okay.

1 Q. It's true, Mr. Bocek, that in preparing your
2 objection letter you didn't read the entirety of Brook's
3 permit application, right?

4 A. Right.

5 Q. And you also did not go and review the paper
6 copy on file with the Department of Environmental Quality?

7 A. No.

8 Q. As a result, you also didn't review any of the
9 correspondence related to the permit, right?

10 A. Right.

11 Q. You also, in preparing your objection letter,
12 didn't look at the comments and responses between the
13 Brook Mine and DEQ, right?

14 A. Right.

15 Q. You also did not review any Wyoming statutes,
16 right?

17 A. Right.

18 Q. You also didn't review any Wyoming regulations?

19 A. That's correct.

20 Q. There are some objections in the objection
21 letter about fires, but you did not review Brook's fire
22 control plan, right?

23 A. Right.

24 Q. As you just mentioned a moment ago, you had some
25 concerns, and they're mentioned in the objection letter,

1 about water wells?

2 A. Yes.

3 Q. But you did not review in the permit application
4 Brook's commitment to replacing water quantity and
5 quality, right?

6 A. Right.

7 Q. You also talked about blasting a moment ago, but
8 you don't know what type of blasting Brook intends to do
9 in the mine?

10 A. At this point, no.

11 Q. You mentioned some -- some air pollution issues
12 a moment ago. You haven't reviewed Brook's Air Quality
13 permit, right?

14 A. No, I haven't.

15 Q. Similar question about the air. There's some
16 concerns in your objection letter about dust. You did not
17 review Brook's dust control plan?

18 A. No.

19 Q. Again, the objection letter also mentions water
20 treatment issues, but you haven't reviewed the water
21 treatment plan in Brook Mine permit application, right?

22 A. Right.

23 Q. You expressed in this objection letter some
24 concerns about night mining. You haven't reviewed any
25 plans in the Brook permit application about night mining?

1 A. No.

2 Q. Again, sticking with the objection letter,
3 you've also expressed some concerns about facilities. But
4 you did not review the facilities loadout section of the
5 permit application?

6 A. No.

7 Q. You and Ms. Anderson spoke about roads, but you
8 did not review the transportation network portion of
9 Brook's permit application, right?

10 A. Not entirely.

11 Q. So, for example, you didn't know that Brook has
12 to have a certified -- excuse me, a licensed engineer
13 certifying design of the haul roads, right?

14 A. No.

15 Q. You didn't review the reclamation plan either,
16 did you?

17 A. I did not.

18 Q. So, for example, you didn't review water quality
19 data that's contained in the permit application?

20 A. No.

21 Q. You -- you also -- you talked a little bit about
22 the Tongue River -- excuse me, Slater Creek, and mentioned
23 some concerns about that. You did not review any sections
24 in the mine permit application that had to do with the
25 Brook Mine's impact on streams and rivers, right?

1 A. No.

2 Q. You didn't review Brook's water runoff plan?

3 A. No.

4 Q. Let's go back to the objection letter for a
5 moment, Mr. Bocek. You expressed some concerns about the
6 Brook bond calculation on there, right?

7 A. I did.

8 Q. You did not, however, review Brook's bond
9 calculation?

10 A. No.

11 Q. You didn't -- you don't have any experience, for
12 example, doing reclamation cost estimates?

13 A. I do not.

14 Q. All right. You didn't review Guideline 12
15 from -- in the DEQ guidelines?

16 A. I didn't.

17 Q. You also don't know how much land Brook will
18 disturb in the first year of operations, right?

19 A. No, I don't.

20 Q. And at least at the time of your deposition, you
21 didn't know that the Department of Environmental Quality
22 will review Brook's bond calculation on an annual basis?

23 A. No.

24 Q. All right. You also didn't know that as part of
25 that review, DEQ can recalculate the amount of the bond

1 for the bond, right?

2 A. Right.

3 Q. And as I understand it, Mr. Bocek, part of the
4 reason that you didn't look at some of these things was
5 you counted on people like Ms. Anderson and the executive
6 director of the Powder River Basin Resource Council to
7 address those issues; isn't that correct?

8 A. That's correct.

9 Q. Getting back to the objection letter for just a
10 moment. You had some subsidence-related concerns in there
11 too, right?

12 A. I do.

13 Q. But you did not review any subsidence data in
14 Brook's permit application, right?

15 A. No.

16 Q. And sticking with the theme of data. You didn't
17 review any data outside what you looked at in the permit,
18 right?

19 A. That's correct.

20 Q. Let's -- as Mr. Sutphin did, I forgot to ask a
21 few questions before I transitioned from a section. Let's
22 talk -- let's go back to blasting for just a second. You
23 mentioned that you worked for Big Horn Coal and you were
24 on their blasting crew, right?

25 A. Yes.

1 Q. And as I understand it, your -- you said your
2 family moved to the property in about 1920; is that right?

3 A. The grand -- my grandparents bought that
4 property, yes.

5 Q. And since 1920 -- I think you said you built
6 your house in 1978?

7 A. Yes.

8 Q. And your water well in that area has, I
9 think you said, flowed ever since then; is that
10 accurate?

11 A. Yes.

12 Q. You would agree with me that Big Horn Coal has
13 blasted in the -- near the area of the proposed Brook Mine
14 since 1978?

15 A. Well, with -- they have blasted, yes. But quite
16 some distance away.

17 Q. I think we can wrap up on this point, Mr. Bocek.
18 You would agree with me that if the Brook Mine complies
19 with all relevant Wyoming statutes and regulations, it
20 should receive a permit to mine coal?

21 A. I believe I said that.

22 MR. POPE: Thank you, Mr. Bocek. I have no
23 further questions.

24 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

25 Mr. LaRock.

1 EXAMINATION

2 Q. (BY MR. LAROCK) Good morning, Mr. Bocek.

3 A. Good morning.

4 Q. Just the same question I'm going to be asking
5 everybody today. After this whole week, do you have any
6 comments or questions or concerns or any proposed
7 conditions that you would like this council to consider or
8 like to put on record?

9 A. I would. I believe with the -- all the
10 neighbors are concerned with foundations and water wells.
11 I believe that we should all be considered in this plan
12 and permit that should anything happen with those
13 foundations or wells, they would be replaced. And the
14 problem with some of that is companies come and go. And,
15 you know, somebody has to have water hauled to them, are
16 they going to do that for a lifetime or lifetime of the
17 company? That's -- that's a concern.

18 Q. Okay. Is there anything else?

19 A. You know, other than, like I say, the
20 foundations and dust control and subsidence issues, I --
21 those are my main concerns.

22 MR. LAROCK: Okay. Thank you very much.

23 We have no further questions.

24 CHAIRMAN BAGLEY: Thank you.

25 Ms. Boomgaarden.

1 MS. BOOMGAARDEN: No questions. Thank you.

2 CHAIRMAN BAGLEY: Thank you.

3 Council members. Nick?

4 COUNCIL MEMBER AGOPIAN: No questions.

5 CHAIRMAN BAGLEY: Meghan?

6 COUNCIL MEMBER LALLY: I have one question.

7 EXAMINATION

8 Q. (BY COUNCIL MEMBER LALLY) In your letter you
9 stated you were concerned about dust. Are you concerned
10 about dust from the mine or on your county road?

11 A. Dust from the mine. The road that goes by me is
12 a paved road.

13 COUNCIL MEMBER LALLY: Okay.

14 CHAIRMAN BAGLEY: Any other questions?

15 COUNCIL MEMBER LALLY: Nope. That's it.

16 CHAIRMAN BAGLEY: Okay. Thank you.

17 Deb?

18 COUNCIL MEMBER BAUMER: No questions.

19 Thank you.

20 CHAIRMAN BAGLEY: Mr. Bocek, thank you for
21 being here. I do have one question.

22 EXAMINATION

23 Q. (BY CHAIRMAN BAGLEY) You mentioned that your
24 well, 500 feet deep and artesian, which is great. Do you
25 happen to know what aquifer it goes into?

1 A. I do not.

2 CHAIRMAN BAGLEY: That's all the questions

3 I have. Thank you.

4 Ms. Anderson.

5 MS. ANDERSON: Thank you, Dr. Bagley.

6 I have just a couple more questions for you,

7 Anton.

8 REDIRECT EXAMINATION

9 Q. (BY MS. ANDERSON) So there was a long line of
10 questions you just got asked about your lack of review of
11 the permit application. Do you have a day job?

12 A. Yes, I do.

13 Q. Yeah. What do you do in your day job?

14 A. I'm a mine manager for a ranch west of Sheridan.
15 So it's full-time. I get home late and really don't have
16 the time to look at all this.

17 Q. Yeah. Are you aware that our organization
18 requested at one time that the permit application be
19 available after working hours for folks?

20 A. I don't believe so.

21 Q. Okay. That's fine.

22 Do you think it's reasonable to expect a nearby
23 landowner to have to read the whole permit application to
24 be able to submit an objection letter to the Department of
25 Environmental Quality?

1 A. No, I don't. I got the letter from the Western
2 Water Consultants, and my concerns were just what I've
3 spoke about. Not from reading documents, it's from living
4 there and the concerns that I have to continue to live
5 under the -- the conditions I am now.

6 Q. Yeah. So you believe it's -- you know, it's
7 important public participation right you have to write
8 that letter?

9 A. Yes.

10 Q. Okay. A moment ago you were just asked about
11 blasting if it were in coal and your experience with that
12 versus maybe blasting that could happen at the Brook Mine.
13 I'm pulling back up DEQ Exhibit 12, page 145. Are you
14 aware that these orange areas on the map are, you know,
15 basically surface mining areas of the proposed mining
16 operation?

17 A. No. I am now.

18 Q. Okay. Would you agree that -- or are those
19 closer than Big Horn Coal to your property?

20 A. Yes.

21 Q. A lot closer or --

22 A. Quite a bit closer. I drove three miles from my
23 house to the Big Horn Coal office. The blasting was
24 probably half to three-quarters of a mile farther than
25 that. So, yes, they would be quite a bit closer.

1 Q. And does that concern you?

2 A. It does.

3 MS. ANDERSON: All right. Thank you,
4 Anton. That's all I have.

5 CHAIRMAN BAGLEY: Thank you.

6 Thank you, Mr. Bocek.

7 THE WITNESS: Thank you.

8 CHAIRMAN BAGLEY: Ms. Anderson, please call
9 your next witness.

10 MS. ANDERSON: Thank you. I call Gillian
11 Malone.

12 MR. SUTPHIN: Mr. Chairman, we would like
13 to launch our standing objection to these witnesses.

14 CHAIRMAN BAGLEY: Thank you.

15 (Witness sworn.)

16 GILLIAN MALONE,
17 called for examination by PRBRC, being first duly sworn,
18 testified as follows:

19 DIRECT EXAMINATION

20 Q. (BY MS. ANDERSON) Hi, Gillian.

21 A. Hi.

22 Q. Could you say and spell your name for the
23 record.

24 A. Yes. My name is Gillian, spelled G-I-L-L-I-A-N,
25 Malone, M-A-L-O-N-E.

1 Q. Okay. I'd like to spend a little bit of time
2 talking about our organization. Are you currently serving
3 on the board of directors?

4 A. I am.

5 Q. And when did you become a member of the
6 organization?

7 A. I became a member in 1973. I'm actually the
8 youngest founding member of Powder River. I happened to
9 be working for a founding member at the time, Sally
10 Forbes, who had Beckton Stock Farm, and I was supposed to
11 be indexing Red Angus cows, but instead I was clipping
12 newspapers articles about stripping mining and doing
13 things -- assorted jobs associated with getting this
14 organization going.

15 Q. Okay.

16 A. So I've been involved for pretty much the whole
17 time on and off. I've been off, you know, going away to
18 school, or whatever. But whenever I've been here, I've
19 been involved with Powder River.

20 Q. How else have you been involved in the
21 organization over the years?

22 A. Well, I have served on the board more than once.
23 I believe I was on the board back in the '80s for a term.
24 I was board chair three years ago, I believe, for a couple
25 years. And I serve on a variety of committees. We have a

1 local foods committee. We have just a lot of different --
2 we have an ag committee, a local internal fund-raising.
3 We do a lot of gatherings, trying to raise money to keep
4 this organization going. So just a variety of issues.

5 Q. Yeah. Could you explain a little bit about our
6 organizational mission?

7 A. Yeah. I might be able to say this. Our -- our
8 mission is a commitment to the conservation of our unique
9 land, mineral, water and clean air resources, consistent
10 with the responsible use of those resources to sustain
11 present and future populations, generations. And also we
12 work to educate and empower our citizens in the state of
13 Wyoming to raise a coherent voice in decisions that will
14 impact their environment and lifestyle. So that's quite a
15 bundle, but it's basically what we do, and everything that
16 we do is based on that mission.

17 Q. We have a long mission statement. So I
18 appreciate you summarizing that.

19 Does our organization have any history with coal
20 mining?

21 A. Well, as I said, I was working for Sally Forbes
22 when strip mining came to the Powder River Basin. So,
23 yes, we have an intimate history with coal mining. And,
24 in fact, we were instrumental in getting the Federal Strip
25 Mine Act passed. One of our founding members was present

1 at the Rose Garden ceremony and signing, which was a great
2 honor for this man, who was a rancher in the Gillette
3 area, and fought and fought and fought for his ranch and
4 for that legislation.

5 Q. So back at the time, and maybe even today, what
6 would you say are the organizational goals around coal
7 mining?

8 A. I would say that they are making sure that coal
9 mines adhere to the laws that are in place to protect
10 water, clean air, neighboring landowners and the citizens
11 of Wyoming as a whole in terms of royalties, and, you
12 know, getting our taxes that come from coal paid and to
13 sustain the state itself. That's basically been our
14 approach. Bonding. Make sure that the bonding is
15 adequate to ensure reclamation. We've had quite a few
16 issues with that lately, as everybody knows.

17 Q. Yeah. Can you tell us a little bit about how
18 our organization works with landowners?

19 A. We work with landowners. Generally, if an issue
20 comes up, we get approached by landowners. That's often
21 how our membership happens, how we get members, is
22 somebody will approach us with a problem and we get
23 involved based on that, and also based on what the board
24 of directors decides. Everything that we do has to go
25 before the board, and we decide based on how our mission

1 is involved and how landowners are going to be impacted.

2 Basically, just the way the mission states it.

3 We educate them. We act as a liaison at times between

4 landowners and the state and the feds. We work with them

5 in a partnership. We talk to them. We educate ourselves

6 based on their experiences, because we consider the

7 landowners to be the experts in the area of expertise.

8 Where they live, for instance, they know the most about

9 it. So we learn a lot from them. It's kind of an

10 exchange.

11 Q. Yeah. Would you say that our involvement in

12 this proceeding and with this proposed coal mine is a good

13 example of how we work with landowners?

14 A. This is an excellent example of how we work with

15 landowners. Particularly, in this difficult -- I would

16 say difficult proposal wherein it's been hard to get the

17 information that landowners need in order to move on with

18 their lives. You need to know what's going to happen in

19 your backyard if you're going to be able to sleep at

20 night, and we have not gotten that with this -- with this

21 proposal. So we got involved on that basis.

22 We started looking for information and it seemed

23 as though the harder we looked for information, the less

24 information there was or the information was changing. It

25 was hard to determine what this mine was going to be, how

1 much coal they were going to mine, what they were going to
2 use the coal for. And so it's been kind of a moving
3 target and -- so we've -- we've encountered quite a few
4 difficulties with this situation, and we feel that it's
5 more than ever important that we're involved for our
6 landowners and for the community of Sheridan.

7 I mean, this proposal is eight miles outside of
8 Sheridan, and we haven't seen a coal mine for quite a few
9 years. And, you know, this is, historically, a rich
10 cultural historic area of mining, but other than Big Horn
11 Coal and something out at Youngs Creek, I believe, that's
12 going still, which is, you know, on the Montana border,
13 there really hasn't been a coal mine around here for
14 decades. And, frankly, we're kind of wondering why
15 there's a coal mine now, when coal mines are closing
16 and -- it just doesn't make a lot of sense to us, and so
17 we're having to sleuth it out as best we can to try to
18 find out what landowners and citizens of this county can
19 expect.

20 Q. Thank you for that.

21 Did the board of directors approve our objection
22 to the permit application of the Brook --

23 A. Yes, we did.

24 Q. -- coal mine?

25 I have up on the screen our Exhibit 1. Is this

1 the objection letter that our organization sent to DEQ
2 on --

3 A. Yes, it is.

4 Q. Actually, hand delivered to DEQ January 27,
5 2017?

6 A. Yep.

7 Q. Okay. Have you seen this letter?

8 A. I have.

9 Q. Okay. Could you tell me a little bit about why
10 the board approved our organizational objections to the
11 permit application?

12 A. Well, I think it was largely because of all the
13 unanswered questions, and because there seemed to be
14 significant gaps in the permit application. And I know
15 we've gone through this over and over and over this week.
16 I don't need to go into a lot of detail about it. But
17 there are gaps in baseline information, hydrology, and,
18 you know, what the blasting would be, all of the things we
19 discussed this week. We just don't feel that they were
20 adequately covered in the permit application.

21 Q. Okay. Thank you.

22 What has our organization done to address those
23 concerns?

24 A. Well, we have hired a couple of experts who,
25 unfortunately, have not been able to testify because we --

1 we're running out of time.

2 Q. Yeah. Anyway --

3 A. But we did hire them, and we have relied on
4 their research and their knowledge to determine that, yes,
5 there are issues with this application, and that we need
6 to delve into it a lot deeper, that the company needs to
7 devil into these things a lot deeper and provide a lot
8 more information before the application -- the permit is
9 granted.

10 Q. All right. I'd like to switch over a little bit
11 to talk about your personal experience with this area.
12 Can you tell us a little bit about why you're personally
13 concerned about the proposed mine?

14 A. Well, as a citizen, I like to recreate. Hiking
15 is my favorite thing. And I get out and walk my dog in
16 walk-in areas around the county. I like to explore new
17 areas. And a few years ago when John Buyok opened up the
18 Walk-in Area Number 7, which I believe is -- and I am
19 definitely directionally challenged, so -- but there is
20 some help. So I believe -- is this Walk-in 7? I think it
21 is. Oh, there's the interstate. There's Kleenburn right
22 there.

23 So there's recreation available here. There's a
24 fishing pond. There's a bunch of little trails that go
25 along the bottom here and along the Tongue River. You can

1 also hike up in the hills above here. This is a state
2 section. And then there's John Buyok's walk-in area,
3 which takes you back partly along the Tongue and then kind
4 of branches out. And you can go way up on top of the hill
5 where you can look one direction towards the mountains,
6 beautiful view of the Bighorns, and then the other
7 direction you look out towards, you know, Montana. And I
8 assume that if there were to be a mine developed there, it
9 would be pretty visible from that site as well.

10 But lots of opportunities for birding. Went in
11 there a couple weeks ago, saw a pair of golden eagles and
12 a juvenile, which was really fun. Saw a Spotted Towhee,
13 and saw a Western Tanager, all the birds that are coming
14 back for the summer. Anyway, it's a unique area. I mean,
15 not that it's not without some impact, because
16 historically it was a mining area. So there's -- you
17 know, there's some debris lying around from the past.
18 Those days they didn't take those olds culverts out.

19 So I don't know if the council had a chance to
20 get out there and get a -- a -- you know, just a little
21 site visit or not, but I certainly recommend it. It's a
22 nice area. It allows you to go -- especially the
23 Kleenburn area and up on a south-facing slope. So you can
24 go up there in the winter when the sun is hitting those
25 slopes and the snow gets blown off by the wind, you can

1 hike up above there.

2 I'm assuming, though, if this mine were to
3 go forward, I heard -- I think it was -- what was the
4 expert -- blasting expert, I think he said that area could
5 be off limits during mining because of the dangers from
6 blasting and just an active coal mine. So that would be a
7 shame. But right now, I enjoy going there.

8 Q. Yeah. And you would go back?

9 A. Yeah, at this point I would go back. I'm not
10 sure I'd go back if it was an active coal mine. I mean,
11 if I could go back even.

12 Q. Do you believe recreation areas like these add
13 value to our county?

14 A. I do. You know, people are moving to Sheridan
15 County for the recreational opportunities. Young people
16 are moving here to raise families, and we have a lot of
17 retirees that are moving here. A lot of them are coming
18 to be with their kids who already live here, which is kind
19 of interesting. Kids are moving back home because they're
20 realizing, after being out in the world, that this is a
21 pretty wonderful community, and we have lots of arts and
22 entertainment amenities. And all these recreation
23 opportunities. So, yeah, it's -- this is not a coal mine
24 community.

25 Q. On that, do you have any concerns about changing

1 the land from a recreation/agriculture use to a more
2 industrial use?

3 A. Yes. You know, when you come down the
4 interstate from Billings, and you come, you know,
5 approaching Sheridan, that's going to be -- if that mine
6 goes in on the side of the interstate there, that's going
7 to be people's view of this community when they come in.
8 That's just -- I don't know, I just -- doesn't really rest
9 very well with me.

10 The other thing is what about blasting? Are you
11 going to be able to shut down the interstate when they're
12 blasting? Because it's going to be that close, as far as
13 I can gather. I do have those concerns.

14 I think it's -- it has too many complications
15 with all the past mining activity, which would only be
16 exacerbated by a new mine. I -- I worry about the dangers
17 from people out there. I know John referred to that
18 yesterday when he talked about his walk-in area, that he
19 would be concerned to have people out there when there's
20 an active mine, and, you know, if there's blasting and
21 there's no way to notify recreationists, I think that will
22 be a concern of mine as well if I were a landowner there.

23 Q. Do you believe there was enough done by the
24 mine, in its proposed permit application, to protect
25 recreation values of the area?

1 A. I don't think they've done anything to protect
2 recreation values. Not that I'm aware of. I mean, I
3 think that some of those recreation areas will perhaps be
4 closed. I'm guessing they would have to be closed because
5 of liability, if nothing else.

6 I know that also, you know, the local community
7 land trust has put a lot of their own resources into that
8 area in terms of, you know, taking old cars out of the
9 bank of the Tongue River and making a safer passage for
10 boaters. They removed an old bridge structure that was
11 impeding people in canoes and kayaks, made it a lot safer
12 and a lot more visually appealing. Spent a lot of
13 volunteer time and money on that, and it seems like a sad
14 situation --

15 Q. Okay.

16 A. -- it's going to be.

17 Q. What does our organization want to have happen
18 with this proposed permit application? What's our goal
19 here?

20 A. I think our goal here is, at a minimum, to make
21 sure that Brook Mine steps up with what they really are
22 going to do, first of all -- and that I know they're not
23 supposed to be talking about it, but I have to talk about
24 it. Because as a citizen and as a member of the board of
25 Powder River, we're here for the long term. We're not

1 here for, you know, the next five years or whatever,
2 however this long -- this mine lasts. We're here for the
3 long term. And especially the landowners who live in that
4 area are there, they hope, for the long term. They hope
5 that their lives won't be disrupted to the extent that
6 they would have to move or, you know, haul water from
7 town, or, you know, whatever.

8 There are too many unknowns. I believe that
9 Brook needs to go back to the drawing board, do all those
10 baseline studies that have been indicated as necessary by
11 our experts and by many people that have testified during
12 this week, including Mr. Gerlach, and maybe they should
13 come forward with that information before they're granted
14 a permit to mine. I don't think a permit with conditions
15 is enough.

16 MS. ANDERSON: Okay. Thank you. That's
17 all the questions I have for you at this time.

18 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
19 Mr. Gilbertz.

20 MR. GILBERTZ: No questions.

21 CHAIRMAN BAGLEY: Thank you.
22 Mr. Sutphin.

23 CROSS-EXAMINATION

24 Q. (BY MR. SUTPHIN) Good morning, Ms. Malone. How
25 are you today?

1 A. Hello again.

2 Q. Hello again.

3 You remember at your deposition we talked about
4 the comments you made at a local county commission
5 meeting, right?

6 A. Yes.

7 Q. And among other things, you told the county
8 commission you "smell a rat." You remember that?"

9 A. Yeah.

10 Q. You still smell a rat, don't you, Ms. Malone?

11 A. Well, one tends to smell a rat if nobody's
12 coming forward to say who they are.

13 Q. We can make this really easy.

14 A. Okay.

15 Q. It's a yes or no. You still smell a rat.

16 A. Yes. I still smell a rat. A stinking rat.

17 Q. Okay. And that's true even though you sat
18 through this entire week of testimony, right?

19 A. Yes.

20 Q. And you've heard from all of the experts at the
21 Department of Environmental Quality, right?

22 A. Ad nauseam.

23 Q. But isn't that what you wanted, Ms. Malone? You
24 wanted to hear from all the experts, right?

25 A. I would have liked to have heard from our

1 experts.

2 Q. And just so the record is clear, you will have
3 an opportunity to have your experts heard; isn't that
4 right?

5 A. I know that. I know that.

6 Q. Okay. So at the time you filed your objection
7 letter with the Department of Environmental Quality, you
8 had not read any piece of the permit file, right?

9 A. Right.

10 Q. And so all of the objections that are based on
11 your -- that are in your objection letter were certainly
12 not based on any of the terms you read in the permit,
13 true?

14 A. Except for the ones that are -- you know, I
15 relied on Powder River Basin Resource Council's expertise
16 and the expertise of our experts to give me that
17 information. I trusted that information based on their
18 expertise, and also a lot of that stuff was mentioned in
19 our objection letter. The -- you know, the council's
20 objection letter.

21 Q. I don't want to be rude, Ms. Malone, but the
22 question's really pretty straightforward. Your objections
23 were not based on anything you read, true?

24 A. Except for the stuff that I read in our
25 objection letter.

1 Q. Okay. I see why we're getting crosswise here.

2 A. Yeah.

3 Q. So your objection was not based on anything that
4 you read personally in the permit file, true?

5 A. Right.

6 Q. Okay. You just testified that at a minimum, you
7 believe that Brook Mine should be forced to go back to the
8 drawing board, right?

9 A. Yes.

10 Q. Okay. And that's what I believe you're
11 testifying on behalf of the Powder River Basin Resource
12 Council when you say that, true?

13 A. I really have that opinion as a citizen,
14 primarily.

15 Q. But isn't it true that at your deposition you
16 told me that you believed the -- the only good thing here
17 to happen is no mining, right?

18 A. Ideally.

19 Q. And, in fact, I think you said that coal mines
20 are incompatible with recreation, right?

21 A. This coal mine. And this is, again, me, as a
22 citizen.

23 Q. I appreciate that.

24 A. Okay.

25 Q. And I agree.

1 A. Yeah.

2 Q. You don't believe that you as a citizen will be
3 able to safely recreate in the vicinity of the Brook Mine,
4 right?

5 A. I have that concern.

6 Q. But you do know that there is currently
7 recreation ongoing up at the Tongue River Reservoir,
8 right?

9 A. I assume there is. I don't go there much
10 either.

11 Q. Okay. But you would have to agree with me,
12 right, that the -- the Tongue River Reservoir is straddled
13 on both sides by the Decker mine, right?

14 A. I know you can see the mine from there.

15 Q. And you're not aware of any recreational users
16 that have been harmed or otherwise --

17 MS. ANDERSON: Objection.

18 Q. (BY MR. SUTPHIN) -- injured as a result of --

19 MS. ANDERSON: Calls for speculation.

20 MR. SUTPHIN: Can I --

21 MS. ANDERSON: I'm sorry.

22 MR. SUTPHIN: -- at least finish my
23 question?

24 MS. ANDERSON: I'm sorry.

25 MR. SUTPHIN: Thank you.

1 Q. (BY MR. SUTPHIN) You're not aware of any
2 recreational users on the Tongue River Reservoir that have
3 been injured or otherwise harmed as a result of the Decker
4 mining operations, are you?

5 A. Well, I do know that people that swim in that
6 reservoir end up with burning eyes. There's nothing being
7 released into that water? I would not swim in that
8 reservoir.

9 Q. Understood. You also would have to acknowledge
10 that the Decker mine operation is larger than the
11 operation proposed by the Brook Mine, right?

12 A. I assume so, yes.

13 Q. You've talked a little bit about blasting, and I
14 think that's one of the reasons you're afraid to recreate
15 out in the area of the Brook Mine, if it's approved,
16 right?

17 A. I have concerns about that, yes.

18 Q. And I think one of the concerns you expressed --
19 maybe it wasn't today, maybe it was at your deposition --
20 but that you're afraid you won't get notice, right?

21 A. Well, it depends on -- yes.

22 Q. But you do understand that the Brook Mine will
23 be required to put something in the newspaper notifying
24 the public about the blasting, right?

25 A. I am aware of that, but I don't even read the

1 newspaper.

2 Q. Okay.

3 A. Not the --

4 Q. But you're also aware, aren't you, that in
5 addition to the publication in the newspaper, Brook Mine
6 will be required to post signs at the perimeter of its
7 mine, right?

8 A. Yes.

9 Q. And that they'll have to have sirens and warning
10 signals, right?

11 A. I don't know, but maybe.

12 Q. Okay. And you don't know --

13 A. If you say so.

14 Q. You don't know because you didn't read the
15 permit.

16 A. Exactly.

17 Q. So you probably don't know that they're also
18 required to have security patrols going around to make
19 sure the area's clear, right?

20 A. Oh, that makes me feel more comfortable.

21 Q. You mentioned that you don't know if they're
22 going to have to shut down the interstate for blasting.
23 Do you remember that?

24 A. I just said that today.

25 Q. Right.

1 A. Yes. I don't know. It's all speculative.

2 Q. Okay. And, again, you didn't read the permit to
3 find out, either?

4 A. Nobody knows. To my knowledge, nobody knows.

5 Q. Let me ask that question again. And, again,
6 it's really --

7 A. No, I didn't.

8 Q. Okay. Thank you.

9 I noticed you didn't bring up really specifics
10 about your wildlife objection today, right?

11 A. I talked about birding.

12 Q. Okay. But you don't actually have any
13 information from the Brook Mine that you base your opinion
14 on that birding might be affected, right?

15 A. Not from their application.

16 Q. In fact, the real basis for all of your
17 objections is what you've seen in other mines, right?

18 A. Probably. Yes or no?

19 Q. Well, no. Ms. Malone, I don't -- please don't
20 make me get your deposition out.

21 A. Okay. Please don't.

22 Q. Okay. You testified at your deposition that it
23 was based on -- that your objections were based on what
24 you had seen at other mines, right?

25 A. Some of my objections.

1 Q. Okay. And, again, you didn't take the time to
2 study or understand what Brook Mine is proposing to do out
3 at its mine, right?

4 A. If it's of any interest to you, I have read it
5 since then.

6 Q. I appreciate hearing that.

7 A. I put it in my bathroom because it was hard to
8 take the time otherwise. Sorry. But --

9 Q. Ms. Malone, the questions and concerns that you
10 have read --

11 A. Sorry.

12 Q. -- you did not talk to Brook Mine about those
13 concerns, did you?

14 A. Not directly, no. There's nobody to talk to.

15 Q. And nor did you talk to Mr. Jeff Barron about
16 those concerns, did you?

17 A. Now, which concerns are we talking about?

18 Q. Any of the issues --

19 A. Any of the issues --

20 Q. -- and concerns --

21 A. -- I brought up? Okay.

22 Q. Ms. Malone, let's slow down just a tiny bit for
23 the sake of Kathy --

24 THE WITNESS: Sorry, Kathy.

25 Q. (BY MR. SUTPHIN) -- the court reporter.

1 THE WITNESS: Sorry.

2 Q. (BY MR. SUTPHIN) And let me ask the question
3 and I'll let you answer the question.

4 A. Okay.

5 Q. Okay. You did not take any of the concerns you
6 have expressed in your objection letter directly to
7 Mr. Jeff Barron, correct?

8 A. Correct.

9 Q. Nor did you take any of the concerns you've
10 addressed in your objection letter directly to anyone at
11 DEQ, correct?

12 A. Correct. Although I would say I did request an
13 informal conference with DEQ, which was denied, which
14 could have saved us a huge amount of time and money.

15 Q. You would agree, Ms. Malone, that you have now
16 had an opportunity to express your concerns in front of
17 the Environmental Quality Council, true?

18 A. Yes. A somewhat intimidating stage, but yes.

19 Q. Ms. Malone, based on what you've heard today,
20 are you -- or you heard throughout this week, you
21 understand there are many commitments that Brook has made
22 in this permit application to protect the environment in
23 and around its proposed mine, right?

24 A. No. What I have understood is that not enough
25 commitments have been made by Brook. A lot of people that

1 have testified this week have pointed out that there are
2 significant gaps and that other measures need to be in
3 place before this permit is granted. And I believe that
4 when our experts are able to testify, that will become
5 even more clear.

6 Q. So you would agree with me, Ms. Malone, that you
7 do not trust the experts at DEQ to do their mandate to
8 protect the environment, correct?

9 MS. ANDERSON: Objection. Argumentative.

10 A. I didn't say that.

11 MR. SUTPHIN: I have no other questions.

12 A. I didn't say that.

13 MS. ANDERSON: It's fine. She answered,
14 so...

15 CHAIRMAN BAGLEY: Thank you, Mr. Sutphin.
16 Mr. LaRock.

17 CROSS-EXAMINATION

18 Q. (BY MR. LAROCK) Good morning, Ms. Malone.

19 A. Morning.

20 Q. Same question I've been asking everyone else.
21 Do you have any other concerns or questions about this
22 permit application that you haven't yet expressed you want
23 to get on the record?

24 A. Well, I'd like to see Brook Mine, whoever they
25 are, be a better neighbor. My concerns are that happen if

1 Brook Mine is the kind of neighbor they've been, thus far,
2 the future is not going to be so rosy for these landowners
3 that live out there. And if you want me to go into
4 detail, I will.

5 Q. I think that's all right.

6 And I know you said that permit conditions is
7 not enough. But if you had to suggest conditions for the
8 council, are there any you'd suggest?

9 A. I would suggest all the conditions that other
10 objectors have mentioned throughout the week. And I'm not
11 an expert in, you know, in blasting. I'm not an expert in
12 hydrology. But that I believe that there are gaps that
13 actually could be quite dangerous for miners and for
14 residents and for recreationists if they aren't addressed.
15 But, ultimately, I believe there are too many unknowns.

16 MR. LAROCK: Thank you. I have no further
17 questions.

18 CHAIRMAN BAGLEY: Thank you, Mr. LaRock.

19 Ms. Boomgaarden?

20 MS. BOOMGAARDEN: No questions. Thank you.

21 CHAIRMAN BAGLEY: Thank you.

22 Council members.

23 Deb?

24 COUNCIL MEMBER BAUMER: No questions.

25 CHAIRMAN BAGLEY: Meghan?

1 COUNCIL MEMBER LALLY: I don't think so.

2 Thank you.

3 CHAIRMAN BAGLEY: Nick?

4 COUNCIL MEMBER AGOPIAN: No.

5 CHAIRMAN BAGLEY: And I have no further
6 questions either.

7 THE WITNESS: Goodness, I did a good job.
8 Or a bad job.

9 CHAIRMAN BAGLEY: I want to thank you for
10 being here today.

11 THE WITNESS: I do want to also thank the
12 council for taking this much time out of your busy lives
13 and coming to --

14 CHAIRMAN BAGLEY: Ms. Anderson, anything?

15 THE WITNESS: -- oversee this.

16 MS. ANDERSON: Dr. Bagley, I really don't
17 want to ask about the reading habits in the bathroom of
18 Ms. Malone, so I think I have no further questions.

19 CHAIRMAN BAGLEY: Thank you for that.

20 THE WITNESS: Thank you.

21 CHAIRMAN BAGLEY: Thank you.

22 THE WITNESS: I'm dismissed?

23 CHAIRMAN BAGLEY: You may step down.

24 Let us take a 10-minute break, then we will
25 continue.

1 MR. GILBERTZ: Thank you.

2 (Hearing proceedings recessed

3 10:53 a.m. to 11:05 a.m.)

4 CHAIRMAN BAGLEY: Okay. We are back in
5 session.

6 Just for everyone's information. Ms. Anderson
7 does have additional witnesses, but we will not be -- they
8 will not be testifying today. The hearing will remain
9 open. And I'll mention at the end of our testimonies today
10 how that will proceed.

11 But you have agreed to let Mr. Gilbertz go ahead
12 and call a witness.

13 So please, Mr. Gilbertz.

14 MR. GILBERTZ: Thank you. Call Mary
15 Brezik-Fisher.

16 (Witness sworn.)

17 MARY BREZIK-FISHER,
18 called for examination by the Fishers, being first duly
19 sworn, testified as follows:

20 THE REPORTER: Now, you're going to have to
21 really speak up.

22 DIRECT EXAMINATION

23 Q. (BY MR. GILBERTZ) Mrs. Fisher, would you state
24 your full name for the record, please.

25 A. First, I just have to say I think I caught what

1 Ms. Boomgaarden has, so I'll do my best.

2 Mary, M-A-R-Y, Brezik-Fisher, B-R-E-Z-I-K, dash,
3 Fisher, F-I-S-H-E-R.

4 Q. Mrs. Fisher, where do you live?

5 A. I live along the Tongue River Valley, between
6 Sheridan and Ranchester.

7 Q. The photograph we have up, Fisher Number 1, is
8 your property located near or on this photo?

9 A. Yes, it is. It's located towards this
10 right-hand corner.

11 Q. And is your husband here with us today?

12 A. Yes, he is.

13 Q. He's there in the back back there trying to hide
14 to make sure I don't call him.

15 A. Probably.

16 Q. Now, everybody else in the room knows, but the
17 council doesn't. Mrs. Fisher, we know each other outside
18 of attorney-client, don't we?

19 A. Yes, we do.

20 Q. And how is that?

21 A. I work with you at Yonkee & Toner.

22 Q. Okay. Occasionally do the partners at Yonkee &
23 Toner force you to work with me?

24 A. Yes, they do.

25 Q. Now, Mary, I know you've got to see witnesses a

1 number of times in the courtroom. I suspect you're
2 getting a new appreciation of how stressful it might be.

3 A. Most certainly.

4 Q. Bear with us, and we'll get through this. Let's
5 start with some easy questions. Give the council a brief
6 description of your and David's background before you came
7 to Wyoming.

8 A. I'll try to be brief, but my husband has been --
9 his career has been spent in the field of education for
10 over 40 years. He -- he taught in school or schools in
11 Iowa, initially, I believe. And then he taught at Ball
12 State University in Muncie, Indiana.

13 From there he taught in some inner city -- he
14 was -- I'm sorry, not taught. He moved to an
15 administrative position with some inner city schools in
16 Indiana and Ohio. And then from there, he became the
17 director of teacher education in Urbana College in Urbana,
18 Ohio.

19 And from there we then moved out to Wyoming, and
20 I guess I can go into that -- the rest of that story after
21 I address my --

22 Q. Now, I ask this because I understand that you
23 were a probation officer at one point in time.

24 A. Yes, I was. A juvenile probation officer.

25 Q. Was that in Indiana?

1 A. Yes. In Lake County -- Lake County, Indiana.

2 Q. Can you tell the council what it was that
3 brought you and Mr. Fisher to Wyoming?

4 A. We were living in Ohio at the time. And we had
5 been coming out to the Bonneville Salt Flats in Wendover,
6 Utah for a number of years. And we, of course, traveled
7 through Interstate 80, southern Wyoming. And I had -- one
8 of my brothers lives -- lived in Casper, Wyoming. And we
9 always made an effort to stop and spend some time with
10 him. He had worked -- has worked in the oil industry
11 during his entire career. He's now retired.

12 Q. I'm pleased you brought up your travels to
13 Bonneville. Is it true that, in fact, you hold the
14 women's land speed record for racing in Bonneville?

15 A. Yes, I do.

16 Q. So will you tell us, then, how you come to be in
17 Wyoming?

18 A. On our trips out to the Salt Flats -- oh, and I
19 should mention that my land speed record was faster than
20 my husband's. I want that on the record.

21 As I said, we had been coming out and we would
22 stop in Casper to visit my brother. And we traveled
23 around a little bit on occasion, and we really loved the
24 state of Wyoming. The oil industry was booming at the
25 time. This was in the late '70s, '79, 1980, early part of

1 1980. And we had decided -- things in Ohio, economically,
2 were experiencing a great downturn. The college where my
3 husband was was experiencing major budget cuts and the
4 economy was not improving. A lot of people were losing
5 their jobs. And we just thought this might be a good time
6 to make a break and go someplace and do something
7 completely different or just see what the new landscape
8 had to offer.

9 So we made a decision and we packed up our
10 things and did what we needed to do to sell our house and
11 packed everything up and came out here. And we initially
12 stayed in Casper with my brother for a few months.

13 Q. What -- what was the thing that came to be your
14 profession once you arrived in Wyoming?

15 A. Well, one day my husband, I believe, saw an ad
16 in the paper, in the Casper paper, and he showed it to me
17 and we both kind of thought, well, this might be something
18 really interesting to do, a different chapter in our
19 lives. There was an ad for managers of a guest ranch,
20 Paradise Guest Ranch, which is one of the oldest dude
21 ranches in the country. And the company who owned
22 Paradise Guest Ranch was Apache Oil out of Minnesota.

23 So we applied. We didn't really think that we
24 would hear anything, but we did. And we were scheduled
25 for an interview, and we interviewed for that position,

1 and we got the job.

2 Q. Just briefly, give the council a quick synopsis
3 of what -- after Paradise Guest Ranch what you did until
4 the time frame in which you bought the property we're
5 going to be talking about today.

6 A. We were at Paradise Guest Ranch for
7 approximately three years. And then my husband was
8 offered a position with the Gillette school district. So
9 we moved to Gillette, and David became -- he had dual
10 position. He was -- Gillette had just opened an
11 alternative school, the Gillette school district. And he
12 became the director and principal of the alternative
13 school. And at the same time he became the director,
14 through the school district again, of the vocational
15 technical secondary -- postsecondary school in Gillette.

16 Q. Did David have occasion to come in contact with
17 mines in Gillette in that position?

18 A. Yes, he did.

19 Q. How was that?

20 A. He developed a mine training program for new
21 miners. And he also had developed a certified welding
22 program for -- and a number of those students ended up
23 getting jobs at the mines. So he had a lot of contact
24 with mine officials, setting up these programs and
25 implementing the programs.

1 Q. During this time frame, did you at some point
2 become a paralegal?

3 A. Yes, I did. I actually moved to Denver in 1986.
4 I had applied with the Denver Paralegal Institute. I'd
5 always been interested in law, and -- especially after my
6 work in the juvenile justice system in Indiana -- and I
7 decided that that would be a pretty good field to go into,
8 that depending on where we ended up, I probably could get
9 a job just about anywhere. So I did that. It was a six-
10 months intensive program, and with the last month being an
11 internship with district court judge in Denver.

12 Q. So let's take ourselves up in time to roughly
13 when you and David purchased the property we're going to
14 talk about today. You remember how you first came to know
15 about this property and look at it?

16 A. Well, actually, my husband was -- well, I guess
17 I should say from Gillette, then, he was offered a job at
18 Sheridan College as the dean of the Agriculture Health and
19 Technical Careers Divisions. So we moved from Gillette to
20 Buffalo because I had been offered a job with a large --
21 with a law firm in Sheridan. Not Yonkee & Toner yet, but
22 Davis & Cannon. So we lived in Buffalo, and David drove
23 to Gillette every day to work and I drove to Sheridan.

24 Q. And then sometime after that was when David
25 became the dean of the ag department up here?

1 A. Correct.

2 Q. So then after that is -- let's talk about the
3 property that we have at issue. What caused you to have
4 interest in or look at this particular piece of property?

5 A. David worked with Joan Tillez, who was the
6 director of the dental hygiene program at Sheridan
7 College. And Joan's brother you met, Anton Bocek, a few
8 minutes ago who testified here. He is our neighbor just
9 up the road from us. And Joan had mentioned to David one
10 day that she knew that we had been looking for property
11 outside of town, and she mentioned to him that there was a
12 fellow -- an older fellow who owned property down the road
13 from her brother on Slater Creek Lane. And she encouraged
14 David to go out and look at it because she thought that it
15 might be something we would be interested in. So he did
16 that without telling me, and he absolutely loved it. And
17 he told me about it that evening and so we drove out there
18 the next day.

19 Q. Okay. Did you find the location of the property
20 attractive?

21 A. Immensely.

22 Q. What about it was attractive to you?

23 A. We both wanted to live outside the town. Even
24 though I wasn't raised in a rural location, David was
25 raised on a farm. And you may have heard the expression

1 you can take the boy out of the farm, but you can't take
2 the farm out of the boy. And that's how it -- kind of how
3 it was with David. We looked at the -- when I saw the
4 property, I thought it just had everything we had been
5 looking for. A view of the mountains in the background,
6 the river, wooded areas, hayfields. It was somewhat
7 isolated, but yet, it was accessible to the highway so
8 that we could both get back and forth to work.

9 Q. So happy with the location. How were the
10 amenities? How was the house and the surrounding
11 structures?

12 A. Well, David saw -- I guess when you see the
13 photo of what the house looked like, I looked at David
14 when I first saw it and I thought he was crazy. It looked
15 like it was going to entail a lot of work.

16 Q. What did you understand about how long it had
17 been since anyone had lived in the home?

18 A. It was our understanding, in talking with the
19 fellow who owned it, Mr. Addleman, that his wife had
20 passed away a couple years earlier and they had lived in
21 Ranchester, but they had owned the property for a number
22 of years. I believe in the 1950s he purchased it. And
23 they -- but they hadn't lived there. His wife had become
24 ill and they hadn't lived there about 15 years. No one
25 had.

1 Q. Let's take a quick look at that. We have Fisher
2 Number 2 here. Is this similar to what the house looked
3 like when you first bought it?

4 A. Yes, it is.

5 Q. Okay. And then over time did you come to have
6 any understanding of the history of the home, how long it
7 had been there, things of that nature?

8 A. Well, yes. Quite obviously it was quite old.
9 We have a rock building on the property that has initials
10 etched on it with the date of 1913.

11 Q. We'll take a look at that photo in a minute.
12 Did there ever come a time of the descendants of the
13 people who built the house happened to come by?

14 A. Yes. A carload of folks drove up one afternoon,
15 and they introduced themselves as being descendants of
16 people who used to own it and live in the house. And they
17 were very interested in the history and what the property
18 looked like and what had happened to the property since
19 their descendants had left -- since their heirs had left.
20 Not heirs.

21 Q. We have a photo up here, Fisher 2.2. What is
22 this a photo of, if you know?

23 A. Well, the people who came to our house that day,
24 I believe his name -- I think his name was Stan Navarro.
25 And he had this picture he had showed us. And he was

1 identifying or attempting to identify the folks in the
2 photo. And he said he believed it was a wedding party.

3 Q. Did you understand the house to be the house
4 that you were looking at buying -- or the one you had
5 already bought at that time?

6 A. We had already bought, right. We had already
7 bought it, yes.

8 Q. So let's talk a moment, then, about a few photos
9 here. We won't take a lot of time, but enough just to see
10 a little bit about the property. What is this a picture
11 of?

12 A. This is the rock barn structure that's on the
13 property.

14 Q. And you were mentioning it has a date etched in
15 it. This looks like it's not presenting quite as well as
16 we might hope, but --

17 A. Yes. It says -- the initials are LS, and the
18 date is July 26, 1913. And it's my understanding, in
19 research in looking at our deeds and speaking with the
20 folks who stopped to visit us that day, there was a couple
21 named Leon and Mary Shegoski, and I can't begin to tell
22 you how to spell that. And I guess I would assume that
23 that -- those initials are from Leon Shegoski.

24 Q. Is this a picture of another structure on your
25 property?

1 A. Yes. That's -- that's as you're coming up the
2 road to our place. That's on our property. And it's our
3 understanding that coal miners actually lived in there --

4 Q. You see --

5 A. -- at one time.

6 Q. -- a little chimney sticking out of the roof on
7 there.

8 A. Yes.

9 Q. Okay. And then this is back to the house as you
10 bought it, right? Fisher 6 -- 2.6?

11 A. Yes. David's version of a fixer upper.

12 Q. Okay. Start with the fixer upper part. This is
13 quite a number of years into the future, I take it?

14 A. Excuse me?

15 Q. This is quite a number of years after that first
16 photo we looked at?

17 A. Yes. We bought the property in 1996, and we
18 worked on it extensively and didn't move in for six
19 months, until January of 1997, and we continued to work on
20 the property while we lived there.

21 Q. Okay.

22 A. This was -- excuse me. This would be our
23 version of Phase I of the property.

24 Q. Okay. And we can see from this photo, did you
25 keep the original structure intact and try to maintain it

1 as part of the new house?

2 A. Yes. That was very important, especially to my
3 husband. He really loved the hip roof structure. You
4 don't see that too often. And we wanted to maintain that
5 historical architecture, so to speak.

6 Q. And I've seen a great picture of you in bib
7 overalls working up in the attic space of this, but I knew
8 somehow my technology would fail me if I tried to show
9 that photo, so...

10 Did you actively help your husband working on
11 the house in doing this Phase I project?

12 A. Yes. We spent many, many hours.

13 Q. Why in the world would you guys have boughten
14 such a rundown and dilapidated place?

15 A. Well, Sheridan County property values are quite
16 high. They have been for quite some time. David and I
17 had traveled -- we would spend many weekends driving
18 around Sheridan County, Johnson County, the Big Horn area,
19 and we just came to the understanding that there was --
20 our finances just wouldn't allow for us to -- to find
21 property with -- at that expense, unless we chose some
22 property which we would need to work on and renovate.

23 Q. Let's take a look at what you call Phase II of
24 the house. I see now that the porch has been enclosed.

25 A. Yes.

1 Q. And there's a lot of rock work put there on that
2 front porch and around over by the walk-in door. Who did
3 all that rock work?

4 A. David and I.

5 Q. And what is this a photograph of, Mrs. Fisher?

6 A. That's a view coming down the driveway to the
7 house. You can see the house is in the background. You
8 can kind of barely see it through the trees there. A lot
9 of mature trees on property. David mostly planted a
10 number of pine trees, which are now mature trees. And
11 you'll see the -- this is a new fence we had just
12 completed a year ago.

13 Q. And this is a photo awfully hard --

14 MR. GILBERTZ: Is that okay for you guys to
15 see? It's horrible for me.

16 MR. RUBY: I'll turn the lights down.

17 MR. GILBERTZ: Thank you.

18 Q. (BY MR. GILBERTZ) We're still on Fisher
19 Exhibit 2. Little better.

20 On this -- is any of your property shown in this
21 photograph?

22 A. Yes.

23 Q. And what direction are we looking in the
24 photograph?

25 A. Well, the mountains you'll see in the

1 background. Our property is right -- sort of right in
2 here. You can barely see the house. And this is part of
3 our neighbor's property.

4 Q. You see the land between where you pointed the
5 house out and the picture where -- or the location where
6 this picture is taken, is some of that land yours?

7 A. Yes. Shows part of our hayfields.

8 Q. So that's the point -- this photograph shows a
9 portion of your hayfields?

10 A. Yes.

11 Q. And is this a picture of the same area?

12 A. Yes. Just a different version. Again, the
13 house is right in that area.

14 Q. Good. I think we're done with that, and I want
15 to move on to some of the concerns that you have in just a
16 moment. But can you tell the commission about some of the
17 types of wildlife and things that you see around your home
18 that are important to you?

19 A. Well, when I left for the proceeding this
20 morning, our resident Sandhill Crane was in our hayfield.
21 We have a couple of Bald Eagles who have nested just down
22 the river from us. We see them quite frequently. We have
23 just -- I mean, turkeys, pheasants. I've been out mowing
24 the front yard and a fox has run right by me in the
25 hayfield. We actually have coyotes. Occasionally we'll

1 hear the coyote pups howling across the river. And, oh,
2 just recently, maybe a year or so ago, we were told that
3 there was a small black bear sighted on our neighbor's
4 property. And, of course, we have deer everywhere.
5 And -- and -- oh, and also the -- I had mentioned to you,
6 Jay, about seeing the Great Blue Heron quite frequently
7 along the river.

8 Q. Let's talk a little bit about the mine, some of
9 your concerns. How was it that you first came to learn
10 that there was a proposal or someone investigating
11 potential of the mine in the area?

12 A. The first that we heard of it was July of 2013.
13 My husband called me. I was at work, I believe, that day.
14 And he and our neighbor across the river, John Buyok, were
15 out in our hayfield. John, Mr. Buyok, does the haying for
16 us and they were working on a baler, I believe, that had
17 broken down. And at one point my husband happened to look
18 up and within about a hundred feet or so he saw two people
19 on the property, and they appeared to be crouching down
20 and looked like they were digging for something.

21 And so he said to Mr. Buyok, "Well, that's odd.
22 Who are those people? You know? And so the two of them
23 started to walk towards the two individuals in the
24 hayfield. And I might add that the two individuals
25 certainly could have seen my husband and Mr. Buyok out in

1 the hayfield, and they made no effort to come forward and
2 identify themselves.

3 So my husband and Mr. Buyok walked up to them
4 and David asked, "Who are you and what are you doing?"
5 And they indicated that they were there to take some type
6 of samples. And David said, "Well, who authorized you to
7 be here?" And they indicated that it was Ramaco. Well,
8 David had never heard of Ramaco. And he asked John who --
9 who -- what is that? And at that point John had
10 mentioned -- or I believe it was after the two individuals
11 left by crawling through the fence, mentioned that Ramaco
12 is a company that is apparently going to be proposing a
13 new coal mine in the area.

14 Q. Okay. Did you -- after this interaction, did
15 you complain at all about these folks having come on your
16 property without permission?

17 A. Yes. My husband -- as I said, he called me to
18 report this and asked me if I knew anything about a
19 company called Ramaco, and I said I did not. I've never
20 heard of that. A couple days later, I prepared a letter
21 and we sent a letter to BKS Environmental Associates, I
22 think it was.

23 Q. We've got that as Fisher Exhibit Number 6. Is
24 is a copy of the letter that you sent to BKS addressing
25 the fact that folks had come on your property without

1 permission?

2 A. Yes, it is.

3 Q. Why was it sent to BKS?

4 A. Well, because my husband had noticed a white
5 truck parked on our neighbor's property the day of the
6 trespass incident, and then the very next day, he was
7 taking our daughter and grandchildren who had been
8 visiting us. He was taking them back to the Billings
9 Airport. And as he drove down the frontage road, he saw
10 three white trucks with BKS on the -- identified on the
11 truck.

12 Q. Did you ever receive any response from BKS to
13 your complaint letter?

14 A. No, we did not.

15 Q. Did you receive any response from anyone at
16 Ramaco to your complaint letter?

17 A. No, we did not.

18 Q. Now, Mrs. Fisher, I don't want to spend too much
19 time doing this, but there's been some suggestions that
20 objectors didn't bother to investigate the details of the
21 mine plan or understand what was being proposed. I want
22 to visit with you for a little bit about what you did.

23 Once you learned there was a proposed mine in
24 the area, as things moved along, what was some of the
25 first things you did to inform yourself about this

1 potential mine?

2 A. Well, I started to look on the Internet for
3 information about Ramaco. As I said, I had not heard of
4 them. And I was able to pull up a prospectus of the
5 company. And -- and then I also began researching
6 information on potential impacts of a coal -- coal mine
7 being proposed.

8 Q. How did you do research about the potential
9 impacts of the coal mine?

10 A. Mostly on the Internet.

11 Q. I'm obligated to ask you, was any of that on
12 your work computer? You don't have to answer.

13 A. I spent many lunch hours and nights and
14 weekends. We have a home computer.

15 Q. Very good. So was there ever a time that you
16 attended any landowner meetings facilitated by the Powder
17 River -- Powder River Basin Resource Council?

18 A. Yes.

19 Q. Why did you go to those?

20 A. Well, because there didn't appear to be any
21 other information from anybody else about what was
22 happening, anything about the coal mine, other than I
23 started to see articles in the newspaper from Ramaco
24 individuals, I believe mainly Mr. Adkins. And they
25 were proposals for a pretty big mine employing about

1 600 people. And so you know, I was wondering why haven't
2 we heard anything about this from anybody.

3 Q. Were you looking for more information?

4 A. Absolutely.

5 Q. We heard a little bit yesterday about an early
6 meeting at which Jeff Barron from Western Water
7 Consultants attended one of these meetings. Do you recall
8 whether you were present at that same meeting?

9 A. Yes. My husband and I were present. It was my
10 understanding -- I seem to recall seeing something, maybe
11 a brochure or something, advertising that there was going
12 to be a meeting for landowners who were interested in
13 learning more about the Brook Mine.

14 Q. How did that particular meeting start, if you
15 remember?

16 A. Well, it was held at the library in Sheridan.
17 They have a room there, which when we walked in, it was
18 completely full. And everyone sat down and the rest of
19 the folks were standing in the back. And I believe it was
20 Jill Morrison asked everybody -- well, people signed in.
21 Some people -- they had a sign-in sheet. And then
22 everyone kind of sat down, and the rest of the people were
23 standing in the back when there were no more seats
24 available. And then Jill identified herself and asked the
25 rest of the folks there to identify themselves and

1 indicate if they were landowners. And so we went around
2 and everyone introduced themselves. And most of the folks
3 who were landowners indicated that they were landowners.

4 Q. Okay. Did anyone during that initial round
5 identify themselves as being present on behalf of Ramaco?

6 A. No, they did not. But I happened to notice
7 Shelleen Smith was in the audience, and I knew that she
8 was a city councilwoman, and I knew that she didn't -- was
9 not -- did not live out in that area, as far as I knew,
10 and I was wondering what city council was doing there. So
11 I raised my hand and asked if -- and asked if anybody was
12 attending the meeting who was there on behalf of Ramaco,
13 and I believe I also asked if anyone was there from the
14 DEQ.

15 Q. Okay. And what happened then?

16 A. Then Shelleen Smith identified herself as being
17 there on behalf of Ramaco. And I believe that Mr. Barron
18 was sitting next to her, and he identified himself as
19 being there on behalf of Ramaco.

20 Q. Yesterday the council heard from Mr. Barron that
21 at this meeting he offered that anyone who wanted to come
22 by his office could to ask questions. Do you recall that,
23 said at this meeting?

24 A. I don't recall.

25 Q. So we've talked a little bit about you doing

1 reading and research to understand some of these things.
2 In -- let's go forward to about April of 2016. What other
3 things were you doing in that time frame to try to
4 understand this mine plan and what was going to happen?

5 A. Well, I was -- I had reviewed I believe we were
6 having meetings, the Resource Council had series of
7 meetings for landowners who were interested in getting an
8 update on what was transpiring with the mine plan. I
9 began reviewing documents that were available, like the
10 mine plan, portions of it. At some of these meetings Jill
11 or Shannon would bring plat maps showing the phases of the
12 mine operation, and we were able to view those.

13 Q. Did there -- was there a time ever that you were
14 supportive of a request to the DEQ for a meeting with the
15 landowners?

16 A. Yes. Yes.

17 Q. Was that around April of 2016?

18 A. Yes. In April of 2016, it appeared that by that
19 time there was more of an indication that things were
20 progressing with the mine plan, and there were many
21 changes that had been made up to that point, I believe.
22 But yet there were a lot of uncertainties and a lot of
23 issues that didn't seem to be addressed by anyone. And
24 the landowners, as a group decided -- you know, we had
25 varying backgrounds. We had coal miners. We had an

1 engineer. We had people like us in different fields.
2 Everyone had issues. And discussing them openly in a
3 setting like a meeting, an informal meeting, was very
4 productive and helpful to all of us. And we felt that it
5 would be -- we were at a point where we really would like
6 to have sat down with somebody like DEQ and/or Ramaco and
7 discussed some of these concerns collectively as a group.

8 Q. And, Mary, I would like to go ahead and flesh
9 out a little bit more what you did, but we want to move
10 along a little bit faster. Okay?

11 A. Okay.

12 Q. So if you know, was a request made to DEQ for a
13 meeting with them and potentially Ramaco to discuss these
14 issues?

15 A. Yes. I believe there were several requests
16 made.

17 Q. And what was your understanding of the response
18 that was received?

19 A. The request for an informal meeting or just
20 meeting with the landowners was not agreed to by the DEQ.

21 Q. Okay. And we know from Fisher Exhibit 17, I
22 believe, which we were able to obtain in discovery
23 internal emails inside the DEQ that show us that request
24 was, in fact, received by DEQ, correct?

25 A. Yes.

1 Q. Okay. Now, in addition to trying to inform
2 yourself by involving yourself with DEQ, we've heard all
3 about the mine plan. Did you ever have occasion to look
4 at the 80-page mine plan?

5 A. Yes, we both did. My husband and I.

6 Q. Did you ever have a chance to look at the
7 adjudication file?

8 A. Yes.

9 Q. Okay. And did you?

10 A. Yes.

11 Q. I didn't ask you that question. Did you look at
12 this?

13 A. Yes.

14 Q. Did you read all 80 pages?

15 A. I reviewed every page, yes.

16 Q. Okay. We got all those binders up behind you.
17 Did there ever come a time you had access to those?

18 A. Yes. We had access to -- I don't believe there
19 were all -- I don't recall if there were all 13, but there
20 were a number of volumes. In one of our meetings -- I
21 don't remember the date -- but Jill and Shannon indicated
22 that if any landowner was interested in reviewing the mine
23 plan in detail, that they would have -- that they had
24 checked the mine plan out from -- with DEQ and had these
25 volumes available at their offices -- at their office in

1 Sheridan. So my husband and I went there one morning,
2 arranged to a -- a time to be there and indicated that we
3 were interested in reviewing the volumes of materials.

4 Q. Did you and your husband, in fact, look at
5 materials from those big binders of materials?

6 A. Yes.

7 Q. And about how long did you spend wading through
8 the gobbledygook?

9 A. Oh, over an hour, and it could have been two,
10 because there were also a number of plat maps available.

11 Q. So to be clear, Mrs. Fisher, did you do all
12 these things to try to understand and inform yourself
13 about the mine and the plans before you filed an
14 objection?

15 A. Absolutely.

16 Q. Why did you decide to file an objection?

17 A. Well, I guess it was our understanding all along
18 that there would be an opportunity for some sort of a
19 meeting with DEQ in particular, and perhaps even with
20 Ramaco, so that landowners who potentially could be
21 impacted would have an opportunity to ask questions and
22 hopefully resolve some issues, which I think we very well
23 could have done in that forum.

24 Q. Are you telling us that you thought filing the
25 objection would get you that?

1 A. Absolutely. And as a matter of fact, even
2 before we received the public notice to file a written
3 objection, all along for all these months -- I mean,
4 Sheridan and Sheridan County, as in other communities,
5 have numerous regular public meetings addressing issues
6 involving fluoride in the water, a new permit for a gravel
7 pit, issues concerning revisions in pathways for the local
8 city park, things of that nature. So I guess we just
9 assumed there would certainly be a meeting or meetings, a
10 series of meetings, set up to address concerns of
11 landowners within a half-mile boundary of a new coal mine.

12 Q. When you prepared and filed your objection, did
13 you have any earthly idea that this was what you were
14 going to get?

15 A. I certainly did not.

16 Q. Now, just to be clear, did you ask me or any
17 other attorney at Yonkee & Toner to help you in any way
18 with your objection letter?

19 A. I did not.

20 Q. When did that change? You came to speak with
21 one of the lawyers?

22 A. That changed when our letter was submitted along
23 with other objectors, and David and I received a letter
24 from Todd Parfitt from the DEQ, I believe it was dated
25 January 30, 2017, in which Mr. Parfitt indicated that the

1 DEQ was denying our request for an informal public meeting
2 or hearing.

3 Q. Now, Mrs. Fisher, let's talk a little bit about
4 some of the specific complaints that you have. One that
5 was raised was a complaint that the way the application
6 materials had been drafted was that protections would only
7 be afforded to adjudicated wells, right?

8 A. Right.

9 Q. And you know now, we've heard in these
10 proceedings, there's been an agreement to change to to be
11 including permitted wells, not just adjudicated, correct?

12 A. Yeah.

13 Q. How does that make you feel that change has been
14 accomplished?

15 A. Well, I very much appreciated that, as did my
16 husband, as I'm sure other landowners feel. But I -- I
17 really wondered why the issue didn't come up or could not
18 be addressed until we submitted a request in our discovery
19 in this contested case proceeding.

20 Q. Let's talk about some of the continuing issues
21 or concerns about water. What is your understanding of
22 the source for the water in your well at your house? What
23 does it come from?

24 A. My understanding is that it comes from coal --
25 through coal seam.

1 Q. And do you understand whether or not Brook has
2 predicted that you will suffer a drawdown -- you are
3 likely to suffer a drawdown as a result of the mining
4 activities?

5 A. Yes. I was here for Mr. Barron's testimony the
6 other day.

7 Q. Yet during Mr. Barron's testimony you heard him
8 say that your well has a high column of water. Did you
9 hear that?

10 A. Yes.

11 Q. I'm certain Mr. Barron got that from information
12 on the original drill well log the day the well was
13 drilled 34 years ago. Do you believe there's a large
14 column of water standing in your well today?

15 A. I do not.

16 Q. Has Mr. Barron ever been to your place to
17 inspect and determine what the actual level of water is
18 now in your well now, 34 years later? 34 years after the
19 permit.

20 A. Well, I guess he didn't indicate how that --
21 that date was established.

22 Q. Okay. Well, we can do it -- the permit for
23 you -- for your water well is contained within the mine
24 plan records, correct?

25 A. Correct.

1 Q. All right. Do you remember off of the top of
2 the head -- off the top of your head when that well was
3 permitted, meaning the --

4 A. Approximately 1978.

5 Q. What informs the basis of your concern that your
6 well is at risk for some sort of material damages as a
7 result of dewatering?

8 A. Well, Mr. Barron testified the other day that
9 there would be a drawdown on our well. Well, we have two
10 wells, but I believe you just addressed the one by the
11 house, and he indicated that we would have a 5-foot
12 drawdown.

13 Q. Is there anything else that informed your
14 concern in this regard?

15 A. Well, after hearing that testimony from
16 Mr. Barron when we left here that day, we went back to the
17 office. My husband was with me and we looked at our
18 permit documents regarding that well. And I believe that
19 evening Mr. Wireman had stopped in the office to visit
20 with I believe -- you may have asked him to come by to
21 visit with you, and he showed up. And being that
22 Mr. Wireman is a hydrologist, I showed him our permit
23 documents.

24 Q. And why does that inform your concern about your
25 wells?

1 A. Because he looked at them and he indicated to us
2 that he had grave concerns about the drawdown on our well.

3 Q. There has been some discussion during the course
4 of these proceedings about a potential condition on the
5 permit that doesn't just say that there will be -- that
6 mining company will be obligated to replace the quantity
7 and quality generally, but making that a bit more
8 specific. If this application is going to proceed, is
9 that the kind of condition you would like this council to
10 consider?

11 A. Yes.

12 Q. Let's talk about the Tongue River very briefly.
13 Do you and your husband rely to any degree on the quality
14 and quantity of water in Tongue River?

15 A. Yes, we do.

16 Q. What do you use it for?

17 A. We irrigate. We have hayfields.

18 Q. Do you have a surface water right from the State
19 Engineer's to do that?

20 A. Yes.

21 Q. One of the things that you brought up in your
22 complaint letter was about the way the quality and
23 quantity of the Tongue River would be monitored. Do you
24 remember that?

25 A. Yes.

1 Q. And you understand from these proceedings that
2 now there's an agreement to -- to consider that and alter
3 the way the Tongue River will be monitored?

4 A. Yes. I understand DEQ has agreed to install
5 additional monitors upstream and downstream as a result of
6 our request in discovery.

7 Q. Good. How do you feel about that?

8 A. I'm very appreciative of that.

9 Q. Let's talk about the alluvial subsurface water
10 by you. And I know folks are trying to get you placed in
11 comparison to everything that we've seen in the case. So
12 I'm going to pull up DEQ Number 16, which is a map we've
13 seen a bunch, Mrs. Fisher. And so this gives us the Brook
14 Mine permit acreage, and it shows us an area called
15 Potential AVF Acreage. Can you tell the council whether
16 or not your property is located in the area labeled
17 Potential AVF Acreage?

18 A. It is.

19 Q. And if we zoom in even tighter, we can see -- I
20 can do both of these things at once. We can see -- right
21 here it says Section 24?

22 A. Yes.

23 Q. And over here we can see Section 19.

24 A. Yes.

25 Q. Are those two sections familiar to you?

1 A. Yes. Those are --

2 Q. Why?

3 A. -- the sections which -- within which our
4 property is contained.

5 Q. Okay. And so it overlaps -- your property is
6 near the river, correct?

7 A. Yes.

8 Q. And somewhere in the vicinity of Section 19 and
9 Section 24 come together?

10 A. Correct. Yes.

11 Q. Okay. So we've talked a bit about this being
12 labeled a potential AVF acreage, and whether or not it
13 should be classified that way. I want to be clear with
14 you. Did anyone from DEQ ever contact you and ask you if
15 they could come on your property to do studies to
16 determine if your land should be properly fully classified
17 as AVF?

18 A. No.

19 Q. Okay. Do you have any objection to DEQ doing
20 that?

21 A. Absolutely not.

22 Q. Are you aware of any of your neighbors being
23 contacted by DEQ about an AVF study?

24 A. No, I'm not aware of any.

25 Q. One thing hasn't been clear, I think I've heard

1 at times that there is maybe an agreement to put
2 monitoring wells in this potential AVF acreage, and other
3 times it sounded like maybe not. Would a -- if a permit
4 is going to be issued in this case, would a condition you
5 would like this council to consider be a placement of
6 monitoring wells in this alluvial valley floor to
7 monitor -- to monitor the water in the alluvium for
8 changes?

9 A. Yes, I think that would be important thing to
10 do.

11 Q. All right. We're going to get through them.
12 We're clipping right along now. We're going to keep up
13 the pace.

14 Let's talk about blasting for a minute. And I
15 think we can do this one pretty quickly. Your concerns
16 are the same as many of those this council has heard
17 about, correct?

18 A. Yes.

19 Q. And there has been a discussion of if it was a
20 requirement, that a homeowner could request and would be
21 provided with seismic monitoring between the mine in their
22 home, if that was a condition of the permit, that folks
23 would like that. Are you also asking the council to
24 consider a requirement that if a homeowner asks for it,
25 seismic monitoring will be placed on their property

1 between the mine and blast zone?

2 A. Yes, we are.

3 Q. One of the things you had brought up in your
4 objection letter was a concern about traffic that might be
5 associated with the mining activities and things of that
6 nature. Over time have you ever developed an
7 understanding about if the amount of coal that is mined is
8 something similar to what Brook has projected, how many
9 trucks -- semi trucks that might mean hauling coal out
10 every day?

11 A. Yes.

12 Q. What's your understanding about how many semis
13 per day that will be?

14 A. I believe at one of our meetings -- I think it
15 was at one of our meetings one of the landowners had done
16 some calculations and predicted on whatever the production
17 was at that time, the estimated production would be
18 approximately 200 semis a day.

19 Q. Okay. And is that a matter of some concern to
20 you?

21 A. Yes, it is.

22 Q. Now, I'm going to end here pretty soon,
23 Mrs. Fisher, but --

24 MR. RUBY: If I could just interrupt for
25 one second.

1 CHAIRMAN BAGLEY: Do we need a technical
2 break?

3 COUNCIL MEMBER AGOPIAN: Mr. Chairman?

4 CHAIRMAN BAGLEY: Yes.

5 COUNCIL MEMBER AGOPIAN: Or Mr. Hearing
6 Officer. I would encourage the parties not to rush. We're
7 here today, please. Don't rush your testimony.

8 CHAIRMAN BAGLEY: Thank you. Is it working
9 now?

10 MR. GIRARDIN: Hers is up, so go ahead.

11 CHAIRMAN BAGLEY: We'll wait until they're
12 all changed or whatever needs changed.

13 MR. RUBY: Go ahead.

14 CHAIRMAN BAGLEY: Is that mic working? We
15 don't see a light on it.

16 MR. RUBY: Shouldn't see the light.

17 CHAIRMAN BAGLEY: Oh, shouldn't see a
18 light.

19 MR. RUBY: Yeah, you should. I must not
20 have hit the button.

21 CHAIRMAN BAGLEY: There we go. Now we feel
22 better.

23 All right. Please continue.

24 MR. GILBERTZ: Pattern of technology and me
25 not communicating well is continuing.

1 Q. (BY MR. GILBERTZ) Mrs. Fisher, I realize that I
2 did not ask you something earlier. You talked about
3 attending a number of meetings hosted by the Powder River
4 Basin Resource Council. Are you and your husband members
5 of that organization?

6 A. No, we are not.

7 Q. So the way we thought we would come to this
8 point is that Dr. Marino and Mr. Wireman, our experts,
9 would have testified already. So I want to visit with you
10 about that for a moment.

11 A lot of folks have talked about the concerns of
12 subsidence. And we've talked all around those issues. I
13 don't think we need to visit with them any more other than
14 for me to ask you, do you share the same concerns that
15 others do about the risk of subsidence?

16 A. Yes, we do.

17 Q. Are there any special concerns that you have
18 about the subsidence as it may relate to water quantity
19 and quality?

20 A. Yes.

21 Q. And what is that?

22 A. Well, we have evidence of ongoing subsidence. I
23 guess I would have to reserve my comments about that in
24 terms of overall subsidence issues until our -- hearing
25 testimony from Dr. Marino.

1 Q. Well, won't be in a position to reserve further
2 testimony.

3 A. Uh-huh.

4 Q. But let's go about it this way. We've talked --
5 we've talked a little bit as we went through today about
6 if a permit is granted, that we would like to see some --
7 this council consider some conditions on that in relation
8 to variety of issues, correct?

9 A. Correct.

10 Q. By saying that, does that mean that you do not
11 have any remaining reservations about the adequacy of the
12 mine plan with scientific testing or studying that has
13 been done up to this point?

14 A. That I don't have?

15 Q. Yeah. That you don't have any more. That's --
16 all it is is about these conditions we visited about?

17 A. No, I can't say that that's true.

18 Q. Okay. Have you -- as you have been informed
19 about the mine plan, have you kept yourself informed and
20 abreast of the opinions of Dr. Marino and -- the
21 subsidence expert, and Mr. Wireman, the hydrology expert?

22 A. Yes, I have.

23 Q. Do those opinions cause you any concern?

24 A. Yes. I read the reports, and they do cause me
25 concern, just as Mr. Gerlach's testimony caused concern.

1 Q. Okay. And you believe that once the council
2 gets to hear from Dr. Marino and Mr. Wireman, that there
3 will then be evidence that perhaps no permit should be
4 issued at all at this time?

5 A. At this time, yes.

6 MR. GILBERTZ: Thank you, Mrs. Fisher.

7 I have no further questions.

8 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

9 Mr. Sutphin.

10 MR. SUTPHIN: Thank you, Mr. Chairman.

11 CROSS-EXAMINATION

12 Q. (BY MR. SUTPHIN) Good afternoon, Mrs. Fisher.

13 How are you?

14 A. I've been better.

15 Q. I'm sure you have.

16 Let me be the first, after Mr. Gilbertz, to tell
17 you congratulations on your land speed record. I knew
18 there was a reason you and I sort of got along.

19 You heard Ms. Malone testify right before you,
20 right?

21 A. Yes.

22 Q. And did you hear her expressing some concerns
23 about how this operation Brook is proposing could affect
24 the city of Sheridan?

25 A. Yes.

1 Q. Just to be clear, Ms. Malone was not speaking on
2 your behalf, was she, Mrs. Fisher?

3 A. No, she was not.

4 Q. And I think you just told us that you are not
5 currently a member of the Powder River Basin Resource
6 Council, correct?

7 A. Correct.

8 Q. But you have relied on the Powder River Basin
9 Resource as a part of this case, right?

10 A. Yes.

11 Q. You've heard in the opening statement that my
12 client or maybe me personally, I don't know, would attempt
13 to call the Powder River Basin Resource Council activists.
14 Did you hear that in Ms. Anderson's opening?

15 A. I believe -- yeah. I can't specifically recall
16 that, but, yes.

17 Q. That was -- oh, I'm sorry, Mrs. Fisher. That
18 was actually a term you brought up in your deposition,
19 right?

20 A. Correct.

21 Q. And I think you said that you saw in a newspaper
22 article that Randall Adkins, the CEO at Ramaco, had made a
23 comment calling landowners activists, right?

24 A. That was my recollection, yes.

25 Q. And you didn't like the idea of being called an

1 activist, correct?

2 A. I didn't like the idea of being generalized. I
3 don't -- Mr. Adkins doesn't know me or my husband.

4 Q. And, in fact, I think in your deposition, as one
5 of the reasons why you are not a member of the Powder
6 River Basin Resource Council, you told me you didn't want
7 to be lumped in with a bucket of activists, right?

8 A. Correct.

9 Q. Now, I know you're -- you felt uncomfortable
10 about the formalities of this proceeding, right?

11 A. Yes.

12 Q. By the way, you're doing a marvelous job. And I
13 understand that it's not a fun seat to be in. But
14 notwithstanding the formalities, you would agree with me
15 that you've now had an opportunity to have the public
16 meeting that you were hoping to get with your objection
17 letter, right?

18 A. Well, it's not exactly the forum that I was
19 expecting, no.

20 Q. Okay. Would you agree with me that the denial
21 of your request for an informal conference was a decision
22 made by the director of the DEQ?

23 A. Could you restate that, please?

24 Q. I certainly can.

25 What I'm getting at is you don't believe that

1 the decision to deny the informal conference was a
2 decision made by my client, Brook Mining Company, do you?

3 A. I don't have any evidence to that effect, no.

4 Q. The letter that you received denying the
5 informal conference was a letter you received directly
6 from DEQ, right?

7 A. Correct.

8 Q. Okay. You told me at your deposition that
9 you're not an expert, right?

10 A. No, I'm not. Not in mine plans.

11 Q. Okay. And to be fair, that's true. I've seen
12 you in action now, and I would have to say you are most
13 definitely an expert at being a paralegal. But you're not
14 an expert at mine plans, right?

15 A. Right.

16 Q. Now that you've heard in this meeting, in this
17 evidentiary hearing, from the representatives of the
18 Department of Environmental Quality, would you agree with
19 me that they are experts?

20 A. Yes. I would say that they are experts, uh-huh.

21 Q. And I mean --

22 A. Very well qualified --

23 Q. Excuse me.

24 A. -- some of them, yes.

25 Q. I mean, you would agree, for example, that --

1 that Dr. Kuchanur, with his PhD and his experience, is an
2 expert in groundwater modeling, right?

3 A. Yes.

4 Q. And I understand that there are yet some experts
5 to testify, but is it your position today that the
6 testimony you heard from the experts at DEQ is not enough
7 to satisfy the objections that you've raised?

8 A. Yes.

9 Q. When you moved to the area out around -- well,
10 when you moved into the area where you live now, you knew
11 that there had been historic coal mining out in that part
12 of the county, right?

13 A. Yes.

14 Q. And you also knew at that time that because
15 there's still coal out there, there could be coal mining
16 in the future, right?

17 A. I suppose. But in talking with other adjacent
18 neighbors and landowners in the area, they had
19 indicated -- well, I don't believe we even talked about it
20 at that point, when we were purchasing the property. The
21 thought never occurred to us that a new coal mine would be
22 developed there. There hadn't been coal activity -- coal
23 mine in that area in over 50 years. And, of course, the
24 fact that we lived along the Tongue River in an alluvial
25 valley floor, I guess, again, we never thought that there

1 would ever be a new coal mine opening in that proximity.

2 Q. Even though you had these questions and concerns
3 that ultimately you raised in your objection letter, you
4 never asked Mr. Barron to explain any of the company --
5 Brook Mine's position on this, did you?

6 A. No. As I indicated, we discussed this with
7 other neighbors, other landowners, of which there are
8 many, and our thoughts were that it would be beneficial
9 for us to collectively, as a group, to attempt to visit
10 with DEQ and/or Ramaco. After our experience with the
11 trespassing incident, I guess we didn't have a high level
12 of comfort with this new company that had never done
13 business in Wyoming, that had never made an effort to
14 communicate with any of the landowners, and I understand,
15 in reviewing the documents that I've reviewed in this mine
16 plan, out of the 13 volumes and thousands of pages of
17 material here, I don't believe that there's one page
18 devoted to landowner concerns, and there are well over a
19 hundred landowners, maybe closer to 200 landowners, within
20 that half a mile boundary. Mr. Kristiansen had indicated
21 in his testimony, I believe, that they had never had such
22 a large number of landowners involved.

23 Q. So I understand that you have some other things
24 that sounds like you want to say to the council, but in
25 the interest of my questions and moving them along, we'll

1 try to keep it a little more focused. Is that okay?

2 A. Yes.

3 Q. Okay. So my question was you did not ask
4 Mr. Barron to address any of the questions you and your
5 husband had, right?

6 A. No.

7 Q. Okay. Nor did you ask anyone else from Brook
8 Mining or Ramaco to address any of your questions, right?

9 A. No. I didn't know anybody from Ramaco.

10 Q. Well, you testified earlier that you knew
11 Shelleen Smith was there on behalf of Ramaco, right?

12 A. Right. Right. She was. That's correct.

13 Q. But you never asked Ms. Smith to answer any of
14 your questions, right?

15 A. No, I didn't know what her capacity was with
16 Ramaco.

17 Q. Okay. On that same line, you never went
18 personally to ask anyone at the Department of
19 Environmental Quality to address any of your concerns or
20 Mr. Fisher's concerns, right?

21 A. As I indicated, we were approaching this from
22 the perspective of there were a large group of us who were
23 questioning a number of things, had concerns. Many of us
24 were not experts in anything to do with a mine plan, and
25 we were anticipating all along, maybe naively, that given

1 the fact that all those other public hearings were going
2 on on a regular basis in this community, that at some
3 point the company would have come forward or DEQ would
4 have come forward and agreed to meet with us.

5 Q. So, again, I appreciate you -- it sounds like
6 you have more to say. I know that you told the council
7 some of those things already. But I guess what I'd like
8 to ask is that that's another example of where you and
9 Mr. Fisher were relying on Powder River Basin Resource
10 Council to help in this process, right?

11 A. Right.

12 Q. All right. I think just to wrap up,
13 Mrs. Fisher, you talked about the unfortunate first
14 interaction that your husband and Mr. Buyok had with
15 someone on behalf of -- well, I guess we assume on behalf
16 of Brook Mine, right? The trespass issue?

17 A. That we assume?

18 Q. Well, I just don't know if it was clear. Are
19 you -- how do you know that whoever was out on the
20 property that day was associated with the Brook Mine?

21 A. Well, as I indicated, the two individuals who
22 were trespassing told my husband they were there on behalf
23 of Ramaco.

24 Q. Okay. You now know that -- that those two
25 individuals were on your property mistakenly, right?

1 A. Apparently.

2 Q. Right. I mean -- I guess what I mean is you now
3 know there was no malicious intent with them going to the
4 property, right?

5 A. Well, I know that through the discovery in this
6 contested case proceeding, yes.

7 Q. Right, you now understand that they thought they
8 were actually on a different parcel, right?

9 A. I really -- I don't know that I understand that.
10 No one has directly communicated that to me or my husband.

11 Q. Well, I guess just to wrap up. You understand
12 now that that company, once they spoke to your husband,
13 they did not take any samples from your property, right?

14 A. That's what you indicated in your discovery
15 responses, so I don't know.

16 Q. And you would agree that there's no evidence in
17 the -- in the mine plan or any of the appendices that
18 shows data being collected from your property, right?

19 A. I'm not aware of seeing anything.

20 MR. SUTPHIN: Okay. Well, I don't have any
21 other questions for you. Thank you, Mrs. Fisher.

22 CHAIRMAN BAGLEY: Thank you, Mr. Sutphin.

23 Mr. LaRock.

24 CROSS-EXAMINATION

25 Q. (BY MR. LAROCK) Good afternoon. Again, I'm

1 sorry, the same question I've been asking everyone else.
2 Now that we're on the record, do you have any concerns or
3 any questions about this permit application that you
4 haven't gotten out yet?

5 A. Well, yes.

6 Q. Please go ahead and tell me about them.

7 A. Well, as I indicated earlier, I have read the
8 expert reports of Dr. Marino and Mr. Wireman, who appear
9 to be, by all accounts, very highly qualified
10 professionals. And until such time as I hear additional
11 testimony from them, I guess I would have to reserve the
12 right to address this issue further.

13 Q. Okay. Is there anything else about the permit
14 application you want to talk about?

15 A. Well, that's pretty broad.

16 Q. I know it is very broad. I'm sorry about that.

17 A. I appreciate the time and effort spent by the
18 DEQ folks. I just wish that there would have been a
19 mechanism for us to have some meetings to express our
20 concerns. I really believe we could have resolved a lot
21 of these issues --

22 Q. Okay.

23 A. -- without having to hire an attorney, I might
24 add.

25 Q. And I know you just testified that you believe

1 there will be evidence that a permit shouldn't be granted
2 at all. But were a permit to be granted, do you have any
3 other conditions you'd like to suggest about the permit?

4 A. You know, again, until hearing from Dr. Marino
5 and Mr. Wireman, I can't say that for sure. You know,
6 issues that -- that we brought up about the adjudicated
7 versus registered or permitted wells, the issue concerning
8 the additional monitoring the Tongue River upstream and
9 downstream. I guess I sort of wonder why it took us, the
10 lay people, to bring those issues to the attention of the
11 DEQ. So my level of comfort is not extremely high.

12 MR. LAROCK: Appreciate that.

13 I have no further questions for this witness.

14 CHAIRMAN BAGLEY: Thank you, Mr. LaRock.

15 Ms. Boomgaarden.

16 MS. BOOMGAARDEN: No questions. Thank you.

17 CHAIRMAN BAGLEY: Ms. Anderson?

18 MS. ANDERSON: Thank you, Dr. Bagley.

19 CROSS-EXAMINATION

20 Q. (BY MS. ANDERSON) Good afternoon, Mrs. Fisher.

21 A moment ago you were asked about the expertise
22 of DEQ. And you've been in the room most of the week,
23 right?

24 A. Yes.

25 Q. Were you here when Mr. Kristiansen testified?

1 A. Yes.

2 Q. Were you here when he testified on his expertise
3 related to subsidence?

4 A. Yes.

5 Q. Do you remember him saying that he doesn't
6 actually have expertise related to subsidence?

7 A. Yes.

8 MR. SUTPHIN: I'm going to have to object
9 to that. I think it's a mischaracterization of what
10 Mr. Kristiansen said.

11 MS. ANDERSON: Dr. Bagley, I think the
12 transcript will eventually show that he said exactly what I
13 represented he said.

14 CHAIRMAN BAGLEY: Yeah, you can go ahead
15 and ask that.

16 MS. ANDERSON: Maybe I'll phrase it a
17 different way, just for the sake of the record.

18 Q. (BY MS. ANDERSON) Mrs. Fisher, do you have any
19 concerns about Mr. Kristiansen's expertise related to
20 subsidence?

21 A. Yes.

22 Q. Okay. I have another question for you. Are you
23 and your neighbors concerned at all about property values
24 and what can happen to your property value if the mine
25 comes in next door to you guys?

1 A. Absolutely.

2 MR. SUTPHIN: Well --

3 Q. (BY MS. ANDERSON) Go ahead. Can you elaborate
4 on that?

5 A. I was just going to say, quite obviously from
6 the photo of the house when we purchased it, it's quite
7 evident that we spent a lot of time, energy and money
8 improving our property to the condition that it's in right
9 now. This is our retirement, and I am very concerned that
10 it's going to have a major impact in attempting to sell
11 our property at such time if we choose to do so.

12 MR. ANDERSON: Okay. Thank you.

13 I have no further questions.

14 CHAIRMAN BAGLEY: Thank you.

15 Council members have any questions?

16 Nick?

17 COUNCIL MEMBER AGOPIAN: No.

18 CHAIRMAN BAGLEY: Meghan?

19 COUNCIL MEMBER LALLY: No.

20 CHAIRMAN BAGLEY: Deb?

21 COUNCIL MEMBER BAUMER: No, thank you.

22 CHAIRMAN BAGLEY: I have just one question,
23 Mrs. Fisher.

24 EXAMINATION

25 Q. (BY CHAIRMAN BAGLEY) As we look at all these

1 maps -- and you probably heard me ask this question
2 before. I just try to get a feel for where you're
3 located. Are you north or south of the Tongue River?

4 A. We're north of the Tongue River.

5 CHAIRMAN BAGLEY: North. Okay. Thank you.

6 That was the only question I had.

7 I wanted to also thank you for you --

8 THE WITNESS: That was easy.

9 CHAIRMAN BAGLEY: -- yeah -- for your
10 coming and speaking with us today.

11 THE WITNESS: And I will add what has
12 already been indicated by other landowners who have
13 testified, that David and I very, very much appreciate
14 having this opportunity finally. And also having the
15 hearing up here in Sheridan as opposed to Cheyenne, which
16 was originally indicated. So we very much appreciate that.
17 Thank you.

18 CHAIRMAN BAGLEY: Mr. Gilbertz, anything?

19 MR. GILBERTZ: I've been informed that I
20 will be flayed alive if I ask any more questions by my
21 client, so no further questions.

22 CHAIRMAN BAGLEY: Not by us.

23 MR. GILBERTZ: No. My client was very
24 clear about that.

25 CHAIRMAN BAGLEY: Okay. Good. Thank you,

1 Mrs. Fisher.

2 So it is 12:20, Friday afternoon, May 26th. We
3 will shortly recess this hearing. There are additional
4 witnesses that will be presented and their testimony. And
5 we are working on a time for that. We are looking at the
6 June 8th timeframe. But Mr. Ruby will be in contact with
7 all of the parties to confirm these dates and times early
8 next week.

9 So I want to thank everybody who's been here.
10 Council members who have remained, thank you very much as
11 well. Others had wanted to be here, but had other duties
12 as well.

13 And all the folks who have been in the audience,
14 appreciate everyone's testimony. And I would like to wish
15 everyone an excellent Memorial Day weekend. I hope the
16 weather stays nice for us. And we are now recessed.

17 (Hearing proceedings recessed
18 12:23 p.m., May 26, 2017.)

7 TRANSCRIPT OF HEARING PROCEEDINGS

8 VOLUME IV

9

10 PURSUANT TO NOTICE duly given to all parties
11 in interest, this matter reconvened for hearing on the
12 25th day of May, 2017, at the approximate hour of
13 8:30 a.m., at the Sheridan College, Thorne-Rider Campus
14 Center, Room TRCC 008, 3059 Coffeen Avenue, Sheridan,
15 Wyoming, before the Wyoming Environmental Quality Council,
16 with Chairman David Bagley, presiding, and Council Member
17 Meghan Lally, Council Member Megan Degenfelder, Council
18 Member Nick Agopian and Council Member Deb Baumer in
19 attendance.

20 Mr. Ryan Schelhaas, Wyoming Attorney General's
21 Office, Attorney for the Council; Mr. Jim Ruby, Executive
22 Director to the Council; Mr. Joe Girardin, Business Office
23 Coordinator, were also in attendance.

1 P R O C E E D I N G S

2 (Hearing proceedings reconvened

3 8:30 a.m., May 25, 2017.)

4 CHAIRMAN BAGLEY: Good morning. It is

5 8:30 a.m., May 25, 2017. I am Dr. David Bagley, the

6 hearing officer in Docket 17-4802 in regards to Brook Mine,

7 LLC.

8 Present today from the council are Meghan Lally,

9 Megan Degenfelder, Nick Agopian and Deb Baumer. Tim

10 Flitner is absent. Councilman Fairservis has recused

11 himself.

12 Parties present today are, on behalf of Brook

13 Mine -- again, I'll let you introduce yourselves -- on

14 behalf of Brook Mine.

15 MR. SUTPHIN: Thank you, Dr. Bagley.

16 Isaac Sutphin, Jeffrey Pope and Tom Sansonetti from Holland

17 & Hart.

18 CHAIRMAN BAGLEY: Thank you.

19 On behalf of DEQ.

20 MR. KUHLMANN: Andrew Kuhlmann and James

21 LaRock.

22 CHAIRMAN BAGLEY: Thank you.

23 On behalf of Powder River Basin Resource Council.

24 MS. ANDERSON: Shannon Anderson. Thank

25 you.

1 CHAIRMAN BAGLEY: On behalf of the Fishers.

2 MR. GILBERTZ: Jay Gilbertz form Yonkee &
3 Toner.

4 CHAIRMAN BAGLEY: Thank you.

5 On behalf of Big Horn Coal.

6 MS. BOOMGAARDEN: Good morning. Lynn
7 Boomgaarden and Clay Gregersen.

8 CHAIRMAN BAGLEY: Also present for the
9 council are Jim Ruby, Executive Officer; Joe Girardin,
10 Council Business Coordinator; and Ryan Schelhaas from the
11 Attorney General's Office.

12 This hearing is being held at Sheridan College,
13 Room TRCC 008 in the Thorne-Rider Campus Center, 3059
14 Coffeen Avenue, Sheridan, Wyoming. There is a court
15 reporter present.

16 So yesterday we completed direct on the first
17 witness from Brook Mine.

18 So, Mr. Barron, can you please come forward
19 again. We'll begin cross-examination. And I want to just
20 remind the witness is he is still under oath from
21 yesterday.

22 THE WITNESS: I understand.

23 JEFF BARRON,
24 called for examination by Brook Mine, having been
25 previously sworn, testified further as follows:

1 CHAIRMAN BAGLEY: All right. Mr. Kuhlmann,
2 please begin.

3 MR. KUHLMANN: DEQ does not have any
4 questions for cross-examination.

5 CHAIRMAN BAGLEY: Great. Thank you.
6 Ms. Boomgaarden or Mr. Gregersen, please.

7 MR. GREGERSEN: Thank you, Mr. Chairman.
8 Could I get the cord for the projector?

9 CROSS-EXAMINATION

10 Q. (BY MR. GREGERSEN) All right, Mr. Barron. We
11 had the opportunity to meet a couple weeks ago, but I'll
12 go ahead and introduce myself for the record. My name is
13 Clayton Gregersen I'm with Crowley Fleck. I'm here on
14 behalf of my client Big Horn Coal Company.

15 Now, Mr. Barron, you may have come right out and
16 said it yesterday, but in any event, I think you implied
17 that you were, in fact, the lead person with WWC in
18 compliance -- in compiling, excuse me, the Brook Mine
19 permit application, weren't you?

20 A. I was, yes.

21 Q. And you were also the chief person from WWC in
22 addressing the various comments from DEQ regarding the
23 permit application and what they would like to see in it,
24 right?

25 A. Yes.

1 Q. Okay. Great. So based on that, then you would
2 be the best person for me to ask if I had any questions or
3 if I wanted to know where something was in the permit
4 application, right?

5 A. Yes.

6 Q. Now, I believe you testified yesterday that you
7 understand a coal mining permit to be a living and dynamic
8 document, and even compared it -- and compared the rules
9 and regulations regarding the permit application to
10 performance-based standards. Is that right?

11 A. That's correct.

12 Q. And I think that I understood what you were
13 getting at, but is it indeed your position that these
14 rules and regulations, along with the applicable statutes,
15 dictate what information the permit application must
16 contain, right?

17 A. It does.

18 Q. Okay. Now, I believe you testified yesterday
19 that when you're putting together the permit application,
20 you have to use and reference both the DEQ rules and
21 regulations and the applicable statutes, right?

22 A. I do, yes.

23 Q. And you also testified that in preparing
24 adequate permit application, collaboration and
25 consultation with the DEQ is critical, right?

1 A. It is, yes.

2 Q. Would you also agree, then, that collaboration
3 with nearby landowners is similarly important?

4 A. Certainly in instances where available, we do
5 want to collaborate with the public. As a matter of fact,
6 in my work with the permit application, we had several
7 opportunities to interact with the public. The PRBRC held
8 a meeting on February 12, 2015 to which we were not
9 invited, but we did attend and gave the opportunity for
10 everyone there to visit with -- as a matter of fact, I
11 stood up and spoke and corrected the record on
12 Ms. Anderson. She put herself as the expert on our
13 permit, and I allowed the public to ask me any question at
14 any time. As a matter of fact, at that time I opened the
15 door of my office to anyone to stop in from that point
16 forward and I would answer any questions they had.

17 Q. Thank you, Mr. Barron.

18 And you testified yesterday that you're okay
19 with permit conditions coming from DEQ because I believe,
20 as you stated it, they make the permit stronger or better.
21 Do I have that right?

22 A. You do.

23 Q. Okay. So then just to be clear, in order to
24 make this permit stronger or better, you'd be okay with
25 any permit condition imposed by the DEQ or even requested

1 by this council?

2 A. I would, yes.

3 Q. Now, shifting gears a little bit. I believe you
4 testified that Brook Mine only intends to mine about
5 45 percent of the coal in mine panels. Do I have that
6 right?

7 A. In the highwall mining panels, we have a range
8 of extraction from about 45 percent to 60 percent.

9 Q. But didn't we hear yesterday from -- or maybe
10 not yesterday, but this week -- from DEQ personnel that
11 with this method of highwall mining, extracting over
12 50 percent of the coal in the mine panels would be
13 dangerous?

14 A. As you heard Mr. Kristiansen say, that's a
15 general rule of thumb. Of course, once you studied the
16 area, extracted the cores and tested the samples, you can
17 be over that number or under that number based on what is
18 in the ground.

19 Q. Okay. So as I understand it, Mr. Kristiansen's
20 testimony that there's -- you should only mine up to
21 50 percent, more than that will be dangerous, that's not
22 applicable in some of the areas that you're mining?

23 A. So I'll repeat again. That's a general rule of
24 thumb. It's put out by OSM to give a guidance. It's a
25 mechanism to use when you're designing a panel to go,

1 okay, I'm within the rule of thumb. I should be adequate.
2 And I've got -- OSM -- an OSM number to help guide me down
3 the road.

4 Q. Okay. So my next question, then, is how is it
5 that DEQ can know or ascertain exactly how much of the --
6 of the coal from the mine panels that you guys are
7 removing?

8 A. As we said before, when we design each panel, we
9 will supply a ground control plan. That will dictate the
10 height of the extraction, the width of the extraction and
11 the amount of coal that is left. So they will have the
12 tool that will tell them how much we're going to extract
13 per panel. And even while we're mining it, that may
14 change as we encounter changes in the ground while we're
15 there.

16 Q. Okay. So I think you got to what I'm wondering
17 about here is. So as I understand it, you're saying that
18 you provide them with a plan of what you're going to do
19 and how you're going to do it, but, as you just testified,
20 you may deviate from that plan based on what you
21 encounter. So how it is when you may deviate DEQ knows
22 exactly how much of that coal you're removing and can make
23 sure you're staying under the threshold to keep it?

24 A. We report to DEQ as we operate.

25 Q. So that's a consistent reporting basis?

1 A. Yes.

2 Q. How often do you do that?

3 A. Monthly.

4 Q. Okay. Now, you also testified yesterday that as
5 far as you know, there's no underground coal seam fires
6 in -- within the permit area, right?

7 A. To my knowledge, no.

8 Q. And what is that knowledge based on?

9 A. AML puts forth a report on known underground
10 fires.

11 Q. Has Brook Mine or has WWC done any independent
12 surveying of whether or not there's coal fires in the
13 area?

14 A. We have not.

15 Q. Okay. And that information you reference from
16 AML, is that found in the permit application?

17 A. It is not.

18 Q. All right. So throughout this hearing there's
19 been a lot of discussion with DEQ personnel about how a
20 lot of the overburden material in this area is dry, but
21 also about how the overburden in the TR-1 area is
22 different because it's actually backfill material and
23 saturated with groundwater. So I don't think we need to
24 rehash any of that. But what I don't think anybody has
25 directly testified, and what I think you might be just the

1 guy to answer for me, is -- is there anywhere in the
2 permit application that specifically addresses the TR-1
3 overburden and its saturation with groundwater?

4 A. No.

5 Q. Okay. So based on that, there can't be anywhere
6 in the permit application that specifically describes the
7 pre-mining groundwater conditions in the TR-1 overburden,
8 can there?

9 A. In the permit application, in the geologic
10 cross-sections, we describe that area as backfill, as a
11 mixture of coals, clays, sands, however it was mixed by
12 Big Horn Coal and placed in that area. That is in the
13 permit application.

14 Q. But as you just said, there's no specific
15 portion of the permit application that addresses the
16 groundwater in the TR-1 overburden. So there cannot be
17 any specific portion of the permit application that
18 describes the pre-mining conditions of that groundwater,
19 can there?

20 A. Again --

21 MR. SUTPHIN: I'm going to object to that
22 question as asked and answered. He already referenced the
23 cross-sections.

24 CHAIRMAN BAGLEY: Any --

25 MR. GREGERSEN: I can move on.

1 CHAIRMAN BAGLEY: Okay.

2 Q. (BY MR. GREGERSEN) And so similar question,
3 then. If there's nowhere in the permit application that
4 addresses the TR-1 saturated backfill material, there
5 can't be anywhere in the permit application that
6 specifically addresses the drawdown in the TR-1
7 overburden, can they?

8 MR. SUTPHIN: I'm sorry, Mr. Chairman. I'm
9 going to have to object again. Mr. Gregersen, implicit in
10 that question is saying that there is no information in the
11 permit. Mr. Barron just said that there is.

12 CHAIRMAN BAGLEY: Your response to that?

13 MR. GREGERSEN: Yes, Mr. Chairman. So I
14 initially asked Mr. Barron -- we can check the transcript
15 if we need to -- whether there's any information that
16 specifically addresses the groundwater in the TR-1 area.
17 He said no. I asked him if there was any portion of the
18 permit application that specifically addresses the over --
19 the pre-mining conditions. He says there is information
20 that addresses the pre-mining conditions. This next
21 question was whether or not there was any information in
22 the permit application that specifically addresses the
23 drawdown that will occur specifically to the TR-1 area.
24 And those -- these are separate requirements in the rules
25 and regulations, so I just wanted to go through each one of

1 those.

2 CHAIRMAN BAGLEY: It's very similar, but
3 I'll allow that question.

4 Q. (BY MR. GREGERSEN) Would you like me to
5 rephrase, or do you --

6 A. No. So the first part of your question you
7 stated that nowhere in the permit describes the TR-1 area.
8 And I'll reiterate it is described in the Appendix D5.

9 As to your question on saturation. Oftentimes
10 in mines -- and our company has been involved in them --
11 when they're mining, for instance, they'll nick a scoria
12 face and it will have water in it that they have to deal
13 with it. This TR-1 area, if it is, indeed, saturated, is
14 no different than that scenario. If we discover water,
15 which we will study the area pursuant to the ground
16 control plan, we will have to drill holes that area. And
17 if we determine there is water and it is saturated, then
18 the mine will develop a plan for dealing with that
19 saturation.

20 Certainly Big Horn Coal has already mined there.
21 They had to deal with the inflows that are saturating that
22 area. I assume that they have constructed some kind of
23 barrier to deal with the water. Brook would do no
24 different.

25 Q. Thank you, Mr. Barron. But I still don't think

1 you answered my question, so I'll ask it a different way.
2 Please direct me to where in the permit application the
3 TR-1 overburden and groundwater is specifically modeled or
4 discussed as to the drawdown that will occur specifically
5 in that area.

6 A. I'll reiterate. Brook Mine has an obligation to
7 study that area prior to mining. We will conduct
8 sampling, and we will know what it is when we mine it.

9 Q. Do you believe you have the obligation to study
10 that before permit issuance?

11 A. The baseline for the area has been studied.
12 Mr. Bj Kristiansen was satisfied with that study, as well
13 as Dr. Kuchanur. That area is no different than a small
14 scoria outcrop, if you will, that may contain water, and
15 we'll deal with it as we approach it.

16 Q. First of all, your position is it may contain
17 water?

18 A. Correct.

19 Q. And I guess what I'm getting from your answer,
20 then, is that this information is not in that permit
21 application; is that correct?

22 A. The presence or absence of water in the backfill
23 of that area is not in the permit.

24 MR. GREGERSEN: No further questions,
25 Mr. Chairman.

1 Thank you, Mr. Barron.

2 THE WITNESS: Thank you.

3 CHAIRMAN BAGLEY: Thank you.

4 MS. ANDERSON: Can I have the little thing?

5 CHAIRMAN BAGLEY: Ms. Anderson.

6 MS. ANDERSON: Thank you, Dr. Bagley. Just
7 going to get my little computer set up here.

8 CROSS-EXAMINATION

9 Q. (BY MS. ANDERSON) All right. Let's see if I
10 can get this here.

11 All right. Good morning, Mr. Barron.

12 A. Good morning.

13 Q. All right. I just had a couple of follow-up
14 questions to what was just asked of you before I get to my
15 own questions.

16 A moment ago you testified that you're not aware
17 of any coal seam fires within the permit boundary,
18 correct?

19 A. Correct.

20 Q. Okay. Do you have any role in preparing the
21 company's responses to interrogatories that we asked
22 during the discovery for this proceeding?

23 A. I had some, yes.

24 Q. Okay. Would you please look at the screen.
25 This is our Exhibit 22, Interrogatory Number 9 that we

1 asked of the company. Were you involved in answering this
2 question at all? Do you remember?

3 A. Yeah.

4 Q. Okay. You were? All right.

5 And -- I mean, you'll see that the question
6 there in Interrogatory Number 9, "Please disclose whether
7 Brook is aware of coal fires in the area at the present or
8 in the past." And the answer has a bunch of objections in
9 it. But could you please read the last sentence there?

10 A. "Without waiving these objections, Brook is
11 aware of coal fires within its proposed permit boundary."

12 Q. Okay. So is your testimony that you're not
13 aware of coal fires within the permit boundary, that this
14 was a wrong answer given to us?

15 A. No, not at all.

16 Q. Okay.

17 A. So we know that there are coal fires adjacent to
18 the permit boundary. We can't completely say that there
19 is nothing within the permit boundary. But there is no
20 evidence on the surface, nor is there evidence from AML
21 that there are coal fires --

22 Q. Okay. But --

23 A. -- in the area.

24 Q. Sorry.

25 But this answer says "...Brook is aware of coal

1 fires within its proposed permit boundary." That's what
2 you gave us during discovery. Is that not your testimony
3 anymore?

4 A. We could have worded it differently, I suppose.

5 Q. You could have worded it differently, you
6 suppose.

7 Okay. So at the current time you're not aware
8 of coal fires within the permit boundary?

9 A. I'll reiterate, there's no evidence on the
10 surface of coal fires. We know there's historic mining
11 and the potential for oxidation and for coal fires to
12 occur. So we wanted to make sure that we were aware of
13 the possibility of coal fires existing.

14 Q. Okay. Thank you.

15 Have you done any surveying about the presence
16 of coal fires within the permit boundary?

17 A. We have not.

18 Q. Have not. Okay.

19 All right. You also just answered some
20 questions about a public meeting that our organization
21 held. Do you remember when that meeting was?

22 A. It was on February 12, 2015.

23 Q. Okay. After that time -- and you said you were
24 there at that meeting?

25 A. I was there, yes.

1 Q. Okay. Do you remember me saying something that
2 it's sort of odd that we're here because we're holding
3 this public meeting, the company isn't? Do you remember
4 me saying that?

5 A. I do remember you saying that, yes.

6 Q. Okay. After that meeting, at any time did the
7 company hold their own public meeting?

8 A. We did not.

9 Q. Okay. Why didn't you do that? You just said
10 engaging the landowners is important, so I'm wondering why
11 you didn't.

12 A. I did --

13 MR. SUTPHIN: I'm going to object to that
14 question as argumentative.

15 MS. ANDERSON: Okay. He just testified to
16 the importance of landowners, but that's fine. I'll
17 withdraw it.

18 Q. (BY MS. ANDERSON) Okay. Did you ever meet with
19 any other landowners in the area and the adjacent lands?
20 For instance, Mr. Buyok or Mr. Bocek?

21 A. I did not with those --

22 THE REPORTER: I'm sorry?

23 THE WITNESS: I met with -- with those
24 individuals during depositions.

25 Q. (BY MS. ANDERSON) During depositions. And that

1 was just a few weeks ago, right?

2 A. It was.

3 Q. Okay. All right. Mr. Gilbertz may have some
4 questions for you on that.

5 All right. Let's get to my questions. So just
6 to clarify your testimony yesterday and today, you keep
7 using the word "we." But you don't actually work for
8 Brook Mining Company, correct?

9 A. Our company is employed by Brook.

10 Q. Okay. But you're not directly employed by
11 Brook?

12 A. No.

13 Q. Okay. Do you have plans to work for Brook
14 Mining Company in the future?

15 A. No.

16 Q. Okay. And you don't work for Ramaco Wyoming
17 Coal Company?

18 A. No.

19 Q. Okay. Or any of the other Ramaco companies?

20 A. No.

21 Q. Okay. Do you have an ownership interest in the
22 mine or any of the facilities planned at or near the mine?

23 A. No.

24 Q. Okay. You're getting compensated for your time
25 today here, right?

1 A. My company does pay me, yes.

2 Q. Okay. And so those bills are submitted by your
3 employer, WWC?

4 A. Yes.

5 Q. Okay. So to be very clear, you're just a
6 consultant to the company, right?

7 A. I am an engineer working for a consulting
8 company, yes.

9 Q. Okay. So, in fact, isn't it correct that the
10 Brook Mining Company currently has zero full or even
11 part-time employees?

12 A. I don't know the employment structure of Ramaco.

13 Q. Okay. Did someone at any of the Ramaco
14 companies give you authorization to testify on the
15 company's behalf today?

16 A. I'm here as a consultant for Western Water
17 testifying for the work I conducted as a consultant hired
18 by Ramaco to prepare this permit application.

19 Q. Okay. Who -- who in the company gave you
20 authorization to testify on their behalf today?

21 MR. SUTPHIN: I'm going to object to this
22 line of questioning. It's irrelevant and it's calling for
23 legal conclusions.

24 MS. ANDERSON: And, Mr. Chairman, I think
25 it's relevant because it speaks to the witness's

1 credibility with you and with us as parties here, and to
2 his knowledge about his role in these proceedings and why
3 it matters and me -- and having a company meet their burden
4 showing that their work is sufficient to approve.

5 CHAIRMAN BAGLEY: Yeah, I think it's -- we
6 should know who has hired WWC, but I'm not sure we would
7 know an individual of that. Go ahead and ask the question
8 again, but let's kind of -- let's keep this moving forward.

9 Q. (BY MS. ANDERSON) Okay. Mr. Barron, are you
10 aware of the individual within the Ramaco companies that
11 hired your company to be their consultant?

12 A. Randy --

13 THE REPORTER: I'm sorry?

14 THE WITNESS: Randy Adkins.

15 Q. (BY MS. ANDERSON) Okay. Did anyone at the
16 Ramaco companies help you prepare your testimony for
17 yesterday and today?

18 A. No.

19 Q. No. Okay.

20 So just to clear this up. When you say "we" in
21 your testimony, you mean your employer, WWC, right?

22 A. I may have used that term interchangeably with
23 we as Ramaco and we as Western Water.

24 Q. Okay. I have another preliminary question for
25 you. You mentioned yesterday that a professional

1 geologist certified some of the data or findings provided
2 to the Department of Environmental Quality, right?

3 A. Yes.

4 Q. Who was that?

5 A. Mike Evers.

6 Q. Mike Evers. Okay.

7 But he doesn't plan to testify in these
8 proceedings?

9 A. I have not seen him on any list to testify, no.

10 Q. Okay. And you're not a geologist, right?

11 A. No, as stated on the record, I'm an engineer.

12 Q. Okay. Let's talk a little bit about your
13 experience. You just explained your role as something
14 like coordinating the permit application and working with
15 some subcontractors pulled together various portions of
16 the permit application. Is that an accurate way to
17 describe what you did for the company?

18 A. That's kind of a broad description, but I'll go
19 with it, yes.

20 Q. Okay. Have you ever coordinated preparation of
21 a new coal mine permit before?

22 A. As I stated on the record, this is the first new
23 coal plan -- coal mine permit in decades. So the answer
24 to that question is no.

25 Q. Okay. Have you ever coordinated preparation of

1 a highwall coal mine permit before -- a new or an
2 amendment?

3 A. No.

4 Q. Okay. In your testimony yesterday, you
5 explained a bit about the highwall mining method via a
6 picture that we actually had in one of our exhibits. Have
7 you ever been on a highwall mining site before?

8 A. I have not.

9 Q. Okay. Have you ever personally seen highwall
10 mining?

11 A. I have not.

12 Q. Have you ever worked for a company that has
13 conducted highwall mining?

14 A. I have not.

15 Q. Do you have any other personal experience with
16 highwall mining?

17 A. No, I do not.

18 Q. Okay. So when you talked about highwall mining
19 yesterday, it was based on maybe some assumptions you've
20 drawn from reading some information or seeing some
21 pictures?

22 A. It's more than seeing some pictures. Obviously,
23 when I prepared this permit application, I had to become
24 familiar with highwall mining. And, certainly, I've
25 investigated that and that went into my thinking in this

1 permit application.

2 Q. How did you investigate highwall mining, as you
3 just put it?

4 A. We worked with a person by the name of Ken
5 Woodring, who has a great deal of knowledge with highwall
6 mining, and have interacted with him in preparation for
7 the permit application.

8 Q. Okay. And Mr. Woodring is going to testify
9 later today, probably?

10 A. I assume so, yes.

11 Q. Okay. I might have some questions for him on
12 that.

13 Okay. You testified yesterday about -- and you
14 just got to this a little bit ago with Mr. Gregersen. But
15 you testified about the performance standards and how they
16 allow some level of flexibility in meeting them, correct?

17 A. Yes.

18 Q. Okay. But wouldn't you agree that in the case
19 of coal mining, there are actually some pretty specific
20 performance standards that require certain things of a
21 company like, for instance, the blasting performance
22 standards?

23 A. Correct. And Mr. Emme outlined what those were.

24 Q. Okay. So they're not all just flexible
25 standards. Some of them are fairly specific.

1 A. In cases, yes.

2 Q. Okay. And wouldn't you agree that it is good
3 practice and in some cases necessary to have measures in
4 the permit or, as we've been talking about, these
5 conditions of approval that ensure these performance
6 standards will be met and that DEQ can enforce them during
7 the life of the mine?

8 A. They are in the permit application.

9 Q. So all of those measures to meet the performance
10 standards are in the permit application. Is that your
11 testimony?

12 A. Yes.

13 Q. Okay. Wow.

14 All right. And wouldn't you agree that the
15 performance standards are distinct from the requirements
16 that need to be met in a permit application? So --

17 A. Define distinct.

18 Q. Okay. So in other words there are different
19 chapters of the coal regulations that deal with permit
20 requirements versus performance standards, right?

21 A. The entire body of the regulations are
22 performance-based standards.

23 Q. So there aren't special rules related to permit
24 application requirements?

25 A. Maybe to help the council clarify, there's two

1 ways to regulate. You can either have a prescriptive
2 regulation or a performance-based regulation.
3 Prescriptive regulation says that, for instance, in runoff
4 on a mine permit application, you should always use a rock
5 check dam. The trouble with using a prescriptive
6 regulation is a rock check dam doesn't always work in all
7 circumstances.

8 The other end of the spectrum is a performance-
9 based regulation. Thou shalt treat its sediment so that
10 it meets these criteria, the constituents of the water
11 before you discharge it. And if you want to use a
12 sediment pond instead of a rock check dam, you can go
13 ahead and use that. It's troublesome when you use
14 prescriptive base.

15 So to answer your question, we use performance
16 standards, and those are in the permit application.

17 Q. Okay. But are you basically saying today in
18 your testimony that the permit application requirements
19 and DEQ's regulations are performance based?

20 A. They are. Absolutely.

21 Q. Okay. So there's not prescriptive requirements?

22 A. No.

23 Q. There's not. Okay.

24 So, for instance, you know, in the case of
25 surface coal, let's take that Chapter 2 regulations

1 requirement. You testified yesterday that you're familiar
2 with these requirements, right?

3 A. Yes.

4 Q. Okay. Are you familiar also with the
5 performance standards -- and I think that's the exact
6 phrase -- in Chapters 4 and 5 of the regulations?

7 A. Yes.

8 Q. Okay. Do you see a difference between those two
9 sets of regulations in terms of whether they're
10 performance based or prescriptive?

11 A. I'll reiterate what I stated before. The entire
12 body of Wyoming's regulations are performance based.

13 Q. The entire body.

14 Okay. So I take that also goes for Section 1 of
15 Chapter 7 related to the requirements for what must be in
16 a permit application for underground mining?

17 A. Yes.

18 Q. Okay. You testified yesterday to your review of
19 the rules and statute applicable to this coal mine permit,
20 like the ones we just talked about. Would you agree with
21 me that the rules and statute need interpretation and
22 application based on professional experience and
23 backgrounds?

24 A. Yes.

25 Q. Okay. And to do that you have to rely on

1 scientific principles or standards of best industry
2 practice?

3 A. You can use those as well, yes.

4 Q. Okay. And then in order to know what those
5 scientific principles or standards of best industry
6 practice are, you have to have a certain level of
7 expertise, right?

8 A. Yes.

9 Q. Okay. Well, great. That brings me to the
10 subsidence control plan. So I have up on the screen DEQ
11 Exhibit 12, page 73. I'm wondering if you would read the
12 highlighted portion.

13 A. The subsidence control plan was prepared by
14 Cardno MM&A, Bluefield, Virginia. Addendum MP-6 contains
15 subsidence control measures at the Brook Mine.

16 Q. Okay. And you testified to this yesterday, but
17 this reiterates your testimony that Cardno prepared the
18 subsidence control plan?

19 A. Yes.

20 Q. Okay. Let's go -- we'll go to page 321 of the
21 same exhibit. And you see a similar sentence there,
22 right?

23 A. I do, yes.

24 Q. And is this the beginning of the subsidence
25 control plan?

1 A. It appears to be that way, yes.

2 Q. Okay. Who at Cardno prepared the subsidence
3 control plan?

4 A. There were several individuals involved.

5 Q. Could you name them, please?

6 A. There was Justin Douthat, Jerry --

7 THE REPORTER: Jerry?

8 THE WITNESS: Enigk, E-N-I-G-E-K [sic].

9 I'd have to look that up. I'm not sure how to spell it.

10 A. And a couple other individuals that I don't
11 recall their name.

12 Q. (BY MS. ANDERSON) You don't recall their names?

13 A. No.

14 Q. Do you have any interaction with them at all --

15 A. Yes.

16 Q. -- in your coordination of the permit
17 application?

18 A. I do.

19 Q. You did?

20 A. Uh-huh. Yes.

21 Q. Regular coordination or just maybe one time and
22 you don't remember who it is?

23 A. So this was completed a couple years ago. The
24 coordinator was Justin Douthat. I tried to have all
25 interactions through him, and he interacted with his

1 staff.

2 Q. Okay. You've read the objections, right -- I
3 think you testified about yesterday -- that were submitted
4 to the permit application?

5 A. Correct.

6 Q. Okay. And you know that subsidence was a big
7 concern raised by our organization and some other
8 landowners in the area?

9 A. Yes.

10 Q. Okay. So then why did you -- why didn't you, in
11 your role working with subcontractors, including Cardno,
12 ask them if they could come to testify to their findings
13 regarding subsidence?

14 MR. SUTPHIN: Mr. Chairman, I'm sorry. I'm
15 going to have to object to that question. The fact that we
16 don't have a particular witness here doesn't really matter
17 when it's clear that this witness is familiar enough to
18 address all the concerns. He testified at length yesterday
19 about the ground control plan.

20 MS. ANDERSON: And, Mr. Chairman, I think
21 we'll get to exactly what he's familiar with in just a few
22 minutes. But he didn't prepare this document.

23 CHAIRMAN BAGLEY: I think your question was
24 why didn't he invite them, and it's not -- he wouldn't be
25 the one to do that. He's an engineer, not responsible for

1 putting together this kind of case. So let's stay focused
2 on what he knows as -- in his role as the permit preparer.

3 MS. ANDERSON: Okay. Sure. Let me ask the
4 question maybe a different way.

5 Q. (BY MS. ANDERSON) Are you aware that these
6 experts that prepare the subsidence control plan won't be
7 testifying at this hearing?

8 A. I did not see them on the witness list, no.

9 Q. Okay. Thank you.

10 All right. So are you personally certifying to
11 the findings and data prepared by Cardno?

12 A. Yes.

13 Q. You are. Okay.

14 So you yourself said yesterday that you hired
15 Cardno as a subcontractor because you didn't have the
16 necessary expertise to prepare the subsidence control --
17 subsidence control plan, right?

18 A. I wouldn't say that we have -- didn't have the
19 necessary expertise. I recognized that we had a company
20 that had more expertise than we did, and so in this case,
21 and because I knew the sensitive nature of subsidence in
22 the area, I chose to use them because of their experience.

23 Q. Okay. So Cardno has more experience than you in
24 subsidence control?

25 A. Yes.

1 Q. Yes. Okay.

2 You also testified yesterday that an important
3 part of being a professional engineer is to use your stamp
4 of approval, so to speak, to certify that you were
5 protecting health and safety, right?

6 A. Yes.

7 Q. Okay. So, Mr. Barron, how can you certify that
8 you were protecting health and safety with your
9 professional engineer certification here if you don't have
10 the expertise and experience to know whether you're
11 actually doing that?

12 A. My certification stamp is not on that document.

13 Q. Is not on that document. Whose stamp is on that
14 document?

15 A. I believe Cardno's.

16 Q. You believe that. Can you show me where? If
17 you pull out Chapter 12 -- or Exhibit 12 and show me that,
18 where their stamp is anywhere in this document?

19 A. They prepared the report. I don't know if they
20 stamped the report. I don't know.

21 Q. You don't know if they stamped it?

22 A. Stamping of a report I don't believe is a
23 requirement of the statutes of the rules and regulations.

24 Q. Well, yesterday you said that putting that
25 PE certification on something is really important, right?

1 A. Correct. And throughout this document my
2 certification is on several maps in exhibits.

3 Q. Okay. So you're the only PE that stamped any
4 part of the permit application, right?

5 A. In the parts where the statutes and the rules
6 and regulations require my stamp, my stamp is on this
7 document along with others. We brought up Mr. Evers. His
8 stamp is on there for the geologic sections.

9 Q. So you don't think a PE needs to stamp the
10 subsidence control plan?

11 A. It's not a requirement of the rules and the
12 regulations.

13 Q. Where in the rules and regulations is this
14 subsidence plan even talked about?

15 A. It's talked about in guidance document,
16 Guideline 6A. And then it's further referenced in the
17 statutes. I'd have to break out --

18 Q. It's referenced in the statutes.
19 The phrase "subsidence control plan" is in the
20 statute?

21 A. I believe so, yeah.

22 Q. You believe so. Okay.

23 All right. Let's go back to Cardno a little
24 bit. To your knowledge -- I think you mentioned Justin --
25 what was his last name again?

1 A. Douthat.

2 Q. Douthat. Okay. Mr. Douthat.

3 To your knowledge, did Mr. Douthat ever visit
4 the mine site in preparing the subsidence control plan?

5 A. I'm unaware of him visiting it --

6 Q. Okay. Did he visit the mine site in preparing
7 any other parts of the application?

8 A. Not in preparing other parts of the application.

9 Q. Okay. To your knowledge, has Mr. Douthat ever
10 prepared a mine permit application for a western coal mine
11 permit?

12 A. He helped develop a series of mine plans and
13 mine panels. Their company did come down for a site visit
14 to look at the specific site. They were the company that
15 developed the layout of the panels that Brook uses.

16 Q. Okay. Have they -- to your knowledge, have they
17 ever prepared a permit application or aspects of a permit
18 application for any other coal mine into Wyoming?

19 A. I've only interacted with them with this permit
20 application. I can't speak to what they've done in the
21 past.

22 Q. Okay. Any highwall mine in Wyoming or maybe
23 elsewhere that you know of?

24 A. I know he worked at length with eastern coal
25 mines.

1 Q. Worked at length with eastern coal mines. And
2 some of those mines are highwall mines?

3 A. Yes.

4 Q. Okay. So given their lack of experience with
5 mining in Wyoming, why did you think they had the
6 expertise to prepare the subsidence control plan?

7 A. I don't know whether they have a lack of work in
8 Wyoming. I can't speak to that.

9 Q. You can't speak to that. But it wasn't one of
10 the factors that you looked at when you thought about
11 hiring subcontractors?

12 A. They have extensive knowledge of highwall mining
13 in the East. Eastern coal mines primarily use this
14 method. It's not a western coal mining method that's used
15 a lot. There are some coal mines in the basin that use
16 highwall mining to extract the last portion of coal as
17 they butt up against their permit boundary, but I -- I
18 know they're the most experienced in highwall mining.

19 Q. Okay. A bit ago we talked a little bit about
20 performance standards. Would you agree with me that there
21 are performance standards related to subsidence?

22 A. Yes.

23 Q. Okay. And wouldn't you agree with me that the
24 subsidence control plan should be designed to ensure those
25 performance standards are met?

1 A. We have a commitment in the permit application
2 that we will not subside.

3 Q. Okay. That's exactly what I'm going to get to.
4 So I'm turning to page 325 of Exhibit 12. And would you
5 read the last just highlighted portion there on page 325.

6 A. "Highwall mining should not result in surface
7 subsidence..."

8 Q. Okay. And for the record, that says "due to,"
9 and then there's some factors on the next page, just so
10 we're clear.

11 All right. But the -- would you agree with me
12 that the overall finding of the subsidence control plan is
13 that highwall mining should not result in surface
14 subsidence?

15 A. Yes.

16 Q. And that's specific to the permit area?

17 A. Yes.

18 Q. The whole permit area?

19 A. Yes.

20 Q. Okay. And would you agree that this finding
21 applies for the life of the mine?

22 A. Yes.

23 Q. Okay. Do you believe that the subsidence
24 control plan provides sufficient information to make this
25 conclusion?

1 A. It does.

2 Q. It does. All right. We'll get to that in a
3 minute.

4 You mentioned that you had no issues with the
5 concerns that Dr. Marino had raised about the additional
6 data analyses which need to be collected, right?

7 A. You're going to have to repeat that. Somebody
8 coughed.

9 Q. Yesterday you gave some testimony about
10 Dr. Marino and his report, and his, I guess, ask of the
11 company to do more information, right? To provide more
12 information, geotechnical analysis?

13 A. Yes.

14 Q. Okay. And you testified yesterday that those
15 studies still need to be done, right?

16 A. We will be conducting further studies as our
17 commitment in the permit illustrates, yes.

18 Q. Okay. But your testimony yesterday was that you
19 agreed with Dr. Marino that more study needs to be done,
20 right?

21 A. I agreed with Dr. Marino's study of the area. I
22 agreed with his calculations and the mechanics of how you
23 determine the stability of a highwall mining area and
24 outlying the strengths that are needed to hold up the roof
25 and floor. I disagree with Dr. Marino in the timing of

1 when that data needs to be supplied in the permit. Also,
2 Dr. Marino came to a conclusion that it is highly likely
3 that the permit area would subside. And on the other end,
4 he says that we needed more data to come to such a
5 conclusion. He didn't have the data to even come to that
6 conclusion, and so I disagree with those components of his
7 testimony.

8 Q. Okay. I'm sure Dr. Marino will be happy to talk
9 to that later today or tomorrow or several weeks from now.
10 We'll see.

11 But -- so just to be clear, when we read this
12 sentence "Highwall mining should not result in surface
13 subsidence," it's your opinion that today in the
14 information in the permit application there's enough
15 information to make that conclusion.

16 A. Yes. With the construction of the subsidence
17 control plan and the performance standard that we've
18 committed to in the permit application, that statement is
19 true.

20 Q. Okay. So would you agree that the mine plan, in
21 its entirety, was designed without any planned subsidence?

22 A. Correct.

23 Q. Okay. To your knowledge, do you know if it's
24 typical to have at least some planned sub -- subsidence
25 within underground mining?

1 A. As Mr. Kristiansen pointed out, you can have
2 underground mining with planned subsidence.

3 Q. Okay. We talked a bit about the rules that
4 apply regarding subsidence. Did you share those rules
5 with the Cardno staff for their review in preparing this
6 document?

7 A. Yes. Absolutely. I shared those rules with
8 them, which is why they were prompted to call DEQ and
9 interact with them and follow up on those rules.

10 Q. Okay. I think in your direct testimony, you
11 said that there was only a limited number of tests that
12 were done to submit the conclusions in the permit
13 application, right?

14 A. We submitted data to ascertain a general sense
15 of the mechanics and the strengths of the material in the
16 ground. We did not use those to come to a specific
17 conclusion about any one area.

18 Q. Any one area. Okay.

19 So this sentence again up on the screen,
20 "Highwall mining should not result in surface subsidence,"
21 is general?

22 A. No. It's a commitment to the performance
23 standard.

24 Q. It's a commitment to the performance standard.
25 Okay.

1 Could you remind us on how many tests were done?

2 A. We conducted two tests.

3 Q. Two tests. Okay.

4 Do you know whether those tests accounted for
5 differences in the type of overburden and floor materials?
6 For instance, did they account for the presence of clay?

7 A. For the council, I'll reiterate that we took a
8 couple of samples, tested those to get a general sense of
9 what was in the permit area. We have committed with the
10 ground control plan to provide the material that
11 Ms. Anderson is asking for each specific mine panel area,
12 and recognizing that each one of those are different in
13 nature and that we need to have design standards for each
14 one of those areas.

15 Q. Okay. But, again, you just testified that this
16 finding is for the entire permit area, right?

17 A. I think you're confusing the prescriptive nature
18 of regulating compared to a performance standard of
19 regulating. This is a performance standard that applies
20 to the whole permit area, and we will abide by that. And
21 we will further study each panel so we can achieve that
22 performance standard.

23 Q. Okay. Okay. Okay. So I think you testified a
24 little bit about this ground control plan, right?

25 A. Yes.

1 Q. Yesterday? Okay.

2 And you said it's approved by MSHA?

3 A. We have not submitted ground control plan to
4 MSHA at this time --

5 Q. Okay.

6 A. -- so there is no approved plan.

7 Q. Okay. That's fine.

8 Can you tell us what MSHA stands for. I don't
9 actually think the council --

10 A. Mine Safety and Health Association.

11 Q. Administration, maybe?

12 A. Administration, yeah.

13 Q. Okay. Mine Safety and Health Administration; is
14 that correct?

15 A. Yes.

16 Q. Okay. To your knowledge, is this an agency
17 focused on preventing surface subsidence or protecting
18 miner safety?

19 A. It's an organization whose sole role is the
20 protection of the safety of miners.

21 Q. Okay. Does that difference matter to you, that
22 their focus is on miner safety, not maybe on preventing
23 surface subsidence?

24 A. So in part of their role in protecting the
25 safety of the people, they need to have parameters that

1 surround or deal with how a highwall is held up, and so
2 they -- you're required to provide geotechnical studies
3 and calculations to a factor of safety for miners. And
4 because of that, it actually addresses the issues of
5 subsidence.

6 Q. Okay. But, for instance, MSHA might not be as
7 focused on impacts to the land resources or other things
8 that subsidence could affect?

9 A. No, because people's lives are probably more
10 important than the surface.

11 Q. So you don't -- you don't think surface
12 subsidence has any impacts?

13 MR. SUTPHIN: Object to the form. That is
14 argumentative. And he's already answered all these
15 questions. I think Mr. Barron's testimony about the
16 performance standards and that MSHA ground control plan
17 will be met is more than sufficient, and I -- I just would
18 urge the council to move this along.

19 COUNCIL MEMBER DEGENFELDER: Also, the
20 ground control plan does not have to be part of the permit;
21 is that correct?

22 MS. ANDERSON: Well, we're going to get to
23 some questions on that.

24 COUNCIL MEMBER DEGENFELDER: Okay. So can
25 we focus on the permit, what we're talking about.

1 COUNCIL MEMBER AGOPIAN: I would agree with
2 that sentiment.

3 MS. ANDERSON: Okay.

4 CHAIRMAN BAGLEY: Yeah. He's answered the
5 question about the rule of MSHA and calling -- trying to
6 call speculation on whether subsidence is more than or less
7 important than human lives is more or less irrelevant at
8 that point. MSHA is focusing on miner safety, and how it's
9 used is something we can proceed on.

10 MS. ANDERSON: Okay. Great. That sounds
11 fine with me.

12 Q. (BY MS. ANDERSON) Okay. I pulled up Exhibit 51
13 from our exhibits. I understand that you're not on this
14 email chain, but -- and it also is from a while ago. But
15 if you would, can you just take a brief look at this email
16 from DEQ employee named Brian Wood explaining what's in
17 Bridger's and Black Butte's requirements regarding
18 highwall mining. Just take a moment to review that.

19 MR. SUTPHIN: I'm sorry, Mr. Chairman. I'm
20 going to have to object to this. I know we've lodged
21 multiple objections about hearsay, but this is a great
22 example of something that Mr. Barron did not draft, did not
23 receive, and likely has not studied. So to ask him to draw
24 conclusions about it is highly improper, especially since
25 we won't have an opportunity to cross-examine the folks

1 behind this email.

2 MS. ANDERSON: And, Mr. Chairman, maybe I
3 could ask this a different way.

4 Q. (BY MS. ANDERSON) Mr. Barron, are you familiar
5 with any other coal mine permits in Wyoming and what they
6 have regarding highwall mining and the subsidence control
7 plan?

8 A. I'm aware that highwall mining is conducted by
9 some mines in Wyoming.

10 Q. Okay. But you haven't --

11 CHAIRMAN BAGLEY: Just a minute.

12 MS. ANDERSON: Yeah.

13 CHAIRMAN BAGLEY: I agree. Let's remove
14 this exhibit. We don't need to be looking at it. I don't
15 see that it's -- I can understand how it may appear overall
16 of interest, but I don't see it directly relevant to this.
17 So let's remove the exhibit, continue with the -- the
18 question you asked about whether you're aware is okay. We
19 can ask that question.

20 MS. ANDERSON: Okay.

21 COUNCIL MEMBER AGOPIAN: Please take it
22 down.

23 CHAIRMAN BAGLEY: Yeah, take this exhibit
24 down.

25 MS. ANDERSON: Okay.

1 CHAIRMAN BAGLEY: Thank you.

2 MS. ANDERSON: Sure.

3 Q. (BY MS. ANDERSON) So I take it you're not aware
4 that in the Bridger and -- in the Bridger subsidence
5 control plan and highwall mining components of that permit
6 there is an approved ground control plan from MSHA?

7 A. I have not reviewed their permit.

8 Q. Okay. That's what I need to know there.

9 Okay. Let's go back to page 323 of Exhibit 12.
10 And do you agree is that -- or are you familiar with this
11 page in the subsidence control plan?

12 A. Yes.

13 Q. Okay. Do you agree that it talks about kind of
14 historic mining in the area?

15 A. Yes.

16 Q. And subsidence has occurred from historic
17 mining?

18 A. Yes.

19 Q. Okay. Are you personally familiar with the
20 history of mine subsidence in the area?

21 A. Yes.

22 Q. Okay. Would you agree that this page says that
23 the AML project in the area has, quote, been reclaimed?

24 A. Yes.

25 Q. Okay. Is that an accurate statement? Can I

1 find it for you? It's right here.

2 A. Yes.

3 Q. Okay. So the Historic Mine Number 44 has been
4 reclaimed?

5 A. I think the area that subsidence occurred for
6 that Historic Mine Number 44 has been claimed. That mine
7 is quite expansive.

8 Q. Okay. Would you agree that there are more than
9 just one AML project in the area?

10 A. Yes.

11 Q. Okay. You were present in the room when I
12 talked to Mr. Kristiansen about all the AML projections in
13 the area -- all the historic abandoned mines in the area?

14 A. Yes.

15 Q. Okay. So it's not just an Abandoned Mine Lands
16 project, right? There's more than one?

17 MR. SUTPHIN: Mr. Chairman, again, I'm
18 going to have to object. Ms. Anderson is mischaracterizing
19 this paragraph. It's clearly talking about one AML project
20 for one part of the Historic Mine Number 44, and I continue
21 to see -- or fail to see the relevance of continued
22 questions along these lines.

23 Q. (BY MS. ANDERSON) Okay. Let me maybe ask this
24 a different way. Does the subsidence control plan talk
25 about any other historic mining?

1 A. I don't think the subsidence control plan
2 discusses anything other than this project that's within
3 the permit boundary.

4 Q. Okay. Okay. Let's turn to page 327. Are you
5 familiar with this part of the subsidence control plan?

6 A. Yes.

7 Q. Okay. Would you read the last sentence that's
8 highlighted there?

9 A. "The operator will continue to perform
10 remediation on any subsidence, detected during or
11 subsequent to the 6 month monitoring period, until bond
12 release is approved."

13 Q. Okay. So would you agree with me that this page
14 talks about the monitoring being proposed for subsidence
15 should it occur, correct?

16 A. Yes.

17 Q. Okay. You spoke to this a bit yesterday, but
18 would you agree that the text that you just read says that
19 monitoring will be discontinued -- or let me -- there's
20 maybe another part of that. But would you agree that the
21 subsidence control plan says that monitoring will be
22 discontinued if there's no evidence of subsidence after
23 six months?

24 A. No. Monitoring continues up and to -- up until
25 bond release.

1 Q. Okay. So it's subsequent to the six-month
2 monitoring period. So there's -- just to clarify, so
3 there's an initial six-month monitoring period?

4 A. Correct.

5 Q. And then what happens after that?

6 A. We still continue to monitor.

7 Q. Okay. So why does the subsidence control plan
8 say there's a six-month monitoring period? I guess what's
9 the point of having six months if really the commitment is
10 until bond release?

11 A. So we wanted to highlight in the permit that we
12 wanted to scrutinize an area immediately after mining so
13 that we portrayed to the DEQ that we're sensitive about
14 subsidence, and if we even see indications immediately
15 following mining, we want to know about them and report
16 those to DEQ. Then we further commit to continued
17 monitoring during the life of the mine.

18 Q. Okay. Does this subsidence control plan
19 differentiate between the type of monitoring and that
20 six-month period versus the longer term monitoring?

21 A. No, it does not.

22 Q. Is it -- so it's going to be the same type of
23 monitoring?

24 A. I'll reiterate again. The difference between
25 prescriptive based and performance based. This is a

1 performance standard, and on DEQ visits to the site as
2 they look at it, and so maybe they see indications within
3 the first six months they might prescribe or ask for some
4 additional monitoring. For us to say a more in-depth
5 monitoring during a first six months time frame would
6 overly constrain the permit. However, it allows the
7 latitude for the regulator to come in and say, look, we're
8 seeing issues here and we want you to do this and that.
9 The permit allows for them to give us that guidance and
10 add constrictions or extra monitoring during a six-month
11 window as opposed to a longer-term window.

12 Q. Okay. So just to reiterate, why is there a
13 six-month identification -- why is that period identified
14 in the subsidence control plan?

15 A. I think I said the answer to this, but I'll say
16 it again. The six-month break offers DEQ the opportunity
17 to ask for different monitoring for this first window and
18 maybe a separate type of monitoring for another window
19 without saying this first type of monitoring has to apply
20 throughout the time frame. So if this needs to have
21 additional monitoring during the first window, we can have
22 this type of monitoring in this time gap and a different
23 in another time gap, and that's why the break in the
24 monitoring.

25 Q. But at this time does the company have any plans

1 about monitoring? Do they know what they're going to do
2 to actually monitor for subsidence?

3 A. Again, performance based, we will monitor. We
4 haven't determined exactly how we're going to monitor.

5 Q. So you're going to wait for DEQ to tell you
6 that?

7 A. Absolutely not.

8 CHAIRMAN BAGLEY: I think we need to move
9 on. I think we all have a pretty good idea what -- that
10 there is some vagueness.

11 MS. ANDERSON: Okay. Thank you for that.

12 Q. (BY MS. ANDERSON) All right. Would you agree
13 that subsidence can happen after six months?

14 A. It could, yes.

15 Q. And, in fact, in the area we've seen
16 subsidence -- do you have knowledge about subsidence
17 happening -- I think I talked to Mr. Kristiansen a little
18 bit about subsidence happening years, if maybe not even
19 decades, after mining.

20 A. It can happen, yes.

21 Q. Okay. Are you aware of a current Abandoned Mine
22 Land study in the area, including sampling at the Taylor
23 Quarry, related to mine subsidence?

24 A. Yes.

25 Q. Okay. And the Taylor Quarry was within your

1 permit boundary, right?

2 A. Yes.

3 Q. Okay. So would you agree that kind of based on
4 this AML study that mine subsidence problems still
5 regularly occur in the area?

6 A. As Mr. Kristiansen pointed out, the mining that
7 was conducted historically had planned subsidence.

8 Q. Okay. And so, again, you're aware of this AML
9 study currently going on for subsidence at the Taylor
10 Quarry within the permit boundary?

11 A. I'm aware of some activity with AML at the
12 Taylor Quarry, yes.

13 Q. Did you -- as the permit coordinator for the
14 company, did you interact with the AML division at all in
15 preparation of your permit application?

16 A. I did not.

17 Q. You did not. Okay.

18 Okay. I'd just like to ask a -- a few last
19 simple questions. Based on your knowledge and expertise,
20 can pillar collapse cause subsidence? Do you have any
21 knowledge or expertise about that pillar collapse?

22 A. I don't have expertise in pillar collapse.

23 Q. Okay. How about roof collapse?

24 A. I don't have expertise in roof collapse.

25 Q. Okay. Mine floor failure?

1 A. I don't have expertise in mine floor failure.

2 Q. Okay. Do you have any knowledge about whether
3 the subsidence control plan even discusses mine floor
4 failure and the possibility thereof?

5 A. The subsidence control plan lists -- and the
6 permit has the commitment for the ground control plan,
7 which does address those issues.

8 Q. Okay. So you're sure that the subsidence
9 control plan discusses mine floor failure?

10 CHAIRMAN BAGLEY: That -- he's answered
11 that.

12 MS. ANDERSON: Okay.

13 CHAIRMAN BAGLEY: Whether he's answered it
14 to your satisfaction or not is a different question, but
15 he's answered it.

16 MS. ANDERSON: Okay. Thank you,
17 Dr. Bagley.

18 Q. (BY MS. ANDERSON) Do you know if the subsidence
19 control plan addresses subsidence risk caused by surface
20 mining above highwall mining?

21 A. It will, yes.

22 Q. It will, but it doesn't right now?

23 A. Again, with the permit commitments that are in
24 place, the permit addresses those issues.

25 Q. Okay. Is it your understanding that the company

1 is, in at least part of the permit application, proposing
2 surface mining above highwall mining?

3 A. Yes.

4 Q. All right. You had a little interaction with
5 Mr. Gregersen earlier today, but we've heard quite a bit
6 of testimony about this 50 percent factor, right? The
7 idea that if you leave 50 percent of the coal in the
8 ground, subsidence will be less likely.

9 A. Yes.

10 Q. Okay. I think you just testified that that's a
11 general rule of thumb, right?

12 A. Yes.

13 Q. Okay. But -- were you here for
14 Mr. Kristiansen's testimony?

15 A. I was.

16 Q. And would you agree that he said that that was
17 one of the key parts of your permit application that he
18 relied on to approve it?

19 A. No.

20 Q. Or to deem it technically adequate, I should
21 say.

22 A. No. He relied on that guidance from OSM and the
23 classes that he took in reviewing our permit application.

24 Q. But that was a part of that, right?

25 A. It was a part of his knowledge and his review of

1 our permit, yes.

2 Q. Okay. So you would disagree that it was an
3 important part of Mr. Kristiansen's review.

4 MR. SUTPHIN: I'm --

5 CHAIRMAN BAGLEY: He can't answer that.
6 He's not Mr. Kristiansen.

7 MS. ANDERSON: That's fine.

8 Q. (BY MS. ANDERSON) Okay. So regardless of the
9 validity of this 50 percent factor, is it your
10 understanding that the company is proposing a permit
11 condition that 50 percent of the coal must be left in the
12 ground?

13 A. We've already got a permit commitment for 40 to
14 60 percent in the permit application.

15 Q. Can you show me the page in the permit
16 application where that is discussed?

17 A. So on DEQ Exhibit 12, page 035.

18 Q. 12-035.

19 A. In the last paragraph and about the middle of
20 the last paragraph, "The recovery efficiency for the
21 highwall mining operation is assumed to be forty to
22 sixty-five percent."

23 Q. Okay. Great. Thank you. We were having
24 trouble finding that because I think we were looking for
25 the numbers and not spelled out. So thank you.

1 So would you agree with me that for a good
2 portion of the permit area coal removal could be more than
3 50 percent?

4 MR. SUTPHIN: Mr. Chairman, again, I'm
5 going to have to object. We have been beating this drum
6 now for over an hour. Mr. Barron has already specified
7 that there will be specific engineered designs for each
8 mine panel. Some of them might be 65, some of them might
9 be 40, but to characterize it as a majority is completely
10 improper.

11 CHAIRMAN BAGLEY: I think the panel -- the
12 council has probably now a really good idea that subsidence
13 is a major concern, and we also have an idea what is -- is
14 and is not in the current mine plan with respect to
15 subsidence. So I'd like to kind of move -- if you have one
16 or two more questions related to subsidence, then I think
17 we will -- we will then take a break and move on to what
18 I'm sure you have other questions.

19 MS. ANDERSON: I do. Thank you,
20 Dr. Bagley.

21 Q. (BY MS. ANDERSON) All right. Okay. My next
22 question was going to be would you agree with me that
23 depending on the site-specific factors of the coal seam
24 and different areas, there could be some degree of
25 variability in these production amounts in the permit

1 application?

2 A. Yes.

3 Q. Okay. You testified that you spent four years
4 to prepare this permit application, right?

5 A. I've been interacting with the permit for four
6 years. We prepared the permit in about two years and
7 submitted it to DEQ and have been dealing with the permit
8 from that time period.

9 Q. Okay. And yet you testified that a great amount
10 of work still needs to be done, like the geotechnical
11 studies, the additional hydrologic characterization,
12 right?

13 A. To comply with the commitments within the permit
14 there are additional studies that need to be done.

15 Q. Okay. Couldn't some of that work have been done
16 in the four-year time span so it would be a part of this
17 permit application at the time of public notice and
18 comment?

19 A. No. That's not the way the permit is designed.

20 Q. So it's not designed to -- when it goes to
21 public comment, to allow the public to meaningfully
22 participate?

23 A. They -- the public is to review the permit in
24 its entirety, which includes all the commitments and all
25 of the pre-mine studies that have been conducted to date.

1 As far as the specifics of the designs for each individual
2 panel as they get there, those will not be in the permit
3 per se, but the commitment to do those is.

4 Q. Okay. I have just one last question on this
5 because my professional engineer expert is wanting me to
6 ask this.

7 So for the subsidence control plan, you
8 testified that you didn't directly prepare it, right?

9 A. Correct.

10 Q. Okay. But was it prepared directly under your
11 supervision?

12 A. Yes.

13 MS. ANDERSON: Yes. Okay.

14 All right. That's all on subsidence.

15 CHAIRMAN BAGLEY: All right. Thank you.

16 MS. ANDERSON: Thank you.

17 CHAIRMAN BAGLEY: Let us take a 10-minute
18 break. And we will start at 9:50.

19 MS. ANDERSON: Okay.

20 (Hearing proceedings recessed

21 9:38 a.m. to 9:50 a.m.)

22 CHAIRMAN BAGLEY: All right. Okay. We are
23 back in session.

24 Please continue, Ms. Anderson.

25 MS. ANDERSON: Okay. Thank you,

1 Dr. Bagley.

2 Q. (BY MS. ANDERSON) Mr. Barron, I have some
3 questions for you about roads and transportation. Are you
4 familiar with the requirements for buffers around county
5 roads or public rights of way regarding mining operations?

6 A. Yes.

7 Q. Okay. And would you agree with me that mining
8 will come within 100 feet of at least one county road in
9 the permit area, as currently proposed in the permit
10 application?

11 A. Yes.

12 Q. Okay. I think I heard you testify yesterday
13 that you haven't submitted any concrete plans to the
14 county about relocating or closing any county roads?

15 A. No.

16 Q. Okay. And this would include a lack of plans
17 about Slater Creek Road?

18 A. Right. This would include Slater Creek.

19 Q. Okay. Would you agree that the mining will come
20 within a hundred feet or actually even maybe closer to
21 Slater Creek Road?

22 A. Yes.

23 Q. Under the -- okay.

24 So are you just assuming that the County and DEQ
25 will sign off on your plans at some later date?

1 A. So in working with several coal mines, they've
2 moved county roads, they've moved highways to allow for
3 the buffer while they mine. Brook Mine is no different.
4 We will be able to move the county road in a fashion that
5 is safe for the public.

6 Q. Is it in the permit application right now that
7 the county road will be moved? Is there a statement to
8 that effect?

9 A. There's a discussion about county roads in the
10 permit, yes.

11 Q. Is there a statement in the permit application
12 right now that says the county road will be moved because
13 of -- it will come within this buffer?

14 A. The highwall -- the mining panels are shown in
15 permit application in relation to that road. The timing
16 is such that plans on moving that route are those plans in
17 the permit have not been submitted at this time.

18 Q. Okay. So there's -- just to confirm, because
19 you're not really answering the question directly -- but
20 there's nothing in the permit application that says
21 anything about moving county roads at this time?

22 A. There is a discussion in the permit application
23 about county roads and how we will deal with county roads
24 as they are encountered in mining.

25 Q. Okay. I have up on the screen Exhibit 33 from

1 our exhibits. Are you familiar with this email chain? It
2 was a while back, but it was an email from you.

3 A. Yes.

4 Q. Okay. And would you agree that the highlighted
5 portion there says it is anticipated that at least
6 one mile of road relocation may be required?

7 A. Yes.

8 Q. Okay. Was this in reference to Slater Creek
9 Road?

10 A. I believe it was, yes.

11 Q. Okay. Pulling up Exhibit 34 of ours. Are you
12 familiar with this map at all?

13 A. It looks likes Google Earth image.

14 Q. Did you help in producing discovery to us?
15 Production documents?

16 A. Yes.

17 Q. Okay. Are you familiar enough to know that this
18 was produced by Brook Mining Company in discovery to us?

19 A. There was a plethora of data supplied to you. I
20 imagine this was amongst them.

21 Q. Are you familiar with the geographic area shown
22 on that map?

23 A. Yes.

24 Q. Okay. Would you agree that that's Slater Creek
25 Road coming off under the interstate?

1 A. That appears to be Slater Creak Road, yes.

2 Q. Okay. And so this is the area you're going to
3 have to relocate?

4 A. Yes.

5 Q. Okay. So at the time it was definite enough to
6 know that at least one mile of the county road would have
7 to be relocated, you have it geotagged on a map, and yet
8 it's not definite enough in the permit application?

9 MR. SUTPHIN: Mr. Chairman, I would like to
10 object to this line of questioning as beyond the scope of
11 the direct examination of Mr. Barron, and particularly
12 asked and answered. He's already addressed that the County
13 has not done any work on this. They haven't done it yet.
14 It's been preliminarily -- I just -- I see this as another
15 waste of time, with all due respect.

16 MS. ANDERSON: Okay. I wouldn't say it's a
17 waste of time, but I think it does point out what is and
18 isn't in the permit application. So maybe we have
19 established that to some degree.

20 CHAIRMAN BAGLEY: Yeah, I would say that we
21 have established that the plans to relocate that county
22 road are not in the permit application.

23 MS. ANDERSON: Okay. Thank you.

24 Q. (BY MS. ANDERSON) Mr. Barron, are you aware
25 that certain landowners in the area depend on this road to

1 access their property?

2 A. Yes.

3 Q. Okay. Have you or anyone affiliated with the
4 company reached out to the landowners who use this county
5 road?

6 A. Yes. Phil -- stopped by my office --

7 THE REPORTER: I'm sorry. Who?

8 THE WITNESS: Phil Klebba.

9 MS. ANDERSON: It's K-L-E-B-B-A.

10 A. Is a resident that uses that road. He stopped
11 at my office. I was not in at the time he stopped, but I
12 followed up with a phone call to Mr. Klebba and told him
13 that he could stop in my office at any time and we can
14 discuss any of his concerns. He has, to date, not stopped
15 by my office.

16 Q. (BY MS. ANDERSON) Okay. I just have one last
17 question on transportation. Did the company consider
18 using conveyors to transport coal as opposed to trucks at
19 any time?

20 A. The conveyance by conveyors in the permit
21 application is contemplated.

22 Q. Is contemplated?

23 A. It's allowed within the permit.

24 Q. Okay. But you don't know for sure whether
25 you're going to use conveyors?

1 A. No.

2 Q. Okay. At the time is the company planning to
3 use just trucks to move coal around?

4 A. At this time, yes.

5 Q. Okay. All right. Let's switch over to blasting
6 a little bit. Did you prepare the blasting sections in
7 the mine plan?

8 A. Yes.

9 Q. Okay. Are you familiar with the limitations on
10 blasting proposed in the mine plan?

11 A. Yes.

12 Q. Okay. Yesterday we heard some testimony that
13 DEQ regulations limit blasting to sunrise to sunset,
14 right?

15 A. Yes.

16 Q. And blasting can happen any day of the week,
17 right?

18 A. Yes.

19 Q. Okay. Did the company consider additional
20 limitations on blasting to smaller windows of time, say
21 regular work hours or regular work days?

22 A. We applied the performance standards outlined in
23 the rules, regulations, statutes and guidelines.

24 Q. But you didn't think to do anything more, given
25 the presence of homeowners in the area?

1 A. We complied with the state statutes, rules and
2 regulations.

3 Q. All right. Let's turn to page 337 of DEQ 12.
4 Is this part of the blasting plan attachments or
5 addendums?

6 A. Yes.

7 Q. Okay. You're familiar with this page?

8 A. Yes.

9 Q. Okay. Does it read the -- I'll highlight a
10 portion here for you. Does that say "Seismograph (if
11 required)"?

12 A. It does.

13 Q. So is it accurate to say this page requires
14 recordings of seismograph readings?

15 A. It says "if required."

16 Q. "If required."

17 Do you know if it's common to have a seismograph
18 between a mine site and homes or structures?

19 A. It's neither common or uncommon.

20 Q. At the time is the company proposing to use a
21 seismograph?

22 A. It's been stated earlier by Mr. Emme, but it's
23 worth repeating here, any resident within one-half mile of
24 the permit boundary can request a pre-blast survey.
25 That's a study of the home, usually like was described

1 before, as video or pictures of the home to establish how
2 the home is this day, along with wells. That can include
3 the request for a seismograph to be placed at the
4 residence during blasting to ascertain the vibrations of
5 the home.

6 Q. Okay. Thank you.

7 And you just testified a little bit that the
8 company didn't consider any additional limitations to
9 blasting, say, for instance, limiting blasting if it's a
10 high and -- windy day?

11 A. I'll reiterate the answer that I've previously
12 given. We have commitments in the permit application to
13 comply with the Wyoming rules, regulations and statutes.

14 Q. Okay. Great.

15 All right. Let's go to bonding. I think you
16 testified to this a little bit. Did you write and prepare
17 the proposed bond amounts that's -- that was submitted to
18 DEQ?

19 A. I put together a bond estimate that was
20 submitted to DEQ, yes.

21 Q. Okay. Have you ever prepared a bond estimate
22 before for a coal mine?

23 A. Yes.

24 Q. Was this a surface mine?

25 A. Yes.

1 Q. Have you ever prepared a bond estimate for an
2 underground mine?

3 A. No.

4 Q. How about a highwall mine?

5 A. No.

6 Q. Okay. Would you agree that no matter how small
7 the disturbance is, that there is a period of monitoring
8 necessary to ensure reclamation success?

9 A. Yes. DEQ outlines a phased bond release for
10 reclamation.

11 Q. Okay. How were monitoring costs considered in
12 the proposed bond amount that you submitted to DEQ?

13 A. As Mr. Emme pointed out, DEQ goes through great
14 lengths to revise and update Guideline 12, which is the
15 document that we used in preparation of our bond estimate.
16 It is current. News to me, we actually overestimated some
17 components. And it includes everything necessary for bond
18 estimate.

19 Q. Okay. Can you tell me a little bit about what a
20 contingency factor is in the miscellaneous portion
21 referred to in Guideline 12?

22 A. A contingency factor is an additional cost for
23 some unknowns.

24 Q. Okay. And would you agree that in -- for some
25 unknowns -- would you agree that's important, actually, if

1 the State takes over in the case of a bond forfeiture, as
2 Mr. Emme testified to yesterday?

3 A. It could be an important factor, yes.

4 Q. Okay. Do you have understanding that actually
5 those items are really important for the State because the
6 State has to hire people to do reclamation work in the
7 case of bond forfeiture?

8 A. Yes. The State does need to hire people in case
9 of bond forfeiture to conduct reclamation.

10 Q. Did you hear Mr. Emme's testimony yesterday that
11 it's important not to have zeros in the contingency line
12 items for that reason?

13 A. I don't recall Mr. Emme saying that.

14 Q. Okay. That's fine.

15 All right. Let's turn to Exhibit 65 of our
16 exhibits. Are you familiar with this chart at all?

17 A. Yes.

18 Q. Okay. Would you read the number there -- I'm
19 going to highlight it there for you at the bottom. Can
20 you read it for me?

21 A. Yes. It -- 8,593,642.

22 Q. Okay. And yesterday we heard some testimony
23 that the proposed bond estimate is about 372,000, right?

24 A. So to help council, this bond is not one that is
25 submitted to DEQ, so its relevance here is questionable.

1 Q. Okay. So at one point, though -- did you
2 prepare this chart?

3 A. I did, yes.

4 Q. Okay. So at one point you had a chart that was
5 8 and a half million dollars as a proposed bond amount.

6 A. Yes.

7 Q. And then now the proposed bond amount is
8 371,000?

9 A. Yes.

10 Q. Okay. Was -- where did the difference come
11 from, and why did the company make that distinction?

12 A. The bond that has been submitted to DEQ shows
13 30.8 acres of disturbance. We have told DEQ what we're
14 going to do in the first year. And using Guideline 12, we
15 came to a dollar figure 371,000. As Doug pointed out, 372
16 is the likely amount that it will be.

17 Q. Okay. So the previous estimates maybe had more
18 acreage or -- I guess I'm trying to figure out what the
19 difference is, if you can identify that for me.

20 A. I'll point out again --

21 MR. SUTPHIN: And, Mr. Chairman, first, I
22 am dying to hear Mr. Barron's answer, so please keep that
23 in mind as I make this objection. But I have to make the
24 objection that the witness himself made. The relevance of
25 this is completely suspect. This was not part of the

1 permit file and has not been submitted.

2 But with that said, I am anxious to hear the
3 answer.

4 A. The answer is this has not been submitted to
5 DEQ. This was a prior estimate that we did for an earlier
6 evaluation of the application, and it's no longer
7 relevant.

8 Q. (BY MS. ANDERSON) Okay. So yesterday you -- I
9 think you used the phrase that the company will submit a
10 "financial instrument of sorts" to provide for the bond,
11 right?

12 A. Yes.

13 Q. Okay. Are you aware of what sorts of financial
14 instruments will be submitted by the company?

15 A. I am not.

16 Q. You're not? So you don't know if it's a letter
17 of credit?

18 A. I am not.

19 Q. Or a CD?

20 A. I am not.

21 Q. Or cash or --

22 CHAIRMAN BAGLEY: I think it's clear --

23 MS. ANDERSON: Okay.

24 CHAIRMAN BAGLEY: -- he doesn't know what
25 the instrument will be.

1 MS. ANDERSON: Okay. Great. Thank you.

2 That's all I have.

3 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.

4 Mr. Gilbertz.

5 MR. GILBERTZ: Thank you.

6 CROSS-EXAMINATION

7 Q. (BY MR. GILBERTZ) Mr. Barron, while I fuddle
8 with my technology, good morning.

9 A. Good morning.

10 Q. So I don't forget to ask it, I've got a couple
11 of questions that are going to jump around a little bit.
12 In the course of having been involved in this permit, fair
13 to say you're pretty familiar with its contents?

14 A. Yes.

15 Q. Can you tell me what the length -- the combined
16 lineal feet in length is of all the proposed trenches or
17 box cuts, whichever term you prefer?

18 A. I cannot.

19 Q. Okay. You can sure give me some sort of
20 estimate, can't you?

21 A. There are several panels and pits ranging from
22 hundreds of feet to thousands of feet.

23 Q. Do they add up to more than a mile?

24 A. I think they potentially do, yes.

25 Q. Do they add up to as much as 10 miles?

1 A. Probably not, no.

2 Q. Okay. There was a little discussion about
3 meeting with landowners. Were you -- you mentioned that
4 you went to a meeting that had been hosted by the Powder
5 River Basin Resource Council in 2015, right?

6 A. Correct.

7 Q. Are you aware that in April of 2016, a group of
8 landowners and the PR -- PRBRC had requested a meeting
9 with DEQ and potentially Ramaco to discuss their concerns?

10 A. I was not aware of that.

11 Q. DEQ did not notify you of that request?

12 A. No.

13 Q. All right. So. Let's talk about the group of
14 people that are impacted here. Part of the mine
15 preparation was to identify all the landowners within
16 one-half mile of the permit boundary, correct?

17 A. Yes.

18 Q. And you did that?

19 A. Yes.

20 Q. And that document with the landowners and legal
21 descriptions goes on for pages and pages, doesn't it?

22 A. It does.

23 Q. Fair to say that they're more than a hundred
24 folks on that list?

25 A. Yes.

1 Q. Okay. And the water wells identified as within
2 that same zone in the permit and within one-half mile of
3 it, any knowledge about how many that is?

4 A. Hundreds.

5 Q. Okay. Would the number 357 sound right to you?

6 A. That would sound reasonable, yes.

7 Q. Okay. So let's talk -- then of that 357, the
8 water modeling identified in a number of wells that are
9 likely to be impacted by the dewatering procedures.
10 You're aware of that, right?

11 A. Yes.

12 Q. And that the Fishers' well is one of those
13 wells.

14 A. They actually have two wells.

15 Q. Okay. And those wells are within the group that
16 may be impacted by the dewatering, correct?

17 A. Correct.

18 Q. Do you know, as you sit here today, should that
19 well fail, is it even possible to drill a replacement well
20 for the Fishers?

21 A. Yes.

22 Q. Okay. How do you know that?

23 A. There are aquifers below the depth to which the
24 Fishers' wells are completed that contain water.

25 Q. All right. Any idea what that would cost?

1 A. Typically a water well installation is about a
2 hundred dollars a foot.

3 Q. How many feet are we going down?

4 A. You may need to go down as far as 500 feet.

5 Q. Okay. So I think it occurred to me yesterday
6 that there might be an easy way for you and I to visit
7 about some of these concerns of the landowners. Let me
8 start with this question for you, though. As a local
9 engineer, are you aware of the problems in the Beatty Spur
10 subdivision with all the domestic water wells going dry as
11 a result of coal-bed dewatering?

12 A. I'm aware of coal-bed development and that in
13 that process they dewater the coal.

14 Q. Okay. And you're not aware of the fact that the
15 entire aquifer was dewatered in the coal -- in the Beatty
16 Spur subdivision?

17 A. Again, I'm aware of CBM development, and I'm
18 aware of the process. I'm not aware to the extent they
19 dewatered a specific area.

20 Q. Okay. And so you're not aware, then, that those
21 landowners had to be in litigation with the company that
22 dewatered the aquifer for years?

23 A. I did not study any of the litigation
24 surrounding that.

25 Q. Okay. You said yesterday that you would welcome

1 permit conditions that this council deems appropriate. Do
2 you remember that?

3 A. Yes.

4 Q. Okay. If there is a condition that states if
5 this council deems it appropriate, that should the DEQ
6 find a reasonable relationship between the loss of water
7 quantity or quality, that the operator, Brook Mine, will
8 be obligated to replace that water without the right of
9 ensnarling the landowners in years of litigation?

10 MR. SUTPHIN: I'm going to just have to
11 object as calling for a legal conclusion.

12 MR. GILBERTZ: No, it's not. I'm asking
13 him if this council were to determine that an appropriate
14 condition on this permit is one that states that if the DEQ
15 finds a reasonable relationship between the loss of water,
16 quantity or quality, for any of these owners, that Brook
17 would then be obligated to replace that water at DEQ's
18 direction.

19 Q. (BY MR. GILBERTZ) Would you welcome that?

20 A. To reiterate -- and this has been stated
21 before -- the permit already has an obligation to replace
22 quality and quantity of wells that show causation for loss
23 of quality and quantity in their well.

24 Q. Well, that's not quite good enough for me, sir,
25 because that leaves it to -- the landowners to the mercy

1 of years of litigation. So my question is very specific.
2 Would you welcome it if this council found that a
3 condition of the permit states that should the DEQ find a
4 reasonable relationship between a loss of quantity or
5 quality in the water wells of these owners, that the
6 operator will be obligated to supply the replacement water
7 on that finding?

8 CHAIRMAN BAGLEY: I -- the -- he's
9 answered -- the part he hasn't answered is would he welcome
10 that. I think he's answered that they would be obligated
11 by the permit, and so I don't know -- yeah, I think you're
12 suggesting a permit condition, which I think is useful
13 information for the council. You can re-word that so he
14 doesn't have to -- whether he welcomes it or not is sort of
15 an emotional issue, legal issue, and not sure that that's
16 what we need this expert to be commenting on.

17 MR. GILBERTZ: Sure.

18 Q. (BY MR. GILBERTZ) If that were a condition, you
19 wouldn't find that to be a problem if it satisfied the
20 landowner's concerns?

21 A. In the confines of the permit, I'm okay with the
22 commitments we've made. And I'm also okay with any
23 conditions that this council will find are necessary for
24 the permit application.

25 Q. Perfect. Thank you.

1 Let's talk about the blasting issues for a
2 moment. Testimony was that Brook does not need to blast
3 continuously like the mines in Gillette, right?

4 A. Yes.

5 Q. And you agree with that?

6 A. Yes.

7 Q. Okay. I noticed this morning that it was light
8 at 5:30 in the morning. And so I looked and upcoming in
9 June, about the 20th, the civil daylight hours will be
10 from 4:45 in the morning until 9:45 at night.

11 A. Okay.

12 Q. Okay? I doubt you're familiar with the grooming
13 habits of the Fishers, but do you know whether they're up
14 and puttering around at 5:45 in the morning?

15 A. I cannot speak intelligently on what they do any
16 time during the day.

17 Q. Perfect.

18 Given that Brook and DEQ has told us repeatedly
19 that there is no need to blast like they do in the open
20 pit mines in Gillette, should this commission determine
21 that it is appropriate to put a condition on the mine plan
22 that limits blasting from 8 a.m. until 5 p.m., is there
23 any reason that could not be accommodated?

24 A. Again, I'll defer to the council. Any condition
25 they see fit to put on the permit, we would welcome.

1 Q. Including ones that would say there would be no
2 blasting on Christmas, Thanksgiving, major holidays like
3 that?

4 A. I can't say what they would impose.

5 Q. Okay. Now, there was a little discussion about
6 the seismic monitoring, and you responded by saying that
7 the owners are entitled to have a pre-blast survey, which
8 I agree with. I do not believe that regulation
9 necessarily provides them with the right to request a
10 seismic monitor for air blasts and shockwaves through the
11 ground near their location. Should this council determine
12 that if any landowner within one-half mile of the permit
13 boundary should request that seismic monitoring be
14 installed at their request, is there any reason that
15 cannot be facilitated?

16 A. Western Water actually has a couple of
17 seismographs and we have, for mines in the basin, used
18 those at residence per their request. So I see no reason
19 why that couldn't be done here.

20 Q. Okay. And as you point out, this is a condition
21 that has been placed on some of the mines in Gillette,
22 right?

23 A. I'm not aware of that as a condition. I know of
24 it as a request that's been made and answered.

25 Q. And, likewise, should this commission determine

1 that it would be appropriate for a condition of the permit
2 to be that blasting only be conducted within the weather
3 restrictions that were established for the mines in
4 Gillette in relation to the orange clouds, that is
5 something that could also be facilitated, correct?

6 A. Again, I would defer to whatever conditions the
7 council may impose.

8 Q. Okay. And will they choose to include with
9 those conditions consideration of inversions?

10 A. Again, I'll repeat, I'll defer to their
11 judgment.

12 Q. Okay. Let's talk about the Tongue River
13 alluvium. I understand that there's now a commitment to
14 put monitoring wells within the Tongue River alluvium; is
15 that correct?

16 A. Yes. It's made known through discovery that
17 monitoring wells would be upstream and downstream on the
18 southern portion -- southern boundary of the Brook Mine
19 permit.

20 Q. Okay. And you and I are talking about two
21 different things, I think. You're talking about
22 monitoring the quality and quantity of water in the Tongue
23 River, right?

24 A. Yes.

25 Q. Okay. Is there or is there not a commitment at

1 this point in time for the operator to install monitoring
2 wells in the alluvium of the Tongue River?

3 A. No.

4 Q. There is no commitment?

5 A. Not that I'm aware of.

6 Q. Okay. Should this council determine that it
7 would be appropriate to put monitoring wells in the Tongue
8 River alluvium to determine whether or not there are
9 quantity or quality problems developing in the alluvium,
10 that is something that could be accomplished, correct?

11 A. I see no reason that couldn't be accomplished.

12 CHAIRMAN BAGLEY: I'd like to ask -- I
13 mean, you're bringing up some points about the kinds of
14 conditions the council could add, and I think it's clear
15 that if the council feels conditions need to be added to
16 the permit, we would -- we would add those, and I think
17 they have to abide by those.

18 MR. GILBERTZ: I agree with that. I'm
19 exploring with this witness whether there's any technical
20 objection to that, that that cannot be done.

21 CHAIRMAN BAGLEY: So you're asking if
22 there's technical issues related to installing this?

23 MR. GILBERTZ: Yeah.

24 CHAIRMAN BAGLEY: Okay, so let's go ahead
25 and phrase it so we focus on that technical side, because

1 I'm hearing will they abide by our conditions, and the
2 answer is, yes, they will abide by our condition. So add
3 the technical side.

4 MR. GILBERTZ: All right.

5 Q. (BY MR. GILBERTZ) Should the council determine
6 that it is appropriate to place as a condition on the
7 permit a stipulation that in the event these monitoring
8 wells in the alluvium register a change in the quantity or
9 quality of the water in the alluvial valley floor, while
10 mining operations are in process, that all mining will
11 stop until Brook can demonstrate that it is not the source
12 of this change, could that be accomplished?

13 A. So Brook Mine falls under DEQ supervision and
14 regulation. We have a monitoring plan within the mine
15 plan for events during mining. DEQ has reviewed that plan
16 and found it technically adequate. Should this council
17 see fit to additional commitments, we welcome those.

18 Q. Very good. Let's visit, then, about --

19 COUNCIL MEMBER AGOPIAN: Mr. Chairman.

20 CHAIRMAN BAGLEY: Just a minute.

21 Yes, Councilman.

22 COUNCIL MEMBER AGOPIAN: I've heard now at
23 least 10 times from the witness that they are willing to
24 consider conditions applied by this council to a permit. I
25 don't feel the need to continue to hear that comment in the

1 line of questioning that is getting us to that same
2 response.

3 CHAIRMAN BAGLEY: Thank you, Mr. Agopian.

4 Please continue asking questions, but please
5 recognize I think the council does understand where you're
6 going and that we understand our duty is to help ensure
7 that if there are appropriate conditions that need to be
8 added, we will add those, and that they have the
9 responsibility to comply.

10 MR. GILBERTZ: Very good.

11 Q. (BY MR. GILBERTZ) As it stands right now,
12 Mr. Barron, if you were performing your mining
13 operations -- well, let's back up one step.

14 One of the things you're telling this council is
15 it can rest assured that your mine plan is such there will
16 be no subsidences as a result of the mining, correct?

17 A. So it was stated earlier no one can say no
18 subsidence will occur. Certainly there's always a chance.
19 But the mine plan itself was designed so that no
20 subsidence will occur.

21 Q. Okay. The -- and nowhere in the mine plan, as
22 it stands today, does it say should this unexpected
23 subsidence occur, that mining will stop, does it?

24 A. No, it does not.

25 Q. Okay. And so if this council were to put a

1 stipulation on this, that this unexpected subsidence were
2 to occur, all additional mining would stop until the DEQ
3 is satisfied with what the explanation for that is, that
4 is something that the mine could accomplish, correct?

5 THE WITNESS: I'm sorry, Mr. Agopian.

6 A. But any commitment that the council deems
7 necessary to put on permit application, we'll accept.

8 Q. (BY MR. GILBERTZ) Just two more questions,
9 Mr. Barron. I just want to confirm that you are the
10 author of a couple of statements. We've seen one already.

11 You remember -- let this thing fuddle for a
12 second and then we should get there. It does not like the
13 Trial Pad for some reason. There we go.

14 Earlier in these proceedings you heard me ask
15 questions about part of the reclamation plan. You
16 remember that?

17 A. Yes.

18 Q. Are you the author of the portion of this report
19 that says that the Carney seam subcrops into the Slater or
20 Tongue River alluvial material?

21 A. Yes.

22 Q. And then further down below, the blue -- second
23 set of blue highlighting where it says, "There is
24 communication with the river alluvium"?

25 A. Yes.

1 Q. Okay. Then let's move to another part of what I
2 believe is DEQ 12. We are now looking at page 231 in that
3 exhibit. I have highlighted for us here, therefore, it is
4 likely the Carney seam would lose water to the Tongue
5 River alluvium. Do you see that?

6 A. I do, yes.

7 Q. And are you the author of that?

8 A. Yes.

9 Q. You stand by these statements as a professional
10 engineer, correct?

11 A. Yes.

12 Q. I will visit with the other witnesses about the
13 implications of those statements. Thank you, Mr. Barron.

14 MR. GILBERTZ: I have no further questions.

15 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.

16 Does council have any questions? We'll start
17 with Deb.

18 COUNCIL MEMBER BAUMER: No questions.

19 Thank you.

20 CHAIRMAN BAGLEY: No?

21 Nick?

22 COUNCIL MEMBER AGOPIAN: No questions.

23 CHAIRMAN BAGLEY: Meghan.

24 COUNCIL MEMBER LALLY: Yeah I have a few
25 questions.

1 EXAMINATION

2 Q. (BY COUNCIL MEMBER LALLY) Earlier -- yesterday
3 you said -- I thought you said that you weren't going to
4 mine in an area where there was previous mining. But I
5 thought that DEQ said you were going to undermine some of
6 the --

7 THE REPORTER: Some of the what?

8 COUNCIL MEMBER LALLY: BHC, Big Horn Coal
9 works.

10 Q. (BY COUNCIL MEMBER LALLY) And I'm just trying
11 to clarify in my mind what exactly is going on.

12 A. So Big Horn Coal mined the Monarch seam.

13 Q. Right.

14 A. And the Carney seam is below that.

15 Q. Right.

16 A. So we are going to mine in the Carney seam below
17 the old surface mine works that are now backfilled.

18 Q. Okay. And then -- I can't remember the exhibit.
19 The one where it kind of -- trees on top and shows how
20 you're going to mine through.

21 A. Okay. Yes.

22 Q. And the way it looks to me, you're going to take
23 a lot less than half of the coal. But everything we've
24 heard it's going to be half the coal. And I guess I don't
25 understand how that diagram actually translates into

1 actual mining, because there's like big columns of coal.
2 You take out 12 feet, 12 feet, 12 feet, and there's
3 another big column of coal.

4 A. So maybe to clarify again. That is a figure
5 just to show the general nature of what a highwall would
6 look like as you're facing it. It is not in any way a
7 specific description on how we would mine any specific
8 panel. This is just a general figure to show the reader
9 what this looks like as you're facing it, showing that
10 it -- and it's somewhat exaggerated because in order to
11 depict a barrier pillar and illustrate that it's wider
12 than the webs, it gets stretched out in this figure to
13 accentuate that.

14 Q. Okay. I'm just -- I don't know much about
15 mining, so I'm trying to figure it all out.

16 A. Correct. Which is why a picture is good.

17 Q. Okay. And then on the blasting notice, Mr. Emme
18 stated that the general notice that most mines give out is
19 anytime during daylight hours, basically any time of the
20 year. Considering the nature of the blasting that's going
21 to go on at the Brook Mine, is it going to be the general
22 notice or will it be more specific like June 1st through
23 the 15th during daylight hours, or with 30-day notice as
24 opposed to we can blast whenever we want to during
25 daylight hours?

1 A. At this point, notice will be more like the
2 general notice, but I can't say specifically which one
3 will be at this time. After this hearing we might have
4 some extra considerations to take into that notice.

5 Q. Okay. And then what if a water well needs
6 replaced and you can't -- I'm echoing -- and you can't get
7 to a seam -- or water? Because the Fishers have stated
8 they tried to a thousand feet, haven't encountered water.
9 You have to haul water in for an indefinite amount of
10 time, and then there's no company that was in business
11 changed ownership, or whatever, how do the Fishers
12 continue to get water or anybody whose water well is
13 dewatered?

14 A. So at this point we're aware of much thicker
15 coal seams that are below ours, specifically the wall seam
16 is one of those seams. We're confident wells could be
17 completed in that formation and provide the type of water
18 that needs to replace both quality and quantity. If -- if
19 trucking needs to happen, we'll have to put in place and
20 haul water per the permit to replace both quality and
21 quantity.

22 COUNCIL MEMBER LALLY: Okay. That's all
23 the questions I have.

24 CHAIRMAN BAGLEY: Megan?

25 COUNCIL MEMBER DEGENFELDER: No questions.

1 Thank you.

2 CHAIRMAN BAGLEY: Mr. Barron, I have a few
3 questions.

4 EXAMINATION

5 Q. (BY CHAIRMAN BAGLEY) Since we're on this slide,
6 I -- as I look at the subsidence control plan language and
7 I look at this slide, I hear you use the words webs and
8 pillars, I get confused. What -- versus -- so -- but with
9 the highwall mining that you're planning -- or the Brook
10 Mine is planning, are we going to actually produce pillars
11 as opposed to just walls?

12 A. So to help clarify and answer your question, the
13 smaller segments that are -- of coal that are left, those
14 are webs, and they'll be 6 to 8 feet in width. And then
15 between series of those, a barrier, a pillar, which is
16 much wider than that. That's a safety mechanism, so that
17 should a failure occur in a series of webs, that that
18 failure can't propagate to another series of webs. So
19 it's a -- a mechanism that's left in the ground as a
20 protection -- an additional protection for the supporting
21 structure should we encounter something and have some kind
22 of failure.

23 Q. Okay. I'm still confused, because I think I
24 heard -- I don't remember who said it, but that we were
25 thinking about 12-foot wide going in, to take coal out,

1 then 12-foot wall left, then the next 12-foot -- you know,
2 12 feet wide by 2,000 feet deep and we have another
3 12-foot wall, but that doesn't sound like what you're
4 saying. And I know this is probably a bad picture because
5 I don't think it describes what you're planning. But I
6 have a struggle, I got 12 foot, 12 foot, 12 foot, or do I
7 have 12 foot and 6 foot? Or what --

8 A. So in general we'll have -- the highwall miner
9 won't mine to the heights of the coal seam. And we will
10 leave a web of coal that's generally 6 to 8 feet wide.
11 And we'll do that for a series of holes. And after that,
12 we will leave a barrier pillar. Now, this is structured
13 so that it is at least as wide as the coal seam is high.
14 And then we'll start another series of webs and pillars.
15 These are placed on either side of this series to help
16 protect should a failure occur, that that failure can't
17 process along to the next set of webs and holes.

18 Q. Okay.

19 COUNCIL MEMBER LALLY: But are they pillars
20 or are they walls that go all the way --

21 THE WITNESS: They're walls just like this
22 room. Imagine us in this space right here, and these walls
23 represent a wall on either side. And then let's say to
24 buttress this wall we put another larger wall against it to
25 hold it for a failure and it would be on the outside of

1 that wall and that's --

2 COUNCIL MEMBER DEGENFELDER: As wide as it
3 is high?

4 THE WITNESS: Correct.

5 Q. (BY CHAIRMAN BAGLEY) So if I, looking at, you
6 know, one of those thin, smaller dark sections, which I
7 assume is coal remaining.

8 A. Correct. Remaining, yes.

9 Q. At some point, as I go back into that, are you
10 going to cut through that somewhere?

11 A. No.

12 Q. So it really -- okay. You're calling it a
13 pillar, but really I would think of it as a wall.

14 A. It's a wall, correct.

15 Q. The reason I ask is I looked at some of these
16 historical mines that were underground and they use a room
17 and pillar type approach, which is different --

18 A. Yes.

19 Q. -- whereas it would be room and there were
20 actual pillars as opposed to just straight walls?

21 A. Correct.

22 Q. Okay. So these really, at least for me, I'm
23 going to think of it as walls.

24 Now, as I listen to concerns -- and I think, you
25 know, subsidence is a major concern. I mean, historically

1 there's been a lot of subsidence out there. People are
2 concerned that a new mine would add to that. And so the
3 question is at what time -- since it doesn't appear to be
4 specified in the plan right now, at what time will the
5 specifics of a particular -- I guess we'll call it panel,
6 mine panel -- what time will that be identified -- you
7 know, designed out, and then at least somebody will know
8 what the specific details will be for an individual panel.
9 What time does that happen?

10 A. So we will have to submit the ground control
11 plan to MSHA. That usually takes 30 to 60 days for
12 review. And upon its approval, that will be submitted to
13 DEQ for insertion into the permit application. And that
14 will all happen prior to mining for any given panel.

15 Q. Okay. So that happens as we move through the
16 mine -- the 12 years of the mining operation. It happens
17 before any panel -- the design has to be done, has to be
18 sent to MSHA. They will examine it specifically to make
19 sure it doesn't fall in because they're worried about
20 miner safety. And your feeling is that would also, if
21 it's not falling in, it won't cause subsidence.

22 A. Correct.

23 Q. And then that goes to DEQ, gets put in the
24 plan -- or the permit. Does -- when does it -- when does
25 it become available for public -- not comment, but just

1 for the public to be able to see it?

2 A. Immediately upon submission to the DEQ. The
3 public can review that at any time.

4 Q. So as soon as it goes to DEQ, it becomes a
5 public document. Up to that time you're working with
6 MSHA, making sure engineering's right, that it's going to
7 be safe, then, as soon as that's submitted. So we won't
8 know on trench number 7 what the design of that panel will
9 be until you're actually ready -- shortly before -- 30 to
10 60 days before you plan to mine that panel in trench
11 number 7 12 years from now?

12 A. Correct.

13 Q. Okay. And is that the -- is it required, to
14 your knowledge, by statute, that you have to provide the
15 information any sooner than that?

16 A. No. The ground control plan, actually, isn't a
17 requirement of Wyoming state statutes. It's commitment
18 that we added over and above the regulations.

19 Q. So you've added that in -- that you're going to
20 follow that approach. So that we would know. You don't
21 have to -- you're not aware of any law that says at this
22 moment before you've begun mining, you have to plan out
23 all -- all the mine panels for all the trenches. That
24 does not have to be done at this moment?

25 A. That does not have to be done per Wyoming

1 statutes or regulations.

2 Q. Okay. I'm hearing -- I'm hearing some people
3 may wish it had. I just wanted to know whether it was
4 required by statute to be done.

5 Okay. Since it was brought up, there was an
6 exhibit about a very high bond amount of -- 8 million was
7 initially proposed, but I have no idea -- that document
8 didn't appear to be in anything. Where did that document
9 come from?

10 A. So in one of the earlier renditions -- and
11 Mr. Kristiansen alluded to this -- we had proposed a
12 loadout facility like you see in the Powder River Basin
13 for a train loadout some three miles long. That bond
14 estimate related to that activity in year 1.

15 Q. Okay. So the table, which didn't have any
16 accompanying narrative, was related to previous version of
17 what you were planning. You changed the plan, so that
18 table is no longer relevant. And you've now submitted an
19 estimate of what you feel is relevant for the -- what
20 you're planning to do in the first year at this point?

21 A. Correct.

22 Q. Okay. Okay. I think I'll -- I'll add this,
23 that I think -- I think you've been hearing this as
24 well -- you know, there's concern -- people want to know
25 as many details as possible because of the -- some of the

1 historic concern when things were done in a manner that
2 was not necessarily the best way to do things. You know,
3 that we have old mines out there that are subsidizing
4 because they weren't designed as well as they could have
5 been, which is all historical. But there's concern that a
6 new mine could exacerbate that. And also the concerns of
7 the water, which -- yeah, because of other activities that
8 weren't related to -- to your activity at all, but had
9 caused problems, people are concerned about that. So I --
10 I think it's -- we're going to hear those questions over
11 and over again. I know that's frustrating probably for
12 people. But it is important. These are important issues
13 and we need to know -- we also need to know what the law
14 tells us we have to do as well.

15 So with that, any other questions from council
16 members?

17 Mr. Sutphin.

18 MR. SUTPHIN: Thank you, Mr. Chairman.

19 REDIRECT EXAMINATION

20 Q. (BY MR. SUTPHIN) Mr. Barron, I'll just follow
21 up on a few of those questions. And let's just begin with
22 what Chairman Bagley was asking you about.

23 What is your -- I'm trying to think of a good
24 way to ask it. Do you believe that too many commitments
25 or too many details in the mine plan would render the

1 operations too rigid to be done safely?

2 A. Yes. There is opportunity for a permit
3 application to be overcommitted. As a matter of fact,
4 Mr. Emme had pointed out a portion of our permit
5 application that was overly constrained and actually
6 needed to be broadened in order to operate safely.

7 Q. So along those same lines, I think I've heard
8 you say now that you would be okay with any permit
9 condition that this council chooses to impose, right?

10 A. Yes.

11 Q. But I want to make sure that we're clear on
12 this. I mean, do you believe that any additional
13 conditions are necessary to protect the environment or for
14 this permit to be considered to be technically adequate?

15 A. At this point, I think the permit application is
16 sufficient to protect the safety of the residents. And
17 then in the discovery there were a couple additional
18 commitments that had already been stated, and I think
19 those are good additions.

20 Q. Okay. I want to be clear. And I -- because, in
21 my mind, there's a distinction between -- of course -- I
22 mean, will Brook Mine, in your opinion, respect the
23 decision of this council?

24 A. Yes. Absolutely.

25 Q. Okay. But are you suggesting to the council

1 that in some way the permit application is deficient?

2 A. No. I am not.

3 Q. So, for example, Mr. Gilbertz asked you about
4 conditions regarding blasting. Would you be okay limiting
5 it to certain times of day or maybe not doing it on
6 Christmas or Thanksgiving? Do you believe that adding
7 those types of restrictions would make the permit too
8 rigid to be done safely?

9 A. In some cases, yes. And Mr. Emme alluded to
10 this. In the case of an equipment breakdown in the middle
11 of a shot, if you were overly constrained to a certain
12 time period and your equipment broke down just before the
13 time period closed or some time where you couldn't repair
14 it, then you've got unexploded material sitting overnight
15 or even through a weekend and rendering it probably likely
16 to have an orange cloud where you wouldn't have one
17 before.

18 Q. Okay. So other than the conditions that the DEQ
19 witnesses have already explained, do you believe any
20 additional conditions are necessary or appropriate for
21 this permit?

22 A. Outside of those that have already been
23 suggested, no.

24 Q. Now, just briefly as to Councilwoman Lally's
25 comment about what happens if a water well is impaired and

1 you can't drill a new one and then the company goes out of
2 business. Would the reclamation bond cover the costs of
3 restoring a water well?

4 A. DEQ could ask for a line item to take care of
5 that, if necessary.

6 Q. On the subject of water wells, you had some
7 questions from Mr. Gilbertz about the Fishers' wells. Do
8 you remember that?

9 A. I do.

10 Q. Are you familiar with the Fishers' water wells?

11 A. I am, yes.

12 Q. Can you tell the council how deep those water
13 wells are drilled to?

14 A. They have one well that is 220 feet deep and
15 another well that is 170 feet deep.

16 Q. And what is that knowledge based on, Mr. Barron?

17 A. That is data that I've gathered from the state
18 engineer's website.

19 Q. Do you also have predictions about the amount of
20 drawdown that is projected to occur in the vicinity of the
21 Fishers' water wells as a result of Brook Mine's proposed
22 operations?

23 A. Our groundwater -- groundwater model predicted
24 about a 5-foot drawdown in those wells.

25 Q. Okay. Can you tell the council, as you sit here

1 today, what you believe the water column at the Fishers'
2 wells to be?

3 A. Data reviewed on the SEO websites says the well
4 that's closest to their house has a negative 4-foot
5 elevation, meaning it's somewhat artisanal at the surface
6 of the whole 220 feet of that well has water in it. And
7 then the second well that's 170 feet deep has a water
8 level that's 25 feet below the surface.

9 Q. And, again, where did you get this information?

10 A. This was at the SEO, State Engineer's Office.

11 Q. So based on what you have reviewed, can you
12 please tell the council -- again, you probably just said
13 it, but how -- how tall is the water column in the first
14 well at Fishers' place?

15 A. The water column in the first well is 224 feet.

16 Q. And what about in the second well?

17 A. The second well, the water column is 150 -- or
18 45 feet.

19 Q. So based on the projections from the groundwater
20 modeling, do you believe that there will be an impact on
21 the Fishers' wells?

22 A. The wells will be impacted, but they wouldn't be
23 substantively impacted.

24 Q. And why do you say that?

25 A. Because the model predicts only a 5-foot

1 drawdown. So in the 224-foot column of water, they'll
2 still have 219 feet of water in that well.

3 Q. Okay.

4 A. It will --

5 Q. I didn't mean to cut you off. I apologize,
6 Mr. Barron?

7 A. It would be the same for the other well.

8 Q. Let's talk very briefly about subsidence. I --
9 I don't have the map -- exhibit memorized, but what --
10 generally speaking, what is the surface area under the
11 mining panels as proposed by Brook? What sort of
12 conditions are on the surface as they exist today?

13 A. On the surface above the highwall mining panels,
14 it's just natural vegetation and drainages.

15 Q. Okay. Let me ask the question a different way.
16 Do any of the -- as far as you know, are there any homes
17 built on top of where your proposed mining panels are
18 going to be?

19 A. No.

20 Q. Are there any barns above where your proposed
21 mining panels are going to be?

22 A. No.

23 Q. What about shops or garages?

24 A. No.

25 Q. Okay. So -- I mean, the point I'm trying to

1 make, if -- if there is any subsidence, what -- what is
2 your opinion about where that subsidence will be located?

3 A. It will be located in open prairie.

4 Q. So if you're -- if we're out here constructing
5 one of these highwall panels, do you have any reason to
6 believe, based on your engineering expertise, that
7 somebody's house is going to fall in a hole half a mile
8 away?

9 A. No.

10 Q. But -- and I don't mean be flippant. Do you --
11 does Brook Mine consider subsidence an issue that needs to
12 be addressed as part of this process?

13 A. Yes. It's outlined in the permit application.

14 Q. There were some questions about how is DEQ going
15 to know if you're actually extracting 45 to -- 40 --
16 whatever the percentage was. I don't even remember. Can
17 you remind the council of what the technology on the
18 continuous miner allows you to do with respect to coal
19 extraction ratios?

20 A. So the continuous miner surveys as it goes into
21 each one of these drifts, and that information is turned
22 into a report on production that is given to DEQ, and so
23 we know exactly how much we removed.

24 Q. You had a question about whether or not you have
25 personally done any surveying for coal fires in the permit

1 area. Do you remember that?

2 A. Yes.

3 Q. As part of the permit application are you
4 required to do surveying to identify underground coal
5 fires?

6 A. No.

7 Q. In your opinion, who has more expertise
8 regarding subsidence control and prevention? Department
9 of Environmental Land Quality Division or MSHA?

10 A. In this case, MSHA.

11 Q. And what's that based on?

12 A. Because they review several mines in several
13 other areas outside of Wyoming and would have an expertise
14 in subsidence.

15 Q. You testified that you personally have not been
16 involved in a new permit for a coal mine. Do you remember
17 that testimony?

18 A. Yes.

19 Q. And we had some questions along these same
20 lines, but what about Western Water Consulting? Do you
21 have any knowledge of their involvement in new coal
22 permits?

23 A. Yes. We've been involved in new -- our company
24 has been involved in new permit applications.

25 Q. You spoke with Ms. Anderson about performance-

1 based standards. And just to clarify, are performance-
2 based standards a way of setting a standard while leaving
3 the method of compliance with that standard up to the
4 permit applicant?

5 A. Yes. So a performance-based standard, in a lot
6 of the guidance documents and some of the regulations, say
7 exactly that. It's a standard we have to meet. But how
8 we meet that standard is up to the operator.

9 Q. So just to wrap up, then. We'll end where the
10 cross-examination began, and those are questions from
11 Mr. Gregersen about the TR-1 area. Do you remember those
12 questions?

13 A. I do.

14 Q. And, again, to confirm, is it your understanding
15 that there are no monitoring wells in the vicinity of the
16 TR-1 area, right?

17 A. We -- we have not placed any monitor wells
18 there.

19 Q. And, again, because it's been overnight, please
20 remind the council why there are no monitoring wells in
21 the overburden in or around the TR-1 area.

22 A. While we were in the process of drilling and
23 placing monitor wells, we were escorted from the site by
24 the county sheriff.

25 Q. So, Mr. Barron, do you believe it's fair for

1 Brook -- or rather for Big Horn Coal Company to -- to
2 object to the lack of data in that area when they were the
3 ones responsible for not allowing you to gather that data?

4 A. I think it's somewhat disingenuous.

5 Q. So, again, just to conclude, do you believe that
6 the Brook Mine permit application file is technically
7 adequate?

8 A. I do.

9 Q. And do you believe that other than those
10 conditions that have been suggested by the Department of
11 Environmental Quality, there should be any additional
12 conditions placed on your -- on the Brook Mine permit?

13 A. I don't feel any additional restrictions are
14 required.

15 MR. SUTPHIN: The words you've been waiting
16 to hear, Mr. Barron. I have no further are questions.

17 CHAIRMAN BAGLEY: All right. Thank you,
18 Mr. Barron.

19 THE WITNESS: Thank you.

20 CHAIRMAN BAGLEY: We will take a 10-minute
21 break and so be back at 11:00.

22 (Hearing proceedings recessed

23 10:51 a.m. to 11:01 a.m.)

24 CHAIRMAN BAGLEY: All right. Let us
25 re-commence.

1 Any other witnesses, Mr. Sansonetti?

2 MR. SANSONETTI: Yes, Mr. Chairman. We
3 would like to call Mr. Ken Woodring to the stand.

4 (Witness sworn.)

5 KENNETH WOODRING,
6 called for examination by Brook Mine, being first duly
7 sworn, testified as follows:

8 DIRECT EXAMINATION

9 Q. (BY MR. SANSONETTI) Would you state your name
10 to the council, please.

11 A. Kenneth Woodring.

12 Q. And where do you live, Mr. Woodring?

13 A. I live in Greensboro, Georgia.

14 Q. What is your relationship with Ramaco and the
15 Brook Mine?

16 A. I am the senior adviser -- operating adviser for
17 the Brook Mine.

18 Q. And how long have you been associated with
19 Ramaco and the Brook Mine?

20 A. Just under five years.

21 Q. And what is the nature of your duties as the
22 senior operations adviser?

23 A. Primarily assisting with conceptual mine
24 planning.

25 Q. Let's talk about your background, how you came

1 to this position. What is your education?

2 A. I have a BS in mining engineering from
3 Pennsylvania State University. Graduated in 1972. I
4 attended the advanced management program at Harvard
5 Business School in 1996.

6 Q. Okay. When did you first become associated with
7 coal mining?

8 A. Well, during my college years I worked summers
9 and some weekends for Bethel Mines Corporation and
10 Pennsylvania Power & Light. Upon graduation, I took a job
11 with Pennsylvania Power & Light working at two large
12 underground mines in central Pennsylvania. They were
13 longwall operations. I had jobs as a construction
14 foreman, assistant longwall superintendent and ultimately
15 mine superintendent.

16 I left there in 1997 to join a new coal company
17 with operations and reserves in east Kentucky, southern
18 West Virginia. Ashland Coal decided it wanted to enter
19 low sulfur coal production at that point in time. And I
20 had the opportunity to go to work with a very young
21 company with some large reserves. I primarily was charged
22 with developing a large dragline surface mine in West
23 Virginia. The first dragline came into operation in 1982.
24 We did a second one in 1984.

25 In the latter part of the '80s, Ashland brought

1 in two other partners to try to take some of the capital
2 back off the table, and ultimately they went public with
3 the intention of further growing the company.

4 We purchased a company operating in the
5 Pikeville, east Kentucky area, Coal Mac, operating several
6 primarily surface mines, but with some contracting mines,
7 but operating three highwall miners around the properties.
8 That's my first involvement with highwall mining on a
9 day-to-day basis.

10 Q. What was the title of your responsibilities when
11 you were working for the Ashland, Kentucky coal mine?

12 A. At that point in time I was promoted to vice
13 president of operations, so I was responsible for all the
14 company's operations.

15 Q. Okay. And you noted in your first exposure to
16 highwall mining was approximately when? The late '80s?

17 A. Yes.

18 Q. Okay. And would you describe for the council
19 the size of operations that you have managed in your
20 district?

21 A. Well, at that point we had grown to 5, 6 million
22 tons a year. Further expansions included a very large
23 deep mine reserve we acquired in Mingo County, West
24 Virginia where we established a large longwall operation.
25 We also had a large contract surface mine and some smaller

1 contract deep mines associated with that property.

2 In the early '90s we acquired another large
3 surface property on which we added yet another dragline.
4 We were also operating two highwall miners on that
5 property. And at that point the company had grown to
6 about 20 million tons a year.

7 In 1997, Ashland Coal was merged with Arch
8 Mineral, forming Arch Coal. Ashland Oil had interest in
9 both those companies and had a very strong desire to get a
10 merger accomplished because we were at that point in time
11 competing with each other in Central App.

12 With that merger, I was made executive vice
13 president of operations for then a 40-million-ton-a-year
14 company. But that was my first real exposure to mining in
15 Wyoming. Arch Mineral had the old Seminoe Mines and
16 Medicine Bow Mines south here in the Hanna Basin, and were
17 actually operating a highwall miner there. So yet another
18 exposure to highwall mining and this time in Wyoming.

19 But getting to the 40 million tons and being
20 publicly traded, we were still looking at opportunities to
21 expand. In the late '90s ARCO decided to sell their coal
22 mining operations, which included Thunder Basin Coal
23 Company, Black Thunder, Coal Creek, three large deep mines
24 in Utah that contained fuel operations and a large deep
25 mine, excuse me, in Colorado, the West Elk Mine. And we

1 were successful winning that auction. We acquired those
2 properties. And at that point the company grew to about
3 hundred million tons a year.

4 Q. And what was your responsibility at that point?

5 A. Executive vice president of operations.

6 Q. Okay. And how many years did you end up working
7 for Arch Coal?

8 A. Well, I retired in 2005. But from the late '90s
9 until 2005, we grew Black Thunder. We did the LBA at
10 Thunder Cloud across the highway from the Black Thunder
11 office building and added a dragline there. Then we
12 acquired Triton mining operations to the south of Black
13 Thunder and consolidated the whole thing. At that point
14 Black Thunder was right at a hundred million tons a year.

15 So when I left the company, we were doing close
16 to 150 million tons per year. Worked on my golf handicap
17 for about a year and decided I wasn't going to make the
18 senior four, so I wanted to go back to work.

19 Q. So what brought you out of retirement?

20 A. I had the opportunity to join a company called
21 Trinity Coal, which was owned by a private equity firm.
22 They were in the process of attempting to merge their
23 company with another company, James River Coal Company.
24 And they hired me to come in as president and CEO and run
25 the merged entity once the merger was finished. So I went

1 to work. Unfortunately, we weren't able to get the merger
2 consummated, but they still had a very strong interest in
3 monetizing their investment. So I stayed on and we pretty
4 quickly did an auction. There was a change -- actually, a
5 beneficial change in the coal markets, and they decided
6 not to accept the offers they had. So they continued to
7 operate.

8 And in the late, you know, 2009 neighborhood, we
9 were able then to sell the company, the mining assets, to
10 an Indian-based, Mumbai-based company, SR Holdings, who
11 had the Algoma Steel plant on the Great Lakes and in
12 Canada and were developing an iron ore deposit in
13 Minnesota. So we were really just trying to consolidate
14 their steel operations with the met coal we were mining in
15 Trinity.

16 Q. So while you were president and CEO of Trinity
17 Coal, did you also have cause to oversee any other
18 highwall mines?

19 A. Yes. We were running at Trinity five highwall
20 miners.

21 Q. Okay. How did you get involved with Ramaco?

22 A. Well, when SR acquired the company, they were
23 very interested in growing the platform and became very
24 insistent with me that I bring in a business development
25 guy. And somehow he was able to pluck Mike Bauersachs

1 away from Massey Energy Company. He had been their
2 business development VP for 15, 20 years and very
3 successful and one of the very best in the business.

4 SR did, I think, genuinely intend to grow the
5 company, but we found out fairly quickly, within 12
6 months, that they had too many other things going on
7 internationally and really didn't have the capital to grow
8 the company. Mike got a little disenchanted and decided
9 to look at some other opportunities, which, in the end,
10 ended up with him partnering with Randy Atkins, Randall
11 Atkins of Yorktown Capital Partners, to form Ramaco.

12 Q. About what year would this have been?

13 A. In 2011 I retired from Trinity. Mike left a
14 little bit ahead of me. And I, again, worked on my golf
15 handicap and fished a little bit. But about a year after
16 my retirement from Trinity, Mike called and said we've got
17 some assets in Wyoming that I think you could help us
18 with, and they invited me to come in as a consultant and
19 help them with a conceptual mine planning here.

20 Q. Okay. Are you familiar -- and we'll zero in on
21 this particular permit application. Are you familiar with
22 the Brook Mine permit application?

23 A. I am.

24 Q. And did you work with Mr. Jeff Barron in regard
25 to the permit application?

1 A. Yes, I did.

2 Q. There's been a lot of discussion about the
3 abilities and background of the Cardno Company that
4 obviously helped produce some of these studies. What
5 interactions have you had with Cardno Company in your
6 history?

7 A. Well, historically, back really into the '80s, I
8 had done a lot of work on many of our acquisitions with
9 Cardno, evaluating reserves we were buying, certifying the
10 reserves we were buying. We were publicly trading. It
11 was important to have an independent consultant verify the
12 numbers. And also really at least do a sore thumb [sic]
13 on the mine plans that we were developing for those newly
14 acquired properties to give the board of directors some
15 comfort.

16 So Cardno has had, while varied experiences,
17 primarily Central App, but certainly worked wider. I
18 don't know how much work they've done in Wyoming, but I'm
19 sure they've done some. And, really, all the major coal
20 basins in the country.

21 Ramaco had been working, when I came on board,
22 excuse me, with Golder Engineering, a Denver-based
23 company. It's the old Marston & Marston Mining
24 Consultants. And had actually developed a conceptual mine
25 plan for the property that was more of an area strip, area

1 surface mine like you would see over in the Gillette area.
2 They had several scenarios. One was just shovel truck.
3 One was shovel truck with dragline. One was shovel truck
4 with some dozer assist in overburden production with a
5 dragline.

6 And they were good plans. And I looked through
7 those plans. I thought there might be a little better way
8 to do it, so we asked them to do another derivation, which
9 did turn out to be a little better, but still not getting
10 the cash cost structure down in the neighborhood that we
11 were trying to get to. And I -- I thought that perhaps a
12 highwall miner approach, which would not mine as many
13 reserves, but potentially mine them more cost effectively
14 could work.

15 So thinking back to the past, the Cardno folks
16 have done a lot of layout work for highwall miner
17 operations in the East. They know the folks that the --
18 that manufacture and operate the highwall miner systems
19 very well. So they just seemed like a logical solution,
20 recommended Ramaco that we bring them in to help with some
21 additional conceptual planning, and we did that.

22 They did a plan first in this Phase I area
23 that's being permitted presently in the subject permit.
24 They also did a Phase II plan on the eastern portion of
25 the property. By design Phase I was intended to cap at

1 about 2 million tons a year. Phase II's in a little
2 larger reserve area. It's designed to do about four
3 million tons a year. And assuming all those plans would
4 be implemented, Ramaco could either run for a longer
5 period of 2 million tons a year, or they could do
6 6 million tons a year if everything was mobilized at the
7 same time. So we thought we had a good solution, flexible
8 solution. The cost structure pretty good. And at that
9 point Ramaco directed that we move forward with the
10 permitting. And Jeff Barron's been involved from the
11 get-go there.

12 Q. Okay. So just briefly describe the mine plan
13 from an operational point of view.

14 A. Well, as we discussed it's a series -- primarily
15 a series of trench cuts in Phase I with highwall miner
16 panels on either side.

17 Q. Okay. Once the permit is issued, there's been
18 discussion about the need to do additional studies. What
19 type of additional technical studies will be performed
20 prior to mining actually commencing?

21 A. Primarily the ground control plan, the
22 subsidence issue we've been talking about. And as
23 Jeff Barron pointed out, as we move in each new set of
24 highwall miner panels, we'll have strata samples taken of
25 the immediate roof, the coal seam and floor material.

1 That information, along with the geological information in
2 that area, the height over the coal seam that we're
3 mining, the thickness of that coal seam, will be run
4 through the ARMPS process, and that then will tell us what
5 size webs we need between those holes, depending, again,
6 on the cutting height, to provide a safety factor of 1.3,
7 which should, then, in turn provide for no surface
8 subsidence.

9 Q. You were present during the testimony of
10 Mr. Barron?

11 A. Yes.

12 Q. And you heard the questions asked of him by the
13 chairman in regard to walls and pillars and webs and
14 things like that. Do you have anything to add to help
15 make that more clear as to whether or not we're talking
16 about holes and walls and some big walls?

17 A. Well, I call the penetration the hole -- I call
18 it hole or a cut. The in between webs I typically call a
19 web. And then the larger web between several holes and
20 web series is a barrier pillar that he alluded to. And it
21 provides you another safety device that if, for whatever
22 reason, there would be a failure in that segment, it would
23 be stopped at that barrier pillar and not override into
24 next set of panels.

25 Q. Okay. Were you also present yesterday when

1 DEQ's Mr. Emme testified?

2 A. I was.

3 Q. And did you hear his testimony in regard to the
4 topics of both blasting and bonding?

5 A. Yes.

6 Q. Is it Ramaco's intention -- Brook Mine's
7 intention to abide by DEQ's rules and regulations in
8 regard to bonding and blasting?

9 A. Absolutely.

10 Q. How would you compare the plan of Brook Mine to
11 others that you have been involved with?

12 A. Well, by Wyoming standards it's a small mine.
13 Compared to Black Thunder, there's just no comparison.
14 It's, in my opinion, much more similar to an eastern
15 surface mine. The equipment for the Phase I area is a
16 992 Cat loader and three 777 Cat trucks. You would find
17 that complement of equipment on a lot of small mines
18 around in southern West Virginia, Kentucky. A mine
19 running that equipment is going to move 3.3, 3.4 million
20 yards of overburden a year. In the East, that's just a
21 couple hundred thousand tons of production. Here it's
22 more than that. Coupled with a highwall miner, it's 2
23 million tons per year. The mining ratios here are just
24 4-to-1 and in the East they're typically in the high teens
25 or even little bit higher.

1 So the overburden activity, which is the primary
2 activity on any surface mine, is comparable to one of
3 those mines in the East. And they're very common.
4 They're all over the place. I've been involved in
5 goodness knows how many of them. They're efficient. They
6 typically don't run on reserves quite as large as this
7 reserve variably. And they might mine for five or six
8 years and then move on to another site.

9 They're often coupled with highwall miner
10 operations. The highwall miner cost structure is far
11 superior to the surface mine structure so the overall
12 project is just far more economical to run, if you can
13 work a highwall miner --

14 Q. Mr. Woodring, have you operated highwall mines
15 in areas with similar density as far as landowners are
16 concerned --

17 A. Yes.

18 Q. -- surrounding the mine?

19 A. Yes, sir. Many of the eastern mines, really.
20 Most of the eastern mines are in mountains surrounded by
21 valleys or hollows. And the topography is such in the
22 east that most of the people live in the valleys. There's
23 usually no good way to get up on top of the mountain. And
24 if you do, there's no flat land up there to build on.
25 There is a small river valley with some flat land on

1 either side, but the hills are very steep. The valleys
2 are not anywhere near the broadness of the Tongue River
3 Valley here. So there are people in very close proximity
4 to the base of that mountain and it's challenging.
5 They're very close to the mine and -- but with the proper
6 blasting and other safety measures, it -- it's not an
7 issue at all, and that's just the way most eastern mines
8 operate.

9 Q. Do we have any doubts about being able to
10 operate this particular Brook Mine with the same safety
11 and health --

12 A. Oh, none --

13 Q. -- concerns?

14 A. None whatsoever.

15 MR. SANSONETTI: Okay. I have no further
16 questions.

17 CHAIRMAN BAGLEY: Thank you,
18 Mr. Sansonetti.

19 Mr. Kuhlmann, any questions?

20 MR. KUHLMANN: No questions for this
21 witness. Thank you.

22 CHAIRMAN BAGLEY: Thank you.

23 Mr. Gregersen?

24 MR. GREGERSEN: Mr. Chairman, we have no
25 questions.

1 CHAIRMAN BAGLEY: Ms. Anderson.

2 MS. ANDERSON: Thank you, Mr. Chairman.

3 I just have a few questions, Mr. Woodring.

4 CROSS-EXAMINATION

5 Q. (BY MS. ANDERSON) Good morning. How are you?

6 A. I'm good. How are you?

7 Q. Good. I'm doing well.

8 So you talked a little bit about this. So can
9 you just clarify again what's your current role with
10 Ramaco?

11 A. I'm senior operations adviser for the Brook
12 Mine.

13 Q. Okay. And do you plan to be involved with the
14 Brook Mine going into the future?

15 A. That's up to Ramaco. I do have an engagement
16 agreement with them that runs for about the next year. At
17 this point I would expect that I will be around, but,
18 again, in advisory role, not a day-to-day operating role
19 in the coal mine.

20 Q. Okay. Great. That answers my next question for
21 me without even asking it.

22 Okay. All right. We've heard some testimony
23 about -- you know, that the company isn't planning to
24 mine, at least in the first year of its permit, right?

25 A. That's correct.

1 Q. Okay. You're just going to move some dirt
2 around? I mean, that's probably a general way of saying
3 it, but --

4 A. Yes.

5 Q. Okay.

6 A. Topsoil.

7 Q. Topsoil. Okay.

8 And we've heard, you know, a lot about the
9 testimony about various geotechnical and hydrologic
10 studies that still need to be done before the company
11 starts mining, right?

12 A. Uh-huh.

13 Q. Okay. And we've heard some testimony about
14 other permits the company still has to get, like a WYPDES
15 permit or MSHA permit?

16 A. (Deponent nods head.)

17 Q. Right?

18 A. Yes.

19 Q. Okay. So I guess my question to you,
20 Mr. Woodring, given all this, when is the company even
21 going to start mining?

22 A. I'm sorry?

23 Q. When is the company going to start mining?

24 A. Well, we'd have to have a mining permit. And we
25 can't go to potential customers and try to sell people

1 coal if we can't tell them when we expect to start the
2 coal mine. That's been a difficulty now for quite some
3 time, and we're just anxious to get to that point where we
4 can move forward with process. And it's very involved.

5 Q. Okay. So sitting here today, you don't know
6 when the company's going to start mining?

7 A. If you tell me when we're going to get the
8 permit, I can give you some pretty good ideas.

9 Q. I don't think that's under my control.

10 All right. So given all of this, if you were
11 sitting in the shoes of one of the neighbors to this mine,
12 would you characterize this as a speculative permit?

13 A. I'm sorry?

14 Q. Would you characterize this permit application
15 as speculative?

16 A. In what regard?

17 Q. In regard that you don't know when you're going
18 to mine or you don't know who you're going to sell the
19 coal to.

20 A. No.

21 Q. Why not?

22 A. I think that's fairly common.

23 Q. That's fairly common. Okay.

24 Mr. Woodring, is public confidence in your coal
25 mine project a concern of yours?

1 A. Again, it's not my company, but I think that's a
2 normal concern for anyone operating anything anywhere.

3 Q. Okay. Thank you for that.

4 Have you read the objection letters to this
5 permit application?

6 A. I have certainly perused through them.

7 Q. But you haven't read them in all detail?

8 A. No.

9 Q. Okay. Would you agree, generally, that there
10 are a lot of concerns and questions from the public about
11 this coal mine permit application?

12 A. Well, certainly based on what I've looked at
13 there are concerns, but I think they're fairly common
14 concerns for anyone's opening a coal mine.

15 Q. You mentioned a lot of your experience back East
16 in Appalachia. Is it similar to get, you know, a dozen
17 permit letter objections to coal mine permits out there?

18 A. Oh, sure.

19 Q. Sure. Okay.

20 So given the concerns, what have you or other
21 agents or employees in your company done to alleviate the
22 concerns of neighboring landowners?

23 A. Well, trying to develop a good operating plan
24 and a good valid permit.

25 Q. And have you reached out to, say, Mr. Buyok?

1 A. I haven't personally.

2 Q. Have you reached out to Mr. Bocek?

3 A. I haven't personally reached out to anybody.

4 Q. Okay. Does the company plan to have any public
5 meetings or, I guess, open dialogs with landowners in the
6 area?

7 A. I don't know.

8 Q. You don't know. Okay.

9 MS. ANDERSON: I think that's all for you.

10 Thank you.

11 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.

12 Mr. Gilbertz.

13 CROSS-EXAMINATION

14 Q. (BY MR. GILBERTZ) Good morning, Mr. Woodring.

15 A. Morning.

16 Q. My name is Jay Gilbertz. I'm an attorney for
17 Mary and David Fisher. I have only a few questions for
18 you.

19 A. Uh-huh.

20 Q. You spoke a little bit about your experience in
21 managing and running coal mines.

22 A. Yes.

23 Q. And so in the course of this hearing, we've sort
24 of heard that, you know, these are evolving operations.
25 Not all contingencies can be planned for. Does that sound

1 correct to you?

2 A. Yes.

3 Q. Okay. And so then what we sort of know is that
4 unforeseen problems might be encountered during coal
5 mining, right?

6 A. They do at any coal mine.

7 Q. And because the previously unforeseen problems
8 or contingencies, those sorts of things are not covered by
9 the reclamation bonds, right?

10 A. Some of them well could be, but certainly things
11 come up and company must address that have nothing to do
12 with the reclamation bond.

13 Q. Let's go ahead and make it specific to the
14 permit we have in front of us. What Brook's told the
15 council is that Brook is confident that there won't be
16 impacts to the alluvial valley floor aquifers. Is that
17 your understanding?

18 A. Yes.

19 Q. And also that there wouldn't be any other
20 impacts to hydrology that are going to impact the
21 landowners, right?

22 A. Of substance in a negative way.

23 Q. Not -- not affect them negatively?

24 A. Yes.

25 Q. Okay. And there's a belief that subsidence for

1 this will be a nonsubsiding mine; is that right?

2 A. That's correct.

3 Q. And, therefore, if those things were to happen
4 in these circumstances in an unforeseen fashion, they
5 wouldn't be covered by the reclamation bond that is being
6 proposed, right?

7 A. Potentially not.

8 MR. SANSONETTI: Do you know the answer to
9 that question? Have you studied the bond?

10 MR. GILBERTZ: He's answered already.

11 A. Well, I think in cases they could be and other
12 cases they might -- might not.

13 Q. (BY MR. GILBERTZ) Okay. Let's then -- in most
14 circumstances, that's when the mine operator would need to
15 rely on its resources in order to remedy any of these
16 unforeseen problems, right?

17 A. That's correct.

18 Q. Okay. Can you tell me who Byron Ubernosky is?

19 A. No.

20 Q. Okay. Are you aware that Brook Mine's formal
21 report under penalty of perjury with the Wyoming Secretary
22 of State reveals that its assets everywhere are worth
23 \$250,000 or less.

24 A. I'm not familiar with that.

25 Q. Okay. At this point in time, Ramaco itself has

1 not agreed to guarantee the reclamation or environmental
2 liabilities of Brook Mine, has it?

3 MR. SANSONETTI: I'm going to have to
4 object there, Mr. Chairman. Where is this line of
5 reasoning going on? We're here because of a permit and
6 whether or not it's technically adequate. This is some
7 sort of examination of financing and the like, which is
8 beyond the scope of direct and certainly beyond the mine
9 operator's knowledge.

10 MR. GILBERTZ: Happy to respond to that.

11 The door to this has been blown wide open. This
12 whole hearing we have heard that these are unforeseen
13 contingencies, contingencies will be dealt with and the
14 operator will step up. The statute requires that the
15 demonstration -- that the reclamation plan can be
16 accomplished. The fact that Brook Mine itself has less
17 than \$250,000 in total assets is directly relevant to
18 whether it can fulfill those obligations.

19 CHAIRMAN BAGLEY: That would seem to be
20 related to the bonding. My understanding, the bonding is
21 not set until after -- before -- immediately before the
22 permit is approved, after this meeting.

23 MR. GILBERTZ: Dr. Bagley, I think that's
24 precisely the point. The bonding, as we have been told,
25 isn't going to cover any of these things, and, therefore --

1 MR. SANSONETTI: That's not true. That's
2 not true.

3 CHAIRMAN BAGLEY: Well, the bonding -- my
4 understanding from yesterday's discussion is the bonding is
5 one year at a time. The DEQ reviews that prior to the --
6 the year beginning and the bond has to be set.

7 MR. SANSONETTI: And the bonding was also
8 not self-bonding.

9 CHAIRMAN BAGLEY: We did also hear that.

10 MR. SANSONETTI: That's right.

11 MR. GILBERTZ: My question --

12 CHAIRMAN BAGLEY: So, yeah, the
13 financial --

14 MR. GILBERTZ: Here's what I'm going to do,
15 is I'm going to make an offer of proof for the record. And
16 I will offer the filings of Brook Mine for 2015 and 2016
17 with the Wyoming Secretary of State, which revealed that
18 they only paid \$50 in filing fees, which can only be
19 accomplished if the value of all assets reported by the
20 filing LLC are worth \$250,000 or less. And I'll ask that
21 the council receive these as an offer of proof.

22 CHAIRMAN BAGLEY: What Mr. -- okay. We
23 will receive that as -- as a -- an offer.

24 MR. GILBERTZ: Thank you. I have no
25 further questions.

1 CHAIRMAN BAGLEY: Thank you, Mr. Gilbertz.
2 Mr. Sansonetti.

3 MR. SANSONETTI: No further questions.

4 CHAIRMAN BAGLEY: Forgot to ask the
5 council.

6 COUNCIL MEMBER BAUMER: No questions.
7 Thank you.

8 CHAIRMAN BAGLEY: Questions? Questions?
9 Do you have any questions?

10 COUNCIL MEMBER AGOPIAN: No.

11 CHAIRMAN BAGLEY: Meghan?

12 COUNCIL MEMBER LALLY: No, thank you.

13 CHAIRMAN BAGLEY: I'm trying to see if I
14 have some questions. I do have some questions.

15 EXAMINATION

16 Q. (BY CHAIRMAN BAGLEY) Mr. Woodring, you
17 mentioned different phases, and so I got confused.
18 and you mentioned 2 million tons per year in -- at
19 one point in production. You mentioned 6 million tons
20 per year production. And so I got confused. What --
21 this current mine plan we're looking at, do you -- do
22 you recall or do you know what the production is for
23 this mine plan?

24 A. It's on for 2 million tons a year. This is the
25 Phase I. There is a Phase II, which is the permit

1 application hasn't been completed yet.

2 Q. So Phase II is a -- a separate -- complete
3 separate?

4 A. Correct.

5 Q. These seven trenches and things that we're
6 looking at this --

7 A. Has nothing to do with this.

8 Q. -- are 2 million tons per year?

9 A. That's correct.

10 CHAIRMAN BAGLEY: Okay. Thank you. That
11 was my only question.

12 So now, Mr. Sansonetti, I still -- since I got
13 out of order, do you have any redirect?

14 MR. SANSONETTI: I don't. I said we would
15 get done in 30 minutes, and we are 29.

16 CHAIRMAN BAGLEY: All right. Thank you,
17 Mr. Woodring.

18 Do you have any other witnesses?

19 MR. SANSONETTI: We do not.

20 CHAIRMAN BAGLEY: So it is 11:35. We are
21 at, I think, a good point to take say an hour and 15 minute
22 lunch break. So little bit early for lunch, but then we
23 come back and we will start with Big Horn Coal witnesses.
24 So let us say at 10 to 1:00 we'll be back. We're in
25 recess.

1 (Hearing proceedings recessed

2 11:35 p.m. to 1:51 p.m.)

3 (Council Member Degenfelder

4 is no longer present.)

5 CHAIRMAN BAGLEY: All right. Let's go
6 ahead and get started.

7 So, Ms. Boomgaarden, please call your first
8 witness.

9 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

10 Big Horn Coal calls its first witness,
11 Mr. Jordan Sweeney.

12 And I've advised Mr. Sweeney that there is a
13 witness notebook right there in front of him. There you
14 go. That has Big Horn's exhibits.

15 I apologize to the council --

16 THE REPORTER: Oops. Swear him in or --

17 MS. BOOMGAARDEN: Yes. Thank you.

18 (Witness sworn.)

19 JORDAN SWEENEY,
20 called for examination by Big Horn Coal, being first duly
21 sworn, testified as follows:

22 MS. BOOMGAARDEN: Thank you.

23 I apologize in advance for the poor quality of my
24 voice and the fact that I've been the one interrupting the
25 audio-recording with coughing. I am trying my best to keep

1 that under control. I don't think I have anything
2 contagious. I think it's just an allergy-asthma issue I'm
3 dealing with this afternoon.

4 So, Mr. Sweeney, if you can't hear me, please say
5 so, and I'll speak up.

6 DIRECT EXAMINATION

7 Q. (BY MS. BOOMGAARDEN) Now, Mr. Sweeney I know
8 you testified in front of this council before.
9 Councilwoman Baumer was not at the council at that time,
10 so we're going to be conscientious with going through a
11 few of these exhibits to at least allow some familiarity
12 for Councilwoman Baumer and to get some information on the
13 record. But please understand council members are not
14 going to exhaustively go through certain of these exhibits
15 that I know many of you already have some familiarity
16 with.

17 Mr. Sweeney, if you could first please turn to
18 what has been marked as Big Horn Coal Exhibit BHC 1. And
19 do you see that exhibit?

20 A. I do.

21 Q. Can you please identify it?

22 A. That is my resume.

23 Q. And in the interest of time, we'll have the
24 council review for themselves your education and prior
25 experience. It says you're currently the regulatory

1 affairs manager for Lighthouse Resources; is that correct?

2 A. That is correct.

3 Q. And the general manager for Big Horn Coal?

4 A. Yes.

5 Q. Can you please just briefly describe what your
6 responsibilities are in those roles.

7 A. Yes. As the regulatory affairs manager for
8 Lighthouse Resources I am responsible for all the
9 permitting and overseeing activities for coal operations
10 that Lighthouse owns and managers.

11 Q. And for Big Horn Coal, what's your
12 responsibilities here in the Sheridan area?

13 A. For Big Horn Coal, it is an active mine permit,
14 and it is in stages of reclamation. We do have operations
15 going on with utilization of the shop and rail spur. So I
16 manage the properties from Big Horn -- Big Horn mine.

17 Q. Have you ever been responsible for preparing and
18 submitting a mine permit application to the DEQ Land
19 Quality Division?

20 A. I have been in the permitting -- or
21 environmental realm for about 10 years, and I have
22 prepared and submitted various types of permit
23 applications to the DEQ.

24 Q. Have you ever prepared and submitted a new
25 permit application?

1 A. I have not prepared and submitted a new permit
2 application.

3 Q. A major revision?

4 A. Yes, I've submitted major revisions.

5 Q. Renewals?

6 A. Yes.

7 Q. And your role in preparing and submitting those,
8 could you describe that a little more fully?

9 A. Yes. So as a permit coordinator or
10 environmental engineer in my past, I am responsible for
11 working with landowners, working with outside independent
12 consultants to collect the necessary baseline data and
13 perform the proper analysis of that data. And to
14 incorporate that into existing permits, revising the
15 permit text for those amendments or revisions, and
16 submitting that in collaboration with the DEQ.

17 Q. And were those permitting activities related to
18 surface mining?

19 A. They were.

20 Q. Have you done any permitting for underground
21 mining?

22 A. No underground mining permitting, no.

23 Q. How about highwall mining?

24 A. I have been involved with highwall permitting at
25 the Black Butte Mine. We did some highwall mining in the

1 year 2007.

2 Q. So is it fair to say that you have direct
3 personal knowledge and experience with the Wyoming coal
4 permitting requirements and processes?

5 A. I do.

6 Q. Excuse me.

7 A. Sorry. I do.

8 Q. Tell us a little bit about Lighthouse Resources.

9 A. So Lighthouse Resources is a resource-based
10 company. They own various coal resources and mine those
11 various coal resources throughout the states of Wyoming
12 and Montana. And they also have an interest in port
13 facilities in the Pacific Northwest where the business
14 strategy for the Decker coal mine, for example, up in
15 Decker, Montana, is to export that resource to Asian
16 customers, mainly Japan and South Korea.

17 Q. And please tell the council what the
18 relationship is between Lighthouse and Big Horn Coal?

19 A. So Big Horn Coal is a direct subsidiary of
20 Lighthouse Resource -- Resources, Inc. -- Lighthouse
21 Resources. And it is owned 100 percent by Lighthouse
22 Resources.

23 Q. And when did Lighthouse acquire Big Horn Coal's
24 operations and assets?

25 A. It was a transaction that occurred during

1 November of 2011, when Ambre Energy came to the United
2 States and they acquired the Level 3 properties, formerly
3 managed by Kiewit Mining Group. And that occurred in
4 November of 2011. And then in September 2014 we had a
5 name change from Ambre Energy, which you may know that
6 name, to Lighthouse Resources.

7 Q. And just please remind us when you began working
8 for Lighthouse Resources?

9 A. I was working at the Black Butte Mine during the
10 transaction, and shortly thereafter, February of 2012, I
11 came down to the Salt Lake office and began working for
12 Lighthouse Resources.

13 Q. Thank you.

14 I'd like you to turn to what we've marked as
15 Big Horn Exhibit 2. And I'd like to use this exhibit to
16 allow you to briefly acquaint the council members with
17 Big Horn's interests in the areas -- mine permit areas
18 that we've been talking about. Do you recognize
19 Exhibit 2?

20 A. I did. I put that exhibit together.

21 Q. And what was the source information that you
22 used for that exhibit?

23 A. A couple sources. The aerial photograph in the
24 background, you can see that it may be two different
25 shades. That's due to various years of that aerial

1 photograph. And that was pulled from an ARMP map program,
2 GIS software. And also you can see the trench cuts. The
3 TR-1 trench cut, TR-2 trench cut, and this pink hatched
4 polygon on this exhibit. And those were taken directly
5 from the Brook Mine permit application and superimposed
6 onto this exhibit.

7 Q. Thank you. I think we've had a fair amount of
8 discussion with regard to the trench 1 and trench 2. But
9 what about that pink hatched polygon? Can you please
10 explain how that area is denoted in the mine permit
11 application?

12 A. So the legend is very hard to read, but down
13 here in the bottom left-hand corner, states Brook surface
14 disturbance. All the area within that pink boundary could
15 be disturbed at one time or another by the Brook
16 operation.

17 Q. And how does that disturbance area in the pink
18 crosshatch relate to Big Horn Coal's existing permit
19 boundary?

20 A. That occurs with inside the Big Horn permit
21 boundary. As you can denote by the red polygon, that is
22 the current Big Horn permit boundary. And the yellow --
23 the polygon -- is the Brook Mine permit boundary. You
24 notice it overlaps. Also, pointed out -- I can point out
25 on this map the vicinity of the Big Horn mine that's

1 located just about six miles north of the town of
2 Sheridan. I-90 is located to the west of the operation.
3 County Road 338 is located to the south and east of the
4 operation. This blue big polygon to the south and east of
5 the Big Horn permit boundary is a state coal lease that is
6 currently leased by Big Horn Coal Company.

7 Also denoted on this map is the Big Horn rail
8 spur outlined in this blue line. The green line on this
9 map that goes up and through the Big Horn -- or pink
10 crosshatched area is the Big Horn Coal access road, which
11 is currently classified an approved post-mine access road.

12 Just north of the pink disturbance area is the
13 Big Horn shop. So that shop was used during mining and is
14 still being used. We had tenants in that facility. And
15 directly to the east of that shop is a bridge. And that
16 is going across the Tongue River, and that is how the Big
17 Horn accesses the lands north of the Tongue River. At
18 this time, that's about it.

19 Q. Thank you.

20 If you could bring your attention back to the
21 TR-1 trench. I want to make sure that the council
22 understands the relationship of that trench. So you're
23 showing from here it looks kind of like a brown polygon
24 that's oriented horizontally. Can you please put your
25 pointer on the TR-1 trench?

1 A. That's correct. The legend states the brown
2 crosshatched, located directly south of the shop area.

3 Q. And if you were to orient that to the Skittles
4 map that we've all become so familiar with this week, that
5 Skittles map seems to extend further both to the north and
6 south of that trench. Can you just please explain the
7 difference between the trench and what is shown on that
8 Skittles map?

9 A. Certainly. So that trench, also known as a box
10 cut, is where the surface mining would occur. So the dirt
11 material would be removed out of that trench, or box cut,
12 and then highwall miner would go in and penetrate with the
13 panels going south and north from that trench cut.

14 Q. And, Mr. Sweeney, is it your understanding this
15 TR-1 area is the first area that Brook intends to mine?

16 A. That is correct.

17 Q. As part of your responsibilities to manage Big
18 Horn Coal operations and assets, are you responsible for
19 monitoring Brook Mine's plans and overlapping permitting
20 activities?

21 A. I was, yes.

22 Q. I'm going to ask you to please turn to Big Horn
23 Exhibit 3. Can you please identify that exhibit?

24 A. This is a document dated January 25, 2017. It
25 is addressed to Mr. Alan Edwards of Wyoming DEQ. And it

1 is the Big Horn objections filed on behalf of -- filed by
2 Big Horn on the review of the Brook Mine application.

3 Q. And is that your signature at the end of the
4 letter?

5 A. It is.

6 Q. And what was the purpose of you sending this
7 letter?

8 A. During the review of the Brook Mine permit
9 application, myself and independent experts that I
10 solicited help from to review that permit application, we
11 denoted some technical deficiencies that we felt the DEQ
12 should be aware of and should address as a result of --
13 result of this letter.

14 Q. And what was your expectation? What result did
15 you think would come from sending that letter to
16 Mr. Edwards?

17 A. It was our intention to have an informal
18 conference with the administrator, deputy administrator,
19 Mr. Edwards, to discuss the -- what we felt -- Big Horn
20 felt was technically deficient with the permit as relates
21 to the surrounding environment in this area.

22 Q. And did you -- did Big Horn request an informal
23 conference?

24 A. We did, yes.

25 Q. Thank you.

1 Let's talk a little bit further about the Big
2 Horn objection letter at Exhibit 3. Did you prepare the
3 letter by yourself?

4 A. I did not.

5 Q. I think you alluded to this, but who else helped
6 you prepare the text of each objection?

7 A. I solicited help from independent professional
8 experts.

9 Q. And who hired those experts?

10 A. I did.

11 Q. How did you determine who you wanted to hire?

12 A. Big Horn has a working relationship --
13 well, actually the parent company, Lighthouse, has a
14 working relationship with Aqua Terra Consultants, so
15 Mr. Joe Gerlach, as well as with Millcreek Engineering,
16 Mr. Jason Todd. And I specifically solicited the help
17 from the two of them based on their professional
18 experience, as well as their history and knowledge of the
19 area.

20 Q. Thank you.

21 What did you ask them to do?

22 A. I asked them to review the Brook Mine
23 application and to -- based on their areas of expertise,
24 to provide just their opinions and general comments on the
25 technical adequacy of the mine plan application.

1 Q. What did you tell them about Big Horn Coal's
2 interests?

3 A. I did not tell them anything about the interest
4 of Big Horn Coal.

5 Q. Did you instruct them to provide any specific
6 opinions?

7 A. I did not.

8 Q. Did you ask them to reach any particular
9 conclusions?

10 A. No.

11 Q. What did they provide you?

12 A. Based on their review, they provided me comments
13 related to their areas of expertise on what they felt was
14 deficiency in the mine plan application.

15 Q. And how did you use what they provided in
16 preparing the January 25th letter?

17 A. So I incorporated those comments into the
18 January 25th letter and submitted it to the DEQ.

19 Q. You mentioned that you solicited Mr. Jason
20 Todd's input on the mine permit application. Did I
21 understand that correctly?

22 A. I did, yes.

23 Q. And that Mr. Jason Todd work for Millcreek?

24 A. He worked for Millcreek Engineering, yes.

25 Q. And you probably heard in discussion at the

1 beginning of this hearing objections to this objection
2 letter on the basis that Mr. Todd was not going to be
3 available at hearing. Did you hear those comments?

4 A. I did, yes.

5 Q. And why isn't Mr. Jason Todd available for this
6 hearing?

7 A. He informed us shortly after this letter was
8 submitted that he was no longer going to be working for
9 Millcreek Engineering by the date of May 1st, and that he
10 would not be available to testify to these comments after
11 that date.

12 Q. When you asked Mr. Gerlach from Aqua Terra to
13 review Brook Mine's application, did you know that he had
14 previously done work for Brook Mine?

15 A. I did not.

16 Q. When did you first learn of Mr. Gerlach's prior
17 contract with Brook Mine?

18 A. After the January 25th letter was submitted to
19 the DEQ, and we learned we were not having an informal
20 conference with the director of the DEQ, that we were
21 going to prepare for a contested case hearing in front of
22 this EQC council did I find out that Mr. Gerlach had
23 previously worked for the Brook Mine.

24 Q. And at that time, did you consider whether
25 Mr. Gerlach should testify at this hearing?

1 A. I did, yes.

2 Q. And what did you determine?

3 A. I left that up to Mr. Gerlach's discretion and
4 his overall decision whether he felt comfortable
5 testifying in this proceeding.

6 Q. Does Big Horn Coal want to prevent Brook from
7 mining coal in Sheridan County?

8 A. No.

9 Q. In fact, did Ramaco and Big Horn once enter into
10 an exploration agreement?

11 A. We did. From July 19, 2012 through July 19,
12 2014, Big Horn Coal Company had an exploration -- let me
13 back up. AE Coal, LLC had an exploration agreement with
14 Ramaco, LLC to conduct exploration activities, as well as
15 to collect necessary baseline data for permitting a
16 surface coal mine in this area.

17 MS. BOOMGAARDEN: And if it is okay with
18 the council, just for purposes of being efficient, we'll
19 sometimes refer to Ramaco or Brook synonymously. And the
20 difference is the date these different things occurred and
21 who was acting at that time, whether it was Ramaco and then
22 later Brook, or whether it was AE Coal, Ambre Energy,
23 Lighthouse or Big Horn Coal. And if we could refer to
24 those synonymously so we don't have to get tripped up on
25 necessarily which name we're using, if that's acceptable.

1 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, you said that
2 that agreement was ended in July -- on July 19th of 2014.
3 What happened at that time? Did the agreement -- did Big
4 Horn Coal terminate the agreement?

5 A. It did not. It just lapsed. It was a two-year
6 agreement and it was not renewed.

7 Q. And did Ramaco offer Big Horn any explanation as
8 to why they let that agreement lapse?

9 A. No.

10 Q. Did you hear Mr. Barron testify both yesterday
11 and today that Big Horn denied Ramaco access to gather
12 data in the TR-1 area?

13 A. I did.

14 Q. Was that statement accurate?

15 A. That statement was not accurate.

16 Q. Did Brook ask permission to enter Big Horn lands
17 to drill after the exploration agreement lapsed?

18 A. No.

19 Q. Are you familiar with the incident that
20 Mr. Barron mentioned where the sheriff, according to
21 Mr. Barron, escorted Brook off Big Horn's property?

22 A. Yes, I was aware of that incident.

23 Q. And do you know when that occurred?

24 A. That occurred February 20, 2015.

25 Q. And were you present on the property during that

1 incident?

2 A. I was not. I was in Salt Lake City, Utah.

3 Q. And so how did you come to learn about the
4 incident?

5 A. A coworker from the Decker mine had gone down to
6 Big Horn to run his dogs on the evening of the 19th of
7 February. And he emailed me the next morning to inform me
8 that there was a drill rig and a water truck parked within
9 the Big Horn property gates and the truck had a name on it
10 by the name of Pronghorn Drilling.

11 Q. And had Pronghorn Drilling requested permission
12 for you -- from you or anyone at Big Horn prior to setting
13 up their rig?

14 A. No, they did not.

15 Q. Had Ramaco requested permission from you or
16 anyone at Big Horn to have Pronghorn drill on your
17 property?

18 A. No, they did not.

19 Q. So how did you learn -- how did Big Horn learn
20 that Pronghorn was one of Ramaco's contractors?

21 A. We had an employee -- after I learned about --
22 the morning of the 20th I learned about the drill rig and
23 water truck being on the property, I had a representative
24 from the Decker mine, his name is Mr. Russ Noble. He's a
25 maintenance supervisor for the Decker mine. I had him go

1 down to the mine site to check it out, to verify that the
2 truck and drill rig were still at the premise -- on the
3 premises and had him contact the sheriff's office to
4 escort them off the property.

5 Q. Are you aware of a sworn affidavit that
6 Mr. Noble prepared and that was filed in state district
7 court in Sheridan County reciting the events that occurred
8 on February 20th?

9 A. There was an incident that occurred while
10 escorting the drill rig off the report.

11 Q. Excuse me, Mr. Sweeney. My question is are you
12 aware of an affidavit that Mr. Noble prepared, a sworn
13 affidavit?

14 A. Yes. Sorry. I am aware of the affidavit.

15 Q. Thank you.

16 I'm going to ask Mr. Gregersen to bring that
17 affidavit up on the screen and ask Mr. Sweeney if he can
18 please take a look at that and identify whether that is
19 the affidavit, as Mr. Noble's supervisor, that he has
20 knowledge of.

21 A. Yes. Yes, the affidavit of Russ Noble.

22 Q. Can you please state the date that's on that
23 affidavit.

24 A. February 20, 2015.

25 Q. Okay. And is it your understanding that this

1 sworn affidavit recites the facts as Mr. Noble experienced
2 them on Big Horn's property on February 20th?

3 A. That is correct.

4 CHAIRMAN BAGLEY: Excuse me. Is this an
5 exhibit?

6 MS. BOOMGAARDEN: Mr. Chairman, thank you.

7 This is being offered as rebuttal evidence to
8 Mr. Barron's testimony that Big Horn Coal wrongly denied --
9 excuse me, that Brook wrongly denied access to Big Horn
10 Coal, and that had Big Horn -- had -- Big Horn had Brook
11 escorted off by the sheriff. That left a false inference,
12 and Mr. Sweeney has personal knowledge. And we also have
13 the sworn affidavit of Mr. Noble, since Mr. Sweeney was not
14 present on site to give the council a more full explanation
15 of the events that occurred that will illustrate that Brook
16 was on Big Horn's property without any permission, indeed
17 and in trespass, and it was not a denial of access under a
18 request for permission.

19 MR. POPE: Dr. Bagley, may I have an
20 opportunity to respond to that?

21 CHAIRMAN BAGLEY: Yes.

22 MR. POPE: The issue is not whether this
23 was a trespass or not. What that will inevitably lead us
24 down to is a discussion of the 1954 Deed and the rights
25 under that deed, which this council has already heard as

1 part of the order in lieu of consent procedures.

2 The testimony by Mr. Barron was simply a factual
3 issue of whether or not they were escorted off the
4 property. There does not appear to be a dispute about
5 that, and, therefore, there is no need to rebut that.

6 MS. BOOMGAARDEN: Mr. --

7 MR. POPE: There was no intent ascribed one
8 way or the other by Mr. Barron as to why it happened. It's
9 just a question of did it happen.

10 MS. BOOMGAARDEN: Mr. Chairman, if I could,
11 please, because Mr. Pope just mischaracterized Mr. Barron's
12 testimony. Mr. Barron could not have been more clear at
13 the end of his testimony today that Big Horn denied access
14 and that it was disingenuous for Big Horn to assert that
15 Brook did not have the information, the data necessary in
16 the TR-1 area, when, in fact, as Mr. Barron asserted, Big
17 Horn denied Brook access. That is not the case. There was
18 never a request for access for that purpose, and these
19 facts would illustrate and rebut -- directly rebut
20 Mr. Barron's testimony.

21 CHAIRMAN BAGLEY: Okay. So this was not an
22 exhibit. It's a rebuttal. And you're -- and I -- I -- I
23 understand what you're trying to do. So let's -- but let's
24 go ahead and tidy this up. I definitely do not want to
25 talk about 1954 Deed. This is just some additional facts

1 related to that incidence. So we'll go ahead and share
2 those.

3 MS. BOOMGAARDEN: Thank you, Mr. Chairman.
4 And we do not want to discuss a deed that has continued to
5 be disputed in its interpretation in front of this council
6 either.

7 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, if you'd
8 please take a look at that affidavit. And we want to go
9 through this quickly. We've already explained Mr. Noble's
10 position.

11 If you could look, please, at paragraph 5. And
12 could you read that quickly for the council.

13 A. "At 9 a.m., Friday" --

14 THE REPORTER: Not too quickly, though.

15 A. Sorry. "At 9 a.m., Friday, February 20, 2015, I
16 contacted the Sheridan County Sheriff's Office on behalf
17 of Ambre, and spoke to Deputy Sanders, the purpose of
18 identifying the individuals that had entered onto the
19 property and for assistance in removing the individuals
20 and their drilling equipment. I was instructed by Deputy
21 Sanders to meet with deed ownership documents at 11 a.m.
22 at the Big Horn Coal property."

23 Q. (BY MS. BOOMGAARDEN) And paragraph 6, did
24 Mr. Noble identify the individuals who entered the Big
25 Horn property as Pronghorn Drilling?

1 A. That is correct.

2 Q. And in paragraph 7, could you please read that?

3 A. "There was no prior notice or agreement to allow
4 Pronghorn Drilling to enter onto the Big Horn Coal
5 property."

6 Q. And the affidavit goes on to explain how
7 Mr. Noble met the sheriff's deputies there and
8 representatives of Pronghorn Drilling in paragraph 8 for
9 purposes of overseeing the removal of Pronghorn's property
10 and personnel; is that correct?

11 A. That is correct.

12 Q. And in paragraph 10, does it say the
13 representatives of Pronghorn Drilling were cordial,
14 removed the property without incident and represented that
15 they had been directed to place the drilling equipment
16 there by Western Water and Ramaco Wyoming Coal.

17 A. That is correct.

18 Q. And in paragraph 11, could you please read that
19 for the council.

20 A. Shortly after Pronghorn Drilling had begun
21 removing their equipment, a representative of Western
22 Water, Jeff Barron, and a representative from Ramaco -- of
23 Ramaco, Mr. Niles Veal arrived at the Big Horn property.

24 Q. I believe the copy says Jeff Barro. Do you
25 believe that just to be a typographical error?

1 A. That's correct.

2 Q. And just for purposes of efficiency, can you
3 just please summarize why Mr. Noble felt that it was
4 necessary to prepare this affidavit? The nature of the
5 encounter that occurred once Mr. Barron and Mr. Veal
6 arrived at the site?

7 A. So if you look at paragraph Item Number 15, that
8 gives you a very good, exact description as to what
9 happened, that there were some altercations between
10 Mr. Veal and Mr. Noble and Mr. Noble felt threatened as a
11 result of this altercation.

12 Q. And then paragraph 18, could you please
13 summarize that representation of Mr. Noble?

14 A. So after Mr. Noble discussed with the sheriff,
15 he too felt that was a direct threat to Mr. Noble.

16 Q. Thank you.

17 After the trespass incident, did Ramaco then
18 come back to Big Horn and ask for permission to access the
19 TR-1 area to drill?

20 A. They did not, no.

21 Q. When did you next hear from Ramaco, then,
22 following the trespass incident?

23 A. The next time we heard from Ramaco was around
24 November 2015, when we were summoned to court.

25 Q. Okay. And what's your understanding of what

1 Ramaco was asking from the court?

2 A. It was Sheridan County court, and Ramaco was
3 asking for their rights underneath the 1954 Deed.

4 Q. And was that lawsuit pending during the order in
5 lieu of consent proceedings?

6 A. That is correct.

7 Q. And did Ramaco subsequently dismiss that suit
8 after these permit objection proceedings began?

9 A. They did.

10 Q. How have the coal companies you've worked with
11 engaged with landowners?

12 A. The landowners are typically very important part
13 of the process. And for coal mining, it is our duty, as a
14 coal -- as an industry, to deal with them with the utmost
15 respect and at the very beginning of the process.

16 Q. Do you wait to be invited to a meeting organized
17 by the landowners?

18 A. No.

19 Q. Has Big Horn's experience with Ramaco given you
20 a new perspective on the importance of early and
21 continuing collaboration with landowners?

22 MR. POPE: Objection. Relevance.

23 MS. BOOMGAARDEN: I'll move on.

24 MR. POPE: We're here about the statutes
25 and regulations, not meetings.

1 MS. BOOMGAARDEN: I'll move on,
2 Mr. Chairman.

3 CHAIRMAN BAGLEY: Thank you.

4 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, what does Big
5 Horn want the council to do at the conclusion of this
6 hearing?

7 A. One of two things. Number one, most -- I guess
8 top priority, require that the DEQ instructs the Brook
9 Mine to go back and look at the necessary baseline data
10 and perform analysis of that baseline data to -- prior to
11 any written findings of the permit being technically
12 adequate and approve it.

13 Number two, if the DEQ is requested to move
14 forward with the permit, Big Horn requests that they
15 consider conditions set forth by Big Horn to be placed on
16 the permit.

17 Q. Have you given any thought to what specific
18 permit conditions Big Horn thinks would be appropriate
19 under these circumstances?

20 A. I have, yes.

21 Q. Could you please turn to what's been marked as
22 Big Horn Coal Exhibit 5. And does this exhibit represent
23 the permit conditions that you are requesting that this
24 council consider?

25 A. It is, yes.

1 Q. Let's look first at -- we're going to look at
2 pages 1 and 2. Page 1 is up on the screen right now. Is
3 that -- the first bullet with the series of subbullets
4 that continue on to the next page, is that a list of what
5 you're requesting as pre-excavation or pre-mining data
6 requirements?

7 A. It is, yes.

8 Q. Let's go through those. We're not going to
9 belabor them, but let's go through them just to make sure
10 the council has a clear idea, particularly if they'd like
11 to ask questions later of what conditions you've
12 identified so if you would just please go through those
13 individually and discuss why Big Horn believes that these
14 conditions are necessary and appropriate.

15 A. So I will go through them up front. I'd just
16 like to say that, as you heard in prior testimony this
17 week, no permit conditions have been issued on the permit
18 to date. So we felt it was necessary to provide these
19 conditions.

20 Starting with number 1, Brook has obtained
21 additional overburden samples and conducted strength tests
22 in consultation with the approval of results by the DEQ.

23 Q. Maybe slow down just a little bit, Mr. Sweeney.
24 Thank you.

25 A. DEQ has reviewed and accepted a groundwater and

1 surface water impact analysis during mining and
2 post-mining based on specific -- site-specific textural
3 and hydrologic data.

4 The hydrologic control plan is revised to
5 include water treatment facilities approved by DEQ.

6 Brook has geographically identified and
7 individually quantified all water sources to be used by
8 the mine. Groundwater sources shall also be identified by
9 their geologic sources.

10 Brook Mine has corrected to DEQ's satisfaction
11 the design error in Sedimentation Pond SP-8.

12 Brook installs seismic monitoring to ensure
13 proper blasting controls for the protection of the Big
14 Horn infrastructure, improvements and tenants.

15 Q. And let's go over -- go ahead and go on to the
16 second page because these are all related.

17 A. TR-1 trench may not remain open at the
18 conclusion of mining of the TR-1 area for the use -- for
19 use as a water source for subsequent mining operations on
20 adjacent lands.

21 Prior to the commencement of mining operations,
22 DEQ must approve a final report submitted by Brook Mine
23 that provides map locations, descriptions, photographs and
24 any existing evidence of underground coal fires within and
25 500 feet adjacent to the areas of proposed highwall

1 mining.

2 Prior to commencement of mining operations,
3 Brook must submit and DEQ must approve additional
4 downstream surface and groundwater monitoring locations
5 for groundwater in the Tongue River alluvium adjacent to
6 TR-1, within existing backfill of Pits 1 and 2 directly
7 east of TR-1, and for surface water monitoring on the
8 Tongue River north of TR-1 in order to adequately monitor
9 the off-site hydrologic impacts from mining trench TR-1.

10 Q. Mr. Sweeney, again, just to confirm, with regard
11 to any of those that talk about data collection related to
12 the hydrology, did you formulate these requested permit
13 conditions based on the analysis that Mr. Gerlach provided
14 you?

15 A. Yes. He assisted me in preparing these permit
16 conditions.

17 Q. And if I could have you turn back to page 1 of
18 Exhibit 5. I want to touch base briefly on the last
19 bullet there, with regard to the seismic monitoring to
20 ensure proper blasting controls for protection.

21 A. Yes. Something I put in there. And you may
22 have heard over the last few days about pre-blast surveys.
23 This is Big Horn wanting to have a pre-blast survey given
24 the close proximity of its shop and infrastructure to the
25 TR-1 trench.

1 Q. And so do you have safety concerns if that
2 monitoring isn't required?

3 A. Yes, there are active tenants in that shop area,
4 and they need to have maintained access through the area
5 to get to that shop facility.

6 Q. And is it your opinion that if that monitoring
7 were provided, it would provide additional assurance that
8 there wouldn't be interference with Big Horn Coal's
9 business operations in that area?

10 A. That is correct.

11 Q. And did you hear Mr. Barron testify this morning
12 that seismic monitoring like this could be done?

13 A. I did.

14 Q. And that he would defer to the council's
15 discretion if they chose to impose such a condition?

16 A. That is correct.

17 Q. And did you understand from Mr. Kristiansen's
18 testimony that DEQ has already agreed that additional
19 overburden sampling must be conducted prior to mining in
20 the TR-1 area?

21 A. I did.

22 Q. So why do you believe it's still important to --
23 for the council to impose a permit condition?

24 A. Again, back to Mr. Kristiansen's testimony. No
25 permit conditions have actually been placed on the permit

1 at this time.

2 Q. And in your experience, would a company actively
3 engaged in the business of mining typically defer this
4 type of baseline study until immediately before operations
5 began?

6 A. No. The data necessary for these baseline
7 studies is very important for the area. Very important
8 part of this permit application, seeing as this is the
9 trench cut that is going to be the initial area of mining
10 in this proposed plan.

11 Q. Did you understand from Mr. Kunze's testimony
12 that DEQ has already agreed to add and change the location
13 of certain surface water monitoring locations?

14 A. I did, yes.

15 Q. And did DEQ's proposed changes and additions
16 adequately address Big Horn's concerns?

17 A. Not related to that comment. Again, that has
18 the surface water and groundwater comments wrapped into
19 one -- one comment. If you could go back to one of the
20 previous slides. That bottom one there has the one, two
21 and three. After Mr. Kunze's testimony, it does sound
22 like they would like to have monitoring stations for
23 surface water closer to the operations, which I do agree
24 with, but there was no discussion of requiring of any
25 additional monitoring wells in the backfill spoils in Pits

1 1 and 2. And also, again, back to there is no current
2 permit conditions for this particular comment.

3 Q. And just for clarification for the record, when
4 you asked to return to a different slide and pointed to a
5 condition, was that the third bullet on Big Horn Coal
6 Exhibit 5, page 2?

7 A. Yes, it was.

8 Q. Thank you.

9 Let's have you turn to page 3 of Big Horn Coal
10 Exhibit 5. Can you please, not too quickly, read the
11 first bullet and subbullet on page 3.

12 A. No permit shall issue or mine operation commence
13 until Brook's mine plan MP.22 and reclamation plan RP.12
14 are amended to accurately reflect the following.

15 There are no operational, surface use, or
16 overlapping permit boundary agreements between Brook Mine
17 and Big Horn Coal.

18 Big Horn maintains a reclamation performance
19 bond which is adequate to reclaim Big Horn's facilities
20 and all disturbance associated with Big Horn's operations,
21 within the plus or minus 25 acres, within Big Horn's
22 permit area.

23 Big Horn should not -- shall not be responsible
24 for reclamation of any disturbance unrelated to Big Horn
25 operations and facilities, specifically including, but not

1 limited, to Brook Mine disturbance within the 25 acres
2 subject to Big Horn's reclamation performance bond.

3 Brook Mine shall maintain a reclamation
4 performance bond which is adequate to reclaim all
5 disturbance associated with Brook Mine operations within
6 Brook Mine's permit area.

7 Q. Thank you.

8 Why did you believe that this condition is
9 necessary to request?

10 A. One, there are no operational agreements inside
11 the adjudication file between Big Horn and Brook Mine, as
12 well as there's not enough language in mine plan to really
13 understand which party has what reclamation obligations
14 under their individual permits.

15 Q. On that, Mr. Sweeney, could you please turn to
16 Big Horn Coal Exhibit 7. This is a two-page exhibit. And
17 I apologize, we reproduced the pages in opposite order, so
18 I'm going to ask you first to please turn to page 2 of Big
19 Horn Coal 7. And I'd like you to focus on the Section
20 MP.22. Do you recognize that as the same language from
21 Brook Mine's permit application that Mr. Kristiansen
22 referred to as covering the dual permitted areas?

23 A. Yes, it is.

24 Q. And does that paragraph identify that portions
25 of Big Horn Mine's permit boundary are within the Brook

1 Mine's permit boundary?

2 A. It is, yes.

3 Q. And that's accurate, is it not?

4 A. That is accurate.

5 Q. And can you please read the last sentence that's
6 highlighted there.

7 A. Agreement between the permittees are located in
8 the adjudication file.

9 Q. And you just testified a minute ago, I believe,
10 that there is no overlapping permit boundary agreement or
11 use agreement between Big Horn Coal and Brook Mine; is
12 that correct?

13 A. That is correct.

14 Q. So that statement's inaccurate?

15 A. That is inaccurate.

16 Q. Okay. If I could have you now turn to page 1 of
17 Big Horn Coal 7. What is -- what is the purpose of RP.12?

18 A. Discusses the reclamation and bonding of dual
19 permitted areas and license to mine.

20 Q. And if you can please look at the second
21 paragraph, the highlighted sentence that begins "Once"
22 could you please read that?

23 A. "Once a second party enters an area bonding
24 responsibility on all lands they plan to disturb during
25 the appropriate bonding period will be transferred. The

1 last party to disturb an area will have final reclamation
2 responsibility on the disturbed dual permitted lands.

3 Q. Did you hear Mr. Kristiansen testify that each
4 permit area is to be treated as a stand-alone unit and
5 that the parties are treated individually for reclamation
6 purposes?

7 A. I did, yes.

8 Q. Is that how you read the language in this second
9 paragraph of RP.12?

10 A. No, the -- the way I read that language is that
11 once a second party comes in and disturbs an area, then
12 the liability of the first party will be transferred to
13 the second party.

14 Q. Did anyone from Brook Mine or DEQ ever discuss
15 with you or anyone at Big Horn a transfer of bonding
16 responsibility or Big Horn Coal's responsibility under
17 this language in Brook's mine permit?

18 A. No.

19 Q. I'd like you to turn, please, to Big Horn Coal
20 Exhibit 6. Can you please identify -- there are four
21 pages. They reflect two different documents. Can you
22 please identify what these are for the council.

23 A. Yes, I can. So Big Horn Exhibit 6, pages 001,
24 002, are in relation to the Cordero Rojo Mine Permit
25 Number 237. Big Horn Exhibit 6, pages number 003, 004 and

1 005 are in relation to the Buckskin Coal Mine Permit
2 Number 500.

3 Q. And where and how did you obtain these
4 documents?

5 A. We obtained these documents -- and by "we" I
6 mean I asked Aqua Terra to go out and search the permit
7 documents that have discussions of dual permitted areas,
8 and they found them within the public realm of the DEQ.

9 Q. And why did you request Aqua Terra go obtain
10 these documents?

11 A. They were familiar with existing mines that had
12 overlapping permit boundaries and agreements between
13 parties.

14 Q. And let me back up. You asked that they go
15 obtain these. And I should point out, as Mr. Gregersen
16 has showing, are these -- each of these documents file
17 stamped to represent that they were obtained from the
18 DEQ's public files and the date in which DEQ received
19 these documents?

20 A. They are. For example, this Big Horn Exhibit 6,
21 page 001, was received from the DEQ Sheridan office, and
22 it was approved and added to Cordero Rojo Mine per the
23 March 26, 2007.

24 Q. And can you represent to the council that each
25 one of these pages -- again, I'm trying to be efficient --

1 is also stamped as having been received by DEQ in District
2 3?

3 A. They have. They have all been stamped and
4 approved by DEQ.

5 Q. Thank you.

6 If we can go back up to page 1, then. And I
7 don't want you to read that highlighted language. The
8 council's able to read that for themselves. But would you
9 say that the highlighted language here on page 1 is
10 representative of the language you found in both the
11 Cordero Rojo mine permit and the Buckskin mine permit --
12 mine permit applications?

13 A. They are representative, yes.

14 Q. And what did you conclude from the language
15 that's highlighted there?

16 A. There are private overstrip agreements between
17 the parties. For example, on this page 1, Cordero Rojo
18 Mine and Nelson Brothers Mining Services, two overlap the
19 permitting boundaries on top of one area. So they had a
20 mutual overstrip agreement between the parties that
21 specifically spells out the reclamation obligations
22 between the parties.

23 Q. And I understood you correctly, didn't I, a few
24 minutes ago that there is no such operating agreement at
25 outlining the use of overlapping permit areas between

1 Big Horn and Brook Mine?

2 A. That is correct.

3 Q. Did Brook Mine ever offer to negotiate such an
4 agreement with Big Horn?

5 A. They did not.

6 Q. And you've testified that Big Horn has tenants
7 and customers that need safe access to the areas that you
8 outlined on the map?

9 MR. POPE: Objection, Dr. Bagley. There's
10 no relevance to this. Although they have identified it
11 occurs in other permits, they have not identified if it's a
12 permit requirement under Wyoming statutes and regulations
13 that there be these agreements. Just talking about the
14 permit application and its requirements. There's no
15 relevance. And they're asking you to draw an inference
16 that they can't connect to this situation.

17 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

18 I believe that the subject of appropriate permit
19 conditions and this council's willingness to consider such
20 conditions has been made acutely relevant in the
21 proceedings the last few days. Mr. Sweeney is testifying
22 as to he wanted to look at what is in other permit
23 applications to get an idea of what would be appropriate to
24 request and the condition that he's presented to the
25 council today, and that's the extent of the testimony that

1 he's providing on these.

2 CHAIRMAN BAGLEY: Right. So we've seen
3 examples of what's in other permits, and he's told us that
4 he has not found that in the current permit, but -- and so,
5 I mean, it's -- it's a good -- to provide those examples,
6 but --

7 MS. BOOMGAARDEN: Excuse me, Dr. Bagley.

8 My questioning with regard to how Big Horn is
9 using the facilities as additional support for the validity
10 of the permit condition that Big Horn Coal has requested
11 today. And we're nearly done with this.

12 CHAIRMAN BAGLEY: Go ahead.

13 MS. BOOMGAARDEN: Thank you.

14 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, I believe the
15 question was does Big Horn Coal have tenants and customers
16 that need safe access to the facilities, as you describe
17 them in our exhibit?

18 A. We do. There's also requirements for other
19 access to the property for wildlife monitoring, hydrology
20 monitoring, as you -- as was stated access for tenants to
21 and from the shop facility.

22 Q. And so is it for the safe access and use by Big
23 Horn Coal for obligations within its mine permit boundary
24 and its tenants and customers that you requested the
25 permit condition?

1 A. That is correct.

2 Q. Thank you.

3 If we could please go back to Big Horn Coal
4 Exhibit 5, page 3. There's one more permit condition
5 you're requesting. Could you please read that for the
6 council?

7 A. The last bullet point, no permit shall issue or
8 mine operations commence until Brook Mining Company has
9 executed a bond pursuant to Wyoming Statute 35-11-416(a)
10 for the use and benefit of Big Horn Coal in an amount
11 sufficient to pay for all statutorily coverage -- covered
12 surface damages.

13 Q. I'm going to go ask Mr. Gregersen to please pull
14 up the statute, 35-11-416(a).

15 Can you identify that as the statute that you've
16 referenced in your final requested permit condition?

17 A. It is, yes.

18 Q. And is it your understanding that this statute
19 requires Brook to post a bond prior to the permit being
20 issued under the express language of the statute.

21 MR. POPE: Objection, Dr. Bagley.

22 Ms. Boomgaarden is asking him to interpret what the statute
23 says. Statute says what it says. The council can read
24 that for itself.

25 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, is it --

1 MS. BOOMGAARDEN: Wait.

2 Q. (BY MS. BOOMGAARDEN) -- because of --

3 MS. BOOMGAARDEN: I'll move on to another
4 question --

5 CHAIRMAN BAGLEY: Okay. Thank you.

6 MS. BOOMGAARDEN: -- Dr. Bagley.

7 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, is it your --
8 iis it because of your rights under this statute that
9 you're requesting the permit condition?

10 A. I am.

11 Q. Why do you believe it's necessary to ask this
12 council to request this as a permit condition at this
13 time?

14 A. Because no permit shall be approved until a
15 surface owner protection bond is in place.

16 Q. And is there anything in the permit application
17 at this time providing for the commitment required by this
18 statute?

19 A. There is not.

20 Q. Okay. Has Brook Mine offered to negotiate a
21 surface damage agreement with Big Horn Coal?

22 MR. POPE: Objection. There's no relevance
23 to negotiations between Big Horn and Brook on a surface
24 damage agreement. Council went through this exact same
25 issue in the order in lieu of consent proceeding.

1 MS. BOOMGAARDEN: Dr. Bagley, if I could,
2 please. If the council would choose to read this statute
3 and interpret it for themselves, I believe this statute
4 makes clear that this statute only applies if there is no
5 surface damage agreement executed. I'm just trying to
6 establish in Mr. Sweeney's testimony that, in fact, Big
7 Horn Coal is eligible for the protection under this
8 statute.

9 CHAIRMAN BAGLEY: So it would seem to me if
10 there is no agreement, that's a fact that can be stated.
11 But whether the parties have negotiated towards one or not,
12 I really leave that to the parties to decide. So we can
13 just -- you know, is there an agreement or is there not is
14 definitely relevant.

15 MS. BOOMGAARDEN: Thank you. I'll restate.

16 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, is there a
17 surface use agreement between Big Horn Coal and Brook
18 Mine?

19 A. No.

20 Q. Has Big Horn entered into any kind of agreement
21 or executed any document which would expressly waive its
22 rights under this statute?

23 A. It has not.

24 Q. Thank you.

25 Did you understand Mr. Kristiansen to testify

1 that there will still be a proceeding to determine the
2 amount of the surface owner protection bond?

3 A. I did.

4 Q. And did you understand Mr. Kristiansen to
5 represent that Big Horn will be able to participate in
6 that proceeding?

7 A. Yes.

8 MS. BOOMGAARDEN: One moment, please.

9 I have no further questions at this time. Thank
10 you.

11 CHAIRMAN BAGLEY: All right. Thank you,
12 Ms. Boomgaarden.

13 Ms. Anderson.

14 MS. ANDERSON: Thank you, Dr. Bagley.

15 CROSS-EXAMINATION

16 Q. (BY MS. ANDERSON) I have just one question for
17 you, Mr. Sweeney. I appreciate what you said about
18 landowner engagement, as somebody who works regularly with
19 landowners. If a landowner would bring you a set of
20 conditions like you just talked about, would you be
21 willing to think of them and have they included in permit
22 of yours?

23 A. I would have addressed them with landowner, yes.

24 MS. ANDERSON: Okay. Thank you.

25 CHAIRMAN BAGLEY: Mr. Gilbertz?

1 MR. GILBERTZ: Good afternoon, Mr. Sweeney.

2 I have no questions.

3 THE WITNESS: Thank you.

4 CHAIRMAN BAGLEY: Mr. Pope.

5 MR. POPE: Can we get the technology set
6 up, please?

7 CROSS-EXAMINATION

8 Q. (BY MR. POPE) Good afternoon, Mr. Sweeney.

9 A. Good afternoon.

10 Q. You stated early in your direct that it is not
11 Big Horn Coal's intention to stop Brook from mining in
12 this area. But Big Horn Coal refused to consent to
13 Brook's mine and reclamation plan, correct?

14 A. That is correct.

15 Q. As a result of Big Horn Coal's refusal to
16 consent, this council had to conduct an order in lieu of
17 consent proceeding, correct?

18 A. That is correct.

19 Q. You have -- excuse me. Big Horn Coal has also
20 filed an objection letter that states Brook, in its
21 opinion, should not get permit to mine coal, correct?

22 A. There are technical deficiencies that I believe
23 should be addressed in the permit before it is approved.

24 Q. So let me be specific. Big Horn Coal's
25 objection letter states that Brook's permit application,

1 as it exists now, should not be approved, correct?

2 A. That is correct.

3 Q. But it's true, Mr. Sweeney, that just a couple
4 years ago, Big Horn Coal said it would step aside and not
5 object to any of Brook's operations and sell all of its
6 assets to Brook if Brook was willing to pay it
7 approximately \$29 million, correct?

8 A. That was evaluation --

9 THE REPORTER: I'm sorry. I can't hear.

10 A. That was a valuation conducted a few years ago,
11 yes.

12 Q. (BY MR. POPE) Sorry, Mr. Sweeney. I need a
13 specific answer to my question. My question was a couple
14 years ago Big Horn Coal said that it would step aside, not
15 oppose Brook's operations, and sell all of its existing
16 assets if Brook paid approximately \$29 million, correct?

17 A. That was during times of settlement and
18 negotiations between Ramaco and AE Coal, and that was
19 said, yes.

20 Q. Thank you, Mr. Sweeney.

21 Just a quick clarification on Big Horn Coal's
22 structure. It's true that if Big Horn Coal needs money to
23 fund operations, maintenance or reclamation, for example,
24 it applies to Lighthouse Resources to receive that
25 funding, correct?

1 MS. BOOMGAARDEN: Objection, Mr. Chairman.

2 I have no earthly idea how this line of questioning with
3 regard to Big Horn Coal's finances is related to the
4 adequacy and completeness of Brook's mine permit.

5 MR. POPE: If I may, Dr. Bagley.

6 CHAIRMAN BAGLEY: Respond to that, please.

7 MR. POPE: Absolutely.

8 Mr. Gilbertz intimated in his cross-examination
9 of Mr. Woodring that the finance -- financial ability of a
10 company is relevant. Mr. Sweeney has discussed other
11 examples of how coal companies operate. Big Horn Coal
12 Company operates in a very similar way to Brook's
13 structure, where Brook has a parent company that has money
14 that finances its operations. The point here is that
15 Mr. Gilbertz' insinuation is untrue as it applies to coal
16 mining industry because it is a common practice.

17 MS. BOOMGAARDEN: Dr. Bagley, I'm afraid
18 this is outside the scope and continues to be irrelevant
19 because there is nothing at issue in this proceeding with
20 regard to Big Horn's operations.

21 CHAIRMAN BAGLEY: Yeah, I -- Big Horn's
22 ability to reclaim land is not -- is not part of this
23 proceedings. The concern you mentioned is not direct --
24 directly related to this witness either. So let's move on.

25 MR. POPE: Very well. Thank you,

1 Dr. Bagley.

2 Q. (BY MR. POPE) I'd like to talk really briefly
3 with you, Mr. Sweeney, about Big Horn Exhibit 6. Those
4 were the newly permitted dual permits for Cordero Rojo and
5 Buckskin, correct?

6 A. That is correct.

7 Q. Those dual permit commitments were revisions to
8 those mine permits, correct?

9 A. I would have to say yes, given the fact that it
10 occurred in 2007. I know Cordero Rojo has been operating
11 long before that.

12 Q. So those commitments were not in the initial
13 permit when those mines began operating, correct?

14 A. That is correct.

15 Q. Let's talk briefly about permit conditions. The
16 permit conditions you read through with the council, you
17 did not provide those in the objection letter Big Horn
18 Coal filed with DEQ, correct?

19 A. They were not part of the submittal in the
20 objection letter to the DEQ.

21 Q. They were also not part of Mr. Gerlach's expert
22 report submitted as discovery and as an exhibit in this
23 case, correct?

24 A. That is correct.

25 Q. One of those conditions was the need to collect

1 baseline data in the TR-1 area. If that becomes a permit
2 condition, is Big Horn Coal going to request that Brook
3 enter into some kind of surface or exploration agreement
4 to collect that data?

5 A. Yes.

6 Q. Apologies to Dr. Bagley. I need to briefly
7 visit about the 1954 Deed.

8 You talked about the drilling incident -- the
9 drilling rig incident that caused the removal of a
10 contractor from Big Horn Coal Company, correct?

11 A. I did, yes.

12 Q. You're aware that Brook is operating this area
13 under a 1954 Deed that grants it ownership of the coal in
14 this area, correct?

15 A. Yes, it is.

16 Q. And you're aware that deed comes with surface
17 use rights, correct?

18 A. Related to mining, yes.

19 Q. And one of those surface use rights is
20 the ability to use the surface as is necessary or
21 convenient --

22 MS. BOOMGAARDEN: Objection --

23 Q. (BY MR. POPE) -- to drill.

24 MS. BOOMGAARDEN: Objection, Dr. Bagley.

25 I'm sorry for interrupting, Mr. Pope. There was

1 a pause. I thought you were done.

2 My objection would be first that this line of
3 questioning isn't relevant. As has been discussed with
4 this council before, the 1954 Deed and the interpretation
5 of that deed is beyond the jurisdiction of this council to
6 consider or determine. That issue is on appeal in the
7 First Judicial District as the single issue appealed in
8 this council's order in lieu of consent ruling.

9 And furthermore, Mr. Pope is asking Mr. Sweeney
10 to draw legal conclusions that he's not qualified to draw.

11 MR. POPE: If I may, Dr. Bagley.

12 CHAIRMAN BAGLEY: Uh-huh.

13 MR. POPE: Ms. Boomgaarden, in response to
14 my objection about the trespass issue, stated that the
15 reasons for why it was a trespass were important. This is
16 a rebuttal to that because Brook was operating using its
17 rights under the 1954 Deed. I'm also not asking
18 Mr. Sweeney to interpret the deed. I'm simply asking him
19 if those words "that use of the surface as is necessary or
20 convenient to drill" are in the document.

21 CHAIRMAN BAGLEY: I -- yeah, it seems to me
22 that the issue I'm hearing is that there are folks who want
23 more testing done on land, and yet there seems to be an
24 unwillingness to allow that testing to be conducted.
25 That's what I'm hearing. You know, not to name names or

1 anything, but I'm hearing that there's this, well, we want
2 more testing, but, well, no, I don't necessarily want
3 people to come do the testing. And the issues whether
4 there's trespassing or ownership are not issues that this
5 council will decide. What we're interested to know is is
6 there a need for more testing or not, from a technical
7 standpoint, to protect health of the environment if such --
8 we -- we determine or the DEQ or someone determines, yes,
9 more testing is required, we will somehow have to figure
10 out how to get that testing done. But that's not something
11 this council will determine.

12 So, I mean, we've been through the 1954 Deed
13 before. We have -- our opinion on that has already been
14 recorded in the order in lieu of consent.

15 MR. POPE: Dr. Bagley, I think from your
16 answer there, the point has been made so I can go ahead and
17 move on.

18 Q. (BY MR. POPE) Mr. Sweeney, let's talk about the
19 surface uses you described at the Big Horn Coal property
20 as they relate to your objections in this case. You have
21 objected on the basis of safety issues related to those
22 existing structures and potential effects of blasting on
23 those structures, correct?

24 A. Yes.

25 Q. It's true, though, that Big Horn Coal is

1 required to reclaim both the shop and the spur, per your
2 reclamation plan on file with DEQ, correct?

3 A. Yes.

4 MS. BOOMGAARDEN: Objection, Dr. Bagley.
5 Again, Mr. Pope is going into a realm of testimony that was
6 widely covered in the order in lieu proceeding, which
7 proceeding was relevant to Big Horn Coal's operations and
8 remaining obligations. Big Horn Coal's reclamation
9 obligations, the timing of those obligations and anything
10 other than the fact of what Big Horn is legally entitled to
11 do and has present on its property right now is not
12 relevant to this proceeding.

13 MR. POPE: Dr. Bagley, Ms. Boomgaarden and
14 Mr. Sweeney discussed the use of the shop and the spur as
15 reasons as to why we have objected. We were allowed to
16 point out that the legal obligation that Big Horn has with
17 those structures is to destroy them.

18 MS. BOOMGAARDEN: Dr. Bagley, if I could.
19 The timing of that legal obligation is a matter between
20 Big Horn Coal and DEQ, and, as was established in the order
21 in lieu of consent proceedings, has not yet been
22 determined.

23 CHAIRMAN BAGLEY: Correct. You guys did
24 bring it up, which surprised me. But please go ahead and
25 ask the question. And we need to keep in mind, though,

1 that there are timing issues that may not be able to be
2 answered today.

3 MR. POPE: Understanding that. I thank
4 you, Dr. Bagley.

5 Q. (BY MR. POPE) Mr. Sweeney, my question is Big
6 Horn, per its reclamation plan, must still reclaim its
7 shop and spur, correct?

8 A. According to his bond calculation he had in the
9 reclamation plan, yes.

10 Q. There was some discussion in the objection
11 letter and in Mr. Gerlach's expert report about future
12 uses of Big Horn Coal's surface. As I understand it, from
13 your deposition, the few -- potential future uses of that
14 surface are still on the drawing board, correct?

15 A. Yes, they are.

16 Q. Let's talk for a moment about the work that Aqua
17 Terra, Mr. Gerlach's company, has done in this case. You
18 testified that you retained independent experts, correct?

19 A. I did.

20 Q. Aqua Terra, however, has done work for Big Horn
21 Coal Company for at least two decades, correct?

22 A. They have.

23 Q. And, in fact, Aqua Terra also did work for Brook
24 Mine in the early stages of preparing its permit
25 application, correct?

1 A. Per my discussion with Joe, that is correct.

2 Q. They also did drilling on Big Horn Coal surface
3 in 2013, didn't they?

4 A. I am unaware of them, meaning Aqua Terra, being
5 on-site in 2013 on the Big Horn property.

6 Q. Mr. Sweeney, you're aware that, as we just
7 talked about, Aqua Terra did work for Brook and for Big
8 Horn Coal. Mr. Gerlach has submitted an expert report to
9 this council opposing or suggesting that there should be
10 objections to Brook's permit application. You testified
11 at your deposition that if a company -- if you hired a
12 company to help you with a project, and that company later
13 on turned around and helped oppose that project, it's more
14 likely that you would not hire that company again,
15 correct?

16 A. That was a hypothetical that you presented at my
17 deposition.

18 Q. Is that a yes, Mr. Sweeney?

19 A. It was stated at my deposition, yes.

20 Q. And the reason you gave for why you would never
21 hire that company again is because it creates a loss of
22 trust and credibility, correct?

23 A. In my eyes, I did say that. Could have been
24 re-worded in the fact that it would depend on --

25 Q. Mr. Sweeney, let me interrupt you. My question

1 was -- was just calling for a yes or no. It's true that
2 the reason you gave at your deposition for why you would
3 not hire that company again is because it creates a loss
4 of trust and credibility, correct?

5 A. I did say that, yes.

6 Q. Mr. Sweeney, let's talk about your review of the
7 Brook permit application in preparing the objections for
8 Big Horn Coal. You did not review any statutes in
9 preparing the objection letter on behalf of Big Horn Coal,
10 correct?

11 A. That's why I had third-party experts do it.

12 Q. Mr. Sweeney, my question was you did not review
13 any statutes in preparing Big Horn Coal's objection
14 letter, correct?

15 A. I did not.

16 Q. You did not review any regulations in preparing
17 Big Horn Coal's objection letter, correct?

18 A. I did not.

19 Q. Even though there are subsidence-related
20 objections in Big Horn Coal's objection letter, you did
21 not review any subsidence regulations in preparing that
22 objection letter, correct?

23 A. The subsidence was handled by Mr. Todd. So, no,
24 I did not specifically handle or review the subsidence
25 rules and regulations.

1 Q. You also did not review any DEQ guidelines in
2 preparing Big Horn Coal's objection letter, correct?

3 A. The rules and regs and guidelines I did review
4 would have been in the discovery responses, as I discussed
5 in my deposition.

6 Q. Mr. Sweeney, a couple weeks ago you came to the
7 Holland & Hart office in Cheyenne for a deposition,
8 correct?

9 A. I did.

10 Q. And you sat down at a conference room with
11 myself and a court reporter, correct?

12 A. I did.

13 Q. And that court reporter's job was to take down
14 everything you said, correct?

15 A. Yes.

16 Q. But before she did that, she administered an
17 oath to you, didn't she?

18 A. Yes.

19 Q. And that oath was for you to tell the truth.

20 A. Yes.

21 Q. And you told the truth, didn't you?

22 A. I did.

23 Q. Mr. Sweeney, I've handed you a copy of your
24 deposition transcript. Would you please turn to page 79.

25 COUNCIL MEMBER LALLY: Excuse me. What

1 exhibit is this?

2 MR. POPE: It is not an exhibit,
3 Councilwoman Lally. This is his deposition transcript.
4 We're just using this for the purpose of impeaching his
5 testimony.

6 Q. (BY MR. POPE) Are you at page 79, Mr. Sweeney?

7 A. I am.

8 Q. We were just talking about your review of DEQ
9 guidelines. I'd like to direct your attention to line 7
10 on page 79. Please follow along with me as I read.
11 Question, "Did you review any DEQ guidelines in preparing
12 this objection letter?"

13 Answer, "No."

14 Did I read that correctly?

15 A. Yes, you did.

16 Q. In preparing your objection letter, you did not
17 speak with anyone at the Department of Environmental
18 Quality about Brook's permit application, correct?

19 A. Only time I spoke with DEQ was while filing the
20 letter. I called up Mr. Bj Kristiansen and asked who to
21 file this with, knowing that Mr. Wendtland had recused
22 himself.

23 Q. You also did not review any data about
24 historical underground coal fires in this area in
25 preparing Big Horn Coal's objection letter, correct?

1 A. I did not personally, no.

2 Q. You also, in preparing this objection letter,
3 did not know that Brook had submitted its sampling and
4 testing methodology to DEQ before it began gathering
5 baseline data, correct?

6 A. Correct.

7 Q. Let's talk about your thoughts on the Department
8 of Environmental Quality generally. It's your opinion
9 that generally DEQ's review of permit applications is
10 pretty strong, correct?

11 A. Yes.

12 Q. And you also believe that the DEQ employees in
13 District 3 do very good work, correct?

14 A. Yes.

15 Q. Let's go to your objections in the objection
16 letter for a moment. Your first objection has to do with
17 Standard Operating Procedure 2.1. You would agree with me
18 that DEQ Standard Operating Procedure 2.1 is an internal
19 DEQ policy, correct?

20 A. It is.

21 Q. And you don't know if any statute or regulation
22 requires DEQ to use Standard Operating Procedure 2.1 in
23 evaluating a permit application, correct?

24 A. That's correct.

25 Q. Now, Big Horn Coal has bonds in place for its

1 reclamation obligations, correct?

2 A. It does, yes.

3 Q. And when Big Horn Coal completes its
4 reclamation, DEQ presumably will release those bonds,
5 correct?

6 A. Yes.

7 Q. You heard Mr. Kristiansen testify that Brook's
8 bond, as it applies to the area around Big Horn Coal, will
9 cover all of Brook's disturbance, even if it occurs in the
10 overlapping portions of Big Horn Coal's permit boundary?

11 A. It will cover related disturbance to Brook Mine,
12 yes.

13 Q. Objection Number 1, which is on the screen, you
14 also object on the basis of the lack of indemnity language
15 in the permit, but you would agree with me that no statute
16 supports Big Horn's objection about indemnity, correct?

17 A. That's correct.

18 Q. Let's move to Objection Number 5 in the letter,
19 which is the pink polygon you discussed with
20 Ms. Boomgaarden on direct.

21 You have no statute or regulation on which you
22 rely for your objections related to the pink polygon,
23 correct?

24 A. That is correct.

25 Q. As we talked about in your deposition, you have

1 worked with other mines that have drawn polygons as part
2 of a mine permit, correct?

3 A. Yes.

4 Q. And you would agree that it is possible for a
5 mining operation not to disturb all of the area within a
6 disturbance polygon, correct?

7 A. Yes.

8 Q. But your objection in Number 5 assumes that
9 Brook will disturb all of the area within the pink
10 polygon, correct?

11 A. That is correct.

12 Q. Let's go to Objection Number 6. This
13 objection -- you don't need to blow it up -- discusses
14 roads. You are not aware of any specific statutes that
15 require county agreements as part of a permit application,
16 correct?

17 A. I do know the -- where I work --

18 THE REPORTER: The what?

19 THE WITNESS: The Black Butte Coal Mine
20 where I work does have a county review.

21 Q. (BY MR. POPE) Appreciating that, Mr. Sweeney.
22 My question, however, was you were not aware of any
23 specific statutes governing county agreements in a permit
24 application, correct?

25 A. Correct.

1 Q. Let's go to Objection Number 7. In this
2 objection, you suggest language for Brook's permit
3 application that is related to Taylor Quarry, correct?

4 A. Yes.

5 Q. The language you suggest, however, is not
6 required by Wyoming statute, correct?

7 A. Correct.

8 Q. Let's go to Objection Number 12. Objection
9 Number 12 has to do with topsoil replacement. As we
10 discussed a moment ago, your future uses of Big Horn Coal
11 surface are still on the drawing board. My question,
12 however, is you were at the order in lieu of consent
13 hearing when Mr. Barron testified that if needed, Brook
14 can accelerate topsoil replacement in the area around
15 TR-1, correct?

16 A. Yes.

17 Q. Mr. Sweeney, you discussed on direct the use of
18 Mr. Todd in preparing Big Horn Coal's objection letter,
19 the few questions about Mr. Todd's role in this case. You
20 are not qualified to be an expert witness on anything
21 related to the objections that Mr. Todd drafted, correct?

22 A. That is correct.

23 Q. Now, you -- you told me at your deposition that
24 Mr. Todd just reviewed Volume XI of Brook's permit
25 application, correct?

1 A. I don't recall specifically. I'd have to go
2 back to the deposition.

3 Q. Let's pick up your deposition transcript there.
4 If you would turn to page 64, please.

5 A. I'm there.

6 Q. And this is just for purposes of refreshing
7 what happened at your deposition. On line -- beginning on
8 line 15, there's a question that says "Do you know what
9 Millcreek considered the mine plan document?"

10 Your answer is, "Volume 11, mine plan." Did I
11 read that correctly?

12 A. That's what they considered their mine plan
13 document, yes.

14 Q. Thank you.

15 But you don't know if Mr. Todd reviewed either
16 Appendix D5 or Addendum D5, which may relate to some of
17 the objections you helped craft, correct?

18 A. I'm not aware. I don't know.

19 Q. And you don't know if Mr. Todd relied on Wyoming
20 statutes, Wyoming regulations or DEQ guidelines in forming
21 his opinions, correct?

22 A. I believe he would have submitted me those as
23 part of the discovery request he had.

24 Q. Mr. Sweeney, I understand that, but my question,
25 however, was you don't know if, in preparing his opinions,

1 Mr. Todd reviewed Wyoming statutes, Wyoming regulations or
2 DEQ guidelines, correct?

3 A. I don't know.

4 Q. You also don't know if Mr. Todd, in preparing
5 some of his water-based objections, reviewed Brook's
6 dewatering plan or watering control plan, correct?

7 A. I'm not aware. I don't know.

8 Q. Mr. Todd, in portions of the objection letter
9 that he drafted, discusses the cost per ton to move coal,
10 but you don't know where Mr. Todd obtained his information
11 about the cost per ton to get coal, correct?

12 A. He used industry averages based on his
13 experience in building models and mine plans. But I'm not
14 aware of where he pulled that information specifically,
15 no.

16 Q. Would you pick up your deposition transcript
17 again, Mr. Sweeney. Please turn to page 73.

18 A. There.

19 Q. I'd like to direct your attention to line 5.
20 Before I read this, again, for the council's benefit, you
21 promised to tell the truth at this deposition, correct?

22 A. Correct.

23 Q. Follow along with me on line 5. The question
24 is, "Do you know the basis on which Mr. Todd estimated the
25 8- to \$12-per-ton cost range?"

1 Answer, "I do not." Did I read that correctly?

2 A. You did.

3 Q. Mr. Todd also drafted in your objection letter
4 language that discusses Brook's use of proper analytical
5 data, but you do not know why Mr. Todd said Brook did not
6 use proper analytical data, correct?

7 A. I am not Mr. Todd, no.

8 Q. And for that opinion, you do not know if he
9 relied on a Wyoming statute or Wyoming regulation,
10 correct?

11 A. Correct.

12 Q. Mr. Sweeney, I'll close on this note. I think
13 you and I can at least agree on a basic proposition here.
14 If a permit application complies with all Wyoming statutes
15 and Wyoming regulations, that permit should issue,
16 correct?

17 A. Correct.

18 MR. POPE: I have no further questions.

19 CHAIRMAN BAGLEY: Thank you. Let us take a
20 10-minute break.

21 You have a question?

22 MR. LAROCK: Could DEQ cross the witness?

23 CHAIRMAN BAGLEY: You will, but I want to
24 take a break first.

25 MR. LAROCK: Sure thing. Thank you.

1 CHAIRMAN BAGLEY: Take a 10-minute break.

2 (Deposition proceedings recessed

3 2:18 p.m. to 2:31 p.m.)

4 CHAIRMAN BAGLEY: All right. We are back
5 in session.

6 Mr. LaRock, please.

7 MR. LAROCK: Sorry for asking earlier.

8 CROSS-EXAMINATION

9 Q. (BY MR. LAROCK) Hi, Mr. Sweeney.

10 A. Hello.

11 Q. So I just want to make sure I heard you
12 correctly. You said several times during your direct
13 testimony that no conditions had been placed on the permit
14 at this time; is that correct?

15 A. Yes. I said that.

16 Q. Does Brook have a permit yet?

17 A. No.

18 Q. Can there be conditions on a permit that doesn't
19 exist yet?

20 A. No.

21 Q. Okay. Just checking. Thank you.

22 Second line of questioning. Do you know if a
23 permit can authorize you to do something that would
24 convene a statute or a rule or a regulation?

25 A. No.

1 Q. Okay. Thank you. Check on that too.

2 All right. And so my last line of questioning
3 is about these proposed conditions. As council heard,
4 these proposed conditions were not submitted to DEQ with
5 the objection letter, so first time we got to look at them
6 was the contested case hearing. I have a few questions
7 about them, if you don't mind.

8 A. Yes.

9 Q. So, for example, let me just read out this
10 condition. One of your conditions was -- let me know if
11 I'm getting this wrong -- that the TR-1 trans excavation
12 and the highwall mining thereof shall not commence until
13 Brook has obtained additional overburden samples and
14 conducted strength tests in consultation with and the
15 approval of results by DEQ; is that correct?

16 A. That is correct.

17 Q. Okay. I'm going to throw something up on the
18 screen here and just ask you to read it for me.

19 MR. LAROCK: Is this speed fine?

20 THE REPORTER: Just a little slower.

21 Q. (BY MR. LAROCK) Mr. Sweeney, do you recognize
22 this?

23 A. I do. It is from Appendix D5.

24 Q. Can you read the highlighted section?

25 A. "Samples will be collected and strength testing

1 will be conducted on those samples in order to satisfy the
2 requirements of the MSHA ground control plan, which must
3 be approved prior to mining. The future testing results
4 and analysis in preparation of the MSHA ground control
5 plan will be provided to Wyoming DEQ/LQD."

6 Q. Is it your understanding that when that's
7 referring to samples, it's referring to overburden samples
8 and interburden samples?

9 A. Yes. In relation to site testing, yes.

10 Q. Thank you.

11 I've got a couple of other questions about your
12 proposed conditions, if you don't mind.

13 So you mentioned also in the first page of your
14 requested permit conditions that no excavation or highwall
15 mining shall commence until Brook Mine has corrected to
16 DEQ's satisfaction the design error in Sedimentation Pond
17 SP-8.

18 A. Yes, that is correct.

19 Q. What's the design error in Sedimentation Pond
20 SP-8?

21 A. I'm not an expert on designing sedimentation
22 ponds. I'm going to leave that up to my expert witness.

23 Q. Okay. Thank you. I'm glad to know.

24 Well, I think that answer takes care of the rest
25 of my questions on these.

1 MR. LAROCK: Are there other questions?

2 Sure thing.

3 Q. (BY MR. LAROCK) Let's see here. One of the
4 conditions is TR-1 trench excavation shall not commence
5 until the hydrologic control plan is revised to include
6 water treatment facilities approved by DEQ. Do you know
7 what you mean by water treatment facilities?

8 A. That, again, will be reviewed by my expert
9 witness.

10 Q. Is it your understanding that the Land Quality
11 Division generally permits or handles water treatment
12 facilities?

13 A. Should be handled by -- water treatment
14 facilities? I don't know what regards our expert witness
15 was stating to -- referring to in that matter, so I'll
16 leave that up to him.

17 Q. Okay. I think just one last question. Is it
18 your understanding that in order to discharge any water,
19 water that might need to be treated, they'll have to get a
20 discharge permit from the Water Quality Division at that
21 time DEQ?

22 A. That's correct. WYPDES permit is required.

23 Q. Is it your understanding they can discharge
24 water without that Water Quality permit?

25 A. No.

1 MR. LAROCK: Okay. We have no further
2 questions for this witness.

3 CHAIRMAN BAGLEY: Thank you.
4 Council members, any questions?
5 Deb?

6 COUNCIL MEMBER BAUMER: Not at this time.

7 CHAIRMAN BAGLEY: Nick?

8 COUNCIL MEMBER AGOPIAN: Not at this time.

9 CHAIRMAN BAGLEY: Meghan?

10 COUNCIL MEMBER LALLY: Give me a second. I
11 don't think so.

12 CHAIRMAN BAGLEY: And I don't have any
13 questions either. Wow. So council's done with its
14 questions.

15 Ms. Boomgaarden.

16 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

17 REDIRECT EXAMINATION

18 Q. (BY MS. BOOMGAARDEN) Mr. Sweeney, when Mr. Pope
19 was cross-examining you, he asked you whether Brook --
20 excuse me, whether Big Horn had refused to consent to
21 Brook's mining reclamation plan. And you answered that
22 yes; is that correct?

23 A. That's correct.

24 Q. Why did Brook refuse to consent -- excuse me.
25 Why did Big Horn refuse to consent to Brook's mining

1 reclamation plan?

2 A. They were unwilling to, I guess, discuss it with
3 us, and shortly thereafter the lawsuit occurred.

4 Q. Mr. Pope also asked you whether Big Horn would
5 request that Brook have a surface use agreement or be
6 required permission to access Big Horn Coal's property to
7 gather TR-1 baseline data as requested in your permit
8 condition. And you answered that in the affirmative yes;
9 is that correct?

10 A. That is correct.

11 Q. I'm afraid you might have misunderstood his
12 question, so I'm going to ask you another question just to
13 make sure that the record is clear. Does Big Horn intend
14 to abide by the access that would be provided to Brook
15 under the order in lieu of consent if that order is
16 upheld?

17 A. Yes.

18 Q. Thank you.

19 Mr. Pope referred to a hypothetical which
20 he had presented to you during his deposition of you.
21 and that hypothetical caused you to draw a conclusion
22 based on an assumption that you -- whether -- with
23 regard to whether you would hire an independent
24 consultant who had been hired by someone else to
25 oppose your mine permit application. Do you recall

1 that?

2 MR. POPE: Dr. Bagley, I have to object.

3 That mischaracterizes the question. I asked if Mr. Sweeney
4 hired a company and that company later on opposed that same
5 project and had nothing to do with third parties or other
6 companies.

7 MS. BOOMGAARDEN: Dr. Bagley, based on
8 Mr. Pope's characterization of the hypothetical, which he
9 presented to you more clearly than I did.

10 Q. (BY MS. BOOMGAARDEN) My question to you is did
11 you ask Aqua Terra to oppose Brook's application?

12 A. I did not, no.

13 Q. And did you have any reason to believe that
14 Mr. Gerlach's expertise or credibility would be
15 compromised by his testimony at this hearing?

16 A. No.

17 Q. You had a lengthy discussion with Mr. Pope with
18 regard to a number of specific objections set forth in
19 Big Horn Coal's January 25th objection letter. And I
20 believe you testified earlier that your intent in drafting
21 that objection letter was to set forth items for
22 discussion with DEQ in informal conference; is that
23 correct?

24 A. That is correct.

25 Q. And did you refine your objections specific to

1 the case you wanted to present in this proceeding before
2 the council?

3 A. Yes, we did.

4 Q. And are those refined objections incorporated
5 into Big Horn Coal's requested conditions?

6 A. Yes.

7 Q. And are those the conditions that you set forth
8 in Big Horn Coal Exhibit 5?

9 A. That is correct. Yes.

10 MS. BOOMGAARDEN: Thank you. I have no
11 further questions.

12 CHAIRMAN BAGLEY: Thank you,
13 Ms. Boomgaarden.

14 Thank you, Mr. Sweeney.

15 THE WITNESS: Thank you.

16 CHAIRMAN BAGLEY: You may step down.

17 Do you have an additional witness,
18 Ms. Boomgaarden?

19 MS. BOOMGAARDEN: Yes, we do. Thank you,
20 Dr. Bagley.

21 Big Horn Coal calls Mr. Joe Gerlach.

22 (Witness sworn.)

23 PAUL JOSEPH GERLACH,
24 called for examination by Big Horn Coal, being first duly
25 sworn, testified as follows:

1 DIRECT EXAMINATION

2 Q. (BY MS. BOOMGAARDEN) Good afternoon,
3 Mr. Gerlach. I just want to make sure that you have that
4 notebook there in front of you, which will have some
5 exhibits we'll be referring to. And also Mr. Gregersen
6 will be projecting specific exhibits on this screen.

7 Could you please state your full name for the
8 record.

9 A. Paul Joseph Gerlach.

10 Q. And what is your title or --

11 THE REPORTER: Title or?

12 A. I'm sorry.

13 Q. (BY MS. BOOMGAARDEN) What is your title or
14 position?

15 A. I am president of Aqua Terra Consulting.

16 Q. And what do you do in your capacity as
17 president -- president of Aqua Terra Consultants?

18 A. Well, I do technical studies, and as best I can,
19 I try to direct the business functions of the company as
20 well.

21 Q. And I'd like you to turn to Exhibit Big Horn
22 Coal 8. Excuse me. Yes, 8. Can you please identify that
23 document.

24 A. It is my resume. My curriculum vitae.

25 Q. And did you prepare that document?

1 A. I did.

2 Q. And is it current and accurate?

3 A. It is.

4 Q. And could you briefly summarize your education
5 and experience for the council.

6 A. Well, I have a Bachelor of Arts degree with a
7 minor in hydrogeology from -- dated 1974 from Miami
8 University of Oxford, Ohio. And I have a master of
9 science degree in geology from the School of Mines in
10 Rapid City, 1976.

11 Q. Following the completion of your education,
12 which you got your MS in 1976? Am I reading that
13 correctly?

14 A. That is correct.

15 Q. And so for the last -- I happen to know that
16 that's a lot of years because I have a high school reunion
17 coming up before too long. So for the last few decades,
18 can you summarize for the council what you've been doing?

19 A. Well, for 40 years I've been doing what I still
20 do now, geologic investigations and hydrologic
21 investigations, directed predominantly towards mining in
22 Wyoming and Montana, sometimes elsewhere.

23 Q. Do you have experience specifically in coal mine
24 permitting?

25 A. Most of my experience is in coal mine

1 permitting.

2 Q. Can you give the council an idea, over the
3 course of your career, what types of mines you've
4 permitted, what kind of permit applications you've worked
5 on, what you've contributed to those applications.

6 A. Types of mines. Well, coal predominantly, some
7 uranium, bentonite, hard rock, dolomite and limestone,
8 little bit of gold in Montana.

9 Q. Let's focus on the coal specifically. Have you
10 permitted surface coal mines?

11 A. Yes.

12 Q. Underground coal mines?

13 A. No.

14 Q. Any highwall mines?

15 A. No. I've permitted no highwall mining.

16 Q. And have you been involved in preparing and
17 submitting new permit applications?

18 A. May I make a correction? I did assist with the
19 Black Butte Mine highwall mining back in the late '80s or
20 '90s, trying to -- I'm sorry.

21 Q. No problem. Thank you.

22 Have you worked on new permit applications?

23 A. Oh, yeah.

24 Q. And on permit renewals or modifications?

25 A. Yes.

1 Q. And have you worked specifically with the Land
2 Quality Division, Division 3, here in Sheridan?

3 A. Not exclusively, but very frequently, yes.

4 Q. Are you a licensed professional geologist in the
5 state of Wyoming?

6 A. I am.

7 Q. And for how long?

8 A. Since they started it. Sometime in the '80s --
9 I can't remember when State of Wyoming started the program
10 for professional licensing.

11 Q. So you hold one of the first numbers on your
12 stamp; is that correct? One of the early numbers?

13 A. Yeah. Number 83.

14 Q. Okay. Mr. Gerlach, have you ever been qualified
15 before by a court as an expert witness in the areas of
16 geology and hydrogeology?

17 A. I have.

18 Q. Have you ever been qualified as an expert
19 witness in those same areas by any administrative agency?

20 A. I have.

21 Q. And what agency was that?

22 A. I'm sorry?

23 Q. What agency was that?

24 A. Well, there was the Board of Control, State of
25 Wyoming, once or twice, over contested water rights. And

1 then there was the water court of Montana over contested
2 water rights.

3 MS. BOOMGAARDEN: Thank you.

4 At this point, Dr. Bagley, I'd like to offer
5 Mr. Gerlach as an expert in this proceeding to testify on
6 hydrology and hydrogeology that is related to coal mine
7 permitting.

8 CHAIRMAN BAGLEY: Okay.

9 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, how did you
10 become involved in this proceeding?

11 A. Well, I was asked to -- to review the Brook Mine
12 permit application.

13 Q. And who asked you that?

14 A. Mr. Sweeney. Jordan Sweeney. Pardon me.

15 Q. And do you remember when Mr. Sweeney contacted
16 you?

17 A. Well, it was early January of this year.

18 Q. Okay. And what did he ask you to do?

19 A. He asked me to review the permit application
20 document, and I responded that, well, I would review those
21 article -- if it was selections of it that I felt
22 comfortable in: geology, hydrology, probable hydrologic
23 consequences, determination of the overall water balance
24 during and after mining. Those are the main features.

25 Q. And did he provide you any specific materials to

1 review?

2 A. He did not.

3 Q. So what did you review in preparing your
4 conclusions?

5 A. I reviewed a copy -- digital copies that he had
6 previously asked in December 2016, during the public
7 review comment period, he had asked Aqua Terra to acquire.
8 And we got those digital copies from the District 3 office
9 here, on a, you know, thumb drive. And that's what I
10 reviewed.

11 Q. Okay. And was it your understanding that with
12 the publication of the mine permit application that there
13 were also copies made available at the Land Quality
14 Division offices, the clerk's office and other places?

15 A. Well, I acquired -- we acquired in December the
16 thumb drive digital copy of what was told to us would be
17 the entire Brook Mine permit application from the District
18 3 office here in town. We went down to the clerk's office
19 here in Sheridan, and all they had were, you know, paper
20 copy. And my coworker that did this file collection
21 thumbed through it, found it was different, substantially
22 different. It had three more rounds of comment and
23 comment responses in it. It all appeared to be related to
24 materials that I did not feel qualified to review anyhow
25 in the adjudication file.

1 Q. So you're confident that you reviewed the most
2 current version of the mine permit application in those
3 areas that you felt qualified to review?

4 A. I am confident, yes.

5 Q. When Mr. Sweeney asked you to review the mine
6 permit application, did he tell you that Big Horn intended
7 to oppose the Brook Mine application?

8 A. What I recall him telling me when he called me
9 in early January was that he was concerned about elements
10 of the Brook Mine permit application related to what he
11 saw in the proposed mine plan of Brook Mine, how those
12 operations looked to him would affect the main entrance
13 route the mine has to the shop, which goes beyond the shop
14 up to the big reservoir, pit 3 reservoir, and goes to the
15 siding area that the mine still has. He was concerned
16 about competing with Brook Mine for the access, the use of
17 those facilities. And the shop itself, he was concerned
18 about it.

19 Q. So did Mr. Sweeney ask you to confine your
20 review to a certain geographic area that was in that TR-1
21 area?

22 A. No. He really didn't give me any instructions.
23 He just asked me to review what I felt -- I told him what
24 I feel comfortable. That's what I reviewed.

25 Q. Did Mr. Sweeney ask you to give any specific

1 opinions or draw any particular conclusions?

2 A. He did not.

3 Q. And what did you provide Mr. Sweeney following
4 your review?

5 A. Well, I prepared some draft comments on it,
6 which were used in the January 25th objections to the DEQ,
7 Mr. Edwards, and followed up, then, with finalizing those
8 on or before -- well, slightly before the 25th of January
9 of this year.

10 Q. Okay. So you understood that Big Horn Coal did
11 intend to file an objection letter with DEQ?

12 A. Yes, I did.

13 Q. Did you understand at that time that Big Horn
14 Coal intended to request an informal conference with DEQ
15 to discuss those concerns or objections?

16 A. Would you repeat that, please?

17 Q. Sure. Did you understand at the time that you
18 were providing this information to Big Horn Coal, that
19 they intended to ask for an informal conference with DEQ
20 to discuss those concerns and objections?

21 A. Yes. That was my understanding.

22 Q. Did you have any prior knowledge of Brook Mine's
23 interest in developing a mine plan in this area?

24 A. Yes.

25 Q. Can you explain how you had that knowledge.

1 A. Well, Brook Mine retained -- contacted me, and I
2 agreed to them retaining my services -- Aqua Terra's
3 services in November 2011.

4 Q. And did you tell Brook that if you became
5 concerned that there -- a conflict could arise between
6 Brook and Big Horn, that your loyalty resided with Big
7 Horn as your existing client?

8 A. Not initially, but as time went on, yes.

9 Q. And did you terminate your contract with Brook?

10 A. I did.

11 Q. I'm going to ask you to turn, please, to Big
12 Horn Exhibit 19. Can you identify that document?

13 A. Yes.

14 Q. And what is it?

15 A. It is my letter of May 9, 2013, terminating Aqua
16 Terra Consultants with Ramaco, Brook.

17 Q. And why did you terminate your relationship with
18 Brook?

19 A. Well, because, as I state first paragraph there,
20 as things had developed over the last six months prior to
21 May 9th, it became quite clear to me I was entering into a
22 probable conflict of interest with two entities that I
23 have a long history and an active current history of doing
24 business with -- providing services for.

25 Q. Did you believe that a conflict of interest had

1 been created at the time you terminated that contract?

2 A. About that time, yes.

3 Q. What kind of work did you do for Brook?

4 A. Well, it was pretty fundamental. It was
5 gathering basic geologic information, drill logs,
6 groundwater hydrology information, all available in the
7 public domain. Some of it from United States Geological
8 Survey, oh, gathering information on who owns what, and
9 making state maps, surface ownership, mineral ownership,
10 all available from like the county tax records here, and
11 mineral ownership from the State of Wyoming of water
12 rights from the State Engineer's Office and mapping those
13 materials and feeding that basic information to Ramaco.

14 Q. Were you charged with responsibility for
15 drafting any portion of an earlier version of Brook's
16 permit application?

17 A. No.

18 Q. Did Brook's mine plans at the time you were
19 working with Brook, did they bear any resemblance to the
20 Brook Mine and reclamation plan that you reviewed?

21 A. Very little. I knew, up to the day of my
22 termination of services, that it was going to be some
23 combination of open pit. I looked at -- there had been
24 things all over the place in terms of having nothing but
25 open pit mining. Golder and Marston you heard about was

1 kicking around lots of ideas of four or five different
2 areas that I believe now were at that time all preexisting
3 Brook permit area. And then there were ideas of, well,
4 we'll do some of that, do some highwall mining. But it
5 was very reconnaissance level.

6 Q. But I understand that was four to five years ago
7 that you did that work; is that correct?

8 A. Well, from -- yeah, 2011 to May 2013, November
9 2011.

10 Q. Thank you.

11 Let's turn back, then, to your review of Brook's
12 2017 mine and reclamation plan. I'd like you to turn, if
13 you would, please, to Big Horn Exhibit 9. Do you see that
14 document, Mr. Gerlach?

15 A. I do.

16 Q. Do you recognize it?

17 A. I do.

18 Q. And could you please identify for the council
19 what that document is.

20 A. It's my expert report In the Matter of Big Horn
21 Coal Company versus Brook Mine is the title.

22 Q. And you prepared this document; is that correct?

23 A. I did.

24 Q. And on the first page that is projected on the
25 screen there, is that your professional stamp or seal and

1 signature on this document?

2 A. It is.

3 Q. Where -- excuse me. When did you prepare this
4 report?

5 A. Well, I prepared it in the -- toward the end of
6 March. The seal's dated the 28th of March, 2017.

7 Q. So do I understand correctly that you provided
8 information for Big Horn to include in its objection
9 letter, but this report was prepared after that objection
10 letter was submitted; is that correct?

11 A. Yeah. Six weeks or so after.

12 Q. And so did you prepare this report specifically
13 for the purpose of these formal proceedings before the
14 Environmental Quality Council?

15 A. Yes.

16 Q. Okay. Thank you.

17 Does the report -- does your expert report
18 reflect the information that you provided to Mr. Sweeney
19 to include in the objection letter?

20 A. Yes, it does.

21 Q. I'd like to refer you to pages 4 through 9 of
22 the report. So that would be Big Horn Coal 9-004. And do
23 you see just underneath that first paragraph, in bold
24 letters -- bold capital letters the word "opinions"?

25 A. I do.

1 Q. And if you flip through to page 005, page 006,
2 007, 008 and 009. Is it fair to say that you provided in
3 your report three different opinions?

4 A. It is.

5 Q. Now I understand the council's admitted this
6 report as evidence. To avoid duplication with the
7 testimony of other experts that are going to be presented
8 by other parties, I'd like to focus your testimony today
9 on your first two opinions. Is that okay?

10 A. That's fine.

11 Q. Would it be fair to summarize the conclusions
12 that you reached in your first two provisions as, first,
13 that Brook's mine and reclamation plans lack the baseline
14 data and study required by LQD rules and regulations?

15 A. It is fair.

16 Q. Thank you.

17 I'm asking you to confirm this because I'm going
18 to ask you in my lay language, because I am not a
19 hydrogeologist. And so in my reading of those opinions,
20 I'm trying to put them in language where we can summarize
21 those for the council. And then your second conclusion,
22 Brook's mine permit application lacks complete and
23 accurate plans as required by the Environmental Quality
24 Act and Land Quality Division Rules and Regulations prior
25 to permit approval. Is that a fair summary of your second

1 conclusion?

2 A. That is correct.

3 Q. Now, Mr. Gerlach, you cite a number of
4 applicable regulatory provisions in your report. And in
5 order to be as efficient as possible here today, we're
6 going to put a series of laws, rules and regulations on
7 the screen, and I'm going to ask you whether you can
8 please confirm whether these are provisions that you
9 have -- that you are familiar with and that you considered
10 in rendering your expert opinion.

11 MS. BOOMGAARDEN: Can we enlarge that at
12 all?

13 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, on this first
14 document, do you see up in it looks like blue font in the
15 box at the top the identification of what this document
16 is, and can you please tell the council?

17 A. Well, your rules and regulations currentness,
18 Department of Environmental Quality, Land Quality-Coal
19 Chapter 2, Permit Application Requirements For Surface
20 Coal Mining Operations.

21 Q. Thank you. And we're going to scroll down then
22 to Section 4 in this chapter. I'm sorry. I'm too slow.
23 I apologize. Is the document on the screen now -- can you
24 please tell me the title of Section 4?

25 A. Other -- Other Baseline Requirements.

1 Q. Is this a chapter and section of the DEQ rules
2 and regulations on which you rely?

3 A. It is.

4 Q. I'm going to go now and ask you to look down to
5 (a)(viii). There are three provisions that I believe you
6 identified as having particular importance to your
7 conclusions. Do you recognize that as Chapter 2,
8 Section 4(a)(viii), the highlighted language with multiple
9 lines?

10 A. Can you flip up a little bit. Make sure we're
11 still in Chapter 4. I recognize this, yes.

12 Q. Okay.

13 A. Oh, yes. Sure, I do.

14 Q. Okay. And can you, please, just generally
15 summarize the baseline requirements for mine permit
16 applications in this provision?

17 A. Well, that there be an identification in the
18 mine permit application of the geologic strata, all the
19 way through the minable sequence stack, down below the
20 lowest stratum of the mine. Keyword here "or any
21 aquifer" -- "aquifer" -- "below the lowest coal seam to be
22 mined which may be adversely impacted by mining."

23 Q. Okay. Thank you.

24 Is there anything that we've missed in that
25 provision or should we move to the next one?

1 A. Well, very next highlighted section is indeed
2 very pertinent. Location of any groundwater.

3 Q. Okay. Thank you.

4 So let's scroll down -- we're still in Chapter 2
5 Section 4 -- to (xii). Do you recognize that provision,
6 Mr. Gerlach?

7 A. I do.

8 Q. And can you please summarize the critical
9 baseline information you believe is required in this
10 provision?

11 A. Well, it requires current information on
12 groundwater, which may be affected in the permit area and
13 adjacent areas, including best native depth and quantity
14 of groundwater existing in the proposed permit area.
15 Again, down to and through the mine hole sequence stack
16 through lowest seam to be mined. It says if you may be
17 the operator -- applicant/operator -- may be required to
18 conduct test drilling and monitoring in order to determine
19 the exact depth, quantity and quality of the groundwater
20 in the geologic formations that may be affected by the
21 mining operation.

22 Q. Thank you.

23 Is there anything else in that provision that we
24 need to raise at this time?

25 A. Well, I'd say so. The sentence lithology of all

1 known aquifers, that's fundamental if you're going to run
2 a groundwater model and calculate PHCs from that model.

3 Q. Okay. Thank you. Let's scroll down then to
4 (xiv). Do you recognize that provision?

5 A. I do.

6 Q. And can you please summarize for the council the
7 critical baseline information required by that provision
8 in a permit application.

9 A. Well, here. Following up on that last sentence,
10 it says, "A description of the surface groundwater related
11 geology in the permit area and general area sufficient to
12 access the probable hydrologic consequences," abbreviated
13 PHC. Then it goes on to talk about additional work we
14 have to do if there's acid toxic -- potentially toxic-
15 forming elements in the strata to be mined.

16 Q. Thank you.

17 So Mr. Gerlach, so that we don't have to go back
18 to these when you're giving your substantive testimony, do
19 you feel comfortable in stating that these provisions in
20 Chapter 2, Section 4, the three provisions that you just
21 summarized, are those key provisions to which your
22 substantive testimony and your conclusions pertain?

23 A. For baseline characterization, although I
24 also -- my thoughts are drawn to the Statute 35-11-406,
25 which a lot of this is, but it requires, for instance,

1 identification of water sources to be used by the mine,
2 specific identification of water sources utilized, I
3 believe, by hydrogeologic strategy in the location.
4 Spatial location.

5 Q. Thank you. I think we're going to come back to
6 that provision also when we talk about the plans that need
7 to be based on this baseline study. So let's go now --
8 we're going to pull up Chapter 19 from the Land Quality
9 Division Rules and Regulations. Do you recognize that as
10 Chapter 19?

11 A. I do.

12 Q. And can you please read for the record the title
13 of Chapter 19?

14 A. Section 2, Required Studies.

15 Q. Required studies for what?

16 A. Well -- I'm sorry. Did you ask for the title of
17 Chapter 19?

18 Q. Yes.

19 A. Well, that's up there in blue at the top.
20 Chapter 19 Required Studies for Surface Coal Mining Permit
21 Applications and Assistance for Such Studies.

22 Q. Thank you.

23 And then you've already told us the -- the title
24 for Section 2. There's a fair amount of language that
25 we've highlighted there. If you feel like you need to

1 read it because that's the best and most accurate
2 characterization, please do. But if you'd like to
3 summarize, your professional understanding, of what you
4 have to do to satisfy Chapter 19, Section 2 in a mine
5 permit application, please summarize.

6 MR. POPE: Objection, Dr. Bagley. Calls
7 for him to summarize legal requirements. He's not an
8 expert in coal.

9 MS. BOOMGAARDEN: Dr. Bagley, I asked
10 him to summarize what he relies on in this language in
11 Chapter 19, Section 2, when he is asked either to review a
12 mine permit application or to prepare a mine permit
13 application. I didn't ask him to draw any legal
14 conclusion.

15 CHAIRMAN BAGLEY: I definitely don't want
16 him to read all that. So, yeah, we will take it as an
17 expert witness to provide his -- what he uses as an expert.

18 A. Well, in summary, this is just the supervisory
19 results of the operator's PHCs for surface and
20 groundwater, provide those results to the administrator
21 down in Cheyenne at the DEQ headquarters so they can
22 conduct on their own a CHIA, a Cumulative Hydrologic
23 Impact Assessment.

24 Q. (BY MS. BOOMGAARDEN) Thank you.

25 And in looking through the language, and as

1 Dr. Bagley noted, Chapter 19, Section 2 sounds like the
2 mother of all baseline requirements. Would you agree?

3 A. Yes, I do agree.

4 Q. In your professional experience, has the Land
5 Quality Division ever ignored the mandatory language
6 contained in that provision?

7 A. No.

8 Q. In your professional experience, have they ever
9 allowed a permit applicant that you were working with to
10 fill in the blanks following permit approval?

11 A. No.

12 Q. We're going to wrap up with the statutes and
13 law. And I'm sure you heard here how important it is to
14 tie the objections or any assertion of missing information
15 to the statutes and laws. So we're going to talk about
16 just four other provisions, and we're going to talk about
17 that in the context of the plans that you deemed to be
18 required in your expert report.

19 So first I've asked Mr. Gregersen to pull up
20 Chapter 2, Section 5(a)(ix). Do you recognize that
21 provision?

22 Oops. I'm sorry. I can't see that far, so I'm
23 not sure if he had the correct one up or not.

24 Do you recognize that provision, Mr. Gerlach?

25 A. I do.

1 Q. And did you rely on that provision in your
2 review of whether Brook Mine's permit application
3 contained a plan to ensure the protection of the quantity
4 and quality of and rights to surface water and
5 groundwater?

6 A. I did, yes, refer to this requirement.

7 Q. Thank you.

8 MS. BOOMGAARDEN: Mr. Gregersen, could you
9 please pull up the statutes. We have just three statutory
10 provisions.

11 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, on the screen
12 now, is that the statute that you referred to a moment ago
13 as 35-11- -- excuse me. No. I apologize. I think you
14 said (n) before, but this is 35-11-406(b)(xviii). Do you
15 recognize that?

16 A. Are we not --

17 Q. I'm sorry.

18 A. I do recognize that.

19 Q. Okay. And does that relate to the requirement
20 you mentioned a minute ago?

21 A. It does.

22 Q. Thank you.

23 And if we could move, then, to 35-11-406(n).
24 First, I'd like you to look at -- do you see the statute
25 for 35-406(n)?

1 A. I see it.

2 Q. Okay. I'd like you to first look at (n)(iii).

3 Can you please -- that's a short provision. Can you
4 please discuss what that requires?

5 MR. POPE: Objection, Dr. Bagley. I
6 believe Ms. Boomgaarden asked for him to describe what that
7 requires. The statute speaks for itself. If it's a
8 what-he-relied-on question, I have no objection, but asking
9 him to interpret what that section requires is different.

10 MS. BOOMGAARDEN: Dr. Bagley, I phrased the
11 question poorly. I'll restate the question.

12 CHAIRMAN BAGLEY: Okay.

13 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, can you
14 please tell me whether you relied on that statutory
15 provision as a requirement when you reviewed Brook Mine's
16 permit application?

17 A. I did rely on this, yes.

18 Q. And, lastly, if I can ask you to please look at
19 35-11-406(n)(i). Did you look at Brook Mine's permit
20 application and conclude -- draw conclusion as to whether
21 you believed it was both accurate and complete?

22 A. I did.

23 Q. And you did that based on the statutory
24 provision?

25 A. Yes.

1 Q. Thank you.

2 Applying sound scientific principles, do you
3 believe that a mine plan can be complete, accurate or even
4 useful if baseline data supporting those required plans is
5 not accurate or complete?

6 A. No, I do not believe that you can accomplish a
7 meaningful understanding of probable hydrologic
8 consequences, surface or groundwater listed data.

9 Q. I'm sorry. Mr. Gerlach. Can you speak up a
10 little bit and slow down a little bit?

11 A. Well, okay. Maybe I'm getting too long-winded.
12 Would you repeat the question, please.

13 Q. Excuse me. Applying sound scientific
14 principles, can a mine plan be complete and accurate if
15 the baseline data supporting that plan is not complete and
16 accurate?

17 A. In my opinion, no.

18 Q. Thank you.

19 Let's focus in greater detail on why you
20 concluded that Brook's mine plan doesn't comply with the
21 baseline study requirements. And I'd like you to focus
22 specifically on the TR-1 area. Were you present to hear
23 the testimony of Mr. Kristiansen and Mr. Kunze?

24 A. I was.

25 Q. And also Dr. Kuchanur?

1 A. I was.

2 Q. And Mr. Barron?

3 A. Yes.

4 Q. Between your review of Brook's mine plan and
5 their testimony, their collective testimony, do you
6 believe that you have a good understanding of the baseline
7 hydrology that Brook collected and used in its mine permit
8 application?

9 A. Relative to the TR-1 area, most certainly not.

10 Q. I'm not sure that you understood my question.

11 Let me ask it again.

12 You reviewed Brook's mine plan; is that correct?

13 A. Yes.

14 Q. And do you have a good understanding of the
15 baseline information that they included in that mine
16 plan --

17 A. I see.

18 Q. -- to support --

19 A. Yes. Sorry.

20 Q. -- the plan?

21 A. I have a good understanding what was submitted
22 in the mine plan.

23 Q. And you also heard the testimony of those
24 different individuals; is that correct?

25 A. I did.

1 Q. And so you're also considering the testimony
2 that they gave in your assessment today; is that correct?

3 A. Correct.

4 Q. Okay. Thank you. Are you aware of any other
5 additional data that was available to Brook and to DEQ,
6 but that was not utilized in the mine permit application?

7 A. I am.

8 Q. Okay. In the notebook, I'd ask you to please
9 turn to Big Horn Coal Exhibit 15. Are you there?

10 A. I am.

11 Q. And can you identify that document?

12 A. It is the Big Horn Mine groundwater restoration
13 demonstration.

14 Q. And did you have any role in preparing that
15 document?

16 A. I did.

17 Q. Okay. For what purpose?

18 A. For what purpose was it prepared?

19 Q. Correct.

20 A. It was prepared to demonstrate to the
21 satisfaction of the DEQ that the lands that have been
22 reclaimed within Big Horn Mine were reclaimed in terms of
23 their groundwater hydrology, meeting the standards that
24 were set in the reclamation plan and meeting the declared
25 post-mining land use for the water -- land -- water uses.

1 Q. And you said that you prepared -- you were
2 responsible for preparing this document, correct?

3 A. I was the principal author.

4 Q. And if I look at different pages -- let's just
5 look at the first two pages of that document. There are
6 different dates on different pages down at the bottom
7 toward the bottom -- toward the right-hand corner. Do you
8 see that?

9 A. I do.

10 Q. And can you please explain for the council why
11 there are different dates within this document?

12 A. Well, we started work on this, oh, '99 or 2000,
13 and submitted it initially in 2001, and then it went
14 through several rounds of back and forth review comments
15 with the local LQD here, Land Quality Division of DEQ.
16 And then, finally, I believe the last round of changes was
17 April of 2002. It was approved by the State of Wyoming
18 because DEQ, as they changed to the permit -- to the
19 permit of Big Horn Mine in August of 2002.

20 Q. And so this was a document in which you had to
21 provide data and analysis, and it went through a comment
22 and revision period with DEQ over that time period. Do I
23 understand that correctly?

24 A. That is correct.

25 Q. In your opinion -- and I'm going to refer to

1 this as the GRD, meaning groundwater restoration
2 demonstration. In your opinion, is it fair to
3 characterize the final GRD as the most recent and complete
4 collection of groundwater data in the TR-1 area?

5 A. It is.

6 Q. And do I understand correctly that the GRD is
7 publicly available in Big Horn's mine permit file?

8 A. It is.

9 Q. If you would, please turn to the index -- excuse
10 me, table of contents. On pages 3 -- we're going to go to
11 pages 3, 4 and 5.

12 MS. BOOMGAARDEN: And, Council Members, we
13 are not going to go in-depth into this document. I'm
14 trying to refer you to the table of contents -- con --
15 excuse me -- table of contents so that we can proceed with
16 this in a more expedited fashion.

17 Q. (BY MS. BOOMGAARDEN) Are you on page 3 of this
18 exhibit, Mr. Gerlach?

19 A. I am.

20 Q. So using this index as a reference, I'd like you
21 to tell me the first piece of information in this index
22 that you think is critical data that you found nowhere in
23 Brook's mine plan.

24 A. The discussion of the water level recovery
25 within the mine backfill, the old Pits 1 and 2 -- Big Horn

1 Mine pits 1 and 2 in the TR-1 area.

2 Q. Thank you.

3 That's the first piece of data --

4 A. That's --

5 Q. First area where data is included in this GRD?

6 And in your expert opinion, what is the risk of
7 not including data related to water level recovery within
8 backfill and adjacent affected aquifers?

9 A. It's not -- the risk is is you're not
10 recognizing the existence of -- as we speak now, probably
11 80, 85 feet of saturated backfill on the average of the
12 pits in the TR-1 area, Pits 1 and 2 area. That thickness
13 represented, I'm sure, about twice the thickness of all
14 the saturated coal in the three coal seams that they did
15 in the model. I --

16 THE REPORTER: Can you say that again?

17 THE WITNESS: That Brook Mine improvement
18 application did a model for inflow rate estimations and
19 drawdown estimations in the coal seams.

20 Q. (BY MS. BOOMGAARDEN) And would that include
21 down below the water level recovery on page 6, also
22 hydrographs of mine backfill wells on page 11?

23 A. Yes. That next entry of beyond the first one I
24 mentioned, that's pretty important -- very important
25 understanding what happened in the TR-1 area, the -- the

1 Pits 1 and 2 of the historic Big Horn Mine area. What
2 happened in that backfill relative to groundwater, the
3 hydrographs give you a temporal -- a time -- time -- a
4 time -- over-time perspective of how long this has gone
5 on, how they got to a point where they were sympathetic to
6 the rise and fall of the two rivers, Goose Creek and the
7 Tongue River.

8 Q. And what would be the next data that you relied
9 on, as evidenced in the table of content?

10 A. Well, the final -- the potentiometric surface of
11 water table surface, map in the -- in discussion in this
12 GRD.

13 Q. And can you please identify where that is in the
14 table of contents?

15 A. Page 13.

16 Q. Okay. Thank you.

17 And what would the next piece of data be?

18 A. The very next thing, page 14, groundwater
19 production grades. We're not talking about an aquifer
20 that is of a negligible groundwater production. Something
21 else instead.

22 Q. And then the next piece of data, in the table of
23 contents?

24 A. Well, the current store -- status of the
25 storage -- groundwater storage in that mine backfill.

1 Q. And can you please identify where that is?

2 A. Page 15.

3 Q. Okay. Anything else?

4 A. Well, then a PHC has to -- you know, quantity
5 and quality, surface and groundwaters, you've got to look
6 at -- you got the Pit 1 and 2 spoils groundwater quality
7 discussion that -- that's on pages 19 and 20.

8 Q. Okay. And you referenced PHC. Did you mean to
9 refer to probable hydrologic consequences and how it would
10 relate to that data?

11 A. Yes. You use this table of the GRD to help you
12 develop -- fundamental in developing for the greatest
13 aquifer that exists in the Brook Mine area for developing
14 PHC.

15 Q. And is there anything else on that first page of
16 the table of contents? I'm going to get to more specific
17 questions in a minute, but I want to make sure we've
18 highlighted for the council the key areas in the GRD that
19 you relied on. Anything else in the first page?

20 A. You know, there is. A recharge capacity of the
21 mine backfill.

22 Q. And what page is that located?

23 A. Sixteen.

24 Q. Okay. Thank you. Anything else on that first
25 page of the table of contents?

1 A. Oh, I think we got the main points.

2 Q. And how about the next page of the table of
3 contents? Is there any critical piece of information on
4 page BHC 15-004 that you believe was omitted from
5 consideration in Brook's mine plan?

6 A. There are a number of things. It compares what
7 we found in and what we documented in this GRD, the review
8 of the predicted. So what we found when we prepared this
9 document relative to what was predicted in the Big Horn
10 Mine permit application document for what ultimately how
11 the groundwater would restore. So we made that
12 prediction. Were those earlier projections, decades old
13 by the time they did this, were they right or wrong?

14 Q. And where would that be found in this report?

15 A. 26. Page 26.

16 Q. Okay. Thank you.

17 And anything else on this page of the table of
18 contents?

19 A. Well, there's an aquifer yields, page 29.

20 Q. Okay.

21 A. Very important Table 2 Soil Aquifer Hydraulic
22 Properties.

23 Q. Okay. And, again, I'm going to ask you some
24 specific questions, but just wanted to make sure we had
25 references. Is there anything else specific in the GRD

1 that you would like to highlight its location for the
2 council?

3 A. There is.

4 Q. What would that -- was is that?

5 A. Well, other drilling that was done, Addendum --
6 Addendum A, Part 2, Results of Spoils Drilling,
7 August 2001, Test Hole Logs and Monitoring Well Log
8 C-2001.

9 Q. Does that cover it?

10 A. For pages iv and v?

11 Q. Yes.

12 A. Well, ultimately the purpose of all this data is
13 to create a meaningful PHC if you were going to go in and
14 re-disturb an area. So, yeah, the groundwater quality
15 graphs and quality results in Addendum B help characterize
16 the way things are -- the way things were in -- when
17 approved August 2002 by the State of Wyoming.

18 Q. Okay.

19 A. Background baseline.

20 Q. Thank you, Mr. Gerlach.

21 And, again, I know you've covered this much more
22 exhaustively in your report, but for purposes of your
23 testimony this afternoon, I'm going to ask you some
24 specific questions now based on your knowledge of the data
25 that you just highlighted. In your professional opinion,

1 without consideration of the data that you just discussed
2 in the GRD, has Brook satisfied the requirement that it
3 provide complete information on all groundwater?

4 A. No.

5 Q. Does the mine plan contain the best available
6 data as to groundwater elevation?

7 A. No.

8 Q. How about groundwater quantity?

9 A. No.

10 Q. How about the direction of groundwater flow?

11 A. No.

12 Q. How about the source of recharge or discharge?

13 A. No.

14 Q. Yet all of that information is available in the
15 GRD?

16 A. For free in the public domain.

17 Q. Okay. Thank you.

18 Did Brook's Mine plan demonstrate whether
19 there's a connection between the Tongue River and the TR-1
20 area --

21 A. Yes.

22 Q. -- strata -- excuse me, TR-1 area strata?

23 A. Yes, it does.

24 Q. Brook's mine plan demonstrated that there's a
25 connection between?

1 A. Oh, Brook's mine -- I'm sorry.

2 Q. Yes.

3 A. I thought I heard you say -- no, it doesn't
4 touch upon the subject.

5 Q. Why -- excuse me. Did I -- okay. Why would
6 that demonstration be important in step 1?

7 A. Tongue River is the largest perennial stream in
8 northeastern Wyoming, and TR-1 is parked right next to it.
9 You can expect it to be, and this GRD strongly
10 demonstrates, it is a constant head source. It's
11 24/7/365.

12 Q. Could Brook have used the GRD to make that
13 determination?

14 A. Yes.

15 Q. Ask you to turn to what we've marked as Big Horn
16 Coal Exhibit 10. Do you recognize that exhibit as the now
17 well-known Skittles map that Mr. Kristiansen and others
18 have referred to?

19 A. I do.

20 Q. And I believe -- do you recognize this -- I'm
21 sorry. I'm skipping ahead. There is a red marking down
22 next to the bottom right-hand corner where it says BHC 10,
23 there's a small box. Can you identify this as the map
24 that's included in Brook's permit application?

25 A. It is -- just a second.

1 Q. I know it's small.

2 A. Exhibit MB.4, I believe, -1.

3 Q. 4-1?

4 A. I believe this is.

5 Q. And do you see underneath where it says "coal
6 removal sequence" in that box, do you see in red font
7 C1-objection Exhibit A?

8 A. I do.

9 Q. And did you add that language in red font?

10 A. Yes.

11 Q. What does that refer to?

12 A. Well, that refers to the objections that were
13 made before the environment quality -- the DEQ.

14 Q. So was this -- did you label this exhibit
15 yourself as an exhibit to your objections and expert
16 report?

17 A. Yes.

18 Q. Okay. Thank you.

19 Did you make any other changes to this map?

20 A. No. I -- I did not, no.

21 Q. There was a pointer there, I believe, on the
22 table, Mr. Gerlach. Using that pointer can you just
23 please confirm for the council what you're referring to
24 when you reference the TR-1 area?

25 A. It's this area here. Just for reference --

1 Q. Thank you.

2 A. -- this is Goose Creek and Tongue River.

3 Q. Can I ask you to please turn to Big Horn

4 Exhibit 12. Did you prepare this exhibit?

5 A. I did.

6 Q. And how did you prepare this exhibit?

7 A. Well, we took the Skittles -- that's what it
8 is -- Skittles map of MP -- of the Brook Mine permit
9 application and combined an element from the GRD,
10 digitally, Rubber Sheeting and AutoCAD, that element from
11 the GRD being the initial trench, the open-pit trench,
12 that will be dug and to which the drive in the --

13 THE REPORTER: I'm sorry. I can't hear
14 you.

15 THE WITNESS: From which they use highwall
16 mining machine to do the highwall mining tunnels to the
17 north and to the south. And it is difficult to see, but --
18 it's easier with this hard copy -- but there's a blue area
19 in here that represents the area of shallow water table,
20 groundwater table, where the water table is 20 feet or less
21 below ground surface as per the GRD groundwater restoration
22 demonstration.

23 Q. (BY MS. BOOMGAARDEN) In your opinion,
24 Mr. Gerlach, does this map illustrate the connectivity
25 between the shallow groundwater above TR-1 and the Tongue

1 River?

2 A. It does, yes.

3 Q. Please explain.

4 A. The shallow water table above -- in this fairly
5 large area here, that goes right into the Tongue River.

6 Q. And, again, did I understand that that's based
7 on the data that's available in the GRD?

8 A. That is correct.

9 Q. In preparing this map, were you able to
10 digitally calculate the distance of the closest point of
11 the TR-1 panel to the Tongue River?

12 A. Yes.

13 Q. And what was that distance?

14 A. It's approximately a hundred feet.

15 Q. Thank you.

16 Did the Brook Mine plan characterize groundwater
17 quality data in the TR-1 area?

18 A. No.

19 Q. Why would that characterization be important at
20 the permit application or step 1 phase?

21 A. What you document in the permit application
22 before mining -- prior to mining -- for groundwater
23 quality and surface water quality is the baseline, the
24 background by which you in the future compare and report
25 in your annual reports all your monitoring results of

1 groundwater quality and surface water quality to look for
2 changes.

3 Q. And without doing that, could the probable --
4 probable hydrologic consequences determination be made as
5 required in Chapter 19?

6 A. Not in my mind. And Chapter 19 is the CHIA, the
7 probable hydrologic -- not in my opinion, no.

8 Q. Thank you for correcting me. You told me before
9 that I had put the wrong thing in my notes, and I missed
10 that.

11 So just to make sure the record's clear, it's
12 your opinion you could not determine the CHIA without that
13 important information?

14 A. I don't think that the State of Wyoming could do
15 a meaningful CHIA without having that piece of the puzzle.

16 Q. Did the Brook Mine plan characterize surface
17 water quality data in the TR-1 area?

18 A. Not in the TR-1 area, no.

19 Q. And could a CHIA determination be made without
20 that information?

21 A. Not in my opinion.

22 Q. And could Brook have used the data in the GRD to
23 make both the groundwater and surface water quality data
24 characterization?

25 A. Well, the GRD is the groundwater water

1 restoration demonstration. So you'd have to -- I mean,
2 there's lots of data in the public domain, years and years
3 worth of monitoring by Big Horn. Again, it's not really
4 right next to the TR-1 area.

5 Q. What is not right next to the TR-1 area?

6 A. The surface water monitoring database, the
7 historic database of Big Horn Mine. And as far as your
8 question is concerned, the answer -- straight answer is
9 no, but what the GRD did was groundwater quality,
10 groundwater restoration demonstration.

11 Q. So did the GRD have useful information for a --
12 for characterization of groundwater quality?

13 A. Yes.

14 Q. Okay. But it did not have useful information
15 for characterization of surface water quality?

16 A. Yes, not -- not complete in the mine plan.

17 Q. Okay. Thank you for that clarification.

18 As a consulting hydrogeologist, do you think
19 it's important that complete baseline data be included in
20 a permit application for purposes of meaningful peer
21 review?

22 A. I do.

23 Q. Given your assessment of Brook's baseline study,
24 I want to talk for a minute about how those data
25 deficiencies affect the accuracy and completeness of the

1 plans that are required. In your opinion, does the Brook
2 Mine plan contain a complete and accurate water quantity
3 and quality protection plan?

4 A. It does not.

5 Q. I'm going to ask Mr. Gregersen to please pull up
6 DEQ Exhibit 12, page 139. Whoops. Do you recognize that
7 exhibit?

8 A. I do.

9 Q. And were you present for Dr. Kuchanur's
10 testimony with regard -- with regard to that exhibit
11 yesterday?

12 A. I was.

13 Q. And based on, again, the legend down in the
14 lower right-hand corner, can you please identify for the
15 record which mine plan document this is?

16 A. I'm sorry. I can't. It's right here and it's
17 so darn fuzzy.

18 Q. And I'm going just to make sure we have clear
19 for the record what it is you're referring to. Can you
20 tell from that, Mr. Gerlach, which mine plan document that
21 is?

22 A. I can.

23 Q. Can you please state that for the record?

24 A. Exhibit MP.5-1.

25 Q. Did you make any alterations to that exhibit?

1 A. No.

2 Q. Does that exhibit help you to explain the basis
3 for your conclusion that the mine plan does not contain
4 complete and accurate water quantity and quality
5 protection plans?

6 A. Yes.

7 Q. Can you please explain how -- why this document
8 supports that?

9 A. The purpose of the TR-1 area, again, down on
10 here, this -- the box cut spot, we do have -- can you blow
11 it up a little bit more in here, please? We have a
12 proposed sedimentation pond, a very small one, nearby that
13 will handle runoff from an overburden stockpile, for Pit
14 3. Very small pond. No access available. Storage
15 capacity per the surface area of the runoff dams. If you
16 look out in the area of the proposed TR-1 area, there's no
17 other ponds. There's no other sedimentation ponds. And
18 I'm mindful of 35-11-406 referring to demanding you show
19 sedimentation ponds.

20 Q. So, Mr. Gerlach, is that small pond that you
21 just pointed to, is that identified Sedimentation Pond
22 SP-8?

23 A. Oh, I'm sorry. There it is. SP-8. There we
24 see it. Yep. SP-8. That's handling the overburden
25 stockpile.

1 Q. And do I recall correctly in your report that
2 you took issue with the design capacity of Sediment Pond
3 8?

4 A. Yes, I did.

5 Q. And can you please explain the reasons for your
6 conclusion that the design of Sediment Pond 8 is flawed.

7 A. Well, it's designed for a runoff area, if memory
8 serves me, of approximately 30 acres. Sediment pond --
9 proposed Settlement Pond SP-8 of Brook Mine is right on
10 top of it. I mean, literally occupies the same position
11 as the Brook -- the Big Horn Mine's current Reservoir 14,
12 which, in itself, has had full hydrologic control release
13 and so has Reservoir 14's contributing drainage area. All
14 released from hydrologic control. Water doesn't need to
15 be treated. The state of Wyoming has returned them to --
16 restoration of all those waters have met the standards.

17 Q. So can you please point out on the map where Big
18 Horn's Reservoir 14 is located?

19 A. Well, it's right here. It's not shown on this,
20 but it's the very same position, virtually.

21 Q. So understanding there's a lack of clarity on
22 the location, do I understand correctly that Big Horn
23 Coal's Reservoir 14 is at capacity and couldn't be used as
24 any additional capacity for Sediment Pond 8?

25 A. Well, Brook Mine has got -- plan is to do some

1 significant modification -- modifications to Big Horn Mine
2 Reservoir 14 to turn it into -- in order to turn it into
3 Sedimentation Pond 8. Okay? And -- but the thing of it
4 is, that caught my eye, it's simple, is that the design
5 for the capacity of the finally modified SP-8 of Brook
6 Mine, it's only for a drainage area of 30-some acres,
7 when, in truth, the design for the same location pond, Big
8 Horn Mine Reservoir 14 -- as I recall, well over 230
9 acres, 260 acres -- with all this drainage that happens
10 outside of the Brook Mine permit area, that comes in from
11 here and it will -- there's no berm. There's no diversion
12 of that flow. So I'm highly confounded as to how that
13 happened.

14 Q. Thank you.

15 With regard to your discussion just now of
16 Sediment Pond 8, was it those same concerns that you
17 raised that supported Big Horn -- Big Horn Coal's request
18 for a mine permit condition that the design of Sediment
19 Pond 8 be reevaluated?

20 A. Yes.

21 Q. Okay. Thank you.

22 Does the Brook Mine plan include a plan to
23 minimize disturbance to prevailing hydrologic balance at
24 both the mine site and associated offsite areas?

25 A. Not in my opinion.

1 Q. I'll ask you to turn to Big Horn Exhibit 14. Do
2 you recognize that exhibit, Mr. Gerlach?

3 A. I do.

4 Q. And I know that, again, it's going to be
5 difficult to read, but would you take any issue with
6 identifying that as the geologic cross-section K-K Prime
7 from Addendum D5-3, Exhibit 2 in Brook's mine plan?

8 A. Sheet --

9 THE REPORTER: I'm sorry. Say that again.

10 A. Sheet 12 of 12, yes.

11 Q. (BY MS. BOOMGAARDEN) Excuse me. Just above the
12 Ramaco seal down in the lower right-hand corner, do you
13 see the red letters C1-objection Exhibit E?

14 A. I do.

15 Q. And did you include that just to make a
16 reference to your expert report?

17 A. I did.

18 Q. And did you make any other alteration to this
19 map?

20 A. Yes.

21 Q. And can you please explain what that is?

22 A. One alteration I made to this drawing is the
23 addition of this red line, which is on elevation 3600 feet
24 beneath sea level. Again -- and this was very well
25 described yesterday by Mr. Kuchanur.

1 Q. Excuse me. I'm sorry. I couldn't hear you?

2 A. Mr. Kuchanur -- Kuchanur.

3 Q. Dr. Kuchanur?

4 A. It is Dr.?

5 Q. Yes.

6 So is this the same exhibit that Dr. Kuchanur
7 was referring to --

8 A. It is.

9 Q. -- yesterday?

10 Okay. And what was the purpose that you added
11 the red elevation line?

12 A. Well, I wanted to show relative to that --
13 remember that exhibit where it's hybrid between the -- the
14 exhibit of the Skittles and the shallow -- area of shallow
15 water table in the TR-1 area, which --

16 Q. So you're referring to -- just let me make sure
17 the council can follow this. You're referring to Big Horn
18 Exhibit 12; is that correct?

19 A. Yes, it is correct.

20 Q. Okay. Thank you.

21 A. Yep.

22 This corresponds to that depth in the TR-1 area
23 of shallow -- shallow groundwater depth of 3600 feet.
24 These are 50-foot intervals, these tick marks. So as
25 Dr. Kuchanur said yesterday, you get about a hundred feet

1 of bed differential between this red line and the bottom
2 of the Carney coal seam where the mining will occur. This
3 is the Tongue River. And so the TR-1 area's in here. So
4 material 1 will effectively excavate all through this in
5 the open trench. This signifies, by the way, in the
6 Ramaco exhibit, mine backfill. Doesn't show any
7 saturation of mine backfill. It, however, does show two
8 monitor wells. And they are showing the potentiometric
9 surface elevation in the Carney and the Masters coal seams
10 below the Carney. There's two --

11 Q. Please speaks up, Mr. Gerlach. It's difficult
12 for the court reporter to hear you.

13 A. Oh.

14 Q. So when you're turned away, if you could speak
15 just a little louder.

16 A. All right. The point being that the proposed
17 mining operation will dig the open pit all the way through
18 and then drive the tunnels -- the highwall mining tunnels
19 back into the coal. For the TR-1 area, if you just add
20 up all the Skittles tunnels, you've got -- which I didn't
21 do -- because many thousands of feet. You're going to
22 have a lattice work, all underneath this backfill,
23 saturated backfill, of tunnels.

24 Going back to the groundwater elevation in the
25 backfill, being the red line, versus the depth of the

1 coal, what's going to happen? There's going to be a
2 large, hundred-foot-plus potential driving the water from
3 the backfill down in the trench. This will be very
4 prevalent during mining before they start backfilling the
5 TR-1 trench. And it's going to go down into those
6 tunnels. There's no place to go. They'll have to pump
7 quite a bit -- quite a bit of water out in order to
8 operate the highwall mining machine out after mining. So
9 that's the probable hydrologic consequences operation of
10 highwall mining. Is it assessed? No. No.

11 Q. Is it a what? I'm sorry.

12 A. Is it analyzed.

13 Q. Okay.

14 A. Assessed.

15 Q. Thank you.

16 And just for clarification, Mr. Gerlach. Do you
17 see that intermediary sort of yellow band, and that was
18 talked about being a strata that separated the two --

19 A. This is the shale band.

20 Q. Okay. And the yellow above that?

21 A. That's a sand or sandstone.

22 Q. And that will be drilled through, is that your
23 understanding -- or cut through for the trench cut?

24 A. Well, the -- the TR-1 mining plan is to cut all
25 the way through, down through the -- you know, I have that

1 wrong, folks. This is the -- it's difficult.

2 This is the Carney coal. This is Masters coal.

3 Okay? This is all shale. You may recall from

4 Dr. Kuchanur's discussion yesterday, this is all shale.

5 Okay. We're looking at a saturated thickness now in the

6 backfill of about 70 to maybe 85 feet. Then we have about

7 70 feet of shale that the open-pit excavation will go

8 through, after it's gone through the saturated backfill,

9 go through the shale. And then it will enter the bottom

10 of the Carney coal, which will drive it through the

11 highwall mining tunnels in the Carney coal.

12 Q. And, Mr. Gerlach, did I understand you think

13 that it will flow out the tunnels, the path of least

14 resistance that was discussed yesterday?

15 A. Yes. They will. In existing environment, as

16 Mr. -- Dr. Kuchanur described yesterday, and I couldn't

17 agree more, is this shale is -- it transmits groundwater,

18 but, as he said, at a very small rate. I agree fully, as

19 documented by the water level clear up here versus clear

20 down here. So you can see the groundwater levels.

21 There's not a -- as Dr. Kuchanur explains,

22 there's not a -- a commingling or an equilibrium between

23 the water that's far apart. Once you -- they go through

24 this and break this shale in here with the initial open-

25 cut trench, then during mining water has no obstacle but

1 to come right down and enter into the tunnels or be pumped
2 out.

3 Q. Let me follow up on that, Mr. Gerlach.

4 CHAIRMAN BAGLEY: Can I suggest maybe we
5 take a break?

6 MS. BOOMGAARDEN: Certainly.

7 CHAIRMAN BAGLEY: We've been going at this
8 for a while. Let's take 15 minutes. It's 4:00. And we'll
9 start back at 4:15.

10 (Hearing proceedings recessed

11 4:00 p.m. to 4:22 p.m.)

12 CHAIRMAN BAGLEY: All right. We are back
13 in session. Please, Ms. Boomgaarden, continue.

14 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

15 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, I want to
16 refer back just for a moment to the exhibit that's up
17 right now, Big Horn Coal 14. And you testified a minute
18 ago about the water in the gray backfill area being able
19 to move down through the different stratum when the trench
20 cut is made and flowing out through the -- the tunnels or
21 drifts of the highwall plan -- or, excuse me, highwall
22 mine. Is that correct?

23 A. That is correct.

24 Q. Can you tell me, is that going to be a one-time
25 event or will that be a recurring event?

1 A. I can.

2 Q. Go ahead and describe how that's going to occur
3 and how often and why.

4 A. The trench will be backfilled by the Ramaco --
5 by the Brook operation. And, in my mind, there's no
6 reason to suspect that backfill will be any different than
7 the backfill that's already out there. But the main
8 difference will be, going forward forever, is that this
9 clay seal will be broken, the shale seal. So consequently
10 water only has one place to go post-mine environment, from
11 here down to the backfill of the Brook Mine trench and
12 then into the mine highwall tunnels.

13 Q. And that backfill that's there, is that
14 continually recharged? So will that drain effect
15 continue --

16 A. It will continually --

17 Q. -- over time?

18 A. -- recharge the water that I mentioned going
19 back down through the future Ramaco TR-1 backfill. It's
20 all recharged by Tongue River --

21 THE REPORTER: Recharged by Tongue River --

22 THE WITNESS: Tongue River and Goose Creek.

23 Q. (BY MS. BOOMGAARDEN) And did the mine permit
24 application that was published, in your opinion, contain
25 information as to how that feature -- that drain feature,

1 and the backfill water flowing back down through and out
2 through the tunnels, did the mine plan address how big --
3 how Brook Mine was going to manage that?

4 A. It does not. It doesn't assess it whatsoever.

5 Q. I'm going to shift gears here with you just for
6 a minute. Did you hear Dr. Kuchanur testify yesterday
7 about the MODFLOW groundwater model?

8 A. I did.

9 Q. And have you used MODFLOW?

10 A. I have.

11 Q. And do you agree with Dr. Kuchanur that MODFLOW
12 represents the industry standard in groundwater modeling
13 software?

14 A. I do.

15 Q. Would the modeling results from the MODFLOW
16 predictions, would those have been improved had data from
17 the GRD been used in the groundwater model?

18 MR. POPE: Objection, Dr. Bagley. I don't
19 believe there's been any testimony that Mr. Gerlach is
20 aware of -- has actually run the model. So I don't know
21 how he would have a basis on which to conclude that new
22 data in the model would lead to a different result.

23 MS. BOOMGAARDEN: Dr. Bagley, Mr. Gerlach
24 has studied the model that was used and the results of the
25 model. And he's testified that he's familiar with data in

1 the GRD that appeared nowhere in the mine permit
2 application, the mine plan. And he's testified that he's
3 familiar and has used that model, and I think that's a
4 sufficient basis upon which he can tell this council if he
5 thinks the results of the model would have been improved by
6 the use of that data.

7 CHAIRMAN BAGLEY: He is being considered an
8 expert. I'm willing to hear his opinions as to what the
9 results of the MODFLOW would be if additional data were
10 added.

11 Q. (BY MS. BOOMGAARDEN) Okay. So, Mr. Gerlach,
12 let me just rephrase it. I tend to speak in too many
13 words.

14 Would the results of the MODFLOW groundwater
15 model for Brook Mine have been improved if that model
16 would have used, in addition, data from the GRD?

17 A. It would be a vast improvement providing vastly
18 different numerical results.

19 Q. Thank you.

20 Without data from the GRD, are the modeling
21 results sufficient to allow the administrator to make a
22 CHIA determination?

23 A. No, they're not sufficient.

24 Q. I believe you've already testified that it was
25 the observations you made and conclusions you drew in your

1 expert report that helped you word specific permit
2 conditions for Big Horn Coal; is that correct?

3 A. That is correct.

4 Q. And is it because you had these concerns with
5 the lack of baseline data and the inaccuracy of the plans
6 that you suggested that Big Horn should request specific
7 permit conditions?

8 A. It is.

9 Q. Did you hear Dr. Kuchanur testify that the
10 groundwater model accounted for overburden drawdown?

11 A. I did.

12 Q. And do you agree?

13 A. No.

14 Q. Why not?

15 A. There's no evidence in the mine plan or in the
16 addendum of the mine plan housing the groundwater model
17 that the groundwater model ever considered any saturation
18 in the overburden. And, indeed, in support of that
19 finding of mine, I mean, there's -- there's -- we
20 discussed it in Section MP.6.2.3, comes right out and says
21 there's no modeling of drawdown in the overburden.

22 Q. Did you hear Dr. Kuchanur testify on
23 cross-examination that TR-1 was included in model layer
24 number 1?

25 A. I did.

1 Q. Do you agree TR-1 was hydrologically included?

2 A. No. It's not hydrologically included, but it's
3 part of what's called a domain in the groundwater model,
4 which is fancy word for geographic extents.

5 Q. And were you here when I believe it was
6 Mr. Barron was -- no, excuse me, it was Dr. Kuchanur --
7 was asked whether the saturated backfill in the TR-1 area
8 constituted an aquifer?

9 A. Would you ask that again, please?

10 Q. Sure. Were you here -- did you hear
11 Dr. Kuchanur testify that the saturated backfill in TR-1
12 wasn't an aquifer because it was not productive at this
13 time?

14 A. I did hear that, yes.

15 Q. And do you agree with that conclusion?

16 A. Not at all.

17 Q. Why not?

18 A. The groundwater restoration demonstration
19 carries with it a number of aquifer tests that were done,
20 some by me for my master's thesis back in the -- well,
21 before I was hired by Big Horn Mine. You know -- you
22 know, if you go to that exhibit, you'll see that we pumped
23 some of those wells for hours and hours and hours, up to
24 37 gallons a minute.

25 Q. In your professional opinion, could a

1 groundwater well be permitted in that backfill?

2 A. By all means.

3 Q. Thank you.

4 Mr. Gerlach, based on your knowledge and
5 experience, has DEQ, Land Quality Division typically
6 required more hydrologic data in analytic detail in a mine
7 permit application than what Brook has provided?

8 A. Yes.

9 Q. In your experience, do you know of any other
10 circumstances where a mine permit application has been so
11 lacking in hydrologic detail?

12 MR. POPE: Objection. Mischaracterizes the
13 evidence.

14 CHAIRMAN BAGLEY: Yeah, I -- I think we
15 need to perhaps rephrase that.

16 MS. BOOMGAARDEN: I'll just move to my last
17 question. Thank you, Dr. Bagley.

18 Q. (BY MS. BOOMGAARDEN) Mr. Gerlach, would you
19 affix your professional stamp and signature on any portion
20 of Brook's mine permit that you reviewed?

21 A. No elements of the mine or reclamation plan.

22 MS. BOOMGAARDEN: Thank you. I don't have
23 any further questions.

24 CHAIRMAN BAGLEY: Thank you,
25 Ms. Boomgaarden.

1 Ms. Anderson.

2 MS. ANDERSON: I have no questions. Thank
3 you.

4 CHAIRMAN BAGLEY: Thank you.

5 Mr. Gilbertz.

6 MR. GILBERTZ: I appreciate Mr. Gerlach's
7 testimony and thank him for it, but I have no questions.

8 CHAIRMAN BAGLEY: Thank you.

9 Mr. Pope.

10 MR. POPE: Thank you, Dr. Bagley.

11 CROSS-EXAMINATION

12 Q. (BY MR. POPE) Good afternoon, Mr. Gerlach.

13 A. Good afternoon, Mr. Pope.

14 Q. Let's start with when you were retained in this
15 matter. As I understand, you were hired by Big Horn Coal
16 on January 6, 2017, correct?

17 A. It was in early January 2016.

18 Q. I believe you testified to this on direct, but
19 you helped prepare portions of Big Horn Coal's objection
20 letter that was filed on January 25, 2017; is that
21 correct?

22 A. That's correct.

23 Q. So the total time that you had to review the
24 permit application, when you were hired in early January
25 and when the objection letter was filed, it's about

1 19 days; is that fair?

2 A. Sounds reasonable.

3 Q. And during that time when you reviewed -- before
4 the filing of the objection letter -- you did not speak
5 with anyone at DEQ about Brook's permit application,
6 correct?

7 A. That is correct.

8 Q. And as a result, you weren't aware of the
9 specific review that DEQ did of Brook's permit
10 application, correct?

11 A. Not directly.

12 Q. Of course, I hate to do this so early under the
13 process, Mr. Gerlach. You remember coming to the Sheridan
14 County courthouse for a deposition a couple weeks ago?

15 A. Uh-huh.

16 Q. You and I had a chance to sit down in the jury
17 room and chat about Brook's permit application, correct?

18 A. Yes.

19 Q. And there was a court reporter present who
20 administered an oath to you to tell the truth, didn't she?

21 A. Yes.

22 Q. And you promised to tell the truth, correct?

23 A. I certainly did.

24 Q. And you told us the truth?

25 A. I believe I did.

1 Q. Mr. Gerlach, I've handed you a copy of your
2 deposition transcript. If you would do me a favor and
3 turn to page 36. I'd like to direct your attention to
4 line number 2. Do you see that?

5 A. I do.

6 Q. Follow along with me, please. The question, "As
7 you identified those issues that as you said were
8 overlooked, did you communicate at all with anyone at DEQ
9 to figure out why they reviewed a particular portion of
10 the permit application the way they did?"

11 Answer, "No."

12 Did I read that correctly?

13 A. Yes.

14 Q. Let's move on to the interaction of your work
15 with Big Horn Coal and Brook. You testified that you had
16 done some initial baseline gathering work as part of
17 Brook's permit application, correct?

18 A. Can you repeat that, please?

19 Q. Sure. You testified on direct that you had
20 worked for Brook gathering some initial baseline data to
21 help prepare a permit application, correct?

22 A. Correct.

23 Q. Okay. But at some point you identified a
24 conflict of interest, at least a potential conflict of
25 interest, between Brook and Big Horn Coal Company,

1 correct?

2 A. Correct.

3 Q. I believe you described it as there was a
4 loyalty you had to Big Horn Coal and I believe Padlock
5 Ranch as well, correct?

6 A. I don't think so.

7 Q. Ms. Boomgaarden asked you the question that you
8 had a loyalty to clients, and you said yes to historical
9 clients like Big Horn Coal. My question is, you were
10 hired as an independent expert, but an independent expert
11 does not have loyalty to the client that is hiring him as
12 an expert; is that correct?

13 A. I'm not sure I understand your question. Sorry.

14 Q. Sure. I mean, I may have asked too long of a
15 question. Let me back up.

16 Ms. Boomgaarden asked you a question about when
17 you identify the potential conflict of interest, that you
18 have a loyalty to historical clients like Big Horn Coal
19 and Padlock Ranch. It was testified that you were hired
20 as an independent expert. My question is, an independent
21 expert does not owe loyalty to the person or party hiring
22 that person as an independent expert, correct?

23 A. If I understand your question to be they should
24 not be biased, by loyalty or whatever affinity, bias as to
25 the entity hiring him to provide an expert report, if

1 that's -- if my understanding there is correct, I agree.

2 Q. And after you identified the potential conflict
3 of interest between Brook and Big Horn Coal, you
4 terminated your relationship with Brook, correct?

5 A. That's correct.

6 Q. You did not is, however, terminate your
7 relationship with Big Horn Coal, correct?

8 A. Correct.

9 Q. You continued to provide services for Big Horn
10 Coal?

11 A. Correct.

12 Q. Mr. Kristiansen testified on direct that ethical
13 responsibilities of professional engineers and
14 professional geologists are important. Were you here to
15 hear that?

16 A. I was.

17 Q. You agree with that statement?

18 A. Yes.

19 Q. And as I understand it, the Board of
20 Professional Geologists in Wyoming propagates Rules of
21 Professional Conduct. Is that accurate?

22 A. That is accurate.

23 Q. You're aware of those rules, then, I take it?

24 A. I am.

25 Q. Have you read them?

1 A. Yes.

2 Q. You follow them?

3 A. I attempt to, yes.

4 Q. Do you follow them or do you attempt to follow
5 them?

6 A. I believe I have followed them.

7 MR. POPE: Mr. Ruby, I have an exhibit
8 here.

9 MR. RUBY: You want this for the witness?

10 MR. POPE: That one is.

11 MR. GREGERSEN: Excuse me, Mr. Pope. Are
12 you offering this exhibit into evidence or are you just
13 using it to examine the witness?

14 MR. POPE: I'm just using it to examine the
15 witness right now. If we need to mark it, we will.

16 MR. GREGERSEN: Thank you.

17 Q. (BY MR. POPE) Mr. Gerlach, we've handed you a
18 copy of the Chapter 4 of the Board of Professional
19 Geologists rules. If you can turn to the second page. At
20 the top it says Section 1, Code of Professional Conduct,
21 correct? The second page.

22 A. 4-2?

23 Q. Should say 4-1 at the bottom.

24 A. Oh, yes. Correct.

25 Q. I'd like you to go down in Section 1 to

1 Section 1(a)(vii). I'd just like you to follow along. It
2 says here that "A licensee or trainee shall not knowingly
3 accept an assignment where the duties to a client or the
4 public would conflict with their personal interest or the
5 interest of another client without full disclosure of all
6 material facts of the potential," goes on to the next
7 page, "conflict to each person who might be related to or
8 affected by the project or engagement in question." Did I
9 read that correctly?

10 A. I believe so.

11 Q. As I understand it, you did not inform Big Horn
12 Coal of a potential conflict. Instead, they informed you
13 of the potential conflict, correct?

14 A. Not correct.

15 Q. So your testimony is that Big Horn Coal did
16 not -- and to be fair, let me be more precise with my
17 question.

18 Isn't it true, Mr. Gerlach, that Big Horn Coal
19 told you that the Brook permit application would involve
20 the use of Big Horn Coal surface?

21 A. I don't recall that they did that --

22 THE REPORTER: You don't recall that they
23 did that what?

24 THE WITNESS: That Big Horn Coal told me
25 that Brook Mine application would utilize Big Horn Coal

1 surface, I believe was the question.

2 THE REPORTER: If I ask you to repeat, just
3 what you just said. Okay? Thank you.

4 Q. (BY MR. POPE) Mr. Gerlach, if you pick up your
5 deposition transcript again, please, and turn to
6 page 25. I'm sorry. That's the binder.

7 A. Oh.

8 Q. I know there's a lot of stuff right there.

9 And when you get to page 25, I'd like to direct
10 your attention to line 8. Do you see line 8?

11 A. I do.

12 Q. If you follow along with me, please. The
13 question here is, "Did you ever come to learn while you
14 were working for Brook that part of its operations would
15 be conducted on Big Horn Coal surface or surface that Big
16 Horn Coal was using?

17 A. Yes.

18 Q. Now that we've established that, did you inform
19 Big Horn Coal that you were doing work on behalf of Brook
20 Mine that would result in operations overlapping on Big
21 Horn Coal surface or surface that Big Horn Coal was using?

22 A. They informed me. They had more knowledge of
23 the subject than I did."

24 Did I read that correctly?

25 A. I believe you did.

1 Q. If you'd -- I know I'm forcing you to switch
2 between various things. Would you pick up the rules of
3 professional geology again?

4 A. Sure.

5 Q. Thank you.

6 If you go to page 4-2. Should say that at the
7 bottom. I'd like you to go down to (xiv). Do you see
8 that?

9 A. I do.

10 Q. This section says that "A licensee or trainee
11 shall not use, directly or indirectly, any confidential
12 information obtained from or in the course of performing
13 services for an employer or client in any way that is
14 adverse or detrimental to the interest of the employer or
15 client, except with prior consent of the employer or
16 client or when disclosure is required by law." Did I read
17 that correctly?

18 A. I believe you did.

19 Q. I'd like to talk, with that in the background,
20 about your use of information in this case. As we
21 discussed a moment ago, you chose, after identifying a
22 potential conflict of interest between Big Horn Coal and
23 Brook --

24 MS. BOOMGAARDEN: Objection. That's a
25 mischaracterization. Mr. Gerlach didn't testify that he

1 characterized it as a conflict of interest.

2 MR. POPE: Dr. Bagley, I think both on
3 direct and on cross Mr. Gerlach said he identified a
4 potential conflict of interest and he took action.

5 CHAIRMAN BAGLEY: Okay.

6 MS. BOOMGAARDEN: I believe his testimony
7 was he identified there could be a potential for a conflict
8 of interest and that's when he took action. If it's
9 characterized fairly, I'm fine with that.

10 CHAIRMAN BAGLEY: The -- there was an
11 exhibit with the actual letter. I don't recall which
12 exhibit it was.

13 MS. BOOMGAARDEN: Uh-huh. 19. Big Horn
14 19.

15 CHAIRMAN BAGLEY: Thank you. Let's see
16 what that says.

17 MS. BOOMGAARDEN: I believe the second to
18 the last line of the first paragraph.

19 CHAIRMAN BAGLEY: "May be nearing the
20 potential situation of entering into a conflict of
21 interest."

22 MR. POPE: And let me be clear, Dr. Bagley.
23 I did ask a question of Mr. Gerlach -- I stated he
24 identified conflict of interest, and he responded in the
25 affirmative. To make it clear for the record, I can re-ask

1 that question again.

2 CHAIRMAN BAGLEY: Yeah. I had to admit I
3 can't quite tell what the objection is and why. If you
4 could re-ask the question so I can hear what the wording
5 is.

6 MR. POPE: Absolutely.

7 Q. (BY MR. POPE) Mr. Gerlach, did you ever
8 identify a conflict of interest between the Brook Mine and
9 Big Horn Coal?

10 A. No.

11 Q. So your testimony here today is that you
12 identified a potential conflict of interest?

13 A. Between Aqua Terra consultants and myself and
14 Brook Mine relative to my relationships with Big Horn Mine
15 and Padlock Ranch.

16 Q. I remember this discussion from our deposition.
17 You -- let's -- for the council's benefit, let's see if we
18 can flesh out this issue so we can work through this
19 efficiently as possible.

20 You understood that at some point in time Big
21 Horn Coal and Brook could have an overlapping permit
22 scenario, correct?

23 A. At some point in time late in my service with
24 Brook, I -- I believe I did see that information. I'm
25 uncertain. What I recall mostly is that all of the Brook

1 plans were well to the west, outside of Big Horn Mine.

2 That's what I remember. Can I absolutely say, well, there
3 might have been some in Brook? I'm not sure.

4 Q. And upon identifying, as you said, potential
5 conflict of interest between yourself, Aqua Terra and
6 Big Horn -- excuse me, Brook, you terminated your
7 relationship with Brook, correct?

8 A. That is correct.

9 Q. You did not, however, terminate your
10 relationship with Big Horn Coal, correct?

11 A. Correct.

12 Q. And even though, as you express in this letter
13 and expressed in your deposition, part of the source of
14 that conflict was the potential overlap between the
15 proposed Brook Mine and Big Horn Coal surface, correct?

16 A. By the date of that letter, when I wrote that,
17 yes, that became a fact.

18 Q. So with that -- with that established, let's --
19 let's circle back to the romanette -- excuse me, (xiv)
20 about the use of information between clients.

21 When you terminated your relationship with
22 Brook, you had gathered data that they could use for their
23 permit application, correct?

24 A. That is correct.

25 Q. And you were also, as part of gathering that

1 data, involved with meetings involving the Department of
2 Environmental Quality, correct?

3 A. That is correct.

4 Q. So you're in possession of Brook's data. You
5 also, based on your testimony on direct, are in possession
6 of a groundwater restoration demonstration you did on
7 behalf of Big Horn Coal Company, correct?

8 A. Long time before I ever knew the existence of
9 Brook, yes.

10 Q. Fair enough. You took that groundwater
11 restoration demonstration and used it as part of forming
12 your opinions in your expert report, correct?

13 A. That is correct.

14 Q. And your expert report in this case, and your
15 testimony on direct, is against a former client, Brook
16 Mine, correct?

17 A. Yeah. Correct.

18 Q. So you used information in your possession from
19 one client and are currently using it against a former
20 client in these proceedings, correct?

21 MS. BOOMGAARDEN: Objection. I think he's
22 already asked and answered.

23 CHAIRMAN BAGLEY: Yeah, I -- he has
24 answered that affirmatively.

25 MR. POPE: Okay.

1 MS. ANDERSON: You know, and, Dr. Bagley,
2 he's not my witness, but I would also note that geology is
3 a self-regulating profession in Wyoming, and should be --
4 should Brook Mine have concerns about Mr. Gerlach's
5 testimony here today, there may be another forum that's
6 more appropriate for raising those concerns.

7 CHAIRMAN BAGLEY: Thank you, Ms. Anderson.
8 I was beginning to wonder myself.

9 We are not the Board of Professional Geologists,
10 and so I think we need to, you know, examine the validity
11 of his expert opinion, which, of course, he's been an
12 expert and that. But I want to be careful that we don't go
13 into an area that could be construed as a complaint or
14 something. That would need to be dealt with by a separate
15 board.

16 MR. POPE: If I may, Dr. Bagley, make, I
17 guess, an offer of proof, however you want to call it. Our
18 intention is not to be lodging a complaint and having you
19 all act as the Board of Professional Geologists. Instead,
20 what this line of questioning is attempting to do is to
21 demonstrate Mr. Gerlach has not filled his ethical
22 obligations as a professional geologist. And that should
23 weigh in your minds as to credibility of this witness.

24 With that said, I'm done with that line of
25 questioning. I can move on.

1 CHAIRMAN BAGLEY: Okay. Thank you.

2 Q. (BY MR. POPE) Mr. Gerlach, let's talk very
3 briefly about your opinion on permits in the state of
4 Wyoming. You would agree with me that permits are living
5 and dynamic documents, correct?

6 A. Portions of them are, uh-huh.

7 Q. All right. Let's talk a little bit more about
8 this groundwater restoration demonstration. You and
9 Aqua Terra prepared this for Big Horn Coal as part of its
10 reclamation efforts, correct?

11 A. Correct.

12 Q. This was not prepared as part of a permit
13 application, correct?

14 A. For -- well, it's prepared with the full
15 understanding that it would become part of the permit
16 application. Not the application application, but permit
17 of the mine. What we generically call the permit
18 application. It's not the initial application, but it's
19 permit 500-whatever.

20 Q. Let me ask a more precise question so we can get
21 there.

22 A. Okay.

23 Q. The groundwater restoration demonstration was
24 not prepared for Big Horn Coal as part of its initial
25 application for a permit to mine, correct?

1 A. Certainly.

2 Q. You would agree with me that the Department of
3 Environmental Quality had access to the groundwater
4 restoration demonstration because it was included in Big
5 Horn Coal's permit, correct?

6 A. Would you repeat that, please?

7 Q. Sure. You would agree with me that the
8 Department of Environmental Quality had access to the
9 groundwater restoration demonstration because it was part
10 of Big Horn Coal's permit file, correct?

11 A. Correct.

12 Q. Did you hear Dr. Kuchanur state that he relied
13 on data outside of Brook's permit application in
14 evaluating his technical adequacy?

15 A. I did.

16 Q. Let's talk briefly about modeling. You did not
17 take the Brook groundwater model and run simulations with
18 it, did you?

19 A. No.

20 Q. So you didn't take information and data in the
21 groundwater restoration demonstration, put it into Brook's
22 model, run that model and see what data comes out?

23 A. No. I don't have any input and output files
24 either. They'd be gargantuan digital files that you'd
25 have to do to do that.

1 Q. So you testified on direct that the numbers
2 would vary wildly if you did that, but you didn't actually
3 conduct that test to see if the numbers varied wildly,
4 correct?

5 A. I don't understand your question. The test of?

6 Q. I may have been imprecise. Let me -- you did
7 not run Brook's groundwater model and get numbers to see
8 if those numbers varied wildly from the numbers in the
9 permit application, right?

10 MS. BOOMGAARDEN: Objection. That's been
11 asked and answered. I believe that Mr. Gerlach's already
12 testified he did not run the groundwater model.

13 CHAIRMAN BAGLEY: Yeah.

14 MR. POPE: Dr. Bagley.

15 CHAIRMAN BAGLEY: I -- we -- we have an
16 expert who testified, and my quote is "vast improvement" if
17 the data were used. And I think as -- we can ask -- his
18 expert opinion can be asked. But we need to finish up the
19 question, you know, and if the answer is he says he didn't
20 run it and can -- so let's not ask the question too many
21 times.

22 MR. POPE: And I apologize, Dr. Bagley.
23 I'm not trying to re-ask a bunch of times. I just, based
24 on the previous answer, I just thought maybe there was a
25 disconnect on Mr. Gerlach's understanding. So I was trying

1 to clarify.

2 CHAIRMAN BAGLEY: Okay.

3 Q. (BY MR. POPE) Give it one last shot,
4 Mr. Gerlach.

5 The quote I wrote down from your direct
6 testimony was that if data from the GRD was added to the
7 groundwater flow model -- groundwater model, excuse me,
8 and that model was run, it would have vastly different
9 results. You did not run the groundwater model to see if
10 there are vastly different results, correct?

11 A. That's correct.

12 Q. Got it. In discussion with Ms. Boomgaarden, you
13 were referred back to Dr. Kuchanur's discussion on whether
14 or not the saturated backfill material in TR-1 is an
15 aquifer. You're aware that aquifer is defined in the coal
16 rules and regulations of DEQ, right?

17 A. Correct.

18 Q. And I don't -- I don't remember if this was
19 asked, so I need to ask it. There are no wells permitted
20 in the saturated backfill material in and around TR-1,
21 correct?

22 A. Not anymore.

23 Q. You also discussed -- and we're going to pull
24 the cross-section up here in just a moment of the area
25 around TR-1. But you testified that the clay seal was

1 going to be broken as a result of mining. But you were
2 here when Dr. Kuchanur explained that when the backfill
3 material was restored, that the -- the discussion with
4 Council Member Flitner, the water will then begin to
5 behave as -- as -- almost as it did before mining,
6 correct?

7 A. I believe I heard something about it. Sometimes
8 I couldn't hear very well. I believe I heard something to
9 that effect.

10 Q. Okay. You discussed sediment ponds, and
11 specifically Sediment Pond 8. A couple of questions about
12 that. You're aware that Brook's mining method will
13 disturb less land than the surface mining method that Big
14 Horn Coal used when it mined in that area, correct?

15 A. Yes.

16 Q. Sort of a technical question here. You
17 testified you're a licensed professional geologist. You
18 would agree with me, though, that only a licensed
19 professional engineer can design a sediment pond in the
20 state of Wyoming, right?

21 A. I would agree.

22 Q. You had some opinions about Brook's hydrologic
23 control plan, and you discussed MP.5.1 -- excuse me, map
24 MP.5.1 with Ms. Boomgaarden. You're aware there's also
25 text inside the mine plan that discusses Brook's

1 hydrologic control model, correct?

2 A. I'm aware.

3 Q. And that text discusses surface drainage and
4 erosion control plan, doesn't it?

5 A. It does.

6 Q. It also discusses sedimentation and wastewater
7 impoundments, right?

8 A. Yeah.

9 Q. It discusses general design criteria and
10 construction standards for those impoundments too, doesn't
11 it?

12 A. Generically, yes.

13 Q. There's a flood control plan in there too,
14 right?

15 A. If I recall, yes.

16 Q. There's also plans for diversions too?

17 A. Yes.

18 Q. There's also a ditch and culvert design in the
19 hydrologic control plan too, right?

20 A. Yes.

21 Q. That hydrologic control plan includes collection
22 ditches and bypass ditches too, right?

23 A. That I don't remember, but I'll take your word
24 for it.

25 Q. Council may not like that, but...

1 The mine plan also includes an impoundment
2 maintenance plan too, right?

3 A. You know, I don't recall seeing that, no.

4 Q. And more directly to the point about potential
5 inflow of water into the TR-1, the mine plan includes a
6 mine pit dewatering plan, correct?

7 A. Yes. I believe it does, uh-huh.

8 Q. If we could, let's go back -- we're going to
9 pull on the screen Big Horn Exhibit 14. I have a few
10 questions for you about that.

11 Mr. Gerlach, as I understand, this is an exhibit
12 that you prepared using a cross-section in the Brook Mine
13 plan, correct?

14 A. Excuse me. That is correct, yeah.

15 Q. Now, you actually on direct described this
16 cross-section identifies certain water areas. I may not
17 be getting the scientific term right there, but water
18 locations in the area around TR-1, right?

19 A. It does.

20 Q. And, in fact, it depicts the elevation of where
21 those areas of water are, right?

22 A. Yes.

23 Q. And you've discussed with Ms. Boomgaarden, based
24 just on this cross-section, a number of things that could
25 happen as Brook removes the saturated backfill and begins

1 to mine, right?

2 A. Yes.

3 Q. And, in fact, you were able to testify that as a
4 result of looking at this cross-section, you could tell
5 what happens to inflows when that backfill material is
6 removed and also it may -- also what may happen when that
7 backfill material is put back into place, right?

8 A. Two questions. The backfill material is
9 removed, and I presume you mean a swath is cut through it,
10 as Mr. -- I'm sorry, Dr. Kuchanur described yesterday,
11 yes.

12 Q. Uh-huh. You're correct. I asked you two
13 questions. I should only ask you one at a time.

14 So the first question was you described what may
15 happen when that saturated backfill material is removed,
16 right?

17 A. Yes.

18 Q. You also testified about some of the potential
19 effects and consequences of when that saturated back -- or
20 when backfill material is placed back into that area,
21 right?

22 A. Correct.

23 Q. You heard Dr. Kuchanur testify that he was able
24 to use this cross-section helping him analyze the probable
25 hydrologic consequences of Brook's mine plan, right?

1 A. I believe I heard that, yes.

2 Q. I have a few questions, Dr. -- excuse me,
3 Mr. Gerlach, about some of the opinions in your expert
4 report. And I -- in attempt to preempt some of the
5 objections about these weren't discussed, this is my only
6 opportunity to ask you these questions.

7 In your expert report, you have some opinions
8 about the potential for subsidence, correct?

9 A. I believe I did put some opinions of that nature
10 in there, yes.

11 Q. In preparing those objections about subsidence,
12 you were aware that Brook has a commitment in its mine
13 plan to develop and implement MSHA ground control plan,
14 right?

15 A. I'm not sure at the time I wrote that expert
16 report if I knew that specific piece of information.

17 Q. But you did hear several of the DEQ witnesses,
18 as well as Mr. Barron, explain that Brook has a commitment
19 in its mine plan to do MSHA ground control plan, right?

20 A. I did.

21 Q. You testified with Ms. Boomgaarden at the
22 beginning about Brook has to identify the water we use as
23 part of its mine plan. You're aware that Section MP.8 of
24 Brook's mine plan discusses its water use, correct?

25 A. Yes.

1 Q. In fact, there's a table in the mine plan that
2 breaks down the water usage in the mine, right?

3 A. Yes.

4 Q. And I apologize. I don't remember if we
5 discussed this, but you -- you reviewed some of the
6 comments and responses between Brook and DEQ?

7 A. Some, yes.

8 Q. You're aware that at least one of the comments
9 in that comment and review process discussed the water
10 usage in the Brook Mine and asked for more detail about
11 that?

12 A. The DEQ asked for more detail?

13 Q. Yes, sir.

14 A. Oh, I don't believe -- there's so many pieces of
15 correspondence back and forth between every human being --

16 Q. Let's do that.

17 A. -- it's hard to say, I think.

18 Q. Fair enough, sir.

19 If we could go to DEQ 34-188. We're going to
20 blow this up for you. We've made it a little bigger on
21 the screen here. This is comment Muk 73 - Round 1. And
22 as we've heard, this is a comment by Dr. Kuchanur. He
23 says, "Mine Plan, Addendum MP-3 Groundwater Model, 73.
24 Please provide a water budget table (in acre-feet per year
25 or cubic-feet per day) showing all the inflows into the

1 model and outflows from the model." Did I read that
2 correctly?

3 A. You did.

4 Q. And below there is a response to that that
5 begins to chart source with inflows and outflows, correct?

6 A. Correct.

7 Q. For the sake of fairness to you, Mr. Gerlach,
8 did you review comment Muk 73 in preparing your
9 objections?

10 A. Well, I think I did. Looks familiar.

11 Q. Let's talk briefly about underground coal fires.
12 I know this is another subject matter you didn't talk
13 about with Ms. Boomgaarden, but it is contained in your
14 expert report, correct?

15 A. It is.

16 Q. You told me that Big Horn Coal, as part of its
17 mining operations, encountered previously unknown
18 underground coal fires, correct?

19 A. Yes.

20 Q. You also told me that Big Horn Coal was able to
21 work with the State of Wyoming to find a remedy for those
22 underground coal mine fires, right?

23 A. What they hoped would be a remedy, yes.

24 Q. As I recall, that remedy was to take and place
25 millions of tons of overburden on top of the area that was

1 on fire, right?

2 A. Correct.

3 Q. And that extinguished the fire?

4 A. For the time.

5 MR. POPE: Give me just one moment,

6 Mr. Gerlach.

7 Thank you, Mr. Gerlach. I don't have any more

8 questions for you.

9 CHAIRMAN BAGLEY: Thank you, Mr. Pope.

10 Mr. Kuhlmann or Mr. LaRock.

11 MR. KUHLMANN: Thank you, Dr. Bagley. I do

12 have a few questions. I'll try to keep them short.

13 CROSS-EXAMINATION

14 Q. (BY MR. KUHLMANN) Mr. Gerlach, I want to talk

15 to you about the groundwater restoration -- restoration

16 demonstration, GRD. I have a question about it. I

17 believe -- did you testify that the groundwater

18 restoration was completed for the Big Horn Mine in 2002?

19 A. It was approved by the State of Wyoming, yes, in

20 August of 2002.

21 Q. Would you say that was when the restoration was

22 completed?

23 A. The actual in-the-field restoration?

24 Q. Yes.

25 A. For all intents and purposes, and certainly

1 enough to satisfy the State of Wyoming, it was complete,
2 yes.

3 Q. Thank you.

4 I believe you testified that there were
5 monitoring wells that were used to collect data that was
6 put in the GRD document?

7 A. Yes.

8 Q. Were some of those monitoring wells in the TR-1
9 area that you were questioned about earlier?

10 A. Yes.

11 Q. Are those monitoring wells still there today?

12 A. Uh-huh.

13 Q. Do you know when the last time those wells were
14 monitored?

15 A. Not off -- not offhand.

16 Q. Would you say that you had -- last date of
17 monitoring was before 2002?

18 A. I'm not certain I could say that. I don't --
19 really don't know. I mean, it's all in the records, I'm
20 sure.

21 Q. Okay. Are you aware that DEQ requires
22 applicants to collect at least one year of recent
23 information for groundwater wells to be considered as
24 baseline data?

25 A. I am aware of that.

1 Q. Would you consider data collected to make the
2 GRD as recent information?

3 A. I'm not sure I understand the question.

4 Q. The -- I'm asking about the data that was
5 collected from monitoring wells that were used for the
6 GRD. Would you consider the data that was collected
7 for -- from those monitoring wells as recent?

8 A. Well, no. It was collected, you know, before we
9 prepared the report and the report's approved August
10 of 2002.

11 Q. Can we reasonably agree that this data is not
12 the one year of recent information that DEQ requires to be
13 collected for baseline data?

14 A. Sure. It's not recent, yeah.

15 Q. I'll ask you to turn to Big Horn Exhibit 15,
16 page -- I believe it was 40. And just to be clear, the
17 page that I'm referring to is BHC 15-040.

18 All right. Mr. Gerlach, I believe you testified
19 about this table from the GRD; is that correct?

20 A. I did.

21 Q. I'd like you to -- do you see the row for
22 Hydrologic Conductivity GPD/FT2?

23 A. I do.

24 Q. And that would be ground -- gallons per --
25 gallons per day over square feet?

1 A. Correct.

2 Q. Could you read the values that appear on that
3 column?

4 A. From left to right, 4.00, 1,182, 0.85, 58, 7,
5 14.25, 930, 1.2, 10.1 and 481.7.

6 Q. Thank you.

7 In all but one of the values you read, was that
8 volume followed by a question mark in the table?

9 A. Correct.

10 Q. For those values where there was a question mark
11 afterwards, could you read the comments that are listed on
12 the comments row?

13 A. Yes.

14 Q. Would you please do so.

15 A. Oh, may I refer to the hard copy in here?

16 Q. Absolutely. If that is easier for you to read,
17 sir. I might be able to help along if you have that table
18 out.

19 A. I do, sir.

20 Q. Under the value that says "1,182?," do you see
21 comments row where it says "saturated thickness
22 questionable"?

23 A. I do.

24 Q. Do you see where it says "unable to measure
25 water level"?

1 A. I do see that text.

2 Q. And then under the value ".85?," do you see in
3 the comments where it says "saturated thickness is
4 questionable"?

5 A. I'm sorry. Say that again.

6 Q. Under the next value, which said ".85?" --

7 A. Yes.

8 Q. -- do you see in the comments row below that
9 where it says "saturated thickness is questionable"?

10 A. Yes.

11 Q. For the next value, "58?," do you see in the
12 comments section that it says "two tests ran; base of
13 spoils not exactly known"?

14 A. Yes.

15 Q. Under the section of the amount for "14.25?," do
16 you see where it says in the comments row "saturated
17 thickness is questionable; base of spoils questionable"?

18 A. Yes.

19 Q. Under the value for "930?," do you see in the
20 comments where it says, "saturated thickness is
21 questionable"?

22 A. I do.

23 Q. And then the next comment from that, where it
24 mentions underneath the "1.2?," says "base of spoils
25 questionable." Do you see that?

1 A. Yes. Uh-huh.

2 Q. Okay. And to speed up the next ones, do you see
3 that the next entry on the comments says "pumped well,
4 well efficiency poor; base of spoils questionable"?

5 A. Yes.

6 Q. And in the next one it says "Observation well;
7 base of spoils questionable"?

8 A. I do.

9 Q. From that table -- oh. Excuse me.
10 Would you consider the pieces of data we
11 mentioned regarding hydrologic conductivity to be
12 questionable based on the comments in the comments row of
13 this table?

14 A. I considered them to be a reasonable, best
15 available estimate of the hydraulic conductivity available
16 for the area and material that was tested.

17 Q. When was this table prepared?

18 A. Well, it was prepared, you know, before August
19 of 2002.

20 Q. Can you identify on that row of hydrologic
21 conductivity what the minimal value of conductivity is?

22 A. Yes.

23 Q. And can you find what the maximum value of
24 conductivity is?

25 A. I believe I could.

1 Q. And I apologize for asking a little bit of math.
2 What is the orders of magnitude variability between
3 those -- the highest and lowest value in that table?

4 A. What are the orders of magnitude -- variability
5 expressed as orders of magnitude?

6 Q. Correct?

7 A. Order of magnitude is a factor of 10. So let's
8 go -- looks like lowest 1.0, .85 times that is 8.5, times
9 10 is 8 -- 8 -- or 85. So there's two orders of
10 magnitude. And, once again, 85 times 10 would be 850.
11 We're getting up to our target here. That's three orders
12 of magnitude. Call it 3.3.

13 Q. To get up to 1,182 --

14 A. Well, let's see. Maybe we should employ a
15 calculator.

16 CHAIRMAN BAGLEY: He did answer the
17 question. He said 3.3 orders of magnitude.

18 MR. KUHLMANN: Okay.

19 CHAIRMAN BAGLEY: Which is about what I get
20 too.

21 MR. KUHLMANN: Okay. Thank you,
22 Dr. Bagley. I guess we don't need a calculator.

23 Q. (BY MR. KUHLMANN) Do you know why the question
24 marks were placed on those values in the hydrologic
25 conductivity?

1 A. I believe I do.

2 Q. Do you know -- can you explain why?

3 A. Well, it's because when the folks were
4 constructing the wells, they didn't quite know -- they
5 weren't quite -- it's kind of a silly thing -- weren't
6 quite absolutely certain, to the perfection that
7 geologists, who are used to doing coring for coal quality,
8 where a few inches can make a big difference, they didn't
9 quite know or feel confident in where they hit base of the
10 soils and went into the native, per the previous
11 cross-section, shale in the strata. Sometimes it's --
12 particularly if you get young people that haven't done it
13 many times, or a driller that's not used to drilling
14 spoils, it just wasn't quite -- usually you can detect --
15 if you're careful, know what to look for and have some
16 experience using the right kind of drill bit, by, you can
17 detect within a couple, three feet where you're getting
18 out of the floor of the spoils and into the native strata
19 beneath the spoils, where spoils is equivalent, in
20 verbiage here, to backfill.

21 Q. So would you describe the placement of the
22 question marks on that table as indicating uncertainty in
23 those numbers?

24 A. A minor amount of uncertainty.

25 Q. Would it be reasonable to use values with the

1 uncertainty indicated there, and also that have a large
2 order of unexplained variability to provide reliable
3 modeling estimates?

4 A. Would you repeat that, please?

5 Q. Yes. I'd be happy to.

6 In your opinion, is it reasonable to use values
7 that are documented as having uncertainty, those question
8 marks, and have a large order of unexplained variability
9 in order to provide reliable modeling results?

10 A. There is a large variability here. Is it
11 uncertain as to why there is a large amount of
12 variability? Not necessarily. It's backfill. It
13 consists of everything that they dug up. And here they
14 were digging in the confluence of two perennial streams.
15 The natural stream -- so they dug up clay. They dug up
16 silt. They dug up sand. They dug up gravel. And then
17 they dug up -- finally, when they got -- might have been a
18 little overburden above the Dietz and the upper Monarch
19 and lower Monarch, that's where the coal was there,
20 there's testimony to, most of the core. You know, they
21 might have hit a little shale, so that was all mixed in
22 too.

23 And so, yes, it is highly variable. Highly
24 variable composition. So that -- no, that was -- the
25 expert -- the -- it doesn't disturb or surprise me at all

1 that there was a large variability. Okay?

2 Q. Okay.

3 A. Did that answer your question?

4 Q. I guess to some extent. Is it reasonable to use
5 data that has such high variability to -- to provide
6 reliable modeling estimates?

7 A. Better than nothing. These are real tests. You
8 can see the duration of them. Oh, boy. Let's see here.
9 Length of test.

10 Q. Is there another section of the table you're
11 referring to?

12 A. Yeah.

13 Q. We'll scroll to that.

14 A. A couple above. Yeah, length of test. Hours,
15 that's 46. You know, going into a groundwater model to
16 deal with your concern that, you know, am I using reliable
17 data to come up with reliable results, rather than just
18 throw up your hands and say, well, gee, it's so variable,
19 so old, we just -- we just won't do anything. I mean, why
20 not model it with a range or a median value or an average
21 value, or, you know, don't like all the question marks,
22 pick the 4.0. I'm sorry. That's longest at the longest
23 test, 46 hours. I drilled those wells. I felt confident
24 when I hit the bottom of it. That was on the --

25 THE REPORTER: I'm sorry. I can't hear.

1 Never mind. Go ahead.

2 Q. (BY MR. KUHLMANN) So -- so based on what your
3 testimony was, if you were concerned about variability of
4 numbers that you had available to you, you'd be
5 comfortable with using just one? That you had less --
6 that -- that you were more comfortable with?

7 A. I might employ the advice of a mathematician,
8 whatever. Pick a value, describe how you picked it, make
9 that description available in your report to the public
10 and run with it. But pick a range. If you don't want to
11 pick one value, pick a 25th and 75th percentile values.

12 Q. Do you know if the groundwater model for the
13 Brook Mine permit application had a value used for
14 hydrologic connectivity?

15 A. I'm sorry. Say that again.

16 Q. Do you know if the Brook Mine permit
17 application's groundwater model had a value in it for
18 hydrologic connectivity?

19 A. It has a value range of values for each layer.

20 Q. Okay.

21 A. That's well described in the -- I think -- once
22 in the body of the mine plan and in the addendum that
23 houses the model.

24 Q. Thank you.

25 A. Yes.

1 Q. One last -- well, just a couple last questions.
2 Do you know how long it took for the backfill in the TR-1
3 area to resaturate?

4 A. That is -- that was one of our major points that
5 we wanted to make real clear when we wrote the GRD, the
6 groundwater restoration demonstration. Off top of my
7 head, I can't remember what I wrote in 2002, but it's in
8 there. We can -- we can find that.

9 Q. Okay. Let's go ahead and turn to Big Horn
10 Exhibit 15, page 15-009. Scroll down a little. Stop
11 about here.

12 Mr. Gerlach, do you see anything on this section
13 of the page that indicates how long it took the backfill
14 in the TR-1 area to resaturate? That's okay.

15 A. Yeah.

16 Q. Do you see it?

17 A. I was just trying to read the whole thing so we
18 don't get things out of context.

19 Q. I understand that.

20 A. And your next question, I guess?

21 Q. I understand that.

22 Can you tell us how long it took the backfill in
23 the TR-1 area to refill -- to resaturate?

24 A. The report says 23 years. For -- yeah, 23
25 years.

1 Q. Thank you.

2 Moving to a slightly different question.

3 your review of -- your review of the permit application
4 and testimony focused on only the TR-1 area; is that
5 correct?

6 A. Can you repeat that, please?

7 Q. Your review of the permit application and
8 testimony here today is only focused on the TR-1 area,
9 correct?

10 A. So far today, yes.

11 Q. Did you review the other data that was used in
12 characterizing the baseline of the entire proposed permit
13 boundary?

14 A. The other baseline presented in the Brook permit
15 application?

16 Q. Yes. For the entire permit area.

17 A. I did.

18 Q. Do the opinions that you presented apply only to
19 the TR-1 area?

20 A. Those we've been discussing today, yes.

21 MR. KUHLMANN: Okay. Thank you,
22 Mr. Gerlach. That is my last question.

23 CHAIRMAN BAGLEY: Thank you.

24 Council have any questions?

25 Deb?

1 COUNCIL MEMBER BAUMER: I guess I do.

2 EXAMINATION

3 Q. (BY COUNCIL MEMBER BAUMER) Just can you help me
4 understand why the 2002 or 15-year-old information would
5 be reliable for Brook Mine to use to do their modeling?

6 A. I believe I can, yes.

7 Q. Okay. Help me understand that.

8 A. All right. Now you got to read the whole thing.
9 Some people that's --

10 THE REPORTER: I can't hear you, sir.

11 A. Okay. The Exhibit 15, the Big Horn Coal
12 groundwater restoration demonstration, what it shows
13 is that hydrographs, graphs of groundwater elevations,
14 over time it shows that by the time we get this thing
15 written, those hydrographs show -- and there's a lot of
16 texts of the type I'm speaking -- that the water level
17 elevations -- the groundwater elevations in the backfill
18 monitor wells had become isotonic. Oh, I'm sorry. They
19 become kind of steady state. And then they move up and
20 down. When they got to that point in phase with the river
21 stages, in the springtime it was high; August, September,
22 it's way down. And they're doing that with the river.
23 That tells me they're pretty much in steady state with
24 whatever that old river's doing. And I suspect that to be
25 something of perpetuity until something happens to the

1 river.

2 Q. (BY COUNCIL MEMBER BAUMER) okay.

3 A. Did that help?

4 Q. I think so.

5 A. So, I mean, how are things -- then you're left
6 asking, well, are things a lot different than they were in
7 2002? Well -- well -- I mean, not necessarily. We have
8 good years and bad years in our climatic cycles. Sheridan
9 County last year was -- the Tongue River took a beating
10 for a while, then even clear up where I live, I couldn't
11 irrigate with water that automatically -- or ultimately
12 makes it to the Tongue River.

13 The state engineer last summer -- I'm
14 probably -- if you're interested.

15 COUNCIL MEMBER BAUMER: I'm okay. Thank
16 you.

17 Thank you, Mr. Chairman.

18 COUNCIL MEMBER AGOPIAN: No questions.

19 CHAIRMAN BAGLEY: Meghan?

20 COUNCIL MEMBER LALLY: I don't think so
21 right now.

22 CHAIRMAN BAGLEY: I have a couple of
23 questions, Mr. Gerlach.

24 EXAMINATION

25 Q. (BY CHAIRMAN BAGLEY) I wanted to follow up on

1 the question Mr. Kuhlmann asked. Today we focused on the
2 TR-1 area. I wanted to ask your opinion on how the
3 groundwater modeling that was done on the rest of the site
4 that was not down right on the Tongue River and TR-1 area.
5 I didn't see any comment on that. I'd just seen comments
6 in the TR-1 area.

7 A. So you're asking me to comment, sir, on --

8 Q. Yeah. Do you have any comment on the
9 groundwater modeling that was done on the rest of the site
10 and not just the TR-1 area?

11 A. I see. I didn't find any fault with the
12 modeling of the coal seams by Brook outside the TR-1 area.
13 I didn't have any problem with the TR-1 area either. It's
14 just they forgot there's all this -- this 70 to 85 feet of
15 saturated backfill with wells that documented that once
16 they cleared 37 gals a minute. Forgot to throw that in
17 the model. No, I didn't have any problem with the coal
18 modeling anywhere, sir.

19 Q. Okay. Thank you.

20 So then the TR-1 area -- and I think Councilman
21 Flitner brought this up the other day, a really good
22 question, which was -- I think you've kind of got at this
23 too. Well, I'm looking at that cross-section that we've
24 been looking at where it shows a -- the saturation and
25 then the coal seam and then we're going to put trench down

1 right through that, right through the shale area?

2 A. Yes, sir.

3 Q. And Mr. Flitner asked this yesterday. Okay. So
4 we've broken that shale area, and today I think you kind
5 of are suggesting that once we break that, the water, you
6 know, in essence, can almost pour into the bottom and into
7 the coal seams. Is that -- is kind of what you're
8 indicating?

9 A. It is, sir. The permit document does not assess
10 it whatsoever. Doesn't discuss the subject, but it's a
11 law of physics. You got one head clear up here in the
12 backfill running out, and remember the two little blue --

13 Q. Uh-huh.

14 A. -- with the water -- you can barely read it?
15 And the monitoring wells in the Carney and Masters is way
16 down here. Water's going to run from uphill to downhill,
17 high head to low head. The only question is how effective
18 will the new future backfill of Brook Mine, as it fills up
19 its base slot, what we call the trench slot, how effective
20 will it be? What will its permeability be?

21 Q. That brings me to my next question. Well, just
22 a -- a comment I had is, as I heard Councilman Flitner's
23 question, and then I listen to you, I thought basically
24 the same thing you did, sounds like folks are going to
25 have to have some pumps running while they're mining this,

1 but that's -- that's an operation issue.

2 I'm thinking now when we're done. They're
3 done -- not we. When they're done mining, and they pulled
4 the pullout, you mentioned sort of left these drifts, sort
5 of like holes, and I'm getting the idea that water's going
6 to go down there and fill them up. My question is, once
7 they're full, do you expect a lot of groundwater movement
8 after that?

9 A. Again, the -- there's just absolutely no
10 assessment of that. So my answer to you is based out of
11 experience, it still carries that shadow of speculation.
12 There's nothing in the permit that discusses the subject
13 that we are --

14 Q. So in your --

15 A. -- discussing now.

16 Q. In your opinion, where do you -- based on the --
17 your looking at this, where do you think movement could
18 occur the fastest? Once the coal -- the open holes, the
19 drifts, are filled up with water and everything backfilled
20 and everything else, where do you think movement could
21 occur the fastest in this geology?

22 A. You know, occur the fastest in the Carney coal
23 seam, the target of the TR-1 mining, around the perimeter
24 or outer -- their whole outer panel shell. All the ribs
25 and pillars that are left in the center, between all those

1 tunnels, probably aren't very effective in absorbing much
2 water. So that will be the part that will fill up quick.

3 Q. Okay.

4 A. But you've got all that wetted perimeter. What
5 is that panel? About half mile?

6 Q. Uh-huh.

7 A. North-south?

8 Q. Right.

9 A. So you've got half mile, a quarter mile, half
10 mile, quarter mile, that outer wetted perimeter in the
11 coal, down 150, 175 feet deep, will forever continue to
12 absorb water. What will that rate be? Well, if you use
13 the -- the Brook model, I believe they assign, what is it,
14 .7 or .8 foot per day of connectivity for the coal?

15 Q. Uh-huh.

16 A. Whereby that makes 60 -- they predicted for
17 years one and two like 60, 75 gallons a minute, just
18 Carney coal in the TR-1 area.

19 Q. So I guess now my next question is, I've heard
20 concern about wells drying up. But if I got a well into
21 this coal seam downgradient from where they put this in,
22 and they're done mining and they filled it back up, will I
23 expect to see a well dry up?

24 A. Well, not too far downgradient. It might become
25 artesian.

1 Q. Right. So -- but it won't dry up. So may have
2 an artesian well where you didn't before.

3 A. Or might be fresh river water that's going
4 through for a ways, but...

5 CHAIRMAN BAGLEY: That was all my
6 questions. Thank you.

7 THE WITNESS: Thank you.

8 COUNCIL MEMBER LALLY: I have some more
9 questions.

10 CHAIRMAN BAGLEY: Oh, we have a question.

11 COUNCIL MEMBER LALLY: Sorry. This brought
12 up a thought.

13 EXAMINATION

14 Q. (BY COUNCIL MEMBER LALLY) Would it be possible
15 to reclaim that in a way with low permeability? Or when
16 you reclaim, does it automatically give it a fairly high
17 permeability?

18 A. To reclaim the backfill?

19 Q. To reclaim the trench.

20 A. Excellent question. Just like your comment
21 yesterday.

22 Well, yes. You know, the DEQ has insisted upon
23 and -- well, I shouldn't get into -- but applying
24 especially low permeable materials, usually 2 feet
25 equivalent to 10 to the negative 7 -- 7 centimeters per

1 second of hydro connectivity -- hydrologic connectivity,
2 is a typical -- for mining valley floors, they're trying
3 to restore AVFs. So, yes, it could be done. It could be
4 done. And that's a really good point.

5 So what I would recommend to the council is that
6 take a range. Get that table -- we can take a median
7 value or average value or pick the one without the
8 question mark of the hydraulic conductivity of the
9 resisted backfill that's accepted by the State of Wyoming,
10 August 2002, re-run that model and use that same
11 conductivity for the new spoils that will go back into the
12 trench of TR-1. Okay?

13 Run that model and see -- and keep the same
14 hydraulic conductivity that the model has now for the
15 Carney coal, which is going to be posing a big head on
16 that Carney coal because the head's really the Tongue
17 River, and see how much water loss that is. See how much
18 water loss. I'm not worried about the coal. I'm not
19 worried about the coal in any groundwater model. It's
20 insignificant when you've got this 70 to 90 feet of -- 70
21 to 85 feet saturation right next to two large ephemeral
22 streams. That's significant.

23 See what your model tells you in that, and that
24 will help answer your question do we need some low
25 permeable backfill in that trench. Could have DEQ

1 approving mine permit application has a long history of
2 requiring low permeable backfill for certain unique
3 hydrologic circumstances.

4 COUNCIL MEMBER LALLY: Thank you.

5 CHAIRMAN BAGLEY: Any other questions from
6 council members?

7 Ms. Boomgaarden.

8 MS. BOOMGAARDEN: Thank you, Dr. Bagley.

9 Thank you, Mr. Gerlach. I just have a few
10 questions for you before we wrap up.

11 REDIRECT EXAMINATION

12 Q. (BY MS. BOOMGAARDEN) Mr. Pope asked you if you
13 were aware that -- or if you were -- if you heard
14 Dr. Kuchanur testify that they had used other evidence in
15 the groundwater model, and you responded that you did know
16 that they had used other evidence. Is that correct?

17 A. That is correct.

18 Q. Did you find any evidence that Dr. Kuchanur used
19 data from the GRD in the groundwater model?

20 A. There is no evidence of that.

21 Q. Thank you.

22 And you were asked about, and shown by Mr. Pope,
23 I believe, the definition of aquifer in the Land Quality
24 Division Rules and Regulations, or asked if you were aware
25 that there was a definition of aquifer in the Land Quality

1 Division rules and regulations. Do you know whether there
2 have ever been groundwater wells permitted in the TR-1
3 backfill?

4 A. Not specifically, but back then the state
5 engineer used to require that you permitted even
6 monitoring wells. They quit that in like 2003 or '5,
7 because it's not a beneficial use. You're not
8 consistently using be -- never mind.

9 So some of those may have been pertinent. They
10 may have had water rights. Those old monitoring wells are
11 there.

12 Q. So at that time, if they were permitted for a
13 specific use, that would have constituted an aquifer; is
14 that correct?

15 A. Yes.

16 Q. Okay. Thank you.

17 Mr. Kuhlmann asked you to refer to Table 2 in
18 the GRD, and that was a table -- there was quite a lot of
19 discussion about the hydraulic conductivity data. Do you
20 recall that?

21 A. I do.

22 Q. And I just want to make sure that I understand
23 that even with data that included the question marks that
24 were noted, DEQ reviewed and ultimately approved that
25 data; is that correct?

1 A. Yes.

2 Q. In your opinion, is it preferable to use data
3 with high variability rather than no data at all?

4 A. Well, yes. If you understand why the -- there
5 is high variability, sure.

6 Q. Okay. And Councilman Baumer asked you about the
7 reliability of the hydrographs, excuse me, and you
8 explained about the steady state of the river in this
9 location. The steady state of the groundwater in
10 relationship to the river. Do you recall that?

11 A. I do.

12 Q. Is this characteristic of steady state between
13 the groundwater and river unique to this TR-1 area within
14 Brook's mine permit application?

15 A. Well, I can't answer that. I mean, it's -- it's
16 best demonstrated here. If they had some alluvial wells,
17 I would expect to see -- the Tongue River alluvial wells?

18 Q. Yes.

19 A. I would expect to see exactly the same.

20 Q. So in your professional opinion, does the lack
21 of data analyzed in this TR-1 area present a unique risk
22 of hydrologic damage?

23 A. Well, I'm sorry. Would you repeat that?

24 Q. Absolutely. Do you believe that the lack of
25 data that we've been discussing in the TR-1 area, given

1 this unique steady state between the groundwater and the
2 river, if that isn't sufficiently analyzed, does that
3 present a unique risk of hydrologic damage?

4 A. It does.

5 MS. BOOMGAARDEN: I have no further
6 questions. Thank you.

7 CHAIRMAN BAGLEY: All right. Thank you.

8 Let us take 10 minutes break, and we will discuss
9 how much further we're going to go tonight, partly during
10 that break, and we'll have answers.

11 (Hearing proceedings recessed

12 5:43 p.m. to 6:00 p.m.)

13 CHAIRMAN BAGLEY: All right. So we will
14 begin with Ms. Anderson. And for those who are wondering,
15 our expectation we'll be finished tonight by 7:00, and we
16 will do a direct. Will not do any cross on this witness
17 this evening. And we will start tomorrow morning at 8:30.
18 So just for folks who are preparing when they may get a
19 chance to eat. Although people have been eating my donuts.
20 So they are available.

21 MR. SUTPHIN: Thank you, Chairman Bagley.
22 They were delicious.

23 CHAIRMAN BAGLEY: Good.

24 Ms. Anderson, please call your first witness.

25 MR. ANDERSON: Thank you, Dr. Bagley.

1 Mr. Chairman.

2 Again, I'm Shannon Anderson with Powder River
3 Basin Resource Council, and I would like to call
4 Mr. John Buyok to the stand, please.

5 MR. SUTPHIN: Mr. Chairman.

6 CHAIRMAN BAGLEY: Yes.

7 MR. SUTPHIN: Per your earlier request that
8 we withhold our objections to witnesses until said
9 witnesses were called, I do have an objection to this
10 witness. But before we get to that, I may have just missed
11 it, but I am not so sure procedurally that Big Horn Coal
12 has rested their case.

13 CHAIRMAN BAGLEY: Oh, gee. Thank you very
14 much.

15 I'm sorry. Are you done with witnesses? My
16 mistake. You're correct.

17 MS. BOOMGAARDEN: Thank you, Dr. Bagley and
18 Mr. Sutphin for watching out for our best interests, and,
19 yes, we rest our case.

20 CHAIRMAN BAGLEY: Thank you.

21 All right. Now, you can proceed with your
22 objection.

23 MR. SUTPHIN: Thank you, Dr. Bagley.

24 Brook Mine objects to the calling of
25 Mr. John Buyok, because as this council is already aware,

1 Mr. Buyok, although he did submit an objection letter to
2 the Department of Environmental Quality, Mr. Buyok did not,
3 in fact, request a contested case hearing before this
4 council, and per council's previous order, that means that
5 he is not entitled to a contested case.

6 Furthermore, Mr. Buyok did not contribute to or
7 assist with the drafting of Powder River Basin Resource
8 Council's objection letter, and, therefore, cannot add
9 anything in the way of testimony that would support that
10 objection letter.

11 Oh. And just so that the record is clear, we are
12 making this objection because we believe that these are
13 valid and legal bases upon which to exclude Mr. John Buyok
14 from testifying, but we are in no way, shape or form trying
15 to silence the Powder River Basin Resource Council in this
16 hearing. Thank you, Mr. Chairman.

17 CHAIRMAN BAGLEY: Thank you for your
18 objection.

19 I consider Mr. Buyok a -- not a party, but a
20 witness that's been called by a party, and so I will allow
21 him to serve as a witness.

22 MR. SUTPHIN: I understand your decision
23 Mr. Bagley -- Dr. Bagley, thank you.

24 MS. ANDERSON: Thank you. I had a good
25 response. I don't have to bring it. So I appreciate that.

1 Please, I call Mr. John Buyok.

2 (Witness sworn.)

3 JOHN PAUL BUYOK,

4 called for examination by PRBRC, being first duly sworn,

5 testified as follows:

6 DIRECT EXAMINATION

7 Q. (BY MS. ANDERSON) Mr. Buyok, could you please
8 say and spell your name for the record.

9 A. It's John Paul Buyok, B-U-Y-O-K.

10 Q. Do you mind if I call you John?

11 A. That's fine.

12 Q. I know this is kind of intimidating, so I want
13 to make sure this is as easy for you as possible to be
14 here today to provide your opinions and information to the
15 council.

16 John, could you tell us your address and explain
17 a little bit about where you live.

18 A. I live at 86 Monarch Road, Ranchester, Wyoming,
19 and my house is up on the screen.

20 Q. Okay. How long have you lived there?

21 A. In this particular house we built in 2001, but
22 I've lived there for about 33 years off and on. My
23 family -- there's another small house across the road on
24 the other side of my house. My grandparents moved into
25 that in 1919. So been there almost a hundred years.

1 Q. Yeah. John, does this picture look familiar to
2 you?

3 A. Yes. That shows a portion of our property and
4 our neighbor's property.

5 Q. And you have a relationship with the Sheridan
6 Community Land Trust, right?

7 A. Yes. Uh-huh. We have a conservation easement
8 with the Land Trust.

9 Q. Are you aware this is a photo that they took and
10 provided?

11 A. Yeah. This was taken originally as part of the
12 exhibits for our land trust.

13 Q. Okay. And yet could you just tell a little
14 about the photo and point some things out in it.

15 A. Our house sits right about here in this
16 photograph. My sister's house is right here. And most of
17 this land back this way, this is part of our ranch.

18 Mr. Bocek, who will be testifying later -- his
19 family's property is here. His parents' property. He
20 lives just off the -- the picture on this side. This is
21 part of the Fishers' property here. And this is Brooke
22 Collins' house right here. She's going to be testifying
23 later. These two fields here are the -- this field is
24 where Brook's proposed labs are going to be, and this
25 field is where their carbon fiber plant's supposed to be.

1 And this is the port of entry at the top of the
2 photograph. And the interstate runs right through here.

3 Q. Okay. Great. Thank you.

4 I'm going to pull up DEQ Exhibit 12, page 145.
5 John, this is just a picture from the mine plan. I think
6 you're familiar with it, right?

7 A. Yes. Uh-huh.

8 Q. Can you tell us a little bit about this map in
9 relationship to where you live and anything you want to
10 tell the council about this map and where you live?

11 A. This map shows the Brook mining area, starting
12 with the TR-1 area that's been talked about. And working
13 their way along this way on up towards Ranchester. Our
14 house sits right here -- or, excuse me, right here.
15 Sister's house sits right here. And these other markings
16 are the old historic mine -- mining areas. This was the
17 Monarch Number 1 Mine. This was the Monarch 45 Mine.
18 This is the new Monarch Mine and Acme Mine. Dietz Mine's
19 back here. More Acme Mine here.

20 Q. Okay. Great. John, would you like to tell the
21 council anything else about why you live where you live?

22 A. Well, it's a really nice area. We really like
23 it. It's scenic. It's got a lot of wildlife resources.
24 That's one of the reasons we put it in the land trust to
25 begin with, is we want to preserve the wildlife habitat in

1 that area. My grandparents moved there in, like I said,
2 1919, and started leasing the house -- field house from
3 the coal company at that time. My -- at the time my
4 granddad moved into that house, all those open fields
5 around our house in that photograph were heavily wooded.
6 And my granddad cleared all those with a horse -- a team
7 of horses and an ax. When he had enough land cleared to
8 make hay for cows through the winter, he started to run a
9 dairy farm there and provided milk and cream and butter to
10 families in the town of Monarch, which used to sit about
11 here and the town of Kleenburn, right in here.

12 So we've been there for a hundred years, and
13 we're in there for the long haul. A lot of our neighbors
14 are -- are kind of cutting and running right now, if they
15 can, because they know if this mine permit's approved,
16 their property value's going to take a big drop. But
17 we're planning on sticking in and holding on. But we're a
18 little concerned that if these people are irresponsible,
19 they can force us out.

20 Q. Yeah. Thanks, John.

21 So to summarize, I think I heard you say this
22 place is really special to you.

23 A. Definitely.

24 Q. Okay. Before we get too much further, just for
25 transparency sake, at various times I think before this

1 hearing I represented to some of the other parties that
2 you wouldn't be testifying. And you and I have had
3 various conversations about whether or not you wanted to
4 testify at this hearing, right?

5 A. Yes, we did.

6 Q. Why have you changed your mind and why are you
7 here today?

8 A. Well, Brook Mine had Niles Veal call me and tell
9 me that he wanted me to -- to come in for a deposition.
10 And then two days later, Holland & Hart said I had to come
11 in for a deposition, so I decided if they wanted me to
12 testify that bad, I will.

13 Q. Okay. Thanks, John.

14 You filed an objection letter to the permit
15 application back in January, right?

16 A. Yes, I did.

17 Q. Okay. This is our Exhibit 5. And it was also,
18 for the record, attached to our petition for this council
19 and incorporated by reference within that petition. But
20 is this an accurate rendering of your letter?

21 A. Yes, it is.

22 Q. Okay. Could you identify who it's sent to?

23 A. Mr. Kyle Wendtland.

24 Q. Okay. Why did you send it to him?

25 A. The notice we got in the newspaper and by mail

1 said that we had to submit our comments to Mr. Wendtland.

2 Q. Okay. Did you request any informal conference
3 with the DEQ to address your concerns?

4 A. Yes, I did.

5 Q. Was that informal conference granted?

6 A. No.

7 Q. Okay. So that's why you're here today?

8 A. Yes.

9 Q. This is the only opportunity you've had so far
10 to raise your concerns with the Department or any decision
11 makers?

12 A. That's true.

13 Q. Okay. So I'd like to talk a little bit about
14 your objection letter. And in it you raise an issue about
15 adjudicated versus permitted wells?

16 A. Yes.

17 Q. Can you tell me a little bit about that
18 objection and why you raised it?

19 A. That was very important to me because most of
20 our house wells in that area are not adjudicated under
21 state law. So when there was a -- in the permit documents
22 they would only be responsible for dealing with those
23 problems with adjudicated wells, that leaves most of us
24 out.

25 Q. Yeah. As a landowner, do you consider the

1 ability to get water for your home a major issue?

2 A. It's a big problem for us. We have -- my sister
3 and I, we each have a well that's completed in one of the
4 Carney seams. And when we were getting ready to build the
5 new house we originally wanted to build up on this hill
6 above the river, but we drilled down to a thousand feet at
7 that point and couldn't find any aquifers in that
8 particular area. There was no water available there at
9 all.

10 So then we decided we would try to drill a well
11 further on down where our house is now, and we drilled
12 down to the thousand feet there again, and the only
13 aquifer we could find was that one Carney seam. And that
14 Carney seam has really bad water, but -- you know, we have
15 to filter it, then we have to put it through a water
16 softener system and then we have to put it through a
17 reverse osmosis system to use it. But if -- if that coal
18 seam which the mine, in their mine plan says -- or if
19 that -- that coal seam that our well is completed in,
20 which the mining company in the mine plan says will be
21 partially dewatered, is dewatered any more, we're going to
22 have problems with our house well. The reason I'm sure
23 that we're going to have problems with our house well and
24 my sister's house well is because back in the dry period,
25 back in the early 2000s, those wells almost went dry. We

1 were sucking sediment out of the bottom of the well. Our
2 well is set just below the bottom of that coal seam. So
3 if -- if those wells go dry, we are pretty much out of
4 luck. We're down to hauling water.

5 Q. Yeah. Were you here -- I know you've been in
6 and out a little bit this week because I'm assuming you
7 have other things to do besides be here, but were you here
8 for the testimony from the DEQ that they consider this
9 adjudicated versus permitted wells a minor technical
10 issue?

11 A. Yes, I was.

12 Q. So, again, as a landowner, do you see this as a
13 minor issue?

14 A. I thought it was pretty major for us, as far as
15 the impacts to us.

16 Q. Yeah. All right. Let's see.

17 Is there anything else you want to highlight
18 from your objection letter, concerns that you've raised
19 about the permit?

20 A. I've raised a question because I thought that
21 the maps that were shown showed that our property was
22 further within the half-mile boundary outside of the
23 permit -- the permit boundary. But after my deposition
24 Mr. Barron showed me a more detailed map. And as it turns
25 out, our house well is about 20 feet outside the half-mile

1 boundary, and our house is about 40 feet outside the
2 boundary. So I guess that kind of leaves us out of a lot
3 of legal remedies we would have as far as notification and
4 requiring pre-blast survey and things like that. So that
5 concerns me a little bit.

6 Q. Yeah. So, John, I should clarify a little bit
7 with you. You have some background and experience with
8 coal mines, right?

9 A. Yes.

10 Q. And would you be a consultant to the industry?

11 A. Yeah. I'm a professional engineer. And over
12 the years I think I've worked for every mine in Gillette
13 and Wright area, except for North Antelope. I've done
14 work for Spring Creek Coal and Big Horn Coal in this area.
15 I've done some work for Black Butte down in Rock Springs.
16 I've also done some work for Dave Johnston in Glenrock.
17 So I've seen a lot of different mines. Worked for a lot
18 of different mines.

19 Q. Yeah. Did you spend quote a bit of time looking
20 at the permit application?

21 A. Yeah. I think I've probably spent hundreds of
22 hours. I've gone through it. I've tried to read every
23 bit of it I could.

24 Q. I've always appreciated your understanding of it
25 when we've had conversations.

1 Is there anything else in your objection letter
2 you want to particularly highlight?

3 A. I would also have some concerns about the
4 effects -- possible effects of blasting. That previous
5 map that was up shows that our house is just not very far
6 away from some of the old mines.

7 Q. Uh-huh.

8 A. The Monarch 45 Mine and the old Monarch, excuse
9 me. And we have subsidence going on, you know,
10 continually now. We have new subsidence holes opening up.
11 I'm concerned that little more vibration from blasting
12 could cause more of those things to open up. If it is,
13 it's a -- it's definitely a safety hazard for us. And
14 it's also a safety hazard for a lot of our people that we
15 have out there. As part of our ranch, we have a walk-in
16 agreement with Game & Fish Department, and so we have
17 people out there hunting all the time. It's open all
18 year-round for prairie dog hunting and then other hunting
19 during the other seasons.

20 We also -- since we have our property open for
21 public access for hunting, we thought it was only fair to
22 let other people use it also. So we have a lot of people
23 that come out there and walk their dogs or cross-country
24 ski, bicycle ride, or just things like that. So we're
25 little concerned about safety of those people too. And

1 it's gotten to be really popular. We have hundreds of
2 people out there during the year. And we really hate to
3 have to shut it down if it became too unsafe to have
4 people there.

5 This is a picture that I took of subsidence
6 that's been slowly subsiding. Just -- this happens to be
7 just right across our fence line from our neighbors up
8 above my sister's house. I took this about two or three
9 weeks ago and shows how it's slowly moving, slowly
10 subsiding some more.

11 When we were there, I took the -- our experts
12 around this morning and showed them some of the subsidence
13 in the area. And when we got there, since I had been
14 there two weeks ago, there's another crack that's opened
15 up about 4 feet outside the perimeter of this. And it's
16 about to subside a little more -- or a lot more if it goes
17 at once.

18 Q. Yeah. So just for the benefit of kind of the
19 scale of this, you see kind of a little tan bump there in
20 the corner. Is that your dog?

21 A. Yeah, that's my dog.

22 Q. Okay.

23 A. He's looking for a rabbit down in there.

24 Q. Yeah. Could you tell us a little bit about this
25 photo?

1 A. This is just kind of a -- this is right along
2 our fence line also with our neighbor. These are some old
3 stabilized pits that have not been reclaimed. You can see
4 there's four of them in a line across here. And that's
5 what a lot of this country looked like before the DEQ and
6 the Soil Conservation Service started to reclaim this
7 area. There were long lines of pits like this that
8 followed the whole mine slopes.

9 Q. And I should have, for the record, the previous
10 picture we were talking about was our Exhibit 80. And
11 this one is Exhibit 81. And I also have up here
12 Exhibit 82. Is there anything you'd like to say about
13 this photo?

14 A. This is generally up in the same area. Just
15 shows another subsidence pit that's been slowly dropping
16 over the last few years. And it looks like it's going to
17 go fairly soon too with all the moisture we've had this
18 spring.

19 Q. Yeah. So when you're out there on the land, you
20 see the subsidence. You know what it's like. You've seen
21 it maybe years after.

22 A. Pardon me?

23 Q. Years after mining?

24 A. Yes.

25 Q. Yeah.

1 A. This area where the active subsidence is going
2 on now was mined -- I can't tell exactly because we don't
3 have the mine maps for the earlier old Monarch Mine, but
4 this area was mined somewhere between 95 and 110 years
5 ago.

6 Q. And it's still subsiding?

7 A. Yes.

8 Q. And do you have any concerns about the -- you
9 talked a little about this, but specifically do you have
10 any concerns about the new mine coming in and what that
11 will do to the historic issues that you're still
12 experiencing?

13 A. I'm just concerned about the vibration. One of
14 the new trenches that's going to be opened up isn't very
15 far away across the valley. It's, you know, close to half
16 a mile away from -- well, maybe a little more than that.
17 Maybe three-quarters of a mile away from this area. And
18 the alluvium in the Tongue River Valley transmits
19 vibrations very well. So I'm afraid that even if the
20 blasting is relatively light, like Mr. Emme says, there's
21 going to be vibrations that cause more subsidence on north
22 side of the river.

23 Q. I'm going to pull up our Exhibit 83. Are you
24 familiar with this map at all? You and I didn't talk
25 about this, so -- if not, that's okay.

1 Do you know the term "walk-in area"?

2 A. Yeah. Walk-in area is a program the Game & Fish
3 has where they have people -- oh, I see what my problem is
4 in understanding this. Anyway, they lease the land from
5 the landowner for a nominal fee, and the landowner allows
6 access to anybody at any time for hunting during the year.
7 The reason I couldn't figure out what this was is this
8 particular area right here is our walk-in area. But our
9 neighbor has a walk-in area right here, a little piece
10 that -- that abuts ours.

11 Q. Okay. Do you have any experience with coal
12 fires in the area?

13 A. Yes. There's been several coal fires in the
14 area. In fact, if you could put that one back --

15 Q. Oh, sure. Yeah. Sorry.

16 A. In fact, there is one going on right here right
17 now. It's just north of our property boundary.

18 Q. Okay.

19 A. It's -- it's sort of under control. They're
20 easy to find in the wintertime. This particular one, if
21 you happen to go out there when there's snow on the
22 ground, the ground would all be white except for about
23 10-foot-diameter circle where the grass is still green and
24 everything's warm. It vents. You can see the vent coming
25 out in the wintertime. Most of the time you can't see the

1 smoke or steam or anything rising out of the hole.

2 Q. Is there anything else -- I know that we've had
3 some conversations about maybe the lack of clarity in the
4 mine plan. Is that a concern that you have?

5 A. Yeah. It seems like everything's fairly sketchy
6 in the mine plan compared to the ones that I've worked on
7 in the past. I can't think of what some of the details
8 are.

9 Q. Yeah. Do you have any concerns about -- I think
10 we talked a little bit about explosive storage in
11 conversations we've had?

12 A. Yeah. That was kind of interesting. They have
13 in the mine plan there are detailed explanations of all
14 the different facilities they're going to have on the mine
15 plan. They talk maintenance shed, an office building and
16 explosive storage and so on and so on. And then when you
17 look at the facilities plan that they put together,
18 there's nothing on it. And so I'm wondering where all
19 these facilities are going to be that they say they're
20 going to have in the mine plan.

21 But the one that really sticks out -- well, I
22 guess the thing that's odd is they talk about all these
23 buildings, but then when you look at the equipment lists,
24 they talk about a maintenance tent and then they talk
25 about office trailer they're going to use just for

1 temporary use, I guess. But the one I don't understand is
2 explosive storage. I don't understand how they can do
3 secure explosive storage in a tent.

4 Q. Yeah. So you talked a little bit about your
5 consulting experience and your background with coal
6 mining. But as a landowner out there, as a neighbor to
7 this proposed mine, what do you think the purpose of the
8 mine permit application and mine plan should be?

9 A. I think it should give the people in the area a
10 good ideas of exactly what's going to be happening so they
11 can assess what the impacts are going to be on the
12 property.

13 Q. So you can participate in, say, a public comment
14 period effectively?

15 A. Yeah. I think that would be very helpful.

16 Q. Yeah. Do you believe this permit application
17 has achieved those objectives?

18 A. They've been very closed-mouth. It's very hard
19 to get any information out of them. Nobody answers the
20 phone at their office. We stop by their office. There's
21 nobody there. I know I haven't personally tried it, but I
22 know that several of the neighbors have tried to call
23 there and never got a call back. Left a message and never
24 got a call back. So it's really hard to -- to get some
25 sort of an idea what's going on when nobody will talk to

1 you.

2 Q. Yeah. In your experience, and, you know, the
3 different permits that you've been involved in or looked
4 at over the years, have you ever seen one like this?

5 A. I've never seen one this sketchy. I think most
6 of the time they're fairly detailed.

7 Q. And, John, I have just one last question for
8 you. So if you were the DEQ and in charge of permitting
9 this mine, what would you want to do?

10 A. Well, we've had all kinds of testimony today
11 about all the problems in the TR-1 area. Everything
12 that -- that they want to do has a problem one way or
13 another in that area. I don't understand why they're so
14 set on sticking with that area. It's -- it's physically
15 isolated, geographically isolated and hydrologically
16 isolated from the rest of the mine. Why don't -- why
17 wouldn't they just go ahead and start with TR-2? They
18 could be -- you know, that might still be a little
19 problematic, because it's -- it's partially -- still
20 partially overlapped with the Big Horn Coal area, this one
21 little triangle on this one corner. But they can bypass
22 all the problems down in this area and get to mining right
23 away. They would be much more isolated from the majority
24 of the residences down in this area. They would be able
25 to prove that they could go ahead and mine and not cause

1 any problems, or, you know, make their proof that that
2 would work. It would be a very minor permit revision as
3 far as the DEQ's concerned. All they would be doing is
4 changing the sequencing, maybe changing, you know, the
5 size of one or two of the stockpiles or sediment ponds.
6 Basically, they can leave everything the same, pretty
7 much, and avoid all the problems they're having down here
8 that may keep them from getting a permit.

9 Q. Yeah. And we're not doing very good in the
10 record here with identification, but just for the record,
11 this is back to page 145 of DEQ 12 that Mr. Buyok's been
12 pointing at.

13 Is there anything else you want to share with
14 the council or --

15 A. Well, I guess -- I guess one other thing I'd
16 like to say is better yet even than starting with TR-2.
17 I'm not sure why they don't go ahead and start with the
18 surface mining area down in this part, because it would be
19 much cheaper to get started. They would be able to --
20 the -- the cost of mining would be much lower. The --
21 they would have time to develop markets and that sort of
22 thing. And as we understand -- you know, lawyers say we
23 can't talk about it, but according to the CEO of the
24 company, they're not going to do any of this anyway, so
25 why not just start down there with a small amount of coal

1 that will supply what they -- CEO says they're going to
2 do.

3 Q. Okay. Thanks. Anything else you want to add?

4 A. No. I don't think so.

5 MS. ANDERSON: Okay. Great.

6 I have no further questions.

7 CHAIRMAN BAGLEY: All right. Thank you,
8 Ms. Anderson and Mr. Buyok.

9 We will go ahead and recess until 8:30 tomorrow
10 where maybe some more people ask you some questions,
11 Mr. Buyok.

12 THE WITNESS: I'm sure they will.

13 CHAIRMAN BAGLEY: We are recessed.

14 (Hearing proceedings recessed
15 6:33 p.m., May 25, 2017.)

ATTORNEYS FOR PERMIT APPLICANT
BROOK MINING COMPANY, LLC

**BEFORE THE ENVIRONMENTAL QUALITY COUNCIL
STATE OF WYOMING**

IN RE BROOK MINE APPLICATION)	
)	Civil Action No. 17-4802
TFN 6 2-025)	

**BROOK MINE’S BRIEF ON STATUTES AND REGULATIONS THAT
THE COUNCIL MUST CONSIDER**

INTRODUCTION

The Council’s Briefing Order asks the parties to brief what law applies to the Council’s review of the Brook Mine permit application and why. Like many parts of this permitting process, the Wyoming Supreme Court has not explained the boundaries of the Council’s review pertaining to Wyo. Stat. Ann. 35-11-406(k). Yet, past Wyoming Supreme Court decisions and Wyoming statutes define the Council’s authority and are the Council’s best guide as to its duties concerning the permitting process.

Using settled law and the pertinent statutes, the Council must review whether the Department of Environmental Quality (DEQ) correctly deemed Brook’s Permit application suitable for publication. This means the Council should review whether Brook has proven that its permit application is complete and has no deficiencies as defined in the Wyoming

Environmental Quality Act. Similar to an informal conference, the Council should decide if the objectors raised any deficiencies in Brook's permit application and issue findings of fact and conclusions of law to answer that question. But the Council should not make the findings required by section 406(n) because only the DEQ administrator can make those findings.

ARGUMENT

I. The Council's authority allows it to review only DEQ's administration of Section 406(a)-(h).

The Council's authority flows from the Wyoming Environmental Quality Act. *Amoco Prod. Co. v. State Bd. of Equalization*, 12 P.3d 668, 673 (Wyo. 2000) (explaining an agency's power depends upon statutes, so "they must find within the statute warrant for the exercise of any authority which they claim.") As a result, the Council can exercise only the authority that the Wyoming legislature granted to it. *Id.*; *Platte Dev. Co. v. State, Env'tl. Quality Council*, 966 P.2d 972, 975 (Wyo. 1998). Under the Environmental Quality Act, the Council has authority to determine "all cases or issues" under the Act and conduct hearings in "any case contesting" the administration of the Act. Wyo. Stat. Ann. § 35-11-112(a), (a)(iii), (a)(iv), (b)(ii). *See also Wyo. Dep't of Env'tl. Quality v. Wyo. Outdoor Council*, 2012 WY 135, ¶ 28, 286 P.3d 1045, 1052-53 (Wyo. 2012) (stating the scope of the Council's authority).

Specifically, the Act authorizes the Council to conduct a "contested case hearing" for: 1) promulgating rules and regulations required to administer the Act; 2) adopting, amending, or repealing rules or regulations as recommended by advisory boards; 3) contesting "the administration or enforcement of any law, rule, regulation, standard or order issued or administered by the department or any division thereof;" or 4) contesting the "grant, denial, suspension, revocation or renewal of any permit, license, certification or variance authorized or required by this act." Wyo. Stat. Ann. § 35-11-112(a)(i)-(iv).

The first two situations do not apply because this case does not involve rulemaking. The fourth situation also does not apply because Brook's permit has neither been granted nor denied. This leaves the third situation, which is to decide whether DEQ properly administered and enforced the permitting requirements under the Environmental Quality Act.

In deciding what this authority allows the Council to review, the Council should turn to the plain meaning of the statutory language. *In the Interest of JB*, 2017 WY 26, ¶ 12, 390 P.3d 357, 360 (Wyo. 2017) (stating that courts apply the plain meaning of a statute to decide the legislature's intent). The statute states the Council will conduct contested case hearings for laws, rules, regulations, and orders "issued or administered" by DEQ.¹ The word "administered" is past tense of the verb "administer." Administer means "to manage or supervise the execution, use, or conduct of." Merriam-Webster's Dictionary <https://www.merriam-webster.com/dictionary/administer>. Applied to this case, this definition means the Council's review is limited to past actions that DEQ has taken to manage or supervise the execution, use, or conduct of the permit application process as set out in the Wyoming Environmental Quality Act.

For Brook's permit application, DEQ has taken two actions. First, DEQ deemed the permit application complete under Wyo. Stat. Ann. § 35-11-406(e)-(g). Second, DEQ found the application has no deficiencies and was suitable for publication. *See id.* at (a)-(d), (h)-(j). Therefore, the plain language of the Council's authorizing statute means the Council can review these two actions. Given the plain language of the statute, the Council must review whether these

¹ The word "issue" does not matter because DEQ has not issued a state decision document or permit. So no document has issued that the Council can review.

two DEQ actions complied with sections 406(a)-(h) and the regulations implementing those sections.

This same logic means the Council does not consider section 406(n) because the DEQ administrator has not yet issued any findings under that section. Section 406(n) states “[n]o surface coal mining permit shall be approved unless the applicant affirmatively demonstrates **and the administrator** finds in writing” that:

- (i) The application is accurate and complete;
- (ii) The reclamation plan can accomplish reclamation as required by this act;
- (iii) The proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area;
- (iv) The area proposed to be mined is not included within an area designated unsuitable for surface coal mining pursuant to W.S. 35-11-425, within an area where mining is prohibited pursuant to section 522(e) of P.L. 95-87 [30 U.S.C. § 1272(e)], or within an area under review for this designation under an administrative proceeding, unless in such an area as to which an administrative proceeding has commenced pursuant to W.S. 35-11-425, the operator making the permit application demonstrates that, prior to January 1, 1977, he has made substantial legal and financial commitments in relation to the operation for which he is applying for a permit;
- (v) The proposed operation would:
 - (A) Not interrupt, discontinue, or preclude farming on alluvial valley floors that are irrigated or naturally subirrigated, but, excluding undeveloped range lands which are not significant to farming on said alluvial valley floors and those lands as to which the administrator finds that if the farming that will be interrupted, discontinued or precluded is of such small acreage as to be of negligible impact on the farm’s agricultural production; or
 - (B) Not materially damage the quantity or quality of water in surface or underground water systems that supply these alluvial valley floors. Paragraph (n)(v) of this section shall not affect those surface coal mining operations which in the year preceding August

3, 1977, produced coal in commercial quantities, and were located within or adjacent to alluvial valley floors or had obtained specific permit approval by the administrator to conduct surface coal mining operations within said alluvial valley floors. If coal deposits are precluded from being mined by this paragraph, the administrator shall certify to the secretary of the interior that the coal owner or lessee may be eligible for participation in a coal exchange program pursuant to section 510(b)(5) of P.L. 95-87 [30 U.S.C. § 1260(b)(5)].

(vi) If the area proposed to be surface coal mined contains prime farmland, the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as nonmined prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards of this act and the regulations promulgated pursuant thereto;

(vii) The schedule provided in paragraph (a)(xiv) of this section indicates that all surface coal mining operations owned or controlled by the applicant are currently in compliance with this act and all laws referred to in paragraph (a)(xiv) of this section or that any violation has been or is in the process of being corrected to the satisfaction of the authority, department or agency which has jurisdiction over the violation.

Id. (emphasis added). The DEQ administrator has not yet issued any findings under 406(n) because DEQ has not conducted the cumulative hydrologic impact assessment (CHIA) that allows the administrator to make findings under section 406(n)(iii). *See* Wyo. Admin. Code § ENV LQC Ch. 19 sec. 2. So DEQ has neither issued any findings under 406(n) nor administered that portion of section 406. As a result, the Council does not have the authority to conduct a contested case hearing to decide something DEQ has not yet issued or administered. *See Amoco Prod. Co.*, 12 P.3d at 673 (explaining an agency’s power depends upon statutes, so “they must find within the statute warrant for the exercise of any authority which they claim.”).

To be sure, the Council has general authority to grant or deny permits. Wyo. Stat. Ann. § 35-11-112(c)(ii). But in construing that statute and other related statutes, the more specific

statute controls over a general statute if they come into conflict. *Cheyenne Newspapers, Inc. v. Bd. of Tr. of Laramie Cty. Sch. Dist. No. One*, 2016 WY 113, ¶ 23, 384 P.3d 679, 685 (Wyo. 2016). Here, the Council has specific authority when exercising its role in contested cases like this one and that authority does not include granting a permit. *See* Wyo. Stat. Ann. § 35-11-112(a)(iii). Section 406 also specifically defines how the permitting process works and assigns the authority to issue a permit for surface coal mining to the director of DEQ. *See* Wyo. Stat. Ann. §§ 35-11-109(a)(xiii) (stating **the director shall** “issue, deny, amend, suspend, or revoke permits....”); 35-11-406(p) (**the director shall** issue or deny a permit within 15 days after receiving any findings of fact and conclusions of law from the Council). As a result, the Council’s authority to grant a permit does not apply here because two more specific statutes control over the Council’s general authority to grant permits. Thus, the Council’s authority in this contested case is to issue findings of fact and conclusions of law as to the actions taken by DEQ under section 406(a)-(h).

II. The rules of statutory construction show that the Council reviews DEQ’s administration of Section 406(a)-(h).

When deciding what a statute means, the Council must seek to give effect to the legislature’s intent. *Chevron, U.S.A. v. Dep’t of Revenue*, 2007 WY 43, ¶ 10, 154 P.3d 331, 334 (Wyo. 2007). This begins with the plain meaning of the words the legislature chose to find the “most likely, most reasonable, interpretation of the statute, given its design and purpose.” *In the Interest of JB*, ¶ 12, 390 P.3d at 360. The Council should consider each statutory section *in pari materia* (sections with the same subject) giving effect to each “word, clause, and sentence according to their arrangement and connection.” *Id.* In this analysis, the “internal structure and the functional relation between the parts and the whole” guide how the Council should interpret a statute. *Id.* at ¶ 16, 390 P.3d at 361. But the Council cannot read words into the statute or render

provisions meaningless. *City of Casper v. Holloway*, 2015 WY 93, ¶ 20, 354 P.3d 65, 71 (Wyo. 2015). Finally, the Council cannot interpret a statute in a way that produces “absurd results.” *Id.* Using these rules to interpret 35-11-406 leads to the same results as applying the Council’s enabling statute.

The Council’s role in this case comes from section 406(k), which states “an informal conference or a public hearing shall be held within twenty (20) days after the final date for filing objections....” Wyo. Stat. Ann. § 35-11-406(k). As described above, the Council serves as the contested case body for DEQ’s administration of laws, rules, and regulations. *Id.* at 112(a)(iii). The public hearing that invokes the Council’s jurisdiction comes after DEQ finds a permit application suitable for publication. *See id.* at 406(j). For a permit application to become suitable for publication, it must be complete and have no deficiencies. *See id.* at (a)-(h). The Environmental Quality Act defines completeness as an application that “contains all the essential and necessary elements and is acceptable for further review for substance and compliance with the provisions of this chapter.” Wyo. Stat. Ann. § 35-11-103(e)(xxii). The Act defines deficiencies as “an omission or lack of sufficient information serious enough to preclude correction or compliance by stipulation in the approved permit to be issued by the director.” *Id.* at (xxiv). Both processes rely on regulations that flesh out details a permit must have. *See Table on Page 10.*

This sequence and structure suggests the Council should review only what led DEQ to deem Brook’s permit application suitable for publication. *See In the Interest of JB*, ¶ 12, 390 P.3d at 361 (explaining that the Council must give effect to a statute’s arrangement and connection). The legislature chose to structure section 406 so that only a DEQ finding of completeness without deficiency could trigger the Council’s review of comments related to the

permit application. No other part of section 406 states that DEQ's findings will trigger a public hearing. The legislature made a deliberate choice to restrict how a public hearing comes to be; that choice also restricts what the Council reviews. *See id.*

The sequence also shows that the legislature did not intend the Council to review the findings under 406(n). In the structure of the statute, the required findings under section 406(n) come after DEQ deems a permit application suitable for publication and after an informal conference or public hearing has taken place. *Compare* Wyo. Stat. Ann. § 35-11-406(k), (n). Those findings do not have to occur before publication. *See id.* at 406(n). Instead, the findings must occur only before a permit issues, which occurs 15 days after the Council makes its findings of fact and conclusions of law. *Id.* at 406(p). Had the legislature wanted the 406(n) findings to be part of the Council's review, it could have required DEQ make those findings before a permit gets published for public comment. The legislature chose not to do so.

The legislature also expressly stated that the administrator makes the findings under 406(n). The Act defines "administrator" as "the administrator of each division of the department." Wyo. Stat. Ann. § 35-11-103(a)(v). That definition does not include the Council and cannot refer to the Council under any reasonable interpretation. The administrator must also conduct the CHIA, which "shall be sufficient to the make the determination of W.S. § 35-11-406(n)(iii)." WY ADC ENV LQC Ch. 19 § 2. The plain meaning of these sections reinforces the fact that the Council does not make the findings under 406(n).

The federal process for issuing a permit under the Surface Mining Control and Reclamation Act (SMCRA) provides more proof that the legislature intended to have only DEQ make the findings under 406(n). As the Council knows, federal law requires Wyoming's surface mining laws be as stringent as federal law for Wyoming to maintain primacy. 30 U.S.C. § 1255;

30 C.F.R. § 730.11. SMCRA’s regulations require the “regulatory authority” make the exact same findings as those described in section 406(n) of Wyoming’s Environmental Quality Act. *See* 30 C.F.R. § 773.15. The federal regulations define regulatory authority as “the department or agency in each State which has primary responsibility at the State level for administering the Act in the initial program, or the State regulatory authority where the State is administering the Act under a State regulatory program....” *Id.* at § 700.5. So in implementing SMCRA’s requirements, the legislature also required the administrator of the regulating agency to make the findings under 406(n).

The same analysis applies to section 406(m). Section 406(m) states that the “director” cannot deny a permit application, except for the reasons stated. *See* Wyo. Stat. Ann. § 35-11-406(m). Again, the plain language means the legislature did not intend for the Council to make the decision under 406(m), leaving the Council to review only the findings that DEQ made leading to publication of the permit application.

This view is also the only way to overcome a practical dilemma. While the completeness and deficiency reviews that DEQ conducts are necessary to make findings under section 406(n), they are not sufficient for all of the required findings because DEQ has to assess cumulative impacts independent of the permit application. *See* WY ADC ENV LQC Ch. 19 § 2. As mentioned above, DEQ has not yet conducted the CHIA. No Wyoming statute or regulation requires that DEQ conduct that assessment before it deems a permit application suitable for publication. Here, DEQ has not yet done that assessment. So it is impossible for the Council to review those findings because they do not exist. To require the Council to review 406(n) would create an absurd and illogical result where the Council would have to review something that is neither completed nor yet required. *See Holloway*, ¶ 20, 354 P.3d at 71 (stating that the Council

should not read a statute to create an absurd result); *In the Interest of JB*, ¶ 12, 390 P.3d at 360 (stating that the Council must find the “most likely, most reasonable, interpretation of the statute, given its design and purpose.”) As a result, the Council should not consider section 406(n).

III. Brook bears the burden of proof.

Brook does not dispute that as the permit applicant it must provide the information necessary for DEQ to find the permit application suitable for publication. *See* Wyo. Stat. Ann. § 35-11-406(a)-(h). Brook also does not dispute that it continues to have the burden of proving to this Council that its application is complete and without deficiencies. *Id.* The Council should also weigh heavily the regulatory and technical expertise of DEQ. Although the Council may not have to defer to their expertise, DEQ personnel are the true experts on permit applications.

IV. The law the Council should review

Although the Council should review only whether Brook has proven that its permit application is complete, non-deficient, and suitable for publication, that review involves multiple statutes and regulations. For the Council’s benefit, Brook has set out the applicable statutes and their associated regulations in the table below. Brook will incorporate these statutes and regulations into its proposed findings of fact and conclusions of law.

Statutes	Regulations
35-11-406(a)	<p>Wyoming Administrative Rules Department of Environmental Quality Land Quality – Coal:</p> <p>Ch. 2, §§ 2(a)(i), (ii), (iii), (v) § 3(b) §§ 4(a)(i), (ii), (iii), (vi), (vii), (viii), (ix), (x), (xi)(A)-(B), (xii), (xiii), (xiv) § 5(a)(viii), (xiii), (xvi) §§ 6 (b)(ii), (vi), (x) Ch. 4, §§ (2)(a), (d), (f), (j), (l)(C)-(D), (n), (r), (t), (w), (x) Ch. 5 § 6 Ch. 7, §§ 1, 2 Ch. 12, §§ 1(a)(v)(D), (E)-(F), (viii), (xi), (xii) Ch. 19, § 2</p> <p>Wyoming Administrative Rules Department of Environmental Quality Land Quality – Coal, Appendix B</p>
